The excavations consist of a number of chambers, connected by low, narrow, and winding passages, which extend fully three-quarters of a mile, but formerly much further, many passages being now closed up by the falling in of the rock. Tournefort, who explored the place, found the entrance so low as not to be passable without stooping. Proceeding onward with torches, a 'thousand twistings, twinings, sinuosities, and turn-again lanes' appeared, defying the efforts of the traveller to penetrate to the further end, or, having done so, to find his way back without some precautions being observed. The method adopted was to scatter straw along the ground, and attach numbered scrolls to every difficult turning. Numerous inscriptions in the interior with dates shewed that the labyrinth had been often threaded, one of which, in Italian, commemorated a Venetian visitor—'Here was the valiant Signor John de Como, captain of foot, 1526.'

The population of Turkey, though not known with any pretensions to exactness, is commonly stated at 15,500,000. But even this number, considered by some authorities as far too high, gives only a small proportion of inhabitants to the area of the country, many parts of which are solitudes, though bearing traces of great natural fertility. The nationalities of Slavonic origin, speaking various dialects, found in Serbia, Bulgaria, Bosnia, Croatia, the Herzegovina, and Montenegro, form the largest body of the people. The Molda-Wallachians rank next; and Greeks are numerous on the shores of the Bosphorus, the Archipelago, and in the islands. These races compose the greater part of the Christian subjects, who were cruelly oppressed in past times, and who are not yet free from heavy grievances in the provinces still under direct Turkish rule. They are mostly members of the Greek Church, in connection with the great see of Constantinople, the bishops of which rose to pre-eminence in the oriental world by favour of the early Greek emperors; assumed the style of patriarchs; took precedence of the older dignitaries of Antioch and Alexandria; disputed the pretensions of the Roman pontiffs to superiority; and, finally, renounced communion with them, constituting themselves the independent spiritual heads of Eastern Christendom. The Greek Church differs from the Latin in a multitude of particulars, doctrinal and ritual, yet they are chiefly of a very trifling nature; while it maintains as strongly, complete submission on the part of the laity to the priesthood. The papas or priests are very commonly illiterate

men, raised from the inferior ranks of life, who secure blind devotion from the ignorant masses, but often contribute to infidelity among the intelligent. Though persecution on religious grounds is prohibited, and impartial toleration is allowed to all classes, yet the government is too weak to restrain provincial officials, and secure obedience to its decrees at a distance from the capital. Hence insults and outrages are not uncommon, offered by a bigoted and fanatical Mohammedan party, of the old school, to their neighbours of a different faith. Only a small portion of the population consists of the dominant race, the Turks or Osmanli, who are probably over-estimated at 2,000,000, and are said to be decreasing in numbers. They live in and around Constantinople, are scattered generally through Roumelia, and are found to a less extent in most of the other towns, either as stated residents, or forming the garrisons. Their ascendancy is maintained entirely by military means, along with the jealousies of the leading European cabinets, who consider the integrity of the Turkish Empire essential to preserve the balance of power.

The Turks belong to the great family of nations thinly spread over the plains and table-lands of Central and Western Asia, known by a variety of names, but often comprehended under the general appellation of Tartars, pastoral in their occupations, and nomadic in their mode of life. They now differ in personal lineaments from the more eastern tribes of the same stock, and correspond to the European type, as the consequence of change of circumstances, settled habits, and marriage alliances with females from the Caucasus. Their language is identical with the Arabic in its alphabet, but has a few additional letters; and the vocabulary is interlarded with many foreign words. It is easy to speak, but difficult to read, the vowels being generally omitted in writing and printing, while no marks of punctuation are observed. The national costume is loose and flowing. That of the women differs but little from that of the men, with the exception of the white veil worn by the former in public, and the turban of the latter. But among the higher classes in the capital, the turban has been largely discarded for the round fez-cap, and tight-fitting clothes have been substituted for flowing robes. The houses are uniformly low, built of wood and sun-dried bricks, often painted over on the outside, with little furniture in the interiors, as chairs, tables, and bedsteads are alike dispensed with. Rice, fruits, coffee, and sherbet are the principal articles of food; baths and coffee-houses are the chief places of recreation; chess and draughts are the popular games; smoking is the universal habit. The Turks have a respectable literature, consisting of translated and original, poetical and historical, compositions, in manuscript and print. But letters are only cultivated to a limited extent, chiefly by the class intended for government employment, or for the purpose of expounding the Koran; and the general ignorance in high-life is profound in relation to topics of ordinary knowledge with the humblest grades among the Western nations. In religion, they are all Mohammedans, faithful to their creed, and attentive to the prescribed ritual of fasts, ablutions, and quintuple daily prayers. While allowed four wives by the law of the Prophet, this licence is now almost entirely restricted to the palaces of the rich and great. The form of government is an hereditary despotism, based upon the Koran, but somewhat modified in recent times as the consequence of political emergencies, and the representations of foreign powers.

The immediate ancestors of the European Turks appeared about the middle of the thirteenth century, as adventurers from the further east in Asia Minor, in search of a territory, under their chieftain Ertoghrl. He obtained possession of the rich plains around Shughut, called the 'Country of Pasture,' and of the Black Mountains on the borders of Phrygia and Bithynia. The former was for his winter abode, and the latter for his summer encampment. In this district, his son Othman or Osman was nurtured, who became the founder of a dynasty and an empire, enlarged his dominion by entering the territory held by the Greek emperors of

Constantinople, but confined himself to the soil of Asia. He began the invasion of Nicomedia, July 27, 1299, and from this era his reign is dated, with the commencement of the Ottoman power. Edward I. then sat upon the throne of England. The third sovereign or sultan, Amurath I., established himself in Europe by the capture of Adrianople in 1361.

The Turks have remarkably preserved their oriental characteristics during the five centuries of their intercourse with Western nations. Most of their usages are in direct opposition to our own. Some of the more prominent are quoted from the pages of Mr Urquhart. Shaving the head is with them a custom; with us a punishment. We take off our gloves before the sovereign; they cover the hands with their sleeves. We enter an apartment with the head uncovered; they enter with the feet bare. With us the women commonly appear in gay colours, and the men in sombre; with them it is exactly the reverse. In our rooms the roof is white, and the walls are coloured; in theirs the walls are white, and the ceiling coloured. Amongst us, masters require a character with their servants; in Turkey, servants inquire into the character of masters. In our fashionable circles, dancing is considered an accomplishment; they deem it a disgraceful employment. An Englishman will be astonished at what he calls the absence of public credit in Turkey; the Turk will be amazed at our public debt. The Englishman will esteem the Turk unhappy because he has no public amusements; the Turk will reckon the man miserable who wants amusements from home. But polygamy, and the seclusion of women, are the most important distinctions between Eastern and Western customs.

The first press for printing in Turkish was established at Constantinople under Achmet III., in 1728. The project encountered strong opposition, as thousands of scribes gained their subsistence by copying manuscripts. It was finally arranged that the *Koran* and theological works should still circulate only in manuscript, and printing be allowed for other books. In the first twenty-eight years, ending with 1756, the press produced eighteen works, and a total number of 16,500 copies. Through the next twenty-seven years it was entirely inactive, but was re-established in 1783 by Sultan Abdul Hamid, with new and better types. Though progress since has been very slow, yet the Turkish press has had a marked effect upon penmanship. The beautiful specimens for which the calligraphists were celebrated have almost wholly disappeared, but the handwriting has gained in distinctness by losing in ornament. During the present century, Mahmoud II. patronised the press, specially with the circulation of translated works on military science in view. In his reign, 1832, the first Turkish newspaper appeared, the Ottoman *Moniteur*. There are now several; and though not a reading people, the Turks now repair to the coffee-houses, many of which are also barbers' shops, to have the latest intelligence reported to them from the journals.

In common with all Mohammedans, the Turks compute from the time of the Hegira, or the flight of the Prophet from Mecca, on Friday, the 16th of July 622 A.D. Their year consists of twelve lunar months, and is therefore shorter than our own. They observe with the utmost strictness the month of Ramazan as a prescribed annual fast and festival, during which, from sunrise to sunset, no one eats, drinks, or smokes. The obligation is imposed upon all but children and invalids. Owing to the lunar reckoning, the sacred month runs through every season in the course of thirty-three years; and when it occurs in full summer, the labouring-classes suffer extremely from exhaustion and thirst, for not even a draught of water is taken. 'I have seen,' says one, 'the boatmen lean on their oars almost fainting; but I never saw, never met with any one who professed to have seen, an instance in which they yielded to the temptation of violating the fast.' But at the sunset hour, a moment anxiously expected and generally announced by the firing of cannon, all classes make up for abstemiousness through the day by revelry through the night. The streets are crowded and the coffee-houses thronged. The mosques are open and the minarets illuminated. Attached as functionaries to the principal mosques, are Imauns, Sheikhs, and Kiatibs, who are the Friday preachers; the Muezzims, or those who call to prayer; the Dewr Khuran, readers of the *Koran*; the Naat-shuran, singers of hymns; the Rewab, door-keepers; and other inferior officers. The small mosques are called *Mesjid*, places of prayer, from which, indeed, the word mosque is derived. In daily life the verbiage of the Turks has a strong religious tinge. The ordinary affirmation is *Inshallah*, 'Please God,' and the negative, *Stafarillah*, 'God forbid.' Astonishment is expressed by *Allah kerim!* 'God is great and merciful!' and gratitude by *Shukur Allah*, 'May God reward you,' or *Ev Allah*, 'Praise be to God,' or *Allah-raz olsun*, 'May God receive you.'

The highest title of the sultan is that of Padishah, father of sovereigns, or king of kings. He is also styled Vicar of God; Successor of the Prophet; Pontiff of Mussulmans, or Commander of the Faithful; Refuge of the World; Shadow of God; and *Unkiar*, the man-slayer, or blood-drinker. The last epithet alludes to the right once possessed of putting to death fourteen persons daily, without cause being assigned for the execution, in accordance with that unlimited power over the lives of their subjects which almost all oriental potentates have claimed. A site on the Asiatic side of the Bosphorus, scene of a famous treaty with Russia in the year 1833, has the name of Unkiar Skelessi, literally, 'the man-slayer's or blood-drinker's stairs.' This prerogative, if ever exercised, was renounced in 1839 by a hatt-i sherif, 'exalted writing,' as all edicts which have the imperial signature are called. The Salic Law fully regulates the succession to the throne, for the daughters of the sultan can transmit no right to it to their male offspring. A cabinet council conducts the executive government, to which the name of the *divan* is given, as the meetings were originally held in a room of the Seraglio, with no other furniture in it but a divan or bench, placed against the sides, covered

with cushions. Its most important members are the Grand Vizier, 'burden-bearer,' the prime-minister; the Seraskier, minister of war, and commander-in-chief of the army; the Capitan Pasha, or high-admiral; the Kharidchije-Naziri, minister of foreign affairs, formerly called the Reis Effendi; and the Mustechar, who acts as an adviser of the grand-vizier, and has the management of the home department.

The views expressed respecting the moral character of the Turks were once uniformly to their disadvantage, and scarcely allowed them the possession of a single virtue. But a more intimate acquaintance, the growth of the present century, has tended favourably to modify the general judgment; and perhaps their own fallen political fortunes has contributed to this result, by depriving them of the opportunity and the means to indulge in the fiery intolerance and licentious excesses of their conquering forefathers. They are undoubtedly a proud, sensual, phlegmatic, and indolent race, yet capable of vigorous exertion in great emergencies; and when tried by the events of the battle-field or the siege, they are not found wanting in bravery. Though not easily provoked to anger, owing to an apathetic temperament, yet when once thoroughly roused, their passions are furious and resentments deadly. On the other hand, temperance must be ascribed to them, both as it respects food and drink, the salutary effect of which is seen in a healthy, robust, and manly appearance. Travellers have frequently had occasion to remark upon their hospitality, honesty, and truthfulness; and humanity to animals is a graceful characteristic. The beasts of burden, horses and camels, are lightly laden, and kindly treated, being very rarely urged by any instrument of punishment. Those who have the means will buy captive birds of the bird-catchers for the mere pleasure of setting them at liberty; and purchase scraps from the *jiguerjis*, vendors of cats' and dogs' meat, in order to feed the animals in the streets. Great reciprocal affection subsists between mothers and children in families, tender in the one, respectful in the other, constant and indissoluble in both. These are some of the traits of character displayed by the followers of Mohammed, not as the exceptions, but prevalent, which may be commended to the notice and imitation of Christian nations.

Wallachian Travelling.

Athens.

## CHAPTER V.

### GREECE.

**G**REECE, the name given by the Romans to the country called by its ancient inhabitants Hellas, is one of the youngest, smallest, and least important of the states of Europe, but has a name of the highest renown in history, as the ancient seat of freedom, of art, and of civilisation in general, and as possessing a copious and brilliant literature, at a period when the remainder of Europe was occupied chiefly by barbarian tribes. Splendid scenery, a transparent atmosphere, and the brightest of skies render the region eminently attractive. Fine remains of temples, many scenes of patriotic struggles, and the memory of illustrious men associated with the soil in past ages—poets, historians, orators, philosophers, and artists—combine to invest it with peculiar interest, though unfortunately, in spite of some social and political advance, the contrast between the spirit of the present population and that of their ancestry justifies the expression of the sentiment, ‘Tis Greece, but *living* Greece no more.’ The modern kingdom, constituted in the year 1832, does not, however, exactly correspond in its dimensions to ancient Hellas. It embraces the south extremity of the peninsula occupied by Turkey through the greater part of its extent, and is washed by the *Ægean* Sea on the east, and by the Ionian on the west. It comprises also a multitude of islands closely adjoining the shores; but the total area very slightly exceeds 16,000 square miles, equal to rather more than the half of Scotland. The northern boundary is an artificial line drawn from the Gulf of Arta, on the western coast, to the Gulf of Volo,

on the eastern. From this frontier the mainland stretches to Cape Matapan, the extreme south point, a distance of not more than 200 miles. The greatest breadth falls far short of this measurement, while the contractions are numerous and considerable from deeply-penetrating bays and gulfs. In fact, they give to Greece a coast-line more extensive in proportion to the size of the country, than that of any other portion of the continent. These far-winding inlets of azure sea, with bold headlands at their mouths, sometimes column-crowned, and the many islets, render the shores indescribably beautiful.

The mainland consists of two principal portions, northern and southern, which are very nearly detached by the close approach of the Gulf of Lepanto from the west to that of *Ægina* from the east. Between these arms of opposite seas there is only a tract which narrows to three miles in width, forming the Isthmus of Corinth. On this neck of land stood in ancient times a famous temple of Neptune; and here was celebrated in his honour one of the four great national festivals of the Greeks, which obtained the name of the Isthmian Games from the site. The country north of the isthmus corresponds to Hellas Proper, and that on the south to the ancient Peloponnesus.

Though so small a country, Greece exhibits all the varied features of a natural landscape, with the exception of important rivers. There are commanding mountains, noble promontories, and grand defiles, along with gentle hills, fertile plains, and numerous basin-shaped valleys completely enclosed. In these circular hollows small lakes are formed, which increase in volume with the rains of autumn and winter, and diminish under the heat of summer, or degenerate into marshes, and give rise to malaria and disease. Lake Topolias, the largest example, has a length of sixteen miles by a breadth of eight in winter, but is partly converted in summer, into an extensive reed-grown swamp. The chain of Pindus reaches the northern frontier from Turkey, where it sends off a branch to the east, the extremity of which, forms, with the adjoining sea, the famous Pass of Thermopylae. The main range ramifies southward in various directions through the country, marked by summits well known by name to the classical student, as Mount Elatea, the ancient *Cithæron*, rising to the height of 4156 feet; Zagora, or *Helicon*, 4500; Lyakura, or *Parnassus*, 8068; and Guiona, or *Axiros*, 8620 feet, the culminating-point of Greece. A branch passes through the Isthmus of Corinth, and then divides into three short ridges, the central one of which terminates at the southern extremity in Cape Matapan. It rises in Mount St Elias, or *Taygetus*, to 7900 feet. The mountains, and indeed nearly the whole country, are chiefly of limestone. It frequently assumes the form of marble of the finest quality, and of various colours, which the ancients extensively quarried for buildings and statuary. No volcanic rocks are found on the mainland, but considerable masses occur in some of the islands, one of which, Santorin, is still a centre of volcanic action. Coal, sulphur, porcelain clay, salt, iron, and argentiferous lead, with some traces of gold, are noticed among the minerals, but the extent and value of these resources have not been developed. Mineral springs, cold and warm, some sulphureous, others saline, are extremely numerous. Those caves and fissures emitting mephitic vapours also abound, which fired the imagination of the old native poets, and intoxicated the priests and priestesses who uttered the divine oracles. The most important of the streams, the Aspropotamo, or *Achelous*, watering the western side of Northern Greece, rises beyond the frontier, and discharges in the Ionian Sea, at the mouth of the Gulf of Lepanto. The Hellada, or *Sperchius*, and the Gavrios, or *Cephalissus*, traverse the eastern side of the country. In the southerly division are the Vasilipotamo, or *Eurotas*, flowing through the plain of Sparta; and the Roufia, or *Alpheus*, by the banks of which the great Olympic games were held.

Though none of the mountains rise to the line of perpetual snow, yet it lingers on the

loftier summits till the summer is far advanced, and speedily returns to them again. Hence very distinctly-marked zones of vegetation are observed within a limited range, occupying the country ascendingly, from the vine and olive of the plains and valleys to the beech and pine of the grand elevations. The olive grows wild in all parts of Greece, as when it sheltered 'Plato's retirement,' and formed the grove of the Academy. Under cultivation, it yields excellent fruit, which the inhabitants preserve in various ways as a staple article of food. The mulberry-tree is raised for the silk-worm; oranges, citrons, lemons, pomegranates, almonds, and other fruits are largely produced; the figs of Attica are still, as aforesaid, celebrated for their quality; and Mount Hymettus, in the neighbourhood of Athens, vindicates its ancient fame for aromatic plants, bees, and honey. In parts of the mainland and some of the Ionian Islands, the dwarf-grape or currant is the prime object of culture, extensively exported in the dried state to England as an ingredient in well-known Christmas fare. The vine grows luxuriantly, and is cultivated in the island of Santorin for wines saleable in foreign countries, owing to the volcanic soil being specially favourable to it. Various kinds are prepared for the markets of Turkey and Russia, as the 'wine of Bacchus,' with the taste of nectar and the colour of liquid gold, and the colourless 'wine of night.' The latter has obtained its name from the fact of the vintage taking place during the night, and from the grapes being intentionally hidden under the leaves of the vine, instead of being exposed to the influence of the sun, by which means they produce colourless wine. With the exception of a few spots, the entire island is now a vineyard, under the management of a company of experienced French wine-growers.

The summer temperature is extremely high, but owing to the essentially maritime constitution of the country, the sea-breezes have extensive prevalence, and greatly modify the heat. Occasionally the 'black sirocco,' as it is called, is a disagreeable visitor. This is a hot southerly wind which shrivels the vegetation and oppresses the animal system, as in the days of yore, when it was described as

'Auster's sultry breath,  
Pregnant with plagues, and shedding seeds of death.'

But the west wind—light, genial, and sometimes humid—has a remarkably reviving effect upon floral nature, and was hence styled *zephyrus* by the ancients, the 'bringer of life,' who ascribed to it the production of flowers and fruits. Rain is, however, rare in summer, and clouds are not much more common. Abundant showers fall during the short winter upon the plains, while frost and snow are chiefly restricted to the higher uplands. Generally, the climate is highly agreeable to the senses, the sky bright, and the atmosphere transparent. To the genial temperature, which allows the inhabitants to pass much of their time in the open air, with the great beauty of nature, modern writers refer, in order to account in part for the defective domestic architecture of the old Greeks, the badness of their streets, and the meanness of their houses, even of those belonging to the most wealthy and noble. In Athens, the people worshipped, legislated, witnessed dramatic representations, and listened to their orators, with no covering over their heads but the naked sky. Sunset adorns the horizon with the most varied and gorgeous hues, which are painted upon the objects below, and render the landscapes indescribably glorious. Dean Stanley speaks of the transparent clearness, the brilliant colouring of an Athenian sky; of the flood of fire with which the marble columns, the mountains, and the sea are all bathed and penetrated by the illumination of an Athenian sunset; of the violet hue which Hymettus assumes, in contrast with the glowing furnace of the rock of Lycabettus, and the rosy pyramid of Pentelicus.

Modern Greece is distributed into ten nomes or provinces, which are subdivided into

forty-nine eparchies or prefectures, and these again are parcelled out into cantons. This arrangement dates from the year 1852; but an additional province will be constituted of the Ionian Islands, of which Great Britain has recently resigned the protectorate,

|  | Provinces.             | Principal Towns.                          |
|--|------------------------|---|
| Northern Greece, }<br>or Hellas, }         | Acarmania and Ætolia,  | Vrachori, Missolonghi, Vonitza, Lepanto.  |
| "  | Phthiotis and Phocis,  | Lamia, Salona, Kastri.                    |
| "  | Attica and Bœotia,     | Athens, Piræus, Livadia, Thiva or Thebes. |
| Southern Greece, }<br>or the Morea, }      | Argolis and Corinthia, | Napoli di Romania, Argos, Corinth.        |
| "  | Achaia and Elis,       | Patras, Kalavrita.                        |
| "  | Arcadia,               | Tripolitza, Megalopolis.                  |
| "  | Messenia,              | Calamata, Navarino, Modon.                |
| "  | Laconia,               | Sparta, Mistra, Napoli di Malvasia.       |
| Insular Greece, }<br>or the Archipelago, } | Eubœa,                 | Chalcis or Negropont, Karysto.            |
| "  | Cyclades,              | Syra, Andros, Naxia, Hydra, Spezzia.      |
| "  | Ionian Islands,        | Corfu, Zante.                             |

NORTHERN GREECE, bordering upon Turkey, comprehends the territories occupied by the ancient states, Attica, Mægaris, Acarmania, Ætolia, Doris, Locris, Phocis, and Bœotia.

*Athens*, the capital of the kingdom, on its eastern side, in latitude 37° 58' north, longitude 23° 46' east, is seated on a plain bounded by hills, watered by the Cephissus and Ilissus, small streams which flow to the Gulf of Ægina, about five miles distant, but are quite exhausted during the heat and drought of summer. Their banks are now treeless, and recall anything but the scene described by Plato in his dialogue of Phædrus with Socrates, as they sat under the high and spreading plantain, and enjoyed the fragrance of the agnus-cactus which then flourished in the channels. The plain itself is broken up by a series of abrupt limestone masses. The present city is almost wholly modern, and has a population of about 41,300. It contains a cathedral in the Byzantine style; a large royal palace, tasteless and heavy, built of the marble of Pentelicius for the recently dethroned sovereign; a university of respectable appearance, and attended by upwards of 500 students, several gymnasia and charitable foundations, but is otherwise a place of narrow streets and mean-looking houses. All the celebrity of Athens is derived from the hoary past, when it was

‘The eye of Greece, mother of arts  
And eloquence.’

and all interest centres in its historic sites, and extant remnants of classical antiquity. Foremost among the latter is the Acropolis or citadel, built upon a rock abruptly rising out of the plain, which comprises within its enclosure the shattered white marble skeleton of the Parthenon, a temple dedicated to Minerva, the tutelary goddess of the ancient city. This building, upon the highest part of the hill, was erected under the administration of Pericles, and completed in 438 B.C. It was of the Doric order, of the purest kind, adorned within and without with exquisite sculptures, executed under the direction of Phidias by various artists. After becoming a Christian church, it was despoiled by Alaric the Goth, and subsequently converted into a mosque by the Turks, but remained tolerably entire down to the year 1687, when, during a siege by the Venetians, the greater part was reduced to a heap of ruins. Since that date wealthy antiquaries have largely carried away

‘What Goth, and Turk, and Time had spared.’

Many of the finest sculptures were removed to England by Lord Elgin in the early part of the present century, and now form the Elgin marbles in the British Museum. Immediately to the west of the Acropolis, separated from it by a narrow valley, is the Areopagus or Mar's Hill, another rocky height, of great interest in the annals of Christianity, as the spot on which the apostle Paul delivered his memorable address to the Athenians. It was also the place of meeting of the Areopagite judges, renowned for the integrity of their decisions. They sat in the open air. The judgment-seat remains, a bench of stones excavated out of the rock, with steps leading up to it, and there are two rude blocks supposed to have been assigned, the one to the accuser, the other to the criminal. The Pnyx, where the popular assemblies were held, is an adjoining hill, marked by a solid rectangular block, from which the orators appealed to the multitude. The traveller ascending it may with certainty say that he is standing where stood Demosthenes, Pericles, Themistocles, Aristides, and Solon. The temple of Theseus, a little older than the Parthenon, once used as a church, is the best preserved of all the ancient buildings, and is now occupied as the national museum. Over the plain still tower sixteen majestic columns of the temple of Jupiter Olympus, once one of the most magnificent structures in the world, begun by Pisistratus, 530 B.C., but only completed by Hadrian, 145 A.D.

The foundation of Athens is ascribed, in Greek legend, to Cecrops, a chieftain of the Pelasgic race, 1550 B.C. The city was burned by Xerxes, rebuilt by Themistocles, adorned by Pericles, and is supposed to have

contained 120,000 inhabitants at the close of the Peloponnesian war. It suffered severely during a siege by the Romans, but was partly rebuilt and embellished by Hadrian. Ravaged by the Goths, it gradually sunk into obscurity, and remained an almost deserted place through the greater part of the middle ages. Among the illustrious men of antiquity in the list of natives, the names of Socrates, Plato, Phidias, Pericles, and Alcibiades occur.

The *Piræus*, or port of Athens, is five miles to the south-west, on the Gulf of *Ægina*. It was formerly connected with the city by long walls built of stones of enormous size, sixty feet high, and broad enough at the top for two wagons to pass abreast. These have long since disappeared, though some vestiges may be traced. A good macadamised road now runs between the two, shaded by groves of olives. In modern times the place has been named Porto Draco, or Porto Leone, from the colossal lions of marble transported to Venice in 1687, and erected near the arsenal. The modern town of about 6430 inhabitants is entirely new, and has in its neighbourhood remains of the tomb of Themistocles, overlooking ancient Salamis, a small island close inshore, the scene of his glory in the naval triumph over the Persians, 480 B.C. Solon and Euripides were natives of the island. On the adjacent mainland, beautifully situated, is *Lepsina*, now a small village, representing the ancient Eleusis, which gave its name to the great festival held in honour of Ceres—known as the Eleusinian Mysteries—the most famous of all the religious ceremonies of the Greeks. Further to the west is *Magara*, similarly reduced, once the mother of colonies, in possession of a powerful fleet, and the seat of a celebrated school of philosophy. The plain of Marathon, scene of the battle in which the Athenians under Miltiades signally defeated the Persians, 490 B.C., is about twenty-five miles north-east of Athens, close to the sea, and partly under cultivation. A mound of earth rises in the centre which the conquerors piled over the remains of their countrymen who fell in the engagement. The Attic peninsula terminates to seaward with the promontory of Sunium, on which stood a splendid temple, some columns of which still exist, and have given to the headland its present name, Cape Colonna.

*Thebes*, the capital of Boeotia in the classic age, the birthplace of Pindar and Epaminondas, survives only as a wretched hamlet under the name of Thiva. *Livadia*, ancient *Lebadeia*, with 5000 inhabitants, is now the chief town of the district. Here are the famous oracular cave of Trophonius, and the fountains of Lethe and Mnemosyne. The Pass of Thermopylae, in which Leonidas and his band of Spartans perished while resisting the Persian host, 480 B.C., leads from Boeotia into Thessaly, between Mount *Ceta* on one side and the sea on the other. It is about five miles long and a hundred yards wide, chiefly occupied by a morass through which runs a narrow paved causeway. The name refers to some copious hot springs, *thermæ*, in the defile. Though called the 'Gates of Greece,' the pass has never opposed an effectual barrier to an invading army, owing to the existence of practicable routes across the mountains.

Within the limits of Phocis, the poor village of *Kastri*, at the base of Mount Parnassus, is all that remains of Delphi, a wealthy city in the time of Homer, distinguished by the temple and oracle of Apollo, and by the Castalian spring, which was accounted the source of poetic inspiration. The mountain rises in vast precipices immediately behind the humble cottages, and the fountain flows at a short distance from the village. It is 'ornamented with pendant ivy, moss, brambles, and flowering shrubs, and is overshadowed by a large fig-tree, the roots of which have penetrated the fissures of the rock, while its wide-spreading branches throw a cool and refreshing gloom over this most interesting spot. In front of the spring, a majestic plane-tree nearly defends it from the rays of the sun, which shines on it only a few hours in the day.' The copious spring forms a very picturesque brook, which passes through a rocky glen, fringed with olive and mulberry trees, and joins the little river Pleistus. Dr E. D. Clarke ascended Parnassus, and found all its higher region bleak in the extreme, and destitute of herbage, with the exception of a few rare plants. He was enraptured with the view from the summit. 'The Gulf of Corinth had long looked like an ordinary lake, and it was now reduced to a pond. Towards the north, beyond all the plain of Thessaly, appeared Olympus with its many tops, clad in shining snow, and expanding its vast breadth distinctly to the view. The other mountains of Greece, like the surface of the ocean in a rolling calm, rose in vast heaps; but the eye ranged over every one of them. Helicon was one of these, and it is certainly inferior in height to Parnassus. We looked down upon Achaia, Argolis, Elis, and Arcadia as upon a model.'

The small fortified seaports of *Mesolonghi* and *Lepanto* are in the western part of Northern Greece. The former acquired notoriety from its sieges during the war of independence, and as the scene of Lord Byron's death in 1824. The latter gives its name to the gulf it adjoins, also called the Gulf of Corinth; and to the great naval battle fought on the contiguous waters, in which the Turks were defeated by Don John of Austria in 1572, and their navy for a time annihilated.

SOUTHERN GREECE, or the ancient Peloponnesus, has been called in modern times the Morea, a term derived from the Greek word for the 'mulberry-tree.' It was applied to the district either owing to the common occurrence of the tree within its bounds, or to some fancied resemblance in its shape to that of the mulberry-leaf. In this division of the kingdom, the ancient states of Achaia, Elis, Messenia, Laconia, Argolis, and Arcadia were situated. Broken by numerous bays and projections, its coast-line was deemed difficult and dangerous in the inexperienced navigation of early times. Cape Matapan,

the south extremity, was reckoned one of the entrances into the infernal regions; and of a south-eastern headland, the proverb was current, 'Before the mariner doubles Cape Mala, he should forget all he holds dearest in the world.'

*Napoli di Romania*, or Nauplia, is seated on the east coast, at the head of a gulf to which its name is given. It contains about 10,000 inhabitants, and was for a short time the capital of the new kingdom, prior to the selection of Athens. A fortress erected by the Venetians on the top of a precipitous rock, 700 feet above the sea, is deemed impregnable, and has been called the Gibraltar of Greece. *Patras*, on the

Patras.

north-west, at the entrance of the Gulf of Lepanto, is the largest town, containing a population of 20,000. It is also a fortified seaport, and the principal seat of the foreign trade, from which large quantities of currants of the best quality are annually shipped. *Navarino*, a small port on the south-west, is memorable for the battle fought on its waters in 1827, when the Turkish and Egyptian fleets were destroyed by the combined British, French, and Russian squadrons. *Argos*, built on the site of the ancient city of the same name, is a thriving town of 11,000 inhabitants. In the vicinity cotton, vines, and rice are grown. *Mycene*—once famous and great—is now a mere city of ruins near the village of Krabata. *Sparta* has been restored in part from the same desolation, having been rebuilt. *Corinth*, 'the city of the two seas,' as both Horace and Ovid style it, on the isthmus between the Ægean and Ionian basins, exists as a small town of 2000 inhabitants with some remains of its ancient magnificence. The principal relic consists of seven fluted columns of the Doric order, with a part of the architrave still resting upon five of them, where the stork loves to build its rude nest. These columns are generally shewn in all engravings of modern Corinth.

INSULAR GREECE, or the Archipelago, on the eastern side of the mainland, embraces the island of Eubœa, the group of the Cyclades, and a portion of the Sporades. The recently-annexed Ionian series extends along the south and west coasts. These islets have a very varying character. Some are scorched and sterile volcanic masses, presenting nothing to the eye at a distance but verdureless acclivities, with scarcely a single tree to break the uniform barrenness; and it is only in nooks and corners, in deep dells and shaded retreats, that the ground has its grassy slopes and leafy copses. But others exhibit the soft yet grand features common to districts which have a rocky skeleton clothed with fertile soil; and no contrast can well be conceived more striking than that presented by

dark groups of tall and tufted cypresses, with the pale quivering foliage of luxuriant olive-groves, the white limestone-cliffs, and the blue sea gloriously lighted by an unclouded sun. With nature's attractive scenes there are often blended remains of once stately temples erected in honour of long dethroned gods and goddesses, imposing, or picturesque, or effective by their very insignificance in contrast with their past grandeur, while historical and poetic associations of the highest interest cling to many a cove and headland. EUBŒA, formerly called Negropont, a name bestowed by the Venetians, who were its masters from the year 1204 till they were dispossessed by the Turks in 1470, is the largest island in the Ægean Sea, remarkable for its length and scanty breadth. At one point, towards the centre, it so closely approaches the mainland as to admit of a bridge being thrown across the intervening channel. The pastures of the island are excellent, and the declivities of the mountains are covered with forests of fir. The chief products are cotton, oil, wine, wheat, fruit, and honey, and the inhabitants are engaged chiefly in the breeding of cattle. The CYCLADES, of which there are twenty of some size, form a cluster on the south, and were so called from the legend of their *circling* around Delos when that island was rendered stationary by the birth of Diana and Apollo. Three of the number are naturally remarkable—Santorin, an active volcanic centre; Paros, yielding the fine white marble of the statuary; and Antiparos, celebrated for its grotto in the limestone rock. The SPORADES, or 'scattered' islands, were so styled from their irregular distribution. Only a few of them now belong to the kingdom of Greece.

*Egripo*, the chief town of Eubœa, is a maritime place now of but little note, situated on the narrowest part of the channel, between the island and the continent. But it represents the Chalcis of the ancients, where Aristotle ended his days, 322 B. C., and the birthplace of the orators Isæus and Lycophron. The city became the mother of numerous colonies—that of Cumæ, in Italy, among others—and was of military importance from completely commanding the navigation of the strait.

*Syra* or Hermopolis, on the island of that name, with about 35,000 inhabitants, is the capital of the Cyclades, a busy and prosperous port, with a harbour generally crowded with vessels, and piles of merchandise lying on the quays. It is the great commercial entrepôt of the Archipelago, a principal station of the Mediterranean steamers going to and from Constantinople, the see of a Greek bishop, and the residence of various consuls. The town is built upon the shore, and ascends from thence to the summit of a steep conical hill situated between two high mountains. Its white houses present an imposing effect from the blue sea. The island, about ten miles in length by five in breadth, has an inhospitable aspect, consisting almost entirely of bold highlands bare of vegetation. But upon being explored, fertile tracts are met with in narrow valleys, in which the vine grows luxuriantly.

Among the other members of the group, Naxos is the largest and most beautiful. The central Delos, once the most famous, is one of the smallest and most desolate, possessing scarcely a vestige of the temple which attracted pilgrims from all parts of Greece. Tinos is celebrated for producing the best Malvasian or Malmsey wine, which derives its name from the town of Napoli de Malvasia, on the east coast of the Morea. Paros, and its neighbour Antiparos, are almost wholly composed of marble. The grotto or cavern, in the latter island, often visited by travellers, is entered on the side of a hill, about two miles inland. It consists of a series of passages and descents leading to a wonderful subterranean apartment, called the 'Great Hall,' 120 yards long, 113 broad, and 60 feet high. The sides and roof of this natural chamber are covered with immense incrustations of calcareous matter, beautifully white. They depend from the ceiling ten or twelve feet, as thick as a man's waist, with innumerable festoons of the same substance occupying the intervening spaces. They rise up from the floor with the appearance of broken columns, or the stumps of trees. One remarkably fine mass, termed the 'Altar,' is twenty feet in diameter and twenty-four feet high. This cavern, which was known to the ancient Greeks, seems to have been forgotten till the seventeenth century, when it was revived by the Marquis de Nointel, the French ambassador to the Porte. He passed the three Christmas holidays in it, in 1673, on his journey to Constantinople, accompanied by a train of domestics, merchants, and natives, who were anxious to explore it. The place was illuminated by 100 large wax-torches and 400 lamps; and high-mass was celebrated by the chaplains of the embassy at midnight.

*Hydra*, a town and port of modern date, is on an island of the name, one of the Sporades, a short distance from the east coast of the Morea. It became a highly-prosperous place during the war of independence, owing to the public spirit displayed by its inhabitants in the cause of national freedom, which attracted a concourse of patriots and refugees from all parts of the country. Though greatly injured by the rise of other seats of commerce more conveniently situated, it carries on an active trade, contains about 12,000 inhabitants, and is one of the most agreeable towns of the kingdom.

The chain of islands known by the collective term IONIAN, extending from the south extremity of the Greek peninsula along its western coast to that of Albania, consists of seven principal members—Corfu and Paxo, northern; Santa Maura, Thiaki, Cephalonia, and Zante, central; and Cerigo, southern. There are upwards of thirty subordinate islets in the series, some only of which are inhabited. All are near the mainland, and belong to the same great calcareous formation which prevails over Greece. Scarcely a parallel instance can be found of tracts so utterly insignificant in size, having a place of such long-standing on the page of history in association with so many stirring events and memorable names; the Peloponnesian wars and the battles of Actium and Lepanto; Ulysses and Alcinoüs in classic legend; Herodotus on his travels; Aristotle and Demosthenes in banishment; Cicero and Cato in flight; Antony and Cleopatra in marriage and defeat; Augustus in victory; Agrippina in widowhood; Robert Guiscard, the Norman viking, in his roving; Richard Cœur de Lion on his way from Palestine to an Austrian prison; Ali Pasha; and Lord Byron. Olives, vines, and the dwarf-grape or currant are the principal objects of cultivation. Earthquakes are of very frequent occurrence, especially in Zante and Santa Maura, and are occasionally destructive. Besides Greeks, who form the majority of the people, there are Italians, Maltese, Jews, and other aliens. For four centuries the islands were held by the Venetians, or down to the year 1797, when that republic succumbed to the arms of Napoleon. They have since been French, Russian, Turkish, and British; and were formally placed under the protectorate of Great Britain in 1815, but with power to regulate their internal organisation by a local legislature. This arrangement terminated in 1863 by a voluntary but conditional cession to the Greek kingdom.

The island of CORFU, the most northerly and important, opposite the coast of Albania, was considered by the ancients as identical with the Homeric insular kingdom of Alcinoüs. Nearly twenty-six centuries may be assigned to its authentic history, or from the year 734 B. C., when it was colonised by the Corinthians, and known for ages afterwards under the name of Corcyra. Corfu, the capital, on the eastern side, is built on the slope of an irregular promontory, with a semicircular bay on either hand, and contains a motley population variously estimated at from 15,000 to 25,000. It has little interest apart from the splendid situation, and an odd grouping of different styles, arcades and piazzas erected in the Venetian times, old bastions bearing the winged lion of St Mark, the university founded by Lord Guilford in 1824, the government house built by the English of white Malta stone, and the Church of St Spiridon, the patron saint. The assumed body of the saint, 'a neat black mummy,' without eyes and nose, is paraded through the principal streets three times a year for the benefit of the sick, and is held in the highest veneration.

The little islet of PAXO (ancient *Paavus*), is of interest as the scene of the wild old legend, related by Plutarch, that about the time of our Lord's Passion voices were heard in the night by seafarers, announcing that the great god Pan was dead, whereupon piteous outcries and dreadful shrieks were heard in all directions. Milton alludes to the legend in the lines:

'The lonely mountains o'er,  
And the resounding shore,  
A voice of weeping heard and loud lament.'

SANTA MAURA (anciently *Leucadia*, in allusion to its splendidly white cliffs) has a south-westerly promontory traditionally connected with the tale of Sappho and other despairing swains leaping into the sea to get rid of their sorrows. The headland is hence locally called Sappho's or the Lover's Leap. CEPHALONIA (ancient *Cephalonia*), is distinguished by the Black Mountain, rising 4500 feet above the sea, and clothed with a forest of dark pines, now crippled by accidental fires and conflagrations kindled by the factious inhabitants. Robert Guiscard ended his career in the island, and left his name attached to its north extremity, which is retained under the Italianised form of Cape *Viscardo*. THIAKI is the renowned Ithaca of Homer, and the paternal kingdom of Ulysses. Its natives are as familiar with the classic as with the modern name. A perennial spring represents the fountain of Arethusa. Consisting of a mountainous mass intersected by narrow ravines, and containing scarcely a hundred yards of continuous level ground, the little territory exactly answers to the description in the *Odyssey*:

\*Our meagre land allows  
Thin herbage for the mountain goat to browse,  
But neither mead nor plain supplies, to feed  
The sprightly courser, or indulge his speed.'

ZANTE (ancient *Zacinthus*), is famed for the profusion of its aromatic plants, the fragrance of which in

spring-time, with that of the flowering vineyards, is carried far out to sea on the wings of the wind. On the edge of a marshy valley, near the shore of a bay, away from human habitations, there are still the pitch springs, much as they were when Herodotus visited and described the spot. From its exquisite beauty and extreme fertility, praised by Theocritus, the island has long been proverbially styled the 'flower of the Levant.'

'Zante! Zante! fior di Levanti.'

The town of *Zante*, on the coast, with 20,000 inhabitants, contains many large handsome houses, built in the old Venetian style, which bespeak the occupiers to be men of substance. CERIGO, the most southerly island, the ancient Cythera, cradle of the Syrian goddess Aphrodite, abounds with natural caverns, and produces honey of fine quality.

After the fall of the Roman Empire with which Greece was incorporated, the country underwent a succession of changes, and suffered grievously from the invasion of Slavonian, Albanian, and other barbarous hordes. In the thirteenth century the Venetians became the predominant power within its limits; they were followed by the Turks in the fifteenth, under whose rule the people had to endure every kind of hardship which avarice could suggest and brutality inflict. Insurrections took place, but they were abortive. In 1820 a general war for independence broke out, which the intervention of Christian Europe rendered successful in 1829, when Greece was recognised as a free state. It became a kingdom in 1832 by the accession to the throne of a Bavarian prince, Otho I., who was deposed by a revolution in 1863, and succeeded by the Danish Prince George I., who bears the title of 'King of the Hellenes.' Violence and factiousness have unhappily been prominent in the conduct of the people, or their political leaders, since the date of independence, but not without provocation from the selfish policy and contemptible incapacity of the government.

The entire population, continental and insular, is estimated at 1,340,000, consisting for the most part of Greeks, though there are a considerable number of Arnauts or Albanians, and some descendants in the islands of the Latin invaders of the middle ages. The language of the Greeks proper bears a very close resemblance to the classical Greek, but is called the Romaic, owing to the people having acquired the name of Romans, while included in the Roman Empire. They style themselves Hellenes, proud of their ancestry, as if of pure descent from the old inhabitants of the country; and the Mainotes, who occupy the mountain-range of Taygetus, in the Morea, bold and independent, boast of being true sons of the ancient Spartans. But the mass of the people, especially of the continentals, are the offspring of a mixture of Hellenic with Slavonic and Latin blood. It is in the islands, especially in those of the smaller class, but little exposed to the ingress of foreigners, that the purest representatives of the old stock exist, and the closest approach is made by the moderns in personal appearance to the style and physiognomy of the ancient race. Still, an example of beauty in strict accordance with the classical model, which bordered on ideal perfection, in proportion, symmetry, and harmony of features, is now rarely met with. The forehead rises less perpendicularly; the cheek has a slight angularity; and between the eyebrows, which, in the beauty of antiquity, nearly met, there is a perceptible space. But the eyes, large, liquid, and dark; the small mouth, not smiling, but suggestive of smiles; and that exquisite oval outline, observable in the visages of the ancient statues, still belong to the race, where there has been little admixture of foreign blood.

It is also in insular Greece that we are left most alone with antiquity, as to manners and customs, and can best realise the days of Hesiod and Homer. Domestic habits have in many respects undergone little change among the peasantry; agricultural implements are much the same; salted olives, coarse bread, and a few common vegetables are now, as they were then, the ordinary fare; and superstitions survive which go back to the age when Zeus, or Jupiter, was revered as the Thunderer. The national dance, called the

Romaika, is a relic of the Pyrrhic dance of antiquity, as appears from its general correspondence to the descriptions of the classical writers, and to representations on marbles and vases. In an olive-grove on the summit of a hill near the town of Corfu, the peasantry assemble on Ascension Day attired in their picturesque attire, and this dance is a prime feature of the festival.

But whether insular or continental dwellers, the moral and intellectual character of the people ill accords with their personal beauty, the historic renown of the race, or the natural loveliness of the country. At the commencement of their struggle with the Turks, the nations of Western Europe simply considered them as the children of an illustrious ancestry, forming a part of Christendom, entitled to sympathy from having been abominably oppressed for upwards of three centuries by a Mohammedan government.

The inhabitants of the coast towns and of the islands are actively commercial, but notoriously addicted to sharp practices, rarely making a bargain without an effort to overreach those with whom they deal. They are also expert seamen, but prone to be piratical, and to act the part of wreckers as opportunity offers. In the inland districts, agricultural and pastoral pursuits are followed, but the mountaineers are averse to industrial pursuits, impatient of subordination, and apt to be predatory. The women excel in embroidery, like their ancestors, and in the art of dyeing in bright colours. In general, the Greeks are a race of quick perceptions; in gesture vivacious, intensely voluble, and ever prone to gossip. They are temperate both in eating and drinking, fond of water as a beverage, and critical respecting its taste and coolness. This last propensity, the indulgence of which is rarely restrained by any urgency of business, gave rise to the lines by Leigh Hunt :

'A merchant, while sailing from Greece to Triestè,  
Grew vexed with the crew, and avowedly testy,  
Because, as he said, being lazy and Greeks,  
They were always for putting in harbours and creeks ;  
And instead of conveying him quick with his lading,  
As any men would who had due sense of trading,  
Could never come near a green isle with a spring,  
But smack ! they went to it like birds on the wing.'

Syra.

Copenhagen.

## SECTION IV.—NORTHERN AND EASTERN EUROPE.

### CHAPTER I.

#### DENMARK—HOLSTEIN-LAUBURG.\*

**D**ENMARK, or more properly, Dane-mark, one of the oldest states of Europe, consists of a peninsula projecting from the north-west of Germany, with an archipelago adjoining on the eastern side, and is thus in part an insular as well as a continental territory. The peninsula is the Cimbrica Chersonesus of the ancients, so called from its earliest known inhabitants, the Cymri, who made themselves formidable to the Romans prior to the Christian era. It is one of the few formations of the kind directed towards the north, for almost all important examples of the peninsular arrangement follow a southerly course. The Elbe forms the boundary of the country on the south; the North Sea on the west; its arm, the Skager-rack, on the north; and the maritime continuations, the Cattegat, the Sound, and the Baltic, on the east. From south to north, the mainland extends upwards of 300 miles; but from east to west, the distance is never more than one-third of that measure, and generally less, contracting to one-tenth, or about

\* The description here given of Denmark refers to that kingdom as it stood prior to the war with Germany.

thirty miles. The area, including the archipelago, comprises very nearly 21,000 square miles, an extent somewhat less than three times that of the principality of Wales. The main divisions of the kingdom are from north to south as follows :

| Provinces.                          | Principal Towns.                             |
|-------------------------------------|--|
| Denmark Proper { Jutland, . . . . . | Aarhus, Aalborg, Viborg, Randers, Silkeborg. |
| { The Archipelago, . . . . .        | Copenhagen, Elsinore, Roskilde, Odense.      |
| Duchy of Slesvig, . . . . .         | Slesvig, Flensburg, Haderslev.               |
| Duchy of Holstein, . . . . .        | Glückstadt, Rendsburg, Kiel, Altona.         |
| Duchy of Lauenburg, . . . . .       | Lauenburg.                                   |

The province of Jutland embraces the northern and larger part of the peninsula, and is, with the Archipelago, an integral portion of the monarchy. That of Slesvig, semi-Germanic in its population, properly belongs to Denmark, but has been wrested from it by war, and its political fate is in abeyance. The two other duchies form a single state belonging to the Germanic Confederation, which gives to whoever holds the sovereignty of it, as Duke of Holstein-Lauenburg, a seat and three votes in the Diet. The Farøe Islands, Iceland, part of Greenland, and three of the West India Islands are Danish possessions.

The continental portion of the kingdom has a very irregular outline, owing to its being indented by a succession of far-penetrating inlets of the sea. The largest of these, the Lim Fiord, underwent a remarkable change in the month of February 1825. This is an arm of the Cattegat, narrow at the commencement, which becomes a winding expanse of considerable breadth as it proceeds inland. It encloses several islands, and formerly terminated within a short distance of the opposite coast. But at the time mentioned, during a storm of terrible violence, the North Sea cut through the intervening isthmus, and thus converted the inlet into a strait intersecting the peninsula. This channel was gradually deepened by the ingress of the sea in tempests, till it became navigable for vessels of small burden. The first passed through it in the year 1834. As many as 1710 vessels, inward and outward bound, used the route in the year 1856, when there was a clear depth of eight feet of water. It has since been reduced to four feet, and the channel appears to be closing altogether, but will probably be re-opened under the same juncture of circumstances, as both processes seem to have been repeated in the lapse of ages. It is said that upon the irruption of the real salt water, the herrings so preferred it to the brackish water of the fiord, that they went out in a body into the open sea, and have not since returned to the nets of the fishermen. These inlets give a very extensive coast-line to the peninsula, but it is largely unavailable for maritime purposes, and eminently dangerous. There is scarcely a good harbour along the whole of the west coast of Jutland, while shallows occur everywhere off shore. From the sandy hillocks which form the sea-board, shifting with the wind, and sometimes spreading a mantle of desolation over cultivated tracts, seldom is there a ship to be seen, except it be one drifting to destruction, or the masts of vessels which mark the spots where the hulls are buried in the sands. Incongruous articles are often met with among the fixtures of humble cabins. A recent traveller mentions finding in one an English patent-stove obtained from the wreck of the *Polyphemus*, an oil painting of some English ruined abbey procured from the stranded *North Sea* steamer, and splendid shutters, carved and gilt, from a hapless Russian brig.

The interior of the country is a gently undulating lowland, part of the great plain of Europe. Himmelbjerg, the highest hill, rises only to 550 feet. Small sheets of water are numerous, connected by a continuous stream, like birds' eggs strung upon a thread; but owing to every portion of the surface being slightly inclined, and within a very moderate distance of the sea, there are no large rivers. The most important, the *Fjord*, divides

Slesvig from Holstein, and is navigable for some distance from the North Sea. This stream was considered the northern limit of the empire of the Franks in the time of Charlemagne, as of the German Empire in later days. But Holstein participates in the commercial advantages offered by the frontier river Elbe. At no very distant date the peninsula was extensively clothed with forests, even where now there are sandy heaths; and in various parts fine woods of pine, oak, and beech remain, chiefly of the latter. Imbedded beneath the existing beech-trees have been found, first, trunks of oak, next of pines; and in these last, flint weapons and other implements of stone have been discovered. They are supposed to have belonged to a people who had no knowledge of metals, and inhabited the country prior to the Celtic and Germanic races, by whom they were expelled or destroyed. Peat lies under the pines, in which no indications of human life appear. The woods once sheltered the elk, wild ox, wild boar, and wolf. In 1694, Christian V. is said to have killed sixteen wild boars in one day's chase; but the animal is now quite extinct. Wolves were common in the middle of the last century, and lingered to the commencement of the present. The last of the race was destroyed in the year 1811. The fox, squirrel, marten, and pole-cat exist in great numbers; and the weasel enjoys himself among the poultry with impunity, being protected, not out of affection, but from fear. The peasant will take off his hat when he meets him on the road, and civilly say, 'Good-morrow,' believing that ill-luck would follow any offence offered to the animal. The otter abounds in the lakes and streams; salmon are so plentiful that by law in some towns no servant can be fed with the fish more than once a week; aquatic birds in vast flights visit the fiords and marshes, captured for their feathers; the black stork fishes in the waters, and, unlike his white-plumed congener, builds in the woods; plovers and black game are numerous on the moors.

The northern province, JUTLAND, is the least fertile district, and the most monotonous in its aspect. Still, in the widely-extended plains, the stranger marks with interest the irregular intermingling of patches of cultivation with tracts of heath, of black soil with white sand, and the endless tumuli defined on the horizon—the burial-mounds of bygone generations—which have enriched the cabinets and museums of the capital with curious memorials of ancient life. The people are principally engaged in seafaring and agriculture, with a little weaving of coarse linen and woollen articles for their own consumption. The towns are all small, but mostly of ancient date, and quaint primitive appearance.

*Aarhus*, on the east coast, with pleasant enclosing woods, contains a population of 11,000, possesses a cathedral, and an interesting Frue Kirke. An epitaph in the former records the death of a Norwegian at the age of 146, who lived through seven different reigns. *Aalborg*, on the flat bank of the Liim Fiord, rather smaller but better regulated, consists of old houses in narrow streets, and was one of the first places in Denmark lighted with gas. The name, 'eel-town,' is now a misnomer, the eels having shifted their quarters, or been used up; and its herring-fishery has ceased, owing to the shoals quitting the waters. But the trade in grain is considerable, and a new small harbour has been constructed. In one of the antique gabled houses died King John in 1513, who changed the royal style from that of 'Your high-born Grace' to 'Your Majesty.' He had been betrothed to a daughter of Edward IV. of England, but she died at Greenwich previous to the marriage. *Viborg*, in the interior, dates from the times of paganism. Its public garden contains the stone on which Hans Tausen, the Danish Luther, proclaimed the Reformation. It bears the name of Tausensminde, and has the inscription: 'Upon this stone, in 1523, Hans Tausen first preached in Viborg, Luther's doctrine.' A scene sketched by Marryat at Viborg is to be seen in most Danish towns: 'I observe the weavers sit at their open windows, busily engaged at their looms: look in at that man, his house shaded by two clipped limes; how neat and tidy all appears about him! Look at his two bas-reliefs in biscuit—one of the present king; the other by Thorwaldsen, the Genius of the Year. Observe, too, his flowers—his oleanders, his carnations—how carefully cultivated! and, above all, his own healthy, well-fed appearance, and his thriving family. He sings as he throws his shuttle at his wool.' *Randers*, on the Guden stream, which flows into a long narrow eastern fiord, pleasant and prosperous, imports deals from Norway and Sweden, returning agricultural produce. *Silkeborg*, the youngest town in the Danish dominions, is in the upper part of the basin of this stream, on a site which, twenty years ago, was a waste. It has not yet

been marked on maps. About the period named, an eminently successful paper-manufacturer, Mr Drewsen, established works at the spot, and gained for his paper the great prize at the London and Paris Exhibitions, owing to its superior glazing, effected by a machine of his own invention.

The north extremity of the province is formed by the Skaw, a long, narrow, curving promontory of sand, the site of the village of Skagen, and of a light-house.

The *DUCHIES*, on the south of Jutland, have agreeable features, without any pretensions to the striking or the picturesque. They are interspersed with beech-woods, which are trimmed by the lopping off of the lower branches, and kept clear of underwood, thus providing for a thick canopy of foliage above and a free circulation of air below. Their appearance in spring is eminently beautiful, being carpeted with moss and wild-flowers, among which the lily of the valley, hepatica, and Solomon's-seal are prominent. The open country presents a succession of well-watered, luxuriant meadows, divided into farms, upon which herds of horses and oxen are reared for export, and vast quantities of dairy produce, well known in the London market. The homesteads, scrupulously clean, are models of concentration, and ornamental likewise, being built of brick and timber in panels, the bricks arranged in pattern, the wood painted and varnished. This description applies to the territories of Holstein and Slesvig, that of Lauenburg being a sandy waste.

*Slesvig*, the old capital of the duchy of that name, lying at the head of a river-like inlet on the east coast, has 12,000 inhabitants, but is in a decaying condition, owing to the silting up of the harbour. It contains the palace of Gottorp, the residence of the ancient dukes, now used as a barrack, and a cathedral remarkable for its unprepossessing exterior, while a crowd of really beautiful objects are within. Among these the black and white marble tomb of Frederic, and an altar-piece reputed to be one of the richest specimens of carvings in existence—the work of a pupil of Albert Dürer—are conspicuous. *Flensburg*, at the upper extremity of another fiord, generally deep and wide, has become much more important, having greater commercial facilities, as large vessels can come up to its quays. It is a clean, thriving, cheerful town of nearly 20,000 inhabitants. Between the two, the railway crosses the line of the Danewirke, an earth-work formed of an old wall, stones and rubbish formerly crowned with towers, constructed in early days for defensive purposes. It was recently stormed by the Prussian and Austrian troops, and is now in process of demolition. *Hadersleben*, a port further north for smaller vessels, is the cradle of the late Danish dynasty; its founder, Count Christian of Oldenburg born here, having been elevated to the throne of Denmark in 1448.

*Glückstadt*, the capital of Holstein, neat and regularly built, is on the Elbe below Hamburg, and possesses a high school, a naval seminary, and a safe port connected with the whale-fishery. It successfully withstood three sieges during the Thirty Years' War, but the fortifications were demolished in 1815. *Rendsburg* possesses a large arsenal. *Kiel*, more important, with 17,500 inhabitants, has an excellent harbour enclosed with finely-wooded and pleasing shores, connected with a magnificent bay of the Baltic. The most ancient of its churches, St Nicholai, dates from the 13th century. The castle has a good sculpture-gallery. It is the seat of a university of repute (founded in 1665), possessing a library of 80,000 volumes, which may not only be read on the spot, but are lent out, three volumes at a time, to parties properly recommended. Professors, students, and townsmen are intensely Germanic in their sympathies; and hence the institution is not in favour with the Danes, who have a proverb to the effect, that 'to lie is a science, as the devil said when he frequented the university of Kiel.' Charming environs attract inland visitors in summer intent on recreation and sea-bathing. The town has greatly advanced since a railway connected it with Altona, and from thence with Germany, Belgium, and France. It has manufactures of tobacco, oil-colours, sugar, machinery, and ironmongery. *Altona*, the largest and most commercial provincial town, with a population of 45,000, close to Hamburg, has the appearance of being a suburb of its huge neighbour, rather than a distinct place, for they are connected by lines of dwellings. A gateway, with a sentinel, and the Danish coat of arms, recently formed the chief distinction between the two. In allusion to its contiguity and mercantile prosperity the Hamburgers give the name the form of *All-zu-nah*, 'All too near.' Its great manufacture is tobacco—one factory working up 600,000 lbs. yearly, but its trade extends to England, France, the Mediterranean, and the West Indies. It possesses an astronomical observatory, which, under the superintendence of Schumacher, who died in 1851, acquired great celebrity.

*Lauenburg*, the capital of the duchy so called, is a very small place close upon the Elbe, dependent upon its transit trade. The territory was ceded to Denmark by the Congress of Vienna in 1815, by way of compensation for the loss of Norway, which was then annexed to Sweden.

Many small islands fringe the west coasts of Holstein and Slesvig, inhabited by a hardy, simple-minded people, of Frisian extraction, seamen at the whale-fishery during one part of the year, and husbandmen at the other. These isles have been formed by the deposits of the North Sea, which often inundates the low grounds, drowning the cattle, and carrying off the produce; and would make havoc with the very dwellings, were they not placed on artificial mounds, and also guarded by embankments. This position, with the

employment of the occupants, has given a somewhat serious cast to their character and habits. Wives generally attire themselves in black during the absence of their husbands. 'Sir,' said one, to an inquiring stranger, 'my neighbours would think strangely of me if, while my husband is at sea, I should go to church out of mourning, or with a gay kerchief on my head.' Widows, in erecting tombstones for their departed husbands, frequently anticipate the day of reunion in the grave by leaving a blank in the inscriptions—'Here rest the bones of a good seaman, N. N., born March 17, 1786 A.D.; died April 12, 1834 A.D.; also, in hope of a joyful resurrection, the bones of his wife, N. N., born May 1, 1797 A.D.; died . . .'. But the burial-grounds shew that the males have commonly the sea for a grave-yard, for by far the greater number of the inscriptions are for women. In the epitaphs of those who die at home, the analogy between human life and seafaring is often introduced, as in the lines

'Steer so across the sea of life,  
As not to miss the port of Heaven.'

On another stone may be read, 'The voyage of the world brings sorrow, danger, and want; but a happy death floats us to rest in the haven of Paradise.' The stone-cutter has endeavoured to illustrate the latter sentiment by rudely carving, as a picture of heaven, a quiet little bay, partly surrounded by houses, resembling those of the harbours of Wyk, Husum, and Tondern.

Insular Denmark, or the Archipelago, lies off the east coast, between the peninsula and Sweden. It consists of the two comparatively large islands of Seeland and Funen; of four lesser, immediately to the south, Langeland, Laaland, Falster, and Møen; and of upwards of sixty others dwindling down to insignificant tracts. The entire group occupies an area not exceeding 100 miles from north to south by 130 miles from east to west. Thus crowded together, the separating channels are narrow, and are rendered still more confined by innumerable shoals and sand-banks. Many of these insulated spots were little known to each other, much less to the outlying world, prior to the establishment of steam-navigation, though contiguous to one of the great thoroughfares of European commerce—the Sound. The physiognomy of the more extensive is very uniform. There is no bold scenery, but it is often picturesque, and eminently beautiful, with tolerable summer weather. Striking blendings of land, water, and sky are to be seen in almost every direction, while the white sails of merchantmen, the boats of pilots and fishermen, rich meadows and noble beech woods, neat churches, wind-mills, and homesteads, give variety and life to the landscape. Vegetation is everywhere luxuriant, and long retains a vernal appearance, owing to the humidity of the atmosphere. When the plains of Germany are brown and ashy with the summer heat, the isles of Denmark delight the eye with a fresh bright green; and as truly deserve the title of 'emerald' as our sister-kingdom. But dense fogs and cold drenching rains are more common experiences than fine weather, marring out-of-doors enjoyment. Yet, when a gale from the westward drives up clouds of mist, alternately veiling and disclosing sea, shore, and sky, fine studies are afforded to the painter of marine scenery. The Archipelago closely blocks the passage between the Baltic and the North Seas, reducing communication to three confined channels—those of the Sound, the Great Belt, and the Little Belt.

The largest island, Seeland, corresponds in area to that of Lincolnshire, and contains on its east coast the capital of the kingdom. It is separated from the Swedish shore by the Sound, which, at the north entrance, the 'narrows,' is somewhat less than two miles and a half wide. In the year 1830, when the channel was choked with drift-ice, which a hard frost converted into a compact mass, an accurate measurement was made of the width. This was found to be 4602 yards between the harbour of Elsinore on the Danish, and that of Helsingborg on the Swedish side. But these towns are somewhat diagonal with reference to the strait, and a direct line across it, from the fortress of Cronberg, immediately above Elsinore, to a stone tower on the opposite shore, measured 4328 yards. The distance expands to upwards of twelve miles off Copenhagen, and to sixteen miles below it. The depth is very irregular, varying from three to nineteen fathoms, but the more considerable of these depths are rare and local. Shallows everywhere abound,

requiring careful pilotage in the instance of large merchantmen. Lord Nelson, with the inferior line-of-battle ships of his day, found it one of the most harassing tasks of his life to reach the Danish capital by this route; and was almost worn out with fatigue and anxiety on accomplishing it. After the battle of Copenhagen, on proceeding to the Baltic, he had the guns of his ships taken out, and carried in merchant vessels, in order to pass through the 'grounds,' or the shoals which stud the southern part of the channel. The annual number of vessels passing inwards and outwards averages very nearly 20,000.

On entering the Sound from the north, the Danish shores have a pleasant aspect, descend-

ing in light-green slopes to the water's edge, adorned with beech-woods almost all the way to Copenhagen. Elsinore, at the entrance, is the scene of

the tragedy of *Hamlet*. But using poetic licence, Shakspeare has transferred the locality of the Prince of Denmark thither from the peninsula of Jutland, where he lived, reigned, died, and was buried. With the same liberty, the dramatist did not concern himself to depict the natural features of the selected site, even supposing that he had any general information respecting them. No spot in the neighbourhood answers to the described place of Ophelia's death :

'There is a willow grows ascant the brook,  
That shews his hoar leaves in the glassy stream.'

Or to the language of Horatio :

'The morn, in russet mantle clad,  
Walks o'er the dew of yon high eastern hill.'

Or to the words of the same party when dissuading the prince from following his ghostly guide :

'What, if it tempt you to the flood, my lord,  
Or to the dreadful summit of the cliff,  
That beetles o'er his base into the sea?  
And there assume some other horrible form,  
Which might deprive your sovereignty of reason,  
And draw you into madness? think of it:  
The very place puts toys of desperation,  
Without more motive, into every brain,  
That looks so many fathoms to the sea,  
And hears it roar beneath.'

Elsinore has no cliffs at all, nor is there a dizzy precipice to be found in the whole of Seeland. Beyond repeated mention of the town, there is nothing in the tragedy which we can identify with the place, except notices which are equally applicable to a thousand

maritime localities. Still, as the selected scene of a splendid work of genius, it will ever be associated in the minds of Englishmen with the bard of Avon, and the obscure Jutish prince he has immortalised. The line in Campbell's famous Ode on the battle of Copenhagen—'Thy wild and stormy steep, Elsinore!'—is equally a poetic fiction.

Between Elsinore and Copenhagen, in the mid-channel of the Sound, the island of Hveen rises with moderately high and steep shores, a dreary spot, but a site of interest, as the scene of Tycho Brahe's residence towards the close of the sixteenth century. The celebrated Danish astronomer, having received a grant of it from Frederic II., with an annual pension, erected a house and observatory on his insular domain, as fantastic in its architecture as in its name—Uranienborg, the Castle of the Heavens.

The spires and public buildings of the capital, with the masts of shipping in its roads and harbour, are distinctly visible from the astronomical island. In the full summer its aspect from the sea is extremely beautiful, owing to the dense masses of foliage which appear in connection with its material and marine features. But the interior is more suggestive of respectability and comfort than of elegance or grandeur, though by no means destitute of imposing edifices.

*Copenhagen, or Kjøbenhavn*, the Merchants's Harbour, in latitude 55° 40' north, longitude 12° 38' east, consists of an old and a new town, simply separated by a street, occupying a promontory of Seeland, with a smaller division built on the adjoining isle of Amak. The intervening channel is the port, across which there is communication by drawbridges. Both parts are fortified with immense earthen ramparts, flanked with bastions, and surrounded by a deep and broad wet ditch. A citadel and some forts, with the celebrated Trekoner battery, on a sand-bank off the entrance to the port, are further defences. The ramparts extend through a circuit of five miles, and being planted with double rows of lime-trees, they form an agreeable promenade. In the old town (*Gamle-By*), the trading part of the city, the streets are generally narrow, the shops small, and the houses plain; but it is rendered somewhat picturesque and Dutch-like by an old-fashioned style of building, and the occurrence of canals which penetrate it in various directions from the harbour. The new town, Frederikshavn, the residence of the court, has superior external arrangements. But the entire street-architecture is of very ordinary description, with wretched paving; and the greater part of the thoroughfares have an air of striking quietude, at variance with what is naturally expected in the capital of a European kingdom of renown in history. The Exchange is its pride, a fine old building, surmounted by a graceful twisted spire, appropriated to its present purpose in 1858, when it was purchased by the merchants from the government. In a modest mansion of the Amaliegade, a street connected with the best square, the present Princess of Wales was born. The population of the city slightly exceeds 155,000. Neither its manufactures nor its commerce can be said to be important.

Though there are few attractions for ordinary sight-seers in Copenhagen, some public exhibitions are of remarkable interest to the more limited class of instructed visitors; the Palace of Christiansborg, containing the two Chambers of Parliament and the Picture Gallery; the Museum of Northern Antiquities; the Museum of Natural History; the Royal Library; Thorwaldsen's Museum; the Palace of Charlottenborg, now the repository of the Academy of Arts; the old Castle of Rosenborg, containing the regalia and rarities collected by the various sovereigns; and the old Observatory. The Museum of Northern Antiquities, founded in 1807, occupies a large suite of rooms; and is quite unique of its kind for completeness and systematic arrangement. Illustrative monuments of the Scandinavian past are here stored, amounting to many thousands of articles, found by the peasant in turning up the soil, or obtained by exploring antiquarians from burial-mounds. There are relics of the age of stone, separately grouped, when the people, ignorant of metals, slew their game, felled trees, and had warlike implements of flint; also memorials of the age of bronze, similarly classified, when the uses of tin and copper became known. Thorwaldsen's Museum contains casts of the works of the great sculptor, as well as several of his statues in marble, which he bequeathed to his native city. The old Observatory occupies the *Rund Tårn*, or Round Tower, an immense round brick building rising to a great height, attached to the Trinity Church. An inclined plane of brick-work winds within the tower to the summit, up which Peter the Great is said to have driven his empress in a carriage and four. The feat is possible enough, though how he contrived to descend is not stated, except by backing, as there is not space for a vehicle of any description to turn. The summit commands a fine view of the capital, the Sound, the Swedish coast, and the Danish islands. No northern city of the same extent rivals Copenhagen in the richness of its literary and antique stores, or in the number of its societies for the encouragement of art, science, and general learning. These have long placed it at the head of the civilisation of Northern Europe; and together with the many illustrious names on the roll of citizenship, Niebuhr, Thorwaldsen, Oersted, Oehlenschläger, Rask, Magnusen, Grundtvig, and others, establish for it a claim to be regarded as the Athens of the North. The Royal Library contains 400,000 volumes, arranged on open shelves, so as to be accessible to the public; besides great treasures of Sanskrit and other MSS., amounting in all to 15,000.

There is likewise the accommodation of a reading-room, and books are lent out to respectable residents, and to strangers competently recommended. The University Library contains 100,000 volumes; and Classen's 40,000, bequeathed to the public by the general of that name.

In the island of Amak, on which part of the city is built, there is an interesting race of foreign extraction, still distinct from the Danes in dress, manners, and language, whose ancestors were imported from Holland, upwards of three centuries ago, in order to introduce more skilful husbandry. The name of their principal village, 'Hollander-byen,' commemorates their origin. Time has effected little change in the appearance of these colonists. They retain their picturesque, many-coloured national costume, which at once discriminates the girls of Amak from the more soberly-attired maidens of Seeland. They are preached to also in the Dutch language by their own ministers, though Danish is of course sufficiently well understood for all practical purposes; and have civil and criminal tribunals peculiar to themselves, but under the jurisdiction of higher courts in the city. With the characteristic industry of their race, the flat swampy island has been rendered very productive, so as to be at once the dairy and kitchen-garden of the capital. About the middle of the twelfth century, Copenhagen was an obscure fishing-village, in the neighbourhood of which Bishop Axel or Absalom built a castle. In 1254, it obtained the privileges of a town, and was constituted the metropolis by Christopher III. in 1443.

*Elsinore*, on the Sound, twenty-five miles north of the capital, with two old churches and a new town-hall, has been called the Wapping of Denmark, and the adjoining Castle of Cronborg its Windsor. Mariners, naval store-keepers, officers of customs or quarantine, and consular agents form the chief part of the population, engaged in victualling, clearing, and piloting ships. A company of incorporated ferrymen are ever on the alert, ready to go out to vessels in distress, whose skill and courage have been tested in many a wild tempest, and are as well known as in the instance of the boatmen of Deal. Many names of our countrymen who have died at sea by hapless shipwreck or natural causes, occur among the inscriptions in the public cemetery. Cronborg Castle, an immense pile washed by the sea, within ten minutes' walk of the town, is an imposing object viewed in any direction, but especially from the surface of the water, combining the strength of a fortress with the elegance and grandeur of a palace. The edifice was founded by Frederic II. in the year 1574, and completed in the reign of Christian IV. It remained a royal residence for some time, but has long been appropriated to other purposes, now being used for a prison and a sea-mark. The northern turret bears a fixed light, and commands a fine view of the channel, with its shipping, and the opposite Swedish shore. In this building, in 1772, Caroline Matilda, queen of Denmark, the sister of George III., was confined upon a charge of which she has been acquitted by the unanimous verdict of posterity, including that of the Danish royal family. The story of her misfortunes is a more than thrice-told tale, though not so familiar to the present generation as it was to their grandsires. She fell a victim to the ambition and malignity of her step-mother, the queen-dowager, who wished to secure the succession to her own son. Permitted, after an imprisonment of some months, to retire to Zell in Hanover, owing to the intervention of her brother, she went in sorrow to the grave three years afterwards, at the still youthful age of twenty-three. The ill-fated Matilda, in her misfortunes, wrote with a diamond on one of the windows of Fredericsborg Castle, the line—

'Lord, keep me innocent, make others great.'

A wire screen was placed over the pane of glass bearing the inscription, the better to preserve it from being effaced. The memorial was swept away by the great fire of December 1859, which destroyed Fredericsborg, and its splendid historic picture-gallery. *Roeskilde*, on the railway, sixteen miles west of Copenhagen, the old metropolis, is now insignificant, but of interest from its cathedral, the Westminster Abbey of Denmark, containing the tombs of the sovereigns for many generations. The Rothschild family have their patronymic from the name of the place, which was formerly so written. The founder emigrated in the last century. 'A Jew, on going to another land, where Solomons and Levis were plentiful as strawberries, was called, to distinguish himself, Solomon of Bamberg, Levi of Frankfurt, and so on, till he ended by assuming as a surname the birthplace of his ancestors.'

The island of Fünen or Fuhnen, smaller and less wooded, is separated from the metropolitan district by the Great Belt. This middle passage between the North Sea and the Baltic is the broadest, varying in width from eight to twenty miles. Though almost everywhere of intricate navigation, there is water deep enough to float the largest vessels, except near the shores. Nearly midway in the channel, the little island of Sprogö occasionally serves as a temporary halting-place, for frequently in winter the accumulation of drift-ice compels a stoppage. Though there is a house of public accommodation erected by the government, yet so well known is this detention for its discomfort, that the Danes commonly express their dislike of an obnoxious individual by wishing him at Sprogö. Fünen is separated from the continent by the Little Belt, a dangerous, unfrequented, and narrow channel, contracting to less than three-quarters of a mile in breadth.

*Odense*, the chief town, occupies an inland site, has a cathedral and 14,200 inhabitants. Hans Tausen, the Danish reformer, the son of a blacksmith, was brought up in a school here. Not many years ago some remains of his father's smithy could be pointed out. He became the second Protestant Bishop of Ribe, a town near the west coast of Slesvig, and lies buried in its cathedral, a large building of the earliest round period. Hans Christian Andersen, so well known to the English public as a popular writer, was born in the island capital.

Some eighty miles from the nearest point of the Archipelago, Bornholm and the Ertholms form the most advanced possessions of Denmark in the Baltic. The former island is but little more than a quarter of that distance from the south-eastern extremity of Sweden, and is often united to it in winter by the ice. It is a rhomboid, averaging twenty miles in length by eleven in breadth; and contains a population of Danish extraction, speaking the Danish language, but with a considerable infusion of German words. Building stone, dark-blue marble, potter's clay, and some coal are wrought for export to Copenhagen.

*Ronne*, the chief town, sends fishing vessels to the North Sea, and despatches fine salmon, taken along-shore, to the nearest Prussian port, whence the fish are sent off by express train to Paris. A few simple manufactures, as wooden clocks, earthenware, tiles, and bricks, with home-spun linens, are the other occupations. An ingenious native having taken to pieces a wooden clock saved from a wreck, attempted the construction of another from the model. He succeeded, and others followed the example, till wooden clocks began, and still continue, to be a prime article of export. The island, cut off from communication with the world in winter, is a very secluded spot, and was especially isolated prior to the age of steam. At present, in some of the villages, the inhabitants display extraordinary simplicity with reference to foreign objects. 'Yes,' said the oracle of one of them, an innkeeper, to his guest, 'all the people look up to me, except on Sundays, when the priest comes down to preach. Ah! he is a great man, that priest! But I have seen much of the world also. I have been three times in Elsinore, and once in Rostock; and few can say as much. Yes, upon my word, I have seen a great deal; so much, that the governor himself sometimes asks my opinion when he comes this way. And he is a greater man than the priest!' Upon the high functionary, the Lutheran parish minister, being visited, he was found in the back-yard of his dwelling, without coat or waistcoat, and with his striped shirt sleeves tucked up above the elbows, killing one of his pigs, though not for the supply of his own table, but for sale to the neighbouring garrison.

The Ertholms, ten miles further in the Baltic, are a cluster of small rocky islets, strongly fortified, each bearing a separate name. Christiansö, the principal, has a citadel, in the tower of which a revolving light is maintained. The common occurrence of the prefix *Christian* in Danish nomenclature is an honour paid to the memory of Christian IV., the ablest of all the rulers of the kingdom, who distinguished himself in many naval battles with the Swedes, and is the hero of several spirited ballads. He paid a visit to James I. of England, his brother-in-law, and became a popular personage in London. Both kings signalised the meeting with a boisterous revelry, more in harmony with the times of Scandinavian paganism than with the seventeenth century.

'King Christian stood by the high mast,  
 'Mid smoke and spray;  
 His fierce artillery flashed so fast,  
 That Swedish wrecks were round him cast,  
 And lost each hostile stern and mast,  
 'Mid smoke and spray.  
 Fly! Sweden, fly! nor hope to win,  
 Where Christian dauntless mingles in  
 The fray!'

Thus commences the national song of the Danes. Their national flag, the Dannebrog, is of crimson marked with a white cross.

The climate of Denmark is humid, owing to exposure to a vast surface of water. Fogs are frequent in summer; rain and snow in winter; and in the latter season, navigation is either impeded or suspended altogether by the ice. Winters of great severity are occasionally experienced, of which the following records occur in old chronicles:

In 1269, the Cattegat was frozen between Jutland and Norway.

In 1292, one sheet of ice extended between Jutland and Norway, so that travellers passed with ease.

In 1323, the winter was so severe that both horse and foot passengers travelled over the ice from Denmark to Lübeck and Dantzic. Communication was maintained for six weeks, and places of refreshment were established on the road.

In 1349, the sea was frozen over, and passable from Denmark to Stralsund.

In 1402, the Baltic was quite frozen over from Denmark to Pomerania.

In 1408, there was one of the coldest winters ever remembered. The whole sea was frozen over between

Denmark and Norway; and the wolves, driven by hunger from the northern forests, came over the ice into Jutland.

In 1423, both the North Sea and the Baltic were frozen. Travellers passed on foot from Denmark to Mecklenburg, and from Lübeck to Dantzic.

In 1460, the Baltic was frozen, and both horse and foot passengers crossed over the ice from Denmark to Sweden.

In 1548, the winter was very cold and protracted. Between Denmark and Rostock sledges drawn by horses or oxen travelled over the ice.

In more recent times, 1658, Charles X. of Sweden crossed both the Belts upon the ice, with his whole army, horse, foot, artillery, and baggage. He was on his way from Holstein to the attack of Copenhagen, and proceeded by the islands of Langeland, Laland, and Falster. His ablest officers endeavoured to dissuade him from the undertaking; but, though hazardous, it was performed in safety, and compelled the Danes to conclude the peace of Roeskilde. Drift-ice, which the currents convey from the Baltic through the straits into the Cattegat, rarely appears in the latter before the new year commences, and scarcely ever before Christmas. The period of its disappearance is more variable. It may be met with in April, is common in March, but generally ceases to be formidable to shipping by the close of February. As long as drift-ice continues to be seen from the light-house on the Scaw Point, at the north extremity of Jutland, a white flag with a vertical blue stripe is hoisted.

Denmark is one of the oldest states of Europe, now under an hereditary sovereignty, with a diet of two houses, upper and lower—the Landsting and the Folkething. Including the duchies, the home population numbers 2,600,000, of whom only 241 out of every 1000 live in towns, the remainder in country districts, sufficiently indicating the agricultural occupations of the people. The great majority belong to the Scandinavian branch of the Teutonic family. These are the Danes proper, occupying Jutland, the north of Slesvig, and the Archipelago. They speak a dialect of the Norse, or Scandinavian Gothic, which abounds with consonants, many of which are slurred over in the pronunciation. The inhabitants of Holstein, Lauenburg, and the south of Slesvig belong to the Germanic division of the same stock, and speak the German language. The Danes are honest and hospitable, make excellent seamen, and have long held an honourable position in the intellectual world. Among the rural classes many old-world customs linger, some of which are not a little interesting and picturesque.

Lutheranism is the established form of religion, while toleration is extended to all sects. The clergy are in general well-educated men, of mild manners, and free from all pretension. Their money income is very moderate, but as they receive tithes, and have land to farm, there is no lack of the substantial comforts of life. A Jutland præstgaard, answering to our parsonage and manse, but one of the best class, seen in its summer dress, has been thus described: 'You first drive through an archway into the gaard, or square court—a yard surrounded with farm-buildings: opposite stands the house occupied by the family; a few lime-trees are planted in the centre; a house-dog barks violently, as though he'd break his chain; cocks and hens and chicks stalk about; carts and horses; but no manure—all clean, though somewhat untidy. The houses consist mostly of one story. You enter rooms scrupulously neat and clean; windows opening on the other side into a flower-garden; lots of roses, lilacs, and common flowers. Here the garden led into a hanging beech-wood, with walks and seats; a lake below—small, but large enough for the enjoyment of a boat, and fish in plenty. Then there is sure to be an orchard and vegetable garden, and a lime avenue leading somewhere.' But as the inevitable result of this system, at least in many cases, the clergy are not free from the charge of caring more for their farms than for their flocks. In the parishes, as once all over England—

'The curfew tolls the knell of parting day.'

Eight massive round churches of very early date, still in use, are remarkable objects, as originally intended to serve the double purpose of fortresses in time of need, and places of worship. Some are loop-holed like a castle turret for the discharge of arrows, having been erected previous to the age of musketry. There are two in Seeland, one in Fünen, one in Jutland, and four in Bornholm. Hour-glasses may still be seen suspended near the pulpits in several of the ordinary churches. They were introduced as a check on the lengthy homilies of the early Lutheran ministers.

The connection between Denmark and our own country is intimate, of long-standing, and striking interest. King Knut the Holy is the Canute of English history, who subscribed himself with 'truth, 'King of Denmark, England, Norway, and part of Sweden.' Gorm the Old, is the Guthrun who so sorely troubled Alfred; and had the Danelagh ceded to him, which embraced our eastern, midland, and northern counties. But much further back—before Britain was abandoned by its Roman masters, though more conspicuously after the complete withdrawal of imperial protection—bands of obscure adventurers, Jutes, Angles, and Saxons, appeared as conquering immigrants on our shores. The Jutes came from the peninsula of modern Jutland, and founded the diminutive kingdom of Kent. The Angles migrated from parts of the present duchies of Slesvig and Holstein, arrived in greater numbers, and spread over a wider area, originating the states of East Anglia, Mercia, and Northumbria. The Saxons left a more inland territory, south of the Elbe, and established themselves in the localities which retain their name, Essex, Middlesex, Sussex, and Wessex, respectively the kingdoms of the east, middle, south, and west Saxons. It is easy to recognise in the orthography of England and English slightly altered forms of Angle-land and Angles. A district in the Slesvig duchy still bears the name of Angeln, inhabited by a people distinct in physiognomy and speech from their neighbours. Dr E. D. Clarke thus writes of it in his travels: 'We were surprised at the number of English faces we met; and resemblance is not confined to features. Many articles of dress, and many customs, are common to the two countries. The method of cultivating and dividing the land is the same in both; the meadows, bounded by quickset hedges, or by fences made of interwisted boughs, reminded us of Kent, Surrey, and Sussex. The natural appearance of the country is also like the south of England, being diversified by numerous hills and valleys, adorned with flourishing woods and fertile fields.' Kohl, a recent visitor, makes a precisely similar remark. This interesting locality—truly Old England—lies on the Baltic coast, between the towns of Flensburg and Apenrade. The latter name, signifying an 'open road,' or station for shipping, is nearly English. There is a closely-adjointing tract, but on the shore of the North Sea, occupied by a Frisian race, where the people have traditionally preserved the memory of the immigration, and claim to be peculiarly of the same stock with the founders of England, appealing to the identity of their language in proof. Kohl quotes a distich current among them, 'Good bread and good cheese, is good English and good Friese.' Walking through one of the villages, he abruptly asked a child: 'Where did Hengist and Horsa sail from?' The answer was promptly returned: 'From Tondern on the Eyder.' Many names of persons are identical, or nearly so, with those in use in this country, the result of subsequent intercourse, as Smit, Pott, Thomsen, Locke, Burns, Green, and others.

The Farøe Islands form a bailiwick of Jutland, and though far out in the North Atlantic, are properly noticed in this place, as geographically belonging to Europe. The group consists of sixteen or seventeen strips of inhabited highlands, or mountains, separated by narrow sounds, nearly all basaltic, often columnar, besides outlying rocks only tenanted by the gull, puffin, and eider duck. They rise bold, bare, and bleak out of the deep ocean, here and there shewing cliffs with perfectly vertical faces of more

than 1000 feet in height. Not a tree or shrub exists. A few patches of soil are cultivated, devoted chiefly to potatoes and a coarse barley, while some sheep pick up a scanty subsistence on the hillside. The islanders number from 8000 to 9000. The men are fishermen, fowlers, and shepherds, while the women have grinding the corn for their ordinary duty. For this purpose, the *quern* or hand-mill is in use—the same implement which is mentioned in the Bible as employed in primitive times for preparing meal, where also grinding at the mill is referred to as the work of the females. Thorshavn, on the western side of Stromoe, is the chief town, one of the rudest of villages in appearance. ‘There are bright patches of green, mixed with one or two masses of black and white,’ remarks a tourist on approaching the spot; ‘and somehow a flag rises out from above these objects; and we strain our eyes, and wonder what the whole thing is, for as yet it appears entirely anomalous. It proves to be a town of the Farøe Islands: these green patches are the sod-covered roofs of houses; the spots of white and black resolve themselves into a merchant’s house and a church; and the flag is hoisted in a little fort, perched on the neighbouring hillside. Such a curiously-disguised, half-buried little town it is; such an odd huddle of cottages mixed with rocks, and rocks mixed with cottages, that in certain lights, if the flag were only to keep itself down, we believe an enemy’s ship might pass it without ever imagining that a town was there.’ It has spaces between the cottages, but nothing in the shape of street or lane, and possesses one baker. There is great interest in peeping into these out-of-the-way nooks of the world, and meeting with circumstances completely apart from our own experiences. In one of the islands ‘Paul Johnson’s *huus*’ is shewn as a wonder, as it is the only one with two stories. Great Dimon Island, occupied by a single family, can only be approached in favourable weather, and then parties have to be hauled up with ropes from the sea. Hence months sometimes pass away without any coming in or going out. It is on record that on one occasion having suffered the fire to go out, in the middle of winter, the family had to remain without fire or light for the rest of the season, not having the means to re-create the blaze. The Farøese very commonly depend for a new fire upon lighted tinder carried from house to house.

Fredericia.

Christiansund.

## CHAPTER II.

### SWEDEN AND NORWAY.

THE territories of Sweden and Norway, politically associated under the same crown, but with distinct estates, naturally compose a single geographical region to which the ancients gave the name of Scandinavia. This is a peninsula, the most extensive in Europe, occupying the north-western part of the continent, and connected by a comparatively narrow tract with Russian Lapland. The Baltic, and its great branch, the Gulf of Bothnia, form the boundary on the east and south; the Atlantic and Arctic Oceans on the west and north. Of the two districts, Norway, the western, extends most to the north, with a gradually diminishing breadth, and forms the extremity of Europe in that direction. Sweden, the eastern division, stretches most to the south, and maintains a much greater uniform breadth throughout its extent. Between the extreme points of the peninsula from north to south the distance is nearly 1200 miles. The greatest expansion is about 450 miles, in the latitude of Christiana and Upsal; but the average width is not more than 200 miles for Sweden, and from 60 to 70 for Norway. The area includes 292,000 square miles, which exceeds that of any other European state after Russia. Of this amount, Sweden has nearly one-sixth part, or 50,000 square miles, more than Norway.

The great northern limb of the Baltic, the Gulf of Bothnia, which separates Sweden from Finland, extends upwards of 400 miles, with an average width of 100, and terminates within a short distance of the Arctic Circle. But nearly midway the breadth contracts to less than 60 miles, and the distance across is frequently accomplished over

the ice in winter. This was effected for the purpose of invasion by the Russian general, Barclay de Tolly, at the head of his army, in the year 1809. Leaving Wasa on the Finnish side, 17th March, he arrived in three days at Umea on the Swedish, after a journey resembling in its details the narratives of polar expeditions. The troops bivouacked at night, with a clear sky and a bright moon aloft. Their guides often lost the way amid frightful masses of ice and snow which storms had confusedly heaped together. Stakes planted as marks by a reconnoitring-party sent beforehand could not be found, having been blown down by the winds. The sledges were continually stopped by broad chasms, which had to be crossed like rivers, or avoided by long detours. Fortunately, though the weather was intensely cold, the air was calm; for had a violent snow-storm occurred, the army must have perished. The perilous exploit was useless, for scarcely had the soldiers gained the Swedish coast, when they were recalled, owing to the conclusion of a truce. At the entrance of the gulf, the mainland of Sweden is within twenty miles of a Russian island, one of the Aland group.

The shores of Sweden have great peculiarities. On the eastern side, around Carlserona, but principally from the Sound of Kalmar into the interior of the Bothnian Gulf, there is along-shore an enormous assemblage of small rocky islands and insulated points of rock, forming a bewildering maze, which no map can represent owing to their number. The country, according to a common saying, has two coasts—one inner and the other outer. The inner is an integral part of the mainland; the outer is the islet fringe closely bordering upon it, in which there is smooth water when the sea beyond is tempest tost. Nothing like it occurs elsewhere in European scenery. Though all the members of this archipelago are of insignificant extent, and are never elevated, while rounded surfaces render the scene exceedingly monotonous, its aspect is singularly impressive to the stranger, from the apparently interminable extent of the labyrinth, and the want of life in connection with it. Isle after isle comes into view, more or less covered with dark stunted pines in the south, but generally destitute of wood in the north, while around and between the larger masses, myriads of naked hummocks of gneiss just rise above the water. For miles and miles the voyager may see no indication of human life, except on board his own vessel; and may fancy himself visiting a newly-created world on which animal existence has not yet been planted. Though contiguous to land in every direction, all is still and solitary. 'We never,' observes the Countess Hahn-Hahn, 'lost sight of the shore, and sometimes were so near it that it seemed as though we could leap to it from the boat. Yet I have never seen anything so desolate as the voyage during this first day. On the open sea we should not complain; but here, so near the land, and not a boat upon the water, not a living creature on the shore, not a garden, not a human being, not a dog, not even a fishing-net to shew that a man had been there—there was something awful in it!' This lifelessness does not belong to the main passages by which Stockholm is approached, which are enlivened by the transit of steamers and sailing-vessels, and by fishermen, pilots, and light-houses on the shores; but as there are innumerable sunk rocks, the navigation is usually suspended during the night. The whole labyrinth is locally called the *Skärgård*, signifying a rocky danger along the shore, or reef-defence; the intervening channels are the *Skärgård-sleden*; and the light craft which navigate them, vessels built for the particular purpose, the *Skärgårds-skutor*.

The shores of Sweden are also of great geological interest, owing to the remarkable proofs they afford of changes in the relative level of land and sea, in gradual process at the present moment. Celsius, a Swedish naturalist, about the commencement of the last century, avowed the opinion that the waters both of the Baltic and of the Northern Ocean were slowly subsiding. In confirmation of it, he quoted the testimony of inhabitants on the shores of the Gulf of Bothnia, that towns, formerly seaports, were then far inland, while the sea was still constantly leaving dry, new tracts along its borders. The same parties also affirmed that

insulated rocks in the gulf, and on parts of the coast, rose higher above the sea-level than they remembered them to have done in their youth; and it was alleged that marks had been cut on fixed rocks to indicate the water-stand, which already denoted its lower level. Celsius, from numerous observations, estimated the rate of depression at from three to four feet in the course of a century. Linnæus personally examined the facts, and adopted the same opinion. But as, by the laws of equilibrium, the level of the sea can neither sink nor rise permanently in one place, without proportionably sinking or rising over the whole surface of the earth, philosophers in general were content to discredit the alleged proofs of change till the commencement of the present century. Accurately to test the question, lines or grooves, at the ordinary level of the water on a calm day, with the date of the year, were chiseled out on the rocks in various localities.

Playfair, in 1802, who admitted the evidence, was the first to suggest the true solution of the phenomenon, referring it to the upward movement of the land, not to the depression of the water. But Leopold Von Buch, who passed more than two years in Scandinavia, from 1806 to 1808, and traversed it in every direction, was the first distinguished geologist to pronounce an opinion upon the subject, founded on personal observation. He sought information from intelligent pilots and fishermen, inspected the marks upon the rocks, observed upraised deposits of shells belonging to species now inhabiting the Baltic and the Bothnian Gulf, and announced his conviction 'that the whole country, from Fredericksshall in Norway, to Abo in Finland, and perhaps as far as St Petersburg, was slowly and insensibly rising.' He also conceived that 'Sweden may rise more in the northern than in the southern part.' All succeeding observers have come to the same general conclusion, and multiplied proofs of its correctness. In the years 1820-1821 the old rock-marks were carefully examined under the joint direction of the Swedish Academy and the Russian Minister of Marine. The officers reported that, on comparing the level of the sea at the time of their observations with the ancient indications, they found it lower relatively to the land in certain places, but the amount of change during equal periods of time had not been everywhere the same. They cut new marks for the guidance of future investigators. Fourteen years later, in 1834, Sir Charles Lyell, who had been sceptical relative to the phenomenon, fully satisfied himself of its reality in the course of a tour; and on examining even the new rock-marks, the sea was found to be sensibly below them at various points to the north of Stockholm. He marked, with the height of the water at the time of his visit, the celebrated stone at Löffsgrund, near Gefle, on the Gulf of Bothnia. Sir Charles's mark was two feet seven inches below one made in 1731; and the sea was found to be about seven inches below the fresh indication by Mr R. Chambers in 1849. The total change of relative level had therefore been more than three feet in 118 years, a confirmation of the accuracy of Celsius in his estimate of the rate of change. The hard texture of the rocks on this part of the coast, and the absence of tides, facilitate the accurate determination of the mean or ordinary height of the water.

On receding from the northern parts of the Gulf of Bothnia, the alteration of level diminishes, and is very slight around Stockholm. Further south, the rise of the land ceases altogether, and evidence is met with of an opposite movement, that of a gradual subsidence. No beds of marine silt containing the shells of mollusca identical with species now inhabiting the sea are found inland through the southern part of the peninsula, while well-known landmarks are at present nearer the water-line than formerly. Linnæus, in 1749, measured and marked the distance between the sea and a large stone near Trelleborg on the shore of Scania. In 1836, eighty-seven years afterwards, the distance had diminished to the extent of a hundred feet. Another conclusive proof of the subsidence appears in the circumstance, that houses and entire streets in the maritime towns occupy positions relative to the sea to which they would never have been exposed had the same relation existed between them when they were built. In many cases they are either at or below the lowest level of the water, and are liable to be overflowed when the wind raises the waves above their ordinary height. This oscillatory movement, upward in the north and downward in the south, is the more striking, as no part of the globe has been less subject to violent physical disturbances since the date of authentic history. However gradual the elevation and the subsidence, great changes must inevitably be produced in the configuration of the peninsula in the lapse of ages. Though quite inexplicable, the slow and silent oscillation seems like an expiring effort on the part of those forces by which the vastly greater geological changes of ancient epochs were effected.

Norway is distinguished by a very complicated coast-line. It presents an uninterrupted series of inlets called fiords, a name analogous to the Scottish firth, both having the same derivation from the old Norse. In a few instances they are spacious bay-like openings, but the great majority are elongated, comparatively narrow, and so tortuous as speedily to exclude all view of the open sea, rendering the appearance of the water lacustrine. It is beautifully clear. In fine weather the reflection of the bordering mountains is often as well defined upon the surface as the rocks themselves; and when viewed at a short distance it is no easy matter to decide where the line is which separates the water from the shore. Sometimes this uncertainty, when crossing one of the fiords in a boat, has a singular effect. Everything appears upside down; houses upset, trees growing the wrong way, men walking on their heads, cattle on their backs; the whole

appearance having an air of reality which for the moment beguiles the senses. Where the rocky walls are exposed to the wild gales of the ocean, they are sternly naked; but in sheltered situations tall pines clothe the sides and summits, with the wild raspberry and strawberry beneath them, the blossoms of which in spring offer an agreeable contrast to the sombre foliage. The scenery in these inlets varies frequently within confined limits from the pastoral and picturesque to the striking and sublime, occasionally to the terrific. Sixty miles to the south of Bergen, the Hardanger Fiord winds inland nearly a hundred miles, and sends off arms on the right and left. One of these branches is connected with the Matre Fiord. This is a tremendous cleft in a mountain mass, nowhere more than a quarter of a mile wide and four miles in length. The sides rise from 3000 to 5000 feet, and are in places literally perpendicular, with masses here and there overhanging the water. 'Though it was nearly eleven o'clock,' observes Mr Wittich, speaking of a midsummer day, 'the sun had not yet penetrated to the bottom of the cleft. The gloom which was spread over it, heightened by the dark rocky masses on its sides, excited a sensation in my breast of the most painful description. The view was not grand, it was not sublime—it was horrific. At the view of a truly grand scene our feelings expand, but at the sight of this cleft I felt that they were contracted. I could not breathe with common ease, and the sensation which filled my mind approached nearer to horror than to any other feeling I know. I was really glad when our boatmen turned their vessel away to continue their course to the Hardanger Fiord.' There, on the eastern shore, before the sunset hour, the traveller was gazing with delight upon Rosendal—the Vale of Roses—with its manor-house and bordering highlands enclosing a beautiful succession of fields, meadows, and groves of fruit-trees, interspersed with hamlets and cottages, bearing witness alike to the productive powers of nature and the industry of man.

The interior of the Scandinavian peninsula is traversed from south to north by a mountainous range, which overspreads nearly the whole of Norway, but only slightly intrudes into Sweden. It defines indeed to a great extent the boundary between the two regions. Boldly rising up from the deep waters of the Atlantic, the mountains attain their greatest elevation at an inconsiderable distance from the west coast of Norway, and decline gradually towards Sweden into the undulating lowlands which compose the chief part of its surface. The range bears the name of the Thulian in the south, the Dovre-field in the centre, and the Koelen in the north. Skagstolsfjnd, in the province of Bergen, the highest point, rises 8153 feet above the sea, or more than 3000 feet above the snow-line in that locality. Owing to the great general elevation of the country in the central and southern districts, and the high northern latitude to which it stretches, it is estimated that an area of not less than 3500 square miles is above the line of perpetual congelation, and is constantly covered with snow. The largest single snow-field, the Folge Fonden, eastward of Bergen, is about thirty miles in length, from six to eighteen miles in breadth, is elevated 5400 feet above the sea, and has a covering of permanent snow forty feet deep. When Pontoppidam, the Bishop of Bergen, published his *Account of Norway* in the last century, he suggested that improved roads might be laid out upon the top of the mountains with little difficulty, except from the snow. No idea could well appear more preposterous than this to readers unacquainted with these highlands. But their peculiar contour would render the suggestion feasible for considerable distances, were it not for the circumstance mentioned. Comparatively few peaked or rounded projections mark their upward outline. The summits consist of high plains, locally called *fjelds*, or 'fields,' with generally level surfaces of varying dimensions, forming an extensive series of tablelands. Thus the Dovre-field is an extensive tract of country, from forty to fifty miles

across in every direction, and between 3000 and 4000 feet above the sea-level, from which platform the pyramidal Sneehätten, or Hat of Snow, rises some 3000 feet more. The general surface of this high region merely undulates, and is sufficiently desolate, owing to the elevation and the latitude. Frost is almost continually experienced through nine months of the year, and snow occasionally falls in the middle of summer. Reindeer-moss and heath clothe the drier spots; grass springs up in some of the depressions; and there are a few patches of birch-trees, but never higher than from three to four yards, with willows and alders less frequent and more dwarfish. Total silence prevails over the scene, except when interrupted by the mournful notes of the whistling plover, as it flits at a distance. This cold and dreary district, devoid of everything necessary for the subsistence of man and beast, while visited with fearful snow-storms, has to be passed on proceeding from Christiana to Drontheim, the modern and ancient capitals of Norway; and very benevolently, to guard against loss of life by the way, King Egsdein, in the beginning of the twelfth century, caused stations to be erected, called *fieldstuer*, as places of refuge, endowed with a certain yearly revenue for their support. These stations are four in number, about ten miles distant from each other. They consist of houses of wood, containing two or three large rooms, one of which is set apart for travellers, with a large fire and requisite provision.

The valleys, though in some instances broad and open, are for the most part rents in the mountain masses: narrow at the bottom, not much wider at the top, and therefore steeply walled. One of these ravines proved fatal to a number of auxiliary Scots, raised for the service of Sweden, just after Gustavus Adolphus, who was then at war with Denmark, ascended the throne. They landed at Romsdale, on the coast of Norway, a hostile country, acknowledging the Danish sovereignty. This was with the view of gaining the Swedish frontier by a march across the mountains, as the passage by sea was guarded by the ships of the enemy. The detachment, 900 strong, under Colonel Sinclair, while in a narrow pass upon the road, was attacked by a band of peasants, who rolled huge masses of rock, stones, and trees upon the entrapped party from the bordering heights, and then rushed down to slaughter the confused and wounded men. All perished, with the exception of two individuals. This disaster occurred near Viig, on the 24th of August 1612, and is commemorated by an inscription on a wooden tablet at the spot. The commander was buried close by in the church of Quam. To reward this exploit, the peasants were formally exempted from paying any taxes, as well as from serving in the army. Though two centuries and a half have now elapsed, the name of Sinclair, pronounced *Zinclar*, is familiar in the district, and will remain so for ages to come. Another detachment landed at Stördal, and safely passed the Scandinavian Alps to Stockholm. Scotch auxiliaries crowded to the banner of the 'Snow King,' as Gustavus was contemptuously called by the imperialists during the struggle for the reformed faith which he conducted in Germany; and such names as Hamilton, Bruce, Colquhoun, Murray, and Seaton are not unknown at present as Swedish denominatives. Broad lowland Scotch is also to some extent intelligible in the south of Sweden.

The peninsula abounds with rivers formed and sustained by the snows and glaciers. The Gotha in Sweden, and the Glommen in Norway, are the most important. Though the Scandinavian rivers have generally but short courses, they have full channels and powerful currents in spring-time, when the deeply-accumulated wintry covering of the country is dissolving, except on the loftiest uplands. But they have very little navigable value, owing to the repeated occurrence of falls and rapids, though highly useful in floating down the timber from the interior to the coasts. The falls of the Gotha at Trolhätta in Sweden are the highest in Europe of the same body of water, and the most magnificent,

for a cataract depends for imposing effect more upon the volume it discharges than the extent of the descent. The river, broad and deep, plunges 130 feet in successive leaps. Its resistless power is illustrated to visitors by a log of wood being sent down by persons who expect a trifle for the exhibition. The log, which is of gigantic dimensions, is tossed like a feather on the surface of the water, and is borne almost in an instant to the foot. The Gotha is the only outlet of the Wenern Lake, which covers an area equal to that of the county of Norfolk, and is skirted with rich forests. This expanse and the adjoining Lake Wetter are the largest in Europe out of Russia. Both have long been traversed by steamers plying between Gothenburg and Stockholm, which are conducted by the Falls of Trollhätta through a lateral canal, aided by a series of locks. But their services are destined to be superseded by railway communication. The beautiful Lake Miosen in Norway, long and narrow, surrounded by fine pastoral scenery, is connected with the capital, Christiana, by a railway forty miles in length, executed by English engineers and contractors, and to a great extent their property. Small elongated lakes are as common as in the Highlands of Scotland. They abound with fish, as well as the streams, supply the people with their daily fare, and are annually visited by a number of our angling countrymen, who pay a rental for the right to fish to the neighbouring proprietor, and are expected to present him in addition with the 'lion's share' of the proofs of their skill. Smoked salmon is the commonest article of food in all the river-valleys, and it is invariably eaten raw.

The Dal is the historically-interesting Swedish river. It enters the Gulf of Bothnia to the north of Upsal, and gives its name to the district through which it flows, the old province of Dalecarlia. In this region the founder of the modern monarchy, Gustavus Vasa, took refuge in his temporary adversity, was sheltered from pursuers by its inhabitants, and roused the bold peasantry to assert triumphantly the liberties of their country. The common people still remember with pride how he wore the peasant's dress among their forefathers, plied axe and flail for daily hire, and many scenes of his adventures and perils are pointed out. The barn is indicated in which he thrashed at Rankhytta, and the one in the hamlet of Isola in which he similarly laboured. The latter has now a monument of porphyry, with the inscription: 'Here worked as a thrasher Gustavus Ericson, pursued by the foes of the realm, but selected by Providence to be the saviour of the country. His descendant in the sixth generation, Gustavus III., raised this memorial.' The barn still belongs to the family of the original proprietor, whose representative received an honorary medal in 1787. In like manner, the spot in the forest at Marness where the fugitive lay concealed three days under a fallen fir-tree, and the peasants brought him food; the hillock surrounded by marshes on Asby Moor, which also served him for some time as a place of refuge, and is now called the King's Hill; the cellar in the hamlet of Utmedland where he hid from his enemies; the site by the church of Mora where he harangued the people; all these are shewn by the descendants of those who shared his dangers, and are little likely to be forgotten by future generations. The Dalecarlians or Dalesmen of the present day are a peculiarly energetic race, and are conscious of it; according to a maxim current with them, one man of the district is equal to two Swedes of any other province. In summer, a large number of the girls migrate to Stockholm, where they are employed in working the boats. They are hardy, honest, industrious, and surprisingly strong, as may be seen by their toiling at the heavy oars from morning to night. Though with somewhat coarse features, their good-natured looks, blue eyes, and rosy cheeks, well set off by a very picturesque costume, render their appearance peculiarly prepossessing.

Woods cover a very large proportion of the surface of the whole country. They shelter the wolf, bear, and wolverine, now limited chiefly to the wilder and more northern districts, with the elk in the least frequented localities, the fox, lynx, and badger generally, and the wary capercaillie, 'cock of the woods,' or 'horse of the woods,' as the bird is called. The stillness of the forests is very remarkable and impressive to persons familiar with our own sylvan scenes. Songsters are wanting; small birds chirping and twittering among the branches are rare; and the solitude is rendered additionally solemn by the sombre foliage of the prevailing trees. But innumerable wild-flowers deck the ground, among which the beautiful *Linnaea borealis*, a favourite with the botanist, is conspicuous. It grows where the woods are most dense, shews its delicate twin blossoms

among the moss, through which its stems extend to the length of several feet. In the southern districts, the oak, elm, beech, and maple mingle with the generally diffused aspen, birch, mountain-ash, spruce, and Scotch firs, *Pinus sylvestris*. The latter are the characteristic trees, lofty, straight, and everywhere prominent. They are the most valuable also for commercial purposes, answering admirably for the masts of ships, while yielding tar, turpentine, and pitch. Hence Milton's lines in the splendid description of Satan :

‘His spear, to equal which the tallest pine  
Hewn on Norwegian hills to be the mast  
Of some high ammiral, were but a wand.’

It is interesting to mark the change of vegetation on proceeding from south to north. Many species, after becoming scarce, entirely disappear, while the birch becomes more and more dwarfish and the pine stunted, till both degenerate into mere bushes under the pinching cold of the climate. The peasantry are expert woodmen, and bring large trees to the ground in a very short space of time. They are then stripped of the bark, the branches lopped off, and the logs laid in rows, till they are ‘received,’ as it is termed, by the merchant. Upon this being done, the timber is rolled to the bank of the nearest stream, and committed to a rough voyage with the current. But previously, each log is marked at both ends, so that if broken in going down the falls, the owner can recognise both pieces as his property. The precaution is indispensable, as timber belonging to different parties may be afloat at the same time. Strong booms are thrown across the mouths of the rivers, or at other convenient points, where the floats are intercepted. But it sometimes happens, when there is a strong flood, or an extraordinary accumulation of timber, that the booms give way, and thousands of logs are irrecoverably drifted out to sea. Besides being expert hewers of wood, the peasants are ingenious carpenters. They fabricate most of their own household furniture, and render ordinary articles ornamental, as bowls, the handles of forks and spoons, by beautifully minute carving.

The peninsula is remarkable for enormous stores of iron and copper, with some lead and silver, but the rugged character of the country, and the want of streams which admit of navigation, check the extraction of its metallic wealth, by rendering transport difficult or impossible. Iron ore occurs in Sweden in immense masses, occasionally forming entire hills, where the mines are open excavations. The iron produced in Dannemora is the best in the world, superior to any other in ductility and malleability; and has long been chiefly sent to England for the manufacture of the finest steel. Copper-mines have existed for several centuries at Falun in the same district, which Gustavus Adolphus was accustomed to call the ‘treasury of Sweden’ from the value of their produce. Though the yield is much less than formerly it is still considerable. Excavations extend here for miles underground, and comprise vast chambers, which were brilliantly lighted up for sumptuous banquets given by Bernadotte, king of Sweden. In Norway, extensive copper-works are carried on in the elevated region of Roraas, a town near the source of the Glommen, where the climate is almost a perpetual winter; and also at the high latitude of nearly 70°, in the neighbourhood of Alten, which give employment to several hundreds of persons, and are under an English director. The silver-mines at Kongsberg, discovered in 1623, once yielding gold, after a period of suspension are again worked at a profit. It was at this spot that the gold was found in 1647 of which Christian IV. caused the famous Billen ducats to be coined, bearing the legend *Vide mira Domini*, ‘Behold the wonderful works of the Lord.’ A mass of silver obtained in the seventeenth century, now in the royal collection at Copenhagen, weighs upwards of 560 lbs.

The littoral climate of Norway is comparatively mild for the latitude, and much more uniform than in the interior of the peninsula, owing to the influence of the adjacent ocean. But in the inland districts, two strongly-contrasted seasons divide the year generally between them, a long and rigorous winter, a short and hot summer. For six months and upwards hard snow covers the ground, while the lakes and rivers are firmly frozen; the thermometer frequently descends many degrees below zero; mercury solidifies; and in the far north, as the effect of the long cold winter, the mean temperature of the year is below the freezing-point. On the other hand, the brief summer has its excessive heat, with an ample population of tormenting mosquitoes. But, unlike the days of winter, which brighten as the cold sharpens, those of summer become dull as the heat increases, while the succeeding nights are magically clear. There is a haze aloft and all round the horizon, often with a bluish tinge, not moist, and therefore popularly called sun-smoke to discriminate it from ordinary fog. It saddens the sky, restricts vision, confuses objects, and tarnishes the landscape. The great summer heat arises from the long-continued presence of the sun above the horizon. From south to north the longest day varies from nineteen or twenty hours to several weeks in its length. A visit to Hammerfest or Tromsøe, within the Polar Circle, by steamer from Bergen, to see the sun at midnight, is now a midsummer excursion with strangers from southerly latitudes.

A Lapp Lady, from Lord Dufferin's Sketch.  
By permission.

Stockholm.

I. SWEDEN.

SWEDEN comprises three principal districts, central, southern, and northern, which are subdivided into *läns*, or governments.

| Districts.                          | Principal Towns.                                     |
|-------------------------------------|--|
| Sveland or Sweden Proper, . . . . . | Stockholm, Upsal, Falun, Orebro.                     |
| Gottland, . . . . .                 | Gothenburg, Carlsrona, Kalmar, Malmo, Norrköping.    |
| Norrland, . . . . .                 | Gefle, Sundsvall, Hernosand, Umea, Pitea, Haparanda. |

*Stockholm*, the capital, in latitude 59° 20' N., longitude 18° E., a city of 112,300 inhabitants, is situated upon a strait connecting the Mälars Lake with the Baltic through the multitudinous channels of the islet coast. On the seaward side of the strait, and in the centre of it, on an island, the strong fortress of Waxholm commands the passage to it, as all approaching ships must come within range of the guns. The site of the metropolis is one of the most remarkable in the world, varied with rock, ridge, wood, water, and island, which combine to render its summer appearance beautiful in the extreme. A profusion of freshly-green verdure, with gleaming expanses, intermingles with the buildings, while the whole is encircled by a wreath of forest foliage. But the interior, especially of the older part, is a labyrinth of narrow crooked streets, in want of a thorough reform as to paving and sewage. The city, properly so called, occupies three islands, so contiguous and connected by bridges as to appear but one. These are the Stockholm, or 'island of the castle,' which gives its name to the capital, and where the first buildings were planted; the Riddarholm, or 'knights' island;' and the Helge Ants Holm, or 'island of the Holy Ghost.' \* This central division contains the royal palace, an edifice of great extent and remarkable architectural beauty; the seat of the legislature, a plain building; the cathedral of St Nicholas, where the kings are crowned; the Riddarholm Church, in which they are buried, along with many of the Swedish captains who served in the Thirty Years' War; and the offices of the principal merchants. Bridges connect this division with a more extensive portion on the southern mainland, the abode chiefly of artisans, and another on the northern, where the best streets and shops are to be found. The opera-house is in the northern, in which its founder, Gustavus III., in 1792, received his death-wound; and where in our own time Jenny Lind achieved her first triumphs. Though every part of the city may be reached on foot, yet this will often require long detours to the bridges; and hence the intervening waters are alive with boats and miniature steamers, the cabs and omnibuses of Stockholm. On fine summer evenings and on Sundays they are crowded with passengers proceeding to the Djurgården, or some other of the magnificent parks, which add so much to the beauty of the environs. Not less animated is the scene in winter when all the water-ways are firm streets of ice, on which pedestrians sport, and people of all classes are perpetually passing to and fro in sledges, the most delightful of all modes of conveyance.

\* Hear the sledges with the bells—  
Silver bells!

What a world of merriment their melody foretells!

*Upsal*, the old capital, readily reached by steamer up Lake Mälär, is some forty miles distant on the north-west, situated on the verge of a vast plain, and has a population of about 8700. A huge brick cathedral claims notice on account of the great names which appear upon tablets on the walls, those of Gustavus Vasa in the Lady Chapel, and Linnæus near the principal entrance. The house occupied by the botanist, where most of his works were written, is a neat dwelling of two stories, with an avenue of shady limes in front, planted by his own hand. The university here, with which he was connected, is the oldest and most important of the two in the kingdom. It was founded in 1477, and that of Lund in 1666. In one of these, all candidates for the clerical, medical, and legal professions must take a degree as a preliminary to official duty. The students are distinguished by white caps of jean, but wear no other academic dress. They lodge in the town, as there are no colleges for their accommodation, and being fond of chorus-singing, their boisterous melody is frequently heard in the streets late at night. Besides Linnæus, the names of Celsius, Bergmann, Scheele, and Berzelius occur in the list of distinguished professors. The library, of 100,000 volumes, contains the *Codex Argenteus*, a manuscript copy of the Gospels in Gothic, translated by Bishop Uphilas in the fourth century. *Falun*, a mining town further north, is locally called *Gamla Kopperberget*, the 'old copper-mine.' Its wooden houses are black with fumes from the smelting-furnaces, destructive of all vegetation, but not deemed unhealthy by the inhabitants. *Orebro*, with 7700 inhabitants, on Lake Hjelmar, west by south of Stockholm, was the first Swedish town in which the Reformation was formally established.

*Gothenburg*, on the river Gotha, about five miles above its entrance into the Cattegat, is by far the largest and most important provincial town, but contains little more than one-third the population of the capital, or 38,000. It is a handsome and rapidly-increasing place, with broad bustling streets, canals running up the centre of several of them. Some recent public buildings are of the first class, as well as manufacturing works. Owing to intimate trading communication with Hull, it is here that Englishmen commonly make acquaintance with Sweden, and with the usages of the natives, such as the triple bows and upliftings of the hat which accompany an introduction; 'snaps,' or various dishes before dinner, washed down by 'finkel,' a kind of home-made brandy, intended to prepare the stomach for operations on a larger scale; and the presence of the 'flicka,' or waiting-maid, by the bedside, betimes in the morning, with coffee to welcome the return of the sleeper to the region of conscious existence and reality. *Carlsrona*, with 15,500 inhabitants, the naval arsenal of Sweden, and the ordinary station of the fleet, is situated towards its south-east extremity, on several islands connected with each other by bridges, and with the mainland by an embankment. A citadel, with walls of granite mounting 200 pieces of cannon, and strong detached forts, render its position peculiarly formidable towards the sea. The town commemorates by its name Charles XI., who founded it in 1680. *Kalmar*, of only 8000 inhabitants, on the same coast to the northward—a decayed place, is conspicuous from afar by its remarkable cathedral and castle. In the palatial castle, June 1397, Queen Margaret assembled representatives of the three Scandinavian kingdoms, and effected the union of Denmark, Norway, and Sweden under one crown, a federation which was never cordial, and lasted little more than a century. On Stenso Point, a tongue of land in the neighbourhood, Gustavus Vasa disembarked in 1520, on returning from his exile at Lubeck to deliver his country from the yoke of a tyrant, and establish a new dynasty on the throne. As a memorial of the event, Louis XVIII. of France, during his temporary residence at Kalmar, caused a tablet to be erected at the spot. *Malmö*, a fortified town and port, is on the east side of the Sound, nearly opposite to Copenhagen. *Jönköping*, containing an arsenal and an arms-factory, is beautifully situated at the south extremity of Lake Wetter, with pine-clad hills rising in the background, and has a population of 7700. *Norrköping*, at the mouth of the Motala River, the outlet of the lake, is the third town of Sweden in size, with docks, building-yards, hardware and cloth manufactures, and a population of 20,000.

*Gele*, the principal port on the Swedish side of the Gulf of Bothnia, is at its south extremity a scene of great activity in summer as soon as the navigation opens. It ranks after Stockholm and Gothenburg in mercantile consequence; exports timber, tar, pitch, and iron from the forests and mines of Dalecarlia; and possesses one of the best court-houses in the country, with a gymnasium and good public library. Its population is about 11,000. *Sundsvall*, *Hernösand*, *Umeå*, and *Piteå* are small, neat-looking ports in the interior of the gulf, somewhat Swiss-like, far more actively commercial than would be inferred from their size and remote position. The inhabitants are engaged in fisheries, the preparation of forest produce for export, and ship-building. The vessels built are small-craft, cheaply built of fir, purchased by the shipmasters of Lubeck, Bremen, and Hamburg. Dr Solander, who accompanied Captain Cook on his first circumnavigation, was a native of Piteå. *Haparanda*, at the head of the gulf, of modern date, is opposite the Russian town of Tornea, separated from it by the river of that name. Upon the annexation of Finland to the Russian empire in 1809, those inhabitants of Tornea who wished to remain under Swedish government withdrew to the contiguous bank of the river, and founded Haparanda. It has become a thriving place, with churches, warehouses, and red painted dwellings, surpassing its older neighbour in appearance, but of smaller size. The two towns communicate by a bridge. The name signifies 'a shore covered with aspens,' which are abundant in the vicinity.

Two islands of some extent and interest belong to Sweden, that of Öland on the south-east coast, and of Gottland, *Goodland*, near the centre of the Baltic. The former,

separated by a narrow channel from the mainland, is singular from its very disproportionate size, extending ninety miles in length, parallel to the peninsula, but never more than ten miles in width. It is a great slab of limestone, so uniformly low and level, that the small churches on one side may be seen across it from the sea on the other.

Gottland, much more extensive, is of special importance from its geographical position and natural capabilities, for in a strategic point of view it has been styled 'a padlock upon the Gulfs of Finland and Bothnia,' by means of which a strong hand might lock up the Russian navy, and command the navigation of the Baltic. The island is watered by a number of small streams and lakes, has productive fisheries, woods of oak and pine, a soil capable of yielding abundant harvests, and harbours of sufficient depth of water for war-steamers. The climate is remarkably mild for the region, as the inhabitants do not calculate upon having more than eight days of sledge-driving in winter; horses and sheep remain abroad the whole season; and the grape, walnut, and mulberry ripen in favourable summers.

*Borgholm*, the chief town, on the west coast, has an old castle remarkable for its colossal architecture, which may be distinguished to seaward on the east. The island possesses a productive soil, abundance of game, fine woods, pleasing villages, and has long been celebrated for a race of diminutive and graceful ponies. One of the most beautiful was presented by a native peasant to Gustavus Adolphus while a boy. He was highly delighted with the gift, but with the thoughtfulness which distinguished him in after-life, immediately proposed to compensate the donor. 'I must not suffer you,' said he, 'to go away unpaid, for it cannot be your intention to give me this horse for nothing; at any rate, you may be in want of money.' So saying, he drew forth his little purse, filled with ducats, and emptied it in the peasant's hands.

*Wisby*, once the chief town, now a poor decayed place, on the west coast, has existing monuments of former consequence, which is frequently noticed in medieval chronicles. Its present aspect is unique in Northern Europe, not unlike that of a ruined city of the ancient world, which the traveller expects to encounter in a southern or oriental region, but views with surprise in the far north, amid the mists and waters of the Baltic. Prior to the Norman Conquest of England it was a prosperous commercial emporium. Some of its deserted but well-preserved churches were founded in the early part of the eleventh century. It was the parent city of the Hanseatic League, and one of its principal dépôts during the period of its ascendancy. The productions of the east, brought by caravan to Novgorod and conveyed across the sea, met in its marts the furs of the north and the buyers of Southern Europe. So numerous were the foreigners resorting to it, that each nation had its own church and house of assembly. *Olaüs Magnus* specifies among its visitors 'Gothi, Suedi, Russi seu Reuthini, Dani, Prussi, Angli, Scoti, Flandri, Galli, Finni, Vandali, Saxones, Hispani.' A code of laws, styled 'The Supreme Maritime Law of Wisby,' was long of paramount authority with seamen on the waters.

The town contains about 4300 inhabitants, lodged mostly in poor cabins, but within an ancient wall, by the side of costly buildings, and in connection with well-paved streets, provided for the accommodation of full 50,000. The wall, built in the year 1283, thirty feet high, is entire, as are nearly all the forty-five towers upon it. The ruined churches, eighteen in number, are most interesting objects to the antiquary; and supply models of the style of building, ornament, and workmanship of the eleventh and twelfth centuries. No specimens so entire of equal date are to be found in England. The *Helige Ánds Kirken*, or Church of the Holy Ghost, a small octagonal structure, built in 1046, has a round massive Saxon arch for the main entrance, with windows and other arches in the same style. A curious aperture occurs in the ceiling of the choir, the purpose of which has not been satisfactorily ascertained. *St Lawrence Church*, erected in the same year, has a transept, and exhibits the pointed arch used indiscriminately with the round. *St Drottens*, built in 1086, is a specimen of the Saxon style. *St Nicholas*, 1097, is altogether Norman, with very beautiful pointed arches. The only church now kept up for the use of the inhabitants, *St Mary's*, was built by the German merchants in 1190. Tombstones applied to strange purposes, forming stairs and pavements, are common objects. Many of these, though of comparatively modern date, exhibit marks resembling hieroglyphics or Runic characters. A lawyer of the place accounted to *Mr Laing* for the occurrence of these marks in an ingenious and plausible way. At a period when writing was not an ordinary accomplishment, even with the wealthiest inhabitants of Wisby and the Hanse Towns, every merchant had his particular mark or scratch, known to his customers and friends as well as if it had been his signature in letters. This countersign was transmitted in the family, and by it their wares were known and their communications recognised by all who dealt or corresponded with them. It was also inscribed on their tombstones to distinguish them from others. This is the tradition of the place respecting the marks. The most ancient tombstone observed by the traveller had the year 1236 inscribed upon it, and was stowed away in a summer-house. Coins from the east and west, Persian, Arabic, and Anglo-Saxon, found at Wisby, are memorials of the extremely foreign character of its visitors in the middle ages.

Falls of Feigumfoss.

II. NORWAY.

Three great geographical regions are distinguished in Norway, subdivided into *amts*, or bailiwicks.

|   |           | Principal Towns.            |
|---|-----------|-----------------------------|
| Sondenfields, the southern ranges of hills, | . . . . . | Christiana, Frederickshall. |
| Nordenfields, the northern ranges of hills, | . . . . . | Bergen, Drontheim.          |
| Norrland, the north land,                   | . . . . . | Tromsøe, Alten, Hammerfest. |

*Christiana*, the capital, stands at the head of a lovely fiord on the south coast, speckled with islands, and bordered with heights thickly clothed with pines. It is a small city of 39,000 inhabitants, remarkably clean, free from indications of squalor and vice, with broad streets, fresh-looking houses, and shops scarcely to be distinguished from private dwellings. A few samples of wares are placed in plain parlour-windows, many of which are without shutters, shewing no apprehension of the thief in the night. There is a university, a botanical garden, an astronomical observatory with which the celebrated Hanstein was long connected, a new storthing-house for the accommodation of the legislature, and a palace also of recent date. The great conflagration of 1853, by destroying many antiquated and irregularly-shaped buildings, opened a large field for the display of architectural taste, of which the authorities and the inhabitants have promptly availed themselves. In the tower of the principal church a fire guardian is constantly posted, who has to prove his vigilance by calling out every quarter of an hour from each of its four sides. Throughout Scandinavia, where the houses are so largely of wood, fire is the great enemy dreaded by the people. The night-watchmen do not forget this danger in their hourly call—

'The clock strikes twelve, may God still keep  
The town from fire, while the citizens sleep!'      The chant varies to      'Unless the Lord the city keep,  
The watchmen watch in vain.'

*Frederickshall*, on a bay of the Christiana fiord, with an excellent harbour and a rock-seated castle, is close to the Swedish frontier. It has a population of 7400. An obelisk marks the spot where Charles XII. fell in 1718, while besieging the fortress. It was raised to his memory by command of Bernadotte, and is surrounded by a double row of cypress-trees. An avenue bordered with the same funeral shrub leads from it to the battery, from whence the cannon-ball that terminated his career is supposed to have come.

*Bergen*, the commercial capital, on the west coast, with about 26,000 inhabitants, has a very plain appearance, considering the wealth and enterprise of its merchants. They are chiefly engaged in the Lofoden fishery; export annually many thousands of tons of dried fish to the southern countries of Europe; import corn, which is not raised in the country sufficient for home consumption, with other articles of necessity and luxury; and carry on the trade in their own vessels. The neighbourhood of the town is very naked and sterile. No woods are to be seen, but only a few small clusters of stunted trees in sheltered situations. This is a feature of the whole coast where it is freely swept by the north-west gales from the ocean. They prevent the growth of timber to the distance of ten or twelve miles from the open sea, and have a marked influence upon the vegetation, rendering it dwarfish, to three times that extent inland. The harbour very rarely freezes, and is commonly accessible to vessels all the year round, though further north than St Petersburg, where the waters are ice-bound through the whole of the winter. This circumstance is important in connection with the Lofoden fishery, which is carried on in February and March, and upon which the prosperity of the whole west coast of Norway depends. *Drontheim* or *Trondhjem*, the old metropolis, on a large fiord further north, is chiefly built of wood, with 16,000 inhabitants. It has an ancient cathedral, once an object of veneration to all Scandinavia, but now simply an odd, irregular, quaint-looking building, having been repeatedly ravaged by fire and re-edified. Within the Arctic Circle are *Tromsøe*, on an island of the same name, where a dealer in smallwares, as the consul, hoists over his shop-door the royal standard of Great Britain; *Alten*, on the mainland, with copper-mines in its neighbourhood, under the direction of an Englishman; and *Hammerfest*, on the island of *Hvaloe*, the most northerly town in Europe, consisting of a single street of straggling, one-storied, wooden houses. An obelisk at the outskirts marks the terminus of a great meridian line drawn from the Danube near *Rustchuk*. It has an inscription signifying that here is 'the northern termination of the meridian line of 25° 20' from the Arctic Ocean to the River Danube, through Norway, Sweden, and Russia, which, after the ordination of his majesty King Oscar I., and the Emperors Alexander I. and Nicholas I., by uninterrupted labour from 1816 to 1852, was measured by the geometers of the three nations—latitude, 70° 40' 11.3". The Thief Mountain; in the vicinity, about 1500 feet high, exhibits in a remarkable manner the effect of altitude upon the vegetation. There are some dwarf birches at the foot of the hill, rising rather more than the human height, which are represented on ascending further by plants gradually diminishing to six or eight inches, yet still having the form of mature trees. The summit commands a view of the island of *Mageroe*, with the North Cape, the extremity of Europe towards the pole.

The whole west coast of Norway is fringed with an immense number of islands, all small, generally close inshore, and often assuming very fantastic shapes. The *Hestmann* or *Horseman* rears his head above the sea on the line of the Arctic Circle, a bold rocky mass, bearing a curious resemblance in one part to the head and ears of a horse. In the same locality are the *Seven Sisters*, a range of seven towering mountains with pointed summits, forming a single island, and making a glorious panorama. The insular granitic rock of *Torghatten* has the name from its outline corresponding to that of a 'wide-awake' or 'sou-wester' hat. It is remarkable for a huge natural tunnel which completely perforates the upper part, so that the daylight is seen through it. The *Lofoden Isles*, a northerly chain at some distance from the mainland, are granitic masses rising from 3000 to 4000 feet above the sea, which break at the summits into a multitude of jagged points, comparable to the jaw of a shark, and are covered with snow for the greater part of the year. Here is the famous *Maelström*, a whirlpool formed in certain states of the tide by the collision of opposite currents, the terrors of which seem to have been exaggerated. It is one of a series of 'grinding streams' or 'bad currents,' according to the meaning of the name, common in the locality, but only dangerous to small-craft. The great fishery at these islands commences in the beginning of February, and annually attracts a large number of vessels to the station. The fish principally taken are a kind of cod, the hake of our countrymen, which, after the necessary preparation, are hung up on poles ashore to dry. There they remain till the middle of June, when the process of curing is considered complete. Cargoes arrive at *Bergen* in August, which have been purchased by the merchants at the spot of the more needy fishermen, as well as obtained by their own vessels. The London market is largely supplied with lobsters from the *Naze* of Norway, its south extremity.

The Swedes number 3,856,000, the Norwegians 1,490,000, making a total of 5,346,000. Though of the same lineage, they are distinguished by difference of language, with those

distinctions of temperament and manners which so universally discriminate a highland from a lowland people. The praise of honesty, industry, and hospitality may be awarded to both, as well as the discredit of being addicted to the immoderate use of ardent spirits, though not to such an extent as in former times.

Corn-brandy is the favourite potation, which the farmer or proprietary peasant in Norway distils from his own crops for the use of his family; and hard drinking does not, as is ordinarily the case, lead to quarrels and fights. The liquor mentioned, believed to inspire strength and long life, is the subject of the old Norse song:

‘To the brim, young men, fill it up, fill again;  
 Drain, drain, young men, ’tis to Norway you drain;  
 Your fathers have sown it,  
 Your fields they have grown it,  
 Then quaff it, young men, for he’ll be the strongest  
 Who drinks of it deepest, and sits at it longest.

To the brim, old men, fill it up, fill again, &c.

The greater intercommunication of nations, consequent on steam-navigation and the railway-system, has not been without effect in refining manners in Scandinavia, and will be extended to its more solitary populations as contact becomes more frequent with foreign visitors. Personal characteristics are most decisively marked among the Norwegian peasantry. They have the vigour and agility common to mountaineers; their free and independent bearing; their fiery patriotism; and their passionate vehemence when pride or prejudices are touched. Any company of natives will be excited by the mention of *Gamle Norge*, Old Norway; and the toast is sure to elicit a burst of exuberant enthusiasm. Marriages are high occasions, as elsewhere, and are almost invariably celebrated on a Sunday. A gilded coronal of paper distinguishes the bride. According to the circumstances of the parties, dancing and feasting antedate and follow the event; the services of fiddlers and drummers are in requisition; corn-brandy flows freely; and kegs of butter, or if the season is winter, salted or frozen meat, are acceptable bridal-presents. In all grades of society, guests on rising from table grasp hands with due deliberation, and say to hostess, *Tak for maden*—Thanks for your entertainment. Thus, at a dinner-party of sixteen persons, as every one shakes hands with fifteen, there will be 240 shakings. Large festal-parties are common, even in the wilder districts of the country, especially at midsummer and Christmas, the guests frequently coming from a distance of twenty or thirty miles.

The legislature of Sweden, called the Diet, consists of representatives of the nobles, clergy, burghers, and peasants, ordinarily meeting once every five years at Stockholm. The four estates of the kingdom assemble in a common chamber divided into four compartments. At one end sits the president; on his right hand are the nobles; on the left the clergy; with the burghers and peasants in front. The *Storting*, ‘Great Court,’ of Norway, is a representative body usually convened every third year at Christiania. It presents a very motley and almost ludicrous appearance to the stranger, owing to the different costume of the members, often apparently below the dignity of legislators. Inglis, who attended one of the sessions, saw several deputies with jackets and girdles. ‘These,’ he observes, ‘I recognised as the natives of Tellemarken, through which I had recently passed. Others, whose coats were as much beyond the length of an ordinary coat, as the jackets of the former were shorter, and who might be seen walking to the hall, their heads covered with something of the shape and colour of a Kilmarnock night-cap, I was informed were the deputies of Gulbrandsdalen, the mountainous district bounded on the north by the Dovre-field and its range. The appearance of the assembly altogether was not superior to that collected at a second-rate cattle-show in England, and infinitely more grotesque. Among the number, however, were several wealthy land-owners, chiefly from the country skirting the Miosen, and from the districts on both sides of the Christiania fiord. They seemed to conduct their deliberations with temper and decorum, although there were neither wigs nor black rods; and I will venture to say they stood in less need of reform than some other deliberative assemblies.’ In both countries Lutheranism is the established form of religion, and in Sweden intolerant laws are in force to check the rise of nonconformity.

Solitary churches, usually on gentle eminences, with red-tiled or white-boarded roofs, are common objects in Sweden, and, useful landmarks to the sailor when on the coast.

The custom is perhaps partly a relic of the northern paganism, for the altars of Odin invariably occupied such sites, as localities were supposed to acquire sanctity by distance from human habitations, and high situations were preferred to low for the same reason, being nearer the sky, the abode of the gods. But in Norway especially, where the parishes are very extensive, and consist of scattered homesteads, the churches are often isolated to suit the general convenience, being fixed at some point central to the more dispersed parishioners. Many have from ten to fifteen miles to traverse to attend public worship, and six or eight miles is a common distance. Hence church attendance is of necessity infrequent on the part of numbers, owing to bad weather, particularly in the more mountainous districts, as the streams and torrents by the way are rendered impassable by storms and floods. This cause operates against the attendance of children at school, and has given rise to the class of ambulatory schoolmasters who visit certain localities on different days to impart instruction. In some instances families remain cooped up in glens through the whole winter, never once being able to visit church, or communicate with a neighbour only a few miles distant, owing to the path out of them, always difficult, being rendered impracticable by accumulations of ice and snow.

Soon after the Rev. U. F. Borgesen was appointed to the charge of a parish in Bergenstift, he heard of Vettie's Giel, the residence of a farmer belonging to his flock, which he determined to visit. Vettie is the name of the farm, and *giel* denotes the narrow glen by which it is approached. It had never been visited by any previous incumbent. Men lived and died contiguous to the spot, without ever seeing it, owing to the extraordinary difficulty and peril of the route. In the middle of summer, M. Borgesen started on horseback, accompanied by guides. The steed was dismissed at the entrance of the glen, for though horses can traverse it, only such as are thoroughly accustomed to the path can be trusted. The whole district being at a great height above the level of the sea, snow and ice were still abundant on the sides and summits of the precipitous hills, notwithstanding the advance of the season. From a projecting mass of granite, a bridge of pliant trunks of trees, laid over with birch bark, turf, and gravel, spans a narrow chasm at an immense height above a roaring stream. The frail structure swings beneath the footfall of the passenger, and leads to a path cut out of a frightful wall of rock. 'You are now in the Giel,' remarks the clergyman; 'traveller, God be with you! The path here is not broader than that a person can just stand on it with both feet beside each other. Sometimes you have only room for one foot; nay, at times, from the quantity of loose earth and small stones which are frequently tumbling down here, you find no place at all to stand on, but must, with your foot, in a manner scrape out such a place in these loose materials, which here lie over the surface of the whole precipice, the upper part of which forms a very sharp angle with your body, while the part below approaches frightfully near to a perpendicular line.' This was the thoroughfare for the space of from four to five miles. 'With the utmost caution, your eye fixed steadily on the point where you are to tread, you set forward foot by foot, without stopping to draw your suppressed breath. A slip, an unsteady step, or giddiness itself, which always threatens to overwhelm the unaccustomed traveller, and in a moment the torrent becomes the grave of your mangled carcass! When overcome by the violence of the exertions I had to make, I stopped a moment. This rest, so far from being refreshing to me, was full of horror. It was better to go on, however exhausted. In doing so, your thoughts were so occupied with the place where you might find some footing, that you had but little time to observe the grimaces with which death seemed everywhere to gape around you. But set yourself down, you cannot avoid seeing yourself sitting on the brink of an abyss—I asked my guides if anybody had ever come to mischief on this way. They recollected only one person who, with a knapsack of birch-bark on his back, by a false step had tumbled over from about the very spot where we were standing. From an irresistible apprehension that I might be the second, I pushed forward from such a place, but yet I found no safer way.'

Having got over the perilous part of the route, the guides were dismissed. The glen began to open a little, and gradually widened till it enclosed the fields of Vettie, with the dwellings of the houseman and his master, where the clergyman was received with unbounded astonishment by the inmates of the homestead, and unsparing hospitality. He goes on to state, that observing the hostess near her confinement, 'I expressed my wishes for her safety, and asked her, "How she would get the child taken to church?" "Oh," answered she smiling, "when matters come that length, there will be no difficulty: the child is well wrapped up, and is carried to church, properly girt, on the shoulders of the servant-man." "By the same way I have come?" "Yes; we have no other." "Now, then, God be with both him and the child." "Oh, we are not afraid of the way, we are so accustomed to it; and after a few weeks it will be better, when all the ice will be away." The glen is an enormous gully prolonged far beyond this point, or to a total extent of more than thirty miles. It has openings and cross glens at intervals, where there are a few inhabitants, who have no means of enjoying other human intercourse than by similar paths along fearful steepes. During his stay, M. Borgesen learned that when a death occurred at Vettie the corpse was wrapped in linen, and laid on a plank, furnished

with holes at both ends, in which were fastened handles of cord. To this plank the body was lashed, and then carried by two men, one before and another behind, till having cleared the glen, it was put into a coffin, and conveyed in the usual way to the churchyard. If any one died in winter, when the route was impracticable, they endeavoured to preserve the body in a frozen state, till it could be carried to the tomb. A funeral, perhaps without a parallel, was related, which took place in an adjoining ravine of equal difficulty. As its occupiers had often changed, there had been no death within the experience of the existing inhabitants, to task ingenuity in the carriage of a corpse to consecrated ground. At last a young man died; a coffin was provided; the body was laid in it; and not till almost ready to set out did the utter impossibility strike any one of proceeding in this way to the grave-yard. 'What is to be done? Good counsel is here precious. They leave the coffin as a *memento mori* at home, and set the dead body astride on a horse. The legs are tied under the horse's belly, and a bag of hay is well fastened on the horse's shoulders, to which the body leans forward, and is made fast. In this manner rode the dead man over the mountains, to his resting-place in Forthuus Church, in Lyster—a fearful horseman!'

Over the more northerly districts, both of Norway and Sweden, a few thousands of Lapps are thinly distributed, a totally distinct race from the general inhabitants, belonging to the Mongolian division of mankind. They are of uncouth appearance, and very diminutive stature; are clothed with the skins of animals or coarse woollen stuffs; live in huts rudely constructed of boughs overlaid with turf; occupy the mountains in summer, and the valleys in winter; depend for subsistence upon their reindeer and fish; and occur both in solitary families and small groups. Once notorious for an insatiable desire for brandy, and wild intemperance at the fairs, and other places of gathering, they have become to a great extent a sober and orderly people, owing to the efforts made to reclaim them. Professor Forbes, who visited a Lapp encampment, after remarking that first impressions made by their appearance were unprepossessing, observes that an attentive survey brought out some more favourable features. 'The countenance was altogether unlike any I had seen, but by no means devoid of intelligence, and even a certain sweetness of expression. Notwithstanding that our party was tolerably numerous, they exhibited no signs either of distrust or of shyness; and whilst some of them entered into conversation with one of the gentlemen from Tromsøe, who knew a little of their dialect, and others went attended by several small active dogs to fetch some reindeer for our inspection from the heights, the greater part remained quietly in their huts, as we had found them, quite regardless of our presence. On inquiring into their occupation, we were surprised to find them possessed of some excellently-printed and well-cared for books, particularly a Bible in the Finnish tongue, and a commentary, each forming a quarto volume. We found some of them also engaged in writing.' It is common for the poorest Lapps to possess a dozen reindeer, while a herd of a thousand, or more, occasionally constitutes a single property. To this magnificently antlered animal, the lemming, another inhabitant of the district, offers a striking contrast in size, not being larger than a mouse. But countless myriads appear at irregular intervals as migrants from the mountain solitudes. Streams, torrents, and gorges are crossed, while all vegetation in their way is consumed. Scarcity of food in their native haunts appears to cause the migration.

Moscow.

## CHAPTER III.

### EUROPEAN RUSSIA.

THE European portion of the Russian Empire embraces the entire east of the continent from the northern to the southern boundaries, contains more than half its area, with one-fourth of its population, and has a single government, that of Archangel, larger than any European kingdom. This vast country is bounded on the north by the Arctic Ocean; on the south by the mouth of the Danube, the Black Sea, and the ridge-line of the Caucasus; on the east by the shore of the Caspian, the Ural River and Mountains; and on the west by the territories of Turkey, Austria, and Prussia, with the Baltic and its gulfs. The extent measures nearly 2000 miles from north to south, by about 1500 from east to west, and the area is estimated to include more than 2,000,000 square miles. The whole is included between the parallels of 40° and 70° north latitude, and between the meridians of 18° and 60° east longitude. Two large islands, Nova Zembla or 'New Land,' and several smaller, are insular dependencies in the Arctic Ocean, only important on account of their cetaceous animals and birds, with the Aland group and a series of islets off the Gulf of Riga in the Baltic. The serviceable part of the coast-line belongs entirely to the inland seas, but it labours under disadvantages, besides being extensively closed to navigation through the winter months.

An arm of the Northern Ocean, the White Sea, is the only inland basin exclusively Russian. It penetrates the country to the extent of more than 200 miles, has a varying breadth, assuming a semicircular shape at its greatest expansion. It forms the Gulf of Kandalask on the north-west, called after an unimportant place at the extremity; and terminates on the south and south-east with the Gulfs of Onega and Dwina, the estuaries

of the rivers so denominated. Periodically the sea answers to its name, for ice clothes the surface from October till May, all the streams are frost-bound, and the region traversed by them is thickly crusted with hard snow. In crevices of the rocks and shaded places, with a northern exposure, the accumulated snow of winter is met with at midsummer, and in some years it remains permanent. Extremes of heat and cold are characteristic of the basin, the heat being limited to a very brief period, while the cold prevails uninterruptedly for six months or more. Mosquitoes are numerous on the coast in summer, and the temperature is at times oppressive. But the transitions are sudden and violent from the wind veering, so that an out-of-doors labourer perspiring at

his task one hour will be glad to resume his furs the next. Dense fogs occur, continued for days together, with furious transient storms. But the fogs are seldom hazardous to shipping, as they are commonly light towards the land, and thick only where there is ample sea-room. The White Sea contains several inhabited islands. Solovetz, the largest of a cluster at the entrance of the Gulf of Onega, contains a town celebrated for its isinglass, with an adjoining monastery, the reputed sanctity of which annually attracts pilgrims from an immense distance. Peter the Great, during his stay at Archangel, paid a visit to the place, and narrowly escaped shipwreck on his return.

The main part of the Baltic supplies only a maritime frontier of limited extent, but the eastern side of its northern arm, the Gulf of Bothnia, and all the coasts of the lesser branch, the Gulf of Finland, are Russian territory. The latter is the important marine highway, leading up to St Petersburg, by which the capital receives the luxuries of the tropics, retains what is wanted for its own consumption, and disperses the remainder far inland, chiefly by a connected system of rivers and canals. But it is rendered periodically useless by wintry bonds, and so strongly frozen at the upper extremity that high-roads are established on its surface between Cronstadt Island and the metropolis, a distance of eighteen miles, on which horses gallop, sledges fly, and houses of refreshment appear. In the opposite season, navigation is active, favoured by the light nights consequent upon the high latitude. 'I am writing at midnight,' observes the Marquis de Custine, 'without any lights, on board the steam-boat, *Nicholas the First*, in the Gulf of Finland. It is now the close of a day which has nearly the length of a month in these latitudes, beginning about the 8th of June and ending towards the 4th of July. About an hour ago I beheld the sun sinking in the ocean, between the north-north-west and north. He has left behind a long bright tract which continues to light me at this midnight hour, and enables me to write upon deck while my fellow-passengers are sleeping. As I lay down my pen to look around, I perceive already towards the north-north-east the first streaks of morning light. Yesterday is not ended, yet to-morrow is begun.' Light-houses in the gulf are lit in spring, as soon as the breaking up of the ice opens the navigation. But towards the close of May they cease

to be illuminated, owing to the brightness of the nights, and are not rekindled till the approach of August, from which period they are kept glowing till the return of congelation suspends maritime pursuits.

The Black Sea is Russian along its northern and eastern shores; and brings the southern provinces into communication with the Mediterranean by the channels which connect the two great basins. This expanse is distinguished by its vast size, compact form, and nearly unbroken surface, for only one small island off the mouth of the Danube, and two rocks off-shore in the Crimea, interrupt its continuity. The inland reservoir has been known under various and contradictory designations. The Greeks, in their earliest age, styled it *Azinus*, or 'inhospitable,' in allusion, probably, to the stormy weather common at certain times of the year, as well as to the barbarity of the rude Scythian hordes on the coast. But when their colonies were established upon the shores, they adopted for it the more auspicious title of *Euxinus*, 'hospitable,' 'friendly to strangers,' out of compliment to themselves, and as an inducement to emigration. The present name, the Black Sea, *Karadenghis*, originated with the Turks, and has no physical claim to appropriateness, the water being intensely blue, but metaphorically refers to real or supposed perils incident to the navigation. It has its dangers and demerits in common with other parts of the great realm of the ocean, but they supply no reason for the adoption of the specially sombre title. Tremendous storms from

the north occur about the equinoxes, and in the winter, tempests of blinding snow and sleet are not unusual. On the other hand, it is admirably adapted for nautical purposes through the greater part of the year, being generally deep, so that the largest vessels may

Caspian and Black Sea.

often sail close inshore, unobstructed by shoals and islands, affords ample sea-room, and possesses many excellent harbours. But down to very recent times, the expanse has not been traversed by expert mariners in efficient craft, and it has had to bear the blame of many a mishap which might have been avoided by ordinary seamanship. On the north, a large offset runs up into Southern Russia, forming the Sea of Azov, everywhere shallow, and blocked up with ice from November to March.

The Caspian Sea, the western shore of which belongs to European Russia, is entirely landlocked, and can only be the seat of very local commerce. Thus it is alone by circuitous routes through narrow channels, the coasts of which are held by other nations, or by waters rendered periodically unserviceable by the climate, that maritime commerce can be pursued—a disadvantage which cripples the relations of the country with the great markets of the world, both as to the export of its own produce and the import of foreign luxuries and manufactures.

The surface of Russia belongs generally to the great European plain, and includes the vast proportion of its area. Low rocky ranges of hills overspread much of Finland, Olonetz, and Russian Lapland; the Valdai plateau, on the south of Petersburg, where the Volga has its source, is of comparatively trifling elevation and very limited extent; spurs from the frontier Urals diversify the country in that direction; offsets stretch out from the mighty chain of the bordering Caucasus; and a bold and beautiful mountainous tract occupies the south-east coast of the Crimea. But apart from these exceptions, the united area of which is inconsiderable, the country is a gently-undulating plain, in many parts

a dead-level, comprehending natural forests, woodless steppes, dreary moorlands, and extensive marshes, with pastures and cultivated soil. These varying aspects are noticed in connection with the great territorial divisions. Three general inclinations of the surface are distinguished, northward, westward, and southward, divided from each other by low water-sheds. In these directions the drainage is conducted by upwards of thirty rivers, which directly enter the ocean or the inland seas, fed by an enormous number of affluents. But only eleven river-basins are of important magnitude, the most extensive of which incline towards the south. They consist of the Volga and Ural, entering the Caspian; the Dnieper, Don, Dniester, and Kuban belonging to the Black Sea; the Neva and Southern Dwina, connected with the Baltic; the Northern Dwina, Mezen, and Petchora, flowing to the Arctic Ocean. In addition, the Vistula is Russian in the middle part of its course, and the Niemen in the upper, while the Pruth, an affluent of the Danube, forms the border-line from the Turkish dominions, and the Tornea from Sweden.

The Volga is the largest river of Europe in the magnitude of its basin, the length of its course, and the extent of its navigation. It receives the drainage of nearly one-seventh of its area, and winds through 2200 miles, though the direct distance from source to mouth is not more than 900 miles. This amount of meandering is owing to the inconsiderable inclination of its bed, for the total fall of the river is under 700 feet, which gives it an average descent of less than four inches per mile. It issues from a small lake on the eastern slope of the Valdai plateau, forms an extensive delta at its termination, and is popularly said to enter the Caspian by seventy mouths. When in flood from the melting of the snow in spring, the stream spreads out to the width of from fifteen to twenty miles towards its embouchure, and appears to bear entire forests upon its bosom. Though gently undulating hills appear in places on either side of the channel, the banks have very rarely a touch of the picturesque, but commercial activity and well-peopled districts distinguish its course. Unobstructed by rapids, possessing considerable depth, navigable nearly up to its source, and employed as a great mercantile thoroughfare, the Volga is fondly called the 'nursing mother' of the empire, from the wealth and plenty it diffuses. Annually, at the junction of the Oka, the two streams present a very animated spectacle, owing to the hundreds of vessels with which they are crowded, in attendance upon the fair of Nijni-Novgorod, held on the triangular piece of land at the confluence.

The Dnieper, second of the Russian rivers in magnitude, known to the ancients as the *Borysthenes*, has a flow of 1200 miles from the government of Smolensk to the northern shore of the Black Sea, but has its navigation wholly interrupted for upwards of 100 miles below Kiev by rocks and rapids, where the scenery is extremely wild. In the vicinity of this impracticable part of its course, a wild, lawless race long had their stronghold, called the Zaporogian Cossacks, a name alluding to the locality, 'beyond the cataracts.' They consisted of fugitives and adventurers from various countries, had almost every language of Europe represented among them, formed an independent community, took part in the Russian, Polish, and Turkish wars of the last century, repeatedly changed sides as interest prompted, were admirable boatmen and bold pirates. Brought into subjection in the reign of the Empress Catherine, they were removed to the banks of the Kuban, to guard the frontier against the mountaineers of the Caucasus, where their descendants remain under the name of Tchernomorski, or Cossacks of the Black Sea. The Dnieper acquires considerable expansion, and discharges through a long and noble estuary, crowded with wooded islands, with but few signs of human life on their shores. 'After having spread out to the breadth of nearly a league, it parts into a multitude of

channels, which wind through forests of oak, alders, poplars, and aspens, whose vigorous growth bespeaks the richness of a virgin soil. The groups of islands capriciously breaking the surface of the waters, have a melancholy beauty, and a primitive character, scarcely to be seen except in those vast wildernesses where man has left no traces of his presence. Nothing in our country at all resembles this kind of landscape. With us, the creature has everywhere refashioned the works of the Creator; the mark of his hand appears even on the most inaccessible mountains; whereas in Russia, where the nobles are the sole proprietors, nature still remains in many places just as God created it.' The Don, ancient *Tanaïs*, third in rank, is scarcely inferior, but has its utility as a commercial artery restricted by turbulence during the spring floods, and sand-banks through the remainder of the year, formed by the immense quantities of mud brought down by the current, a portion of which, carried into the Sea of Azov, where it discharges, renders it so shallow as only to be navigable by vessels of small size.

Among the northern rivers, the Southern Dwina flows through the heart of the flax-producing districts to the Gulf of Riga; the Neva conveys the surplus water of the great lakes to the Gulf of Finland; the Northern Dwina and Mezen enter the White Sea; the Petchora travels direct to the Arctic Ocean, but through a region scarcely habitable by civilised man from the rigorous climate, and only occupied by a few hordes of wandering Samoiedes.

The Neva, of importance and interest from the position of St Petersburg on its banks, is remarkable for its volume of water, derived chiefly from four great lakes of which it is the outlet. These are the Onega, which has an area of 3280 square miles; the Ilmen, 3390; the Saima, 2000; and the Ladoga, with a superficial extent of 6330 square miles. The latter receives the drainage of the other three. Ten different streams flow into the Onega, eleven into the Ilmen, and thirteen into the Ladoga, besides those which convey the tribute of its lacustrine feeders. From such an accumulation of waters, it is natural to expect an immense outflowing, especially as the solar heat, upon which evaporation mainly depends, acts only with vigour through a brief portion of the year. Accordingly the Neva is found to discharge into the Gulf of Finland upwards of 116,000 cubic feet of water in a second, only a fraction of which proceeds from eight small streams which flow into it during its course from the lake to the gulf. This admeasurement, executed with great care and skill, was made in order to obtain data for devising means for protecting the capital from the inundations which have often threatened its existence. At the city, the river divides into several deltoidal branches, the largest of which bears along a mass of 74,000 cubic feet of water per second, while the Nile, in the same time, furnishes but 21,800 cubic feet. From the lake to the gulf the Neva has only a course of sixty-nine versts, or but little more than forty miles. It maintains a medium breadth of 1500 feet, and a considerable depth in the mid-channel, generally amounting to fifty feet. But it cannot be entered by large vessels, owing to a bar across the mouth with not more than nine feet of water upon it. The brimful stream is a fine object, the pride of the metropolitans, and the only ornament which nature has given to their locality. The water is beautifully blue and transparent, much lauded by the citizens for its quality, one reason for which may be found in the fact, apart from its merits, that there is no other supply of the first necessary of life fit for domestic use, not a single pure spring within leagues of the city.

Besides the lakes mentioned, an immense number of fresh-water expanses, some of which are of comparable extent, overspread the whole of the north-western district, while saline lacustrine waters are numerous in the region towards the Caspian. Both lakes and rivers are frozen in the winter season, though much more feebly, and for a far briefer

interval, in the south than in the north. Ranging through nearly thirty degrees of latitude, the climatic variations are considerable, but strongly contrasted temperatures in summer and winter are everywhere characteristic of the climate, with seasonal heat and cold much more excessive than is experienced under corresponding parallels of latitude in Western Europe. It appears from a record of the freezing of the Neva at St Petersburg, and the breaking of its wintry bonds, extending over an interval of 117 years, compiled by Colonel Jackson—*1st*, that out of 117 times the river has only been frozen up once so late as the 14th of December; *2dly*, that it has been frozen up 13 times in October, 95 in November, and 8 in December, the general period being from the 5th to the 20th of November; *3dly*, that out of 117 times, the ice has never broken up before the 6th of March, and only once at that early date; *4thly*, that it has broken up 18 times in March, and 99 in April, the general period being from the 5th to the 15th of April; and *lastly*, that one year with another, the navigation may be said to be open seven months, and closed the remaining five. Further north, the Dwina and the port of Archangel are blocked with ice for seven months out of twelve. But vegetation advances with remarkable rapidity as soon as the genial season returns, and scarcely has the spring revealed itself than it is summer. In little more than thirty days after the Neva has been covered with ice three feet and a half thick, the birch-trees have put forth their full complement of leaves, and in ten days afterwards the *Syringa vulgaris* is in flower. Observations upon the first manifestations of vegetable life, made by Erman and Goppart, serve to shew that while they are about a month later at St Petersburg than at Breslau, the various phenomena of development succeed one another with far greater rapidity at the northern capital, both with reference to native and acclimatised plants. Thus the budding of the birch is followed by that of the

In the southerly districts the winter is short but severe, and the summer long, dry, and oppressively hot. But in the extreme south, on the coast of the Crimea, where there is a protecting range of mountains in the background, the climate is balmy; the tree-frog climbs; and both on the seaward slopes, and in the deep valleys of the chain, the vine, fig, olive, orange, pomegranate, mulberry, and plantain flourish luxuriantly. Here are imperial chateaux, and the villas of nobles, occupied by their owners in summer, at least before the outbreak of the Crimean war.

Russia has important natural resources in minerals, forests, fisheries, and a vast extent of fertile corn-growing land, only a comparatively small proportion of which has hitherto been brought under cultivation, though, besides the home consumption of grain, a large amount is raised for export to western markets. Iron occurs in various parts of the country, and is extensively worked in Finland and other provinces. Lead, copper, arsenic, nitre, alum, and salt are also yielded; but the metalliferous wealth of the empire is chiefly developed on the Asiatic side of the Urals. Coal, though generally wanting, is found on the banks of the Oka in association with iron; also in the valley of the Donetz, the principal tributary of the Don; and a rich field of great extent is a discovery of recent date in the government of Moscow. Immense forests clothe the central districts, chiefly between the parallels of 52° and 60°. In the southern part of this zone the beech and oak appear, but the predominant trees are the lime, birch, elm, ash, maple, alder, willow, Scotch fir, and various pines, with an undergrowth of hazel, juniper, and berry-bearing plants, the fruit of which serves the rustic as a substitute for orchard and garden produce.

Besides supplying fuel and materials for dwellings, the woods act as a protection against the biting blasts of the north, furnish timber for export, with pitch, tar, potash, and turpentine, the preparation of which goes back to a remote age. Hence the primitive Slavonic name for the month of April is *Beresosol*, or 'birch ashes,' in allusion to the period usually devoted to the production of potash. Wild bees abound in the forests, using the aged and hollow trees for hives, from which a considerable quantity of honey and wax is obtained; and wild animals, hunted for their skins and furs, are numerous, the bear, fox, lynx, ermine, squirrel, and otter. The wolf boldly roams the more open and unwooded districts; the polar bear appears on the shores abandoned to icy desolation in the north; reindeer browse upon the moss-grown treeless plains within the Arctic Circle; the auroch, a huge bovine species, lingers under imperial protection in one of the Lithuanian forests; semi-wild horses and cattle range in vast droves the southern steppes; the buffalo and Bactrian camel are employed for draught and burden in the Crimea and neighbouring districts. On the Volga, the Don, the Sea of Azov, and the Caspian the fisheries are highly valuable. Sturgeons of enormous size are taken, with the beluga, the largest known of all edible fish. Isinglass is prepared from the sounds or swimming-bladders, and caviare from the roes, an article of food in great demand, owing to the numerous fasts enjoined by the Russian Church.

Entrance to Sea of Azov.

Revel.

European Russia, exclusive of Finland and Poland, is distributed into forty-nine governments, but it is usual and most convenient, politically, to divide the country into the following territories, with which natives and foreigners are alike familiar :

|  | Cities and Towns.                                |
|--|--|
| The Baltic Provinces—Courland, . . . . . | Mittau, Libau.                                   |
| " " Livonia, . . . . .                   | Riga, Dorpat, Pernau.                            |
| " " Esthonia, . . . . .                  | Revel, Narva.                                    |
| " " St Petersburg, . . . . .             | St Petersburg, Czarskœe-sloe, Cronstadt.         |
| Grand Duchy of Finland, . . . . .        | Helsingfors, Sveaborg, Viborg, Abo, Uleaborg.    |
| Great Russia, or Muscovy, . . . . .      | Moscow, Tula, Nijni Novgorod.                    |
| Little Russia, or the Ukraine, . . . . . | Kiev, Pultowa, Kharkov.                          |
| West Russia, including Poland, . . . . . | Grodno, Wilna, Warsaw, Vitepsk, Vola, Archangel. |
| South or New Russia, . . . . .           | Kertch, Anapa, Sebastopol, Odessa.               |
| East Russia, . . . . .                   | Kasan, Saratov, Simbirsk, Oufa.                  |

#### I. THE BALTIC PROVINCES.

This region occupies the shores of the Baltic from the Prussian frontier in the neighbourhood of Memel to the far extremity of the Gulf of Finland, and consist, in order from south to north, of Courland, Livonia, Esthonia, and St Petersburg. The three provinces first named are frequently distinguished as the Germanic provinces, on account of the Teuton-Scandinavian origin of the towns, with the inhabitants and institutions. Their coast is indented by an arm of the sea, the Gulf of Livonia or Riga, the third in point of extent which it forms. No natural features of interest belong either to the sea-board or to the interior. Dark pine-woods, sandy heaths, swamps, and small lakes, with memorials of the northern drift, occupy a great proportion of the area. The remainder of the surface, under cultivation, produces large crops of rye, barley, flax, hemp, and linseed for exportation ; while the woods supply the outports with masts, deals, pitch, and tar for the foreign markets. The majority of the people are Lutheran Protestants.

Few parts of Europe have been more bandied about by different powers than the three provinces mentioned. In early times they were occupied by a branch of the Finnish family, now represented by the Esthonian peasantry. These aborigines were pagans, predatory and piratical in their habits. The Danes appear to have first intruded upon them. The Germans followed upon the rise of the Hanse Towns, and formed an association to repress piracy by Christianising, as it was called, the natives. Its members, men of Lübeck and Bremen, took the name of Schwert-brüder, Brethren of the Cross and Sword, a conjunction of means common in the dark times of the middle ages. The result of their establishment upon the coast was

the slaughter or slavery of the obdurate, and the hypocrisy of the yielding, temporarily assumed in order to concert schemes of vengeance. But soon after the commencement of the thirteenth century, the Lithuanians, another race of pagans of a different stock, the Slavonic, came pressing westward from the interior, established themselves in Southern Livonia and Courland, founding the present Lettish population of those provinces. The new-comers so shook the power of the Schwert-brüder, that the brotherhood was only preserved from a complete overthrow by calling in the aid of the Teutonic Knights. This order of military priests acquired predominant authority, erected castles, built palaces, and remained masters of the territory till the middle of the sixteenth century, when the Swedes and Poles became lords of the soil. Sweden obtained possession of Esthonia, and Poland acquired Livonia and Courland. But the Grand-Masters of the Teutonic Knights were allowed to hold the latter province as a duchy dependent upon the Polish crown, taking the title of Dukes of Courland. The Swedes, under Gustavus Adolphus, captured Riga in 1621, and deprived the Poles of Livonia. They remained the paramount power till the struggle between Charles XII. and Peter the Great terminated to the entire advantage of the latter. The peace of Nystadt in 1721 declared Esthonia and Livonia, with the adjacent islands, annexed to the empire of the czar; and Russia obtained Courland at the second partition of Poland in 1795.

COURLAND immediately adjoins the Prussian territory, to which its wild and pitiless snow-storms pass in winter, where they are familiarly styled 'Courland weather.' *Miltau*, the chief place of the province, with a majority of wooden houses, painted with staring colours, is of little importance. The population is 23,000, all of whom are Germans, except about 1000 Jews, and a few Russians. *Libau*, another wood-built town on the coast, with 10,000 inhabitants, is the principal port, of some consequence as the most southern harbour which Russia possesses in the Baltic, free from ice for some weeks before the other ports.

LIVONIA, northward, extends along the eastern side of the gulf of that name, and is traversed by the Southern Dwina, one of the most important rivers of the empire. On its banks, about five miles above its mouth, *Riga* is situated, the capital of the government, the church-spires of which are visible many miles off-shore. The river is here as broad as the Thames at London, and has a bridge of boats thrown across it, with a railway bridge opened in 1863, which rendered communication uninterrupted between Paris and St Petersburg. The Dwina is navigable for a distance of 400 miles, but, owing to shallows and rock-obstructions, the navigation is very difficult except during the spring and autumn floods. Riga is wholly German and Hanseatic in its interior appearance, consisting of old and lofty stone houses, terminating with pointed gable-ends, often turned towards the streets, which are narrow, crooked, and ill paved. The extensive suburbs are entirely modern, and Russian in their style. Among the public buildings, the Rathhaus, the Exchange, the Castle, and St Peter's Church are the principal. Riga has several colleges and schools, and a public library, with numerous rare and valuable MSS. As a commercial mart, it ranks next to the capital in the Baltic provinces, in the extent of its trade and the number of its population, which, in 1853, amounted to 72,000. While the navigation is open, a numerous array of vessels may be seen in the river, closely moored below bridge, and an equal number of flat-bottomed barges above it, laden with timber, corn, flax, and other produce of the interior for export. The Dwina flows through the heart of the flax-producing districts, where an article of the finest quality in the world is grown. All the great commercial houses are represented by foreigners; but a few branches of retail trade, and some industrial occupations, as the preparation of leather, are in the hands of Russians. *Dorpat* (called by the Russians *Guriev*), an agreeable inland town, with 14,000 inhabitants, on an affluent of the Great Lake Peipus, whose stormy surface may be seen from the suburbs, is the seat of a university founded by Gustavus Adolphus, with an observatory, which acquired distinction from the researches of Strüve. The university has about 70 professors, and is attended by about 600 students. It is also the chief school of the Protestant clergy in Russia.

ESTHONIA, called by the inhabitants *Wiroma* (Border-land), extends along the southern side of the Gulf of Finland, and has its seat of government at *Revel* (called by the Russians *Kolyvan*), a town on the coast, possessing regular fortifications, a fine harbour, and considerable commerce. It was founded by the Danes; remained long in the hands of the Swedes; and exhibits many features of an old Hanse Town—antique guild-halls with groined roofs, and arched doorways, approached by flights of steps, with stone benches adjoining, where neighbours sat conversing together on summer evenings in bygone days. The place consists of two distinct portions, upper and lower. The upper part occupies the *Domberg*, or hill of the cathedral, a singular reef of lofty rocks, circular in shape, and about a mile in circumference. It has at a distance the aspect of a citadel, being an insulated mass, with levels of deep sand around it. The vaults of the cathedral are curious for containing the remains of different trading corporations in the town in the middle ages, who preserved a kind of distinction in death as well as in life, by being separately grouped. Thus butcher slumbers with butcher, and shoemaker with shoemaker; but the men of the cleaver and the awl do not commingle. Insignia also denote the respective profession of the deceased. The bas-relief of a colossal boot in the pavement indicates the resting-place of the shoemakers, and an ox's head that of the butchers. *Narva*, the scene of the great victory of the Swedes under Charles XII. in the year 1700, over the army of Peter the Great, is a small town near the mouth of the Narova, which divides the province from the government of St Petersburg. Out of the towns, which are few in number, in each of these provinces, and contain but a fraction of the whole population, the people live in detached houses on the estates of the landholders which they cultivate, or in connection with the country residences of the nobles. Leagues may be traversed without meeting with a village or hamlet. The higher classes are, with few exceptions, of

German, Polish, or Swedish extraction; the town dwellers are mostly German, with a considerable number of Jews; the peasantry are Letts in the south, and Esthonian Finns in the north.

Adjoining the mainland of Esthonia are the two large islands of Osel and Dagö, with several smaller ones adjacent, and many stragglers, Runö, Kunö, Möön, Wormsö, Odinsholm, and Rogö. They have collectively the name of Sarri-ma, or the island-country. Some are wooded, all are low, and several have enormous boulders upon the surface, which might be mistaken for ruined towers at a distance. In this island-country, the inhabitants are neither Lettish nor Finnish; but Swedish blood predominates, and the Swedish language is exclusively spoken where the blood is the purest. The name of *Odinsholm* points directly to Scandinavia. As in the case of Sweden, Thursday is the unlucky day, and the almanacs of the people are Runic. They own no lord, but call themselves the 'free Swedish yeomen;' are pilots, fishermen, and seal-hunters. The islanders are all Lutherans, and have clergy so little acquainted with the ways of the world, owing to their seclusion, that 'the parson at Runö' is a common saying for simplicity.

The government of St PETERSBURG lies at the eastern extremity of the Gulf of Finland, extends from thence to the central region of the Ladoga Lake, and contains *St Petersburg*, in latitude 59° 56' N. and longitude 30° 20' E., with a population of 520,000. It is situated on both banks of the Neva, and several islands between them. It occupies an area of nearly twenty miles in circumference; but large open tracts, vast squares, gardens, and ornamental grounds are included within this space. The number of the streets is very limited, owing to their great length, and to the same name being retained from one extremity to another, however often interrupted by cross-streets. The Nevski Prospekt has an extent of more than two miles and a half, with a breadth of sixty yards. Both sides are lined with footways formed of granite pavement, and separated from the carriage-way by a row of lime-trees. It is the great thoroughfare, generally crowded with foot-passengers and vehicles of all kinds, from the four-in-hand of the noble to the dirtiest droshky, all gliding over the central wooden pavement at the furious pace common with Russian drivers, who announce their approach with wild halloos. Showy shops appear on either hand, with such a number of places of worship belonging to different confessions, as to acquire for it the sobriquet of Toleration Street. But no subject is at liberty to leave the established Russo-Greek communion throughout the empire, under pain of banishment to Siberia. The number of houses in proportion to the population is also very small, and is similarly explained by their vast size. The humblest classes are to be found in dwellings comparable to those of the great in magnitude, but are at once to be distinguished from them by the filthy odours they emit, as well as by the dingy appearance of the paint or stucco covering their walls and timbers. The houses of the opulent are chiefly of brick; many occupied by the lower ranks are of wood; but both are stuccoed or painted to hide the material. Owing to the frequency of destructive fires from the number of timber buildings, their erection has been properly prohibited. All have roofs inclined at a very small angle, and are therefore readily cleared of snow. St Petersburg has a respectable university founded in 1819, with celebrated surgical and military schools, schools of commerce and navigation, a famous observatory, an imperial library containing 420,000 volumes, and 7000 MSS., and numerous scientific and literary institutions.

By far the largest part of the capital is on the left or south bank of the Neva, with those imperial and government edifices which have won for it the style of the City of Palaces, the Palmyra of the North. This is, therefore, called the Great Side, and is also known as the Admiralty Quarter, from that building being prominent, and a central point from which the principal streets diverge. It is a vast structure, nearly half a mile in length, running parallel to the river, with a tower rising from the centre of the grand front, surmounted by a tall tapering spire, gilt with the finest ducat gold, which glitters brilliantly in the sunshine. Eastward is the Winter Palace, the ordinary residence of the emperor for seven or eight months of the year; the Hermitage, an imperial museum for works of art, the Louvre of St Petersburg; and the Column of Alexander. Westward is the equestrian statue of Peter the Great, and the Isaac Church, one of the grandest of temples, remarkable for simplicity of design combined with colossal proportions, and for profuse ornamentation, with polished granite, marble, malachite, and gold. The czar is represented riding up the steep face of a rock, and checking the steed so as to make him rear at the instant of having gained the summit, an expressive personification of the natural difficulties encountered and overcome in founding the city. A little above the Winter Palace, on an island across the river, stands the citadel, with the church of Peter and Paul, the burial-place of the imperial family, within its precincts. The tombs are plain sarcophagi, covered with a velvet pall, on which the names of the deceased appear, and sometimes only their initials. The remains of Suwarrow and other distinguished Russians are in the church of the Annunciation, attached to the monastery of St Alexander Nevski; Kutusoff lies in the Kasan Cathedral; and Moreau, the conqueror of Hohenlinden, in the Roman cathedral church.

Many peculiar features belong to St Petersburg. Its social aspect is eminently masculine, the males being immensely in excess of the females. This arises from the number of soldiers in garrison; the host of government employes who flock from the provinces in quest of higher posts, and remain unmarried till their aspirations are realised; and the multitude of peasants from the interior who sojourn in the capital for a term as servants and labourers, leaving their wives and families at home. Owing to these circumstances, few cities have such a fluctuating population, only a minority of the inhabitants remaining stationary. The whole number, in 1858, amounted to 520,000. It is, too, the coldest great capital in the world. In winter, the temperature often descends to -24° of Reaumur, equal to 54° below Fahrenheit's zero; and even a greater degree of cold has been registered.

Small circular buildings may be seen in various parts of the city, furnished with public fireplaces for the accommodation of coachmen and servants, whose profession compels them to stand still in the open air at night, waiting to take up parties from the ball or the theatre. In the Sennaia Ploschad, or Haymarket, a vast square where provisions of all kinds are sold, besides fodder for cattle, the scene is without a parallel elsewhere. The ground, deeply overlaid with snow, hardened by frost, is covered with an immense number of sledges, many from very distant parts of the empire, laden with oxen, pigs, sheep, calves, and other dead stock. The stiffly frozen carcasses stand upright as if in life; the flesh is as hard as the bone; and if a few pounds of meat are wanted, the quantity has to be detached by an axe or saw. While the coldest of all capitals, St Petersburg is one of the nearest to the haunts of savage life. Some of the islands at the mouth of the river have not yet been occupied by man, and remain as nature formed them, swampy, birch covered, and scarcely known to the citizens. They are visited by fishermen in summer, and by wolves in winter, who come over the ice to them. In severe seasons, when pressed by hunger, the wolves have been known to approach the suburbs, and prowl in the precincts of the houses. No European metropolis occupies a site so proximate to a cause of danger, with the single exception of Naples. Owing to its slight elevation above the ordinary level of the river, destructive inundations occur when a westerly gale blows for any length of time, as it opposes the exit of the stream, and drives up the waters of the Gulf of Finland into the channel. So certain is this result, under the circumstances, that when there is a prolonged gale from the westward, the state of the river is anxiously watched by the police authorities. For a brief period, in fine weather, at midsummer, St Petersburg is a very enjoyable place to the stranger, especially at night, which is but a softened continuation of the day, and when the moonbeams, mingling with the strongly-reflected sunlight, invest the river, the quays, and palaces with a kind of unearthly beauty. But when the scene has lost its novelty, and first emotions of astonishment are overexcited by imposing material features, the impression of the place upon most visitors is repelling rather than agreeable. It has no hoar antiquity and storied associations to interest the feelings. There is no Acropolis as at Athens; no Colosseum as at Rome; no Piazza as at Venice; no Kremlin as at Moscow; not a stone identified with those events and achievements which at least stir the imagination, if they fail to inspire respect and touch the heart.

Fifteen miles to the south, connected with the capital by railway, is *Czarskoe-selo*, an imperial palace, by which a town of some magnitude has sprung up, with *Pultova* intermediate, the site of an astronomical observatory. More attractive from its maritime site and elevated position is *Peterhoff*, the summer residence of the emperor, with a fine surrounding domain, on the chalk-cliffs which form the southern shore of the Gulf of Finland, commanding an extensive view of its waters, with the northern coast in the distance, and *Cronstadt* intermediate. This celebrated bulwark and seaward gate of St Petersburg, a town, fortress, and great naval station, occupies the eastern extremity of an island, and, with detached forts, completely commands the approach to the Neva. The intervening distance, about sixteen miles, is not navigable for large vessels, which therefore anchor at Cronstadt, while horses gallop and sledges fly over it in winter, when the entire surface is solidly frozen. The town has a large summer population, when trade is active, consisting of workmen, soldiers, sailors, merchants, and employés; but at the opposite season, when all maritime operations are at a stand, the number is reduced by more than two-thirds, and an aspect of utter dreariness is impressed upon the site. The chief exports are tallow, flax, hemp, timber, iron, and copper, oils, furs, hides, and canvas.

Riga.

Helsingfors.

## II. FINLAND.

Finland, a very extensive province, but largely desolate, forms a north-western section of the empire, washed by the Finnish gulf on the south, and by the Gulf of Bothnia on the west. It is a rocky plateau of moderate elevation, upon which lakes, streams, and swamps are profusely distributed, which engender cold and unwholesome mists, render travelling circuitous in summer, but form a hard and easy pavement for the sledge in the opposite season. This copious water-supply, the great natural feature of the country, originated its native name, for the inhabitants style it Suomesimaa, the 'region of lakes and swamps,' and call themselves by a derivative signifying 'dwellers in the morasses.' The prevailing geological formation is granite, which has been quarried for the palaces, quays, public buildings, and monuments of St Petersburg. Besides being a component of the general surface, it is strewn over the lower sites in huge blocks and smaller boulders, seriously diminishing the extent of the cultivable ground. Many of these blocks are estimated to weigh from 100 to 200 tons. They are mostly coated with large lichens of green, purple, and yellow colours; and ferns of great size grow beneath the shelter of the masses. Occasionally the boulders lie heaped upon one another, and form a very wild spectacle. Some are imbedded in their own debris, owing to the granite rot, *la maladie du granite* of the French, a disintegration from atmospheric causes to which the rock is liable when its felspar constituent is in excess in its composition. The more elevated hills are bare, but the lesser heights and the lowlands abound with forests of pines and firs, with which the birch, ash, aspen, and alder intermingle. Woodland produce, as timber, deals, potash, pitch, tar, and resin, are hence important

articles of export, owing to which the maritime districts have been largely cleared, and the forests limited to the interior. Reindeer, wolves, elks, beavers, and various kinds of game abound; while the numerous lakes and the adjacent gulfs, supply the inhabitants with an abundance of salmon, herring, and other fish. Notwithstanding the northerly latitude, great heat is experienced in summer, and the temperature is higher than in much more southerly localities, owing to the longer continuance of the sun above the horizon. This hot weather comes suddenly, with no other precursor than grass and green leaves, when in myriads the flies awake from their torpor, and distress the traveller. Winter commences early in October, and lasts till the end of April; spring is confined to the month of May; summer begins in June, and terminates at the close of August; autumn, like spring, is limited to a single month, September. But even by the middle of August the night frosts are sharp. The progress of vegetation during the brief period allotted to it is astonishingly rapid. In the neighbourhood of Uleaborg grain has been sown and reaped in the space of six weeks.

About six centuries ago Finland was annexed to Sweden by Eric the Saint, and became exactly to it what Wales is to England, a district in which two nationalities blended, subject to the same laws, serving on common battle-fields, and rendered as much one as friendly intercourse and political union can amalgamate distinct races. Peter the Great obtained the south-eastern province of Viborg; and the rest of the country passed to Russia by conquest in the time of the Emperor Alexander. A considerable number of the inhabitants along the shores are of Swedish extraction; many Russians are in the long-occupied province; but the great bulk of the people are Finns, quite distinct from the Slavonic and Teutonic races in physiognomy, language, character, and manners. A short stature, sallow complexion, and flat face, with tawny hair, scanty beard, and small, lustreless eyes, are their personal characteristics. They are taciturn and grave, bold and hardy, make good seamen, and are numerous in the Russian fleet. Winter is their busiest season. The great fairs are then held, owing to the facility afforded by the ice and frozen snow for travelling and the transport of goods. Journeys of many hundred miles are made to dispose of produce, and procure commodities, performed in one-horse sledges, which accommodate a single individual, his few wares, and provender for his steed. Frozen fish, peltry, and corn are the chief articles brought, to be exchanged for salt, brandy, tobacco, and domestic utensils. The Finns are nearly all Lutherans, but retain many traces of ancient heathendom in popular sayings and usages. *Helsingfors*, the capital, of comparatively modern date, occupies a peninsula of the south coast, and contains 16,000 inhabitants. It has several handsome structures, a cathedral, senate-house, and university, with all the institutions which usually distinguish the head of an important province. The university was removed hither from Åbo in 1829, has 60 professors, and about 600 students. Population, 14,000. It has, since 1840, become a favourite bathing-place, and, during the summer months, attracts many visitors from St Petersburg. It is guarded by the fortifications of Sveaborg, within long-range cannon-shot of its quays. This renowned fortress extends over six islands or rocks, and commands the only channel to the town which has water deep enough for large vessels. It was bombarded with effect by the Anglo-French in the summer of 1855. It was shamefully surrendered to the Russians, during the invasion of the year 1808, by the Swedish commandant, Count Cronstedt, with all its vast munitions of war. Though never explained, the surrender was generally supposed to have been purchased by a bribe. Hence the indignant lines of the patriot poet Runeberg:

‘Conceal his lineage, hide his race—  
The crime be his alone!  
That none may blush for his disgrace—  
Let it be all his own!  
He who his country brings to shame,  
Nor race, nor sire, nor son may claim.’

Åbo, the former metropolis, stands on a picturesque river three miles from its entrance into the Gulf of Bothnia, where the stream is overlooked by an old castle, now occupied by a detachment of infantry, and used as a prison. The city is the most ancient in Finland, dating from the twelfth century. Its history has been eminently one of disasters, chiefly from fires. One in November 1827 raged for two entire days, and was not extinguished till more than two-thirds of the houses had become a confused heap of ruins. A cathedral of coarse red brick is venerated as the cradle of Christianity in the country, and the place where repose the ashes of bishops, nobles, and captains, few of which are now distinguished by any memorial. The great fire referred to melted the bells, destroyed the altar and organ, with almost everything consumable in the interior.

Northward, the shores of the Gulf are dotted at intervals with small and neat wood-built towns, where coasting vessels are built, and forest produce prepared for export by the men, while knitting, spinning, and weaving are general branches of household industry with the women. The go-to-bed time is regularly

announced in these, as well as in the inland towns, by *klokans*, or night-criers, in a monotonous tone of voice. But at *Brakestadt*, in 1847, Prince Galitzin found the curfew proclaimed by beat of drum. The night-criers are appointed to take charge of the streets, and watch against fire. Instituted in the middle ages, they have preserved in several instances the singular costume of that period. They wear a long hanging gray cape, a felt-hat with an enormously broad brim, on which a metal plate exhibits the arms of the town, and carry in one hand a stout baton, in the other a rattle. Thus accoutred, they set out at nightfall, drawing a kind of civic psalmody. It consists of couplets, the burden of which commonly invites those who are abroad to make haste home, and those who are indoors to put out their fires. *Torneå*, at the head of the Bothnian Gulf, on an island of the river of the same name, is the frontier town of Russia towards Sweden, and communicates with it by a bridge. A detachment of from thirty to forty Cossacks keep watch and ward at this extremity of the empire; and the distance from the capital is painted in large letters on a wooden post: 'To St Petersburg, 1735 versts.' The town, a mean-looking place, is an old Swedish foundation of some interest and celebrity. Being within half a degree of the Arctic Circle, it has about two hours of daylight at midwinter; and even this brief day is often darkened by tremendous falls of snow, which is sometimes drifted in the streets to the very roofs of the houses. But at the opposite season, circumstances are reversed, for from an elevated position the sun may be seen just above the horizon at the midnight hour. In 1694, Charles XI. of Sweden visited *Torneå* for the purpose of enjoying the spectacle, and saw the midsummer midnight sun from the steeple of the church. In the summer of 1736, the French *savans*, Maupertuis, Clairaut, Lomonnier, and others, deputed by the Academy of Sciences, made the town their head-quarters while engaged in measuring an arc of the meridian. They fixed their trigonometrical stations in the valley of the *Torneå* River, and in the following winter commenced measuring a base-line on the frozen surface of the stream. The general result obtained confirmed the Newtonian doctrine, that the earth is a sphere flattened towards the poles, which the great philosopher inferred must be the case from the fact of its diurnal rotation.

THE ÅLAND ISLANDS, at the entrance of the Gulf, belong to Finland, and extend from thence to within twenty miles of the Swedish coast, separated by expanses of water so closely landlocked as to resemble a succession of inland lakes. The archipelago consists of about sixty inhabited isles; 200 more which are uninhabited. Though of Swedish origin, the islanders do not identify themselves with the Swedes more than with the Finns, but proudly call themselves Ålanders, regarding their chief island as a kind of continent. They subsist chiefly by fishing, seal-hunting, and piloting, are a hardy race, enjoy their isolated position and rigorous climate, hailing its phenomena with the expressions: 'Brave ice!' 'Fine snow!' 'Good winter!' Åland, properly so called, is somewhat smaller than the county of Middlesex, but is equal to more than half the area of the whole group. It acquired notoriety in the year 1854, owing to the total destruction of Bomarsund by the Anglo-French fleet, a strong fortress on the east coast, intended to be to Sweden like Sebastopol to Turkey, a menace and a means of aggression.

### III. GREAT RUSSIA.

This section of the country, by far the largest, is an old portion of the empire, central and northern. It comprehends the most densely-peopled districts, the principal centres of agricultural produce and manufacturing industry, grouped around the former capital, which is still venerated as the 'Holy Mother' of the Russians, and it comprises also tracts which are among the most desolate as to population, where vegetable life is entirely confined to the production of mosses and lichens. Moscow, with its 380,000 inhabitants, is seated on the small river Moskva, 728 versts, or nearly 486 miles, south by east of St Petersburg, following the old road. Peter the Great made the journey in winter between the two places in forty-six hours. This was considered a feat. The Emperor Alexander, more than once, in an open sledge, in severe weather, passed between the two capitals in forty-two hours. The distance is now accomplished by an express train on the railway in twenty hours, with the allowance of ample time for refreshments on the way. The line runs almost as the crow flies, and hence the distance is less than as given above. It is said that upon the engineers, appointed to survey the best route, submitting their plans to the Emperor Nicholas, he terminated controversy by drawing a straight line upon the map between the cities, observing: 'Make it as I have drawn.' As the consequence, the shortest route has been obtained, but no important place is passed by with the single exception of Tver. No railway in existence intersects such an extent of unpicturesque scenery. Dark woods appear on either hand, cleared away on both sides for the space of

about 100 yards, except that the stumps of the trees have been left in the ground, which, with stagnant pools of water between them, form a most uninviting landscape. Here and there tracts of open country under cultivation occur, dotted with groups of log-built cabins, which afford no relief to the eye owing to their extreme ugliness, except when the green dome of a church appears in the larger villages above the other dwellings. This dreariness of the road renders the traveller impatient to reach the end of his journey, and undoubtedly adds to the attractions of the remarkable place at the terminus.

Moscow is pre-eminently a city of churches, convents, towers, and bells, of gilded domes and painted cupolas, of objects most magnificent and mean, massive and tiny, of styles Asiatic and European, confusedly intermingled so as to occur in the closest connection; and not a little picturesqueness is the result of this incongruity. It has a circuit of about twenty-six miles, and is seated on an extensive plain overlooked by the Sparrow Hills on the south-west. From their summit Napoleon and the French had their first view of the renowned old capital. After having traversed dreary wastes and sombre forests, the legions shouted, 'Moscow!' in the confident imagination, soon to be utterly dispelled, that one of earth's richest prizes was about to fall within their grasp, offering ample compensation for every march and fight. Towards the summer sunset, when the strong beams of the departing luminary fall full upon an endless series of golden and silvery domes and minarets, the spectacle from these hills is superb; and its effect is heightened on a festival-day, as the breeze bears along the varying tones of a thousand bells. A glorious panorama also meets the eye from the top of the tower of Ivan Veliki in the Kremlin, the loftiest and most remarkable in the city, the campanile to a church below. This tower contains thirty-three bells, which diminish in size from below upward. In the first story hangs the largest, a solitary giant, only allowed to speak three times a year, to which our Great Toms and Big Bells are pigmies, as it weighs rather more than sixty-four tons. But a much huger neighbour, the Monarch, *Czar Kolokol*, King of Bells, is unsuspected, and probably never has been hung. It is 21 feet high, 22 feet in diameter, and rests on a mass of granite close to the base of the tower. The extreme thickness of the metal is 23 inches; the length of the clapper 14 feet; the greatest circumference 67 feet; and the weight is estimated at about 180 tons. On one side there is a fracture large enough to admit the body of a man. 'I went inside, and called aloud,' says Stephens, 'and received an echo like the reverberations of thunder.'

Centrally seated on a hill, stands the Kremlin or fortress—the original nucleus of the city—its present head and heart, an immense assemblage of buildings, old and new, sacred and secular, civil and military, with which beautiful gardens intermingle. All travellers confess themselves at a loss to describe this prime feature of Moscow. 'I have frequently been asked: "What is the Kremlin?"' says a visitor in 1861, 'and confess I have experienced considerable difficulty in answering this question. It is everything at once—a maze of mighty temples, towers, ramparts, and palaces thrown promiscuously together, and looking more like some wild freak of nature in the Rocky Mountains than the work of human hands. Raised on a high elevation above the rest of the city, it seems, when viewed from the distant hills, like an immense island floating in a wavy sea of domes, the surface here and there broken by the massive walls of an ancient monastery with its silvered minarets sparkling in the sun, and resembling some bold rocks among which the bright breakers are playing. The Kremlin is a stupendous fortress surrounded by massive Tartar walls, raised some five centuries ago to resist the attacks of the Eastern barbarians, who waged a perpetual war against the infant Russia. Here are arranged numerous guns, standards, trophies, captured from conquered foes. The Kremlin is the nation's sanctuary. Within a space of not more than a mile in circumference rise the spires and gilded domes of above thirty churches, sometimes in such close proximity that in passing from one to the other you seem to be traversing the chapels of a huge cathedral. Here the emperors are crowned, here lie the remains of the ancient czars, and relics of the most revered Russian saints. The Kremlin is also an imperial residence, and contains magnificent palaces. Among countless treasures are the crowns worn by the rulers who swayed their sceptres over the kingdoms of Poland, the Crimea, and Kasan, before they were absorbed in the ever-encroaching gulf of Russian conquest. No city but the "Holy Mother" could form so rich a setting for so splendid a gem intertwined with the glittering chain of the silvery Moskva.' There are several entrances to this famous site. The most important is the Gate of our Saviour, a vaulted portal, over which hangs a picture of the Messiah, behind a glass, with a lamp kept constantly burning beside it. No person, prince or lackey, is allowed to pass without taking off his hat, and remaining uncovered till clear of the entire entrance, about twenty paces long. A sentinel rigidly enforces the act of reverence; and the greatest care is taken to keep dogs away from the threshold. Both Dr Clarke and Mr Stephens attempted to evade the observance, by way of testing its stringency, but were compelled to submit. Exterior to the Kremlin, on the east, is the Kitai-gorod, or Chinese Town, the finest and busiest part of the city, surrounded by a wall with battlements and towers. Both these divisions are enclosed by the Beloi-gorod, or White Town, so called from having been formerly encircled by a white wall, the site of which is now occupied by the inner boulevard. Beyond this, and bounded by the outer boulevard, is the Zmelnoi-gorod, or Earthen Town, once fenced with an earthen rampart. Further out are suburbs, and the country-seats of nobles, which are considered to belong to the city to the distance of twenty-five miles, and are called Podmoskuvi, or Moscow appurtenances.

The story of Moscow is crowded with calamities, rarely equalled, and never surpassed in any other place. The origin of the city is lost in obscurity. But early in the fourteenth century it became the capital, under Ivan I., and the primate removed his residence to it from Vladimir. 'My bones,' said he, 'shall rest in this city. Here will the primates fix their abode; it will overcome all its enemies.' Famine, pestilence, sword, and fire followed each other in quick succession soon after the middle of the sixteenth century. The two latter came together in 1571, brought by the Tartars under the khan of the Crimea. Having set fire to the suburbs, a furious wind rapidly carried the flames into the heart of the city. A Dutch merchant, an eye-witness, whose account is among the Harleian MSS., speaks of the event as a 'storm of fire,' owing not only to the wind, but to the oily and resinous fir-wood with which the streets were paved and the houses built. In 1771, the plague raged with fearful violence, and so maddened the populace that they rose against the primate, Ambrosius, who had ventured to interfere with their superstitions. Hearing of his danger, he fled to the Donskoi monastery without the city; but he was followed thither by the mob, and savagely murdered while officiating at the altar. The burning of Moscow upon the entrance of the French in 1812 is a tale of our own times, and a catastrophe unexampled in modern history. Towards the evening of Sunday the 13th of September, the advanced-guard of the enemy arrived under Murat; and before night Napoleon was in the Kremlin. But scarcely were the invaders established in their new quarters, when smoke and flames were observed issuing from houses closely shut up in different districts. By Tuesday the fires had assumed a menacing aspect, distracting the efforts made to quench them by their number, while a high wind rapidly connected them with each other, and wrapped the city in one vast sheet of flame. The conflagration raged till Saturday, when the wind fell, the smoke gradually cleared off, and revealed the extent of the desolation. It is supposed that 7000 principal edifices and 14,000 public buildings were consumed. More than two-thirds of the city were entirely destroyed, but it was restored by the inhabitants and the government with remarkable rapidity, and considerable improvement. The year after the fire, seedling aspen plants were observed springing up everywhere among the ruins. The tree is abundant in Russia, especially in the woods around Moscow. The seeds had been wafted by the winds, and if the people had not returned, the whole site would speedily have become a forest. Moscow has a university with upwards of 100 professors and 800 students, an observatory, and numerous literary and scientific institutions.

Around this heart of the country, but at considerable distances from it, there are many towns of important size, yet with few exceptions without any features of interest. *Tula*, on the south, commonly called the Russian Birmingham, with a population of 57,700, has large government works for the manufacture of firearms, which were originally erected, while the artisans were instructed, under the superintendence of Englishmen. Various fancy articles are also made of hardware, as platina snuff-boxes. At *Torjok*, on the north, embroidered leather goods are produced—shoes, slippers, belts, caps, and reticules; and the material is prepared in the peculiar way which has obtained for it the name of Russia leather. Oak bark is used in the tanning; cochineal gives the red colour; and a vegetable oil imparts the distinctive odour. *Nijni* or *Lower Novgorod*, on the east, is annually one of the most remarkable places in the world, owing to its great fair, which swells the population from 36,000 to 300,000. The fair, which lasts from July 1 to September 1, old style, was originally held at *Kasan*, but was finally fixed at its present site by the Emperor Alexander in 1817. The permanent stone-market consists of 2522 store-rooms. These are connected with as many chambers for the owners of goods to live in. A noble edifice rises in the centre for the official superintendents of the fair, the ground-floor of which is used as a post-office during its continuance. But the number of temporary shops, with dwelling-rooms attached to them, erected for the occasion, is enormous. They are not raised at random, but are regularly arranged in streets; and churches, barracks, hospitals, and theatres appear in connection with them, the whole vanishing in a few weeks as completely as if they had never been. The site of the fair is about a mile from the centre of the town, across the broad river *Oka*, which is passed by a bridge of boats, and close to its junction with the majestic *Volga*. Both rivers are then crowded with craft of all descriptions conveying merchandise, and have a floating population of perhaps 40,000 persons. Asiatic products are here exchanged for European goods. Closely grouped together are Chinese with tea, Persians with scents and amulets, Bokharians with precious stones, Siberians with furs, Cossacks with hides and caviare, German jewellers, Swiss watchmakers, Frankfurt wine merchants, Hamburg leech buyers, Dresden pipe makers, Warsaw furriers, French fancy dealers, and Manchester manufacturers. Apart from this great gathering, *Nijni Novgorod* has little to invite notice, but one of its natives distinguished himself by taking the lead in the revolution which placed the reigning dynasty on the throne. This man, named *Minin*, an obscure butcher, has a monument to his memory here and at *Moscow*.

The name of *Novgorod*, or *New Town*, without any prefix, is borne by one of the oldest places in Russia, situated about 100 miles south of *St Petersburg*, near the confluence of the river *Volkhof* with the great *Lake Ilmen*. A thousand years ago, or in 862, this was the seat of *Rurik*, the founder of the monarchy; and here, in 1862, Russia commemorated her thousandth anniversary by uncovering a monument raised in honour of the event. Favoured by geographical position in the north, which secured it from the Tartar invasions which harassed the centre and the south, while readily communicating with the Baltic, it became one of the leading factories of the Hanseatic League. Commerce fostered public spirit, and brought wealth to strengthen it. Hence the people acknowledged only a nominal allegiance, assumed an independent attitude, and adopted in the main a republican form of government. There was a municipal body who elected a burgomaster for a limited term; a boyar of the commons appointed to watch over their interests; and popular assemblies

were held to decide upon important questions in which every citizen had the right of voting. These public meetings were summoned by the sound of a famous bell, called the *vetchooi-kolokol*, or assembly bell, which the inhabitants regarded as a type of their independence, the palladium of the state, and dignified with the appellation of 'eternal.' In the days of its commercial and political glory the city occupied an area of sixty-three versts in circuit, and contained a population of from 300,000 to 400,000 souls. Its power originated the proverb, *Quis contra Deos et magnam Novgorodiam?*—'Who can resist the Gods, and Novgorod the Great?' Ivan III., in 1478, destroyed its liberties, and marred its fortunes. Upon the plea that one of the Hanse Towns had offered him an insult, he confiscated the property of the League in the city, and put the foreign merchants in irons. The place has now a melancholy appearance, containing scarcely a population of 16,000, surrounded by ruined churches and grass-grown streets.

*Archangel*, forty miles from the entrance of the Dwina into the White Sea, is the head of the most northerly province, bearing the same name, or, more correctly, that of Archangelskoe, 'the land of the Archangel.' St Michael is the celestial personage referred to, to whom a convent was dedicated at an early period on the north bank of the river. The province is the most extensive of the territorial divisions of European Russia, and the most thinly peopled. Though equal in extent to the united areas of Great Britain and France, its total population is far inferior to that of the borough of Liverpool, and does not give one individual to the square mile. A few Lapps and Finns, fishermen, hunters, and reindeer breeders occupy the peninsula of Russian Lapland on the north-west. The town occupies a low flat, 400 miles north-east of St Petersburg, and contains about 20,000 inhabitants. It is almost entirely built of wood, and the streets are paved with timber. Situated close to the line which marks the northern limit of cereal and garden culture, all its supplies of grain and vegetables are brought from a distance, as well as fodder for cattle. The port is the oldest in the empire, and was for nearly a century and a half its only channel of communication with the maritime nations. It is still frequented by many English-vessels, but is closed to navigation by the ice for six months in the year. *Cholmogory*, thirty-five miles further up the river, is of unimportant size, but of interest as the seat of one of the first English trading settlements. Here an enterprising factor set up a rope-manufactory, for which workmen were specially sent out from England; and at this spot, in 1578, Sylvester, a political agent of Queen Elizabeth to the court of Moscow, was killed by a flash of lightning, as he was preparing to prosecute his journey. The lightning set fire to the house and destroyed it, with the dispatches of the envoy. The town has also been used as a place of exile. To it the regent Anne was sent, along with her husband, Prince Anthony Ulric of Brunswick, upon the deposition of their infant son in favour of the Empress Elizabeth in 1742. They occupied a log-built house, surrounded with high palings, which enclosed a little garden containing a few birches, ferns, and nettles. Death soon delivered the princess from bondage; but her husband, at the time of his decease, had been for nearly twenty years exposed to the dreariness, cold, and snows of the Arctic Circle. *Kola*, the most northerly town in European Russia, between the Kola and its tributary the Tuloma, has a population of 800 Russians, Lapps, and Finns, chiefly occupied in the walrus, whale, and cod fishery.

Kola, in the White Sea.

Vladimir.

#### IV. LITTLE RUSSIA.

This south-western district, the original nucleus of the empire, lies along the middle course of the Dnieper. The river has on its banks one of the oldest and most remarkable of the Russian cities—Kiev—the cradle of the sovereignty and of the church. It was the capital for nearly three centuries; and the scene of extraordinary ceremonies in the reign of the Grand-Duke Vladimir, about the year 980. Having embraced Christianity, this prince signalled his zeal against idolatry. Perune, the thunder god, who occupied a place in Slavonic mythology analogous to the Zeus of the Greeks and the Jupiter of the Romans, was represented at Kiev by a huge image, with a trunk of the hardest wood, a head of silver, ears and whiskers of gold, and legs of iron. Deprived of ornaments, and reduced to the character of a naked log, the image was tied to the tail of a horse, dragged to the Dnieper, and thrown into the water, after being soundly cudgelled by twelve stout soldiers on its passage to the stream. All the inhabitants were then ordered to repair to the river at a particular time to be baptized. Men and women, old and young, bowed to the edict. But the royal children received the rite with greater ceremony. In a pretty romantic spot within the limits of the city, there now rises a lofty stone obelisk surmounted by a cross, built over a fountain where they were baptized. A wooden crucifix close to the base has the inscription, in Hebrew, Greek, and Latin, ‘Jesus of Nazareth, the king of the Jews.’

Striking and welcome is the appearance of Kiev, especially to the traveller from the south, who has been passing over a country of monotonous steppes. Two divisions of it, the Old Town and the Petcherskoi, also called the New Fort, occupy two bold hills separated by a deep ravine. A third division, the Low Town, or Town of the Vale, the business quarter, stretches from the base of the hills to the river. A fine suspension-bridge, half a mile long, the work of Mr Vignolles, an English engineer, crosses the stream. The whole of the iron for this erection, upwards of 3000 tons, was wrought in England, with all the requisite machinery. Fifteen vessels conveyed it to Odessa, from whence it was transported in bullock-wagons over the steppes. ‘On the opposite bank,’ says Stephens, after crossing the old bridge of boats, ‘I turned for the last time to

the sacred city, and I never saw anything more unique and strikingly beautiful than the high, commanding position of this "city on a hill," crowned with its golden cupolas and domes, that reflected the sun with dazzling brightness.' On the hill of the Old Town stands the cathedral of St Sophia, founded in 1037, with the palace of the metropolitan close by, shaded with venerable trees. The opposite hill has the Petcherskoi monastery, with the attached Church of the Assumption. This building has seven domes, gilt and coloured, connected with chains, and a belfry standing apart, which rises to the height of 300 feet, making with the hill a total of nearly 600 feet above the Dnieper. Kiev has a flourishing university, with mineralogical and zoological collections. But the catacombs—a great charnel-house of Russian saints—form the point of attraction here. They consist of two caverns behind the monastery, excavated in the precipitous cliff which faces the river. These caverns were occupied by living monks prior to the erection of the monastic edifice, and have since accommodated the remains of departed holy men of repute. The bodies are ranged along the sides in open coffins, but enveloped like Egyptian mummies in wrappers, so that no part, not even the face, is left visible. But the stiffened hands are so arranged as to receive the kisses of devotees, and on the breasts are written the names of the deceased, with occasionally a short record of their deeds. Kiev is hence the Jerusalem and Mecca of the empire, annually visited by multitudes, who seek an interest in the intercession of the defunct. They come from the remotest parts; the confines of Tartary, and the wilds of Siberia, as far as Kamtchatka; performing the whole journey on foot, seldom sleeping under a roof, and depending for subsistence by the way on precarious charity. The pilgrims have amounted in a single year to 50,000. 'I remember, as if they were before me now,' says Stephens, 'the groups of Russian pilgrims strewed along the road and sleeping under the pale moonlight, the bare earth their bed, the heavens their only covering.' The population of Kiev is 60,000.

The broad, deep, and beautiful Dnieper forms a series of rapids below Kiev, occurring at intervals through a course of more than 100 miles. They are caused by reefs of granite which diagonally cross its bed; and the navigation is impracticable to barges, except during the spring floods. Rocky islands rise here and there out of the channel, haunted by wild-fowl; and huge blocks of granite lie on the banks, as if piled at random by the hands of giants. In this scene of stern grandeur the Cossacks of the Ukraine were cradled, and it continued long to be their head-quarters. The islets of the river were kept as war establishments, supplied with arms, provisions, stores, and ammunition. Women were rigorously excluded from these strongholds, and death was the penalty of their intrusion. The islets were intrusted to the care of a corps selected from the bravest and most agile of the race, who formed a kind of aristocracy. These men, among the wildest that ever lived, acquired the name of Zaporogians, from the two Polish words, *za*, beyond, and *porog*, water-falls. In long light barks they descended the stream on piratical expeditions, sailing by night, and concealing themselves in the osier-beds by day, in order to take the villages by surprise. Their excursions extended to the Black Sea, and once they appeared within sight of Constantinople. In the wars on land they joined the Poles, the Turks, the Russians, as expediency dictated. A rock in the Dnieper, called the Brigand, commemorates the rude race who were once lords of its waters. One of their chief establishments was on the island of Cortetz, a natural fortress, rising upwards of 100 feet above the stream, and defended on all sides by masses of granite, now in the possession of peaceful and industrious German colonists. *Pultowa*, in the country eastward of the Dnieper, is about four miles from the field of battle, where Peter the Great signally defeated Charles XII. of Sweden in 1709. A tall mound of earth, surmounted by a cross, covers the remains of the Swedes who fell in the action, and the town has a monument of the czar. *Kharkov*, on some affluents of the Donetz, contains 45,000 inhabitants, a university, and has vast commerce in wool and corn carried on chiefly at four annual fairs.

#### V. WEST RUSSIA.

West Russia comprehends the territory which still retains the name of Poland, and the greater part of the provinces formerly belonging to the Polish crown, some of which formed the ancient and independent grand-duchy of Lithuania. The whole was annexed to the empire by the two infamous partitions of 1772 and 1795 with Prussia and Austria. The country is intersected by the Vistula, traversed by the Niemen, and sends a number of affluents to the Dnieper. It contains very extensive swamps and marshes, with vast woods, one of which, the forest of Bialowieza, is perhaps the largest single remnant of the primitive woods of Europe. The site is noteworthy also on account of its aurochs, of which about 1500 survive. This animal is supposed by Cuvier to be a distinct species of the genus *bos*, or ox, which man has never subdued, and is one of the most massive of all existing quadrupeds. As late as the reign of Charlemagne it was not uncommon in Germany, but is now fast following its extinct congener, the *urus* of Cæsar, from which the common ox has descended. No living specimens are known, except in this Lithuanian forest. Pallas observes that it is remarkable the auroch does not exist in

any of the vast forests of Russia Proper and Northern Asia, whence, if it had penetrated, hardly anything could have eradicated it. The preservation of the animal at this spot is entirely due to the protection afforded it, first by the Polish, and next by the Russian government. Not only has the slaughter been long prohibited under severe penalties, except by the royal and imperial owners, or parties duly authorised, but a certain number of the peasants and serfs of the neighbourhood have always been engaged to make hay for them at appointed places, to serve for winter fodder. On the 18th of October 1860, when the sovereigns of Russia, Austria, and Prussia met in conference at Warsaw, there was a grand chase, and nine aurochs were killed. The herd had not been similarly disturbed for more than a century, or since the 27th of September 1752, when Augustus Sigismund III., king of Poland, and elector of Saxony, took part in the hunt. A monumental stone commemorates the event. Besides these animals, the forest harbours elks, wild boars, red deer, lynxes, wolves, hares, badgers, beavers, grouse, woodcocks, and partridges. Formerly there were bears, but none have been seen since the year 1846, when one was shot.

The forest of Bialowicza, once the private patrimony of the Polish sovereigns, now a Russian imperial domain, is situated in the government of Grodno, and extends north and south from the river Bog to the heights near the town of Osla. There is here an expanse of wood 31 miles long, 27 broad, and 112 in circuit, with an estimated area of 135 square miles, nearly equal to the half of Middlesex. A village, two small hamlets, and a few cultivated spots, are almost the only interruption offered to the trees. The site is generally level, and the soil sandy, with here and there marshes and bogs. An intensely severe winter alternates with a hot summer. Several streams rise in the interior, feeders of the Vistula. The Narew issues from a true peat-bog, which extends several miles exterior to the forest; and the Narewska flows through it. Both are navigable for boats and timber-rafts, the former nearly to its origin. The village of Bialowicza, from which the forest has its name, is near the centre, and consists of a church, an inn, and some sixty dwellings. Augustus III. of Poland built here a hunting-seat, which was enlarged by Stanislaus Augustus. Round the exterior are several villages and hamlets, the inhabitants of which are all connected in some way or other with the wood, and under its local jurisdiction. They are of Russo-Polish descent, rude, and uncultivated, simply and poorly clad, having as the only covering for the feet sandals made of the wood of the lime-tree. Their dwellings consist of logs of timber piled one upon another, with boards or shingles for the roofs. In return for certain services, such as providing fodder in winter for the aurochs, they have free use of the timber for building and fuel. Preferring a wandering forest life to agricultural operations, they are very expert as foresters and hunters, on which account all the imperial huntsmen and foresters are selected from them. When requisite, a small army of 2000 men can be brought together for the chase—all true Nimrods—content for the time being with the honey, wild fruits, and edible mushrooms found in the forest.

The Scotch pine is the most common tree, as on all the sandy Sarmatian plains; and next to it the silver fir. Larches and the spruce fir are entirely absent. Oaks occur, and supply magnificent specimens; but beeches are more abundant, generally found in the vicinity of the oak. The birch is scattered throughout. Elder, both the black and white, with a great variety of grasses, grow along the sides of the streams, and in the low swampy situations. The lime-tree is very common, and attains vast dimensions. The poplar, elm, ash, and sycamore are met with, and also the wild apple and wild cherry. It appears from the stems of a number of the pines that the tree has here a duration of from 250 to 300 years; the birch reaches 120 years; the beech 220; and the life of the oak terminates in from five to six centuries. An innermost district of about 15,000 acres, or two square miles, has not yet been penetrated by the wood-cutter. It bears the name of Niezeanow, or the 'unknown region,' and is quite impassable till the axe clears the way, owing to the multitude of trunks of trees rooted up by the storms of ages crossing one another in all directions. Such is the old forest of Bialowicza, the last stronghold of the auroch, the bison of Europe. In 1845-1846 the whole domain was measured and appraised. It has since been divided into five districts, each of which is under the care of an officer of the forest corps, as highest inspector and conservator.

*Grodno*, the head of the government containing this interesting site, is of mournful celebrity in Polish history, as the place where the Diet, after withstanding Russian intimidation and violence for three weeks, assented, but under protest, to the second partition of their unhappy country in 1793. The record ran: 'Surrounded closely by foreign troops on the second of this month, threatened with further invasion, and oppressed by innumerable violences—thus situated, we do declare in the most solemn manner, that unable to prevent, even with the risk of our lives, the effect of the oppressive force, we leave to our posterity, happier perhaps than ourselves, those means of saving our dear country whereof we are bereft at present; and thus the project sent to us by the Russian ambassador, though contrary to our laws, wishes, and opinions, forced by the above means to accept, we do accept. Done at Grodno, the 24th September. Signed and engrossed in the public records, according to law.' Grodno carries on a flourishing trade, almost wholly in the hands of the Jews, who form three-fourths of the

population. *Wilna*, the old Lithuanian capital, with 51,000 inhabitants, still retains importance, but has nothing in its appearance to interest the stranger. The remark applies to all the towns of the ancient duchy, except it be those connected with the fatal march of the French to Moscow. The country, too, is dreary; and the villages, few and far between, are miserable collections of small straggling log-built huts, with holes to admit the light and let out the smoke. Near *Kovno*, the grand army crossed the frontier river Niemen, and within six months afterwards a wretched remnant came back to the same point, 'like ghosts returned from the infernal regions.' In the market-place of the town, an ugly monument commemorates the event, but it bears a neat inscription: 'In 1812, Russia was invaded by an army numbering 700,000 men. It recrossed the frontier numbering 70,000.' *Vitepsk*, on both banks of the Dwina, is memorable as the place of which Napoleon remarked on his advance: 'Do you think I have come so far to conquer these miserable huts?' and then changed his first determination to halt there for the winter, for which preparations had already been made, and pushed on to his ruin. Stephens, while traversing this region, observed with surprise the utter ignorance of the inhabitants in regard to circumstances so recent and momentous. At *Borizoff*, on the Berezina, close to the terrible scene of the passage of the river, one had merely heard of a great battle having been fought there; and the best informed referred to the scenes of struggles and tragedies without half the interest with which the Greek, even now, points the stranger to the field of Marathon, or the ruins of Argos.

*Warsaw*, once the capital of a great European kingdom, now the head of the comparatively small Russian government of Poland, is seated on the left or western bank of the Vistula, which is here much broader than the Thames at Westminster, and is crossed by a bridge of boats to the totally-decayed suburb of Praga on the opposite side. It has a population of 162,000. Few cities have a more imposing appearance at a distance, especially from the St Petersburg road, and most refreshing is the view to the traveller who has come from thence, after having passed over 650 miles of utterly uninteresting and dreary country. It stands upon an ascent rising up rather steeply from the river, which displays its huge public buildings to great advantage. But though many of the palaces are magnificent, and of colossal size, the greater portion of the private dwellings are mean, while the spacious streets and squares are dirty, badly lighted and paved, and almost entirely destitute of trottoirs for foot-passengers. All the houses are numbered, beginning from the government palace, a modern edifice of immense dimensions, which is reckoned number one, and mounting up to between 5000 and 6000. Conspicuous in the centre is the vast Zamek, the old palace of the kings of Poland, containing the Hall of the Diet, and a splendidly-gilt ball-room, now occupied by the Russian commandant. A statue of Copernicus, a Pole by birth, adorns one of the principal squares; and memorials are still numerous of the nation's kings and captains, though Poniatowski's statue by Thorwaldsen, one of his greatest works, has lost its place among them. The fashionable lounges are the *Jardin de Saxe*, in the interior of the city, and the *Ujazlov*, beyond the barriers, with its long and labyrinthine avenues branching off from a large central octagon, divided from each other by rows of lime and chestnut-trees. But Warsaw has long been a city of mourners and military; the former, the most inflexible of all patriots; the latter, the rudest of all soldiery. Gardens are deserted, theatres abandoned, public and private festivities suppressed. Every woman, until forbid by police order, dressed from head to foot in black; and a people gay by temperament, fond of show and pleasure, now totally refrain from such indulgences, intensely occupied with one subject, the fallen fortunes of their native land, from which lapse of time has failed to extract the bitterness, and the resurrection of which they believe to be possible. In Warsaw there are said to be more Jews at present than in any other city in Europe. Though excluded from all offices of honour, profit, and trust by the Russian government, they were exempt from military service on payment of a tax, down to the accession of the Emperor Nicholas, who made them subject to the regular conscription. Hence they are with the patriotic party to a man, and are Poles in everything but religion and physiognomy.

Three miles from the city, the Chateau of Willanow, with its finely-planted park, is a place of pilgrimage to native and foreigner. It was erected by the renowned King John Sobieski, and was his favourite residence, where most of his time was passed when away from the battle-field. To it he returned as the deliverer of Vienna from the Turks amid the shouts of his countrymen. Then,

'When his horse triumphant trod  
 The burghers richest robes upon,  
 The ancient words rose loud, "From God  
 A man was sent whose name was John."

Within its walls he died, leaving an intriguing queen and unnatural children wrangling about his possessions; and the name of Sobieski has ceased to be inherited. Another celebrated place, five miles distant, is the field of *Volz*, the scene of the election of the Polish sovereigns. It was formerly surrounded by a ditch with three gates—one for Great Poland, a second for Little Poland, and a third for Lithuania. Here the nobles assembled, from 150,000 to 200,000 strong, to elect the sovereign from a list of candidates, and encamped in separate bodies under the banners of their respective palatinates. They did not vote individually, but by their palatines. The primate went round on horseback to collect their suffrages. Among the paintings by Canaletto, removed from Warsaw to Moscow, there is one beautifully executed which represents the election of Stanislaus Augustus in 1764. This mode of filling the vacant throne frequently divided the nobles into hostile bands, ready to use the sword in the cause of a favourite candidate, and it undoubtedly contributed not a little to the political extinction of the kingdom.

Fort of Kimburn.

#### VI. SOUTH RUSSIA.

This great natural division of the country consists of a series of steppes or plains, and embraces the greater part of the basins of the Dnieper and the Don, with that of the Kuban, and the interior of the Crimean peninsula. It is a portion of the vast similar tract stretching from the borders of Hungary into the heart of Asia, of which it has been said, though with obvious exaggeration, that a calf beginning to graze at the foot of the Carpathian Mountains might eat its way to the Wall of China, and arrive there a full-grown ox. The word *steppe* is of Russian origin, and strictly denotes a flat, open, and unwooded country, mantled with a rank, grassy, and herbaceous vegetation. This is the general character of the region, but it includes extensive swamps and marshes, with tracts of saline sand of the true desert description. Rubruquis, the Dutch traveller, who crossed the steppes in the fifteenth century, aptly describes them: *Nulla est sylva, nullus mons, nullus lapis*—‘Not a tree, not a hill, not a stone.’ ‘We journeyed,’ says he, ‘towards the east, with no other objects in view than earth and sky, and occasionally the sea upon our right, which is called the Sea of Tanais (Azov).’ Hundreds of miles may be passed on a soil remarkable for its richness and the luxuriance of its herbage, without a tree being encountered; although in a few favoured spots there are small copses known to the natives which shelter game, and are visited on that account. While almost perfectly flat through extensive spaces, the surface more generally gently undulates. Hollows, or slight rounded depressions, also occur, as if made by the stamp of a Titan on his passage across the plain. These places are of no small importance as natural troughs in which the rain collects. Though the water is speedily evaporated by the sun, and absorbed by the soil, they remain moist and verdant long after the adjoining lands are wholly parched; and are hence prized by the herdsmen. Tumuli, the *Khourgans* of the natives, are other diversities of the steppes, of an opposite character to the depressions. The tumuli are now

devoted to the practical purposes of life. Herdsmen, when they have to call together the horses and cattle under their charge, station themselves upon their summits to command a view of the surrounding plain.

In spring, when the grasses are rising, the steppes resemble an immeasurably verdant ocean of the freshest and brightest green. But this hue soon ceases to be uniform, and is almost entirely extinguished over extensive spaces, owing to flowering plants putting forth their floral glories, and waving to the wind their masses of varied colour. Thousands of acres may be seen covered with the purple larkspur, intermingled with patches of bright scarlet poppy and the pink-coloured wild peach-shrub. There are tulips, crocuses, pinks, hyacinths, and anemones innumerable, finely contrasting with each other; and there is mignonette in abundance, but without the odour which cultivation has given to it. While the vegetation is astonishingly luxuriant, it is not remarkable for variety. Botanists usually enumerate about 500 species of plants in these vast grazing-grounds, each species usually growing in large masses. The most common plant is the hair-grass, *Stipa capillata*, which often occupies more than half the surface. Next to it is the closely related feather-grass, *Stipa pennata*, called Schelkowi, or silk-weed, by the Russians, which generally covers a fourth of the land, and is frequently grown as an ornament in English gardens. Though these grasses are not esteemed with us as fodder for cattle and sheep, they form the principal food of the herds and flocks on the plains of Southern Russia. Thistles are also prominent, occasionally attaining the height of six or eight feet. Hence the relation may be credited of the Cossacks concealing themselves and their small horses in the thickets of the steppes. Wormwood rises to the height of six feet, and the cattle are compelled to feed upon it in specially dry summers, when milk and butter are rendered detestably bitter by the aliment.

Locusts are a terrible scourge to the vegetation, natural and cultivated, though fortunately their appearance in destructive swarms is only occasional. Years pass away without damage from them, owing to the limited number. Then for successive years a gradual increase is perceptible, till millions upon millions cover the ground, and darken the air when on the wing. The most common species, the *Gryllus devastator*, is also the most formidable, as the name implies, combining, according to a current saying, the bite of the horse, the greediness of the wolf, and unequalled powers of rapid digestion. In the beginning of May, when the eggs deposited in the ground the preceding autumn are hatched by the returning warmth of summer, the baby locusts crawl out of their holes, and immediately begin to feed. After remaining stationary a few days, they are compelled to migrate by the consumption of the grass. Not having wings, they creep slowly, or proceed by a series of leaps. They pause at night, and also in cold wet weather, but when on the march, no natural impediment or artificial obstruction arrests it. Though commonly proceeding in a straight line, they acquire a taste for the cultivated vegetation, and will move to the left or right to attack the plantations of a town or village. The Tartars endeavour to get rid of the enemy by beating the ground with branches of trees. Deep trenches are also dug, filled with lighted straw, to protect fields threatened with invasion; and at Odessa long iron rollers are dragged by horses over the invaded surface. But all the means resorted to are more plausible than effectual, as the living are not sensibly diminished by the numbers destroyed.

Dreary in the extreme is the appearance of the steppes in winter, when the snow is lord-paramount of the soil, and every trace of a road or trackway is obliterated, while storms of fearful violence occur. The Russians distinguish three classes of storms, and give them distinctive names. The mildest form, called the *Miatjel*, corresponds to the wildest weather to which we are accustomed, rain, sleet, or snow simply descending from the clouds. The second and severer kind of storm, the *Samet*, occurs more rarely, though the winter seldom passes without an example. It raises the snow from the ground with its whirl in vast masses, and drives it forward horizontally, filling up ravines, and sometimes burying men and cattle beneath the drift. Indoors, there is tolerable security from danger. Abroad, the traveller may protect himself by gaining the shelter of a forest; and a large number of men or beasts may withstand the blast in an open country by grouping together. But woe betide the solitary wayfarer with no shelter at hand. The driving shower of snow blinds him, and no horse will move though flogged and spurred to the utmost. But the third kind of storm, the *Wiuga*, far exceeds the second in violence, though still more rare, and always announcing its coming by unmistakable indications. When these have appeared, no one sets out upon a journey, not even to the next village, though only a verst or two distant, lest the dreaded hurricane should overtake him. Precautions are taken for the safety of the houses by protecting them on the north side with heavy stones, and propping them up on the south. Drovers of cattle, flocks of sheep, and troops of wild horses in the steppes gather in a compact circle to resist the gale, if no shelter is attainable. But entire groups have been driven before it with headlong speed, till blown over the edge of a precipice into a ravine, or swept from the cliffs into the Black Sea. There have been instances of men near the sea being surprised by the tempest, and forced into the water; while roofs, trees, stones, and other objects in its path are taken up from the earth like chaff from the thrashing-floor, and conveyed by the eddy air whole versts away. Government couriers are excused, if during the three days the *Wiuga* is abroad—its usual duration—they remain closely housed at the post stations.

*Odessa*, the head-quarters of the governor-general of Southern Russia, stands on the north-western shore of the Black Sea, at the distance of about 900 miles from Moscow, and 1200 from St Petersburg. It was founded on the site of an old Turkish fortress and a few fishermen's huts, by Catherine II. in 1792, and is now the third commercial port of the empire, while one of the most important in Europe for the export of

wheat. It has a population of 104,000. The capacious harbour, protected by two moles, has sufficient depth of water almost to the very shore for the largest men-of-war. The city is seen to great advantage from the sea. It occupies a high limestone cliff, along which runs a promenade. Then a long line of buildings occurs, with the Exchange at one extremity, and the princely palace built by the late Count Woronzow at the other. Some principal hotels are intermediate, all overlooking a broad expanse of intensely blue waters. From the centre of the promenade, a monster staircase descends the cliff to the beach, with a bronze statue at the top of the Duke de Richelieu, a French emigrant. He was made governor by the Emperor Alexander, and laid out most of the streets. Instead of amassing wealth, he devoted his income to public objects, and is said to have left the place, on relinquishing office, with a small portmanteau containing his uniform and two shirts. Such a Russian official deserved a monument. Odessa labours under great disadvantages as a place of residence, and would never have prospered but for its commercial position. The neighbouring country is of the tamest description, and can sustain no luxuriant timber, while owing to the friable texture of the limestone on which it is built, the dust forms an insufferable plague in dry weather, which rain converts into a sea of mud. *Nicolaief*, on the coast eastward, with 33,000 inhabitants, where the rivers Bug and Ingul blend in a common estuary, of equally modern origin, exhibits the outline of an immense naval port, not destined at present to be filled up, owing to the loss of the vocation for which it was designed, that of harbouring and recruiting the Russian Black Sea fleet. *Cherson*, near the mouth of the Dnieper, with 40,000 inhabitants, will ever have a name in history from its connection with Howard, the philanthropist, whose tomb is in the adjoining steppe. A small japanned hand-candlestick, much bruised, once his property, is now in the museum of Odessa. *Ekaterrinostav*, on the Dnieper inland, founded by Catherine II., during her famous journey to the Crimea, has not prospered. Though planted upon a gigantic scale, as if intended to be the abode of a million of souls, it has only gathered a population of a few thousands in the space of threescore-years-and-ten. The palace provided at the spot for the imperial tourist was a splendid edifice, standing on a slope by the river, surrounded by an extensive park. The trees have grown up to be magnificent timber; the stream flows on with undiminished majesty and might; but the royal dwelling, spoiled by the peasantry for materials to erect or repair their cabins, is a heap of shapeless fragments—a ruin without the interest of history or the dignity of age.

*Taganrog*, on the north-east shore of the Sea of Azov, seated on a high cliff, is a thriving shipping port, subject to the disadvantage of shallow water, which compels vessels to lie off at a great distance to unload and receive their cargoes. It was founded by Peter the Great in 1706, whose sojourn at the spot is commemorated by an oak wood of his own planting, a suitable monument in a district naturally destitute of trees. At this place the Emperor Alexander ended his days, December 1, 1825, after a visit to the Crimea, during which he caught his intermittent fever. From hence to the decayed town of *Azov*, on the opposite shore, a shoal extends, or rather a continuation of shoals; and when violent east winds blow, the sea retires so remarkably, that the inhabitants are able to make the passage between the two points on foot, a distance of about fourteen miles. But the experiment is somewhat hazardous, as the wind shifts suddenly, and rapidly brings back the water. This singular kind of monsoon takes place almost every year after midsummer. The Sea of Azov is the *Palus Mæotis* of the classical geographers. It extends nearly 200 miles from north-east to south-west, by 100 miles in the opposite direction, but is more lacustrine than sea-like, as the water is everywhere shallow and comparatively fresh. It is supposed by the people on its shores to be filling up, and there seems to be no doubt of the fact. Pallas records in 1793 the launch of a large frigate where lighters now sail with difficulty. This is the consequence of the large amount of sediment brought down and deposited by the Don, which also renders the waters anything but blue and limpid. The great river gives its name to the Don Cossacks, who occupy the country around its mouth, which forms one of the governments, with *Novo-Teherkask* for the capital, at a short distance westward of the main stream. The town was founded in the year 1807 upon the recommendation of their celebrated ataman, Count Platow.

The SEA OF AZOV, with its arm, the Putrid Sea, washes the north-eastern side of the Crimea. At the commencement of the recent war with Russia, the latter name excited curiosity on the part of many who were led by passing events for the first time to pore over charts of the district. Ideas of the tragic or the horrible were suggested by it. But only very common-place features are indicated. The tract in question is one of shallows, lined with swamps and quagmires, scarcely passable by men or animals, which give off noxious exhalations in the heat of summer, and render the whole neighbourhood at that season highly insalubrious. Large beds of oysters jut out into it, and serve as a haunt for a quantity of moor-fowl. The ancients appreciated its true character when they called it an unwholesome marsh or lake, *Palus Putris*. These closely-landlocked basins communicate with the grand expanse of the Black Sea by the Strait of Kertch, the old Cimærian Bosphorus, at the eastern extremity of the Crimea. Both shores of this channel exhibit evidences of pseudo-volcanic action. Kertch has a mud volcano in its neighbourhood, but the most remarkable is on the opposite coast, at a short distance from Taman. The hill here in its ordinary state resembles a vast sore. Various apertures appear in a crater-like area, from which water is discharged, with dingy-looking mire and a fetid gas. But paroxysmal action has been sometimes displayed in a prodigious outpouring of mud, accompanied with grand columns of fire and smoke. One of these eruptions took place February 27, 1794, when the flames rose to the height of 300 feet, and the mud was thrown into the air. In a short time, according to the estimate of Pallas, who repaired to the spot, 100,000 cubic fathoms were ejected. The Cossacks distinguished the place by the name of Prekla, signifying 'Hell.' In 1799 an

Kertch.

island was thrown up in the Sea of Azov, which, after remaining visible some time, gradually subsided beneath the waves. Tremendous noises alarmed the inhabitants on the shore, and shocks of an earthquake were felt. It is not unlikely that in former ages igneous action might be far more intense or frequent in the district, and originate the fancy, common to all the ancients, that Cimmeric lay at the entrance to the subterranean kingdom of Hades.

The CRIMEA, formerly called Crim-Tartary, and in remoter times known by the designation of Taurica Chersonesus, is a peninsula on the northern shore of the Black Sea, projecting into it from the mainland of Southern Russia. This territory, now of celebrity in our annals, extends 130 miles from north to south by 170 from west to east; but the latter direction embraces a long narrow strip of country abutting eastward from the main mass. The area is estimated at 1050 square miles, which is equal to that of our own principality of Wales, with the addition to it of the English border counties. Travellers in the middle ages frequently styled the peninsula the island of Caffa, in allusion to its almost complete insulation, and the great commercial town of that name on the east coast. In fact, that it once was entirely detached from the continent, according to ancient opinion, is very probable from the character of the connecting neck of land. This is the Isthmus of Perekop, seventeen miles in length by five in breadth, and so low, that from the centre the seas on either hand are apparently above the level of the spectator, and seem only to require a slight impulse from the wind to unite their waters. Nature has distributed the surface into two very distinct regions. There is a highland range on the south coast, and a series of steppes lay to the north of it which comprehend by far the greater portion of the country. This highland range runs some seventy or eighty miles along the shore, and is from twelve to twenty miles broad. It culminates in the Tchadir-dagh, or Tent Mountain of the Tartars, the Table Mountain of the Greeks, and the Saddle Mountain of the Cossacks, upwards of 5000 feet above the sea. In the space between the crest of the main ridge and the beach, or the under-cliff, the climate is delightful, as it is open to the warm breezes of the south, while protected from the cold winds of the north. It has therefore been studded with chateaux and villas belonging to the great Russian nobles. Originally, a perfect chaos of rocky fragments, traversed by deep ravines, the stern and savage features have been toned down by art covering them with creepers; and the vegetation of a southern clime has been introduced, the almond, arbutus, olive, cypress, wild chestnut, and Judas-tree, which flourish with great luxuriance. The principal residence, Aloupka, called the Alhambra of the Crimea, was built by the late Count Woronzow, and is of rich greenstone in various styles. The Gothic and Saracenic predominate, and are somewhat typical of the site, on the confines of Europe and Asia, the west and the east, the land of the feudal baron and the oriental satrap.

No river occurs in the whole district worthy of the name throughout the year. The Salghir, the most considerable, descends from the northern slope of the mountains, enters the steppes, and creeps slowly

through them to the Putrid Sea. In nearly all parts of its course before reaching the plains, it may be passed dry-shod in summer, by simply stepping from one stone to another in its bed. The Alma, the scene of the victory of the Anglo-French in 1854, similarly changes its character with the season from a rapid stream to an insignificant rill. Among the members of the animal kingdom, the wolf, fox, stag, and roebuck are found in the wooded highlands. Hamsters, small burrowers, annoy the husbandman by making havoc with grain and vegetables. The harmless and graceful jerboas, 'earth-hares' of the Germans, feed upon the bulbous plants in the steppes, and divert the traveller by their frolics. Birds of prey are numerous, with birds of song and beauty, the nightingale and lark, the oriol, hoopoe, and brightly-coloured bee-eater. Reptiles include the tree-frog, so brightly green as to be scarcely distinguishable from the leaves of the trees it haunts, and peculiarly interesting from its habits and bird-like note. The creature is weather-wise, and is sometimes kept in large glass jars, half filled with water, to answer the purpose of a barometer. A little ladder being inserted, the frog ascends it to the upper half of the jar in fine weather, and indicates an approaching change by taking refuge in the water below. The scolopendra, or centipede, from six to eight inches long, and the tarantula spider, of huge size, are both common, and justly dreaded from the severe effects of their bite. The latter abounds in the vicinity of Sebastopol. Besides the usual domestic quadrupeds, Bactrian camels are employed for draught on the plains, and buffaloes in the mountain districts.

The Country round Sebastopol.

*Sebastopol*, lately the military capital, close to the south-west point of the peninsula, was founded in the year 1786, but received all its chief fortifications and public buildings during the reign of the Emperor Nicholas, while Woronzow was viceroy in the south. It is now rapidly rising from the heap of ruins to which it was reduced by the memorable siege of 1854-1855, but under treaty is not again to be made a formidable stronghold. In 1861, Alexander II., with the empress, paid a private visit to the place, and laid the foundation-stone of a new church. The noble harbour is a repetition of Malta on a larger scale, and of Sidney on a smaller. Previous to the appearance of the town, there were two humble hamlets on the shores, *Aktiar* on one of the creeks of the southern side, and *Inkermann* at the upper extremity. But the site was anciently occupied by Greek colonists from Heraclea, who founded a city, and gave it the name of the Heracleatic Chersonesus, in memory of their original home. It survived every storm down to a comparatively late period. Two strong towers were entire after the rise of Sebastopol, a little to the south. Vestiges of walls, gates, dwellings, and sepulchres, the shafts and capitals of columns, were also found strewn over the ground. The Tartars regarded them with wonder and reverence, but the Russians swept them away by using them up as building materials. A railway is also commencing which will connect Sebastopol with Moscow. It will be 963 miles in length, and is in the hands of English engineers. *Balaclava*, about eight miles to the south, with one of the most completely landlocked harbours that nature ever made, has likewise been a

Port of Balaclava.

long occupied site. The Genoese held it while they were lords of the shore; reared the fortress, the remains of which are on the heights; and originated the name, which is a corruption of *bella chiare*, 'beautiful port.' Very fancifully, Dubois de Montpereux fixed the wanderings of Ulysses in the Euxine; and regarded the harbour of Balaclava as the identical spot described in the tenth book of the *Odyssey*:

'Within a long recess a bay there lies,  
Edged round with cliffs, high pointing to the skies;  
The jutting shores that swell on either side,  
Contract its mouth, and break the rushing tide.  
Our eager sailors seize the fair retreat,  
And bound within the port their crowded fleet;  
For here, retired, the sinking billows sleep,  
And smiling calmness silvered o'er the deep.  
I only in the bay refused to moor,  
And fixed, without, my hawsers to the shore.'

Excluding the theory from notice, a more exact description could scarcely be given of the harbour of Balaclava, about three-quarters of a mile long, from 300 to 400 yards wide, very deep, with lofty promontories at the mouth, which so closely approach each other that two large vessels can hardly pass in the intervening channel. *Kaffa*, on a convenient roadstead of the east coast, has gone to decay, but contains many memorials of former importance, when, as the capital of the Genoese colonies, it was popularly called Little Constantinople from its extent and prosperity. *Kertch*, on the strait leading into the Sea of Azov, with the distant summits of the Caucasus in view, is a small well-built town, entirely modern. It stands on the site of the ancient Panticapæum, founded by Greeks from Miletus, eventually the capital of Mithridates, and of the kingdom of the Bosphorus, from about 502 B. C. to 344 A. D. This district is mentioned by Demosthenes as the granary of Athens; and the buck-wheat of Kertch carried off the prize at the Great Exhibition in Hyde Park in 1851. The environs are of special interest. Huge cones of earth stud the surface, the tombs of the wealthy and gay of a long-departed generation, which have yielded gold ornaments and trinkets, gilt bronze vases, all of very fine workmanship. A hill fronting the sea has the name of Mount Mithridates, as the supposed site of his palace. The traveller may now have historical recollections revived at Kertch, not only by undoubted remains of antiquity, but by putting up at the *Bospheri Tractor*, the Bosphorus Hotel.

*Simferopol*, the civil capital of the peninsula, is inland, on the banks of the Salghir, in the hilly tract between the mountains and the plains, and has a population of 25,800. It has some handsome government buildings, with churches gay with pictures of saints in richly-gilt frames. But by far the most interesting place, a few miles distant, is *Bakchiserai*, the Palace of Gardens, the old metropolis of the khans of Crim-Tartary. The site is a Matlock-like valley, through which a small stream wends its way. The houses are on its banks and the

slopes of the hills on either side, interspersed with gardens, vineyards, and clumps of Lombardy poplars. The Serai, or palace, towards the centre, was restored as much as possible to its original condition by the Emperor Alexander.

#### VII. EAST RUSSIA.

This portion of the empire borders on the Ural Mountains, fringes part of the Caspian, and touches slightly upon the Black Sea and the Sea of Azov. It comprehends an extensive portion of the course of the Volga upward from its mouth, with a vast area of its basin, and stretches southward to the banks of the Kuban and the Terek, beyond which is Circassia and the other regions of the Caucasus. In its northerly extension the country has forests, pastures, and fertile cultivated soil. Corn is grown, cattle are bred, bees kept, woodland produce is abundantly obtained, and river fisheries are conducted. But the surface southerly consists chiefly of barren wastes, salt marshes, and lakes; and the aggregate population is altogether inconsiderable in comparison with the immense area. Bordering upon Asia, a large number of the people are much more Asiatic than European in features, dress, and habits. Mohammedanism is also the prevailing religious profession, while a species of Buddhism distinguishes some nomadic tribes. Nearly the whole of this part of Russia was included in the khanates of Kazan and Astrakhan, two of the divisions formed out of the old empire of the Mongols upon its dissolution. They remained independent till the middle of the sixteenth century, when they were reduced by the arms of the czar, Ivan the Terrible.

*Kazan*, containing 53,000 inhabitants, stands on an affluent of the Volga, at a short distance from the great river, about 200 miles eastward of Nijni-Novgorod, and 450 miles from Moscow. It has an oriental appearance, possesses numerous churches, nine mosques, and many educational establishments. There are various manufactures, and the city is an important dépôt for goods and produce passing to and from Siberia. *Perm*, comparatively small, towards the Urals, has metals extensively wrought in its neighbourhood, iron, copper, and platina. *Orenburg*, on the river Ural, close to the border of Asia, is the thoroughfare of the trade between Russia and Bokhara. *Saratov*, the largest town, seated on the right bank of the Volga, contains a population of 63,800. *Astrakhan*, with 44,700, occupies an island formed by the river at its mouth. Across the Caspian, costly embroidered goods, raw silk, drugs, rhubarb, and other articles are received from Persia, while leather, woollens, salted fish, caviar, and isinglass are exported. The town has a mean appearance, most of the houses being of wood, and the fish-curing, of which it is the great seat, renders it additionally unattractive. But the place is somewhat remarkable for the number and diversity of its religious buildings. These include thirty-seven Greek, two Roman Catholic, one Protestant, and two Arminian churches, with fifteen Mohammedan structures, and an Indian temple. *Stavropol*, a small fortified town in the direction of the Caucasus, is the head of the government of that name, about midway between the Caspian and the Black Sea. Nearer to the grand chain, with military appointments and Cossack garrisons, are *Ekaterinodar*, 'Catherine's Gift,' *Ekaterinograd*, and *Kizliar*, on the lines of the Kuban and Terek.

CIRCASSIA extends along the slope of the mountains from the Black Sea to about the meridian of 42 degrees, and, being on the northern side of the chain, is a border country of Europe. The people have no towns, but are distributed in villages seated high up the ravines, consisting of rudely-built cabins, and are physically among the finest specimens of the human race. Apart from their bravery and love of freedom, they have no claim to respect, having been accustomed to subsist in part by brigandage, and also by the sale of their female children to those who supply the slave-markets of Constantinople and other cities of the East. After a long struggle for independence, they have quitted their homes by thousands for the Turkish dominions. South of the Terek, on the side of the Caspian, extending thence to the Caucasus, is DAGHESTAN, another border European district, which has long been Russianised, and formed into a government. *Derbend*, a town and port, at its head, with about 12,000 inhabitants, occupies an important military position, at the entrance of a defile between the mountains and the shore, called by the ancients the 'Albanian Gates.'

European Russia contains a population of upwards of 65,000,000, a large aggregate, but a very small proportion to the vast area of the country, and irregularly distributed. Thus the northern province of Archangel, equal in extent to the whole of Great Britain and France, has a much smaller number of inhabitants than the borough of Liverpool, not amounting to one individual to the square mile. No European state contains such a variety of races, but they are mainly referrible to four principal stocks—the Slavonic, the Finnish, the Teutonic, and the Turkish. But in a general view of the population, the

three latter may be overlooked as of very inferior numerical importance, and attention fixed upon the Russians proper, the great branch of the Slavonic family, who alone number nearly 50,000,000. Though generally diffused, they are specially prominent in the central provinces, and speak a language subject to few dialectical variations considering the wide area over which it is spread, but one of extremely difficult attainment to the foreigner. It embraces thirty-six characters in its alphabet, some of which are Greek, with others peculiar to itself, and is the vehicle of only a very meagre literature. Modern Russian writers use the German or French languages, which are commonly understood by the reading classes of society, and thereby secure for themselves a hearing at home and abroad. Nobles, many of whom are in the possession of immense estates, held by hereditary right, but with no political privileges annexed, form a large body. Clergy of the dominant church compose an enormous proportion in comparison with the number in other states, and enjoy some special immunities, being exempt from taxation and corporal punishment. They are in general very ignorant, and often too much addicted, along with their flocks, to strong potations of corn-brandy. Citizens of the middle and lower classes, chiefly engaged in trade, with government officials and military, constitute a considerable section of the population. But the great bulk of the people are in the rural districts as agriculturists, the majority of whom were, till recent times, farm-labourers attached to the soil, and might be bought, sold, or exchanged with it, while completely under the dominion of the 'stick.' These serfs, after acquiring some legal protection from tyrannical masters, were emancipated by an imperial edict in 1861, subject to gradations of liberation. This grand social change is full of promise for the future. It must inevitably tend to reduce the prestige of the nobles; but unfortunately, so degraded is the mental and moral condition of the Russian peasant, while so few are the improving influences which can possibly gain access to him, that, under the most favourable circumstances, the hope of any speedy social and political advance cannot be indulged.

Religious forms are prominent in the everyday phases of Russian life, and whatever opinion may be formed of their character and influence, the sincerity of the observers of them in general admits of no dispute. The dominant and established faith is that of the Greek Church, of which the sovereign is the head. In the architecture of the sacred edifices, the Byzantine style, with its single or clustered domes, is more or less conspicuous. The interiors of those in the cities and great towns are splendidly ornamented, and the services are conducted with great pomp. But display is much more obvious than taste in the adornments, and after the novelty is over, the ceremonies are wearisome to the stranger, from the incessant crossings, bowings, and genuflexions, and the non-provision of seats. Each church has its inner sanctuary, shut off from the rest of the building by a screen, forming a kind of holy of holies, reserved for the use of the priests. It is subject to the singular regulation, that though laymen may enter, no woman, not even the empress, must intrude. Pictures of the Virgin and popular saints are suspended on the walls, to which the people pay great veneration, bowing to them, and lighting tapers before them, which are always on sale at the spot for the purpose. They are also hung up and similarly honoured in the thoroughfares, the shops, public offices, and dwellings. Easter is the grand festival, a carnival season. At a late hour on the eve of the Sunday, the streets are thronged with people proceeding to the different places of worship, where a kind of dramatic representation of the resurrection is the principal feature of the service. The buildings are only illuminated at one point, where the priests are stationed in full canonicals, while the congregations have unlighted tapers in their hand. After chanting litanies and repeating prayers, the officials retire into the inner sanctuary, and are supposed to be seeking the body of Christ. At the midnight

hour the screen is thrown open, and the announcement is made, *Christoss voskress!*—‘Christ is risen!’ Tapers are then rapidly lighted, bells ring, cannon thunder, and congratulations are afterwards general in the streets: Acquaintances meet with the greeting, ‘Christ is risen,’ and with the response, *Vo-istino voskress!*—‘He is risen indeed!’ Another rite observed with great state, the blessing of the waters, takes place in the depth of winter, on the day of the Epiphany, and is attended at St Petersburg by the emperor and the whole court. Over an opening made in the ice of the Neva, a stately canopy is erected, to which the archbishop and clergy proceed, followed by the secular dignitaries, while thousands of spectators are congregated on the frozen surface of the river. The act of blessing consists in the prelate taking the cross and plunging it into the water. The populace regard this ceremony with excessive superstition. Upon the retirement of the imperial cortege, they rush with eager haste to the opening, anxious to touch the consecrated stream, and fill pitchers from it to carry home. Even infants have been sent with their nurses to be plunged, under the idea that if the immersion is endured they will be fortified to bear all the perils of life. The last occasion on which Peter the Great appeared in public was at this celebration. He had been previously indisposed, and exposure to the severe weather of the season in a few days brought on his death. At Moscow, the waters blessed are those of the Moskva; at Simferopol, the consecrated stream is the Salghir.

There are Russians, properly so called, who do not belong to the church of the empire, and have been subject to most oppressive treatment. They were once numerous through the whole country from the shores of the White Sea to the southern provinces, but have vastly diminished, toleration having subdued the sectarian obstinacy which persecution seldom fails to strengthen. These parties are known by the general name of Raskolniks, a term which is exactly equivalent in its meaning to that of Dissenters in England. But their original dissidence from the establishment was the result of absurd ignorance and prejudice. They arose soon after the middle of the seventeenth century, when the Slavonic Scriptures and the liturgical books of the church, having become exceedingly corrupt in the process of transcription, were revised by an ecclesiastical council, and the purified texts were ordered to be alone used in the churches. This measure, wholesome in itself, met with opposition. Thousands, both of the clergy and laity, revered the antiquated copies, however corrupt, simply because they were ancient; and preferred separation to conformity. Hence arose the Raskolniks, an imposed and not an adopted title, as the seceders style themselves by terms signifying adherents to the ‘old faith,’ or the ‘old rite.’ They now number only 759,000. The Roman Catholics, who are chiefly Poles, are returned at 2,800,000; the Mohammedans or Turkish tribes in the south and east, at 2,320,000; the Protestants, principally Lutherans in Finland and the Baltic provinces, at 1,900,000; the Jews at 1,400,000; and the Greek Church includes the vast remainder. Though toleration is conceded, proselytism is dangerous. No member of the national communion can openly leave it for another fold without hazard of banishment to Siberia, while the government has long steadily aimed at securing as large an incorporation of subjects as possible within its pale. The object of this policy is obvious, as the hierarchy and priesthood maintain their temporal head to be a kind of vicegerent of the Deity, whose decisions are not to be disputed. In the ecclesiastical constitution of the empire, he has all the authority and prestige of the pope in the Roman Catholic communion, with the addition of wearing a military costume, and having more than half a million of soldiers at his command. ‘I believe in God in heaven, and in the Czar on earth,’ is part of the orthodox confession of faith. Hence as the power of the crown is strengthened in proportion as the personal ecclesiastical supremacy of its wearer is

admitted, the imperial government has pursued with no little zeal and unscrupulousness the work of proselytism to the national establishment. Upon the issue of an edict directing the conversion of the Samoiedes from heathenism, some of them were speedily brought by missionary priests under a guard of Cossacks as candidates for the waters of baptism.

The emperor is the only source of law recognised in the form of government. His authority is exercised by means of boards of administration which take cognizance of legislation, war, finance, and religion. His official style of *Samoderjetz* or autocrat, signifies that he governs simply by his own will. The title of *Czar* is an altered form of *Cæsar*, adopted from the Roman emperors. It was first used by Ivan III., who married a princess of the imperial Byzantine line in 1472, and also introduced the double-headed black eagle of Byzantium as the national symbol. Her issue reigned till the year 1598, when the House of Rurik, the founder of the empire, became extinct. After a term of dreadful turmoil under an usurper, a Romanoff was raised to the throne, from whom the present dynasty descends.

---

THE SPITZBERGEN ARCHIPELAGO.

Spitzbergen, an extensive island, upwards of 200 miles from north to south, and three considerable isles adjoining, *Edge's*, *Prince Charles's Foreland*, and *North-east Land*, with many of smaller size, and a multitude of rocks, form an archipelago in the Arctic Ocean, between the parallels of  $77^{\circ}$  and  $81^{\circ}$ , and the meridians of  $10^{\circ}$  and  $24^{\circ}$  east of Greenwich. Its position will be better understood by the statement, that it deviates a little to the west from being due north of the North Cape of Europe; and the most southerly point is at the distance of more than 400 miles from that promontory. The cluster contains the most northerly known land of the globe, with the exception of the coasts recently explored by Captain Inglefield in *Sir Thomas Smith's Sound*, an inlet running up from the head of *Baffin's Bay*. Throughout the long winter, it is completely environed by the polar ice, in a compact field, which extends for miles to the southward, cutting off all communication with the external world; nor is there always an open sea in summer, so as to admit of the land being reached, though this is generally the case. On approaching the coast of this outlying region, the eye is arrested by a forest of peaks—the sharply-defined snow-capped tops of mountains—which rise to the height of from 3000 to 4000 feet, exhibit brown, lilac, and purple tints, as seen from a distance, giving them an unsubstantial appearance, as if the spires of fairyland. Hence the name, *Spitzbergen*, 'the peaked mountains.'

On further acquaintance with the scenery, its general desolation powerfully impresses the mind, though both animal and vegetable life have representatives on the shores. 'How shall I give you an idea,' remarks Lord Dufferin, on landing, past midnight, the 6th of August 1856, 'of the wonderful panorama in the midst of which we found ourselves? I think, perhaps, its most striking feature was the stillness—and deadness—and impassability of this new world: ice, and rock, and water surrounded us; not a sound of any kind interrupted the silence; the sea did not break upon the shore; no bird or any living thing was visible; the midnight sun—by this time muffled in a transparent mist—shed an awful, mysterious lustre on glacier and mountain; no atom of vegetation gave token of the earth's vitality; an universal numbness and dumbness seemed to pervade the solitude. I suppose in scarcely any other part of the world is this appearance of deadness so strikingly exhibited. On the stillest summer day in England there is always perceptible an under-tone of life thrilling through the atmosphere; and though no breeze should stir a single leaf, yet—in default of motion—there is always a sense of growth; but here

not so much as a blade of grass was to be seen on the sides of the bald excoriated hills. Primeval rocks—and eternal ice—constitute the landscape.' Upon closer examination, a scanty flora is observed near the level of the sea, but vegetation ceases at a very inconsiderable elevation above it. It consists of moss and lichens, sixty-three species of flowering plants, and the dwarf willow creeping a few inches above the ground. The animals are reindeer, the Arctic fox, white hare, polar bear, the walrus, seal, and sea-fowl of many varieties.

Rivers of ice, or glaciers, occupy the valleys between the mountains, several of which, according to a careful estimate made by Dr Scoresby, were forty or fifty miles in length, by ten or twelve in breadth. They terminate seaward in crystal cliffs from 400 to 500 feet high. In the height of summer, the loftiest summits lose their winter covering of snow, owing perhaps to the accumulation of heat consequent on the sun being above the horizon for three or four months together, and their own elevation above the region of fogs and mists. Nothing is more remarkable than the contour of the mountain-tops, literally jagged spikes of stone, or steep narrow ridges on which a man might seat himself as if on the back of a horse. This feat was actually performed by Scoresby, who was rewarded with the view of a striking panorama. The ascent is toilsome and dangerous from the looseness of the surface, often schistose strata, which the frost has fractured and crumbled. No true volcanic rocks are known. Coal occurs, and is so readily procured that the Dutch whalers were formerly in the habit of laying in a stock for the homeward passage. On one occasion some walrus-fishers took as many as fifty tons to Hammerfest in Norway. Dolomite marble is found agreeing in colour, grain, and other characters, with the statuary marble of Italy. The precious garnet is not uncommon, and is therefore of all the gems the one which has the widest geographical range, extending in the northern hemisphere from the equator to within a few degrees of the pole. Among well-known localities on the west and north coasts, there are English Bay, a secure roadstead between Prince Charles's Foreland and the mainland; Mitre Cape, a singular cliff which Scoresby clambered up; Hakluyt's Headland, the north-west point; Cloven Cliff, named from its resemblance to a cloven hoof, so perpendicular that it is never covered with snow; Moffen Island, where Nelson had an adventure in his youth; and Hecla Cove, whence Parry started on his attempt to reach the pole.

Great interest belongs to the history of Spitzbergen. In 1633 the Dutch contemplated a permanent settlement there, and seven sailors volunteered to stay the winter. On the 30th of August, they were left in North Bay; and at once began to visit the neighbouring shores, looking out for fresh provisions. On the 27th of May next year, a boat was seen, to the great joy of the sojourners, which soon conveyed them to their countrymen in a neighbouring bay. It is evident that they were indebted for their preservation from scurvy, and endurance of the severity of the climate, to their prudence in securing the vegetable antiscorbutics, subsisting as much as possible on fresh provisions, and leading an active life.

Encouraged by this successful experiment, seven other seamen offered to renew it in the ensuing season, and were left apparently furnished with every facility to go through the dreary interval with the like result. But they had not the intelligence and energy of their predecessors. Disappointed in early attempts to procure fresh victuals, they shut themselves up in their hut, when the sun left them on the 20th of October, and scarcely ever stirred out of it. Attacked by scurvy, it soon assumed a malignant form, in the absence of fresh meat, vegetables, and requisite exercise, till three died, whose bodies were with difficulty enclosed in coffins by the others. Some relief was found by the survivors in killing a fox and a dog for food, but not enough to arrest the progress of the malady.

Their mouths became ulcerated; they could not chew their biscuit; and only one had power to rise from his bed, and kindle a fire. This was their miserable condition when the sun reappeared on the 24th of February. Their journal closes with the record: 'We are all four stretched on our beds, and are still alive, and would eat willingly, if any one of us were able to rise and light a fire. We implore the Almighty, with folded hands, to deliver us from this life, which it is impossible to prolong without food or anything to warm our frozen limbs. None of us can help the other; each must support his own misery.' In the early spring the fishing-vessels arrived, and a party repaired to the hut. They found it a sepulchre. Three of the men were enclosed in the coffins which had been framed for them; the other four lay dead, two in their beds, and two on a piece of sail spread upon the floor. These last had perished from sheer inability to make the effort necessary for reaching and dressing their food, and the gripe of the frost had brought knees and chin together, so that they lay rolled up like a ball.

More than a century elapsed before another instance of wintering at the spot is on record. This was a most extraordinary adventure, wholly inadvertent. In 1743 a Russian vessel from Archangel visited the shore, and four seamen landed, soon to find themselves imprisoned, for a violent tempest arose, which drove the ship out of sight, and it was never heard of afterwards. Thus abandoned, without the slightest preparation for a stay, the unfortunate men did not despair. They had a gun, with which twelve deer were killed, before their small stock of powder was expended. Then finding some pieces of iron on the beach, they contrived to fashion them into pikes. With these weapons, just as their store of flesh was beginning to be exhausted, they attacked a polar bear, and despatched him after a formidable struggle. The animal supplied food, his skin clothing, and the entrails, duly prepared, furnished the string for a bow, with which they could once more assail the reindeer. By the activity which the necessities of their position imposed, and subsisting on fresh meat, these hardy men preserved their health, and endured the hardships of a wearisome sojourn through the extraordinary period of *six years*, looking often but in vain for deliverance. During that time they killed 10 bears, 250 reindeer, and a multitude of foxes. At last one of them died, and the three survivors, regarding his fate as significant of their own, were sinking into despondency, when, on the 15th of August 1749, a vessel was descried. They lighted fires on the heights, hoisted a flag made of skins, and were discovered by the ship, which proved to belong to their own countrymen. Since that period Russian hunters have repeatedly wintered in huts on the coast, taking care to provide themselves with fresh provisions, and collecting those plants from under the snow which act as antidotes to scurvy, often making their way out by the chimney, when the snow-drift has blocked up the door. But it is not uncommon for human skeletons to be found, scantily sepulchred, or not at all, either struck down by ordinary disease, or accident, or unable to endure the climate.

The archipelago, so dreary and so isolated, was brought within the range of yachting by Lord Dufferin, in the *Foam*, in August 1856, who, in the course of a ramble on shore, unexpectedly stumbled upon a human relic. 'Half imbedded in the black moss, there lay a gray deal coffin, falling almost to pieces with age; the lid was gone—blown off probably by the wind—and within were stretched the bleaching bones of a human skeleton. A rude cross at the head of the grave still stood partially upright, and a half-obliterated Dutch inscription preserved a record of the dead man's name and age: "Vander Schelling . . . . Comman . . . . Jacob Moor . . . . Ob 2 June 1758 Æt 44." It was evidently some poor whaler of the last century to whom his companions had given the only burial possible in this frost-hardened earth, which even the summer sun has no

force to penetrate beyond a couple of inches, and which will not afford to man the shallowest grave. A bleak resting-place for that hundred years, I thought, as I gazed on the dead mariner's remains! It was no brother-mortal that lay at our feet—softly folded in the embraces of “Mother-Earth”—but a poor scarecrow, gibbeted for ages on this bare rock, like a dead Prometheus; the vulture, frost, gnawing for ever on his bleaching relics, and yet eternally preserving them!’

A Swedish scientific expedition under Mr Torell visited Spitzbergen in the year 1861, when many positions were astronomically determined for the correction of maps, while new harbours were discovered, and numerous zoological, botanical, and geological specimens were brought away. It was ascertained beyond doubt that the Gulf Stream impinges upon the coast—its utmost limit in a northerly direction. Not only was the seed of *Mimosa scandens* discovered there, but also quantities of glass bottles, which the inhabitants of the Norwegian shores use as floats for nets in their cod-fisheries. The pumice-stone found in abundance upon the strand, in all probability, is drifted thither by this stream from Iceland, as a branch of it sweeps the southern coast of that island, while the drift-timber common to both Iceland and Spitzbergen is conveyed by an opposite current from the northern shores of Asia, to which it is carried from the interior by the Siberian rivers. Birch bark was met with, rolled together in a peculiar form, evidently manufactured by man, which the fishermen of Siberia use as net-floats. Upon examining a white bear that was shot, the stomach was found full of plants, thus proving that these animals can be herbivorous. A curious fact was ascertained relative to the walrus, that among other uses the tusks are employed to dig up food from the bottom of the sea, as the stomach of one contained a quantity of the *Myn truncata*, a species of sand-mussel. It lies buried at least one foot below the surface of the mud, and could only have been reached by the walrus using his tusks like a dung-fork. Deep-sea soundings yielded interesting results. Several species of living mollusca and crustacea were brought up from the depth of 1300 fathoms. The nominal sovereignty of the Spitzbergen group is claimed by Russia.

Sea-shore, Spitzbergen, after Lord Dufferin's Sketch.

The Gausriankar Peak, Himalaya range.

## PART II.

### DESCRIPTIVE GEOGRAPHY OF ASIA.

#### INTRODUCTORY CHAPTER.—GENERAL VIEW OF ASIA.

ASIA, the largest of the great land divisions of the globe, and the most populous, takes the lead also in diversity of surface, variety of organic forms, and historical antiquity. It is nearly five times the size of Europe, considerably exceeds that of Africa and Europe taken together, and surpasses the joint masses of North and South America. Within its limits are found more than half of the whole population of the earth, yet so little proportion is there between this vast number of inhabitants and the magnitude of their dwelling-place, that Europe is three times more densely peopled. The immense region contains the loftiest elevations and the deepest depressions of the terrestrial surface, with the most varied and highly-developed forms of animal and vegetable life ;

while from its plains, valleys, and hills have been distributed to other parts of the world the most valuable of the domesticated quadrupeds, the choicest fruits, and those food-plants which are most important to the daily sustenance of mankind.

The mainland of Asia is situated entirely in the northern hemisphere, but it makes a very close approach to the equator, within a hundred miles, and the insular appendages advance southward of the line. In the opposite direction it passes far into the depths of the north polar zone. While conterminous with Europe, and attached to Africa by the slender Isthmus of Suez, its eastern extremity is only separated from America by the narrow channel of Behring Strait. The other boundaries are the Caspian and Black Seas, the Archipelago, Mediterranean, and Red Sea, on the west; the Indian Ocean on the

Section of Asia on the Meridian of Comorin.  
A, Cape Comorin; B, Chirs Gap; C, Nilgheries, 9971; D, Tableland of the Deccan, 2200; E, Valley of Nerbudda; F, Vindhya Chain; G, Table-land of Malra, 1800; H, Plains of India, 1000; I, Himalayas, 23,000; J, Ladak, 12,700; K, Koon-Loo; L, Khatun; M, Tan-Shan Mountains; N, Tarragata, 7410; O, Salsan Lake, 850; P, Altai Mountains, 11,000; R, Barnaul, 394; Q, Plains of Siberia; S, Sea-level.

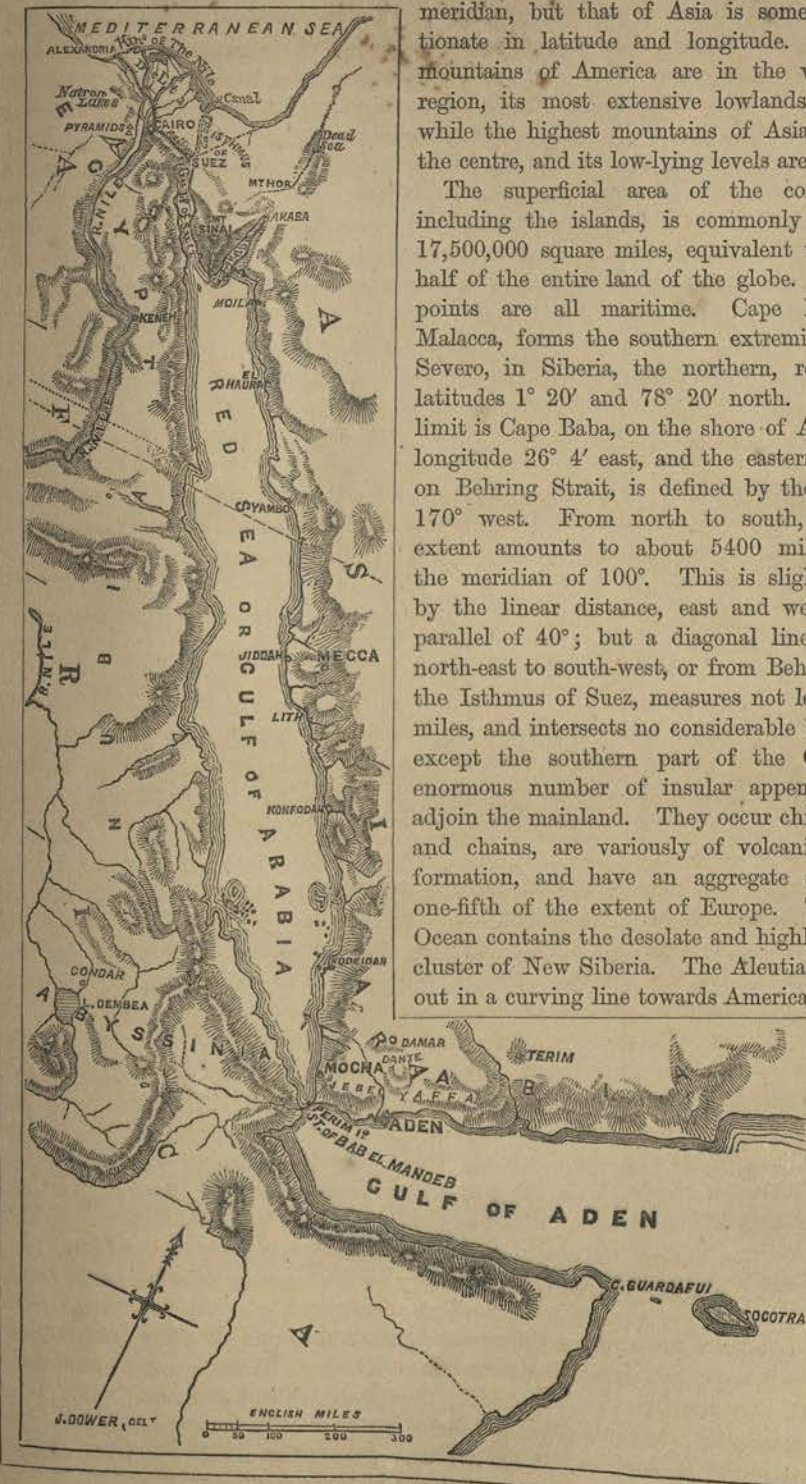

Waterfalls, 1, 2, 3, 4, 5, of Bondelkund; 6, of the Himalaya Ghauts; 7, of the Jumna; 8, of the Ganges; 9, of the Gutsupah; 10, 11, 12, of the Godavery.

south; the Pacific on the east; and the Arctic on the north. These ocean-basins advance to some extent inland, forming minor seas, fringed and dotted with numerous islands. The most important are the Arabian Sea and Bay of Bengal, southern; the China, Yellow, and Japanese Seas, with that of Okhotsk, eastern, each of which has its subordinate gulfs. On the northern side the indentations are numerous, but upon an inferior scale, and have more the character of river estuaries than oceanic inlets.

Generally speaking, Asia is distinguished by great compactness. It has therefore a smaller extent of coast-line in proportion to its magnitude, though reckoned at 35,000 miles, with fewer maritime advantages than the other continents, Africa alone excepted. The main mass forms a trapezium, from which there are huge projections. Those on the southern side remarkably correspond to the projections of Southern Europe. Thus, peninsular Arabia, on the west, is the gigantic counterpart of the Western Spanish peninsula; India, with the adjoining island of Ceylon, central, has a family-likeness, but with broader features, to Italy and the insular Sicilian dependency, similarly placed; and India beyond the Ganges, with its multitudinous islands, eastern, may be taken for a magnified representation of the eastward Turko-Hellenic tract and the bordering Greek archipelago. But there are striking differences between Asia and the other great masses of land, both as it respects horizontal and vertical configuration. Europe may be compared to a body with very prominent limbs; Africa, to a body without members; while Asia has arms of enormous magnitude, with a body preponderating conspicuously in its dimensions. Glancing at America, its extension is principally in the direction of the

meridian, but that of Asia is somewhat proportionate in latitude and longitude. The highest mountains of America are in the western coast region, its most extensive lowlands are central, while the highest mountains of Asia are towards the centre, and its low-lying levels are maritime.

The superficial area of the continent, not including the islands, is commonly reckoned at 17,500,000 square miles, equivalent to nearly one half of the entire land of the globe. Its extreme points are all maritime. Cape Romania, in Malacca, forms the southern extremity, and Cape Severo, in Siberia, the northern, respectively in latitudes  $1^{\circ} 20'$  and  $78^{\circ} 20'$  north. The western limit is Cape Baba, on the shore of Asia Minor, in longitude  $26^{\circ} 4'$  east, and the eastern, a headland on Behring Strait, is defined by the meridian of  $170^{\circ}$  west. From north to south, the greatest extent amounts to about 5400 miles, following the meridian of  $100^{\circ}$ . This is slightly exceeded by the linear distance, east and west, along the parallel of  $40^{\circ}$ ; but a diagonal line drawn from north-east to south-west, or from Behring Strait to the Isthmus of Suez, measures not less than 6700 miles, and intersects no considerable body of water except the southern part of the Caspian. An enormous number of insular appendages closely adjoin the mainland. They occur chiefly in groups and chains, are variously of volcanic or coralline formation, and have an aggregate area equal to one-fifth of the extent of Europe. The Northern Ocean contains the desolate and highly fossiliferous cluster of New Siberia. The Aleutians, stretching out in a curving line towards America, the long and

narrow tract of Sagalien, of the Kurile and of the Japanese series, Formosa and Hainan, are off the eastern coast. Off the southern shores of the continent lies Ceylon, with

the Andaman and Nicobar, the Maldivé and Laccadive groups. Westward, in the Mediterranean, are Cyprus, Rhodes, and other dependencies of the Lesser Asia. But the grand insular examples are on the south-east, where the large masses of Sumatra, Java, Borneo, Celebes, the Philippines, and a world of contiguous isles, compose the East Indian or Malayan Archipelago. This splendid region—the ‘gardens of the sun’ in eastern speech—divides the basin of the Indian from that of the Pacific Ocean, leads by a series of huge stepping-stones to within hail of Australian lands, and forms part of a separate division of the globe under the name of Oceania.

The interior of Asia embraces lowlands, plateaus, chains and groups of mountains, developed upon a scale in harmony with its colossal proportions. Six great lowlands are prominent in the vertical configuration of the surface—namely, the Siberian, by far the largest; the Chinese; the Indo-Chinese; the North Indian; the Syrian, comprehending the historically-renowned basin of the Euphrates; and the plain of Turkestan, part of which is an area of actual depression, being below the level of the sea. These low-lying levels are of vast extent, and vary in their character, from dreary and desolate wastes, true sandy or gravelly deserts, nearly rainless and waterless, to districts of the richest soil, clothed with continually exuberant vegetation, which are visited periodically with copious showers, and irrigated by rivers of ample volume. Great extremes of temperature occur in these regions, some districts being subject to a burning heat for the greater part of the year, while others are carpeted with deep snow for as long an interval, and the subsoil constantly remains so firmly frozen, that, in order to excavate a grave of any depth, fire is commonly employed to thaw it, even in the midst of summer. Densely-crowded cities and large village populations occupy the plains of China and Bengal, but the signs of human life are few and far between on those of Siberia and Turkestan. Two principal highland systems are likewise distinguished in the continental interior. The one is south-western, sometimes called the Tauro-Caucasian; the other is central, generally styled High Asia, on account of its stupendous elevations, with which extensive ranges of subordinate mountains and intervening high grounds, on the east and north-east, are connected.

Mountains of Asia.

The south-western highland system includes the table-lands of Iran or Persia, Armenia, and Asia Minor, which range in altitude above the sea from 3000 to 7000 feet—the Armenian being the loftiest. It forms a grand platform for the volcanic cone of Ararat, which attains a total height of 17,323 feet, and is the colossal boundary-stone of three

great empires, standing at the convergence of the Russian, Persian, and Turkish dominions. This generally highly-elevated region is a kind of mountain nucleus, with which several chains are more or less directly connected, while some immediately radiate from it. They include the Zagros Mountains, in Kurdistan, running parallel to the Tigris, as the eastward boundary of its basin; the range of Taurus, extending into Asia Minor in several branches, and sending off Lebanon as a southerly prolongation into Syria and Palestine; the bolder Caspian Mountains which skirt the southern shores of that sea; and the still more majestic Caucasus, intersecting diagonally the isthmus between it and the Black Sea, the ridge-line of which is part of the boundary between Asia and Europe. Near the centre of the last-named grand chain is Mount Elburz, crowned with snow and clad with glaciers, untrodden by the foot of man, which attains the height of 18,493 feet, and may be regarded, from its position on the frontier, as at once the culminating-point of Europe and of Western Asia. The table-lands of this region differ widely in their character. Those of Persia are sternly desolate, consisting of sandy and salt deserts, with the blast of utter barrenness upon them, while those of Asia Minor, though treeless, afford fine pasturage, and are the summer camping-grounds of nomadic tribes. Several of the mountain-passes present fine scenery, and were celebrated in ancient times as the routes of armies, as well as the thoroughfares of commerce. Alexander the Great, in his wild eastern campaigns, crossed the Taurus by the *Pylæ Ciliciæ*, or Cilician Gates, a defile which connected the old provinces of Cappadocia and Cilicia, now called the Pass of Gölek Bógház. He proceeded from Asia Minor into Syria by the *Pylæ Syriæ*, now the Pass of Beilan, in the range of Amanus, close to which Darius was overthrown on the battle-field of Issus. In pursuit of the fugitive monarch, he threaded the *Pylæ Caspiæ*, a rent in the high mountain-wall south of the Caspian, in the neighbourhood of the modern Persian capital. In a central part of the Caucasus, the present Pass of Dariel, converted into a military-road by the Russians, represents the *Portæ Caspiæ*, or Caucasian Gates of the Romans. Their *Portæ Albanicæ*, at the eastern extremity of the range, between it and the Caspian, is now called the Pass of Derbend.

The central highland system is an immense region of table-lands and mountains, occupying an area much larger than the whole of Europe, and containing the most elevated points of the terrestrial surface. It forms the core of the continent, and exerts a natural influence which is felt at the opposite extremities. The parallels of 28° and 53°, and the meridians of 73° and 120°, generally define the extreme limits, equal to a linear distance of 1730 miles from north to south by 2400 miles from east to west. This remarkable district, High Asia, many parts of which are still very obscurely known, appears to be a four-sided protuberance, with chains of mountains on its borders, all of which rise far above the line of perpetual snow; while some ascend to that elevation, on the exterior, rising from the zone of apricot and pomegranate trees, of rice and cotton, of sultry heat and tropical jungle. The southern side is formed by the gigantic Himalaya rampart; the western by the Bolar-Tagh or Cloudy Mountains; the northern by the Altaï chain; and the eastern by the Khing-Khan, In-Shan, Yung-Ling, and other Chinese ranges. Intermediate to the Himalaya and Altaï—the southern and northern walls—parallel to them and to each other, are the equally grand chains of the Kuen-Lun and the Thian-Shan or Celestial Mountains. The country, thus bordered and intersected, consists of high plains, diversified with valleys, streams, and lakes, but by no means of uniform elevation, though the general level is high in relation to that of the sea. Between the Himalaya and the Kuen-Lun, comprehending the whole of Tibet, the plateau ranges in altitude from 10,000 feet to a height exceeding that of Mont Blanc, and is the loftiest in the world. The table-land of Pamir, on the north-west, has a mean elevation of 15,000 feet. From west to east the surface

generally declines, but probably the lowest part, including the whole of Mongolia, a region of sandy deserts, has an average elevation of from 3000 to 4000 feet, and is the most extensive table-land of the globe.

The Himalaya Mountains form a magnificent frontier to the north of India, and separate its low plains from the high plateau of Tibet. They follow a curving course of considerably more than 1000 miles, contain the greatest elevations of the earth's surface, and answer to the meaning of their name, 'the abode of snow.' Upwards of forty peaks have been ascertained to exceed the altitude of 23,000 feet; several rise to a much greater height; and one, Mount Everest, or Gausriankar, represented at the head of this chapter, copied from the magnificent atlas of the Brothers Schlagintmeit, attains to very nearly 29,000 feet, the highest known point on the globe. On the southern slope of the range, mosquitoes go up to 8000 feet; monkeys and tigers to 11,000; the leopard to 13,000; and snakes to 15,000 feet; while the dog follows his master over the loftiest passes. The main masses are separated by deep gorges, which furnish routes between India and Tibet, but all of them above 16,000 feet are closed with snow from November till May. The Parang Pass, in Spiti, ascends to 18,500 feet, and is the loftiest used as a commercial thoroughfare; but the Ibi-Gamin Pass, leading into Gurhwal, reaches the elevation of 20,450 feet. Glaciers abound in the higher parts of the mountains, many of which are of great magnitude, and appear to correspond to the icy masses of the Alps in their rate of movement. Their lower extremities are found at the height of from 11,500 to 12,000 feet, south of the great peaks, but on the northern side, where the snow-line is higher, they are not met with below 16,000 feet. The illustration of these stupendous mountains has been chiefly effected by English expeditions from India, while that of the Altai, the opposite northern wall, has been accomplished by Russian men of science and travellers from Siberia.

The high central mass of the continent has mountainous connections on the north-east, stretching out to the shores of the Pacific Ocean and Behring Strait. In the opposite direction, it is linked with the south-western highland system by the Hindu-Kush, a prolongation of the Himalaya, extending through Afghanistan to the plateaus of Persia. But besides these two systems wholly distinct from them, the Asian highlands include the eastern slope of the Urals on the frontier of Europe, the lofty table-lands and ranges of the Arabian peninsula, the elevated ground of the Deccan in India, walled by the Eastern and Western Ghauts, and the scantily known chains of China and the Indo-Chinese countries. The region of the Caspian offers a striking contrast to the uplands, and a singular exception to general terrestrial arrangements, as the expanse occupies an area of actual depression, its surface being below the level of the Black Sea. Active volcanic mountains are very rare except in the peninsula of Kamchatka, and in the islands, where they are numerous and formidable. Two examples in the continental interior, connected with the Thian-Shan, apparently feeble, are remarkable as variations from the prevailing rule of such sites being proximate to the sea, as they are upwards of 1500 miles from the nearest point of the ocean. Earthquakes are frequent and often violent in the southern region, especially in the

south-west, as in ancient times, when the Hebrew writers graphically described their terrible phenomena by the bowing down of the perpetual hills, the wilderness shaking, the earth reeling to and fro like a drunkard, and being removed like a cottage. These are not altogether the highly-coloured pictures of imagination, but refer to dread phenomena which have their counterpart in the modern age within the bounds of Syria, Palestine, and Asia Minor.

Magnitude and diversity mark the hydrography of Asia. The snows and glaciers of the high uplands are the sources of magnificent rivers, which, though not equal in length and volume to those of the western world, owing to the different disposition of the mountains, make a very close approach to them, while the lakes are remarkable for their number, size, and varied attributes. At the same time vast tracts of the surface are waterless wastes. In the northern half of the continent the great streams have a very languid current in their mean state, owing to the vast extent of country between the central highlands in which they rise, and the Arctic Ocean to which they flow. So slight is the declination of the surface, that Tobolsk, on the Irtish, though 550 miles from the sea, is little more than a hundred feet above its level. For the same reason the rivers overflow their banks, and spread out in wide inundations, upon the melting of the snows which deeply cover the whole of their basins in winter; and in that season they are useless as navigable channels, being strongly frozen. In Southern Asia the rivers are generally rapid, having a considerable fall, consequent on the comparative proximity of the highlands from which they descend, to the ocean. They are subject to an annual or a semi-annual rise, from the melting of the snow in spring towards their sources, and from the deluges of rain which periodically visit the countries they traverse.

Binary rivers are characteristic of the hydrographic condition of the continent, and are nowhere else exhibited in such a prominent manner. The components of the double systems rise not far apart from each other; pursue, with a variously-divergent course, the same general direction; and either finally come to a confluence, or converge to a common delta, or enter the ocean in comparative proximity. Thus the colossal streams of the Chinese Empire, the Hoang-ho and Yang-tse-kiang, are in near neighbourhood at the beginning of their course, but separate to the distance of 1000 miles on their eastward flow, and again approach, having their outlets in the Yellow Sea, very little more than 100 miles asunder. The Indo-Chinese peninsula is traversed by a series of great parallel rivers, which pour down from the central table-land, the Irawaddy and Salween, the Meinam and Cambodia, forming conspicuous pairs, the former having a common estuary in the Gulf of Martaban, the latter entering the Chinese Sea. From opposite slopes of the Himalaya Mountains, but not far apart at their rise, the Ganges and Brahmaputra descend to mingle their waters in the same vast delta, at the head of the Bay of Bengal. The twin streams of the Euphrates and Tigris issue from contiguous sources in the highlands of Armenia, diverge to a considerable distance, and then gradually approach to an actual confluence, flowing in one channel to the Persian Gulf. But a considerable proportion of the river-drainage of Asia never reaches the ocean, being discharged in inland seas or lakes, which are without any outlet, and yet experience little change of level, as the strong evaporation fully counterbalances the supplies received. Among the rivers which are thus wholly continental in their course, the principal examples are the Amu or Jihun (ancient *Oxus*) and the Sir or Sihun (*Jaxartes*), entering the Sea of Aral; the Kur (*Cyrus*) and the Aras (*Araxes*), received by the Caspian; the Helmund, descending from the Afghan highlands to the Lake of Zurrah; the Yarkand, which terminates in Lake Lob, on the great central plateau; and the Jordan, which flows into the Dead Sea. Several of the Asiatic rivers are of older historical date and celebrity than

any others, with the exception of the Nile. The Tigris and the Euphrates recall the memory of the Assyrian and Babylonian monarchies, which arose upon their banks; the latter is associated with the wanderings of Hebrew patriarchs; and the Jordan, with the passage of Israel into the Land of Promise.

The following table presents approximate estimates of the course of the principal rivers.

| Principal Rivets.         | Course.                 | Termination.          | Length<br>in Miles. | Area of Basin<br>in Square Miles. |
|---------------------------|-------------------------|-----------------------|---------------------|-----------------------------------|
| Obi, . . . . .            | Western Siberia, . . .  | Arctic Ocean, . . .   | 2500                | 1,250,000                         |
| Yenesei, . . . . .        | Central Siberia, . . .  | " . . . . .           | 2900                | 1,110,000                         |
| Lena, . . . . .           | Eastern Siberia, . . .  | " . . . . .           | 2400                | 960,000                           |
| Amoor, . . . . .          | Eastern Asia, . . . . . | Pacific Ocean, . . .  | 2300                | 900,000                           |
| Hoang-ho, . . . . .       | China, . . . . .        | Yellow Sea, . . . . . | 2600                | 400,000                           |

| Brahmaputra, . . . . .    | Tibet, . . . . .        | Bay of Bengal, . . .  | 1300                | 350,000                           |
| Ganges, . . . . .         | Northern India, . . .   | " . . . . .           | 1491                | 420,000                           |
| Indus, . . . . .          | " . . . . .             | Indian Ocean, . . .   | 1700                | 400,000                           |
| Tigris, } . . . . .       | Western Asia, . . . . . | Persian Gulf, . . .   | { 1140 }            | 230,000                           |
| Euphrates, }              |                         |                       | { 1780 }            |                                   |

Lakes are extremely numerous, both on the high table-lands and in the low plains, and have very diversified features. They offer indeed more striking contrasts as to extent, position in relation to the level of the sea, and the physical quality of the water, than lakes in any other part of the globe. The Caspian Sea, situated on the European frontier, but chiefly within the limits of Asia, is a true lake, and is called a sea from its vast magnitude. It is the largest inland body of water in the world, considerably exceeding the united area of the lakes of Canada, spreading over a surface of 140,000 square miles. In the direction of its length, from north to south, it extends about 700 miles, by an average of 200 from east to west, and has great central depth, amounting in places to 500 fathoms, though shallow along the shores, which are extensively fringed with sheets of ice on the north every winter. The water is salt, though less so than that of the ocean. While receiving the great stream of the Volga, and other rivers, the Caspian has no outlet, yet its level, instead of rising, appears to be sinking, owing to the strong evaporation during the summer months. Its depression below the surface of the Black Sea may be regarded as an ascertained element, but is probably more moderate than was formerly supposed. The navigation, almost wholly in the hands of the Russians, is now conducted by steamers, and the fisheries are valuable. The Sea of Aral, to the eastward, is similarly a lake without an outlet, though receiving river contributions, and has an area of 26,000 square miles. It is less salt than its neighbour, and being comparatively shallow, the surface is largely frozen over in winter. Little was known of this expanse previous to the years 1846—1848, when it was explored by the Russian government by means of schooners built at Orenburg, and transported in pieces across the intervening steppe. Towards the centre some islands were discovered, before unknown even to the Kirghiz wanderers on the shores, which received the name of the Islands of the Czar. The Lake Sir-i-kol, on one of the central plateaus, where the Oxus rises,

‘ In his high mountain cradle in Pamere,’

is the most elevated sheet of water on the terrestrial surface, at the height of 15,600 feet above the sea-level, or nearly as high as the top of Mont Blanc. It is crescent shaped, about fourteen miles long, by an average breadth of one mile, frozen, and deeply covered with snow during the winter months. By the end of June the ice has broken up; the snow has entirely cleared away from the neighbourhood; swarms of aquatic birds appear

upon the water; and the natives drive up their horses and sheep from the lower grounds, to pasture on its banks till the inclement season returns. As a contrast to this high lake, the Dead Sea in Palestine is 1300 feet below the level of the Mediterranean, and is remarkable for the intensely saline quality of the water, though it is not, as sometimes stated, the saltiest water in the world, being exceeded by that of the Lakes Elton in Russia, and Urumiah in Persia. The largest Asiatic fresh-water expanse, Lake Baikal, in Siberia, has an area of about 15,000 square miles, with peculiarities of a different kind. It is the Holy Sea of the Russians, who regard it with superstitious feelings, owing to an apparently mysterious movement of its waters in calm weather, apparently occasioned by the earthquake shocks which are common on its shores. The navigation is highly dangerous, arising from the excessive violence of the winds, their unsteadiness, and sudden shifting. It is a proverbial saying, that it is only upon the Baikal in autumn, when its surface is most vexed by the rude and inconstant gales, that a man learns to pray from his heart. In winter the lake is covered with ice four feet thick, and is then traversed by sledges, laden with tea and other products from China.

Ranging in its latitude from the equatorial to the polar zone, and varying in its elevation from sites actually depressed below the level of the sea, to mountains rising five miles above it, the continent has every diversity of climate within its bounds, the extremes of heat and cold, of aridity and moisture, of rain in torrents, causing the hot earth to steam, and snow in clouds, covering the frozen surface to the depth of several feet through more than half the year. In the southern countries, embracing the two Indian peninsulas, the south-west of China, and some maritime parts of Persia and Arabia, the climate may be generally characterised as hot and moist. No real cold is experienced except in the more elevated districts, to which the phenomena of winter, frost, and snow are exclusively confined. At Calcutta the mean temperature of summer is  $86^{\circ}7$ , that of winter  $72^{\circ}2$ , and that of the year  $82^{\circ}4$ . The rains are seasonal and regular, often falling with tremendous violence, so that in the course of a few days, sometimes of a few hours, the amount precipitated is equal to the whole annual quantity received in higher latitudes. The winds, over a large proportion of the area, are periodical or monsoons, blowing from the north-east and the south-west alternately, and maintaining each direction for six months together. In the more easterly localities, as at Canton, the average annual amount of heat is considerably less, and the difference between the temperatures of opposite seasons much greater. In the middle Asiatic zone, on the lofty plateaus, the temperature is low, the wind biting, and the air dry, as the high wall of the Himalayan range prevents the northerly progress of warm moist currents from the tropics. Through the entire north the climate is extremely rigorous; and the coldest in the world in the basin of the Lena, in the eastern division of Siberia. A short, warm summer alternates with a winter extending from the middle of September to that of the following May, during which, in ordinary seasons, mercury remains a solid body for two months, all the rivers are frozen up through seven months, and the whole country is covered with a deep layer of hard snow. This rigour is occasioned partly by the obstruction offered by High Asia to the advance of warm air from the south, and in part by the great levels on the shores of the Arctic Ocean, which freely admit the polar blasts.

Great range of latitude and difference of level, with the connected diversity of climate, render the vegetable features of Asia extremely varied. Dense jungles of arborescent ferns, orchidaceous plants in profusion, and forests of stately timber, characterises the warm and watered southern zone. Entire treelessness, where there is only a temporary supply of trailing plants, coarse grass and rushes, mosses and lichens, when the dissolving

snows permit the surface of the ground to be exposed, distinguishes the extreme northern. In the less inclement parts of Siberia, pines, birches, and willows form enormous woodlands, and make the furthest advances to the north, assuming gradually a stunted appearance, and occurring only as stragglers. Berry-bearing plants are abundant, as the crowberry and bilberry, with some herbaceous species of culinary value. In the middle zone, comprehending the high table-lands, trees of large growth are scarce; vast districts are almost entirely bare of arborescent forms; but succulent grasses abound as pastures for flocks and herds, wild and domesticated. Vegetation in the southern zone, including India, the greater part of China, and specially the Indo-Chinese peninsula, with the Indian Archipelago, is remarkable for its exuberance, beauty, varieties, and utility, not only to human subsistence, but the arts of life. Forest trees furnish timber prized for ship-building in the Indian teak, with a profusion of ornamental and dye woods, and the substances caoutchouc and gutta-percha, very extensively applied in arts and manufactures. The caoutchouc or India-rubber tree is of large size and great beauty, one of the fig family, to which the banyan-tree belongs, so peculiar from the lateral branches sending down shoots to the ground, which take root, and become stems—

‘And daughters grow  
About the mother-tree.’

In the warm and temperate region generally, the botany is rich in products which supply food, luxuries, and medicines, besides a vast variety of plants distinguished for their floral ornaments. Palms of different species in the tropical districts furnish dates,

Banana Tree.

cocoa-nuts, and sago, where also the banana, plantain, and yam contribute largely to sustenance. The sugar-cane is a native of India and China; the tea-plant, wild and cultivated, is common to China, Japan, and Assam; the coffee-bush clothes the highlands of Yemen; the cinnamon laurel flourishes in Ceylon; the pepper vine grows on the coast of Malabar, and in the islands of the Archipelago; nutmegs and cloves are the crops of the Moluccas; the camphor-tree is found in China and Japan; the rhubarb of the druggist occurs throughout most of the temperate zone; and so distinctive of the warmer parts of Arabia, Persia, and adjoining localities, are plants yielding odoriferous gum-resins,

that the countries are grouped together as the Region of Balsam-trees. While the native seat of the vine, orange, lemon, olive, peach, nectarine, apricot, damson, cherry, fig, and mulberry, it is probable that the important cereals, wheat, barley, and oats are of Asiatic origin, like rice. Beautiful flowering-plants, now widely diffused—camellias, azaleas, and China-asters, the China rose, the damask rose, the common jasmine, the peony, hydrangea, and chrysanthemum—have their home in Asia, where they flourish in wild luxuriance.

The animal kingdom is also distinguished by the diversity and importance of its forms, more so than in any other division of the globe, especially in relation to the larger quadrupeds. Asia alone possesses the tiger, and has in common with Africa, but of different species, the lion, elephant, and rhinoceros. The tiger, though eminently the tyrant of the jungles in the warm regions around the Bay of Bengal, bears a cool atmosphere, and hence is found high on the mountains, and far to the north, even to the confines of Siberia, but does not appear in the south-western countries. The lion has a much more restricted northerly range, but advances further west, to the banks of the Euphrates, and not so anciently—in Aristotle's time—the lion was found more westerly still, in Thrace and Macedonia. The elephant and the rhinoceros are not known north of the Himalaya or west of the Indus. On the shores of the Arctic Ocean the white bear growls, and the walrus splashes in the waters. Formidable species of the bear family inhabit the northern pine-woods, and a comparatively harmless race appears in the tropical forests, intent upon insects, fruit, and honey. The reindeer and elk, the wolf and fox, with the small fur-bearing animals, are characteristic of Siberia. Troops of the wild horse and ass, with goats, sheep, and varieties of the ox tribe, are prominent on the upland plains and mountains of the central region, some of which never leave the highlands, while others pass between them and the lowlands, according to the season, almost all occurring also, reduced to a state of domestication. The wild ass, high-spirited, fleet, and wary, scours the levels of Turkestan as a summer pasture, and appears on the shores of Lake Aral, but migrates southward in vast troops on the approach of winter to Persia and the borders of India, being impatient of cold. On the contrary, impatient of warmth, the yaik, or Tibetan ox, never quits the keen air of the mountains, can scarcely exist in summer at the height of 8000 feet, and has been met with in small herds at the elevation of 19,000. The camel is distinctive of the lands of great heat, where there is often great drought—India, Persia, Syria, Arabia—though it is met with far to the north, on the confines of Siberia, close to the southern limit of the reindeer. Through all the warmer parts of the continent the hyena and jackal are common, with numerous species of monkeys, the largest of which, the orang-outang, is limited to the Malayan peninsula, and the adjoining islands. The ostrich, king of the birds, inhabits the south-western deserts; the nightingale sings in Persia; but birds of song are generally scarce, while those of splendid plumage abound in the south-eastern districts. All our domestic poultry, except the turkey, originally came from Asia, where they run wild in the woods, with the peacock and pheasant. Both the temperate and the warm regions have dangerous reptiles. The largest saurian, the gavial or crocodile, infests the Indian rivers; the python, an ophidian, sometimes of enormous length, crushing its prey with its folds, haunts the forests and swamps; the smaller cobra-de-capello bites with deadly venom. In the countries of the south-west, locusts occasionally display the power of agents—feeble singly—to commit dreadful ravages by the combined action of myriads. They obscure the sky as with a cloud when on the wing, and alighting upon the fields, destroy the subsistence of villagers, in a few hours, by consuming the crops, with every green thing in their way.

The mineralogy of Asia is rich and varied. Mines were opened within its limits in far remote ages. The mountains of Kurdistan, on the eastern border of the old

Assyrian Empire, have ancient workings from which supplies of copper, iron, and lead were drawn. Mr Layard, during his interesting explorations in the region, visited a disused copper-mine, only known to a few mountaineers, nearly blocked up with earth and rubbish. He found the metal occurring in veins, small crystals, compact masses, and powder, and recognised at once in the latter the material used to colour the bricks and ornaments in the exhumed palaces of Nineveh. Inscriptions on copper, various utensils, figures of lions in the solid metal found in the long-buried halls, bear witness to its extensive use, while it is the ordinary material of tools, daggers, arrow-heads, and armour. Gold, copper, and iron are now obtained from mines in connection with the Ural Mountains; gold, silver, iron, lead, and the finest porphyries from the Altai chain. Tin has been supplied for centuries by Banca Island, in the Indian Archipelago; quicksilver occurs in Tibet, China, and Japan; kaolin, or porcelain earth, and zinc are abundant in China; coal is found in Asia Minor, India, China, and Japan; salt is extensively distributed; the best lapis lazuli, used for ornamental purposes, from which also ultramarine is made, is procured in Bokhara; and Asia has furnished a greater number of precious stones of the more costly kind than any other part of the world. The largest topazes come from Siberia, the finest sapphires from Ceylon, the best rubies from Burmah, and the most valuable diamonds, which are European crown jewels, are of Asiatic origin. The great Russian diamond, placed at the top of the imperial sceptre, formerly adorned the throne of Nadir Shah, and passed from Persia to St Petersburg for 450,000 rubles, about £70,000. The Regent diamond, the property of France, at first set in the crown, and then affixed to the sword of state, was purchased in India by a governor of Madras, and re-sold to the Regent, Duke of Orleans, for about £80,000. But these are exceeded in size and value by the Koh-i-nür, 'mountain of light,' the property of the English Sovereign, originally found in the year 1550, on the banks of the Godavery, in the Deccan. This was long the pride of the Mogul emperors, from whom it passed to Runjeet Sing, ruler of the Punjab, and became British upon the annexation of that territory to the Anglo-Indian Empire.

The inhabitants of this vast continent are supposed to number 650,000,000, equal to nearly two-thirds of the population of the globe, according to the ordinary estimate. They consist almost exclusively of indigenous races, for the descendants of the old Greeks who colonised the shores of Asia Minor, with the Russians, British, and other Europeans in their respective possessions, form comparatively a very insignificant fraction. From the inhospitality of the climate through the entire north, and the large area occupied by towering mountains, chill plateaus, and dry sandy deserts, the people are very irregularly distributed, being thinly sprinkled over Siberia, High Asia, Turkestan, Persia, and Arabia, while densely massed on the rich alluvial plains of China and Bengal. Discriminated by differences of physical conformation, the Asiatics generally are divisible into two great groups of nations. A line drawn from the delta of the Brahmaputra along the Himalaya Mountains, and thence passed westward by the Hindu-Kush to the Caspian Sea and the Caucasus, will generally define their respective geographical positions. South and west of the line are nations belonging to the variety of mankind, commonly, but improperly, called the Caucasian, consisting of the Hindus, Afghans, Persians, Syrians, Jews, and Arabs. On the north and east are populations corresponding to the Mongolian type, embracing the Chinese, Indo-Chinese, Japanese, Mongols proper, Kirghis, and other branches of the Turkish family, with the semi-barbarous native tribes scattered through Siberia. The Malays, in the extreme southern peninsula, and prominent also in the Indian Archipelago, are mainly a Mongolian subdivision.

The first great group embraces two widely-distinct linguistic families—the Indo-

European or Aryan, and the Syro-Arabian or Shemitic. To the former belong the inhabitants of Northern India, Afghanistan, Persia, and Armenia, whose different languages (springing, however, from the same root) are distinguished by a highly-developed system of inflections; to the latter the inhabitants of Syria, Palestine, Mesopotamia, and Arabia, in whose kindred tongues inflections are much fewer. The second group branch likewise into two divisions—the Chinese and Indo-Chinese languages, monosyllabic and wholly destitute of inflections; and the other tongues of the Mongolian nations which are more or less inflexional and polysyllabic.

Among the various forms of religion in Asia, two systems, inveterately hostile, prevail in the south and south-east, where population is the densest, and are remarkable as governing the thoughts and actions of more than half the human race, Buddhism, with perhaps not less than 400,000,000 professors, and Brahmanism, with 120,000,000. The former holds sway in Ceylon, Burmah, Siam, Tibet, Nepaul, the Japanese empire, and over the Mongols generally. The latter is the national creed of India. Yet there is reason to believe that Buddhism was once extensively prevalent for a long period even in India, till uprooted by persecution from the priesthood of the other creed. Among the monuments of past time in that country, cavern-temples occur belonging to both religions, which curiously illustrate their difference, and prove their former contiguity. The deities of Brahmanism are supposed to have often become incarnate, under a variety of forms, sometimes appearing with many heads and hands, or with the heads of animals, and other unnatural combinations, of which there are sculptured representations in the cave-temple of Elephanta, near Bombay. Buddhism, on the contrary, does not recognise a god at all—even in the Pantheistic sense. It is a system of utter Atheism; it knows no beings with greater supernatural power than any man is supposed capable of attaining to by virtue of austerity and science; and a remarkable indication of this startling fact is to be seen in the circumstance that some at least of the Buddhist nations—the Chinese, Mongols, and Tibetans—have no word in their languages to express the notion of God. No Buddhist believes that even Buddha any longer exists. He has reached the blessed goal of existence, and has passed away into *Nirvana*, or Annihilation. The essential idea of this strange religion, which finds no place either for a god, or for the doctrine of Immortality, is that existence is, on the whole, a restless, insecure, unhappy thing, to escape from which is the consummation of felicity, and Buddhism only professes to teach a way to escape—the path to Nirvana. In temples of this faith there are no many-headed and many-handed monsters sculptured, no combinations of man and beast, but simply the images of men in various attitudes, sometimes standing upright, but usually sitting crosslegged in a meditative posture. At no great distance from Bombay, the caves of Kanara, in the island of Salsette, and those of Karli on the mainland, belong to Buddhism; those of Amboli, also in Salsette, and of Elephanta adjoining, belong to Brahmanism; while examples of both kinds occur at Ellora, in the territory of Hyderabad.

The creed of Islam ranks next in the number of its adherents within Asian limits, reckoned at 60,000,000, consisting of all the Arabs, the Turkish tribes, the Persians, the Afghans, and a considerable number of the Hindus, upon whom it was enforced by the sword of invaders. Christianity and Judaism divide a comparative remnant between them. Forms of heathenism linger among the rude natives of Siberia; and Guebres, descendants of the followers of Zoroaster, remain in India and Persia, addicted to sun-worship—

‘Those slaves of fire, who, morn and even,  
Hail their Creator’s dwelling-place  
Among the living lights of Heaven.’

Communities exist in the basin of the Euphrates and Tigris whose usages have a mixed Pagan, Jewish, Mohammedan, and Christian complexion.

The principal countries of Asia are enumerated in the table, with their area and population, but in most instances these elements are approximations merely :

|  | Area in<br>Sq. Miles. | Population. | Capitals or<br>Chief Towns.    |
|--|-----------------------|-------------|--------------------------------|
| Russian Asia—Siberia and Trans-Caucasia, . . . . .   | 5,486,750             | 8,328,000   | Tobolsk, Teflis.               |
| Ottoman Asia—Asia Minor, Turkish Armenia and Kurdi-<br>stan, Mesopotamia and Babylonia, Syria and Palestine, } | 508,800               | 16,050,000  | { Smyrna, Aleppo,<br>Damascus. |
| Arabia, . . . . .  | 1,200,000             | 8,000,000   | Mecca.                         |
| Persia or Iran, . . . . .  | 450,000               | 8,000,000   | Teheran.                       |
| Beloochistan, Afghanistan, Kafiristan, . . . . .   | 390,000               | 5,600,000   | Kelat, Cabûl.                  |
| Turkestan, comprising Bokhara, Khokan, Kündûz, }<br>Khirghis Territory, . . . . .                              | 720,000               | 1,700,000   | Bokhara, Khiva.                |
| India—British, Protected, and Independent States, . . . . .  | 1,383,600             | 90,000,000  | Calcutta.                      |
| Further India—British Possessions, Burmah, Siam, }   | 668,000               | 18,905,000  | Moulmein, Bankok.              |
| Anam or Cochin China, Malaya, . . . . .  |                       |             |                                |
| Chinese Empire, comprising China Proper, Corea, Mant-<br>churia, Mongolia, Tibet, . . . . .                    | 5,393,000             | 415,500,000 | Pekin.                         |
| Japanese Empire, . . . . .   | 210,000               | 30,000,000  | Jeddo.                         |

Burial-place of the English and French killed at Petropaulovsk.

Desert of Gobi.

## CHAPTER I.

### ASIATIC RUSSIA.

USSIAN ASIA comprehends two unconnected tracts, very dissimilar in size, climate, superficial features, and inhabitants.—Siberia, in the north, a vast, monotonous, and dreary region—Trans-Caucasia, in the south-west, a comparatively small district, highly diversified, and splendidly luxuriant. They are separated from each other by a portion of Turkestan and the basin of the Caspian Sea.

#### I. SIBERIA.

SIBERIA embraces the whole northern part of the continent, extending from Turkestan and the Chinese Empire on the south to the Arctic Ocean on the north, and from the chain of the Urals on the west to the coast of the Pacific on the east. A linear distance of 1900 miles may be traversed, due north and south, and one of nearly 4000 miles, east and west. The total area is computed not to be less than 5,000,000 square miles, thus exceeding by one-third that of the entire surface of Europe, while the population does not equal that of Scotland. On the western side, a portion of the country is included in the European governments of Perm and Orenburg. Southerly, in the direction of Turkestan,

no frontier exists; and the policy steadily pursued by Russia is to appropriate as much as is desirable, and can be accomplished. From the Chinese dominions, the general boundary is defined eastward by the river Amur, and westward by the Altai Mountains. This chain, or rather series of ranges, though of moderate elevation generally, rises above the line of perpetual snow in Mount Bielukha, which attains the height of 11,000 feet. Further west, the border has recently been advanced to the northern range of the Thian-Shan, or Celestial Mountains, towards which, settlements of Cossacks and immigrant peasants now make a close approach, all of them dating since the year 1854, when the Russian colonisation of the district commenced.

Lowland plains, declining very gradually from south to north, or towards the Arctic Ocean, occupy an immense proportion of the surface. Some are clothed with dense forests of pine, aspen, larch, and birch. Others, in the west and south-west, are true steppes, with no vegetation for hundreds of miles except a few bushes, willows, and saline plants, but plentifully besprinkled with salt lakes and marshes. The whole northern zone consists of the mossy, rush-grown levels, called *tundras*, swampy in summer, hard bound with ice and snow in winter, which have been styled 'the types of everlasting rest,' from the invariable sameness of their seasonal features, and the impossibility of altering them by introducing cultivation. In the eastern portion of the country, there is greater superficial diversity. Ranges of mountains occur, which are finely clothed with woods in the southerly districts, and enclose fertile valleys. These features are specially characteristic of the region of the Baikal and the Amur. Three great river-systems ramify over the whole surface from south to north, and discharge in the Polar Ocean. The Obi, with its principal arm, the Irtysh, is western; the Yenesei, with its chief affluent, the Angara, is central; the Lena, with its leading tributary, the Aldan, eastern. Further east is the Kolima, with a shorter course, belonging to the same basin, and on the south-east the frontier river Amur flows to the Pacific. A melancholy interest is attached to the Irtysh, on which stands Tobolsk. Its passage is considered the entrance into Siberia Proper, and hence the ferry is the symbol of political death to the exile. In this river perished Yermak, an adventurous Cossack, who began the conquest of the country in the last half of the sixteenth century, during the reign of Ivan the Terrible.

The central Yenesei is distinguished by Lake Baikal, in the upper part of its basin, the drainage of which is conveyed to its channel by the Angara. This crescent-shaped expanse of fresh-water covers an area of 14,000 square miles, and has great depth, with rugged granitic mountains on its borders. The water is remarkable for its clearness and low temperature. It forms part of the great line of communication between the Russian and Chinese Empires, being navigated in summer, and traversed by sledges in the winter season. Though receiving upwards of a hundred rivers, it has only the single outlet mentioned. Lake Balkash, and its neighbour the Issikul, the latter at the base of the Thian-Shan, with many others, have also important magnitude, and the number of smaller dimensions is immense. Both lakes and rivers swarm with fish, while the woods and waters are haunted by myriads of gallinaceous and aquatic birds. The zoology embraces the white and black bear, the wolf and glutton, the reindeer and elk, the fur-bearing species, as the sable, ermine, marmot, marten, beaver, fox, and squirrel, with a valuable race of dogs. Coniferous trees compose the main mass of the forests, and make the furthest advances to the north of the arborescent vegetation. The undergrowth of the woods consists extensively of edible berry-bearing shrubs; and herbaceous plants of large size are common in the less frigid regions, as the species of rhubarb cultivated in Europe for the table, which was originally derived from the temperate zone of Asia.

A Siberian climate has become a proverbial expression for the extremity of rigour.

Over the whole country the reign of winter is long and severe; mercury remains a solid body for two or three months together in ordinary seasons through the north-eastern districts; and snow-hurricanes occur, as sudden as they are violent, which endanger the traveller by completely obstructing his view and obliterating the track. The lower part of the valley of the Lena is the coldest region of the globe. At Yakutsk, in this basin, only a little further north than the Shetlands, the first night-frost, announcing the advent of winter, and withering the leaves of the birch, occurs usually by the 17th of September. The frost becomes unabating day and night by the middle of October, and the river is frozen up by November 2. Throughout January the mean temperature is  $45^{\circ}$  below zero; breathing becomes difficult; and the reindeer hides himself in the depths of the forest. About the beginning of April the first symptoms of thaw in the shade are observed. The last night-frost occurs about 12th May, and the Lena is free from ice by 25th May. During a brief summer, in July, the hottest month, the mean temperature is  $68^{\circ}$ ; and the surface is completely thawed. Scanty crops of the hardy cereals and useful vegetables are then raised. But the heat only penetrates the ground to an inconsiderable depth, three or four feet, below which the soil is perpetually frozen. Though the climate has not this extreme character in the western and southern parts of the country, yet rigour is everywhere its invariable feature, and hence agriculture can only be prosecuted to a very limited extent. In the milder region a few fruit-trees succeed, the gooseberry and cherry. Wheat is grown in the upper part of the basin of the Irtysh, but rye, barley, and oats are principally cultivated, and have in general their northern limit at the parallel of  $60^{\circ}$ .

In compensation for an inhospitable climate and restricted husbandry, nature has been lavish in supplying various kinds of produce independent of the arts of cultivation, such as fish, furs, peltry, metals and precious stones. According to Erman, the minimum amount of the annual take in the fisheries of the Obi may be estimated at 26,000,000, consisting of sturgeons, salmon, herrings, and other migratory species. Great havoc has been made among the animals valued for their furs and skins by the exterminating warfare of the hunter. Some of the most important have nearly disappeared from the western districts, and are chiefly captured in the remote eastern region. Sable furs rank with the most valuable, according to the deepness of their colour; also ermine furs, purely white; fiery-fox furs, of a brilliantly glowing hue; silver-fox furs, of a lustrous gray; and sea-otter furs, remarkably fine, soft, and glossy, are obtained along the shores of the Pacific Ocean. Tribute furs for the emperor are exacted from the native tribes as an acknowledgment of allegiance; and they are rendered of the finest kind by the simple people, under the idea that they will reach St Petersburg. But as they pass through the hands of many individuals, each substitutes an article of an inferior quality, and the tribute rapidly deteriorates in value.

In the variety and amount of its mineral wealth, Siberia is unrivalled, embracing the precious and the useful metals, with some of the rarest gems. The great sites of mining industry are along the base and slopes of the Ural and Altai Mountains. In the former locality, gold is obtained by washing from the sands and gravel on the borders of the streams; copper-ores abound, with noble specimens of the green carbonate, or malachite; but iron, bulging out at the surface, is the first product in point of quantity, and of financial importance. The precious metal is also occasionally met with in considerable masses. Upon the auriferous deposits of the river Miass seeming to be exhausted, new explorations were made in the neighbourhood; particularly along a little stream, the Targana. The search for gold was attended with great success in the marshy plain through which it flows, and the surface was completely turned over, except that part of it occupied by the buildings in which the washing operations were conducted. In 1842 it

was resolved to take down these workshops, and examine the soil, when sands of extreme richness were met with, and a 'nugget' was found weighing ninety-six and a half pounds troy. This mass, of the estimated value of £4000, now in the collection of the *Corps des Mines* at St Petersburg, was the largest known example of native gold prior to the Australian discoveries. The mining prosperity of the Ural dates from the reign of Peter the Great; and originated with Nikita Demidoff, ancestor of the present noble family of that name. His portrait is a favourite subject with humble artists, who usually represent him grasping a sturdy staff as the untiring explorer of the mountains. The woods of the Demidoffs, near Nevyansk, so essential to the smelting of the metals, cover an immense area, and are still untouched to a wide extent, where the elk has not been disturbed. Russians, Germans, English, and other foreigners, are the miners and artisans, as the native Bashkirs and Veguls look upon such employments with aversion. Their only concern, on the arrival of the first adventurers, was to have the fossil remains of the huge animals respected, which were found imbedded in the soil, under a misconception of their character. 'Take from us,' said they, 'our gold, if you will; but leave us the bones of our great ancestors.'

The riches of the Altaï, principally silver, with gold from the sands, copper and lead ores, were not fully disclosed till a comparatively recent date, though the first mine was commenced by the son of the Demidoff mentioned, in the year 1728. It is remarkable that in both the mining districts, decisive evidence exists, in pits and galleries, sometimes containing relics of implements, of their treasures having been freely drawn upon in remote antiquity. Near the silver-mines of the Schlangenberg, or Snake Mountain, there is an ancient excavation extending 1000 feet, plainly artificial; and a stone sphinx, discovered in one of the old workings, of rude construction, is now preserved in the museum of Barnaul. These monuments appear to throw light upon a statement of Herodotus, who, speaking of the Arimaspes, the most easterly Scythians of whom he could obtain any account, refers to their mines of gold, guarded by griffins and monsters, which Humboldt identified with the bones of elephants and other animals at present to be found in the steppes between the Ural and the Altaï. Both districts supply precious stones of great beauty and value, and of many varieties; the emerald, amethyst, beryl, topaz, rose-tourmaline, and garnet; jaspers, deep green, dark purple, dark violet, cream coloured, and striped; porphyries of equally variegated hue, which are made into columns, pedestals, vases, and tables in the establishments of the government. The Alexandrite, a species of beryl, shewing the Russian colours, green and red, received that name from having been discovered in the Urals on the birthday of the Emperor Alexander. A fine topaz from the same locality, in the museum of St Petersburg, measures nearly five inches in length. All precious stones, wherever found in Siberia, are the property of the emperor, but do not always find their way into the imperial cabinets and jewel-cases. Instances of gem smuggling and gold stealing have repeatedly been detected at the mines, in which officials have not infrequently been implicated.

There is a third great mining region, the district of Nertchinsk, in the country beyond the Baikal, rich in lead, quicksilver, tin, zinc, and iron. At quite a recent date, discovery has added plumbago or graphite of the finest quality, highly prized for making lead-pencils, and very rarely found in considerable quantity in any condition, whether fine or coarse, to the known minerals of the country. An extensive bed occurs on the summit of the mountain of Batongul, not far from the Chinese border. To work the mines, criminals convicted of the highest crimes are sent from European Russia, chiefly to those situated in the remotest districts. Minor delinquents, and political offenders generally, are established by themselves in little knots as agricultural

colonists, under regular supervision, restricted as to distance and the use of firearms. This system of deportation dates from the reign of Peter the Great. Not a few statesmen, generals, and authors have shared the banishment, with a host of unfortunate Poles of the middle ranks, guilty of patriotism. The number of exiles is estimated at about 10,000 annually, including the wives who choose to share the lot of their husbands. One-fifth die in the first ten years, owing to change of climate and general hardships.

Fossil ivory is a valuable and curious part of the produce of the country. It consists of the tusks of mammoths, elephants, and rhinoceroses of extinct species, found imbedded in the frozen soil in the lower part of the valley of the Lena, but occurring more abundantly in the islands of New Siberia, or the Liakhov group, in the Arctic Ocean. It is remarkable that the tusks decrease in size and weight from south to north, as if they had been borne to their present sites by some great drift in that direction, which carried the lighter ones the furthest. Those of the islands are the smallest, but are much whiter, and apparently fresher, than those of the continent. The ivory, though of inferior quality to that obtained from the living species, is used in the arts.

The foreign commerce is almost exclusively with China, and is very extensively carried on entirely by barter. Merchants from Pekin bring to the frontier teas, raw and manufactured silk and cotton, all kinds of porcelain, lacquered ware, artificial flowers, toys, ginger, rhubarb, musk, sugar-candy, and other sweets. The greater part of the raw cotton is employed in packing up the porcelain. Camels are chiefly used in the transport of this merchandise across the Mongolian desert to Maimatchin, one of the principal trading

Kasan.

stations on the Chinese side of the border, a journey of about forty-six days from the Great Wall. Furs, skins, metal wares, and other native produce, with European manufactures, are brought to the adjoining Kiachta on the Russian side. These goods are conveyed along the rivers in summer, and overland on sledges, drawn by dogs or reindeer, in winter. They might be transmitted all the way from Kasan, Nijni-Novgorod,

or St Petersburg by water, but owing to the long intervals during which the frost suspends navigation, three summers would be required for the transit. The interior trade is largely conducted at fairs, to which the natives bring their furs, and exchange them for the articles they require.

Siberia is distributed into two vast regions, western and eastern, each of which has a governor-general at its head, and is subdivided into minor governments.

|                         | Governments.             | Chief Towns.                                  |

| " " . . .               | Tchoukchi Country, . . . | Ostrovnoi, Anadirsk.                          |

With two or three exceptions, these places are of unimportant size. They are chiefly built of timber, and would be utterly insignificant but for the public offices and works established by the government, with the barracks of the military.

WESTERN SIBERIA includes the whole basin of the Obi, and the greater part of that belonging to the Yenesei. Enormous forests of coniferous trees are spread over the central and north-western parts of the surface, in which last direction the larch extends to the mouth of the Obi, and the utmost limit of arborescent forms, though the tree is only known in Europe as a native at a southerly latitude, on the mountains of Austria. On the south and south-west, extending to the Caspian and the Aral Lake, are vast steppes, apparently interminable and dismally monotonous, with no elevations but a few low hills, and with scarcely any vegetation except tall rank grass, occupied by wandering hordes of the Kirghis. On the south-east, a change of scenery awaits the traveller in the newly-colonised Trans-Ilian region, as the basin of the Ili, one of the feeders of Lake Balkash, is called. This expanse separates the uniform steppe from the mountain-ranges which lead up to High Asia, in the midst of which Lake Issikul, bounded by the chain of the Alatau on the north, and the Thian-Shan on the south, is cradled. The valleys here contain scenes of surprising beauty and richness; the apricot, pear, apple, plum, and the vine flourish; and while, on the one hand, the landscape fades away from a considerable elevation into the silvery surface of Lake Balkash, and what seems a boundless plain beyond, the eye catches in the opposite direction the dazzling whiteness of perpetually snow-clad heights.

*Tobolsk*, though not the capital, is the largest town, with 20,000 inhabitants, seated on the Irtish, near its confluence with the Tobol. It is much frequented, being on the commercial thoroughfare between European Russia, Further Siberia, and China. The streets are regular and spacious, but the buildings are of wood, with the exception of the cathedral and a few public edifices. It contains a monument to the memory of Yermak, the founder of Russian influence in the country. Tanneries and soap manufactures are the principal industries. *Omsk*, higher up the Irtish, at its junction with the Om, is the most important military station, and the capital of Western Siberia, being the residence of the governor-general. It has only a population of about 11,000, trading with the Kirghis in furs, brandy, and tobacco. A short distance below the town, the Irtish is broader than the Rhine at Cologne, though with a course of 1000 miles still to run. *Tomsk*, a smaller place, on the route eastward, is on an affluent of the Obi, contains a military-school, and is largely connected with the mines of the Altai. *Kolyvan*, in the same district, is remarkable for the extensive jasper quarries in its neighbourhood. There is here a great government establishment for cutting and polishing the jaspers and porphyries, which are worked into tables, vases, chimney-pieces, columns, and ornamental objects for European palaces and mansions. *Barnaul*, an actively industrial town on the south, is the chief smelting-place for the ores of the Altai, the seat of the mining administration, and contains a magnetic and meteorological observatory. *Krasnoiarisk*, on the Yenesei, and the great eastward road, marks the distance of 3197 miles from St Petersburg. The town contains 7000 inhabitants, in possession of herds of cattle and horses; and has a large number of tanneries, a considerable fur trade, and a good collection of Siberian antiquities.

U.S. GEOLOGICAL SURVEY

U.S. GEOLOGICAL SURVEY

*Berezov* has a mournful interest attached to it, as a common place of exile for prisoners of rank, male and female. The small town lies far down the course of the Obi, 400 miles north of Tobolsk, in a cold and dreary region, surrounded with pine woods. At this spot the sun just peeps above the horizon at the winter-solstice, and a day of four hours alternates with a night of twenty, while the light prevailing through seven months of the year is that of the 'half-dark day,' as the Russians call the sombreness occasioned by clouds of mist, sleet, or snow-flakes in the atmosphere. Here, in 1727, when the place was a miserable group of log-houses, Prince Menzikoff, the powerful favourite of Peter I. and Catherine I., was deported. Becoming a devotee, the fallen minister helped with his own hands to erect a little wooden church now gone to decay. He went to the forest, axe on shoulder, to fell trees for the work, then served as bell-ringer in it, and was finally buried before the door of the building, having sunk in little more than two years under the shock of his political overthrow. His resting-place, not marked by any monument, but known through tradition, remained undisturbed to the year 1821, when the governor of Tobolsk had the grave opened. The coffin was found to be imbedded in frozen soil; and owing to this circumstance, after the lapse of ninety-two years, its contents had undergone so little change that pieces of the clothing which wrapped the body were sent to the descendants of the deceased as relics. The site of the wooden hut he occupied is still pointed out near the Spaska Church, the dwelling itself having been destroyed by a fire. A few years afterwards, Osterman and Dolgorouki, both the colleagues of Menzikoff, were banished to the same place, and both like him ended their days at it. It has been said that the flower of the Russian court and army lie buried beneath the snows of Berezov.

*Ekaterinburg*, the first town which the traveller usually enters on passing from Europe into Asia, is perhaps the most interesting, but is included in the European government of Perm. It is the capital of the Ural mining district, founded by Catherine, wife of Peter the Great, and bears her name. It stands at the foot of the mountains, on the banks of a beautiful lake, from the surface of which it is seen to great advantage. The towers, spires, and domes of eight churches, a monastery and a convent, rise with pleasing effect over the public and private buildings, while pine-clad hills appear in the background. The town contains about 16,000 inhabitants, most of whom find employment, as officials or workmen, in connection with the works for smelting and coining metals, polishing and cutting ornamental stones, erected by the government on an enormous scale, and fitted up with machinery and tools from the best English makers. In the *Granulnoi Fabrique*, the sumptuous jasper tables are made, inlaid with different coloured stones representing birds, flowers, and foliage, which adorn the palaces of St Petersburg. The machines in use are moved by water-power, and worked by peasants, who display great imitative genius, and acquire admirable skill in their calling. An amount of labour is bestowed upon a single article, the cost of which would effectually prevent its execution with us, even if the materials were at hand. But owing to the excessively low rate of wages, it is not uncommon for four or five men to be employed upon a table or a vase for several years. In 1853, Mr Atkinson saw a man engaged in carving foliage in a style not to be excelled, whose wages were three shillings and eightpence a month, with two poods or thirty-six pounds of rye-flour for the same period—meat he was never supposed to eat. Another, who received the same remuneration, was cutting a head of Ajax after the antique, in jasper of two colours, in very high relief, intended for a brooch. *Ekaterinburg* has in its neighbourhood the remarkable hill of *Blagodot*, a name signifying 'benefit' or 'blessing,' which is almost entirely composed of magnetic iron ore. This hill rises out of a plain, and presents two rugged naked peaks. A wooden bridge spans the cleft between them, and appears to hang in the air. The lower peak is ascended by a flight of narrow steps, cut in the rock, whence, passing over the bridge, the path conducts to a neat stone chapel on the other eminence. It is related that one of the *Voguls*—the aborigines of the district, communicated the knowledge of this metallic mass to the Russians. The result was the immediate irruption of mining adventurers, whose presence proved so unwelcome to the old inhabitants that they burned their communicative countryman alive on the hill, and erected the chapel, having repented of their cruelty. Very powerful magnets, capable of raising a hundred times their weight, were once procured at this spot, but few now are met with exerting more than a sustaining power of forty times their weight. *Tiumen*, on the road to Tobolsk, has a population of 10,000 engaged in various manufactures, Russia leather, woollen fabrics, and soap, being the principal.

A very rich collection of mineralogical specimens from the Ural and Altai Mountains, with an interesting model of a mine, upon a scale large enough for visitors to enter, is exhibited in the museum of the *Comps des Mines* at St Petersburg. The more remarkable treasures include a single crystal of beryl, weighing more than six pounds, supposed to be the finest specimen in existence, valued at £6500; a piece of native platina, from the mines of *Nuovo Demidoff*, weighing ten and a half pounds, valued at £4300; a block of malachite from *Ekaterinburg*, weighing 4000 pounds, valued at £18,400; and a piece of native gold from the sands near *Miask*, eight inches long and five broad, valued at £26,000. There is also the mass of meteoric iron, discovered by *Pallas* in the last century, on the summit of a mountain in the valley of the *Yenesei*, which, after having supplied specimens to many European museums, still exceeds three cubic feet in bulk.

*Fort Vernoe*, in the Trans-Ilian region, the most advanced post towards the *Thian-Shan*, founded in 1855, has 4000 inhabitants, consisting of immigrant peasants and Cossacks. Timber for building is supplied from the mountain slopes, which, at elevations of from 4000 to 7500 feet, are overgrown with the Siberian fir. The settlement stands at the emergence of a rapid stream from its mountain-bed, which thenceforth flows to join the *Ili*, through a valley clad with natural orchards of apple and apricot. This river descends from the

highlands on the Chinese frontier, and enters Lake Balkash, where it forms a low delta, clothed with reeds of impenetrable thickness, in some places from seventeen to eighteen feet high. From Fort Vernoe, in 1858, M. Sevenof, of the Russian Geographical Society, started to visit the Thian-Shan, and was the first European to ascend the Celestial Mountains. At the foot of the lower range, on the high marshy plain of Santash, or the 'numbered stones,' a pile of them was observed, evidently an artificial heap. A legend of the Kirghis connects it with Tamerlane, who certainly marched his army through the district. Wishing to ascertain the number of his warriors, it is stated that he directed each to take a stone, and deposit it in one place. Thus a colossal pile was formed. On re-crossing the plateau, after a battle, in which, though victorious, his army suffered severely, he directed each survivor to remove a stone, in order to ascertain his loss. To the plateau of the 'numbered stones,' the lower range of the Thian-Shan slopes abruptly, covered with a luxuriant light-green verdure, bright flowers of the sub-alpine zone, with many bushy species, as the mountain-barberry, varieties of the honeysuckle, and the tasteless alpine currant. A hot spring, shaded with trees, was reached at a considerable elevation. It was deemed sacred by the Kirghis, and hence covered with rags of every variety of colour, as offerings to the spirit of the fountain.

The immediate ascent of M. Sevenof was made by the Zauku Pass, a thoroughfare from time immemorial, but a perilous route through the sternest wilds, of which incontestable evidence was observed. 'The horror of the scene,' remarks the traveller, 'was increased by the countless carcasses of camels, horses, oxen, sheep, goats, and dogs that strewed the path in every direction. They occurred by thousands, stretched in every imaginable posture. This frightful picture of death was in harmony with the sublime though fearful character of the scenery, and the icy atmosphere that surrounded us. We were now not more than an hour's journey from the summit, but the principal difficulties of the ascent were still before us. We were soon enveloped by a cloud of snow, and our horses, trembling with fear, continually stumbled over sharp stones and rocky masses, making a dead-stand at the sight of each new carcass. We were at last obliged to dismount and lead them by the bridle. The guide assured us that the difficulty of breathing at the summit was so great, that existence beyond half an hour was impossible. At last we obtained the object of our journey, and found ourselves on the summit of the mountain-pass, where a landscape of unexpected beauty spread out before us. Directly in front were two lakes, covered with ice, already dissolving round their edges. Here I found myself in the very heart of Asia, rather nearer to Cashmere than to Semipalatinsk, to Delhi than to Omsk, to the Indian than to the Northern Ocean, and midway between the Pacific and the Euxine, in about  $41\frac{1}{2}^{\circ}$  north latitude. The fire which we kindled cracked and burned unequally; but I experienced no particular oppression in breathing. Around the lake, flowers of the most brilliant colours, and of the highest alpine zone peeped out from under the newly-fallen and dissolving snow.' The height of the Tengri-Khan, one of the gigantic peaks of the Celestial Mountains, is approximately estimated at not less than 21,000 feet.

The native tribes of Western Siberia consist of Samoiedes in the extreme north, who are thinly sprinkled on the shores of the Arctic Ocean, and belong to the same family as the Finns of Europe. They subsist chiefly by fishing, are an extremely ignorant and degraded race, addicted to forms of the grossest heathenism. South of these, spread over a wide area, are Ostiaks and Voguls, fishers and hunters, who probably belong to the same stock, and are only to a slight extent more advanced. Some have been made by baptism members of the Russo-Greek Church; others profess a mongrel kind of Mohammedanism; but the idlest superstitions are prevalent respecting the power of evil spirits, the effect of charms and magical incantations, while the bear is occasionally honoured with propitiatory rites before the hunter will go out into the woods upon an expedition to destroy him. The immense southern steppes are occupied by the Kirghis, who extend into the Trans-Ilian region, Chinese Tartary, and Turkestan. They belong to the Turkish race, and profess a corrupt form of Islamism. Though claimed as subjects of the Czar, only a few have adopted a settled life as agriculturalists under his protection, and acknowledge allegiance. The majority are completely independent, have their own khans or chiefs, are nomadic in their habits, and wander at will in the territory as their own, which is delineated on maps as Russian ground. For many centuries these nomades have been discriminated as the Great, the Middle, and the Little Hordes, each of which has a particular general location. But the titles have now lost their numerical significance, as the Great Horde has become the least, and the Little Horde the largest. They are supposed to number together 400,000 tents, or to form an aggregate of 1,500,000 persons. Their wealth consists in horses, cattle, sheep, and camels. But they attack merchant caravans, and sell their captives in the slave-markets of Turkestan. A wild

mountain tribe south of Lake Issikul, called the Dikokamanni Kirghises, make war upon their neighbours indiscriminately for the sake of spoil.

EASTERN SIBERIA, a region of immense extent, comprehends the river-valleys of the Lena and Kolyma, the expanse of Lake Baikal, great part of the basin of the Amur, and a vast maritime tract on the Pacific Ocean. The country is mountainous in many parts. It comprises the eastern portion of the Altaï series, with the chain of Saian, and the Jablonovy or Apple range, towards the southern border, while parallel generally to the east coast, the Stanovoi Mountains stretch northward to the shore of Behring Strait. Forests of gloomy pines largely clothe the central portions of the surface. Other trees prominently mingle with them southerly, especially in the direction of the Amur, or the 'Great River,' as the Tunguses call it, while their Mantchu neighbours apply the name of Sagalientula, 'River of the Black Water,' to the stream. This is the most naturally fertile part of the vast province, but it has only become Russian by cession from the Chinese, at a recent date, and is therefore very little colonised. Northward, with every advance, the general aspect of the country becomes increasingly cheerless and desolate, while subject to a winter cold, terrible in its rigour and long duration. Thousands of square miles of this area are very imperfectly known to the authorities, and are not worth exploration, except by the fur-hunter. The most remarkable district is the extensive peninsula of Kamchatka, occupied by a series of lofty active volcanoes, one of which attains the great elevation of 16,000 feet. It now emits smoke and ashes, but was formerly distinguished after brief intervals by grand explosions. The northern members of the Kurile Isles, which stretch out from the peninsula towards Japan, with the north part of Sagalien Island, off the mouth of the Amur, and the singular ivory-bearing Liakov group, opposite to the mouth of the Lena, are included in this division of Siberia.

*Irkutsk*, the seat of the general government, and the head of a bishopric, is an agreeable town, situated on the Angara, the river which drains the Baikal, close to its confluence with the mountain stream of the Irkut, from which the name is derived. It is surrounded with remarkably fine scenery, contains the residence of the governor-general, with the official establishments, a handsome cathedral, various churches, a public library, a museum of natural history, and other institutions. The population amounts to about 19,000, and includes many wealthy merchants, with the best society in Siberia, as it respects educational accomplishments. The climate is healthy, but severe, as mercury freezes in the winter, though the latitude is only 52° 17', corresponding to that of the centre of England. Some manufactures are carried on for the supply of the native tribes, and an oil is prepared from the nuts of the stone-pine. There is also an imperial factory of woollens for the supply of the troops. The first settlement was made at this place by Ivan Pochapof, a Cossack leader, in the year 1661. The town is 3842 miles from St Petersburg; and hence its Russian inhabitants are nearly equidistant from their own capital and the earth's centre. The transmission of letters by post requires twenty-four days; but telegraphic communication was opened throughout in December 1863. The first dispatches left *Irkutsk* at noon, and reached St Petersburg at 8.30 P.M. *Kiachta*, about 200 miles on the south-east, is close to the Chinese frontier-town of Maimatchin. The place is small, but a highly-important seat of trade, fitted with storehouses for the reception of goods. A mart on neutral ground denotes the actual frontier of the two empires. A door on the northern side opens into the Russian dominions, and an opposite one into the Chinese. At sunset a bell is rung when transactions terminate, and both parties retire within their respective boundaries. Intercourse is maintained between them by the use of a Mongolian *patois*. No money passes. Tea, made up into bricks or cakes, called 'brick-tea,' is the standard of value. An immense quantity is imported into Russia by this overland route, of better quality than what is known in Europe generally, being the first crop, undeteriorated in flavour by a long sea voyage, but of a higher price, owing to the expense of the land transit. *Nertchinsk*, in the Trans-Baikal district, is in the midst of lead and quicksilver mines, to which the worst criminals are consigned.

*Yakutsk*, on the left bank of the Lena, is nearly 5000 miles distant by road from St Petersburg, 1100 miles north-east of *Irkutsk*, and 700 miles from *Okhotsk* on the shore of the Pacific Ocean. It is surrounded by extensive forests and marshes, remarkable for the intensity and duration of its wintry cold, which political offenders of rank have been doomed to experience by exile in this dreary site also. Of M. Mouravioff, who was sent here for his share in the conspiracy at the accession of the Emperor Nicholas, the officer in charge of him reported, in reply to an inquiry from the governor-general as to how he spent his time, 'He sleeps—he walks—he thinks.' The town is small, containing only 3400 inhabitants. But it is the centre of the fur

trade of Eastern Siberia, and has important traffic in ivory obtained from the walrus of the Arctic Ocean, as well as in the fossil kind procured from the remains of extinct animals found imbedded in the frozen soil of the Lena valley. The place puts on an animated appearance in the summer months when annual fairs are held. The native hunters then bring in their tusks, skins, and furs; and manufactured goods arrive from Irkutsk by the river to be exchanged for them. A month is required for their passage. They reach the Lena by an overland transit of about 100 miles, and are embarked at a point where the river is as broad as the Thames at London, though with a course of more than 2000 miles still to be accomplished. Butter is also brought by the natives to the Yakutsk market, which is forwarded on horseback through 700 miles of swamps and woods to Okhotsk, wholly dependent upon this distant supply.

*Okhotsk*, a naval port and trading station of the Russo-American Fur Company, on a vast arm of the Pacific, contains government offices, a church, ship-yard, and log-built houses, the whole forming a mere village in size. It rests upon a mass of shingles, one effect of which was not foreseen by its founders, but is related by a visitor. 'The church is the most lone and wretched imaginable. It stands apart from the houses upon a little elevation of the shingles, and has a burial-ground attached to it, the rails of which were however falling down for want of solid earth to sustain them. Moreover, we heard afterwards that it was impossible to place the remains of the dead out of reach of the wolves, by which they were continually raked from the shingles amidst which they were laid.' *Port Aian*, another station of the Fur Company, is further to the south. *Nicolaevsk*, a settlement at the mouth of the Amur, dates from the reign of the Emperor Nicholas, founded with the design of making it the principal Russian station on the Pacific Ocean. *Blagoveshensk*, far inland up the river, is the seat of government for the territory of the Amur, but has not yet gained the slightest consequence. Great recklessness has been displayed in attempting to open up the navigation of the river, and by it establish easier communication between the interior of Siberia and the Pacific. In 1855 about 400 infantry were ordered to ascend the stream in barges, as far as possible, and make their way to *Kiaichta*. They set out late in the season, furnished with an insufficient supply of provisions, and soon found themselves in a very sparsely peopled country, wholly solitary through great distances, when they were overtaken by the winter. They all perished of hunger, exhaustion, and cold, except eleven, who survived by subsisting on the bodies of their fallen comrades. *Sagalien* island, off the mouth of the Amur and the coast of Manchuria, separated by a narrow channel, is upwards of 500 miles long, but very contracted; and is apparently a valuable territory. The northern half is Russian, and the southern Japanese. Its native population are an abject race grovelling in the depths of barbarism. Of the *Kurile* islet-chain, extending between Japan and Kamchatka, twenty-two in number, the three southernmost belong to Japan, and the remaining nineteen to Russia. They are all volcanic, and possess fur-bearing animals.

*Petropaulovski*, the 'Port of Peter and Paul,' on the east coast of Kamchatka, is the Russian headquarters, naval and military, in that peninsula. It occupies an agreeable nook adorned with pine-woods, possesses an excellent harbour, but is often disturbed by earthquakes, and has an active volcanic crater in the background. Three interesting memorials of distinguished navigators are erected at this remote spot—one to *La Perouse*, the Frenchman, who sailed on the adjoining waters, and perished in the southern seas; a second to *Behring the Dane*, who discovered the strait which bears his name, and died after shipwreck on a neighbouring island; a third to *Captain Clerke*, the companion of *Cook* in his last voyage, who, after the violent death of his superior, here succumbed to disease, and was interred. The officers of *Sir John Franklin's* unfortunate expedition, in their last communications home, fully expecting to make the North-west Passage, requested future letters to be addressed to them at *Petropaulovski*, *via* *St Petersburg*. In 1854, during the war, the place was unsuccessfully attacked by the Anglo-French fleet. It was afterwards abandoned by the Russians in expectation of the arrival of a larger force, and the fortifications were destroyed, but they have since been restored. The Kamchatkan peninsula has a milder climate than the interior of the continent at the same latitude. It has been held by Russia since the close of the sixteenth century, contains a very sparse native population, and possesses a peculiar breed of dogs, half mastiff and half wolf in their appearance and habits, but differing from both in the sound of the voice, which can scarcely be described, except as not corresponding either to the bark of the one or the howl of the other. They are tractable to their masters, but are not so much won by kindness as restrained by authority. In winter they cheerfully work hard, drawing the sledges for journeys of several days or even weeks in succession, with very little food; and are thus as valuable to the Kamchadales as the horse or the bullock to the civilised nations.

The aborigines of Eastern Siberia belong to various tribes like those in the western division, and correspond to them in modes of subsistence, wandering habits, paucity of numbers, gross ignorance, and low social condition. Though generally following fishing and the chase, yet many possess large herds of reindeer, and lead a more settled life. The *Buriats*, dwelling around *Lake Baikal*, are of Mongol origin, and are said to be the most numerous, though only reckoned at 150,000. They adhere to forms of Buddhism, as do the *Tunguses*, who are spread over the country eastward of the *Lena*, blending with

them rites analogous to fire-worship. Upon assembling at the annual fairs, they light enormous bonfires by night, and dance wildly around them, while the priests perform religious ceremonies as if to propitiate favourable commercial transactions. Some of the Yakutes in the lower part of the Lena valley, and the Kamchadales in their peninsula, have nominally embraced Christianity, but retain old superstitions, and cling to ancestral habits in all their rudeness. The Tehukchi, who occupy the extreme north-eastern angle of the continent, are pagans, bold and warlike, completely independent of Russian control. They occasionally visit the post of Anadirsk for the purpose of barter, but all attempts to subdue them, and occupy the country beyond this station, have hitherto been repulsed with loss. The name of these people is said to signify a confederation or brotherhood. But less is really known respecting them than of almost any other race on the face of the globe, considering that Behring communicated with them nearly a century and a half ago, and Cook touched on the coast. Lieutenant Hooper a recent visitor, discriminates two races, the Reindeer Tehukchi, or natives proper, chiefly in the interior, and the Fishing Tehukchi, an alien tribe, limited to the shores, with a dialect allied to that of the Esquimaux.

The climate of the regions of the Amur is influenced by two causes; first, its position at the eastern extremity of a large continent; and, secondly, by its being washed, towards its lower part, by the Pacific Ocean. The features of a continental and maritime climate being thus blended, the cold during winter is less severe, nor is the summer so warm as in other places under the same parallel. At the confluence of the Bureya, in  $130^{\circ}$  east longitude and  $48^{\circ}$  north latitude, thick fogs hang upon the river in August, and the nights are cold. In 1857, the first snow fell on the 6th October, and the temperature on the 24th was 23 degrees Fahrenheit; but by the 2d November, the snow had disappeared; by the 13th November, the river was frozen, and the glass had fallen to 10 degrees.

The Bureya Range, at the Mouth of the River Bureya.

Tiflis.

## II. TRANS-CAUCASIAN PROVINCES.

Trans-Caucasia, or the country beyond the Caucasus, as viewed from the European side of the range, is situated between the Black Sea and the Caspian, and is subject to the sway of Russia as far to the southward as the borders of the Turkish and the Persian Empires. The grand mountain-chain runs in a very diagonal line from the one sea-basin to the other, north-west and south-east, which gives it an extent of about 700 miles, while its peaks rise to a stupendous elevation, the loftiest, Mount Elburz, nearly central, attaining the altitude of 18,400 feet. The next highest, Mount Kasbeck, to the eastward, is 16,500 feet. A military road is carried through a defile on its slope, and is the only carriage-way across the Caucasus, but is traversed with great difficulty in the winter season. This great range sends off numerous spurs and branches southerly, which ramify over the country, enclose lovely river-valleys, which almost link themselves with the mountains of Armenia. The whole region is eminently beautiful and fertile, with the exception of tracts on the Caspian, which are sterile plains, sandy, saline, or bituminous. Vegetation is very diversified and vigorous; and magnificent trees appear at an extraordinary elevation. Oaks, beeches, elms, and limes, of great size, crown the summits of dizzy heights, which, in less favoured climes, would exhibit the dark foliage of the pine. The yew, chestnut, and cherry are rarely seen elsewhere of equal magnitude; the common box-tree is a perfect giant of the forest; the juniper attains such dimensions as to be fifteen feet in circumference; and rich varieties of fruits and flowers grow in wild luxuriance on the lower grounds. The stag, antelope, wild boar, and wild goat are common animals. Nothing seems wanting in the outward aspect of the country but the picturesque moss-grown castle, the ivy-clad abbey, and the neat English-looking village, with its church tower or spire, in connection with a well-governed and instructed people, to render it one of the most charming in the world.

The largest river, the Kur, ancient *Cyrus*, enters the Caspian, after receiving the Aras or *Araxes*, which, for a considerable distance, forms the frontier line from Persia. On the side of the Black Sea the principal streams are the Ingur and the Rion. The latter is the *Phasis* of antiquity, which had a temple at its mouth, with cities and bridges on its banks. No remains of by-gone civilisation are extant at the spot, which is now occupied by the small modern village and fort of Poti. But, says Lieutenant-general Monteith, 'there was formerly here a preserve of pheasants, which birds derive their European name from the river Phasis, the present Rion.' The neighbouring district represents the Colchis of the pre-historic age, which the Argonauts are said to have visited in order to obtain the golden fleece, a relation which may have historical basis in some real voyage, commercial or piratical, of the early Greeks.

The Trans-Caucasian provinces form the four modern governments of Kutais, Tiflis, Shamaki, and Derbend; and embrace an area of about 80,000 square miles. But the names of the old divisions of the country maintain their hold on local remembrance, and are most familiar generally—Abassia, Mingrelia, Imeritia, Georgia, Shirwan, and that part of Armenia which has been absorbed by the Russian Empire.

ABASSIA is a narrow slip of territory lying along the north-east coast of the Black Sea, intersected by ridges sloping from the inland mountains, everywhere presenting the finest scenery, especially as seen from a little distance off shore. There are no towns, and only a few Russian posts on the coast, with highland villages in the interior, now largely deserted by the martial mountaineers, who have retired into Turkey rather than submit to the power which has so long oppressed them. In the defile of Jagra, the house occupied by Elijah Mansur is pointed out, who so strenuously exerted himself, towards the close of the last century, to unite the tribes of the highland isthmus in a common league, in order to cope with their northern antagonists with the greater chance of success. This extraordinary man, like his successor Schamyl, united the character of warrior, prophet, and priest, but was far superior to him in capacity and power. To this favourite cot in the defile he retired, when not engaged in war, where multitudes visited him to hear his discourses, which taught a more tolerant form of Islamism than that announced in the Koran, as well as to profit by his skill in medicine. His memory lives in songs; and a wild legend is current, that because he was not a true Mussulman, he has been condemned to imprisonment in the bowels of a mountain, but is to re-appear at the expiration of a hundred years, and wave his conquering sword to the terror of the Muscovites.

'He was born to tread the Moscov's pride  
Down to the lowly dust;  
He fought, he conquered, near and wide  
That northern race accurst.

The swift deer bounds from hill to hill,  
No arrow like its flight;  
But Mansur's step was swifter still,  
When he led on the fight.'

MINGRELIA, a maritime district immediately to the south, and IMERITIA, inland on the east, are comprised within the basin of the Rion. The fine region of GEORGIA extends southward from the central and highest portion of the Caucasus, and is entirely inland.

*Kutais*, in Imeritia, the head of the government, is a small town containing many Armenians and Jews, who monopolise the trade. *Tiflis*, the capital of Georgia, and of Trans-Caucasia in general, occupies both banks of the Kur, the best or Russian portion being on the western side. It contains about 37,900 inhabitants, but is enlivened with the noise and bustle of crowds of people from the neighbourhood. There are manufactures of carpets, silks, and shawls, celebrated hot baths, and an ample supply in season of exquisite fruits, as peaches, apricots, almonds, figs, and grapes. In many houses of the natives, common

paper, or oiled paper, may be seen as a substitute for glass in the windows, or the doorway answers the purpose of a window. Tiflis is about 1750 miles from St Petersburg. From hence starts the military road across the Caucasus, following the valley of the Kur, and its affluent the Aragna, until it enters the mountain region, which is traversed by the pass known to the ancients as the *Porta Caucasica*, now commonly called the Pass of Dariel. This is a series of tremendous defiles, extending altogether not far short of 100 miles, often so contracted as scarcely to afford room for the waters of the Terek to foam through on the northern side. Dariel is a miserable fortress, on a nearly isolated rock at one of the narrowest points, but a position which might easily be defended against any force that could be brought to bear against it. At the summit of the pass, the Kreuzberg, or Mountain of the Cross, 8000 feet above the sea, a stone monument commemorates the completion of the road in the year 1809. But the route was taken by General Toklabene in 1768 with a convoy of ammunition and stores. The descent of avalanches, torrents, and masses of schistose rock, are the natural dangers to be apprehended in this pass, especially after a thaw.

The imbecility of the native princes of Georgia threw them into the toils of Russia as suppliants for help in political difficulty, and they ceded their independence to gain it. Upon the death of Gourgheen Khan, sometimes styled George XI., in 1801, the Emperor Alexander incorporated the country as a province of his empire, appointed a governor-general, and to secure quiet submission he directed the widowed queen and other branches of the royal family to be sent to reside in Russia. This event did not transpire without a tragedy. General Lazaroff, charged with the execution of the office, found the queen obstinate; and when the carriages were ready, she refused to move. Placing his hand upon her to enforce compliance, the indignant woman drew a dagger, and stabbed him to the heart. A few months afterwards, she was on the banks of the Neva, with her sons and daughters, prisoners of state, and objects of curiosity to the people. Imeritia and Mingrelia were occupied in 1808, and subsequently incorporated.

The Georgians, like the Circassians, have long been celebrated for the athletic frames of the men and the beauty of the women. Hence there was formerly a large demand for both sexes, the males to serve in the armies, and the females to occupy the harems of the Turks. Nor has the traffic in the women ceased, or is it objected to by the parties concerned, though opposed by the Russian government. The girls, fascinated by the thought of a luxurious life in Constantinople, are reconciled to appear in the slave-market, while the consent of parents is won by a stipulated money value. A local legend at Gori, north-west of Tiflis, oddly refers the beauty of the women in part to an English origin. Allah, it is said, wished to stock his celestial harem with the fairest daughters of earth. He therefore commissioned an Imam, who was a good connoisseur in female beauty, to cull for him forty of the loveliest women he could find. The Imam journeyed into Frankistan, into the country of the *Inglics*, whence he carried off the king's daughter. The English monarch pursued him, but Allah, who protected his servant, threw dust in the eyes of the pursuer, and thus checked him. From England the Imam proceeded to Germany, where he selected many lovely maidens; but when he came to Gori, he fell in love with one of the beauties he had chosen for the celestial harem, and remained there with the whole bevy. Allah punished the treachery of the Imam by death, but the beautiful maidens all remained in Gori, and became the mothers of a splendid race of mortals.

The majority of the Georgians are not Mohammedans, as might be inferred from the legend, but only some of the mountain tribes. They belong to the Greek Church, and both clergy and people are abundantly ignorant and superstitious. Their old sovereigns lie buried in the cathedral of Msket, the place of their coronation. Over the grave of the last, Alexander caused a monument to be erected, with an inscription mentioning the cession of his territory. The emperor likewise restored to the people the cross of their patroness, St Nino, by way of conciliating them. According to ecclesiastical tradition, this female missionary came into the country, in the fourth century, to diffuse the true faith, bearing a cross made of the vine bound with her hair. Holding this symbol in her hand, she preached the doctrine of the evangelists. The cross was afterwards carefully preserved by the kings, who, when absent, deposited it in the cathedral of Msket, and in times of invasion retired with it to the mountains. The venerated relic found its way to Moscow at an early stage of the intercourse between Georgia and Russia; and its return had been solicited without success, till upon the annexation the emperor sent it back as a cheap benefaction to his new subjects, and a prized offering.

The province of SHIRVAN, formerly part of Persia, extends along the shores of the Caspian, and consists generally of a series of plains, well watered in the south by the lower course of the Kur, but in many places very unhealthy. The summer temperature is remarkably high. When Peter the Great made his ineffective campaign in this district, his soldiers suffered so grievously on the march from the intolerable heat that many of them dropped in the ranks. Wearing a dimity waistcoat, a white night-cap, with a plain flapped hat over it, the czar shared their fatigues, and trudged at their head, occasionally mounting an English pony.

*Baku*, a small walled town on the coast, defended by two forts, is one of the principal ports on the Caspian. At its gates, in 1806, Prince Zizianof, the first governor-general of Georgia, was shot dead by the treacherous commandant, who had invited him to a conference, with the expectation of delivering up the place into his

hands. The body was removed to Tiflis, and interred in the cathedral. The town stands on the southern shore of the peninsula of Apsheron, celebrated for its mud volcanoes and springs of naphtha, which yield annually upwards of 4000 tons. The naphtha issues from natural crevices in the ground, as well as artificial holes, and readily ignites. These springs are the

‘Fountains of blue flame  
That burn into the Caspian.’

In their vicinity is the Field of Fire, about half a square mile in extent, from which inflammable gas is continually escaping. From remote antiquity to the present, this spot has been held in the highest veneration by the Guebres or Parsees, fire-worshippers, and visited by thousands of the race. There are still fire-temples at the place, and a few pilgrims from Persia and India.

RUSSIAN ARMENIA, sometimes called the district of Erivan, lies to the south of Georgia, extends to the Aras, and has a small south-western portion beyond the river. This last embraces the highest point of the colossal mass of Mount Ararat, where the Russian, Persian, and Turkish Empires are in contact. The country is for the most part a high plateau, and contains the large fresh-water lake of Sevan. Rapidly overrun by Prince Paskiewitch, the Persian part was ceded in the year 1828, and the Turkish in 1829.

*Erivan*, the capital, a poor town, but with an extensive caravan trade, and an important military position, occupies an elevated plain upwards of 3000 feet above the sea. Taken by storm by the general mentioned, he received in consequence the surname of Erivanski. About thirty miles to the south, Ararat, traditionally called the mountain of Noah, and regarded as the resting-place of the ark, but without the slightest authority from Scripture, rises majestically 14,320 feet above the plain, far above the snow-line, and has a total elevation of 17,323 feet above the sea. In harmony with the tradition referred to, a small town on the south-east has the name of *Nakhitchivan*, ‘first place of descent,’ as the spot where the patriarch fixed his first residence after the subsidence of the waters. Turks and Persians know nothing of Ararat by that denomination, but call it *Agri-dagh*, supposed by some to mean ‘the painful mountain.’

From its isolated position on the plain, which in comparison with itself has but a moderate elevation, this celebrated mountain reveals by far the greater part of its height and mass at once to the spectator, and is a sublime object. There are two summits, Great Ararat and Little Ararat, the latter upwards of 4000 feet lower than the former. They gradually slope to a blending in a common mass, while the peaks are seven miles apart in a direct line. For a short time the snow annually disappears from the top of the lower, but never from that of the higher. Great Ararat was ascended for the first time by Professor Parrot, October 9, 1829, who found the summit a gently-vaulted surface, about 200 paces in circuit, formed of eternal ice, without rock or stone to interrupt its continuity. It was next scaled by M. Abich, July 29, 1845, with six companions, who remained a full hour at the elevated point. The north-east slope of the mountain is the shortest, measuring about fourteen miles, on which there is a deep, gloomy, crater-like chasm, which can be seen from Erivan. Near this chasm, previous to a grave disaster, stood the large and beautiful village of Arguri. Its inhabitants cultivated the vine, believing, according to tradition, that Noah first planted it at the spot, and hence the Armenian name of the place, *argh*, ‘he planted,’ *urri*, ‘the vine.’ At a short distance, but higher up, was the monastery and chapel of St James, on a grassy platform.

The chronicles of adjoining monasteries extend back over a period of eight centuries, but are silent as to disturbance in the instance of Ararat, though the volcanic character of the mountain is not doubted by travellers, owing to the products on its slopes, consisting of trachytic porphyry, pumice-stone, and varieties of lava. The complete demonstration came on the 2d of July 1840, when a rent was formed at the upper end of the great chasm, which played the part of a crater. A little before sunset, with the atmosphere clear and calm, the inhabitants through a wide extent of Armenia were alarmed by a thundering noise, which was loudest in the vicinity of Great Ararat. An undulating motion of the earth was felt. Pillars of vapour or smoke rose from the point indicated, and quickly overtopped the mountain. Stones, earth, and mud were projected over its slopes, and fell into the plain. The vapour exhibited prevailing blue and red tints for a time. Its colour then changed to the deepest black, and a strong smell of sulphur was diffused through the air. Masses of rock were discharged upwards of fifty tons in weight. The eruption continued a full hour, accompanied by subterranean explosive sounds, and the noise caused by the stones whizzing with immense force through the air, crashing against each other, and falling to the ground. The village of Arguri and the monastery of St James perished, through being overwhelmed by the projectiles. Of their inhabitants, consisting of 1500 Armenians, 400 Kurdish servants, and 8 monks, only 114 escaped, who were at a distance from the immediate scene of the calamity. Erivan, Nakhitchivan, and other towns were injured severely by the earthquake; and 6000 houses were laid in ruins.

The Armenians of this district, like their brethren elsewhere, are addicted to trade, generally honest in their dealings, and though great ignorance prevails among them, it is not so gross as that in which their neighbours of the Greek communion are involved.

The ecclesiastical capital of the entire community, Etchmiadzin, is thirteen miles to the east of Erivan, in the valley of the Aras. This is a monastery where the head of their church resides, the primate, patriarch, or catholicus, near a considerable village. Externally it has the appearance of a quadrangular fortress, being surrounded with a lofty wall, entered by four gates, and flanked by towers, which, as well as the walls, are furnished with loopholes. It contains a church said to date from the time of St Gregory, 'the enlightener,' with a seminary, printing-press, and library, the latter to some extent useless, as it includes Latin and Greek books, which none of the monks and priests are able to read. A remarkable people, some of the Yezidis, who are reputed to be devil-worshippers, wander in summer in the region around Ararat, live in tents, but resort to the villages in the winter season. They deny the imputation, but maintain secrecy respecting their usages, and hence may have had practices ascribed to them of which they are innocent. It seems true, that believing in the existence of two powerful agents, the one good, the other evil, they carefully abjure the use of those expressions in relation to the latter, which are in common use, and convey ideas of horror or contempt.

Anapa, with the Abasian Mountains.

Coast of Anatolia.

## CHAPTER II.

### ASIATIC TURKEY.

THE Asiatic portion of the Turkish Empire is far more extensive than the European, embracing at least double its area, but containing a much smaller proportionate population, as vast tracts have no permanent inhabitants, though they are the temporary camping-grounds of nomadic tribes. It includes countries situated at the upper extremity of the Mediterranean, which form also the eastern side of the Greek Archipelago, the southern shore of the Black Sea, and extend thence to the north coast of the Persian Gulf. The region thus lies between the arms of two great oceans, the Atlantic and the Indian; and is of geographical interest as a central part of the Old World, while of the highest historical distinction as the theatre of most of the important events which mark the early annals of the human race. Trans-Caucasia, Persia, and Arabia form the inland limits, but on the side of the latter countries the frontier is very indefinite. The greatest linear distance, east and west, between Mount Ararat and Cape Baba on the Archipelago, measures 950 miles; in the opposite direction, the Black Sea and the south of Palestine are separated by an interval somewhat exceeding 800 miles; but a diagonal line, drawn from north-west to south-east, or from Scutari on the Bosphorus, to the head of the Persian Gulf, will extend over 1400

miles. The entire area embraces considerably more than 500,000 square miles, and is included between latitude 30° and 42° N., longitude 26° and 48° E. This territory is commonly supposed to contain the natal seat of mankind, as well as the centre from which the post-diluvians dispersed themselves. The great events which distinguish the annals of Judaism and the rise of Christianity transpired within its bounds, where also the old Assyrian and Babylonian empires—with their renowned capitals, Nineveh and Babylon, whose remains excite the curiosity and wonder of the present age—rose and perished. Cyrus and Alexander triumphed in decisive battles upon the soil. The ancient Greeks extensively colonised the maritime districts, where their degenerate descendants are now numerous in the ports, as well as in many inland towns and villages, by the side of ruined monuments of the taste and art of their forefathers, the fragments of temples and sepulchres.

Ottoman or Turkish Asia consists of four principal geographical regions—Asia Minor, Turkish Armenia and Kurdistan, Al-Jezireh and Irak-Arabi (corresponding to ancient Mesopotamia and Babylonia), Syria and Palestine.

#### I. ASIA MINOR.

The Lesser Asia, one of the finest countries in the world, is a peninsula projecting from the main mass of the continent towards Europe, which is very closely approached at the channels of the Bosphorus and the Dardanelles. It is enclosed by the waters of the Black Sea on the northern side, and has the Archipelago on the west, with the Mediterranean on the south. The coast-line abounds with gulfs and bays, bold headlands, and striking rock scenery. But generally the maritime region consists of a belt of fertile lowlands, of varying breadth, frequently very narrow, at the foot of high table-lands which occupy great part of the interior, and are both intersected and bounded by chains of mountains. The best defined range, that of Taurus, runs from east to west, parallel to the Mediterranean, and sends out offsets in its direction, against some of which the waves play or dash in hours of calm or storm. One of these points, on the south-west, anciently bore the name of Climax, or the 'Ladder,' in allusion to the regular gradation with which the heights rise one above another as they recede from the shore. The place figures in the campaigns of Alexander the Great, and can be identified. In ordinary circumstances there was no passage along the beach, but when the wind blew strongly from the land, causing a retirement of the waters, it might be traversed, though the enterprise was perilous. Availing himself of a favourable breeze, the king pursued this course in order to avoid a tedious journey across the ridge. The adventure was safely conducted, but the soldiers had to wade in places deeply through the water, and had an adverse gale arisen, the victor at the Granicus would never have seen another battle-field. An eastward interior outlier of the Taurus, near the modern town of Kaisariyeh, is the highest point of the peninsula. This is the volcanic snow-crowned cone of Mount Arjish, the ancient *Argæus*, which rises from a broad and extensive base to the height of 13,100 feet above the sea. It was ascended by Mr Hamilton in 1837, who met with the effects of volcanic action all the way up, and found at the summit two large and contiguous craters, containing deep unbroken snow. In the western part of the country, which has been shaken by earthquakes in the modern epoch, the evidences of volcanic action are very decisive, in numerous hot springs, and the remarkable 'burned region,' so styled by the Greeks from its monuments of fiery activity in past ages.

The table-lands have a mean elevation of from 3000 to 4000 feet above the sea, but the plain of Kutaiah attains the height of 6000 feet. These are dry and treeless tracts, in many parts sterile, in others clothed with excellent pasturage. But the slopes of the high

mountains, with the crests of the inferior ridges, and also a considerable extent of the maritime lowlands, are forest clad. A range parallel to the coast of the Black Sea has noble woods of ash, elm, plane, poplar, larch, beech, and oak, called by the Turks *Agatch Degnis*, 'the Sea of Trees,' extending through more than a hundred miles in length by forty in breadth, which supplies timber for their navy. The rivers are numerous, but have generally short courses, owing to the close approach of the highland interior to the sea; and their volume is not considerable, except during the winter rains, when they become ungovernable torrents. In the heat of summer they mostly dwindle to insignificance, and the channels of many are in places wholly dry. The largest example, the Kizil-Irmak, 'Red River,' is the *Halys* of antiquity, and flows to the Black Sea, which receives also the *Bartin* (*Parthenius*) and the *Sakaria* (*Sangarius*). On the side of the Archipelago are the *Bakir* (*Caicus*), the *Kodus* (*Hermus*), and the *Mendere* (*Meander*). The Mediterranean has connected with it the *Tersus* (*Cydnus*), the *Sihun* (*Sarus*), and the *Jihun* (*Pyramus*).

Several of these rivers, with some of their affluents, and other very minor streams, are celebrated in history under their old classical names. The *Halys* was the boundary between the Lydian monarchy under *Cresus* and the Median under *Cyrus*, on the banks of which the first battle was fought in the struggle between the potentates, which eventually transferred the sceptre of Asiatic dominion from the former to the latter. The defeated king had interpreted an oracle in his own favour, which stated, 'By crossing the *Halys*, *Cresus* will destroy a mighty power'—an ambiguous response as much susceptible of an adverse as of an auspicious signification. From the *Pactolus*, a gold-bearing runlet, which descended from adjoining heights to his capital, *Sardis*, he is said to have derived much of the wealth now proverbially associated with his name. The rivulet still flows to join the *Hermus*, but its auriferous sands have vanished, along with the city on its banks. The *Granicus*, a stream of no natural importance, which *Mount Ida* contributes to the *Sea of Marmora*, witnessed the first triumph of *Alexander* over the army of *Darius*. Bathing in the *Cydnus*, while oppressed with heat and overcome with fatigue, the conqueror contracted a fever, which for a time threatened to prove fatal. On the plains through which it flows, the heat of summer is fiercely felt, while the cold and snow of winter still mark its sources on the *Tauric highlands*. Hence till the warm season is sufficiently advanced it descends with a temperature in striking contrast with that of the atmosphere at the lower level. The *Cydnus* actually occasioned the death of the Emperor *Frederick Barbarossa* during the *Crusades*, but no property belongs to it except what is common to rivers which descend quickly from cold elevated uplands into burning plains. Modern travellers have sustained no inconvenience from repeating the experiment. 'We found the water,' remarks *Captain Beaufort*, 'undoubtedly cold, but no more so than that of other rivers which carry down the melted snow of *Mount Taurus*; and we bathed in it without feeling any pernicious effects.'

Salt-lakes and beautiful fresh-water expanses are numerous distributed over the surface of *Asia Minor*. On the plain of *Konieh*, the shallow salt-lake of *Koch Hissar*, with a circuit of about ninety miles, is one of the most remarkable of its class. The water is so extremely saline that no fish can live in it; no aquatic birds visit it, as their wings would become stiffened by the mineral; and anything thrown in is speedily coated. The remains of a causeway, built across the lake by *Sultan Selim*, are now almost concealed by an incrustation. The salt is a government monopoly, farmed by the *Pasha of Konieh*, who disposes of it. Among the other minerals are copper and argentiferous lead, productive mines of which are worked. Coal of excellent quality occurs in abundance near the shore of the *Black Sea*, in the vicinity of *Erekli*, which represents the ancient *Heraclea*. The field extends from seventy to eighty miles, and belongs to the true carboniferous formation. It was opened and wrought under English direction during the *Crimean war*, for the supply of the steam navy, and is of obvious importance to navigation on the adjoining waters. In the neighbourhood of *Konieh*, the peculiar earth, the *meerschaum*, literally 'sea-foam,' of the Germans is quarried, and is locally used like fuller's-earth with ourselves, in addition to its well-known appliance to the manufacture of tobacco-pipes. Loadstones, found near *Magnesia ad Sipylum*, first received the name of magnets after that of the town. *Jet*, the bituminous mineral, was similarly named from a river in the *Lycian province*, the *Gages*, on the banks of which it was collected by the ancients. It was originally called *gagates*, which passed by successive corruptions into *gagat* and *jet*. The most valuable animal native to the country—the *Angora goat*, has a limited range on one of the high upland plains, west of the *Kizil-Irmak*, where the winters are very cold and the summers excessively hot. This climatic contrast is supposed to contribute to the fineness of the hair, made into shawls and camlets, for which the breed is celebrated. The wild boar and hyena are common; with troops of jackals, making the night hideous with their cries, and dogs are a pest in all the cities, towns, and villages. The camel is the principal beast of burden; caravans of them are formed in long files for the transport of goods and merchandise; but a general change in the old eastern mode of locomotion is betokened by the *Smyrna and Aidin Railway*. Fruits in vast abundance, wax and honey, drugs and dyes,

silk, wool, cotton, leather, and goats' hides are the important commercial products. The insular dependencies consist of Cyprus in the Mediterranean; Rhodes at the entrance of the Archipelago; Mitylene, Scio, Samos, Cos, and many others, off its coast.

The political divisions include six eyalets or governments, under pashas of varying rank :

| Governments.                | Cities and Towns.                                       |
|-----------------------------|---|
| Anatolia, . . . . .         | Kutaiah, Smyrna, Aidin, Budrun, Brusa, Scutari, Angora. |
| Rumili, or Sivas, . . . . . | Sivas, Tokat, Amasia, Mersivan, Samsun.                 |
| Trebisond, . . . . .        | Trebisond, Kerasun.                                     |
| Marash, . . . . .           | Marash, Malatiah.                                       |
| Karamania, . . . . .        | Kaisarieh, Konieh, Karaman.                             |
| Adana, . . . . .            | Adana, Tarsus.  |

In ancient times Asia Minor comprehended nine maritime and five interior provinces, many of which were at intervals distinct states. Their names are therefore introduced as of common occurrence on the page of history.

| Ancient Divisions.  |  |
|---------------------|--|
| Northern, . . . . . | Bithynia, Paphlagonia, Pontus.                   |
| Western, . . . . .  | Mysia, Lydia or Mæonia, Caria.                   |
| Southern, . . . . . | Lycia, Pamphylia, Cilicia.                       |
| Central, . . . . .  | Phrygia, Pisidia, Lycaonia, Galatia, Cappadocia. |

ANATOLIA, the largest and most important part of the peninsula, is immediately contiguous to Europe, and has its position in that connection defined by the name, which signifies the 'sun rising,' or the 'east,' equivalent to the Levant of the Italians and French. Rich plains extend along the coasts, but a considerable portion of the high central plateau region is embraced, with the western part of the range of Taurus on the south, and of the chain which skirts the shores of the Black Sea on the north. The narrow waters thence to the Archipelago are overlooked by the peaks of the Bithynian Olympus and Mount Ida. The wooded heights of the latter enclose the famous Troad

Mount Ida, from the Plains of Troy.

on one side, which the sea directly south of the Dardanelles washes on the other. This renowned scene of the struggle commemorated in the *Iliad* is a level peninsular plain, watered by the Mendere and the Bunarbashi, which are supposed to represent the Simois and Scamander of antiquity. Three miles from the shore, a hill called Hissarlik has claims to be considered the true site of Homer's *Ilium*; and artificial mounds on an adjoining promontory have had the names of Achilles and Patroclus traditionally associated with them as their tombs from a very ancient date. The entire plain has now few noticeable features; and it must have undergone great changes from natural causes in the lapse of ages, as the rivers named, inconsiderable in summer, overspread it with torrent-like floods when swelled by the winter rains.

*Kutaiah*, the ancient *Cotyceum*, is an inland city on a branch of the Sakaria, on the great route between Constantinople and Aleppo, said to contain 50,000 inhabitants. It possesses no ancient remains or objects of interest, but ranks as the capital, being the residence of the Pasha of Anatolia, who has military command of the whole country on the west of the Euphrates. This place was the residence of Kossuth, and other Hungarians under mild restraint as refugees in the Turkish dominions. *Afium Kara-Hissar*, 'Opium Black Castle,' further inland, on the south-east, is a considerable town, deriving its name from the extensive production of opium in the neighbourhood.

*Smyrna*, by far the largest city of Asia Minor, and the most important commercial port of the east, after Constantinople, is finely situated at the head of a gulf of the Archipelago, partly on a plain by the shore, and partly on the slope of the ancient Mount Pagus, the summit of which is crowned by a citadel in ruins. It is of high antiquity, has traditional claims to be considered the birthplace of Homer, and was celebrated in the classical ages as 'the crown of Ionia,' 'the ornament of Asia.' In modern times it has been eulogised as 'Izmir the lovely,' its Turkish name, and denounced as 'Izmir the infidel,' in allusion to the large number of its non-Mohammedan inhabitants. The population is estimated at about 150,000, consisting to the extent of at least one half of Greeks, Armenians, Jews, and Franks belonging to most European states, with their consuls. The Greek and Frank quarters stretch two miles along the shore, in the midst of which is the Casino or Merchant's Club, an establishment worthy of Western Europe, well supplied with papers and magazines, access to which is readily granted to strangers. Six newspapers are published in five different languages. Street scenes are full of interest from the varied appearance of the motley population, embracing the long-bearded Turk, the classically-dressed Greek women, sailors from all parts of the Levant, dervishes, Greek priests, camel-drivers, and camels. The trade, in the export of figs, raisins, and gall-nuts; silk, raw cotton, goat's hair, and skins; madder, olive oil, valonia, drugs, and gums, is immense. Cotton and woollen goods and hosiery, are the important imports from England. Coffee-houses and pleasure-gardens are scattered along the banks of the Meles, which enters the gulf outside the city. Its caravan bridge is a picturesque spot. Files of camels are constantly passing over it, with packs of merchandise brought from far-off places; while others, having discharged their burden and returned, are seen reposing in groups by the side of the stream, in the shade of enormous cypresses. The railway to Aidin, partly opened in 1860, now brings up the fruit crop, with other produce, from the southerly districts. Old Smyrna chiefly occupied the slope of Mount Pagus. An excavation on one side of the hill marks the site of the Stadium, and is traditionally regarded as the spot where Polycarp suffered martyrdom in the first age of Christianity.

The city was the seat of one of the 'seven churches' of the early Christian period addressed in the Apocalypse; and it alone has flourished. Of the remaining six, *Pergamos*, now *Bergama*, 48 miles on the north; *Thyatira*, now *Ak-Hissar*, 'White Castle,' 60 miles on the north-east; and *Philadelphia*, now *Allah-Shehr*, 85 miles on the east, are inconsiderable places. *Sardis*, 50 miles on the east, has no representative but the nodding walls of its Acropolis, and a few mud-built huts; *Laodicea*, 120 miles on the south-east, has only the poor village of *Eski-Hissar*, 'Old Castle,' by its site; and little appears at *Ephesus*, 40 miles on the south, but a ruin-strewed malarious plain, abandoned to desolation and silence, except that the rattle of the railway from Smyrna to Aidin, which passes over it, occasionally mingles with the sea-bird's cry, the howl of dogs and jackals, and peasant voices from the adjoining hamlet of Aiasaluk. Yet vast substractions and some mighty fragments, half entombed in sand and rubbish, attest the grandeur of the ancient city, which have been recently illustrated by the industry of Mr Falkener. Its temple of Diana, one of the seven wonders of the world, has utterly perished, and its site has not been identified. But traces of the theatre, the scene of a memorable incident in the history of St Paul, are distinct on the slope of a lofty hill, and shew its immense extent, capable of accommodating upwards of 50,000 spectators. *Aidin*, a commercial town, is 60 miles south of Smyrna, in the fruitful valley of the Meander.

*Budrun*, a small port and fortress, on an inlet of the south-west coast, occupies the site of Halicarnassus, the capital of Caria, and the birthplace of Herodotus. The city was famous for a splendid tomb erected for Mausolus, one of the rulers, from whose name the word mausoleum is derived. This structure, long concealed by the rubbish of ages, has been discovered in the present day, and fragments of it transported to the British Museum. Striking sepulchral remains of the ancient Greeks abound in this part of Asia Minor. The site of Telmessus, now occupied by a small village port, has its 'mountain of tombs,' consisting of

excavations in the hill, the exterior of which present the appearance of finely-built temples, having porticoes, columns, gates, and doors beautifully sculptured, but in a more or less ruined condition. The interiors are small rooms, with benches running along three sides, upon which the coffins or urns have been placed. Some are larger, affording accommodation for mourners within them. The tombs are of several styles and various dates, but none are thought to be more recent than about 370 B.C. Extant inscriptions shew that the domestic affections were fondly cherished by the old Greeks. *Adalia*, at the head of the gulf to which its name is given, is a thriving port on the Mediterranean.

Brusa.

*Brusa*, formerly *Prusa*, in the northern part of the peninsula, about twelve miles from the Sea of Marmora, ranks next to Smyrna in importance and population, 60,000. It is renowned for its splendid situation, the number of its warm springs and of its mosques, 365 large and small, some of which are magnificent erections, but the majority are woefully dilapidated. The city occupies a plain sparkling with streams, gay with flowers, and diversified with meadows, gardens, and mulberry woods, the whole surrounded by a framework of mountains, among which the noble head of Olympus is conspicuous from afar, silvered with snow through the greater part of the year. The site is eminent for historical associations as well as natural beauty. Here, at a remote period, the kings of Bithynia kept their court, one of whom gave an asylum to the illustrious Hannibal in his misfortunes, who probably ended his days in the locality. Here Pliny, as the Roman governor, noted the early progress of Christianity, and illustrated the piety of the primitive believers. Here likewise Othman, the founder of the Ottoman dynasty, fixed his residence, and was interred in one of the mosques, originally a Byzantine church, where some curious relics of him were preserved down to the first year of the present century. A fire then desolated the city and ravaged the mosque. The dome fell in, and covered the tomb with a heap of rubbish. This event, happening at the beginning of a century, was popularly regarded by the Turks as ominous of the speedy downfall of the empire. The remains of Amurath I., third sultan of the Ottomans, and the first who died upon the soil of Europe, repose at a village in the neighbourhood, where he had caused his own mausoleum to be prepared. This edifice is a beautifully-proportioned domed structure, still in good preservation, with the funeral arrangements just as they were nearly five centuries ago. In our own day Brusa became the residence of the celebrated Arab emir, Abd-el-Kader, when allowed to withdraw from France. It suffered severely from an earthquake in 1855. Silk is extensively raised on the adjoining plain, the preparation and spinning of which is the chief industry of the inhabitants. On the north-east, bordering a spacious lake, the poor village of Isnik occupies the site of *Nicaea*, where the ecclesiastical council was held which drew up the Nicene Creed, 325 A.D.; and in the same direction, at the head of a long inlet of the Sea of Marmora, the inconsiderable but pleasant town of Ismid represents *Nicomedia*, once a splendid city, made by Diocletian, for a time the capital of the Roman world.

*Scutari*, on the Asiatic side of the Bosphorus, a suburb of Constantinople, is celebrated for its vast Moslem cemetery, constantly replenished from the great city. It has now a conspicuous Protestant burying-ground,

containing the graves of many of our countrymen who died of sickness or wounds in the hospitals here provided for their reception during the Crimean war. The name of the place is a corrupt Persian word signifying a courier; and Soutari is the starting-point of couriers and caravans from the capital bound for inland Asia. *Sinope*, a port of the Black Sea, of ancient fame, founded by a Milesian colony, acquired notoriety in

Sinope.

1853 from the merciless destruction of a Turkish squadron at anchor in the roadstead by the Russian fleet from Sebastopol. *Angora*, formerly *Ancyra*, occupies a high interior site on a branch of the Sakaria, and contains a great number of khans and mosques, with many antiquities, and a considerable population. The fine silky hair of the goats of this upland region, an effect of the climate, distinguishes to some extent the cats and the shepherds' dogs, whose fleeces are used for the purpose of adulteration. On the plain of Angora, in 1403, the fiery Ottoman sultan, Bajazet I., was overthrown and taken prisoner by the invading Mongols under Tamerlane. The city was the capital of Galatia, a district named after its inhabitants, who branched off from the great Gaulish emigration which crossed the Hellespont under Brennus, 270 B.C. From the mingling of these settlers with Greek colonists, the country obtained the name of Gallo-Græcia, whence Galatia. A Celtic dialect was spoken in the time of Jerome, six centuries after the immigration. The apostle Paul visited Galatia, and addressed an epistle to the Christian part of the population.

The pashalics of RUMILI and TREBISOND extend along the Black Sea, and have shores possessing great scenic attractions, with a history dating from the days of Grecian fable. Vines and fruit trees clothe the lower slopes of the mountains, above which, up to the summits, are noble beeches and pines. Among the undergrowth is the pale-yellow honeysuckle on which feed the bees, whose honey had an intoxicating effect, amounting almost to temporary madness, upon the Greeks under the command of Xenophon, described in his history of the Retreat of the Ten Thousand. This deleterious property, noticed by the moderns, is supposed to be consequent on the bees extracting the honey from the *Azalea Pontica*.

*Sivas*, ancient *Sebaste*, an inland town of 30,000 inhabitants, is situated in the valley of the Kizil-Irmak, not far from the sources of the river; and has many elegant mosques and minarets, well-stocked bazaars, and a considerable transit trade. *Pokat*, on a branch of the Yeshil-Irmak, or Green River, another centre of inland commerce, is a somewhat larger town, with a cheerful appearance, owing to extensive groves and gardens, the former made musical by nightingales, the latter teeming with odorous flowers. Copper-mines are in the mountainous vicinity; and copper refining, with dyeing, and printing cottons, are prevailing industries. *Amasia*, nearer to the coast, is distinguished by antiquities, as the capital of ancient Pontus, the

birthplace of Mithridates and Strabo the geographer. It has only one mosque, as the greater part of the inhabitants are Christians. *Mersivan*, more important, with a population of 30,000, is surrounded by a region of wooded mountains, and luxuriant well-watered valleys. The country abounds in corn and fruit; the vineyards are extensive; and an excellent red wine is made from the grapes. All the preceding towns are on the great route leading from Constantinople to Mosul on the Tigris, a distance of about 1000 miles. *Samsun*, on the coast, though only a small place, has an active commerce as the shipping port of Sivas and Tokat.

Trebisond.

*Trebisond*, a principal port of the Black Sea, situated near its south-eastern extremity, about 600 miles from Constantinople, is the natural entrepôt of merchandise destined for Armenia and Persia. It contains a population of 25,000, has enclosing walls passed by six gates which are shut at sunset, with a dilapidated citadel, and considerable suburbs. There are eighteen large mosques, the handsomest of which, Saint Sophia, formerly a Christian church, is built of hewn stone, and has four white marble Corinthian columns at the principal entrance. The other public buildings are Greek and Catholic churches, khans and baths, with a beautiful aqueduct carried on arches across a valley conveying cool and refreshing water to the inhabitants. Though without any proper harbour, the roadstead has good holding-ground for vessels, and the remains of an ancient mole still serve the purpose for which it was made. The imports are largely British manufactures, purchased and shipped at Constantinople, conveyed inland on the backs of mules, asses, oxen, or camels, and also in rude native carts. The exports are silks, wool, hides, tobacco, wax, nut-galls, and various gums. Few places are so magnificently situated, or have a more pleasing aspect at a little distance. A range of lofty mountains forms the background umbrageous from base to summit. Viewed from the sea, white houses are seen with red tops peeping out from the foliage of trees and shrubberies. But the interior has its proportion of poor hovels, ragged beldames, and sinister-looking beggars. The climate is very genial. Figs, olives, pomegranates, and lemons are abundant; and the atmosphere is wonderfully transparent, but so humid, that no metals can be left about, even for a day, without contracting rust. Trebisond is the *Trapezus* of antiquity, so called from its shape corresponding to that of a parallelogram or trapezium. It was from the adjoining heights that the immortal Ten Thousand, after their severe winter march through the Armenian highlands, first caught sight of the waters of the Euxine, communicating with their homes, and rapturously exclaimed, 'The sea—the sea!' *Kerasun*, westward on the coast, wholly insignificant, answers to *Cerasus*, from whence Lucullus introduced the first cherries into Italy. Hence their German name *Kirschen*.

The provinces of MARASH and KARAMANIA are wholly inland, on the eastern side of the peninsula. That of ADANA is maritime, and forms the extreme north-eastern coast of the Mediterranean, indented by the Gulf of Iskenderun. It coincides with ancient Cilicia,

and is chiefly a fertile plain, separated from the interior table-lands by the range of Taurus, which is crossed by the pass of Golek-Boghas, the old Cilician Gates.

*Marash*, a flourishing town, is beautifully situated at the southern base of Taurus, immediately overlooked by its wooded heights. *Malatiah* is on the northern side, within a short distance of the banks of the Euphrates. On the neighbouring plain the general of the Emperor Justinian defeated the Persian Chosroës, who crossed the river on an elephant, and escaped on a camel, abandoning his army to its fate.

*Kaisariëh*, a walled, dilapidated, but still considerable city, a few miles south of the Kizil-Irmak, is the *Cæsarea* of the Romans, the capital of Cappadocia, once containing a vast population. *Koniëh*, seated on the route between Smyrna and Aleppo, occupies a rich and well-watered plain, and is rendered by its position a great emporium for the produce of the interior. It has manufactures of carpets and morocco leather, and contains 30,000 inhabitants, besides a suburban population. In 1832, on the adjoining plain, the Turkish army was signally defeated by the Egyptian under Ibrahim Pasha, a disaster which laid the road to Constantinople quite open to the invader. The city, under its ancient name, *Iconium*, was visited by St Paul. In the middle ages it was the capital of a dynasty of Seljukian princes. Here Mollah Hunkiar, a Moslem saint of high repute, and an author of eminence, founded the order of the Mevlevi Dervishes, one of the most venerated in the Turkish Empire. It contains his tomb, and the most celebrated monastery of the community. *Koniëh* retains its walls, now half in ruins, and has some interesting fragments of Saracenic architecture, with substructions of the palace of the Seljukian sultans.

*Adana*, on the banks of the Sihun, a town of 10,000 inhabitants, is in a richly luxuriant neighbourhood, with vineyards around it, and intermingling groves of mulberry, olive, fig, apricot, and peach trees. *Tarsus*, near the waters of the old Cydnus, is smaller and decayed, but has great historical distinction. It was once a flourishing city, connected with Alexander, Cicero, Cæsar, Mark Antony, and Cleopatra, but most distinguished as the birthplace of the apostle Paul, who described himself on a memorable occasion as 'a Jew of Tarsus, a city in Cilicia, a citizen of no mean city.'

Among the insular adjuncts of the peninsula, *CYPRUS*, the largest, is situated opposite the shore of Cilicia, and forms a separate pashalic. Its greatest extent is from north-east to south-west, upwards of 120 miles, in which direction two chains of mountains run respectively along the northern and southern coasts, which attain the height of 8900 feet above the sea in Mount Santa Croce. Between them lies a fertile plain extensively abandoned to neglect, but rich with flowering plants, myrtles, and bright-leaved shrubs, which ascend high up the bordering slopes, and load the air with their perfume.

*Nicosia*, the capital of Cyprus, in the interior, contains 12,000 inhabitants. The general population consists of Greeks in the largest proportion, with the dominant Turks. The island has successively belonged to various masters, the Phœnicians, Persians, Greeks, Romans, Crusaders, and Venetians, from whom it was wrested by Selim II. in 1570. It was anciently celebrated for female beauty and licentiousness; and had a famous shrine of Venus at Paphos, a site on the south-west coast, now occupied by a few fragments of prostrate columns and a poor village.

*RHODES*, also an island of considerable extent, the 'lovely island of the sun,' as it was fondly styled by the old inhabitants, is a south-easterly member of the Greek Archipelago. It enjoys a delicious climate, possesses great natural fertility, and has high historical distinction, though now reduced to comparative desolation. In classical times it was the seat of commerce, navigation, literature, and the arts, while the stronghold in the middle ages of the Knights of St John. Many remains of both epochs invite the traveller to the shores. *Rhodes*, a town of 10,000 inhabitants, at the north extremity of the island, is of ancient date, celebrated for its brazen Colossus, reputed to be one of the seven wonders of the world, erected 238 B.C., and thrown down by an earthquake 227 B.C. It became the capital of the Knights of St John in 1308 A.D., an order of military monks founded in the crusading age, who held the island for rather more than two centuries. They successfully defied the arms of Mohammed II., the conqueror of Constantinople; but were compelled to yield to the immense force brought against them by Soliman the Magnificent, after a long and terrible struggle. The siege is remarkable in military annals for the first use of bombs, which were employed by the besiegers, and the invention of counter-mines by an Italian engineer. On Christmas Day 1522, the sultan entered the city, and the members of the order were finally put in possession of Malta. Rhodes retains splendid memorials of its chivalrous defenders, and nearly perfect remains of its ancient fortifications. Houses still bear on their front the arms of noble families in France, Spain, Italy, and Germany, the former residences of the knights, which are now converted into wretched shops. Towers and gates, warlike and massive, but beautiful and aristocratic, survive as relics of their high-born builders. The chief field of battle, a plain extending from the ramparts to Mount St Stephen, is now covered with the tombs of those who fell in the contest.

The other islands of the Archipelago are beautiful, fertile, and more or less celebrated. The principal include *Cos*, the birthplace of Hippocrates and Apelles; *Samos*, of which Pythagoras was a native, once renowned for its pottery, one of the chief seats of ancient civilisation; *Chios* or *Scio*, a lovely spot, the scene of a dreadful tragedy in 1822, at the commencement of the Greek revolution, when the whole of the inhabitants, 120,000, were either massacred by the Turks or sold into slavery; and *Mytilene*, or *Lesbos*, famed in antiquity for its wine, the native place of Alceus, Sappho, and Theophrastus. It produced also Barbarossa, the pirate of the sixteenth century, who made himself master of Algiers, and established there that system of

piracy of which it was the seat to a comparatively recent date. *Patmos*, a small rocky islet, is memorable as the spot to which the apostle John was banished, and as the scene of the Apocalyptic visions.

Throughout Asia Minor, the great majority of the population consist of Turks, the ruling race, differing in nothing from their European brethren except in being more Asiatic in appearance and habits, while more ignorant and intolerant as Moslems. Under their misgovernment, a region possessed of splendid natural resources, which flourished under successive Persian, Greek, and Roman masters, in spite of campaigns and battles, has had its fortunes sadly marred. They are now reviving as the effect of foreign enterprise, and may be expected to improve rapidly, should the scheme, often proposed, be adopted, of intersecting the country with a railway from Scutari to the valley of the Euphrates, thence extending to the Persian Gulf, as part of the great line of communication between England and India. The wires of the telegraph stretch through it to Bagdad, and will shortly by extension establish daily intercourse between the two far-distant realms. Turkomans, a branch of the same family as the Ottomans, who speak a kindred dialect, but retain the nomadic usages of their ancestors, are numerous on the high plains, where they live in tents during the summer, frequently shifting their camps in search of pasturage, and generally spend the winter in fixed villages. They possess large herds of camels, buffaloes, goats, and sheep, and breed horses for sale; while the women spin wool, make carpets, and articles of clothing. Each camp is under the government of a chief, and pays a tax to the pashas of the respective districts proportioned to the number of tents, for the privilege of pasturing their flocks and herds. While adhering to Mohammedanism, they have little acquaintance with its dogmas and precepts, and have no mosques or priests. The Turkomans are variously spread further east, over the high grounds of Armenia, the wavy downs of Upper Mesopotamia, and the northern plains of the Syrian desert.

Fishing Huts on the Bosphorus.

Erzerum.

## II. TURKISH ARMENIA AND KURDISTAN.

ARMENIA, an old historical country, to the east of Asia Minor, is not defined in its extent by any permanent natural boundaries, except on the south, where the chain of Taurus sinks into the plains of Mesopotamia; and its limits have repeatedly fluctuated. Though probably the first peopled district of the post-diluvian world, it has seldom been the seat of an independent kingdom. Shortly before our era, it was the head of one of those vast oriental monarchies which rise and perish in a lifetime, formed by Tigranes, who found a conqueror in the Roman Lucullus; and afterwards, the Romans and Parthians were engaged in constant struggles for predominance in the region, alternately installing and dethroning its rulers. The largest portion of the country belongs at present to Turkey; another section is included in Persia; and a third in the Russian dominions. Lofty plateaus, overtopped by vast ridges of granite, gneiss, and mica-schist, and intersected with deep valleys, occupy nearly the whole surface, forming the grand nucleus of the Western Asiatic or Tauro-Caucasian mountain-system. Numerous traces of volcanic agency in past ages are met with, and still at present the fiery internal force occasionally displays its activity.

Owing to the great elevation of the country, the winters are long and severe, attended with immense falls of snow. The sufferings of the Ten Thousand Greeks from the rigorous temperature, while traversing the uplands, are well known to the readers of Xenophon. It was the French retreat from Moscow upon a small scale. The north wind parched and benumbed the men, which caused the priests to offer sacrifices to it. The snow was a fathom deep; and many of the slaves, soldiers, and baggage-horses perished in it. Some of the troops contracted a disease from exposure, attended with excessive hunger and faintness; others lost their sight by the snow; and many their limbs by mortification, while the infuriated natives harassed them by attacks, and cut off every straggler. All travellers have borne testimony to the rigour of the climate. Mr Ainsworth left the

plains of Mesopotamia in the latter end of August, where the mid-day heat was almost insupportable, and the nights were passed in the open air, on the grass or on the house-tops; but on reaching the table-land of Mush, a fire was a welcome refuge, and on the road from that place to Erzerum, in the early part of September, there was keen frost every night. Schulz, on his route from Trebisond into the interior, passed over districts covered with deep snow in the month of June. Tournefort found the springs thinly frozen over during the night in July; the corn only a foot high; and vegetation no further advanced than it is wont to be at Paris towards the close of April. Mr Southgate, the American missionary, remarks upon more temperate nights being desirable at Erzerum in June, and upon one great occupation of the summer—by way of preparation apparently for preserving warmth in winter—most of the houses have cakes of fresh dung plastered upon the walls and spread upon the roofs to dry for fuel. The same practice prevailed in the heart of England not more than half a century ago, before increased means of intercommunication brought coal within reach of the peasantry. Xenophon describes the villages as consisting of underground dwellings, containing horses, cows, goats, sheep, and fowls, in addition to one or two families, who resorted to this protection from the severity of the climate, with an ample stock of provisions and fodder. There was a sloping entrance dug for the cattle, the owners themselves descending by ladders. The description applies to many Armenian villages in the present day. In exposed elevated situations the dwellings are uniformly underground or semi-subterraneous, entered by as small an aperture as possible, to prevent the cold getting in, or rather the escape of heat. Domestic animals participate with the household in the warmth and protection afforded by them.

The Euphrates and Tigris, sacred and classic streams, have their sources in the highlands, and periodically overflow their banks in the level countries to which they descend, in consequence of the melting of the snow in spring. The former river has its principal spring on the southern slope of the Ala Tagh, or 'Beautiful Mountain,' which rises nearly midway between Ararat and the great Lake Van. It has a course of 1700 miles from thence to its confluence with the Tigris, when the joint streams take the name of the Shat-el-Arab, or 'River of the Arabs,' and proceed to the Persian Gulf. But the direct distance between the two points is not more than 600 miles, thus giving 1100 miles for the amount of meandering. This great development of the stream is due to the Armenian Mountains, which oppose its passage to the south, and give it a westward flow, as if making for the Mediterranean; and also to the flatness of the country afterwards entered, which favours a tortuous course. The Tigris rises in Central Armenia, on the southern slope of the Anti-Taurus, which forms the water-shed between its tributaries and those which descend the northern slope to feed the Euphrates. It has a course of about 1000 miles, following the windings; a more rapid current than the sister-river; and brings down to the junction a greater quantity of water, as less is drawn off for the purpose of irrigation, and more received from affluents. Their total average discharge is more than one-third less than that of the Danube. At the Castle of Felujah, on the Euphrates, nearly due west of Bagdad on the Tigris, their channels are only thirty miles apart, yet the confluence does not take place till the former river has accomplished a further course of 380 miles. Lake Van, a highland expanse more than 200 miles in circuit, renowned among the orientals for its beauty, is on the frontier of Armenia and Kurdistan, and belongs about equally to the two regions.

The country is in general bare of wood, and in many parts sterile. In the watered valleys, hemp, flax, tobacco, wine, cotton, and fruits of various kinds are raised in abundance; but grazing husbandry is followed much more extensively than tillage. Copper,

lead, iron, salt, and naphtha occur among the minerals. Some of the mines appear to have been worked from remote antiquity, and perhaps formed the chief source from which the metals were supplied to the ancient Assyrians, as illustrated by ornaments and implements found among the remains of Nineveh. Xenophon in his day noticed that the deserted houses encountered in the country were well furnished with all sorts of brass or copper utensils. The Tigris flows from its source in a deep valley, through a region of grand and rugged highlands, to the mines of Arghana, a site as wild as imagination can conceive, to which a Turkish, Greek, and Armenian population has been drawn by the mineral wealth of the bleak and barren mountains. Magharat, 'the Hill of Caves,' which contains the principal mine, has been so called from the numerous galleries carried into the rock. The annual produce of copper ores, which are sent to Tokat to be smelted, is considerable. Near the junction of the two head streams of the Euphrates, in a dreary ravine producing neither tree nor shrub, nor vegetation of any kind, argentiferous lead ore is obtained. The name of the little adjoining town refers to the site, Keban Maden, 'Mine of the Gorge or Pass.'

KURDISTAN is a southerly continuation of the Armenian highlands, eastward of the Tigris, from which the river receives affluents equal to itself in volume, the Greater Zab and the Diyaleh. The former is the *Lycus* and the latter the *Gyndes* of antiquity. The lower slopes of the hills are clothed with different kinds of oaks, some of which furnish the finest gall-nuts of commerce, used in medicine, the arts, and as a chemical test. The district also yields the remarkable vegetable substance known to us by the name of manna, but expressively called in Turkish, *Kudret-halvassiz*, 'the Divine Sweetmeat.' It is found on the leaves of the dwarf-oak, the flowering ash, and other plants.

'The manna on each leaf did pearlèd lie.'

Occasionally it occurs on the sand, rocks, and stones. The Kurds go out before sunrise, after rainy or dewy nights, to collect it, spreading cloths under the trees, and shaking down the manna from the branches. It is not only an article of food in its natural state, but employed in the preparation of sweetmeats, and hence carried for sale to the Mosul market. The castor-oil shrub, *Ricinus communis*, abounds near the Tigris, the region of the prophet Jonah's mission to Nineveh, and is probably the 'gourd' mentioned in the history of it. The plant grows rapidly, attains a considerable height, has a thick hollow stem, yellow mossy flowers, broad palmate leaves of a deep green colour, which afford an agreeable shade. A sultry and 'vehement east wind' is also characteristic of the country. It resembles the sirocco of Italy and the solano of Spain, but is more intense, and greatly dreaded in the district. The points from which it blows are east, north-east, and those intermediate. Hence the Arabs call it *Sherki*, or Easterly, while the Kurds denominate it from its painful effects, *Baya-rish*, or the Black Wind. It occurs by night as well as by day, and the singular fact is asserted by numerous authorities, that though violent, its influence is not felt at the same time more than two hours off in any direction. 'Last night,' Mr Rich states, referring to his stay in Sulimania, 'while I was sitting with a large company at Omar Khaznadar's, the evening having previously been calm and warm, and we were all busily employed in talking, just as the moon rose about ten, an intolerable hot puff of wind came from the north-east. All were immediately silent, as if they had suddenly felt an earthquake, and then exclaimed in a dismal tone, "The sherki has come!" This was indeed the so much dreaded sherki, and it has continued blowing ever since with great violence from the east and north-east. This wind is the terror of these parts, and without it the climate of Sulimania would be very agreeable.'

Kars.

*Erzerum*, the ancient capital of Armenia, occupies a central position in the country, on one side of an extensive plain, at the great elevation of 5800 feet above the sea. It is protected by a citadel surrounded by a double wall, but the fortress is overlooked by adjoining hills, and is of no great strength, having been built before the age of artillery. In the Russian invasion of 1828—1829 it surrendered to Paskiewitch after the first few guns were fired. The fortifications were probably constructed by the Genoese, when the enterprising merchants of that republic were allowed to erect buildings for the protection of their trade to India by the way of Trebisonde, Erzerum, Tabriz, and Ispahan. In many parts of the country there still exist, more or less perfect, remains of khans, bridges, causeways, castles, and other buildings, of hewn stone, so massive and imposing in their proportions as to proclaim the energy of the traders, and the vast wealth derived from their commerce. The town lost great part of its population at the time of the Russian campaign, owing to a large number of Armenian families being either compelled or induced to emigrate from it and the surrounding district to become settlers in Georgia. But it soon recovered, contains about 30,000 inhabitants, and profits by the transit of British and European produce, landed at Trebisonde, to the northern parts of Persia. As the roads are not to any extent fit for vehicles, the usual means of transport are on mule or horseback, but camels, asses, and oxen are also employed. There are not less than thirty-six khans in Erzerum, and one of the largest custom-houses in the Ottoman empire. *Kars*, upwards of 100 miles to the north-east of Erzerum, is seated on a high plain more than 6000 feet above the sea, and is almost wholly built of black basalt. It attracted the attention of Europe in 1855 from June to December, owing to its heroic defence under General Williams, whom famine alone compelled to surrender it to the Russians. *Bayazid*, a decayed place, is near the foot of Mount Ararat, and contains the ruins of a magnificent monastery. *Uch Kilisa*, or the 'Three Churches,' derives its name from three Armenian monasteries, only one of which survives, a massive stone building surrounded by a lofty wall.

The Armenians, properly so called, are a widely-scattered race, rivalling the Jews in that respect, while resembling them in mercantile character; but are still considerable in number in their original seat. Though once of independent spirit and martial habits, ages of subjection have extinguished these qualities, and have rendered them passive and enduring, often servile and cringing, moulding themselves according to the will of their masters, whether Turk, Russian, Persian, or Kurd. A somewhat cumbersome frame, long moustaches and beard, a high cylindrical cap, with a flowing robe and coloured shawl, distinguish them in the towns;

and the attire of the peasantry is similar, but of homelier material. The villagers are agricultural, and possess large stocks of cattle, sheep, and horses, occupying the semi-subterranean dwellings previously referred to. The town-dwellers are commercial, and engross nearly all the trade of their respective localities. They frequently amass great wealth, and are generally liberal. Hence it has been said that the inscription might properly be put upon almost every tomb beneath which sleeps the rich Armenian: 'He hath dispersed and given to the poor.' However despised and oppressed by the Moslem, their passive fidelity and ready obedience are appreciated, so that they are frequently selected by the authorities to discharge offices of trust. The Armenians embraced Christianity soon after the commencement of the fourth century; but towards the close of the fifth, a synod of their bishops rejected the decrees of the Council of Chalcedon, and by that act cut themselves off from communion with the rest of Christendom. Their patriarch and bishops are vowed to celibacy, while the priests are not only allowed but compelled to marry.

*Van*, in Kurdistan, on the south-eastern side of its great lake, much dilapidated, is locally distinguished as the town of Semiramis, in memory of the Assyrian queen. *Mush*, on the Ak-su, or 'White River,' an affluent of the Euphrates, is a confused group of streets, houses, and bazaars, with a Turkish and Armenian population, under a pasha of the second rank. Crops of grain and tobacco are raised on the neighbouring plain, which is studded with villages, built in the usual underground manner. *Bitlis*, on the south-east, not far from the western side of Lake Van, is very romantically seated in a mountain valley, 5156 feet above the sea, above which limestone rocks rise on every hand to the further elevation of 2000 feet. Several ravines converge to the valley, each the bed of a little stream, which unite and flow off to the Tigris. The town stands at the point of junction, and extends partly up the ravines. Its streets line the banks of the streams, and are interspersed with flourishing gardens and orchards. In the centre rises a perpendicular rock, crowned with the ruins of a castle, formerly the residence of Kurdish chieftains, who down to a recent date preserved their independence, and struck a small copper coin, which is still current in the place. The streams are crossed by single-arched bridges built of a volcanic rock, of which almost all the houses are composed. The population consists of about 2000 Mohammedan and 1000 Armenian families. Bitlis contains three mosques with minarets, large and well-stocked bazaars, several khans for the accommodation of foreign traders, who bring British calicoes and woollens, East Indian indigo, and Mocha coffee to this secluded spot. It has manufactures of cotton cloths celebrated for their bright-red dyes. The remarkable situation of the town, the severe aspect of the mountains, with the contrast offered to them by the cheerful vegetation of the valley, combine to form a scene of singular interest.

*Diarbekr*, 'the tents or dwellings of Bekir,' its Arabic style, alluding to a chieftain of that name, is the *Amida* of the Romans, frequently called by the Turks *Kara*, or the Black Amid, from the dark-coloured basalt of which the walls and houses are largely built. It stands on the Upper Tigris, at a short distance from the river, and elevated above it on a mass of basaltic rock. The town was formerly one of the largest and most flourishing in the east, had numerous cotton looms constantly at work, and an extensive trade with Bagdad in Indian, and with Aleppo in European produce. It is still a considerable place, though ruinous, with many baths and caravansaries, fifteen mosques with minarets, and numerous mesjids with domes. The great mosque was once a Christian church, probably the cathedral of ancient Amida, the square tower of which is now used as a minaret. *Sert*, a small town on the east, is supposed to represent the *Tigranocerta* of the campaigns of Lucullus, 69 B.C. *Mardin*, a place of some importance on the south, occupies a remarkable site, being built on the steep sides of a high hill, the summit of which is crowned with a citadel, exceedingly difficult of access. The houses are placed in ranges above each other, like the seats of an amphitheatre. The streets, running round the hill, form successive terraces, and are connected laterally by flights of steps like similar cross-streets at Malta. The town has produced many Mohammedan authors, who have been called Mardini from the place of their birth, in addition to their other names. It is deemed the capital of the Jacobite Christians, many thousands of whom are found within the circle of a few days' journey. They derive their name from Jacob Baradaeus, who, towards the middle of the sixth century, propagated the tenets condemned by the Council of Chalcedon, united those who held them, and organised a hierarchy. There is also a small community called Shemsiah, or, as the name implies, worshippers of the sun. They live principally in a distinct quarter by themselves, refuse to marry out of their own number, and practise some ancient rites respecting which the strictest secrecy is observed. In neighbouring villages, Yezidis are found, whose religious system appears to be a monstrous combination of Sabæism, Judaism, Manicheism, Mohammedanism, and Christianity. They are sometimes called *Sheitan purist*, or worshippers of Satan; and though not perhaps guilty of the practice in the gross form, it is certain that all epithets commonly applied to the evil one are carefully abjured, nor will they suffer them to be used in their presence. To such an extent is this carried, that names are even avoided resembling Sheitan in sound, as *shat*, a river, for which the Kurdish *ave*, or the Arabic *ma*, is substituted, in referring to a stream. *Sheikh maazen*, the exalted doctor or chief, is their ordinary phrase for the devil. This is the most marked peculiarity of the Yezid tribes. They venerate Moses, Christ, and Mohammed; adore the sun as the symbol of the divinity; use baptism, the sign of the cross, and in some instances practise circumcision; abstain from pork, wine, and spirituous liquors; and are accustomed to kindle great fires of bitumen and naphtha on the night of an annual festival.

*Mosul*, on the western bank of the Tigris, a walled city with eight gates, and about 40,000 inhabitants, is the seat of a pasha, who, though of the second rank, receives investiture immediately from the sultan, and is

therefore independent of the great pashas of Erzerum and Bagdad. It is the centre of a considerable caravan trade, and was formerly a great commercial mart, with some important manufactures. Those textile fabrics which first received the name of muslins, including gold tissue, silks, as well as fine cottons, were so called, either from being made at Mosul in great perfection, or because they were conspicuous in its commerce. Marco Polo, the Venetian traveller, who was here in the thirteenth century, says that 'all the cloths of silk and gold which are called *mosulin*' are the produce of Mosul; but he also denominates the great merchants of the city *mosulin*, who imported Indian goods. Alabaster, commonly called Mosul marble, is the predominant formation in the immediate vicinity. It consists of calcareous gypsum, non-fossiliferous, disposed in solid massive beds lying near the surface, or actually protruding, and therefore easily obtained. The uncovered buildings of Nineveh, close at hand, shew slabs of this material lining the interior walls, bearing the records of victories and triumphs in sculptures and inscriptions. Having undergone the action of fire in the conflagration of the palaces, the gypsum slabs, reduced to lime, rapidly fell to pieces on exposure to the air, but not before the pencil of the artist had preserved faithful representations of many of the originals. Modern Mosul has no interest apart from its position, contiguous to the site of the once mighty Assyrian capital, in the country on the opposite bank of the river.

Classical writers are not consistent with each other respecting the position of Nineveh. Ctesias places it on the Euphrates, where we know it could not have been, an error into which Diodorus Siculus was also betrayed. Herodotus, Strabo, Pliny, and Ptolemy assign its site to the region of the Tigris. Strabo and Ptolemy more particularly define it in the country between the Tigris and the Lycus, now the Greater Zab, one of its principal affluents, and not far from their junction, which takes place about eighteen miles below Mosul, and is the southern limit of the pashalic. Here oriental tradition fixes it, and indicating mounds of ruins occur. It is remarkable that though remains of the city must long have been considerable and prominent, no reference is made to them by the most ancient profane writers by name, so soon and completely was it forgotten. Gibbon, in relating the triumph of the Emperor Heraclius over the troops of Chosroes, styles it 'the battle of Nineveh,' because fought on the vacant site of the city, which afforded a spacious field for the operations of the two armies. In a note he adds that Niebuhr passed over Nineveh without perceiving any traces of it. An old English traveller quaintly remarks: 'Now it is destroyed, as God foretold it should be by the Chaldeans, being nothing else than a sepulchre of her selfe.'

Travellers were long familiar with numerous lonely mounds, scattered through the country on the east of the Tigris, to some distance from Mosul. Owing to an active research directed to these sites in the present age, their true character has been disclosed, as the tombs of palaces, halls, and temples, containing works of art in admirable preservation, hitherto hid from notice by accumulated earth and rubbish. Through twenty-five centuries, the Greek and Roman, Parthian and Persian, Arab and Tartar, successively trod them under foot with ignorant indifference, not dreaming of any memorials of powerful kings and a mighty empire beneath the green-sward or the corn crop on the surface. More enlightened Europeans viewed them with interest and curiosity, as monumental remains of a departed race, conscious of their artificial structure, though wearing the semblance of nature; but it was not deemed likely that anything would be found in the interior, beyond confused heaps of building materials, till actual excavation revealed their secret treasures. The mounds occur at Kouyunjik, opposite Mosul; at Khorsabad, about fourteen miles north-north-east; at Nimrud, eighteen miles south-south-east; at Yaramles, Hussein, Yaramjeh, Karakush, and other places in the neighbourhood. Excavations were first commenced by M. Botta, the French consul, at Khorsabad, in the summer of the year 1843. His example was followed by Mr Layard at Nimrud in the autumn of 1845. Other mounds have since been subject to systematic examination. As the general result, the chambers of ancient palaces, long buried from the playful breeze and genial sunlight, deep beneath the verdant sod, were laid open, with elaborate sculptures decorating the walls, and inscriptions in the cuneiform character. Scenes of war and of the chase—monstrous combinations of the human and animal, as human-headed winged bulls and lions, eagle-headed winged human forms of colossal proportions—kings and great men, in costume which betrays the fondness for ornament characteristic of the Shemitic race—are the subjects of the sculptures, and intimate the barbaric pomp and power of a great old-world oriental state. The history of Assyria, so long wanted to supersede the few unsatisfactory fragments handed down by ancient writers—the work which Herodotus contemplated, but which has perished, if ever it was produced—may now be said to be in process of composition, from materials gathered out of the recesses of the silent hills, inscriptions containing the names of kings, with the records of their victories, bas-reliefs representing their regal state and martial prowess, and implements or ornaments illustrating the social condition of the people.

At some distance to the south, on the right bank of the river, directly washed by its waters, there is one of the greatest monuments of ancient Assyria, enclosed by the jungle, but visible from afar. The Turks call the place Toprak Kalaa, and the Arabs, Kalah Sherghat. Both names signify the 'Castle of the Earth.' It is a colossal mass which strikes every one with surprise by its vastness, as the total circumference is 4685 yards, or rather more than two miles and a half. Though unquestionably the ruin of a great city, evidence is wanting to connect it with any of those mentioned by ancient historians. Westward in the desert about twenty-eight miles, the remains of Al-Hadr rise to view, the Atr of the Roman campaigns, comparable to Tadmor in the wilderness, owing to their magnificent appearance and secluded site.

*Erbil*, a small town, in the country eastward of Mosul, represents ancient *Arbela*. The name is given to one of the world's decisive battles, 331 B.C., which transferred the empire of Asia from Darius to Alexander

the Great. It was the nearest important place to the scene of action, which lay at an insignificant village from forty to fifty miles distant, called Guagamela (the camel's house). Darius reached Arbela as a fugitive at midnight. The victor was there the next day, and proceeded across the Lesser Zab to the modern *Kerkuk*, a town mentioned under a different name in the narrative of his wars. Here he admired the perpetual fires which from time immemorial had issued from a spot in its vicinity. There was also nigh at hand fountains of liquid naphtha. The natives, eager to shew its powers to the conqueror, formed a long train of the combustible in front of the king's lodgings, and as soon as it was dark set fire to one end, when the whole street was illuminated by the blaze. These fountains are situated in low gypseous hills, about three miles north of *Kerkuk*. They are nearly three feet in diameter, some of them eight or ten feet deep, emitting a disagreeable odour. The naphtha, which is perfectly black, liquid, and in quantity inexhaustible, is sent all over the country for various purposes besides that of giving light. The other site, where the subterranean fire bursts forth, is a little hollow, of a cinereous aspect in broad daylight. The flames are only visible then upon a near approach, though distinct at night. They are sufficiently powerful to boil water or cook meat, and hence the place is called *Abu Geger* by the Arabs, and *Kerkuk Baba* by the Turks, both meaning the 'father of boiling.'

The Kurds or Koords proper, though widely dispersed, occurring in Asia Minor, Armenia, and Syria, are principally found in their old ancestral seat. They are descended from the wild mountaineers mentioned by Xenophon as the Karduchi, who so severely harassed the Ten Thousand Greeks during their retreat. Afterwards they were conspicuous in history under the name of Parthians, the formidable antagonists of the Roman generals; and at a more recent date they sent forth one of the greatest of eastern conquerors, Saladin, celebrated in the wars of the Crusades. They have no knowledge of the name by which in Europe they are distinguished, but style themselves *Kermanj*, and attribute their origin to the Jins, or genii of the air. There are two classes of the race, the peasantry who cultivate the soil, and are in a state of grievous serfdom; and the military, who are their masters, commonly disdaining industrial occupations, and therefore predatory in their habits. The military Kurds are divided into a great number of small clans or septs, forming separate patriarchal governments, each having an hereditary chief, often styled the *derch-bag*, or lord of the valley. The clansmen are remarkable for that blind devotion to their chiefs which distinguished the Scotch Highlanders in former days. They are also as strongly attached to their native mountains as the Swiss. 'It is true,' said the chief of Sulimania, when offered the government of Bagdad, 'that I should become a pasha of the first rank; but one draught of the snow-water of my own mountains is worth all the honours of the empire.' While mostly Mohammedans, uncivilised, fierce, and lawless, Kurdistan numbers among its inhabitants an interesting body of Chaldean or Nestorian Christians, occupying a very difficult part of the country.

In the upper part of the basin of the Zab, where narrow vales and deep ravines are hemmed in by towering mountains whose summits are mantled with the storm-cloud, the members of the Christian community referred to are found, though not confined to it. In bygone ages their fathers are supposed to have fled to the highlands to escape the sword of the persecutor; but heavily has it descended upon the race in modern times. In the early part of the summer of 1843 rumours of war and massacre in the mountains reached Mosul, which were soon confirmed by the appearance of fugitives from the scene of conflict, whose homes had been destroyed and relatives slaughtered. The Chaldean patriarch was one of the refugees. Influenced by Mohammedan fanaticism and the prospect of plunder, the Kurdish chiefs secretly prepared to invade the territory, with the knowledge, as was supposed, of the Pashas of Erzerum and Mosul, whose connivance was purchased by the offer of a portion of the spoil. Taken by surprise, and assailed simultaneously at various points, the unfortunate people were soon overpowered, and put to death in various ways without mercy. Three years before the massacre, in 1840, Mr Ainsworth visited *Lizan*, a village on the right bank of the Zab, which there flows through a valley guarded by stupendous cliffs, and is crossed by a bridge of wicker-work. He found a neat whitewashed church, embosomed in a grove of mulberry and pomegranate trees, with equally neat cottages, built in the Swiss style, which presented a very pleasing appearance. Three years after the massacre, in 1846, Mr Layard visited the same spot, descending to the village through scenery of extraordinary beauty and grandeur, but exhibiting on every hand memorials of dreadful outrage.

*Rowandiz*, containing about 1300 houses, defended by a wall with round towers, is one of the largest strongholds of the military Kurds. It occupies a naked plain, at a high elevation, only approached by difficult ravines, and therefore easy to be defended against an enemy. At some distance, the peak of *Rowandiz* rises to the height of 10,568 feet, as determined by the boiling-point of water. Mr Ainsworth scaled its summit, after passing over glaciers and immense piles of snow, here and there broken through by bold and sharp pinnacles of the subjacent mass. The crest commands a view of the noble expanse of Lake *Urumiah* in Persia, the plains spreading along the *Tigris*, and an intervening country of awful chasms and stern declivities. 'It was with regret,' he observes, 'that we tore ourselves from this magnificent prospect, added to which the mountain itself had a charm which was deeply felt by all. It perhaps more particularly originated in the deep silence which reigned upon this lofty summit, and which appeared as if for ever unbroken on the spot which thus rose up to the region of the clouds—so perfectly alone, so pure in its canopy of white, and with an atmosphere so substantially deep and blue, that it seemed a cloud of itself, and the spectator shuddered to think himself upon its bosom.'

Urfah.

## II. AL-JEZIRAH AND IRAK-ARABI.

The region between the Euphrates and Tigris, after they leave the mountains, and begin to wander most apart, down to the point where they approach each other, answers to the Mesopotamia of the Greeks, or 'the country between the rivers.' This is the Greek translation of the Hebrew *Aram-Naharaim*, or 'Syria of the two rivers,' called also *Padan-aram*, or 'the plain of Syria.' The region now bears the Arabic denomination of AL-JEZIRAH, the island or peninsula, referring to its almost complete environment by water. IRAK-ARABI denotes the territory from thence to the confluence of the streams, stretching southward also along their common channel, and corresponds in general to ancient Babylonia. The two districts form one great geographical region, hilly and undulating where it borders on Armenia, clothed with forests of oak, maple, chestnut, and terebinth, but for the most part consisting of a series of levels, the renowned plains of Assyria and Babylonia. The character of these plains varies from alluvial deposits on the banks of the rivers periodically overflowed, to permanent marshes, sandy or stony tracts often impregnated with salt and bitumen—true deserts, inhabited by the roving Arab, wild ass, and ostrich. The greater part of the territory is now included in the pashalics of Urfah (ancient *Orphah*) and Bagdad. Throughout the whole district the summer heat is excessive, but in the northern part, during the autumnal and spring months, the strongly-contrasted temperature of day and night is the chief peculiarity of the climate. The patriarch Jacob correctly characterised it at these intervals, when stating his own experience in Padan-aram, while serving in the fields of Laban, 'In the day the drought consumed me, and the frost by night.' In summer, vegetation entirely ceases; everything is burned up; but with the moderate showers which descend after this period, grasses, herbaceous and flowering plants awake to life, to flourish till the dry and scorching season returns. So high is the temperature

then, that the inhabitants commonly pass the night either altogether in the open air, or quite exposed to its influence.

| Pashalies.        | Chief Towns.                      |
|-------------------|-----------------------------------|
| Urfah, . . . . .  | Urfah, Bir, Sumeisat, Rakka.      |
| Bagdad, . . . . . | Bagdad, Hillah, Kurnah, Bassorah. |

*Urfah*, is one of the oldest historic sites connected with the Euphrates, apart from the main stream, but in the northern portion of its basin. By the Jews and all orientals it is regarded as identical with Ur of the Chaldees, the birthplace of Abraham, Sarah, and Lot. A pool within the walls, filled from a clear and copious fountain, commemorates the patriarch by its name, *Birket ul Ibrahim ul Khalil*, 'the Lake of Abraham the Beloved or Friend of God.' A mosque attached to it is similarly entitled. This is one of the most elegant edifices of Asiatic Turkey, a square building, surmounted by three domes of equal size, with a slender minaret rising up from a grove of tall cypresses. The adjacent waters, overshadowed with trees, and surrounded with structures full of Saracenic grace, ripple through clean white marble basins, forming a scene of peculiar beauty. The Pool of Abraham, about 200 yards long by 20 broad, is slightly thermal, beautifully clear, and has its water distributed by various channels through the town for the convenience of the inhabitants. It contains an incredible number of fish, which are traditionally connected with the patriarch. They are hence forbidden to be caught or molested, and the visitor seldom fails to see parties on the brink feeding them as a meritorious act. Lovely gardens are in the environs, and within the walls there are many bazaars, khans, baths, with some manufactories, and a considerable population, upwards of 30,000. The houses are all of stone; the streets are constructed with a paved causeway on each side of a central channel for a running stream; and trees are common in them, affording an agreeable shade in the hot season, of which the people avail themselves for repose, or to take ice brought from the summits of Taurus. The transit is accomplished in about twenty-four hours; and the ice being cheaply sold, is within reach of the poorest classes. Urfah was known to the Greeks and Romans by the name of *Edessa*. Seized by the Crusaders, it became the head of a principality under one of the branches of the house of Courtney, who took the title of Counts of Edessa, and from whom the Courtneys of England are descended. Twenty miles to the south-east, *Carrha*, now a desolation, is identified with the *Charran* or *Haran* of sacred story, the home of Rebekah, of Leah and Rachel, and of Jacob during his sojourn in Padanaram. In its neighbourhood, the Romans were signally defeated by the Parthians, and their general, Crassus, was slain.

*Bir*, the *Birtha* of antiquity, is on the Euphrates, near the point where it makes the closest approach to the Mediterranean, being only eighty miles distant from it. The small town has a fine old castle crowning a perpendicular cliff of chalk by the water-side. It lies on the great line of communication between Aleppo and Upper Mesopotamia, and is one of the most frequented points of passage across the river. *Sumeisat*, a poverty-stricken place, higher up the stream, at its emergence from the Tauric highlands, represents Samosata, the birthplace of Lucian and the heretic Paul. *Rakka*, a flourishing city under the califs, and the favourite residence of Harun-al-Raschid, of whose palace there are some remains, is lower down, and now insignificant. At a short distance stood ancient *Thapsacus*, a site now known as the ferry of Hammam or the ford of the Bedouins, where the river is fordable when the water is low. Xerxes, the younger Cyrus, Darius, Alexander, and Crassus, here successively conducted armies from bank to bank. From this point downwards, Arab tents are prominent in the landscapes of the Euphrates. Copses of tamarisk, poplar, white mulberry, clematis, line its borders, sheltering wild boars, landrails, quails, and other game, while wolves and jackals prowl among the ruins which bestrew its plains.

*Bagdad*, on the Lower Tigris, familiar by name from the days of childhood as the scene of the *Arabian Nights' Entertainments*, occupies both banks of the river, but by far the largest part is on the eastern side. A high wall of brick and earth surrounds both portions, flanked at regular distances with round towers, and passed by six gates, three in each division. It has a total circuit of about five miles, but is now greatly dilapidated. Seen from a distance the aspect of the place is highly pleasing. Surrounding groves of date-trees conceal the meanness of the buildings, while lofty minarets and beautifully-shaped domes rise above them, ornamented with glazed tiles, painted chiefly green and white, which reflect the rays of the sun with brilliant effect. The interior is a labyrinth of narrow unpaved streets and crooked lanes, rendered noxious by the filth and offal cast into them, which a tribe of half-savage dogs, without owners, alone clear away. There are a few imposing mosques, some extensive khans and bazaars, the latter well stocked with merchandise, and open spaces devoted to the sale of particular kinds of goods, hence named after them, the 'Thread Market,' the 'Muslin Market,' and the 'Corn Market.' The scene by the water-side is pleasing and animated, owing to the palm groves which intermingle with the buildings along the banks, the number of keleks, coracles, rafts, and other kinds of craft afloat upon the surface, and the constant transit of men, horses, camels, and caravans across the bridge of boats. But scarcely any traces of its former glory appear, when, as the capital of Harun-al-Raschid, it was styled the 'dwelling of peace,' the 'tower of the saints,' and was in reality the Mohammedan Athens. The palace of the califs is no more, nor has the memory of its site survived. The celebrated *medressch* or college still exists as a building, with part of it transformed into a khan, while another part is used as a custom-house. Though vastly decayed, the city still contains a population of 60,000, but it had nearly twice that number prior to the year 1831, when the triple calamity of

plague, flood, and famine swept off two-thirds of the inhabitants. Bagdad was founded by the Calif Almansur, 762—766 A.D. It was greatly enlarged in the ninth century by Harun-al-Raschid, who erected numerous edifices on the east side of the Tigris, and connected its two banks by a bridge of boats. Bagdad was taken by Timur in 1393, and was long a bone of contention between Turks and Persians. Considerably below Bagdad, the sites of *Seleucia* and *Ctesiphon* occur, on opposite sides of the river. Of the former, a Greek city, on the west bank, there are only a few insignificant remains; but of the latter, a Parthian foundation, the stupendous *Tauk e Kesra*, or Arch of Khusru survives as a majestic fragment of the past, probably a remnant of the white palace of Khusru, which was pillaged at the time of the Arab conquest.

The Lower Euphrates has the town of *Hillah* upon both its banks, occupying a remarkable site, being within the area over which Babylon was spread, and built of materials derived from its ruins. The remains of the ancient city, once the queen of nations and mistress of the east, consist of immense masses of brick-work, in some instances more or less changed into a vitrified state; of mounds of earth formed by the decomposition of buildings under the action of the elements, channeled and furrowed by the weather; and of fragments of brick, bitumen, and pottery, strewn upon the surface. On the eastern side of the river is an immense confused mass called by the Arabs the *Mujellibeh*, or 'the Overturned,' and a mound at some distance from it, with which conspicuous vestiges of building are connected, styled *Al-Kasr*, 'the Palace,' composed of the finest furnace-baked bricks. General opinion considers this a relic of the new royal palace of Nebuchadnezzar, with which the celebrated Hanging Gardens were associated. Those gardens rose in terraces resting on immense buttresses, each of which was supplied with mould deep enough for large trees, and received water by hydraulic machinery from the neighbouring river. They were designed to gratify the queen, a Median princess, who wished to behold a picture of the physical diversity of her native country on the flat alluvial plain of Babylonia, and would of course be stocked with exotics, rather than with plants common to the region. It is a curious fact that there is now an ancient tree in the locality, of a species quite unknown in the neighbourhood, which has arrested the attention of all travellers, owing to its unique character, solitariness, and venerable age. The tree is an evergreen, with leaves like those of the pine and cedar, but of a lighter green, and with boughs almost as flexible as those of the willow. 'Its present height,' says Captain Mignan, 'is only twenty-three feet; its trunk has been of great circumference; though now rugged and rifled, it still stands proudly up; and although nearly worn away, has still sufficient strength to bear the burden of its evergreen branches, which stretch out their arms in the stern grandeur of decaying greatness. The fluttering and rustling sound produced by the wind sweeping through its delicate branches has an indescribably melancholy effect, and seems as if it were entreating the traveller to remain, to unite in mourning over fallen grandeur.' The Arabs regard this vegetable relic of the past with veneration, believing that it flourished in ancient Babylon, from the destruction of which it was specially preserved, in order to afford the Calif Ali a convenient resting-place after the battle of Hillah. It is a species of tamarisk, frequently observed overshadowing wells in various parts of Persia.

Besides these mounds, there is one of much larger dimensions, on the opposite side of the river, about six miles south by west of Hillah. It bears the name of *Birs Nimrud*, and is the most remarkable feature of the plain of Babylon. The hill, in itself a ruin, is of oblong form, 2286 feet in circuit, rising in a conical shape to the height of 198 feet, and surrounded by a distinct quadrangular enclosure. The sides are deeply furrowed by the violence of the wind and rain to which for thousands of years they have been exposed. The summit is surmounted by a tower thirty-seven feet in height by twenty-eight in breadth, diminishing in thickness towards the top where it assumes a pyramidal form. It is a solid mass of beautiful brick-work, so firmly cemented as to be inseparable without damage. But it has been riven or split from the top nearly half-way down; and at the base there are several immense brown and black masses, of irregular shape, changed to a vitrified state, looking at a distance like so many edifices torn up from their foundations. Mignan took them for fragments of real rock, previous to examination. The change exhibited by these vitrified masses shews them to have undergone the action of the fiercest fire. The aspect of the *Birs Nimrud* is sublime, and in connection with its isolation, the impression made by it is solemn. Clouds play around the summit. Its cavities are the dens of wild beasts. Three lions were quietly basking on its heights when Porter approached, and scarcely intimidated by the cries of his Arabs, slowly descended into the plain. This ruined pile has been deemed a memorial of the temple of Belus, one of the wonders of the ancient city, though its distance from the other remains present a difficulty.

Some places famous in the annals of Mohammedanism lie in the desert westward at no great distance; *Kufa*, for a time the residence of the early califs, but now totally decayed; *Meshed Ali* contains the tomb of Ali, son-in-law of the Prophet, to which the town, often visited by Persian devotees, owes its origin; *Meshed Hussein*, with the tomb of Hussein, eldest son of Ali, is likewise a venerated shrine, was ravaged with fire and sword at the commencement of the present century by the Wahabi sectaries. Hamlets of mud huts appear on both banks of the Euphrates as it flows southerly, rendered pleasing to the eye by the date groves and pomegranate gardens in which they are imbedded. Villages also of neatly-formed reed dwellings occur, generally surrounded with an earthen rampart, crowned with rude towers and battlements, intended to secure the grain and property of the inhabitants from marauding hordes. There is likewise the largest permanently occupied Arab town on the entire line of the stream, called *Sheikh el Shuyukh*, the 'Sheikh's Market-town,' containing about 3000 houses. Soon after the influence of the tide becomes perceptible in the Euphrates, it joins the Tigris. On the peninsula formed by the confluence stands *Kurnah*, an

insignificant place, but occupying the site of the ancient *Apamea*, a city founded by Seleucus Nicator in honour of his wife. The combined rivers form the *Shat el Arab*, which has a course of 100 miles to the Persian Gulf, with *Bassorah* or *Basra* on the west bank, a foundation of the Calif Omar, governed by a subordinate of the Pasha of Bagdad. Seated on a majestic stream, commanding an extensive navigation, this town soon became one of the largest and most flourishing places in the east, and it is still the great emporium of commerce between Asiatic Turkey and India. The walls have a circuit of more than seven miles, and enclose 50,000 inhabitants, about a tenth of the former population, with extensive gardens and date plantations. In the adjoining country, whole fields of roses are cultivated for distillation; large quantities of rice are grown in the marshes; and the liquorice plant flourishes on the borders of the river.

The most numerous people in the region under review are Arabs, who bear a general resemblance in character, appearance, and habits to their brethren in the Arabian peninsula, from whence their ancestors came at various periods, at first under the generals of the early califs of Mecca. They are divided into tribes more or less extensive, each consisting of numerous clans. The latter are known by various names, that of the clan itself, the place at which it resides, the great tribe to which it belongs, as the Aniza, Shammar, Montefige, or Aggiel, and that of its own sheikh, which is used on ordinary occasions. The powerful tribe of Aniza, a word signifying union or assemblage, rate themselves at a million, and are spread from Arabia as far as the borders of Persia. The Shammar, often at variance with the preceding, are found in almost every part of Mesopotamia. The Montefige are on the Lower Euphrates and the *Shat el Arab*. The Aggiel are widely dispersed, as the most general carriers of the desert, enlisting also as soldiers in the service of the different pashas. This tribe, according to their own account, was one of those engaged in the conquest of Spain, and they still bear the standard of that nation.

The attention of mercantile men in Europe has frequently been directed to the Euphrates, as a favourable channel for commerce and communication with India, *via* Aleppo and the Levant. In 1574, Leonhart Rauwolf, a German, descended the stream from Bir to Babylon with this object in view. Gasparo Balbi, a Venetian jeweller, followed him four years later with merchandise. In 1583, Messrs Fitch and Newbery, agents of the merchants of London, bearing letters of credit from Queen Elizabeth, pursued the same route. But attention was diverted from it by the opening of trade to India by sea, in the hands of the East India Company. In our own time the river has been deemed a suitable channel for communicating with the far east by steam navigation, and an expedition was sent out by the British government, under the command of Colonel Chesney (1835-1837), to try its practicability. The materials for two iron steamers having been conveyed overland from the Mediterranean to Bir, a distance of about eighty miles, the boats were built, and the descent of the stream was accomplished. But the ineffectiveness of the Turkish authorities in the district, and the barbarism of the Arab tribes, with other disadvantages, led to the preference being given to the passage to India by Egypt and the Red Sea. The Euphrates route is, however, the shortest, and has since been surveyed for a railway, which will probably at no distant period be executed. A vast body of information was collected by the Chesney expedition, of the highest interest to the geographer; and for the first time the great historic streams of Western Asia were fully illustrated.

Rebecca's Well at Charran.

The Dead Sea.

### III. SYRIA AND PALESTINE.

This region, skirting the eastern side of the Mediterranean, is called SYRIA; the southern portion of which, PALESTINE, or the Holy Land, far surpasses all other parts of the globe in the interest and importance of its associations, as the promised inheritance of the seed of Abraham, and the scene of the birth, life, and death of the Messiah. Syria comprises a narrow strip of maritime lowland, expanding at intervals into spacious plains; grand mountains or hilly ranges running north and south at a varying distance from the sea; and the vast expanse stretching from their eastern base towards the basin of the Euphrates, known as the Syrian desert. The Lebanon, the name of the bold highlands, whose towering summits are seen by mariners from the sea around Cyprus, forms a single chain along the coast for some distance, and then divides into two great parallel ridges, which enclose between them the beautiful longitudinal valley, called by the ancients Coele-Syria or Hollow Syria. The western range, Lebanon proper, follows the coast, gradually inclines to it, and terminates at the sea a little to the north of Tyre. The eastern or inland range, Anti-Lebanon, pursues the same direction to the sources of the Jordan, where it forms the north portion of Palestine, and is continued southwards by the high countries which line on both sides the valley of the river. The highest point is the peak of Dahrel-Khotib, in the range called Jebel-Makmel, which attains an elevation of 10,050 feet. In the crevices and crater-like hollows of Jebel Sunnim (8555 feet) perpetual snow lies in immense quantities, forming a compact mass; and from May to November the business of cutting it up with hatchets, and conveying it to Beirout for cooling drinks, is actively carried on. Jebel-esh-Sheikh, the Hermon of the Scriptures

(8376 feet), likewise retains snow at the summit throughout the year. The Arabic name, signifying Old Man's Mountain, is said to be taken from the resemblance of the top in summer, clothed with snow, descending in streaks some distance down the slopes, to the hoary head and beard of a venerable sheikh. Ascending the mountains from Tripoli or Beyrout, on the way to Damascus, the traveller passes warm, temperate, and cold zones; and leaves oranges, figs, vines, roses, and a profusion of flowers, for oaks, aspens, willows, firs, and cedars, till, at about two hours' distance from the summit, utter barrenness prevails. 'The Lebanon,' say the Arabian poets, with truth and beauty, 'bears winter on his head, spring on his shoulders, and autumn in his bosom, while summer lies sleeping at his feet.'

In ancient times these highlands were extensively clothed along their slopes with forests of cedar and other trees, which furnished materials for the Phœnician merchant-vessels and the Jewish temple. A few venerable cedars remain, among a total number of about 400. They form a beautiful grove, one of the most picturesque productions of the vegetable world, on the line of route from the coast to Baalbec. No cedars of the same antiquity are found in any other part of the Lebanon. The patriarchs are large and massy, rear their heads to an enormous height, spread their branches afar, but have a strangely wild aspect, as if wrestling with some invisible power bent on their destruction, while life is still strong in them all. Rauwolff, in 1575, found twenty-four standing in a circle. Fernel, in 1630, counted twenty-two, and one which had recently fallen, having been accidentally set on fire by some shepherds. La Roque, in 1688, found twenty; Maundrell, in 1696, only sixteen; Pococke, in 1738, fifteen, the sixteenth having been blown down shortly before his visit. Two more perished during the last century. There are now seven representatives of ancient days standing very near each other; three more, at a short distance, almost in a line with them; and a few others of great age are reckoned. According to the mountaineers, the cedars anticipate the change of seasons, and prepare to receive the coming snow by inclining their branches upwards the better to sustain its weight, resuming an horizontal direction as it melts. Southey has poetically adopted the idea:

'It was a cedar-tree  
That woke him from the deadly drowsiness;  
Its broad, round-spreading branches, when they felt  
The snow, rose upward in a point to heaven,  
And standing in their strength erect  
Defied the battled storm.'

Great care is now taken of these remnants of the old forests of Lebanon. A solemn mass is annually performed under their shade on the feast of the Transfiguration. Lord Lindsay observed the names of Laborde and Lamartine cut on one of the largest trees, and properly deemed this customary commemoration of a visit 'more honoured in the breach than the observance.'

The high countries which precipitously wall in the Jordan valley are the mountains of Gilead of former times on the eastern side—the mountains of Ephraim and Judah on the western. The latter and best known tract is continuous through the whole of Palestine from north to south, passing from a wooded and fertile character to one bare and sterile, in its southerly prolongation, where it blends with the desert. The greatest breadth is about thirty miles. This upland mass is intersected by deep valleys, and crowned with hilly ridges, which have echoed the voice of prophets and been the scenes of miracle. Most of the scenes of our Lord's life lie within its limits. It attains an elevation of from 1000 to 3000 feet above the sea, as in the table.

In this district the climate is temperate, for while the summer heat is great, cold is rendered a decided element of the winter by the elevation of the country. At Jerusalem thin ice is occasionally formed for one or two days upon the pools, though the frost never bites the ground. Snow is more common, but quickly passes away.

The maritime lowlands are mere strips of territory in the neighbourhood of the Lebanon, but at its southerly termination they spread out into extensive plains, as those

Natural Bridge of Ain-el-Lebanon.

of Acre, Sharon, and Sephala, where the more distant hills of Judea form the inland boundary. Winter is here so genial that the orange, banana, and other delicate trees flourish in the open air, while at Beyrout or Tripoli, in the month of January, the picturesque spectacle may be seen by the European of orange-trees laden with flowers and fruit beneath his windows, with grand highlands in the background white with ice and snow. In the opposite season, along the coast, the sea-breeze relieves the high temperature, but in the more interior districts, apart from its influence, the summer heat is excessive, and renders well-known figures of speech peculiarly significant, 'a shadow in the daytime from the heat,' 'the shadow of a great rock in a weary land.' No rain falls during the specially hot months, or from the beginning of May to the close of August, and showers are rare in September. During this interval, the mornings break without clouds, and the days pass away without them, except some of the wisp-like and feathery, or the soft and fleecy description. A few cirri occasionally spread their delicate filaments aloft at noon, feebly and transiently intercepting the sun's rays, but not diminishing their fierceness. Small flocculent masses also form, but are more common at night, appearing when the moon is present,

'The beauteous semblance of a flock at rest.'

Towards the middle of August, larger and denser masses may be seen drifting from the

south-west, but without bringing rain. These are the Nile clouds, so called from their supposed cause, the inundation of Egypt by the Nile. Owing to the combined influence of heat and drought, the spontaneous herbage is shrivelled. Every flower fades, every green thing vanishes, except in the immediate neighbourhood of permanent springs and streams. The only verdant objects remaining are the scattered fruit-trees, the occasional vineyards, and fields of millet, which experience the care of man, for the foliage of the olive, with its dull grayish hue, scarcely deserves the name of verdure.

The period in which rain may be expected extends from the autumnal equinox to a month or six weeks after the vernal. The autumnal rains are the 'first' or 'former' rains of Scripture; the vernal are the 'latter;' and are probably so called in allusion to the order of agricultural operations. The showers of autumn do not commence suddenly, but by degrees, and give opportunity for the husbandman to sow his wheat and barley, while the showers of spring serve to refresh and forward both the ripening and the sprouting products of the field. Prominence is given to rain falling at the two periods because of its importance to the agriculturist. But the whole interval from the one to the other is the rainy season, and has no regularly recurring term of prolonged fair weather. If drought rapidly produces a marked effect upon the face of nature, so does the rain, especially in the spring months, when the daily accelerating heat combines with the moisture to force vegetation. The young grass covers the plains and meadows with a mantle of the freshest verdure; wild anemones, ranunculuses, verbenas, and other flowering plants, exhibit their varied colours by the wayside, in clefts of the rocks, and by the renewed rivulets; tall thistles, with gorgeous purple hues, rise up on every hand; the hawthorn and jasmine put on their blossoms; the myrtle and laurel temper their dark winter green with leaflets of a lighter hue; the fir-trees powerfully exhale their resinous particles; and the so-called juniper bushes, with their slim, feathery stalks, exhibit their clusters of pendent white and yellow-coloured flowers, perfuming the air with balsamic odours. A thousand rills are put in motion on the highlands, which, uniting in their descent, form powerful streams, and refill the exhausted water-courses in the plains, while the permanent rivers, which have dwindled in their volume, are swollen to overflowing by these temporary feeders.

The principal rivers have their sources in the great mountain system. From hence the Orontes flows northerly by Antioch to the Mediterranean; the Leontes runs westward to the same basin; the Barada descends eastward to Damascus, losing itself in the desert beyond; and the Jordan proceeds southerly to its termination in the Dead Sea, centrally intersecting the Holy Land from north to south. They are comparatively of inconsiderable magnitude; but the latter, while imperishably linked with the memory of grand transactions, is physically remarkable for the great and rapid declination of its bed. In a total course of about 117 miles the Jordan falls 1849 feet, and the greater part of this descent takes place between the Lake of Tiberias and the Dead Sea, the direct distance from the one to the other being about sixty-five miles. This steep decline renders the current correspondingly strong. A host of pilgrims annually repair to the Jordan for the purpose of bathing at the supposed spot of our Lord's baptism.

The Ghor or Valley of the Jordan is bounded on both sides by a chain of steep and lofty highlands, from five to six miles asunder in the northern part, but receding to three or four times that distance in the southern, where the plain of Moab lies on the eastern, and that of Jericho on the western bank. There is a much narrower valley let into this larger, through which the river winds its way. Repeated allusion is made in sacred story to the altered level of the stream. In the account of its first passage by the Israelites, it is spoken of as overflowing 'all its banks in the time of harvest.' An enraged enemy is also compared by one of the prophets to a lion coming up from the 'swellings of Jordan,' dislodged from his lair among the reeds and brushwood along the margin by the annual flood, and compelled to seek a shelter elsewhere. The river at present periodically overflows the banks of its immediate channel, but its highest water-mark is considerably below the level of the upper or great valley. If this was inundated in former times, the stream has since excavated for itself a deeper bed. In the northerly part of its course, the Jordan forms the Lake of Tiberias, often styled the Sea of Galilee, and also the Lake of Gennesaret. It extends from twelve to fifteen miles in length by from six to nine in breadth, and has a mountainous shore, on which stood the cities of Capernaum, Bethsaida, and Chorazin, whose sites can scarcely be identified, while their names have entirely perished in the district. The expanse is a very lovely one. It abounds with fish, and is subject to sudden changes from calm to disturbance, owing to

the strong gusts of wind which rush at intervals through the gorges of the mountains. Fishing is now entirely conducted by casting the net from the shore. No boat or sail appears upon the surface, except at very rare intervals, when some enterprising traveller from the west makes the venture, and provides the conveyance. The feathered tribes are numerously represented in water-fowl, birds of prey, and small warblers. But hours may be passed without seeing a human being upon the strand once occupied by flourishing towns.

The remarkable expanse of the Dead Sea, which the Jordan mainly contributes to form, and in which it terminates, has an extent of about forty-five miles in length, by ten in breadth, and exhibits generally profound depths, amounting in many places to not less than 1000 or 1300 feet. It has been known by various names, as the Sea of the Plain, in allusion to the ancient and beautiful plain of Siddim, the site of the cities of Sodom and Gomorrah, over which its waves are supposed to roll; the East Sea, in reference to its position with respect to the Mediterranean; the Salt Sea, from the intensely saline quality of its waters; and the Lake Asphaltites, from the quantities of bitumen found in it and on its borders. The Arabs of the district now style it *Bahr Lot*, the Sea of Lot, and sometimes *Bahr Mutneh*, the Stinking Sea. Its common European name, *Mare Mortuum*, or the Dead Sea, alludes to the sluggishness of the surface, which, owing to the density of the water, only yields to the action of violent winds, and to the absence of fish, with the treeless and herbless desolation of the greater part of the shores. The lake belongs to the class which have affluents, but are without an outlet, yet generally maintain the same level, for such formations occur in regions of great heat, where the excessive evaporation to which they are subject, is quite sufficient to account for the disposal of the accessions they receive. The water is far saltier than that of the ocean, a quality derived from the saline tracts which form the south-eastern shore, and have doubtless a subaqueous extension. It is found by analysis to contain one-fourth of its weight of salt ingredients. Though beautifully clear and transparent, the taste is indescribably nauseous, being not only saline but bitter beyond bitterness. Experimentalists compare it to sea-water mixed with Epsom salts and quinine, or to a solution of nitre mixed with an infusion of quassia. It affects the eyes pungently like smoke, irritates the skin, and leaves a white deposit upon the person of the bather.

Wild fictions have been circulated respecting the Dead Sea. It was affirmed by some old travellers to smoke, and exhale deleterious vapours, so that no bird could fly over the surface, or venture upon its bosom without hazard of perishing, while no object could be made to sink in its waters. Statements of this description, which led many a pilgrim to cast an eye of wonder and awe upon the lake, involve in the main distorted or exaggerated representations of certain physical characteristics. In common with other expanses, dense mists form at intervals, which the summer sun dispels soon after its rising; and during the hot season, in the middle of the day, the active evaporation is often visible to the eye. Irby and Mangles, from a spot which commanded an extensive prospect of the lake, observed this effect, in broad transparent columns of vapour, not unlike water-spouts in appearance, but very much larger. The fresh-water fish of the Jordan, which the river in its floods may force down, must of course perish in a salt-lake, and it appears to have no fish whatever of its own. This circumstance would satisfactorily explain the entire absence of aquatic birds, were that the case. During the summer heats, when all the vegetation, which is somewhat plentiful in places along the western border, is scorched, land birds also are scarce or altogether wanting. The truth seems to be, that at certain times of the year utter lifelessness reigns upon the shores and surface. But this is only a temporary seasonal effect, though the feathered tribes are naturally rare at any time, owing to the general barrenness of the adjoining lands, deficiency of shelter, and the entire want of food in the water. Stephens saw a flock of gulls floating quietly on the waves, and when disturbed by him, they flew along the lake, skimming the surface till they were out of sight. Elliot watched some wild ducks cross the sea from Moab to the hills of Judah. Irby and Mangles witnessed a pair of Egyptian ducks and a flight of pigeons make the passage. Dr Robinson speaks of the carols of the lark at early dawn, the cheerful whistle of the quail, the call of the partridge, and the screaming of birds of prey on the wing about the cliffs. Miss Martineau remarks: 'It is said that small birds do not fly over the lake on account of the deleterious nature of the atmosphere. About small birds I cannot speak: but I saw two or three vultures winging their way

obliquely down it.' Salt, deposited by the Dead Sea, collected on the western side, is now and has long been used at Jerusalem for culinary purposes.

Owing to the quantity of briny matter held in solution, and the great specific gravity of the water, it is remarkably buoyant. Ancient representations of its capacity in this respect only require limitation. The testimony of all bathers is uniform and explicit. 'There is some truth,' says Paxton, 'in the saying that it requires an effort to keep the feet and legs under, so as to use them to advantage in swimming. I could lie on my back in the water, with my head, hands, and feet all out at the same time, and remain thus as long as I pleased without making any motion whatever. This I could not do in any other water that I have been in.' Stephens has given a lively description of his bath. 'From my own experience,' remarks the traveller, 'I can almost corroborate the most extravagant accounts of the ancients. I know, in reference to my own specific gravity, that in the Atlantic and Mediterranean I cannot float without some little movement of the hands, and even then my body is almost totally submerged; but here, when I threw myself upon my back, my body was half out of the water. It was an exertion even for my lank Arabs to keep themselves under. When I struck out in swimming it was extremely awkward, for my legs were continually rising to the surface, and even above the water. I could have lain and read there with perfect ease. In fact I could have slept, and it would have been a much easier bed than the bushes at Jericho.' A fruit, pleasing to the eye but of deceptive appearance, 'the apples on the Dead Sea shore,' mentioned by Josephus and Tacitus,

\* Which grew

Near that bituminous lake where Sodom stood,'

is very probably the produce of the 'osher or asheyr tree, found in the district. It resembles externally a smooth apple or orange, hangs in clusters of three or four upon the branches, and is of a yellow colour when ripe. Upon being struck or pressed, it explodes with a puff, and is reduced to the rind and a few fibres, being chiefly filled with air.

The district of the Dead Sea, and of the whole valley of the Jordan northward to the Lake of Tiberias, is quite a phenomenon in physical geography, being below the level of the ocean. No other example of similar depression is known, for that of the Caspian Sea, if admitted, is comparatively inconsiderable. The Lake of Tiberias is 328 feet below the level of the Mediterranean; and from thence the river-valley declines to the Dead Sea, the surface of which is very nearly 1400 feet below the same level. This is the mean of barometrical and trigonometrical measurements executed by the Count de Bertou in 1838—1839, Von Russegger in 1838, Lieutenant Symonds in 1841, and Von Wildenbruch in 1845. Owing to the great depression of the surface, together with the heights which wall in the valley, heat powerfully accumulates by the concentration and reflection of the solar rays, while the bordering highlands prevent the admission of external breezes to relieve the temperature. The climate is therefore tropical. Travellers on descending into this low country feel as if they had entered another zone. They confirm the accuracy of Josephus, who reports that winter in the plain of Jericho resembled spring, and that the inhabitants wore linen garments at the time when the people in other parts of Judea were shivering in the midst of snow. Snow, indeed, is almost entirely unknown in the valley. The mean annual temperature, in the southern and lower portions, is probably 75 degrees, while that of Cairo, a more southerly latitude, is 72 degrees. Hence dates ripen earlier than in Egypt. Indigo, which requires a high temperature, grows wild, and is also cultivated, the product commanding a higher price than Egyptian indigo, being of superior quality. The balsam-tree, a tropical plant, which yields the medicinal gum, now called the balm of Mecca, and is now limited to Arabia, once flourished in groves near Jericho, and furnished the renowned balm of Gilead. The vegetation is still luxuriant and abundant wherever there is moisture. Tamarisks, willows, oleanders, and tall reeds line the borders of the Jordan, and in many places almost hide its waters. But apart from the margin of the river, the surface has the aspect of a parched desert through the months of the summer. During the early part of May, and in the morning, a recent traveller found the thermometer standing at 92 degrees, in the shade of a clump of wild fig-trees overhanging a copious spring, and near its edge.

*Aleppo*, in Northern Syria, is an inland city situated nearly equidistant from the Mediterranean and the Euphrates. Though on the edge of the great Syro-Arabian desert, it occupies a well-watered and delightful locality, which has obtained the name of the Syrian Gardens from its numerous plantations of fruit and forest trees, with various kinds of esculent plants and flowering shrubs, blended with patches of cotton and tobacco. Twice desolated in the present century by terrible earthquakes, it is still one of the most busy commercial places of the Ottoman Empire, possesses good houses of freestone, well-supplied bazaars, numerous khans, baths, fountains, and mosques, a substantial wall, with a population of 80,000; while riven and ruined buildings, in every stage of destruction, proclaim the fearful nature of the visitations incident to the neighbourhood. On the last occasion, August 13, 1822, the sun went down, and the day closed peacefully; but at half-past nine o'clock the ground rocked, the whole pashalic was shaken, and in a few seconds the city was reduced to a heap of ruins. The next morning all the surviving inhabitants were scattered homeless over the open country; while the dead, to the number of 20,000, among whom was the Austrian consul, lay beneath piles of prostrate masonry and brick. The plague in 1827, the cholera in 1832, and the oppression of the temporary Egyptian government were further disasters. But as a great centre of inland trade, the place has rallied from these misfortunes. The merchant-citizens are distinguished for refinement, and are hence styled by the Arabs *Halepi tshelabi*—the 'foppish Aleppines.' *Iskenderun*, or *Scanderoon*, the port of Aleppo, seventy miles distant, on a fine inlet of the Mediterranean, has considerable trade, but is a wretched town, surrounded with swamps, notoriously unhealthy. *Antakia*, on the left bank of the Orontes, about twenty miles from the sea, is the poor modern representative of the vast and splendid Antioch of former times. This city, for several centuries the favourite residence of the Syro-Macedonian kings, and afterwards of Roman governors, was built partly on the plain through which the river winds its way, and partly on the rugged ascent towards Mount Casius, the slopes of which were once covered with vineyards. It was as large as Paris, celebrated for stately buildings and luxurious embellishments, which won for it the style of 'Antioch the Beautiful,' 'the Crown of the East.' The Jews were partial to it, owing to the *jus civitatum*, or right of citizenship, which the founder, Seleucus, gave them, in common with the Greeks. In the early history of Christianity it is noted as the place where the name of Christians was first applied to its professors. In later times, it was commonly denoted the 'Eye of the Eastern Church,' and witnessed ten ecclesiastical councils held within its walls. The Temple of Daphne stood in the neighbourhood, embosomed in thick groves of laurels and cypresses, through which numerous streams were led, forming a cool summer retreat for the inhabitants of the city. But nothing now remains of the glory of Antioch, beyond what history relates, except the fragments of massive walls which lie around the crazily-built houses of Antakia, and those gifts of nature in fruits, flowers, and foliage to the site which wars and earthquakes may ravage, but cannot permanently destroy.

*Tripoli*, on the coast, is one of the chief ports, with 18,000 inhabitants, and an important shipping trade in raw silk, and other produce. The name, signifying 'three cities,' refers to its origin as the offspring of colonies from the three cities of Tyre, Sidon, and Aradus. The town is environed with delightful gardens, has many agreeable features, and contains striking architectural monuments of the age of the Crusades. *Latakia*, ancient *Laodicea*, another seat of maritime commerce, is a smaller place on the north, with a flourishing trade in the export of tobacco and sponges of the finest quality. *Beyrout*, on the south, the port of Damascus and Central Syria, is magnificently situated, the blue sea on the one hand, the lower slopes of the Lebanon on the other, with the higher parts of the range in the background, whose snow-covered peaks are in view of the inhabitants. The town is walled on the land-side, and surrounded with mulberry groves for the cultivation of silk, along with rich gardens of fruits and flowers, divided generally by hedges of the prickly pear. It prospered in former times under the name of *Berytus*, sunk for ages into obscurity, and has only recently gained consequence owing to the extended growth of silk and wine in the neighbourhood. The population, about 12,000, consists chiefly of Christians, many of whom represent European mercantile firms, or are connected with Protestant mission establishments. Coal and iron occur in the vicinity, and hills of red sand are prominent on the shore. From some examples of the latter, a small stream to the northward, the *Nahr Ibrahim*, *Adonis* of antiquity, probably derived a real discoloration which mythology interpreted in the manner described by Milton:

'Thammuz came next behind,  
Whose annual wound in Lebanon allured  
The Syrian damsels to lament his fate  
In amorous ditties all a summer's day;  
While smooth *Adonis* from his native rock  
Ran purple to the sea, supposed with blood  
Of Thammuz yearly wounded.'

The coast of Syria, with a narrow strip of territory inland, the breadth of which perhaps nowhere exceeded

twenty miles, corresponds to the limits of Phœnicia Proper. This region was early studded with flourishing cities, for the most part well fortified, and situated on islets adjacent to the shore. The insular position rendered them more secure, and was suited to the habits of a maritime people. They were equally the abodes of industry and the arts, celebrated for their fleets, and for naval and commercial enterprise. The more important had a section of the neighbouring country under immediate control, with an independent government, which, though monarchical, was so strictly limited as to be almost republican. *Aradus*, the *Arpad* of sacred history, on the north, occupied the small island of Ruâd, about two miles from the coast, of which cisterns cut in the solid rock and some masses of masonry are the principal remains. The few islanders now rear poultry and

Beyrout and Mount Lebanon.

vegetables, and are engaged in the sponge-fisheries, a laborious and perilous calling. They dive for the product, remain under water for a wonderful length of time, and are often in a state of complete exhaustion on regaining the surface. The best season for the fishery is during the month of August and September, when the regular sea-breezes are to be depended on. The sponges are bartered to merchants for grain, clothes, and other necessaries of life. Only very few of the best quality find their way to the markets of Western Europe, as the home demand for them at a remunerating price is very great, owing to the frequent use of the bath. Turkish ladies are as fastidious respecting the shape and size of the sponge, as the men are in relation to the mouth-pieces of their pipes. *Tartus*, an insignificant place on the adjoining mainland, is the *Tolosa* of the middle ages, the *Ant-aradus* of the Greeks, with Phœnician antiquities and Gothic remains, which bespeak its former consequence. *Sidon*, the mother city of the country, celebrated in the time of Homer for the artistic skill of its inhabitants, and often mentioned in the Scriptures, exists as a small town on a southerly part of the coast with the name of *Saida*, but has had its commerce transferred to the northern ports. There are very few traces of the Phœnician past at the spot, but many memorials of the Crusaders. *Sâr*, further south, towards the border of Palestine, little more than a mean hamlet, is all that survives of *Tyre*. This ancient daughter of Sidon soon surpassed the parent in prosperity, and became the greatest commercial mart of the ancient world.

The position of *Tyre* was originally confined to the mainland, but gradually its buildings were extended to a rocky isle, separated from it by a narrow arm of the sea. Eventually, for the sake of security, the inhabitants became wholly insular, and strongly fortified their home. It fell into the hands of Alexander the Great after a long siege, 332 B.C., owing to his construction of an enormous causeway or pier from the main shore to the island, over which his troops marched with their engines to the assault of the walls. Though sacked, the city revived, and was populous at the commencement of the Christian era. It was taken by the Saracens in the seventh century; recovered by the Crusaders in the twelfth, and made an archiepiscopal see, of which

William of Tyre, an Englishman, the well-known chronicler, was the first prelate. Mastered finally by the Turks, it sank rapidly into complete insignificance, and became by the seventeenth century a miserable village, inhabited by a few fishermen. Still, its present Arab name, now occupies a peninsula, accumulations of sand having converted the causeway of Alexander into an isthmus more than a quarter of a mile in width. The ruins of an old church—some tottering walls of ancient date, and towers that mark the time of the Crusades—a white domed mosque—a few unconnected houses, jumbled together on the sea-washed rock—and rising above all, some waving palms, whose plummy tops seem to mourn over the surrounding desolation, are all the objects that now present themselves to the traveller on a spot once 'glorious in the midst of the seas,' whose 'merchants were princes, and whose traffickers were the honourable of the earth.'

*Damascus*, locally called *El-Sham*, is an inland city, situated on an extensive plain at the eastern base of Anti-Lebanon, highly fertile, being watered by numerous streams which descend from the mountains, of which the Barada and Awaj are the most important, representing 'Abana and Pharpar, rivers of Damascus,' mentioned in the Jewish annals. Completely encompassed with gardens and orchards, the distant view of the place from the mountain slopes is very charming. It is one of the oldest of existing cities, and also one of the very few which has not dwindled from its ancient importance, nor changed its aspect for centuries, remaining thoroughly oriental in the appearance of its houses and inhabitants. The population exceeds 100,000, consisting chiefly of Turks, who have not yielded to modern influences, who cling like their ancestors to the dignity of high turbans and flowing robes, and are strongly tinged with Moslem pride and fanaticism. There are an immense number of coffee-houses and cook-shops, of smiths and jewellers, but manufactures of leather are the most extensive, with coarse woollen cloths for the cloaks universally worn by the Syrian peasants. Formerly the artisans were famed for the production of sword blades, which appear to have been made of thin sheets of steel and iron welded together, so as to unite great flexibility with a keen edge. Tamerlane carried off the workmen into Persia; but sabres of inferior quality continue to be made. The mosques amount to two hundred. One of the finest was once a Christian structure, built upon the site of a pagan temple, some columns of which are extant. Damascus, under the Saracens, was the head of a califate, and several of the mosques were erected as mausolea for the califs. It was taken by the Turks in 1516, and is now the true capital of Syria, and head-quarters of the army, with a pasha who is always one of the highest officers of the empire. *Hamah*, the *Hamath* of Scripture, and *Homs*, the *Emesa* of the Greeks and Romans, are considerable towns on the north, in the direction of Aleppo. *Baalbec*, or *Heliopolis*, 'City of the Sun,' in the great valley between the ranges of Lebanon, now a mere village, is remarkable for splendid remains of a huge temple of the sun-god, the erection of which is commonly ascribed to the Emperor Antoninus Pius. Single blocks of stone lying prostrate are of colossal proportions, amounting in one instance to sixty-nine feet in length, and in some others to fifty-three feet each. *Palmyra*, 'the City of Palms,' exhibits an equally striking spectacle of fallen grandeur. It was originally founded by Solomon as *Tadmor* in the wilderness, 'for the accommodation of caravans,' and became in the Roman age the capital of the renowned Queen Zenobia, conquered and taken captive of the Emperor Aurelian. The site is an oasis in the desert, nearly midway between the Mediterranean and the Euphrates, about 120 miles north-east of Damascus. Here are now a few mud-built cottages, by the side of perennial springs and shady palms, along with sixty Corinthian columns of white marble, and other ruins covering an extensive space, which surprise the visitor by their appearance in a wilderness destitute of a single building, and contrast strikingly in their snowy whiteness with the yellow sands. English merchants at Aleppo first made known the remains of Palmyra to the western nations. The Arabs still apply the name of *Tadmor* to the spot.

*Acre*, ancient *Acco-Ptolemæis* (now *Akka*), a small seaport, marks the southern limit of old Phœnicia, and the northern border of the Holy Land. It occupies the shore of a semicircular bay, the only prominent inlet of the whole coast-line. Its position, walls, and fortress rendered it the key of Palestine when a vigorous ruler was its lord, like Djezzar Pasha at the commencement of the present century. Fierce have been the struggles for its possession between the Christian and Mohammedan powers. Fortifications and town are now utterly dilapidated, but exhibit evidences of former strength. The place, though still containing 10,000 inhabitants, belongs essentially to the past, and has a history memorable for its many sieges—by Baldwin, Saladin, Richard Cœur de Lion, Napoleon, Ibrahim Pasha, and Sir C. Napier. The peculiarity belongs to its annals that at the close of the Crusades, within the narrow circuit of its walls, between the hosts of the Saracens on the one hand and the waters of the Mediterranean on the other, there were cooped up a greater number of chieftains, exercising authority, than ever appeared at the same time in any other stronghold. Within that circuit, destined to be driven from it, having lost every other part of Palestine, 'the kings of Jerusalem and Cyprus, of the House of Lusignan; the princes of Antioch; the counts of Tripoli and Sidon; the grand masters of the Hospital, the Temple, and the Teutonic Orders; the chiefs of the republics of Venice, Genoa, and Pisa; the Pope's legate; and the kings of France and England, each assumed an independent command. Seventeen tribunals exercised the power of life and death.'

The Bay of Acre has Mount Carmel on the southern side, a range of hills from four to five miles in breadth, and running eighteen miles inland, bounding on the south-west the great plain of Esdraelon. Through this plain 'that ancient river, the river Kishon,' winds its way to the sea, skirting the foot of the range—an inconsiderable stream in the dry season, with its upper channels dry, but a furious and overflowing torrent after heavy rains. Ascending from the lowlands, where the summer heat is oppressive, the traveller meets with a cool and bracing air on the hills, especially on the brow of the terminating headland—a bluff

promontory fully exposed to the refreshing sea-breeze. This summit is completely devoid of verdure. But, further inland, beautiful vegetation clothes the slopes and fills the dells, giving them a garden-like appearance. There are copses of the evergreen oak, with dense underwood of hawthorn, myrtle, and acacia; picturesque green glens spangled with bright flowers, and fragrant with aromatic plants; while wild vines and olive-trees remain amid the spontaneous produce of the soil to bear testimony of ancient cultivation. This fertility constituted the 'excellency of Carmel' in former times, the evidence of which has survived the neglect of ages; and the hand of industry is alone needed to renew it in all its glory on the spot. On the side of the sea, half-way up the hill, stands the convent, a foundation of the celebrated order of the barefooted monks who have carried the name of Carmelite to the extremities of Europe. The building is quite new, a handsome structure of three stories, with nine windows looking towards Acre, and thirteen towards the Mediterranean, containing rooms fitted up for the reception of European visitors. The view from the roof is very extensive, but fatiguing from its uniformity, as a sail but rarely appears on the adjoining waters. But occasionally the cloud is seen, as aforetime, not 'bigger than a man's hand,' which increases in volume, overspreads the sky, and discharges itself in deluging torrents. In this manner the commencement of the autumnal rains in Palestine is often announced. When sailing along the coast on a bright and beautiful morning, the approach of a squall was intimated to Mr Emerson. On looking out he saw no indication of it till his attention was directed to a small black cloud on the verge of the horizon, which every instant drew nearer the vessel, and enlarged its bulk. Orders were immediately given to take in sail, and prepare the ship for scudding before the hurricane. It came on with tremendous violence; the rain poured down in torrents upon the deck; and in little more than a quarter of an hour, the sky cleared, the sun shone out, and all was peaceful except the rough and billowy deep.

Southward on the coast some thirty-six miles, masses of masonry and prostrate columns, partly washed by the waves, are the only remains of *Cesarea*, the capital of Roman Palestine. No village, habitation, or hovel marks the site, but the Arabs preserve the memory of the city in the equivalent name of *Kaisaria*, applied to the spot. About the same distance in the like direction leads to *Jaffa*, or *Joppa*, a town of 5000 inhabitants, the old port of Jerusalem, from thirty to forty miles north-west of the city. It stands directly on the beach, and answers to the meaning of its name, 'Beautiful,' occupying a little rounded hill which dips on the west into the waves, and is encompassed on the land-side with orchards of oranges, lemons, pomegranates, and apricots, scarcely surpassed in the world. Steamers are occasionally in sight plying between Alexandria and Beyrout, but they rarely stop, as there is little or no accommodation for the landing and embarkation of passengers, while the harbour is nearly sanded up. The site has been occupied from a very remote antiquity, and been the scene of many interesting transactions. To this port the cedar and pine woods of the Lebanon were brought on floats which were used in the building of Solomon's Temple. Here for a time the apostle Peter resided with Simon the tanner, whose house is described as 'by the sea-side,' on the flat roof of which he saw the vision which corrected his Jewish prejudices against the Gentiles. The prominent incident in the modern history of Jaffa is the infamous massacre of his prisoners in the neighbourhood by Napoleon.

*Jerusalem*, the modern representative of the city of David and Solomon, of Herod and Pilate, is situated between the shores of the Mediterranean and the head of the Dead Sea, nearer the latter than the former, in latitude 31° 46' north, longitude 35° 13' east, a place now humbled and forlorn, no longer the capital of a kingdom, though in one sense the metropolis of the world. It stands on the edge of a rocky plateau, part of the extensive table-land or backbone of Judea, which is broken into several eminences, and nearly surrounded by valleys, or rather deep ravines. On the north the site is open to the high plains. But eastward it is limited by the Valley of the Kedron, the bed of a winter torrent, completely dry for the greater part of the year, which separates it from the Mount of Olives. Southward is the Valley of Hinnom, likewise traversed by a stream in the rainy season, which joins that of the Kedron, and is itself a continuation of the shallower Valley of Gihon on the western side. The ground thus enclosed on three sides by natural fosses includes the two hills known by the names of Acre and Zion, the last of which is only embraced in part by the present walls. The highest point of Zion, the south-western brow, is about 300 feet above the lowest portion of the adjoining valleys, 2535 feet above the level of the Mediterranean, and 3835 feet above that of the Dead Sea. The Gothic embattled wall around the city is about two miles and a half in circuit, and is passed by four principal gates. It encloses narrow, unpaved, and irregular streets, gloomy prison-like houses, and a population of perhaps 20,000, consisting of Moslems in the proportion of full one-half, with Jews, Armenians, Latin and Greek Christians. The most conspicuous edifice, the so-called Mosque of Omar, occupies the site of Solomon's Temple, and is considered by the Mohammedans as only inferior in sanctity to the Kaaba at Mecca. Latin, Greek, and Armenian Christians venerate the Church of the Holy Sepulchre, believing it to stand on the very site of the Messiah's death, burial, and resurrection. They have their separate chapels in the Byzantine building, re-constructed in the present century; but have often been involved in the fiercest quarrels by the clashing of their respective pretensions. A Protestant bishopric, with a church on Mount Zion, is jointly sustained by England and Prussia, the appointment to which rests alternately with the two governments. The only prominent industry in the city is the manufacture of crucifixes, beads, artificial shells and reliquaries, which are disposed of in immense quantities to the crowds of pilgrims.

In the view of Jerusalem, looking westward, northward, or southward, it is seen on an elevation higher than the hills in the immediate neighbourhood, with its walls and towers projected against the sky. But facing the

east, the ridge of the Mount of Olives forms a background, the highest peak of which rises to 2724 feet above the Mediterranean, or nearly 200 feet above the top of Mount Zion. These summits are familiar objects in every view from the roofs of the city, and so near are they as to seem almost within its bounds. The olive, from which the name of the first is derived, still grows in patches at the base, but must have clothed the slopes more completely to have originated the distinctive title. The Roman general, Titus, cut down all the wood in the vicinity of the city in order to facilitate operations during his famous siege; but there would seem to have been constantly springing up a succession of the denominative trees. As spontaneous produce,

Jerusalem, from Mount of Olives.

uninterruptedly resulting from the original growth, the existing venerable examples are of high interest. It appears from allusions that the site had once myrtles, figs, pines, and palms, all of which have passed away except the fig, which lingers here and there along with the olive. Thus clothed with shady vegetation, and close at hand, Olivet was the favourite resort of the old inhabitants—their open ground to ancient Jerusalem; it was as the Campus

Martius to ancient Rome, or as the Prater is at present to Vienna, and the Parks to London. The ridge has four distinct summits distinguished by traditional names. The first in order, proceeding from north to south, is the lowest, called the 'Galilee,' from the supposition that the angels appeared over it who said, 'Ye men of Galilee.' The next is the 'Ascension,' so entitled as the presumed scene of that event, which has the site indicated as the Garden of Gethsemane at its base. The third is the 'Prophets,' with a catacomb called the 'Prophets' Tombs' on its side. The last is the 'Mount of Offence,' so styled from Solomon's idol worship. The third summit is the most elevated, and has the direct route to Bethany and Jericho on its southern shoulder. This is a rough, broad, and well-defined mountain-track, winding over rock and loose stones, undoubtedly the path followed by the Saviour on his triumphant progress to the city. Lieutenant Lynch, who approached by this tract, coming up from his adventurous expedition in the Valley of the Jordan, was surprised at the magnificence of the first view. Bartlett, who beheld the same prospect at eventide, which no other modern traveller seems to have done, owing to the gates being closed at sunset, remarks: 'Beautiful as this view was in the morning, it was far more striking when the sun, about to sink into the west, cast a rich slanting glow along the level grassy area and marble platform of the Temple enclosure, touching with gold the edge of the Dome of the Rock, and the light arabesque fountains with which the area is studded; while the eastern walls and the valley below are thrown into a deep and solemn shadow, creeping, as the orb sinks lower, further and further towards the summit (of Olivet), irradiated with one parting gleam of roseate light, after all below was sunk in obscurity.' Most visitors confess to a strong feeling of disappointment at the first sight of Jerusalem, as Richardson, Buckingham, and Chateaubriand, owing to their arriving either from the west or south, by the road from Jaffa or Hebron. It is from the Olive mount on the east, the road from Bethany and Jericho, the approach by which the army of Pompey advanced, that the appearance is grand, though all, upon further acquaintance, will be disposed to say: 'How doth the city sit solitary, that was full of people! How is she become as a widow! she that was great among the nations, and princess among the provinces!'

Close to the city of the living there is a city of the dead, a long series of ancient sepulchres, chiefly on the sloping sides of the adjoining ravines. The great majority of the tombs exhibit the same general mode of construction. A small doorway, usually simple and unadorned, has been cut in the face of the rock, leading to one or more chambers excavated out of it, commonly upon the same level with the entrance, though sometimes having a descent of several steps. In some instances advantage has been taken of a spot where the stone has been quarried for building purposes, in order to obtain a perpendicular face for the door. Many of the doors and fronts have been broken away by violence, so as to leave the interior of the chambers quite exposed. Most of the sepulchres seem to have been simply secured by large stones or blocks at the doors, easily removed and replaced upon a fresh tenant being brought to the family grave. It was the general custom to deposit the body in a chamber, or in a niche, without any sort of coffin, but wrapped round with grave-clothes, though, in the case of the noble and wealthy, stone coffins with sculptured lids, or sarcophagi, were used. In striking contrast with the habits of the Egyptians, Greeks, and Romans, from whose funereal monuments whole acres of inscriptions have been gathered, not a single letter has been found in any ancient sepulchre of Palestine. There are a few remarkable exceptions to this description of the old abodes of the dead contiguous to Jerusalem. One called the 'Tombs of the Judges,' a name supposed to refer to the members of the Jewish Sanhedrim, presents a portico surmounted with a fine pediment, sculptured with flowers and leaves. Another, styled the 'Tombs of the Kings,' consists of a large square court sunk in the solid rock. A portico on one side leading to many excavated chambers, with crypts, is ornamented with carved clusters of grapes between groups of flowers, intermingled with Corinthian capitals, and forms the finest specimen of ancient sculpture extant in the neighbourhood. This sepulchre, from its extent and magnificence, has most likely been a royal burial-place, perhaps of the princes of the line of Herod.

An account of the relative position of the renowned city, 'written by Henry Timbérlake,' in 1601, is quaint and curious.

'Now concerning how the country about Jerusalem lyeth, for your more easy and perfect understanding, I will familiarly compare their several of our native English towns and villages, according to such true estimation as I have heard made of them.

The river Jordan, the very nearest part thereof, is from Jerusalem as Epping is from London.

Jericho, the nearest part of the plains thereof, is from Jerusalem, as Lowton Hall, Sir Robert Wrath's house, is from London.

The Lake of Sodom and Gomorrah is from Jerusalem as Gravesend is from London.

The fields where the angels brought tidings unto the shepherds, lye from Jerusalem as Greenwich doth from London.

Mount Olivet lyeth from Jerusalem as Bow from London.

Bethania is from Jerusalem as Blackwall is from London.

Bethphage is from Jerusalem as Mile End is from London.

The valley Gethsemane is from Jerusalem as Ratcliffe Fields lye from London.

Brook Cedron is from Jerusalem as the ditch without Aldgate is from London.

The distances of Bethlehem, Beersheba, Gaza, Joppa, Samaria, and Nazareth, from Jerusalem, are similarly estimated by those of Wandsworth, Alton, Salisbury, Aylesbury, Royston, and Norwich from London.'

*Nazareth*, or *En Nasireh*, included in the pashalic of Acre, is a small inland town of 3000 inhabitants, full two thirds of whom are Greek, Latin, and Maronite Christians. This place has an enduring high association. It was the residence of 'Jesus of Nazareth,' before he entered upon his ministry, the abode of his parents Joseph and Mary. The site is a sweetly sequestered valley enclosed by barren hills, but clothed itself with rich grass, dotted with fig-trees and small gardens lined with hedges of the prickly pear. A spring outside the town, arched over with stone, is traditionally regarded as having been visited by the Virgin to draw water, one of the legends which may be received without distrust, for daily at present, women and girls with long white veils and bands of coins over their heads may be seen at the spot filling their graceful water-jars. Nazareth is on the northern side of the plain of Esdraelon, about twenty miles west of the Lake of Tiberias. Between the two, the wooded and conical Mount Tabor rises boldly, from the summit of which the eye overlooks the lake and the greater part of Galilee, hails the snow-capped heights of Hermon, and catches sight of the country of Bashan and Gilead beyond Jordan, where primeval oak forests alternate with rich pastures and fertile corn-lands. *Safed*, a neighbouring town, is built round the slopes of a mountain, the brow of which is crowned by the massive ruins of a castle. It had formerly a large Jewish population, with many learned rabbis and celebrated schools, but was dreadfully injured by an earthquake in 1837. Nearly every house was overthrown, and more than half of the inhabitants perished. *Nablous*, southward in ancient Samaria, is the *Shechem* and *Sychar* of the Scriptures, called in later times *Neapolis*, of which the present name is a corruption. It occupies a narrow, watered and luxuriant valley between Mounts Ebal and Gerizim, but is chiefly built at the base of the latter, and has a population of 8000, mostly Mohammedans. The town is one of the prosperous places in Palestine, with the production of cotton fabrics, soap, and olive oil for its industries. A few Samaritans remain at the spot, the old metropolis of their faith, who revere the summit of Gerizim as the place where 'men ought to worship.' In the vicinity is Jacob's Well, the scene of a memorable interview, an excavation in the rock usually furnishing an abundant supply of water.

*Bethlehem*, 'House of Bread,' in which the royal line of David dwelt, and the Messiah was born, is six miles from Jerusalem on the south, reached by a dreary road. It stands upon a limestone ridge, the slopes of which

have the vine, the fig, and the olive flourishing in the dark-red loam found in clefts and furrows of the rock. The place is simply a village of about 2000 inhabitants, busy with the manufacture of beads, crucifixes, and rosaries, vended to the pilgrims who repair to it as a sacred shrine. A monastery of great extent accommodates Greek, Latin, and Armenian monks, who have the joint use of the church. They profit by offerings from visitors of their own communions, to whom a crypt beneath the building, paved and lined with marble, is shewn as the Grotto of the Nativity, with the very spot where the birth took place indicated by a Latin inscription on the floor. *Hebron*, in the same direction, 21 miles from Jerusalem, is a town of 5000 inhabitants, almost all Moslems. It has the modern name of *El-Khalil*, 'the Friend of God,' in allusion to the patriarch Abraham, who was here interred, along with Isaac, Jacob, and other members of the patriarchal family. The principal mosque, once a Byzantine church, contains the so-called tombs. No Christian in modern times has entered this building, except one or two, in disguise or by stealth, till the Prince of Wales's visit in 1862, when curiosity was gratified, but no result of interest appears to have been gained. 'We passed,' says one of the party, 'without our shoes, through an open court into the mosque. In the recess on the right is the alleged tomb of Abraham, on the left that of Sarah, each guarded by silver gates. The shrine containing the tomb of Sarah we were requested not to enter, as being that of a woman. The shrine of Abraham, after a momentary hesitation and a prayer offered to the patriarch for permission to enter, was thrown open. The chamber is cased in marble. The tomb consists of a coffin-like structure, like most Moslem tombs, built up of plastered stone or marble, and hung with carpets—green, embroidered with gold. The three which cover this tomb are said to have been presented by Mohammed II, Selim I., and the late Sultan Abdul Medjid. I need hardly say that this tomb (and the same remark applies to all the others) does not profess to be more than a cenotaph, raised above the actual grave which lies beneath.' Within the area of the mosque were shewn, in like manner, the tombs of Isaac and Rebekah, in separate chapels, and closed with iron gates.

*Gaza*, or *Guzzeh*, the head of a pashalic in the south-west of Palestine, contains a population of 15,000, and enjoys considerable trade both by land and sea, being on the caravan route to Egypt, while only about three miles from the Mediterranean. The present town is not upon the spot once occupied by the lordly city of the Philistines, connected with the story of Samson. The ancient site is desolate. Scarcely a shrub, plant, or blade of grass interrupts and relieves its monotonous barrenness, or anything but the jackal stealing over it, with a few ruins half buried in the sand.

The population of Syria and Palestine consists of Turks, Arabs, and Greeks, in the largest proportion, with examples of nearly all the races found in Asiatic Turkey, forming a supposed total for the whole region of Ottoman Asia of 16,000,000, of whom the great majority are in Asia Minor. But two communities in close proximity, yet of different habits and religion, the Maronites and Druses, are peculiar, or nearly so, to the Lebanon, and at deadly variance with each other, engaged in a horrible civil war in the year 1860. The Maronites occupy the hill-country between Beyrout and Tripoli, live in villages on spots apparently inaccessible, perched on the edges of ravines and frightful chasms, many of which, though within pistol-shot of each other, are separated by hours of toilsome march. The great valley which extends like a funnel from the sea-shore at Tripoli, to the snow above the mountain-cedars, is their principal home. They are Christians by profession, deriving their name from Maron, who advocated opinions denounced in the fifth century as heretical; and hence his followers were compelled to seek a retreat from persecution in the difficult highlands. Though now in communion with the Church of Rome, they are allowed by the papacy, as the price of adhesion in general, to elect their own ecclesiastical chief, reject the celibacy of the priests, and have the sacrament in both kinds administered. They have many convents, with which villages are commonly associated. Kanobin, fifteen miles on the south-east of Tripoli, is the seat of their patriarch. The Maronites cultivate the vine and mulberry, raise raw silk at a fixed price for the merchants of Marseille and Lyon, and are considered to be under the protection of France.

The Druses are chiefly found in the higher parts of the Lebanon between Beyrout and Acre, and round the roots of Mount Hermon, and the interior tract of the Hauran, a vast level plain on the south of Damascus. They are heretical Mohammedans, but their tenets and practices are involved in as much mystery as possible by a priestly class. With them, Hakem, the calif of Egypt, in the early part of the eleventh century, is honoured as the last medium of communication between the Deity and mankind. Darazi,

a zealous supporter of his pretensions to this character, proclaimed them in the Lebanon; and his disciples, by a natural and easy change in etymology, obtained from him the distinguishing epithet of Druses. The origin of these mountaineers is uncertain, though, with some probability, they are supposed to be descended from the ancient Iturei, who possessed the district in the time of the Romans. Their long standing may be inferred from some beautiful usages of primitive times, in strict accordance with the law of Moses. Thus, in the season of fruit-gathering, when a man has once descended from a tree, having shaken off as much of the produce as his strength permitted, he will upon no consideration shake the tree again, however much fruit may tenaciously adhere to the branches. What is left falls to the lot of the poor and the gleaner. 'When thou beatest thine olive-tree, thou shalt not go over the boughs again; it shall be for the stranger, for the fatherless, and for the widow.' In the same spirit they never reap the fields without leaving a full measure for the gleaners; rarely muzzle the ox that treadeth out the corn; and will not yoke a bullock and a mule together. Owing to the feuds between the two races, the Lebanon was constituted a special government in 1861, and placed under the charge of Davoud Pasha, an Armenian—the first Christian raised to the rank of pasha by the Turkish sultans.

Aden.

### CHAPTER III.

#### ARABIA.

THE island or peninsula of the Arabs, *Jezira-al-Arab*, so called by the natives in allusion to its extended enclosure by the sea, is the Arabistân of the Turks and Persians, a great south-western peninsula of Asia, connected with Africa on the north-west by the narrow Isthmus of Suez. The name is variously derived by etymologists from Semitic roots referring either to its physical features, the habits of its inhabitants, or its relative position, as *Arâbah*, a barren place or wilderness, *Eber*, a nomade or wanderer, and *Arab*, to go down, that is, the west, or to the region in which the sun appeared to set to the early dwellers on the Euphrates, which would, however, only be true of the most northerly portion of the country. It extends about 1500 miles from north to south, by 800 miles, at the greatest breadth, from

east to west, and comprehends an area of more than 1,000,000 square miles, considerably exceeding one-fourth of the entire area of Europe. The Syrian Desert lies on the north, the Persian Gulf on the east, the Indian Ocean on the south, and the Red Sea on the west. This vast peninsula is of sacred celebrity, as the land of Ishmael, whose predicted lawlessness and independence is now reflected by the tribes within its bounds; and as the scene of the great transactions which immediately followed the exodus of Israel. It is of historical fame, as the original seat of those fanatical hosts sent forth by the early successors of Mohammed to propagate his faith with the sword, who finally extended their conquests, religion, and language to the shores of Spain, the banks of the Ganges, the wilds of Tartary, and the heart of Africa. It is, too, of interest in the annals of literature, for while Arabian learning followed the decline of letters in Europe, it stimulated their revival; and its influence is decisively indicated by the fact that the nomenclature of modern science is largely indebted to the Arabic for its terms in almost every department.

The Red Sea is the prime maritime feature of the country, for the greater part of its coast-line belongs to the peninsula, and hence it is still frequently styled the Arabian Gulf, *Sinus Arabicus*, after the example of the ancients. At a more remote antiquity, the historian of the exodus referred to it as the 'weedy sea,' or 'sea of rushes,' *Yam Suph*, an allusion to the patches of reedy vegetation which appear on the northern shores. Its present common name is one out of many instances supplied by the nomenclature of seas and shores, of a general title being grafted on very partial and evanescent features, or upon appearances which are by no means peculiar to the localities they denominate. Thus, the White Sea is not whiter than at the same interval is Baffin's Bay; the Vermilion Sea is not more rosy than parts of the Levant; the Black Sea is not duskier than all other expanses under a darkened sky; the Red Sea is not ruddier than portions of the Persian Gulf; and the Pacific Ocean roars just as terribly as the Atlantic, and quite as often. Such epithets are unfortunate, as they make a false impression upon the mind in early life, which subsequent knowledge may correct, but seldom entirely effaces. Most travellers have described the Red Sea as exhibiting the brightest blue. But a pilgrim of the olden time has the discriminating remark, 'The Rede Sea is not more rede than any other sea, but in some places thereof is the *gravelle* rede, and therefore men clepen it the Rede Sea.' Coralline formations line the shores. Within their range, especially in the spring months, animalculæ are developed in patches of varying extent, which give to the coral below, of itself chiefly white, a blood-red hue, as well as to the superincumbent water. But distant from land, where the water is deep, the colour is the intensest blue imaginable, varying to greenish-blue, green, and light-green, as the shallows increase. 'Through the bright blue and pellucid water,' observes a voyager, 'we could discern the minutest objects at an immense depth, and the secrets of the deep thus laid open to us afforded the most magnificent spectacle which can be conceived. Although there were neither

"Wedges of gold, vast anchors, heaps of pearls,  
Nor other treasures of the vasty deep,"

yet the productions of nature, valueless but far more beautiful, were before us. Every formation of the coral was exposed to view. On the one hand we had a huge and shapeless pile formed by their horizontal layers, on the other a ponderous and widely-spread mass, like a huge blossoming plant supported by a thin cylinder or stem. Successive circular fragments reared themselves aloft, or assumed the fantastic tortuous forms of gnarled and knotted forest-trees. How varied, how beautiful was their colouring! sometimes appearing of a brilliant red, blue, or purple; sometimes gorgeously

The Red Sea, from Ras Mohammed.

diversified with orange, crimson, or the deepest black. By a well-known delusion, as we glided along, the vast ocean caverns seemed to pass away from beneath us. Now they were partially illumined by the beams of the sun glancing thereon from the undulations of the waves, and at the next moment sinking into their former gloom.'

The basin of the sea is a rocky cavity, long and narrow, extending about 1400 miles from north to south, but never exceeding 200 miles in breadth, and averaging much less. It does not receive a single tributary stream. The navigation is highly dangerous near the coasts, owing to the coral-reefs; but centrally, through its entire course, there is a hollow, about forty miles wide, with a mean depth of a hundred fathoms. Islands are numerous, all near the shores, and of unimportant size. One, towards the south, *Jebel Tor*, exhibits volcanic appearances, and continually emits smoke. The prevalent direction of the wind is from north to south for eight months of the year, and from south to north through the remaining four. This is of great importance to the Egyptian side of the channel, for a strong prevailing breeze from the east would enable the vast locust armies of the Arabian peninsula to pass over it, to the destruction of the crops in the Valley of the Nile. At the north extremity the sea divides into two branches, the westernmost and largest of which is the Gulf of Suez, *Sinus Heroopolites*, and the eastern the Gulf of Akaba, *Sinus Ælanites*, enclosing between them the region of Sinai. Burckhardt makes the curious remark, that the coral in the western branch is chiefly white, and red in the eastern. At the south extremity, the inland sea communicates with the Indian Ocean by the Strait of Bab-el-Mandeb, an Arabic phrase signifying the Gate of Tears, and alluding doubtless to maritime disasters in the neighbourhood. In the narrowest part, the strait is about seventeen miles wide, but is divided into two channels by the small, bare, and rocky island of Perim, now a station of the British. It lies much nearer the Arabian than the African coast. The latter has a cluster closely adjoining its wall-like strand,

called from the number the Eight Brothers. As the great thoroughfare of passengers between England and India, some sketches of the features of sky, sea, and shore, at different hours of a summer's day, will be read with interest. The sketcher is Captain Burton, coasting the northern waters on the Arabian side in a native vessel.

*Morning.*—The air is mild and balmy as that of an Italian spring; thick mists roll down the valleys along the sea, and a haze like mother-of-pearl crowns the headlands. The distant rocks shew Titanic walls, lofty donjons, huge projecting bastions, and moats full of deep shade. At their base runs a sea of amethyst, and as earth receives the first touches of light, their summits, almost transparent, mingle with the jasper tints of the sky. But morning soon fades. The sun bursts up from behind the main, a foe that will compel every one to crouch before him. He dyes the sky orange, and the sea "incarnadine," where its violet surface is stained by his rays, and mercilessly puts to flight the mists and haze, and the little agate-coloured masses of cloud that were before floating in the firmament; the atmosphere is so clear that now and then a planet is visible. For the two hours following sunrise, the rays are endurable; after that they become a fiery ordeal. The morning beams oppress you with a feeling of sickness; their steady glow, reflected by the glaring waters, blinds your eyes, blisters your skin, and parches your mouth; you now become a monomaniac; you do nothing but count the slow hours that must "minute by" before you can be relieved.

*Noon.*—The wind, reverberated by the glowing hills, is like the blast of a lime-kiln. All colour melts away with the canescence from above. The sky is a dead milk-white, and the mirror-like sea so reflects the tint that you can scarcely distinguish the line of the horizon. After noon the wind sleeps upon the reeking shore; there is a deep stillness; the only sound heard is the melancholy flapping of the sail. Men are not so much sleeping as half senseless: they feel as if a few more degrees of heat would be death.

*Sunset.*—The enemy sinks behind the deep cerulean sea, under a canopy of gigantic rainbow which covers half the face of heaven. Nearest to the horizon is an arch of tawny orange; above it, another of the brightest gold; and based upon these, a semicircle of tender sea-green blends with a score of delicious gradations into the sapphire sky. Across the rainbow the sun throws its rays in the form of spokes, tinged with a beautiful pink. The eastern sky is mantled with a purple flush, that picks out the forms of the hazy desert, and the sharp-cut hills. Language is a thing too cold, too poor, to express the harmony and the majesty of this hour, which is evanescent, however, as it is lovely. Night falls rapidly, when suddenly the zodiacal light restores the scene to what it was. Again the gray hills and the grim rocks become rosy or golden, the palms green, the sands saffron, and the sea wears a lilac surface of dimpling waves. But after a quarter of an hour all fades once more; the cliffs are naked and ghastly under the moon, whose light falling upon this wilderness of white crags and pinnacles is most strange—most mysterious.

*Night.*—The horizon is all of darkness, and the sea reflects the white visage of the moon as in a mirror of steel. In the air we see giant columns of pallid light, distinct, based upon the indigo-coloured waves, and standing with their heads lost in endless space. The stars glitter with exceeding brilliance. At this hour—

"River, and hill, and wood,  
With all the numberless goings on of life,  
Inaudible as dreams"—

the planets look down upon you with the faces of smiling friends. You feel the "sweet influence of the Pleiades." You are bound by the bond of Orion. Hesperus bears with him a thousand things. In communion with them your hours pass swiftly by, till the heavy dews warn you to cover up your face and sleep. And with one look at a certain little star in the north, under which lies all that makes life worth living through—surely it is a venial superstition to sleep with your face towards that Kiblah!

Inland Arabia is still very imperfectly known in detail, no European having traversed either its entire length or breadth; but its general characteristics appear to be ascertained. A narrow belt of flat ground, chiefly of sand, with saline incrustations at intervals, called the Tehama, or 'Low Land,' runs round the whole coast, and forms an intensely hot region. This is backed, at the distance generally of from ten to thirty miles from the shore, by a range of mountains, which in some places attain a very considerable elevation. These highlands are the walls and crests of lofty interior plateaus, scantily covered with grasses and other herbage, serving as pasture-grounds, while the intervening mountain-tracts contain cultivable soil in watered valleys and on terraced districts, which exhibit the verdure of date groves, orchards and gardens, grain crops and spice plants. In many parts rain is so rare that the surface is condemned to eternal sterility, but along the west coast, for a brief season during our summer months, it periodically descends, converts the dry wadys into real water-courses, and originates for the time powerful torrents. Storms of great violence are also common in this region, occasioning destructive inundations,

several of which are mentioned by the historians of Mecca. But a constantly serene sky overhanging utterly barren tracts of rock or sand is much more general. No river worthy of the name exists, only temporary streams and perennial springs, few and far between. No forests appear even in the watered districts, only groves and coppices. In the cultivable localities, tobacco, indigo, cotton, and coffee are raised, with many aromatic and spice plants, as opobalsamum, yielding the balm of Mecca, the acacia, producing gum-arabic, and the frankincense-tree.

Scantly supplied with water, and without forests or jungles, large wild animals are rare. They include the panther, hyena, wolf, and jackal, gazelles and ostriches, with the ibex on the rocky heights. Flights of locusts occasionally make sad havoc with the vegetation, but they are eaten by the natives, both dried and roasted; and are devoured in immense numbers by a species of thrush, *Turdus Seleucus*, a migrant from Persia, for the purpose of partaking of the repast. The country seems to be the special home of the ass, wild and domesticated; the camel, both poetically and justly styled 'the ship of the Desert;' and the horse, the pride of the Arab. Some breeds of camels are famed for their beauty and swiftness, as those of Yemen, a southern district, and of Oman in the east. They have not the uncouth appearance or shuffling gait common with their congeners, but carry their heads erect, throw out the legs with as much freedom and boldness as the horse, and their progress, at what appears their natural pace, according to Wellsted, cannot be less than twelve or fourteen miles an hour. Breeds of horses, cultivated for several thousand years, celebrated for fleetness, sagacity, and attachment to their masters, are of almost fabulous price. In fact, nothing but the direst necessity will induce an owner to part with a thoroughbred steed; and no event diffuses greater joy through a family than the birth of a colt or a camel. Goats are common; poultry scarce; oxen extremely rare and poor. Sheep are numerous, and it is not unusual to find gazelles mingling with the flocks, and being gradually tamed by the association. Thin succulent grasses, sprinkled with aromatic herbs, on the interior plateaus, form excellent pasturage for sheep and horses.

The old geographers made a triple division of the peninsula into Arabia Petrea, Arabia Deserta, and Arabia Felix, the credit of which is usually assigned to Ptolemy. The first comprised the north-west; the second, the centre; and the third, the south-west. The denomination applied to the latter, Felix or Happy—'Araby the blest,' in the style of the poet—arose out of the unfounded idea that precious commodities of India, which the European nations received through the medium of Arab traders, were the growth of their own soil. The arrangement is vague and arbitrary; and was never recognised by the native geographers. In fact, the country has never had any systematic civil divisions. But certain portions of territory, with very indefinite limits, are distinguished by particular names. The principal districts are as follow: 1, *Bahr-el-Tour Sinai*, Desert of Mount Sinai; 2, *El-Hejaz*, Land of Pilgrimage; 3, A group of independent states, such as *Yemen*, a south-western tract; *Hadramaut*, extending along the southern coast; *Oman*, the kingdom of Muscat, a south-eastern territory; *El-Hassa* or *Lahsa*, on the Persian Gulf; *Nedjed* or *Nejd*, the high plains of the interior.

#### I. BAHR-EL-TOUR SINAI.

This region is a triangular peninsula, lying between the two northern arms of the Red Sea, and embraces also the country from thence to the borders of Palestine. Eastward is the Gulf of Akaba, long a deserted channel, but once traversed by the fleets of Solomon and Jehoshaphat. Westward is the Gulf of Suez, to which the commerce of the former was diverted upon the rise of Alexandria, now the great thoroughfare of communications between England and India. The intervening space and its northerly continuation, a desert of rocks, pebbles, and gravel, with but few tracts of drifting sand, has been the scene of events perfectly unique in the history of nations, for it is the actual wilderness in which the host of Israel wandered after the departure from Egypt. Yet though desolate, it is not altogether barren. A few living perennial springs are the centres of verdure; aromatic shrubs grow on the high hillsides; and a thin coating of vegetation is seldom entirely withdrawn.

In an interesting passage Dean Stanley refers to the botanical products, which are still those mentioned in sacred annals relating to the district. 'The wild acacia, *Mimosa Nilotica*, under the name of "sont," everywhere represents the "seneh" or "senna" of the Burning Bush. A slightly different form of the tree, equally common under the name of "sayal," is the ancient "shittah," or, as more usually expressed in the plural form, from the tangled thickets into which its stem expands, the "shittim," of which the tabernacle was made—an incidental proof, it may be observed, of the antiquity of the institution, inasmuch as the acacia, though the chief growth of the Desert, is very rare in Palestine. The "retem," or wild broom, with its high canopy and white blossoms, gives its name to one of the stations of the Israelites (Rithmah), and is the

very shrub under which—in the only subsequent passage which connects the Desert with the history of Israel—Elijah slept in his wanderings. The “palms,” not the graceful trees of Egypt, but the hardly less picturesque wild palms of uncultivated regions, with their dwarf trunks and shaggy branches, vindicate by their very appearance the title of being emphatically the “trees” of the Desert; and therefore, whether in the cluster of the seventy palm-trees of the second station of the wanderings, or in the grove which still exists, at the head of the Gulf of Akaba, were known by the generic name of “Elim,” “Elath,” or “Eloth,” “the trees.” The “lasaf” or “asaf,” the caper plant, the bright-green creeper which climbs out of the fissures of the rocks in the Sinaitic valleys, has been identified on grounds of great probability with the “hysop” or “ezob” of Scripture, and thus explains whence came the green branches used, even in the Desert, for sprinkling the water over the tents of the Israelites.’

The northern portion of the peninsula is a table-land of limestone, skirted by horizontal ranges of hills of the same formation, to both of which the name of *Tih*, the ‘Wandering,’ is attached by the Arabs, in memory of the pilgrimage of a long bygone era. The southern portion is almost entirely filled up by the remarkable cluster of the Sinaitic Mountains, which are of primitive rock, granite, or porphyry, flanked with sandstone, both of which are of a deep red or reddish-brown hue, which gives a very peculiar character to the landscape. These two sections of the peninsula, thus geologically distinct, are separated by a belt of pure yellow sand, which the roaring wind drives before it in clouds, compelling the traveller to halt till the storm is over. The southern section is the region specially celebrated in Hebrew poetry.

‘God came from Teman,  
And the Holy One from Mount Paran—  
He stood—and measured the earth,  
He beheld—and drave asunder the nations,  
And the everlasting mountains were scattered,  
The perpetual hills did bow—  
The eternal paths were trodden by Him.’

The whole land is rife with traditionary memorials of the exodus. Besides the plateau of the Wandering, there are the ‘Wells of Moses,’ *Ayoum Mousa*, on the shore of the Gulf of Suez, and the ‘Baths of Pharaoh,’ *Hammam Farouan*, lower down on the same coast. The gulf itself is called by the Arabs the ‘Sea of Destruction,’ *Bahr-el-Kolzoum*, in whose roaring waters they pretend still to hear the cries and wailings of the ghosts of the drowned Egyptians. There is a valley styled the ‘Path of the Israelites,’ *Tiah-Beni-Israel*; and a bold ridge bears the name of the ‘Mountain of Deliverance,’ *Jebel Attaka*. There is the ‘Seat of Moses,’ in the Wady Feiran; the ‘Mountain of Moses,’ in the cluster of Sinai; the ‘Cleft of Moses,’ in Mount St Catherine; the ‘Hill of Aaron,’ at the base of the traditional Horeb; and the ‘Tomb of Aaron,’ at the top of the ‘Mountain of Aaron,’ overhanging Petra; with the ‘Island of Pharaoh,’ in the Gulf of Akaba. A romantic story was told to Burekhardt of a pass leading down to that gulf. In summer, when the wind is strong, a hollow moaning sound is sometimes heard, as if coming from the upper country. The natives say that the spirit of Moses then descends from Sinai, and in flying across the sea, bids a sorrowful farewell to his beloved mountains.

The Wells of Moses are small springs of indifferent water lying close along-shore, which are speedily lost in the sands, but form an agreeable halting-place, having several palm-trees scattered around them. The sea, from eight to ten miles wide, is here overlooked westward to the heights of Africa, and northward to the roadstead of Suez. The route usually followed by modern travellers from this point, and doubtless that taken by the emancipated people, lies along the shore. It is alternately a stony and sandy track, with the sea of the deepest blue on the right, overhung with an azure and spotless sky, the plateau of the Wandering on the left, and a vast amphitheatre of mountains gradually rising up on the southern horizon as progress is made in that direction. At the distance of about forty miles, the Well of Howara is commonly identified with the bitter Well of *Marah*, which was sweetened by Moses. It rises within an elevated mound, surrounded by sand-hills, and two small date-trees grow near it. The Arabs never drink of it themselves, and there is said to be no other water on the whole coast absolutely undrinkable. Lord Lindsay tasted, and at first thought it insipid rather than bitter, but held in the mouth it became excessively nauseous. The

complaints of its quality made by the Israelites, who had been accustomed to the sweet water of the Nile, as Burckhardt observes, are such as may be daily heard from the Egyptian servants and peasants who travel in Arabia. Familiar with it from their youth, there is nothing which they so much regret as its loss. Further on, Wady Gharandel, with its springs, tamarisks, acacias, and palms, is probably the *Elim* of Scripture, with its twelve wells and seventy palm-trees. The country here assumes a more picturesque character, becomes rugged, and the grandest of the sacred mountains is soon in full view. This is Jebel Serbal, a vast mass of granite, with five column-like peaks, which, like its fellows, is streaked from head to foot as if with boiling streams of dark red matter, really the igneous fluid squirted upwards as they were heaved from the ground. Stanley thought it one of the finest forms he had ever seen. 'The Serbal,' says Professor Lepsius, 'here rises at once majestically several thousand feet. Its splendid peaks towered up to heaven like flames of fire in the setting sun, and made upon me an almost overpowering impression. It is impossible to describe the sublimity and majesty of these black mountain masses—rising, as they do, not in a wild and irregular form, but on a grand and imposing scale—at the foot of which I was standing, not separated from it by any projecting promontory or ledge, so abruptly does the whole body of the mountain start up from this point.' It has been ascended by Burckhardt, Rüppel, and Stanley; and has claims to be regarded as the mount on which the law was delivered, to which Dr Kitto, with some others, has given the great weight of his authority. Though for many centuries, certainly since the age of the Emperor Justinian, another height, that of Jebel Mousa, has been invested with this distinction, yet prior to that date tradition pointed to Jebel Serbal as the true scene of the event, and it was then a place of pilgrimage. Hence Sinaitic inscriptions are found on the top of the mountain, and a ruined edifice appears on its central summit. Rüppel states that the Bedouins who accompanied him deemed the summit a sacred place, to which at certain times they repaired with sacrifices.

These highlands, the Alps of Arabia, have been styled 'the Alps unclothed,' in allusion to the general absence of vegetation, which is so characteristic of the Swiss mountains up to the snow-line. They present a very distinct contour when seen from a distance, but are really a confused and intricate assemblage of jagged peaks and tortuous ridges. Sir Frederick Henniker states that if he had to represent the end of the world, he would take the view from Jebel Mousa for a model, adding, that 'it would seem as if Arabia Petraea had once been an ocean of lava, which, while its waves were literally running mountains high, had been suddenly commanded to stand still. In a region which is without the roar of torrents, the trickling of brooks, the rustle of leaves, and the cries of animal life, the stillness is profound and impressive, causing the human voice and other noises to be heard with unusual distinctness at a great distance. Hence a slide of sand or the fall of a stone, arrest attention, and become to the superstitious Arabs sounds of mysterious origin and significant import. To the south of Serbal, at a short distance from the sea, the remarkable mountain of Nakus, or the Bell, is so called from the sounds emitted from it, which the Arabs believe to be produced by the bell of a convent entombed in the interior. They are variously soft and loud, sometimes resemble the tones of musical glasses, and at other times are like the clang of pieces of metal struck against each other. Some refer the phenomenon to the rush of different quantities of sand down the slopes. Others, perhaps with greater probability, conceive of interior cavities communicating with each other, and with the atmosphere, by means of small apertures, through which, under control of considerable changes of temperature, currents of air pass with sufficient velocity to produce sonorous vibrations. Striking features of the landscape are the wadis, or valleys, which separate and surround the mountains. For a few days in winter, or a few weeks, they have their thundering torrents, then become absolutely dry and waste, but still give tantalising indications in their deeply-cut channels, rounded pebbles, and fringe of shrubs and rushes, of

'Water, water everywhere, and not a drop to drink.'

The most important sites in the peninsula are as follows: Convent of St Catherine, 5452 feet above the sea; Jebel Serbal—Mountain of Myrrh (*ser*)—Sinai of old tradition, also of Kitto and Lepsius, 9759 feet; Jebel Mousa—Mountain of Moses—Sinai of modern tradition, 7564 feet; Jebel Katerin—Mountain of St Catherine—Horeb of Rüppel, 8705 feet; Um-Shomer—the Mother of Fennel, 8850 feet. None of these particular points answer to the Scriptural account of the giving of the law 'on the top of the mount,' 'in the eyes of the children of Israel,' 'in the sight of *all* the people.' There is not space enough in the narrow precipitous ravines immediately adjoining for the vast host to have encamped with the order and comfort so clearly intimated, though undoubtedly these are the mountains which quaked when Jehovah came down in fire to make known his will, and these are the valleys which then heard his voice. But a site every way suited for the assemblage is found in the plain of Er-Raha, a noble expanse, and the only large convenient area in the entire district. This is overlooked by a northerly prolongation of Jebel Mousa, the cliffs of the Ras Sasafeh, or the 'Willow Head,' which rise with great magnificence, and have the yellow plain sweeping down directly to their base. 'That such a plain,' observes Stanley, 'should exist at all in front of such a cliff is so remarkable a coincidence with the sacred narrative, as to furnish a strong internal argument, not merely of its identity with the scene, but of the scene itself having been described by an eye-witness. The awful and lengthened approach, as to some natural sanctuary, would have been the fittest preparation for the coming scene. The low line of alluvial mounds at the foot of the cliff exactly answer to the "bounds" which were to keep the people off from "touching the mount." The plain itself is not broken and uneven and narrowly shut in, like almost all others in the range, but presents a long retiring sweep, against which the

people could "remove and stand afar off." The cliff, rising like a huge altar, in front of the whole congregation, and visible against the sky in lonely grandeur from end to end of the whole plain, is the very image of "the mount that might be touched," and from which the voice of God might be heard far and wide over the stillness of the plain below, widened at that point to its utmost extent by the confluence of all the contiguous valleys.' Ras Sasafeh is literally 'the nether part of the mount,' in relation to Jebel Mousa, as the spot is described, to which Moses brought forth the people 'out of the camp to meet with God.'

In early Christian times the solitudes of the Sinaitic district drew to a site invested with such sanctity a large number of anchorites. A host of cells and convents arose in clefts of the rocks and at the base of the mountains; the town of Feiran was founded in the wady of that name, close to the precipices of Jebel Serbal, and became the seat of a bishopric, and not less than 6000 monks or hermits were in the neighbourhood at the time of the Saracen conquests. Some ruins of the town, overgrown with tarfa-trees, crown a lofty rock in the middle of the valley, and on both sides of it are seen deserted houses, several perched at a great height, with ancient excavated tombs. Wady Feiran, the most pleasant spot in the peninsula, and possibly the scene of the long halt of Israel prior to the one at Sinai, has a generally constant brook, and therefore vegetation of luxuriant palms and feathery tamarisks. 'For two hours and a half,' writes Lord Lindsay, 'every winding of the valley revealed new loveliness; it would be beautiful even without a single tree. At the first turning, after passing the ruined town, a most superb view of Jebel Serbal opened on us—every crag and pinnacle of his five peaks relieved clearly against a sky of the most delicious blue, and perfectly cloudless—the pale moon, about half full, sailing in the pure ether above us—the eye could pierce far beyond her. Jebel Serbal was of a bluish-gray, but the jagged rocks of the valley, forming the foreground of the picture, were black, the bright lights and deep broad shadows rendering them perfectly beautiful. I sat on my

Defiles of Mount Sinai.

dromedary under a tarfa-tree, enjoying the shade and a delightful breeze, and talked with the Bedouins.' Of all the establishments of the old Christian population of the highlands, the only important one remaining is the convent of St Catherine, its vice-patroness, but really dedicated to the Transfiguration. It stands at the base of Jebel Mousa, and partly on its steep slope, in a valley so narrow that little room is left between its walls and the mountains opposite. It was founded by the Emperor Justinian, at the traditional site of Jethro's Well and the Burning Bush. According to a stupid legend, one of its early inmates was informed in his sleep that the body of St Catherine, who suffered martyrdom at Alexandria, had been conveyed by angels to the top of the highest peak in the vicinity. The monks therefore ascended in procession, found the corpse, and deposited it in their church; and hence arose the common name of the convent, with that of Jebel Katerin. The building is a regular monastic fortress, being enclosed with high and solid walls of granite, surmounted with small towers, and defended by guns against the Arabs. In the interior are several courts planted with flowers and vines. Balconies with wooden balustrades run round each area, on which the doors of the several apartments open. The inmates, from twenty to thirty in number, are all foreigners, chiefly

from the Greek islands, and are employed in some profession—baking, shoemaking, or carpentry—in addition to their religious duties. No natives of the wilderness are allowed to enter the convent, except those who are retained as servants, but a supply of bread is lowered down to them from the walls as often as it is demanded; and as there is no door, visitors from distant lands are hoisted up to the battlements by a windlass. The interior of the church has a richly-ornamented roof, supported by rows of granite pillars; walls hung with portraits of saints; and a floor paved with beautiful slabs of marble. From 5000 to 6000 wandering Arabs constitute the present population of the Desert of Sinai, some of whom are engaged in furnishing travellers with guidance and safe-conduct, while the rest subsist by flocks and herds, claiming at pleasure the hospitality of the monks.

Northward from the head of the Gulf of Akaba a broad valley extends, bounded on the eastern side by a belt of hills, the Biblical mountains of Seir, the tallest summit of which is Mount Hor, or Jebel Haroun, the 'Mountain of Aaron,' as it is now called, from being the scene of his death and burial, and of the inauguration of his successor in the high-priesthood. This is one of the few sites connected with the wanderings of the Israelites, the identity of which admits of no reasonable doubt. It is a conspicuous landmark from afar to the wayfarer, remarkable for its double summit, the upper rising from the lower in the form of a huge castellated building. A small and plain Mohammedan chapel marks the supposed sepulchre, in which the Arabs suspend ragged shawls, ostrich eggs, and beads as votive offerings. The view—the last landscape overlooked by Aaron, as that from Pisgah was afterwards to his brother—is very extensive, but consists chiefly of bald sandstone rocks and intervening ravines. 'If I had never stood on the top of Mount Sinai,' says Mr Stephens, 'I should say that nothing could exceed the desolation of the view from the summit of Mount Hor, its most striking objects being the dreary and rugged mountains of Seir, bare and naked of trees and verdure, and heaving their lofty summits to the skies, as if in vain and fruitless effort to excel the mighty pile on the top of which the high-priest of Israel was buried.' But all is not really barren. There is freshly beautiful vegetation in the deep-shaded ravines, where there is the sound of running waters. This is the case with the remarkable *Sik*, or 'Cleft,' forming the entrance of Wady Mousa, or Valley of Moses, so called from the belief of the Arabs that the gorge was made by the rod of the legislator, in order to accommodate the brook that ripples through it. In this valley are the extraordinary remains of Petra, the rock-hewn capital of ancient Idumea, enclosed as in a kind of *cul de sac*, to which the usual approach was by the Cleft.

This famous defile, perhaps the most magnificent in existence, is about a mile and a half long, and so narrow that there is in general not more than sufficient space for the passage of two horsemen abreast. Through the bottom winds the brook that watered the ancient city. It follows now its own wild way, but was formerly protected and regulated in its course, as of vital importance to the inhabitants. The channel seems to have been covered by a stone pavement, vestiges of which remain, and parapets at intervals gave the current a proper direction, as well as prevented it from running to waste. On each side of the ravine rises a wall of perpendicular red sandstone rocks, varying from 100 to 500 feet in height, often overhanging so as to intercept the sky, and leave but little more light below than that of a cavern. Nourished by the rivulet, and protected by the shade, the tamarisk, the wild-fig, the oleander, and the green caper plant, with grasses and flowers, flourish with a luxuriance that almost chokes the path. Near the entrance of the pass a bold ruined arch is thrown across it at a great height, meant apparently to indicate the immediate boundary of the city. Without changing much its general direction, the chasm winds as if it were the most flexible of rivers, so that the eye sometimes cannot penetrate more than a few paces forwards. At every step, as the traveller proceeds, the solitude is disturbed by the screaming of eagles, hawks, owls, and ravens, soaring aloft, alarmed by the sound of his footfall or his voice. 'The character of this wonderful spot,' remarks Dr Robinson, 'and the impression which it makes, are utterly indescribable, and I know of nothing which can present even a faint idea of them. I had visited the strange sandstone lanes and streets of Adersbach, and wandered with delight through the romantic dells of the Saxon Switzerland, both of which scenes might be supposed to afford the nearest parallel, yet they exhibit few points of comparison. All here is on a grander scale of savage yet magnificent sublimity.' Passing on, the Cleft widens into Wady Mousa, containing the remains of *Petra*. These consist of temples, habitations, and tombs cut out of the surrounding cliffs; a theatre similarly excavated, with complete rows of benches capable of seating above 3000 spectators; vast heaps of hewn stones, foundations of buildings, fragments of pillars, and vestiges of paved streets. All visitors

mention with wonder and admiration the rich and variegated colouring of the rocks. 'They present,' according to Robinson, 'not a dead mass of dull monotonous red, but an endless variety of bright and living hues, from the deepest crimson to the softest pink, verging also sometimes to orange and yellow. These varying shades are often distinctly marked by waving lines, imparting to the surface of the rock a succession of brilliant and changing tints, like the hues of watered silk, and adding greatly to the imposing effect of the sculptured monuments.' Stephens makes a similar remark. 'The whole stony rampart that encircled the city,' he states, 'was of a peculiarity and beauty which I never saw elsewhere, being a dark ground with veins of white, blue, red, purple, and sometimes scarlet and light orange, running through it in rainbow streaks; and within the chambers, where there had been no exposure to the action of the elements, the freshness and beauty of the colours, in which these waving lines were drawn, gave an effect hardly inferior to that of the paintings in the tombs of the kings at Thebes.' These descriptions, though correct in the main, have a tinge of error. Observing apparently with greater precision, Stanley objects to *bright* hues being spoken of, and mentions as the two predominant colours a gorgeous though *dull* crimson, streaked and suffused with purple, with an occasional veining of yellow and blue. Of the three comparisons usually employed by describers to illustrate the appearance—"mahogany, raw flesh, and watered silk"—he deems the last the best.

The origin of Petra dates from the very infancy of commerce. It was a flourishing emporium seventeen centuries before the Christian era, a central point to which all the trade of the vast Arabian peninsula tended, and from which it branched out to Egypt, Palestine, and Syria. The caravans of India threaded its defile, and the precious commodities brought by them were thence diffused through the countries of the Mediterranean. It was the impregnable nature of the site that rendered it so celebrated as a commercial *dépôt*; for while it admitted of easy access to beasts of burden, it could defy the attacks of marauders and enemies. Roman generals assailed the place, and failed to capture the formidable stronghold. But it was reduced under the later emperors, and continued to be the seat of wealth till the fall of the empire. During the wars of the Crusades, its possession was fiercely contested by the Saracens and Christians. The Latin kings of Jerusalem were for a time its masters, and it became the seat of a Latin bishop. It then ceased to be the mart of nations, obscurity covered its ruins, and the very place where it stood became a subject of controversy. Its site was first ascertained by Burckhardt in 1812. Repeated failures in gaining access to this remarkable spot, or in being permitted to examine at leisure its monuments, owing to the extortion or hostility of the surrounding tribes, add not a little to the interest which the place inspires. 'It is literally,' as Stanley remarks, 'paved with the good intentions of travellers unfulfilled. There was Mount Hor, which Robinson and Laborde in vain wished to ascend; there the plain half-way, where Burckhardt was obliged to halt without reaching the top; here the temple, which Irby and Mangles only saw through their telescope; here the platform from which the Martineau party were unable to stir without an armed guard; and, lastly, on the very plain of our encampment, at the entrance of the pass, travellers with our own dragoman were driven back last year, without even a glimpse of the famous city.'

Mountains of Seir.

Entrance to the Red Sea.

## II. EL-HEJAZ.

This district, the Land of Pilgrimage to the followers of Mohammed, lies on the eastern side of the Red Sea, and is somewhat centrally intersected by the line of the northern tropic. It is the Holy Land of the Moslem, *Belled-el-Haram*, containing the two sacred cities of Mecca and Medina, respectively the birthplace and burial-place of the Prophet, with their ports, Jiddah and Yambo, which specially enjoy the title of 'Gate of the Holy City.' Jealously guarded against the intrusion of unbelievers, the territory has been penetrated by very few of the Western Europeans, who have only succeeded in the adventure either under extraordinary circumstances, or by adopting the most complete disguise, at the hazard of life from the fanaticism of the natives, in the event of the imposition being detected. The region has no natural inland boundary, nor has it any definite political limits; and though claimed as a dependency by the Turkish government, its authority is only respected in the towns, and would be resisted if exercised over the wandering population in the country.

'Our notions of Mecca,' observed Gibbon in his day, 'must be drawn from the Arabians. As no unbeliever is permitted to enter the city, our travellers are silent.' The historian was not aware of two visits having been paid to the place long before his time, one by an Italian, the other by an Englishman, both of whom published brief narratives of the journey on their return home. The first of these, Lodovico Bartema, 'gentleman of the citie of Rome,' in April 1503, made the pilgrimage with the caravan from Damascus, 'in familiaritie and friendshyppe with a certayne captayne Mameluke,' and in the garb of a renegado. His account appeared at Milan in 1511, and was translated into English in 1555. The next visitor was Joseph Pitts, a native of Exeter, about the year 1690. Going to sea in early life, he had the misfortune to be captured by an Algerine pirate, and was sold into slavery. His master, a profligate ruffian, having determined to proselytize a Christian as an atonement for his past iniquities, succeeded in making him profess himself a convert to Mohammedanism, by mercilessly applying a great cudgel to his bare feet. Pitts afterwards attended him to Mecca and Medina, but made his escape on his return, and reached Exeter safely, where he compiled an account of his wanderings, with a description of the pilgrimage. It closes with the prayer, in allusion to his enforced apostasy, which he ever regretted, 'God be merciful to me a sinner.'

During the present century all mystery has been removed from the sacred cities, chiefly by M. Badhin, a Spaniard, who travelled thither in 1807, under the name of Ali Bey, and was everywhere received as a true Mussulman; by Burckhardt, the able and enterprising Swiss traveller, in 1814, who adopted a similar disguise; and by Captain Burton, in 1853, in the service of the Royal Geographical Society, London, who professed himself to be an Indian physician and dervish, with the title of Sheikh Abdullah. The latter took great pains to qualify himself to act in character, but did not escape suspicion, being pronounced to be an Ajemi, or a kind of Mohammedan, not a good one, but still better than nothing. He mentions M. Bertolucci, Swedish consul at Cairo, as the only European who ever visited Mecca without apostatising, but adds that, though in disguise, his terror of discovery prevented him making any observations.

The *haj*, or pilgrimage, is obligatory upon all the faithful, according to the law of the Koran, at least once in their lives. But it is only binding in relation to Mecca, though being at no great distance, and an equally sacred city, Medina is commonly visited, and additional repute acquired thereby. The first instance occurred under Abubekr, in the ninth year of the Hegira, who proceeded at the head of 300 believers from Medina to Mecca, and purified the city by the expulsion of all idolaters and infidels from it. The journey may be made at any time, but the great concourse of travellers takes place in Zu'l Hijjah, the pilgrimage month. Two great caravans are formed. One is popularly known as the Haj El-Shami, or 'Damascus Pilgrimage,' where contingents assemble from Constantinople, Smyrna, Erzerum, Bagdad, and places further east, starting thence in a common body. The other is the Haj El-Misir, or 'Cairo Pilgrimage,' a main stream from that city in which the minor African currents are united. Trade, quite as much as religion, has long been an impelling motive to the expedition. Almost all the pilgrims convert it into a matter of speculation. On leaving their own country, they load themselves with its peculiar products, either to sell on the road, or at the end of the journey. Carpets and silks are brought by the Turks of Asia Minor; amber, hardware, embroidered stuffs, trinkets, shoes and slippers, by the Turks of Europe; shawls and silk handkerchiefs by the Persians; precious stones, muslins, and costly manufactures by the Hindus; woollen cloaks and red bonnets by the Mogrebins. The strange association, with the change of scene, has not contributed to good manners, judging from a current Arab proverb: 'Distrust thy neighbour if he has made a *haj*; but if he has made two, make haste to leave thy house.' In former times the number of devotee tourists was enormous, but for a considerable period it has been annually decreasing. At Constantinople the starting of the caravan was once one of the great ceremonials of Islamism. The sultan was present, and with his own lips deputed to the Sunni Emiri, or chief of the pilgrims, an officer appointed by himself, the task of conducting the faithful to the sacred shrines. The late sultan, Abdul Medjid, observed the custom of his forefathers till the year 1855, when he was absent without pretence of indisposition, and the ceremony excited comparatively little interest. But his successor, in January 1862, the first year of a new reign, deemed it prudent to revive the practice.

*Mecca*, the cradle and capital of Mohammedanism, sixty miles inland from the Red Sea, is situated in a narrow sandy valley, bounded by rocky hills of moderate height, perfectly treeless and barren. The city is without walls; the houses are generally substantially built of dark-gray coloured stone. The streets are unpaved and unlighted, choked with dust in dry weather, and with mud after rains. No trees, gardens, or pleasure-grounds enliven the neighbourhood; the desert forms the precincts; and though described by native writers under a variety of imposing titles, as the 'noble,' the 'mother of towns,' no public building exists with any pretensions to architectural grace. The Beitullah, 'House of God,' the great point of attraction, consists of an oblong court, with a covered colonnade on one side, and of the Kaaba, a kind of holy of holies, in the centre. This is simply a massive structure of rough stone, containing at the north-east corner the famous 'black stone,' said to have been brought from heaven by the archangel Gabriel, a lava-like block, smoothed by the millions of touches and kisses it has received from the faithful. The Kaaba is covered with curtains of black silk stuff along the sides, which are renewed at the expense of the Turkish sultans. Not being tightly fastened down, the slightest breeze causes them to move in slow undulations, which are hailed with rapture by the congregation around the building as a sign of the presence of its guardian angels, whose wings, by their motion, are supposed to cause the waving of the covering. Seventy

thousand angels are said to have charge of this spot, and to be under orders to transport it to Paradise when the last trumpet shall be sounded. A copious and never-failing spring rises within the enclosure of the mosque, the Well of Zemzem, to which a small building is appropriated, the interior of which is beautifully ornamented with marbles of various colours. Pilgrims eagerly drink the water as a sacred beverage, regarding it also as an infallible cure for all diseases; and there is scarcely a family in the town that does not send a jar daily to be filled. It is reserved for drinking and ablutions.

The ordinary population of the city is perhaps under 30,000, of a most mongrel description, consisting chiefly of the descendants of pilgrims from various countries, who have been induced to settle permanently and intermarry. The most numerous class refer their paternal ancestry to Yemen and Hadramaut; next are the Meccawys of Hindu, Egyptian, Syrian, Mogrebbin, and Turkish origin; with some of Persian, Kurdish, Tartar, and Bokharian extraction. In short, representatives are to be found of every part of the Mohammedan world. The greatest number of passengers is seen in the Mesaa, the longest and best built street. This is the scene of the 'holy walk,' one of the duties of the haj; and the place where capital offenders are put to death, in a less barbarous manner now than formerly. Here, during Burckhardt's stay, a man was beheaded for robbery by order of the *cadi*. But in 1624, in this street, two thieves were flayed alive; and a few years later, a military chief of Yemen had his body perforated, and lighted tapers put into the wounds till he slowly expired. All the streets abound with pigeons, and especially the great mosque, which are considered to be the inviolable property of the temple. Hence no one harms them even when they enter the private houses, but small stone basins are regularly filled with water for their use, and women expose for sale corn and dourra on straw mats for the pilgrims to purchase in order to feed the birds. Under the pretence also of selling corn for the sacred pigeons, the public women exhibit themselves. Streets and mosques resound with the cries of beggars, who address their appeals to strangers, as the ordinary inhabitants are not disposed to give alms, though enjoined by the Koran to do so as one of the first duties of religion. Mecca has been called the paradise of the fraternity. They lay hold of the foreigner with the injunction of the Prophet, as if resolved to enjoy the full benefit of it. A few are modest, simply accosting the passenger with *Ya Allah! ya Kerim*—'O God, O bounteous God!'—repeating the words if refused, and passing on. But the majority follow the profession with matchless importunity and impudence. 'Think of your duty as a pilgrim,' cries one; 'God does not like the cold-hearted. Will you reject the blessings of the faithful? Give, and it shall be given unto thee.' 'I ask from God fifty dollars,' exclaims another, 'a suit of clothes, and a copy of the Koran. O faithful, hear me! I ask of you fifty dollars.' 'O brethren,' shouts a third, 'O faithful, hear me! I ask twenty dollars from God to pay my passage home; twenty dollars only. You know that God is all-bountiful, and may give me a hundred dollars; but it is twenty dollars only that I ask. Remember that charity is the sure road to paradise.' When successful, alms will commonly be received without a word of thanks, 'It is God, and not you, who gives it me.'

About the time of the equinoxes at Mecca, occasionally at other intervals, the sky is often suddenly overcast, and violent storms of thunder, lightning, hail, and rain give rise to destructive floods. The native chroniclers record many dreadful inundations, when the whole place was laid under water, houses were destroyed, and lives lost. In 1039 of the Hegira, answering to the year 1626 of our era, a torrent rushed so rapidly down into the valley that 500 of the inhabitants were drowned; the great mosque was filled; three sides of it were swept away, and every human being within perished. When Burckhardt and his party were on the road to the city a tempest came on which speedily covered the Wady Noman with water three feet deep, while furious streams, crossing the route before and behind, rendered it impossible to advance or retreat. They took refuge on the side of a mountain till the flood subsided. On the 16th of December 1861, a dreadful storm visited the city, and inundated it to such an extent that the inhabitants were obliged to seek their upper rooms. Great numbers fled for safety to the mosque, but that too was invaded, and eighteen were drowned. The library was almost entirely destroyed. Gold and silver vases, with other valuable objects, were carried away; 300 houses were thrown down; and the flood did not entirely disappear till the third day.

*Jiddah*, the port of Mecca, is built on rising-ground washed by the sea, and enclosed by the desert in other directions. The town has a small population of traders, some of whom are wealthy, and who export coffee, and import products from Egypt, Abyssinia, and India. The Moslem inhabitants are fanatical. They rose against the Christian residents, British and French, in 1858, murdered several of them, for which they were chastised by the British fleet. *Yambo by the Sea*, the port of Medina, on the north, is so called to distinguish it from an inland village, Yambo of the Palm Grounds. The place profits by the pilgrimage, and has a regular shipping trade of importance. *Medina*, containing the tomb of the Prophet, is 130 miles inland, seated upon the high plateau of Arabia, 250 miles nearly due north of Mecca. It is a much smaller town, contains a similar great mosque, in which the tomb is an object of veneration. The place has an agreeable appearance as it comes suddenly into view, being surrounded with date groves. Medina is enclosed by a strong wall, provided with towers and loopholes, passed by four gates. Its great mosque contains four tombs—those of Mohammed, his daughter Fatima, and his two immediate successors, Abubekr and Omar. They are screened from vulgar gaze by a curtain of brocaded silk, supplied from Constantinople as often as one is needed. Owing to the high situation of the town, the winter is very cold, while the summer is hot. Storms are as common and violent as at Mecca. The date-trees in the neighbourhood are of large size, very productive, and the fruit is highly esteemed. Packets of the best dates are sent as presents to the remotest parts of the Moslem world.

A great day is the Day of Arafat. The place named is a granite hill about fourteen miles on the east of Mecca. The time is the close of the annual pilgrimage, when, having gone through the prescribed ceremonies in the city, attendance at the spot completes the ritual observances, constitutes every man a perfect *hadj*, authorises him thenceforth to assume the title, and return to his home, it may be to the shores of the Bosphorus, the rose gardens of Shiraz, or the burning sands of Nubia, to receive the congratulations of his friends. The hill is rather more than a mile in circuit, and rises gradually from the plain to the height of 200 feet. At one point of the ascent, Moslem tradition says that Adam was instructed by the archangel Gabriel how to adore his Creator. It therefore bears the name of *Modaa Seidna Adam*, or 'Place of Prayer of our Lord Adam.' At another point, the Prophet is said to have addressed his followers, a practice in which he was imitated by his successors, the early califs. The hill is therefore an object of special veneration, to which the whole concourse of visitors repair at an appointed time from the city. Some are on camels, others on mules or asses, but the greater number walk barefooted, which is esteemed the most pious mode of travelling. The chief ceremonial of the day commences about three o'clock in the afternoon, when a sermon is preached from a stone platform near the top of the hill, while the multitude are on the slopes, and at the base. The discourse lasts till sunset, but is wisely interrupted at intervals by the preacher stretching forth his hands to implore blessings on his hearers, while they rend the air with shouts of *Lebeik Allabuma lebeik*—'Here we are at thy command, O God.' The spectacle is wild and striking, but not without its disorderly scenes. Burckhardt, when he was present, counted about 3000 tents; computed the camels scattered over the plain at upwards of 20,000; and estimated the whole number of persons at 70,000, speaking more than forty different languages.

Plan of the Prophet's Mosque, Mecca.

*a b c d e*, Minarets; 1 to 19, Babs or gates; A, Kaaban; B B, Cloisters; o c, Gravel; d, Bab-el-Salem; e, Outer step; FFFF, Makam Hanafy, north—M. Maleky, west—M. Kanbaty, south—M. Ibrahim, east; g, Oval circuit; x, Irak corner; i, Yemani corner; j, Black stone; k, Shami corner; L, Door; m, Maajan; n, El Daraj; o, Zem zem; p, Staircase; q, Raised pavement.

## III. YEMEN—ADEN—HADRAMAUT—OMAN—LACHSA—NEDJ.

YEMEN, an extensive district in the south-west of the peninsula, consists of a low, arid, and burning coast region, with interior highlands at no great distance from the shore, rising up in successive terraces to a considerable elevation. On these uplands the temperature is more moderate; rain descends violently, though long intervals often elapse between the showers; and there is a rich natural vegetation, embracing fine timber, fruit-trees, and gum-yielding plants. The coffee-bush is here the principal object of culture, with the fig, plantain, orange, citron, and indigo, frequently in the same plantation. This region forms a native sovereignty, under the government of an imaum or sultan, who has a standing army and a regular revenue.

*Sana*, the capital, is an inland town situated in a beautiful valley on the table-land, and contains two royal palaces, many good houses, numerous gardens and fountains, with a population of 40,000, in the centre of the coffee district. The merchants of the town are rich; but they affect the appearance of poverty, especially the Jews, who are about 3000 in number, and live, a despised and ill-treated race, in a special district of the town. *Mocha*, the most strongly fortified port on the low coast of the Red Sea, has about 5000 inhabitants, and gives its name to the best coffee, the great article of export. About 10,000 tons are shipped annually, besides large quantities of dates, gums, senna, balm, ivory, and gold-dust.

The coffee shrub is not a native of Yemen, but was transplanted thither from Abyssinia in the early part of the fifteenth century. The berry was not known at Mecca until the year 1454. Into Turkey the beverage was introduced during the reign of Soliman the Magnificent, 1520-1566. It was first made known in Italy in 1615, and in England during the closing years of the reign of Charles I. It came through the medium of Turkish subjects. Hence the name, 'coffee,' is a form of the Turkish *kahve*, derived from the Arabic *kahwah*, both signifying the same thing, 'wine.' One of the first coffee-houses in London, in Exchange Alley, had the sign of the Great Turk, with the inscription, 'Morat the Great,' a corrupt abbreviation of the name of the sultan, Amurath IV., who died in 1640.

ADEN, a small peninsula of Southern Arabia, rather more than a hundred miles east of the entrance to the Red Sea, consists of a range of barren and wild hills, connected with the mainland by a narrow sandy isthmus. It does not include more than an area of eighteen square miles. The hills are of conical shape, composed of a bluish coloured rock, and are evidently of volcanic origin. One of the highest, Signal Hill, used as a signalling station, rises to the height of about 1770 feet above the sea. This is a British possession, obtained in 1839 from a neighbouring sultan or sheikh, in the first instance by cession, but secured by force of arms, with the view of facilitating steam communication between England and India.

The town of *Aden* occupies a remarkable site. It stands in a valley or hollow enclosed with rocky walls, which is really the crater of an extinct volcano. The place is of great importance as a coaling station for the steamers passing to and fro between Suez and Bombay, the Mauritius, and the further East. Sailing vessels take out immense quantities of coal from England, and then pass on to India or Australia in search of homeward freights. Upon the arrival of steamers in the offing, boats manned by red-haired, wild-looking Arabs are at hand to carry passengers ashore while the vessels receive their lading, who make their frail craft skim the surface with astonishing celerity. A good hotel on the sandy beach offers accommodation, consisting of one immense ground-floor with a verandah around it. The town, recently a village, now contains a population of 40,000, of a most miscellaneous description. It is defended by a garrison in a fortified camp in the vicinity, and has generally one or two men-of-war at anchor in the roads. Considerable trade is carried on with the interior of Arabia by means of asses and camels. Though disposed to be predatory, the native tribes bring fruit, rice, mutton, coffee, and other articles from the mainland to the peninsula. Aden, signifying Eden, or Paradise, received the name from the sons of Ishmael, in allusion to the climate and the rich commerce it once commanded. In the middle ages, before the maritime route to India was known, it was a large and wealthy place, as a chief mart for the produce received from the Oriental world by the Western nations; but gradually declined to a wretched hamlet upon the passage by the Cape being discovered. Vast cisterns for collecting the rain-water, constructed centuries ago, have been restored, and are applied to their original purpose. The climate is salubrious; the summer heat great, but pleasantly tempered by the sea-breezes.

The remaining portion of the south coast region, which passes under the general name of HADRAMAUT, is a territory of immense extent. Hardly anything is known of its interior, but it appears to be scantily occupied by small settled tribes and wandering Bedouins, with

fishermen on the shores, who are ichthyophagi, exclusively subsisting upon the produce of their calling. OMAN, a maritime district on the east, at the entrance of the Persian Gulf, is a regularly constituted and powerful state, under an imaum or sultan, with a mixed patriarchal and despotic form of government. Apart from a belt of land on the coast, the country is a desert, but interspersed with watered valleys or oases, of which a glowing account is given by the natives, founded chiefly upon their rarity, though really productive. The same description applies to LACHSA, a tract on the western side of the gulf, held by a number of petty sheikhs, the shores of which are besprinkled with islands, the seat of a valuable pearl-fishery. NEJD, or the vast interior of Arabia, is a region which has only been subject on its skirts to limited European observation, but may be inferred from report to be generally a wilderness of rocks and sands, in many parts utterly sterile, and with only a scanty desert vegetation in the most favoured sites.

*Muscat*, the capital of Oman, a highly-important port, is perhaps the largest city in Arabia, containing about 60,000 inhabitants, who belong to various nationalities—Arabs, Persians, Kurds, Syrians, Indians, Belochees, Afghans, are attracted to the spot by maritime commerce, as well as by the security which a stable and generally just government offers to person and property. While the master of a fleet and army, the sultan is bound to attend to the summons of any inhabitant who calls him to a court of justice. Muscat stands at the head of a cove, which communicates with the sea by a narrow entrance, and is girded by bare rocks of considerable height, so as to overhang the town and harbour. Thus shut out from every breeze except the one blowing directly into the mouth of the inlet, there is seldom a breath of air, and the summer heat is oppressive, while the reflection of the sun from the naked hills is distressing. Commercial activity is the prominent feature of the place. Silk and cotton sashes, canvas, and arms are manufactured; hides, horses, asses, dates, and salt are exported; cloths and various kinds of grain are imported. A northerly headland, Ras Mussendum, at the narrow entrance of the Persian Gulf, is 'Selama's sainted cape,' on passing which the native seamen throw offerings of fruits and flowers into the sea to propitiate a favourable voyage. Within the Persian Gulf, the Bahrein islet group, close to the shore of Lachsa, is the centre of the pearl-fishery. It has been carried on from early times, and is mentioned by Pliny. A considerable number of vessels and small-craft are employed, in the hot season of the year, chiefly by merchants resident at *Manama*, the chief town of Bahrein, who reap the profits of the fishery, giving only a miserable pittance to the divers. Its annual value is said to be about £150,000. The pearl-oyster occurs generally along the whole coast of Arabia, but can only be obtained where the water is comparatively shallow.

*Derayeh*, the chief town of Nejd, in the heart of the country, seventeen days journey from Medina, is principally known from its connection with the Wahabees, the Puritans of Mohammedanism. They derive their name from the founder, Abdel Wahab, a Bedouin sheikh, who, towards the close of the last century, having travelled extensively, declared that the faith of Islam had become corrupted in practice, assumed the character of a reformer, and brought entire tribes, with their chiefs, to adopt his views. While believing in the divine mission of the Prophet, they objected to pay religious veneration to him; deemed it specially sinful to honour the tombs of saints; denounced luxury in food and dress; forbade the use of spirituous liquors, smoking tobacco, and wearing silk; and proceeded to enforce this creed by the sword. Mecca was taken after a long siege in 1803; Medina fell in the following year; and nearly the whole of the peninsula was reduced. But the power of the Wahabees was finally broken by Mohammed Ali, the pasha of Egypt, whose army recovered the holy cities, and penetrated to Derayeh in 1819, which was nearly destroyed. The sectaries remain in the remote interior of the country.

Arab Tents.

Falls of Bund-a-Mer.

## CHAPTER IV.

### IRAN OR PERSIA.

IRAN is the name which the Persians give to their country, and which has been in use from remote antiquity; it formerly denoted the whole region between the basins of the Tigris and the Indus, which, at more than one period, has been comprised within the limits of a single empire. The eastern portion of this extensive district is now held by various independent tribes, and modern Iran, the Persia of European geography, is confined to the western division. Its boundaries are formed by Russian Armenia, the Caspian Sea, and Turkestan, on the north; the Persian Gulf and part of the Arabian Sea on the south; Asiatic Turkey on the west; Afghanistan and Beloochistan on the east. No natural landmarks form a border on the east and north-east, nor can any artificial frontier line there be drawn, for the surface is

largely a desert waste in those directions, freely wandered over by nomadic hordes. But the extreme extent is defined by the parallels of 26° and 40° north latitude, and the meridians of 44° and 61° east longitude. Within these bounds, direct linear distances of from 700 to 800 miles may be traversed, while an area, roughly estimated at 500,000 square miles, is included. The Persian Gulf, the chief maritime feature of the country, is an extensive arm of the Indian Ocean, closely land-locked, forming the only inland sea, properly so called, which exclusively belongs to the Asiatic continent. This expanse sweeps in the form of a crescent through 600 miles from its mouth to the far extremity, and has a breadth varying from 100 to 230 miles. It is numerously studded with islands, one of which, at the entrance, a few miles from the mainland, is the historically famous Ormuz, to which Milton refers :

‘ High on a throne of royal state, which far  
Outshone the wealth of Ormuz or of Ind ;  
Or where the gorgeous east, with richest hand,  
Showers on her kings barbaric gold and pearl,  
Satan exalted sat.’

This was in the hands of the Portuguese from 1507 to 1622, who founded the town of Ormuz as a commercial emporium, where the produce of Persia, India, and China was exchanged for the manufactures of Europe. They were dispossessed in the latter year by Shah Abbas, assisted by the English; the town and port were ruined; and the island is now nearly desolate, and would be entirely so but for its rock-salt and sulphur.

The interior of Persia varies in its aspect from stern desolation to luxuriant beauty; but sterile features so far preponderate as to be characteristic of the surface. The maritime region is low, flat, and arid, subject to excessive heat, where the date-palm is almost the only sign of vegetable life, and cultivation is limited to the neighbourhood of a few springs. Centrally and easterly, embracing the vast proportion of the area, the country consists of an enormous highland or plateau, ranging from 3000 to 4000 feet in its mean elevation, baked by a burning sun in summer, and swept by piercing winds in winter. It comprises deserts of sand, gravel, and clay, covered with salt and nitre, doomed to everlasting barrenness; with landscapes in other parts exhibiting masses of bare rock, and intervening valleys, streamless, treeless, and uninhabited, league after league, where an encounter with a single caravan in the course of a day's journey is as much evidence of human life as is ordinarily met with. Northward, the lofty chain of Elburz hems in the plateau; and from thence to the Caspian a narrow lowland tract extends of a totally different character. Here an exuberant vegetation appears, fostered by the combined influence of humidity and heat. Westward, the table-land is also walled by high ranges, the Zagros Mountains of the ancients, from which streams and rivers descend into the adjoining valleys and plains, where a prodigal display is made of the riches of vegetative nature. The Elburz chain culminates in the Peak of Demavend. This is the highest point of the country, the summit of which is described by the national epic poet, Firdousi, as ‘far from the abode of man, and near to Heaven.’ It rises capped with eternal snow to the height of 21,500 feet above the level of the sea. The mountain is a conspicuous object from Teheran, and a noted landmark to seamen on the Caspian, the subject of many a wild legend. High up amid rocks and snow, as the worshippers of fire believe, dwells Zohâk, the most wicked of kings, surrounded by a court of magicians and sorcerers. From the top, says tradition, the arrow was shot with such miraculous prowess as to reach the banks of the Oxus, which caused the whole of the intervening country to be ceded to Persia,

and led the followers of Zoroaster to institute the annual 'Festival of the Arrow,' in commemoration of the event.

Scarcity of water is the great natural disadvantage of the country. The hydrography embraces a number of streams with short courses generally, which discharge into the Caspian, and some important tributaries flowing to the Tigris and the Shat-el-Arab. But tracts of immense extent are either entirely waterless, or are only supplied with salt-lakes, while a large proportion of the running streams are not perennial in their flow, but dry up during the heat of summer. Hence the 'bed of a stream,' *rood-ichanch*, is the common phrase for a river in Persia, an idiom which has probably arisen from the fact stated. Forests are therefore only prominent in the humid lowland tract, between Elburz and the Caspian, where the oak, beech, elm, walnut, cyprus, and box are found, while the mulberry, sugar-cane, and vine are cultivated. More sparingly, timber-trees clothe the slopes of the western mountains, and adorn the irrigated plains and valleys at their base. But in this last region, every species of fruit-tree known to Europeans grows in wild luxuriance; roses of many varieties occur in profusion, from which the well-known otto of roses is prepared; and the loveliest flowers, tulips, anemones, hyacinths, ranunculuses, pinks, jasmines, and violets flourish untended by the wayside and in the fields. In the dry districts the vegetation consists principally of the date, the camel's thorn, saline and gum-yielding plants, among which the perennial *Ferula assafetida* is very abundant. From the milky juice of the root the gum-resin called after it is obtained, and forms an important article of commerce. The wild animals include the lion, panther, bear, hyena, jackal, wolf, wild boar, and wild ass, with various kinds of antelopes, and other game, which sportsmen pursue with hawk and hound. Among the domesticated stock, several breeds of horses are highly valuable, some for their beauty, others for their speed and power of endurance. Thoroughbred Arab steeds are distinguished as of 'pure veins,' *regee pak*, and receive as much attention to preserve the original blood as could be shewn in the first race-studs in England. The Persians are admirable horsemen, and will despise the foreigner unable to ride well more than for any other failing. There is considerable mineral wealth in the country, but very little developed. Besides the useful metals, it comprises celebrated mines of turquoise, a beautiful sky-blue gem, of very rare occurrence elsewhere.

Ancient *Persis*, called in the Old Testament *Paras*, is represented in its general limits by the modern province of Fars. This is Persia Proper, and the present name is simply Paras or Pharas abbreviated into Phars or Fars. The word in the Zend, or old Persian language, is said to signify 'clear,' 'bright,' 'pure as ether,' and the particular region designated by it probably received the name from its generally pure atmosphere and clear serene sky.

Though modern Persia is a state of very subordinate political consequence, it has been the central seat of powerful and widely-extended empires. Cyrus, about 559 B.C., united his native Persians with the neighbouring Medes, and founded the Medo-Persian monarchy, which included the whole of Western Asia, subdued part of Northern Africa, aspired to conquest in Southern Europe, and was overthrown by Alexander the Great, 331 B.C. A Parthian empire soon afterwards succeeded, which resisted the attacks of the Romans, and inflicted upon them some signal reverses. During the early centuries of the Christian era, under several of the Sassanide sovereigns, the monarchy was again extended from the Red Sea to the Indus. In modern times, 1586—1628, under a Mohammedan dynasty, represented by Shah Abbas I, a magnificent barbarian, Persia was once more formidable. Two Englishmen, brothers, Sir Anthony and Sir Robert Shirley, at the head of some followers, presented themselves at his court as soldiers of fortune, and were graciously received. By their instructions an army was disciplined after the European model; the use of artillery was introduced; and the Shah triumphed over the Portuguese and the Turks. 'The Persian,' curiously remarks a contemporary writer, 'hath learned Shirleian arts of war, and he which before knew not the use of ordnance, hath now 500 pieces of brass and 60,000 musketeers; so that they which at hand with the sword were before dreadful to the Turks, now also in remoter blows and sulphurean arts are grown terrible.' In the last century Nadir Shah reduced the Afghans, and extended his power over part of Northern India. But by the rise of small independent states eastward, and successive losses of territory to the Russians in the direction of the Caucasus, the Persian monarchy has been reduced to its present limits. There is

little in the present state of the country to inspire hope of civilisation advancing, or to interest the mind apart from the monuments of ancient times. The government, administered by a Shah, or emperor, is perfectly despotic, though controlled by the apprehension of revolts.

The political divisions of Persia have repeatedly fluctuated in number and extent. Nine provinces are generally enumerated, but their limits are not strictly defined.

| Provinces.            | Cities and Towns.                          |
|-----------------------|--|
| Irak-Ajemi, . . . . . | Teheran, Kasbin, Kashan, Ispahan, Hamadan. |
| Azerbaijan, . . . . . | Tabriz, Maragha, Urumiah, Miana.           |
| Ghilan, . . . . .     | Resht, Lahijan, Enzeli.                    |
| Mazanderan, . . . . . | Sari, Balfurush, Amol.                     |
| Khuzistan, . . . . .  | Shuster, Dizful, Hawiza, Mohammerah.       |
| Fars, . . . . .       | Shiraz, Bushire.                           |
| Laristan, . . . . .   | Lar.                                       |
| Kerman, . . . . .     | Kerman, Gombroon.                          |
| Khorasan, . . . . .   | Meshid, Nishapur, Astrabad, Yezd.          |

Each of the provinces has a governor, usually a prince of the blood-royal, with the style of *beglerbeg*, who is represented in districts by subordinates, and by still more inferior officers in the towns. The chief business of these officials is not so much to maintain order, and see to the proper administration of justice, as to extract as large a revenue for the crown as possible from the people, not forgetting their own profit.

IRAK-AJEMI, one of the most extensive of the sectional divisions, and the first in rank from containing the former and the present capital, is central and western in its position, and has very different natural features in the two directions. The central portion, though not without many fertile tracts, consists principally of desert table-lands, where the streams lose themselves in sandy wastes, and intermit their flow in summer, and where ridges of naked rock on the borders of verdureless valleys offer a dismal diversity to the monotony of the scene. On the route from Ispahan to Teheran the traveller passes through a series of stony ravines, so utterly desolate and frightfully savage as to be called the Valley of the Angel of Death, traditionally said to be one of the resting-places upon earth of the dread minister, where ghouls attend upon him, whose voices are heard in the howl and sighing of the wind. But the western portion of the province, traversed by the Zagros Mountains, is rife with scenes of luxuriant beauty in the glens, perennially watered by streams from the highlands, which unite to form rivers in the plains, and render them spontaneously fruitful. Of these streams, the Holvan, which finally reaches the Tigris, is a lovely example. It flows through the romantic dell of Rijab, which contributes copious rivulets to its current. This dell, extending through a distance of nearly eight miles, has a medium width of not more than a hundred yards, and is shut in on both sides by a wall of tremendous precipices. Yet from one end to the other it is filled with gardens and orchards, through which the stream rushes impetuously, until it emerges into the plain below. The dell takes its name from that of a little village in it, occupying a nook, where the defile widens into something like a dale. The peaches and figs, which are the produce of its gardens, are celebrated throughout Persia. Their excellence has given rise to a proverbial saying, 'The figs of Holvan are not to be equalled in the whole world.'

*Teheran*, the present capital, in latitude 35° 40' north, longitude 51° 30' east, stands on a barren elevated plain, near the southern base of Elburz, about seventy miles from the Caspian. It is almost entirely contained within an embattled mud wall, four miles in circuit, flanked by numerous round towers in very tolerable repair, preceded by a ditch. The four gates are ornamented with figures of tigers and other animals. Royal palaces and gardens of great extent and beauty occupy a considerable space in the interior. The bazaars are large, surmounted with domes, and roofed with variegated coloured tiles. But the dwelling-houses are chiefly mud-built huts. The population, at its greatest about 120,000, fluctuates remarkably, for, owing to the intolerable heat in summer, the court, with all who have the means, retire to a cooler site, and encamp on the plain of Sultaniah. Teheran became the capital of the kingdom in 1788, owing to its proximity

to the native possessions of the reigning dynasty. About twenty-five miles distant, on the east, are the extensive ruins of *Rhagez*, a city contemporary with Persepolis and Ecbatana, the metropolis of the Parthian kings, and the birthplace of Harun-al-Raschid, still important in the middle ages. *Kasbin*, one of the trading towns on the north-west, about ninety miles from Teheran, is celebrated for its grapes, pistachio-nuts, and manufacture of ornamental tiles. Before the time of Shah Abbas, it was for a brief period the capital of Persia, and had a population of 200,000, but has now probably not more than a fifth of that number. *Kum*, on the south, ancient and once populous, now almost a mass of ruins, is venerated as one of the holy cities, to which many of the wealthy are conveyed for interment on their death, in coffins carried on the backs of mules and camels, from distant parts of the country. The place has gardens luxuriant with fruits and flowers; storks sitting on their nests on the roofs of the buildings; nightingales singing day and night, so domesticated as freely to approach the houses; and the custom is observed by the inhabitants of strewing the apartment with roses destined to receive a welcome guest. *Kashan*, further south, highly industrial, is famed for the manufacture of silk brocades for garments, shawls of the same texture, of exquisite design, and also velvets. Scorpions, large and venomous, are here numerous, but rarely injure the natives. 'May you be stung by a scorpion of Kashan' is a common malediction in Persia. The silk-weavers, along with the artisans of Ispahan, are reputed to be poor warriors. Population, 30,000.

*Ispahan*, once a splendid metropolis, is situated in the southern part of the province, 226 miles from Teheran. It stands on a fertile and beautiful plain, watered by the Zenderud, a broad river crossed by three noble bridges, the banks of which are lined with groves, avenues, gardens, and spreading orchards, which intermingle with the buildings, and render the distant view of the place extremely delightful. The city is, however, a wreck, presenting on almost every hand the melancholy spectacle of deserted palaces, ruined houses, tenantless streets, and neglected parterres; yet still exhibiting scenes of animation along with the evidences of decay. The most noteworthy building is a palace, called the *Chehel Sitton*, or 'Forty Columns.' The pillars are inlaid with mirrors, and the walls and roof are profusely decorated with glass and gilding. In the days of its prosperity, under Shah Abbas I., the walls had a circuit of twenty-four miles, and the population was so great as to be proverbially accounted 'half the world.' It no doubt considerably exceeded half a million; and Ispahan is still the largest city of Persia, and of Western Asia, containing upwards of 180,000 inhabitants. Manufactures are extensively conducted of woven fabrics, rich gold brocades, calicoes, chintzes, and other cotton goods, from the cotton raised in the neighbourhood, with firearms, sword-blades, glass, and earthenware. Stone and seal cutters are famed for their workmanship. Many bazaars are crowded with all kinds of goods, and daily thronged with merchants. In the vicinity immense flocks of pigeons appear, bred for the profit derived from their manure, which is prized for rearing melons of the finest quality. *Hamadan*, in the western part of Irak, 180 miles west-south-west of Teheran, is a mean-looking but important commercial town, with a considerable transit trade, as the centre to which caravan routes converge, from Teheran, Ispahan, Bagdad, and Erivan. It occupies a high site at the northern base of Mount Elwund, and has therefore an agreeable summer, with a very cold winter. Hence the Medo-Persian kings selected the spot for their usual summer residence, for Hamadan stands on the same ground where stood the Median *Ecbatana*, the *Achmetha* of the sacred writings. Nothing of interest remains of the ancient capital; but a sepulchre exists reputed to be that of Esther and Mordecai, venerated as such by a resident Jewish remnant.

*Kermanshah*, a modern town of 30,000 inhabitants, is on the south-west of Hamadan, rendered of some political importance as the seat of a government frequently held by princes of the blood-royal. It has manufactures of carpets, swords, and firearms. About twenty miles distant on the east, the little hamlet of *Bisitun*, or *Behistun*, adjoins a locality very remarkable on account of its natural aspect, and as a memorial of ancient times in sculptures and inscriptions. A range of barren limestone mountains, presenting on their sides and summits the boldest and sharpest outlines, here terminates so abruptly as to form a naturally scarped precipice 1700 feet high, in appearance as if the hand of man had been employed in giving a perpendicular face to the mass. On this surface a very perfect piece of sculpture appears, accompanied by cuneiform writing. It represents a line of nine persons united by a cord tied round their necks, and having their hands bound behind them, obviously captives. They approach a personage of more majestic stature, who, holding up his right hand, treads upon a prostrate body, evidently a king or commander. Behind him stand two warriors as his body-guard, with long spears in their hands. Above all, in the centre, floats as if in the air, the winged personage, so often seen at Persepolis, the attendant guardian angel of the monarch. The position of the sculpture proclaims the care taken by the author to insure the permanence of the monument. It is at least 300 feet above the ground, and could only have been executed with the aid of scaffolding. The inscriptions are trilingual, or engraved in the three great classes of the cuneiform character, the Babylonian, Median, and Persian. Sir H. Rawlinson has deciphered the Persian record, from which it appears that the principal personage sculptured is Darius Hystaspes. The prostrate body represents Gomates, a Magian pretender to the throne. The nine captives are rebel leaders who raised the standard of revolt in the empire, and were subdued. This monument is referred to about the year 516 B.C. *Bisitun* is the *Baghistan* of ancient history, or 'Place of Gardens,' where Alexander lingered for thirty days while on his march from Susa to Ecbatana. It had a palace, park, pleasure-grounds, and reservoirs, traditionally ascribed to the Assyrian Queen Semiramis.

AZERBIJAN, a north-western province, borders on Russian Armenia, from which it is separated by the river Aras. The name, signifying 'Land of Fire,' refers to the fire-fields of Baku, now beyond the frontier, as well as to the circumstance of the district having been the original seat of the Guebres, or fire-worshippers. The surface is very strikingly diversified with mountain and lake. It rises in the peak of Savalan to the height of 13,000 feet, and embraces the remarkable lake of Urumiah, the largest in Persia. This expanse measures from eighty to ninety miles in length, and has a medium breadth of twenty-five miles, but with only an average depth of about twelve feet. The water is very clear, intensely salt, and has a sulphureous smell. Owing to its great specific gravity, the winds have comparatively little effect upon the surface, and the waves are speedily at rest after the strongest gale. No fish can live in it, but zoophytes are abundant and curious.

Tower of Yazd, near Teheran.

*Tabriz* about thirty miles from the north-eastern shore of the great lake, and built on very high ground, is a city of 160,000 inhabitants, surrounded with fruitful gardens and orchards. It is the emporium of the trade of Persia with Europe through Turkey, which amounted to the value of nearly £2,000,000 in 1859, and has silk and cloth manufactures. British calicoes were formerly extensively imported, then dyed blue, and sent out as native products. Indigo, an article of great consumption, is obtained direct

from India. Several streets are devoted to the sale of particular goods, as one for saddlery, another for silks. The climate is remarkable for extremes of temperature, great heat in summer, severe cold in winter. According to a register of the weather, Fahrenheit's thermometer, which stood frequently at 94 degrees in June, never rose above zero when exposed to the open air at night, from the middle of December to the close of January, and was seldom above 18 degrees within doors at mid-day. But Tabriz is accounted healthy, and has therefore been rebuilt after repeated demolition by earthquakes. It is rarely free for a twelvemonth from slight shocks, and lost nearly all its inhabitants by a tremendous convulsion in 1792. *Maragha*, eighteen miles from the south-eastern shore of the lake, was once more important, as the capital of Hulagu, grandson of Ghengis Khan, where he relaxed from warlike toils, and assembled men of science around him. The foundations of the observatory may be traced on the top of a hill, where the astronomer of the thirteenth century, Nasir-ud-Deen, watched the heavens. A white marble is obtained in the neighbourhood, which, when cut thin, is capable of being used as a substitute for window glass. *Urumiah*, a few miles from the western side of the lake, a considerable town and an American mission station, has also some Nestorian Christians among its inhabitants, found in the adjoining villages, employed as agricultural labourers on the estates of Mohammedan landholders. Two of this interesting community, called the 'Protestants of Asia,' Priest Yohanan and Deacon Yishlak, travelled on foot nearly all the way from the plain of Urumiah to London in 1862, and were hospitably entertained during their stay in the Home for Asiatics at Limehouse. *Miana*, a small place towards the southern border of the province, is remarkable for its poisonous bug. This pest is not known apart from the town and its immediate environs, and only causes ordinary annoyance to the natives. But the bite is usually mortal to strangers, sometimes causing speedy death, but generally producing a fatal wasting of the frame. Russian embassies, having had occasion to pass, have pitched their tents at the distance of three miles, on account of the terrible bugs. Azerbaijan has near its extreme southern frontier an extraordinary structure, called *Takhti-Suteimán*, or 'Solomon's Throne,' consisting of a hoary mass of crumbling walls and buildings on the top of a hill. They enclose a small sheet of water of the deepest azure, and are bounded by a strong line of wall supported by numerous bastions. These ruins have not been identified with the least certainty as those of any known place.

The districts of GHILAN and MAZANDERAN are of very small extent, lying on the southern shores of the Caspian, with the range of Elburz in the background. They differ in every respect from the rest of the country, being low and swampy, drenched with summer rains, and covered with wood and jungle. The clouds, borne along by the prevailing north-west winds, are arrested by the high mountain rampart, and discharge themselves in violent showers, and the surface being a dead level, the streams rapidly overflow, originating extensive marshes. Hence this region is notoriously insalubrious, rife with fever and ague, to which a common proverb refers, 'Whoever is tired of his life, let him go to Ghilan.' Still, it contains large and flourishing towns, owing to the exuberant vegetable produce. Rice is grown on the moist soil; the sugar-cane thrives; and the mulberry-tree is cultivated in extensive plantations for the silkworm.

*Resht*, in Ghilan, at a short distance from the Caspian, is a well-built town, possesses many bazaars, and contains 50,000 inhabitants, in commercial communication with Russia, but is one of the most unhealthy spots in Persia. *Sari*, the capital of Mazanderan, similarly situated, has good brick houses, neatly tiled, with paved streets, and about 20,000 inhabitants; *Balfurush*, stragglingly built over an extensive woodland area, has a total population of at least 60,000. Both places were formerly more populous, but have suffered from cholera and the plague.

KHUZISTAN, on the south of Irak-Ajemi, extends thence to the head of the Persian Gulf, and is a beautiful and highly-fertile district naturally. The surface rises inland into lofty hills and mountains, but consists of great alluvial plains in the maritime region, suited to the cultivation of rice, cotton, the sugar-cane, and indigo. It is traversed by the Kerkah and the Karun, both of which flow to the Shat-el-Arab. The Kerkah, the largest river, is the ancient *Choaspes*, so celebrated for the excellence of its water, that the Persian monarchs generally carried a sufficient quantity of it with them when journeying, so that recourse might not be had to any other supply. Hence Milton's reference,

'There Susa by Choaspes' amber stream,  
The drink of none but kings.'

The province is historic ground. It represents generally the *Susiana* of antiquity, which comprised within its limits *Susa*, the *Shushan* of the Books of Esther and Daniel—one of

the old royal cities of the Persian kings, and chosen as their winter residence, owing to the warmth of the climate.

*Shuster*, the present provincial capital, stands on the Karun, enclosed by a wall of unburned bricks, and is a decayed place, largely depopulated in 1832 by cholera and the plague. It is supposed to have been founded by Sapor, the second of the Sassanide dynasty, who is stated to have had it built under the direction of his prisoner, the Roman emperor Valerian, and to have employed the captive soldiers as the workmen. Its castle, seated on a bluff hill of sandstone, was the reputed abode of the unhappy emperor. Part of the ancient structure is still standing, and has a gate in the Roman fashion, furnished with a drawbridge, still entire. The Karun here is crossed by a bridge of forty-four arches, called Puli-Kaisar, or 'Cæsar's Bridge;' and at a short distance from it, the summit of a hill is crowned by the ruins of an edifice, named Takhti-Kaisar, or 'Cæsar's Throne.' These works have doubtless been so styled from a traditionary remembrance of the unfortunate Roman. *Dizful*, seated on an affluent of the Karun, is a larger town of the same date, with about 15,000 inhabitants.

Of ancient *Susa* there are no remains but the mounds of Sus, on the Kerkah, which is very closely approached at the spot, within a mile and a half, by another river, the Shapur, believed to be the Ulai of the Book of Daniel. The mounds cover an immense space, are high and imposing. They extend not less than twelve miles from one extremity to the other. Large bricks are observed among the rubbish, both sundried and burned, with bitumen as cement, and pieces of marble inscribed with cuneiform characters. A plain dome-like building, comparatively modern, shaded by very graceful palm-trees, stands on the edge of the Shapur, and has received the name of the Tomb of Daniel. It has usually a dervise for a tenant, who shews the spot with as much reverence as if it contained the bones of Mohammed himself. The entire vicinity is now a gloomy wilderness. Lions, hyenas, and jackals haunt the tall reeds and thickets by the rivers. But Sir H. Rawlinson noticed the beautiful natural herbage of the whole district. It was difficult to ride along the banks of the streams owing to the luxuriance of the grasses, and the entire plain was covered with a carpet of the richest verdure. Hence, perhaps, the designation of the city, Sus being the Hebrew and Persian name for the lily, a flower which abounds in the neighbourhood, and has always been considered the emblem of purity. The Jews applied the name to their daughters, and it is with us a familiar female denominative; Susan, 'white lily;' Susannah, 'my white lily.'

FARS and LARISTAN are districts on the eastern side of the Persian Gulf, embracing a considerable interior space, which agreeably changes its aspect as the hot arid region of the shore is left behind. At the distance of from fifty to sixty miles from the coast, an ascent by successive terraces, through watered, fertile, and wooded valleys, leads to the high table-lands, on the surface of which the features of sterility are again presented. Here occurs Lake Bakhtegan, sixty miles long by an average of eight broad, from which a considerable quantity of salt is obtained. The towns of importance are few, but many are the sites of interest.

*Shiraz*, the chief city of Fars, and at one time the capital of the kingdom, 118 miles inland from Bushire, stands on a site elevated 4200 feet above the sea, in a lovely neighbourhood. The walls are four miles in circuit, but the place has little consequence at present in comparison with its past renown. It was formerly celebrated for its grapes, wines, and rose gardens; its commerce and manufactures; and had a large population. But the inhabitants had dwindled to 20,000, when nearly half of them perished by earthquake shocks on five successive days in the year 1853, and many of its finest features were utterly destroyed. It will be long before the effects of this blow disappear. About two miles from the city is the tomb of Hafiz, the native lyric poet of the fourteenth century, sumptuously adorned, and frequently resorted to by pilgrims from a distance. On the swampy solitary plain of the Merdasht, twenty-five miles to the north-east, are the striking fragments of Persepolis, one of the royal cities of Persia, and its capital, when 'Macedonia's madman,' Alexander, entered it as a conqueror, to revel in its halls, and fire the palace with his own hand. Here there is a terrace or platform of masonry, faced with enormous blocks of dark-gray marble, exquisitely polished, and without cement. It rises above the plain from twenty-five to fifty feet, according to the inequalities of the ground. The west side is more than a quarter of a mile in length, and is ascended by a magnificent staircase formed of a double flight of steps, of so easy an inclination that Sir R. K. Porter rode his horse up and down it. From the first terrace there rises a second, ascended by a corresponding staircase, but remarkable for a superb display of bas-reliefs of colossal bulls and other objects. This platform supports what is now called the Chchel Minar, or Palace of Forty Pillars, consisting of a series of columns, still erect, sixty feet high, with finely-fluted shafts. Della Valle, in 1621, saw twenty-five pillars standing; Herbert, in 1627, and Olearius, in 1638, saw nineteen; Kempfer in 1696, and Niebuhr in 1765, saw seventeen. Only thirteen remain at present. But judging from the fragments that lie prostrate in the accumulated dust of ages, as well as from indications of structure respecting the edifice, the total number belonging to the original building is estimated at upwards of 200. At fifty miles on the north-east of Persepolis, the plain of Mourgaub has remains identified as those of Pasargada; the city founded by Cyrus on the scene of his victory over the Medes, where he caused his own tomb to be erected, which was visited by Alexander and rifled by

his officers. A particular structure, now called by the natives Musjed Madre-i-Suleiman, the Tomb of the Mother of Solomon, is generally recognised as the mausoleum of Cyrus. *Bushire*, 'father of cities,' the principal port on the Persian Gulf, trades chiefly with British India, and is a station of the Anglo-Indian telegraphic line. It occupies the extremity of a sandy peninsula, and is nearly surrounded by the sea, fortified with towers or forts on the sea-wall. The town looks well from the roadstead, being built of

Bushire.

a whitish sandstone, while skirted with tall palm-trees and the dark-blue water. But the interior is only a collection of mean low dwellings. The inhabitants are almost all of Arab race, with a few Persian and Armenian merchants. Though tempted by the hope of gain to the shore, the Persians of all classes have an unconquerable antipathy to the sea, while the Arabs delight in it.

KERMAN and KHORASAN embrace between them the entire east of the country, and are jointly as extensive as the united area of the other provinces. But a vast proportion of the surface is a frightful wilderness, where not a blade of grass is to be seen, consisting of plains of shifting sand, or of sea-like plains white with crystallised salt, across which communication by caravan is rare and difficult. Mules are seldom permitted to travel by their owners, being less enduring than the camel. Where springs occur on the leading routes, they are usually met with covered in with a dome-like roof, and an entrance-door is at the side. Small towers at intervals are significant of other dangers besides the natural. They are built as a protection against the marauding Turkomans, and have a confined hole at the base, which allows only one man to enter at a time. Not content with plunder, the robbers, when successful, secure captives also for the slave-markets of Bokhara. The Desert of Kerman, the Great Salt Desert of Khorasan, are appropriate titles. The country improves in the northern part of the last-named province, owing to spurs of the Elburz Mountains running through it, among which the valleys are water-courses. Artificial channels are connected with them, constructed in past ages to lead off

supplies for the irrigation of distant plains, but these works of industry have now become for the most part unserviceable, from the neglect incident to an insecure social condition.

*Kerman*, centrally placed in its province, occupies one of the exceptionally fertile tracts, and is a walled town of 30,000 inhabitants, with manufactures of shawls, coarse woollens, and matchlocks. *Gombroon*, its port, is on the Persian Gulf, opposite the isle of Ormuz. It attained great prosperity for a time, succeeding to the Portuguese insular settlement, in becoming the chief seat of maritime commerce. But it has now declined to a small place, owing to the foreign trade being transferred to Bushire. Town and isle are subject to the sultan of Muscat. *Meshid*, in the northern and favoured part of Khorasan, is seated on a fruitful plain, enclosed by strong walls about seven miles in circuit. But the interior embraces gardens, cornfields, and ruins; the population is 100,000. The tomb of Imam Riza, with the gilded dome and minarets of the mosque adjoining, is a striking object. As the chief seat of the great sect of the Shiites, Meshid is of nearly equal importance with Mecca, the sacred city of orthodox Mohammedans, and hence it abounds in 'holy' men, arrayed in green turbans and sashes, who instruct the pilgrims visiting the city. The town carries on manufactures of woollen goods and metal wares, especially sword-blades, gold-work, and articles of jewellery. *Nishapur*, fifty miles on the west, occupies likewise a well-watered and cultivated plain, celebrated for its fine climate and fruits, and has the turquoise mines in its vicinity. *Astrabad*, at the south-east corner of the Caspian, some miles inland, fluctuates in the number of its inhabitants owing to the unhealthiness of the site. It was once important as the seat of the Kajar princes, from whom the present royal family of Persia descend, which led to the establishment of the capital at Teheran, as a proximate position across the Elburz. *Yezd*, in the southern part of the province, is situated in an oasis of the Great Salt Desert, and is an important commercial station between Central and Western Asia. Caravans meet here from the east and west for the exchange of commodities. The town is the only place in Persia where the fire-worshippers are at all numerous.

Persia is supposed to contain a population of at least 10,000,000, consisting of two great classes, the one fixed, the other erratic. The fixed class reside in cities, towns, and villages; and are conceived to amount to 7,500,000 of the whole. The erratic class change their locality according to the season, or other exigencies of their condition. These two divisions of the people differ further on religious grounds, while both adhere to the creed of Islam. The stationary inhabitants are Mohammedans of the Shiah sect, who reject the authority of the first three califs, Abubekr, Omar, and Osman; stigmatise them as usurpers, and begin the true ecclesiastical succession with the fourth, Ali, who, they consider, ought to have been immediately chosen to follow the Prophet, as the commander of the faithful. But the wandering tribes are generally Mohammedans of the Sunni community, which embraces the Turks and Arabs, who recognise what the others repudiate.

The erratic class includes various nationalities, as Kurds, Arabs, Turkomans, Uzbeks, and Afghans; but they are all comprehended under the general name of *Illyats*, signifying 'families' or 'tribes.' However various their origin, they agree in being pastoral, martial, and more or less predatory, constituting the strength of the government, when friendly, but its plague and terror, if hostile. They claim the lordship of certain uninhabited districts—are completely uninstructed—enjoy a consideration in their own community which they would not have if merged in the mass of society—derive subsistence principally from their flocks, and eat hard black bread of barley or rye with their cheese and curds. But some have departed from the habits of their ancestors; and hence the distinction has arisen among themselves denoted by the terms *Shehr-nishin*, 'dwellers in cities,' referring to those who have adopted a changed life, and *Sahra-nishin*, or 'dwellers in the field.' The latter abide in tents all the year round, and despise the former as a degenerate race. They keep in the winter to tracts which enjoy a warm climate, or to low grounds, then journey to the boundary between the hot and the cold region, ascend in summer to the high lands where they find pasture, and as the season advances, return to their former location to pass the winter. These are regularly defined tracts to which particular tribes claim exclusive right, open of course to appropriation by the shah, the princes, and nobles. Intrusion by their compeers would lead to a fatal feud. A patriarchal kind of government is recognised

among them, disputes being submitted to the decision of elders, *Rishsefeeds*; literally 'white beards.'

The fixed class represent the old inhabitants of the country, but with a strong admixture of foreign blood. These are the Persians proper, a remarkably handsome race, lively, affable, and courteous—hence styled the French of the east—but insincere, treacherous, and cruel, vices with which cowardice is commonly allied. Among no people are the forms and ceremonies conceived to be proper, more strictly observed on public occasions, as well as in the intercourse of private life. Etiquette has the rank of a science, denominated *Kâida-e-nishest-oo-berkhâst*, or 'the art of sitting and rising,' in which is included a knowledge of the manners of good society. Instruction commences in early life, and hence a mere boy will receive visitors of distinction with surprising manliness and grace in the absence of his father, using the same delicately-worded phrases of compliment and inquiry which the head of the household would have employed. Where to ride in a procession, and to stand or sit within doors, when to rise, and how far to advance to meet a guest are points of importance, along with the time and manner of smoking and taking coffee. A welcome, and its opposite, may be signified by the mode in which these favourite refreshments are offered. Court ceremonials are specially prolix, as well as offensive to western notions of propriety. British envoys have had stoutly to resist their observance, and have only conquered by accepting the alternative of refusing to approach the footstool of royalty rather than comply with them. The Shah is honoured by his subjects as *Kibla-e-Alem*, which some render 'centre of the universe,' and others, 'point of the world's adoration.' He possesses a pair of bracelets valued at nearly a million sterling. One is remarkable for the *Deria-e-Nur*, or 'Sea of Light,' a diamond said to be of unequalled lustre, but nearly rivalled by the *Taj-e-Mah*, or 'Crown of the Moon,' upon the other. His peacock throne, one of the spoils of India, carried off by Nadir Shah, is an object of barbaric magnificence. Yet with all their respect for forms, the Persians are not a formal people, but highly cheerful and social, applying themselves to recreation with an appetite apparently sharpened by the occasional restraints to which their customs condemn them. They delight in flowers and gardens, which are commonly plantations of shady trees and ornamental shrubs, particularly roses—are refreshed by streams or fountains, and have elegant garden-houses. Their language, founded upon the ancient dialects of the country, and the modern Arabic, is distinguished as the Italian of Asia, owing to its harmony of sound, facility of versification, and adaptation for the lighter forms of poetry.

Persepolis.

Madzai and Bodeen Peak, Cabul.

## CHAPTER V.

BELOOCHISTAN—AFGHANISTAN—TURKESTAN.

THE territory which forms the northern shore of the Arabian Sea, or Indian Ocean, is known by the general name of BELOOCHISTAN, referring to a portion of its inhabitants, and has Persia on the west, India on the east, and Afghanistan on the north for its inland frontiers. Though of considerable extent, it is, with the exception of a few limited spaces, rough with barren highlands, blighted with intervening sterile plains, and therefore very thinly peopled, while imperfectly known to Europeans. The Hala Mountains on the eastern side—parallel to the course of the Indus—separate the district of Cutch Gundava, which lies in the valley of the river, and has some well-watered tracts where rice and cotton are cultivated, from the larger portion of the country. This range, lofty and of considerable breadth, is intersected by narrow defiles, through which communication is maintained between the borders of India and the regions westward. They are occupied by small streams which swell to overwhelming torrents when rain falls on the heights above, and altogether interrupt transit for a time, or render it difficult and dangerous. One of these clefts, the Bolan Pass, was traversed by a column of the British army, with artillery, when on its way to Cabul, in the year 1839. The crest of the pass is 5793 feet above the sea; its total length, about fifty-four miles; the average ascent, ninety feet in the mile; and six days were required for the troops to march through. 'The minutest descriptions,' says Lieutenant Conolly, 'could hardly convey a just idea of its strength. It is a defile which a regiment of brave men could defend against an army.' There are

points where the opposite walls approach each other so closely at their bases as to leave scarcely room for but a few men to pass abreast; and there are other points where the basements of the cliffs are more apart, while the summits so far overhang as to render the path below gloomy in the extreme by excluding the light of day. The other mountain-ranges run in an inverse direction, or parallel to the coast, and have tracts of loose red sand between them, furrowed by a few water-courses, which are visited by sudden torrents in the rainy season, but remain dry through the greater part of the year. These sandy levels are terraces or table-lands, which become more elevated with their distance from the coast.

The maritime region, to which the name of Makran is given, is one of the hottest portions of the globe. Between March and November the heat is overpowering on the low grounds and in the valleys. According to the natives, the unburned bricks are made red by the scorching rays of the sun. This district is the *Gedrosia* of the ancients, memorable in history, owing to the march of Alexander through it, with part of his army, on returning from India; while another portion sailed along the shore under the admiral, Nearchus. The accounts given of the country and people by the historians of the expedition are fully verified by the reports of modern travellers. Both will become better known, as *Gwadel*, on the coast of Makran, is the station to which the Anglo-Indian telegraphic line passes by submarine cable from the Persian Gulf, and is from thence conducted by land to Kurrachee in Scinde.

Several half-barbarous tribes occupy this region, mostly nomadic and pastoral, all Mohammedans, but referrible to two principal branches, called Belooches and Brahoos, who differ in language, appearance, and habits. The former are tall and well proportioned, martial and predatory, excellent marksmen, fond of field-sports, and speak a corrupt Persian dialect. The latter are of shorter stature, milder disposition, and speak a dialect of Sanscrit origin. A miserable race of ichthyophagi, sparingly occupy the coast. No chieftain aspires to paramount authority, or is more than very locally influential, except the Khan of Kelat, whose territory is in the north-east, towards the Afghan border.

*Kelat*, a town of mud-built houses, surrounded by a mud wall, occupies a high plain, upwards of 7000 feet above the sea. It contains about 12,000 inhabitants, and is the seat of a considerable transit trade, carried on by Afghan merchants. A watered and cultivated tract in the neighbourhood supplies very fine fruits. Melons of extraordinary size are raised, with almonds, apricots, peaches, pomegranates, and figs. The place was taken by the British after emerging from the Bolan Pass in 1839, when the Khan fell fighting bravely in defence of his capital. Left with a small Sepoy garrison, it was captured by the Belooches in the following year; re-occupied before its close by the army under General Nott; and relinquished with the retirement of the troops to the banks of the Indus.

Alexander commenced his march through Beloochistan towards the close of the summer 325 B.C., when the earth had been baking for months under the fiery sun; and according to the unanimous testimony of the soldiers, all former labours and privations were surpassed by the perils and hardships of this homeward expedition. Nature shewed a wild vigour in the districts immediately bordering the Indus. Aromatic trees and shrubs, particularly the myrrh-bearing plants, and the nardus, from which spikenard was extracted, flourished in great abundance and perfection. A grateful fragrance was diffused through the air as the plants were crushed by the tramp of the advancing columns. But as the country further west was penetrated, all vegetation disappeared, and perfectly desert plains of fine soft sand alone met the eye, so hot by day as to blister the feet. The sand was perpetually shifted by the wind, and drifted into ridges, obliterating all traces of a road, and the guides were compelled to steer their course by the stars. Sir H. Pottinger, in modern times, has described the high waves of sand which he had to cross in this region for a distance of seventy miles. The army marched in the night owing to the tremendous heat, but it often happened that they were far from a watering-place at daybreak, and had to travel to it, exposed to the full solar glare. The beasts sank beneath their burdens and perished; the baggage was abandoned; the men in great numbers died of fatigue and thirst; and but for the indomitable bearing of the commander, despair would probably have seized upon the whole force to its destruction. On one occasion a small quantity of brackish water was carefully brought in a helmet for his refreshment. Alexander accepted the offering, and thanking those who had procured it for him, poured the water out on the sand. The action, it has been justly said, marks not only the great man, able to control the cravings of nature, but the great general, for every soldier who witnessed it would receive a far stronger stimulant to endurance than if he had himself partaken of the draught.

The admiral, Nearchus, on his part, found the shore he coasted utterly destitute of supplies. No meat or corn could be obtained, and but little water. Famine thus threatened the crews. Fine turtle were to be had in abundance, but the Greeks never conceived it possible to feed upon such a creature, and the natives of the shore at present reject the diet. The habits of the race are precisely as they were nearly twenty-two centuries

ago, both as to their food, the fodder of their cattle, and the construction of their cabins. They live entirely upon fish, as described by the historian, chiefly crabs, oysters, and other molluscs. These are picked up on the recession of the tide in hollows on the beach, for proper sea-fishing is beyond their art, owing to the want of boats and implements. In the absence of meadows and grass, the cattle have much the same food as their owners, or a compound of dried fish and dates. When the Greeks arrived at a part of the coast clothed with date-trees, they expressed their joy at the prospect of obtaining vegetable diet.

AFGHANISTAN, the land of the Afghans, a people whose name revives the memory of a sad disaster to the British arms, is situated immediately north of the preceding district, and is a more extensive territory, with very varied physical features, and a climate remarkable for its strongly-contrasted seasons. It measures about 450 miles from north to south, a distance which is slightly exceeded by that from east to west; and comprehends an area of at least 210,000 square miles. On the west and south-west the country is a sandy wilderness, comparable to the most sterile parts of Beloochistan and Persia, yet studded with a few smiling oases. But on the east and north-east, the surface rises in a series of elevated terraces, from which majestic mountains ascend to the region of the ever-during snow, and send down streams into the subjacent valleys, clothing them with beauty and fruitfulness. The Sulaiman Mountains, on the eastern border, form the frontier on the side of India. The grander chain of the Hindu-Kush, a westerly continuation of the Himalaya, extends over the north-east, and forms the boundary from Turkestan. Many peaks of this range exceed the height of 18,000 feet, while the only pass across it practicable for artillery ascends to 13,000 feet. These protecting highlands, with scarcely passable deserts on the borders in other directions, render the country peculiarly difficult of access, and give it the character of a strong natural citadel. This consideration mainly induced the Anglo-Indian government to make its unfortunate attempt to place an ally upon the Afghan throne, in the person of Shah Sujah, in the year 1839, in order to guard against the bulwark of India towards the west being held by an enemy. The mistaken policy had a brief term of success, but led to a general rising of the natives, the murder of the British representatives, the winter retreat of the occupying army, and its wholesale massacre by the way, when the troops were paralysed by the cold and impeded by the snow in the savage wilds of the Khurd-Cabul defile.

None of the rivers are of important magnitude, though numerous and highly valuable. The Cabul, which passes the city of that name, flows with a strong current beyond the frontier, and joins the Indus nearly opposite the town of Atak or Attock. The Helmund has a longer course, chiefly through the western desert region, where it is lost in the large salt-lake of Hamoon, more properly a brackish, shallow, and reedy morass. While varying with differences of elevation, the climate is everywhere distinguished by extremes of heat and cold. In the oases of the sandy wilderness on the west, the date-palm flourishes, and in the deeper valleys of the mountains on the east, cotton and sugar are raised. The summer heat admits of the culture of the vine with great success, on the high terraces. Fine fruits of various kinds, tobacco, rhubarb, asafetida, and other aromatic plants, with the mulberry-tree in vast plantations, are grown in the watered highland vales, where also an extraordinary variety of roses, stocks, jessamines, hyacinths, and tulips, both wild and cultivated, display their beauty. The loftier uplands are well clad with pines, oaks, cedars, cypresses, pistachio, and walnut trees. At Ghizni, though at the elevation of 7700 feet, the high summer temperature is indicated by the common saying, 'Great God, why hast thou made hell, when there is Ghizni?' But it alternates with the severest cold in winter, marked by 20° below the zero of Fahrenheit, when the inhabitants rarely quit their dwellings. Snow falls in heavy showers, and lies deeply upon the ground, sometimes remaining till the vernal equinox has passed. Three times, according to tradition, the place has been visited with tremendous snow-storms, when most of the

The Khyber Pass.

houses were covered, and the people perished. The lion is found in the warm valleys, but is not often seen; tigers and leopards are more numerous; the bear is common in all the wooded mountains; the wolf, hyena, and jackal are generally distributed. The country is rich in minerals, iron, copper, and lead, but the natives neglect these resources, and are so jealous of strangers that they will admit of no mining attempts being made by them. Whole cliffs of *lapis lazuli* occur among the rocks.

The political divisions of Afghanistan include three states without any definite limits, under rulers respectively at Cabul, Kandahar, and Herat, whose authority is merely nominal over tribes in their immediate neighbourhood.

*Cabul*, in the north-east, on the river of the same name, is seated on a plain 6400 feet above the sea, surrounded by ramparts which are said to enclose a population of 60,000. It possesses a citadel, called the Bala Hissar, which contains within its circuit the residence of the Khan, and has several bazaars, with an extensive transit trade. Orchards and gardens in the vicinity are very celebrated for their fruits. In the centre of one of the gardens, two erect slabs connected with a chaste mosque of marble, mark the grave of Baber, the founder of the Mogul Empire in India. The native outbreak against the British, in 1841, commenced in this city, when Sir W. Macnaughten and Sir A. Burnes were murdered, and 4700 troops, with 7500 camp-followers, perished in the retreat. Fresh forces poured into the country, re-occupied the capital, and ravaged the citadel and the great bazaar, as a punishment for the treacherous proceedings. The Cabul River descends to *Jelalabad*, 78 miles distant, a small place distinguished by Sir R. Sale's successful defence of it during the insurrection. Further east is the Khyber Pass, leading through slate mountains to the plain of Peshawur, within the limits of British India. This pass is a ravine about thirty miles in length, the bed of a torrent, in places very narrow, with high and almost perpendicular rocks on either hand. *Ghizni*, south-west of Cabul,

a fortress and small town, is remarkable for its site, climate, and history. It stands on a very elevated plain, and occupies a scarpd rock which rises 280 feet above the general surface. High walls and a wet ditch add to the natural strength. Its strongly-contrasted summer and winter has been already mentioned. The place was once a large and splendid city, the capital and stronghold of the Ghiznevites, a line of princes who held it from about 961 to 1150 A. D., whose empire extended eastward to the Ganges and westward to the Tigris. Among its famous buildings was the 'Palace of Felicity,' and a mosque called the 'Celestial Bride.' Sultan Mahmoud, conqueror of India, the greatest of the Ghiznevite sovereigns, reigned from 998 to 1030. His tomb remains. From its doorway, the sandal-wood gates, brought from the temple of Somnauth, were taken by order of Lord Ellenborough in 1842, and returned to Gujerat, after an absence of seven centuries. Ghizmi was captured by storm by the British under Lord Kane in 1839, then recovered by the Afghans, but retaken by General Nott, and restored with the fortifications dismantled. The citadel has since been rebuilt, but the town itself has gone to decay.

*Kandahar*, about 280 miles south-west of Cabul, is of considerable extent, surrounded by a mud wall, fortified with towers and bastions; and is further defended by a fortress in the vicinity, which crowns the summit of a precipitous rock. It is regularly built, has intersecting canals which bring water to the inhabitants from a neighbouring river, and serve to irrigate the orchards and gardens, which are very fruitful. Manufactures of arms, silks, and woollens are carried on, and the trade is considerable with Persia, Bokhara, and India. From the latter country, the approach is through the Bolan Pass in Beloochistan, before described. The population is variously estimated from 25,000 to 100,000, and probably fluctuates greatly. The place is of ancient date, is said to have been founded by Alexander the Great, and has had a checkered history. It was taken by Tamerlane in 1384, and by Shah Abbas in 1620. The adjoining fortress was held by the British through the whole of the Afghan war. Great part of the present town was built in the middle of the last century by Ahmed Shah, whose tomb is one of the principal public buildings.

*Herat*, in the north-west, 390 miles from Cabul, is a town of perhaps 45,000 inhabitants, protected by a wall and ditch. The site is very delightful, though it can only be gained by the traveller from any direction by passing over miles of desert. This is a valley watered by several streams, irrigated by many canals, abounding with villages, gardens, and vineyards. The place itself is highly industrial, producing carpets, cloaks, caps, and leather goods, with saffron and asafetida, extensively grown in the vicinity. Herat was formerly the capital of princes of the house of Tamerlane, and has not lost its political importance. Situated near the Persian province of Khorasan, it is considered the key to Afghanistan from the west, which itself affords the only route by which a military force can advance by land towards India. Hence its conquest by the Persians, who might let in the Russians, has always been resisted by the British government, and was the occasion of a brief war in 1856.

Afghanistan is not without its remarkable monuments of antiquity, which the natives call 'topes,' an equivalent expression to our own barrows or mounds. They are most numerous in the north-eastern districts, towards Cabul and Jelalabad, and from thence to the banks of the Indus. These monuments are round towers of stone, or of brick with a stone or stucco facing, the largest of which have a circuit of about 200 feet at the base, and rise to the height of 60 feet. The favourite sites selected for them are at the skirts of hills, on elevations separated from each other by ravines. In the neighbourhood are invariably found a number of caves, varying as to extent and arrangement, but all originally lined with cement, and doubtless occupied by persons in charge of the buildings. Water is always to be found at a convenient distance, pure and flowing from the rock. Upon the topes being opened, small square chambers are met with in the interior, containing vases of copper, brass, and steatite, some of globular form, others cylindrical. In these appear ashes, coins, rings, and other relics. Sir A. Burnes considered these monuments to be the tombs of princes, either of the Bactrian kings, or of their Indo-Scythic successors, but most probably they are Buddhist memorials.

One of these, with sculptured colossal figures, occurs at Bamian, upon which no gleam of light can be thrown. The place gives its name to the principal pass across the Hindu-Kush. Here the hills on each side consist of a conglomerate, composed of indurated clay and pebbles, which renders their excavation a work of easy performance. For about eight miles, innumerable caves have been scooped out, in which the greater part of the present population dwell. A detached hill in the middle of the valley is honeycombed by them, and is called the city of Ghulghula. The deserted caves, partially choked up with accumulations of rubbish, are occasionally dug into by labourers, who find rings, coins, and other relics of their former occupants, which generally bear Cufic inscriptions, of a later date than the age of Mohammed. The mass of these cave-houses have no pretensions to architectural ornament, being only squared holes in the hills. Some of them are finished in the shape of a dome, and have a carved frieze below the point from which the cupola springs. The inhabitants, says Burnes, tell remarkable tales of the caves of Bamian; one in particular, that a mother had lost her child among them, and recovered it after the lapse of twelve years. The tale, he remarks, need not be believed, but it will convey some idea of the extent of the works. At one point, two colossal figures, a male and a female, are cut in alto-relievo on the face of a hill, with excavations around them in which half a regiment of soldiers might find quarters. The male is the larger of the two, about 120 feet high, and is somewhat mutilated. The lips are very large, the ears long and pendent, and there appears to have been a tiara on the head. The female figure is more perfect, and about half the size. There is nothing in the execution of the sculpture indicative of much advance in the arts. Neither images

nor caves are mentioned by the annalists of Alexander's expedition, who certainly passed this way. But they are noticed by the historian of Tamerlane.

The country is supposed to contain a population of at least 5,000,000, consisting of a proportion of Hindus in the east, Persians in the west, and Huzarehs—an inoffensive pastoral race, apparently of Mongol descent—in the north, in addition to the proper Afghans. The latter are strangers to the name by which they are known to foreigners, and style themselves Pushtaneh; they are divided into numerous clans or tribes, and resemble in many respects the Scottish Highlanders. But their attachment is to the community rather than to a chieftain, and forms a strong bond of union for common defensive purposes. They are proud of their race, carefully keep their genealogies, and will think lightly of the man who cannot prove at least six descents. Of fiery temper, they are capable of acting the part of fiends under strong excitement, but contrast favourably with the majority of orientals in various traits of character. They are completely indifferent to rank, treat women with respect, pay reverence to age, have in general the virtue of truthfulness, and are tolerant Mohammedans. Their features are harsh, strongly aquiline, but not unpleasing. They delight in all kinds of field-sports, especially falconry. Many are nomadic, live in tents, chiefly occupied with flocks, but the greater number are house-dwellers, following various pursuits, and supplying the ranks of the army. The Afghan language, called the Pushtu, is allied in its vocabulary both to the Sanscrit and the Persian. It has a literature of lyrics and ballads, mystical, amatory, and moral. Poems of the latter class correspond to the sayings of the Preacher in the Book of Ecclesiastes :

'Since thou art occupied in giving ear to envy and covetousness,  
Though thou shouldst the possessor of treasures become, a poor beggar art thou.'

'Safety from hell's burning flames cannot be effected by this,  
That thou shouldst gay clothes don, eat delicacies, and extol thyself.'

Afghanistan was included in the Persian Empire under Nadir Shah, but became independent on his death in 1747, when the dynasty of the Dourani princes was founded, one of whom was the exiled Shah Sujah, in whose cause a British army perished.

TURKESTAN, or INDEPENDENT TARTARY, a region of immense extent, but of little natural interest, and no political importance, is enclosed by Afghanistan and Persia on the south, and has Asiatic Russia on the north, with the Caspian Sea on the west, and the high lands of Central Asia, included in the Chinese Empire, on the east. These limits are separated by linear distances of nearly 1000 miles, and comprise an area approaching to 1,000,000 square miles. Towards the eastern and south-eastern borders, the surface is varied by spurs and offsets from the high ranges of the Thian-Shan, the Bolor-Tagh, and the Hindu-Kush, where there are watered valleys smiling with luxuriance and beauty. Apart from these limited spaces, the country consists of low, open, unwooded, and undulating plains, declining westward to the great cavity occupied by the Caspian, but chiefly north-westward to the Sea of Aral, in which direction the two principal rivers proceed. These are the Amu and the Syr, which respectively represent the *Oxus* and the *Jaxartes* of the ancients. The Amu is the largest of the interior rivers of Asia, and descends from the lofty lake Sir-i-Kol, on the table-land of Pamir, at the height of 15,600 feet. Its banks were visited by Alexander the Great, in the early summer of 329 B.C., when the snow was melting in the highlands towards its source. The channel of the river was tolerably full, the current rapid, and the water deep. Sir A. Burnes, who saw it for the first time in June, and who was in the line of the conqueror's route, describes it rolling in the grandeur of solitude, about 800 yards wide and 20 feet deep, the flow swift, and the water loaded with the soil of the uplands. The Macedonians lighted fires on some elevated ground,

that the distressed in the rear might perceive they were not far from their comrades; and sand-hillocks are still common along its course, with outer banks, which limit the extent of the inundations. No boats or rafts being procurable, nor materials for constructing them, the soldiers passed over by means of floats made of the tent skins stuffed with dry grass and reeds. The hazardous operation was safely performed in five days. Burnes made the passage in a singular manner, now common, but quite peculiar to the country. A pair of horses swam across, drawing a boat after them, to which they were yoked by a rope fastened to the hair of the mane. The description of the population of the river in remote ages, given by Arrian, correctly pictures the habits of the wandering tribes on its banks in the present day—'they exercised robbery and lived by spoil.'

Tall reeds and sedges, with patches of woodland, line both the rivers, but apart from the borders of lakes and streams, a tree is rarely met with, and the only vegetation is the thin grass common to a desert region. Wastes of loose sand continually shifting with the winds, small salt-pools, and saline marshes are characteristic of the general surface. Between the Amu and the Syr, extends the desert of Kizil-Kum, or 'red sand,' with that of Kara-Kum, or 'black sand,' northward of the latter river, each of which is several days' journey across. The climate is dry and healthy; the sky is usually clear, and of the brightest azure; but great extremes distinguish the temperature, and hurricanes of tremendous violence sweep over the plains, driving the sand or the snow along in clouds, according to the season. In summer the thermometer rises to 108° in the shade, and to 144° in the sun; in winter it sinks to from 12° to 25° below zero, and the cold is aggravated by strong blasts, and the general want of wood for fuel. The troops of Tamerlane were frozen to death on the banks of the Syr; and in 1839 a Russian expedition against Khiva was completely frustrated by the climatic rigour. Most of the camels and many of the soldiers perished, while the entire armament was lost. The inhabitants are a medley of races, Kirghis in the north, Turkomans in the west and south-west, Uzbeks in the east and south-east, all Mohammedans, with whom Persians, Arabs, Afghans, Jews, and others, are variously associated. Many lead a wandering life, rear sheep, goats, and horses, and are addicted to slave-dealing. Others are stationary, attend to agriculture, are highly commercial, and have various manufactures. The districts of Bokhara, Khiva, and Kokan form separate political divisions, without any precise limits, each under the government of an Emir or Khan, subject to no restrictions in the exercise of authority, but the influence of the Mohammedan priesthood.

*Bokhara*, a large, ancient, and celebrated city, is the head of an extensive territory on the middle course of the Amu, watered also by several streams which are absorbed in the sands, or terminate in small salt-lakes. The inhabitants, at the lowest estimate, are stated to number 70,000, which is only half the return made by some authorities. It has a circuit of more than eight miles, and is surrounded by a wall of earth, about twenty feet high, pierced by twelve gates. Few important buildings are to be seen from the exterior, but when the gates are passed, massive structures appear, colleges, mosques, bazaars, and caravansaries for the merchants of different nations frequenting the place. The city is styled the 'Treasury of Sciences,' and contains upwards of 100 large colleges, besides small schools, attended by some thousands of students from a distance. They are only open for half the year, impart no instruction except on Mohammedan dogmas, and when closed, the students add to their means of living by working in the fields. The mosques are equally numerous. A dome distinguishes the largest, of very costly appearance, being covered with enamelled tiles of an azure-blue colour. Attached to it is a lofty minaret, from which criminals are thrown. The priesthood are fiercely fanatical. They control the Khan, and probably induced him to order the execution of Colonel Stoddart and Captain Conolly, while on a political mission, on the ground of difference of religion. Dr Wolff, in 1845, sent to ascertain their fate, narrowly escaped sharing it. Bokhara is a place of immense commerce, visited by merchants from Cabul, India, China, Russia, and Turkey. Water is conveyed by a canal from the river of Samarcand, six miles distant, but it is often dried up in summer, and the inhabitants suffer greatly. They are subject to ophthalmia, and to the attacks of the guinea-worm, which inserts itself in the flesh, and causes extreme distress. *Samarcand*, 120 miles on the east, the capital of the vast empire of Tamerlane, is now insignificant, with scarcely 10,000 inhabitants. The tomb of the conqueror remains, an octagonal building paved with white marble, as well as the observatory of the astronomer Ulugh Begh. *Balkh*, on the south-east, of high

antiquity, venerated as the 'mother of cities,' consists of a small town in the midst of ruins—those of mosques, tombs, aqueducts, and dwellings—which extend over a circuit of nearly twenty miles. Under a mud wall, outside the town, lie the remains of the English travellers, Moorcroft and Guthrie. *Merve*, towards the frontier of Persia, formerly a capital of the Seljukian princes, is more completely fallen, having scarcely a single stated inhabitant.

*Khiva*, the head of a Khanate on the lower course of the Amu, is a small wretched place surrounded with an embankment of earth. The neighbourhood is well cultivated and fruitful, forming an oasis along the river. The Khans have long been notorious for slave-dealing in the unfortunates kidnapped by the roving Turkomans. But in 1854 a treaty with Russia stipulated for the abandonment of the practice, in the case of Russian subjects.

*Khokan*, the capital of a district on the Syr, is a large town on the river, with a population of 60,000, upwards of 300 mosques, many bazaars and baths, some silk and cotton manufactures, and a considerable trade in cattle. *Khojend*, lower down the stream, contains 30,000 inhabitants, and has active commerce with the Russian dominions; so has *Tashkend*, a somewhat larger place, surrounded with cotton and mulberry plantations. The Khanate borders on Chinese Tartary, in which direction the country is mountainous, contains many well-watered valleys, in which the finest fruits are produced. The vine and mulberry-tree are cultivated generally; water-melons of enormous size are raised; and sheep are extensively reared. In the opposite direction, the whole surface is a frightful sandy waste.

Turkestan, the 'land of the Turks,' may not have been the original home of the great race, but it was the locality from which they issued to make their power formidable and their name notorious. Passing westward, they came into contact with Mohammedanism, gradually embraced it, entered the service of the califs, swelled their armies, and at length compelled them to resign the temporal supremacy. The first chief who became a convert called his people Turk-imams, or Turks of the faith, to distinguish them from those who continued in heathenism, a name since corrupted into Turkomans. The first tribe conspicuous in history, the Seljukian Turks, founded an empire embracing nearly the whole of Western Asia, which broke up into minor principedoms, and paved the way for the rise of the Ottoman branch of the race to dominion.

Valley of the Yarkand.

Government House and Ochterlony Monument, Calcutta, from Chouringhee.

## CHAPTER VI.

### INDIA OR HINDUSTAN.

INDIA, in the widest acceptation of the term, denotes an immense region of Southern Asia, embracing the two peninsulas separated by the Bay of Bengal, with an enormous number of insular appendages. The easternmost of these tracts is commonly distinguished as Further India, or India beyond the Ganges, in allusion to its position relative to western nations, and is also known as the Indo-Chinese Peninsula, while its islands constitute the great Indian Archipelago. The western portion is Hither India, situated within the river-boundary named, and is often called Hindustán, the Country of the Hindus. This territory, the subject of the present chapter, is remarkable alike for its magnificent scenery and rich natural productions, its early civilisation and wonderful antiquities, as well as for its modern history. Few facts in the annals of nations are more surprising than the rapid subjection of its native empires and states, populous and once powerful, to British authority and influence, effected by a company of British traders, whose first visit to the land dates no further back than the beginning of the seventeenth century, and whose means were long limited to a handful of ships, forts, and factories. A queen reigned on the banks of the Thames when the East India Company received its charter of incorporation; but Elizabeth had gone to the grave at Westminster before her subjects themselves had imported an ounce of spice, a stick of cinnamon, or a yard of silk. Akbar the Great, greatest of all the Mogul emperors, ruled

on the banks of the Jumna; but he too had been borne to a mausoleum at Agra before his people had any dealings with the visitors from the far-away west. 'The most enlightened Englishmen,' observes Macaulay, referring to the views of distant contemporaries at the period, 'looked on India with ignorant admiration. The most enlightened natives of India were scarcely aware that England existed. Our ancestors had a dim notion of endless bazaars, swarming with buyers and sellers, and blazing with cloth of gold, with variegated silks, and with precious stones; of treasuries where diamonds were piled in heaps, and sequins in mountains; of palaces, compared with which Whitehall and Hampton Court were hovels; of armies, ten times as numerous as that which they had seen assembled at Tilbury to repel the Armada. On the other hand, it was probably not known to one of the statesmen in the Durbar of Agra that there was, near the setting sun, a great city of infidels, called London, where a woman reigned, and that she had given to an association of Frank merchants the exclusive privilege of freighting ships from her dominions for the Indian seas. That this association would one day rule all India from the ocean to the everlasting snow, would have seemed to the wisest of European or of Oriental politicians as impossible as that inhabitants of our globe should find an empire in Venus or Jupiter.'

India or Hindustán consists of an extensive section of the main mass of the continent on the north, to which both terms are restricted by the natives; and of a triangular peninsula, called from its relative position the Deccan, or the 'south,' which has the large island of Ceylon off the south-east extremity. On the south-western side are the Laccadive and Maldive Archipelagoes. The country has strongly-marked natural frontiers, formed by the lower course of the Brahmaputra and the Bay of Bengal on the east; the Sulaiman Mountains and the Arabian Sea on the west; and the range of the Himalaya on the north. Southward the opposite coasts of the peninsula converge, and meet at the same point, breasting the Indian Ocean at Cape Comorin. These limits lie between latitude  $8^{\circ}$ — $35^{\circ}$  north, and between longitude  $67^{\circ}$ — $92^{\circ}$  east. The extreme linear extent amounts to about 1900 miles from north to south, by 1500 from east to west; the coast-line measures 4000 miles; the whole external boundary is estimated at 11,260 miles; and the area, as deduced from the trigonometrical survey, contains 1,309,200 square miles. This survey, suggested by the late Duke of Wellington, and commenced shortly after the fall of Seringapatam, has recently been brought to a conclusion, and is without a parallel for extensiveness and accuracy. It has been carried on frequently under considerable physical difficulties, arising from the necessity of occupying unhealthy swamps and jungles nearly at the sea-level, and of ascending and encamping on snowy mountains of great elevation. Out of sixteen principal trigonometric stations connected with the Himalaya, fourteen were above 15,000 feet, and two exceeded 18,000. Occasionally, in consequence of clouds and storms, the surveying party had to remain pitched upon the snow for upwards of a week together. Another difficulty arose on the Pir Punjal peaks in Cashmere, where the electricity was frequently so troublesome, even when there were no storms, that it was found necessary to carry a portable lightning-conductor for the protection of the theodolite.

NORTHERN INDIA, the more strictly continental portion of the country, is comprised between the river Nerbudda on the south, and the chain of the Himalaya. It has very varied superficial features—mountain, plateau, and lowland—forest, river, and waste—each developed upon a scale of great magnitude. There are plains of the richest alluvial soil, intersected by a net-work of grand streams, refreshed seasonally with abundant rains, bathed in the intensest sunshine, and clothed with brightly-green verdure; and there are sandy or stony tracts, flats of hard-baked clay, where the mirage is often observed, and

the wild ass has its dwelling, with salt-morasses, the haunt of porcupines and vast flocks of aquatic birds.

The high mountains are on the borders, as the Himalaya, the natural boundary between India and Tibet. These are the loftiest highlands of the globe, culminating at the height of nearly five miles and a half, or 29,000 feet, above the level of the sea. A grass-covered marshy tract, followed by a belt of dry forest land above it, mark the approach to the outer edge of the elevated region. Both districts are extremely unhealthy, inhabited by countless wild animals. They skirt the Sivalik Hills, and other sub-Himalayan ranges, of moderate elevation, on which are placed the sanitarium for troops. Passing these, the

surface ascends rapidly, but the stupendous heights of the great northern barrier are eighty or ninety miles from the exterior ridge. Their aspect in the distant view is often not more magnificent than extraordinary, owing to clouds completely hiding the lower slopes from sight. Hence the peaks appear projected against the clear blue sky without a visible solid basement, either wholly silvered with snow, or partly patched and tipped, or, where the inclination is too precipitous for snow to find a resting-place, their naked pyramidal masses of gneiss and granite are exhibited. Other important highlands, but of far inferior elevation, the Sulaiman Mountains, run from north to south beyond the Indus, with the Hala range, and form the western boundary of the country from the Belocchee and Afghan territories. Their loftiest summit, Takht-i-Sulaiman, or 'Solomon's Throne,' rises to 11,000 feet. On the southern side, parallel to the river Nerbudda,

Bridge at Biram Ghati, near the Source of the Ganges.

the Vindhya Mountains form a line of separation between Northern and Southern India, but nowhere exceed the height of 6000 feet. These natural boundaries, respectively on the north, west, and south, enclose minor ridges, with the table-lands of Malwa and Rajasthan, and the vast lowland plains which stretch in a huge curve between the mouths of the Ganges and the Indus, along the course of the rivers. Of these plains, the Gangetic is a region of exuberant fertility, while that of the Indus has a very varying

character, and embraces the sterile district of the Indian desert, extending from the Punjab to the Runn of Cutch.

Among the rivers, the first place is due to the Ganges, as well from its utility as its magnitude, and from being within the limits of India from source to mouth, while the rival systems of the Brahmaputra and the Indus have a foreign origin. It chiefly traverses a north-eastern alluvial flat, stretching from the Punjab to the Bay of Bengal, on which the great water-course and its numerous tributaries, some of which exceed the Rhine in length and volume, are spread out like the intersecting veins of a leaf. Its basin is the best cultivated and most densely-peopled portion of the whole country. The river is deemed specially sacred by the natives, whose dreams of an auspicious future existence are closely connected with the consignment of their ashes to its bosom. It issues from a bed of snow in the Himalaya, at the height of 13,800 feet above the sea, and makes a very rapid descent to a low level. This is gained at Hurdwar, upwards of 1300 miles from the mouth, where the river begins to be navigable for the light passenger-boats, and for larger craft about 100 miles lower down. But the navigation is carried on with difficulty, owing to rapids and shifting shoals, to avoid which, as well as to irrigate a district which has often been scourged with drought and famine, the great Ganges Canal has been constructed. At Allahabad, 840 miles from the sea, where the stream receives the Jumna, it is about a mile across, but varies greatly in breadth and depth through the whole of its course according to the season. At about 280 miles from the coast, branches are thrown off on the right bank, several of which unite to form the Hooghly, on which Calcutta is seated, while the grand trunk passes on to link itself with the system of the Brahmaputra. The two great rivers commingle in a highly complex manner, ramify in numerous channels over an extensive area, divide it into islands by their intersection, and discharge themselves by at least twenty mouths. This deltoidal region is swampy and unhealthy, densely clothed with trees and jungle, hence called the *Sonderbunds*, or *Woods*. In these the tiger prowls, the rhinoceros roams, while the waters swarm with huge crocodiles. The Brahmaputra, 'offspring of Brahma,' has the upper part of its course in Tibet, and only forms in the lower the eastern frontier in relation to India Proper. Owing to the periodical rains, and coincident meltings of the snow in the Himalaya, both rivers are annually in flood, inundate vast tracts of country, and bring down an enormous quantity of sediment, which discolours the sea to the distance of sixty miles from the shore. It has been calculated that the Ganges annually discharges an amount of earthy matter equal in bulk to forty-two such structures as the Great Pyramid of Egypt.

The Indus traverses the north-western side of the country, and has a longer flow than the Ganges, with a less extensive basin, somewhat prominently distinguished by arid features. It rises on the northern side of the Himalaya, at the height of 18,000 feet, proceeds at first to the north-west, but breaking through the mountains, inverts its course to the south-west, receives the waters of the Punjab, or 'five rivers,' collected into a single channel, and descends to the Arabian Sea through several mouths. The river has a lengthened navigation, but, owing to its inconstancy and general want of depth, its navigable value is far inferior to that of streams of scarcely half the magnitude. The lower course is invested with interest from having been traversed more than 2000 years ago by the hastily-constructed galleys of Alexander. Upon his fleet gaining the delta, great dangers were experienced from the violence of the waters. The monsoon blew from the sea, and drove up its billows against the impetuous current of the river, producing an angry swell, while the rapid flow and ebb of the tide astonished and alarmed the Macedonians, whose maritime experience had been solely acquired from the Mediterranean,

where tidal influence is scarcely perceptible. Into the modern as into the ancient Indus the flood-tide rushes with impetuosity, and forms a *bore*, owing to the confined space. The water rises in a ridge of several feet, which is swept along with great violence, endangering craft on the surface, and inundating the low grounds on the margin. The ebb takes place as suddenly; and thus vast tracts are rapidly converted into navigable expanses and flats of mud. Quintus Curtius states, that the fields skirting the stream were overflowed, and only 'tops of knolls' were seen on either hand, like 'little islands.' This is exactly the appearance now presented by the mangrove patches on the banks at high-water. Parallel with the river on the eastern side, and diverging from it hundreds of miles, is the Indian Desert, which embraces upwards of 150,000 square miles. It is not entirely sterile, but contains at intervals tracts of cultivable land; and the sandy portions are generally overgrown with coarse grass and jungle shrubs after the rains. But this vegetation perishes completely in the hot months, and the true desert aspect is exhibited. Southward lies the Runn of Cutch, a remarkable flat district bordering the Gulf of Cutch, arid through the greater part of the year, without weeds or grass, sustaining only a few tamarisks. But during the monsoon, when the sea runs high, its waters are driven over it, leaving shallow salt-lakes behind; and the general surface receives a saline incrustation from the subsequent evaporation.

SOUTHERN INDIA, the peninsular portion of the country, consists of an immense central plateau, broken by river-valleys into a series of table-lands, which range in elevation from 2000 to 3000 feet. They advance in height from north to south, and have a gradual slope from west to east, in which direction the important rivers have their course. Between this high country and the sea are lowland tracts, commonly distinguished as the coast of Coromandel on the eastern side, and the Malabar coast on the western. The plateau has chains of mountains on its edges, called the Eastern and Western Ghauts, which run parallel to the shores, and converge southerly in the wild tract of the Neilgherries, or Blue Mountains. This district contains the highest point of the peninsula, the peak of Dodabetta, which rises to 8760 feet, and is the seat of the principal sanitarium owing to the temperate climate. Further south, the highland region is broken by the sharply-defined valley or gap of Palghat, beyond which hilly ridges rise again, clothed with woods, and are continuous to Cape Comorin. The word *ghaut*, 'gate,' is of Sanserit origin, and refers to the terrace-like passes by which the ranges are crossed. The upland country is denoted by the phrase, *Bala-ghaut*, 'above the passes,' and the maritime lowlands by *Payan-ghaut*, 'below the passes.' The Western Ghauts form a lofty and persistent chain, through which no streams of the slightest consequence find their way from the central region to the sea. They present a very steep face towards the ocean, press closely to its border at various points, and contribute to give a bold character to the coast-line, which has many convenient harbours. The Eastern Ghauts are lower, and are much less continuous, offering channels through which nearly all the drainage of the interior is poured. They are also at a much greater distance from the shore, which is uniformly low and without harbours, exposed to the roll of a violent and dangerous surf. The Godavery (Godávári), the largest river, has a course of rather more than 850 miles. It rises on the inland face of the Western Ghauts, and passes to the Eastern, flowing through them with such a gentle descent that the navigation is not interrupted, either up or down. The Kistna and the Kaveri are next in importance, following the same general direction. The Nerbudda, on the north border of the peninsula, is the largest westward-bound stream, entering the Gulf of Cambay after a course of 800 miles. Neither Northern nor Southern India have any extensive lakes, and the number of small size is few compared with the magnitude of the area. This is the chief exception

to the oft-repeated remark, that the country may be regarded as 'an epitome of the whole earth.'

The valleys and mountain-slopes are profusely adorned with splendid vegetation, varying from tropical to alpine forms according to the elevation, and combining all the materials requisite for utility, beauty, and luxury. The cocoa-nut palm, the palmyra palm, the betel palm, and other varieties of the tribe, with shady mango topes, tall bamboos, jungle grasses, tree-ferns, arborescent flowering-plants, and the members of the fig family, which include the banyan-tree, are eminently characteristic of the flora at the lower levels, where heat and humidity combine their influence. Timber of the highest value is supplied by the teak, sandal-wood, satin-wood, ebony, and sappan trees; and in the belt of forest which skirts the southern base of the Himalaya remarkably handsome forms appear. The eye marks with delight 'the exquisitely-cut foliage of the acacias and moringa, the gracefully-drooping clumps of bamboo, the *saul* with its tall erect trunk and brilliant dark-green leaves, the *semal* with its deep red cup-shaped flower and curiously-butressed stem, and the *huldoos* with its magnificently-drooping branches spreading from the summit of its huge columnar trunk, while from the limbs of these lords of the forest trail gigantic climbers.' The greatest botanical variety is of course seen in the grand mountain-region, owing to the different climates met with ascendingly. It is not, however, so strikingly exhibited on the exterior face of the highlands as in the interior, where the valleys are watered, deep, and warm. Here a tropical flora is carried up to intermingle with the temperate forms of vegetable life, and a strangely-contrasted picture is produced by the admixture of palms with pines, orchids with oaks or maples, and bamboos with ivy. From the height of 5000 to 8000 feet, oaks and rhododendrons compose the main mass of the forest—the latter, not shrubs, as with us, but trees of considerable size bearing their splendid purple flowers. In association with them are the cypress, ash, birch, elm, holly, hornbeam, alder, and several laurels. Still higher, up to 11,500 feet, most of the preceding occur, but other objects are more prominent, as pines, yew, horse-chestnut, walnut, several maples, hazel, and the magnificent deodar. At a greater elevation, a few trees struggle for existence in a stunted condition, and with a deformed aspect. Shrubs go up to 15,200 feet, with herbaceous plants to a loftier altitude, till all vegetable life ceases, and the eternal snow and azure sky alone are present.

The objects of cultivation to supply the daily wants of the natives, and meet the demands of commerce, illustrate by their diversity the bounty of nature in supplying vast tracts of deep black vegetable soil, with the other conditions of seasonal rains and a high temperature to render it prolific. They include rice, the staple food, with other cereals; the sugar-cane, cotton plant, mulberry-tree for the silkworm, poppy for opium, tobacco, indigo, coffee, and cinnamon; various medicinal shrubs, and flowering-plants for perfumes; with an immense variety of fruits, among which the pine-apple, custard-apple, pomegranate, plantain, guava, melon, mango, banana, and cocoa-nut are the most common. Several of these are known ancient products of Indian agriculture. The Greeks of Alexander's expedition noticed that garments of fine cotton were ordinarily worn by the great men of the country, either wrapped round the shoulders, or enveloping the head as turbans. The general food, pillaus made of rice, attracted attention, as well as the mode of planting the rice in water, with the distillation of a strong spirit from it, the arrack of the natives. They remarked also the sugar, calling it honey, made from canes, without the assistance of bees. We have the word 'sugar' from its Sanscrit name *sukkhar*, as also 'sugar-candy' from *sukkhar kund*. In our own time the objects of culture have been increased by the growth of tea on the southern face of the Himalaya, with a success which has changed the aspect of entire districts, and is likely to convert a belt of country

along the whole range into a large tea-plantation. The plant there occurs in the wild state, and was noticed in Nepal as far back as the year 1816, but was pronounced by some to be a camellia. It is probably the parent stock of all the varieties raised in the old tea-producing districts, China and Japan, since the wild shrub is not known in either of those countries. More recently, the Peruvian bark trees have been introduced, in order to secure a supply of quinine independent of South America, where the woods are in danger of being totally destroyed by the ruthless habits of the natives. The plantations, on the Neilgherry Hills, succeed perfectly; and the bark thus artificially grown is found to contain precisely the same alkaloids as the natural produce on the slopes of the Andes.

The fauna, like the flora, is distinguished by a great number of species, and the profusion of individuals. It includes also a remarkable proportion of animals of large size, and of the dangerous class. The elephant roams wild, but is very generally domesticated, carrying rajahs on state occasions, and obediently drudging in the service of the humblest menials. The rhinoceros is found in the secluded forests of Bengal; the lion occurs chiefly in the north-western provinces, Rajpootana and Guzerat; the tiger is general, from the jungles of the lowest levels up to the region of the snows and glaciers. Leopards, panthers, bears, hyenas, wolves, lynxes, and jackals are the more ordinary beasts of prey. The wild ass, shy and fleet, inhabits the great sandy desert, with varieties of antelopes; and the camel is there the usual beast of burden, an office which the ox performs elsewhere. Monkeys abound everywhere, being held in religious respect by the natives, a distinction enjoyed also by the buffalo, wild and tame. The goat of Cashmere, a variety of the common species, but chiefly in the adjoining highlands, is renowned for its very long, fine, and silky hair, of which the high-priced shawls are made. Reptiles comprise the poisonous cobra da capello, or black-hooded snake, the formidable python in the woods, and the gavial, or Gangetic crocodile. The birds, many of which are noted for splendid plumage or curious habits, are extremely numerous. The argala, commonly called the adjutant, is one of the most useful, and enjoys protection as a scavenger, visiting the towns on the look-out for offal, in the absence of snakes and lizards; this bird, a kind of heron, with very long legs, is full five feet high; and stands like a sentinel on the watch for prey, furnished with an enormous bill and a voracious appetite, quite competent to make a mouthful of a stray cat or a leg of mutton, if the chance is afforded. Insect life is intensely developed as a consequence of the profuse vegetation, and includes myriads of the annoying or destructive class, such as locusts, white ants, and mosquitoes; the butterflies display the most gorgeous colours and forms.

From the earliest historic date India has been renowned for its mineral wealth, but entirely in relation to the possession of gold and gems. The precious metal occurs in a state of minute diffusion in many alluvial soils and in the sands of many rivers; and some richly-auriferous reefs of quartz rock are known. Precious stones of great beauty and variety are also occasionally found, as diamonds, rubies, amethysts, chrysolites, the topaz, beryl, and many others. But these valuables, while they excited the cupidity of orientals and westerns, in ancient and modern times, are of inferior importance as regards public prosperity in comparison with homelier products, the useful metals and coal. Both iron and copper ores appear to be abundant along the base of the Himalaya. Iron of the finest quality is widely diffused, as well as lead. Rock-salt is plentiful in the Punjab. Coal is obtained in seven different localities, but the only field of importance at present known is the Burdwan, in the lower part of the valley of the Ganges. No field has yet been discovered in the North-West Provinces, or in Oude, the Punjab, or the Presidencies of Bombay and Madras, where it will be prudential to conserve the forests in the absence of native fossil fuel. But it is

not unlikely that the geological survey of the country, now in progress, will develop within its limits a coal-producing power in some degree commensurate with its area, and adequate to the supply of its wants. The annual consumption at present, chiefly in manufactures and by vessels leaving the ports, may be estimated at 800,000 tons, towards which India contributes rather more than one-half, and the remainder is sent out from England.

The climate generally is distinguished by three well-marked seasons, the cool, the hot, and the rainy, which divide the year. The cool season extends from October till towards the close of February; the dry hot season follows, and continues till the beginning of June; the great rainy season succeeds, and lasts with occasional intermissions till October. But during the cool period the heat is still great by day, though slight frosts occur in the elevated districts for an hour or two before sunrise, and a thin ice is formed. The greatest heat prevails on the lowlands of the Coromandel and Malabar coasts, and through the north-western sandy region. At Bombay the mean annual temperature is  $84^{\circ}$ ; at Madras,  $83^{\circ}$ ; at Calcutta,  $79^{\circ}$ ; and at Delhi,  $72^{\circ}$ . The monsoon winds are the peculiar features of the climate, but are common to the neighbouring regions from Africa to the Malay peninsula. They blow periodically from the south-west and north-east, maintain the same direction for nearly half the year, and regularly succeed each other. The south-west monsoon commences about the middle of April, but later from south to north, and continues till September. It brings on the great rainy season to the Malabar coast and the Gangetic plain, owing to the masses of vapour blown up from the ocean being arrested by the Western Ghauts and the Himalaya Mountains. The showers descend in deluges, and commence with violent thunder-storms. The north-east monsoon follows with less decided features, and brings a rainy season to the Coromandel coast, usually lasting about two months. At different stations the rain-fall varies greatly in its amount. In the valley of the Ganges it does not differ much from that of Great Britain, being 64 inches annually at Calcutta, 41 at Benares, 27 at Allahabad, 20 at Delhi, and 32 inches at Meerut. But the quantity in other situations is enormous, amounting at Darjeeling, among the sub-Himalayas, to 122 inches, and at Mahabaleshwar, a sanitarium connected with Bombay, to 250 inches. Among the Cossya Hills, in the valley of the Brahmaputra, but beyond the bounds of India Proper, the annual fall is ascertained to be 610 inches, equal to fifty feet!

The political divisions of this great region, though extremely numerous and complex, may be arranged in five main sections: 1. The British Territory under the direct government of the Crown; 2. Protected or Tributary States, which have native rulers, but are entirely subject to British control; 3. Independent States; 4. French and Portuguese Possessions; 5. The island of Ceylon, a separate colony of Great Britain. The territory subject to direct British rule embraces considerably more than half the entire area of the country. It is distributed into the three Presidencies of Bengal, Bombay, and Madras, each of which is under a governor appointed by the Crown, whose supreme representative is the governor of Bengal, with the style of Viceroy. Each presidency has a certain number of the Protected States attached to it for purposes of superintendence; and hence the first and second of the sections may be merged in one grand division, constituting BRITISH INDIA, which comprehends the whole region from Cape Comorin to the cyclopean walls of the Himalaya, with the exception of the comparatively insignificant tracts which are independent, or held by the French and Portuguese.

The modern history of India commences with the Mohammedan conquest under Mahmoud of Ghizni in 1001, who permanently established the profession of that faith in the country. After the extinction of his dynasty three Mongol invasions occurred, followed by the inroad of Timur in 1397. Baber, the fifth in descent from him, appeared as an invader in 1525, established himself upon the throne of Delhi, and founded

the empire of the Great Moguls. It attained great power and splendour under a few vigorous sovereigns, to whom succeeded princes who abandoned themselves to a life of indolence and luxury in their palaces. Meanwhile, western commercialists, Portuguese and Dutch, made their appearance in the land, and the English, represented by the East India Company, who founded their first settlement at Madras in 1639. This body, powerful as it afterwards became, held its first meetings in the room of an obscure inn, opposite to Bishopgate Church, London. In the early stages of its history, while proprietors at home amassed wealth, their agents abroad were confined to the precincts of a factory or fort, where they were viewed as pedlers trading on sufferance, obliged to approach the native princes with lowly salaams. But circumstances rapidly changed after the middle of the last century, when Lord Clive drew the sword in the service of the merchants, followed by Coote, Cornwallis, and others. Showers of prize-money from the sack of treasuries ensued upon conquest; vast sums were obtained in the shape of indemnifications; an untold amount of 'barbaric pearl and gold' was accepted from frightened rajahs as the price of amicable relations; and at length the original foreign tenants of a few acres became lords of the soil over more than 1,000,000 of square miles. Grievous wrongs were unquestionably committed, and with little scruple too by the corporate body. The British government, in 1773, identified itself with the Company, and appointed the first governor-general, Warren Hastings. In 1833 its commercial monopoly terminated, and the trade to India was thrown open. In 1857-1858 the Indian mutiny, a rebellion of the native troops, occurred, upon the suppression of which the political existence of the Company terminated, by the administration of affairs being transferred to the Queen, now practically Empress of Hindustan.

I. PRESIDENCY OF BENGAL AND ITS DEPENDENCIES.

The Bengal Presidency, with the dependent states attached to it, embraces nearly the whole northern and central region of the country. The following are the main divisions :

|                        | General Divisions.                           | Cities and Towns.                            |
|------------------------|--|--|
| Presidency Proper.     | The Lower Provinces, . . . .                 | Calcutta, Serampore, Murshedabad, Patna.     |
| " "                    | The North-West Provinces, . . . .            | Agra, Cawnpore, Allahabad, Benares, Delhi.   |
| " "                    | Oude, . . . . .                              | Lucknow, Fyzabad, Oude.                      |
| " "                    | The Punjab, . . . . .                        | Lahore, Umritsir, Mooltan, Peshawur, Attock. |
| " "                    | Nagpur, or Berar, . . . . .                  | Nagpur, Chanda.                              |
| Attached Dependencies. | Hydrabad Territory, . . . . .                | Hydrabad, Secunderabad, Aurungabad.          |

THE LOWER PROVINCES are so called from being situated on the lower course of the Ganges. They consist of Bengal Proper, which embraces the delta of the river, and of the district of Behar, higher up the stream. A large portion of Orissa is also included, extending southward along the coast to the Chilka Lake, a shallow expanse separated from the sea by low ridges of sand, which forms the northern border of the Madras presidency. Noble water-courses intersect Bengal. The most commercially important, the Hooghly, is formed by the junction of two arms of the Ganges, and is ascended to Calcutta by the finest merchantmen in the world. During the south-west monsoon, it remarkably displays the phenomenon known as the Bore, caused by the impetuosity with which the tidal wave enters the estuary. Upon reaching the more confined part of the channel, the water accumulates in a ridge from five to eight feet in height, and the liquid wall rushes up violently at the rate of twenty miles an hour. Ships often part their cables. Small-craft make for the deep centre of the stream, where the wave does not curl and break over. Both in the dry and in the rainy season the banks of all the rivers are richly verdant, displaying the gracefully drooping bamboo, and the magnolia with its flowers, while the babool fills the air with its fragrant perfume. The luxuriant foliage of a tree, and the welcome shade it offered to a travelling party of commercialists, led to the

establishment of a factory at the spot, which has now grown up into Calcutta. Periodically, towards the close of July, the rivers are in flood, and more or less overflow. A vast portion of the delta of the Ganges is then a sheet of water, interspersed with villages and trees, among which are craft of every description. Rice is the product most extensively cultivated, but large quantities of sugar, cotton, indigo, tobacco, and opium are raised. The more maritime portion of the Orissa province is low and sterile. Hills rise in the interior covered with dense bamboo and other jungle, inhabited by the wild tribes of the Khonds, among whom, after the abominable rite of Suttee had been suppressed, and Thuggism hunted down, the practice of infanticide and of human sacrifice was found to exist. The discovery of these crimes was made in the year 1836. Owing to a silly

View from the summit of Pierre-pahar, near Monghyr, looking towards Jumalpoore.

superstition, every female infant was stifled at birth, and women were imported from abroad. It was quite common, with the view of securing a favourable crop and averting calamity, to obtain a victim by kidnapping, an adult being preferred, and propitiate the earth-god by a public barbarous immolation. All the energy of the British government was at once exerted to put an end to these horrors. No less than 1506 victims had been rescued by the year 1854, when it was believed that the abolition of the frightful practice had been secured.

*Calcutta*, the capital of Bengal and of British India, is situated on the east bank of the Hooghly, about 100 miles from the sea, in latitude  $22^{\circ} 35'$  north, longitude  $88^{\circ} 30'$  east, and is supposed to contain nearly 500,000 inhabitants, chiefly Hindus, but with a considerable number of other Asiatics and Europeans. The river, about half a mile broad, has well-wooded banks on both sides, which shut out the view of the city on ascending the stream, till the steamer approaches its anchorage, when the prospect is magnificent. Fort William is seen on the margin, constructed by Lord Clive, capable of containing a garrison of 15,000, with 619

guns and 80,000 stand of arms. Northward, beyond the esplanade, is the Government House, a splendid pile. Eastward, is the quarter occupied by European and native merchants, with its Wellesley Street and Hastings Place, lined with stately residences, worthy of the title of the 'City of Palaces.' But a far larger portion, forming the native or 'black town,' is repulsive from its filth and noise. The public institutions are numerous, and the commerce immense. Ice and pale ale figure largely among the imports. The ice arrives in large blocks from America. Yachting, horse-racing, wild-boar hunting, antelope coursing with the cheetah or hunting leopard, and bustard shooting are the amusements of the Europeans. On the opposite side of the river, the suburb of Howrah is rapidly becoming a large town. It contains the Custom House, through which merchandise of the value of £20,000,000 passes annually; and also the East Indian Railway Station, a line nearly open throughout to Delhi, a distance of 900 miles. The name of Calcutta is compounded of *Kali*, that of a goddess, and *cuttah*, 'a temple,' once at the spot. The first English factory was established at the site in the year 1690, by permission of the reigning Mogul emperor Aurungzebe. In 1756 it was taken by Suraja Dowla, a Bengal prince, who caused 146 of its defenders to be confined in a small close dungeon, which acquired the name of the Black Hole, for only twenty-three survived till the morning. *Serampore*, a short distance higher up the river, on the west bank, is a small beautiful town with a well-known name, as a mission station of the Baptists, from which many translations of the Scriptures into the languages of India have issued. It was a possession of the Danes down to the year 1845, when it was purchased from them for £120,000. *Barrackpore*, opposite, with a military cantonment, is the country-seat of the viceroy. The park, which offers a pleasant display of turf, tree, and flowering shrub, contains the remains of Lady Canning, interred there by her own request. *Plassy*, eighty miles north of Calcutta, a small place, is memorable as the scene of Clive's decisive victory in 1757, which established British supremacy in Bengal. *Murshedabad*, further north, a large but unhealthy native town, contains 147,000 inhabitants, who produce silks, carpets, and embroidery. *Monghyr*, the capital of a district of the same name, with a population of 800,000, carries on extensive manufactures of firearms and hardware of an inferior quality. *Dacca*, on a branch of the Brahmaputra, has a reduced population of 60,000, and is rapidly becoming a heap of ruins. It was formerly the principal seat of the native muslin manufacture, and of light cotton fabrics, industries still carried on by a race of patient weavers.

The East Indian Railway, which runs up the valley of the Ganges, with its continuations in the Punjab, will have a total length of 1364 miles. A short branch from the grand trunk in the Bengal division runs from Burdwan to the most important of the coal-fields at Ranigunje, and brings down its produce to Calcutta, distant 121 miles. The whole of this district formerly swarmed with bears, which have been largely driven away by the cutting down of the jungle. There are about thirty collieries, with as many steam-engines at work. Men and women belonging to a tribe native to the locality are chiefly employed. The pits descend to the depth of 134 feet, and pass under the bed of the river Damuda, which joins the estuary of the Hooghly. The coal-bearing strata consists of beds of coal and iron ore, with limestone suitable for flux, and hard sandstone for building purposes. The field is supposed to extend over an area of 500 square miles.

*Patna*, the chief town in the province of Bahar, is an immense assemblage of mud huts, with 280,000 inhabitants, on the south bank of the Ganges, a great emporium of the trade in rice, opium, indigo, saltpetre, sugar, and other products. *Gaya*, a town on the south, is a noted place of pilgrimage on account of its connection with Siddhartha, known in Indian history as Buddha, the founder of the Buddhist religion, either as his birthplace, or the scene of his ascetic life. Modern inquirers deem his existence as certain as that of Confucius or Socrates, and agree in fixing his death about 543 B.C. *Juggernaut*, a town on the coast of Orissa, is another great place of pilgrimage, on account of the temple of Vishnu, one of the objects of Hindu idolatry, at the spot.

THE NORTH-WEST PROVINCES extend along the middle and upper course of the Ganges, include the country between it and its affluent the Jumna, called the Do-ab, or 'two rivers,' and embrace also some high grounds towards the Himalayan border. They consist, from south to north, of the districts of Benares, Allahabad, Agra, Delhi, Meerut, and Rohilcund, which form a lieutenant-governorship. Through the whole of this region the soil is much less damp than in Bengal, and there are large tracts of sandy surface in the northern portion, while the two rivers are of little avail for irrigation, owing to the depth of their channels. Hence any deficiency in the seasonal rains is a calamity to the crops, and occasionally the people have severely felt the scourge of famine. The Mogul emperors caused canals to be constructed to promote the water supply, but their works were inadequate at the best, and speedily became unserviceable from neglect. The same object, with more convenient navigation also in view than that afforded by the fluctuating streams, is now contemplated by the great Ganges Canal, opened in 1854, but not completed. This stupendous undertaking commences at Hurdwar, near the issue of the

river from the mountains, extends through the country on the right bank, and has numerous branches, one of which returns to the channel again at Cawnpore, while another communicates with the Jumna. The total length measures 810 miles, of which 350 miles belong to the grand trunk, and 460 miles to the offsets. In the upper part of its course, the canal is carried over the river Solani by one of the most magnificent aqueducts in the world, consisting of an earthen embankment about three miles long, protected throughout with walls of masonry, and of a bridge of fifteen arches, each of fifty feet span. Owing to the general aridity of the surface, it becomes parched, brown, and grassless in the dry months, while Bengal remains green as an emerald. The temperature

Benares.

forms another point of difference. It takes a wider range, being intolerably high during the hot winds of May and June, while sharp night-frosts occur in January, though the thermometer may mark great heat at midday. But in the appearance of the cities, the North-West Provinces have the decided advantage. They are largely built of stone, while those of Bengal are masses of soft brick and plaster, to which the heavy periodical rains speedily give an unsightly or ruinous aspect. Bright, gay colours are also worn by the inhabitants, which are more picturesque than the unvarying white clothing of the Bengali. To the vegetation of these districts the tallow-tree of China has of late years been extensively added. It grows equally well in sandy soils, on the rich mould of canals, on

low alluvial plains, and on the acclivities of mountains. From its seeds tallow and oil are procured; the leaves yield a black dye; the wood is hard and durable; and the culture is likely to be commercially worthy of attention.

*Benares*, a fine, large, and remarkable city, containing 186,000 inhabitants, is seated on the left or north bank of the Ganges, and occupies it for nearly three miles. The river makes a picturesque bend at the site, which gives a crescent shape to the mass of houses and temples grouped on the border. A bridge of boats crosses the channel. Such are the fluctuations of the stream, at different times of the year, that it ranges from 1400 to 3000 feet in breadth, and from 35 to 78 feet in depth. The city side is lined with ghâts, buildings erected to give bathers convenient access to the water, which are almost peculiar to the rivers of Northern India, and are specially distinctive of the sacred Ganges. They consist of several flights of steps, surmounted at the top by a roofed structure for protection from the rays of the sun, which serves as a lounging-place, and has commonly one or more little temples attached to it. 'Upon these ghâts are passed the busiest and happiest hours of a Hindu's day. Escaping from the narrow unwholesome streets, it is a luxury for him to sit upon the open steps, and taste the fresh air of the river; so that on the ghâts are concentrated the pastimes of the idler, the duties of the devout, and the necessary intercourse of business.' Many have been erected by rajahs and powerful natives as a meritorious act, and with the view also of being brought themselves in old age or sickness to expire by the side of the heaven-sprung stream.

From the water's edge the ground on which the city is built rises gradually, and is crowned at the summit by the great mosque built by the Emperor Aurungzebe, on the site of a former temple of Vishnu. The whole number of mosques is 333. Still, Benares is not Mohammedan but Hindu, and the head-quarters of Hinduism, possessing 1000 temples, large and small. It is visited, as one of the holiest places in the world, by crowds of pilgrims, many of whom are rich and aged, and who come on purpose to die within its precincts. Beggars and priests swarm, who subsist upon their offerings. Huge Brahman bulls are its other inhabitants, protected and revered as sacred animals. They freely roam the streets and bazaars, take what they like from the

Simla.

vegetable stalls, but whom they choose, and are certain of expiring only of old age, unless kidnapped by some unscrupulous Mohammedan butcher to be turned into beef for the English. These are the peculiar features of the place. It is the seat of extensive general industry, and has numerous bankers and diamond dealers. Many of this class, who have risen to great wealth, commenced life as money-changers of the humblest grade, sitting cross-legged upon old rugs in the bazaars, with piles of copper coins before them, and rupees upon their persons. This is borrowed capital generally in the first instance, upon the exchange of which for gold or notes a small commission is charged. There are two great colleges in which natives are instructed, one connected with the British government, and the other administered by the Church Missionary Society. This last is called Jay Narain's, from a rich Hindu, who inclined to Christianity, but was never baptised, and founded the institution in 1818 for the benefit of his countrymen. Benares, like all the other Anglo-Indian towns, consists of the city proper, occupied by the natives, and the station in which the English are settled. The two parts are quite distinct, and generally but at a short distance, though sometimes it amounts to two or three miles. Each station, if upon a large scale, is divided into *civil lines*, where the commissioner, judge, magistrate, with other officials reside; and into *cantonments*, furnished with barracks for the troops, hospitals, magazines, parade-grounds, and rows of white bungalows or houses for the officers, enclosed with gardens. During the great Indian mutiny most of the outbreaks commenced in the cantonments. *Mirzapur*, twenty-seven miles above Benares, on the opposite bank of the river, contains about 80,000 inhabitants, and is a great mart for cotton, and a place of extensive general commerce.

*Allahabad*, 'God's house,' at the confluence of the Jumna with the Ganges, another of the sacred cities of the Hindus, is resorted to annually by a host of pilgrims, as one of the *prayagas*, or holy junctions. It is a great military *dépôt*, and contains a population of 72,000. *Cawnpore*, 140 miles further up the great river, has about the same number of inhabitants, but including the cantonments, with which a large native town is associated, 108,000. The Ganges here varies, according to the season, from 500 yards to more than a mile in breadth. Though at an inconsiderable elevation above the sea, water exposed at night in shallow vessels freezes in winter, and a large quantity of ice is collected for use in the hot season. Cawnpore will be ever memorable in Anglo-Indian history as the place where Nana Sahib, after the murder of his English captives, consummated his treachery by the massacre of the women and children, when he heard of Havelock's advance from Allahabad.

*Bareilly*, the chief town of the old province of Rohileund, now divided into three districts, is an important site of manufactures, with more than 100,000 inhabitants, producing hardwares, carpets, cabinet-work, and embroidery. The province lies eastward of the Ganges, and embraces a sub-Himalayan region within its limits. It is bordered by the territory of Kumaon, the greater part of which is a mass of mountains and forests, where upwards of thirty peaks rise to heights varying from 18,000 to 26,000 feet. But the lower slopes have been covered in our own time with the leaves and silver blossoms of the tea-shrub, and only roads are wanted as an outlet for the produce to enable the growers to compete successfully with others in the markets of the world, their tea being of the finest quality. A district westward contains the small town and station of *Simla*, 7866 feet above the sea, with a delightfully temperate and invigorating climate, the favourite temporary residence for many years of the governors-general, and likely to become their permanent home. The place is not far from the south bank of the Sutlej, 170 miles north-east of Delhi, and 900 miles in a direct line from Calcutta.

*Agra*, on the west bank of the Jumna, is the seat of the lieutenant-governor, 783 miles above Calcutta, and 139 miles below Delhi. It is built of the red sandstone of the neighbouring hills, has a clean appearance, and contained previous to the mutiny a population of 70,000. As the early capital of the Mogul emperors, it retains several monuments of their magnificence, with ruins which extend far beyond the limits of the present city. Within the walls of the fortress, built by Akbar, now the British Residency, are the palace and audience-hall of Shah Jehan, and the Pearl Mosque, so called from its great beauty. Immediately without the city, on the bank of the Jumna, is the Taj-Mahal, a mausoleum which the emperor last named erected for himself and his favourite wife. This is one of the most splendid specimens of Mohammedan architecture extant. Tavernier, the traveller, who saw the work while in progress, states that 20,000 men were employed upon it for twenty-two years. The building is constructed or overlaid, outside and in, with white marble; and the sepulchral apartment is adorned with mosaic work of precious stones, especially of lapis-lazuli. The fort of Agra, more than a mile in circuit, accommodated thousands of refugees during the late rebellion, besides the usual European residents, who held it through the whole struggle, while the city itself was in the hands of the mutineers, and was sacked by them.

*Delhi*, the Mogul capital after Agra, stands on the right bank of the Jumna, in a sandy district studded with many remains of a more extensive city, the precursor of the present, which was chiefly built by Shah Jehan, subsequent to the year 1631. It remained the residence of his feeble descendants, as the titular sovereigns, pensioned by the British, down to the time of the late revolt. Upon its suppression, the representative of the Great Moguls was transported beyond seas as a felon, for his share in the mutiny and massacre. The city, after being for several months in the hands of the insurgents, was taken by storm in September 1857. It is surrounded by walls, contains the imperial palace, close to the river, now shattered, with many mosques, among which the Jumna Masjid, a royal foundation, is conspicuous. The population numbered 160,000 prior to the disturbances, engaged with the production of cotton cloths, shawls, jewellery, and other manufactures. In the vicinity a handsome Saracenic structure marks the grave of Humayun, the

second of the Mogul emperors, and father of the celebrated Akbar. A graceful circular tower, the work of an unknown designer, called the *Cuttub Minar*, rising to the height of 265 feet, is also a prominent object.

*Meerut*, 32 miles north-east of Delhi, is a chief military station, and the head of a district, with 29,000 inhabitants. It was considered one of the most agreeable and cheerful residences in India, when an unhappy notoriety was acquired. At this place, after a few premonitory symptoms of rebellion in other quarters, the first terrible outbreak occurred, on the 10th of May 1857, when the native troops shot their officers, and the station was surrendered to bloodshed and desolation. *Hardwar*, close to the emergence of the Ganges from the mountains, on the right or west bank of the river, is deemed from its position one of the most sacred sites on the stream, and changes its aspect remarkably by an annual influx of visitors under the twofold influence of religion and trade. At the end of March and the beginning of April a great fair is held; and this being accounted the season most proper for ablutions, there is a prodigious gathering of pilgrims, merchants, pedlars, and beggars from a wide area of Asia. The ordinary attendance averages from 200,000 to 300,000. But every twelfth year, when a particular festival is held, the number is said to mount up to 2,000,000. The merchandise collected is of the most varied description, embracing the products of European and Asiatic industry; and a vast number of animals are brought both for sale and exhibition.

*Cawnpore*, a district of the Doab, occupying its entire breadth, touching at once on the Ganges at the city of the same name and the Jumna at *Culpee*. Besides these two mighty rivers and their tributaries, it is traversed by the Ganges Canal for about sixty miles, through alluvial plains of great fertility, where the vine is cultivated and the indigo grows wild. The city is on the right bank of the Ganges, about 140 miles above Allahabad, with a population of about 50,000 in the city, and a similar number connected with the cantonments; the whole population of the district is estimated at a million.

Bridge between the Palace and Selimghur, Delhi.

Chandy Chouk or Bazaar, Lucknow.

ODE, a territory included between the middle course of the Ganges and the high mountain region of Nepaul, is well watered with affluents of the river derived from the highland border. It smiles with refreshing verdure in every season through the greater part of its extent like Bengal, and forms one of the gardens of India. Though not without brown and dreary tracts, yet day after day the traveller may pass through park-like scenery, and repose in the shade afforded by the wide-spreading branches of mango-trees, screened from the burning sun. This fine district was a province of the Mogul empire, long under the government of lieutenants with the title of Subahdar, then with the style of Nawab Wuzeer, with which we are familiar in the slightly-altered form of Nabob, formerly applied to all Englishmen who returned from India with long full purses and sallow complexions. The lieutenants assumed the name and state of kings, abandoned themselves to misrule, selfish luxury, and outrageous licentiousness, became dependents on British influence, till the last was deposed by the Marquis Dalhousie in 1847, and his country absorbed in British India.

*Lucknow*, the capital, 53 miles north-east of Cawnpore, is situated on the Gumti, an affluent of the Ganges, surrounded by a belt of fine wood-land country, and contains a population of 300,000. The city is spread over an immense space of ground, and is as purely Mohammedan in its aspect as Benares is Hindu. No pagoda-shaped spires meet the eye in the distant view, but minarets, domes, and other outward

expressions of Islam. It is remarkable for the size of its palaces, which are of a light and elegant, but fantastic style of architecture, and of extremely showy appearance. Each sovereign seems to have shared the absurd passion common to oriental potentates of perpetuating his name by some building larger and costlier than any precursor. The Kaiserbagh, erected by the last king, is an enormous mass of stucco, longer than the palace of Versailles, and consists of many courts, with gardens, basins, fountains, water-courses, now dry, silent, and useless. 'Let us mount some good height,' says a visitor, 'and look down upon Lucknow, which has been created by the Nawábs and kings. It is of immense size, as large as Paris, and also, like Paris, of fairy-like beauty, spreading itself out mainly on the right bank of the Gunti, but with a few striking buildings on the left. From the midst of a mass of green trees of glorious foliage, rise domes, towers, and minarets; some white, some golden, some painted in many colours, gleaming in the setting sun, and displaying a light vision of oriental splendour. But our impression of the magnificence of Lucknow was diminished, when we got into a carriage, and made a closer investigation of the actual buildings, for they are deficient in strength, solidity, reality: brick, plaster, and other gimerack materials take the place of stone and marble; they are the work, not of the great days of Akbar and Shah Jehan, but of a degraded and effete dynasty, who had no thought beyond the selfish shams which would most conduce to present splendour and self-indulgence. Their style is generally bad, a mixture of French, Italian, and Turkish; but they are redeemed by their fine position, their admirable grouping, their size, their number, and their variety.' The siege of the British Residency by a swarm of rebels in 1857, the unconquerable energy displayed by the garrison through three months of hope deferred, the first relief by Havelock and Outram, the renewed siege of the victorious army, and the final deliverance by Lord Clyde in 1858, clouded by the death of Havelock, are memorable passages in the story of the Indian mutiny. The city has since been much improved, by the removal of useless buildings, the construction of good streets, lined with bazaars, English built, but in the true eastern style, while a wise statesmanship has been displayed in opening posts of honour and influence to the natives, and training them to independent action. *Oude*, the ancient capital, from which the country took its name, is now utterly decayed, but the site is revered by the Hindus from its being the residence of the famous Ráma of pre-Christian times. *Fyzabad*, the second capital, though still retaining a considerable population, is said to be rapidly declining.

The PUNJAB, or country of the 'five rivers,' is a large north-western district, formerly the kingdom of the Sikhs, from whom it was wrested after severely-contested battles in the course of a provoked struggle, and annexed to the Anglo-Indian Empire in the year 1849. The name refers to the number of principal streams by which it is watered, all descending from the boundary mountains of the Himalaya, and following a south-westerly direction to the great current of the Indus. These affluents, enumerated from north to south, are the Jhelum, the Chenab, the Ravi, the Beas, and the Sutlej, which successively represent the *Hydaspes*, the *Acesines*, the *Hydraotes*, the *Hyphasis*, and the *Hesudrus* of ancient geography. The first and second unite; the third flows into the joint stream; the fourth and fifth blend their waters; and then merge in the common channel of the other three, which, under the name of the Ghara, enters the grand trunk of the Indus. The country intersected by these rivers was traversed by Alexander the Great; but the Sutlej, the southernmost, was the limit of his extraordinary advance. A district not naturally part of the Punjab is incorporated with the province, lying west of the Indus, and formerly included in the kingdom of Cabul. The surface embraces large tracts of sand and clay, but though not so fertile generally as the basin of the Ganges, the soil is highly productive on the borders of the rivers. A wavy ridge of hills between the Indus and the Jhelum is distinguished as the Salt Range from the abundance of the mineral. This last-named stream, the 'cedar-fringed Hydaspes,' deserves the epithet in the upper part of its course, where it breaks from the Himalayan valley of Cashmere, through one of the grandest defiles in the world. The bed is a succession of rapids and a mass of foam, offering a fine contrast to the dense forests and thick undergrowth of jungle clothing the banks, from the edge of the water to a high elevation. Oaks, pines, and the gigantic deodar or cedar are prominent up to 11,500 feet, above which a low bushy juniper is the chief variety of tree foliage met with. These forests supply the Punjab with timber; and furnished the materials for the fleet of Alexander, which were floated down the river to the spot where the vessels

were built. The historian states that, in felling the timber, troops of monkeys and baboons were disturbed in their haunts, and congregated on the summit of a hill, which the workmen mistook from a distance for a detachment of hostile natives.

*Lahore*, the chief city, stands on the left bank of the Ravi, the central one of the five rivers, and contains about 100,000 inhabitants. It is surrounded by a brick wall seven miles in circuit, which encloses magnificent gardens and numerous wells. The place has no prominent feature besides the citadel. It was one of the favourite residences of the Mogul emperors, under whom it is said to have contained 1,000,000 inhabitants, and it is surrounded for several miles with extensive ruins. At the close of the last century it became the capital of the Sikhs, under Runjeet Singh, but declined upon his court being established at *Umritsir*. This town, thirty-two miles east of Lahore, and connected with that city by rail, is more wealthy and commercial, possesses manufactures of cottons, silks, and fine shawls, carries on a great transit trade with Central Asia, and contains 90,000 inhabitants. It is the head-quarters of the Sikh religion, but the inhabitants are mostly Hindus or Mohammedans. *Ferozeshah*, south of the Sutlej, ancient and once ruinous, has been renovated under British rule; possesses convenient streets and bazaars; and is an important military station. It contains a monumental church in memory of the officers and privates who fell in the course of the Sikh campaigns. The fiercely-disputed battles of Ferozeshah, Moodkee, Sohraon, and Aliwal were fought in the adjoining country; and northward, between the Chenab and the Jhelum, the decisive victories of Gujerat and Chillianwallah were gained, all named after the nearest towns or villages. *Jhelum*, a British cantonment on the north bank of that river, marks the site of Bucephalia, the city which Alexander founded in honour of his celebrated charger. Many interesting relics have been found in the vicinity. The steed died of fatigue or wounds received in the action with the native prince, Porus, the scene of which is fixed, according to recent surveys, where the Jhelum debouches from the mountains into the plains. The river there flows through a rocky bed, which has so little changed its aspect that the description given of the site by the Greek historian Arrian and present features correspond almost minutely.

*Mooltan*, near the left bank of the Chenab, in a south-western district, is the third city of the Punjab in population, having 80,000 inhabitants. It formerly possessed a strong fortress, taken by the British after an obstinate defence in 1849. The name is a corruption of *Malli-than*, 'place of the Malli,' in local use at present, referring to an ancient people through whose territory Alexander marched on leaving the country. The tribe assumed a hostile attitude, and military preparations were necessary to secure a passage. In the neighbourhood an officer killed the largest snake which the Greeks saw in India, a python, twenty-four feet long. It is remarkable that the tiger was not seen by them, though the skin of one was shewn, and many reports were heard of the ferocity of the animal. *Peshawur*, on the north-west, in the trans-Indus region, is an important frontier town towards Afghanistan, containing a population of nearly 60,000. It stands a few miles south of the river Cabul, and east of the great Khyber Pass. The grand trunk road from Calcutta, broad, and excellently constructed, extending through a distance of 1400 miles, has here its northern terminus. Between Peshawur and Lahore, 264 miles, 'it passes upon 103 great bridges, and 459 smaller ones, penetrates the height of six mountainous chains, and crosses on immense embankments the *morais* of two great rivers.' *Atak* (or *Attock*), a fort, with an adjoining mean small town, is situated on the left bank of the Indus, nearly opposite the entrance of the river Cabul, and marks the site where the great stream has been crossed for ages by invading armies. It was here passed by Alexander in the spring of the year 326 B.C., as also by Timur in 1398 A.D., Nadir Shah in 1738, and Runjeet Singh in his Afghan wars, who maintained constantly a fleet of thirty-seven boats, ready to be thrown across when required by his troops. The river is contracted at this point to a breadth of not more than 260 yards before its periodical rise. The current is then strong, but not tumultuous, the water very deep, and of an azure-blue colour, while the rocks which confine it are black, and polished like marble by the action of the stream. *Kalabagh*, lower down on the opposite bank, presents an extraordinary spectacle. The Indus cuts through the Salt Range for about two miles, and is bounded on each side by steep cliffs. The town is built up on their face, street rising above street in terraces, connected by steps. Brine springs issue from the base of the rocks, and incrust the ground. These incrustations are brilliantly white, while the general colour of the earth around is almost a blood red, and the river is blue, or of a dusky yellow, according to the season. *Murri*, the principal sanitarium in the Punjab, is pleasantly seated on a hill of the sub-Himalayas, at the height of more than 5000 feet above the sea. It was established in 1851, and has attracted a considerable population. The lieutenant-governor, most of the higher officials, and numbers of the military, resort to it in the hot season. The scenery is very beautiful, and the wild-flowers in the spring are lovely, especially the roses, which, after a shower, fill the air with their perfume. There are barracks for the reception of invalid troops, a neat English church, besides a chapel for the use of the soldiers. A reading-room, club, and ball-room are among the other appointments of the place, with archery, picnic, croquet parties, and bear shooting in the adjoining Black Forest, for the amusements. The Lawrence Asylum, for the children of the European soldiers in India, founded in honour of the lamented Sir H. Lawrence, who fell at Lucknow, is built on a spur of the hill on which Murri stands.

The territory of **NAGPUR**, an extensive province of Central India, is almost wholly within the plateau of the Deccan, and generally level, except on the northern side, which is penetrated by spurs of the Vindhya Mountains. The upper course of the Mahanadi

lies within its limits, but the chief part of the drainage is carried off by an affluent of the Godavari, and conducted by both channels to the Bay of Bengal. A considerable proportion of the surface on the south-east, covered with the densest jungle, the haunt of numerous tigers, is occupied by an aboriginal race, the Khonds, before mentioned, addicted to human sacrifice, as a propitiatory rite. The small adjoining district of BERAR, on the western side, is watered by a tributary of the Tapti, flowing to the opposite sea-board. It raises a large amount of cotton, and has railway communication with Bombay, either wholly completed or nearly so, for its transport to the coast. The SAGAR and NERBUDDA territory, on the north of Nagpur, extends partly along the upper course of the river Nerbudda, in the valley of which there are workable coal-fields, and belongs partly to the basin of the Ganges.

*Nagpur*, 'Town of Serpents,' 430 miles north-east of Bombay, is an unhealthy town of 115,000 inhabitants, with manufactures of hardwares, and various textile fabrics. The houses are mostly huts of earth, thatched with straw. *Kampti* is a large British cantonment, ten miles distant. *Ellichpur* is officially the chief town of Berar, but a smaller place than *Amrawati*, the principal dépôt for its raw cotton. *Sagar*, on an affluent of the Ganges, is a town of 50,000 inhabitants, with a fort, military cantonment, and government school. *Jabalpur*, on the Nerbudda, contains a population of 30,000, and is on the northern branch of the Great Indian Peninsular Railway, extending from Bombay to the East Indian line from Calcutta.

The territory of Nagpur was governed by native rajahs down to the year 1853, when the dynasty became extinct. That of Berar was ceded by the Nizam, as a part of his dominions, for the maintenance of his contingent. These two districts, with the Sagar and Nerbudda Territory, now form a single province governed by a British commissioner.

*Dependencies of the Presidency.*—The kingdom of HYDERABAD, under a native ruler called the Nizam, is the largest of the Protected States, separately considered. It embraces a central portion of the Deccan, watered by the Godavari, with its numerous tributaries, and has the Kistna flowing along the southern frontier, to which several affluents are contributed. This region contains some of the most wonderful monuments of Hindu antiquity. It is renowned for its diamonds and other gems, but has a more valuable possession in the famous black soil, so favourable to the growth of cotton, which forms a large proportion of the surface to a very considerable depth. In the last century the Nizams, in alliance with the celebrated Hyder Ali and his son Tippoo Sultan, aided by the French, exercised a dangerous influence against the British power in the peninsula, but afterwards promoted its ascendancy in the campaigns of Cornwallis and Wellesley.

*Hyderabad*, 'Lion's Town,' the capital, is seated on the right bank of the Mussi, a tributary of the Kistna, and contains a population of 200,000, including the suburbs. It is a Moslem city, distinguished by a mosque built after the model of the Kaaba at Mecca. Among the artisans are lapidaries noted for their skill in cutting precious stones. On the opposite side of the river, spanned by a granite bridge, stands the British Residency, a large handsome building, with apartments for state receptions hung with scarlet cloth, bordered with gold, ornamented with gorgeous chandeliers and gigantic mirrors. Each step of the grand staircase is formed of a block of the finest granite. In the days of the old Company's power and pride, on a single reception night, the lighting of the whole establishment used to cost £1000; and at entertainments, Nauch or dancing girls were commonly introduced, some of whom have been known to wear jewels of the value of £30,000. The city has been called the Sodom of India, from the beautiful gardens in the neighbourhood and the depravity of the inhabitants. A late Nizam maintained a regiment of females, accoutred as soldiers, who were paraded, and trained in all the evolutions of the men. *Sikandarabad*, four miles on the north, is a British cantonment, and chief military station. *Golconda*, seven miles westward, is simply a strong fort where the treasury of the Nizam is kept, but directly adjoins the ruins of an ancient city, once the metropolis of an independent kingdom, which was absorbed by the Mogul empire under Aurungzebe. Mausolea of the sovereigns, dome-crowned structures of gray granite, each with a mosque attached to it, are the conspicuous remains. Though proverbially famous for diamonds, Golconda was merely the place where they were cut, polished, and stored. The diamonds themselves were principally found at the base of the Nelha Malla Mountains, a part of the Eastern Ghauts. Though occasionally met with in that neighbourhood, the celebrated mines are exhausted and deserted. *Aurungabad*, 'Throne Town,' on the north-western side of the territory, has 60,000 inhabitants, but is supposed to be declining. The name is derived from Aurungzebe, 'Ornament of the Throne,' the powerful Mogul, with whom it was a favourite residence. His palace is in ruins. The tomb of his daughter remains. *Ellora*, a little rural village, twenty miles on the north, is remarkable for its rock-temples, ranged along the side of a gently-sloping crescent-shaped granite mountain,

about a mile in length, resembling a desolate religious city. Some are cave-temples, properly so called, being excavations cut in the rock, one of which, styled the Dumarheyna, or the 'Nuptial Palace,' derives its name from a sculpture supposed to represent the marriage of Siva and Parivati. The roof, 19 feet high, is supported by 23 pillars and 20 pilasters. The area is larger than that of Westminster Hall by upwards of 7000 square feet. Others are huge monolithic buildings cut out of the rock, furnished with chambers, pillars, and colossal elephants, having an advanced and rich exterior architecture. *Assaye*, a hamlet, claims notice as the scene of the decisive overthrow of the Mahratta power by Wellington (then Wellesley) in September 1803 by a very inferior force.

The principalities of **INDORE** and **GWALIOR**, respectively Holkar's and Scindia's dominions, consist of several detached tracts, partly in the valley of the river *Nerbudda*, but chiefly on the northern side of the adjacent *Vindhya Mountains*, and are ruled by the representatives of two powerful Mahratta families, with the style of *Maharajah*. The petty district of **DHAR**, and the territory of **BHOPAL**, are in the same part of Central India, with the **BUNDELCUND** states, thirty-two in number, and those of **REWAH**, belonging to the basin of the *Junna* and the *Ganges*. More northerly, adjoining the province of *Agra*, are the small chieftainships of **DHOLPUR** and **BHURTPUR**. On the north-west, enclosed by the old province of *Rohileund*, is the territory of **RAMPUR**.

*Indore*, on the elevated plain north of the *Vindhya Mountains*, 2000 feet above the sea, is a modern mean-looking town of 15,000 inhabitants. The principality contains many of the *Bheels*, one of the most savage of the aboriginal tribes of India. Holkar, the reigning prince, educated under the direction of the British government, took the field in its support on the breaking out of the mutiny, but could render no assistance owing to the revolt of his troops, who held him in durance, while they massacred many of the Europeans. The first of the family who reigned, *Mulha Rao Holkar*, was a native of the *Deccan*, and died in 1768. *Mhow*, a small town and British cantonment, acquired some notoriety as the scene of the proceedings which led to the *Crawley court-martial*, belongs to this state.

*Gwalior*, the capital of *Scindia*, about 60 miles south of *Agra*, has a population of 50,000, grouped around a rock-fortress of remarkable strength, said to have been a stronghold for more than a thousand years. The rock rises almost perpendicularly to the height of 300 feet, and is completely isolated. The spacious summit is crowned by a citadel, which can accommodate a garrison 15,000 strong, and is provided with large tanks of water. It is hence impregnable to native troops. But their revolt during the troubles of 1857—1858 placed it in the hands of the rebels, and the *rajah* was compelled to fly to *Agra*. It became for a time the headquarters of the notorious *Tantia Topce* and his coadjutor, the *Ranee* of *Jhansi*, a princess of high spirit and dauntless courage. The place was recovered by *Sir Hugh Rose*. Upon the approach of his troops, the *Ranee*, with an attendant lady, both in military attire, mounted their horses and fled. Their sex being concealed, she received a shot in the side, and a sabre-cut on the head, but rode on till she fell dead from the saddle. Her guards raised a funeral pyre, and burned the body according to custom. *Jhansi*, recently the head of a small protected state, now transferred to the rule of *Scindia*, is a fortified town on the south of *Gwalior*, with considerable trade, and a large population. Upon the death of the *rajah* in 1853, he left a letter written to the governor-general, entreating that his adopted child might be accepted as his successor, while the *Ranee* might officiate as regent during the minority, according to the custom of the country. A recommendation to comply from the British agent was forwarded along with it. The appeal was rejected, upon which the disappointed woman made a vow of vengeance, and kept it. All the Europeans fell by the hands of the native troops in 1857, men, women, and children, not one being left alive to tell the story of their fate. The town was taken by storm in the following year by *Sir H. Rose*, after a desperate defence. Women were seen carrying ammunition to the batteries, one of which was fought under the black flag of the *fakirs*. The *Ranee* escaped by night to *Gwalior*. *Oojein*, or *Ujein*, an ancient capital, in a southern part of the country, contains 130,000 inhabitants, and has many mosques, mausolea, and temples, with extensive trade. It is one of the seven sacred cities of the *Hindus*.

*Dhar*, about 30 miles south-west of *Indore*, and 25 west of *Mhow*, is the chief town of a principedom not so large as the county of *Durham*, the interests of which have recently been the theme of speeches in the British parliament, and of sundry pamphlets. Relations remained amicable with this little state down to the year of the mutiny, when the old *rajah* died, and his troops joined the revolt. On this ground, his heir, a boy-prince, was set aside by the *Bengal* government, and the confiscation of the state decreed. The supreme home authorities, represented by *Lord Stanley*, reversed the decree, and directed the restoration of the prince, a youth of very good abilities, but the counter-order had not been executed in the year 1864.

*Bhopal*, near the northern base of the *Vindhya* range, is the seat of a Mohammedan government, understood to be well administered, but the mass of the people are *Hindus*. The *Ranee* controlled her subjects with remarkable sagacity during the insurrection. The town is enclosed by a decayed wall, two miles in circuit, exterior to which is a fort on a huge rock, in which the court resides. Enormous tanks are in the neighbourhood, formed apparently by the damming up and embankment of streams. The largest measures four and a half miles in one direction by one and a half in another. *Bhurtpur*, thirty-one miles on the west

of Agra, is said to contain 100,000 inhabitants, within a circuit of about eight miles, and was once strongly defended by an earthen wall and a wet ditch. The town long baffled the assaults of Lord Lake in 1805, but finally capitulated. In 1826 it was taken by storm out of the hands of a usurping chief by Lord Combermere, and the fortifications destroyed. An extensive trade is carried on in salt obtained from a neighbouring lake.

RAJPOOTANA, a region of great extent, consists of the country between the basin of the Jumna on the east and the border of Scinde on the west, and is nearly equal in size to the area of the United Kingdom. The chain of the Aravulli Hills is included within its limits, culminating in Mount Abu at the height of 5000 feet. But the vast proportion of the territory belongs to the Indian desert, with only sand-hillocks for its superficial diversities, which shift their position and change their shape under the direction of the winds, and are often seen in the dry season, when the gale blows strong, moving in huge columns over the surface. Villages of small wretched-looking huts occur at intervals, grouped in the neighbourhood of wells, from which only a scanty supply of brackish water can be obtained. The wild ass is met with, solitary and in droves, with antelopes, foxes, and the desert rat in prodigious numbers. The latter resembles the squirrel, and has the habit of sitting upright like the kangaroo. In many parts the ground is so perforated with the burrows of the animal that the surface yields to the slightest pressure, impedes progress on horseback, and distresses the steed. These features distinguish the western and northern portions of the country. In the opposite directions are productive districts, being watered by affluents of the Jumna, and streams which descend to the Gulf of Cambay. Rajpootana embraces fifteen states, in which the dominant people are the Rajpoots, 'sons of kings,' haughty and warlike, who occupy the more favoured localities; while the lower classes and the dwellers in the sandy wastes are a puny race of Jauts. BAHAWALPORE, a considerable district further north, extends along the banks of the Ghara, the river formed by the junction of the Sutlej and the Beas, with the stream of the Chenab, which is called the Ghara, thence to the Indus. This territory is mainly a continuation of the desert region, irreclaimably barren, but has a remarkably productive alluvial soil, on the borders of the rivers, on which cotton, sugar, tobacco, indigo, corn, fruits, and provisions in general are raised in large quantities. The ruler is a Mohammedan prince with the style of Khan.

*Jeypore*, the capital of the most populous Rajpoot state, large and regularly built, is said to be the handsomest native town in India. It forms a rectangle, has a palace and gardens in the centre, contains many mosques and temples, an arsenal, and a fully-equipped native observatory. The other principal towns are *Kotah*, on the right bank of the Chumbul, strongly fortified; *Bundi*, possessing a palace of great beauty; *Joudpore*, distinguished by an immense citadel; and *Bikanir*, of striking external appearance from being walled and battlemented, while situated in one of the dreariest parts of the desert.

*Bahawalpur*, a few miles from the south bank of the Ghara, is a prosperous commercial town, with manufactures of chintzes and other cottons, scarfs and turbans, and a great trade in provisions. It has a population of 20,000, and spreads over an extensive space, owing to groves of trees being intermingled with the houses. Grain, butter, fruits, and other agricultural produce, are raised in the neighbourhood for export.

## II. PRESIDENCY OF BOMBAY.

The Bombay Presidency is the smallest of the three main divisions of British India, and wholly confined to the western side of the country. It has a coast-line extending from the territory of Canara on the south to beyond the mouths of the Indus on the north, including that of protected states, or from 16° to 25° of north latitude; and stretches inland from 200 to 300 miles from the sea-board. The northern half of the Western Ghauts is included within its limits, along with the lower course of four important rivers, the Indus, the Mhye, the Nerbudda, and the Tapti. Different races and languages are numerous among the population, while extensive tracts are uninhabited, covered with jungle, and tenanted by wild beasts. In this part of India the Parsees are principally found, settled in considerable numbers in most of the towns, especially on the coast.

They are descended from the ancient fire-worshippers of Persia, who were driven from thence by Mohammedan intolerance; and are distinguished by their mechanical skill, mercantile habits, general probity, and unbounded munificence. Many are extensive shipowners, who have risen by their own industry to the rank of merchant-princes, and are represented by partners or agents on the Exchanges of London and Liverpool. The late Sir Jamsetjee Jeejeebhoy, the first native of India made a baronet of the United Kingdom, eminent in the annals of philanthropy, belonged to this body. Its members adhere to the religious faith and habits of their ancestors. They venerate the fiery element kept constantly burning in temples, being fed with sandal-wood; and pay adoration to the solar luminary, assembling in groups by the sea-shore at sunrise and sunset, to make prostrations and repeat prayers before the ascending and declining orb. The Parsees are far outnumbered in the presidency by the Mohammedans, while the great majority of the people are Hindus. Males preponderate over females, but not so conspicuously as in other parts of India, a disparity between the sexes occasioned partly, it is to be feared, by the practice of female infanticide.

Viaduct on the Bhor Ghaut Incline.

The two CONCANS embrace the narrow strip of country between the ridge of the Ghauts and the ocean, the coast of which supplies several excellent harbours, and is begirt with small rocky islets containing monuments of ancient India—cave-temples and rock-sculptures—in close connection with those wonderful expressions of modern civilisation and commercial enterprise, railways and canals.

Bombay.

*Bombay*, the capital, is seated on the southern side of the island so called, a name which originated with the Portuguese, and is a compound of *bom*, 'good,' and *bahia*, 'harbour,' in allusion to the splendid anchoring ground, available for vessels of the largest class, extending over an area of fifty square miles. The island passed to the English by cession in 1661, as part of the dowry of the Infanta Catherine, the bride of Charles II, who surrendered it to the East India Company. It is connected with adjoining islets, and with the mainland by artificial causeways. At one time the site was so unhealthy that three years were reckoned the average duration of European life at the place. But the gradual recession of the ocean, the exclusion by artificial means of the tidal water, and an improved system of drainage, have rendered the surface dry, and the rate of mortality at present is said not greatly to exceed that of London. The city has rapidly enlarged since the establishment of communication with England by the Red Sea route, as the first port of India reached by outward-bound steamers, and the last left on the homeward voyage. It consists of a strongly-fortified European town, and a much larger native or black town at a little distance, with the villas of merchants on heights in the suburbs, commanding fine views of the sea and of the distant Ghauts. The total population exceeds 600,000. In the dockyard, which embraces 200 acres, and is in a high state of efficiency, frigates and line-of-battle ships are built. Ship-building is also extensively prosecuted in private yards. Engineering establishments and other factories are large and numerous. The principal exports are raw cotton, shawls, opium, coffee, pepper, ivory, and gums; the imports are chiefly cotton twist, piece goods, metals, wine, pale ale, tea, raw silk, and timber. Motley groups are to be seen walking about in the cool of the day, in their national costume, conversing in a variety of tongues, English, French, Germans, Americans, Portuguese, Chinese, Parsees, Arabs, Armenians, Hindus, Greeks, and Persians. *Bombay*, by the route of the Peninsular and Oriental Company's Steamers, is 1636 miles from Aden, 2977 miles from Suez, and 6167 miles from Southampton. The Great Indian Peninsular Railway diverges from it in two branches, north-east and south-east, to communicate with lines respectively from Calcutta and Madras. Great works have been

requisite to effect the ascent of the mountain barriers from the low sea-coast, and there are still gaps at the Bhore and the Thull Ghauts, but in process of being filled up by steep inclines. The first turf for the first railway in India was turned up at Bombay on the 31st of October 1850. In preparing the permanent ways, cobras and other deadly snakes, lurking among stones and grass, have endangered the workmen.

Picnic-parties frequently proceed from Bombay to the small and beautiful island of Elephanta, celebrated for its cave-temples, about seven miles distant from the city. The name refers to the colossal statue of an elephant cut out of the solid black rock on the acclivity of a hill, which the religious zeal of the early Portuguese led them to mutilate, and which is now a complete ruin. Three temples have been excavated, the largest of which is 130 feet long by 123 broad. Fluted columns, arranged in rows, some of which are broken, support the roof, and bulge out in the middle, as if under the weight of the superincumbent rock. From forty to fifty colossal figures appear on the sides without being quite detached from the wall. But the principal object is immediately opposite the entrance, consisting of an enormous bust with three faces, one of which fronts the spectator, while the others look to the right and left. This is a representation of Siva, to whom the temple is supposed to have been dedicated, the whole carved out of a dark-gray basaltic rock. Though still frequently visited by devotees, it has no establishment of priests, nor is any care bestowed upon its preservation from injury and decay. Brushwood and wild shrubs overhang the entrance, and pools of water collect upon the floor. Caves of similar character, but of larger size, are found in the island of Salsette, with which that of Bombay is welded by a causeway, situated in a wild country of great beauty. They contain boldly-carved colossal statues of Buddha, placed in arched recesses, and represented both standing and sitting, with his legs bent under him, and his hands joined as if in prayer. Around are jungles in which the tiger lurks, and the animal sometimes visits these deserted shrines, leaving his footprints on the floor.

The district of PUNAH, and other adjoining collectorates, with the province of SATTARA, form part of the table-land interior to the Ghauts. They enjoy a more temperate climate than the coast region, and remarkably contrast with it in being liable to droughts, while deluges of rain descend on the maritime lowlands. This arises from the high mountains intercepting the inland passage of the vapours of the south-west monsoon. The country is watered by the upper course of the Godavari, but chiefly by the Kistna and its affluents.

*Punah*, formerly the capital of the Mahratta Empire, is a large and important town of 75,000 inhabitants, on the south-eastern railway from Bombay, at the distance of 112 miles. It possesses a Sanscrit college, founded for the cultivation of the ancient literature of India, a government law school, an engineering and mechanical school, and is the principal military cantonment of the Deccan. Its water-works were constructed at great cost by Sir Jamssetjee Jeejeebhoy. A botanical and medicinal garden, established by the government, is at Dapuri, in the neighbourhood. It yields colocynth, croton and castor oils, senna, taraxacum, and other drugs for the use of the public hospitals. In many parts of the adjacent country the hill-forts, often mentioned in the annals of Indian warfare, are to be seen. In 1816, by the treaty of Punah, the head of the Mahratta confederacy was reduced to a state of vassalage, and in the following year he was compelled to retire into private life with an allowance of £80,000 a year. *Ahmednuggur*, seventy miles on the north-east, once the head of a native kingdom, still prosperous, preserves the mould used for casting the largest piece of brass ordnance in existence. This is shewn as one of the wonders of *Bijapur*, a deserted city on the south-east, called, from its vast and grand remains, the 'Palmyra of the Deccan.' It was the metropolis of an independent state for centuries, under Hindu and Mohammedan rulers, till it was captured by Aurungzebe in 1686, and thenceforth began to dwindle to its present condition. In the days of its prosperity it is said to have contained 100,000 dwellings, and was divided into quarters of several miles in extent. Massive and lofty walls of hewn stone remain entire. They enclose temples, tombs, palaces, and mosques, abandoned to silence, more or less ruinous, but now preserved by order of the British government as much as possible from further decay. The fort has a circuit of six miles, and an inner citadel containing the colossal piece of ordnance. *Sattara* and *Belgaum* are principally military stations. The former was the head of a protected native principedom down to the year 1843, when it was annexed on the death of the rajah.

KHANDESH, a territory on the middle course of the Tapti, and GUZERAT, which embraces the mouth of the river, with that of the Nerbudda and the Mhye, extending round the Gulf of Cambay, are rich alluvial tracts, largely cotton grounds, from which the finest Indian staple is procured. The three rivers are crossed by the Baroda and Bombay Railway. Being broad and rapid, subject to sudden floods, which have been known to raise the level fifty feet in a single night, the bridges and viaducts required involved great engineering difficulties in their construction, are of extraordinary magnitude, and rank with the finest structures of the kind in the world.

*Surat*, near the outlet of the Tapti, a large and meanly-built city, contains a population of 135,000, but is declining, having been superseded extensively in its commerce by Bombay. It has a remarkable feature in a hospital for sick, maimed, and aged animals. At this place the East India Company had their first mercantile

establishment. The Mogul Emperor Jehangire granted the imperial permission to settle at Surat in 1612, when Captain Best formed the factory, and left ten persons there, with £4000 for the purchase of goods. *Baroche*, near the mouth of the Nerbudda, a celebrated commercial emporium in ancient times under the name of *Barygaza*, is still a shipping port for grain and cotton. An island in the river is distinguished by a banyan-tree which must have stood for ages. It has a circuit of more than 2000 feet, measured around the subsidiary trunks, and overshadows several acres.

The extensive province of SCINDE forms the most westerly part of India, and embraces the lower portion of the Indus valley, from a short distance below the influx of the waters of the Punjab to the mouth of the river. Along its banks, and within the area of its inundations, the soil rewards the labours of the cultivator with rich crops of rice, barley, and other grain, with indigo and sugar; but apart from these districts the surface is sandy, and falls on the eastern side within the limits of the irreclaimable Indian desert. Buffaloes are reared in large herds in the swampy tracts, and a considerable number of camels are bred. The population is everywhere thin, but varied in character, very wild in some localities, and consists of a larger proportion of Mohammedans to Hindus than is found in any other part of India.

*Hyderabad*, the former native capital, about four miles from the east bank of the Indus, and 120 miles from the sea, has a military appearance, standing on a steep height surrounded by a rampart flanked by round towers. It was military also in the chief occupation of the inhabitants, who number 24,000, the manufacture being swords, spears, and matchlocks. Six miles on the north is the village of Meeanee, the scene of Sir C. Napier's decisive defeat of the Ameers of Scinde, as its old rulers were called, in 1843, which led to the annexation of the province. *Tattah*, at the head of the delta of the river, is an ancient place, once important, now decayed, apparently on or near the site of Pattala, a city existing in the time of Alexander, which he strengthened, and intended to make a great naval station. *Shikarpoor*, in the northern part of the province west of the Indus, is the most populous town, containing 30,000 inhabitants, in active commercial intercourse with Afghanistan and Bokhara through the Bolan Pass. *Kurachee*, the only seaport of Scinde, and the most western port of India, has advanced rapidly from an obscure to an important town since it became British in 1839. It will probably rise to great prosperity, as the seat of the provincial government, the principal military station, and the focal point of telegraphic communication between England and India. A railway extends from the place to Kotah on the Indus, near Hyderabad, 105 miles; and thence the traffic is extended to Mooltan in the Punjab, by means of a regular bi-monthly postal line of steamers.

Among the dependencies attached to the presidency, GUZERAT is by far the largest and the most important. It is accounted one of the gardens of India from its general productiveness, has cotton for its staple, but possesses an unhealthy climate. The territory extends around the Gulf of Cambay, but has little direct communication with it owing to intervening districts. On the Arabian Sea an extensive coast-line is supplied by the peninsula of Kattywar. In this province a large number of petty chieftains, who reside in villages, exercise authority. Many of them are tributary to a ruler styled the Guicowar, who represents one of the old Mahratta families, while all are subject to British control.

CAMBAY, at the head of the gulf, forms a small native principality. Cutch, an extensive peninsula, has an ocean boundary on the south in the Gulf of Cutch, with the singular tracts of the Runn, which are alternately, with the dry and rainy seasons, sandy and watery wastes, separating it from Guzerat and Scinde. Earthquakes, permanently altering the face of nature, occur in this region, and numerous traces of volcanic action are met with. It is politically held by feudatories under a chief called the Rao. KOLAPORE and SAWUNT-WARREE, each under a native rajah, are remains of the Mahratta confederacy, bordering each other on the southern side of the presidency, and nearly enclosed by it.

*Baroda*, the capital of the Guicowar, is a populous trading city, in the country between the two rivers, the Myhe and Nerbudda, said to contain upwards of 140,000 inhabitants. It is connected by the Central Indian Railway, in course of extension to Bombay, with Ahmedabad on the north and Surat on the south. Insurrectionary movements, of frequent occurrence in the Guicowar's territories, led to the general disarmament of the natives, in 1858, by Sir R. Shakespear. From 8000 villages there were taken 160 cannon, 21,000 fire-arms, about 118,000 swords, and 307,000 weapons of a miscellaneous description. *Cambay*, on the estuary of the Myhe, formerly celebrated for its manufactures of silk, chintz, and gold stuffs, exhibits evidences of bygone prosperity in ruinous palaces, mosques, and tombs. The gradual growth of incumbrances to its maritime

communications led to the decline of the city. But it is still a shipping port, and is noted also for the cutting of precious stones. *Bhoj*, the chief town of Cutch, in the heart of the peninsula, contains a population of 20,000, and is widely renowned for its manufactures in gold and silver. It is seated on a plain at the foot of a fortified hill, remarkable for having a temple erected to the cobra da capello. Pagodas, mosques, and interspersing palms, give a pleasing appearance to the town at a distance.

### III. PRESIDENCY OF MADRAS.

The Madras Presidency embraces the whole southern part of the Indian peninsula from sea to sea, with the exception of three insignificant tracts held by the French. It extends northward along the western coast to the latitude of 14°, or to the border of North Canara, belonging to the Bombay territory; but reaches on the eastern side of the country to nearly latitude 20°, or to the Chilka Lake, which forms the division from Bengal. Though a dreadful act of sepoy mutiny transpired within its limits, at Vellore, as far back as the year 1806, yet during the recent outrages in Bengal, both the military and the civil population remained remarkably peaceful and loyal, while the sister-presidency of Bombay was agitated. The opposite coast regions remarkably contrast in their climate. On the eastern side there is more continuous and intense dry heat than in almost any other part of India. At the midnight hour the thermometer is not unfrequently above 100°. Wood-work shrinks and warps; nails are loosened, and fall out of doors and tables; glass globes and shades are cracked. But on the western shore, while the temperature is not so fierce, the humidity is immense, and anything like protracted drought is unknown. Owing to the incredibly heavy rains which dash against the Western Ghauts, that singular feature of the coast has been formed called the 'backwater.' This is an enormous lagoon, 120 miles in length, and of every width from a few hundred yards to ten miles, from one to two feet deep after the longest suspension of a shower, communicating at only three points with the ocean. Intervening table-lands have the genial climate of the temperate zone, varying from warm to cool, according to the elevation. The people differ in character and appearance in harmony with these climatic diversities. In general, the complexion is of the deepest black on the low burning eastern coast, but on the highlands it is not uncommon to meet with countenances as fair as many Spaniards or Portuguese; and the women especially have pleasing features, with finely-proportioned figures.

THE CARNATIC, though no longer a recognised geographical division, is a familiar term from its historical use for the greater part of the presidency, or that portion which was the battle-ground of the French and English for ascendancy in India in the last century. It may be defined to extend from Cape Comorin along the eastern shore to near the mouth of the Kistna, but with a very uncertain inland limit, though embracing two naturally distinct regions, called the Upper and Lower Carnatic, or the country above and below the Ghauts.

*Madras*, the capital of the presidency, is seated on the Coromandel coast, in latitude 13° 4' north, longitude 80° 14' east, 763 miles south-east of Bombay, 1063 miles south-west of Calcutta, and contains a population of 720,000, including the suburbs, according to the return for 1862. It bears the native name of Chennapatnam, the 'City of Chennappa,' an Indian prince, who granted the site to the British, on which a settlement was first planted in the year 1639. The number of Europeans, excluding those employed in the service of the government, or in connection with the railways, is very small; and the variety of races is less than in Calcutta and

Bombay. Fort St George, the citadel, directly on the shore, has the sea flowing within a few feet of the ramparts. It is defended by heavy guns on the coast face, has bomb-proof fortifications on the land-side, and usually contains a large garrison. Northward, beyond a broad esplanade, on which stands the light-house, is the native or black town, occupying a low site, but protected by a strong stone bulwark from the high-water waves. Southward, along the beach, are public offices and residences of the wealthy, with intervening gardens which have a pleasing effect. A good road, shaded with trees and lined with handsome villas, leads to the

Madras.

cantonment on St Thomas's Mount, a gentle rising-ground about six miles distant. The public edifices and institutions include a government house, a mint, a university, with library and museum, a botanic garden, an astronomical and magnetic observatory in working-order; schools, asylums, and hospitals; a club, which supersedes the necessity of hotels; eleven places of worship belonging to the Church of England, and many dissenting chapels. The oldest church, St Mary's, connected with the Fort, dates from the year 1680; but this was preceded by the Roman Catholic cathedral, in the native town, founded in 1642. A People's Park, provided with aviaries, enclosures for deer and other wild animals, walks, trees, and green-sward, has been opened since 1859. The climate renders a large supply of ice essential to the health and comfort of the inhabitants. It has been hitherto furnished by America, to the amount of from 2000 to 3000 tons annually; but war having rendered the import precarious, an Ice Company has been formed for its artificial production after the example afforded at Calcutta, Bombay, Suez, and Melbourne. Eleven newspapers are published, nine of which are English, and include three dailies. The other two are in Telugu and Tamil.

No city in the world of equal extent and commerce is so unfavourably situated as Madras, especially for maritime trade. It stands on no navigable stream, has only soil of moderate fertility in the neighbourhood, and occupies a harbourless strand upon which the surf rolls with tremendous violence. Large vessels can anchor in the roadstead, but it is exposed to every wind except from the west, and upon the occurrence of a sudden squall they have to make in all haste for the open sea. Passengers and goods are landed in light craft, dexterously handled by native boatmen, but not without frequent danger in addition to the inconvenience. An attempt to construct a breakwater was unsuccessful. But at the commencement of 1864, a screw pile-pier, running out to an extreme length of 1000 feet, was nearly complete. The Madras Railway has its station on the beach, and extends in a single line across the peninsula to Beypore on the Malabar coast, a distance of 405 miles, open throughout. About thirty miles on the south, *Mahabalipoor*, 'City of the great Bali,' utterly ruined and partly engulfed, presents an extraordinary spectacle. It contains seven monolith pagodas, of which only one at present is on dry land, the other six being visible at low-water, rising up like rocks, and extending a considerable way into the sea. Every building of this enormous town, whose remains are spread over an extent of twelve miles, was hewn out of the rock, and then the interior of each was excavated, a work which involved the cutting up of a whole mountain into temples, palaces, and houses. It is conjectured, from a great rent in one of the temples, that an earthquake occurred, which let in the sea, and destroyed this city of giants.

*Arcot*, an inland city on the railway from Madras, the former capital of the Carnatic, has its name associated with that of Lord Clive, as the place where his military reputation was firmly established. It was taken by him with a very small force in 1751, and then successfully held through nearly two months against a host of

assailants, under circumstances of the greatest hardship. The adjoining country is bestrewn with tanks, many of which are of immense size, constructed to afford a water-supply in the dry season when the streams fail. The largest measures eight miles in one direction by three in another. *Vellore*, a neighbouring town, is chiefly noticeable as the scene where the native troops rose against their European officers in 1806, owing to the issue of regulations which interfered with their prejudices. *Tanjore*, on a branch of the Kaveri, 212 miles south of Madras, is a large manufacturing city, with a population of 80,000, distinguished also as a seat of Hindu learning and religion. It is particularly celebrated for its great pagoda, dedicated to the god Siva, considered the finest specimen of the pyramidal temple in India, and is resorted to by vast multitudes on days of public festival. The building, about 200 feet in height, stands within an area enclosed by high walls, the top of which, along their whole extent, is decorated with bulls sacred to the divinity. The interior contains a chamber or hall, which has no light except from lamps. *Tanjore* is passed by the Great South of India Railway from *Negapatam*, 49 miles distant on the coast, which runs along the Valley of the Kaveri. It proceeds further west to *Trichinopoly*, a fortified town of 30,000 inhabitants, noted for its hardwares, jewellery, and cheroots of the finest quality. *Madura*, a smaller place further south, is the head of a district containing the Pulney or 'Fruit' Hills, the highest peaks of which are supposed to rise more than 8000 feet. The general summit is an extensive undulating plateau, covered with grass, and fine woods appear in sheltered hollows and ravines. Elk and bison abound. The scenery resembles that of the Scottish Highlands; European fruits, flowers, and vegetables flourish; and the nettle stings, which it will not do at Simla on the Himalaya. These hills are now occupied by a sanitary station, which is 7200 feet above the sea, where the sweltering heat of the plains is exchanged for a climate in which good fires, carpets, and curtains are often acceptable.

The NORTHERN CIRCARS consist of a narrow tract continuing the coast region of the Carnatic from the southernmost outlet of the Kistna to the Chilka Lake. This district includes the mouths of the Godavery. It has a low and generally insalubrious shore, but the surface rises in bold hills in the interior, and the chain of the Eastern Ghats forms the inland boundary.

*Ganjam*, once a maritime town of consequence, with very handsome buildings, has fallen into complete decay, owing to the unhealthiness of the site. Fatal fevers in 1815 led the British residents to retire from the place; and the public establishments being removed, the fort and cantonments speedily became ruins. *Chicacote*, southward on an inlet of the coast, profited by the decline of *Ganjam*, and has now a population of 50,000, exclusive of military and European civilians. *Masulipatam*, a fortified town near the mouth of the Kistna, has long been celebrated for its chintzes and richly-worked muslins.

SOUTH CANARA and MALABAR are continuous tracts on the opposite coast, between the Western Ghats and the sea. The mountains occupy a large extent of the surface, and have slopes richly clad with teak-trees, sandal-wood, and other valuable timber. They enclose many well-cultivated valleys, while a sandy plain forms the immediate shore. Betel and cocoa nuts, rice and other grain, with various spices, as pepper, ginger, and cardamoms, are the principal products. The latter, known in commerce as Malabar cardamoms, are the capsules of plants native to the highlands, the seeds of which form an aromatic pungent spice, with stimulant properties and an agreeable taste, hence used in medicine and confectionary. The plants require careful cultivation; and great vigilance is necessary on the part of the natives to secure the crop, which ants, and snakes especially, are eager to devour.

*Mangalore*, a small town in South Canara, is the principal shipping port for rice, inconvenienced by the silting up of the harbour, with a healthy cantonment adjoining, on an elevated site, open to the sea-breeze. *Calicut*, on the Malabar coast, is historically distinguished as the first spot in India touched at by Vasco de Gama. It was then a populous and powerful city under a native ruler, with stately pagodas, and twice repulsed the Portuguese. Owing to war, the competition of other localities, and a gradually sand-choked harbour, the town became a miserable ruin. It has somewhat recovered, and now contains a population of 25,000, but large vessels cannot approach nearer than two or three miles from shore. The fabric *calico* is supposed to have derived its name from that of the town. *Beypore*, the terminus of the Madras Railway, is in the vicinity. *Cannanore*, a place of great antiquity, and a considerable shipping port, occupies the head of a bay which forms a convenient harbour, fifty miles north of Calicut. Spices, grain, and vast quantities of cocoa-nuts raised in the neighbourhood, are exported. A headland on one side of the bay is the site of a military station.

The province of COIMBATOR, wholly inland, lies between Malabar and the Carnatic, and has some interesting natural features. It embraces the great gap of Palghat which

cuts through the Ghauts, opens a free passage for the monsoon winds from either of their seasonal directions, and is now the route of the Madras Railway between the opposite coasts. On the northern side of the gorge, the Neilgherries, or Blue Mountains, rise abruptly in mural precipices, form a plateau broken by ridges and eminences, which declines gradually into the table-land of Mysore. The soil of the plateau is highly productive; the surface is grassy, interspersed with patches of woodland; and the climate is famed for its salubrity and for remarkable evenness in its seasons. Coorg, a small territory on the north-west, formerly a native principality of ancient date and larger proportions, lies almost wholly in the bosom of the Ghauts, and is beautifully diversified with well-cultivated valleys, and hills crowned with forests. This district is singularly traversed by artificial ramparts, from fifteen to twenty-five feet in height, with ditches in front from eight to ten feet wide, and the same in depth. In many places they are double, triple, and even quadruple; and are estimated to have a total linear extent of not less than 500 miles. These ramparts, obviously constructed for defensive purposes, like the Picts' Wall in Britain, are of great antiquity, being at various points crowned with enormous trees.

*Coimbatore*, a small town near the gap of Palghat, is one of the stations on the Madras Railway where passengers for the whole route of 405 miles have to remain a night. *Utacamund*, abbreviated by Anglo-Indians into Ooty, founded as a sanitarium in 1822, is visited both from Madras and Bombay. The settlement is on the Neilgherries, 7300 feet above the sea. In the warmest period of the year, April and May, the thermometer rarely reaches 75°. In the coldest months, December and January, the mercury descends to the freezing-point. The mean temperature for the year is 57°; and the average rain-fall about sixty inches. A Lawrence Asylum for the children of the European soldiery, founded in honour of Sir H. Lawrence, was established here in 1853. There are also private high and middle class schools for the English, and a benevolent scholastic foundation for natives. Two minor stations, each 6000 feet above the sea, afford a different climate, and a third recently planted at Jackatalla, now Wellington, occupies a well-sheltered valley, exempt from the cutting north winds which are frequently felt at Ooty.

*Mercara*, the chief town of Coorg, is among the mountains, more than 4000 feet above the sea, and was long the seat of a line of native sovereigns. The principality is mentioned by the historian Ferishta as an independent state in 1583. Its people contrast favourably with other Hindus in appearance and habits, being a handsome, athletic, warlike race of mountaineers, usually above the middle size, cleanly in their persons and habitations, and very industrious. In 1792 the Rajah of Coorg marched with Lord Cornwallis against Seringapatam. The last prince, deposed in 1834 by the British authorities, who then took formal possession of the country, would not allow his subjects to fight against the powerful allies of his ancestors, but quietly submitted to his fate. In 1850 he came to England to obtain restitution of money invested in the government funds, and died in 1859 at London without having succeeded in his suit.

The territory of Mysore, ruled in the last century by the renowned Hyder Ali and his son Tippoo Saib, is an extensive central province, larger than the mainland of Scotland. It consists of a triangular-shaped plateau, skirted by the Ghauts on the east and west, and by the convergence of the two ranges on the south. The enclosed district has generally a considerable elevation, which renders the climate temperate through a great portion of the year. Isolated rocks, called *droogs*, rising up abruptly from the table-land to the height of 1000 or 2000 feet, with broad bases, are striking features of the surface. These gigantic columns are composed of granite, gneiss, and hornblende; and were in former times crowned with nearly inaccessible fortresses. Exposed by altitude to the influence of both monsoons, the annual rain-fall is heavy, and favours agricultural pursuits, in which all classes of the population are engaged. In 1832, upon the plea of incompetency, the native ruler was set aside, but received an ample stipend, and the country has since been governed directly by a British commissioner.

*Mysore*, the capital of Hyder Ali, contains the British Residency, the palace of the deprived rajah, and a large number of teak-built dwellings, with probably a population of 55,000. *Seringapatam*, made by Tippoo Saib the capital of his kingdom, and strongly fortified by him, occupies an island in the river Kaveri, and has declined from its former consequence. It was taken by storm by the British in 1799, when Tippoo fell fighting bravely in its defence. His descendants receive a pension. The deprived Maharajah is also allowed

a stipend of £35,000 a year, with a fifth part of the net revenues of Mysore, which made his income £114,000 in 1860-61. *Bangalore*, the largest town, has 60,000 inhabitants, an extensive trade, with some silk and cotton manufactures. It is nearly due west of Madras, at the distance of 205 miles, and is much visited by Europeans on account of its comparatively cool climate, being 3000 feet above the sea.

The protected states of *COCHIN* and *TRAVANCORE* are contiguous, and form the extreme south-western section of peninsular India. They are naturally among its finest regions, abound with picturesque scenery, have vast forests of teak and pine on the hills and mountains, luxuriant rice-grounds in the valleys, with a large assortment of wild animals in the woods. The population is remarkable for its variety. It includes Hindus, Mohammedans, White and Black Jews, Native Christians, with outcasts who are fishermen on the coast, and Hill-people who are described as so degraded as scarcely to deserve the name of human, and may be regarded as descendants of the aborigines.

*Cochin*, a seaport, is included in the British province of Malabar, while the territory is ruled by a native prince. It contains a population of 30,000, is highly commercial, and the only port south of Bombay where large ships are built. The teak forests supply abundant materials, and the peon, a kind of pine, is as well adapted as the Norwegian species to be 'the mast of some tall admiral.' Not only merchant-vessels but men-of-war have been constructed here. The harbour labours under the disadvantage of being obstructed by a bar, which is open to the south-west monsoon, and often renders ingress and egress impossible during its prevalence. Cochin was occupied by the Portuguese in 1503, their first station in India. It was taken by the Dutch in 1663, and fell into the hands of the British in 1796.

*Trivandrum*, the chief town of Travancore, is on the coast at the outlet of the Karamany, over which a handsome stone bridge was thrown by the late rajah. This prince, a very remarkable man, was well acquainted with European science, a good practical chemist, and maintained for many years in complete order an astronomical and magnetical observatory. He presented a splendid ivory throne to the Queen, which attracted attention at the Great Exhibition of 1851, and illustrated the skill of the native carvers. The style of his successor is thus given in the Madras Almanac for 1864: 'His Highness Sree Palmanabha Dausa Vunchee Baula Rama Vurmah Koolashagara Kireeda Padu Munnay Sultan Maharauj Rajah Rama Rajah Bahadur Shamsheer Jung, Maha Rajah of Travancore; born 14th March 1832; ascended the Musnud 19th October 1860.' He appears on state occasions in a magnificent car, in comparison with which the old regal carriages of Versailles and the Lord Mayor's coach are puny vehicles. Troops of elephants attend His Highness.

The native Christians of Cochin and Travancore are of three denominations: first, Syriac, who refer their origin, but without authority, to St Thomas the apostle, and recognise the Patriarch of Antioch as their ecclesiastical head; second, Roman Catholics, the descendants of converts made by the Portuguese; third, Protestants, descended from converts made by the Dutch. The White Jews spring from true immigrants of the race, settled in India at an early period. The so-called 'Black' Jews are Hindu proselytes, who venerate their white brethren as the genuine sons of Israel.

CASHMERE, in the extreme north of India, bordering the Punjab, consists of an elevated valley, and a belt of enclosing mountains, among which are some of the loftiest summits of the Himalaya. It is one of the most interesting and beautiful portions of the earth, embracing almost every variety of scenery and climate, rich in fruits and flowers, while offering objects on every hand to arrest the attention of the man of science, whether botanist, geologist, or antiquary. The valley itself is of a somewhat oval form. It extends about ninety miles from north-west to south-east, and has a breadth varying from ten to thirty-five miles. The lowest part, occupied by the Wuller Lake, is 5189 feet above the sea, but the average height is 5500 feet. Thrice that altitude is attained by several peaks of the mountain-wall immediately adjacent, but in the distance northward rises the magnificent mass of Nanga Parbat, or 'Naked Mountain,' so called from being bare of snow, owing to the remarkable steepness of the sides. It attains the elevation of 26,629 feet above the sea, and ranks fourth among the highest measured summits on the globe. There are several passes by which this secluded region is reached from the plains of the Punjab, but with one exception, that through which the Jhelum effects its escape, they are too lofty to be practicable in winter, and this single opening will not admit of a wheeled vehicle. The river named drains the whole valley. Its remotest source is a small pool on the further side, from which it flows with a gentle current in snake-like curves, spreading out in

places into several lakes, the largest of which, Lake Wuller, is about ten miles in length by five in breadth. The low grounds have the mulberry, chestnut, walnut, poplar, and plane tree, groves of which were planted by the Mogul emperors, who made this region their summer residence, adorned it with palaces, gardens, summer-houses, and luxurious retreats, the ruins of which attest their taste by the picturesqueness of the sites. Orchards of apples, pears, and cherries abound; and almost every variety of fruit known in Europe flourishes, with the exception of the orange, the lemon, the fig, and the olive. Rice and maize are the principal objects of cultivation. The wild animals include the ibex, stag, and bear, the first of which is found only in the wildest and most inaccessible parts of the country. In various localities the shrill whistle of the marmot is almost constantly heard over the barren rocks. The beautiful menal and other pheasants are abundant, with the red-legged and snow partridge. In winter the temperature is severe, and the snow lies deep. In summer the heat is occasionally oppressive, but generally moderate. Leather manufactures, weaving the famed Cashmere shawls, and the preparation of ottar of roses, with bee-keeping, are prevailing industries. In recent times the story of this highland district has not been that of the Happy Valley. It fell under the power of the Sikhs in 1819, and was soon afterwards terribly desolated by an earthquake, a pestilence, and a famine caused by the failure of the rice harvest. Upon the conquest of the Sikh kingdom by the British, it was ceded by them as a separate state to Gholab Singh, who had conquered an adjoining portion of Tibet. The people are a fine race in personal appearance, and consist chiefly of Mohammedan Hindus.

*Serinaur*, the capital, often called *Cashmere*, near the centre of the valley, is seated on both banks of the *Jhelum*, and contains a population of 40,000. Immediately eastward, the hill of *Takht-i-Sulaiman* rises abruptly, the summit of which is crowned by an ancient temple, still in an almost perfect state of preservation. It commands a view of snowy mountains, grassy plains, river, lake, forest, and almost every element of the fine landscape, exhibited on a grand scale. *Islamabad*, higher up the river, is a seat of the shawl manufacture, producing also chintzes, coarse cottons, and woollens. *Baramula*, a small place, stands on the inner side of the pass by which the *Jhelum* breaks through the outer range of the Himalaya. This is a grand cleft, upwards of 7000 feet in depth, with almost perpendicular sides, very narrow at the bottom, which is almost wholly occupied by the river. The natural sluice extends from twenty to thirty miles, and presents successive scenes of striking grandeur. It can only be traversed by the foot-passenger.

The entire Valley of Cashmere is traditionally believed to have once been a great upland lake, a persuasion which various natural appearances confirm. Small lakes are numerous at present, especially around the capital, liable to inundation from the joint effect of the melting of the winter's snow and the copious spring rains. To counteract in some degree this disadvantage, the curious expedient is resorted to of forming floating gardens on the surface of the water, which rise and fall with it, and thereby place the produce out of danger from any overflow. They are made by cutting through the reeds, sedges, lilies, and other aquatic plants, about two feet below the surface, which are pressed into closer connection, become matted together, are arranged into a number of small beds, upon which a thin coating of mud is laid. The beds float, but are kept in place by willow stakes, which admit of a change of level according to the action of the water. These gardens are cultivated by men in boats, who in the same manner gather the crop, chiefly cucumbers and melons, though they are often compact enough to bear the weight of a man.

Genuine Cashmere shawls, though not in such demand as formerly in Europe, owing to excellent French and other imitations, are still in repute, and furnish employment to a large proportion of the population. The number annually produced, plain and variegated, fine and inferior, is stated to be 30,000, the work of 16,000 looms. Those of the best quality, which have realised prices of £100 and upwards, owe their superiority to the fineness of the texture, the firmness of the colour, and the patient industry of the workmen, for they are woven in rudely-constructed looms. Three or four men will be engaged a whole twelvemonth in weaving a single pair. The shawl-goat which yields the material in its long silky hair inhabits the high table-lands of Tibet, and is distinguished by horns of great length, flattened, and wavy. Our word 'shawl' is a corruption of the native name of the fabric *duschala*.

The history of Cashmere goes back to an early age. Herodotus states that it formed, along with a portion of Upper India, the twentieth satrapy of the Persian Empire in the reign of Darius Hystaspes. It is mentioned by Strabo, Pliny, and Ptolemy. The last very accurately describes the position of the valley. It appears to have long remained the seat of an independent Hindu kingdom, and had next a series of Mohammedan rulers, who held possession down to the year 1586, when it was reduced by the Mogul emperor, Akbar, and added to the empire of Delhi. That prince, and his consort, the peerless Noor Mahal,

Kunchinjunga Peak.

favoured the district, and strove to render it paradisiacal, as did their successors. Shah Jehan constructed the celebrated Shalimar Gardens, eulogised by poets and travellers. Scrais, or halting-places, were established on the way at convenient distances. The royal progresses required providing for. Bernier, the French physician, who accompanied Aurungzebe in 1664, states that the imperial cortege consisted of 35,000 horse and 10,000 foot, with 70 pieces of heavy cannon, and from 50 to 60 pieces of stirrup artillery, as it was called. The route commonly taken was that of the Pir Punjal Pass, the most direct, but one of the loftiest, 11,400 feet above the sea, yet the most frequented in summer. A good road across the mountains is said to have existed in those days. The route is still called the 'Emperor's Highway.' At present there are no roads in Cashmere, nor anything in the shape of a wheeled conveyance in the valley.

NEPAUL, a sovereign state, is a long and narrow territory on the southern slope of the Himalayas, intervening between the British province of Kumaon on the west and the protected district of Sikkim on the east. It is about 500 miles in length by 100 miles in average breadth. A region of grassy downs, and a belt of forest, form the border towards the plains of India, apart from which the country is everywhere rugged with stupendous elevations and deeply-cut valleys, which admit of an ascent, within limited areas, from tropical heat and luxuriance in the hollows, to icy cold and the sternest barrenness on the towering heights. Dhwalagiri, the 'White Mountain,' rises on the western side, with the highest mountain mass of the globe, Mount Everest or Gaurisankar, on the eastern, while the Kunchinjunga (28,620 feet high) dominates over Sikkim. Numerous streams, descending from the glaciers of the Himalaya, form considerable rivers by uniting in the valleys, render them in the highest degree fruitful, and pass through the plains to the Ganges. Nepal was formerly subject to several petty

Temple and Priest's House in Bhotan.

princes, but Jung Bahadur, the chief of the Ghurkas, a warlike tribe, who was made a Knight Grand Cross of the Bath for his services against the mutineers in Oude, is now the sovereign of the whole country. BHOTAN embraces the southern face of the Himalaya eastward from Sikkim to the intersection of the range by the Brahmaputra. It is a corresponding tract in its natural features, being mountainous, long, and narrow, but has fewer fertile valleys, while a more direct offshoot of Tibet as to its inhabitants, their religion, and form of government.

*Khatmandu*, the capital of Nepal, contains a mean palace, narrow and dirty streets of wooden houses, many brick-built Buddhist temples, with 50,000 inhabitants. The predominant tribe in the country, the Ghurkas, are a very diminutive race, but remarkably agile, strong, and warlike. They appeared under Jung Bahadur at the siege of Lucknow; but as most of the fighting was over before their arrival, they could only take part in the 'looting.' At this work they proved so indefatigable, that Lord Clyde was compelled to request the Nepalese chief to lead off his men before anything like order could be restored. When they departed, it was with an enormous baggage-train containing the spoil of the city. The Begum of Oude, when her cause became desperate, with Prince Feroze Shah of Delhi, and thousands of the sepoy, fell back upon the skirts of Nepal, where many perished of jungle fever, while others were slain in fight with the Ghurkas, or were captured, and delivered up to the British authorities. *Tassisudon*, the chief town of Bhotan, is near the western frontier, but is principally a summer capital, being deserted in winter on account of the cold. It contains a fortified palace, in which the Deb Rajah, the head of the executive government, resides. This functionary is elected only for three years, and is obliged by the terms of the constitution, along with all other officials, to separate himself for the time from all domestic ties. He is chosen by a council of eight, and completely controlled by the oligarchy. The supreme head of the state nominally, the Dherma Rajah is regarded more as a god than a sovereign, being revered as a born Buddh—that is, a child into whom the spirit of a deceased Buddh has been transmitted. Such an one is discovered in extreme infancy by a preference for cows' milk to that of his mother, as well as by other signs, and is forthwith installed till death as the religious ruler of the country. He resides at Poonakho, with a large number of monastic religionists, who practise celibacy, and devote themselves to the ritual observances of Buddhism. During the present year, 1864, a British mission to Tassisudon has been treated there with gross indignity and outrage, and Bhotan is now in collision with the Indian government.

#### V. FOREIGN SETTLEMENTS.

Portuguese, French, Dutch, and Danes have alike held territory in India, but only the two former powers retain any possessions at present, and these are of unimportant extent.

The Dutch occupied Chinsura on the Hooghly a century and a half, and had their gardens and country-houses in the home style, to which they repaired for recreation when the heat of the day was over. But in 1824 it was ceded to the British, along with some other places, in exchange for possessions in the island of Sumatra. The Danes held Serampore, on the same river, ninety years, and sold it to the British government in 1845, along with Tranquebar, a coast town on the south of Madras. Portuguese and French India, after embracing considerable territories, is now limited to a few detached sites of an insignificant collective area.

|                         | Locality.   |
|-------------------------|---|
| Portuguese India. . . . | Goa, . . . . . Western coast.                     |
| " " . . . .             | Damaun, . . . . . Concan coast.                   |
| " " . . . .             | Island of Diu, . . . . . South coast of Kattywar. |
| French India. . . .     | Chandernagore, . . . . . On the Hooghly river.    |
| " " . . . .             | Karical, . . . . . Coromandel coast.              |
| " " . . . .             | Pondicherry, . . . . . Coromandel coast.          |
| " " . . . .             | Yanon, . . . . . Orissa coast.                    |
| " " . . . .             | Mahé, . . . . . Malabar coast.                    |

The Portuguese were the first Europeans who established themselves in the country, arriving on the 20th of May 1428, but making then no permanent stay. Under a succession of able viceroys they rapidly acquired great power and prosperity, but their fortunes as quickly declined from various causes, not the least influential being the intrigues of the Jesuits, the Inquisition, and its concomitant, religious persecution, and marriage alliances with natives of the lowest castes. In the middle of the last century, the French gained ascendant influence by levying native troops, and disciplining them in the European manner. But with the recall of the Governor-general Dupleix, in 1754, their prestige vanished, and the opportunity for founding a Gallo-Indian Empire was lost for ever.

*Goa*, the city and dependent territory, on the west coast, intervene between the limits of the presidencies of Bombay and Madras. The town, some miles inland, once wealthy and magnificent, has a name in history, having been for a long period after its foundation the head-quarters of the Jesuit missions in the east. It was superseded as the seat of government, in 1753, in consequence of a dreadful pestilence, and is now utterly decayed. The present inhabitants are chiefly ecclesiastics, the place retaining its rank as the see of an archbishop, who is the primate of the Portuguese Indies. 'Old Goa,' remarks Captain Burton, 'has few charms when seen by the light of day. The places usually visited are the cathedral, the nunnery of Santa Monaca, and the churches of St Francis, St Gaetano, and Bom Jesus. The latter contains the magnificent tomb of St Francis Xavier. Altogether we reckoned about thirty buildings. Many of them were falling to ruins, and others were being, or had been, partially demolished. The extraordinary amount of havoc committed during the last thirty years is owing partly to the poverty of the Portuguese. Like the modern Romans, they found it cheaper to carry away cut stone than to quarry it.' *Panjim*, or *New Goa*, nearer the sea, to which the viceroy removed his residence at the time mentioned, the present seat of government, is a well-built town, of 10,000 inhabitants, with one of the best harbours on the west coast of India.

*Pondicherry*, the capital of the French settlements, 85 miles south of Madras, is a maritime town with a population of 30,000 and important commerce. Indigo, sugar, and the mulberry-tree are cultivated in the vicinity. In 1761 it was taken by Sir Eyre Coote, and the fortifications razed. The present town, in Sir C. Trevelyan's Minutes of a Tour, 1860, is pronounced to be 'more European than any Anglo-Indian place. It is like a small continental town transported to the shores of the Indian Ocean. It is teeming with intelligence and enterprise.' *Chandernagore*, on the Hooghly, an important place when Calcutta, 21 miles distant, was only a cluster of mud huts, is now rapidly falling into decay. A mound, ditch, and ruined fort are the only remains of its once formidable fortifications. The entire French settlement extends two miles along the bank of the river, and one and a half inland from it. Just beyond the boundary is the station of the East Indian Railway.

#### VI. CEYLON.

The large and valuable island of Ceylon, remarkable for magnificent woods, unsurpassed fertility, and stupendous antiquities, is situated on the south-east of the Indian peninsula, at the distance of about sixty miles from the mainland, at the nearest point. A northerly section of the separating channel has the name of Palk Strait, derived from a

Adam's Peak, Ceylon.

Dutch navigator. A larger southerly division is called the Gulf of Manaar, after an islet in its basin. The two are divided by a chain of isles and sand-banks, which obstructs completely the passage of large vessels, bears the name of Adam's Bridge, and figures in Hindu mythology as the route by which the demi-god Râma invaded Ceylon. This oval or pear-shaped island has a length of 271 miles from north to south, by an extreme breadth of 137 miles in the opposite direction, and includes, with some insular dependencies, an area of 25,742 square miles, being about one-sixth smaller than Ireland. The shores almost everywhere rise gently from the water, are verdant throughout the year, and the contrasted colour of the perennially green foliage, with the yellow strand, and the sea, blue as sapphire, never fails to excite the admiration of the voyager, fresh from the less variegated and more sober livery of European scenes. At a short distance from the beach, the surface pleasantly undulates with richly-wooded hills, but the general elevation is moderate, except in a central southern zone occupied by a plateau, from which the Pedrotallagalla Mountain, the highest point, shoots up to the altitude of 8280 feet. Adam's Peak, in the same district, the subject of many a wild legend and a place of pilgrimage, attains to 7420 feet. On the summit, Buddha himself is believed to have stood, leaving there the imprint of his sacred foot. This is a depression in the rock, five feet long and two broad, around which a ring of brass has been placed, ornamented with a few gems of trifling value. The mountain is therefore ascended as an act of homage by his followers, and is locally distinguished by a name signifying 'the footstep of fortune.' In its vicinity the principal river has its source, called the Mahawelli-ganga, which flows to the north-east coast, and enters the splendid Bay of Trincomali. The climate is governed entirely by the monsoons like that of the mainland, but the island enjoys a more equable temperature. Its mineral products include carbonate of iron in great abundance, rich veins of plumbago, precious stones found in the alluvial plains, as sapphires and rubies, and a valuable pearl-fishery which has been prosecuted from time immemorial in the Gulf of Manaar. This fishery in some years yields a revenue to the government of £20,000. The divers inhale a full breath, descend rapidly to the bottom of the water weighted with a sinking stone from which they immediately liberate themselves, fill their baskets with the pearl shells, and are then quickly hauled up to the

surface. From sixty to seventy feet is the greatest depth to which they descend, and eighty-seven seconds the longest time they can remain submerged.

The vegetation is singularly exuberant and splendid. Forests yielding useful and ornamental timber, teak, ironwood, ebony, and satin-wood, are extensive and dense, enlivened with flowering shrubs and climbing plants of prodigious magnitude. Many of the latter literally cover the trees with a blaze of gorgeous crimson flowers, and spread, by shedding them, a carpet of scarlet on the ground at the base. One enormous creeper, called the great hollow climber, forms pods, some of which are five feet long and six inches broad, containing beautiful brown beans, which the natives adapt to ornamental purposes. The palmyra, talipot, jaggery, and cocoa-nut palms are specially prominent in the northern part of the island. It is estimated that the number of cocoa-palms amounts at least to 20,000,000, the fruit of which contributes largely to food, while almost every part of the tree is employed for some domestic service, and the oil is extracted from the nut for export. Members of the fig family are planted near the temples, especially the peepul, *Ficus religiosa*, some of which are of vast size and great age. In the elevated southern district the cinnamon-laurel is grown in greater abundance than in any other part of the world, supplying three principal articles of commerce, the aromatic buds called cassia buds, the dried bark of the plant or cinnamon, and the essential oil used in medicine obtained by distillation. In this region many of the mountain forests have been superseded by coffee plantations, the cultivation of which is increasing. Ceylon corresponds generally to India in its forms of animal life, but has not the tiger, the cheetah, the wolf, or the hyena.

The Portuguese were the first European visitors to Ceylon in 1505, and founded a permanent settlement in 1517. They were driven away by the Dutch in 1658, after a war of twenty years, who, in their turn, were compelled to cede all their possessions to the British in 1796. The island now forms a colony of the crown, wholly unconnected with the Indian presidencies, and the affairs of which are administered by a governor nominated by the sovereign, assisted by a cabinet and a legislative council. Native kings continued to reign over the mountainous part of the interior, with Kandy for their capital, down to the year 1815, when the last, a frightful tyrant, provoked war with the British, was taken prisoner, and formally deposed with the consent of his chiefs.

Colombo, the capital, on the west coast, bordered by a lake or lagoon, contains a population of 40,000, and is the principal centre of the foreign trade. The harbour is small and can only be entered by light craft, but large vessels anchor safely in the offing, except during the south-west monsoon. Residences of the British and government offices are within the enclosure of the fort. Exterior to its walls are modest-looking houses of the Dutch and Portuguese, with the quarter occupied by the native races, whose dwellings are of white-washed mud, either covered with tiles, or thatched with the plaited fronds of the cocoa-nut palm. The town is the seat of a colonial bishopric and of the supreme court of justice. In the latter the eminent Tamil advocate practises, Coomara Swamy, who was called to the English bar at Lincoln's Inn in 1863, being the first non-Christian Hindu-English barrister, and who is also a member of the Legislative Council. Civil and military authorities, native and European merchants, resort to the neighbouring hamlet of Calpitty for recreation, surrounded by cinnamon gardens and cocoa-nut groves. A magnificent mountain road connects Colombo with Kandy in the interior, and is thronged with bullock-carts laden with coffee for the port, or carrying up rice and stores to the hill-country. Another road diverges southward through exquisite scenery to Point de Galle, seventy miles long, literally an avenue of palm-trees. Railways are now in progress. The first turf was cut by the governor, Sir H. Ward, August 13, 1853. *Point de Galle*, the 'Cock's Point' of the Portuguese, the *Galla*, 'rock' of the natives, is on the south-west coast, a station for the Peninsular and Oriental Company's steamers, 2134 miles from Aden. The mail arrives by the overland route from England in thirty-one days. Passengers embark the same day in steamers for Calcutta or Singapore, and the further East, according to their destination. The place consists chiefly of public buildings, which include the fort, about a mile in circuit, the post-office, barracks, light-house, a Dutch church, and hotels. Groups collected at the landing-place on the arrival of steamers offer a picturesque sight from variety of costume. The private houses are one story high, furnished with verandahs which run along the entire frontage. Except for about four months in the year, the harbour is unsafe, being exposed to sudden squalls of tremendous violence. Ceylon, having been visited for trading purposes from remote antiquity, many authorities are inclined to identify Point de Galle with the Tarshish of the Hebrew Scriptures, from which Solomon's ships returned bringing gold, silver, ivory, apes, and peacocks. *Trincomali*, a fortified commercial port on the north-east coast, contains 30,000 inhabitants, and possesses a capacious haven, secure in all seasons, landlocked and calm as a mountain

lake. *Jaffnapatam*, a small seaport at the north extremity of the island, is of Dutch origin, contains a considerable number of persons of Dutch descent, with learned Tamils, and has long been an American mission station.

*Kandy*, the old native capital, is beautifully situated in the mountainous region, on the margin of a small lake, overhung on all sides by hills. But besides the commandant's residence, and some dilapidated temples, it is little more than a collection of huts. The Malegawa temple here contains the most sacred relic in the country, which attracts pilgrims from the remotest parts of India, Burmah, and Siam. This is the Delada, reputed to be the tooth of Buddha, which is preserved in a costly shrine, and guarded with jealous care. But it is well known that a relic so called was destroyed by the Portuguese. The substitute is only a piece of discoloured ivory, about two inches in length and one in diameter, slightly curved. Natives regard it as the palladium of the country, and believe that whoever possesses it acquires the right to govern Ceylon. So strong in general is this persuasion, that in 1815, when the British forces captured the place, further resistance ceased. Chiefs and people united in submitting to the English as the proper masters of the island, as they had obtained possession of the Delada. Devotees lay offerings before the shrine by which the priests profit. *Neuera Ellia*, fifty miles on the south, connected with Kandy by an excellent road running through coffee plantations, is entirely modern, and is used by Europeans as a sanitarium. The place occupies a table-land 6210 feet above the sea, in the neighbourhood of which *Pedrotallagalla* rises 2000 feet higher, and overlooks a magnificent landscape. The climate is temperate, owing to the elevation. Almost all kinds of European fruits and vegetables are raised. Here the governor may generally be found, with military and civil officers, invalid soldiers, and other visitors, in the season between January and May.

Monuments of antiquity of extraordinary magnitude are met with in the northern parts of the island, buried in the depths of the forests. They consist of ruined cities, with pagodas, sculptured figures, and a few rock-hewn temples, which proclaim the existence of a departed race far superior to the mass of the present natives. Reservoirs for purposes of irrigation also remain, more or less dilapidated, of which 30 of colossal size are reckoned, with not less than 700 of small dimensions. The restoration of some of these useful works is in progress.

Ceylon contains a population of about 1,698,000, of whom those of European descent form a very small proportion. By far the most numerous body, called the Singalese, are found chiefly in the southern and central parts of the island. They are Buddhists in religion, ingenious workers in metals, and in manufactures of cordage, matting, and baskets; of effeminate and cowardly spirit, except those in the highland region, who are a sturdy race, and bravely defended their hills against the intrusion of the Portuguese, Dutch, and British. In the northern districts are numerous Tamils, descendants of invaders or immigrants from Southern India, who adhere to Brahmanism, are physically and mentally a superior people, widely spread by their mercantile enterprise, and extensively familiar with the advantages of English education. Not a few have shewn themselves accomplished in mathematics, mechanics, and jurisprudence. A Tamil engineer has been employed in the construction of the Madras railways; nor would it be difficult to find men among them who can correctly predict an eclipse, explain the calculus of Newton, and propound the laws of gravitation. The Moormen form another section of the population, who are Mohammedans, supposed to be of Arab descent, everywhere energetic traders. Probably the aborigines are represented by a remnant in the eastern part of the island—the *Veddahs*—but little above the wild animals of the forests, except in inoffensiveness, now subject to improving influences supplied by the British government.

#### VII. MALDIVES AND LACCADIVE ISLANDS.

Two groups of islands, the Maldives and the Laccadives, north and south of each other, are situated off the south-west coast of India. They consist chiefly of low coral formations, densely clothed with cocoa-nut trees, which contribute to the support of the inhabitants by the use and export of the produce. The Maldives, the most southerly cluster, include upwards of a thousand isles and reefs, under the rule of a native chief, who pays tribute to the governor of Ceylon. The Laccadives, seventeen in number, are occupied by a race of Arab descent, who profess a kind of mongrel Mohammedanism, and have their own ruler, subordinate to the presidency of Madras.

India, even in those parts under direct British control, has not yet been subject to a complete census of the people. This was to have been taken in the year 1861, but owing to the general agitation occasioned by the mutiny, its execution was deemed inexpedient, lest the vast population should misconceive the motive of the government, and be excited by the designing to insurrectionary movements. Official estimates return the number of strictly British subjects at about 155,000,000. To these, it is supposed, must be added 40,000,000 for the inhabitants of protected states and independent territories, thus making a grand total for the entire population of nearly 200,000,000. In classifying this immense aggregate, Mr Montgomery Martin conceives that aboriginal races, known by various names, and greatly scattered, number 20,000,000. The Mohammedians he reckons at from 12,000,000 to 15,000,000; the Sikhs, on or near the Sutlej, at about 2,000,000; the Jains or Buddhists, widely diffused, at 5,000,000; Hill tribes and sundry others, at 8,000,000; the remainder, 150,000,000, being Hindus of the Brahmanical creed.

At an unknown period, but many centuries prior to the Christian era, the Hindus are believed to have migrated from a northerly clime, probably in large bodies and in rapid succession, entering the country from the north-west, and establishing themselves first in the Punjab. In that district they were found by Alexander as the master-race, evidently long settled; being in possession of regular government, arts and manufactures, with trained cavalry and infantry, war-chariots, and disciplined elephants, over whom he obtained a hardy-won victory. They were also spread over the whole of Northern and Central India, yet are supposed only to have extended in small numbers into the Deccan. The conquering immigrants reduced the primitive inhabitants to serfdom, or drove them to escape the lot to the hill fastnesses and woodland heights, where many of their descendants have remained to the present day, while others are dispersed far and wide. These aboriginal races are known by the various names of Konds, Bheels, Santals, Mairs, Koles, Bengies, Domes, and Bhâts. They are found in jungles, forests, mountainous districts, and the outskirts of towns; were formerly prone to live by plunder, and committed frightful excesses to obtain it; but many have been reclaimed by the care of the government, and now faithfully serve it as efficient soldiers and armed police. The numerically dominant people, the Hindus, had in their turn to succumb to Mohammedan invaders, and were reduced to a condition of inferiority, varying with the ability and disposition of the conquerors. These victors eventually shared the lot of the vanquished in the loss of political predominance; and the overthrow of both Hindu and Mohammedan power may in no slight degree be referred to a suicidal abandonment to the intoxicating influence of opium and the enervating pleasures of the zenana.

Under the modifying influence of different climate, food, and other external circumstances, operating for ages, the Hindus have ceased to be a homogeneous people. Their diversities in appearance, character, habits, and language are now as great as those which exist among the various nations of Europe. 'The native of the cool, dry, elevated regions of Malwa and the Deccan is as unlike the denizen of the hot and moist plains of Bengal and Tanjore, as the hardy Swiss to the voluptuous inhabitant of the banks of the Tiber, or the industrious Englishman to the slothful Portuguese.' In general, the figure is slight, graceful, and admirably proportioned, but muscular and athletic on the high table-lands; the face is oval, and the features regular; the eyes and hair are black; the skin is soft and polished; the complexion varies from the deepest olive to a light transparent brown. About twenty-six different languages are spoken, embracing a great number of dialects; but with the exception of a few in Southern India, they are all derived from the Sanscrit, the ancient tongue of the people, that of their sacred books, which, though not now vernacular, is cultivated by the learned. The Hindustani is the most

useful language for the European, as it is not limited to any particular district, but the ordinary medium of colloquial intercourse throughout the country, employed in the courts of justice, and by the authorities in communicating with the natives. It is of comparatively modern date, the result of the admixture of a native dialect with the Arabic and Persian introduced by the Mohammedan conquerors, and was formed chiefly during the reign of the Emperor Akbar. But in many localities the English language is making progress, being taught in schools sustained by the government, and in mission seminaries. Among the social institutions, that of caste restrains individuals of different classes from intermarriage, and even from association with each other. Similar distinctions are, however, practically recognised to a great extent in the intercourse of life among the western nations. Originally, caste existed in its four broad divisions of the Brahmans, or priests; the Kashatrya, or military; the Vaisya, or mercantile; and the Sudras, or servile class. Human passions, however, proved too strong to be restrained, and except in the instance of the sacerdotal order, the others intermingled. But a multitude of castes sprung up from their admixture. Yet unsanctioned by ancient usage, unauthorised save by common consent, these artificial social partitions are becoming less rigid, and may be expected to be altogether broken down, as far as they are prejudicial to general interests, by the influence of sound instruction and wholesome example.

An indigenous form of municipal government of great antiquity is an interesting feature in the social life of the Hindus. Each of the villages, meaning thereby not a mere group of dwellings, but a district of varying extent analogous to a township, is under the jurisdiction of a head-inhabitant, called the *potail*. He acts as a kind of chief-magistrate, arranges disputes, sees to the collection of taxes, and appoints or superintends the *chokeydars*, watchmen or police, who have a certain number of houses committed to their charge. Several other functionaries are recognised as of public utility, as the priest, the schoolmaster, the musician, and the dancing-girl, all of whom are rewarded for their services in various ways at the expense of the community. 'Under this simple form of municipal government, the inhabitants of the country have lived from time immemorial. The boundaries of the village have been but seldom altered; and though the villages themselves have been sometimes injured, and even desolated by war, famine, and disease, the same name, the same limits, and even the same families, have continued for ages. The inhabitants give themselves no trouble about the breaking up and division of kingdoms. While the village remains entire, they care not to what power it is transferred, or to what sovereign it devolves. Its internal economy remains unchanged. The *potail* is still the head-inhabitant, and still acts as the petty judge and magistrate, the collector or renter of the village.' The indigenous rural police is effective in rendering petty thefts comparatively rare, and the poorer classes are content with the system, as it is from such minor offences that they principally suffer. But owing to the great extent of the country, with wild and uncivilised people in almost every part of it, some of whom are fiercely fanatical, an army of civil and military police is required for the repression of heinous crimes, and the maintenance of public order. This is now organised throughout British India after the model in general of the English county constabulary. It consists largely of the despised aborigines of various races under European officers, with inspectors drawn from the superior classes of native society, and has taken to a great extent the place of the regular army.

Pagoda of Phrabat.

## CHAPTER VII.

### INDO-CHINESE PENINSULA.

THE easternmost of the three great peninsulas of Southern Asia, frequently called Further India, and India beyond the Ganges, is more properly distinguished as an Indo-Chinese territory, from its position, population, and political relations. It is a region of very singular conformation, enclosed by the Chinese dominions on the north, conterminous with India on the north-west, having a western maritime boundary in the Bay of Bengal, an eastern in the China Sea, and a southern in the narrow strait of Malacca. Situated between latitude  $1^{\circ} 20'$  and  $27^{\circ}$  north, and between longitude  $90^{\circ}$  and  $109^{\circ}$  east, it embraces an area of at least 700,000 square miles, but is so extremely irregular in shape as to render any estimate difficult, and the insertion of extreme linear distances is on the same account fallacious as an indication

of magnitude. From an average breadth of 700 miles in the north, it suddenly dwindles to less than one-eighth of that extent, in the long and slender tract of Malaya. This is a southerly projection from the main mass of the country, which gives peculiarity to the outline, and is without a parallel as to unequal proportions. It has an extension of nearly 1000 miles in the direction of the meridian, but is narrow throughout, and diminishes in width to less than sixty miles where the greatest contraction occurs. The Gulf of Martaban on the west, of Siam on the south, and of Tonquin on the north-east, are the conspicuous maritime features of the Indo-Chinese peninsula.

The interior of the country is to a great extent very imperfectly known. Many parts have not been visited except by a few missionary travellers, and there are remote highland districts to which no European has penetrated. The general superficial aspect appears to be determined mainly by several chains of mountains, which diverge southward from the eastern extremity of the Himalaya, enclose great valleys between them, each the bed of a grand river-system, expanding into rich alluvial plains at the maritime extremity. These rivers are the Irawaddy and Salwn, westward, which descend from the Burman Empire to the Bay of Bengal, at the Gulf of Martaban; the Meinam, central, flowing through the kingdom of Siam, and entering the gulf of that name; the Makiang or Cambodia, eastward, which has the longest course, and passes through the empire of Anam to the China Sea. The first and last rank with the mightiest streams of the continent. Along the borders of the rivers, and on the slopes of the mountains, vast forests are found in almost all parts of the country, consisting of teak, ebony, white sandal-wood, red dye-wood, rose-wood, iron-wood, and other timber of value for ordinary and ornamental purposes. Members of the palm family and the bamboo luxuriate upon all the low grounds, especially the betel-palm, the fruit of which is nowhere of finer quality. Cinnamon plants of several varieties, and other aromatic shrubs are abundant, with trees yielding gum-resins used in medicine and the arts. The varnish-tree grows in perfection, and furnishes the resin applied to produce a highly-polished surface. Gamboge or camboge, the well-known pigment, with a place also in the pharmacopoeia, is the produce of *Cambogia gutta*, obtained by incision of the stem. The tree is lofty, bears edible fruit, and grows in Cambodia or Camboja, whence the name is derived. Gutta-percha, a concrete vegetable juice, is obtained from a large forest tree indigenous to Malaya and the adjoining countries. The scented eagle-wood is peculiar to Tsiampa, remarkable for its agreeable odour when burned, which is reduced to the powdered state, and used in immense quantities in the temples of China. Rice holds the chief place among the products of agriculture, as the general food of the people, along with various farinaceous roots. The sugar-cane, mulberry, cotton, indigo, and tobacco are also extensively cultivated. The plantain or banana is the staple fruit.

The number of wild animals is enormous. They include most of the huge quadrupeds of India; the elephant in large herds in the woods; the rhinoceros on higher ground and of wilder habit than his congeners elsewhere; the tiger, equally as fierce as the animal in Bengal; and the powerful buffalo in swampy places, is found domesticated as well as wild, along with the elephant and the ox. The forests teem with monkeys, and with birds of the richest plumage. All the varieties of domestic fowl are found in the villages, with the tall ungainly species in Cochinchina, so popular in England upon the first introduction of the breed. Alligators swarm in the large rivers, and are captured for food; nor are snakes, lizards, slugs, vermin, and offal refused as diet, while all classes abstain from the produce of the cow. In Burmah and Siam an absurd veneration is paid to animals of a white colour. Being deemed peculiarly sacred, no native meets a white cock without saluting him, and the white monkey is also revered. But the highest honours

are reserved for the 'Lord White Elephant,' who ranks as an estate of the realm, takes precedence after princes of the blood, has a palace, a minister, and numerous attendants. A tuft of his hair has figured in presents to the British Queen.

The Indo-Chinese peninsula includes several political divisions, some of which have no regularly-defined limits, and are feebly held by their respective governments.

| States.                        | Cities.                                      |
|--------------------------------|--|
| Empire of Burmah, . . . . .    | Ava, Amarapura, Muts-hobo, Patanageh.        |
| Kingdom of Siam, . . . . .     | Bangkok, Yuthia, Pechaburri.                 |
| Empire of Anam, . . . . .      | Hué, Turon, Kachao.                          |
| Basse Cochin-Chine, . . . . .  | Saigon, Mytho.                               |
| Country of the Laos, . . . . . | Chang-mai, Nang-rung.                        |
| Malaya, . . . . .              | Perak, Johore, Pahang.                       |
| British Possessions, . . . . . | Arracan, Pegu, Moulmein, Malacca, Singapore. |

The total population is supposed to range from 19,000,000 to 30,000,000, but only data of the vaguest description exists for an estimate. With the exception of a few Hindus in the western districts, Malays in the Malayan peninsula, and Europeans in their respective territories, the people ethnologically consist of nations of Mongolian origin, low in stature, allied in physiognomy to the Chinese, in manners and customs also in the eastern states, on the shores of which a large number of Chinese proper have long been settled. The languages spoken are of the monosyllabic class, but many polysyllabic terms have been ingrafted from extraneous sources. Buddhism is the prevailing form of religion, and has innumerable pagodas, temples, and image-houses, attended by thousands on great festival occasions, to honour with offerings the figure of the last Buddha, who is often represented in them of colossal size. Confucianism is professed by the higher class of the Anamese. A corrupt Mohammedanism is observed by the Malays, while Jewish traditions are cherished by the Tsiampis, the inhabitants of a little state on the China Sea, who have no idol worship, practise circumcision, and observe a day of rest. The native governments are completely absolute, exact servile submission from all classes of subjects, and use the stick freely to enforce it, from the infliction of which ministers of state and the highest court officials are not exempt. In industrial skill the people are far inferior to their neighbours, the Hindus and the Chinese. Women conduct the business of life much more than men, in addition to their domestic duties. They buy, sell, engage in agriculture, and consequently enjoy great personal liberty. Some of the better classes have brick houses roofed with tiles, but the majority of their dwellings have a wooden or bamboo framework thatched with palm leaves, while those of the lower orders are mere huts. Both sexes of almost every age in all ranks smoke immoderately, and chew the betel-nut.

#### I. BURMESE EMPIRE.

BURMAH, largely shorn of its proportions by wars with the British, in the present century, is a north-western territory, now entirely inland, bordered on the east by China and Siam, and enclosed in other directions by British provinces. It is traversed centrally from north to south by the Irawaddy, in the upper and middle part of its course, the 'father of waters,' as the name is interpreted. The river is navigable for vessels of considerable burden up to the capital, 400 miles from its mouth, and for barges to a greater extent in the rainy season, but all native control over communication by it with the sea has been lost, the whole delta having become British ground. The northern part of the country is mountainous, clad with immense forests of teak and pine. Oil-trees are members of the woods on the banks of the Salwn, from a single trunk of which many gallons of vegetable oil may be obtained every season. But petroleum, or mineral

oil, supplied in vast quantities by springs, is universally used for lighting, notwithstanding its disagreeable odour. Burmah has vast stores of mineral wealth, consisting of auriferous sands, gold and silver mines, iron and lead ores, celebrated ruby-mines, the property of the sovereign, under jealous guardianship. In the ruby-mines sapphires also, of great value, are occasionally found. Serpentine, marble, and amber are other products.

*Ava*, constituted the capital in 1819, a restoration of the distinction possessed twice before, lost it for a time in 1839 by a dreadful earthquake which destroyed nearly all the important buildings. It stands on a fertile plain by the Irawaddy, has the local name of Ratnapura, or 'City of Pearls,' but has not recovered from the catastrophe it suffered. *Muts-hobo*, to which the seat of government was temporarily removed, about thirty miles distant, is of note in Burmese history as the reputed birthplace of Alompra, a man of obscure origin, who made himself master of the country about the middle of the last century, and founded the present dynasty. *Amarapura*, 'Town of Immortality,' a seat of royalty on the river a little above Ava, shared in its disaster. *Patanageh*, lower down the stream, is chiefly a representative of the past, with remarkable remains of temple-architecture. In its vicinity are the principal petroleum-wells extending over a space of sixteen square miles. *Megung*, a fortified town, has the amber-mines in its neighbourhood, to which many foreign merchants repair. *Bhamo*, in the direction of the Chinese frontier, is the chief mart for the trade with that country.

The first war between the Burmese and the British broke out in 1823. At its close the king consented to pay the English a million sterling, receive a resident at his court, and ceded likewise the provinces of Arracan and Tenasserim. A second war commenced in 1852, which resulted in the capture of Rangoon, the capital of Pegu, and the permanent annexation of that province to the Anglo-Indian Empire.

The central and southern territory of SIAM extends around the head of the gulf of that name, and embraces the great valley watered by the Meinam, 'Mother of Rivers,' with the alluvial plain through which it discharges into the sea. It is the most important of the native states in a commercial point of view, has extensive mercantile dealings with adjoining countries, but the trade is almost entirely in the hands of Chinese settlers. The people are remarkable for the extravagant manner in which social respect is demonstrated. No inferior stands in the presence of a superior. Even younger brothers kneel in addressing the elder, or handing them anything requested, and subjects of the highest grade approach the sovereign on hands and knees. Ambassadors to England not many years ago instantly went down on all-fours in the presence of the Queen, and thus hobbled along to the foot of the throne, to the disturbance of the gravity of the court. The form of government is dual, conducted by two kings, whose respective duties have not been very clearly defined, but one seems to be at the head of the civil and the other of the military administration. They are far in advance of their subjects in apprehending the utility of European arts, and have a predilection for the English language. The king, Somdel Phra, who ascended the throne in 1851, had, according to M. Mouhot, mastered several of the physical sciences, besides having acquired a fair knowledge of Latin, and had even written several treatises in English. The population of Siam cannot be determined with anything like accuracy. The Roman Catholic bishop, Pallegoix, estimates it at 6,000,000. The difficulty of arriving at any correct result is augmented by the native practice of numbering males only. The native registers, according to Mouhot, shewed a few years ago, of the male sex, 2,000,000; Siamese, 1,000,000; Laotians, 1,000,000; Malays, 1,500,000; Chinese, 350,000; Cambodians, 50,000; Peguans, 50,000; and 50,000 of various tribes inhabiting the mountain-ranges.

Troops have been trained in the western manner, roads and canals constructed, ships built, steamers introduced, science and commerce encouraged, and printing from types, before unknown to the Siamese, has been established. Court astrologers and prognosticators are maintained with small annual stipends, who in former reigns received a sound castigation upon the failure of their predictions. By the crudest methods these astronomers-royal calculate the movements of the sun and moon, and eclipses.

*Bangkok*, the capital, near the outfall of the Meinam, is a vast town with an estimated population of, according to M. Mouhot, from 300,000 to 400,000, who live chiefly in bamboo huts, large numbers of which are

afoat on rafts in the river. 'Owing to its semi-aquatic site,' says M. Mouhot, 'we had reached the city while I believed myself still in the country; I was only undeceived by the sight of various European buildings, and the steamers which plough the majestic river, whose margins are studded with floating houses and shops. In this Venice of the East, whether bent on pleasure or business, you must go by water.' Forests of teak are in the neighbourhood, with some iron-mines. The appearance of the stream is the reverse of the picturesque. The water has the colour of loam, and teems with impurities, while extensive mud-flats are exposed on the recession of the tide, which the white pelican, a stately bird, and other sea-fowl attentively examine for prey.

*Yuthia*, or *Siam*, the old capital, higher up the Meinam, is a large town, but has not been of much importance since it was desolated in a war with the Burmese in 1767. *Pechaburri*, on the west side of the Siamese Gulf, is under royal patronage as a place of occasional resort, intended to be a kind of Brighton to the court. It was visited in 1859 by Sir R. Schomburgk, and described in a geographical paper.

## II. EMPIRE OF ANAM.

The empire of ANAM embraces an easterly division of the country, lying on the China Sea, the maritime parts of which are generally fertile alluvial plains, bounded by a mountain-range which runs parallel with the coast, but at a varying distance from it. Three principal districts are included, formerly distinct states, and only loosely held together at present. These are Tonquin on the north, bordering upon China, from which the Song-ka, or 'Great River,' is received, celebrated for the auriferous sands in the beds of its tributaries; Cambodia, on the south, chiefly a level region singularly productive, fertilised by the overflowing of the Makiang, and a net-work of streams; and Cochin-China, intermediate, a long but comparative narrow tract of land on the coast, with a background of wild and naked granitic mountains. The north-eastern shores are within the range of the typhoons, which sweep over the China Sea with fearful violence, and are initiated by such an awful aspect of the sky as if the day of doom to universal nature were portended. The country of the LAOS, rich in metals and woods, is in the far interior, enclosed by Burmah, Siam, Anam, and China. It belongs partly to each, but contains tribes which retain independence under their respective chiefs. MALAYA, the remarkable south-western projection of the Indo-Chinese peninsula, is held by a few separate tribes of Malays, insubordinate to their own chieftains, good seamen, but piratical in their habits, and treacherous in their character. There is British ground within its limits.

*Hue*, the capital of Anam, one of the coast towns of Cochin-China, is on a river of the same name, which flows through lovely scenery, about ten miles above its outlet. It has been well fortified by European art, contains an arsenal and building docks, but is accessible only to small vessels owing to the shallowness of the stream, and a bar at the mouth. *Turon*, southward on the coast, is famed for the sacred mountains of marble in its neighbourhood, in which a very striking Buddhist temple has been excavated. *Kachao*, an inland town of Tonquin, on the Song-ka, is said to be the largest in the empire, with a population of 100,000. It was once the seat of English and Dutch factories, and is in active commercial intercourse with China. The Tonquinese of the present day are averse to communication with Europeans, and but little is known of the country. It was added to the empire of Anam by Gia-lung, a sovereign who lost his throne towards the close of the last century, but recovered it by the aid of French officers, and died about the year 1820, having firmly re-established his authority. In return for military assistance he promised protection to Roman Catholic missionaries, who speedily began their labours, but opposition and persecution followed from his successors. This led the French actively to interfere to compel the reigning monarch to alter his policy, at the same time possessing themselves of Basse Cochin-Chine, a portion of his dominions, lying on the lower course of the Saigon.

*Saigon*, formerly the capital of Cambodia, now of Basse Cochin-Chine, is situated upon a river of the same name, about sixty miles from the sea, with sufficient water to float a three-decker. It is a large, well-built, commercial city, with fortifications in the European style, contains a naval-yard, an arsenal, and is said to have at least 100,000 inhabitants. The place was taken by the French in 1859. Their territory, which promises to be a valuable acquisition, is divided into six provinces. It comprises an area of more than 10,000 square miles, and has a population estimated at 2,000,000. By the recent treaty, the whole of Cambodia has been placed under the suzerainty of France.

*Chang-mai*, the chief town of the Middle Laos, is on the Meinam, and contains about 25,000 inhabitants. The character and manners of these people were first illustrated by the missionary traveller Dr Gutzlaff. They are divided into numerous tribes under chiefs whose government is patriarchal, follow various pursuits, but chiefly agriculture and mining; are peaceful, honest, and industrious; fond of music, and graceful dancers. They sing to the tones of the bamboo organ; and dance holding garlands of flowers or lighted torches in

their hands. The wealthy Siamese have commonly Laos women for their wives. The men are expert at mining. They obtain gold, silver, copper, and iron from the mountains, metals which are principally sent into China, but clandestinely, in order to avoid the heavy tax.

Moulmein.

## BRITISH POSSESSIONS.

|                                   |  |
|-----------------------------------|--|
| Assam, Chittagong, &c., . . . . . | Gowhati, Sylhet, Chittagong.             |
| British Burmah, . . . . .         | Arracan, Akyab, Rangun, Prome, Moulmein. |
| Andaman Islands, . . . . .        | Port Blair.                              |
| Eastern Settlements, . . . . .    | Georgetown, Malacca, Singapore.          |

ASSAM, a long and narrow province, is situated on the middle course of the Brahmaputra, and is limited to the valley of the river, joining Bengal on the west, to the presidency of which it belongs. It was formerly part of the Burman Empire, but was ceded by that power after the first war, in 1826, when all right to some adjoining districts was at the same time renounced. The population is spare, and consists chiefly of Hindus of the Brahmanical creed, of an inferior type to the majority of their brethren. The towns, so called, are little more than ranges of straggling huts, but the country is important, as a home of the tea-plant, to which by cultivation the aspect of a great tea-plantation is in process of being given.

High bordering mountains, streams descending their declivities to the centrally intersecting channel of the Brahmaputra, great forests and jungles occupied by an immense number of large and formidable wild animals, as elephants, rhinoceroses, tigers, leopards, and buffaloes, with frequent shocks of earthquakes, are the natural characteristics of Assam. A considerable extent of ground is now occupied by the tea-plant, carefully cultivated in the first instance under the direction of Chinese instructors. The produce has realised higher prices in the London market than the finest qualities from China. Plantations established by the government have supplied 100 tons of tea-seeds, and 2,500,000 seedling plants in a single season to other districts. Land is granted for the purpose on easy terms to enterprising capitalists. In July 1862 there were actually under cultivation 13,223 acres, bearing an estimated crop of 1,788,737 lbs., and affording employment to 16,611 daily labourers. But a total space of 71,218 acres had been appropriated. There are now 160 plantations, owned by sixty companies and individuals. *Gowhati*, in Lower Assam, is the principal

seat of trade, and the only place entitled to be called a town. *Saikwah*, in the upper or eastern part of the province, is chiefly a military station.

Southward of Assam are the wild, wooded, and hilly districts of *Cossya*; *Cachar*, where the tea-plant grows wild, and is also under culture; and *Sylhet*, where coal is worked. Tribes in an almost savage state here occupy stockaded villages in natural fastnesses, from which they issue on marauding expeditions, and make good their retreat with plunder before the military police can arrest the foray. Further south, on the Bay of Bengal, is *Chittagong*, the head of a district, in an unhealthy locality, once a commercial port and site for ship-building, but decayed since the acquisition of more favoured positions in British Burmah.

BRITISH BURMAH, a maritime territory, on the eastern side of the Bay of Bengal, extends between latitude  $11^{\circ}$  and  $21^{\circ}$ , equal to a direct distance of about 700 miles, but the average breadth is comparatively limited. It includes the provinces of Arracan, Pegu, Martaban, and Tenasserim, obtained by conquest from the Burmese; and consists of a generally flat, alluvial, rice-growing coast region, with hills rising into ranges of forest-clad mountains for the inland boundary, and a multitude of islands close in-shore. The area is estimated at 81,400 square miles, and the population at 1,732,000. There are a variety of races among the inhabitants, but nearly half the number are Burmese, principally found in Pegu, in the delta of the Irawaddy. Karens are also numerous, wild highland tribes, favourably spoken of as disposed to receive instruction themselves, and send their children to schools to learn English as the key to general knowledge.

*Arracan*, on a river of the same name, 50 miles from the sea, is seated in a swampy insalubrious valley, surrounded by extensive ancient defences. The seat of government has been removed to *Akyab*, and Arracan has declined in favour of its successor as a local capital. *Akyab*, now the chief port of the province, stands on an island at the mouth of the stream. *Rangoon*, on an eastern branch of the Irawaddy, near its outlet, was formerly the chief port of Burmah. It is now fortified in the European manner, possesses a dockyard, and a flotilla of steamers and flats for the conveyance of passengers and stores up the river. On the 4th of December 1858, the ex-king of Delhi, with the queen, and some ladies of the zenana, arrived here, on board *H.M.S. Megera*, and was sent to an inland station to undergo the sentence of a felon transported beyond seas. *Prome*, higher up the Irawaddy, is the largest place in British Burmah, containing 30,000 inhabitants, situated in the midst of rice-ground and gardens. *Moulmein*, near the mouth of the Salwn, is a flourishing seaport, with vast forests of teak for ship-building in its vicinity. Its history is somewhat curious. Soon after the cession of the territory to the British in 1826, Mr H. Gouger crossed the Salwn from the town of Martaban. He found a wide extent of country on the opposite bank, completely covered with woods and jungle, of which wild beasts and reptiles had long been the only inhabitants. But evidence appeared of human occupancy in bygone time. In the very midst of the wilderness stupendous walls were found, neatly and strongly built of brick, with large forest-trees growing from their tops, or out of rents and fissures in their face. The walls had towers at their angles, and along their several sides at regular distances. They enclosed a vast square or parallelogram, then a void space, but fragments of buildings shewed that a very considerable city had once occupied the spot. This was Moulmein, of which the Portuguese traveller Pinto caught a glimpse in the middle ages; ruined by savage warfare, it disappeared in the jungle which rapidly overgrew its remains. It is now a thriving shipping port, with 17,000 inhabitants, among whom are Parsee, Armenian, and Burmese traders. Good coal is found in the vicinity, as well as at some other points southward on the coast.

The ANDAMAN ISLANDS, an extensive group in the Bay of Bengal, opposite the shores of British Burmah, are occupied as a penal settlement, selected in the first instance for the captured sepoys concerned in the Indian Mutiny, but now destined to receive generally the convicts sentenced in India to transportation. *Port Blair*, the colony recently established, with upwards of 2000 prisoners, is named after Captain Blair, who founded a settlement on the North Andaman in 1792, which was abandoned after four years' struggle with disease. The islands were re-visited in 1857, by a deputation in the steamer *Pluto*, for the purpose of fixing upon a suitable site for the station.

The trees are of enormous size, closely packed, almost hid from view by a growth of parasites and creepers. The mangroves, with their long hanging branches falling to the earth, and again taking root, grow almost in a line of forest along the shore, and even projecting far into the water at high tide. The natives are a pigmy race, but fierce and intractable as demons, incredibly agile, extremely barbarous in their habits, wearing no covering beyond a coating of mud, renewed every night as a protection from mosquitoes, ticks, and other annoying insects.

The EASTERN SETTLEMENTS are connected with the Strait of Malacca. They consist of Prince of Wales's Island, at the north entrance; that of Singapore, at the south extremity;

and the district of Malacca, intermediate, on the mainland, which completely commands the channel. It separates the peninsula of Malaya from the island of Sumatra, and is the best and most frequented route between India and China.

Prince of Wales's Island, its official style, has the native name of Pulo-Penang, 'Betel-nut Island,' from the areca-palm which produces the fruit, and grows luxuriantly. It is eighteen miles long, eight miles broad, traversed centrally by a ridge of hills, and about two miles from the mainland. *Georgetown*, the capital, contains a population of 40,000, of a very miscellaneous description, possesses a good harbour, and enjoys a delightful climate. The island was acquired by the East India Company in 1785; and on the adjoining main shore, in 1800, a small district, called Wellesley province, was obtained by purchase from a native chief. The pepper vine is very successfully cultivated in Penang. In 1858, at Georgetown, the first execution of a white man occurred, an American sailor, for the murder of the mate of his ship.

*Malacca*, a well-built town, at the mouth of a small Malayan river, is the chief military station of the British on the strait. Its name has become widely known from the association of St Francis Xavier with the Church of Our Lady del Monte, and the Anglo-Chinese college founded by the missionaries Morrison and Milne. It was ceded by the Dutch, in 1824, in exchange for Bencoolen in Sumatra. The dependent territory extends about forty miles along the coast, by twenty-five miles inland, but has no features of interest, and very thinly occupied.

*Singapore*, 'City of the Lion,' is a principal entrepôt for European and Asiatic merchandise, containing a population of 60,000, among whom the Chinese are prominent. It is 1470 miles from Point de Galle in Ceylon, and 1600 miles from Calcutta, and is a principal station of the Peninsular and Oriental Company's steamers. Being within eighty miles of the equator, the climate is hot but equable. The island, bearing the same name as the town, is of elliptical form, twenty-seven miles long, and fifteen miles broad, separated by a narrow channel from the mainland. The Malays call it Ujong Tanna, the 'Land's End,' situated at the south extremity of their peninsula, and of the continent of Asia. Its soil is fruitful, it does not abound in trees, but its hills and valleys are covered with pleasant verdure. The port is secure at all seasons of the year; the imports amount to £3,500,000, and exports to £3,000,000. It became a British possession in 1824.

Malacca.

Canton River and Ho-nan Island.

## CHAPTER VIII.

### THE CHINESE EMPIRE.

HINA, and the adjacent territories usually considered component parts of the empire, though several are now very loosely connected with it, include a vast section of Eastern and Central Asia, enclosed by the Russian dominions on the north, India and the Indo-Chinese peninsula on the south, Turkestan on the west, and arms of the Pacific Ocean on the east. The region within these bounds is proudly denominated by the native race *Tchou-Koue*, 'Centre of the Earth,' in allusion to its supposed importance, and *Teen-hea*, 'Under Heaven,' in reference to its extent, while its rulers have assumed to themselves the titles of 'Sons of Heaven,' and 'Brothers of the Sun and Moon.' The area is estimated at 5,393,000 square

miles, equal to nearly one-third of the extent of Asia, while half as large again as the whole of Europe. It contains at least one-third of the entire human race. Immense districts are comprehended with totally opposite features. There are the most densely-peopled lands, and also utter solitudes, or wastes thinly sprinkled with nomadic tribes. An alluvial plain of the richest soil, larger than France, minutely cultivated, and bordered by ranges of azalea-clad mountains, co-exists with tracts of sand or shingle without the slightest vegetation, the monotony of which is unbroken in its dreariness for leagues, and

has no variety at all but low sterile hills and rocky ravines. Tremendous hail-storms, clouds of dust or snow flying in alternate seasons characterise these regions; mingling with the camels, merchants, and couriers of a passing caravan. Besides China, the principal divisions of the empire are Mantchuria, Corea, Mongolia, Chinese Turkestan, and the Tibetan countries.

#### I. CHINA PROPER.

This region, forming the south-easterly section of the empire, embraces one-third of its extent, according to a probable estimate, or 1,700,000 square miles, and contains a population of more than 360,000,000, who form generally a homogeneous people, with one type of countenance, one written language, similar modes of thought, and great uniformity of dress, habitation, and social life. The boundary is maritime on the east and south, formed by branches of the Pacific Ocean, of which the most important are the Yellow Sea and the China Sea. The Yellow Sea divides the north of China from the Korean peninsula, and has been so named from the discolouring of the water by the sediment brought into it by the rivers, the deposition of which renders it in many parts extremely shallow. The China Sea intervenes between the southern provinces and the Philippine Islands; and is occasionally of perilous navigation, owing to the typhoons or rotary storms which visit its basin, strew the shores with wrecks, and destroy life and property by the fall of houses even in the cities. A vast number of islands closely fringe the coasts, but all are of small size, with the exception of Formosa and Hainan. The country has an extent of about 1470 miles from north to south, by 1350 miles from east to west; and is comprised between latitude 20° and 42° north, longitude 98° and 123° east. On the western side, embracing half the area, the surface is mountainous, and rises in bolder ranges as Tibet is approached, some of which long retain the winter's snow upon their crests, but are richly clad with woods on the slopes. The other half, in the southerly part, is beautifully varied with hills, cultivated to the summit on the terrace principle, clothed with fruit-trees, flowering plants, or edible vegetation. The northerly portion consists of the great plain, the most productive granary in the world, and the seat of its densest population, extending from the south of Nankin to the north of Peking. Its low swampy tracts are cultivated as rice-grounds, while those which are firm and dry are irrigated and manured with the utmost care for various produce.

Two rivers of the first class in magnitude, the Hoang-ho and the Yang-tse-kiang, distinguish the hydrography. Both descend from the Tibetan highlands, and traverse the country from west to east, but make enormous detours to the north and south. They separate to immense distances in the middle parts of their course, but closely approach each other in the lower, and have their outlets within the limits of the same province. These rivers are very differently regarded by the Chinese. The Hoang-ho, or Yellow River, contributes the sediment which gives colouring and a name to the Yellow Sea, derived chiefly from the great plain, as in the early part of its flow the water is remarkably clear. It has a mighty, furious, and unmanageable current, and is therefore little adapted for navigation by native craft, requiring embankments to prevent inundations on its passage through the lowlands, and from often breaking bounds, one of the emperors styled it 'China's Sorrow.' Very recently the turbulent river has left its former channel for upwards of 200 miles from the mouth, and chosen a new one more to the north, though this is probably only a return to an ancient water-way, as there have been repeated shiftings in its course. Many slight shocks of earthquakes experienced in the great plain in 1852-1853 are believed to have promoted the change. The Yang-tse-kiang, 'Son of the Ocean,' has a longer course, an ampler basin, a milder and more majestic flow; and only agreeable associations are connected with it. It is the favourite river of the

natives, with vast cities on its banks, wide margins of fertile and cultivated lands on either hand, and thousands of junks constantly afloat upon its surface. British ships of the line passed up it to Nankin during the recent wars; and since the treaty of Tien-tsin in 1860 it has been ascended by a private party under Captain Blakiston, with the view of penetrating by it through Tibet into India. The adventurers gradually exchanged the alluvial plains of the coast for bold and beautiful scenery, high rocks and mountains, glens and gorges, with frequent rapids. Coal of superior quality, and gold associated with mica, were found worked on the banks; but, after a progress of 1500 miles by the stream, the explorers encountered such difficulties from the disturbed state of the country, that they were compelled to return, having penetrated further into the interior of China than any other Europeans.

Rivers of minor rank, but of high local utility, are numerous, and lakes overspread a considerable extent of the surface, some of which are economised by being occupied with artificially constructed floating islands, sustaining homesteads, with the gardens and live-stock of the inmates. These internal waters are extensively united by a system of canals, in the formation of which the Chinese early excelled, but more by industry than skill. The Imperial Canal, the largest work of the kind, passes from south to north through the great lowland, connects Hang-chow with the river-system of Peking, and has a total length of nearly 700 miles. Owing to the generally level surface and the light alluvial soil, its construction required little mechanical ingenuity, but involved vast labour, as it is sufficiently broad and deep to accommodate vessels of considerable burden. But in some places it is carried across rising-grounds by excavations, and over depressions by mounds. The southern portion of this great work was executed in the seventh or eighth century, but the northern part was made in the thirteenth by Kublai Khan and his successors, when the Mongol dynasty removed the imperial residence from Nankin to Peking. While intended to answer the purposes of general commerce, irrigation, and drainage, it was mainly designed to facilitate the passage of the provision fleets from the productive provinces, to the capital, by an inland route, thereby avoiding a long sea-voyage, and exposure to danger from storms and pirates on the coast.

Another monument of useless industrial labour, the Great Wall, encloses the country on the north, and was erected by the first emperor of the Tsin dynasty, about 220 B. C., as a security against the incursions of the Tartars. It passes through nearly nineteen degrees of longitude, over high mountains, deep valleys, and across broad rivers by means of arches; has a total course of about 1250 miles; and terminates in the midst of nearly impassable rocks and extensive deserts. This great rampart, where it is the strongest, consists of an exterior of stone and brick, inlaid with earth, and is broad enough to allow of six horsemen riding abreast at the summit. It is furnished with towers at intervals of every 100 yards, and passed at certain points by gates under a guard. The height varies, but may average twenty feet. It is said to have been erected in five years by the enforced toil of every third labourer throughout the empire. The wall is now in many parts in a very dilapidated condition, but even when most perfect and best guarded it entirely failed in its object—that of keeping out erratic nations. Smugglers passed openly through the crumbling breeches. Peking is about sixty miles south of the barrier, known among the natives as the *Wan-li-Chang*, or 'myriad-mile-wall.' From the Tsin dynasty, under whom it was built, the country is supposed to derive its name, corrupted from Tsina into China.

All the metals are known to occur in China with the exception of platina. Small quantities of gold are obtained from the sands of rivers; silver, copper, lead, and iron mines are worked; coal, widely diffused in great abundance, is used for common fuel and in manufactures; the highly-valued greenstone, called jade, and various gems are met with; and from vast beds of porcelain earth of the finest quality, the ware is produced which once monopolised the markets of Europe, and led to all the superior kinds of pottery wherever made being denoted by the name of 'china.' No active volcano appears to exist, but there are solfataras emitting sulphureous vapours, springs of hot water, wells of petroleum, and the soil in many places indicates a volcanic origin. Large wild animals are entirely absent from the densely-peopled districts, where man himself is cramped for elbow-room, and has to nurture every little patch of soil to provide the means of subsistence. But the mountainous provinces bordering on Tibet contain the elephant, rhinoceros, tiger, bear, and tapir, with varieties of deer and monkeys. Formidable reptiles are also unknown; pheasants and other gallinaceous birds, with water-fowl, are plentiful; and the ichthyology, both along the coasts and in the rivers, comprises beautiful and peculiar forms,

from which Europe has been enriched with its goldfish. Locusts occasionally commit great devastation, and some other insect tribes are noxious. From the earliest ages the silkworm has been reared. The domesticated quadrupeds are not numerous, for much of the work is performed by human hands, which in other countries falls to the lot of the horse; but the Bactrian camel appears in the north as a beast of burden, and the buffalo is employed to till the rice-grounds in the south, under the name of the 'aquatic ox.'

The 'Flowery Land,' as the country is styled by the natives, is an epithet appropriately bestowed upon it. In the southerly districts the hillsides are clothed with groves of camellias, azaleas, magnolias, and tree-peonies, with which clematises, roses, honeysuckles, and chrysanthemums intermingle, spreading before the eye a display of gorgeous beauty, and gratifying the senses with delicious perfume. The useful vegetation of the large and more important kind includes the tallow-tree, the varnish-tree, the camphor-tree, the wax-tree, the mulberry, the funeral cypress, and palms on the southern coast. Bamboos, of which upwards of sixty varieties are enumerated, form forests in the warm regions, and are of great value to the owners, being applied to an endless number of uses, besides the one which led Marco Polo to remark, 'Of a surety there is no such country for *stick* as Cathay.' The fruits of temperate climes are produced in the north, where also the ordinary cereals of Europe, maize, barley, and wheat are raised, while rice is grown in vast quantities in the south, and tropical fruits appear. With marvellous care every foot of ground is tilled, every nook occupied by some useful plant, and the highest honours of the state are paid to the task of cultivation. Once a year, towards the close of March, the emperor repairs in person to a particular field, attended by princes of the blood, high officers of the court, and several labourers. After offering sacrifice on an altar of earth, he lays his hand upon the plough, and traces part of a furrow. The princes and functionaries severally imitate the example of the monarch, and then the common labourers proceed to complete the work of tillage. The same ceremonial is observed by the governors of provinces. But of all the botanical products of China, the tea-plant is the most characteristic and valuable, cultivated in almost every province, but principally between the latitude of 27° and 31°, on the slopes of hills in the basin of the Yang-tse-kiang.

There are two varieties of the tea-plant, *Thea viridis* and *Thea bohea*, from either of which black and green tea is produced, mainly by different modes adopted in preparing the leaves. The maritime province of Fuk-keen, on the western border of which are the famous Bohea Mountains, is the principal black-tea district. The largest amount of green tea is raised further north in the adjoining provinces of Che-keang and Keang-se. From the unexpanded shoots and very young leaves Pekoe, a black tea, and young Hyson, a green tea, are obtained. The fully-expanded, but still young leaves, produce Souchong, Pouchong, and Campor, among the black teas, with Imperial Gunpowder and Hyson among the green. The oldest and coarsest of the leaves produce Bohea, the most inferior in quality of the black teas. Great Britain takes annually upwards of 70,000,000 pounds.

In manufactures the people display the same patient industry as in agriculture, and particularly excel in all works which require dexterous and delicate handling. They are unsurpassed in the production of silk, cotton, and linen fabrics, light gauzes and embroidered satins, fine porcelain and lacquered wares, filigree-work in gold and silver, fans and artificial flowers, carvings on ivory and engraving on wood or stone, ink and paper, while their dyeing is renowned for its brilliant and durable hues. In various points of knowledge, as the polarity of the loadstone, the art of printing, and the composition of gunpowder, the Chinese long antedated the Europeans; but either from incapacity to advance beyond a certain limit, or obstinate adherence to ancestral habits, they failed to benefit by the discoveries, from which the Western nations speedily reaped advantages as soon as they were comprehended. In spite of their own amazing assiduity and ingeniousness, with the natural productiveness of the soil, the country is vastly overstocked; the masses of the population are poverty-stricken; and hence the multitudes

who have sought to find relief in emigration, and are now established in large communities in Siam and Cochin-China, in Java, Borneo, and the Philippines, at Singapore and Calcutta, in California and Australia. Social misery, political discontent, and religious fanaticism have combined to fill almost every province with rebels, the most considerable body of whom, the Taepings, since 1850, have wrested an immense domain from imperial authority.

The modern history of China dates from its conquest by the Mongols under Kublai Khan in the year 1279. In his reign the country was visited by Marco Polo, the Venetian traveller, who may be called its first European discoverer. A native Ming dynasty succeeded in 1368. This was followed by the line of the Mantchu Tartars, the present rulers, in 1644, which gave able sovereigns to the throne in the last century, but their late successors have devoted themselves chiefly to luxury and opium. Yellow is the imperial colour, and none but persons of the blood-royal are allowed to wear yellow girdles. The emperor is not necessarily the eldest son of his predecessor, but nominated by him from his family. The present monarch, Hien Fung, 'Perfect Bliss,' who ascended the throne in 1850, was a fourth son. The first attempt of any European government to open direct intercourse with the court of China was made by the Russians. This was in 1655. The first British envoy, Lord Macartney, in 1792, proceeded by sea to the mouth of the Peiho, the river of Peking, and ascended it in yachts provided by the native authorities. Though honourably received, no commercial advantages were secured by the mission, and British trade remained restricted to the single port of Canton, till hostilities enlarged its sphere. By the treaty of Nankin in 1842, after the first war, the ports of Amoy, Fu-chow, Ning-po, and Shang-hae were thrown open, and the island of Hong-kong was ceded to Great Britain. By the treaty of Tien-tsin in 1858, after a second war, other ports and cities were declared free to British subjects, with the right of travelling under passports from their consuls through all parts of the interior, and the appointment of diplomatic agents to reside at the capital. In 1860, to enforce the ratification of this treaty, British and French armies advanced to Peking, where all demands were conceded.

For administrative purposes China is divided into eighteen provinces, all of which are of very large size, and each is under an imperial legate or governor.

| " "                 | Yun-nan, . . .    | 5,000,000  | 107,969               | Yun-nan.                         |

The provinces are sub-divided into districts, departments, and circuits, under subordinate officers. Towns are ranged in three classes according to their rank, which is denoted by terminals attached to their names, as *foo* or *fu*, signifying a town of the first rank; *chow* or *cheou*, one of the second; and *heen* or *tsien*, one of the third. In Chinese nomenclature, *pe* signifies north; *nan*, south; *tung*, east; *se*, west; *king*, court; *ho* and *kiang*, river; *shan*, mountain; *hoo* or *hu*, lake. Hence *Pe-king* means the north court, *Nan-king*, the south court, at different periods imperial residences; *Shan-tung*, east of the mountains; *Shan-se*, west of the mountains; and *Hoo-nan*, south of the lake.

In general the towns have little variety in arrangement and architecture. Few Europeans have been so largely acquainted with those in the interior as the late Père Hue, who remarks upon their uniformity:

'The towns are almost all built on the same plan; they are usually of the quadrilateral form, and surrounded by high walls, flanked with towers at certain distances, and sometimes also by ditches, wet or dry. In books which speak of China, it is said that the streets are broad and perfectly straight, but it is not less true that others are narrow and tortuous, especially in the cities of the south. We have seen here and there some exceptions, but they are extremely rare. The houses in town as well as country are low, and have seldom more than one story. Those of the first class are built of brick, or painted wood, varnished on the outside, and roofed with gray tiles; the second are of wood or clay, with thatched roofs. The buildings of the north are always inferior to those of the south, especially in the villages. In the houses of the rich there are usually several courts, one behind another, and in the last are the apartments of the women and the maidens. A southern aspect is always preferred. The whole of one side of the apartments is usually occupied by windows, in which either talc, painted in various designs, a sort of transparent shell, and white or coloured paper, is used instead of glass. The edges of the roof are turned up to form a gutter, and the corners decorated with dragons and other fabulous animals. The shops are supported by pilasters, ornamented with inscriptions on painted and varnished boards, and the mixture of colours produces from a distance a very agreeable effect. Very few private houses can be called magnificent, though the term may be applied to some public edifices. At Pekin the government offices and palaces of the princes are raised on a basement, and covered with varnished tiles; but the most remarkable monuments are the bridges, towers, and pagodas. The bridges are very numerous, and we have seen some stone ones, composed of arches of great strength and span, that were very handsome and imposing in appearance.' Shops of confectioners, seedsmen, grain-dealers, hardwaremen, old-clothes sellers, and other descriptions, have their fronts wholly removed during the daytime. Soon after sunset they are carefully shut up and locked.

#### NORTHERN PROVINCES.

The Northern Provinces include the country extending generally from the parallel of 35 degrees, and the lower course of the Hoang-ho, to the Great Wall. Two of the number are maritime, Chih-le and Shan-tung, enclosing the greater part of the upper extremity of the Yellow Sea. This region has hot summers, but very cold winters, quite Siberian in their rigour, and produces the grains and fruits of Northern Europe. At Pekin, which is more southerly than Naples, there is a winter marked with daily frost for three or four months, and ice a foot thick blocks up the rivers. In various parts, outcrops of coal indicate the presence of stores of the combustible never as yet touched by the hand of man. Some extensive deposits are worked for consumption in the capital, where wood is dear. But coal-working, with mining in general, is conducted in the rudest manner. Nothing is known of the machines which facilitate the procurance of the mineral, and relieve the mines of water, nor are vertical shafts in use. The coal is brought from its bed in baskets by manual labour, and the water is discharged in a similar manner by means of small casks. Artificial fuel is prepared of coal-dust and a yellow clay, mixed with water into a thick paste, then moulded, and baked as in the manufacture of bricks.

*Pekin*, more correctly *Pe-king* ('the northern court'), the capital of the empire, is situated a short distance from the banks of the Peiho, about 106 miles from the sea, in latitude 40° north, longitude 117° east. It has an uninviting external appearance, and is wholly without advantages of position, being situated on a barren and sandy plain, while the navigation of the river ceases, except for boats, twelve miles lower down. The city is said to contain a population of at least 1,400,000. It consists of two distinct divisions or towns, both enclosed with walls. The one is Tartar and imperial, containing the palaces of the emperor, princes, and grandees, with the garrison. The other is Chinese and commercial, chiefly remarkable for bustle and hubbub in the streets, varied and curious articles in the shops, but contains the 'Temple of Heaven,' one of the finest of the religious edifices in the empire, in its construction and ornaments. The chief hall, circular in shape, supposed to represent the heavens, is adorned with columns painted sky-blue, and richly covered with gold. To this temple the emperor repairs annually, on the day of the winter-solstice, to offer sacrifice, and prepares for the ceremony during three previous fasting-days in a portion of it called the 'Penitential Retreat.' When the allied army entered Pekin in 1860, they met only a curiosity-stricken mob, gazing with open eyes and mouths on their doings, while not a few drove a thriving trade in selling fruits and sweetmeats, and some were good-natured enough to help in planting the guns.

*Tien-tsin*, the scene of the treaty of 1858, is on the south bank of the Peiho, sixty-eight miles below Pekin, and thirty-eight from the sea. It is the northern terminus of the Grand Canal, now disabled by the irruption of the Hoang-ho, and the largest port on the coast north of Shang-hae, containing 300,000 inhabitants. Many of the houses are good, and have verandahs well filled with flowering-plants. The

fashionable lounge is a street with the name of 'Everlasting Prosperity.' The city is considered the key of the capital, where at any time a superior force can stop its supply of provisions, whether brought from the southern provinces by the canal or by sea.

## CENTRAL PROVINCES.

The Central Provinces are limited generally by the parallels of 26° and 35°, and embrace the lower part of the basin of the Yang-tse-kiang. Three of the number are maritime, Kiang-su, Che-kiang, and Fu-keen. With the latter the large island of Formosa is connected as a department, along with some small dependent groups. This section is the richest district of the country, its principal granary, the chief seat of the production of tea, porcelain, and silk, with cotton manufactures. The winters are much milder than in the northern division, though at Nankin, in the latitude of the mouth of the Nile, frost and snow are annually experienced.

*Nankin* or *Nan-king* ('southern court'), a former imperial capital, stands on the south bank of the Yang-tse-kiang, about 90 miles from the beginning of its estuary, and 200 miles from the mouth. It is surrounded by a wall above 40 feet high, 18 miles in circuit, passed by 13 gates, but large interior spaces are now covered with ruins, or consist of fields and gardens. The population, though vastly reduced, is estimated at 300,000. A porcelain tower is, or rather was, a celebrated object. This was a pagoda of nine stories, 260 feet high, with projecting balconies at each story, the balustrades of which are painted with highly-varnished gaudy colours. It was erected by the Emperor Yung-lo to reward the kindness of his mother (1413—1432), and has recently been destroyed by the Taepings. The calico called 'nankeen' derived its name from that of the city, as either the seat of its production, or the place from which it was first obtained. Its peculiar buff colour, once supposed to be artificial, and valued for its durability, is the natural hue of the cotton employed, and is extensively imitated. The manufactures of silks and paper are in high repute, and the article called Indian ink is largely made. Nankin was taken by the insurgents in 1853, and is now the capital of Taepingdom. Not one of the Tartars who were captured was spared. 'We killed them all,' said the ruffians; 'we left not a root to sprout from. The bodies were thrown into the Yang-tse.' This movement first became prominent in the autumn of 1850, under Hung-tsiu-tsuen, a man of humble origin, educated in a Protestant missionary school in the south of China, and a disappointed candidate for government employment. He proposed to found a new native dynasty, that of Taeping or 'Universal Peace.' Familiar by instruction with some Christian doctrines, many Europeans abroad, with the religious world at home, were disposed for a time to look favourably upon the enterprise. But the scales soon fell from their eyes. The bubble burst. The leader assumed the title of the Heavenly King, pretended to divine revelations, and propounded a system which has blood-thirstiness, blasphemy, and polygamy for its principal features.

*Shang-hai*, the seat of immense commerce, is situated upon a large navigable river flowing into the mouth of the Yang-tse. Its prosperity, and almost its existence, are quite of recent date. In 1846, when it was opened as a port to British trade, only a few houses were to be seen among corn, rice, and cotton fields. It is now one of the largest cities in the east, with a population estimated at more than 1,000,000, consisting chiefly of Chinese who have flocked to it from places held by the Taepings, seeking refuge under the flag of foreign nations. In 1862 the resident consuls declared it under their protection, as a warning to the disturbers who were troubling the neighbourhood. *Hangt-chou*, on the south-west, at the commencement of the imperial canal, answers to the description of its visitor, Marco Polo, in the middle ages, as one of the finest and most considerable cities in the empire. The walls are twenty miles in circuit; the streets are broad and well paved; the canals, bridges, and temples are numerous; and the environs are beautifully wooded. But the inhabitants, 800,000, have grievously suffered from the rebels. *Ning-po*, *Fut-chou*, and *Amoy* are free ports on the south. The latter, on a small island close in-shore, has an excellent harbour which admits of ships coming up to the quays. *Kin-te-ching*, in the interior, east of the Poyang Lake, is distinguished by clouds of smoke by day, and pillars of fire by night, from hundreds of furnaces, as the great centre of the porcelain manufacture. Of three inland places on the banks of the Yang-tse, whose names are scarcely known out of the country, *Han-yang*, *Vou-chang*, and *Hoang-chou*, it is stated by Père Hue that 'these three towns, standing in a triangle, in sight of one another, and only separated by the river, form a kind of heart, from which the prodigious commercial activity of China circulates to all parts of the empire. They are calculated to contain together nearly 8,000,000 of inhabitants, and they are so closely connected by the perpetual going and coming of vessels that they may almost be said to form one!'

The island of Formosa, 'Beautiful,' a name applied to it by the Portuguese—the Chinese name is *Tai-wan*—opposite the coast of Fu-keen, extends 237 miles from north to south, and has an average breadth of 70 miles. Some Malay tribes maintain a rude independence on the eastern or oceanic side, and are separated from the Chinese on the western by a lofty chain of mountains, with summits nearly reaching the snow-line. Rich fruits are produced, and coal of good quality occurs in abundance. *Tai-wan*, the chief town, on the west coast, was opened to foreign commerce by the treaty of Tien-tsin.

Canton, from Temple of Five Genii.

#### SOUTHERN PROVINCES.

The Southern Provinces range from the preceding district to the sea, and include possessions of the Portuguese and the British. Being intersected by the tropic of Cancer, the productions and climate are tropical. The cocoa-nut and other palms wave on the shores. Oranges, pomegranates, pine-apples, mangoes, and bananas occur among the fruits. At Canton oppressive heat prevails in summer, but in January frost is not uncommon. Snow fell in the winter of 1835; but its advent is so rare, that the shower was regarded with the utmost astonishment by the inhabitants.

*Canton*, a corruption of the Chinese *Kwang-Tung*, till recent times the only port at which Europeans were permitted to trade, is situated on the east bank of the Choo-kiang, or Pearl River, at the head of the picturesque estuary which it forms at its mouth, called the Bocca Tigris. Vessels heavily laden cannot come up to the city, owing to the shallowness of the stream, but anchor some miles below. It has a circuit of nine miles, is enclosed by a rampart, passed by twelve gates to which guard-houses are attached. Several streets are monopolised by particular trades, and hence are named after them, as Carpenter Street, Apothecary Street, and so on. The population, noted for its turbulence and hatred of foreigners, is supposed to exceed 1,000,000. This includes an immense number who live constantly in boats on the river, and in miserable huts built on piles driven into its bed. The commercial importance of the place has been greatly diminished by the opening of the other ports. In 1857 Canton was taken by the allied British and French, when the notorious governor, Yeh, was captured in his palace, and conveyed to Calcutta, at his own request, where he died. He confessed to having put to death 70,000 of his countrymen during his viceregal reign over the province.

*Macao*, a Portuguese town, with an adjoining district about eight miles in circuit, occupies the peninsular projection of an island on the western side of the entrance of the Canton River. The settlement was obtained in the year 1586, partly in return for services rendered in clearing the seas of pirates, and partly by stealth. The town is small, but highly agreeable, and has a salubrious site, open on all sides to the sea-breeze. In the vicinity a cave and garden are shewn, as the favourite haunt of Camoens, the national poet

of Portugal, who wrote the greater part of his *Lusiad* during his residence in the settlement, where he held the post of administrator of the effects of deceased persons. A small ground-rent was paid to the Chinese government for the possession till the recent treaties with other foreigners enabled the Portuguese to claim exemption from it. The total population is about 30,000.

The island of HONG-KONG; a British possession, is on the opposite side of the entrance to the Canton River, forty miles from Macao, and close to the main shore. The name signifies 'Sweet Waters' or 'Fragrant Streams,' for which the Chinese commonly substitute the unpoetical and odd style of 'Petticoat String Road.' It is about nine miles long by from two to six miles broad, and has a surface rough with mountains of granite, serpentine, and trap, which render the scenery extremely picturesque, though of no considerable elevation. The climate is unhealthy, excessively hot and damp in summer, while dry and cold in the winter months, when fires are often required. *Victoria*, the chief town, on the coast towards the mainland, occupies a site which was covered with brushwood and jungle a quarter of a century ago, but now extends upwards of a mile along the beach, has spacious streets, fashionable shops, and great commercial establishments. A magnificent bay forms the harbour, one of the finest in the world, a deep and spacious expanse landlocked by a circle of hills, on which men-of-war and steamers, merchant craft of every country, trading junks of all shapes and colours, are constantly to be seen. *Victoria Peak* rises behind the town, and is a fine object from the water, but unfortunately shuts out during the hot months the refreshing influence of the south-west monsoon. The island has a total population of 75,000. It forms a colony of the crown, the affairs of which are administered by a governor and legislative council. Ceded by the treaty of Nankin in 1843, there was added to it by the treaty of Peking in 1861 a small strip of the mainland adjoining, which forms the peninsula of *Kow-lung*.

The Chinese belong to the Mongolian variety of the human race, and exhibit minor characteristic differences in the respective provinces, while generally very much alike in conformation, disposition, and habits. They fall below the average height of Europeans, especially the women, and are far less muscular. The complexion is tawny, though ruddy countenances may be seen in the colder northern parts of the country. The eyes are small, the hair coarse and lank, and the cheek-bones high. Sleek corpulency is

Tiger Island.

admired in men, and nature deformed as to the shape of the foot in women. In early childhood, among the superior classes, the feet of the girls are tightly bandaged, the toes are bent down and under so as to form part of the sole, and the heel is brought forward. By this process the foot is reduced in adult life almost to a stump. One which a shoe measuring three and a half inches in length will fit, is the 'golden lily' in Chinese esteem. The subordination of juniors to seniors, respect to parents and the aged, with charity to the poor, are prevailing virtues, while low cunning, falsehood, barbarous punishments, and inhumanity to captives taken in war are prominently national crimes. No people can be more accomplished in the art of dissimulation. 'A Chinaman,' remarks Mr Oliphant, 'has wonderful command of feature. He generally looks most pleased when he has least reason to be so, and maintains an expression of imperturbable politeness and amiability, when he is secretly regretting devoutly that he cannot bastinado you to death.' Gambling is a common vice; the use of opium a universal habit; and in few communities are petty delinquencies more abundant. The upper classes are completely and undisguisedly sensual, and practically regard catering for the stomach as the great purpose of life. Samples of food, forwarded from Shang-hae, through the medium of Sir John Bowring, are in the South Kensington Museum, and contain specimens of tobacco marked 'Mild for Women.' The fins of sharks, tongues of ducks, and sinews of deer are prized delicacies; and unhatched chickens are a favourite dish. The tripang, a sea-slug, caught by the hand on distant shores, and also speared, appears as a costly viand at aristocratic tables; and the peculiar material of certain birds' nests is never wanting in the cookery of the wealthy. These nests are formed by a species of swallow which inhabits the coasts of the Indian Archipelago, and are built in limestone caverns and gloomy rock retreats. They resemble small tea-saucers in shape, and are composed mainly of a glutinous sea-weed, of a light-red colour, nearly transparent. The substance is used in soups in the same manner as Europeans employ vermicelli. An extract from it also enters into the construction of the lanterns for which the Chinese are famous. These articles are wonderfully varied in their form, and annually illuminate each door on the night of a festival, the 'feast of lanterns,' held at the first full moon of the new year, when merry-making is universal.

The Chinese language is the principal member of the monosyllabic or uninflected family, remarkable for its antiquity, originality, extensive prevalence, and difficulty to Europeans. It consists of two entirely distinct parts, the written and the spoken. The written language is ideographic; and embraces an immense number of characters, more or less complicated, each of which represents an idea or object, and not a sound. In the great national lexicon published in the seventeenth century, by order of the emperor, 30,000 distinct characters are given, but most of these are now obsolete. Only about 3000 are in very general use, which are resolvable into 214 primitive forms or roots. The characters are essentially hieroglyphs or signs, and have the same meaning universally attached to them; but their vocal expression remarkably varies in the different provinces, and originates a great number of spoken languages. An inhabitant of the south receiving a written or printed document from one in the north will understand it; but it would be wholly unintelligible if spoken in the local *patois* of his correspondent. A precisely parallel case is the use of Arabic numerals in Europe by different nations. Thus, the figures 22, or any other, are instantly comprehended by English, French, and Italians, though respectively ignorant of the vocal expression which each gives to them, as *twenty-two*, *vingt-deux*, *venti-deux*. The same character for the number twenty-two prevails all over China, and is everywhere understood, but when reduced to speech, it is *urh-shih-urh* at Peking, *gne-a-gne* at Ning-po, and *e-shape* at Canton. The native

literature embraces a vast series of standard works in the various departments of history, medicine, general science, biography, agriculture, and poetry. Day-schools abound in all the towns and villages, but give little instruction beyond the familiar arts of reading and writing.

The yellow robe of the Buddhist monk, and the slate-covered garment of the Taoust priest, indicate the two prevailing religious professions. The latter represents a scheme of rationalism, as it was originally proposed, but which is now connected with the grossest forms of idolatry, as well as divination, magical arts, and pretended intercourse with departed spirits. Confucianism, a system of political ethics and speculative atheism, is followed by the court and the educated classes. But no form of faith has any strong hold upon the national mind, and hence the religious tolerance which distinguishes the people is not the offspring of any conviction of its propriety, but of their own indifference to religion in general. Only in relation to what is called the 'worship of ancestors' is any earnestness shewn. It is expressed by ceremonial visitations to the tombs of parents; offering banquets to the dead; addressing pathetic speeches to them; and the rich have small apartments in their dwellings dedicated to their forefathers, in which the names of the deceased are inscribed on tablets, and have prostrations made before them. Though no direct mention is ever made of death, it does not arise from any personal dread of the event, or concern respecting a future state. On the contrary, the apathy is remarkable and general in relation to humanity's last great trial.

Chinese Wall at the Pass of Sha-po-yu.

## II. DEPENDENT TERRITORIES.

MANTCHURIA, the native seat of the dynasty reigning at Peking, is a north-easterly region of the Chinese empire, extending from the Great Wall to the river Amur, chiefly watered by its tributaries. Though reduced in its area nearly one-half since the year 1860, by the cession of a maritime tract southward of the great river to the Russians, it still remains larger than France, but has only a population of a few millions. The bulk of the people are Chinese, traders and agriculturists, located near their own country, as the natives proper, or Mantchu-Tartars, being disposed to a military-life, are drafted off to serve in garrisons beyond the border, and sustain the tottering imperial throne. In the south the surface is mountainous and well wooded, but consists of grass-lands in the north, where pastoral occupations and hunting are pursued. A peninsular projection from this territory, COREA, washed by the Yellow and the Japanese Seas, is the seat of a separate kingdom, which acknowledges dependence upon the empire by an annual tribute.

*Mukden*, or *Moukden*, the capital of Manchuria, and residence of the viceroy, is a large city of 200,000 inhabitants, surrounded by walls, situated on a river descending to the Yellow Sea. Its good appearance has surprised recent European visitors, as Mr Fleming, who found his way to it from the Great Wall in 1861. 'The great regularity of the streets—the ample breadth of the principal ones—the absence of filthy and indecent displays at their sides, such as everywhere offend the eyes and nose in Peking; the uniform height and frontage of the shops, and their respectable, though far from gaudy appearance, and the total absence of tumble-down wooden arches, such as in almost every other town obstructed the way or marred the prospect—quite took our good opinions by storm. Moukden, so far as our experience went, was pronounced to be the Edinburgh of the Middle Kingdom. The people were well though not luxuriously dressed, and I do not think that during our stay we noticed a beggar or a ragged individual within its walls. There were large stands of cart-cabs with excellent mules in them, superior to those of Peking. There were capital shops with large open windows, in which were counters for the sale of furs, native cottons, dye-stuffs, grain, and medicines, as well as ready-made clothing; but we could perceive nothing European, save a couple of boxes of German lucifer-matches, which we saw when we afterwards had an investigation on foot. A good proportion of these shops were kept for the manufacture and sale of bows and arrows, and in some of them there were splendid specimens of the skins of eagles and vultures. We passed several large Yamuns, or government buildings, before which were drawn up dozens of cabs, and crowds of attendants awaiting the convenience of their several owners who were within, probably discussing

questions concerning the management or mismanagement of a province. Each of these public offices was guarded by rows of high and black *chevaux-de-frise*. Booths and stalls there were none, and even the nomadic vendors of catables, and the peripatetic craftsmen of all grades and trades, who roam freely elsewhere, were here invisible. The family residence and place of sepulture of the reigning dynasty is Hing-King, about sixty miles east of Mukden. *Kirin-Oula*, a flourishing trading city, the head of a province, is seated on the Sungari, a principal affluent of the Amur, which winds its way to the frontier river, between low, fertile, and peopled banks, through a total course of 1000 miles.

*King-ki-tao*, the capital of Corea, is little known beyond being an inland site. The tributary peninsular kingdom has hitherto been sealed to European intercourse.

MONGOLIA, sometimes called Western Tartary, which defines its position in relation to Mantchuria as Eastern Tartary, is a territory of immense extent, included between China on the south, and the Siberian frontier on the north. It measures upwards of 1200 miles from east to west, by an average of 500 miles in the opposite direction, and consists of a generally high table-land, but elevated 3500 feet above the sea, in that part of it traversed by the merchant caravans and couriers passing between Peking and the Russian dominions. The tract called Gobi, a Mongol term for 'naked desert,' to which its Chinese name corresponds in meaning, Shamo, 'sand desert,' is the characteristic physical feature. This is, for the most part, a frightfully stertile wilderness, consisting of loose sand, bare rock, and shingle, alternating with firm sand scantily clothed with vegetation. But a large portion of the country, while equally treeless and monotonous, seasonally assumes the aspect of an ocean of grass, and supplies pasturage to the flocks and herds of pastoral tribes, whose camps, like moving cities, make the tour of the vast prairie-grounds, and leave traces of their halts in the ashes of their hearths. A short summer, with very hot days and cool nights, alternates with a very long and rigorous winter. In the former season the opposite incidents of droughts, torrents of rain, and terrible hail-storms are common experiences. On the borders, towards the Great Wall, the surface is mountainous, forest-clad, and there is a considerable Chinese population, who profit greatly by practising upon the simplicity of the wandering Mongols in dealing with them for their cattle.

Mongolia was the central seat of the great empire of Genghis Khan, in the early part of the thirteenth century, who made Karakorum his capital. This place fell into decay upon the conquest of China by his grandson, Kublai Khan, who transferred the court to Peking. It has lapsed into oblivion, for little is known of any present remains. But the traveller occasionally stumbles upon a ruin in the Mongolian solitudes, which tells a tale of by-gone life and power, though without a name, and without a tradition. So it happened to Père Huc. 'We had gone,' says he, 'nearly three days' march when we came to an imposing and majestic monument of antiquity. It was a great forsaken city, with battlemented ramparts, watch-towers, four great gates directed to the four cardinal points, all in perfect preservation, but all sunk three parts into the earth, and covered with thick turf. Since the abandonment of the place the soil around it has risen to that extent. We entered the city with solemn emotion; there were no ruins to be seen, but only the form of a large and fine town, half buried and enveloped in grass as in a funeral shroud. The inequalities of the ground seem still to point out the direction of the streets and the principal buildings; but the only human being we saw was a young Mongol shepherd, who, seated on a mound, was silently smoking his pipe, while his goats grazed on the deserted ramparts around him.'

The Mongols are Buddhists in religion, or rather Lamaists, who adhere to a corrupted form of Buddhism. They are shepherds and herdsmen, occasionally hunters, utterly averse to a sedentary life; and, as in the case of nomadic people in general, the senses of sight, hearing, and smell are very strongly developed. At a few frontier stations they come into contact with the Chinese, to be corrupted and duped by them. 'When the Mongols,' remarks Huc, 'simple and ingenious beings, if there are such in the world, arrive in a trading town, they are immediately surrounded by Chinese, who almost drag them into their houses. They unsaddle their cattle, prepare tea, render them a thousand small services, caress, flatter, and as it were magnetise them. The Mongols, free from duplicity themselves, and never suspecting it in others, are generally completely duped by all this apparent kindness. They take seriously all the fine sentences about brotherhood and devotion that are lavished on them, and aware besides of their own want of address in business, they are enchanted to find friends who will transact it for them; a good dinner gratis given them in the back-shop is sure to convince them of the good faith of their Chinese "brothers." It is generally during this dinner that all the corruption and dishonesty of the Chinese come into full play. Having once got a hold on the poor Tartar, they never let him go; they intoxicate him with brandy; they keep him two or three days in their houses,

never losing sight of him; they make him eat, drink, and smoke, whilst the clerks of the establishment sell, as they well know how, his cattle, and supply him in return with the articles of which he stands in need. These goods are generally sold at double and often triple the current price; yet they have the infernal talent of persuading the unhappy Tartar that he is making an excellent bargain. Thus, when the victim returns to the "Land of Grass," he is full of enthusiasm about the incredible generosity of the Kitats, and promises himself to see his good friends again whenever he has anything to buy or sell.

*Maimatchin*, on the Mongolian frontier towards Siberia, is a small Chinese town opposite Kiachta on the Russian side, where the traders of both countries exchange goods. The two places are separated by a space of neutral ground, 280 yards wide. The change, says Erman, on passing from the one to the other, seemed like a dream, or the effect of magic. A contrast so striking could hardly be expected at any other spot upon the earth. The unvarying sober hues on the Russian side were succeeded all at once by an exhibition of gaudy finery, more fantastic and extravagant than was ever seen at any Christmas wake, or parish village-festival in Germany. The roadway of the streets consists of a bed of well-beaten clay, which is always neatly swept, while the walls of the same material on either side are relieved by windows of Chinese paper. Sunset is announced from a wooden tower by gongs, when business terminates. The Chinese annually deliver here tea worth from 10,000,000 to 15,000,000 of Prussian dollars, and rhubarb to the value of about 600,000 dollars; and from the Russians, on the other hand, they buy every year a large quantity of Polish linen, woollen cloth, and furs. Mr Grant made a journey from Peking to Maimatchin, across the Mongolian Desert, in 1863 with apparently little difficulty; soon afterwards the route was traversed inversely by a correspondent of the *Times*, Mr Bishop, and his wife, a delicate English lady. It appears from Mr Bishop's statement, that several English gentlemen have, by his advice, adopted this 'overland route' home.

CHINESE TURKESTAN, a westerly continuation of Mongolia, has a widely different natural aspect, owing to the intersection of the Tian Shan, or Celestial Mountains, which originate many streams, rendering the valleys and high plains extremely fertile. They do not escape from the elevated region and reach the sea, but terminate their course in landlocked lakes, or lose themselves in swamps and sands. The great range runs east and west, and forms the two districts of Tian-shan Pe-loo, and Tian-shan Nan-loo, meaning the country north and south of the mountains, thus discriminated by the Chinese geographers. The former is sometimes called Sungaria, and the latter Little Bokhara. A few Mongol hordes wander over the surface, but races of the Turkish family compose the bulk of the people, who are settled in towns, Mohammedans in religion, rude, and turbulent. They are in general politically subject to chiefs of their own; but the Chinese occupy military posts, guard the frontiers, collect a revenue, and maintain some penal settlements.

*Ili*, or *Gouldja*, a considerable town north of the dividing range, has trading connections with Russia, being situated on the banks of the Ili, which passes into the Russian territory, and enters Lake Balkash. *Yarkand*, on the south of the mountains, seated on a river of the same name, which debouches in Lake Lob, is the principal seat of commerce, the residence of a Chinese governor, and contains upwards of 50,000 inhabitants. *Cashgar*, towards the western frontier, maintains commercial intercourse with Bokhara, and is the seat of a native khan, who barbarously caused one of the enterprising German brothers Schlagintweit to be executed before the gates in the year 1858. *Aksu*, eastward, on the caravan route to China, is the residence of the Chinese military commander, and the head-quarters of the troops.

TIBET, a south-western section of the empire, on the borders of India and Burmah, is an extensive and elevated plateau, the loftiest on the globe, having an altitude of from 10,000 to 15,000 feet above the sea. It is enclosed by the mountain-chains of the Kuenlun and Himalaya on the north and south; and has a surface both spread out in plains and furrowed with valleys and ravines, through which many of the great rivers of Asia descend to the adjoining lowland countries, as the Indus, Sutlej, and Brahmaputra, the Yang-tse-kiang and Hoang-ho. Lakes are also numerous, mostly salt or brackish, several of which are regarded with religious veneration by the Buddhists, and attract pilgrims from afar to their shores. The cold climate restricts industry chiefly to the rearing of sheep and goats in immense numbers on the pastures, though some of the hardiest cereals are raised. Among the native animals, the yak or grunting-ox is the most remarkable, occurring both wild and domesticated, but so impatient of warmth as to keep to the snow-mountains in summer, and descend with the snow to the table-lands in winter. The people are of the Mongol stock, and Lamaists in religion, subject generally

to the sovereignty of China, represented by a viceroy, but with very little interference in their affairs; and to a spiritual ruler or pope, the Dalai-Lama, literally the 'Ocean Priest,' a hyperbolical allusion to the extensiveness of his authority. The country includes three principal divisions, Great Tibet, the largest, on the east; Middle Tibet, on the west, conquered by Gholab Singh, the ruler of Cashmere, and annexed to it in 1835; and Little Tibet, on the north-west.

*Lassa*, the capital of Great Tibet, is an open city of very wide streets, surrounded with gardens, from which foreigners, especially Europeans, are carefully excluded. Père Huc reached it, but was at once conducted out of the country. The place is to Buddhism as Mecca to Mohammedanism, and Rome to Catholicism, being the residence of the Dalai-Lama on the adjacent Mount Botala. At this spot there is an immense establishment of convents and temples, with a pontifical court, consisting of a great number of subordinate priests. In theory the chief functionary never dies, as his gifted soul is said to pass immediately to his successor. The individual favoured with this transmigration is supposed to be indicated to the priests by a variety of signs, but the Chinese viceroy, who has troops in garrison at his elbow, is believed to have actual control over the appointment. *Lassa* has a considerable population, vastly increased for a time by the arrival of devotees. Dogs abound constantly, owing to the peculiar mode adopted by the Tibetans in disposing of the dead. In no case is there any interment. The bodies are either submitted to combustion, or submerged in lakes and rivers, or exposed on the tops of rocks to be the prey of beasts and birds, while many are cut up and committed to the dogs to be devoured. This applies to both rich and poor. The only difference is, that the corpses of the indigent are given to the unowned street dogs, and those of the wealthy, or of men of rank, become the property of a select number kept for the purpose in the convents, and carefully attended to as sacred animals.

Rope Bridge over the Spiti Torrent.

General View of Yeddo.

## CHAPTER IX.

### JAPANESE EMPIRE.

APAN, an insular empire, which has recently taken its place in the family of nations by formal communication with them, after having long kept aloof from intercourse, except to a limited extent with the Chinese and Dutch. It is situated on the eastern side of the Asian continent, from which it is separated by the Japanese Sea and the narrow Strait of Corea, while the broad expanse of the Pacific Ocean rolls in the opposite directions. It consists of an elongated curving archipelago, extending generally north and south, through a distance of more than 1200 miles. Four principal islands constitute Japan Proper—namely, Yesso, the most northerly; Nipon, central, and by far the largest; Kiusiu and Sikok, southerly. With these are associated an immense number of small islets, reckoned at 3850. In the extreme north the southern part of Saghalien Island and of the Kurile series is claimed by the empire, the northern portion of which in both cases belongs to Russia, while at the opposite extremity the Loo Choo group is a southerly dependency. The entire chain lies between latitude  $26^{\circ}$  and  $50^{\circ}$  north, longitude  $128^{\circ}$  and  $151^{\circ}$  east; and has an area estimated at 266,000 square miles. A crescent shape, with the concave side turned towards the continent, distinguishes Nipon, the mainland of the archipelago, which is upwards of 800 miles in length,

CONSTANTINOPLÉ  
The Golden Horn.

Drawn by Giovanni Battista Piranesi.

but comparatively narrow. Its name, from which that of Japan is corruptly derived, is said to signify in Chinese 'Sunborn,' 'Land of the Rising Sun,' referring to its position in relation to that country.

The coasts are generally rocky, much broken by picturesque inlets, and are of difficult access, which, with the occurrence of typhoons or hurricanes of tremendous violence, and the imperfection of nautical surveys, has occasioned many lamentable disasters to shipping since the ports were opened to the commercial nations. A chain of mountains traverses the whole insular series in the line of its greatest extent, some of which rise to a considerable height, and have their summits snow-clad for many months of the year, while upon a few it is permanent in patches. Several are active or extinct volcanoes. In their neighbourhood earthquakes are so frequent that the natives calculate upon one of their cities being destroyed upon the average every seven years. In August 1783 the shocks continued at intervals through twelve days, and desolated twenty-seven towns. The focus of disturbance is sometimes in the bed of the adjoining ocean, or a wide sweep of the expanse lies within the area of concussion. In December 1854 the south-east coast of Nipon was dreadfully ravaged. The Russian frigate, *Diana*, lying at anchor off Simoda, was spun round forty-three times in the space of half an hour, and cast nearly a wreck upon the beach; the harbour was rendered useless; and repeated waves overwhelming the town left only sixteen out of a thousand houses standing. Between February 1860 and the same month in 1861, there were thirty-three shocks at Yeddo. In this district the far-famed Fusi-yama, a volcanic mountain, dormant since the year 1707, rises to the height of 14,177 feet above the sea, and is the culminating-point of the empire. It is the *mons excelsus et singularis* of Kæmpfer, the physician to a Dutch embassy in the seventeenth century, who enthusiastically states: 'Poets cannot find words, nor painters skill and colours, sufficient to represent the mountain as they think it deserves.' Springing abruptly from a broad base, it forms an almost perfect cone, truncated only at the extreme pinnacle; and towering far above all the surrounding hills, its glistening peak of snow, tipped with the rays of the rising or setting sun, may be seen from Yeddo, a distance of about eighty miles. To the people of the lower class, Fusi-yama, 'Rich Scholar's Peak,'—the Parnassus of Japan—is an object of veneration. They make pilgrimages to it in the hope of averting misfortune and sickness, appear in white vestments upon the occasion, which, on the summit, are stamped with various seals and images by the priests located there during the summer season when alone the ascent is practicable. According to the tradition of the natives, the volcano rose in a single night from the bowels of the earth, and coincidentally at Miaco a spacious lake was formed.

Though the surface is mountainous, the elevations are generally moderate, and are either cultivated to their summits, or clothed with woods. In the volcanic regions the soil in the plains and valleys is similar to the 'black' or 'cotton soil' of India, a rich earth, several feet in depth, without a stone, composed of the detritus of igneous rocks, further fertilised during a long succession of ages by the application of liquid manure from the towns. In other districts, especially in the island of Kiusiu, sandstone hills are prominent, and the soil of the lowlands consists chiefly of sand, but rendered fertile by careful manuring. Washed by the rains into the channels of the rivers, the sand is deposited at their mouths, producing shoal water; and hence, though broad and impetuous, they are not navigable, except for short distances by the small native junks. In the northern island, Yesso, the winters are long and severe; the summers brief and hot. Snow lies upon the lowlands from November till May. But in the southern tracts, more exposed by geographical position to oceanic influence, violent seasonal contrasts are unknown, for though the summers are hot, the winters are mild. Rain descends copiously

in June, July, and August; dense fogs occur, and sometimes hide the sun for several days in succession; and typhoons in the autumn, sweep the seas with fatal effect, while uprooted trees mark their course over the land. Nowhere are water-spouts more frequent.

The vegetation is singularly rich, varied, and abundant. It comprises a profusion of beautiful flowering plants, wild in the woods and waste places, many of which, as the hydrangea and camellia japonica, have been introduced with ornamental effect into the gardens of Europe. The hydrangea is commonly seen covering the banks by the waysides with its large flower-clusters, black, blue, and white, in company with the unpretending Scotch thistle. Splendid camellias are common throughout the valleys, and bushes of azaleas are plentiful in all the forests at a low elevation. Dense masses of luxuriant trees and shrubs ascend from the valleys to the tops of the hills, consisting of oaks, evergreen and deciduous, pines, and chestnuts, with the maple, beech, elm, lime, elder, cypress, and alder. The great preponderance of evergreens gives the country almost as fresh an appearance during the winter months as in summer. With this vegetation of the temperate zone there is intermingled in the southern districts, high up the mountainsides, the sago-palm, the tree-fern, the banana, the bamboo's light and graceful foliage, with other tropical forms. The northern island, where the ground has not been much cleared for cultivation, is the most wooded, and has vast forests of oaks and pines of enormous magnitude. In the size and variety of its conifers, the botany strikingly corresponds to that of the opposite coast of North America. Fine avenues of the cedar of Japan, *Cryptomeria Japonica*, and other pines, enclose the main roads, especially in the neighbourhood of towns, rising to the height of 150 feet, with a girth of from 14 to 16 feet, at three feet from the ground. Their upper branches uniting, form a perfect covered archway. The members of the pine family enjoy high consideration with the people. The trees shade their little chapels, and are found near their dwellings, while the branches are employed for decorative purposes and as religious symbols. But the remarkable vegetable objects, specially characteristic of the country, are the camphor-tree, the lacquer or varnish tree, the wax-tree, and the paper-mulberry. Among the food plants, rice is the most extensively cultivated, as the staple fare of all classes, sown in May and gathered in November. It is grown in enormous quantities in low, marshy valleys, but a much less productive species is raised on dry soil, and hills of considerable elevation are terraced to the summits for the crop, giving to the country a most picturesque appearance. Boiled rice serves for daily bread. Sugar, tea, cotton, and tobacco, the latter smoked by both men and women, are likewise objects of culture; the orchard and garden produce is profuse and varied; but it is an apparent anomaly in a region singularly gifted by nature in many respects, that generally fruits and vegetables are more or less flavourless, while the flowers are without fragrance, and the birds have no song.

The camphor-tree, *Laurus camphora*, found in most of the forests, bears black and purple berries which render its aspect agreeable. The natives make the camphor by a simple decoction of the stem and roots cut into small pieces. The tree occasionally attains huge dimensions. One, visited and described by Kämpfer, in the island of Kiusiu, was capable of containing in its trunk, which was hollow to a great height, fifteen individuals with ease. It is still standing, and is supposed to be 1000 years old. There is a roadside inn at its foot. The tree is also a native of the Chinese province of Fokeen, and of the island of Formosa, whence the chief portion of the camphor of commerce is derived. It is exported to this country in small friable masses, of a grayish colour, resembling half-refined sugar. Another kind of camphor is yielded by a forest-tree in the Malay archipelago. It is found in concrete masses in the fissures of the wood, and is more fragrant and less biting and pungent than that obtained from the laurel, but is not known in Europe as an article of trade, being almost wholly consumed by the Chinese.

The lacquer or varnish tree, *Rhus vernicifera*, yields the gum, from the application of which by the Japanese we have the term japanning, used to denote the art of producing a highly-varnished surface. The articles thus treated by the natives are of *papier-maché*, but extensively in Europe of metal also.

The wax-tree, *Rhus succedanea*, yields seeds from which wax for candles is obtained by compression, one of the chief articles of export from Japan. It thrives on mountains, barren and stony ground, unfit for other agricultural purposes. The trees are planted young along the highways, leaving a distance of about three feet between the stems, and also in squares at double the distance. They are kept low by lopping, and trimmed in the shape of pyramids. In the fifth year after planting, each tree yields on an average 4 lbs. of seed: in the eighth year, 6 lbs.; in the tenth, 18 lbs.; in the twelfth, 40 lbs.; in the fifteenth, 60 lbs.; in the eighteenth year the tree enters upon its decline; 400 lbs. of seed yield 100 lbs. of wax. Of these trees 20,000 were planted soon after the first demand made by foreigners for the product. The vegetable wax is not exactly of the same nature as common wax, since it melts in summer at the ordinary temperature; but the inconvenience is obviated in Japan by protecting the candles with a coating of bees-wax. In England other modes are adopted to give consistency to the substance.

The paper-mulberry, *Broussonetia papyrifera*, grown likewise on the roadsides, has its name from the use made of the bark. But the rind of various other plants is employed for the same purpose, some for the fibrous quality, others for glutinous properties. The process of manufacture is very simple. After the bark has been steeped in water until thoroughly saturated, it is beaten with wooden mallets until reduced to a state of mash, then again macerated in water, and when finally brought into a pulpy homogeneous state, any colouring matter desired is introduced, and the semi-fluid pulp is poured over wire frames and dried. No people surpass the Japanese in the adaptation of their paper to the purposes for which it is wanted, which are very numerous. Besides its ordinary use in writing and packing, they make handkerchiefs of it, a vast variety of *papier-maché* articles, boxes, reticules, hats, tiles, and an equally numerous list of objects in imitation of leather. Between seventy and eighty different kinds of paper are manufactured.

Wild animals of the formidable kind are limited to a few wolves and boars in the north of Nipon; and probably the bear is a tenant of the woods in Yesso. Those of the harmless class are not numerous, owing to the great extent of surface under cultivation, though several species are protected by the laws, as well as by the universal abstinence of the people from animal food. Hence, as the effect of freedom from molestation, Europeans have seen with surprise deer running about the streets of Osaka. The same indulgence is extended to the storks, many of which are found in the towns, and to other birds. Not a trigger is allowed to be pulled within thirty miles of the capital, to the great disappointment of sporting foreigners, who see wild geese, ducks, and teal floating on the castle moats and the temple lakes in the vicinity of the city, quite indifferent to the presence of man. The sparrow is here, as almost everywhere else—a true cosmopolitan. Domesticated quadrupeds include an indigenous race of horses, used only for riding, and mounted on the off side, contrary to our own usage. Oxen are employed for draught and burden. Dogs abound, being objects of veneration, a superstition of which the cat and fox have also the benefit.

The mineral treasures of the empire are very varied and important. Mines of gold, silver, copper, iron, and argentiferous lead are worked, but in the most primitive manner, and only to a limited extent, upon the principle maintained by the government, that as minerals are not capable of increase, the general store should not be diminished except to supply the most urgent current wants. Coal is abundant, yet though bituminous, it seems to be chiefly of inferior quality, at least as far as the produce has been tested. Sulphur of extraordinary purity occurs in profusion, and is conspicuous at Sulphur Island, an active volcano, in the archipelago off the south coast of Kiusiu, which serves as a landmark by day and a light-house by night to vessels on the neighbouring waters. Hot mineral springs, saline and sulphureous, in various parts of the country, are visited by great numbers from a distance for luxury and sanitary purposes. The small village of Atami, secluded in a gorge by the sea on the south-east coast of Nipon, is remarkable for its ebullient fountains, which give to the site a caldron-like appearance. From several sources or vents, but from one in particular, an immense volume of steam and slightly sulphureous water is ejected, at a temperature varying from 100° to 120° Fahrenheit. The eruptions take place at irregular intervals; the explosive force also varies in its energy; and the time occupied by its action differs considerably, from a few minutes to an hour and a half. But there are usually five or six repetitions of the phenomenon every twenty-four hours. The villagers, consisting of small cottars, farmers, and fishermen, immerse themselves in the warm water, collected in troughs, and cook their sweet potatoes at the smaller vents, many of which are close to the doors of their dwellings. Honjins, or houses of entertainment, are expressly provided for the accommodation of the grandees and their families at their visits.

The form of government is commonly represented as dual, vested in a fancifully-styled spiritual and a temporal emperor. But in reality the former is the only acknowledged titular sovereign, called the Mikado or Dairi, 'the Great One,' who is the representative of a long line of kings, originally heaven descended, or sun-born, and whose residence, at Miaco, is the stronghold of temple-worship. He reigns *de jure*, and his sanction is reckoned necessary, theoretically at least, to give validity to all acts of state. But they neither emanate from him, nor are they executed by his orders. His person is considered too sacred to be allowed to intermeddle with secular affairs. The sun must not shine, or the wind blow upon him, neither must he ever touch the earth. Hence, to prevent actual contact, his palace is carpeted throughout with the softest mats, and he only leaves it in a litter, carried on men's shoulders, shaded from the beams and the breeze by umbrellas and fans. His condition is that of an enshrined idol, or more properly of a prisoner of state, surrounded by spies, and subject to stringent restrictions, in compensation for which, the privilege, such as it

is, of having a dozen wives is conceded. The sovereign *de facto*, head of the executive, styled the Siogoon or Tycoon (Chinese *Tai-kun*—that is, 'Generalissimo' or 'great Lord'), is descended from one of the old commanders-in-chief, who usurped the functions of government, and secured them for the inheritance of his family. This dignitary still receives investiture from the Mikado, and keeps his court at Yeddo, but has now become nearly as helpless as his suzerain, a puppet dependent upon an oligarchy of Daimios, or territorial lords of the soil, who exactly correspond to the feudal nobility of Europe in the middle ages, in the hereditary possession of lands, wealth, and power. Two councils composed of this body, higher and lower, 'Imperial Old Men' and 'Young Old Men,' analogous to great feudal barons and petty baronial chiefs, control the Tycoon, and dictate the policy of the empire. The laws are dreadfully sanguinary in principle, attaching the death-penalty to almost every offence, but the severity is greatly modified in practice, at the discretion of the local magistrates. The most remarkable punishment, now becoming obsolete, is that of the *Hara-wo-kiru*, or 'belly-cut,' a legal form of suicide, effected by making two cross-cuts on the abdomen with a sharp-pointed knife. Offenders of rank against the state are deported to Fatsizu, an islet 200 miles from the south-east coast of Nipon, so precipitous as to be scarcely accessible.

The population of the empire can only be conjecturally stated, but it is supposed by the best informed not to be less than 30,000,000. In their general physiognomy the people correspond to the Mongolian type, and probably belong to that family of nations, with an admixture of Malay blood. They have small dark eyes and heavy arched eyebrows; are of low stature, but more robust than the Chinese; and possess a complexion varying from deep copper to a more prevalent light-olive hue. The men elaborately tattoo the body and limbs with figures of dragons, tigers, lions, and nondescript objects. They wear a robe of sober black or dark blue, of cotton, gauze or silk, according to their means, which falls down from the neck to the ankles, but is gathered in at the waist by a girdle of the same material. The women dress in gayer colours, have a passion for paint and powder; and cultivate in married life a style of beauty which is hideous deformity to Europeans. They varnish the teeth with black, dye the lips a brick red, pluck every hair from the eyebrows, and powder the face and neck with rice flour. The spoken language is of soft enunciation, and not of difficult acquirement. It does not embrace the sound of *r*. Hence 'velly good' takes the place of 'very good' in attempts at English; and a speaker in referring to himself will adopt the roundabout mode of saying, 'the person who is before your hand,' in expressing I. The written language is highly complicated, embracing a hieroglyphic and a phonetic system; but that of China is familiarly known, and often appears over the shop-doors. Japanese literature includes original writings, but is mainly an importation from China. The oldest form of religion is Sintuism, 'faith in gods,' at the head of which is the Mikado. This is a kind of mythological naturalism, having for the prime object of worship the sun-goddess, from whom he claims to be descended, with a number of subordinate divinities, consisting of popular personages who are supposed to rise at death to the rank of demi-gods. But Buddhism, variously modified, including several sects, is much more generally professed. Confucianism has also its adherents, chiefly literati, not a few of whom are sceptically indifferent to all religious observances.

While diligent cultivators of the soil, both as farmers, gardeners, and florists, great proficiency is shewn in various mechanical arts, some of which were probably acquired by long-continued intercourse with the Dutch. Beautiful silk and crape fabrics are produced, good cabinet and basket work, with small wooden wares of wonderfully perfect execution, though made with the roughest tools, out of the roots of the camphor and maple tree. Porcelain is manufactured as thin as an egg-shell; excellent paper, and the processes of enamelling and varnishing are conducted with the highest skill. The face of the country bears witness to patient industry and careful attention to outward appearances on the part of its occupiers, in the few signs of neglect and dilapidation. They build substantial bridges, have main roads kept in perfect repair, and the rural lanes are lined with hedges duly clipped and tended. Along the highways, booths are met with at short distances, in which the poorest traveller may have refreshment for the smallest coin, or

may rest himself if wholly destitute. The ordinary travelling vehicle is a kind of palanquin, made of wicker-work or lacquered wood, carried by two or four men, according to the material. In their general mode of life the habits of the people are singularly simple and uniform. The dwellings of the rich, equally with those of the poor, are almost entirely without furniture, for they rest themselves by squatting on a matted floor, take their meals in the same position, and lie down at night in the apartment occupied by day, with the scantiest of pillows, and a cotton coverlet or two for bedding. Fish, rice, fruits, and vegetables are the ordinary food of all classes. For beverages they have tea and saki, a spirit made from rice, or one distilled from the grape. Low cunning distinguishes the national character, with the most glaring indifference to truth, and an entire want of the sense of decency. Polygamy is not permitted, but divorce is within easy reach of the husband, and he may indulge in concubinage as much as he pleases. Parents may devote their daughters legally to prostitution for money in appointed places, nor is it thought that any disgrace accrues thereby to the females, who have as good a chance of marriage as if they had never left their homes. Men and women bathe promiscuously without the slightest attention to decorum, and with no idea of any immodesty in the usage. Public bathing-houses or rooms are distinctive national institutions, in full operation for both sexes, in the afternoon, in the evening, till late at night, as well in the country villages as in the crowded cities.

*Yeddo*, the residence of the Tycoon, and the actual capital, is situated on the south-east side of Nipon, at the upper extremity of an inlet or bay, twenty miles long, which forms the harbour, and is completely sheltered from the roll of the ocean by a narrow entrance, and a number of outlying islands. The water shoals from the entrance, as in the case of most of the Japanese harbours, and boats touch the ground at the distance of a mile from the city. This shallowness contributes to its security in the event of a naval attack. The port is at Kanagawa, sixteen miles nearer the mouth of the inlet, where the British consular establishment is planted. At Yokohama, an adjoining place, furnished with a granite pier and quay, the foreign merchants reside. A headland has received the name of Treaty Point, off which the American squadron of Commodore Perry lay at anchor during the first negotiations which opened the country to foreign commerce. Within eighteen months after the commencement of trade, the exports, chiefly tea, silk, mother-of-pearl, gall-nuts, and wax, amounted to the value of £1,200,000. Camlets, shirtings, chintzes, and drills figured among the earliest imports. Though the Americans were first in the field, and enjoy peculiar advantages, since passages from San Francisco in California have been made in five weeks, yet British enterprise signally took the lead. In 1860 there were, of British vessels, 15 arrivals and 23 departures; of American, 6 arrivals and 5 departures; of Dutch, 2 arrivals and 1 departure.

The city of *Yeddo*, a veritable human ant-hill, is supposed not to lag far behind London in population, and to cover as much ground. It lines the margin of the inlet about ten miles, and extends seven miles inland, but a large space appropriated to gardens and orchards is included. Hills sloping to a considerable height are embraced within its limits, and also form the background. The streets are broad, clean, and well drained; and can be shut in by gates in the event of disturbance. Some of them have rows of peach and plum trees, which, when in blossom, present a gay and lively appearance. The most populous part of the city is intersected by the river *Okawa*, which is crossed by a great central bridge. From it, all distances are measured along the roads throughout the empire. Public baths are very numerous and cheap. Tea-houses and gardens are plentiful in the suburbs. There are shops for books, bronzes, copperware, lacquer goods, basket-work, prints, inlaid-wood, paper, and old clothes, several of which devoted to the same trade frequently stand together. Owing to the frequency of earthquakes, the houses have only one story; and being of wood, fires are very common and destructive. There are no striking public buildings, though temples everywhere abound. Disgraced government officials may occasionally be seen walking about, forlorn objects, with their heads in cages of basket-work. During the summer the temperature ranges from 70° to 90°, and only falls occasionally in winter below the freezing-point. Snow rarely lies upon the ground. The highest hill, 1200 feet above the bay, is surmounted by the Tycoon's palace or castle, encircled by a triple moat, and by the dwellings of the Daimios or feudatories. In this quarter is the residency over which the British flag waves, occupying part of one of the largest and best temples, enclosed with trees. The feudatories are obliged to be in residence at the capital part of every year, and when absent on their respective domains, their wives and children are detained as hostages. They travel to and fro with a crowd of retainers, varying from a few hundreds to ten thousand, according to their consequence, armed with bows and swords, distinguished also by armorial bearings on their dresses. Hence, for the accommodation of such throngs, their one-storied dwellings necessarily cover an immense space. Some of them are a quarter of a mile long. These vassal barons, nearly independent on

their own estates, number about 264; and have incomes ranging up to a million *kokoo*s, or measures of rice, the ordinary Japanese mode of estimating revenue. Each *kokoo* being equal to 13s. 10d. in money, the total sum represented is nearly £700,000. The chiefs and their retainers form the most turbulent part of the population of Yeddo. In 1860, during a minority, the regent was slain in the streets by a band of the Prince of Meto's men, who cut their way, sword in hand, through his retinue, and hacked his head off as he sat helpless in his palanquin.

*Miako*, an inland city, upwards of 200 miles to the westward, is the old and still the titular capital, as the residence of the Mikado, said to contain half a million of inhabitants. It abounds with temples, is an educational seat for the priesthood, has better houses than Yeddo, with exquisitely laid out gardens, and considerable manufactures of carved ornaments and japanned wares. *Osaka*, a few miles on the south-west, one of the treaty ports, is a great trading centre, so populous as to be reputed able to raise an army of 80,000 men. It is pleasantly situated in a fruitful plain, on the banks of a navigable river, the waters of which are led off by numerous canals through the principal streets, for the purpose of conveying goods in small boats to their destination. More than a hundred bridges, many of them of extraordinary beauty, span these artificial channels. Wealthy merchants abound, skilful artificers ply their craft, and immense commercial activity reigns everywhere. Below the city is its port, *Hiogo*, on a bay of the Suonada Sea, where there is convenient anchorage for sea-going vessels, with docks and ship-building. The intermediate river navigation for cargo-boats is short and easy. But *Osaka* is also a seat of luxury, the Paris of Japan, a place of resort for the rich and fashionable, who repair thither for relaxation and gaiety. It possesses the most sumptuous tea-houses, extensive pleasure-gardens, and the best theatres. Many of the Daimios have residences on the banks of the river. Valuable copper-mines are in the vicinity, and the place is famed for the excellence of its saki.

Panoramic View of Nagasaki.

*Nagasaki*, the port to which the Dutch traders were restricted for more than two centuries, is seated on the western side of the island of *Kinsiu*, upwards of 800 miles from Yeddo, and about ten days' steaming-distance from Hong-Kong. It occupies the shore of a bay of some magnitude, landlocked and picturesque, resembling a Norwegian fiord, enclosed by hills clothed with pines, palms, bamboos, pomegranates, and other trees. The town covers a considerable space; contains many gardens; has streets interspersed with trees and shrubs,

which give them a pleasing appearance; and is intersected by a canal, across which handsome stone bridges are thrown. Porcelain, silks, and lacquered wares are produced. The mechanical talent of the Japanese has here been remarkably exemplified, by the establishment of a steam-factory, entirely by the natives, aided only by drawings supplied to them by an officer of the Dutch navy. It turned out a steam-engine before a foreign one had been seen. Decima Island, occupied by the Dutch during the long term of foreign exclusion, is an artificial construction in the harbour, fan-shaped, connected with the mainland by a stone bridge. It is only 600 feet in length by 240 feet in breadth. The traders were here cooped up like poultry in a yard, and condemned to a life of celibacy, as no female was ever allowed to arrive. They paid an exorbitant rental for the spot, and had to defray the expenses of the guard-house at the bridge, which was constantly occupied by a body of police or soldiers, to prevent the exit of the inmates and the entrance of every one except officials. The commercialists quietly submitted to every indignity, and carried complaisance so far, that at the time of the great persecution, one of them being surprised in some place by the Japanese police, and asked whether he was a Christian, replied, 'No; I am a Dutchman.' Nagasaki is one of the opened ports, at which the British flag was for the first time hoisted on the 18th of June 1859. The climate is very genial, having a temperature ranging from 60° to 80° in summer, with scarcely any winter.

*Matsmai*, the chief town of the northern island, Yesso, seated at its south extremity, is said to contain a population of 50,000, and is the capital of a feudatory, who claims lordship over the entire territory. But the mountainous interior has never been occupied by the Japanese, who are principally confined to the coasts, though gradually extending themselves inland. The proper natives are a distinct race, called Ainos, unwarlike and extremely rude, who live in log-built huts, and are said to take refuge in caverns from the severity of the winter. *Hakodadi*, a treaty port on the north-east of Matsmai, 650 miles from Jeddo, fully surrendered by the feudal prince, is small and almost wholly new, but likely to become of commercial importance. It stands on the shore of a spacious landlocked bay, which forms a fine harbour, and has striking mountain scenery in the background. It has been compared in position and aspect to Gibraltar and Hong-Kong. The winters are extremely cold; the thermometer has been observed to register 18° below zero; the snow lies on the lowest situations till the close of April; and torrents of rain, blown up by the south-east winds from the Pacific, accompany the return of spring.

Cairo and the Pyramids.

### PART III.

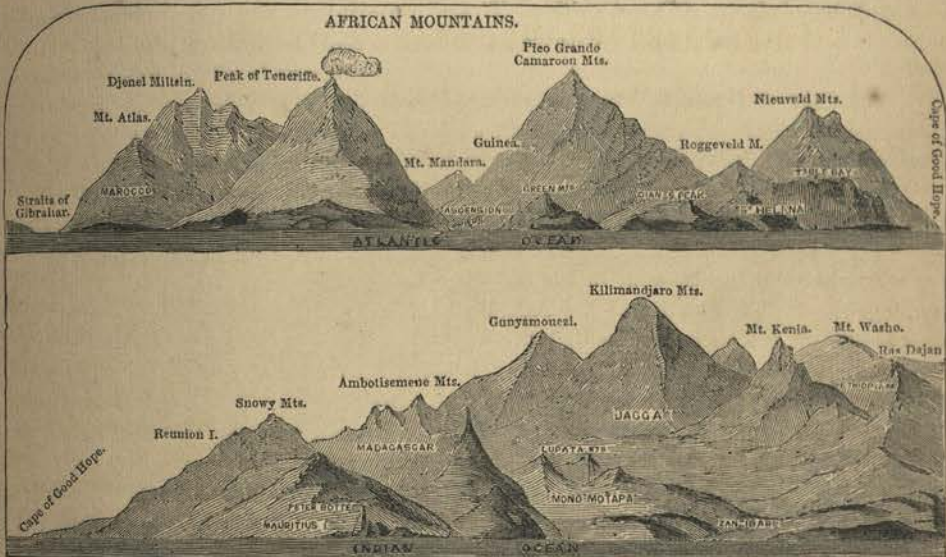

## DESCRIPTIVE GEOGRAPHY OF AFRICA.

#### INTRODUCTORY CHAPTER.—GENERAL VIEW OF AFRICA.

**A**FRICA, a huge south-western pendent to Asia, is the third of the great divisions of the globe in point of magnitude, the most monotonous in its general aspect, the least advanced socially, and the most unimportant in political influence. It is also the only continental portion of the Old World which passes into the Southern Hemisphere. This mass of land is of an irregular pear-like form, or rudely triangular, with the vertex directed towards the south. It is separated from Europe by the Mediterranean on the north, washed by the Atlantic on the west, and bounded by the Isthmus of Suez, the Red Sea, and the Indian Ocean on the east. At the contracted southerly extremity, the waters of the latter ocean blend with those of the Atlantic. Hence Africa is very nearly insulated, and would form an immense island, were it not for the Isthmus of Suez stretching between the head of the Red Sea and the Mediterranean, and connecting it with Asia. This is a neck of land little more than 70 miles across, with few elevations besides sand-hills, but occupied by several salt-lakes, which render it perfectly feasible to unite the two seas by artificial excavation. A canal effected this object in ancient times, traces of which remain; and a repetition of the work is at present in process. But though a channel may be opened, it is very improbable that one of any permanent navigable value can be executed, owing to the constant encroachment of the bordering sands.

The bold headland of Cape Agulhas, crowned by a light-house, is the southern extremity of the continent; Cape Bon, the northern; Cape Verde, the western; and Cape Guardafui, the eastern. These points are respectively in latitude  $34^{\circ} 50'$  south and  $37^{\circ} 20'$  north, and in longitude  $17^{\circ} 42'$  west and  $51^{\circ} 20'$  east. Intersected by the equator, and ranging to nearly the same distance north and south of it, Africa has by far the largest proportion of its surface within the limits of the torrid zone, therefore under the immediate power and dominion of solar influences. Most of the people see the great orb, in its annual progress from tropic to tropic, pass twice over their heads, and thus experience a repetition of its intense vertical rays. The greatest length, from north to south, falls little short of 5000 miles; the greatest breadth, from east to west, closely corresponds to this measure; and the superficial area is usually estimated at 12,000,000 of square miles, equal to more than three times the extent of Europe, and two-thirds that of Asia. But though so much larger than Europe, while almost completely surrounded by water, Africa has a smaller amount of coast-line, being of compact form, with shores remarkably free from great bays and gulfs. The principal indentations are the Gulfs of Sidra and Kabes, connected with the Mediterranean; the Gulf of Guinea, in which are the Bights of Benin and Biafra, belonging to the Atlantic; and Delagoa Bay, on the side of the Indian Ocean. This want of far-penetrating inlets of the sea has practically isolated Africa from the rest of the world, retarded the civilisation of the people by preventing intercourse with more enlightened nations, and rendered a vast portion of the interior down to the present day a land of mystery to them, though now the veil is in process of being removed by the enterprise of explorers.

Though the features of the surface are distinguished by greater uniformity than those of the other continents, very varied scenes and surprising contrasts are by no means wanting. There are mountainous ranges, visited at their summits with keen frosts and heavy snow-falls, the gorges of which are river-beds fringed and largely overgrown with gigantic reeds and creepers; splendid forests of the stately and park-like acacia, in the branches of which the social crossbeaks chiefly rear their singular and interesting nests; monotonous sand-plains upon which the sun glows hotly, stretching out to an apparently interminable extent, with only a thin sprinkling of grasses, and no trees, but a few dark

green mimosas straggling along the narrow and often dry water-courses ; and levels equally vast, but stony and more wildly sterile.

'A region of drought, where no river glides,  
Nor rippling brook with osiered sides ;  
Nor sedgy pool, nor bubbling fount,  
Nor tree, nor cloud, nor misty mount  
Appears, to refresh the aching eye,  
But barren earth, and the burning sky,  
And the blank horizon round and round.'

Such is the Sahara, or Desert, one of the most extensive and frightful on the earth, the most conspicuous feature of African geography. It forms a barrier between the northern and central portions of the continent, extends full 3000 miles from the Valley of the Nile westward to the Atlantic, by a breadth exceeding in various places 1000 miles, and would be impassable by man without the aid of the camel. The animal carries water for him from the few springs which occur at distant intervals along the frequented routes, while itself able to dispense for long periods with the refreshment, besides being otherwise naturally adapted to traverse such territories. But men and camels frequently perish by the way, and their bones are encountered by the traveller to remind him of what may be his own fate. While Major Denham was dozing upon his horse, overcome by the noonday heat, he was suddenly aroused by the crashing of something beneath him. The steed had stepped upon the perfect skeletons of two human beings, and had cracked their brittle bones. The skull of one was separated from the trunk, and rolled on like a ball before him.

The Sahara-bela-ma, 'Desert without Water,' according to the full Arabic name, is generally a plateau of moderate elevation. Its surface consists partly of sand so loose and fine as to shift with every breath of wind that blows, but more largely of bare rock, hard clay, and indurated gravels, often rising into ridges and hills. The sand is principally composed of white and gray quartz particles of various sizes, but seldom so large as to form pebbles. Winds blow over the district from the east through nine months of the year, and from the west through three months. They raise the sand in awful clouds when they are violent, which darken the atmosphere, and threaten to overwhelm the caravans. From the greater prevalence of the east winds, it has resulted, that in travelling towards the west the sand increases in depth, and forms a more continuous covering. It is even prolonged beneath the waters of the Atlantic to an unknown distance, forming enormous sand-banks off the coast, and leading the mariner to keep far away from shore. Cape Blanco, its apparent termination westward, is a low flat tongue of verdureless white sand projecting into the sea, and owes its name to the prevailing hue. If westerly winds were to become predominant, Egypt would speedily be overwhelmed by the sand-flood, all cultivation cease, and the oases on its borders—these spots, where springs ooze up, and gather a little world of vegetation around them, chiefly date-trees—would disappear. Over a large portion of the Sahara rain never falls, but it is everywhere rare, while the surface is exposed to the fierce glare of a tropical sun. But though the heat by day is often almost insupportable, the nights are frequently singularly cold, owing to the excessive radiation promoted by the purity of the sky and calmness of the air.

North-Western Africa is diversified by the Atlas Mountains, consisting of groups of high masses irregularly disposed, but connected by inferior ranges. They form a chain running parallel to the Mediterranean, at no great distance from the coast, which gradually lowers in its easterly extension, and is skirted on the interior side by the Balad-el-Jerid, or Land of Dates, on the edge of the Sahara. Snow is very rarely absent from several of the summits, the loftiest of which, Miltin, within view at the city of Marocco, rises to the

height of more than 11,000 feet, and is crested with it permanently. The upper part of the Nile basin embraces the plateau region of Abyssinia, of great general elevation, and the platform from which Abba Yared towers to 15,000 feet, deemed till recently the culminating-point of Africa. This distinction appears to belong to Kilimandjaro, about 3 degrees south of the equator, which rises above the snow-line, indicating in such a latitude an altitude of 20,000 or 21,000 feet. Near the coast of the Bight of Biafra, the Pico Grande, the loftiest peak of the Camaroons, reaches to 13,129 feet, upon the brow of which Captain Burton planted his foot in 1861. From the south coast, within the limits of the Cape Colony, mountainous ridges rise in succession above each other as the shores are receded from, separated by terraces or high plains, the karroos of the colonists. The loftiest range, the Sneeberg, or Snowy Mountains, attains the elevation of 10,000 feet. It appears from the explorations of Livingstone and others that the central region of Southern Africa, north of the tropic, is a moderately high and well-watered table-land, fringed with mountains on the edges, through openings between which the interior rivers effect their disengagement, and descend to the coasts.

The Nile is the largest of the African rivers, and the only considerable one connected with the basin of the Mediterranean. It issues from the great lake Victoria Nyanza, immediately south of the equator, and has a course of 3000 miles to the sea, which is entered through the far-famed Delta. In Nubia the river is fully formed by the junction of the White Nile, the main branch, with the Blue Nile from the Abyssinian highlands. It is remarkable that after receiving the Atbara, or Tecazze, lower down, from the same country, no affluent enters the channel, though the river has still a course of 1500 miles to run. Hence it diminishes in volume as it proceeds, owing to the powerful evaporation and the quantity of water drawn off for irrigation. For ages it has been celebrated for the regularity of its annual rise and overflow, caused by seasonal rains in the upper part of its basin. The utility of this overflow to Egypt, which altogether depends for its fertility upon it, has long been known; and it is, moreover, a curious circumstance, that even when the river is most turbid, the water retains its salubrity and agreeable taste. 'What,' said the general, Pescennius Niger, to his soldiers, 'crave you for wine, when you have the water of the Nile to drink?' So nutritious was it deemed by the old Egyptians that the priests refrained from giving it to their sacred bull, Apis, on account of its fattening properties. But as a present fit for royalty to receive, it was sent to distant kings and queens. The Arabs in the present day account it a delicious beverage, and will even excite thirst artificially by eating salt, in order to gratify themselves with it. On journeys and pilgrimages nothing is spoken of with so much enthusiasm as the delight of again drinking of the great river on their return. They are accustomed to say, that if Mohammed had once tasted the stream, he would have asked an immortality on earth, that he might enjoy it for ever.

The second great river, the Niger, also called the Quorra and Joliba in different parts of its course, enters the Atlantic at the Bight of Biafra, after a flow of perhaps 2500 miles. Though navigable to a great distance from its mouth, with populous nations on its borders, the pestiferousness of the mangrove swamps along the banks, is to Europeans a serious check upon its commercial utility. The Gambia, Senegal, Congo, and Orange Rivers are also connected with the Atlantic basin. On the eastern side of the continent, the Zambesi is the only stream of consequence, the course of which was traced by Livingstone from the interior to its outlet in the Indian Ocean at the close of his great journey. It is remarkable for its 'smoke-resounding falls,' a native allusion to the spray and roar of a cataract, perfectly unique of its kind, now usually called in England the Victoria Falls, which the traveller just named pronounced the most wonderful sight he

Victoria Falls, Zambesi River.

ever witnessed in Africa. At a point where the river is upwards of a mile in breadth, flowing through a level country, it comes suddenly upon a connected series of deep and narrow chasms running in abrupt zigzags athwart its bed, but hardly extending beyond it. These finally widen out, and lead away in the general direction of its course. Into the first of these chasms, the entire Zambesi tumbles at a single leap to the depth of 400 feet, and thus disappears entirely from the surface of the land. After its fall, the river is visible from occasional points of view, struggling in those strangely-contracted and tortuous depths through which it has to make its further way.

The lakes are numerous and extensive, but those which appear to be the most important have not been fully explored, and are quite of recent discovery. A considerable space in Central Africa is occupied by Lake Tchad or Tsad, an expanse of 200 miles in circuit, but fluctuating in its extent with the seasons, shallow throughout, and lined with a belt of almost impenetrable tall grasses. The highland lake of Dembea or Tzana, in Abyssinia, through which the Blue Nile passes, is also an extensive sheet of water, at the elevation of 6270 feet above the sea-level. The Victoria Nyanza, nearly under the equator, the probable source of the White Nile, and the Lake Tanganika, further south, are important bodies of fresh water, both made known in the year 1858, since which period Livingstone has reported on the Niyanyizi-Nyassa, 'Lake of the Stars,' still more southerly, belonging to the river-system of the Zambesi.

The high temperature which generally distinguishes the climate of Africa, especially in the northern half, is the result of its tropical position, the structure and configuration of the land, and other subordinate causes. Vast tracts of sandy soil reflect with intense power the heat of the solar rays, while an immense extent of the surface is naked, without forests to protect it from the vertical sun's fiery glow. A lofty chain of mountains towards the Mediterranean prevents the ingress of the cool north wind, while the want

of such a chain on the north-east freely admits the currents of air which have passed over the warm tracts of Arabia. The general absence of deep inlets of the ocean also operates to shut out the refreshing sea-breezes from the interior. In the central part of the Sahara, and the country between the Nile and the Red Sea, the temperature attains the highest mean annual rate hitherto observed in any portion of the globe. It amounts to  $87^{\circ}$  at Massowah or Massuah on the coast of Abyssinia. Winds from these highly-heated districts partake of their temperature, and extend it to the countries bordering upon them. The dry burning breath of the Harmattan, felt all over Senegambia, at intervals in December, January, and February, is a blast from the fiery furnace of the Great Desert. If it continues for some time, the branches of tender trees wither and die; all herbaceous vegetation perishes; and the panels of doors, windows, and articles of furniture crack, as if exposed to the action of a strong fire. But though thus pernicious, while disagreeable in its effect upon the human frame, causing the skin to peel, the harmattan as a dry wind is extremely favourable to life and health, arresting the spread of epidemics, and banishing the fevers prevalent in the wet season which precedes its visit. On the low coasts of this region, the climate is specially unfavourable to Europeans, owing to the malaria arising from the immense mass of decomposing vegetation brought down by the rivers, which has been stimulated by the hot and moist atmosphere. Hence Sierra Leone acquired the name of the 'white man's grave' from its extreme unhealthiness, but this has now been somewhat mitigated by the clearance and cultivation of the ground. On the elevated lands the temperature is moderate, the air invigorating, and the climate wholesome, but a very uncertain rain-fall is an incident common to them, especially in the far interior, where long droughts severely distress the inhabitants, and have led the simple and barbarous tribes to retain professional rain-makers in their service.

Vegetable life is less varied in its forms, and more scantily diffused than in the other continents, but wherever the soil is sufficiently watered, as in the basins of the Senegal, Gambia, and Niger, the utmost luxuriance of growth is exhibited, under the combined influence of moisture and heat. Fine forests clothe the landscapes, consisting of acacias yielding gum-arabic, rosewood, teak, cotton-trees, masses of the unwieldy boabab, and tall gramineous plants. The boabab, or great calabash, which bears the fruit called monkey-bread, used as food by the natives, is not remarkable for height, but has the most enormous trunk of any known tree, measuring from sixty to seventy feet in girth, and occasionally reaching to ninety feet. An instance is mentioned of a hollow trunk serving the purpose of a council-chamber to a Negro village. The date-palm distinguishes the northern skirts of the Sahara; the doom-palm is characteristic also of sandy soils; the oil-palm, from which the palm-oil of commerce is obtained, flourishes on the shores of the Gulf of Guinea; and the cocoa-palm waves on the tropical coasts. Cassia plants abound in Upper Egypt and Nubia, from which senna is prepared. The coffee shrub grows wild in Abyssinia, its native seat. A very peculiar flora appears in Southern Africa, or the Cape Colony, distinguished by the prevalence of succulent plants, bulbous roots, geraniums, and heaths, the latter very remarkable for their beauty, though of little utility to man. Indigo, cotton, tobacco, and the sugar-cane are cultivated in various parts, with maize, rice, dhurra, a kind of millet, bananas, and yams. The vine is cultivated with success at the Cape.

African zoology is characterised by the great number of species of the higher orders, many of which are quite peculiar to the continent. It includes the animal which makes the nearest approach to man in its organisation, the chimpanzee, with the enormously-powerful gorilla, both found in the woods of Upper Guinea and Senegambia, though but rarely met with. Three varieties of the king of beasts occur, the Barbary lion, with a very thick brown mane covering the head and shoulders of the male; the Senegal lion, of a yellower hue, with a thinner mane; and the Cape lion, of which the mane is nearly black. The elephant abounds, but is not domesticated as in Asia; it is the tenant of all the countries south of the Sahara; and with it, the rhinoceros, with two horns, has much the same range. Another animal of immense bulk, the hippopotamus, exclusively belongs to Africa, inhabiting the Upper Nile, with all the other large rivers, especially the Congo, the Niger, and the Zambesi. It is fitted alike to stalk on land, march along at the bottom of the waters, or swim upon the surface. Of the horse tribe, the beautifully-striped zebra, the quagga, and the dow roam over the arid plains of the central and southern regions in herds, and are not known in any other division of the globe. This is the case likewise with the giraffe, one of the ruminants, the tallest of all quadrupeds, feeding on the leaves of trees, straying over a wide area, but not approaching the western coast. The antelope family is profuse in species and in individuals, sometimes migrating in vast droves in search of pasture, when severe drought compels them to quit their customary haunts. The male ku-du

Scene on the Logier River, South Africa.

above was sketched and shot by Mr Baines in February 1863, the scene represented lies between the Logier and Luisi rivers; the shrubby trees on the left being the *Marrunia purpurea* or poison-tree of the Bushmen. The tiger is not an African animal, neither is the bear, but the leopard, panther, and hyena are widely distributed over the surface, while the wolf and jackal are chiefly limited to northern localities. Over the same region the Arabian camel has been established from the earliest ages, and is essential to ordinary travelling and commercial transactions.

The ornithology includes many species remarkable for gracefulness of form and beauty of colour, as the sun-birds and bee-eaters, the roseate ouzel, the Senegal thrush with its bronzed black plumage glossed with blue and violet, and the highly-adorned African creeper, admired also for its musical powers. Other species occur distinguished by interesting instincts, or by their size. The honey-guide birds, ranked with the cuckoo family, attract notice by their peculiar cry and habit of fluttering near the traveller, leading when followed to the wild bee's home. The ostrich, tallest of its class, and perhaps the swiftest of all running creatures, hunted for its white feathers, inhabits the open sand plains of the continent from north to south. The marabou, or gigantic stork, roosting in the cotton-trees, enjoys protection as a useful scavenger. Every order in the reptile world is represented. The crocodile of the Nile, celebrated in the ancient history of Egypt, is no longer found in the Delta, but abundant in the Thebaid, and in all the large rivers. In the swamps of the west coast, the python lurks, sometimes twenty-two feet in length. The list of venomous serpents embraces the asp, anciently regarded as an emblem of the protecting divinity of the world, often represented in hieroglyphic and other sculptures of the Egyptians. Southern Africa has its deadly varieties of the viper family, among which is the spitting-snake, so called from its power of ejecting poison to a distance when irritated. Batrachian life is enormously developed in the singularly coloured donder paade, or monster toad, about a foot in length, and three-quarters of a foot in breadth.

Among the insect tribes, locusts are occasionally a terrible scourge to many parts of the continent, migrating from the deserts where they are propagated to the fertile lands, and consuming all the vegetation wherever they alight, every leaf, and every blade of grass. A single swarm upon the wing makes the mid-day as sombre as the eventide, so dense is the mass; and will be often more than half an hour in passing overhead. On one occasion the troops of Ibrahim Pasha, in attempting to extirpate one of the insect

armies, gathered up no less than 65,000 ardebs of them, equal to 325,000 bushels. 'I never saw,' writes a missionary at an interior station, 'such an exhibition of the helplessness of man as I have seen to-day. While we were sitting at dinner, a person came into the house quite pale, and told us that locusts were approaching. Every face instantly gathered "blackness." I went to the door, looked above, and all around, but saw nothing. "Look to the ground," was the reply, when I asked where they were. I looked to the ground, and there saw a stream of young locusts covering it at the entrance of the village. It was about 500 feet broad, moving at the rate of two miles an hour. In a few minutes they covered the garden wall some inches deep. To examine this phenomenon more fully, I walked about a mile and a half from the village, following the course of the stream of locusts. Here I found it extending a mile in breadth. It appeared as if the dust under my feet were forming into life. Man can conquer the lion, the tiger, the elephant, and all the wild beasts of the desert; he can turn the course of mighty rivers; but he is as nothing before an army of locusts. Such a scene as I have beheld this afternoon would fill England with more consternation than the terrific cholera.' A resemblance between the head of the locust and that of the horse has often been noticed, and hence the Italians call it *cavaletta*, or the 'little horse.' The Arabs compare the head to that of the horse, the breast to that of the lion, the feet to those of the camel, the belly to that of a serpent, and the tail to that of a scorpion. The formidable light in which they view the puny creature is evident from these comparisons. It is expressed also in the interpretation they put upon certain markings on the wings, resembling oriental characters, which are supposed to form an inscription, signifying 'We are the army of the mighty God. We have each ninety-and-nine eggs, and had we but the hundredth, we would consume the world, and all that it contains.' Though not capable of taking long flights, they have effected the passage of the Mediterranean, with a strong and regular wind blowing in a favourable direction. If a calm comes on, they fall exhausted into the water, or if there is a storm they are precipitated to the surface to perish. Termites, or white ants, are a hardly less formidable insect tribe, destroying furniture, books, clothes, and everything that comes in their way. They are chiefly found in Western Africa. They form vast colonies, each under a female sovereign, and build conical nests of earth from ten to twelve feet in height, divided in the interior by thin partitions into a variety of cells. These nests are grouped together in great numbers, and appear like villages from a distance. The tsetse-fly, whose bite is fatal to nearly all domestic animals, haunts certain parts of the basin of the Zambesi, with a few adjoining localities.

Africa appears to be much more sparingly endowed with mineral wealth than the other continents, but such a vast proportion of the surface is either wholly unknown, or remains so scantily illustrated, that no positive conclusion can at present be arrived at. Gold has been for ages a characteristic product, and originated the name of the Gold Coast on the Gulf of Guinea. It occurs in the form of minute grains or dust, diffused through the alluvium of rivers, lakes, and valleys, also mixed with the wide-spread sand of the Sahara. It is sold in the ports of the west coast, as well as in the marts of Morocco, Fez, Algiers, Cairo, and Alexandria. The gold-dust is frequently accompanied with grains of iron ore. Auriferous quartz rocks certainly occur, the disintegration of which has probably formed the sands and gravels in which the gold-dust is found. Kordofan, to the south-east of the Sahara, affords a considerable supply of the precious metal, brought to market by the Negroes in quills of the ostrich and vulture. Copper and iron are abundant in the Atlas Mountains, and in the desert between the Nile and the Red Sea, where mines were worked in ancient times, traces of which remain very distinct. The Sierra Leone coast possesses valuable iron ores; and in Southern Africa, particles of iron intermixed with sand form the soil of the Great Karroo. Salt is plentiful and widely diffused, though in some districts wholly wanting; sal-ammoniac, saltpetre, sulphur, and emery are also furnished; and natron or soda—an important article of commerce—is obtained from lakes and springs, chiefly in the eastern half of the Great Desert. The mineral crystallises at the bottom when the water is sufficiently saturated. It forms cakes varying from fine films to the thickness of a few inches, and is conveyed by camels to the markets of Egypt.

Though entirely a matter of conjecture, the total population of Africa is probably not less than 100,000,000, consisting of many small nations and tribes, very largely out of the pale of the most ordinary civilisation. Few of the people are strictly nomadic in their habits, but dwell in permanent towns and villages, the great majority of which are groups of humbly-constructed thatched earthen or wooden cabins.

The North Africans, between the limits generally defined by the parallel of  $20^{\circ}$  and the Mediterranean, belong chiefly to the Syro-Arabian stock, but often display the presence of central African or Nigritic peculiarities. Over the whole of this region a race of foreign extraction is spread, the Arabs, who came in from Asia under the standard of the early Mohammedan chieftains, and have both maintained themselves of pure blood, and become mixed with the natives proper. The indigenous people are arranged by Dr Latham in three groups of Atlantidæ, respectively styled Egyptian, Nilotic, and Amazigh. The first of these groups includes the descendants of the ancient race on the lower course of the Nile who reared the pyramids, or the modern Copts, few in number, whose thick lips, broad flat nostrils, and full eyes correspond to the sculptured representations on the old monuments. The second group, or the Nilotic Atlantidæ, comprises tribes and nations occupying the middle and upper basin of the river, Nubians, Agows, Gallas, and Bishari, the present population of Nubia and Abyssinia. The Amazigh Atlantidæ are the people usually called Berbers, who were known to the Greeks and Romans by the name of Amazigh, signifying free, independent, brave, like the term Frank among the Europeans. It indicates their present condition. They now inhabit the mountainous region of the Atlas, and are thinly scattered over the northern part of the Great Desert, extending also far into its southern portion, occupying the oases. In many parts they are in contact with the Moors, a mixed people, the offspring of a native race and of Roman, Vandal, and Arab conquerors, still retaining primitive characteristics, and chiefly dwelling in cities and towns. The Arabic is the prevailing language in Africa north of the equator. It was introduced by the Mohammedan conquerors, gained diffusion with the extension of their power, and was imposed by force of circumstances to some extent upon natives subject to their rule. In general the inhabitants of this portion of the continent have dark eyes, long black hair, and a brown complexion, varying in its shade from light to dusky.

The Central Africans belong principally to the Negro or Ethiopic variety of the human race, and are styled Negro Atlantidæ. They form the vast majority of the population, and are physically characterised by a complexion varying from deep sallow to intense black, by dark woolly hair, an unctuous skin, high cheek-bones, projecting jaws, and thick lips. These features are by no means strongly marked throughout, but endless modifications appear. The jet-black hue seems to be confined to those who inhabit the river-valleys and other low grounds within the tropics. In strength and stature the Negro is fully equal to Europeans, nor has any natural intellectual inferiority of the black man to the white yet been proved. True Negro tribes are most prominent in the region of the west coast from the banks of the Senegal to the latitude of  $16^{\circ}$  south, and in the interior of the continent from the Great Desert nearly to the Tropic of Capricorn, while occurring also on the east coast. In Senegambia, Guinea, and Sudan they form populous nations, but are principally divided into small communities under hereditary chieftainships. In the economy of some interior communities, social and political, Livingstone unexpectedly stumbled upon the discovery of female influence predominating, but was for some time hard of belief in relation to it, till repeated inquiries established its truth. Among all uncivilised people hitherto known, women have invariably been found to be little more than the drudges and pack-oxen of the men; but in a part of Nigritia the relations between the sexes change completely, and the lady-blacks have decidedly the upper hand. In the event of marriage between a young man and a girl belonging to a neighbouring village, he removes to the house of his bride; and it becomes his duty not only to treat the mother-in-law with the greatest respect, but to supply her with fire-wood throughout the remainder of her days. In cases of separation, it is the wife who divorces

the husband, the children going along with her; and in almost all the ordinary transactions of life, her influence is supreme.

The South Africans are ranged in the two groups of the Kaffir and Hottentot Atlantida. The Kaffirs, consisting of numerous tribes under a great variety of names, occupy the east coast region and the central districts, from the borders of the Cape Colony and Natal up to the basin of the Zambesi. They are a tall, well-made, athletic race, of a deep brown complexion, with short curly black hair, less woolly than that of the Negro; but become gradually assimilated to the Negro type on passing to the northward, till all trace of difference fades away. The word Kaffir is derived from the Arabic *Kiafir*, signifying an 'unbeliever,' and was applied by the Arabs as Mohammedans to all the natives in their vicinity. In conformity with this usage, the early Portuguese and Dutch settlers adopted the designation, called the country beyond their bounds the land of the Kaffirs, out of which Kaffraria was formed as the name of a particular district. This family includes the Bechuanas, Damaras, Zulus, Matabele, and Makalolo. The Hottentot Atlantida are found in the west coast region north of the Cape Colony and within its limits, penetrating inland to the Kalahiri Desert. They are of short stature, have very unprepossessing features of the Mongolian cast, but have shewn an aptitude to acquire the habits of civilised life under patient instruction. The Griquas, Koranas, Namaquas, and Bosjesmans or Bushmen belong to this race. The latter are strictly a nomadic people, follow no industrial pursuit, wander in search of roots and game, possess some wretched dogs, are now few in number, and appear to be verging to an utter extinction. Throughout the northern countries Mohammedanism is professed, but with no strict attention to its ritual, except by the inhabitants of the Nile valley and the Barbary states. A form of Christianity, but very much corrupted, is observed by the Egyptian Copts and the Abyssinians. The lowest phases of superstition appear among the Kaffir and Negro nations, some of whom observe the practice of circumcision, and peculiar rites of purification analogous to those prescribed by the Mosaic law. They dread the influence of sorcerers and wizards, have recourse to fetishism, or the worship of animate and inanimate objects. This is specially distinctive of the Negroes, on occasions of emergency, public or domestic, who venerate also the spirits of their departed relatives. Clay figures of the lion and crocodile are set up, or blocks of timber rudely carved with the human face, generally in the most utter seclusion in the woods, to which the Negro repairs solitarily when the shadows of the night have gathered, to invoke aid in his distresses. Sometimes they are established in public places, when crowds assemble around the images, and beat drums to render them propitious.

#### I. WEST AFRICAN ISLANDS.

The insular dependencies of the continent are all small, with one signal exception, but have many interesting features. Except a few close inshore, they are not politically associated with the mainland, are chiefly held by the Portuguese, Spanish, British, and French, and are hence most conveniently noticed in detail collectively.

MADEIRA, a possession of the crown of Portugal, is situated about 390 miles off the north-west coast of Africa, and is justly celebrated for its beautiful scenery, fine climate, and great fertility. It extends thirty-five miles in length by fourteen where the breadth is the greatest, and consists of a mass of basaltic rock rising abruptly out of the sea. It attains the elevation of 6050 feet above its level, in the Pico Ruivo, the loftiest point, from the summit of which the view is magnificent on favourable occasions. Deep narrow gorges cleaving the mountains almost down to their base; rivulets flowing through them, leaping in cascades from rock to rock, and at times swelling into furious torrents; and luxuriant vegetation are characteristic of the scenery. Pines and chestnuts form noble groves on the higher declivities; myrtles and geraniums flourish in their native wildness, and give beauty to the ravines; bananas, dates, figs, spices, coffee, and all the choicest

Funchal, Island of Madeira.

fruits of the tropics are raised abundantly on the lower grounds. The vine is, however, the chief object of cultivation, and wine the important export. But in Madeira, as in other wine-growing districts, the vintage has in recent years been damaged to the great distress of the inhabitants, owing to the grape blight, originated by a parasitical fungus. The people are mostly of Portuguese descent, upwards of 98,000 in number. About one-fourth occupy *Funchal*, the capital and only town, agreeably seated on a bay of the south coast, the residence of many English merchants engaged in the wine trade. It has an English Episcopal and a Scotch Presbyterian Church. Owing to the mildness and uniformity of the climate, invalids from Europe resort to the place to pass the winter, suffering from pulmonary affections, occasionally of illustrious rank. Within the last quarter of a century a villa adjoining Funchal has successively received Prince Alexander of Holland, Adelaide queen-dowager of England, the Duke of Leuchtenberg, the ex-empress of Brazil, and the empress of Austria. On the north-east of Madeira lies the small isle of Porto Santo, with a few inhabitants; and on the south-east are the three rocky islets, called the Desertas, occasionally visited by fishermen, herdsmen with goats, sheep, and cattle, and by parties in quest of archil, a dye-yielding lichen.

The CANARIES, a group considerably to the southward and much nearer the mainland, consist of seven principal islands, Tenerife, Gran Canaria, Fortaventura, Gomera, Lanzarote, Palma, and Ferro, with several smaller. They are subject to the crown of Spain, and form a province of the kingdom, attached to the archiepiscopal see of Seville. Their population, about 230,000, are almost exclusively of Spanish descent, but mingled in blood by intermarriage with the aborigines, or the Guanches, who have disappeared as a distinct race. A pestilence swept away the few survivors in 1494. When first known to Europeans, these people recognised a Supreme Being, with a future state of rewards and punishments. They embalmed their dead, and deposited them in caves. When the embalming process was complete, the body was sewn up in goat-skins, and bandaged with leather. The chiefs had the distinction of a coffin formed of a hollow tree, but in all cases cave-burial obtained. In a spacious sepulchre, the cavern of a steep cliff in Tenerife, upwards of 1000 mummies were found, and five or six were commonly joined together, the feet of one being sewn to the head of the next. Remains of aromatic plants connected with the skeletons were met with, and small laces to which were suspended little cakes of baked earth. Tenerife, the largest island, contains the seat of government, at *Santa Cruz*. Gran Canaria, nearly round, and about forty miles in diameter, has the best anchorage ground, in the bay on which stands the principal commercial town, *Ciudad de las Palmas*. Fortaventura, the nearest to the African main, is little more than sixty miles from Cape Juby. Ferro, the most westerly, in longitude  $13^{\circ} 9'$  west of Greenwich, was formerly considered the extreme western point of the Old World, and all geographers adopted its meridian as the starting-point in reckoning longitudes. Some of the Germans and others still adhere to this old standard line, which has been used for the purpose from the time of Ptolemy. The islands are fertile, have a warm salubrious climate, but are subject to very severe droughts. The well-known canary bird, originally brought into Europe from the group, and hence so named, is still plentiful, but differs in colour and appearance from those bred abroad. Canary-grass, a native plant, is also naturalised in England, and cultivated for the seed in various parts of the counties of Kent and

Essex. The Canaries are all of volcanic formation, and contain both extinct and active centres of eruption. The whole of Lanzarote is a mass of lava and cinders, with a crater which was in action in the year 1824; and the Peak of Teneriffe is one of the grandest volcanoes of the globe. It rises pyramidally to the height of 12,236 feet; and with the ascending and declining sun projects a huge and clearly-defined black shadow, stretching away upwards of fifty miles across the deep, and partly eclipsing the adjoining isles. Zones of different vegetation are successively passed on making the ascent. The region of vines at the bottom is left for that of laurels and various woods, followed by that of pines and juniper, to which succeeds a species of tall broom, which forms oases in the midst of a wide sea of ashes around the Piton; or Sugar-loaf, a mountain on the top of a mountain.

The CAPE VERDE cluster, belonging to Portugal, is situated about 320 miles off the promontory of that name, the most westerly point of Africa. There are ten principal islands, Santiago, Fogo, Brava, Maio, Boavista, Sal, San Nicoláo, San Luzia, San Vicente, and San Antonio, occupied by about 80,000 negroes and mulattoes, with a few whites. They are volcanic, generally rocky and barren, have a very unhealthy climate, intense heat prevailing during the greater part of the year, with storms and fogs through the remainder. Santiago, the largest of the group, contains *Porto Praya*, formerly the residence of the governor. Fine specimens of the giant tropical tree of Africa, the boabab, appear in the vicinity, with the pear-shaped trunk nearly forty feet in circumference, though not more than ten feet high. The seat of government is now at *Mindello*, in San Vicente, which possesses an excellent harbour in the Porto Grande, regularly resorted to as a coaling-station by steamers bound to or from the Southern Hemisphere. The slopes of a volcano occupy almost the whole area of the island of Fogo. It rises to the height of 9159 feet, and has been in recent activity, after a long interval of repose; the islanders speak a Portuguese jargon called *Lingua Creolita*.

FERNANDO PO, in the Bight of Biafra, bears the name of its Portuguese discoverer, Fernando Gomez, but was very appropriately called by him *Illa Formosa*, the 'Beautiful Island.' It is within sight of the mainland, and has a very attractive appearance from the sea, being traversed by a mountain-ridge clothed to some of its highest elevations with dense forests, while in other parts the trees have a park-like arrangement, occurring in groves. Clarence Peak rises 10,650 feet, and has a summit composed of volcanic ashes, mantled with grass, and almost constantly enveloped in clouds. The woods consist of palms and the magnificent bombax, or silk cotton-tree, 'looking in the distance,' says a describer, 'so like the white sails of vessels, hull down, that one might almost have supposed they saw a numerous fleet with canvas loosened to dry.' Birds of fine plumage are numerous; monkeys occur in crowds, some of which are of large size; alligators infest the streams; snakes are very common; goats and sheep run wild. With the consent of Spain, to whom the island had been ceded by the Portuguese, it became the seat of a British settlement in 1827, designed to aid in the suppression of the slave-trade, but was resigned in a few years, and the military withdrawn, owing to the fatal influence of the climate. *Clarence Town*, a British foundation on the north-east coast, consists of a single street of wooden houses, with a small population of negroes, chiefly liberated from slavery, and a few whites as merchants, engaged in the palm-oil trade, over whom the Spanish government exercises no active authority, though the sovereignty has reverted to it. In the grave-yard many English victims to the fell fever of the place are interred, among others, Richard Lander, the explorer of the Niger.

PRINCE'S ISLAND, two degrees from the equator, and that of ST THOMAS, intersected by it, are small possessions of Portugal, under a governor resident at the latter.

ANNOBON, or Anno-bom, immediately south of the equator, a very interesting spot, is under the government of natives, though claimed by both the Spanish and Portuguese, without either interfering. It is only about four miles long by two broad, and rises up from an unfathomable depth of ocean to the height of 3000 feet. Provisions and water being plentiful, vessels often make for this independent speck of land to procure supplies, which are much more readily obtained by barter than by money. There are about 3000 natives, whose political economy is doubtless without parallel. The government is vested in five persons, who hold office by turns, and have their term of service regulated by the arrival of ships. When the number of ten has been reached during one chief-magistracy the functionary gives way to another.

ASCENSION ISLAND, a British possession, is one of the lonely islets of the globe, being upwards of 900 miles south-west of Cape Palmas, the nearest point of the continent, and 500 miles from St Matthew's, the nearest shore. The name commemorates its discovery by the Spanish on Ascension Day 1501. It is an arid volcanic spot, eight miles long by six broad, and rises to 2870 feet above the sea. First occupied by the British for the purpose of surveillances during the captivity of Napoleon at St Helena, it has since been retained as a victualling station for ships returning from the East, and for the squadron engaged in suppressing the slave-trade. Immense numbers of birds' eggs are taken, and turtles abound on the shores. *Georgetown*, the settlement, is occupied by a small garrison and some negroes.

ST HELENA is still more solitary, being upwards of 700 miles south-east of Ascension Island, the nearest coast. It is one of the best known of all lonely sites, owing to the detention here of Napoleon from 1815 to his death in 1821. Discovered on St Helena's Day 1502, whence the name, it became a Dutch possession. It was ceded to the English East India Company in 1673, from whom it passed to the British crown in 1833. The island is ten miles long by seven broad, and consists of a rugged, dark volcanic rock, facing the sea so precipitously that the interior is only accessible in four places. Diana's Peak, the highest point, rises to 2700 feet. In one of the ravines opening towards the ocean stands *Jamestown*, strongly fortified, possessing an excellent harbour, a handsome church, and many good official residences. It is frequently touched at by

homeward-bound vessels to take in vegetables and fresh water. The whole population of the island does not exceed 6000, consisting of one-third whites, the remainder coloured people of Africa and Asia, with half-castes. Though the surface is generally rugged, it embraces some spacious plains, one of which, Longwood, was the residence of Napoleon, whose house is now in ruins. His remains lay in Geranium Valley till their removal to Paris in 1840. A willow marks the site of the grave.

#### EAST AFRICAN ISLANDS.

MADAGASCAR, on the south-eastern side of the continent, separated from it by the Mozambique Channel, is one of the largest islands of the globe, extending 1030 miles from north to south, by 350 miles from east to west, where the breadth is the greatest, and embracing an area of 225,000 square miles. The shores are low and swampy, often lined with shallow lagoons in which are giant sea-weeds, or clothed with close woods and jungles of tall grasses, forming a very insalubrious region, one portion of which has the native name of Matitana, the 'Land of Death;' while the adjoining isle of St Mary is known in the annals of colonisation as the 'Dead Island' of the Dutch, and the 'Graveyard' of the French. The interior is traversed in the direction of its length by a mountain-range, rising in several summits to upwards of 10,000 feet, and spreading out into extensive table-lands. This elevated district, on which ice is sometimes formed, and sleet storms descend, is entirely free from the pestilential malaria of the coast.

The population—upwards of 5,000,000—consists of tribes with dark African features, over whom the Hovas, who are Polynesian in their complexion, language, and other characteristics, are politically dominant. The propagation of Christianity has been alternately encouraged and interdicted by different sovereigns; intercourse with Europeans has been allowed and suspended, but the island is at present open to communion

with the civilised world. *Antananarivo*, the capital, the 'City of a Thousand Towns,' is in the elevated central district, but has no extent corresponding to the name. It is reached by foreigners from *Tamatave*, the most frequented port on the east coast. The French hold the small isles of St Mary and Nossi Bé, close inshore. The *COMORO* group, at the north entrance of the Mozambique Channel, consists of four principal islands,

Cascade of the Savanna, Mauritius.

and have inhabitants chiefly of Arabic descent, who profess Mohammedanism. They are governed by a native sultan, with one exception, Mayotta, which was ceded to the French in 1841. The surface is volcanic, mountainous, and fertile in tropical products. Cocoa-nut oil and tortoise-shell are exported. The MASCARENE ISLES, the collective name given to a group lying between the 20th and 22nd parallel, consisting of Réunion or Isle of Bourbon, the Isle of France or Mauritius, and Rodriquez, lying 360 miles to the eastward. They were discovered in 1505 by the Portuguese navigator Mascarenhas. REUNION, formerly called Bourbon, 400 miles on the east of Madagascar, has long been a colony of France, or since the year 1649. It has an area of 905 square miles, and consists of two groups of volcanic mountains separated by a plain, with a narrow belt of highly-fertile land for the coast. Piton de la Fournaise, an active volcano, rises 7218 feet, and has thrown out lava, which forms great part of the surface soil. The loftier Piton de Neiges, 10,100 feet, is extinct. Sugar, coffee, cloves, tobacco, cocoa, pepper, saltpetre, ebony, and dye-woods are the principal exports. No venomous reptiles exist, but the island suffers from storms, being within the hurricane region of the Indian Ocean. *St Denis*, the chief town, is on the north coast. The total population amounts to 166,000, of whom about 30,000 are whites, the remainder Africans, formerly slaves on the plantations.

MAURITIUS, a British colony, 115 miles north-east of Réunion, is a somewhat smaller island, mountainous, thickly wooded, and well watered, with a healthy climate, but liable to destructive tempests. A reef of coral nearly encircles the shores, openings in which admit the access of vessels to the strand. The Peter Botte Mountain, remarkable for its summit, is one of the highest points, 2874 feet above the sea. Sugar plantations cover a large extent of the surface, and yield the principal export, in addition to which, coffee, cotton, and indigo are grown. *Port Louis*, the chief town, is beautifully situated, possesses a good harbour, and contains about 26,000 inhabitants. The whole island has a population, including its dependencies, of 322,000, consisting mostly of coloured people once in slavery. It was called Mauritius by the Dutch, the original discoverers, in honour of Prince Maurice of Holland, but passed from them to the French, who held it nearly a century under the name of *Ile de France*. In 1814 its possession was confirmed to the British, who restored the old title. The whites on the island are chiefly of French extraction, and speak the French language. The Mauritius government includes insular dependencies at a considerable distance; the isle of Rodriguez, with a few settlers of French descent; the Amirante and Seychelles Archipelagos, with *Port Victoria* on one of the latter, and a small garrison; and the Chagos group, in the heart of the Indian Ocean.

*Socotra*, about 100 miles from the eastern extremity of Africa, of considerable extent, is inhabited by Arabs, and has been known from a remote age. It is the *Dioscoridis Insula* of Ptolemy, and is mentioned by Arrian, has long been famous for its aloes, and for the gum-resin obtained from the dragon's-blood tree.

Peter Botte Mountain.

Tangier.

## CHAPTER I.

### NORTHERN AFRICA.

THE region known by the general name of the BARBARY STATES, or MAROCCO, ALGERIA, TUNIS, and TRIPOLI, extends along the Mediterranean from the Atlantic on the west, to the borders of Egypt on the east, and has a coast-line of more than 2000 miles, with comparatively narrow but very indefinite inland limits. It includes a series of maritime plains, with a highly fertile calcareous soil, which were the granary of Rome in ancient times, and at an earlier period supplied the wants of the citizens, fleets, and armies of Carthage. They still retain all the conditions necessary to productiveness. The chain of Atlas rises in the background, running from Cape Gher, on the Atlantic sea-board, to the Bay of Tunis, at a varying distance from the shore, and sending off spurs to it which divide the plains from each other, and prevent convenient land communication between them by their steepness. Westward, in Marocco, the chain consists of a double line, the Great and Little Atlas, relatively north and south. The former is the highest, rises to the snow-line, and has the local name of Jebel-el-Thelj, or

the Snowy Mountains. Eastward, towards Algeria, the two lines lose distinctness, and form an elevated broad plateau, edged with bold, abrupt, and rugged heights on the northern and southern sides. Between the edges a space intervenes varying in breadth from 150 to 200 miles, consisting of high levels, extremely hot in summer, but subject to great cold in winter, on which the snow lies long. Upon its melting in spring, the surface becomes rapidly clothed with profuse vegetation, and populous with camps of scattered sections of a nomadic people, who come up from their winter-quarters in the Sahara to take advantage of the fresh food which nature is furnishing to their flocks and herds. Long strings of camels, some with their young by their side, others carrying the women of the tribe, and the tents which are to be pitched when the grazing-ground is reached, present a picturesque spectacle. The southern slope of the mountains descends to the semi-desert region, called Belud-el-Jerid, or the Country of Dates, which forms the northern border of the Great Desert.

Valleys of the Atlas are the beds of streams which unite to form short rivers, flowing on the northern side to the Mediterranean, and descending on the southern to salt-lakes on the verge of the Sahara. Vast woods clothe the declivities far up to the summits. The principal trees are the oak, beech, cork, white poplar, juniper, and wild olive, with the sandarach-tree, yielding the gum-resin of which pounce is made, and famous for its timber, which is almost imperishable. It is employed in constructing the ceilings of the mosques, and is deemed by some identical with the shittim-wood of sacred history. In the Belud-el-Jerid, groves of the date-palm supply the inhabitants with food, afford protection from the burning sun and hot southern winds of the desert, and in their shade the orange, lemon, pomegranate, and vine are reared. The term *Jerid* denotes the dry branches of the palm used to form javelins. On the plains of Marocco the wild mulberry grows luxuriantly; and the favourite fragrant plant, *Reseda odorata*, is there a native, now naturalised in our own climate. It was first introduced from Barbary to the south of France, where it received the common name of mignonette, 'little darling;' it was brought to England in 1742. The lion, panther, hyena, and boar are the formidable wild animals.

In the time of the Romans the country must have swarmed with lions, from the numbers exhibited at their games, obtained chiefly from their North African dependencies. Pompey collected 315 on one occasion for the purpose of fighting in the Circus; and Sylla possessed 100 full-grown males. The latter were sent by the king of Mauritania. At present a brace of lions would be thought a very princely gift. The animal is now confined to the more difficult and densely-wooded parts of the Atlas Mountains, where many have been shot by the rifle since the French occupation of Algeria. The Barbary ape, found in great numbers in the woods, is a small species of tailless monkey, commonly seen in England in attendance upon itinerant showmen in the streets. A colony of the same race has long been naturalised on the Rock of Gibraltar, the only European locality of the quadrumanous order. The horses of Barbary are renowned for their temper, speed, and endurance. Taken by the Arabs into Spain at the time of the conquest, they originated the noble breed of Spanish chargers, so highly valued throughout Western Europe, which received from their native country the name of *barbs*, an abbreviated form of Barbary. The horses of the Nomades on the border of the Great Desert, and in its oases, are the fleetest, but will not bear removal from the sandy plains.

The Barbary States probably contain a population of 10,000,000 or 12,000,000, consisting of various races, almost all united by a common faith, Mohammedanism, and extensively so by a common speech, the Arabic. This is the language of commerce and general intercourse, and also that of the government in the empire of Marocco. Six distinct races may be enumerated; the Berbers, Moors, Arabs, Turks, Kuluglis, and Negroes, besides the cosmopolite Jews, the French in Algeria, and the Spaniards in their own possessions. The name of Berber is a collective one for various tribes native to the soil, who occupy the highlands and the desert region on the south, to which they were driven from the fertile plains by the great Arab immigration of the seventh and following

centuries. The word is of foreign origin, probably derived from the Greek and Latin term *Barbari*; and was naturally applied to their territory in the form of Barbary. They are now distinguished according to locality, as Shelluhs in Marocco, Kabyles in Algeria, Zouaves in Tunis, and Tuaricks in the Sahara. These people are rude and warlike, chiefly pastoral in their habits, though some are cultivators and miners, and manufacture their implements of labour, and even their arms and ammunition. They are either wholly free, or only in formal subjection to the organised governments. The Moors have their name from the Mauri, signifying 'dark,' an aboriginal race so denominated by the Romans; and are descended from them and various conquering immigrants. They are principally town-dwellers, as artisans, tradesmen, and merchants, while the Arabs share the open country with the Berbers, and enjoy much the same amount of practical liberty. The Turks, introduced by conquest in the sixteenth century, with the Kuluglis, their children by native women deprived of all paternal rights, are chiefly found in Tripoli and Tunis, never having established themselves permanently in Marocco.

In the oldest historical times Phœnician colonies were established on the coast, of which Carthage became the head, one of the greatest commercial cities of the world, long the centre of a powerful and extensive state. After bringing Rome to the verge of ruin, it was mastered by the Romans in 146 B.C., who succeeded to the possession of all its dependencies. Roman Africa, in the imperial period, consisted of six provinces, Mauritania-Tingitana, westward on the Atlantic, then in succession eastward, Mauritania-Cæsariensis, Mauritania-Sitifensis, Numidia, the Proconsular Province, or Africa Proper, and Byzacium. The two latter corresponded to the strictly Carthaginian territory in her palmy days. Upon the introduction of Christianity, it has been hastily assumed to have become the religion of nearly the whole population. This inference has been drawn from the number of bishops of the African Church who were collected in the conference at Carthage, on the occasion of the Donatist disputes. But the bishoprics corresponded more to modern incumbencies than anything else, and both parties reproached each other for appointing bishops in insignificant places, 'in vills and hamlets,' with the object of increasing votes on their own side. The so-called dioceses were in many instances mere villages, and some of them shew by their name that they owed their existence to a military outpost. In the declining days of the Roman power, Genseric, at the head of the Vandals, crossed over from Spain, and rapidly reduced the country, 439 A.D. In the following century the barbarians were defeated by the great Roman general Belisarius; but in the succeeding one, 647, the Arabs appeared, and permanently established themselves in the country, with the Moslem creed.

Each of the Barbary States has a maritime frontier, and extends inland to the Great Desert, embracing a portion of it, but with wholly undefined limits.

|                    |  |
|--------------------|--|
| Marocco, . . . . . | Marocco, Fez, Mequinez, Tangier, Mogadore. |
| Algeria, . . . . . | Algiers, Bona, Oran, Constantine, Mascara. |
| Tunis, . . . . .   | Tunis, Kairwan.                            |
| Tripoli, . . . . . | Tripoli, Murzuk.                           |

The whole country, in allusion to its position in relation to Egypt, has the Arabic name of *el-Maghrîb*, 'the West,' while the people are called *el-Maghrîbbîns*, 'the West-men.' Algeria, being somewhat central, is denoted as *Maghrîb-el-Ansat*, 'the Middle West,' and Marocco, *Maghrîb-el-Aksa*, 'the Far West.'

Marocco, the Mauritania of ancient geography, an empire or sultanate, is the largest, most fertile, and populous political division, but the worst governed and most neglected in its natural resources. It has an area of about 230,000 square miles, and a population estimated at 8,500,000, many of whom are wild highlanders of the Atlas, fierce and intractable, who own no allegiance to the emperor, but have their own chiefs, and levy transit dues on goods and passengers in their respective domains, while some of the coast-dwellers have repeatedly brought the government into collision with foreign maritime powers, or received direct chastisement from them, owing to their piratical habits. The sea-board extends from Cape Nun, on the Atlantic, to a little beyond the outfall of the Muluya into the Mediterranean, on the Algerine frontier. Intermediately the projection occurs which brings Africa within fifteen miles of Europe, and forms, in connection with the shore of Spain, the Strait of Gibraltar. It is distinguished by one of the fabled

Pillars of Hercules, the Mount Abyla of classical antiquity, now called Jebel-Muza, from the name of a Moslem saint whose tomb is at the spot. This mountain is also known by the name of the Hill of Apes, from the number of monkeys which, with wolves and wild swine, are its only occupants. It presents a steep and stupendous front towards the Rock on the opposite side of the channel, is a bulkier and loftier mass, but the peculiar and sharply-defined outline of the European pillar, its isolation, historical events, and the town at its base, give it a far greater interest. A great number of winter torrents descend the slopes of the Atlas on both sides, the channels of which are dry in summer. The principal perennial stream, the Muluya, waters the north-eastern division of the country, and belongs to the Mediterranean basin. The central and south-eastern sections are drained by the Sebu, Omer-begh, Tensift, Suse, and Draha, which empty themselves into the Atlantic.

The Moors form more than half of the population. They are distinguished by a complexion of the deepest olive, fine features, an apathetic appearance and indolent disposition, but are capable of being roused to the extremity of fiery passion. A woollen cloak, called a *haique*, thrown over the shoulders and fastened round the body, of various colours, a pair of yellow slippers, and a white turban, with a red or green centre, are the principal parts of the ordinary costume. The country Moors, who lead a pastoral life, or are cultivators, are of more active habits than the people in towns, indulge in horsemanship, military evolutions, dancing, and music plaintive in its strain. Next in numbers are the Berbers, a portion of whom on the Riff coast are savage wreckers and pirates as opportunity offers. Jews abound in the cities and towns, who have the greater part of the trade of the country in their hands, and are the medium of foreign commercial transactions. They swarmed over from Spain upon being expelled from that country by the unwise policy of Ferdinand and Isabella in 1492, and contrive to amass wealth, though most grievously maltreated by the dominant race, robbed with impunity, cheated without redress, and compelled to pay mortifying attentions in public to the observances of a religion they consider false. In 1864 a benevolent mission of Sir Moses Montefiore from London to the court of Morocco secured for his brethren the promise from the government of its influence being exerted for their protection from injustice, but with what effect remains to be seen.

The principal industrial art is the preparation and dyeing of leather, which has the name of 'morocco leather' from the country, in which the Moors far surpass the Europeans. It is made extremely soft and white by the use of two species of plants indigenous to the soil, and receives red, green, and yellow dyes, remarkable for brilliance and durability. The red dye is extracted from the *termes*, an insect collected by the mountaineers, and brought to the towns for sale. Morocco leather, fruits, gum, olive oil, ostrich feathers, honey, and wax are among the important exports. The internal trade is carried on by mules, horses, and camels. A considerable commerce is carried on with Central Africa by caravans across the desert.

The present dynasty of Morocco descends from Hassan, sheriff of Taflet, who obtained the throne by conquest in 1647. Claiming descent from the family of the Prophet, the sultan enjoys great distinction in the Mohammedan world, being widely regarded as the only lawful calif and chief of Islam. He assumes the titles of *Emir-ul-mumenin*, 'Prince of the Believers,' and *Khalifeh-Allah-fchalkiki*, 'Vicegerent of God upon Earth.' The form of government is a despotism ignorantly and brutally administered. Though formal executions even for heinous crimes do not often occur, death is frequently the lot of the delinquent for venial offences, owing to barbarous neglect in crowded prisons and the merciless severity with which the bastinado is applied. Yet the victims generally exhibit surprising apathy. It is on occasions of political revolution that the Moors give full vent to their passions, and exhibit their innate cruelty without restraint. 'It is then,' says M. Durrieu, writing in 1854, 'that the rivers and the sea engulf hundreds of unfortunate creatures sewn up in sacks; then do others, impaled in the public squares, die slowly in inexpressible agonies; then, on the slightest pretext, or often without any, are feet, hands, breasts, and ears cut off. These detestable tortures are endured by all, Moors, Arabs, and Berbers with sombre resignation. It is nothing uncommon to see them in the squares and market-places standing nailed by the hand or ear to the gallows, smoking their pipe as quietly as if they were witnessing a public festival; or when set free after mutilation, picking up with a careless air their ear or their hand, and walking off with it at a composed and deliberate pace.'

*Morocco*, the capital, occupies an inland site, 130 miles from the Atlantic, near the banks of the shallow and rapid river Tensift. It is finely seated on an extensive, luxuriantly-fertile, and palm-clad plain, which is bordered by the loftiest of the snow-mountains. The city was founded in the year 1072, and speedily attained great prosperity, attracted a vast population, but has lapsed into apparently hopeless decay, not now containing more than 50,000 inhabitants. It is surrounded by a high and substantial wall, six miles in circuit, but unoccupied spaces, gardens, and ruins are enclosed within it. A royal palace, an hospital, two colleges, and nineteen mosques, some of which are spacious and elegant, are the public buildings. *Fez*, formerly the capital, and still an imperial residence, is the head of the northern province, seated on a branch of the Sebu, which divides it into two parts, Old and New Fez, and flows through a valley

bordered with hills of orchards and orange-groves. It was founded by a descendant of Mohammed in the year 786, and was once a magnificent city of great extent, containing 700 mosques, with many schools, and other seats of Arabic learning. The place is still the most considerable in Morocco, with a population of 80,000. Manufactures of carpets, woollens, silks, jewellery, and saddlery are carried on; and the red morocco leather is here prepared in great perfection. Bazaars, caravansaries, baths, and shops are numerous, but most of the dwelling-houses are miserably decayed. Owing to its origin, and the large number of existing mosques, Fez is venerated as a holy city by the western Arabs. The mosque erected by Sultan Muley Edris contains his tomb, and once gained by the greatest criminals, it is an inviolable refuge. *Mequinez*, at no great distance westward, a third seat of royalty, possesses a palace of considerable extent and beauty, and ranks as the second city of the empire, having a somewhat larger population than the capital.

*Tangier*, a principal port, is on the north coast, in the vicinity of Cape Spartel, nearly opposite to Cape Trafalgar in Spain, and has a place in history. Seen from the surface of the Strait, the square-built, flat-roofed houses, whitewashed to the highest polish, with the castle, and the many-coloured flags of the European consuls flying over their dwellings, make a pleasant impression, which landing speedily corrects. Within an easy excursion distance of Gibraltar, the place is often visited by English tourists, for the purpose of taking a peep at Moorish life. The town, of 10,000 inhabitants, derives interest from varieties of costume in the narrow ill-paved streets, and from the castle, seated on a rugged eminence, which commands a superb view of the Gibraltar Rock, the vineyard-crowned knolls on the Spanish shore, and the intervening waters. It was a Portuguese possession in 1682, when it passed to England upon the marriage of Charles II. with Catherine of Braganza, as part of her dowry, but was abandoned in 1684, on the ground of expense. *Rabat*, a flourishing shipping port, with a dockyard, and a population of 20,000, is on the Atlantic coast, at the outlet of the Ba-Regreb, much less known by name than *Sallee*, on the opposite bank of the river. This is now a decayed place, but was once famous in the annals of piracy, as the stronghold of the corsairs in the sixteenth and seventeenth centuries, whose appearance on the shores of Spain often raised the cry: *Los Moros sur la costa!*—'The Moors are upon the coasts'—and who were the terror of merchantmen in the English Channel. *Mogadore*, further south, the outport of Morocco Proper, nearly due west of the capital, is the principal centre of the foreign commerce of the country, which is very extensively in the hands of British merchants.

*Ceuta*, at the base of Mount Abyla, opposite to Gibraltar, belongs to Spain, and is a strongly-fortified town, quite European in its style, with white well-built houses, and paved streets. An insult offered here to the Spanish flag led to the war with Morocco in 1859, in which the Moors were defeated, and compelled to sue for peace in the following year. The Spaniards have some small possessions eastward on the coast, Penon de Velez, Alhucemas, and Melilla, under the charge of the governor of Ceuta, to which criminals and political offenders are exiled.

**ALGERIA**, a department and province of France, extends eastward on the coast from the Morocco territory to that of Tunis, and corresponds in its general limits to the Numidia of the ancients. It contains an area estimated at 160,000 square miles, and embraces a region of maritime plains, an inland district of wooded mountain and heathy plateau, the latter interspersed with salt-lakes, with a portion of the Sahara still more in the interior. The forests furnish many ornamental woods valued by the cabinet-makers of Paris, and the fine marbles of the country, celebrated in ancient times, rival the timber in the delicate beauty of their shades. Ores of iron, copper, lead, zinc, and manganese are worked with advantage, and extensive deposits of rock-salt occur. The proper agricultural district is a limited area, confined to the plains along the coast, called the Tell. Cereal produce is here raised in abundance, with olives and the finest fruits, justifying the renown of the soil for fertility in the Roman age, which the Arabs of the present day express by a current proverb: 'The Tell is our mother; whoever may be her lord, he is our father.' Cotton, tobacco, and silk are other products. The cultivation of cotton is of long standing, but has been extended by the patronage of the French government, and the enterprise of European capitalists, stimulated by the course of events in America. The mulberry-tree flourishes readily in various parts of the country under almost all circumstances, in addition to which the *ricin* of Japan has been introduced for the support of the silkworm, owing to the supposition that the disease so fatal to the insects in France and Algeria in 1854 originated with the mulberry-leaf. The population amounts to very nearly 3,000,000, consisting mainly of Kabyles and Arabs, with a subordinate number of Moors, Negroes, Turks, and Jews. There are 205,000 Europeans, nearly 7000 of whom are Protestants, the remainder Roman Catholics.

*Algiers*, the capital, on the coast, has its name from Al-jezira, 'The Island,' originally an insular spot in the harbour, now connected with the mainland by a mole, on which an Arab chief planted a stronghold about the year 935, and called it Al-gazie, 'The Warlike.' The city is built upon a hill rising gradually from the shore, the summit being crowned by the old fortress of the deys. It appears to great advantage in the seaward view from the declivity of the site, and contains a population of about 53,000, two-thirds of whom are Europeans. In 1516 it was mastered by Barbarossa, the famous sea-rover, who entered the service of the Turkish sultan, Soliman the Magnificent, agreed to hold it as a dependency of the empire, and established that system of piracy of which it was the seat to a comparatively recent date. In 1541 the Emperor Charles V. of Germany made a vigorous attempt to crush the corsairs, and lost a fine fleet and army in the service. The deys, elected as the rulers by the janissaries recruited from Constantinople, contrived to maintain piratical expeditions, and defy the powers of Christendom down to the present century, when, in 1816, signal chastisement was administered by the British fleet under Lord Exmouth. Subsequent lawless proceedings led the French to interfere, who took possession of the place in July 1830, allowing the dey to retire with his private property. Since the French occupation in 1830, it has undergone a complete change of aspect, and now consists of two parts: an upper or old town, Moorish in its aspect and inhabitants; a lower or new town, Parisian in its style, with the exception of some mosques. This last comprises spacious streets and planted squares, government buildings, theatres, cafés, hotels, fountains, baths, good shops, and omnibuses; and were it not for the swarthy complexion of a crowd of passengers, with the oriental costume, the European visitor might fancy himself in his native continent. A *Jardin d'Acclimatation*, for the naturalising of foreign plants, and the *Ouvroir Musulman*, in which Arab orphan girls are received and educated, are interesting institutions. The vicinity, studded with villas, is unusually picturesque, traversed by excellent carriage-roads, threaded by numberless footways and bridle-tracks. Besides the permanent inhabitants, Algiers has become one of the health stations for the north Europeans, who imitate the example of the swallows, and migrate to Africa in autumn, to escape the rigour of their own winter. Fogs and white frosts are unknown in the city and its neighbourhood; and the winter temperature is uniformly mild and genial. In general, if the winter is very severe in England and Germany, it is colder than usual at Nice and Pau. But Algiers is placed beyond the influence of these northerly vicissitudes, and is the nearest point to England where the invalid is certain of meeting with a second summer at the expiration of the home season. Algiers has regular steam communication with Marseille, Toulon, Tunis, and other ports; and is within seventy-two hours of England by the railway through France. It is closely passed by the Peninsular and Oriental Company's steamers, between Gibraltar and Malta, and affords a picturesque sight to those on board.

*Bona*, a seaport towards the border of Tunis, is a thriving town of 12,000 mixed native and European inhabitants. It closely adjoins the few remains of Hippo Regius, once celebrated for its schools, aqueducts, temples, and commerce, a favourite residence of the Numidian kings, and the episcopal seat of St Augustine, who died there in 430. *Oran*, more important, in the western part of the country, has an excellent harbour about three miles distant, and a population of 30,000. The town has Spanish as well as Moorish features, having been held by Spain to the close of the last century. *Constantine*, the principal inland town, with 23,000 inhabitants, represents the Cirta of antiquity, the Numidian capital, which, being rebuilt by Constantine the Great, was named after him. It occupies a formidable position, on the summit of a perpendicularly escarped cliff, upwards of 800 feet above the river Roumel at its base. The French styled it the 'City of the Devil' from the natural strength of the site. They were ignominiously compelled to retreat from the walls under Marshal Clausel in 1836. But in the following year it was taken by storm by General Damrémont, who lost his life in the attack. *Mascara*, on the south-east of Oran, the head-quarters of Abd-el-Kader, was burned by Clausel in 1835. Great atrocities were committed on the side of both the invaders and the natives during the long struggle for the mastery in Algeria, an acquisition which has very heavily taxed the finances of France.

The indigenous people, the Kabyles, are a fierce and warlike race, but very industrious and highly skilful. They carefully till the soil, make superb carpets and other woollens, produce burnouses of great beauty, and various works in leather, excel in embroidery, and their home-made gunpowder was at first supposed by the French to be of English manufacture. Specimens of their handicraft were in the London International Exhibition of 1862. These highlanders, with the Arabs, are now practically subdued, and have been wisely conciliated by the French government, in the dry districts, by the opening of Artesian wells. No boon more likely to soften the exasperation occasioned by conquest. Three copious wells provided by borings in 1856 were hailed by the children of the desert with the utmost enthusiasm, and received the names of 'Fountain of Peace,' 'Fountain of Benediction,' and 'Fountain of Gratitude.'

TUNIS, to the eastward of Algeria, the smallest political division, extends along the southern bend of the Mediterranean, and encloses the Gulf of Kabes, the Syrtis Minor of classical geography, containing some small islands close inshore. It answers generally to the territory of ancient Carthage, and the Proconsular Province, or Africa Proper of Roman times. The area is estimated at about 60,000 square miles, and the population probably amounts to 2,000,000, consisting of Moors, Arabs, and Turks, who have long

been upon terms of friendly intercourse with Europeans, and have profited by it. The government is administered by hereditary rulers, with the style of Beys, who acknowledge subordination to the Turkish sultans, but are practically quite independent. The beyalik contains interesting remains of ancient date.

*Tunis*, the capital, near the north coast, is situated on the margin of a shallow lagoon, communicating with the sea by a narrow channel. It is the largest city in the Barbary States, containing 130,000 inhabitants, among whom there are a very large number of Jews; and the most commercial place in the north of Africa after Alexandria. The manufactures embrace silk and woollen stuffs, morocco leather and earthenware, with the preparation of olive oil, and various celebrated essences. The bey resides in the vicinity, in a palace built in the Saracenic style. In 1535 the city was taken from the native Berber race by Charles V. of Spain, with the assistance of the Arabs, who put 70,000 of the inhabitants to the sword, as Mohammedan heretics in their esteem. But it was delivered from Spanish rule by a naval armament from Constantinople in 1574, and then annexed to the Turkish Empire. *Kairwan*, an inland city on the south, on a sandy, marshy, and treeless plain, though fallen from its former rank as a seat of Saracenic power, is still a considerable place, with a population of nearly 50,000. It is venerated as one of the holy cities of Islam, contains about fifty mosques, one of which, the Okbah Mosque, is deemed peculiarly holy from possessing the tomb of the Prophet's barber. The interior is adorned with columns of marble, granite, and porphyry. A brick wall, surmounted with towers, surrounds the town.

A short journey of twelve miles northward of Tunis leads to the site of Carthage, a city great and glorious before her destruction by the Romans. A new Carthage arose, which became in the second and third centuries of the Christian era one of the finest cities in the Roman Empire. Genseric made it the capital of the Vandal kingdom in 439, and uttered the memorable words on leaving the harbour, when the pilot asked him whither he was going, 'Against all who have incurred the wrath of God.' Belisarius captured it in 533, and changed the name. The Arabs under Hassan conquered it 698, and left scarcely one stone upon another. Nothing remains of either Old or New Carthage, but substractions, broken columns, statues, and other ruins. Two miserable hamlets occupy the spot—Moalka, chiefly constructed out of the cisterns extracted from the great aqueduct; and Dowar Eshutt, an irregular mass of hovels built up of fragments. Other parts of the Tunisian territory contain striking Roman remains, particularly a magnificent amphitheatre at Eljem, little inferior to the Colosseum itself, with architectural pretensions beyond those of the celebrated structure at Ravenna. On this site stood ancient Tysdrus, where an inscription has been found which shews that in that city water was laid on in the private houses.

One of the islands off-shore, Jerbah, was anciently called *Lotophagitis*, as the abode of eaters of the lotus, a fruit once believed to have such an intoxicating effect, that whoever partook of it forgot his own country and wished to spend his days in the region where it was produced. This is the produce of a shrub, *Zizyphus Lotus*, which grows on the whole coast, and is sold under the name of jujube for the preparation of sweetmeats.

**TRIPOLI**, with its dependency Barca, is a long narrow tract extending from the Tunisian to the Egyptian border, embracing in its line of coast the Gulf of Sidra, the Syrtis Major of antiquity. It is the most sterile of the Barbary States, owing to the great chain of the Atlas having terminated its eastward course, and the want of such a barrier to protect from the hot winds of the desert region, and prevent its sands from being blown up to the very margin of the sea. The area is estimated at 200,000 square miles, extensively doomed to almost utter barrenness. Hence the Arabs call the country Bahr-al-Abiad, the 'White Sea,' in allusion to its sandy character. Still there are not wanting beautiful scenes, wooded slopes, and valleys of rich vegetation, where the olive contrasts with the fig, the tall cyprus and the dark juniper with the arbutus and the myrtle, while the pleasant breeze is laden with balmy perfumes. This territory was successively subject to Greeks, Carthaginians, and Romans, to the Vandals and the Arabs or Saracens, to Charles V. and the Knights of Malta. From the latter it was wrested by the Turks in 1551. It is now under the rule of a hereditary pasha, who is in nominal allegiance to the Ottoman Empire. The population, estimated to number 1,500,000, consists mainly of Berbers, Moors, Arabs, and Turks. The name, originally Tri-polis, 'Three Cities,' refers to three ancient towns, Leptis Magna, Oea, and Sabrata, which were allied together, and shared the country between them.

*Tripoli*, the capital, on the coast, is of humble dimensions, containing only about 20,000 inhabitants, but has a considerable caravan trade with Central Africa, and is the usual starting-point of enterprising travellers across the Sahara southward to Lake Tchad, and south-westward to Timbuktu. It is washed on three sides by the sea, and joined on the fourth by a sandy plain to the rest of the country. A very strong wall surrounds the place, surmounted with towers, but not kept in good repair. The castle or palace where the pasha

resides is within the enclosure, and is itself environed by a wall upwards of forty feet high, furnished with battlements, embrasures, and towers which appears impregnable. Low, flat, square houses, covered with lime, the extreme whiteness of which, from encountering the sun's fiercest rays, is very striking; baths, with clusters of large cupolas crowded together; mosques, with small plantations of fig-trees and date-palms growing close to them; and narrow streets here and there almost choked with hills of rubbish, and arched at intervals, are the prominent features of Tripoli. It does not possess a vehicle of any description, except a kind of palanquin, entirely enclosed with linen, and placed on the back of a camel, which a few of the rich Moors keep for the accommodation of the ladies of their families. There are some striking Roman remains, in particular the 'old arch,' as the natives call it, a grand monument erected by an officer in control of the customs, in honour of the joint emperors, Marcus Aurelius and Lucius Verus, 164 A.D. Southward of Tripoli, the district of Fezzan, a collection of oases with large intermingling tracts of deserts, is tributary to the pashalic, under the government of a bey. *Murzuk*, the chief town, occupies a low, hot, unhealthy site. Merchandise to the value of £21,000 annually changes hands here, and of that amount, the Slave-trade forms seven-eighths. Murzuk is now the great starting-point from the north for the interior of Negroland. While waiting for their equipments at Tripoli, Drs Barth and Overweg occupied their time in an excursion through the mountain region which encircles Tripoli at the distance of from sixty to eighty miles to the south, consisting for the most part of barren sand-hills. Hence they turned inland over the prairies of the Belasa, visiting Murzuk and Ghat, through valleys rich in herbage and clothed with ethel-trees; gradually ascending until a table-land was reached, 4000 feet above the sea. From this table-land the descent lay through the valley of Egeri. 'We began to descend,' says the Doctor, 'by a most picturesque passage, into a deeper region, high cones towering over a hollow in the ground; the scenery assuming a grandeur as we advanced, and exhibiting features of such variety as we had not expected to find in this desert country.' While our camels slowly descended, I made the following sketch which conveys a better idea of this abrupt cessation of the high sandstone level succeeded by its sloping strata of marl and still another of granite, than any verbal description could do.'

The eastern division of the Tripolitan pashalic, Barca, represents the Cyrenaica of the ancients, also called Pentapolis, 'Five Cities,' in allusion to five principal towns planted by the Greeks upon the coast, Cyrene, Berenice, Barce, Ptolemais, and Derna, all of which have passed away. But vast ruins of Cyrene remain, with sepulchral monuments; and the fountain of Apollo, which led to the foundation of the city at the site, still flows copiously, cool in summer, genial in winter. An expedition of the British government, in 1861, brought away for the National Museum a splendid collection of marble statues, statuettes, heads, and inscriptions.

Valley of Egeri.

Island of Philae.

## CHAPTER II

### NORTH-EASTERN AFRICA.

THIS region includes what may be called the COUNTRIES OF THE NILE OF EGYPT, NUBIA, KORDOFAN, and ABYSSINIA. Upwards of twenty-three centuries ago Egypt was described by the historian as a land of marvels, excelling all others in mighty works. This remark, true in the age of Herodotus, its author, was emphatically applicable more than a thousand years before his day, and it is just as pertinent in the present age as ever, owing to the peculiar natural features of the country, which have no parallel in any other region of the globe, and the wonderful architectural monuments of ancient date extant upon the soil. Gigantic statues and obelisks, enormous temples, pyramids, and sepulchres, whose magnitude and solidity have enabled them to withstand the wasting hand of age, and the still more destructive ravages of barbarians—aptly denominated ‘rocks amid the flood of time’—fill the mind of the beholder with astonishment, however familiar with the accomplishments of modern art; and are invested with solemn interest by the fact of their origin being still a mystery. This land of the Pharaohs and Ptolemies, belonging equally to sacred and classic geography, is a section of North-Eastern Africa, extending southward from the Mediterranean to the first cataract of the Nile, at Syene, now Assouan, on the Nubian border. Eastward, the Red Sea forms the general boundary, and westward the limit is wholly undefined in the Libyan Desert. But cultivable and habitable Egypt has a much more contracted area, being confined, with the exception of some oases, to the valley of the river, and the delta formed at its termination. The rest of the surface is a wilderness of sterile rocks and desert plains.

The great feature of the country, the Nile, runs through it from south to north in a narrow winding valley, bounded on both sides by hills, which in some places are high enough to deserve the name of mountains. They leave on each bank a strip of fertile land, varying from a breadth of several miles to very confined dimensions. The western range retires in general the furthest from the river, and affords the widest space for cultivation. From Assouan to the neighbourhood of Cairo, where the valley and its hills begin or terminate, the direct distance is about 450 miles. Here the river divides into two main arms, and into numerous canals, which intersect the flat, triangular, alluvial district on the coast, known in ancient as well as in modern times as the Delta, from its correspondence in shape to the Greek letter of that name. The western arm is the Rosetta branch, and the eastern the Damietta, so called after the towns at their mouths. The breadth of the included space at the coast, the base of the triangle, is about eighty miles, and from thence to the apex, or the bifurcation of the river, the distance in a direct line is about ninety miles. Seven mouths of the Nile were distinguished by the ancients, five of which have either silted up, or are lost in lakes. On ascending the river, the hills on the western side are composed chiefly of a tertiary nummulite limestone, very easily worked, of which the great pyramid of Gizeh is built. In the neighbourhood of Esné a sandstone formation commences, durable, and wrought without difficulty, largely used in the buildings of Thebes, and also occasionally employed for the purposes of sculpture. On the Nubian border that particular species of granite mixed with hornblende is met with, called sienite, from the locality in which it is found, Syene, where the quarries still lie open which furnished the old Egyptians with materials for their colossal statues and monolithic obelisks. The cataracts of the Nile, seven of which are commonly enumerated, are all in Nubia, except the first at Assouan, which is only a rapid formed by granite rocks encumbering the bed of the stream. The others are also rapids, having no perpendicular fall of any extent.

From the earliest antiquity Egypt has been considered the gift of the Nile, owing to the regular rise and overflow of its waters. Not that the country has been formed or even extended by its successive deposits encroaching upon the sea, for this has not transpired to any important extent within the age of history; but it so entirely depends for irrigation and fertility upon the annual inundation, that the cultivable soil is really the legacy of the water-floods. In the maritime districts heavy rains are not uncommon in the first three months of the year; but they are rarely witnessed at any great distance in the interior. Over an immense extent of country the sky is almost constantly serene; and the whole period of man's life may pass away without the experience of a single drenching shower. Hence, if it were not for the inundations of the river, the whole valley through which it flows, except close to its margin, would be like the region by which it is surrounded, partly a sandy waste, and partly a stony desert. But seasonal rains descend in tremendous torrents upon the grand plateau of Abyssinia, and the equatorial countries in which the Nile has its sources. Then the river rises; its channel is gradually filled to overflowing;

\* And Egypt joys beneath the spreading wave.\*

By this natural provision the lands within reach of the overflow are not only supplied with requisite moisture, which is retained in canals and reservoirs for service after the subsidence, but a layer of soil is deposited upon them, brought down by the waters, thereby giving them greater fertility than could be produced by the richest manure. The cereal produce of the country has hence been appropriately designated the 'harvest of the river,' and the course of the Nile has been aptly compared to the path of a good man in the midst of an evil generation, owing to the strongly-contrasted aspect of the soil within and beyond the range of irrigation. In ordinary seasons the rise begins about the middle of June; the overflow commences in the first half of August; it attains its maximum at the end of September; and the stream is again confined to its channel towards the close of October. About the end of November the fields are put under culture, and are covered with green crops through our winter months to the end of February. In March is the harvest, and in April the river is at its lowest ebb. Amrou, the Arab conqueror of Egypt, hence observed with truth in his report to the Calif Omar that, 'according to the vicissitudes of the seasons, the face of the country is adorned with a silver wave, a verdant emerald, and the deep yellow of a golden harvest.'

While rich in shrubs and herbaceous plants, the country is very deficient in timber-trees, and hence the old rulers engaged in wars to possess themselves of the forests of Lebanon.

The papyrus, an elegant aquatic, of the white pith of which the ancient paper was made, yet appears among the reeds of Lake Menzaleh, though rarely, its importance having passed away, while its cultivation, with that of other plants, has been superseded by the culture of available products, indigo, cotton, tobacco, and the sugar-cane. Abundant crops of the vegetables mentioned by the murmuring Israelites in the wilderness are still raised, 'the cucumbers and the melons, the leeks, the onions, and the garlic.' The date-palm is pre-eminent among the indigenous vegetation for utility and profusion, cultivated on the inundated and irrigated lands in groves sometimes of several thousands, and forming an ornament to the landscape. The doum-palm, a remarkable species, is chiefly met with in the southern districts. Coppices of acacias and tamarisks wave on the borders of the river. The district of Fayum contains impenetrable hedges of cactus, and plantations of roses for the production of rose-water. The common species, *Rosa alba*, bears a double flower, of a pale colour tinged with red, and very fragrant.

From the earliest periods of which we have any record, Egypt has had the horse, ass, and camel, and nowhere are finer specimens of the domesticated quadrupeds to be found at present. He-asses and she-asses are mentioned among the wealth acquired by Abraham during his sojourn in the country. They are often represented on the monuments with rich comparisons; and are a very superior breed to the animals with which we are familiar. Among the wild animals, the hippopotamus, formerly well known in the Delta, and chased for its hide, is now very rarely, if ever, seen below the cataracts; and the giraffe is only occasionally found in the more southern localities. The hyena, jackal, and jerboa are common, with the ichneumon, Egyptian vulture, and great stork-ibis, all famous with the old inhabitants. Among the reptiles the formidable crocodile is now restricted chiefly to the Nile in Upper Egypt. Two venomous serpents are abundant, and justly dreaded, the asp, or *Hai coluber*, and the cerastes; but with them the serpent-charmers play very surprising tricks.

The climate of Egypt is hot and dry, except in the maritime districts, where the air is moist. Inland, the extreme dryness of the atmosphere contributes to preserve natural substances from the decay incident to them in other countries; and hence the bodies of men and animals, ages after burial in the rock-tombs, or in the sands of the Desert, are found retaining the outward form as perfect as if in life, though crumbling to dust upon the slightest touch. In summer the nights and mornings are generally pleasant, but the forenoons are sultry, and the afternoons are a fiery ordeal. From June till August the heat is moderated by the north or Etesian winds. In April and May, the greatest climatic disadvantage and most unhealthy season is experienced, occasioned by the *khamsin*, the wind of fifty days, blowing from the south. It prevails more or less during the period named, though it seldom lasts longer than three days at a time, and brings with it the fine dust and burning temperature of the Desert. Instantly the atmosphere assumes a troubled aspect, and sometimes acquires a purple tinge; the air seems to lose its property of sustaining life, and becomes stifling; whirlwinds sweep over the country, resembling the blasts from a furnace, and carrying along clouds of impalpable sand; the sky is darkened; and the sun, shorn of his beams, appears like a dull ball in the heavens, often with a violet tinge. At this season the plague has usually made its appearance. Though favourable to consumptive subjects, the climate is not generally salubrious, neither is it friendly to long life. The ancients observed that the old Egyptians, notwithstanding their attention to diet and medicine, were the most short lived, and the Britons, in spite of their barbarism, the longest lived of men. From fifty to sixty years is now considered a great age. At Alexandria the population is said to be renewed every fourteen years. Ophthalmia, dysentery, intermittent fevers, and ulcers are the most common disorders.

Eye disease seems to have prevailed from the most remote times, for Sesostris died stone-blind, and his successor lost his sight for ten years. Glare and dust will not alone account for this scourge of Egypt, as it is almost unknown in the Desert, where the people live in an atmosphere of blaze and sand.

For administrative purposes, Egypt is divided into thirteen provinces, but the country is also distributed into three principal geographical regions, which are better known, and were distinguished in ancient times.

Principal Towns.

|                         |  |
|-------------------------|--|
| Lower Egypt, . . . . .  | Alexandria, Rosetta, Damietta, Aboukir.                    |
| Middle Egypt, . . . . . | Cairo, Suez, Medinet-el-Fayum, Benisuef, Minieh, Manfalut. |
| Upper Egypt, . . . . .  | Siout, Girgeh, Karnae, Luxor, Assouan.                     |

LOWER EGYPT, or BAHARI, comprehends the Delta, with the adjacent plains on either hand of the main branches of the river. This district is poor in works of ancient art, but is historically known to have been once crowded with cities and temples, the materials of which have been carried off to build modern towns, while earth and rubbish have accumulated in other places so as to conceal many vestiges from view. Ruins still attest the former magnificence of the Zoan of the Scriptures, now San, in the vicinity of Lake Menzaleh. The region occupied by the Israelites, called the Land of Goshen, cannot now be defined, but it was undoubtedly in Lower Egypt, and between the Pelusiac, or easternmost branch of the Nile, and the Palestine border.

Street in Alexandria.

*Alexandria*, locally called *Scanderieh*, on the coast, founded by Alexander the Great, and named after him, is the principal seaport, and has been for nearly twenty-two centuries the commercial emporium of Egypt. It rapidly advanced to distinction under the Ptolomean successors of the conqueror, who made it their residence, ranked after Rome and Antioch in the ancient world, contained within its circuit of fifteen miles 300,000 free inhabitants, with an equal number of slaves, and was renowned for its literati and vast library, even more than for the extent of its trade and the splendour of its monuments. The present city, with a population of about 80,000, occupies only part of the old site. It comprises vestiges of the Greek and Roman age intermingled with erections of the Mohammedan dynasties, in addition to which many public buildings and works have arisen in consequence of its recent connection with western civilisation, and

its position on the overland route between Great Britain and India. Features belonging to the west and east, the European and Oriental, are now closely blended in its aspect. Men with hats and women with bonnets, English, French, and Italians, are commonly met with, both afoot in the streets and driving about in phaetons. A great change was effected by the vigorous administration of Mohammed Ali in the demeanour of the natives to persons in the Frank dress. It is, however, a curious and sometimes a ludicrous instance of the force of habit, that many a Moslem, without meaning to be offensive, will indulge in maledictions before those who are just as much compromised by them as the parties to whom they personally refer. His reference to a Christian will most likely be supplemented with a 'Allah, make his countenance cold!' or to a Jew with, 'May his lot be Jehannum!'

Spacious cisterns or vaulted chambers beneath the houses to which the water of the Nile was conveyed; catacombs upon the coast constructed in the best style of Grecian art; Pompey's Pillar and Cleopatra's

Banks of the Nile.

Needles, both misnomers, however, are the chief remains of old Alexandria. The Pillar, a noble column, the shaft of which is of red granite, seventy-three feet long, adorned one of the edifices of the city, till, according to an inscription which is still legible, it was removed to its present site by the Roman prefect of the province, furnished with a capital and base, and set up in honour of the Emperor Diocletian. The so-called Cleopatra's Needles are two obelisks of the time of Thothmes III., who reigned some fifteen centuries before Cleopatra

was born. They were removed from Heliopolis to their present station, probably in the age of imperial Rome. One of them, a monolith, stands erect, and is about seventy-two feet high. The other, close at hand, lies prostrate on the ground, half buried in the sand. This last is the property of the British, having been presented to George IV. by Mohammed Ali in 1820.

A canal connects Alexandria with the Rosetta branch of the Nile, and thus brings the port into direct water-communication with Cairo. Steamers conducted the 'Overlanders' to it by this route previous to the construction of the railway. The work was executed by Mohammed Ali with all the tyranny and cruelty which marked the gigantic labours of the old sovereigns. A few miles to the north-east of Alexandria are the castle, bay, and harbour of *Aboukir*, the scene of Lord Nelson's decisive victory over the French fleet in 1801. *Rosetta* and *Damietta*, the other ports, at the respective mouths of the Nile, have very little foreign trade, but rice and fruit are sent into the interior from plantations and gardens in the neighbourhood. Striped cloths were once extensively made at Damietta, and hence obtained the name of 'dimity' in Europe.

MIDDLE EGYPT, or VOSTANI, embraces the Valley of the Nile from the apex of the Delta to about the village of Manfalut. Numerous pyramids mark the course of the river, at Ghizeh, Sakara, Abou-sir, and Dashur, all on the western side of the stream, varying in their size and state of preservation. The remains of not less than sixty-nine, extending in a line, have been discovered by the industry of travellers. But the 'Pyramids,' eminently so called, are a remarkable triplicate seen from any open space around Cairo, at the distance of about ten miles. They have been not inaptly styled the 'goal of nations,' owing to the number of pilgrims of different countries attracted for ages to the site, among whom members of the Anglo-Saxon race from both sides of the Atlantic have certainly been most prominent in modern times. Whatever other design these wonderful monuments were intended to answer, they are undoubtedly the sepulchres of kings, and of those who reigned at Memphis during the bondage of the

Israelites, the Pharaohs therefore of sacred history, while the sepulchres of the ordinary inhabitants of the capital are in the sand-hills around them. It is conceived that the different size of the structures bears some relation to the differing lengths of each monarch's reign, the foundation of a tomb being laid upon the accession of a new sovereign, over which a fresh layer of stones was laid annually until his decease, when the monument was finished and closed up.

*Cairo*, or Grand Cairo, properly *Al-Kahira*, or the 'Victorious,' in latitude 30° north, longitude 31° 18' east, is situated on the east side of the Nile, about three miles from its bank, and twelve miles above the head of the Delta. It is the capital of Egypt, the official residence of the viceroy, and the largest city of Africa, containing about 250,000 inhabitants. Founded by the Arabs in the tenth century, it remains to this day essentially an Arabian city, possesses many fine specimens of their remarkable architecture, is intensely oriental in its arrangement, appearance, and population, for though not without the phases of European life, they have the aspect of accidental excrescences, imposed and not adopted, nor in any way interfering with the impression of general features. It occupies an area of three square miles, and is surrounded by a low wall. Groves and plantations of mimosas, palms, oranges, lemons, and pomegranates, with trained vines, adorn the environs; and not unfrequently in the narrowest lanes of the interior, the foliage of a palm may be seen overhanging the high wall of some private garden. Except the Esbequeeh, a large irregular square, in which is the Oriental Hotel, called into existence by the requirements of the overland passengers, the open spaces are few; and the greater number of the streets are so narrow, that two laden camels can scarcely pass abreast, while in many there is barely sufficient room for one. This arrangement excludes, as it was intended, the rays of the sun, places the thoroughfares in shadow, and renders the numerous bazaars, richly stocked with goods, dark and gloomy. In the cool of the evening the crowd is incessant; the variety of costume striking; and the street-cries are deafening and discordant. 'O chick pease! O pips!' shouts the vendor of parched grains. 'Sweet water, and gladden thy soul, O lemonade,' sings the seller of the luxury. 'Out of the way, and say, "There is one God,"' bawls the water-carrier to passengers equally anxious to get along. Beggars there are by the hundred, vociferous and importunate, commonly appealing to religious feelings. 'My supper is in Allah's hands! my supper is in Allah's hands! Whatever thou givest, that will go with thee!' cries the old vagrant. 'Curse thy father, O brother of a naughty sister!' is the testy response of some one whom he has elbowed, or touched with his staff. 'The grave is darkness, and good deeds are its lamp!' chants the blind woman. 'Upon Allah! upon Allah! O daughter!' reply the bystanders, advising resignation, but not moved to charity. There are between 300 and 400 mosques, many of which have very lofty and beautiful minarets, built of alternate layers of red and white stone. Some are ruinous hovels, and others stately piles. Not a few are earthquake-shaken, with minarets which rival the leaning tower of Pisa in departing from the perpendicular. A college for instruction in Mohammedan theology and jurisprudence, a school of anatomy, medicine, and surgery, others devoted to arts, sciences, and engineering, are among the public institutions of Cairo, with a newly-founded museum for the collection of Egyptian antiquities.

While seated chiefly on the alluvial plain of the river, the eastern portion of the city rests on a slope of Mount Mokattam, and has its citadel on one of the towering crags. The building was founded by the great Saladin. It acquired a melancholy notoriety in the time of Mohammed Ali, whose stern policy led him to inveigle the Mamelukes within its walls, and remove them out of his way by an indiscriminate massacre. From this point the view is superb, embracing the whole capital, with all the objects of interest in its neighbourhood. Eastward, in the direction of the brown desert towards Suez, is a long line of tombs in which the old califs sleep, some of which are triumphs of Saracenic architecture. Westward the eye ranges across the city to the silver line of Nile, bordered with palm-groves and the minarets of Fostat, or Old Cairo, beyond which the pyramids rise up in mysterious serenity, on the verge of the Libyan wilderness. Northward the dense verdure of the Delta may be caught, reduced to a dark-green streak, with the nearer mounds and solitary obelisk of Heliopolis.

A short ride from Cairo through avenues of tamarisk, fig-trees, and acacia—across fields waving with corn and clover—along causeways raised above the level of the summer inundations—leads to Heliopolis, the *On* of sacred history, which seems to have been a city upon a small scale, simply a collection of colleges and temples, but of the greatest celebrity as the chief seat of the learning of the old Egyptians. The place was certainly connected with the domestic history of Joseph, for he married Asenath, the daughter of Potipherah, priest of *On*. It was visited in later ages by Pythagoras, Herodotus, Eudoxus, and Plato, the last of whom resided thirteen years within its precincts. But even in Strabo's time the site was deserted. Earthen mounds now indicate the line of the walls. They enclose a smooth, spacious, oblong area, partly planted with date and acacia trees, containing a pool overhung with aquatic vegetation, the Fountain of the Sun, and an obelisk rising from the midst of garden shrubs to the height of from sixty to seventy feet in solemn loneliness. This is a single block of red granite, eroded by the destroying hand of time in several places, but upon the whole very entire, covered with hieroglyphics from top to bottom. It bears the name of Pharaoh Osirtesen I. 'This is the first obelisk,' says Dean Stanley, 'I have seen standing in its proper place, and there it has stood for nearly 4000 years. It is the oldest known in Egypt, and therefore in the

world—the father of all that have arisen since. It was raised about a century before the coming of Joseph; it has looked down on his marriage with Asenath; it has seen the growth of Moses; it is mentioned by Herodotus; Plato sat under its shadow; of all the obelisks which sprang up around it, it alone has kept its first position. One by one, it has seen its sons and brothers depart to great destinies elsewhere. From these gardens came the obelisks of the Lateran, of the Vatican, and of the Porta del Popolo; and this venerable pillar, for so it looks from a distance, is now almost the only landmark of the great seat of the wisdom of Egypt. Immediately outside the mounds, there is an ancient sycamore with an immense hollow gnarled trunk, upon which innumerable pilgrims have cut their names, for according to Coptic legend, the Holy Family reposed under its branches on the flight into Egypt. The neighbourhood was once famous for its balsam-trees, said to have been brought from the celebrated gardens of Jericho, and planted at the spot by Cleopatra. All old travellers, Arab and Christian, mention the plantation with great interest. Its produce, called the balm of Gilead, was sent far and wide for use on the most important occasions.

‘Not all the water in the rough rude sea  
Can wash the balm from an anointed king!’

The last tree perished in 1615, in consequence of an excessive inundation of the Nile.

On the route to the pyramids the Nile is crossed in a ferry-boat at Old Cairo, a beautiful and bustling spot, with light arabesque houses and crowded cafés parallel to the river, which rolls proudly down, and is here divided into two branches by the island of Rhoda in the mid-channel, exquisitely laid out with gardens, pleasure-grounds, fountains, and every kind of ornamental vegetation. At the point of the island is the building containing the Nilometer, a graduated octagon pillar, on which the daily rise of the stream is marked during the inundation, and then publicly announced. From Ghizeh, on the opposite bank of the river, the start is fairly made for the pyramids, the nearest approach to mountains that the art of man has ever produced. They seem close at hand, owing to the purity of the atmosphere, but it requires some two hours of hard donkey riding to reach their base, just beyond the edge of the cultivated land, on the verge of the Libyan Desert.

The close approach to these objects dissipates the distant impression. Viewed a mile or so away, they seem perfectly smooth, but are really very rugged, as the outer coating of stones and the plaster have been broken away, both by the hands of barbarian conquerors and the dilapidations of time. It is not till the visitor has come up to the piles, and the eye has leisurely surveyed them, that the mind entertains a due idea of their magnitude. The Great Pyramid, that of Cheops, its reputed founder, has for thirty centuries, morning and evening, thrown its long shadow over the brown desert on the one hand, and the verdant river-valley on the other. It stands upon a lofty platform of rock, along with the two companion structures, which contributes to their being so well seen at a very considerable distance. It rises from a base which measures 746 feet each way, covers eleven acres of ground, has a perpendicular height of 461 feet, and is ascended by 206 tiers of steps, varying from four feet high to one foot. The ascent usually occupies about twenty minutes, and is made without difficulty or fatigue, but the Arabs will perform it in half that time. The view is magnificent from the top, and very striking from the contrasted aspect of the objects it embraces—the white line of the minarets of Cairo to the eastward, with nature's luxuriance in the glorious Valley of the Nile—and her inhospitable features in the yellow sands of the Desert stretching away westward to the horizon. It is rendered also not a little impressive by the reflection which naturally arises in the mind, that amid all the mystery hanging over the pile, never perhaps to be fully dispelled, as to its date, founder, builders, and entire design, it is perfectly certain that the chiefs, the statesmen, poets, philosophers, and historians of the old world were admiring spectators of its mass—that Alexander once stood at its base, and with naked foot Pythagoras may have reached the summit.

In front of the second or central pyramid, at a short distance, appears an equally remarkable object, if not more so—the Sphinx—a gigantic figure, half-human, half-animal, cut out of the solid rock. The head and shoulders are those of a man, connected with the body of a lion couchant, which is concealed by the shifting sands. The circumference of the head around the forehead is 100 feet, while the paws stretch out fifty feet in advance from the recumbent body. Though a monster is represented, it is not one to tremble at, for the countenance, plainly Nubian in its cast, has a strange mysterious beauty, a placid and benign expression, which mutilation has failed to erase from it. Yet there is something awful in the appearance of this enormous head, moveless, silent, and solitary, overlooking the wilderness, with the pyramids in the background. It seems like an apparition in stone, and is known to the Arabs by the name of Abuhöl, or the ‘Father of Terrors.’ This marvel of the ancient world is supposed to have been originated by Thothmes III., if not a portrait of him. The names of his son and of later monarchs are inscribed upon it. In the vicinity, the village of Metrahenny occupies the site of Memphis, the second capital of ancient Egypt, now represented by heaps of fragments, but by no important vestiges.

*Suez*, connected with Cairo by rail across the eastern desert, about eighty miles in length, is built on a low sandy tract of land near the head of the western fork of the Red Sea. Formerly little more than a miserable walled village, it has put on an improved appearance, and increased in the number of its inhabitants to upwards of 6000, since the opening of the overland Anglo-Indian route. There are now many well-built handsome houses belonging to the different steam companies, the Peninsular and Oriental, Messageries Impériales, Royal Navigation, French Imperial Marine, and Medjidieh Company, trading to the Arabian

Lake Timsah and Suez Canal.

ports. Several first-class steamers may commonly be seen at anchor in the roadstead, with many small vessels belonging to private merchants. A large building for the manufacture of ice belongs to the Peninsular Company, with an excellent hotel. The town and neighbourhood are entirely destitute of any natural supply of fresh water, which had till recently to be conveyed by the railway from Cairo. But it is now furnished by a canal from the Nile, part of M. Lesseps's scheme for the canalisation of the Isthmus, which, whether the ship-canal to the Mediterranean is ever successfully executed or not, is an inestimable benefit to Suez. This sweet-water canal, opened in December 1863, is twenty-two feet wide and four feet deep, navigable for boats hauled along by dromedaries.

Ascending the Nile from Cairo, borne lazily along by the uncertain breeze against the current, the district of Fayum is passed in the country on the right bank, fertile, healthy, and populous. A gap in the mountain rampart of the valley admits the overflow of the river into it, which replenishes the Birket-el-Kernan, the ancient Lake Moeris, an expanse stocked with fish and aquatic birds. *Medinet-el-Fayum*, the chief town, the Arsinoë of antiquity, also called Crocodilopolis, as a seat of the worship of the animal, contains several mosques and Coptic churches, and has some woollen manufactures. *Benisuef*, the outport of the district, is directly on the stream, with cotton-mills, alabaster-quarries, and sugar-plantations. *Minieh*, on the same bank, one of the prettiest towns on the river, with clean-looking houses and conspicuous date-groves, is next advanced to; and further on, upon the opposite side, are the remarkable tombs of Beni-Hassan, which have furnished in their paintings so many illustrations of the manners of the old Egyptians. *Manfalut*, an unimportant place, yet claims attention from the crocodile mummy caves in the range of mountains opposite, which various travellers have explored.

UPPER EGYPT, or SAID, extends from the preceding district to the Nubian border, and is the largest division of the country. It comprehends the finest scenery of the Nile Valley, adorned by a new vegetable feature, that of the doum-palm, which intermingles its fan-like foliage with the more familiar date. It corresponds in general to the ancient Thebaïa, renowned for its temples, statues, obelisks, and sepulchres, which bring upwards of 100 boats with travellers every season, not merely to admire and wonder, but to deface and destroy, monuments of the hoary past spared by the atmospheric changes of thirty centuries, aided by the fury of Persian invaders and Mohammedan iconoclasts.

*Siout*, the chief town, the largest and best built south of Cairo, on the west bank of the river, contains several handsome mosques, with bazaars and baths. The environs are very pleasing, and the trade considerable. *Girgeh*, next in consequence, is probably of Christian origin, deriving its name from the monastery of St George within the walls, the oldest Roman Catholic establishment in Egypt. The great architectural monuments of ancient times are at Denderah, Esné, and Edfu, all on the west bank, and on the

Siout.

small islands of Philæ and Elephantine in the river, but they distinguish more especially the plain of *Thebes*, the most celebrated and magnificent of the ancient capitals. These are at the poor Arab villages of Luxor and Karnac, on the east bank, consisting of vast palaces and temples, sphynxes and obelisks, while on the opposite bank is the necropolis of the city, from which most of the mummies brought to Europe have been taken; with the tombs of the kings, excavations in the solid rock of extraordinary magnitude and splendour. On this side also are the two lonely colossi, darkened by time and mutilated by man, one of which bears the name of the Vocal Memnon, from the responsive sounds supposed to issue from it when struck by the first rays of the morning sun, very probably a trick of priestcraft. The origin of Thebes is lost in antiquity, but it was at the height of its prosperity and greatness about 1600 B.C. Rome, Paris, and London have each portions of its spoils. *Assouan*, the frontier town towards Nubia, represents ancient Syene, from which the peculiar kind of granite which abounds in the neighbourhood acquired the name of sienite. It is situated immediately below the first cataract of the Nile, reckoned ascendingly, where the river rushes through a maze of rocky islets from Nubia into Egypt. An officer, called the 'Captain of the Cataract,' attends to the passing and re-passing of boats. Old Syene was an important place in the geography and astronomy of antiquity, being supposed to mark the line of the Tropic of Cancer. But it is rather more than half a degree to the north of it.

Westward of the Nile Valley, in the Libyan Desert, a wilderness of rocks, stones, and sands, some extensive oases occur, with springs, verdure, and a resident population. To these tracts, properly termed Islands in the Sandy Sea, criminals were deported in the days of imperial Rome. The Great Oasis, under the parallel of Thebes, consists of a chain of these spots, about 100 miles in length, from north to south. It comprises many villages, and one chief town, *El-Kharjeh*, with plantations of olives, liquorice, grain, and fruits. The Western Oasis, west of the preceding, and the Little Oasis, on the north, have the same general features. Under the parallel of Cairo, much more in the heart of the desert, is the Oasis of Siwas, the most interesting of all, as the site of the renowned Fountain of the Sun, and the Temple of Jupiter Ammon, to which Alexander the Great paid a pilgrimage. Lying completely out of the way of regular European travel, and only accessible by a difficult route, it has rarely been visited in modern times. Mr St John penetrated to it in 1847. This oasis is a valley enclosed by sand-hills. It contains both fresh and salt waters, with beds of fossil salt of dazzling whiteness, and fertile soil luxuriant with dates, pomegranates, figs, bananas, and other fruits, which, with a little grain, sustain a small population. The Temple of Ammon is represented by some majestic remains, and the fountain bubbles up copiously hard by. Shattered and moss-grown masonry peeps out at the brink of the pool from a growth of reeds and rushes, intertwined with creeping plants; surrounding palms open between themselves long stately and shady vistas, like the solemn aisles of a great cathedral; while a rill emerges from the spring, and runs rippling towards the mouldering temple of the unshrined, dethroned, and almost forgotten divinity. Salt obtained from this spot was highly valued by the ancients, on account of the presumed sanctity of the place. It was deemed a suitable present for dignitaries and kings, and was called Salt of Ammonia from the site.

Through twenty-four centuries Egypt has been subject to the domination of foreign rulers. It was overrun by the Persians under Cambyses, 525 B. C., who spoiled many of the monuments; it was next conquered by Alexander; falling, upon his death and the division of his empire among the generals, to the lot of the Ptolomies. Upon the extinction of this dynasty, shortly before the Christian era, it became a Roman province. In the seventh century it was seized by the Arabs, and became a Mohammedan state. After being governed by a line of califs, the famous Saladin obtained possession of the country. He organised the Mamelukes, a military body which supplied princes to the throne till the Turkish conquest under Selim I., at the commencement of the sixteenth century. It has remained in connection with that empire down to the present date, except during the temporary occupation by the French in 1798, and the short-lived independence of Mohammed Ali in 1832. The government is now a hereditary vicerealty, vested in the successors of Mohammed Ali, who are perfectly despotic, but acknowledge subjection to the court of Constantinople by an annual tribute.

Egypt contains an estimated population of 5,225,000, including the tribes wandering or permanent in the desert. The great majority of the people are of Arabic descent, speak the Arabic language, and profess the Mohammedan religion. They are chiefly *fellahs*, or peasantry, located in villages by the Nile, occupying a very low social position, clamorous for *bucksheesh*, or presents from the passing traveller, whether services are rendered to him or not. The oppressive manner in which they are treated by the government has contributed to their degradation. Besides being subject to military conscription, they were liable to be dragged off at a moment's notice from their homes to labour on the public works at the will of the pasha, receiving scant remuneration, but a recent edict of the sultan has somewhat altered their condition. The construction of the Mahmudieh Canal by Mohammed Ali employed 250,000 of these unfortunates for a year, who were allowed a penny a day and a ration of bread, and of whom no less than 20,000 perished. Turks, politically dominant, fill most of the public stations. The Copts, supposed to represent the old inhabitants, profess a corrupt form of Christianity under a patriarch resident in Cairo. They live principally in the towns, are industrious and trustworthy, and follow various handicrafts. Jews, Armenians, and Franks compose the remainder of the population.

## NUBIA—KORDOFAN.

NUBIA, a thinly-populated region of great extent, embraces the country on both banks of the Nile, from the Egyptian to the Abyssinian border, bounded by the Red Sea on the east and the Libyan Desert on the west. It is circuitously traversed by the river, which forms five cataracts within its limits, receives its principal tributary, the Atbara or Teccazee, and is fully formed near Khartoum by the junction of its two main branches. The peninsular district included between the Nile Proper, the Atbara, and the Blue Nile, called by the ancients the Island of Meroë, corresponds in part to the vaguely-defined Ethiopia of antiquity. It contains remnants of mighty buildings, covered with sculptures representing battles or priestly ceremonies, with half-defaced inscriptions, and abounds with mutilated sphynxes and colossi. Lower Nubia, the northern portion, apart from the inundations of the great water-course, is a dry, burning, and sterile wilderness of rocks, shingle, and sands. But the upper or southern part of the country has a totally different character, being within the range of the tropical rains. The surface is largely clothed with mimosa forests, parasitical plants, and arborescent grasses, remarkable for an extraordinary number of wild animals, herds of elephants, troupes of hyenas who make the night dismal by their howls, droves of antelopes, with the rhinoceros, lion, and giraffe, the crocodile in the waters, much fiercer than in Egypt, and huge hippopotami. The inhabitants are partly of Arab descent, but chiefly Nubians proper, a muscular, finely-moulded, dark-complexioned race, with whom true Negroes intermingle in the southern districts. They are principally agriculturists, raise dhourra, maize, and dates for food, grow some cotton and tobacco, which, with natural products of the soil, as senna, myrrh, and frankincense,

are sent into Egypt, along with hides, ivory, ebony, and ostrich feathers. Owing to the depth of the bed of the Nile, its waters cannot be led off by artificial channels, and the annual rise of the river only at intervals occasions an overflow. Hence water-wheels are in constant use along its course, for the purpose of irrigation. KORDOFAN, the 'White Land,' on the south-west, is a collection of small oases, inhabited by Arabs and Negroes, who cultivate the soil, rear cattle, and possess herds of camels, which are let out on hire for the transport of merchandise.

Both Nubia and Kordofan are subject to the pasha of Egypt. They were conquered by the army of Mohammed Ali, under his second son Ismayl, in 1820—1822, whose atrocious cruelties exposed him to a fearful fate. He was surprised at a nocturnal banquet, while at a distance from his camp, and burned to death. In Nubia the people are chiefly grouped in villages on the river, enclosed with date-groves. *Derr*, the first town met with after quitting Egypt, is on the east bank, but unimportant. *New Dongola*, on the opposite side, above the third cataract, contains about 6000 inhabitants. It is a military depôt, and has an indigo factory belonging to the pasha. *Shendi*, more considerable, above the junction of the Atbara, is a market for live-stock, wheat, cotton, and senna, raised in the vicinity. Many ruined pyramids in the neighbourhood probably mark the site of the ancient city of Meroë, once the capital of a powerful and highly-civilised state, but already desolate in the early days of the Roman Empire. *Khartoum*, near the confluence of the Blue and White Nile, entirely modern, is the largest town, with a population of 40,000. It is the seat of the local government, the centre of several converging caravan routes, and the head-quarters of ivory hunters, and of travellers bent upon exploring the countries in the basin of the Upper Nile. *El Obeid*, the chief town of Kordofan, consists of several villages of mud houses thatched with straw, clustered together in an oasis, said to contain upwards of 20,000 inhabitants.

Types of all the architecture of Egypt are found in the ancient monuments of Nubia, from the first rude attempts to cut a temple in the rock, to the detached edifices erected under the dominion of the Greeks and Romans. This fact seems to intimate that in far bygone time the stream of civilisation and religion followed in this region the course of the Nile, or passed from south to north, while its fountain-head is even more obscure than the source of the river. The most remarkable of the rock-cut temples are at Abusambul, Ebsambul, or Ipsambul, as the name is variously written, between the first and the second cataract, on the western side of the stream. There is no village at the spot, but one appears at no great distance on the opposite bank in the midst of fine spreading palm-trees. A high sandstone rock is seen, the termination of a mountain-ridge, which closely approaches the river, and commands a beautiful view of its course. Its face has been cut so as to form the fronts of two temples, at a short distance from each other, with chambers in the bowels of the rock. The larger has four enthroned colossi sitting at the entrance, supposed to represent Rameses the Great, the Sesostris of Herodotus, the pride of Egypt, the terror of Africa and Asia, whose name and titles repeatedly occur in interior inscriptions. Reproductions of these colossal figures, of the size of the original, are striking objects in the Crystal Palace at Sydenham. Sir F. Henniker remarks: 'Ebsambul is the *ne plus ultra* of Egyptian labour, and is in itself an ample recompense for my journey. There is no temple at Denderah, Thebes, or Philæ that can be put in competition with it; and I am well contented to finish my travels in this part with having seen the noblest monument of antiquity that is to be found on the banks of the Nile.'

#### ABYSSINIA.

ABYSSINIA, on the south-western shore of the Red Sea, bordered by Nubia on the north, is for the most part a grand highland region, bounded by a narrow lowland zone on the maritime side, and by plains in the direction of the Nile, but is connected with the great plateau of Southern Africa, of which it may be regarded as a north-eastern promontory. High table-lands crowned with mountains rising to the line of perpetual snow, intersected by deep ravines cut by torrents and streams, and overspread with several lakes, are the conspicuous features of the country. It gives birth to the Blue Nile, which issues from fountains on the elevated plain of Dembea, and flows through the spacious lake of that name; and to the Tacazze, or 'Terrible,' the last affluent of the Nile Proper, so called from its impetuous descent in foaming cascades from the upper to the low grounds. During the rainy season the showers are everywhere perfect deluges. In the valleys and on the coast the heat is excessive and the climate unhealthy, but on the elevated tracts the air is cool and bracing. Beautiful and large specimens of the acacia, cedar, sycamore, and other trees, form extensive forests; the table-lands furnish excellent pasturage; the coffee-shrub, cotton-plant, and sugar-cane grow wild; medicinal plants are numerous;

and fruits are abundant. Besides the common cereals, a grain called Tef, *Poa Abyssinica*, is principally cultivated for the daily bread of the people. Various parts of the country swarm with almost all the wild animals of Africa. The population, supposed to exceed 3,000,000, consists of a medley of races. There are descendants of the old Ethiopic stock, a large number of Arabic origin, many Jews forming distinct colonies with the name of Falashas, or 'Exiles,' savage Gallas in the southern districts, and Negroes in a state of slavery. To this diversity, Habesh, the Arabic name of the country refers, signifying 'mixture' or 'confusion.' Christianity, Judaism, Mohammedanism, and Paganism co-exist within its limits.

Abyssinia was formerly included in a single sovereignty, which, in remote times, embraced part of Arabia, and had commercial intercourse with India. *Axum*, the old capital, is now a comparatively deserted place, but has some interesting remains, consisting of obelisks without hieroglyphics, of which more than forty lie prostrate, and two are standing. The largest of these is a granite monolith, sixty feet high, one of the most perfect examples of its kind. Another monument, the Axum Inscription, is an upright slab inscribed with Greek characters, referring to an event 330 A.D. The Axum Chronicle, of which a copy was brought to Europe by Bruce, is a history of the country preserved in the Christian church of the village. Christianity, introduced in the fourth century, survives chiefly as a very corrupt ceremonial. Its professors are under a metropolitan, called Abuna, 'Father,' who is subject to the Coptic patriarch of Egypt, by whom he is ordained. The churches are almost uniformly very small buildings, thatched with straw, surrounded with juniper-trees forming the churchyards, in which there are no funereal monuments. The old language of the people, the Ethiopic, called *Leshana Gheez*, 'Language of the Kingdom,' is no longer spoken, except with great dialectic debasement, but survives in an ancient version of the Scriptures, and other writings understood by the educated, and is hence styled *Leshana Mazhaf*, 'Book Language.'

Three principal political divisions at present exist, the kingdoms of Tigré, Amhara, and Shoa, respectively northern, central, and southern, but with very uncertain limits and unstable governments, owing to the civil warfare which has long prevailed. *Antalo* is the capital of Tigré, but very inferior to *Adowa*, a place of some manufacturing importance. *Gondar*, the chief town of Amhara, 7420 feet above the sea, and thirty miles from the shore of Lake Dembea, has vastly declined, and scarcely contains 7000 inhabitants. *Ankobar*, the capital of Shoa, with a population of 10,000, enjoys a delightful climate, being at the elevation of 8200 feet. The present king, Theodoros, was originally a penniless boy in a convent, then a chief of freebooters, next a conqueror, who gained the throne by his courage and ferocity.

The French, in 1863, obtained by purchase a settlement on the Abyssinian coast, near the entrance to the Red Sea, apparently as a counterpoise to the British station on the island of Perim in that locality.

Scene in the Desert.

Village of Musgu, Central Africa.

### CHAPTER III.

#### WESTERN, CENTRAL, AND EASTERN AFRICA.

**W**ESTERN AFRICA, though a very vague denomination, is usually understood to indicate the country on the shores of the Atlantic, between the parallels of 18 degrees north and south of the equator, with a considerable but wholly undefined extent of inland territory. The coast-line embraces the great bend of the Gulf of Guinea, with the western extremity of the continent, distinguished by two lofty sand-hills overlooking lesser downs. This promontory was called by the early discoverers Cape Verde, 'Green,' either from the meadow-like appearance given to the ocean by the profusion of sea-weed afloat upon the surface, or from the verdure of a group of boabab-trees seen in the distance contrasting with the arid aspect of the strand. The region includes the basins of the Senegal, the Gambia, and the Gaboon, with many streams of minor importance, and the lower courses of the Niger and the Congo. An addition to knowledge respecting its animal races has recently been made by sober details of the habits of the huge anthropoid ape, the gorilla, inhabiting the dense woodlands of the equatorial district. This creature, of enormous strength, feeds strictly on vegetable diet, moves along the ground on all-fours, roosts in the trees at night, and, like the elephant, the stag, and other naturally timid animals, is not disposed to attack man unless assailed by him. The discovery has also been made of native tribes in the same locality, similar in their superstitions, their ordeals, and their general customs, to those which distinguish the great Negro family, yet addicted to a system of cannibalism, though, curiously enough,

not otherwise remarkable for brutality of character. The revolting practice is thought to have arisen from some casual failure in the ordinary supply of animal food, and then to have grown into an established usage, as in the parallel case of the old New Zealanders. Western Africa, sometimes called Maritime Nigritia, from being occupied chiefly by Negro races, thus discriminating them from their brethren in more continental sites, includes three geographical regions, Senegambia, Upper Guinea, and Lower Guinea.

SENEGAMBIA, according to the name, comprises the basins of the two rivers, the Senegal and the Gambia, respectively north and south of each other. Both are deep and navigable streams, crowded with crocodiles and hippopotami, deriving their head-waters from contiguous sites on the western extremity of the mountains of Kong. Visited periodically by abundant rains, and subject to great heat, the vegetation is surprisingly vigorous. Forests of acacias, yielding the gum-resin of commerce, boobabs, cotton-trees, and butter-trees, with ornamental and dye woods, extensively clothe the surface, while maize, rice, millet, bananas, indigo, and cotton are cultivated plants. The country is inhabited by a great number of petty tribes, under their respective chiefs, but belonging to three principal branches of the Negro family, the jet-black Jalufs, and the lighter-complexioned Fulahs and Mandingoes, generally superior in intelligence and social advance to the race in other parts of Nigritia. There are Moors in the northern and eastern districts, with Europeans at their settlements. The French were the first to explore the course of the Senegal, while the English devoted themselves to the illustration of the Gambia.

*St Louis*, an island and town near the mouth of the Senegal, is the principal station of the French, founded about the year 1623, now containing about 11,000 inhabitants. There are trading dependencies up the river, and southward on the coast, of which *Goree*, an islet and fort near Cape Verde, is the chief. The French are mostly occupied with the gum-trade. To the north of the river, where its fertile borders pass into the region of the Sahara, large forests of those species of the acacia, *A. Senegal* and *A. Seyal*, grow from which the gum is distilled. No incision is necessary. Under the influence of the hot winds the bark dries and cracks in various places, and the resin exudes. But by its tenacity it remains attached to the trunks in large tear-like drops, which are as clear and transparent as the finest crystal. In these forests the Moors claim property, and arrive at the proper season in great crowds, on horses and camels, to collect the product. Six weeks are usually spent in the gathering, after which the Moors dispose of the commodity to the French traders. The Senegal gum is valued for dressing various textile fabrics, as muslins and silk, and is employed by confectioners for the finest kinds of lozenges.

*Bathurst*, a town on the island of St Mary, at the mouth of the Gambia, is the principal British settlement, of which *Fort George*, on Macartney's Island, and other stations up the river, are dependencies. The whole population is under 6000. Ivory, wax, hides, gold-dust, tortoise-shell, teak-wood, palm-oil, rice, and ground-nuts, are the chief exports. The exploration of the Gambia commenced in the year 1618, under the auspices of the African Company, and was attended with many mishaps. The river was speedily ascended up to the falls of Barraconda, about 400 miles from the sea, where the navigation is slightly impeded, to which point the British trading stations at present extend, though not continuously. Ascending the stream, much the same profusion of animal life appears in the water and on the banks, which astonished the early English explorers. Sometimes as many as twenty crocodiles were seen at once, and hippopotami were observed tossing and snorting on every side. Elephants appeared in herds on the shore, with lions, leopards, and ounces. But amid the alarms inspired by these formidable creatures, the sailors were amused by watching the movements of the monkeys. The baboons marched along in great droves, with several of the tallest in front, under the guidance of a principal leader. They sometimes mounted the trees as if to obtain a better view of the English, a sight which seemed to occasion the strongest dissatisfaction, expressed by grins, shaking the boughs violently, and uttering angry cries. The Gambia was the starting-point of Major Houghton and Mungo Park, the early adventurers into the interior. On the coast south of the river the Portuguese have some small factories.

The peninsular district of Sierra Leone, 'Lion's Hill,' forms a small British colony in the southern part of Senegambia. It has an area of about 319 square miles, and a population of 60,000, nearly all blacks. The surface rises in peaked granitic mountains clothed with forests of lofty trees, and is copiously watered in the rainy season, when fever is rife, which has been fatal to many Europeans. This territory was purchased by a number of private individuals in 1787, for the purpose of being a place of refuge for the Negroes rescued from slavery, and a convenient centre for the introduction of civilisation into Western Africa. But since 1807 it has been under a governor appointed by the crown, and forms a bishopric of the Anglican Church.

*Freetown*, the capital, is pleasantly situated on the left bank of the Rokelle or Sierra Leone River; has wide streets ornamented with rows of orange, lime, banana, and cocoa-nut trees; and contains about 16,000 inhabitants, among whom are very few whites besides the authorities, the garrison, and missionary agents. Moslem visitors have here made proselytes in the colony, who have two mosques, and regularly keep their Ramazan. Among the sable families the names of Lumpkins, Lewis, Pratt, and Macarthy are common patronymics. In the colony there are said to be members of 17 chief and 200 minor tribes, while 100 languages, according to M. Koelle—150 says Bishop Vidal—are spoken in the streets of Freetown.

UPPER GUINEA extends on the northern side of the gulf of that name, includes the lower course of the Niger, and the country inland to the mountains of Kong, a range of moderate elevation, running parallel to the shores, at the distance of about 200 miles. The maritime portion of this region is usually divided from west to east into four sections, the Grain Coast, the Ivory Coast, the Gold Coast, and the Slave Coast, indicating the commodities obtained from them, in addition to which, indigo, pepper, cotton, sugar, and palm-oil are products of the soil. The estuaries and borders of the rivers are highly pestilential from their mud-banks and decomposing vegetation, but have been ascended without ill effects to the crews when the proper season has been selected for the voyage, and due attention paid to sanitary precautions. The British and Dutch have settlements on the shores, and several powerful Negro states occupy the interior, some of which are addicted to very barbarous practices, besides engaging in wars for captives to sell into hopeless bondage to the slave-dealer.

The Grain Coast extends from the Sierra Leone peninsula to Cape Palmas, and was so called under the idea that the cochineal it once furnished was a vegetable production. The name also refers to a species of coarse pepper, termed 'Grains of Paradise,' yielded by a parasitical plant of the region, now obtained chiefly from India. Cape Palmas marks the commencement of the great eastward bend of the African coast, and is crowned by immense groups of the *Borassus Ethiopum*, a tall palm-tree. The natives of the neighbourhood, called Kroomen, are an industrious race, very expert seamen, well known to traders from the Gambia to the equator. Another species of palm, the *Elais Guineensis*, is very abundant, and furnishes the palm-oil of commerce, extracted from the seed or nut. Thousands of tons of oil are annually sent to the ports of London, Liverpool, and Bristol for the manufacture of composite candles. The Grain Coast includes the territory of Liberia, a settlement founded by some American citizens in 1822 for the purpose of removing to it free persons of colour from the United States. It has a coast-line of about 500 miles, extends to the average distance of fifty miles inland, and is divided into five counties, with a population of (1850) 300,000, who form a Negro republic under the government of a president, a senate, and a house of representatives. This colony, after encountering many difficulties, is now in a flourishing condition, well supplied with places of worship, schools, and public journals. *Monrovia*, the chief town, seated upon a lofty promontory, is named after President Monroe, during whose government at Washington the settlement was founded.

The Ivory Coast, immediately eastward of Cape Palmas, extends from it to the river Assinie, and was so called from the tusks of the African elephant, formerly exported in great quantities from it. The Gold Coast, further east, lies between the rivers Assinie and Volta, and has been long frequented for gold-dust and other products. A gold coin formerly current, the guinea, first coined in the reign of Charles II., received its name from the first specimens being of Guinea gold. It originally bore the impression of an elephant. *Cape Coast Castle*, the principal British settlement, dates from the year 1664. It consists of three forts built on a rock close to the sea, with a considerable native town adjoining. The place contains the grave of the poetess L. E. L., and acquired notoriety from the circumstances of her death. Several trading stations are on the shore, east and west, among which, James's Fort, near Accra, is almost under the meridian of Greenwich. *Elmina*, a fortified Dutch settlement, is the oldest European station on the coast, originally founded by the Portuguese in 1481. The interior country is chiefly included in the Negro kingdom of Ashantee, one of the most powerful of the native states, a mountainous but very fertile district, generally healthy, watered by the Assinie and the Volta. The natives are a courageous race, skilful in various manufactures, as cotton fabrics, earthenware, and sword-blades, but addicted to sanguinary rites, as human sacrifices on the decease of royalty and other similar occasions. *Coomassie*, the capital, built on the slope of a rocky hill, is about four miles in circuit, contains at least 20,000 inhabitants (the natives say 100,000), and consists of houses of wood-work and clay, thatched with palm leaves, not excepting the king's palace.

The Slave Coast forms the shores of the Bights of Benin and Biafra, and has long been, according to its name, the principal seat of the disgraceful traffic in human flesh. It is extensively included in the native kingdom of Dahomey, of which *Abomey*, a populous clay-built place, eighty miles inland, is the chief town. The country obtained its name in a singular manner, highly characteristic of the barbarity of the people. Upon a former king, called Da, being killed by 'ripping open his belly,' his conqueror assumed the style of king of *Da-omi*, or 'Da's belly.' This region is the scene of scarcely credible cruelties; human immolations

are regularly established customs, partly religious in their design, partly festive, but perhaps chiefly intended to be demonstrative of power, and thus sustain the authority of the sovereign. This potentate, tall and stalwart, with a skin of much lighter hue than that of his subjects, maintains a regiment of women, to the number of several thousands, who may be properly styled Amazons. Commodore Wilnot visited the barbarous court in 1863, and witnessed a scene before the palace not readily forgotten. At the further end of the courtyard was a large building, of some pretensions to beauty in that country, being made of thatch, and supported by columns of wood, roughly cut. In front of this, and close to it, leaving an open space for the admission of the king, was placed a large array of variegated umbrellas, to be used only by the sovereign. Near these were congregated his principal chiefs. On either side of him, under the building, were his wives, to the number of about 100, gaily dressed, most of them young and exceedingly pretty. The king was reclining on a raised dais, about three feet high, covered with crimson cloth, smoking his pipe, while one of his wives held a glass sugar-basin as a royal spittoon. He was dressed very plainly, the upper part of his body being bare, with only a silver chain holding some fetish charm round his neck, and an unpretending cloth around his waist. The left side of the courtyard was filled with Amazons, from the walls up to the king's presence, all armed with various weapons, such as muskets, swords, gigantic razors for cutting off heads, bows, arrows, and blunderbusses. Their large war-drum was conspicuous, being surrounded by human skulls. The king gave orders for them to perform a number of evolutions, which they did most creditably. They loaded and fired quickly, singing songs all the time. The commodore, both going and returning, was received with the utmost hospitality by the head men and the people. They sent him presents of water, fowls, and goats, but at the same time expressed the utmost ferocity towards those whom they considered public enemies. The war-dance was performed by the women and children, and motions made with swords as if in the act of cutting off heads. One singular custom was universal from the king downward, that of sending a stick as a token of welcome and friendship. *Whydah*, the chief seaport of Dahomey, is the principal slave-mart, hence closely watched by English cruisers.

Several small states lie eastward in the basin of the Niger, with populous chief towns. *Benin*, a place of considerable trade, stands on a western arm of the river, seventy miles above its mouth, and is the head of a territory of the same name, which contains *Gato*, lower down the stream, where the traveller Belzoni ended his days in 1823. *Lagos*, the principal seaport, is British, captured in the year 1851, now a flourishing centre of legitimate commerce. *Abbeokuta*, in the Yoruba country, a chief mission station, is said to contain 60,000 inhabitants, who have made no mean advances in civilisation. A recaptured slave, a native of this district, is now Bishop Crowther, the only coloured prelate of the Anglican Church. *Eyo*, the capital, surrounded by a belt of brilliant verdure, has an extensive circuit, but contains many fields and open spaces. When visited by Clapperton in 1825, the king boasted that his wives, linked hand in hand, would reach entirely across the kingdom, but they were seen acting as porters, carrying enormous burdens on their heads, and performing other servile offices. In the Yoruba country the dark deeds common in Dahomey and Ashantee are generally mentioned with abhorrence. The people are industrious, and have extensive fields covered with thriving plantations of maize, millet, yams, and cotton. The women spin, work at the loom, and dye cloths with their fine indigo. *Egga*, on the right bank of the Niger, above the confluence with the Chadda, has an immense population, occupying clay-built houses, and engaged in commerce by canoes along the river.

LOWER GUINEA includes the maritime region extending southward from the equator to the neighbourhood of Cape Negro, in which are the provinces of Loango, Congo, Angola, and Benguela, with wholly undefined inland limits, and a population consisting of various Negro races. The Portuguese claim the sovereignty of the entire country. They occupy the coast with several small towns, have some settlements also far in the interior, with solitary posts still more remote from the shores, called *feiras*, or fairs, which are visited by the natives as trading stations. But over a large proportion of the area their authority is merely nominal. Their commercial transactions are partly legitimate, but though greatly checked, slave-dealing has long been a principal object, and has contributed to demoralise the people, instigating them to wars in order to obtain victims for sale to the whites.

*San Paulo de Loando*, on the coast of Angola, is the seat of the governor-general, and ranks as the capital. It was founded in the year 1578, and contains about 12,000 inhabitants, said to be on the decrease. At this town Livingstone reappeared to European knowledge in 1854, after having been long buried in the wilds of the continental interior; he found a single Englishman, the acting consul, resident. *Casanga*, a principal settlement, about 300 miles inland, the traveller passed through on his way to the coast. *San Felipe de Benguela*, the chief town in that province, formerly a great slaving port, is now reduced to insignificance by the abatement of the traffic, though still carried on as opportunity offers. It occupies an unhealthy site, and has a ruinous appearance, to which a troop of wild elephants not long ago contributed. The animals, maddened with thirst, rushed into the town in quest of water, and demolished many of the dilapidated buildings. Salinas, or salt-lakes, occur on the Portuguese coasts, from the produce of which the government derives a

revenue. Iron ores are obtained in various places, and copper is stated to be abundant. Ivory, bees-wax, gum-opal, and the archilla lichen, yielding a rich purple dye, are the ordinary exports.

Guinea-fowls, a tribe of gallinaceous birds, common in the poultry yards of England, received that name from being originally introduced from this part of Africa, though not peculiar to it. Guinea-grass is also a naturalised product, of the same genus with millet, but does not grow so luxuriantly as in its native warm climate. The guinea-pig, or cavy, a well-known domesticated little animal, is wild in most parts of the country whose name it bears, from which it was first brought. The guinea-worm, an offensive and dangerous parasite, which inserts itself beneath the skin of the human body, and occasionally grows to an enormous length, is indigenous in the basins of the Senegal, the Gaboon, and other parts, as well as in most hot, rainy, and marshy districts. Negro slaves have taken it to America.

#### CENTRAL AFRICA.

The vast region immediately south of the Sahara, extending from Senegambia on the west, to Kordofan on the east, is comprehended under the general name of Central Africa, but is particularly defined in relation to its inhabitants by the title of Belad-es-Sudan, or Nigritia, the Country of the Blacks, as the continental home and original seat of the Negro family. It embraces the upper course of the Niger flowing westward; the basin of Lake Tchad, central, both bordered with swampy plains of great fertility and thickly peopled, while sterile sandy or rocky districts occur eastward, very thinly occupied. Troops of ostriches, giraffes, and antelopes rove amid the luxuriant herbage of the alluvial lands; the white ants rear their habitations, and the earth-hog, fox, and fenel dig their burrows. The elephant is also frequently met with, approaching the Asiatic variety in size, but with the well-known distinctive size of the ear. The rhinoceros is also often met with. Dr Barth encountered on one occasion a whole herd of elephants, arranged in regular array, like an army of rational beings, slowly proceeding to water. In front appeared the males, as was evident from their size, marshalled in order; at a little distance followed the young ones; in a third line were the females; and the whole were brought up by five males of immense size. Ninety-six were counted. Locusts are of common occurrence, and it is not unusual to see whole calabashes filled with the roasted insects, which occasionally form a considerable part of the food of the natives, particularly if their grain has been destroyed by this plague, who then take a pleasant revenge on the ravagers of their fields. Tamarinds, boobabs, and doum-palms appear among the botanical ornaments of the surface. The bentang-tree of Mungo Park, the tallest member of the vegetable kingdom, is planted at the principal gate of many of the large towns, probably from motives of superstition. 'At times,' says Barth, 'the landscape was one of exceeding beauty. The ground was pleasantly undulating, covered with a profusion of herbage, and the trees, belonging to a great variety of species, were not thrown together into an impenetrable thicket of the forest, but formed beautiful groups, exhibiting all the advantage of light and shade. Birds of numberless variety were also playing and warbling about in the full enjoyment of their liberty. Cotton and karkesia fields interrupted the park-like scenery; nor were tilled fields of wheat and onions wanting. Cattle, horses, and goats were everywhere browsing about. All the cattle were of a white, and all the goats of a coffee-brown colour. So much for despised Negroland.' But it must in truth be added, that scenes of culture and social comfort have a very uncertain tenure, owing to the collisions of bordering tribes, the drum of civil war, and repeated razzias for cattle, general plunder, and kidnapping for slaves.

Besides the true Negro family, distinguished by simple modes of life, a fondness for recreation in the cool of the evening far on into the night, and fetish worship; the population of Sudan includes Moors, Arabs, and Berbers; with mixed races, as the Fulahs or Felláta, who are of lighter complexion, more socially advanced, maintain troops of horse and foot, and profess Mohammedanism. As an example of the general insecurity of property, not to say life, in the country, the traveller mentions the town of Alama, which

Kano.

he noticed in a complete state of defence, surrounded with an earthen wall, a ditch, and a high thorn fence; exterior to which was a large extent of cultivated ground, with a numerous herd of fine cattle lying tranquilly on the open spaces in the interior. But the next time he passed, the place was deserted and looked mournful; not a single cow was to be seen; and tall reed-grass had grown up on the tilled fields. The people are grouped in numerous states, only a few of which are entitled to specific notice.

**BÓRNU**, a sultanate, on the western side of Lake Tchad, is a level district, swampy in the rainy season, inhabited by Negroes subject to rulers of Arab descent. *Kuka*, the capital, consists of two distinct towns, each surrounded by a wall of earth; the one for the better classes, containing very large establishments; the other, a congeries of small low dwellings and narrow winding lanes. The towns are half a mile distant, connected by a broad road, lined on both sides with a medley of large clay buildings and thatched huts, in enclosures of light reed fences. Daily little markets are held, at which camels, horses, and oxen are sold in considerable numbers. There is also a large market or fair every Monday in the vicinity, which brings together the people from a great distance with commodities for sale, as corn, butter, dried fish, mats, whips made from the skin of the hippopotamus, leather-work, beads of all sizes and colours, neat little boxes made of the kernel of the doum-palm's fruit, and live-stock, among which slaves are conspicuous. The markets are all held in the hottest hours of the day, and not, as in other parts, in the cool of the evening. *Angornu*, a larger town, on the margin of the great lake, is the centre of extensive trade in slaves, cotton, amber, coral, and metals. *Gummel*, the chief place of a dependent province, is a principal mart for natron, which is disposed of in large masses. *Ngurutuwa*, on an extensive plain, with houses under the shade of huge fig-trees, contains the 'white man's grave,' that of Mr Richardson, the head of the expedition of which Barth was a member. His other companion, Overweg, had the imprudence while shooting to enter deep water in the pursuit of water-fowl, remain in his wet clothes, and died at *Maduwari*, in the neighbourhood of Kuka.

**ADAMAWA**, a country on the south of Bórnu, is separated from it by the great forest of Marghi, full of elephants; it forms a disputed frontier region between the two states. It is traversed by the upper waters of the Chadda, the great eastern arm of the Niger, which has been explored by Baikie from the ocean for 300 miles above the confluence, and which Barth crossed in a still more interior part of its course, where it was nearly half a mile wide, and eleven feet in general depth. *Yola*, the chief town, a short distance from the south bank, is a large open place not less than three miles long, but composed of conical huts in the midst of spacious courtyards, and sometimes even of cornfields. Slavery exists upon an immense scale in this district. Many private individuals have more than 1000 slaves, who cultivate grain for their use or profit, and raise some amount of cotton. This region is one of the finest parts of Central Africa, watered by a first-class river, diversified with hill and dale, but unhappily either in the hands of warlike pagan tribes, or subject to ruthless Mohammedan chieftains.

**BAGIRMI**, a district on the south-east of Lake Tchad, appears to comprise a number of distinct principalities, and the dialects vary with almost every large town. The vegetation is varied and magnificent, among which are beautiful and wide-spreading fig-trees, shading the dwellings of the people, and serving as lounging-places

for loiterers. Animal life is also profuse. The ayu, or river-cow, *Manetus Vogelii*, common to the Niger and Chadda, inhabits the streams, leaving them at night to feed on the fresh grass of the banks. Barth here experienced his greatest annoyances from insects. Ants, grubs, and a species of beetle swarm by millions, and consume an immense proportion of the produce of the soil. But the poor natives do not fail to take their revenge, devouring the grubs when they have grown fat and large by the consumption of their crops. *Mas-ena*, the capital, like most of the other towns, has a decayed appearance from disastrous civil wars.

In the eastern parts of Sudan are the little known territories of Dar-zaleh and Darfur, the latter bordering on the Egyptian pashalic. Westward, between Bórnu and the Niger, the country is chiefly occupied by the Fúlaha, who, about the beginning of the present century, commenced a great religious war on the surrounding pagans, which ended in the establishment of the great Fulah empire of Sókoto. It contains some populous commercial towns. *Kano*, one of the principal, combines a singular variety in its appearance. There are clay houses, huts, and sheds; green open spaces affording pasture for oxen, horses, camels, donkeys, and goats, in motley confusion; deep hollows containing ponds overgrown with aquatic plants; beautiful specimens of vegetation, as the fine symmetric gonda, the slender date-palm, the spreading alleluba, and the majestic silk cotton-tree; and people in diverse costumes, from the almost naked slave to the gaudily-dressed Arab. The people are of cheerful disposition, and highly industrious. They manufacture and dye cloths, make sandals with great neatness, export tanned hides, red sheep-skins, and various articles of leather, and have a slave-market. *Sokoto*, the capital, was the scene of Clapperton's death in 1827, affectionately attended to in his last moments by his faithful servant Richard Lander. It is situated on an affluent of the Niger, and contains about 20,000 inhabitants; but *Wurno*, a smaller place, about fifteen miles distant, is the residence of the sultan.

Near *Sego*, in the Bambarra country, on the upper course of the Niger, the river was first seen by Mungo Park. The town has numerous mosques, neatly whitewashed clay houses, many canoes, and a population estimated at 30,000. At *Bussa*, in the territory of Borgu, on the middle course of the stream, the unfortunate traveller was killed in an affray with the natives. About midway between the two places stands *Timbuktu*, on an extensive plain a few miles from the north bank, but in water-communication with it, skirted in the opposite direction by the Sahara. A mysterious greatness was formerly attached to this town as the capital of a powerful kingdom, which recent visitors have completely dissipated. It is surrounded by a decayed wall little more than two miles in circuit, which encloses mud dwellings generally one story high, with three large mosques, and a population of 20,000. But it is the centre of important commerce by caravans across the Desert between Negroland and the Barbary states. Gold-dust is a principal staple, though the amount exported is exceedingly small measured by a European standard. Salt, gum, wax, and a few native manufactures in wool and leather from the neighbouring districts, are other articles of the traffic.

#### EASTERN AFRICA.

The eastern side of the continent, washed by the Indian Ocean, corresponds to the western in its hot climate, numerous streams, profuse vegetation, and general insalubrity. Only a very limited knowledge of its features and people was possessed prior to the present day, as the Portuguese, who once held extensive command of the shores, and still retain considerable possessions, discouraged the intrusion of other Europeans into their settlements, for the nefarious purpose of concealing their participation in the slave-trade, and carrying it on without interruption. The equatorial part of this region is distinguished by the lofty Kilimandjaro, ascended by the Baron von Decken to the height of 13,000 feet, where he experienced a fall of snow, the first that has been endured by any white man, rarely even by a black one, in tropical Africa. It is also the site of spacious lakes, one of which almost certainly contains the head waters of the Nile. The more southern portion embraces the lower part of the river-system of the Zambesi. From Cape Guardafui on the north, to Delagoa Bay on the south, a distance of more than 3000 miles, the seaboard is usually divided into the coasts of Ajam, Zanzibar, Mozambique, and Sofala, the last of which makes a close approach to the British colony of Natal. North of the equator, the country is occupied by numerous native tribes of Somulis and Gallas. Southward of the line, the indigenous people are either pure Negroes or Kaffirs. But two foreign races politically predominate, Arabs and Portuguese.

The Ajam Coast has some small ports which are annually visited by traders from Guzerat in India for odoriferous gums, myrrh, ostrich feathers, coffee, and other articles. Their Somali inhabitants are chiefly Mohámmédans, fishermen, and commercialists. Those in the interior are variously pastoral and cultivators. The Gallas, 'invaders,' a vigorous race, partly in Abyssinia, have spread themselves by conquest far to the

southward, and include barbarous tribes entirely heathens. The Galla ox, remarkable for its immense lyre-shaped horns, has its name from the people.

The Zanzibar Coast is mostly included in an Arab sovereignty, which has the insular town of *Zanzibar* for its capital, a highly-important place, containing the palace of the sultan, an arsenal, several mosques, many stone-built houses, and a permanent population of 30,000, which is considerably increased at certain seasons by the arrival of foreign traders. The island is separated from the main shore by a channel twenty-five miles wide. The opposite mainland was the starting-point of the expedition under Captains Burton and Speke, which led to the discovery of the great lake region; and of the later and more celebrated attempt of Speke and Grant to determine the source of the Nile. *Mombas*, a well-known mission station on the north, occupies likewise an island close to the main coast, and is similarly connected with the discovery of the snow mountains, Kilimandjaro and Kenia.

The Mozambique and Sofala Coasts, respectively north and south of the mouth of the Zambesi, are claimed by the Portuguese, who have settlements on the shores, and in the far interior. To the latter, criminals are transported from the mother-country. *Mozambique*, a fortified town on an island, once considerable, but now decayed, is the residence of the governor and of a British consul. *Quillimane*, a small port, at the outlet of the great river, and *Tete*, about 300 miles up its course, with Sena intermediate, are the principal stations, in a declining condition. Ivory, bees-wax, and gold-dust are exported, with slaves when practicable.

## CHAPTER IV.

### SOUTHERN AFRICA.

THE Tropic of Capricorn may be regarded as the line of division between the central and southern portions of the continent. At this point it extends east and west about 1300 miles, and stretches upwards of 750 miles, with a gradually-contracting breadth, to Cape Agulhas, the south extremity. This sharply-defined headland received its name, signifying 'needles,' from the Portuguese, which is given also to a vast adjoining sand-bank, over which rolls a harassing sea, and to an important current flowing from the Indian to the Atlantic Ocean. The interior country includes very varied scenes, as mountain-chains broken by wild, watered, and wooded gorges; elevated terraces alternately flowery and verdureless; low grassy or sandy plains, with tracts of desert, as barren and savage as are to be found on the surface of the globe. Rivers with a generally rapid descent to the sea are numerous, but none admit of any extent of inland navigation. The most important example, the Gariep or Orange, received the latter name from the early Dutch colonists in honour of the House of Orange. It has a winding course of more than 1000 miles from east to west, flows between banks lined with

mimosas, willows, and black ebony; but can be readily forded at many points in almost all seasons, and possesses therefore no navigable value, while sand-banks at the mouth prohibit access to it from the ocean. On the north of the river, extending to beyond the tropic, is the great central Kalihari Desert, a fearful wilderness, which long arrested the task of exploration, till the happy thought occurred to Livingstone of skirting it on the eastern side, instead of attempting the direct passage. Rain rarely falls in this district, and no water is to be had except at a few springs or 'sucking-places,' which the miserable natives who wander over it in search of game carefully conceal. Yet, as a singular feature, the surface is not naked, but in many places well wooded, and largely covered with thorn-trees.

The territorial divisions include the Cape Colony, British Kaffraria, Natal, the Orange River Republic, and the Trans-Vaal Republic, with districts occupied by native tribes under their respective chiefs.

A bold promontory at the south-west extremity of the continent, originally called Cape of Tempests, from the storms encountered by the early navigators in doubling it, but which was soon superseded by the auspicious title of *Cabo de Bon Esperança*, Cape of Good Hope, gives its name to an important British dependency, the CAPE COLONY, and to its capital, Cape Town. The headland, upwards of thirty miles from the town, is the southerly termination of a peninsula occupied with rugged hills, which culminate in the remarkable Table Mountain immediately behind the capital. This peninsular tract, connected with the main body of Africa by a flat sandy isthmus, forms the Cape district, one of the subdivisions of the colony. The entire territory has an extent of about 550 miles from the ocean on the west, to the outfall of the Keiskamma River on the east, by 450 miles from Cape Agulhas to the northern boundary, or the Orange River. Within these limits there cannot be less than 200,000 square miles. But the space actually occupied by the settlements of civilisation is comparatively contracted; and a very large area in the north must be left to the wild animals or to thinly scattered aborigines, as condemned by nature to irretrievable sterility. The coast-line measures 1200 miles, a considerable portion of which on the north-western side lies out of the ordinary track of navigation, and is hence imperfectly known, but supposed to consist of sand-plains with a scanty clothing of shrubby plants. More southerly, promontories and indentations occur in an almost uninterrupted series. Many of the inlets form capacious bays, with ample depth of water, but are very defective roadsteads, being exposed in some direction or other to the winds. Saldanha Bay, on the west, affords protection in all weathers; Table Bay, the most frequented, having the capital on its shore, is generally secure, except in winter, when north-westerly winds prevail; Simon's Bay, immediately to the south, is safe throughout the year, and is the chief naval station of the colony.

High grounds occupy great part of the interior of the country, consisting of three ranges of mountains, which run parallel to the coasts, and rise in succession above each other. They are cut by transverse valleys, many of which are mere ravines, but admit of communication through them, and have been made practicable as carriage-roads. The ranges are separated by terraces or upland plains, each range forming the boundary of a lower, and the abutment of the next higher plain. The loftiest and most interior chain is known in different parts of its course by the Dutch names of the Roggeveld Bergen, the Nieuveld Bergen, and the Sniew Bergen, or Snowy Mountains. They retain the snow for several months upon the most elevated peaks, which reach the height of 10,000 feet in the Compass Berg, in the neighbourhood of Graaf Reynet. Northward of this chain the country descends by a very gradual slope to the bed of the Orange River. The intervening upland plains, during the summer heat and drought, are perfect deserts; and hence the

term, *karroo*, applied to them, signifying 'dry' or 'arid,' which has been incorporated from the language of the Hottentots into the vocabulary of physical geography for barren table-lands in general. But they remarkably change their aspect. In the cool season, soon after the rains fall, and soften the soil, the germs of myriads of plants are quickened, and the surface speedily exhibits a delicate green covering. This is followed by the glowing colours of the full-blown flowers, which almost entirely conceal the green of the plants, fill the air with the sweetest odours, and delight the eye with gorgeous and varied hues. At this time the colonist brings his flocks and herds into the karroo-ground, where the animals find a plentiful and wholesome supply of food, while troops of ostriches and antelopes share the repast and enliven the scene. After a calm day, as the sun declines, the landscape is paradisiacal from its beauty and fragrance. But lengthening days, and the increased power of the African sun, rapidly obliterate every fair appearance. The flowers fade and fall; the stems and leaves dry; the streams that have been set in motion fail; the soil bakes, and is covered with a brown dust from the ashes of the vegetation; the farmers, flocks, and wild animals retire; and the surface is a ghastly waste and a dreary solitude till the next year's rain renews the verdure. The Great Karroo, at the base of the Roggeveld and Nieuveld chain, is a belt of table-land 300 miles in length, and 80 miles in average breadth, at the height of 2000 feet above the sea.

Both the fauna and flora of the colony are of singular interest. Towards the close of the last century, naturalists visited the Cape attracted by the brilliancy of its botanical productions, and the remarkable forms of the animal kingdom, which, though widely distributed, could there be most conveniently studied. Sparrman, and after him Le Vaillant, viewed with admiration the strange outline of the giraffe and the superb marking of the zebra, animals then nearly unknown in Europe; the light shape and bright eye of the springbok, the most beautiful of antelopes; and observed with astonishment the vast number of gnus and quaggas, with buffaloes, lions, elephants, rhinoceroses, and hippopotami. The large and formidable quadrupeds have extensively fallen victims to the hunter's rifle, or been driven into the wilds of the interior by the advance of colonisation. The elephant is no longer found south of the Orange River, and the lion is very rarely met with on its borders, but members of the antelope family and of the horse tribe scour the plains in great troops, and migrate intermingled with ostriches, when severe drought compels them to quit their customary haunts in search of pasture. Singular succulent plants abound, with geraniums and heaths growing wild like common weeds, the latter remarkable for elegance of form and variety of species, many of which are established favourites in the conservatories of Europe. Patches of natural forest are in the highland gorges and on the sides of the mountains, but timber-trees are in general sparingly distributed, except along the southern shore. The prevalent tree in the vicinity of Cape Town is the Witteboom, or Silver Tree, conspicuous for the brilliant silky whiteness of the leaves, which have a beautiful appearance when agitated by the wind. With the exception of grasses and aloes, the indigenous vegetation is of little service to man, but most of the grains, fruits, and vegetables of the northern hemisphere have been introduced, with the varieties of domesticated live-stock with which we are familiar. Agriculture, embracing the cultivation of the vine, and pastoral husbandry, are the leading industries. Wool and wines are the most important exports. The climate has great summer heat, but is highly salubrious. Its principal disadvantage is the uncertainty of the rains, which are sometimes suspended for long intervals, and occasion severe distress from drought.

The country to the north of Orange River, first traversed by Livingstone, is described as extremely varied. In his first journey from Kuruman to Lake Ngami, he determined

The Zambesi River, from Logier's Hill.

to skirt the eastern flank of the Kalihari Desert instead of going through it. The space to be traversed 'has been called a desert,' he says, 'because, though intersected by the beds of ancient rivers, it contains no running water, and very little in wells. Far from being destitute of vegetation, it is covered with grass and creeping plants; and there are large patches of bushes and even trees. It is remarkably flat; and prodigious herds of antelopes roam over its trackless plains.' Starting for the unknown region, a range of tree-covered hills was crossed to Shokuane, afterwards along the bed of an ancient river, through a perfectly flat country. On the third day they were traversing a trackless waste of scrub, the grass so dry as to crumble into powder in the hands, and, on the 4th of July, after a month's toilsome journey, they reached the banks of the Zouga River, which the people informed them flowed out of the Lake Ngama. Following the banks of this beautifully-wooded river, ninety-six miles from the point where they first struck it, the lake was reached on the first of August.

In a future journey he reached the Zambesi, a river whose existence was previously unknown, through a country perfectly flat, except where large ant-hills formed mounds a few feet high—generally covered with wild date-trees and palmyras. Occasional forests of mimosæ and mopane also occurred.

The Cape was discovered by the Portuguese in 1486, whose fleets occasionally stopped for water and refreshments, but no attempt was made to occupy the country. In the reign of James I. two commanders of the English East India Company formally took possession of it, but no settlement followed. The Dutch, having found their way into Indian seas, perceived the advantage of having a naval station at the site, and in 1650 founded Cape Town. The territory remained in their hands nearly a century and a half, during

which time colonists from Holland spread themselves as farmers over the interior. Hence the common occurrence of Dutch names in the nomenclature of towns, mountains, and streams. In 1795 the dependency was taken by a British armament, and after being restored to Holland, it was recaptured in 1806, and permanently annexed to the empire.

The Cape Colony consists of two provinces, a western and an eastern, each of which is subdivided into eleven districts, generally of large extent. The western province, or oldest settled portion, chiefly agricultural, is under a governor-in-chief; and the eastern, principally pastoral, under a lieutenant-governor. Each forms a diocese of the Anglican Church, with an episcopal seat at the capitals, Cape Town and Graham's Town. Both provinces have a common legislature, composed of a council of fifteen nominated members, and an assembly of forty-six elected representatives.

|                             |   |
|-----------------------------|---|
| Western Province, . . . . . | Cape Town, Stellenbosch, Beaufort, George Town. |
| Eastern Province, . . . . . | Graham's Town, Port Elizabeth, Graaf Reynot.    |

The total population is loosely reckoned at 285,000, considerably more than one-third of whom are whites. These consist partly of the descendants of the original Dutch colonists, called boers or boors. The majority are located on grazing-farms, and have degenerated in the remoter districts from the standard of their ancestors, become rude in their manners, and oppressive in their treatment of inferiors, while very illiterate. They are, perhaps, now outnumbered by the new-comers, the British, who are still slowly recruited from the mother-country; while many of the old settlers, as discovery opened up the region north of colonial limits, transferred themselves to it, for the double purpose of escaping a foreign government, and taking by force the inheritance of native tribes. There are also some of French extraction, who are chiefly the wine-growers, descended from a number of the Protestants who became refugees upon the revocation of the Edict of Nantes in 1685. The coloured people consist of the aborigines proper, or tribes of the Hottentot race, with Kaffirs on the border, Negroes, Malays, and Africaners, the latter sprung from foreigners by native women. The Hottentots were once considered almost without the pale of humanity, so degraded were their habits, and inferior their appearance. But subject to proper treatment, they have shewn themselves capable of becoming attached and faithful to their masters, make good farm-servants, soldiers, and police.

*Cape Town*, the capital, is situated on the southern shore of Table Bay, in latitude 33° 56' south, longitude 18° 28' east, and contains a population of nearly 30,000, of a very motley description, Dutch, English, Negroes, Malays, and Hottentots, with mixed races of almost every shade of colour. The main streets, arranged in straight lines and right angles, are threaded by canals, and have rows of trees, after the style of the original founders. Most of the houses are flat-roofed, and have a brick terrace in front, called the *stoep*, shaded by the trees, which forms the usual evening lounging-place of the inmates. Directly facing the mid-day sun, with naked mountains immediately in the background, the town is exposed to great heat from its situation, the mean temperature being 58° for the winter, and 76° for the summer. It possesses several good government buildings, fifteen churches and chapels, an exchange, a college, a literary institution, a public library, a botanic garden, and an astronomical observatory. A regular citadel, with various outworks, protect the colonial capital and the harbour. The streets are lighted with gas. Cape Town is under the control of a municipal body, and returns four representatives to the local parliament. It has a considerable number of Mohammedans among its inhabitants, and is perhaps the only place in the world where natives of Britain have become converts to their creed. A grand altar-like mountain rises immediately behind the town to the height of 3760 feet. This is the Table Mountain. The Lion's Head and the Devil's Peak are lower adjoining eminences. The three mountains form an amphitheatre of about five or six miles in diameter, in the centre of which Cape Town is placed.

*Graham's Town*, the capital of the eastern province, in the district of Albany, is about 500 miles east of Cape Town. It contains an almost exclusively English population of 6000, and occupies an inland site. *Port Elizabeth*, on the shore of Algoa Bay, a flourishing commercial town, is the principal shipping-place for the whole of the eastern division. About twenty-five miles inland from it, on a large well-watered plain, is *Uitenhage*, the head of a district of the same name, with 5000 inhabitants.

BRITISH KAFFRANIA, immediately east of the Cape Colony, extends along the coast between the outlets of the Keiskamma and Great Kei Rivers, and embraces an area of about 4500 square miles. It is under a separate administration, as the head-quarters of the troops employed to keep the independent Kaffirs beyond the frontier in check. The district was wrested from them by the war of 1847, and contains numerous military posts established for protective purposes. Many parts of this territory are highly picturesque, while adapted both for grazing and agriculture. A considerable number of the soldiers who formed the German Legion during the Crimean war, along with British settlers, have here received grants of land on easy terms, who probably form a population of 10,000, while the Kaffirs associated with them as fellow-subjects are supposed to number 100,000. *King William's Town*, the capital, situated inland, is still in its infancy, but issues an English and a German newspaper. *East London*, at the mouth of the Buffalo River, with good anchorage-ground, is the port.

NATAL, a young and rising British colony, derives its name, *Terra Natalis*, from the fact of the discovery of the district by the Portuguese on the festival of the Nativity, or Christmas-Day, 1497. It is situated on the south-east coast of Africa, in 30° south

latitude, about 800 miles from the Cape of Good Hope, and within seven degrees of the Tropic of Capricorn, extending inland to the distance of 100 miles from the shores of the Indian Ocean. The Draken-berge, or Dragon Mountains, on the west, form the boundary from the Orange River Republic; the Tugela River, on the north, defines the frontier from Zulu-land; and similarly the Umzimkulu, on the south, from Independent Kaffraria, which intervenes between Natal and the eastern part of the Cape region. Within these limits there is a compact territory of about 25,000 square miles. Whether approached by sea or by land from the Cape, the country makes a very agreeable impression, owing to its freshly-verdant aspect throughout the year, so strikingly different to the general aridity of the regions left behind. On gaining the last heights of the Draken-berge range from the interior, after passing over dry and sterile lands, the traveller hails with surprise the prospect of a well-watered, wooded, and grassy landscape, stretching for miles to the eastward, and can appreciate the feeling which led the first Dutch explorers to exclaim at the view, *Een andere wereld!*—‘Another world!’ On nearing also the strand, the voyager marks with delight a series of beautifully-sloped and round-topped hills, all green and luxuriant, some covered with grass, others with trees, which descend to the very water’s edge, or to the white beach upon which the waves are playing. This is the appearance of the surface even in the hot months, when all vegetation is parched, brown, and dusty at the Cape. It is occasioned by the rains falling in this part of Africa in the interval from September to March, or during the summer of the southern hemisphere.

From the coast the land rises rapidly in four distinct steps or terraces, each averaging about twenty miles in breadth, and having its own peculiarity of soil and climate. In the maritime region there are fine woodlands and park-like scenery. The temperature ranges high, and though not strictly tropical, even in the height of summer, the climate admits of the growth of cotton, sugar, indigo, arrow-root, coffee, pine-apples, and other productions of the tropics. Further inland, as the country rises in elevation, the temperature is diminished, and the air is refreshing, except when the hot wind blows from the north-west, the direction of the sun-scorched regions of Central Africa. This range of land, on which stands the capital, is almost bare of trees, but well adapted for the growth of maize and the usual harvests of Europe. Beyond this, the higher terraces supply immense tracts of pasturage, with timber-trees of considerable size and serviceable quality. Large wild animals, rhinoceroses and elephants, once numerous, have either been exterminated by the hunter, or are only met with in the more retired districts, from which they are rapidly disappearing. Alligators abound in some of the rivers, with hippopotami, and serpents allied to the boa are not uncommon. The British government proclaimed the district in May 1843 a regular colony of the crown. Since that period it has been under a lieutenant-governor. Rapid advances to prosperity have been made by the arrival of English and German settlers, and by the possession of those natural advantages in which the Cape is deficient: abundance of wood, water, iron, copper, and other metallic ores, coal, which occurs in various places, and a fertile soil. Natives have also flocked across the frontier to enjoy the peace and protection secured to them by a strong government. The whites number 10,000, and the Zulus 120,000, who, under just treatment, are docile and industrious, acquitting themselves well in domestic and farm service. Their huts are constructed of twigs thatched with grass. Baskets for carrying produce are made of grass strongly plaited together, and calabashes for water consist of a scooped-out vegetable of the pumpkin kind. Natal has recently received a representative constitution, and forms a diocese of the Anglican Church. It is divided into seven counties, and has *Pietermaritzburg* for the capital, near the centre of the province, about fifty miles from the coast. The town is neatly laid out in the form of a parallel square, and possesses some substantial public buildings, but is only partially built. It stands in a branch of the Umgani River, which has a fall of 262 feet perpendicular in the neighbourhood. The name is compounded of the Christian name of Pieter Rietief, and the surname of Gert Maritz, two leaders of the immigrant boers who first entered the country in the time of the sanguinary chief Choka. *Durban*, the port of the colony, often called Port Natal, the first settlement, is seated on the shore of a fine land-locked bay, but a bar at the entrance prevents the admission of large vessels. Sugar, wool, ivory, coffee, and arrow-root are the principal exports. Sugar plantations are extending in the coast region.

The ORANGE RIVER REPUBLIC, enclosed by two arms of the stream, and the adjoining TRANS-VAAL REPUBLIC, named after a leading branch, claim to rank as two independent states, westward of Natal, and north-east of the Cape Colony. They originated with the Dutch farmers, who, disliking restraint, emigrated at various times beyond colonial limits, in order to enjoy a rude freedom wholly irrespective of the rights of the natives. They have usurped their lands, compel them to do their bidding as convenience dictates, assemble in force to punish the refractory, and have violently opposed the opening of the country northward, whether by missionaries or hunters, in order to keep the traffic in ivory and hides in their own hands. Livingstone’s home and station, previous to his grand tour, was desolated by them, and his life would undoubtedly have been sacrificed

but for his absence at the time of the attack. *Blomfontein*, the seat of government in the Orange River state, is a skeleton town with a Dutch and a Roman Catholic Church, as is *Potscherfatroom* in the Trans-Vaal district.

**KAFFRARIA PROPER**, the popular name of the coast country between British Kaffraria and Natal, extends about 120 miles inland, is occupied by the broken remains of once powerful Kaffir tribes. At various times they have harassed the frontier of the Cape Colony, penetrated as invaders far into its interior, and baffled the imperial troops, though finally driven back with immense loss and the capture of their principal chiefs. They are supposed to number 300,000, but are said to be decreasing, and will probably be incorporated, with their territory, in the British dominions. The Kaffirs are physically a finely-formed race, brave and warlike, but good-natured in time of peace, partial to amusements, and honest except in relation to cattle, which bordering tribes are prone to steal from each other as opportunity offers. This has occasioned frequent wars among themselves, which, with those against the British, have contributed to a large reduction of their numbers. They are strictly a pastoral people, and regard their herds with an intensity of feeling approaching to idolatry. The men attend to them exclusively, make them companions as far as possible, address them by name, and speak to them in terms of praise, while the women cultivate the soil, fetch water, and gather in fuel, in addition to household work. They live in collections of huts, called kraals, several of which are mission stations, where the European traveller is sure to meet with an hospitable reception. Polygamy is practised, and seems to be a firmly-established usage. The tribes are under patriarchal government and hereditary chiefs. They are expert in the use of firearms, can manoeuvre in a style which has frequently elicited the admiration of English officers, and in conferences with them, on grounds of difference, the European has often been foiled by the logic of the native.

A district further inland, watered by the Caledon branch of the Orange River, is inhabited by the Basutos, a section of the Kaffir race, but somewhat inferior to the true Kaffirs in physical development. Tribes of Kaffir descent, pastoral and agricultural, but differing from the 'magnificent savages' in being of inferior appearance and comparatively timid, are spread over a large tract of the interior north of the Orange River, extending to the Zambesi. They are comprehended under the general name of Bechuanas, occupy a region of plains and low hills, a dry and thirsty land, where a cloud may not be seen for months, and years have sometimes passed away without a shower. In such a district a copious fountain is a thing of joy.

## PART IV.

### DESCRIPTIVE GEOGRAPHY OF AMERICA.

#### INTRODUCTORY CHAPTER.—GENERAL VIEW OF AMERICA.

AMERICA, one of the principal divisions of the globe, ranks next to Asia in magnitude, and is very nearly equal to the joint area of Europe and Africa, while it forms the largest continuous mass of land in the direction of the meridian; entering within the north polar zone, and approaching the confines of the Antarctic Circle. Three great oceans enclose the continent; the Arctic on the north, with its winter-frozen surface; the Atlantic on the east, intervening like a grand canal between its shores and those of Europe and Africa; and the Pacific on the west, the largest section of the world of waters, forming the separation from Asia and the island-realm of Oceania. At the narrow south extremity the two latter basins blend their billows. The northern limit of the mainland, a headland of the Boothian peninsula, and the southern, or Cape Froward, on the Strait of

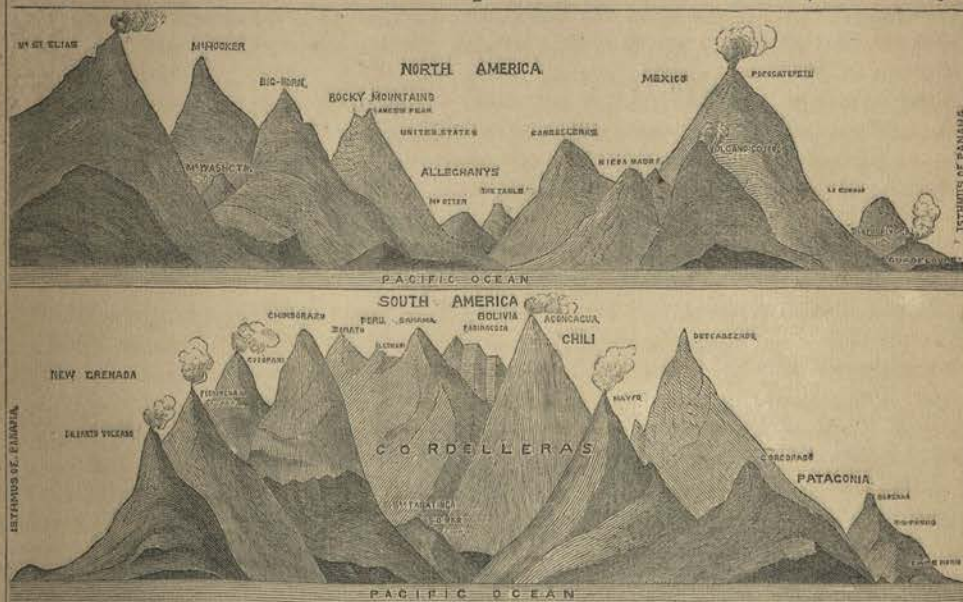

Magellan, are respectively in latitude  $72^{\circ}$  north and  $53^{\circ} 54'$  south. Between these points, following the curving course of the land, the distance is not less than 10,000 miles. In the opposite direction the extent is much less, only slightly exceeding 3000 miles, under the parallels of  $45^{\circ}$  north and  $5^{\circ}$  south, where the greatest expansions occur. But immediately the breadth remarkably contracts to a mere span, for in the Isthmus of Panama, the opposite waters of the Atlantic and Pacific, at their closest approach, are only twenty-eight miles apart. This isthmus divides the continent into two great portions, or North and South America, which correspond in their general form, being rudely triangular peninsulas, and in the westerly position of their principal mountains. The northern and largest portion, exclusive of islands, has an area of about 8,600,000 square miles, and the southern of 7,000,000, making a total of 15,600,000 square miles. These main divisions have some contrasted features. The northern is specially distinguished by the number and extent of its fresh-water lakes, and by the broad and deep indentations of its coast, especially on the eastern side, where the vast sea-like inlets of Hudson's Bay and the Gulf of Mexico occur. It has therefore the greatest extent of sea-board, amounting to about 24,000 miles, while the southern division has only 13,600 miles, giving for the entire line of the shores a length of 37,600 miles. North America is also characterised by insular dependencies of great extent, with an immense number of small dimensions; as Greenland, Iceland, Newfoundland, the Arctic series, the West Indies, Vancouver's, Queen Charlotte's, and others. South America has only a few small appendages of the kind. The principal group, the Fuegian Archipelago, may by proximity, as well as on geological grounds, be regarded as a southerly continuation of the continent, being only separated from it by the narrow Strait of Magellan. This will extend the latitude to  $55^{\circ} 58'$  south, and make the dark and stormy headland of Cape Horn the terminating point in that direction.

America derives its name from Amerigo Vespucci, a Florentine naval adventurer and friend of Columbus. It seems to have originated inadvertently, probably in Germany, where the narrative of his voyages to the American shores was published, and received with intense interest as the first account of the country. Owing to the comparatively recent date of the European discovery, it is still commonly styled the New World; and also the Western Continent, from its position in relation to the prime meridians of European geographers. It is not unlikely that the great idea of Columbus, the real discoverer, that of opening a western passage to the East, will ultimately be realised by the construction of a ship-canal through the narrow central part of the continent, where lakes and rivers occur to facilitate the enterprise. This would insulate the northern and southern divisions, directly connect the navigation of the Atlantic and Pacific Oceans, and shorten by many days the voyage from Europe to China, Japan, New Zealand, Eastern Australia, British Columbia, and the whole western coast of America. An iron road, the first tropical railway, crosses the Isthmus from Aspinwall on the Atlantic to Panama on the Pacific. It follows a circuitous course, and has a length of fifty miles, but the distance between the termini, as the crow flies, is only thirty-eight miles. This is one of the most profitable undertakings of the kind to the shareholders ever executed, in spite of its immense cost; but a marine route would offer incomparably greater advantages.

Imposing ranges of mountains, supported by extensive table-lands, occupy the western side of the continent, and form a chain of grand highlands stretching through its entire length from north to south, subject to comparatively few breaks, but passing under a variety of names. From the shores of the Arctic basin, near the mouth of the Mackenzie River, the Rocky Mountains extend southward to the Mexican plateau, with bare and rugged summits, one of which, apparently the loftiest, Mount Brown, on the inland border of

British Columbia, attains the height of 16,000 feet. Parallel to this range, on the coast of the Pacific, are the Californian or Maritime Alps, less persistent, but embracing the culminating-point of North America, in Mount St Elias, 17,860 feet, within the limits of the Russian territory. This highland system is continued southward by a series of table-lands studded with volcanic cones to the depression of the Panama isthmus, immediately

Comparative Height of American Mountains.

beyond which rise the Andes, which stretch in an unbroken line to the extremity of South America, rarely receding far from the ocean, and occasionally forming the coast-line. These mountain-ranges, varying widely in their aspects, are so far knit together as to constitute a single colossal chain, the great axis or vertebral column of the continent, and the most important example of a longitudinal chain on the earth's surface. The Chilean Andes, though of inferior average elevation, contain Aconcagua, in the background of Valparaiso, which has an altitude of 23,910 feet, and is the highest point of the whole surface in the Western Hemisphere. It will thus be seen that in the disposition of its principal mountains the New World differs decidedly from the Old. They skirt the ocean in the former case, and are in central districts in the latter.

In different parts of its course the Andean chain consists of a single compact ridge shooting up its pinnacles into the realm of eternal snow, and of two or three parallel ranges which enclose elevated valleys or plains between them, and form at the points of reunion a confused aggregation of masses, or mountain-knots. Three ranges appear in New Granada, two in Equador, Peru, and Bolivia, and only one in Chili. Though the high valleys are treeless, the grasses are luxuriant, and a limited cultivation prevails. But the lofty plains, formed by the flat summits of the main mass of a range, are true mountainous deserts, never enlivened with fresh-looking verdure. These districts, called *paramos* or *punas*, are often veiled in fogs for several days in succession, and then exposed to the rush of tremendous tempests, which have proved fatal to many a traveller, as some of the frequented routes lie across them. Transverse gaps, or immense chasms, termed by the natives *quebradas*, cut the ridges at irregular intervals, sometimes so sharply and deeply that the rocky sides are perpendicular precipices, between which

Volcanic Mountain of Jorullo.

Vesuvius might be placed without its top rising to their height. The loftiest and most powerful volcanoes of the globe are seated in the Andes, or connected with the northerly continuations of the highland system, either now or formerly in active ignition. Some are cones of prodigious magnitude, as Pichincha, with an elevation of 15,924 feet, Cotopaxi, 18,875, and Antisana, 19,132 feet. They do not in general discharge lava, but volleys of stones, clouds of ashes, torrents of water, accompanied with mud, mineral pitch, and other fluid ingredients. Earthquakes are of common occurrence in all the countries associated with this backbone of mountains, and occasionally visit with awful energy the shores of Chili, Peru, Venezuela, Central America, and Mexico; the most singular on record perhaps being that of Jorullo, represented above. In the month of June 1859, a fertile and highly-cultivated plain, six days' journey north of the city of Mexico, experienced a sudden commotion, a frightful earthquake followed, which continued for two whole months. At the end of this time, the fears of the inhabitants were subdued and their calm seemed restored, when, in the night of the 28th September, the plain for many leagues round was slowly upheaved in a rounded mass truncated at the summit. From the summit thus formed, volcanic exhalations emanated, all the plain up to the foot of this hill undulated like the waves of a stormy sea; thousands of little hills from ten to twenty feet high, rising very near to each other, opened and closed their summits alternately, finally the mountain itself opened; and from this gulf of three or four square leagues, immense masses of flame,

scoria, and rocks in fusion were vomited. The eruption continued for a whole year, diminishing slowly, but never entirely ceasing, and Jorullo still continues to discharge its torrents of fire and molten scoria. Two rivers which formerly flowed through the plain were engulfed and reappeared in the west, far from their ancient bed—probably after traversing the volcanic conduit, for the waters reappear at a temperature of 53°. As a rule the Andes present a steep face towards the ocean, but decline gradually on the continental side. There the slopes are clothed with seemingly boundless forests, very solitary as to human inhabitants, but rife with prodigious swarms of mosquitoes, eager to fasten upon any intruder, and never intermitting their attacks in any season of the year, any hour of the day or night, so long as there is an object to assail, a victim to torment.

Secondary, but locally important ranges occupy a considerable space on the opposite or eastern side of the continent. They include in the north division the Alleghany or Appalachian chain, a series of parallel ridges stretching from the Gulf of St Lawrence, in a diagonal direction, to the state of Alabama, of moderate elevation in general, but containing a few summits, as Mount Washington in New Hampshire, which exceed the height of 6000 feet. In the southern division a branch of the Andes forms the Venezuelan coast chain, which culminates in the remarkable Silla of Caraccas at the elevation of 8600 feet; and nearly the same altitude is attained by narrow ridges in Brazil, running parallel to the eastern shores.

Between the eastern and the western highlands are enormous levels, but slightly elevated above the sea, which eminently characterise the superficial aspect of the continent in both divisions. From the base of the Alleghanies to that of the Rocky Mountains, and from the Gulf of Mexico to the Arctic Ocean, the whole of North America is an immense plain, comprehending more than 3,000,000 square miles, with very varying features, but with no irregularity of the surface beyond a few low hills and gentle swells, while embracing extensive and perfectly flat tracts. Towards the foot of the Alleghanies and the shores of Hudson's Bay the country is undulating and well wooded, but at the base of the Rocky Mountains the opposite feature is displayed of a true desert, a district covered with gravel, boulders, and granitic sand. Intermediate, extending through upwards of 1000 miles, and generally limited by the parallels of 30° and 50°, are prairie-grounds, which form the chief part of the basins of the great rivers, the Mississippi and Missouri.

Though the term 'prairie' strictly signifies a region destitute of timber, and is therefore the antithesis of the 'forest,' it is applied to districts where the two mingle with and intersect each other. Hence there are 'timber prairies,' but the wooded tracts bear no proportion in their extent to that of the open spaces between them. Other prairies, properly so called, being woodless, have distinctive names from the predominant vegetation, grasses or flowers, with which they are clothed. Their features differ in other respects, as the surface is often as level for miles as the top of a table, and then becomes billowy, while some are constantly dry and others are swampy. The floral verdure of prairie-land has been pictured by a vivid sketcher. 'I stand in an open plain. I turn my face to the north, to the south, to the east, and to the west, and on all sides behold the blue circle of the heavens girdling around me. Nor rock, nor tree breaks the ring of the horizon. What covers the broad expanse between? Wood? water? grass? No; flowers! As far as my eye can range, it rests only on flowers, on beautiful flowers! I am looking as on a tinted map, an enamelled picture brilliant with every hue of the prism. Yonder is golden yellow, where the helianthus turns her dial-like face to the sun. Yonder, scarlet, where the malva erects its red banner. Here is a parterre of the purple monarda; there the euphorbia sheds its silver leaf. Yonder the orange predominates in the showy

flowers of the asclepia; and beyond, the eye roams over the pink blossoms of the cleoma. The breeze stirs them. Millions of corollas are waving their gaudy standards. The tall stalks of the helianthus bend and rise in long undulations, like billows on a golden sea. They are at rest again. The air is filled with odours sweet as the perfumes of Araby or Ind. Myriads of insects flap their gay wings: flowers of themselves. The bee-birds skirr around, glancing like stray sunbeams; or poised on whirring wings, drink from the nectared cups; and the wild bee, with laden limbs, clings among the honeyed pistils, or leaves for his far hive with a song of joy. Who planted these flowers? Who hath woven them into these pictured parterres? Nature. It is her richest mantle, richer in its hues than the scarfs of Cashmere. This is the "weed prairie." It is misnamed. It is the garden of God! The name originated with the trappers, practical men, indifferent to objects which have no bearing upon the immediate demands of existence, intent upon furs and skins, fodder for their steeds and food for themselves. Yet the flowers have a weed-like distribution, being indiscriminately scattered, and not arranged in beds.

These floral prairies are found in the greatest perfection in the more southern latitudes, especially in Texas, where the traveller may ride through them the entire day without observing change in the general aspect of nature. Many are intersected by streams and belted with wood; and thus offer the two essentials of water and timber to the settler, invite the hand of industry to raise a homestead, and change them into corn-bearing lands. Another variety, the 'grass prairie,' answers to its name. Not a flower appears in sight for miles, but there is an expanse of verdure green as an emerald, now darkened in its hue by the fitting shadows of the summer clouds, and anon lightened by the returning sunbeams. Drove of bisons cover these meadows in compact masses, often a mile in length: they are the chief dependence of the Indian tribes; deer are met with in herds of several thousands, supplying the frontier settlers with venison at every meal; and wild horses are seen in long columns of eight or ten abreast shaking the ground with their stampede.

South America has its corresponding great central plain, extending between the Andes on the one hand, to the Brazilian Mountains on the other, and stretching to the southern extremity. This region exhibits great diversity. Northward are the Llanos, or 'level fields' of Venezuela, singularly flat, bordering on the Orinoco, by which are largely inundated in the rainy season, afterwards clothed with the rankest grasses, and then reduced to utter sterility by the succeeding heat and drought. Next, proceeding southward, occur the Selvas, or 'forest' plains of the Amazon, the densest and most extensive woodland on the terrestrial surface, where the magical beauty of tropical vegetation is seen in all its glory, interspersed with open patches of marsh and meadow. Further south are the Pampas, or treeless flats of the La Plata states. They include sandy and stony spaces doomed to permanent barrenness by saline impregnation, but consist chiefly of red calcareous soil, almost as level as the sea, part of which is covered successively with a luxuriant growth of grass, clover, and thistles, but it varies remarkably in its appearance with the season. As the spring advances, the whole region becomes a wood of enormous thistles, which have suddenly sprung up to the height of ten or eleven feet, and are in full bloom. Wherever there is a road or path it is hemmed in on both sides by the plants, and the view is completely obstructed. Not an animal is to be seen, for so strong and close together are the stems, that, independent of the prickles with which they are armed, they render the country impassable except along the regular thoroughfares. But the summer heat is not over before there comes a change. The plants lose their verdant appearance, the leaves shrink and fade, the stems become dry and black. For a time they remain rattling with the breeze against one another, till the powerful pampero, a hurricane from the Andes,

levels them with the ground, rapidly to decompose and disappear. The grass and clover then shoot up; the scene is again verdant; and the wild cattle return to graze upon the pasture. The soil of this district contains many fossil remains, those of the megatherium and mylodon, extinct animals allied to the sloths, and of the glyptodon, a gigantic armadillo.

The New World has immensely the advantage of the Old in point of fluvial communication, possessing rivers unrivalled in length of course, size of basin, volume of water, and extent of navigation; independently of a series of sea-like lakes, with a vast number of secondary rank. Owing to the great chain of mountains which traverses the coast of the Pacific, only a very small proportion of the surface-drainage finds its way to that ocean, but is conducted through the vast central plains to the Atlantic. This statement applies with the greatest force to South America; in the far north, the country slopes towards the Arctic basin. Through its entire extent, from the close approach of the Andes to the western shore, the streams flowing in that direction are all insignificant, while the eastward-bound rivers, the Orinoco, the Amazon, and the Plata, are magnificent, traversing nearly the whole breadth of the continent. In North America the more inland position of the principal water-shed, the Rocky Mountains, furnishes greater facility for hydrographic development on the side of the Pacific; and here are the Colorado entering the head of the Gulf of California, the Sacramento discharging in the harbour of San Francisco, and the Columbia passing into the great ocean. Yet these, though of local consequence, are but as brooks when compared with the rivers on the opposite side of the range, the Missouri, the Mississippi, and the St Lawrence, which belong to the Atlantic; but these rivers, while naturally of greater magnitude, are inferior in practical value as arteries of communication to the Hudson, the Delaware, and the Potomac. The northern rivers, flowing to the realm of the polar ice, the Mackenzie, the Coppermine, and the Great Fish River, are of little note from their high latitude, being frozen up through nine months of the year; they can never be utilised in their brief summer, except by the boats of trappers and the canoes of Indians and Esquimaux.

The Mississippi, 'Father of Waters,' deserves the name, as by far the largest river in the northern section of the continent, and the longest in the world, estimated with the channel of its principal tributary, the Missouri. Little more than three centuries have elapsed since it was first seen by European eyes. It was in 1541 that De Soto, a bold Spanish adventurer, who had gone out into the wilderness in search of gems, gold, and barbaric cities, met with the broad stream flowing through tangled forests, wide morasses, and far-spread prairies; but it was not actually traced to its source till the present century, long after steam communication had been established on its bosom. It issues from the small Lake of Itasca, a transparent sheet of water bounded by woody hills, on the table-land westward of Lake Superior. Thence it runs southward through the great central plain, receives numerous accessions from either side, describes repeated sweeps and windings, returns after long bends to the borders of its own channel as if disposed to re-enter it, and has a total course of 3160 miles to a swampy delta in the Gulf of Mexico. The Mississippi is clear and placid down to its junction with the Missouri, 'Mud River,' which brings in whitish-yellow waters, renders the flow rapid, and is actually the dominant flood. Lower down, the Ohio, *La Belle Riviere* of the French, on the left bank, contributes a greenish sediment; and still lower, on the opposite side, the Arkansas and the Red River enter charged with darker soil. Following the channel of the Missouri up to its source in the Rocky Mountains, the whole length somewhat exceeds 4200 miles, embracing more degrees of latitude than are traversed by any other American water-course. Hence great contrasts in climate and vegetation appear on comparing the extreme points, pines being

prominent in the north and tropical plants in the south. Below the confluence with the Ohio the river loses its picturesqueness. Bluffs become rare. The level banks are covered with woods, which seem as endless as they are monotonous, while the surface presents only a tedious succession of islands, flat boats, rafts, drifting logs, and panting steamers. In the lower half of its course, or downward from the great junction where the Mississippi-Missouri is formed, the depth increases, but the width is diminished, and seldom exceeds three-quarters of a mile, except during the spring floods consequent on the melting of the snows in the high latitudes, when vast tracts of country are occasionally overflowed. To guard against these incursions, 'levees,' or artificial ramparts, are raised along the banks at the exposed points; but the mighty current is often too strong to be thus resisted, and 'crevasses,' or gaps, are opened, through which it pours, converting the cotton plantations into temporary lakes. The entire river-system has a basin estimated to include 1,300,000 square miles, and is computed to offer not less than 36,000 miles of uninterrupted steam navigation.

If somewhat inferior in the length of its course of 3900 miles, the Amazon, in South America, drains a much greater extent of surface, reckoned at 2,500,000 square miles, discharges a far larger volume of water, and ranks as the most considerable river of the globe. It descends from the higher parts of the Peruvian and Bolivian Andes, pursues a general direction from west to east, and enters the Atlantic nearly under the equator. While perpetually fed from the snows of the mountains, it flows through a region more humid than that of any other part of the world of equal extent. In the wet season the rain pours down in torrents; the drops are of enormous size; and fall with a violence which Europeans who have not witnessed it are unable to conceive. Hence is formed that vast flood which is fifty miles broad at the mouth, never less than four miles wide through the last 450 miles of its course, the freshness of which is perceptible at a distance of more than 500 miles out in the ocean, while the depth is so great that large vessels may go up the channel for 2000 miles, and still be in forty fathoms of water. Yet flowing through a country very scantily occupied by rude tribes, there are fewer vessels upon its surface throughout the year than appear every hour of the day on the bosom of the Mississippi. But it may be regarded as the river of the future, opening a splendid field for enterprise from the exuberance of nature on its banks, admirably adapted for navigation, the powerful current facilitating it downwards, while this obstacle to the ascent is relieved by the prevailing wind, which is uniformly contrary to the course of the stream. The Amazon received the name in allusion to a tribe of women accustomed to go out to battle, who were rumoured to have once lived on its banks. But above the entrance of the Rio Negro it is called the Solimoes, and higher up the Maranon. By the Spaniards the whole river is often styled the Orellana, from the first white who descended it from Quito by the Napo tributary in 1539. Of the two head streams which unite to form it, the Tunguragua issues from the Lake of Lauricocha, on the inland slope of the Andes of Peru; and the Ucayali, the longest branch, has its origin more southerly, on the table-land of Bolivia.

In the north of the continent, almost every stream, small and large, pauses in its course to expand into ponds or lakes, the number of which is legion, and are supposed altogether to contain considerably more than one-half of the entire fresh water of the globe. The Great Lakes, as they are called, or the Canadian series, five in number, are expansions of the St Lawrence, which, though called by other names in the upper parts of its basin, is strictly a single river, with a continued current through the reservoirs. They are properly inland seas, subject to all the vicissitudes which attend the navigation of the Baltic or the Black Sea; and form by their position a boundary between the territory and institutions

of a monarchy and a republic, as the frontier line between British America and the United States is supposed to run through their centre.

Their united area exceeds that of Great Britain, and their total contents are estimated at upwards of 13,000 cubic miles of water. Between Lake Erie and Ontario the connecting river has the name of the Niagara, and forms the celebrated falls so called, which the Indians of the olden time, their only human spectators, viewed with awe, and applied the appropriate epithet of *O-ni-aw-ga-rah*, the Thunder of Waters, to the matchless scene. A second series of large expanses extends from near the preceding in a north-west direction—Winnipeg, Athabasca, Great Slave, and Great Bear Lakes—the first connected by the Nelson with Hudson's Bay, and the remaining three by the Mackenzie with the Arctic Ocean. Owing to the high latitude, they are regularly closed by the ice through the long winter, and travelled over on sledges by the fur-hunters. Lakes abound on the plateau of Mexico, and also in Central America, which are not of comparable magnitude. Two in the latter district, the Leon and Nicaragua, connected together, and discharging by the San Juan into the Carribean Sea, offer facilities for uniting the opposite oceans by a ship channel, as the distance is inconsiderable between the western extremity of Lake Leon and the Pacific, and the line is in actual use for transit across the whole breadth of the Isthmus. South America, considering its extent and vast volumes of flowing water, is singularly deficient in large lakes. One of the most spacious, Lake Titicaca, on the Bolivian table-land, overlooked by some of the grandest of the Andes, is remarkable for its height above the sea, 12,846 feet. The expanse has an outlet in the Desaguadero, but the stream does not leave the mountain region, losing itself in a highland swamp. In the present century, during the fever for South American mining, an English company had the skeleton of a brig transported from the coast of the Pacific to this elevated lake, and set afloat upon its waters, the only vessel that ever sailed at nearly the same level with the loftiest of the Alps.

Upon the discovery of the western continent, Europeans viewed with astonishment its forms of vegetable life, making acquaintance with them for the first time in tropical situations. There is no very surprising contrast in the more northerly localities. The forests are there composed mainly of members of European families—oaks, pines, birches, willows, poplars, elms, alders, aspens, hazels, and berry-bearing plants. But the species differ, and are often developed with a magnitude rarely seen elsewhere, as in the instance of the gigantic pines westward of the Rocky Mountains. Approaching the tropic, however, genera appear which are entirely wanting in the Old World; and in the hot, humid equatorial zone, or the basin of the Amazon, the vegetable kingdom exhibits a variety and profusion which is unequalled in any other part of the globe, whether regard be had to number of genera and species, the vast extent of the forests, the size and close grouping of the individuals, bearded and clothed from the roots to the extremities of the tiniest branches with orchids and flowering climbers. The explorer cannot advance a yard without using the hatchet to open a pathway through the underwood; and were it not for the interruption to progress offered by the rivers, the monkeys might travel hundreds of miles without once descending from the boughs to the ground. In this

zone the forest-trees supply much valuable timber, with ornamental and dye woods, as mahogany and Brazil-wood. Some bear huge fruits, used for food by the natives, as the well-known Brazil nuts of the shops, from which also a lamp-oil is extracted, while the hard thick shells in which the nuts are packed are employed for domestic purposes. Others yield a resin which thickens into caoutchouc. The cow-tree of Venezuela is so called from a juice exuding on incision, which has many of the properties of milk, and is obtained as a substitute for it.

No true heaths are indigenous to any part of the continent, while all the cactuses belong

Virgin Forest of America.

exclusively to its tropical districts, though known by introduction in other warm climates. The gigantic water-lily, *Victoria Regia*, now raised in tanks in the conservatories of Europe, is peculiar to a few equatorial streams. Trees of the order *Cinchona*, which yield the celebrated Peruvian bark of medicine—the naturalisation of which is in process on the hills of India, in order to secure an adequate supply of the invaluable febrifuge—are limited to tracts on the inland slope of the Andes. Few cultivated plants of importance for food or luxury are of American origin. Maize, tobacco, the potato, cacao, from which chocolate is prepared, the pine-apple, and the Jerusalem artichoke are the most valuable. Fuchsias and dahlias,

among the ornamental tribes, have their home in the same quarter. On the other hand, to European colonisation America is indebted for wheat and other kinds of grain, as also for rice, flax, the sugar-cane, the banana, coffee, and cotton.

The native types of animal life are in general inferior in size, strength, and appearance to those

of Africa and Asia. None occur to be compared in bulk to the huge pachyderms, the elephant, rhinoceros, and hippopotamus; and the wild-boar has no nearly allied representative. The quadrupeds of the largest class are the elk, musk-ox, reindeer, wapiti, and bison, commonly but improperly called the buffalo, all confined to the north, with the great tapir peculiar to the south. The beasts of prey formidable to man are limited to the

jaguar found in the tropical forests of South America, the puma ranging northward to the borders of Canada, the wolf, and three varieties of the bear. Quadrumanous tribes abound in the equatorial region, distinguished from the monkeys of the eastern world by being more gentle, of smaller size, and having in most examples long prehensile tails, answering the purpose of a fifth hand. Rodents are specially numerous, of great commercial value from their furs, embracing the beaver, musk-rat, and ermine, all in the north, with the chinchilla in the south, where also edentata, or toothless animals, occur, comprising sloths and armadilloes. The llama, and its congeners the alpaca and vicuña, of the same order of ruminants as the camel, but very inferior in size, strength, and intelligence, are limited to the Andes of Peru and Chili, where they are, whether wild or domesticated, important as wool-bearing animals. The dog was common previous to the transatlantic passage of the Spaniards, but the horse and ox were entirely unknown, though now roaming free by thousands in the prairies, llanos, and pampas, where they are captured by the lasso. The first horses seen by the natives, descendants of the noble barbs that bore the Moors through Barbary and Spain, inspired astonishment, awe, and terror, the steed and his rider being conceived to be one and indivisible. The largest of all birds that take wing, the condor, is not found north of the equator. Humming-birds, of fairy-like diminutiveness and dazzling beauty, are exclusively an American family. They are common in the temperate as well as the tropical zone, and pass northward in the summer along the west coast up to the parallel of 60°, owing to the greater warmth of that side of the continent, being rarely seen above 42° of latitude in the opposite direction. Pigeons, reckoned by millions of individuals, which darken the air in their migrations, are characteristic of North America. The common turkey, naturalised in Europe, was obtained from Virginia. Reptiles dangerous to man, the boa-constrictor, the rattlesnake, and the alligator, are found in the tropical provinces and the bordering districts. Wild bees of many species are indigenous, but the common hive-bee was introduced by Europeans. Insects are found everywhere, especially in the hot swampy districts, embracing many species of the noxious or venomous class, with brilliantly-variegated butterflies, and fireflies, illuminating the woods by night with their phosphorescent lustre. The rich and varied mineralogy of America has been proverbial. The old Mexicans obtained silver, lead, and tin from the mines of Tasco; copper from the mountains of Zacotollan; and gold was gleaned from the beds of rivers and superficial debris. The Peruvians likewise gathered gold from the deposits of streams, and silver from the bowels of their mountains. The whole chain of the Andes is richly metalliferous, and is supposed by some to have been so called on that account, *Anta*, signifying, in the language of the Incas, metal in general. Humboldt calculated from mining records that in the three centuries following the year 1499 the mines of Mexico, Peru, and Brazil yielded to the whites a total amount of gold and silver of the value of £1,248,000,000 sterling. Brazil at present supplies diamonds, other precious stones, and some amount of gold; Mexico contributes a proportion of its former products, with the addition of iron, which does not appear to have been worked till a recent date; Chili, in its northern district a sterile, mountainous desert, has stores of the purest silver ore, with copper, lead, iron, bismuth, cobalt, antimony, arsenic, and quicksilver, which are largely in the hands of an English Mining Company; all the useful metals abound in states of the distracted American Union, with immense deposits of coal in nearly all its known varieties; and coal, of good quality and easy access, is likewise abundant in New Brunswick, Nova Scotia, and Vancouver's Island.

In relation to climate South America has in general a higher temperature than the North, having a much larger extent of surface within the tropics, while very striking inequalities distinguish its rainfall. The annual amount of precipitation is enormous over

the whole valley-plain of the Amazon up to the higher slopes of the Andes; but on the opposite side of the range, the coast of Peru is nearly a rainless region. This is occasioned by the direction of the trade-wind, which drifts the vapours from the Atlantic westward over the great central plain, till their further progress is arrested by the mighty mountain-wall. North America, on the side of the Atlantic, and through the whole of its central districts, has a lower mean annual temperature than Western Europe in corresponding latitudes, with warmer summers and colder winters. This is the effect of various causes, as the direction of the Gulf Stream, which carries its warm water away from the shores, while the prevailing south-west winds similarly divert from them the circumambient air, warmed by contact with the current; the great polar stream which annually brings down the icebergs to the coasts of Newfoundland and Labrador; and the broad expanse of land towards the Arctic zone, without mountains to prevent the free egress of the chill northern blasts. The western side of the continent, in its north division, is much warmer than the eastern, and has not the same extremes of summer heat and winter cold. Thus Sitka Island, in Russian America, has a mean annual temperature of 45° Fahrenheit, while at Nain, on the shore of Labrador, in the same latitude, it is only 28°. The different temperatures of the Pacific and Atlantic coasts is most perceptible in the winter months. Referring to the mouth of the Columbia River, Sir George Simpson states that the first half of December presented one deluge of rain after another, the weather winding up with a storm of thunder and lightning, while, 'to mark the difference of climate between the two sides of the continent, the good folks of Montreal, though occupying a lower parallel than ourselves, were sleighing it merrily through the clearest and driest of atmospheres.' Only slight frosts occur in this locality, when at Quebec, in a corresponding latitude, the cold is intense, the streams are ice-bound, and the snow lies for five months hard and deep upon the ground. The milder temperature experienced on the Pacific coast is due to the warm winds from its surface, and to the great barrier of the Rocky Mountains, which acts as a screen from the biting breath of the polar zone. The political divisions of the continent are as follows:

|  | Area in Sq. Miles.           | Population. |
|--|------------------------------|-------------|
| Danish America.—Iceland, Greenland, {  | Iceland, . . . . . 38,000    | 65,000      |
|  | Greenland, . . . . . 400,000 | 9,400       |

| Empire of Brazil, . . . . .  | 3,000,000                    | 9,000,000   |
| Peru—Republic, . . . . .   | 530,000                      | 2,400,000   |
| Bolivia, " . . . . .   | 374,000                      | 2,326,000   |
| Chili, " . . . . .   | 170,000                      | 1,439,000   |
| Argentine Republic, . . . . .  | 1,120,000                    | 1,224,000   |
| Uruguay, Paraguay—Republics, . . . . .   | 194,000                      | 850,000     |

Considerably more than one-half of the population are Europeans by descent, chiefly British, Spanish, and Portuguese, with a sprinkling of French; and newly-arrived European settlers, among whom the Germans form an important body. The remainder

consist of Indian tribes and Esquimaux, the indigenous people; of African Negroes, partly in slavery, partly free; and of mixed races, the offspring of the European and the Negro, the European and the Indian, the Indian and the Negro. In Mexico, Central and South America, the pure aborigines and the mixed races preponderate. The Esquimaux, few in number, and limited to the far north, correspond to the north Asiatics, and are classed with the Mongolian division of the human race. The Indians constitute a distinct variety. Though usually called the red men, the complexion has no uniform hue, but varies from nearly black, or deep bronze, to light cinnamon, and even fair. Yet by certain physical characteristics common to the race, with a structural bond of union in their verbally discordant languages, they are identified as a single family. At the time of the first European inroad, their ancestors were found organised as flourishing nations in Mexico and Peru, in possession of a comparatively advanced civilisation. They inhabited great cities, built temples, palaces, and mausoleums, constructed roads and other public works, the remains of which have in many instances been discovered in our own age, on the long-deserted shores of lonely lakes and buried in the depth of gigantic forests, beneath their undergrowth, in vegetable tombs. But monuments of a hoary antiquity are scattered over a wide area in the valley of the Mississippi, consisting of conical mounds of sepulture, sacrificial mounds, temple mounds, beacon mounds, and systems of fortification, with earthenware vessels, vases of copper, weapons of the same metal, and personal ornaments. Who handled the weapons, reared the mounds, and formed the circumvallations, are questions which can never be satisfactorily answered.

Glaciers of Chili.

Mount Hecla.

## CHAPTER I.

DANISH AMERICA—ICELAND, GREENLAND. RUSSIAN AMERICA.

THE large volcanic island of ICELAND, a possession of the Danish crown, is connected with Europe by its people and language, but belongs by proximity to the western world, being separated by a comparatively narrow channel from the east coast of Greenland, while it is divided by the breadth of the open ocean from the nearest main shores in the opposite direction, the British and Norwegian. It is situated on the confines of the polar circle, and contains an area very little short of 40,000 square miles. The interior exhibits the most extraordinary spectacle to be seen on the surface of our planet, and no known parallel to it exists in the domain of nature, except perhaps those savage solitudes which science has revealed in lunar scenery. There are vast desolate plains of black fractured lava, jagged and sharp, liable to wound the incautious wayfarer; deep yawning crevasses, swollen unbridged streams, and treacherous bogs apt to arrest his course; natural warm and steam baths in hot waters and vapours; ice and snow mountains, *yökuls*, as they are called, many of which are volcanoes occasionally in tremendous action; sulphur and brimstone ridges

exhibiting the most glaring yellow and brick-red hues; and caldrons of huge diameter boiling with slaty-blue mud, which splutters up at intervals in jets five or six feet, and diffuses clouds of sulphureous vapour in every direction. Hence not more than one-eighth of the surface is habitable; and a large portion of the remainder never has been, and never can be, even traversed. Insurmountable obstacles are presented by conglomerations of ice, and by the lava-fields, once red hot, but suddenly cooled, being now rent, torn, twisted, and tormented, as the French say, in every possible manner, into every conceivable shape. Beautifully-executed maps have been produced by the Danish government, excelling in minuteness of detail. Each little crevasse, mountain-torrent, and lava-flood is shewn with remarkable distinctness, except over a portion of the country towards the south-east coast, which is left blank. This region, of about 400 square miles, embracing the Skapta, Vatna, and Klofa Yökuls, defied the investigation of the surveyors, and will probably remain for ever untrodden.

The loftiest of the ice-mountains, as at present known, is the Oræfa Yökul, 6426 feet above the sea, near the south-east coast; next is Snæfells, 5965 feet, on the west coast; then Eyafialla, 5579 feet, near the south-west coast; and Hecla, in the interior, due north of the latter, 5110 feet. Travellers are most familiar with Hecla, from its proximity to the Geysers, the great object of attraction to them; and readers likewise are well acquainted with the name from the frequency of its eruptions. It is in sight at the famous boiling springs, rising cold and clear against the sky, and has a circuit of at least 12 miles at the base, occupying the margin of an extensive plain, completely isolated, and terminating upwards in three peaks, on the western sides of which are the craters. The central peak is the highest. Snow in summer clothes the mountain about two-thirds of the way down the slopes. The eruptions on record, commencing with the tenth century, are forty-three. After rather a long interval of repose, it became active in September 1845, and continued so with little intermission till November 1846. Some of the ashes thrown out descended in fine dust on the Orkney Islands; masses of pumice-stone weighing half a ton were projected to the distance of more than a league; and a torrent of lava was poured forth, which, at two miles from the point of discharge, was a mile in width, and from forty to fifty feet in depth. Light wreaths of vapour were ascending when Commander Forbes went up in 1860, who succeeded in lighting a fusee, and subsequently his pipe. The Great Geyser, a true aqueous volcano, is only a giant example of water in ebullition among a hundred similar displays upon a smaller scale in the neighbourhood. It resembles an artificial intermittent fountain. At irregular intervals the boiling water is thrown up, accompanied with violent detonations underground, sometimes rising to the height of 100 feet or more, giving off clouds of vapour. The display is commonly over in a few minutes; and when quiescent, the Geyser is a small pool, clear as crystal, in a basin at the top of a mound composed of siliceous incrustations derived from its spray. In the absence of roads, all the traffic of the country is conducted by means of horses along the bridle-paths which centuries of travel have worn in the lava plains. As inns are entirely wanting, strangers arriving to see the 'lions' must either procure a troop of baggage-ponies to carry a tent, bedding, and provisions, or take their chance at parsonages, solitary farmhouses, and peasants' dwellings. Lord Duferin's equipment, who entertained Prince Napoleon at the Geysers in 1856, consisted of three guides, twenty-six steeds of every colour the race is heir to, with as many pack-saddles. The clergy very commonly officiate as hosts, with whom conversation may be maintained in corrupt Latin, and should their dwellings be full, the pews and chancels of churches serve as dormitories for the night without thought of sacrilege. Mr R. Chambers and his party passed two nights in the church of Thingvalla, a low cottage-like structure of tarred deal and rough masonry—the roof covered with the green sod—the pulpit, barely sufficient to stand in, and without a seat—the pews, five or six in number on each side, of the rudest carpentry—the door, four and a half feet high—the floor, bare earth—and the whole interior measuring twenty-five feet long by ten feet three inches wide. 'It was,' says he, 'with an uncontrollable feeling of amusement, strangely mingling with intense feelings of personal discomfort, that I examined the place and all its miniature features. It was curious,' he adds: 'to waken in the morning, and by peeps through the opening eyes, under the imperfect light, to catch the singular features of that dwarf church, its pictures, candlesticks, legends, and little windows, while the mind as yet was scarcely alive to a whereabouts.'

Vegetation is confined within narrow limits. The so-called trees, the service-tree and the birch, seldom rise higher than six feet, and never above ten. But a valuable quantity of drift-wood is borne to the shores by the oceanic currents. Grain will not ripen in the climate, but many garden vegetables are raised, and a belt of rich grass-producing land generally fringes the coasts, and extends in places some distance into the interior along the margin of the streams. This is the inhabited district, where the great bulk of the people dwell, and their horses, cattle, and sheep are sustained. Fiallagrass,

or Iceland moss, a lichen of medicinal value and an article of food, carefully collected for home consumption and export, grows on rocks and stones in the more desolate parts of the island. It is gathered by the women in summer time, who go out in parties for the purpose under the care of experienced matrons, and dwell in tents for the interval amid scenery of the wildest description. After being boiled, dried, and reduced to powder, it is either made into bread, or used mixed with milk. Sea-fowl, including the eider-duck, are very abundant; the ptarmigan, curlew, plover, and tarn occur among the game birds; splendid trout are in the streams; salmon, cod, haddock, and seal fisheries are conducted along the shores. Reindeer, imported originally from Norway, run wild in large herds in the interior; and the polar bear occasionally arrives as a passenger on the drift-ice. The animal is readily despatched, being exhausted for want of food during the voyage from distant shores. Sulphur is the most important mineral, but is only beginning to be turned to account, chiefly by English enterprise and capital.

The island is divided into three amts or provinces—Nordlendinga, the northern; Sunlendinga, the southern; and Westfydinga, the western—which are subdivided into syssels or counties. The latter have each a principal officer, or sysselman, chosen by the people, who is sheriff and magistrate, convenes public meetings, presides over elections, and maintains order. Each syssel, of which there are twenty, returns one member to the Althing or Icelandic parliament; and in addition, six members are nominated by the Danish government. Acts of the legislature must be approved by the crown to become law. The governor, or stiftamtman, usually a poor noble, is sent out from Copenhagen, serves for five years, and has a very moderate salary.

*Reikiavik*, 'Reek Town,' a name referring to steaming springs, is not equal to many a village, and of very homely appearance. It is seated on the south-west coast, on the shore of a fine bay; and is simply a collection of small wooden dwellings, one story high, coated with tar, and therefore black, with which white painted sash windows contrast strongly. As a further set off, there are curtains of white muslin, sometimes crimson, with pots of flowers, as roses, geraniums, fuchsias, which speak of comfort and taste. Wood being brought across the sea, chiefly from Norway, and therefore expensive, accounts for the diminutive size of the houses; and as all coal is likewise sea-borne, scant room economises fuel. The poorer classes throughout the island have recourse to extraordinary firing material, as the dried dung of sheep and cows, dried sea-weed, fish-bones, the entrails and bones of birds, the odour of which renders their cabins unendurable to strangers. A recently-modernised cathedral of stuccoed brick, the governor's house, without lock, bell, or knocker, a college, a hotel, with the house of assembly, a public library of 8000 volumes, a Royal Icelandic Society, an observatory, and a neatly-kept cemetery, complete the public establishments of the little capital. The cathedral contains a font executed by Thorwaldsen, and presented by him to Iceland, as the birthplace of his father. In an apartment under the roof there is a library of a few thousand volumes for the benefit of the inhabitants. Down to the present century, instead of meeting at Reikiavik under a roof, the parliament held its sessions beneath the canopy of heaven, in a kind of natural amphitheatre, on the shore of the Thingvall Lake. The total population amounts to about 64,000, descended from Norwegian immigrants, who began the permanent colonisation of the island in the ninth century.

GREENLAND, on the north-east of the American continent, appears an immense mass of continuous land on our maps; but as the interior is quite unexplored—covered with ice and snow, it may consist of several large insulated tracts, with many minor dependencies, the whole welded together and concealed by the perpetual congelation. It stretches from the parallel of 60° north to an unknown extent towards the pole. Cape Farewell, the south point, is a cliff at the extremity of a small island, visible far out at sea, which may have received its name from some home-sick mariner glad to escape from the dangers of northern navigation, and resolved not to encounter them again. It is the Staaten Hoek, 'States Promontory,' of the Dutch. The east coast has not been completely traced, and can rarely be approached, owing to the masses of ice which in summer are drifted down from higher latitudes, and form a broad margin along-shore. The western shores, washed by Davis Strait and Baffin's Bay, are well known, regularly touched at by whalers, and sparingly occupied by small Danish settlements, and a few Esquimaux. They are rugged, mountainous, and barren, indented with numerous bights, creeks, and fiords, and fringed with many islands. The lofty interior has the appearance of one vast glacier, with occasional bare tracts. Large fragments of ice, becoming detached from the parent

Floating Ice Mountains, with Galleries.

mass along-shore, are often set afloat as icebergs—a process locally termed the ‘calving’ of the glacier, which gives note of its occurrence by the noise like thunder which the dash into the sea occasions. Streams appear in the warm season of the year, and lakes are formed, supplied solely by the melting of the snows. For a short period in summer, slips of land along the fiords are verdant, and furnish tolerable pasturage. But no trees grow except in the most favourable situations, where the birch, willow, and mountain-ash form bushes. A few culinary vegetables are cultivated with success, but all attempts to raise the hardest cereals have failed. No description can give an adequate idea of the rigour of winter in the northerly localities. Yet hot springs occur, which, unaffected by change of season, flow all the year round with a high temperature, and form three pools in the island of Ontarnok. About 1000 Danes are constant residents, in connection with a native and mixed population of 7000. The commerce consists in the exchange of the skins of seals, reindeer, and other animals, with eider-down, train-oil, whalebone, and fish, for European products. Greenland is divided into two Inspectorates, southern and northern.

The Southern Inspectorate contains, passing from south to north, *Julianashaab*, Juliana’s Hope, one of the largest settlements, near which the most numerous remains of the old colonies have been found; and *Fredericshaab*, where Pastor Otto Fabricius spent the long winter nights compiling his *Lexicon* and *Fauna Grœnlandica* in a dreary cabin. At *Fiskeruaes*, huts of Esquimaux appear, roofed with sods, but scarcely distinguishable from the ground, being let into the soil. Peas persistently sown here for some years usually produced leaves, and once yielded a crop of diminutives for the table. Turnips attain the size of a pigeon’s egg, and very dwarfish cabbages are raised. The radish is scarcely checked at all in its growth. *Godhaab*, the residence of the inspector, was the home of Hans Egede, and has *New Herrnhut*, the first settlement of the Moravians, founded in 1733, close adjoining. Passing *Zukkertoppen*, ‘Sugarloaf,’ so called from a singular conical mountain, *Holsteinborg* occurs, a little beyond the Arctic Circle, the only part of the country where earthquake shocks have been experienced.

In the Northern Inspectorate the principal place is *Godhavn*, on the shore of Disco Island, a well-known rendezvous of whalers, possessing stone-quarries, beds of coal, and the centre of an important fishery. The scenery here is of the grandest description, the north end of the island rising 4000 feet, almost a precipice to its snow-capped summit. On the mainland are *Christianshaab*, *Jacobshaab*, and *Egedes-mûnde*. The latter has

an archipelago of islets in front, of the same name. *Upernivik*, in latitude  $73^{\circ}$ , enjoys the distinction of being the most northerly permanent abode of civilised man. Further north, in Melville Bay, a mighty glacier takes the place of the coast-line, extends unbroken upwards of 40 miles, and stretches inland to an unknown distance and elevation. Though the icebergs detached from it are of the loftiest description, they can only be likened to mere chippings off its edge, and the floe-ice to the thinnest shavings. There is here an unusual dearth of animal life—a painful stillness—save when with a rumbling crash the glacier ‘calves,’ parts with one of its progeny, and launches it on the deep. The highest latitude hitherto reached on this coast,  $81^{\circ} 20'$ , was gained by Dr Kane in 1854, when accompanying the American expedition in search of Franklin.

A remarkable spot, Jan Mayen Island, lies nearly equidistant from the east coast of Greenland and the northern shores of Iceland, but considerably removed from both. It bears the name of the captain of the Dutch whaler who discovered it in 1611, and was claimed by Holland, but is now ‘no man’s land.’ Seven seamen were induced to stay upon it for the winter in 1635, in order to test the climate, but none survived when the fishing-vessels returned in spring. The island is several degrees within the Arctic Circle, about sixteen miles long by four broad, surrounded with stormy waters in the open season, but often so beleaguered with drift-ice as to be inaccessible. Though small and isolated, it shoots up in the snow-covered cone of Mount Beerenberg, like a church-steeple, to the height of 6780 feet above the sea. This peak, as far as at present known, is the most northerly of all volcanoes, as well as the highest point of the north polar zone. In July 1856, Lord Dufferin landed on the shore, but it is very rarely visited.

RUSSIAN AMERICA embraces the north-west corner of the continent, bounded inland by the meridian of  $141^{\circ}$ , with a strip of maritime territory extending southward to the border of British Columbia, and a fringe of islands. This region has an immense area, equal to twice the size of France, but the interior is wholly uninhabitable by civilised man, subject to terrific winter cold, with a very scanty vegetation, occupied by a few Indians and Esquimaux, the reindeer and the musk-ox. Mount St Elias, the highest summit of North America, falls within its limits, situated on the coast, with Point Barrow, one of the most northerly projections of the continent, and Cape Prince of Wales, its western extremity. This district is held by the Russo-American Fur Company under an imperial charter. Skins of the sea-otter, bear, fox, hare, and other animals are obtained by barter from native hunters, and the seal-fishery is extensively prosecuted. The Russians maintain a few trading forts on the coast of the mainland, and have their head-quarters at *New Archangel*, a village-like town on Sitka Island. This place is nearly on the same parallel as St Petersburg, 6300 miles distant following its course. But in the line of the meridian, which is nearly common to both, the distance is only 4200 miles, though to pass from the one to the other in that direction the whole polar zone must be intersected.

Reikiavik, Iceland.

Horse-Shoe Fall, Niagara.

## CHAPTER II.

### BRITISH AMERICA.

WITH the exception of the north-western section, which belongs to the Russian dominions, the entire north of the continent, where distances may be measured by thousands of miles, both in the direction of meridians of longitude and parallels of latitude, is included in the empire of Great Britain. Its limits are the Atlantic Ocean on the east; the Pacific and the meridian of  $141^{\circ}$  on the west; the Arctic basin on the north; and the parallel of  $49^{\circ}$  in its extension from Vancouver's Island to the Lake of the Woods, on the south. This southern frontier-line then passes to the great lakes and through their centre. It descends with them to a lower latitude, ascends to the parallel of  $45^{\circ}$  along the St Lawrence, and then follows a tract of high ground on the southern side of the stream, proceeding by a very circuitous route to the River St Croix, by which it is continued to the Bay of Fundy. In the latter part of its course it separates Canada and New Brunswick from the states of New York, Vermont, New Hampshire, and Maine; and through its entire extent it is a dividing-line between the territory of a monarchy on the north and a republic on the south. Within the boundaries named there is an area of

more than 3,000,000 square miles, nearly equal to the whole extent of Europe; and though the larger proportion of it is by rigour of climate and sterility of soil not permanently habitable by civilised man, and must continue a mere hunting-ground, there is a vast extent of useful space remaining for the accommodation of an immense population. Important insular dependencies adjoin the continental territory on the east and west; and on the north the islands and archipelagoes of the frozen zone, to which British enterprise has penetrated, belong by right of discovery to the British crown. Seven colonies are regularly constituted: five western, I. Canada; II. New Brunswick; III. Nova Scotia; IV. Prince Edward's Island; and V. Newfoundland—two eastern, VI. Vancouver's Island; and VII. British Columbia. Intermediate lies the vast tract of New Britain, or the Hudson's Bay Company's Territory, long under the jurisdiction of that mercantile body, and studded with its trading-posts. In addition, but apart from the limits and districts named, Great Britain holds in the western world portions of Honduras and Guiana, most of the West India Islands, the Bermudas and the Falkland group, which are noticed separately.

#### I. CANADA.

This extensive province occupies both banks of the St Lawrence, from its mouth to St Regis, sixty miles above Montreal. From this point westward, it is wholly on the northern side of the river and the great lakes into which its waters expand. The limit in this direction has not been defined, but it is generally placed at the further end of Lake Superior, a direct distance of 1200 miles from Cape Gaspe, at the eastern extremity. Northward, the frontier is also undetermined, but it may be fixed with propriety at the line of water-shed between the streams flowing to Hudson's Bay and those which descend to the St Lawrence. The extent, north and south, varies from 200 to 400 miles; and the area may be stated at not less than 350,000 square miles.

The prime natural feature of Canada is the great river, with its romantic shores, numerous tributaries, thousand isles, sea-like lakes, and magnificent water-falls. With a little artificial aid from canals, a navigation is afforded in the summer season more extensive and convenient than is to be found in any other region of the same extent. In the upper part of its basin it has the name of the St Louis, the remotest feeder of Lake Superior. In the successive continuations, it is called the St Mary between Lakes Superior and Huron; the St Clair between Huron and Erie; the Niagara between Erie and Ontario; and thenceforward to the ocean preserves its proper denomination of the St Lawrence. It follows a curving course of at least 2000 miles, and takes high rank among the hydrographical systems of the globe.

After emerging from the last of its great basins, the Ontario, the channel of the river becomes spacious, and forms the Lake of the Thousand Islands. This number was viewed as a vague exaggeration till they were counted, and found to exceed it by more than one-half. They are of varying size, shape, and appearance, from patches of a few square yards to several acres; and offer such picturesque combinations of rock, wood, and water as imagination is apt to attach to the Happy Islands in the Vision of Mirza. Lower down, formidable rapids occur at intervals, which are avoided by short canals for the river-steamers, but are safely passed by hardy boatmen familiar with them in flat-bottomed barks. The Ottawa, the subject of the well-known song, enters on the north bank, and forms by its junction with the main stream several large islands, on one of which is Montreal. On the same side the St Maurice debouches about seventy miles above Quebec, and the remarkably deep Saguenay 130 miles below. The shores between these two tributaries, on both sides, are generally bold, and exhibit the finest scenery, especially in the neighbourhood of Quebec. Higher up they are low, or only moderately elevated, and the country is a spacious and fertile plain, with gentle eminences to diversify the surface. This aspect is continued far beyond Montreal, along the northern shores of Lakes Ontario, Erie, and Huron. The principal affluents on the south bank are the Richelieu and the Chaudière, the former entering below Montreal, and the latter just above Quebec. The valley of the Richelieu, which widens to embrace Lakes Champlain and George, the shores of which belong to the states of Vermont and New York, was called by the old French settlers the 'Gate of Canada.' By the Iroquois it was termed, in their picturesque tongue, the 'Mouth of the Country.'

The St Lawrence, at its mouth, is not less than 90 miles in breadth; at 200 miles above the embouchure, the width is still 18 miles; at 400 miles, opposite Quebec, it narrows to three-quarters of a mile, but again expands; and at Montreal, 560 miles from the sea, to which it is navigable for vessels of 600 tons, it is still more than two miles from shore to shore. Above Quebec the navigation is arrested by the ice from the beginning of December to the middle of April. Below the capital, though the river is not entirely frozen over, owing to its great breadth and strong current, it is not open to vessels till towards the middle of May, on account of the masses of ice floating down. Along the St Lawrence runs the grand trunk railway of Canada, unfortunately on the southern side. It extends from the Rivière du Loup, or Fraserville, 120 miles above Quebec, the eastern terminus, to Montreal, where the Victoria Bridge is within forty miles of strong positions in the United States.

Forests of immense extent, as well as waters, are eminently characteristic of the country, though a vast surface has been cleared of its timber by the settler's axe. It is surprising how completely the trees have been swept away from many of the long inhabited grounds, once covered with the unbroken forest, not a row or clump left standing, generally esteemed essential to an agreeable landscape. Man has waged war against them with fire and steel, as though they were his most inveterate foes. The reason assigned is, that though of magnificent appearance when viewed in mass, the trees are so close together, that while they rise to a great height, the roots have little hold in the earth, and the few short lateral branches are almost without foliage. Hence, left singly, they would not be ornamental, or long withstand the violence of the winds. Still, notwithstanding the havoc, the forest shews a bold front over the greater part of the country, and will do so for generations to come. In the woods, in proportion to their distance from the long occupied districts, the black bear is found, which, when pressed by hunger, will approach the solitary homesteads in search of prey. Wolves are numerous, and make the winter nights dismal to the lonely settler by their fearful howling. They often suffer severely from famine when the deep and long-enduring snow is on the ground, and would be troublesome neighbours if their courage was equal to their rapacity. Small herds of the elk or moose-deer, the most gigantic of the genus, roam the solitudes of the country. Over a wide area the interesting beaver, formerly very abundant, has been extirpated by the fur-hunters. Rich copper ores abound on the northern shores of Lake Superior; and gold is disseminated through the deposits of a wide region on the southern side of the St Lawrence in sufficient abundance to repay industry. Coal, except in small quantities, cannot be registered among the economic minerals, but there are large beds of peat, and mineral oils are accumulated in surface wells, or in the shales which overlie the true oil-bearing rock. In the eastern or maritime parts of the colony, spring, summer, and autumn are crowded into five months, from May to September inclusive, while winter reigns during the remaining seven. An almost tropical temperature is experienced in the height of summer, and polar cold in the opposite season. Heavy snow-storms precede the interval of greatest severity, after which the atmosphere becomes clear and the sky cloudless. In the western portion of the province, especially in the vicinity of the great lakes, the winters are shorter, and the seasonal extremes of heat and cold are much less marked. Sudden and great changes of temperature in spring and autumn are trying to persons of delicate constitution, but to the healthy the climate is favourable.

The forests consist of numerous varieties of pine, oak, birch, ash, beech, cedar, alder, willow, and maple, beneath which a host of flowering plants in summer put forth their adornment. The species which may be most usefully preserved are the sugar-maple; the beech and white-ash for firewood; the oak, cedar, and hemlock-spruce for fences; and the hard woods in general for timber, or the ashes, from which soap may be made. In the decline of autumn, two or three frosty nights suffice to change the verdure of the forests into every possible variety of hue, brilliant scarlet, vivid violet, with shades of blue, brown, and glittering yellow. No language can adequately describe the gorgeous beauty of the woodland. Only the stern, inexorable fir tribes maintain their livery of dark green. In winter again, the whole forest occasionally puts on an almost magical appearance, when a heavy fall of snow is followed by a thaw, or misty rain falls. The next frost coats the trees, every trunk, branch, and twig, with transparent ice, and in the sunshine all vegetable nature seems decked with diamonds, from the myriads of the sparkling crystals.

Scene on the St Francis, Lower Canada.

The timber is felled by wood-cutters who form what is termed a 'lumbering party.' It consists of persons who are all either hired by a master-lumberer, who pays them wages and finds them in provisions, or of individuals who enter into an understanding with each other to have a joint interest in the proceeds of their labour. The stock taken out by a party includes tools, cooking utensils, a cask of spirits, tobacco and pipes, a sufficient quantity of biscuit, pork, beef, and fish, peas and pearl-barley for soup, with a cask of molasses to sweeten a decoction usually made of shrubs, or of the tops of the hemlock-tree, which is taken as tea. Two or three yokes of oxen are necessary to haul the timber out of the woods, with hay to feed them. Thus equipped, the lumberers proceed up the rivers in autumn to the place fixed on for their winter establishment, which is selected as near a stream as possible. They commence by clearing a space of ground, building a shanty, or camp of logs, seldom more than four or five feet high, with a roof covered with birch bark or boards. A pit is dug to preserve anything liable to injury from the frost. The fire is either in the middle or at one end; the smoke goes out through the roof; the floor is strewn with hay, straw, or fir branches, on which the men sleep, with their feet next the fire, which is kept in all night by those who chance to waken. One person is hired as cook, whose duty it is to have breakfast ready before daylight, when each one takes his 'morning,' or dram, before the meal. The men then go out to work in three gangs. One cuts down the trees; a second hews and trims them; the third is employed with the oxen in hauling them to a site convenient for launching them on a stream.

The winter is thus spent in unremitting toil. When the snows begin to melt, the rivers swell, or, in the lumberers' language, the 'freshets come down.' All the timber cut is then thrown into the water, and floated down by the powerful current till the river becomes sufficiently wide to arrange the logs in distinct rafts, which descend to the St Lawrence. No course of life can well be more laborious or undermining to the constitution, yet the wild freedom connected with it is relished, and when once adopted, it is preferred to any other. Night-blindness is a very peculiar complaint to which the lumbermen are subject, the causes of which are obscure, but a complete change of diet and air is the best remedy. Those affected in this way can see as well as usual in the blaze of day, but as the shades of evening fall they fail to distinguish objects, and are stone-blind in a dull natural or an artificial light. The night-blind men always endeavour to reach home, or a shelter before dusk, because after that time they are perfectly helpless, and some have encountered terrible adventures.

The country was discovered, colonised, and long held by the French, but has been a

British possession rather more than a century. It includes the two main divisions of Canada East and Canada West, of tolerably equal size, separated generally by the river Ottawa. These sections were formally distinct colonies, and though no longer politically apart, they are naturally as well as ethnologically different districts, and are conveniently recognised as such in popular speech. Canada East is maritime, situated in general at a higher latitude than Canada West, and has a population of French descent numerically predominant.

## Provinces.

|                          |  |
|--------------------------|--|
| Eastern or Lower Canada, | Quebec, Montreal, Trois Rivières, Sorel, Sherbrook.      |
| Western or Upper Canada, | Ottawa, Toronto, Kingston, Hamilton, London, Queenstown. |

## Cities and Towns.

The administration is conducted by a governor appointed by the crown, who is at the same time governor-general of the adjoining colonies; a legislative council; and a representative assembly, elected upon a very broad basis for four years. The latter consists at present of 130 members, equally distributed between the two divisions.

*Quebec*, the military capital and the oldest foundation, in latitude  $46^{\circ} 48'$  north, longitude  $71^{\circ} 11'$  west, is situated on the north bank of the St Lawrence, at the influx of the river St Charles, on the summit and at the base of a lofty promontory occupying the angle between them. It consists, therefore, of an upper town, containing most of the public buildings, the dwellings of the wealthy classes, and the best shops, enclosed within fortifications; and of a lower town, extending from two to three miles on a narrow strip of land between the river and the cliffs, crowded with wharves, stores, timber-yards, merchants' offices, and inns, the general seat of commerce. Nothing can be finer than the site of the city, or more imposing than its aspect when approached by the voyager. The citadel crowns Cape Diamond, the highest point of the cliffs, 350 feet above the river, strong by nature and art, the Gibraltar of the New World. The view from the battlements is magnificent. Directly in front, on the opposite bank of the stream, the eye rests upon Point Levi, a large and picturesque village, with brightly-painted cottages and a romantic little church; and by a slight shift of position, the grand Falls of Montmorenci are in sight. Quebec was founded in the year 1608, and wrested from the French in 1759, by the battle on the adjacent Heights of Abraham, in which they were defeated by the British. Both commanders, General Wolfe and the Marquis de Montcalm, fell in the action, and are commemorated by the same monument on the plain. The city contains a population of 51,000.

*Montreal*, the commercial capital, occupies an island in the St Lawrence, 180 miles above Quebec, and fifteen miles below the confluence of the Ottawa with it. The site was occupied by the Indian village of Hochelaga when the first French adventurer reached the spot in 1536. He ascended a lofty hill, the only eminence that diversifies the neighbourhood, overlooking a prospect of singular beauty, and called it Mont Royal. The name has since been corrupted into that of Montreal, given to the handsome city on the site of the old wigwams, the largest in Canada, and to the island on which it stands. The inhabitants, amounting to about 100,000, are distinguished by mercantile activity and public spirit. They are chiefly of French origin, and Roman Catholics, have a cathedral of rich Gothic architecture, reputed to be the largest building of its kind on the American continent. The churches, banks, colleges, court-houses, hotels, and other public edifices, are both substantial and attractive. Montreal is the seat of vast commerce, as the natural outlet for the produce of the fur countries and the grain districts on the shores of the great lakes. It is the centre of an extensive system of railways, and possesses in the Victoria Tubular Bridge an unequalled monument of engineering skill. The bridge, opened in August 1860, is nearly two miles long, and conveys the Grand Trunk Railway across the St Lawrence. It has been constructed with special reference to sustaining the enormous pressure of the ice annually brought down by the stream. *La Prairie*, *Chambly*, *St John's*, and *Sherbrook* are small towns on the line of communication with the United States. *La Chine*, on Montreal Island, connected with the city by canal, received the name from the chimerical idea of the first European explorers that they were on the route to China. *Trois Rivières*, an old French town, midway between Quebec and Montreal, stands at the influx of the St Maurice, here divided into three channels, to which the name 'Three Rivers' refers.

*Ottawa*, the legislative capital, on the river of the same name, at the head of its navigation, is comparatively small but rising city—the population in 1861, was only about 14,700—selected recently by the crown to be the seat of the Canadian parliament. The foundation-stone of the requisite buildings was laid by the Prince of Wales during his visit in 1860. Its convenient position as central to the two main divisions of the colony led to the selection. Magnetic iron ore occurs in great abundance in the vicinity. *Toronto*, formerly the colonial metropolis, the third Canadian city in size, is seated on the north-west shore of Lake Ontario, in command of an excellent harbour. It is well built and prosperous, thoroughly English, and entirely modern. Population 44,800. At the time of the British conquest the whole country westward of Montreal contained no place of importance. Here and there might be seen a neat wooden church, the centre of a few farms closely bordered by the encumbering forest. The fine grain region on the shores of the lakes Erie and Ontario had been but very partially explored, chiefly by the fur-hunters, scarcely less rude than the

savages in the wilderness. Where Kingston now stands, a few dwellings clustered around Fort Frontenac. Niagara was a small hamlet. Myriads of water-fowl had undisturbed possession of the bay, or the shore of which Toronto is seated, where parliaments have met, ships are built, trade is active, and an intelligent population is grouped. The city was founded in 1793, and was at first called York, a name properly superseded by the old Indian appellation of Toronto, signifying 'place of meeting.' The thriving towns of *Port Hope*, *Coburg*, and *Belleville* are eastward, on the shores of the lake, with *Kingston*, near the issue of the St Lawrence from it, which was for a few years the seat of the general government upon the union of the two Canadian provinces. It contains an admired City Hall, with other important public buildings, and has recently been made the seat of the Anglican bishopric of Ontario. *Hamilton*, near the opposite extremity of the lake, is connected with a fine agricultural country, in which are the homesteads of many Dutch and German settlers. *Niagara*, at the outlet of the river of that name, and *Queenstown*, seven miles along the channel, are annually passed by crowds of tourists on their way to the world-renowned Falls eight miles higher up, where stately hotels on either bank offer them accommodation. The broad river is here precipitated over a ledge of rocks, and formed into two cataracts by the intermediate Goat Island. The Horseshoe Fall, so called from its former curvilinear shape, now worn somewhat angular, on the Canadian side, is by far the most effective, being the broadest, above 600 yards wide, though with a slightly inferior height to the other branch. The respective descents are about 154 and 162 feet. Miles away from the spectacle the boom of the waters is heard and the spray seen. At a short distance below the Falls the river is spanned by the celebrated wire suspension-bridge for the Great Western Railway, with a road underneath for ordinary vehicles and foot-passengers. It is distinguished by extreme lightness and beauty, to which the roaring waters below offer a striking contrast. In the roughly triangular district between the lakes Ontario, Erie, and Huron, *London*, on the Thames, and other towns, are rapidly increasing their population, and improving in appearance. *Port Sarnia*, on the last-named lake, is the western terminus of the Grand Trunk Railway from below Quebec, which has a total length of 870 miles. Timber, pot and pearl ashes, furs, grain, and flour are the important exports of Canada.

The total population of Canada amounts to 2,507,000 (more than one-half of whom are British), which includes a number of Germans, white and coloured natives of the United States, with 12,700 of the aboriginal Red Indian race. Under the auspices of its present possessors, the lingering natives are no longer treated as a people without rights. Canals have been constructed to connect rivers and avoid rapids. Good macadamised roads have been substituted for the pathless wilderness. More miles of iron for the locomotive are laid down than in any other country in proportion to the population. Ocean steamers go up to Montreal, where the most gigantic bridge ever erected carries the railway across its magnificent stream. Light-houses illuminate the lakes; sea-going vessels ascend to them by means of artificial cuttings where natural difficulties beset the river route; and though in close proximity to negro slavery, the colony has never been a house of bondage, but often a secure asylum to those who have fled from oppression. The means of general education are liberally provided for by universities and colleges, grammar and common schools.

## II. NEW BRUNSWICK.

This province is a compact territory enclosed generally by a portion of Lower Canada on the north, the Gulf of St Lawrence on the east, the state of Maine on the west, and the Bay of Fundy on the south. It forms an irregular parallelogram, extending about 200 miles in length from north to south, by an average width of 130 miles, and contains an area of 27,100 square miles. The coast-line abounds with bays, inlets, and creeks, with deep water for shipping, in which salmon, herring, and other fisheries are conducted, while the flat shores have in many parts deep fertile soil stretching for some miles inland, admirably adapted for agriculture. But the greater part of the surface, especially towards the Canadian border, is densely clothed with the natural forest, and to the timber trade, with the fisheries, the industry of the people is principally directed. Carboniferous strata are extensively developed, containing highly bituminous coal in apparently inexhaustible quantities. Iron ore, plumbago, gypsum, and freestone, with excellent salt-springs, are other elements of mineral wealth. The largest river, the St John, enters the province from the state of Maine, and follows a south-easterly course to the Bay of Fundy. It is

navigable for large vessels near the sea, and for steamers up to Fredericton, seventy miles above its mouth. The Restigouche forms the boundary from Canada, and, together with the Miramichi, flows eastward to the Gulf of St Lawrence.

New Brunswick, in conjunction with Nova Scotia, originally formed a French colony, under the name of Acadia, or New France. It was ceded to Great Britain in 1713, and constituted a distinct colony in 1784. A lieutenant-governor, a legislative council appointed for life, and a representative assembly of forty-one members elected for four years, conduct the administration. The population, 252,000, consists of Acadians, the descendants of French settlers; Anglo-Americans, sprung from the royalists who retired from the United States on the Declaration of Independence; British settlers; and rather more than 1100 native Indians. The first British emigrant arrived from the north of Scotland in 1764, and reared his log-cabin on the banks of the Miramichi. This district, in the year 1825, was the scene of one of the most dreadful, and certainly the most extensive conflagration on record—the noticeable event in the history of the colony. The fire desolated the country for more than 100 miles along the river, to the extent of sixty miles from the south bank, and to a great distance on the northern side. At least 500 persons lost their lives, with an immense number of bears, wolves, deer, foxes, snakes, and other wild animals. Even the birds of strong wing could not save themselves, being confused by the smoke; and the fish perished in the lakes and streams, poisoned by the alkali formed by the ashes precipitated into the water.

*Fredericton*, the seat of government, a small inland town on the river St John, is chiefly built of wood, except the public buildings, one of which, King's College, is maintained by an annual grant. The winter cold is frequently excessive, indicated by 35° below zero; but the season is supposed to be becoming less severe, by the clearing away of the timber, and drainage of the ground. Ordinarily the river here is frozen up 147 days in the year, and open the remaining 218 days. *St John*, the commercial capital and largest town, on the estuary of the river so called, has a population of 27,000, with an excellent harbour protected by forts, open at all seasons to vessels of the largest class. Ship-building, the lumber trade, and fisheries are the prominent industries. A railway connects St John with Shediac on the east coast, and another, only partially open, diverges from *St Andrew's*, a rising town of 7000 inhabitants, on the shore of Passamaquoddy Bay, northward towards Quebec.

### III. NOVA SCOTIA.

The peninsula of Nova Scotia is connected by a narrow isthmus with the south-east angle of New Brunswick, and enclosed in other directions by the Bay of Fundy, the Gulf of St Lawrence, and the open ocean. It forms, with the closely-adjointing island of Cape Breton, a single colony, which has a total area of 18,670 square miles. The narrow channel separating the two portions, only three-quarters of a mile wide, called the Gut of Canso, having deep water throughout, is a navigable passage by which ships enter the St Lawrence Gulf from the south. The island is singularly formed, being nearly cut in two by the Bras d'Or, a deep and irregular inlet of the sea. Both peninsula and island are rich in coal of the best quality, iron ore, gypsum, with other minerals; and attention has recently been directed in Nova Scotia to its auriferous quartz rocks. The coal is worked for local consumption, the supply of the Cunard steamers, and export to neighbouring districts. Valuable tracts of timber remain, and the coasts swarm with cod, haddock, herring, mackerel, and other varieties of fish.

Nova Scotia received that name upon its cession by the French to the British in 1713. Cape Breton Island was obtained by the capture of Louisburg in 1758, after an obstinate resistance. Scarcely a trace remains of this formidable stronghold, but a few hovels occupy the site. The colony is under a lieutenant-governor, a legislative council, and a representative assembly of fifty-one members. It has a population of 332,000, which includes some Negroes sprung from runaway slaves, and a few Indians descended from the Micmacs, a tribe of warriors, who fought gallantly for the French in their struggle with the British. Timber, dried fish, fish oil, coal, and grindstones are exported. In Nova Scotia a considerable extent of the surface adjoining the Bay of Fundy is under tillage, but corn has to be imported. This bay is remarkable for its high tides, amounting to a rise of from sixty to seventy feet, which sometimes takes place so suddenly that cattle have been swept away from the shores.

*Halifax*, the seat of government, on the southern coast of the peninsula, is beautifully placed on an arm of the sea which forms one of the finest harbours in the world. It is the principal transatlantic station of the British navy, possesses a large dockyard, a military hospital, a good public library, two colleges, and contained, in 1861, a population of 49,000, mostly intelligent, hospitable, and enterprising. Province Building, erected for the accommodation of the legislature and the government offices, is one of the best edifices in British America. But nearly all the houses are of wood. The churches likewise are mostly of the same material, and being painted white, the spires included, they present a curious appearance to the visitor fresh from Europe. Fires are hence of common occurrence, for which there is a well-organised fire-brigade ready to turn out at a moment's notice. Halifax is the nearest port of the American mainland to England, about 2700 miles from Liverpool, from which the Cunard steamers make the passage with great punctuality in ten days. A railway, partly open, diverges from it northward, to be continued through the heart of New Brunswick to Quebec, which will bring that city within twelve days' distance of the mother-country.

#### IV. PRINCE EDWARD ISLAND.

This small crescent-shaped tract is situated in the southern part of the Gulf of St Lawrence, separated from New Brunswick and Nova Scotia by Northumberland Strait, a channel which in various places is little more than ten miles wide. It has a length of 140 miles from east to west, but the breadth very rarely exceeds thirty miles, and no part of the surface is said to be more than eight miles from the sea owing to the deeply-indented coast-line. The island has an area of 2137 square miles, and possesses blander natural features than the adjacent colonies, with a much milder climate. Very beautiful scenery marks the northern shores, where the hills are well wooded, but interspersed with pleasant villages and homesteads, while the chief part of the surface has been cleared for agricultural and pastoral purposes.

Prince Edward Island, originally called St John, received its present name in honour of Edward, Duke of Kent, father of the Queen, who paid attention to it while commander of the forces in British America. It was first settled in the year 1715, and has now a population of 80,800, a large number of whom are of Scotch descent. King's County, Queen's County, and Prince County are the insular divisions. Besides a lieutenant-governor, there is a legislative council, elective since 1863, chosen for nine years by the holders of property, and also a house of assembly of thirty members, chosen for four years without any property qualification being required of the voters. *Charlottetown*, the seat of government, on one of the northern bays, contains 6700 inhabitants, two banks, and the Prince of Wales' College, founded in 1860, the most important educational institution. The island is in the Anglican diocese of Nova Scotia.

#### V. NEWFOUNDLAND.

This old British dependency is one of the largest of the American islands, situated on the north-east side of the Gulf of St Lawrence, separated from the mainland by a narrow strait, and from Cape Breton by a broad channel, which forms the maritime highway between the Atlantic and Canada. It resembles in shape an equilateral triangle, of which

Cape Race is the south-east corner, a point so often mentioned at present in our intercourse with the United States, being commonly the last left, and the first gained by vessels making the transatlantic passage. The island has a circuit of 1000 miles, and an area of 36,000 square miles. The coasts are deeply penetrated with bays and inlets forming excellent harbours; but the vast proportion of the interior is a dreary region of lakes, swamps, thickets, and bare sterile ground, with a severe climate, restricting settlements and cultivation entirely to the sea-board, and chiefly to the south-eastern shores. Except at a few spots, there is scarcely a single house more than a mile apart from the coast-line. The reindeer, black bear, and wolf occur among the wild animals; and the well-known Newfoundland dog, famed for size, temper, sagacity, and swimming power, received its name from being derived originally from the island, probably indigenous to it. Numbers at present are employed for draught, but are left to take care of themselves for long periods when their masters are at sea in the fishing season. The aboriginal inhabitants have all perished, though a few survived to a very recent date.

The island was visited by the early colonists of Iceland and Greenland. Being rediscovered by John Cabot in the reign of Henry VII, it was called the *new found land*, and claimed as a British possession by right of discovery. It contains a population of 122,630, under a governor, a nominated legislative council, and an elected general assembly; and forms a diocese of the Anglican Church. *St John's*, the capital, and the only town deserving of the name, occupies an inlet of the south-east coast, which forms a spacious harbour well defended by forts. It contains a population of 25,000, whose primary business, that of curing fish, and extracting oil from them, contributes to render the place offensive to the stranger. Telegraphic communication is maintained with New York. Steamers arriving from England carry out epitomes of English news in tin cases attached to floats, which are thrown overboard off the adjoining Cape Race, picked up by boats, taken ashore, and the news is telegraphed to New York three days before the packets can reach the port. In like manner, steamers as they pass Cape Race on their way to England receive there New York telegrams, with three days' later news to bring over the Atlantic. Sometimes the darkness of night and rough weather prevent the telegrams from being put on board, and in the winter months the steamers dare not approach the coast owing to the fogs and icebergs.

The Great Bank of Newfoundland, a rocky submarine plateau, is the largest known formation of the kind. It extends full about 600 miles in length by 200 in breadth, and has a depth of water over it varying from 20 to

Cape Race.

100 fathoms. The sides descend precipitously as appears from the soundings. Hither resort enormous shoals of small fish, capelin and lance, which attract the larger cod and others to prey upon them. Rights of fishery, and of curing the produce on certain unoccupied parts of the shore of the island, are specially guaranteed to the French and Americans. The French have also had ceded to them for the same purpose the small isles of St Pierre and Miquelon, off the south coast, subject to the stipulation that no fortifications are to be erected.

*Anticosti Island*, at the mouth of the St Lawrence, and the coast of Labrador, are included in the government of Newfoundland. The island, 125 long by 30 broad, has low southern and high northern shores, with a swampy interior studded with birch-trees and firs. It is only occupied at a few stations established for the purpose of rendering assistance to crews in cases of shipwreck. Labrador, a vast adjoining peninsula of the mainland, extending northward to the entrance into Hudson's Bay, is in its more interior districts a wilderness of forests, with a broad maritime border utterly naked and sterile, blocked up with ice through the winter months. But the fisheries are valuable, especially that of the seal, conducted by the agents of mercantile companies in decked vessels from Newfoundland and the United States. Large herds are met with on the field ice, which are called 'seal meadows,' on which the animals are surprised while sleeping, and despatched by the hunters with guns or bludgeons. There are a few stations on shore with permanent residents—fur-traders and seal-catchers, along with Esquimaux families, and some Moravian missionary settlements. *Nain*, the oldest of the latter, founded in 1771, in about the same latitude as Edinburgh, has a mean annual temperature of, as we have seen, 4°, or 23° below the freezing-point.

#### VI. AND VII. VANCOUVER'S ISLAND AND BRITISH COLUMBIA.

These twin colonies, on the opposite or Pacific side of the continent, closely contiguous, and founded recently at nearly the same period, may be regarded as practically a single dependency, being under a common governor, and possessing the power of incorporation. VANCOUVER'S ISLAND, intersected centrally by the parallel of 50°, is separated from British Columbia on the east by the Gulf of Georgia, and from the territory of the United States on the south by the Strait of Juan de Fuca. Both are narrow channels, and complete between them its insulation. The island extends 275 miles from north-west to south-east, and has an average breadth of 50 miles, with an area of 16,000 square miles. It possesses no navigable rivers, but is penetrated deeply by several arms of the sea, which form excellent harbours. The surface is finely timbered; the valleys have fertile soil; and the natural resources are varied and valuable.

Captain Cook passed along the west coast under the impression that it belonged to the mainland. He entered the bay which received from him the name of Nootka Sound from an Indian village at the spot. Captain Vancouver, who had been one of his midshipmen, first threaded the separating channels; and the island is therefore properly called after him. It was not till the spring of 1843 that any settlement of civilised men was effected. The Hudson's Bay Company then landed some of their servants under Mr Finlayson, who soon constructed a picketed enclosure containing the buildings for the storing of furs and for dwellings. Upon their completion, they began to bring sufficient ground under cultivation for the support of the establishment. Nothing at that period was contemplated beyond a new trading-post, which received the name of Fort Victoria. In 1849 the island was granted by charter to the Company on certain conditions, but in a few years it was formed into a regular colony. Tall pines, cedars, cypresses, and various kinds of oaks are prominent in the woods. Roses, with the hawthorn and myrtle, are indigenous. The strawberry, raspberry, currant, and gooseberry are native fruits. Fish swarm along the shores and in the lakes. The elk, deer, and fur-bearing animals are found, with numerous game-birds and wild water-fowl. Coal, copper, and magnetic iron ore are abundant. The climate resembles that of England, but with a warmer summer and a moister winter. The total population may amount to 20,000, of whom full 12,000 are Indians of various tribes. They are peaceable towards the whites, but quarrelsome among themselves, and at one period raised their war-whoops in the streets of Victoria. The singular custom prevails among them of flattening the skull in infancy into a kind of sugar-loaf shape, by artificial means, but it does not seem to be productive of any mental deficiency.

*Victoria*, the capital, and now the seat of government for British Columbia, is seated on a sheltered river-like harbour of the south coast, and has rapidly acquired a town-like appearance, from being in 1858 a small collection of log-built dwellings. Temporary wooden shells of houses and shops, hastily run up when the place was an experiment, have been replaced by substantial brick ones, and the streets have been macadamised. There are two churches, Christ Church, of wood, and St John's, of iron, with a number of chapels. The town contains the government buildings, a small neat theatre, a public library, a concert-room, gas-works, a fire-engine house and brigade, and a brick prison, in which the inmates are usually those guilty of selling ardent spirits to the Indians. The inhabitants number 6000. Beacon Hill, a grass-covered mound, is their favourite promenade, enclosed by a natural park of oaks and other trees, with a race-course and cricket-ground at the immediate base. From its summit the snow-capped Mount

Baker, which rises upwards of 10,000 feet, within the territory of the United States, is a grand object on the eastern horizon. *Nanaimo*, on the east coast, has attracted a population engaged at the coal-mines in the vicinity, and in the shipment of the produce, an increasing quantity of which is regularly exported. There is an Episcopal Church and a Wesleyan Chapel. Coal was discovered here in 1850 of excellent quality, in great abundance, and very accessible, as it cropped out at the surface. The principal seam, called the Douglas, after the name of the governor, has a general thickness of from six to seven feet. The produce was first exported to San Francisco, in 1853, in the ship *William*, and was taken alongside the vessel by the Indian women in canoes. The mines are worked by a company.

BRITISH COLUMBIA includes the mainland from the Pacific Ocean to the Rocky Mountains, between the parallel of 49°, the frontier-line of the United States on the south, and Simpson's River, in latitude 55°, on the north. The extent is of about 700 miles from north to south, by a breadth of 500 miles from east to west; area, about 236,500 square miles. The country comprises bold mountain-ranges and large open plains, with numerous rivers, the principal of which, the Fraser, 900 miles long, and navigable for steamers for 200 miles, enters the sea opposite the southern end of Vancouver's Island. The discovery of gold in the alluvial deposits of their affluents—the far-famed *Carriboo Gold-fields*—brought this region into prominent notice, stimulated an eager rush of adventurers to it, many of whom had been trained in the rough school of California. This led to the constitution of the colony, in 1858, for the purpose of introducing organised government, and placing natives and foreigners as far as possible under the control of the law.

*New Westminster*, on the banks of the Fraser, about fifteen miles above the mouth, is a town still in its infancy. It is incorporated, and has a representative council, with power to levy rates for purposes of public improvement. It contains a court-house, an assay-office, and several places of worship. The total white population of the colony is perhaps not more than 10,000, which includes a sprinkling of Chinese. The native Indians are thinly spread over the surface, but are supposed to form an aggregate of 60,000. In 1861 gold was exported from Victoria, amounting in value to £500,000, the produce of British Columbia. But independent of auriferous deposits, which are disappointing in general to the many, while the few extract wealth from them, there can be no doubt that a large proportion of the country is eminently adapted by soil, climate, and natural productions for civilised occupation, and will afford a permanent recompense to patient industry and prudent thrift. Varieties of pine and firs attain enormous dimensions in height and girth, from which the noblest spars in the world may be taken. A settler laid a wager that he would cut through a single tree in three weeks' time with an axe, and lost his money. Steam-mills have been established which quickly bring down the timber-kings.

#### VIII. NEW BRITAIN.

The country included under the name of NEW BRITAIN, one of recent adoption, embraces the remainder of British North America, lying principally between Hudson's Bay on the east and the Rocky Mountains on the west, and extending from the shores of the Arctic Ocean on the north, to the frontier of the United States on the south. The area of this immense region can only be approximately stated as bordering on 2,000,000 square miles. It has a generally low and level surface, abounding with lakes, rivers, swamps, and inhospitable land. Only a few diminutive woods occur in the far north, with creeping plants, mosses, and lichens; but more southerly are extensive forests of pines, alders, and other trees, with vast tracts of prairie-ground eminently adapted for agriculture, yet chiefly supplying pasture to herds of bisons, elks, and deer. The winter cold is severe throughout, and rigorous in the extreme in the higher latitudes, where the subsoil is permanently frozen, and only a thin superior stratum thaws in summer. Fur trading-posts, with hardy Scotchmen for their occupiers, are distributed through the country at wide intervals apart from each other. The Red River Settlement, towards the southern border, is an important agricultural station. Indians of numerous tribes are thinly scattered over the surface in diminishing numbers, and a few Esquimaux are found on the north coast.

New Britain is commonly designated the Hudson's Bay Company's Territory, from that body having had a monopoly of the fur-trade for nearly two centuries. It is also called Rupert Land, from the original charter of incorporation having been obtained under the auspices of Prince Rupert, in 1670, the reign of Charles II. The right of exclusive trade ceased in 1860. Skins of the beaver and the marten supply the

most valuable furs, and with those of the musk-rat, bears, foxes, and wolves, are the main staples. According to a living writer, Dr Lankester, the traders buy in a cheap market while selling in a dear one, for the natives are paid by a fixed tariff, which is made wholly independent of the value of the skins. They are often purchased by barter. Thus a fourpenny comb will be given for a bear's skin worth two pounds, and a sixpenny knife for three marten's skins, which in London will sell for four guineas. *Fort York*, near the western shore of Hudson's Bay, is the head-quarters and principal dépôt of the company, in latitude 57° 2' north. The site is low and dreary, enclosed with stunted pine-woods, a swamp in summer when the surface thaws, and hard as iron through the winter months. The thermometer sometimes descends to 50° below zero; brandy freezes to a solid substance in rooms with a constant fire; and but for supplies obtained from more temperate regions existence would be impossible.

*Martin's Fall*, on the Albany, which flows into the southern extremity of Hudson's Bay, is exactly in the latitude of London. This circumstance renders a record of the progress of the seasons of interest. *December, January, February*.—Dead winter months; intense frost; snow permanently hard. *March 15*.—Snow often melts at mid-day. *20*.—Tops of the higher grasses appear. *April*.—Slight crust on the snow from the day thaw and the night frost. A few insects appear in bright mild weather. *22*.—The gray goose of Canada and stock ducks sometimes appear; often forced back to the south by northerly blasts. *25*.—A few spots of ground bare. *23*.—The American robin and other birds are now arriving, feeding on benumbed grubs and caterpillars. *May*.—Ground getting barer; snow melting rapidly. *10*.—Ermines and rabbits become altogether brown. *12*.—The buds of poplar, aspen, and various willows swell. *15*.—The larger rivers break up; swamps and stagnant pools are thawed. *June*.—Insects on warm days are busy on the bushes and the ground. *10*.—Night frost sometimes occurs. *15*.—Country covered with verdure; the latest shrubs have leaves; birds are nesting. *July*.—Summer month; weather often very warm; strawberries ripen; mosquitoes numerous. *August*.—Summer month; raspberries and currants ripen. *September*.—The air generally cooler; winds stronger; frosty nights looked for. *10*.—Many insectivorous birds leave; night frosts frequent. *15*.—Leaves rapidly turn yellow; gray goose of Canada begins to pass southward. *October*.—Pools and swamps crusted with ice; mosquito utterly defunct. *5*.—Foliage falls; snow succeeds to rain. *20*.—Small lakes and rivers sometimes fast frozen; the American hare and the ermine change colour. *November*.—Ground covered with snow; strong rapids closing fast with ice; swamps passable; rabbits and ermines entirely white. The most northerly stations are in the basins of the Mackenzie. At *Fort Norman*, in latitude 65°, a small quantity of barley has been raised, with potatoes about the size of marbles. At *Fort Good Hope*, 66° 16', there is only very diminutive wood.

The RED RIVER SETTLEMENT, which makes the only approach to a colony in the whole of this vast region, is situated on the wooded banks of the stream, the upper course of which is in Minnesota, one of the United States. It was founded by the Earl of Selkirk in 1813, and has a population of about 6500, consisting of retired servants of the company, Scotch emigrants, a few Indians, and half-breeds. They have a governor, council, recorder, sheriff, coroner, trial by jury, and a prelate of the Anglican Church, with the style of Bishop of Rupert Land, whose diocese is co-extensive with the fur-trading stations. The Red River joins the Assiniboine at Fort Garry, in the neighbourhood of the settlement, and proceeds thence to Lake Winnepeg. From this point the late Sir G. Simpson, an officer of the company, accomplished the following journey in the winter in sledges over the ice and snow:

|  |                        |
|--|------------------------|
| Fort Garry to Fort Pelly, on the Upper Assiniboine, . . . . .        | 394 miles, in 15 days. |
| Fort Pelly to Fort Carlton, on the Saskatchewan, . . . . .           | 276 " 12 "             |
| Fort Carlton to Fort La Crosse, on the lake of that name, . . . . .  | 236 " 7 "              |
| Fort La Crosse to Fort Chippewayan, on the Athabasca Lake, . . . . . | 371 " 12 "             |
|  | 1277 46                |

At the Bath meeting of the British Association, in September of the present year, 1864, a paper was read detailing a recent journey made by Lord Milton across the Rocky Mountains to British Columbia, taking the Athabasca River in his route. His party crossed the mountains by the Yellow Pass, which he recommends in preference to all others for road or railway connecting British Columbia with Upper Canada.

The Red River freezes in November and opens in April, but Lake Winnepeg remains closed till the end of May. The settlement has woods of oak, elm, maple, and pine; the introduced live-stock common to English farms; and a soil from which large crops of grain are raised.

The ARCTIC ISLANDS of the Western World bear the names of Melville, Banks, Cornwallis, Wollaston, Victoria, King William, Montreal, and others, and are parts of British America by discovery. Though not of the slightest value, they will ever be of interest as scenes where the skill, endurance, and heroism of our fellow-countrymen have been signally illustrated in attempts to thread the icy labyrinth. Of difficult access in the height of summer, and completely frozen up in winter, these lands must be left to their proper native tenants, the prowling white bear, the roving musk-ox and reindeer, the ptarmigan, polar fox and hare, with the few families of Esquimaux.

Potomac and Shenandoah at Harper's Ferry.

### CHAPTER III.

#### THE UNITED STATES.

HE great Transatlantic Republic, at the head of the civilisation, commerce, wealth, and power of the Western World, and entitled to rank with the first-class states of Europe, extends across the continent between the Atlantic on the east, the Pacific on the west, the British Possessions on the north, and Mexico on the south. The northern boundary in general is formed by the great lakes of Canada and the parallel of  $49^{\circ}$ ; the southern, by the Gulf of Mexico, the Rio del Norte flowing into it, and a line drawn from the upper channel of the river, to the head of the Gulf of California. Twenty-four degrees of latitude are embraced within these limits, from Cape Sable, in Florida,  $25^{\circ}$  north, to the parallel named.

In the opposite direction the country includes fifty-eight degrees of longitude, from the shores of Passamaquoddy Bay,  $67^{\circ}$ , to the coast of the Pacific,  $125^{\circ}$  west. The total area is estimated at nearly 3,000,000 square miles, acquired chiefly by successive extensions of territory during the present century. The greatest linear distances amount to about 2800 miles east and west, and 1600 miles north and south, while the frontier-

line measures at the least 10,000 miles, of which considerably more than one-half is either sea-board or lake coast.

|  | Square Miles. |
|--|---------------|
| Area of the Republic at the peace with Great Britain, in 1783, . . . . .       | 820,680       |
| Louisiana, obtained by purchase from the French in 1803, added about . . . . . | 899,579       |
| Florida, acquired from Spain in 1819, added . . . . .                          | 66,900        |
| Texas, admitted into the Union in 1845, made an addition of . . . . .          | 318,000       |
| Oregon Treaty with Great Britain, added . . . . .                              | 308,052       |
| Treaty with Mexico, in 1848, made a cession of . . . . .                       | 522,955       |
|  | 2,936,166     |

The land on the shores of the Atlantic is generally low and level, broken by many inlets of the ocean, the estuaries of rivers. It forms an undulating plain extending for some distance into the interior, on which are the cities and towns of the oldest date. From the breadth of only a few miles in the extreme north, this plain expands southward to the width of more than 150 miles in the Carolinas, and becomes still more spacious as the coast of the Mexican Gulf is approached. Its maritime districts, in their southerly extension, contain extensive swamps haunted by alligators and water-fowl, and also monotonous tracts of sand, called Pine Barrens, which are clothed with forests of giant pines. The Atlantic plain is bounded inland by the Appalachian Mountains, which stretch in a south-westerly direction from the interior of Maine to the borders of Alabama, and divide generally the rivers which flow directly to the ocean from those which descend to the channels of the St Lawrence and the Mississippi. They do not form a water-parting through their entire length, being crossed by the Hudson, the Connecticut, and the Delaware streams, nor are they any barrier to convenient communication, being intersected at various points by railways and canals. This chain is known by various names in different parts of its course, as the White Mountains, in New Hampshire, from the hue of the exposed rock; the Green Mountains, in Vermont, from their mossy summits and wooded slopes; the Catskill Highlands, in New York, which present fine Rhine-like scenery to steam-boat voyagers on the Hudson; and the Alleghanies, in Pennsylvania and Virginia, the 'Endless Mountains' of the old Indians, where the chain consists of several parallel ridges separated by valleys or plains, and attains its greatest width. The Peaks of Otter, within the limits of Virginia, rise to 4260 feet, but are exceeded in height by Mount Washington, 6234 feet, one of the White Mountains. In this group the remarkable Gap occurs, called the 'Notch,' which is in some places not more than twenty-two feet wide, with wild and lofty precipices on either hand, and is used as a thoroughfare.

Westward of these highlands the surface falls by a very gradual descent to the Mississippi and its mighty arms, with their varied and apparently interminable prairies, level and rolling, grassy and timbered. Dense forests line the banks of the rivers, and park-like clumps of trees adorn the surface apart from them, with copse woods, the 'islands,' as they are called, of the grassy sea. This region is solitary league after league in the 'far west,' with exception of the wild animals and wilder Indians, but at intervals nearly throughout, more or less extended, the outposts of advancing civilisation appear. In the woods, huge trunks stand thickly around, with snake-like parasites coiled around them, and the Spanish moss hanging in festoons from the branches, while prostrate trunks, yards in diameter and half decayed, lie along the ground, in the ends of which the porcupine and the opossum hollow out their homes. The moss, of a silvery-gray colour, gives a somewhat mournful appearance to the forest. Trees are frequently met with of remarkable girth, with cavities in their stems, while standing, capable of entertaining both man and horse, particularly those of the sycamore and button-wood species. Captain Mayne Reid mentions coming upon a squatter who, with his wife and children, was

living and actually burning a fire within the trunk of a standing sycamore. In this singular natural habitation the party had passed the winter.

Approaching the furthest west, the region of the Rocky Mountains, between the parallels of 32° and 43°, the ground gradually rises, and the aspect of the surface is altogether different. Verdure becomes thin and less vivid, till it passes away entirely; water grows scarce, and ceases to be found for many a league except impregnated with salt; the bare ground appears, sand or gravel, bestrewed with large boulders; and the sterility is nearly total. Trappers here distinguish the 'sage prairies'—plains besprinkled with the wild wormwood; the 'sand prairies'—barren and trackless wastes; the 'salt' and the 'soda prairies'—where the country is covered with a salt or soda efflorescence—features these of the true desert. Bones mark many a spot where the horse and his rider have fallen together, overcome with fatigue and thirst, the water brought along with them having failed, while ignorant of the sites where a little further effort would have brought them to the source of a fresh supply. Fragments of clothing, old hats, bruised canteens, stirrups red with rust, strewed here and there, tell a melancholy tale of mischances to adventurers. The perils of the passage of the chain, now greatly abated, are proclaimed by the significant name of the 'Journey of Death,' while a spacious expanse, pleasant to the eye, but briny and bitter to the taste, has the ominous title of the 'Lake of Death!' The Rocky Mountains, within the limits of the United States, appear to culminate in Fremont's Peak, first ascended by the distinguished explorer of that name in 1842. It attains the height of 13,570 feet, lies a little to the north of the South Pass, one of the practicable routes across the range. Nearer to the Pacific Ocean, and parallel to the chain, is the Sierra Nevada, rising to the snow-line, as the name implies. The two enclose the high tract of country known as the 'Great Basin,' which contains the Great Salt Lake, with its Mormon city and strange community. Between the Sierra Nevada and a Pacific coast-chain, lies the long broad valley of the San Joaquin and Sacramento Rivers, the gold-bearing region of California. A northerly continuation of the maritime chain, beyond the Columbia River, called the Cascade Range from its numerous waterfalls, has the culminating-point of the entire United States, in Mount St Helens, with an elevation of 15,750 feet.

Though the Atlantic side of the country has no river of considerable magnitude, yet several are of high value as lines of inland navigation, extended by a net-work of canals. The principal examples from north to south are the Penobscot, the Connecticut, the Hudson, the Delaware, the Susquehanna, and the Potomac. The important rivers of the Pacific basin, from south to north, are the Colorado, the Sacramento, and the Columbia. The latter has the upper part of its course in British territory, and is remarkable for its rise close to the source of the Saskatchewan, the waters of which are conducted finally into Hudson's Bay. Sir George Simpson states that he could 'fill his kettle for breakfast out of both at the same time.' On the coast of the Mexican Gulf the Mobile has its outlet, with the Rio del Norte, and the mighty Mississippi-Missouri, the grand artery of internal communication, already illustrated in its course, affluents, and features. The States share with Canada in the navigation of the great lakes, and command the whole basin of Lake Michigan. By means of a canal of 363 miles, which unites the Hudson with Lake Erie, and another of 324 miles connecting that expanse with the Ohio, there is uninterrupted inland navigation from New York to New Orleans.

In the northern part of the Atlantic region the climate is distinguished by great annual extremes of temperature, the winters being very severe, and the summers excessively hot, while striking variations of temperature in each season are frequently experienced. Proceeding southerly, the seasonal differences become less marked, and the temperature

approximates to tropical uniformity throughout the year below the parallel of 35°, which defines in general the northern limit of tropical cultivation, indicated by rice-grounds, cotton and sugar plantations. The most productive cotton districts are maritime. They are famous also for the quality of the produce, denominated 'Sea Island,' from being raised on the low coasts and islands of the Carolinas and Georgia, where the plantations are exposed to the spray of the ocean. It is found that at a certain distance inland the fibre deteriorates, and hence it is inferred that the saline properties of the soil and the atmosphere have a beneficial influence upon the growth of the plant, contributing to render the cotton fine and long in the staple. If the weather is fine, and no frosts linger, the sowing commences in March or April. Blooming takes place towards the end of May or the beginning of June, and the picking in July or August. The first seeds were sown in the year 1786 in Georgia, probably introduced from Barbadoes; and the first export of a small quantity of the crop was made in 1790. Tobacco and maize are grown over a wide area; and an immense amount of ordinary cereal produce is raised in the western states for export across the Atlantic. Manufactures, fisheries, and general commerce chiefly engage attention in the north maritime districts. Coal-mining, iron-smelting, and hardware production are prominent industries in connection with the central portion of the Appalachian chain. This range has a great bituminous coal-field extending through 800 miles from the north of Pennsylvania to the middle of Alabama, with a breadth in places of 180 miles, and a total area estimated at upwards of 50,000 square miles.

The republic, at the date of its formation, included thirteen provinces federally united. It now embraces forty-three political divisions, states or organised territories, between two sections of which, styled Federal and Confederate, the bond is for the present broken. These divisions are as follows: 1, Six North-Eastern States—Maine, \*New Hampshire, Vermont, \*Massachusetts, \*Rhode Island, \*Connecticut; 2, Five Middle Atlantic States—\*New York, \*New Jersey, \*Pennsylvania, \*Delaware, \*Maryland; 3, Five Southern Atlantic States—\*†Virginia, \*†North Carolina, \*†South Carolina, \*†Georgia, †Florida; 4, Four Gulf States—†Alabama, †Mississippi, †Louisiana, †Texas; 5, Twelve Western States—Ohio, Kentucky, Tennessee, †Arkansas, Missouri, Kansas, Illinois, Indiana, Michigan, Wisconsin, Iowa, Minnesota; 6, Two Pacific States—California, Oregon; 7, Nine Territories—Arizona, Colorado, Dakota, Idaho, Nebraska, Nevada, New Mexico, Utah, Washington. In this enumeration the states to which an asterisk is attached are the provinces which signed the Declaration of Independence in 1776, and formed the original Union. The dagger defines those which are distinguished as Confederate in the present struggle with the Federal. Territories may be described as states in embryo, to be recognised as such when a certain proportion of population has been attained. In the meantime they can send delegates to the National Congress, who have the right to speak, but not to vote. In addition, there is the Federal district of Columbia, which contains the capital, under distinct jurisdiction, and the Indian Territory, a tract of country in the far-western wilds set apart for the unfortunate Red men, dispossessed of their hunting-grounds, who are disposed to place themselves under the care of the whites, adopt settled habits and industrial pursuits.

The small district of Columbia, on the Potomac, originally embraced a tract on both sides of the river, or portions of Maryland and Virginia. Since 1846 it has been confined to the north or Maryland bank, and forms a single county, with an area of only sixty square miles. It is under the immediate government of Congress, but has no representation in it, and contains the two cities of Washington and Georgetown.

*Washington*, the political metropolis of the United States, in latitude 38° 55' north, longitude 77° 1' west,

is beautifully situated on the left bank of the Potomac, the 'River of Swans,' nearly surrounded by an amphitheatre of hills, which were recently covered with trees and shrubberies, but now bristle with forts and cannon. It is the ordinary residence of the President and the foreign ambassadors, the seat of the government offices and of the annual sessions of the legislature. The Capitol, containing the halls of the senate and the representatives, the library of congress, and accommodation for various departments of the executive, occupies a commanding site, and is a noble structure of white marble, perhaps on the whole the finest in the New World. It is surmounted in the centre by a lofty massive dome, and has an imposing Corinthian portico at the main entrance, which furnishes a fitting site for the presidential inaugurations. Pennsylvania Avenue, the principal street, lined with handsome blocks of public and private buildings, radiates from the Capitol to the White House, the official dwelling of the Presidents, a mile and a half distant, in the centre of a small park. The objects of interest in Washington are very limited. In the Museum connected with the Patent Office is preserved the printing-press at which Franklin worked, with the 'Declaration of Independence' in a glass case, not far from which appears the tanned skin of an African. An early number of the *Pennsylvania Gazette*, shewn in the State-Paper Office, contains the curious announcement: 'Printed by B. Franklin, who will give ready money for old rags, and sells glazed, fulling, and bonnet papers.' The Smithsonian Institution, founded for the diffusion of knowledge by funds bequeathed by an Englishman for that purpose, and the Observatory, are the other public establishments of note. The latter, well supplied with the best instruments, was brought to a high state of working efficiency by the late director, Commander Maury, the eminent physical geographer, who, being a Virginian, left his post in 1861 to join the Confederates. An assistant here added the thirty-first asteroid, Euphrosyne, to the long catalogue, being the first star discovered on the American continent. The capital contains a population scarcely exceeding 40,000, but greatly increased by the arrival of strangers when the legislature is sitting. Having been planned originally upon a scale of magnitude far beyond that which has been attained, it wears an unfinished, disjointed appearance, unless fancy can see

'Squares in morasses, obelisks in trees.'

An aqueduct, opened in 1863, brings a copious supply of water from the Falls of the Potomac, fifteen miles distant. About thirteen miles lower down the river, on the opposite bank, is Mount Vernon, where General Washington resided, with his tomb in the grounds, close to the water-side, shaded with oaks and cedar. In a humble canoe he conducted the first survey of the stream with reference to its navigation above tidal water.

The collective name of New England is commonly given to these states. It originated with the Pilgrim Fathers, the first colonists, from various parts of England, but chiefly from Lincolnshire, who landed on a southern point of the coast in November 1620. The country then wore a very wild aspect, was covered with thickets and dense woods, and snow lay upon the ground. The population at present is mainly English by descent, or Scotch, the Irish infusion being comparatively small, and the German quite insignificant. But this region may now as properly be called Old England, in relation to other parts of America occupied by the Anglo-Saxon race. It contains traces of their handiwork to which some venerableness is attached, while such expressions of the modern spirit as mammoth hotels, gigantic stores, and palatial-looking warehouses are but rarely encountered. The names of towns and villages are also prominently English, or have a sober stamp, instead of being collected as elsewhere from every country under heaven, the records of antiquity, and the realm of romance, while most incongruously associated. It is possible in Maine to visit Portland, and to reach Northampton without going out of Massachusetts, but no Pekin, or Bagdad, or Jericho is to be found within their limits, nor do they include a Styx, an Aladdin, or a Rough and Ready. The New Englanders are the Yankees proper, lean, lank, and nasal, in comparison with their cousins on this side of the Atlantic. But the women, not far out of their teens, have a reputation for great personal beauty.

MAINE, the most easterly of the group, borders on New Brunswick and Lower Canada. The settlement of the boundary between them is quite of recent date, and was not arranged without disputes ominous of war. It has a remarkable coast-line, not extending to 300 miles in direct distance, but measuring more than 2400 following the various sinuosities. The interior is hilly in general, and boldly rugged in the north, where the

woods are still extensive, being nominally distinguished as the Wilderness. The principal rivers are the Penobscot and the Kennebec, the latter issuing from the large Moosehead

Wilderness of Maine.

the chief towns in the interior of Maine, but taken together they are smaller than *Portland*, on the coast. This place contains a population of 27,000, has extensive commerce with the West Indies and Europe, an excellent harbour, easy of access, deep and spacious, protected by islands from the swell of the ocean. The first settlement in Maine was made in the year 1625. For some time afterwards every twentieth settler is said to have been killed by the Indians. It formed part of Massachusetts, and became a distinct state in 1820. New Hampshire dates its settlement from 1623. *Concord*, on the Merrimac, the state capital, is inferior to *Portsmouth*, a naval station and considerable shipping port. In 1761 the *Boston Evening Post* contained the announcement of 'a large stage-chaise, with two good horses, well equipped,' to make the journey from Portsmouth, 54 miles, once a week, stopping a night on the road, going and returning. *Hanover* is the seat of Dartmouth College, an old and respectable institution. *Burlington*, a small town in Vermont, but the largest, is charmingly placed on the shore of Lake Champlain, the surface of which is alive with steamers through the summer. This state has a very democratic constitution. It did not subscribe to the Declaration of Independence, but declared for independence of both parties, and remained neutral to the year 1791, when deputies were first admitted to Congress.

MASSACHUSETTS, on the south of New Hampshire and Vermont, by far the most important of the New-England States, is distinguished by its manufactures of textile

Lake. NEW HAMPSHIRE, on the west and south-west, has only about eighteen miles of coast, chiefly a sandy beach bordered with salt-marshes. The surface is low for some distance from the shore, and then rises into the grand heights of the White Mountains, the summits of which are generally covered with snow from the close of October to the end of May, and are sometimes not wholly divested of their winter clothing till August, to be speedily resumed. Granite for architectural purposes, of the best texture and colour, is very abundant, and largely quarried. VERMONT, further west, is entirely inland, separated from the territory of New York by the spacious and many-islanded Lake Champlain, so called after the founder of Quebec, the issue of which is conducted by the Richelieu to the St Lawrence. The state has its name from the Green Mountains, *Verts Monts* of the French, distinguished by soft wooded slopes.

*Augusta*, on the banks of the Kennebec, and *Bangor*, an important lumber depôt, on the Penobscot, are

White Mountain, Vermont.

fabrics, enterprise in the fisheries, general commerce, and literary cultivation. The maritime border is extensive, marked by the long tapering curve of Cape Cod, with the islands of Nantucket and Martha's Vineyard, and many of smaller size. The surface is naturally sterile, consisting for the most part of a mass of granite covered with a thin layer of soil, and swamps are numerous. But skilled industry has introduced fertility, and there are productive farms, with homesteads almost buried beneath the green foliage of overhanging trees, and whole tracts cultivated like a garden. The lower course of the Merrimac, and the middle part of the Connecticut, fall within the limits of the state. RHODE ISLAND, the smallest member of the Union, directly on the south, consists of the island of that name, which was formerly supplemented with that of Providence Plantations, and a tract of the adjoining mainland. CONNECTICUT, the most southerly part of New England, is divided into two nearly equal parts by the lower course of the river of the same name, along which there are fertile lands, well tilled, and abounding with orchards. Long Island, extending to New York, fronts the whole length of the shore, and facilitates the coasting-trade by sheltering vessels in the intervening sound from the gales of the Atlantic.

*Boston*, the fourth city of the United States in population, 200,000, including the suburbs, the second perhaps in commerce, and the first in literature, is situated principally on a peninsula projecting into Massachusetts Bay, and derives its name from the fact of the founders emigrating from Boston in Lincolnshire. The oldest portion, built on the uneven ground of the peninsula, consists of narrow, crooked streets of brick-built houses, though some still remain of wood, seeming as if a dozen generations had been born within them. One in Washington Street bears the inscription, 'The oldest house in all Boston, built MDCLVI.' Before many of the houses there are 'little patches of grass-plot gardens, hemmed in by iron railings of substantial respectability. At the corners of the streets, perched at the most inconvenient localities, there are old stone-built churches, which must have heard King George III. prayed for on many a Sunday. In quaint nooks, right in the city's heart, stand old-fashioned English graveyards, shaded over by trees.' In the very centre is the Common, originally a cow-pasture on the skirts, now a public park with turf and knots of trees. Faneuil Hall, once used as a market-place, as well as for public meetings, is an interesting historical spot, where the revolutionary orators roused the people to resist what was called British oppression. A granite obelisk on Bunker's Hill, in the

neighbourhood, commemorates the battle fought there in 1775 between the American and the royalist forces. Boston has many literary institutions and large libraries. The public library contains 110,000 volumes, the Athenæum has 80,000, and the Mercantile 21,000. The city is the cradle and principal seat of the ice trade, which has attained wonderful development since its commencement about the year 1820. Several hundred thousand tons are annually exported. The Wenham Lake ice, well known in London, is obtained in the vicinity. The lake occupies an elevated position, and is surrounded by hills. It has great depth, and no visible affluent, but depends upon springs which issue from the rocks at the bottom. In 1833, the first cargo of ice from Boston was discharged at Calcutta. *Cambridge*, four miles distant, with villas and houses, standing each in its own garden, nearly all the way, is the seat of Harvard University, the oldest and one of the best in the United States, founded in 1638, possessing a library of 140,000 volumes. Under a tree on the grounds, called Washington's Oak, the general is said to have signed the Declaration of Independence; and Whitfield, excluded from the college chapel, preached beneath it. The names of Emerson, Longfellow, and Hawthorne are associated with adjoining sites. *Lynn*, nine miles north of Boston, is celebrated for its boot and shoe manufacture, producing annually 5,000,000 pairs. *Lowell*, twenty-five miles distant, is distinguished as the American Manchester from its cotton-mills. It contains a population of 40,000, but had only a few dwellings in the year 1820.

*Providence*, at the head of Narragansett Bay, with 47,000 inhabitants, is the seat of the local government of Rhode Island, but alternately with *Newport*, a much smaller town on the island itself, greatly resorted to in summer as a watering-place. *Hartford*, an inland town on the river Connecticut, is the capital of that state, alternately with *Newhaven* on the coast, much more important, containing a population of 39,000, deemed one of the most beautiful of the American cities. It is eminently the 'city of elms,' both venerable and young. The streets are lined with grand old examples, or with luxuriant maples, forming long vistas of arched verdure, and the public squares seem nothing but groves at a distance. Temple Street is the admiration of strangers and the pride of the natives. Newhaven is the seat of Yale College, 'Old Yale,' as it is commonly called, a well-known literary institution, possessing a library of 42,000 volumes, and an excellent mineralogical collection. There are large iron and india-rubber works, with manufactures of clocks and leather. First planted in 1638 by a colony of Puritans from London, who were men of property and station, the settlement speedily became one of the most flourishing in New England, and was very strictly governed by the elders. Three of the regicides, Goff, Whalley, and Dixwell, who sat in judgment upon Charles I. and fled beyond seas at the restoration, spent the remainder of their days at Newhaven. Though large rewards were offered for their apprehension, their secret was faithfully kept by those intrusted with it. When closely pursued by the royalists, they retired to the Rocks, two miles and a half from the town, and were concealed in a cave for weeks together. This spot, still called the 'Judges' Cave,' is a favourite resort of excursionists.

## II. MIDDLE ATLANTIC STATES.

|                         | Area in Sq. Miles. | Population.         | Capitals and Chief Towns.             |

The state of **NEW YORK** is the wealthiest and most populous member of the whole federation, distinguished by the great diversity of its industrial pursuits, commercial relations with all maritime countries, and varied means of intercommunication profusely supplied by nature and art, which embrace ocean, lake, river, and canal, with plank-roads, common roads, tram-roads, and railways. It resembles an irregular triangle in shape, and though the apex alone reaches the ocean, yet still the coast-line is considerable, as Long Island is included, extending upwards of 100 miles from east to west. New England forms one side of the triangle; New Jersey and Pennsylvania supply the second; and the St Lawrence, with Lake Ontario and part of Lake Erie, the third. The territory shares the Falls of Niagara with Canada, and has several magnificent water-falls on its own streams in the highland gorges. Besides the great frontier lakes named, with that of Champlain, also on the border, a large number are wholly interior and much admired, as Lake George, remarkable for its transparency and picturesque shores, a Loch Katrine on a larger scale. The most important river, the Hudson, traverses the eastern section of the country from north to south, and supplies a long line of navigation, being ascended for 150 miles by tidal water. It flows through scenes of striking grandeur, and has its sources in a very

wild region, west of Lake Champlain, where mountainous heights appear, the loftiest of which, Mount Marcy, has an elevation of 5300 feet. Mineral springs in its basin, at Saratoga and Ballston, attract a crowd of summer visitors. Of the total population nearly one in every four is foreign born. The Irish are in the greatest force, being about 500,000; the Germans next, 256,000; numbers which immigration has kept up in spite of the havoc made among them by the war. Names of places have been liberally culled from sources ancient and modern, sacred and secular. The state has a Troy, Attica, Ithaca, and Marathon; a Rome, Carthage, Syracuse, and Utica; a Carmel, Gilboa, Salem, and Zoar; a Peru and Lima, China and Peking, Russia and Warsaw, Cairo and Delhi; and even a Paradox.

*New York*, called the 'Empire City' by the inhabitants, is the commercial metropolis of the United States, the largest city in the Western Hemisphere, and entitled to rank with the great capitals of the globe. It is situated on the south extremity of Manhattan Island, at the mouth of the Hudson, 225 miles from Washington, 1397 from New Orleans, 210 from Boston, and 372 miles almost due south of Montreal. Long Island opposite, and Staten Island on the south-west, form a nearly land-locked bay for the port, which has space and depth sufficient for whole fleets of vessels of the largest size, and is but rarely obstructed or much incommoded by ice. Including Brooklyn, on Long Island, and other suburbs within a radius of five miles from the centre, the city contains a population of about 1,200,000. It is traversed by wide streets in straight lines, crossed by others at right angles, lined with handsome houses and shops, but has, like other places of similar extent, its low, filthy, and wretched quarters. Broadway, the principal thoroughfare, more remarkable for length than breadth, stretches upwards of three miles, and combines the aspect of our Regent Street and Cheapside. Several of the public buildings are large and costly, as the City Hall, the Merchants' Exchange, the Custom House, the Cooper Institute, and Trinity Church. The hotels are upon a vast scale, magnificently fitted up, and ample provision is made for recreation in open grounds laid out with great taste. One of the most important of the public works, the Croton Aqueduct, the execution of which involved an outlay of £4,000,000 sterling, brings a stream of pure soft water to the city from the river of that name, a small affluent of the Hudson, through a total distance of forty miles. Objects are of course wanting which time has rendered venerable, and history invests with interest. Nor is there any edifice commanding admiration by stupendous yet harmonious proportions, like many in the Old-World cities, while the site has no natural picturesqueness. But for bustle in the streets and on the waters, shops, stores, wharves, steamers, and ships, New York is only second to London. It is honourably distinguished also by philanthropic and literary institutions, as grammar-schools, colleges, art schools, and libraries. The Astor Free Library contains 120,000 volumes; the Mercantile, 64,000; the Society, 50,000; the Historical Society, 25,000; and the Apprentices, 19,000. Local general usages include the three o'clock hour for dinner; the display of the whole refection at once, and not in courses; changes of residence previous to the full setting in of spring, with wholesale house-cleaning at the same date; and the observance of May Day for marriages.

The bay of New York was entered in the year 1523 by Verrazzano, an Italian in the service of the French, its first European visitor. He described it as 'a gulfe wherein are five small islands, very fruitful and pleasant, full of hie and broad trees, among the which islands any great navie may ride safe, without feare of tempest or other danger. The land is situated in the parallel of Rome, but somewhat more cold by accidentall causes.' Hudson, the English navigator, discovered the river which now bears his name. The Dutch colonised the country, and founded the city as New Amsterdam in 1621. Governor Stuyvesant surrendered it to the English in 1664, when the name was changed to New York, in honour of the Duke of York, afterwards James II. It was the seat of the first American Congress, and of the inauguration of Washington as the first President of the Republic.

*Albany*, the state capital, is an important commercial town of more than 60,000 inhabitants, the seat of a university. It is situated 144 miles up the Hudson, reached by steamer and rail, both passing West Point—the Military Academy of the United States, in which the Generals Lee and McClellan received their training—on a height above the river. *Troy*, six miles higher up the stream, has manufactures of hardwares and machinery, with a timber trade, for its noticeable features; and contains a Reusselaer Institute for scientific and practical instruction, founded by the wealthy head of an old Dutch family. In fantastic keeping with the classical name of the place, two small hills in the vicinity have the high-sounding titles of *Ida* and *Olympus*. The town is on the great thoroughfare from the south to the Saratoga Springs, the most fashionable watering-place, about twenty-five miles distant. The waters here have a carbonated saline quality. Congress Spring, the principal, has been so called from its discovery by a member of the legislature in 1792. This locality is of special interest to the American, as the scene of the surrender of the English General Burgoyne, with his whole army, in 1777, which virtually settled the question of national independence. In the western part of the state, on the line of the Erie Canal and the Western Railway, are *Syracuse*, the seat of an extensive salt manufacture from brine-springs; *Rochester*, a few miles from the southern shore of Lake Ontario, a city of flour-mills; and *Buffalo*, near the outlet of Lake Erie by the river Niagara, which supplies

an instance of wonderful advance. It was first laid out at the commencement of the century, and contained 200 houses in 1814, when it was burned by the British, with the exception of two buildings. It has now a principal street two miles long, three squares, shaded by rows of trees, many ship-yards, iron-foundries, saw-mills, and wool stores, a court-house, lyceum, and university, with a population of 84,000. The Erie Canal, which connects Buffalo with the Hudson, and makes it the entrepôt between the north-western states and the Atlantic sea-board, has been the main cause of its prosperity.

PENNSYLVANIA, on the south and south-west of New York, is an extensive district with the general outline of a parallelogram, slightly touching Lake Erie at the north-west corner, and bordering the tidal waters of the Delaware at the opposite south-east extremity. It has essentially a mountainous surface, being traversed by the Alleghany ranges in a broad band, which are divided by valleys as fertile as they are lovely, while containing vast stores of coal and iron, with marbles, slates, building-stone, and brine-springs, from which salt is abundantly obtained. Eastward, besides the frontier stream of the Delaware, the country is intersected by the Susquehanna, winding through beautiful scenery, but obstructed in its navigation by falls and rapids in the lower part of its course. West of the mountains, the waters of the Monongahela and Alleghany unite at Pittsburg to form the Ohio, one of the leading tributaries of the Mississippi. There are rich agricultural tracts within the limits of the state, but mining and iron manufactures are the prevailing industries. It has rapidly increased in population at a recent date, owing to the demand for labour created by the extraction of its mineral wealth, and contains at present the largest number of foreign born inhabitants after New York. Of these about 138,000 are Germans and 202,000 Irish.

*Philadelphia*, the largest city, is the second in the Union as to population, 568,000, but considered to be the first in wealth and refinement. It is situated on a gently-swelling plain between the Delaware and its affluent the Schuylkill, a little above their junction, and 120 miles from the ocean by the river-channel, which is ascended by the largest sea-going vessels. The city is laid out upon a very regular plan, adorned with fine trees, and contains many good public buildings of white marble, with important charitable institutions. Girard College, founded by a citizen for the education of orphans, and amply endowed, is one of the number. The Library Company possesses 80,000 volumes; the Mercantile Library contains 25,000; that of the Athenæum, 20,000; and the Apprentices, 17,000. Before the Hospital stands the statue of William Penn, the celebrated Quaker, founder of the city and father of the state, whose name, combined with *sylva*, 'wood,' forms that of Pennsylvania. Receiving the grant of an immense territory from Charles II. in 1682, he purchased portions for colonisation from the Delaware Indians. The oak arm-chair in which he sat, in a kind of audience-hall at his country-house, Pennsburg Manor, while negotiating treaties with them, is preserved. Philadelphia has since been the principal seat of wealthy and influential members of his communion in the United States. In its state-house the Declaration of Independence was signed in 1776, and the convention sat to draw up the constitution. The room is kept in its original state; and the bell in the steeple, cast many years before, is still in being, inscribed with the verse of Scripture—'Proclaim liberty throughout this land, unto all the inhabitants thereof.'—Leviticus, xxv. 10. *Harrisburg*, in the midst of splendid scenery on the Susquehanna, is chiefly of note as the state capital, and the centre of several diverging railways. It was first settled by an Englishman named Harris, in 1733, under a grant from the Penn family. About thirty-six miles on the south, in a fertile farming country, a place before obscure, *Gettysburg* has been made known by the terrible three days' battle between the armies of Lee and Meade, in June 1863, with indecisive results. *Pittsburg*, at the junction of the two streams which form the Ohio, in command of an extensive river-navigation, is the great seat of the iron manufacture, the Birmingham of the States, where the machinery for the Mississippi steamers is chiefly made. It consisted of a few cabins half a century ago, and has now a population of 110,000, with foundries, glass-factories, steam-engines, and ship-yards on every hand.

NEW JERSEY is enclosed between Pennsylvania and the ocean, with the state of New York on the north. DELAWARE, the smallest of the territorial divisions after Rhode Island, extends southward in a narrow strip along the shore of Delaware Bay. MARYLAND, a very irregular tract, chiefly on the west, curves round the great inlet of Chesapeake Bay, and forms thence the north bank of the Potomac, by which it is divided from Virginia. The river is navigable by ships of the heaviest burden to the Falls above Washington.

These states have greater importance than might be inferred from their limited area, having an extensive

**THE WORLD**  
ON MERCATOR'S PROJECTION.

BY J. BASTIEN LIPPINCOTT.

The distance on the Sea route  
The distance on the land route

sea-board. New Jersey was first planted by the Dutch and Swedes in 1627. Taken by the English, it came under the control of Penn for further settlement, whose communion is represented within its limits. It forms the west bank of the Hudson for some distance above its mouth, and includes that remarkable feature of the river scenery called the Palisades, where a long and high wall of trap-rock hems in the sea-like stream. The Falls of the Passaic, a small affluent, within easy excursion-distance of New York, are frequently visited by picnic-parties. *Trenton*, the scene of one of Washington's victories, is the state capital, much exceeded in size by *Newark* and other places. *Atlantic City*, on the coast, connected with Philadelphia by rail, is the resort of the Pennsylvanians for sea-bathing, who visit also Cape May for the same purpose, naturally a quiet spot, recently furnished with a hotel, the Mount Vernon, large enough to accommodate the inhabitants of a township. The building is palatial in the Italian style. It consists of a front, four stories in height, and 306 feet long, with two wings extending backwards at right angles, of similar height, but each 506 feet in length. Enclosed between the wings is a large garden, beautifully planted, with a fountain of elaborate construction in the centre. Balconies and verandahs are continued round the structure in front of each story, which have a total extent of one mile and a half. The hotel contains 3500 sleeping-rooms and beds, besides saloons for dining, and drawing-rooms for separate parties, all fitted up in a costly manner.

Delaware State, River, and Bay commemorate by name a numerous and powerful Indian tribe with whom Penn chiefly negotiated. About 1000 of the Delawares are now in the Indian Territory in Kansas. *Dover*, and the other towns, are of little note.

Maryland was first settled by an English colony of Roman Catholics under Lord Baltimore in 1634, who originated the name in honour of Henrietta Maria, the queen of Charles I. It is described in the royal charter as 'part of America; not yet cultivated or planted, though in some parts thereof inhabited by certain barbarous people having no knowledge of Almighty God.' The Crown stipulated for 'the yielding and paying to us two Indian arrows of those parts every year on Easter Tuesday.' Formerly, before the emancipation edict, the traveller from the north made his first acquaintance with negro slavery in this state. It has only been retained in the present contest on the side of the Federals by a strong military force. *Annapolis*, of no importance except as the seat of local government, was so constituted in the reign of Queen Anne, and hence the name. In the senate-chamber of the state-house, Washington formally resigned his commission at the close of the revolutionary war. *Baltimore*, at the head of an inlet of Chesapeake Bay, is the third city of the Union in size, containing a population of 214,000. It has been called the 'city of monuments,' having a Monument Street, in which stands a noble Doric column of white marble, 196 feet high, surmounted by a colossal statue of Washington. The 'Battle Monument' commemorates the successful defence of the place against an attack of the British in 1814. Fort M'Henry protects the harbour and commands the city. Baltimore is the principal port for the shipment of tobacco, and a great mart for flour.

### III. SOUTHERN ATLANTIC AND GULF STATES.

VIRGINIA, the largest of the Atlantic states, and the first part of the entire continent planted by an English colony, comprehends a low maritime region, broken by inlets of the ocean; the estuaries of rivers, in some places marshy, in others sandy, but clad with pitch-pine trees. The whole of this flat country is unhealthy during the summer heats. But from the limit of tidal water in the rivers, the land rises gradually towards the Alleghanies, which, in successive ridges, divided by long valleys or table-lands containing rich soil, occupy a great breadth of the surface. This district has fine woods, iron ore in abundance, striking scenery, and a very healthy climate. Beyond the mountains the country descends by undulations to the course of the Ohio, to which it contributes several feeders. The Potomac rises in the interior of the state, but flows chiefly along the northern border, receiving the Shenandoah at Harper's Ferry, where the joint stream passes through the Blue Ridge of the Alleghanies, and forms a scene of great natural beauty. The other

rivers of importance are the Rappahannock, the York, and the James, now associated with the crossing of armies and terrible battle-fields. Spring is the lovely season of the year, often declaring itself on the lowlands when terrific snow-storms are heard of westward in Kansas, as well as northward at New York. For many weeks in the woods the abundant and pure white blossoms of the cornel contrast strikingly with the dark cedars and sombre pines; the rich bloom of the magnolia and lofty tulip-tree fill the air with their fragrance; and the Virginian creeper becomes as the season advances the crowning glory of the trees and hedges, hanging on them its large clusters of bright scarlet and orange flowers. Maize, wheat, and tobacco are very largely grown, with cotton and flax to a less extent. Mining and ordinary farming are pursuits in the mountain districts.

Virginia was so named in honour of Queen Elizabeth, who granted the country by charter to Sir Walter Raleigh. But the first settlement did not take place till the reign of her successor, in 1607, when Jamestown was founded on the river James, 32 miles above its mouth, both being called after James I. Not a single house now remains. None of the states have given so many great names to the nation as this—Jefferson, Patrick Henry, Clay, Madison, and Monroe, belonging to the past; Lee, Maury, and many others, to the present.

*Richmond*, the state capital, and present head-quarters of the Confederates, is agreeably situated on the north bank of the James, about 100 miles from its mouth, at the point where the navigation ends and rapids commence. Interrupted by rocks which are strewn about in the most picturesque manner, the waters foam over and around them in beautiful cascades. The suburbs of Manchester and Spring Hill are on the opposite side of the stream, to which three bridges extend. Previous to the war the city contained about 35,000 inhabitants, one-third of whom were blacks, either slaves or free. It has good civic public buildings, several colleges, about thirty churches, and large tobacco stores, many-storied and windowed, like factories in England. The Capitol is a fine edifice, splendidly placed on an eminence overlooking the river, from which the view is superb. A central hall contains a statue of Washington, of remarkable interest, being by far the best likeness in existence, so that almost all portraits of him have been copied from it. The French artist, Houdon, was expressly invited across the Atlantic for the purpose of modelling a bust; and resided for some weeks with the patriot commander at Mount Vernon, returning to Paris, where it was executed, with the model for the present statue. A brief inscription on the pedestal, tradition states, was penned by Madison on his knee in the midst of the legislature of Virginia. Richmond has its slave-mart, resembling an ordinary place of business, the operations of which may have been suspended by the war, but were recently often signified by the announcement at the door, 'Negroes for sale at auction this day at twelve o'clock.' *Petersburg*, the scene of Grant's mining attack and fearful repulse, is twenty-three miles to the south, on the

Potomac at Washington.

Appomatox, an affluent of the James, and lately contained about 14,000 inhabitants. *Norfolk*, the principal port, near the mouth of the river, and a naval station, was abandoned and dismantled by the Federals on the secession of Virginia, to prevent ships and stores from falling into the hands of the Confederates. A few miles on the south the tract known as the Dismal Swamp commences, extending into North Carolina. It is about thirty miles long and ten broad, thickly wooded with pine, juniper, cypress, and, in the drier parts, with white and red oak, in some places almost impervious from the dense growth. A canal runs through the swamp, and a lake occupies the centre. *Fredericksburg*, midway between Richmond and Washington, with other small towns and villages on the route, have been brought out of obscurity by severe skirmishes and great engagements. *Harper's Ferry*, often mentioned in the story of the struggle, is on the Potomac, fifty-three miles above Washington. It was the scene of John Brown's imprudent enterprise in 1858, and the site of a national foundry, armoury, and arsenal, destroyed by the United States government.

The western part of Virginia, adhering to the Federal cause, constituted itself into a separate state in 1861, and was reorganised by Congress in the following year. It embraces an area of 20,000 square miles, and has *Wheeling* on the Ohio, the seat of extensive glass and iron manufactures, for its chief town. Its Great Seal is two and a half inches in diameter, and bears the legend, 'State of West Virginia,' with the motto, *Montani semper liberi*, 'Mountaineers always free.' In the centre is a rock, with ivy, considered by the National Almanac emblematic of stability and continuance.

The CAROLINAS, North and South, originally constituted a single province; and the two are still commonly associated in popular speech, being bordering districts, distinguished by the same natural features and industries, a remark which applies also to GEORGIA, their southern neighbour. These states have islet-fringed shores, on which the celebrated 'sea island cotton' of commerce is grown, with a broad belt of low country extending to the distance of from 80 to upwards of 100 miles inland. This district is nearly a dead-level, swampy in many places, where fine rice-grounds are formed; sandy in others, but thickly clothed with pine forests supplying pitch, tar, turpentine, and timber. More in the interior the surface swells into hills and rises into mountains, forming part of the Alleghanies, which attain in Mitchell's Peak, North Carolina, to 6000 feet above the sea, and sustain table-lands of considerable elevation. The chief rivers are the Santee, in South Carolina, and the Savannah, which forms the border between it and Georgia. FLORIDA, the most southerly member of the confederation, is one of the least populous and important. It is mainly a long and broad peninsula, projecting between the Atlantic and the Gulf of Mexico, and containing more prominently the low, marshy, sandy, and woody belt of the preceding districts, possessing a very dangerous sea-board. Making a close approach to the tropics, oranges, lemons, figs, pomegranates, and dates are common fruits.

The Carolinas are named after Charles II. The king made a grant of the whole country from the Atlantic to the Pacific Ocean, between the parallels of 29° and 36° 30', to eight needy courtiers, who forthwith engaged in the most enormous land speculation on record. The allotment embraced the present provinces of North Carolina, South Carolina, Georgia, Alabama, Tennessee, Louisiana, Mississippi, Arkansas, much of Florida and Missouri, nearly all Texas, and a large portion of Mexico. The charter constituted them absolute proprietors of the soil, with power to establish cities and manors, baronies and counties, create orders of nobility, erect fortifications, and levy troops. The most active member of the incorporation was Ashley Cooper, Earl of Shaftesbury, whose name is commemorated by the Ashley and Cooper Rivers flowing by Charleston. Emigrants were offered land cheaply, and invited to meet the agent of the proprietors, at the 'Caroline Coffee House, Birch Lane, near the Royal Exchange, every Tuesday morning at eleven o'clock.' The first settlers sailed in January 1670, and founded Charleston. Locke, the philosopher, drew up officially a scheme of government for the dawning states, the Constitutions of Carolina, much vaunted of in their day, but impracticable and fantastic. His autograph is said to be preserved in the Charleston public library.

*Raleigh*, in North Carolina, and *Columbia*, in the southern province, are small but pleasing interior towns, the seats of their local legislatures. *Charleston* is maritime, and the most important city on the Atlantic sea-board south of the Potomac. It occupies a tongue of land between the rivers Ashley and Cooper, 780 miles from New York. The confluent streams form a bay two miles wide, and extending seven miles to the ocean, studded with small islands occupied by forts, now dismantled by the guns of the Federals. The site was called Oyster Point by the first settlers, from shell-fish being numerous. Amid ancient groves of pine, cedar, and cypress, that swept down to the water's-edge, covered with the yellow jasmine, the rude cabins of husbandmen antedated the modern city of merchants and planters, now of soldiers. It was long renowned for its splendid vegetation, especially in the Broadway, the present Meeting Street. Houses, furnished with piazzas, and ornamented with vines; gardens of orange-trees, peaches, and magnolias; and streets lined with

the 'Pride of India,' and other beautiful trees, were lately prominent in its appearance. Before the war Charleston contained a population of 41,000. Though gallantly defended, it must have suffered severe material injury from the furious attacks of the northerners. The city will have a place in history, as having by its Act of Secession and the attack on Fort Sumter, when held by a small national garrison, taken the initiative in the most bloody civil contest which has marked the annals of the world.

Georgia was the last planted of the states which formed the original Union, and has its name from George II., in whose reign the first white settlement was made. *Savannah*, on the estuary of the river so called, is the largest and most commercial town, with an excellent harbour, and a population of 28,000. Florida, nominally a Spanish possession down to the year 1819, was so denominated from being discovered on Palm Sunday, *Pasqua Florida*. Favoured by the swamps, the Seminole Indians long maintained their independence, after the annexation of the territory to the great republic. The region is very remarkable for a vast amount of surface water, which forms the extensive grass-ponds called the 'Everglades.' Low islets off the south coast, known as the Florida Keys, have always been the dread of mariners. *St Augustine*, a decayed place, two miles from the Atlantic shore, is the oldest town in the United States, having been founded by the Spaniards in 1564.

ALABAMA, the first in order of the Gulf states, proceeding from east to west, has only a limited extent of coast-line in direct distance, but embraces the deep and spacious inlet of Mobile Bay, which includes several harbours. Inland, the territory assumes the form of a rectangle of considerable breadth and length, in the northern section of which the Alleghanies terminate. Thence the surface declines from mountains into elevated hills, clothed with oaks, poplar, hickory, elm, chestnut, and mulberry; and into a low country in the southern part of deep rich soil, often swampy. Here the natural forests are of pine and cypress, while groves of oranges and lemons are luxuriant, and cotton, rice, and sugar are raised. The two principal streams are the Alabama and Tombigbee, both navigable for steamers, which unite to form the Mobile, at the outlet of which the city of the same name is situated. The states of MISSISSIPPI and LOUISIANA, westward, correspond generally to the preceding district in natural features and cultivated products, with the exception of having only very slight elevations of the surface within their limits, with a larger proportion of woodland, marsh, and open prairie. The great stream is for several hundreds of miles the dividing-line between them, and receives the Red River on the west bank, the Yazoo and the Big Black on the east. But its outlet and entire delta belong exclusively to Louisiana. Extensive portions of both states are below the high-water level, and have to be protected from submergence by levées or dykes, the rupture of which by the power of the current occasions destructive inundations.

The number of foreign-born inhabitants in these states is by far the greatest in Louisiana, though its population is inferior to either of the other two. In 1860 it amounted to 81,029, while Alabama had only 12,352 and Mississippi 8558. Of the total, 101,939, there were 29,223 Germans and 37,764 Irish.

Alabama was admitted into the Union in 1819. The name is Indian, signifying 'Here we rest,' said to have been the exclamation of a chief in allusion to its well-stocked hunting-grounds. Deer and wild turkeys are still abundant in the woods; and aquatic fowl are plentiful. Mineral waters of various kinds are numerous. Blount's Springs, chiefly sulphureous, in the northern district, is a fashionable watering-place. *Montgomery*, the seat of government, is handsomely built, occupies a central position, and was the capital of Secession prior to Richmond. *Tuscaloosa*, on the Black Warrior River, possesses the state university, a very fine pile of buildings. *Mobile*, the important city and only seaport, stands at the outlet of the river, and the head of the bay which bears its name. Before the blockade it was one of the largest of the shipping ports for cotton, which always commanded a high price in the Liverpool market, and contained a population of 29,000. It occupies a spacious plain elevated above the highest tides, open to the sea-breezes, and overlooks beautiful prospects. The bay is thirty miles long by from three to eighteen miles broad, protected at the entrance by Forts Morgan and Gaines, taken by the Federal squadron under Admiral Farragut in 1864.

The state of Mississippi became a member of the Union in 1817. *Jackson*, centrally placed on the Pearl River, the seat of the legislature and public institutions, was captured and partly destroyed by the Federals in 1863. It communicates by railway with *Vicksburg*, forty miles westward, on the left bank of the Mississippi, forced by famine to surrender in the same year to General Grant. *Natchez*, lower down on the river, derives its name from a tribe of Indians who destroyed an infant settlement at the spot, were afterwards defeated, and the survivors sold into slavery in St Domingo.

*Louisiana*, planted by the French in 1699, has its name from Louis XIV. of France. In 1803 it was purchased by the Washington government from Napoleon I. for 15,000,000 dollars, and became a recognised

state in 1812. *Baton Rouge*, the seat of its legislature, is a small modern town on the east bank of the Mississippi, occupying the first bluff met with on ascending the stream. The bluffs are masses of limestone on its banks, often perpendicular, seeming at a distance like the walls and battlements of a city. They are striking objects, and relieve the monotony of the channel in its lower course. *New Orleans*, the commercial capital, called the 'Crescent City' from the shape of the older portion, is situated on the same side of the great river, about 100 miles from its mouth following the current, 1172 miles from Washington, 1397 from New York, and 1612 miles from Boston. Though on the *eastern* bank of the stream, it occupies a bend so deep and sinuous that the inhabitants see the sun rise over the *opposite* shore. The site is several feet below high-water mark, protected from the invasion of the flood by a broad *levée*, which forms a splendid promenade, and is convenient for shipping purposes. Owing to the soil being saturated with water, no underground cellars can be made, and the dead are not buried in the cemeteries in excavated graves, but in tombs above the surface, called 'ovens.' The hotels, theatres, and public buildings are magnificent, and the villas of the wealthy in the suburbs are very beautiful. They are built of planks, called frame-houses, painted white, with green venetian blinds; and have verandahs running round them, with which tropical plants entwine, while groves of orange-trees are in the gardens. But yellow fever occasionally visits the city with fatal effect, especially to the unacclimatised. Previous to the outbreak of hostilities it contained a population of 163,000, of a most promiscuous description, but chiefly Americans, French Creoles, and Negroes; and was the seat of a vast commerce in cotton and sugar. In the streets might be seen the 'dark, sallow, black-bearded, and mustached Spaniard; the smooth, clean-shaved, lantern-jawed Yankee; the light-haired, greasy, and red-faced German; the smug Englishman; the cautious, keen Scot; the Celt, with his rich brogue; the proud southern planter, in Panama hat, purest of linen and whitest of clothes; the reckless Texan, with broad felt sombrero, and trousers tucked into his high boots; the tall flat-boatman, in hunting-shirt and leggings; and the Mexican, with his everlasting corn-shuck cigarita in his mouth.' In 1862 the city surrendered to the Federal navy under Farragut, and has since been subject to military government.

TEXAS embraces the coast from Louisiana to Mexico, and has a vast inland extent, being larger than the whole of France, possessing natural resources as well as space to sustain an immense population, and form the seat of a flourishing independent empire. The country is flat for some distance from the shores, and exhibits an uninterrupted sea of verdure, the view of which is only bounded by the horizon. Then the surface rises in gentle knolls forming the 'rolling' prairies, some of which are park-like, being dotted with single trees, or with clumps of timber called 'mottes,' behind which fancy is apt to picture the lordly castle or stately mansion, where there is probably not a single hut for miles. More in the interior, the elevations become hills of considerable height, and then mountains on the north-western frontier, the summits of which are covered with snow for many months of the year. Few districts are so well supplied with springs, streams, and rivers. All the latter flow from the north-west, and eventually pay tribute to the Mexican Gulf. The Colorado and the Brazos are the most important. Wood generally form their border, varying from a few yards to twenty miles in width, but occasionally the grass of the prairies runs up to the bluff banks. Cotton, sugar, and tobacco are raised, and cattle breeding is very extensively conducted. Many of the *rancheros*, or stock-owners, possess 20,000 head, have good houses, generally built where tall trees afford a shade, with which orchards of peach, nectarine, fig, and other fruits are connected, as well as gardens of tropical plants and flowers.

The name Texas is Indian. It is related that a tribe driven from their hunting-grounds by more powerful neighbours wandered south. Reaching a high prairie swell, the chief gazed with silent delight upon the plains, covered with vast herds of deer, bison, antelopes, and other animals. Waving his arm, he called the attention of his warriors to the fair landscape with the exclamation, 'Texas, Texas!' or 'Plenty, plenty!' Texas, originally part of Mexico, gained independence under General Houston by the decisive battle of San Jacinto, April 21, 1836. It remained a separate republic till the year 1845, when by vote of the people it was annexed to the United States. *Austin*, on the Colorado, about 200 miles from its mouth, ranks as the seat of government; *Houston*, on the Buffalo, is larger; but *Galveston*, at one extremity of an island of the same name, is the principal place, containing 10,000 inhabitants and some good public buildings. The island is a long narrow tract of sand, destitute of timber, except three trees, called the 'lone trees,' which form a well-known landmark for coasting vessels. Lafitte's Fort is at one end of the town, the stronghold of a notorious buccaneer of that name, ultimately pardoned by General Jackson, for services rendered to the Americans during the British attack on New Orleans in 1815. His story is said to have suggested adventures connected with a different sea in Lord Byron's *Corsair*.

## IV. WESTERN STATES.

|                      | Area in Square Miles. | Population.         | Capitals and Chief Towns.               |

| Minnesota, . . . . . | 83,531 . . . . .      | 173,855 . . . . .   | St Paul, St Anthony.                    |

OHIO, on the west of Pennsylvania and Virginia, is extensively enclosed by the river Ohio, and the south-western waters of Lake Erie, which give it a fluvial boundary of more than 400 miles, and a lake frontier of 230 miles. It embraces a large section of the mineral region of the Alleghanies, where coal and iron are worked; possesses prolific salt-springs and oil-wells; includes important remains of the natural forest; and the heaviest crops of cereal produce are obtained without manure from the alluvial soil of the valleys, which contribute numerous streams to the bounding lake and river. Most of the hills have also deep rich soil, and are capable of being cultivated to their summits. Thus endowed with great advantages by the bounty of nature, this territory has rapidly accumulated a large and prosperous population, while the unoccupied and even untouched tracts are still extensive. MICHIGAN, on the north-west of Ohio, is chiefly included within the great horseshoe bend of Lakes Erie, Huron, and Michigan, a level tract covered with pine woods interspersed with prairies, but has a detached portion between the last-named expanse and Lake Superior, boldly rugged and also forest clad. An enormous quantity of timber is annually prepared for export; the agricultural produce is considerable; and pastoral husbandry is also pursued. INDIANA touches the southern shore of Lake Michigan, extends thence to the banks of the Ohio, and has its affluent, the Wabash, running along the greater part of its western border. It is a region of alternate forest and prairie, with tillage and the rearing of live-stock for prevailing pursuits.

The state of Ohio was admitted into the Union in the year 1803, and ranks the third in the number of its foreign born inhabitants, or next to New York and Pennsylvania. Germans vastly preponderate. In 1860 they amounted to 168,210, while the Irish only numbered 76,826, the English 32,700, and the Scotch 6535. *Columbus*, the political capital, on an affluent of the Ohio, is a town of moderate size, possessing a state library of 26,000 volumes. Its site was part of the wilderness in 1812. *Cincinnati*, situated on the north bank of the main river, the pride of the West, is the largest city between the Alleghanies and the Pacific Ocean. It was founded in 1789 by a few families from New England and New Jersey, and was only a log-built village of 750 souls at the beginning of the century, and has now a population of 160,000, with palatial banks, hotels, and warehouses, from forty to fifty churches, a Roman Catholic cathedral, an observatory, several markets, and all the appurtenances of a great metropolis. The Public School Library contains 25,000 volumes, the Mercantile 21,000, and St Xavier's College 17,000. The manufactures are various; that of household furniture, chiefly sent down the river by the steamers for the rising places in the far western wilds, is very extensive. *Cleveland*, on Lake Erie, is the principal grain mart, containing 55,000 inhabitants. The corn is thence shipped to Buffalo, and reaches the Atlantic sea-board by the Erie Canal.

MICHIGAN, a youthful state, dating from the year 1837, has *Lansing* for its seat of government, where the first settlement was made in 1847. *Detroit*, the principal town, is of old establishment, having been founded as a fur-trading post by the French Canadians nearly two centuries ago. It stands on the river of its own name which connects Lakes Huron and Erie, and forms the frontier from Upper Canada. The place is actively commercial, containing a population of 45,000. Thousands of emigrants annually disembark here bound for the far west. Indiana became a member of the Union in 1816, and has *Indianapolis* for its capital, with 30,000 inhabitants, near its centre.

KENTUCKY, one of the older states, has the course of the Ohio for its northern border,

and that of the Mississippi for the western, which forms in that direction the limit of TENNESSEE, a southerly adjoining district. Both have a generally hilly surface, abundantly wooded, with the Cumberland Mountains on the eastern side, a branch of the Alleghanies. They correspond in their staple agricultural products, wheat, maize, and tobacco, while cattle-rearing is pursued upon a great scale, and enormous numbers of swine are fed on mast in the forests. Limestone is likewise the prevailing substratum in both states. It abounds with fissures, called 'sinkholes,' in which entire streams disappear in the dry season; it also contains some chambered stalactital and osseous caverns of immense dimensions.

Kentucky dates as a state from the year 1792. *Frankfort*, the legislative seat, is of far inferior importance to *Louisville*, an increasing city of 69,000 inhabitants, at the Rapids of the Ohio. A short canal obviates the obstruction offered here to the navigation, but when the water is high the largest steamers traverse the river

Mammoth Cave, Kentucky.

without difficulty. The great Mammoth Cave, in Edmonson County, once containing remains of the fossil elephant, is the largest known cavern in the world. It consists of a series of chambers connected by passages, which have been explored through a length of ten miles, and has probably been the bed of a subterranean river. TENNESSEE was received into the Union in 1796. *Nashville*, the capital, on the banks of the Cumberland, contains a costly state-house, with about 16,000 inhabitants, and has the 'Hermitage' in the vicinity, once the residence of President Jackson. It was taken in 1862 by the Federals under General Rosencrans. Afterwards (Jan. 1—3, 1863) the Confederates under Bragg were defeated in a great battle at *Murfreesboro'*, a town on the south-east. *Memphis*, seated on a fine bluff of the Mississippi, above its highest floods, was highly prosperous before the war, as the outlet of a cotton region, containing a navy-yard, fifteen churches, with daily and weekly newspapers, and a population of 22,000. Captured by the Federals in 1862, it became the base of their operations against Vicksburg, lower down the river.

ARKANSAS, separated by the Mississippi from the southern part of Tennessee, derives its name from a principal affluent of the great river by which it is intersected, and divided into two nearly equal portions. It contains a large extent of prairie-ground, with the usual animals in abundance, but has a very spare population in proportion to the area,

which is about the same as that of England, with no settlements ranking above the size of villages. MISSOURI, on the north, extends along the course of the Mississippi-Missouri, and embraces a series of rolling prairies, occasionally swelling into hills stored with mineral wealth, bituminous coal, iron, and lead ores. KANSAS, on the west, is a similar district, but more extensively in a state of nature.

Both Arkansas and Missouri had at an early date a few French settlements, and were included in the Louisiana purchase from Napoleon I. They were admitted into the Union, the former in 1836, the latter in 1821. Kansas was received in 1861. No towns occur entitled to notice except *St Louis*, the 'Queen of the Mississippi Valley,' belonging to the state of Missouri. This is the commercial emporium of the West, and the principal dépôt of the American Fur Company, a scene of extraordinary activity. It is seated upon one of the limestone bluffs of the 'Father of Waters,' eighteen miles by the stream below the junction of the Missouri, 1100 below the Falls of St Anthony, 1132 above New Orleans, and 808 miles from Washington. The spot was selected by Laclede, a French trader from Canada, in 1764, for a trading post with the Indians, who foretold its rise to distinction from the favourable site, in command of a vast river-navigation. But half a century ago it was still only a paltry hamlet. St Louis has now a population of 160,000, chiefly collected since the year 1840, with spacious streets, costly public edifices, several colleges, a United States' arsenal and barracks, a full complement of churches, and a vast transit trade. The city presents a beautiful appearance as seen from the opposite bank of the river, and as approached on its surface. Long caravans of emigrants leave it annually for the country beyond the Rocky Mountains, and on the western side of the state, at the small town of *Independence*, make the final start for the weary pilgrimage.

Between the three states of Kansas on the north, Arkansas on the east, Texas on the south and west, lies the Indian Territory, set apart by Congress for the native tribes compelled to remove from the Atlantic side of the Mississippi, owing to the 'pale faces' taking possession of their land. The district contains 70,000 square miles, abounds with game, and is plentifully watered. Remnants of the red race brought from distant points are here located, provided with industrial schools, and allowed an annual grant to aid in procuring the means of subsistence. A Commissioner of Indian Affairs, to take charge of these sons of the wilderness, Cherokees, Creeks, Seminoles, Choctaws, and others, was appointed by the Washington legislature in 1862.

ILLINOIS touches upon the southern shore of Lake Michigan, and extends along the eastern side of the Mississippi to the confluence of the Ohio, contributing to the great central water-course the river from which the state derives its name, and other affluents. It is eminently a region of fertile prairies, with great depth of vegetable soil, a few low hills, interspersing groves of timber, rich lead deposits, iron and coal in abundance. IOWA, westward, has the same superficial aspect and natural resources, in which WISCONSIN shares, extending northward from the shores of Lake Michigan to the far extremity of Lake Superior. MINNESOTA stretches from the last-named expanse to the Lake of the Woods, and along the parallel of 49°, which forms the dividing-line from British ground. It includes a tract of limited extent, but remarkable importance in the hydrography of the continent, or the table-land of no considerable elevation, where, within a few miles of each other, rivers begin their flow in opposite directions, the Red River communicating with Hudson's Bay, the St Louis with Lake Superior and the Gulf of St Lawrence, and the Mississippi with the Gulf of Mexico.

Illinois was received into the Union in 1818. The population has increased with marvellous rapidity from 12,282 in 1810 to 55,211 in 1820, 157,445 in 1830, 476,183 in 1840, 851,470 in 1850, and 1,711,951 in 1860. The state ranks the fourth in the number of the foreign born, who amount to nearly one-fifth of the whole. These included at the last-named date 130,804 Germans and 87,573 Irish. Illinois abounds with the tracts called 'bottoms' and 'barrens' in the peculiar dialect of the West. The bottoms are on the river-margins, and consist of the richest land, formed of alluvial deposits. An extensive tract of this description commences at the mouth of the Kaskaskia, on the Mississippi, and runs up the course of the latter for the distance of ninety miles, having an average width of five miles. It bears the name of the 'American bottom.' Hedges of the Osage orange are common in many parts, and make good fences. *Springfield*, in the centre of the state, was laid out as the seat of its public institutions in 1822, but has lagged behind other towns of more recent date. *Chicago*, the largest, at the outlet of a river of the name into Lake Michigan, has a singularly advantageous site. There is a fine expanse on the one hand, a fertile prairie on the other, with extensive tracts of timber at hand, and a good river harbour in its centre. This is perhaps the most remarkable city in the world for rapid growth. The name, which is Indian, pronounced *She-kaw-go*, has long been known, and the place was occupied by the frontier military post of Fort Dearborn down to the year 1831, around which the wolves howled, and the natives had their wigwams. There were then about seven families of whites, besides the few soldiers, for whose wants a single log-tavern sufficed. In the brief interval since, a population of 160,000 has

been gathered, in possession of first-class public buildings, immense storehouses, numerous shipping, and the place is second to none as a great grain-dépôt. It has its Historical Society, with a library of 15,000 volumes, and a Young Men's Association, with 10,000. *Galena*, in the north-west corner of the state, is the metropolis of the lead-mining region, to which it owes its origin and name. The town contains about 14,000 inhabitants, and sent out annually upwards of 42,000,000 lbs. of the metal before the war. *Nauvoo*, on the Mississippi, was the original seat of the Mormon community, where their first prophet, Smith, was killed by the mob in 1844, which led to the exodus of his followers, 20,000, to the Great Salt Lake, and reduced the place to insignificance.

Iowa was recognised as a state in 1846, Wisconsin in 1848, which contains *Milwaukee*, a town of 40,000 inhabitants, on Lake Michigan, and Minnesota in 1857. This last, in 1862, suffered an awful calamity. Instigated by reports concerning the war, as well as by some real grievances, the Sioux Indians rose against the settlers, burned their houses, murdered the inmates or carried them into captivity, sparing neither age nor sex, and ravaged a broad tract of country upwards of 200 miles in length. A military force hastily collected checked the massacre, and finally wholly dispersed the natives, taking many of them prisoners, of whom thirty-eight were hanged on the same scaffold. *St Paul*, the state capital, is on the Mississippi, first settled in 1846 by about ten persons, and possessing 10,000 inhabitants in 1856. The Falls of St Anthony, fourteen miles above, mark the head of the navigation, and were so named by Friar Hennequin, the first European who reached them, about the year 1680, from his patron saint. The river is here divided by an island into two branches, the largest of which is about 300 yards wide. The perpendicular descent is not considerable, but rushes down a steeply-inclined bed with great grandeur. A beautiful cascade in the neighbourhood has the name of Minnehaha, or the 'Laughing Water.' Minnesota contains an immense number of small clear lakes, abundantly stocked with fish, the shores of which have generally features of the bland description.

Minnehaha Falls, Minnesota.

V. PACIFIC STATES.

|                       | Area in Square Miles. | Population.       | Capitals and Chief Towns.       |
|-----------------------|-----------------------|-------------------|---------------------------------|
| California, . . . . . | 188,932 . . . . .     | 379,994 . . . . . | Sacramento City, San Francisco. |
| Oregon, . . . . .     | 95,274 . . . . .      | 52,465 . . . . .  | Salem.                          |

CALIFORNIA, on the Pacific Ocean, embraces as a state only a small portion of the geographical region known by the name, parts of which have been assigned to other

sectional divisions, while a southern tract remains within the limits of Mexico. It extends northward from the long narrow peninsula and Gulf of California to the border of Oregon, and from the sea-board inland to the high chain of the Sierra Nevada. Parallel to the coast, and only a short distance from it, runs a subordinate range of mountains, between which and the inner range lies a grand longitudinal hollow, the distinguishing feature of the country. This great valley has a length of 500 miles from north to south, by an average breadth of 50 miles, but includes valleys of smaller extent, formed by lower lateral ridges along the main chains. It is traversed from the north by the Sacramento River, and from the south by the San Joaquin, which come to a confluence towards the termination of their course, and enter as one stream the noble harbour of San Francisco. While renowned for gold, other metals are either obtained or are known to exist in this region; as silver, quicksilver in the form of cinnabar, platina, copper, and iron. The finest timber in the world is also found within its limits in pines of giant height and girth; and all the fruits of the warm and more temperate countries of Europe are raised in perfection, from the apple to the olive, from the grape to the orange.

California was obtained by cession from Mexico at the close of the war with that country in 1848. It was then very scantily peopled by cattle-breeders and trappers, who exported hides, tallow, and furs. But the discovery of gold, which had just before been made, in Sutter's mill-race, Sacramento Valley, changed as if by magic its industry and aspect. Thousands poured in from the Atlantic states and other quarters; and the territory speedily acquired a population sufficiently large to be received as a state into the Union, which took place in 1850. In the interval from April 1849 to December 1856, gold was exported of the average value of more than £9,000,000 per year. It was entirely obtained at first from the drift in the great valley, composed of a heterogeneous mixture of clay, sand, gravel, and pebbles, varying in thickness from a few inches to several feet. But quartz-crushing mills were speedily introduced for its extraction from the solid rock. In 1861 there were 192 quartz-mills in operation, and the mining ditches, or 'diggings,' numbered 481, having a total length of 4300 miles. The gold has attracted a large body of foreigners. There are Dutch, Swedes, and Norwegians, Greeks, Italians, and Swiss, French and Spaniards, Russians and Poles, West Indians and Sandwich Islanders. The three largest numbers are contributed by the Germans, 21,646, the Irish, 33,147, and the Chinese, 34,935. But during the last ten years the yield of gold has immensely diminished. In 1852 diggers commonly earned ten dollars per day, but can scarcely obtain one-fifth of that amount at present. Many anticipate that by the year 1872 no white man will be found in California engaged in gold-digging, and hence attention has been turned to other pursuits.

Permanent snow caps the higher summits of the Sierra Nevada, while the lateral ridges are clothed with forests of oak, fir, arbor-vitæ, and various pines of huge dimensions. Fremont measured one tree that was 21 feet in diameter, or 66 in circumference; and larger examples are met with. Some pines in the valley of Murphy's, locally called the 'Big Trees,' have made the site a place of pilgrimage. The village is about 2000 feet above the sea, and the trees, fifteen miles distant, require an additional ascent of 2500 feet to reach them. 'Huge shafts of fir, arbor-vitæ, and sugar-pine,' remarks a visitor, 'arose on all sides, and the further we advanced the grander and more dense became the forest. Whenever we obtained an outlook, it revealed to us hills similarly covered; only now and then, in the hollows, were some intervals of open meadow. The air perceptibly increased in coolness, clearness, and delicious purity. The trees now rose like colossal pillars, from four to eight feet in diameter, and 200 feet in height, without a crook or a flaw of any kind. There was no undergrowth, but the dry soil was hidden under a bed of short golden fern, which blazed like fire where the sunshine struck it. Our progress, from the ascent, and the deep dust which concealed the ruts, was slow, and would have been tedious but for the inspiring majesty of the forest. But when four hours had passed, and the sun was near his setting, we began to look out impatiently for some sign of the Trees. The pines and arbor-vitæ had become so large that it seemed as if nothing could be larger. As some great red shaft loomed dusky through the shadows, one and then another of us would exclaim, "There's one," only to convince ourselves, as we came nearer, that it was not. Suddenly, in front of us, where the gloom was deepest, I saw a huge *something* behind the other trees, like the magnified shadow of one of them, thrown upon a dark-red cloud. While I was straining my eyes, in questioning wonder, the road made a sharp curve. Glancing forward, I beheld two great circular—shot towers? Not trees surely!—but yes, by all the Dryads, those are trees.' The colossi, to the number of ninety, are scattered through the forest over a space half a mile in length. They have all received names, more or less appropriate, as the 'Beauty of the Forest,' the 'Three Graces,' 'Uncle Tom's Cabin,' the 'Old Bachelor,' the 'Old Maid,' 'Hercules,' and the 'Mother of the Forest.' The last is 93 feet in circumference and 325 feet high. The bark, which has been stripped off to the height of 110 feet, represents her in the Crystal Palace, Sydenham.

*Sacramento City*, the state capital, on the river of that name, and *Stockton*, near the San Joaquin, are the principal inland towns. *San Francisco*, the commercial metropolis and great shipping port, contains a

varying population of from 50,000 to 60,000. It is seated on the shore of a landlocked bay, resembling a lake in its placid aspect, and a highland loch from the adjacent mountain scenery, with space enough to contain all the navies of the world, and depth of water for the largest vessels. Many islands dot the surface. The entrance to the bay, a few miles distant, is comparatively narrow, and bears the not inappropriate name of the 'Golden Gate.' Being built almost wholly of wood, the city has often suffered from fires. But it was visited by an opposite calamity in 1861-62, a succession of tremendous floods, which submerged the lower rooms of the houses, converted the streets into navigable canals, and suspended communication through a wide area of the country except by the telegraph-wires. Large quantities of snow had fallen in the mountains, followed by warm rains, which, as estimated by the rain-gauge at some stations, amounted to the extraordinary fall of three feet nine inches in a single month. Hence the lower part of the great valley was changed for a time into a spacious lake—nearly the extent of Lake Michigan—and property was destroyed valued at several millions of dollars. But unquestionable evidence was afforded, by the age of the trees swept down, and other circumstances, that no such deluge could have occurred for several centuries. *Benicia*, on Karquenas Strait, possesses an arsenal, a navy-yard, and large docks, with a name rendered familiar as the cognomen of the 'Boy' who crossed the ocean to fight his battle with the champion of England.

The vegetation introduced into California is now very varied, and has succeeded remarkably well. In 1861 there were, in round numbers, 2280 pomegranate-trees, 3700 of olive, 5700 orange, 19,000 fig, 50,000 apricot, 53,000 nectarine, 115,000 plum, 212,000 pear, 960,000 peach, and 1,170,000 apple-trees, with 10,590,000 grape vines, estimated to cover 11,500 acres.

OREGON extends northward on the coast from California to the Columbia River, and is a similarly mountainous and woody region. The state is the youngest member of the Union, admitted in 1859, at present in an early stage of transition from the natural wilderness to civilised occupation and culture. One branch of the frontier river descends from British America, and the entire navigation is open alike to British and Americans, but is of little value, as the stream is broken up by falls and rapids into many separate portions. Its mouth was the site of the fur-trading post founded in 1811 by Mr Astor, the enterprising merchant of New York, a commercial adventure which forms the subject of Washington Irving's *Astoria*.

VI. TERRITORIES.

|                       | Organised.     | Estimated Area.<br>Square Miles. | Capitals.             |
|-----------------------|----------------|----------------------------------|-----------------------|
| New Mexico, . . . . . | 1850 . . . . . | 124,450 . . . . .                | Santa Fé.             |
| Utah, . . . . .       | 1850 . . . . . | 109,600 . . . . .                | Great Salt Lake City. |
| Washington, . . . . . | 1853 . . . . . | 71,300 . . . . .                 | Olympia.              |
| Nebraska, . . . . .   | 1854 . . . . . | 63,300 . . . . .                 | Omaha City.           |
| Colorado, . . . . .   | 1861 . . . . . | 106,475 . . . . .                | Golden City.          |
| Dakota, . . . . .     | 1861 . . . . . | 152,500 . . . . .                | Yangton.              |
| Nevada, . . . . .     | 1861 . . . . . | 83,500 . . . . .                 | Carson City.          |
| Idaho, . . . . .      | 1863 . . . . . | 333,200 . . . . .                | Florence.             |
| Arizona, . . . . .    | 1863 . . . . . | 130,800 . . . . .                | Tucson.               |

The population of these territories has in some instances not been taken, and in others, returns have been rendered fallacious by a redistribution of their limits. With few exceptions, the towns are infant settlements. Only a general idea of the relative position of the districts need be given.

NEW MEXICO, ceded at the close of the war in 1848 by the Mexican government, is immediately west of Northern Texas, and contains the head waters of the Rio Grande, in the long valley of which the greater part of the inhabitants are settled. They consist of whites chiefly of Spanish descent, with semi-civilised Indians in villages, and wild predatory Indians in the open country. *Santa Fé*, twenty miles east of the great river, is a small old town of Spanish foundation, maintaining trading communication by mule and wagon trains with St Louis in Missouri. The full name is *Santa Fé de San Francisco*, 'Holy Faith of St Francis.'

UTAH embraces the central part of Fremont's 'Great Basin,' or the valley between the Sierra Nevada and the Rocky Mountains, distinguished by the Great Salt Lake, about 75 miles in length, and 4200 feet above the sea, supposed to be the Lake Temponogos visited by the early Spanish ecclesiastics. Fremont conducted the first boat expedition ever attempted on the surface in 1843. It contains several mountainous islands. The water is strongly charged with common salt, almost transparently clear, and of an extremely beautiful bright-green colour. The shores are whitened with incrustations of the mineral from the spray of the waves. A smaller fresh-water expanse on the south, Lake Utah, at a higher level, pours its overflow into it by the river Jordan. The inhabitants of this region are mostly Mormons, or, as they style themselves, the 'Church of Jesus Christ of the Latter-Day Saints,' who originally emigrated from the state of Illinois, in order to secure freedom from molestation in the great mountain valley, and have been annually joined by recruits

from the old countries of Europe. However wild their religious views, fantastic their ecclesiastical organisation, and odious their polygamy, no colonists have ever been more energetic and successful, having converted a naturally barren land into a lovely region of cultivated fields, rich orchards, flower-filled gardens, and pleasant residences. Essentially agricultural in their industry, they are strongly opposed to mining adventures which might be profitably conducted. Polygamy, considered to have attained a respectable standard when five wives are possessed, is here productive of a large preponderance of female births, as in other parts of the world where it is practised. *Great Salt Lake City*, near the south-east border of the lake, is regularly built, and contains a population of 15,000. The houses are almost all of the same plain pattern, widely apart from each other, and therefore extend over a great space. The broad streets are lined with trees, and have streams of sparkling water led through them from the neighbouring hills. The site is 776 miles from San Francisco by the ordinary route of land travel, and upwards of 1100 miles from St Joe on the Missouri. In the whole territory the Mormons number 40,000, occupying small towns, many of whom are emigrants from Great Britain and Denmark.

The territory of WASHINGTON extends along the coast of the Pacific, northward from Oregon to British Columbia. That of NEBRASKA lies directly west of the state of Iowa. The route of emigration overland to Salt Lake, California, and Oregon passes through it up the great valley of the Platte or Nebraska River. DAKOTA is immediately on the north, and west of the state of Minnesota, named after an Indian tribe. NEVADA embraces part of the mountain region between Utah and California, rich in mines of the precious metals, especially of silver. In 1862 one of its counties contributed to the United States Sanitary War Commission eight massive silver bars, five of which weighed 111 lbs. each. Quicksilver, lead, and antimony are also found in great abundance. ARIZONA, east of Southern California, and COLORADO, west of Kansas, are both important mineral districts. *Denver City*, the chief town in the last-named territory, contains 5000 inhabitants, and issues two daily papers, the *Commonwealth* and the *Rocky Mountain News*. IDAHO, the youngest organised district, lies north of Utah and Colorado, and extends in that direction to the frontier of British America, an immense region destined at no distant date to be subdivided. It contains the upper waters of the Missouri, Fremont's Peak, and the South Pass of the mountain-range, the great route between the Atlantic and the Pacific states.

The South Pass of the Rocky Mountains is approached by the westward-bound traveller over plains covered with *artemisia*, or wild-sage, which grows as well on the hills as the river-bottoms, and impregnates the air with the odour of camphor and turpentine, which combine in the plants. In the later stages of the weary journey, the upper valley of the Platte is followed, and then that of one of its head branches, the Sweetwater. North of the first-mentioned river are the Red Buttes, a famous landmark, consisting of lofty escarpments of red argillaceous sandstone. The distinctive name is naturalised in the mountain-region from the French *butte*, and applied to all detached hills and ridges which rise abruptly. Along the course of the Sweetwater, the noticeable object is the dome-shaped Rock Independence, an isolated mass of granite, everywhere inscribed with the names of wayfarers, where the surface is sufficiently smooth. A few miles beyond is the Devil's Gate, where the stream cuts through a granite ridge, and flows between vertical walls of rock. The summit of the Pass is gained by a long and very gradual ascent. At the height of about 7000 feet above the sea, the traveller suddenly finds himself in the presence of waters flowing westward to the Pacific Ocean. This is the route of the celebrated Pony Express between California and St Joe on the Missouri. The riders accomplish 100 miles at a time with four changes of horses, and secure communication between San Francisco and New York in less than thirty days.

The general government of the United States is conducted by a President, a Senate, and a House of Representatives, collectively called the Congress, which meets annually at Washington in the month of December. The President is commander-in-chief of the army and navy; and has power, with the concurrence of the Senate, to declare war, make treaties, appoint ambassadors, judges, and other officers of the executive. He must be a native-born citizen, not under thirty-five years of age, and is popularly elected for the period of four years, but eligible for re-election. He takes the following oath at his installation: 'I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the constitution of the United States.' The current presidential term, ending March 3, 1865, is the nineteenth since the establishment of the Republic, but owing to the double terms of Washington and others, the present president is only the sixteenth in the high office. Virginia has contributed five presidents; Massachusetts two; Tennessee two; New York two; and Ohio, Louisiana, New Hampshire, Pennsylvania, and Illinois, one each. The Senate is composed of two members from every state, chosen for six years by their respective local legislatures. The House of Representatives consists of members elected for two years by the people in each state according to population. Both senators and representatives are paid eight

dollars a day during the period of their attendance in Congress, with eight dollars for every twenty miles' travel, by the usual roads, in going to and returning from the seat of government. At the close of the year 1863, the United States contained a white and free coloured population amounting to nearly 30,000,000. Immigration has mainly contributed to this majestic aggregate. It has been calculated, that if there had been no foreign arrivals during the present century, the sum-total would scarcely have reached 10,500,000, by the slow increase produced by the excess of births over deaths.

|  |             |
|--|-------------|
| Since the year 1800, the immigrants and their descendants are estimated at | 19,000,000. |
| Since " 1810, " " " " " "  | 17,000,000. |
| Since " 1820, " " " " " "  | 15,000,000. |

Prior to the war, there were nearly 4,000,000 Negro slaves, a sad additional item to the population under the 'Stars and Stripes,' and a dark blot upon the fame of the Republic, subject to the reproachful reflection upon its statesmen, that previous to the outbreak of existing hostilities no measure was ever submitted to the legislature providing for the abolition of slavery by legal and peaceful means. The great body of the slaves were in Virginia, the Carolinas, Georgia, Alabama, Louisiana, Mississippi, Tennessee, and Kentucky, with a limited number in Missouri, Maryland, Florida, Texas, and Arkansas, and some in Columbia within the very shadow of the Capitol. No religious communion is established or sustained by the government, but liberally is the voluntary system put in action by the people. The Presbyterians, Baptists, and Methodists are numerically the most important denominations; and next the Congregationalists, Episcopalians, Roman Catholics, and Lutherans. Some of these bodies are divided into very numerous sections. The Baptists include the Regular, the Anti-Mission, the Seventh-Day, the Six-Principle, the Free-Will, and the River Brethren communions, with the Winebrennarians, Dunkers, Mennonites, and Campbellites. The Presbyterians are of the Old School, the New School, the Cumberland, the Reformed, the United, and the United Synod Associations. In most of the states large sums are voted by their legislatures for the support of free primary schools, as well as for high schools, gymnasiums, colleges, and universities. School libraries are diffused by thousands throughout the country, and are estimated to contain an aggregate of from five to six millions of volumes.

Great Salt Lake.

Jalapa, from the High Road between Vera Cruz and Mexico.

## CHAPTER IV.

### MEXICO, CENTRAL AMERICA, AND WEST INDIES.

#### I. MEXICO.

**T**HIS country, one of the most remarkable in its physical features, is for the most part an isthmus gradually contracting in width from north to south, intersected somewhat centrally by the line of the tropic, so that the two halves are respectively in the temperate and the torrid zone. It has for its boundaries the Pacific Ocean on the west, the Mexican Gulf on the east, the United States on the north, and the territory of Guatemala on the south. The Gulf of California, on the western coast, upwards of 700 miles long, but comparatively narrow, is the most considerable inlet on that side of the American continent, formerly the site of an important pearl-fishery, now abandoned owing to social distractions and the diminution of the supply. Early navigators styled it the Vermilion Sea, from the reddish colouring of the waters, probably occasioned by the presence of minute animalculæ. The Spaniards name it from its discoverer, *Mar de Cortez*. The distance from sea to sea across the isthmus, where the greatest expansion occurs, scarcely exceeds 500 miles. It decreases southerly to little more than a fourth part of that measurement, but owing to the extension north and south, the area comprises not less than 750,000 square miles. Belts of lowland form the coasts, the broadest of which is on the side of the Atlantic. Between them is an

immense plateau, the main mass of the country, divided into a series of table-lands, ranging in height from 6000 to 8000 feet, on which are populous cities, spacious lakes, mountain-ridges, and numerous volcanic cones, which rise to more than double the elevation of the general surface, far above the snow-line. This plateau region presents a steep face towards the Pacific, but slopes in the opposite direction, and declines gradually towards the north-east. It is formed by the main chain of the Andes, which, after traversing the whole of South and Central America, with a few slight interruptions, ramifies over the greater part of Mexico, and connects itself with the grand chains on the western side of the north section of the continent. Except the Rio del Norte, part of the frontier from the United States, and chiefly in the hands of that power, there are no rivers of navigable value. Most of them have short courses, and either a torrent-like character, or are obstructed by bars of sand at their mouths. This deficiency of water-communication renders it necessary to employ mules for the transport of goods in the interior; and in prosperous times as many as 70,000 of these useful animals have been engaged in the carrying trade between the port of Vera Cruz and the capital. The numerous lakes are the remains of immense basins of water which formerly existed on the elevated plains, and appear to be still annually decreasing in size.

Conical colossal summits rise from the plateau as from an elevated platform, the principal of which extend in a line from east to west, nearly coincident with the parallel of 19°. They are the sites and monuments of volcanic action, some extinct or dormant, while others are frequently in a state of activity. Afar on the waters of the Gulf of Mexico, the seaman hails the snow-crowned peak of Orizaba, also called Citlal-tepetl, the 'Star Mountain,' from its appearing at a distance like a star when fire has been emitted from the summit. It has an elevation of 17,388 feet, occupies the eastern edge of the plateau, is some sixty miles inland, connected by a chain of hills with the Coffer of Perote. This mass of basaltic porphyry is not so lofty, 13,415 feet, but remarkable for a large square box-like rock at the top, which has originated the name, as also that of Nauhcampa-tepetl, or 'Square Mountain,' another denomination. More interior is the stupendous and beautifully-shaped Popocatepetl, 'Smoking Mountain,' 17,735 feet, the highest point of the country, and in near neighbourhood the somewhat broken and irregular Iztaccihuatl, 'White Woman,' not far short of the same height, both overlooking, like guards, the valley of the capital. More to the westward, seen from the waters of the Pacific, is the volcano of Colima, generally with snow on the crest. From many points of the road between Vera Cruz and the city of Mexico, the traveller may look around, and see most of these grand heights at once. Diego Ordaz, in the train of Cortes, with nine companions, made the first attempt to reach the summit of Popocatepetl, a feat which has often been performed since his day, for which the Emperor Charles V. gave him permission to enter a volcano in his coat-of-arms. Clouds of sulphureous vapour, with ashes, issue at intervals from the crater of the 'Smoking Mountain,' but no tradition lingers of the fiery activity of his lady, the 'White Woman,' and Orizaba has long been dormant. Earthquakes, especially of the slighter kind, are common, but have occasionally occurred with tremendous violence, accompanying volcanic eruptions, by which the features of the surface have been permanently changed.

The conformation of the country gives it three distinct zones of climate, and a correspondingly diversified vegetation, indigenous and cultivated. The lowlands belting the whole coast of the Mexican Gulf, extending from the sea-level to the height of 2000 feet, form a hot region, the *tierra caliente*, where the usual high temperature of an equinoctial clime is experienced. This district extends about fifty miles into the interior, and has tracts of desolate sand, the nursery of myriads of sand-flies, a perfect pest to the traveller. They bite with sharpness, and are so small that nothing will exclude them, but fortunately they disappear at sunset, and afford a chance of sleep if the mosquitoes allow of it. Deep black mould of fertile soil appears in other places, where the eye is bewildered with the variety of trees, shrubs, and creeping plants, generally thrown together in such extreme confusion as to render their classification difficult. The air is perfumed with brilliantly-coloured aromatic wild-flowers, while the vanilla, banana, maize, indigo, cacao, cotton, and sugar plants flourish luxuriantly. But the oppressive heat, the abundant rains, and the decomposition of the rank vegetation engender the malaria which produces yellow fever, the scourge of the coast in the summer months. Ascending the plateau, a temperate region is entered, the *tierra templada*, which ranges from the altitude of 2000 to 5000 feet.

Here the deadly fever of the lower zone is unknown; the extremes of heat and cold are never felt; majestic cypresses, forests of the Mexican oak, wheat, and the ordinary cereals of Europe are met with; but thick fogs are common, consequent on the rise of the land to the height to which the clouds usually ascend above the sea. All who have the means leave the lower for the upper zone, Vera Cruz for Jalapa, in the more unhealthy season of the year, to avoid the pestilence. A cold region, *tierra fria*, so considered by the natives, commences at the height of 5000 feet, and embraces the general surface of the tablelands, where, and on the lower slopes of the projecting mountains, pine-woods occur. But only to those who have just left the lowlands is it really cold, as the ordinary warmth is equal to that of Rome. At the altitude of 8000 feet, the atmosphere becomes frigid, and at 14,800 feet the line of perpetual snow is encountered.

The vegetable productions include a splendid variety of flowering shrubs, which have contributed to enrich the gardens of Europe, as in the instance of the well-known dahlia, and several of the fuchsias. At the time of the Spanish conquest of the country a passion for flowers distinguished the natives, and it is still a characteristic of their descendants, exhibited in household life and on festive occasions. Curious and highly useful as well as beautiful species occur. The hand-plant, as it is popularly called, a tree of some size, has the name from the organisation of its bright-scarlet flowers, the central part of which is in the form of the human hand with the fingers a little bent inwards. Around Jalapa grows the convolvulus, the root of which supplies the jalap of medicine, so called from the site. The plant is a parasitical creeper, with leaves like the ivy, and a red flower which shuns the light, opening as the day declines, and hence styled by the French *belle de nuit*. From Mexico we have both the use and the name of chocolate, *chocolatl*, still grown, but supplanted largely by the superior cacao of other countries. The cochineal cactus is abundant, upon which the cochineal insect subsists, feeding only upon the leaves, which are carefully tended by Indian women in the plantations to keep them clean. Another cactus, the magney, is extensively reared, the leaves of which are usually from five to eight feet in length, but often considerably exceed these dimensions. The juice supplies the lower classes with a favourite beverage. Of the leaves the old Mexicans made their paper. The more fibrous parts furnish a strong thread or twine, still made up into ropes. The prickles were formerly used for pins and nails, and the priests pierced their arms and breasts with them in their acts of expiation. A third species looks exactly like an old man's head, as it is covered with long gray hair, which completely conceals the thorns. Nutritious bread is prepared of flour of the manioc root, which in its raw state is an active poison, but loses its deleterious qualities upon the juice being expressed. In the temperate region, cypresses, *Cupressus disticha*, attain extraordinary dimensions.

Wild animals of the formidable class are scarce, though both the jaguar and the puma are met with in the hot region, and the common black bear of the continent is found in the upland forests. The bison and musk-ox wander in immense herds over the northern plains. Birds of resplendent plumage are numerous, parrots, paroquets, and humming-birds of many varieties, the gay feathers of which are still worn by the Indians for ornament as in the time of Montezuma. Feather-painting, an arrangement of the colours so as to produce pictures, was an industry with his subjects, and is not yet obsolete. The low grounds swarm with noxious insects, and snakes are very common, but not generally dangerous. All the domestic quadrupeds introduced by the Spaniards, horses, oxen, sheep, and hogs, have multiplied surprisingly, and may be seen running wild over the open country. The mustang, or wild horse, of which there are vast droves, a spirited, hardy, and active animal, becomes very docile and useful, if captured young, although apt to rejoin the free rovers whenever an opportunity occurs.

From the time of its discovery by Europeans, the country has been renowned for its wealth in the precious metals, especially silver, of which, perhaps, it has yielded a larger supply than any other part of the world. To capture the treasure-ships sailing from Vera Cruz to Spain, or from Acapulco to the Philippines, was long a favourite object with the bucaniers, and with British naval officers in time of war. But the useful metals are not wanting, iron, copper, lead, and tin, though they have been neglected in the anxious quest for the more costly. The total number of mines, of all kinds of produce, worked and disused, has been stated at 3000.

Mexico was conquered by Cortes, who landed upon the Atlantic coast in 1519, at the spot where Vera Cruz now stands, and after two years of warfare, added it to the crown of Spain. It remained in that connection for nearly three centuries, then became an independent state for a short time under an emperor in 1822, and was constituted a Federal Republic in 1824, but has since been subject to the rule of unprincipled military dictators, and the scene of great crimes and public disturbances. Aggressions against foreigners led to the French intervention in 1862, and the conquest of the country, with the recent elevation of an Austrian prince to the sovereignty. The name of Mexico

originated with the Spaniards, who derived it from *Mexitli*, the god of war of the natives. The dominant people at the time of the Spanish invasion were the Aztecs, under Montezuma, who fell in defending his inheritance.

The city of *Mexico*, the capital, is very grandly situated on the central plateau, in the centre of an oval-shaped valley, in latitude 19° 25' north, longitude 99° west, the lowest part of which is still 7483 feet above the sea, while overlooked by towering volcanic mountains. How the Spaniards were filled with admiration at the sight of this valley has been vividly described by Robertson and Prescott, and with similar feelings present external appearances are noted by all travellers. The city stands on perfectly level ground, near the margin of an extensive lake. The streets are broad, and drawn at right angles; and hence looking along any of them, east, west, north, or south, the grand barrier of the mountains appears. Though at the least fifteen miles distant, yet in fine weather, owing to the extreme purity of the air, they are so distinctly seen, that from the intersections it seems as if the streets led directly to them. The houses are substantial, spacious, and terrace-like, having flat roofs. Most of the public buildings are deficient in height, partly owing to the difficulty of securing a firm foundation in a swampy site, and partly from the frequency of earthquakes. Few features of any metropolis are finer than the *Plaza Mayor*, or Great Square, paved throughout, and embracing twelve acres of ground. The north side is wholly filled up with the cathedral and its appurtenances; the east, with the government palace, the former residence of the viceroys; on the west and south are buildings occupied as shops, with covered colonnades, forming a favourite evening promenade. The Alameda, a kind of park at the west end, and the Paseo, a long avenue of trees connected with it, are places of fashionable resort, crowded on a Sunday or *Día de Fiesta*. Churches and convents are extremely numerous. Bell ringing is hence incessant, yet the tones are very sweet, said to be owing to the silver in the composition of the metal. Trading life has no noticeable features, except the profusion of rich flowers and fruits exposed for sale on the stalls, brought in by the country-people; and the odd circumstance that the milliners, those who veritably make up ladies' dresses, are not women, but brawny fellows of all complexions, with moustaches. Gambling, cigar-smoking, and intrigue are the popular pursuits, in which both sexes, and priests as well as seculars, are pretty equally proficient. The population is supposed to number 170,000, embracing a large class of lazzaroni, wretched beings without homes or decent raiment, who live and sleep in the streets, or occupy filthy dwellings in the suburbs.

Travelling from the capital in a northerly direction, along what is called the road of the interior, *Querétaro*, *Guanajuato*, *Aguas Calientes*, 'warm waters,' *Zacatecas*, *Sombrerete*, and *Durango* are successively passed. Some of these are celebrated mining localities, but have only ordinary features. Along part of this route the electric telegraph has been introduced, but it does not seem to have prospered. Von Tamsky, in 1854, noticed the high posts by the wayside, but the wire had snapped, or been intentionally broken, and was lying on the ground, kicked by the mules and asses in the dust of the road. Upon representing the matter to the official in charge at the next diligence station, he coolly answered: 'It always breaks, and so we don't trouble about it any more, as there has been no occasion for it ever since it was first used.' The towns

correspond in their general plan as far as variations of site will allow. They are built in rectangular streets, very regularly laid out, and have at least one square, *plaza*, at or near the centre. In those of the larger class, the central or great square, *plaza grande*, has the cathedral on one side, the governor's residence and government houses on another, offices of the municipality on a third, and usually shops on the fourth. There is also a public promenade, *alameda*, with shady trees and benches, resorted to in the evening; and a circus for bull-fights, *plaza de torros*, commonly near it, chiefly a Sunday recreation. The best hotels, *fondas*, offer rooms very scantily furnished to the traveller, with sorry fare, but with no lack of vermin; while the country inns, *posadas*, are wretched cabins for the sale of pulque, the national nectar. Between the towns, in the more peopled districts, numerous villages are passed, with vineyards, fields of bright-green maize plants, and large cattle estates, sometimes so extensive as to be stocked with 10,000 head, while more than an entire day's journey is required to traverse the limits of a single property. Droves of pack-mules are frequently encountered on the roads, small, smooth, light limbed, and heavy laden, sometimes amounting to several hundreds, as almost all goods are transported in this way. They are trained to follow a leader, or bell-mule, and to kneel until the load is packed on them, when they are helped up by one or more of the muleteers. These men, generally a very honest class, mounted on mustangs, riding to and fro, form a striking picture, with their high-peaked saddles, huge spurs that tinkle at every step, picturesque dress, and incessant shouts of encouragement or rebuke to the lagging animals. But brigandage, involving both robbery and murder, in case of resistance, is almost everywhere to be apprehended by passengers, unless sufficiently numerous and well armed. If either of these points is neglected, the summons is certain to be heard, 'Face to the ground! *Cara en tierra!*' analogous to the Italian, *Face en terra!* Many a rude cross looming from the shadow of fir-trees, or heap of stones, marks the spot where some murdered traveller has been interred. The diligences in Mexico, from their frequent stoppage by robbers, have been styled an institution set on foot for the purpose of securing a certain revenue to the Mexican highwaymen.

*Puebla*, or, according to its full name, *La Puebla de los Angeles*, 'The Town of Angels,' on the route from the capital to Vera Cruz, ranks after it in extent and population. It is celebrated for the number and splendour of its ecclesiastical foundations, and the fierce intolerance of the inhabitants, while the wealth and influence of the priests, with the popular submission to their unblushing licentiousness, has won for it the title of the 'Paradise of Priestcraft.' There are not less than 69 churches, 9 monasteries, 13 nunneries, and several colleges. Indians and the female part of the population receive the tale with implicit faith, that during the erection of the cathedral angels made their appearance every night, and carried on the building. Hence the name of the town. *Vera Cruz*, on the shore of the Mexican Gulf, a well-built town in the old Spanish style, is the principal port, defended by the strong castle of San Juan d'Ulloa. The place is notoriously the metropolis of pestilence, the head-quarters of death, owing to the yellow fever, here known by the name of the black vomit, *tomito prieto*, so called from one of the symptoms by which dissolution is usually preceded. It is common more or less to the whole coast, almost certain to attack newly-arrived strangers from other climes, more particularly in the hottest months. Through the remainder of the year, from the middle of October to the close of March, boisterous north winds blow at intervals, cool the air, purify the atmosphere, and render the maritime lowlands, though never a safe, yet not a very dangerous place of residence to the foreigner. On the opposite coast of the Pacific, the once flourishing *Acapulco*, has lost nearly all its consequence, though still visited occasionally by foreign men-of-war for the convenience of its fine harbour. *Mantlan*, further north, has experienced an opposite change, and become a neatly-built town, while an active shipping port, since the discovery of gold in California, owing to the number of passengers arriving and departing, and its proximity to the blockaded American ports.

The population of Mexico has been returned at 7,800,000, a recent estimate, but founded upon very uncertain data. It consists of miscellaneous elements. 1. Whites of pure extraction, called Creoles, the direct descendants of the Spaniards, are few in number, but constitute the aristocracy of the country, as the largest landed proprietors. 2. A much larger body are those who consider themselves whites, but are not of pure lineage, being the descendants of Spanish and Indian parents. Most of the military, the lawyers, the government officials, and the owners of small cattle estates belong to this class. 3. Indians of the indigenous copper-coloured race form the great bulk of the population, follow agriculture, live in villages, often in a state of abject misery and servitude. Though slavery is not recognised by law, yet practically many of these people are slaves. Receiving very inadequate remuneration for daily labour, they are obliged frequently to apply to their employers for a loan, and thus become involved in such an inextricable slough of debt that they must work to the end of their days with little hope of retrieving their condition. 4. Negroes, formerly slaves, are a small and decreasing remnant. 5. Mixed races, *mestizos*, are found in every part of the country, distinguished by various names. The issue of an Indian and a Negro is called a *zambo*; that of a white and a

Negress, a *mulatto*; of a white and a mulatto woman, a *terzeron*; of the latter and a white, a *quadroon*. 5. Foreigners are tolerably numerous, chiefly French and Germans. There is scarcely a town in which a French tailor and a German watchmaker cannot be found; and in the most out-of-the-way places some stray Teuton or Gaul may be met with, as doctor, barber, bootmaker, or general shopkeeper. While connected with the crown of Spain, great importance was attached to the complexion in Mexico, white being the master-colour. Any marked removal from it placed the individual under disqualifications for social and political advancement, unless formally removed by decree of the government, expressed in the words, *Que se tenga por blanco*—‘Let him be considered white.’ In quarrels, the saying was frequently heard: ‘Is it possible that you think yourself whiter than I am?’ Distinctions of colour lost their importance during the struggle for independence, which compelled the whites to court the alliance of other classes.

The Mexican Indians, though resembling each other in colour, and in some general characteristics, differ in costume, habits, and very decidedly in speech. More than twenty languages are known to be spoken within the limits of the country, many of which are not dialects, traceable to the same root, but differ as completely as the German and the Greek. In the language of the Aztecs, the tribe dominant at the time of the Spanish conquest, and still in use, the letter *r* is unknown, though common in almost every word spoken in adjacent districts. It does not occur in the names of the mountains, Popocatepetl and Iztacihuatl, or in Tenochtitlan, the old denomination of the capital, or in that unpronounceable word given by Humboldt, *mollazomahuiztes-picacatacin*, signifying ‘Venerable-priest-whom-I-cherish-as-my-father,’ used in addressing the priesthood. But in the prevailing names of places in a neighbouring district the letter is prominent, as Ocambaro, Puruandiro, Zitacuaro, and Cinepeuaro. Most of the Aztec words are of excessive length, as *telemami-quibitli*, ‘a kiss;’ *tellatolamilitli*, ‘a demand;’ *tellaghivilitli*, ‘a torment.’ The terminal *tin* indicates the plural, which is often formed by the duplication of the first syllable, as *miztli*, ‘a cat;’ *mimistli*, ‘cats;’ *tochtli*, ‘a rabbit;’ *totochtin*, ‘rabbits.’ This radical difference of language among the indigenous races powerfully contributed to their European conquest, and has tended to keep them in subjection. Besides the settled and peaceful aborigines, *Indios manzos*, ‘tame Indians,’ as they are called, there is a class of very dissimilar habits on the northern frontier, *Indios bravos*, warlike tribes of Apaches and Comanches, roving about to plunder and destroy.

The great majority of the Mexicans subsist almost entirely upon maize flour, made up into thin cakes, called tortillas, which are eaten warm. They form nutritious bread, but are very insipid to the taste, and are hence accompanied with some highly-seasoned sauce, in the composition of which chile, a kind of capsicum, is the prime ingredient. Whole estates are devoted to the cultivation of this powerful stimulant, of which all classes of the people are extremely fond, though its pungency is so great as to produce absolute excoeciation among the uninitiated. The tortilla answers the double purpose of a viand and an implement to eat with, being used to raise the peppery sauce or stew to the mouth, while at each mouthful a portion of the temporary spoon is bit away, and another is soon required to take its place. Eggs, beans, and milk are also common articles of diet. Early in the morning, Indians from the neighbouring hamlets crowd into the larger towns, belabouring their donkeys as they go, laden with fruit, vegetables, and other commodities of daily consumption. They squat down at the corners of the streets and in the plazas, arrange their wares beside them, and then commence a chorus inviting custom, while laughing, singing, and chattering, by way of interlude. Among the more frequent ejaculations may be distinguished, *Huevos!* ‘Eggs!’ *Leche!* ‘Milk!’ *Frijoles!* ‘Beans!’ *Tortillas calientes!* ‘Hot tortillas!’ *Chile bueno!* *excelente!* ‘Good, excellent chile!’ while *Pan fino!* *pan blanco!* ‘Fine bread! white bread!’ cries the baker; *Agua!* *agua limpia!* ‘Water! pure water!’ shouts the aguadoré; *Carbon!* *carbon!* ‘Charcoal! charcoal!’ screams the charcoal-burner; and *Atolé,* *atolé!* a kind of gruelly compost of maize, is heard from the vendors of the compound. In general the men are far more addicted to showy attire than the other sex. An important article in the equipment of equestrians is the spur, very varying in shape, sometimes costly, and always heavy; for which no intelligible reason can be assigned. The rowels frequently carry jingling appendages, *campanillas*, or little bells, which, it may be presumed, tinkle agreeably to the ears of the riders. Most Mexicans are admirable horsemen, and manage their steeds with unexceptionable ease and grace. The animals are chiefly the descendants of the horses first carried by the Spaniards to the New World. While some broke loose, others were set free by the death of their masters in battle. Reaching the great savannahs, there they interbred, and originated the droves of wild horses which roam the prairies in incalculable numbers, and are now captured by the lasso.

Monuments of the age of Montezuma—remarkable vestiges of ancient Mexican civilisation—are found in various parts of the country. Such is the famous pyramid or *teocalli* of Cholula, a few miles to the west of Puebla, consisting of four distinct and decreasing stories, which appear to have been constructed exactly in the direction of the four cardinal points. It is built of sun-dried bricks and clay, in alternate layers; and is now covered with evergreen trees and shrubs, among which flights of birds nestle. The base is almost double

that of the great pyramid of Cheops, being 1423 feet on each side, but the height is very inferior to it, only 164 feet. The object of the erection was undoubtedly religious; but it seems to have answered as well the purpose of a sepulchre, for in cutting into it a square chamber was discovered, without an outlet, supported by means of cypress-wood, in which were two skeletons, a number of curious vases, and some idols made of basalt. On the elevated platform at the summit there is a small chapel dedicated to the Virgin, raised by the conquerors, as if to mark the substitution of another creed and another race for the nation by whose united exertions this stupendous monument must have been reared. At Mitla, in the province of Oaxaca, are very striking groups of ruins, apparently those of a palace or palaces, with arabesque-like ornaments, and the singular feature of six porphyry columns, placed in the midst of a vast hall, as supports to the ceiling, almost the only examples of the kind in the western world, which go back to the age of its European occupation. They bear, however, strong marks of the infancy of art, having neither pedestal, capital, nor architrave. Near the village of Palenque, in the adjoining province of Chiapas, are considerable remains of a city—palaces, temples, public buildings, decorated with paintings and sculptures, along with humbler dwellings suited to the mass of the inhabitants—accidentally discovered in the last century, entombed beneath the luxuriance of tropical vegetation, in the midst of a fertile country, but almost entirely depopulated. A fortnight was occupied by a corps of pioneers, despatched by the government, in felling and firing the timber, and clearing away the creeping plants, with which the monuments were closely matted.

## II. STATES OF CENTRAL AMERICA.

Central America, in the geographical sense, embraces the whole of the narrow portion of the continent between its two main masses. But the political signification is restricted to the space occupied by the states within its limits, which are included between the northern isthmus of Tehuantepec, belonging to Mexico, and the southern isthmus of Panama, a part of the Granadian confederation. This territory is washed on the eastern side by the Caribbean Sea, an arm of the Atlantic, which deeply invades the shores, and by the waters of the Pacific on the western, which have a comparatively smooth coast-line. It has a length of about 900 miles from north-west to south-east, by a very varying breadth, contracting from 300 to less than 80 miles; and an area computed at nearly 190,000 square miles. High table-lands traversed by mountainous ridges and overtopped by volcanic cones occupy a large proportion of the interior, where the scenery is splendid, and the climate is rendered singularly balmy by the elevation, while the fierce heat of the torrid zone is experienced on the maritime lowlands. But the beautiful in the landscape is often seen in close alliance with memorials of a terrible agency; and the calm of nature is frequently interrupted by physical convulsions. In many parts, sudden chasms, deep rents, and capricious twistings of the surface, bear unmistakable evidence of having been caused by violent paroxysms of volcanic action; and few regions at present are more subject to furious outbursts from the constantly-smoking craters, with displays of the earthquake's dreadful power. Upon the achievement of independence from the Spanish monarchy, the five states which then formed themselves into a federation adopted for their national cognizance, in allusion to the natural peculiarities of the country, the figure of five volcanoes on a plain bordered on either side by the ocean.

The indigenous vegetation is very diversified, and rendered luxuriant by heavy seasonal rains in connection with the hot climate. It constitutes the main source of wealth, embracing magnificent trees of cedar, mahogany, and dye-woods, with sarsaparilla, vanilla, balsams, gums, and other medicinal plants. The cultivated products include the cochineal plant, indigo, sugar, cotton, coffee, tobacco, cacao, and fruits. Some of the birds are of great beauty; as the quescal, most frequently met with in Guatemala, remarkable for its exquisite green plumage, spotted on the wings with brilliant red and black, while the long feathers of the tail are of green powdered with gold. The population, upwards of 2,000,000, consists of whites chiefly of Spanish descent, and a large number of native Indians, with a mixed race called *Ladinos*, and a few Negroes. Though converts generally to Roman Catholicism, and speaking the Spanish language, some of the Indians, in the secluded mountain districts, adhere to ancestral forms of idolatry, and retain their native dialect.

| Political Divisions. | Area in Sq. Miles. | Population. | Towns.                                |
|----------------------|--------------------|-------------|---------------------------------------|

| Nicaragua,           | 57,000             | 400,000     | Managua, Leon, Blewfields, Greytown.  |
| Costa Rica,          | 21,000             | 126,700     | San José, Cartago, Alajuela.          |
| Belize,              | 14,000             | 11,000      | Belize.                               |

Central America was discovered by Columbus in the course of his fourth and last voyage. He coasted it from Cape Honduras to Cape Gracias a Dios, and established the first European colony in the New World on the shore of Costa Rica in 1502. The country became a Captain-Generalcy of Spain, and remained in that connection to the year 1821, when the struggle for a separate political existence commenced. But the Spanish flag continued to float on the battlements of Omoa, in Honduras, to the year 1832. After a brief term of union between the five states at the head of the table, the federation was dissolved, and they now exist as separate republics, but, with the exception of Costa Rica, internal troubles have been frequent, to which a war was superadded in 1863. These disturbances have checked industry and social improvement. The roads are very generally mere trackways, and the vehicles are of the most wretched description.

GUATEMALA, the most northerly state, bordering on Mexico, extends from sea to sea, but only touches the angle of the Bay of Honduras on the Atlantic side, while possessing a considerable coast-line on the Pacific. The surface has very remarkable objects in its fire and water volcanoes, and singularly charming features in the course of the river Montagita, distinguished by falls and rapids, with the silvery expanse of Lake Atitlan, slumbering in its cradle of rocks and mountains. Cochineal is very largely produced, and is the principal export.

*Nueva* or *New Guatemala*, the capital, is an inland city on the table-land, 4960 feet above the sea, 45 miles from the coast of the Pacific, containing a population of 60,000. At this elevation the climate corresponds to that of Italy, subject to less cold in winter. The production of muslins, cotton yarn, artificial flowers, plate, and embroidery are the chief industries. Water is brought from a spring five miles distant by an aqueduct, and conducted to twelve reservoirs, from which it is distributed to the private dwellings. The houses have generally but one story, with very thick walls, and gardens attached to them, as a precaution against earthquakes. An old viceregal palace, a university, a great hospital, a superb cathedral, and many richly-ornamented churches are the principal public buildings. Religious observances are incessant, chiefly attended by the women, who throng the churches at matins and vespers. *Antigua*, or *Old Guatemala*, twenty-one miles distant, occupies a beautiful valley between the two volcanoes, called *Del Agua*, 'of water,' and *Del Fuego*, 'of fire,' both lofty and wonderfully-grand objects. The place was the capital of the country till the year 1773, when, after having been repeatedly damaged by earthquakes, it was dreadfully desolated, and the seat of government was in consequence removed. Still, many survivors of the catastrophe clung to the site, and acquired the name of the 'Incorrigible' from their attachment to it. Ruins of the old buildings remain as monuments of the former grandeur of the place, upon which its founder, the conquering Alvarado, bestowed the singular name of the 'City of St James of Gentlemen.' The Water Volcano, so called from its discharging water during eruptions, rises to the height of 13,758 feet. The Fire Volcano is slightly lower, distinguished by three peaks, the southernmost of which is the Fire Peak, constantly emitting steam and sulphureous vapour.

*Quesaltenango*, next to the capital in extent and trade, possesses well-paved streets, picturesque houses, a richly-decorated cathedral, and a fine fountain in the centre of the Plaza. *Totonicapan* is chiefly occupied by Indians, who speak the Quiche language, manufacture earthenware, woollen cloths, and wooden utensils for their own use. *Istapa*, on the Pacific coast, and *St Thomas* on the Caribbean Sea, are the shipping ports. The territory contains the remains of ancient cities, similar to those in Mexico, which were flourishing at the time of the Spanish conquest, and are now overgrown with vegetation. Guatemala, nominally a republic, is governed by an oligarchy, at the head of which is the celebrated Carrera, sustained by a profligate aristocracy and a bigoted priesthood. This successful chief, originally an obscure half-breed, was appointed president for life in 1851, with the style of Captain-General, and signally defeated the united forces of Honduras and San Salvador in June 1863.

HONDURAS, eastward of Guatemala, extends chiefly along the southern shore of the bay of that name, an inlet of the Caribbean Sea. It contains valuable mines, though they are but little worked at present, with extensive forests of mahogany and logwood.

*Comayagua*, the capital, formerly called Valladolid, is an inland town, on one of the projected lines of railway across Central America, containing 18,000 inhabitants. *Omoa*, one of the hottest places in the world, very unhealthy, and *Truxillo*, are the principal ports. At the latter the notorious filibustering adventurer

Walker, from the United States, was shot in 1860. The Bay Islands, close inshore, consisting of Ruatan, Bonacca, and Utila, with several islets, were proclaimed a British colony in 1852, and attached to the government of Jamaica. But chiefly to avoid unpleasant altercations with the cabinet at Washington, they were relinquished in 1856, and finally ceded to the Honduras republic in 1860.

Harbour of Bay Islands.

SAN SALVADOR, the smallest state, but the most densely peopled, is entirely confined to the Pacific seaboard, enclosed inland by Guatemala and Honduras. Like most parts of Central America, it has its tale to tell of grave misfortune from natural convulsion.

The seat of government, *San Salvador*, twenty-two miles from the coast, contains many memorials of the disaster of 1854, previous to which it was a beautiful city of 28,000 inhabitants. In that year, on the Thursday before Easter Sunday, movements of the earth were felt, preceded by sounds like the rolling of heavy artillery over a pavement. On Friday and Saturday all was quiet. The heat was considerable on Sunday, with the atmosphere very calm. In the evening a severe shock alarmed the whole city, and shortly before eleven o'clock, without premonition of any kind, it was entirely prostrated with the exception of a single building. Nearly 5000 persons perished in the ruins. *Cojutepeque*, with 15,000 inhabitants, *Sonsonate* 10,000, and *San Vicente* 8000, are the other inland towns. *Acajutla*, *Libertad*, and *La Union* are the seaports. The trade is extensive in tobacco and indigo. In November, after the indigo crop, a great fair is held at San Miguel, near the southern border for the disposal of the produce to foreign merchants and others. A part of the coast region is remarkable for producing the famous Balsam of Peru, so called from having been originally shipped for Spain from a Peruvian port, and hence supposed to be a native product. It is obtained by the Indians from a tree—common in the district between the ports of Libertad and Acajutla, but not known to grow elsewhere—by incision of the trunk.

NICARAGUA, on the south, now embraces the whole country between the two oceans, having recently been put in possession of the Mosquito territory on the Atlantic side. It is in many parts richly wooded, commands the navigation of the spacious lake which bears its name, and contains a very small proportion of whites compared to the Indians and half-breeds among the population.

*Managua*, the capital, on the shore of a lake, is chiefly inhabited by aborigines, who number 10,000, and are noted for the facility with which they imitate foreign manufactures. *Leon*, the principal city, nearly midway between Lake Managua and the Pacific, contains a population of 35,000, a university, a stately cathedral, many large churches, and other public buildings, which rank with the finest in Central America. *Realejo* and *San Juan del Sur*, seaports on the Pacific, ship the produce of the state, consisting of various woods, cacao, indigo, sarsaparilla, ipecacuanha, ginger, aloe, and hides; but political distractions have interfered with the attainment of commercial prosperity. The great lake of Nicaragua, its prime natural feature, is a fresh-water basin more than 300 miles in circuit, studded with beautiful groups of islands, and admits of being navigated by the largest vessels. It is only separated from the Pacific by a low narrow isthmus, while sending its overflow to the Atlantic by the river San Juan. Hence, this point has long been regarded with interest as suitable for the construction of a maritime highway from sea to sea, by cutting a channel from the lake to the ocean on the one side, and canalising the river on the other.

The Mosquito territory includes the eastern coasts of Nicaragua and Honduras. It was never conquered by the Spaniards, and had its own Indian king, who, with the consent of his chiefs and people, applied for British protection to the governor of Jamaica in the reign of Charles II., which was accorded. This protectorate continued to a very recent date. But in order chiefly to pacify the United States' government, the protectorate was relinquished, and in 1860 Mosquitia was made over to the Nicaraguan republic. *Blewfields*, the nominal capital, is a collection of mean huts. *Greytown*, at the mouth of the San Juan, with an excellent harbour, is the residence of many foreigners, and much frequented by adventurers on their way to California.

COSTA RICA, 'Rich Coast,' the most southerly state, and perhaps the most prosperous, is distributed into two principal departments separated by a range of mountains, the Oriental on the side of the Atlantic, and the Occidental on that of the Pacific. Intertropical productions in general are raised, but coffee is the principal export. No Negroes are included in the population.

*San José*, the capital, about midway between the opposite coasts, and 4500 feet above the sea, contains 30,000 inhabitants. *Carthago*, fifteen miles distant, was originally the capital, but is now extensively a ruined city, so dreadfully visited by an earthquake in 1841, that out of 3000 houses and eight churches, only 100 of the former and one of the latter were left standing. A volcano of the same name rises in the vicinity to the height of 11,480 feet, and is a noted landmark to mariners. Both oceans are visible from the summit. *Puntas Arenas* on the Pacific, and *Matina* on the Atlantic, are the seaports.

BELIZE or BALIZE, a British dependency, embraces part of the west coast of the Bay of Honduras, but the inland limits have never been strictly determined. It contains a river and town of the same name, with a large proportion of Negroes among the inhabitants, who are under a superintendent subordinate to the governor of Jamaica. The territory is only valuable for its forests of mahogany and logwood. Felling the trees, trimming the trunks, and conveying them to the rivers are the occupations of the dry season, from February to the close of May. The rains begin to descend in June, when the streams swell, and the timber is drifted down by the powerful currents, but prevented going out to sea by strong booms across the outlets. The town of Belize is almost wholly of wood. Besides the timber trade, it is the general dépôt of British manufactures intended for Central America.

### III. THE WEST INDIES AND BERMUDAS.

The remarkable collection of islands which forms the West Indian Archipelago includes four of large dimensions, about fifty of the smaller class, and many thousands of islets, rocks, reefs, and sand-banks. They extend in a curving chain between the two great masses of the American mainland, from the shores of Florida on the north, to the mouth of the Orinoco on the south, and separate the broad expanse of the Atlantic from the subordinate basins of the Caribbean Sea and the Gulf of Mexico. Their total area is estimated at 92,000 square miles, more than one-half of which has long been held by Spain, while nearly another third, in Hayti, which has been under two independent governments, may perhaps be destined by present hostilities to aggrandise the Spanish monarchy. Great Britain possesses the next largest share, about one-seventh; and comparatively diminutive portions belong to France, Holland, Denmark, and Sweden. The islands vary greatly in their structure and aspect. Many are boldly mountainous, and of volcanic

origin ; others are low, flat, and chiefly of coralline formation ; and some exhibit both coralline and volcanic rock in alternate layers. Situated almost wholly in the torrid zone, the summer heat is excessive on the low grounds, but the sea-breezes are felt with refreshing effect, and are generally the strongest in the afternoon, when their cooling agency is most needed. In winter, snow is never known to fall on the loftiest of the highlands, but slight frosts occur. A long dry interval, and another shorter, alternate in the year with corresponding periods of heavy rain. Everywhere the nights are supremely beautiful, the stars shining out with signal lustre through the transparent atmosphere. Some of the small islands are in the path of the intertropical hurricanes ; others are occasionally disturbed by earthquakes ; and yellow fever is a scourge in the rainy season. The indigenous vegetation is varied and luxuriant, distinguished by the profusion of ferns and orchidaceous plants. Coffee, sugar, tobacco, spices, maize, and mahogany, with the most delicious fruits of different kinds, are the staple products.

The aggregate population is computed at 3,700,000, consisting entirely of foreign races of whites and Negroes, with mulattoes, except a few families in Trinidad, said to represent the aboriginal Indians. That island has also some Mohammedan Negroes, one of the few communities of the kind in connection with the western world. The coloured people are free, except in the Spanish possessions, where unmitigated slavery is maintained. The popular name of the Archipelago originated with Columbus, its discoverer, who supposed that he had reached the portals of India by a western route. But the Antilles is a common denomination, or the 'forward islands,' alluding to their position in relation to the continent. A triple distribution is made of the series : 1. The Bahamas ; 2. The Greater Antilles ; 3. The Lesser Antilles.

Nassau.

THE BAHAMAS.

| Principal Islands.  | Area in Square Miles. | Population. | Chief Town. |
|---|-----------------------|-------------|-------------|
| Great Bahama, Great Abaco, New Providence, Eleuthera, Inagua, Andros, Exuma, Cat Island, Harbour Island, Turk's Islands, &c., | 5800                  | 30,900      | Nassau.     |

This chain numbers upwards, of 500 components, including the islets, but not more than twenty are permanently inhabited. It forms the most northerly portion of the West Indies, and closely approaches the Florida shore, extending thence through 700 miles to the north of Cuba and Hayti.

The Bahamas are a British colony, under a governor, council, and house of assembly. New Providence contains the seat of government, *Nassau*, a neat town, with a good harbour, healthy climate, and 7000 inhabitants. Its name has recently become notorious in connection with the blockade runners of the American ports. The island was once a stronghold of the bucaners. It received the first English settlers in the year 1629. Eleuthera is the principal fruit-growing island. Andros is celebrated for its cedars. Cat Island is commonly supposed to represent the Guanahani or St Salvador of Columbus, the first land of the New World on which he gazed. Shell-work, palmetto, sponge, bark, fibres, cotton, arrowroot, and other articles were displayed in the Bahama department of the International Exhibition, London, in 1861. The islands are all low, and consist of coral-rock covered with a thin layer of soil. On the side of the Atlantic they rise steeply from an unfathomable depth of ocean, but in the opposite direction are vast submarine reefs, which render the navigation highly intricate and perilous. Many of the inhabitants are 'wreckers;' but not in the vulgar sense, being licensed by the government to recover property from wrecks, receiving a salvage upon it according to the value. Turk's Islands, a south-eastern offshoot of the chain, have a distinct administration, and form a dependency of Jamaica.

THE GREATER ANTILLES.

|             | Area in Square Miles. | Population. | Government.                     | Chief Towns.                        |
|-------------|-----------------------|-------------|---------------------------------|-------------------------------------|
| Cuba, .     | 42,383                | 1,450,000   | Spanish, . . . . .              | Havana, Matanzas, Santiago.         |
| Hayti, .    | 28,000                | 760,000     | Partly Spanish and Independent, | St Domingo, Port au Prince.         |
| Porto Rico, | 3,800                 | 380,000     | Spanish, . . . . .              | San Juan.                           |
| Jamaica,    | 6,400                 | 379,000     | British, . . . . .              | Kingston, Port Royal, Spanish Town. |

These large islands extend through 20° of longitude, equal to a linear distance exceeding 1200 miles, from the western limit of Cuba to the eastern extremity of Porto Rico. Traversed by highlands in the direction of their length, they appear to be parts of a grand mountain-chain, interrupted in its continuity by deep valleys and depressions occupied by the sea.

CUBA, the largest and most westerly member of the entire Archipelago, has an extent of 750 miles from east to west, with an average breadth of more than 50 miles, and well deserves the title of the 'Queen of the Antilles,' for its displays of scenic beauty and abundant natural resources. A range of mountains runs through the island, which attains the height of 8000 feet at the eastern extremity, and is there distinguished by the name of the Sierra del Cobre, or the Copper Mountains, from vast stores of the metal. The slopes and the plains on either hand are richly timbered with mahogany, cedar, and other valuable woods, while the tropical jungle, composed of a host of brilliant flowering-plants, proclaims the fertility of the well-watered soil. But more than two-thirds of the surface have never been submitted to cultivation, and extensive tracts have had no human visitor except the now extinct aboriginal savage, the outlaw, or the absconded slave. The monopolising spirit of the government officials, who are Spaniards from the mother-country, represses native industry and enterprise. Sugar, tobacco, and coffee are the principal objects of culture, and the main exports, with copper ore, hides from the cattle-farms, and mahogany. Nearly three-fourths of the population are slaves, who are recruited by the illicit importation of cargoes from Africa, when opportunity offers, often with the connivance of the Captains-General. *Havana*, the capital, on the north coast, is by far the largest city in the West Indies, containing nearly 200,000 inhabitants, among whom are many foreign commercialists, British, French, German, Dutch, and American. Cigars are manufactured to an enormous extent, and have universal celebrity. The harbour is a noble expanse, with a narrow entrance guarded by forts; the opera-house is magnificent; and the promenades are delightful, shaded with trees and adorned with fountains. The cathedral contains the grave of Columbus. The shops display costly silks and shawls from Europe, glass and china ware, upholstery in fancy woods, fruits and birds. Shops for the sale of saints are not wanting, where their images may be bought from that of a shepherdess to a venerable graybeard. Railways diverge from the city to several places in the interior; and one leads to *Matanzas*, a considerable seaport 50 miles on the east. The name is

remarkable. It signifies 'the Massacres,' and is said to be a memorial of the last wholesale slaughter of the aborigines by the early Spanish conquerors. Their first settlement was made in 1511, at *Santiago de Cuba*, a fortified town on the south-east coast, enclosed with mountains, now next to the capital in importance; and by the year 1560 all the natives were extinct.

HAYTI immediately eastward of Cuba, has its greatest length in that direction, amounting to nearly 400 miles. It contains mountainous ridges of volcanic origin, with a general surface largely covered with splendid forests and rich tropical verdure. Two Negro republics recently divided the island between them, the Dominican on the east, with St Domingo for its capital, and the Haytian on the west, with Port au Prince for the seat of government. But in 1861 the Dominican voluntarily united itself to Spain, and the attempt is at present in process to reduce the Haytian to the dominion of the Spanish crown. *St Domingo*, a fortified seaport on the south-east coast, is the oldest existing city in the New World founded by Europeans, dating from the year 1504. It is regularly built in the old Spanish style, and contains about 15,000 inhabitants. *Port au Prince*, at the head of the fine Bay of Gonaives on the west shore, is a larger place, chiefly of wood, supposed to have a population of 30,000. An inglorious historical distinction belongs to Hayti. Near Cape Samana, a high and beautiful headland at the eastern extremity, which Columbus rounded in January 1493, the first blood was then shed by white men in the Western Hemisphere in an affray with the natives. At the ports of this island, also, the first Negroes brought across the Atlantic were disposed of, and an Englishman, Sir John Hawkins, commenced the abominable traffic, in the reign of Queen Elizabeth. *PORTO RICO*, the third of the Spanish islands in extent, is eastward, about 105 miles long by 40 broad. *San Juan*, on an islet of the north coast, connected with the mainland by a bridge, is the chief town, well built and commercial, containing 10,000 inhabitants.

JAMAICA, the most important of the British possessions in the Archipelago, is situated on the south-east of Cuba, and extends about 150 miles from east to west, by 50 miles where the breadth is the greatest. Its aspect corresponds to the meaning of the aboriginal name from which the present is derived, Xaymaca, 'the land of wood and water.' The Blue Mountains run through the centre, rising to 7000 feet, greenly beautiful with tropical vegetation. They send rippling streams down the slopes on either hand to the plains below, where sugar, coffee, pimento or allspice, with cocoa, indigo, and tobacco, are the commercial crops. But unfortunately they are vastly diminished in amount since the passing of the Slave Emancipation Act, as the Negro obtains with little exertion the means of subsistence from the bounty of nature, and is hence unwilling to devote himself to onerous agricultural toil. Sugar plantations are now few and far between. But by the roadsides, on the edge of the wood and jungle, the gardens or provision-grounds of the Africans may be seen, pleasant-looking spots, where cocoa and bread-fruit trees are cultivated, with oranges, mangoes, plantains, and yams. Some of them pay a trifling rent, but the majority have squatted on the waste lands, asking no man's permission. The island was discovered May 3, 1494, and colonised by the Spaniards in 1503, but passed from Spain to England in 1655. It is distributed into three counties, Middlesex central, Surrey eastern, and Cornwall western; and forms a diocese of the Anglican Church which includes the Bahamas and Belize. The administration is conducted by a governor and council appointed by the crown, and a house of assembly chosen by duly qualified electors, in which coloured persons have long been prominent. The centres of population border on a spacious inlet of the south coast. They consist of *Kingston*, the commercial capital and principal port, with 35,000 inhabitants; *Port Royal*, at the entrance of the harbour, with 15,000; and *Spanish Town*, a few miles inland, only of note as the seat of government.

## THE LESSER ANTILLES.

|  |  |
|--|--|
| 1. The Virgin Islands, . . . . .         | British—Tortola, Anegada, Virgin Gerda.                      |
| " " . . . . .                            | Danish—St Thomas, St John, Santa Cruz.                       |
| " " . . . . .                            | Spanish—Culebra.   |
| " " . . . . .                            | To all the three Powers—Bieque or Crab Island.               |
| 2. The Leeward Islands, . . . . .        | { British—Antigua, Anguilla, St Christopher, Nevis, Barbuda, |
| " " . . . . .                            | { Montserrat, Dominica.                                      |
| " " . . . . .                            | { French—Guadeloupe, Marie-Galante, Desirade, North St       |
| " " . . . . .                            | { Martin.  |
| " " . . . . .                            | Dutch—South St Martin, Saba, St Eustatia.                    |
| " " . . . . .                            | Swedish—St Bartholomew.                                      |
| 3. The Windward Islands, . . . . .       | { British—St Lucia, St Vincent, Barbadoes, Grenada, Tobago,  |
| " " . . . . .                            | { Trinidad.  |
| " " . . . . .                            | French—Martinique.   |
| 4. The Venezuelan Coast Chain, . . . . . | Dutch—Curaçao, Oruba, Buen Ayre.                             |

The LESSER ANTILLES extend in a vast semicircular sweep from the east of Porto Rico to the shores of Venezuela, and are with few exceptions of very unimportant size, but highly beautiful and productive. The Virgin and the Leeward groups are to the north of the parallel of 15°, and the remainder to the south. But the popular distinction between

them has no foundation in nature. The entire series is windward in relation to the trade-wind, except the Venezuelan, which are alone properly the Leeward Islands. It is, however, retained from convenience as familiar.

SANTA CRUZ and ST THOMAS are the most important of the Virgin Isles, both Danish. The town of St Thomas is the station of the Royal Mail Steam Packets plying between Southampton and the West Indies, where passengers and goods are distributed to other vessels and received from them. It is the central seat of three lines of steam communication—one to Havana and the Mexican Gulf; another to Jamaica and Central America; a third by the Leeward and Windward Islands to British Guiana. While traffic is hence active, the place is a *dépôt* for all goods in demand along the respective routes. Shops and stores exhibit a pell-mell mixture of light dresses and cigars, boots and brandy, straw hats and eau de Cologne. The population is also miscellaneous, collected from different quarters for trade. A few government functionaries, custom-house officers, and soldiers are Danes. The remainder have been described as an Anglo-Hispano-Dano-Niggery-Yankee-doodle people. St Thomas is pleasantly seated on three hills sloping down to the water's-edge, each topped by some public building, and backed by higher hills green to their summits. But it is notoriously unhealthy from yellow fever, which has been fatal to many of the steamers' crews. Large quantities of coal are stored for the supply of the vessels.

ANTIGUA, at the head of the British Virgin and Leeward Islands, contains *St John*, the seat of the general government, with 15,000 inhabitants, on the north-west coast. It has a bishop of the Anglican Church, whose diocese is co-extensive with the dependency. The island has only an area of 108 square miles, is not remarkable for beauty, and is without streams or springs but what are brackish, which compels the inhabitants to depend upon the rain collected in large tanks. It was the first of the West Indian colonies to advocate the abolition of slavery, and the only one that adopted complete emancipation at once, without the intermediate apprenticeship. English Harbour, on the south coast, spacious and picturesque, is a convenient naval station much used in time of war. MONTSERRAT, of volcanic formation, is distinguished from afar by the sharp peaks of the twin mountains which compose the greater part of its mass. It was discovered by Columbus, and named by him from its resemblance to the famous mountain so called near Barcelona in Spain. Lofty trees, and tropical shrubs clothe the heights. Plymouth, a small well-built town, is on the coast, but has no harbour, nor is there one along the whole shore. A peculiar kind of craft, called a 'Moses boat,' is used for conveyance to and from the ships in the roadstead. ST CHRISTOPHER, or St Kitts, contains *Basse Terre*, and NEVIS, its neighbour, *Charlestown*. Both are mountainous, beautiful, and fertile, separated by The Narrows, a channel two miles wide. DOMINICA contains an area of 275 square miles, and the small town of *Roseau*. Mountains rise in the centre to the height of 6000 feet, clothed with the greenest foliage, forests of rose-wood and other trees, which render its appearance exquisitely lovely from the sea. The name refers to the discovery of the island on a Sunday.

GUADALOUPE, midway between Antigua and Dominica, is the most important of the French islands, containing 534 square miles, and a population of about 133,000, three-fourths of whom are coloured people. There are really two islands, but only separated by a channel forty yards wide, yet of a widely different character. The one is generally low and coralline. The other is mountainous and volcanic, with vents emitting smoke, and sometimes sparks. *Basse Terre* ranks as the capital, but *Point-à-Pitre* is the largest town, and the chief seat of commerce. MARTINIQUE, also French, one of the Windward Islands, is covered with high rocky masses, many of which are extinct volcanoes. *Port Royal* is the seat of government, but is much inferior in size to *St Pierre*, the principal port. Slavery was abolished in these colonies by decree of the French Republic in 1848. Their towns are generally superior in their appearance and appointments to those in the British settlements. The streets are neat, orderly, and clean, often shaded with trees, and supplied with conduits, or channels of running water. The reason is said to be that the French colonists look upon the West Indies as their home, while the British are intent upon a return to Europe as soon as sufficient means have been acquired to retire from commerce.

BARBADOES, politically at the head of the British Windward Islands, as the residence of the governor-general, is a kind of outpost of the series, being somewhat advanced in the Atlantic, containing 166 square miles, and a population of 140,000. It is the oldest British possession in the Archipelago, having been uninterruptedly occupied since the year 1625, when all the aborigines had been destroyed by the Spaniards. Vast coral-reefs nearly enclose the shores. The surface has no picturesqueness, being generally low, but it is so cultivable, and so thoroughly occupied with sugar-plantations, that upon the passing of the Emancipation Act there was no waste land upon which the Negro could squat and easily subsist upon its produce. Hence here he has been compelled to labour as much as ever for hire, and Barbadoes has consequently escaped the disaster which has fallen so heavily upon Jamaica. The island is the seat of an Anglican diocese which embraces its dependencies. Codrington College, on the eastern side, a foundation of the family of that name, is the best educational institution in the West Indies. *Bridgetown*, the capital, on Carlisle Bay, a strong military post, contains upwards of 30,000 inhabitants. The streets converge to a Trafalgar Square, which, like its London namesake, has a Nelson statue in the centre, with a tree in addition. ST LUCIA, ST VINCENT, and GRENADA are in a line from north to south, and with TOBAGO, on the south-east, have in succession for their chief towns *Castries*, *Kingstown*, *St George*, and *Scarborough*. They are all volcanic, rich in striking scenery, possess good harbours, and yield delicious fruits, but along with Barbadoes, and other

neighbouring islands, are specially in the track of the West Indian hurricanes. These whirl-storms sweep up with tremendous power from the adjoining ocean, follow thence a general direction west-north-west, and either veer round with the Gulf Stream, re-entering the Atlantic, or proceed across the Gulf of Mexico to exhaust their fury on its shores. They occur with varying energy at intervals a few years apart, and are most frequent in the months of August, September, and October.

TRINIDAD, the largest of the Lesser Antilles, and the southernmost part of the West Indies, is situated off the mouth of the Orinoco, and nearly touches at two of its corners the mainland of South America. The name refers either to its discovery by Columbus on his third voyage, or to three mountain-ranges by which it is intersected from east to west. It contains an area of 2000 square miles, and is remarkable for its pitch-lake, or plain covered with bitumen, which boils up in the centre, but is hard along the shore, used for coating the bottoms of vessels. Many parts of the island are imperfectly known. The occupied districts are highly fertile, producing sugar, coffee, cocoa, tobacco, ginger, cotton, cedar-wood, and various fruits. Recently, cultivation has been stimulated by the importation of Coolies from Calcutta and Madras. Trinidad was Spanish down to the year 1797, when it was taken by Abercromby, and has since been a British possession, under a governor, who is aided by a council, but without a house of assembly. *Port of Spain*, the capital, is a handsome regularly-built town of 18,000 inhabitants, with the streets running at right angles to each other, after the modern fashion, a very convenient harbour, a good public library, and magnificent scenery around it.

#### THE BERMUDAS.

This group is remarkable for its isolation in the North Atlantic, being 580 miles from Cape Hatteras, a projection of North Carolina, and 640 miles from the Bahamas, the nearest points of land. Though mere islet-specks in the ocean, they are of interest as forming the oldest British settlement in the Western Hemisphere.

Though popularly said to correspond to the days of the year in number, the group consists of five small islands, with many hundreds of rocky patches, all low, but very pleasing from innumerable little bays and creeks of the clearest water, the whole surrounded by a belt of coral-reefs only passable through narrow channels. The total area is about twenty-two square miles, and the population 11,000. There are two small towns on different islands, *St George*, the military head-quarters, and *Hamilton*, the seat of government, consisting of a governor, council, and legislative assembly. As the summer naval station of the admiral in command on the North American waters, large sums have been expended in forming a dock-yard, and in fortifications. Arrowroot and various vegetables are raised for export; early potatoes are sent to New York; and the whale-fishery is pursued. The Bermudas have that name from the Spaniard, Juan Bermudez, who discovered them; and are also called the Somers' Islands, after Sir George Somers, who was wrecked upon them in 1609, when their British occupation commenced. A convict establishment founded here in 1825 has recently been abandoned, when those felons whose sentences had not expired were removed to Western Australia.

## CHAPTER V.

COLOMBIA—VENEZUELA—GUIANA.

### I. COLOMBIA.

HIS state, formerly called New Granada, an old viceroyalty of Spain, includes a north-western section of South America, with a link of the chain by which it depends upon North America, or the Isthmus of Panama. It has a maritime border in the waters of the Caribbean Sea on the north, and those of the Pacific on the west, while enclosed on the east by the state Venezuela, and on the south by that of Ecuador. The minor inlets of the Gulf of Darien and the Bay of Panama indent the opposite sides of the remarkable isthmus, a portion of which is, by special convention with the United States, considered as neutral ground for the railway by which it is crossed. Colombia, in a southerly direction, stretches a little to the south of the line of the equator, and embraces eastwardly the upper branches of the river Orinoco. It contains an area of 333,000 square miles, and consists mainly of two regions of nearly equal extent, with strongly contrasted superficial features. Grand highlands occupy the whole of the maritime side, declining inland into low level plains. The latter are partly forest clad, but more generally are almost treeless, alternating from fine pastures in the rainy season, which sustain vast herds of cattle, to verdureless and dusty deserts under the burning sun at the opposite interval. From south to north, the Andes traverse the country in three parallel ranges, which are known as the western, the central, and the eastern cordillera. The central range is the highest. It contains the culminating point of all America north of the equator, in the truncated Nevada de Tolima, an active volcano, the summit of which slightly exceeds the elevation of 18,000 feet. The more

interior range is the broadest, spreading out into table-lands, which have a temperate climate, and are the chief seats of population. Between these two ranges lies the long valley of the Magdalena, the principal river, which rises near the equator, receives the Cauca from the enclosure of the central and the maritime cordillera, and flows with great force and volume into the Caribbean Sea.

The mountain region abounds with striking scenery, extraordinary natural objects, and

Natural Bridges on the Icononzo.

the evidences of stupendous derangements. It is rich in the precious metals, with copper, iron, lead, platina, and coal, and supplies many precious stones to commerce, especially emeralds. There are mines also of rock-salt, with sulphureous hot springs, nitrous caves, and the singular air volcanoes emitting azotic gas and mud. Different zones of vegetation appear with the changing elevation of the country, from the tropical in the valleys and on the low plains, to the productions common to temperate climes on the table-lands. Coffee, cacao, tobacco, cotton, sugar, and maize are raised, but cultivation, mining, and industries in general have often been paralysed by political distractions, while the indolence of the people is at variance with an adequate development of their natural advantages. The

total population is estimated at nearly 2,300,000, composed in nearly equal proportions of the descendants of the Spanish colonists and the native Indians, with a few Negroes.

New Granada was first colonised by the Spaniards in 1510, and became a viceroyalty in 1718. Becoming independent of Spain in 1819, it united with Venezuela and Ecuador to form a federal republic. This compact was dissolved in 1830, and the three members were constituted separate republics. After various changes of the constitution, New Granada received a fresh organisation, carried into effect in May 1863, by which its provinces were converted into states federally united, to be officially designated 'The United States of Colombia.'

| States.                     | Chief Towns.                    |
|-----------------------------|---------------------------------|
| Federal District, . . . . . | Santa Fé de Bogota.             |
| Cundinamarca, . . . . .     | Honda.                          |
| Magdalena, . . . . .        | Santa Marta.                    |
| Cauca, . . . . .            | Popayan, Cartago, Pasto.        |
| Boyaca, . . . . .           | Tunja Socorro.                  |
| Antioquia, . . . . .        | Antioquia, Medellin.            |
| Bolivar, . . . . .          | Carthagena.                     |
| Santander, . . . . .        | Pamplona.                       |
| Tolima, . . . . .           | Tolima.                         |
| Panama, . . . . .           | Panama, Aspinwall, Porto Bello. |

*Bogota*, the capital of the confederation, is seated on a table-land of the eastern Andean ridge, 8690 feet above the sea, considerably higher than the Alpine hospices of the St Gothard and the Great St Bernard. At this elevation in the torrid zone the climate is delightful—a perpetual spring. The population is about 41,000. Besides the cathedral and churches there are no buildings of importance; and being an earthquake-shaken city, the houses are all low and the walls thick. It was founded by the Spanish conqueror of the country, Ximenes de Quesada, in 1545, with the name of Santa Fé de Bogota. There are remarkable objects in the neighbourhood. From the high plain, the river of Bogota descends rapidly into the valley of the Magdalena, and forms by a single leap of 574 feet the Falls of Tequendama, a magnificent scene in the rainy season when the stream is full. The column of spray is seen from the capital, seventeen miles distant. In the same range of the Andes are the two natural bridges of Icononzo, masses of rock arching over a deep ravine, one above the other. The upper is 300 feet, and the lower 250 above a torrent at the bottom. Another locality, the 'Treasure Lake of Guatavita,' has had many eyes directed wistfully to its surface. The name was originated by the tradition that at the time of the conquest the Indians threw all the gold they could collect into its waters, to disappoint the rapacity of the Spaniards. *Popayan* and *Pasto*, between the central and the maritime cordillera, in the valley of the Cauca, are at a high elevation, with a lovely climate, the former 5800 feet above the sea, and the latter 8500. *Cartago*, similarly situated, communicates with Bogota by a road across the central range, which rises in the Pass of Quindio to the height of 11,400 feet.

*Cartagena*, the principal seaport, is on the shore of the Caribbean Sea, south-west of the mouth of the Magdalena, in command of a harbour naturally good, but now extensively obstructed. It was once a great commercial mart, from which rich freights were sent to Spain; strong also in war, a point where many a grandee has landed. The town and its trade have greatly decayed, though there are said to be still 10,000 inhabitants; but the place is very unhealthy, chiefly caused by neglect. Old buildings, once noble abodes, in various picturesque stages of decay, barred-up windows, and desolate court-yards, offer a melancholy contrast to the profuse tropical vegetation on every hand, shewing every diversity of vivid tint, to which flights of paroquets add their gorgeous plumage of scarlet and pea-green. *Panama*, on the Pacific coast of the isthmus, an old and once important Spanish city, exhibited similar decline previous to the opening of the railway to Aspinwall on the Atlantic side, which has brought to it passengers and commerce. A few miles out in the ocean there are several picturesque islands, on two of which are the dépôts of two great steam-packet companies. One, American, carries on the traffic with California. The other, English, plies its vessels between Panama and the ports of Peru and Chili. A small colony of captains, doctors, engineers, officers, artificers, and sailors have here a little town of their own, without women. The Panama railway is a single line of fifty miles. It follows for a considerable distance the course of the river Chagres, and runs through tropical forest scenery. So rapid is the growth, that the ground on either hand has to be cleared of jungle every six months, or the line would be obstructed. At intervals of a few miles there are wooden houses, built with much taste, in each of which a superintendent resides, with some labourers. In 1861 the passengers by railway to Panama amounted to 20,049, and from it to 10,920. The fare is enormously high, and there is only one class.

*Aspinwall*, the Atlantic terminus of the railway, on the shore of Navy Bay, is a hastily-built, bustling, and thriving place, virtually Yankee, created for the passenger and goods traffic which comes to it both from Southampton and New York. That from New York is of course immensely the greatest, as this is the main route to California and Oregon. *Porto Bello*, eastward on the coast, was so called by Columbus in allusion to its fine harbour, but acquired the name of 'the grave of the Europeans,' *La Sepultura de los Europeanos*, from its notorious unhealthiness, and has long been wretchedly dilapidated. The deep inlet of the shore immediately east, or the Gulf of Darien, is historically distinguished. At the upper extremity, where the river Atrato enters, the first European settlement in South America was established in 1509. This was called *Santa Maria del Antigua*. It adopted for a cognizance the figure of a golden castle, with a jaguar on one side, and a puma on the other. A second settlement soon followed a few miles inland, from which the earliest expeditions to the Pacific Ocean and Peru set out. Both were ultimately abandoned. In 1698 the western shore of the gulf was the scene of an attempt to plant a Scotch colony on an inlet which received and still bears the name of Caledonia Bay, entered by the Caledonia River. It was made by Mr W. Paterson, who afterwards planned and founded the Bank of England, but this proved a most disastrous failure. In 1854, British, French, and American men-of-war anchored for the first time in Caledonia Bay. They were connected with an engineering survey of the isthmus for a ship-canal, from the deep water of the Caledonia River to that of the Savana on the opposite side, which enters the Gulf of San Miguel. The distance is under forty-five miles, with a hilly ridge only two miles wide at the base, and 150 feet high, for the chief difficulty on the route. In 1857 a Commission of Engineers, to whom the question of practicability was referred by the Emperor Napoleon, reported in favour of it.

## II. VENEZUELA.

VENEZUELA, a territory of great extent, stretches along the Caribbean Sea from Colombia to British Guiana, and is bounded southerly by the Brazilian Empire. In the last direction the mountains of Parime rise and form the border; a chain also runs along

the coast, subject to only a few interruptions; and a branch diverging from the Andes enters the country on the north-west. But three-fourths of the surface consist of llanos or plains, traversed by the Orinoco and its affluents, in many parts well wooded, in others entirely bare of arborescent forms, with the exception of a few clumps of palms. The open plains are grassy after the rains, occupied by immense droves of cattle; but in the dry season, baked by the sun, they are completely parched and desert-like, being thickly covered with the dust of the pulverised vegetation. So low and level are these tracts, that the annual rise of the Orinoco converts them into spacious lakes, when the cattle take refuge on gently-rising mounds, while the Indians ascend the palms, make hammocks of the broad long fronds, and subsist upon the fruit. This change of aspect is of regular annual occurrence. The basin of the great river is almost entirely within the limits of Venezuela, through which it follows a very winding course of 1900 miles, setting out from east to west, then turning north, and finally running from west to east, so as to bring the termination and the source into nearly the same longitude. At upwards of 250 miles from the mouth, which is the head of the tidal water, it is four miles wide, and more than 300 feet deep. The estuary is historically celebrated for having been entered by Columbus, who sagaciously inferred from the vast body of fresh water the continental character of the adjoining region; and the basin is physically remarkable for uniting itself with that of the Amazon by the natural canal of the Cassiquiari. The Orinoco may be styled the Nile of South America, corresponding strikingly to the African river in its delta, its regular rise and fall, its numerous saurian reptiles, with the cataracts and rapids of the upper part of its course. The open plains are generally on the left bank, and the woods on the right. On the left bank also the principal affluents are received, the Guaviare, the Meta, and the Apure. The hydrography includes further the beautiful Lake of Valencia, eighty miles in circuit, and the guitar-shaped sea-lake of Maracaybo, which covers an area of about 8000 square miles, and is connected by a narrow channel with a gulf of the same name.

The vegetable produce of Venezuela is singularly diversified, and constitutes the chief part of its wealth. Of useful plants which are cultivated there are said to be not less than 180 varieties, while the forests contain 240 species of valuable woods, 36 plants yielding gums and resins, and 45 from which medicinal drugs are obtained. The most extraordinary feature of the native botany, the cow-tree, *Palo de Vaca*, has no prepossessing appearance. It grows on the parched sides of rocks in the mountain region, seems scarcely to penetrate the ground with its roots, while the foliage is dry and leathery. Yet though months may pass away without the leaves being moistened by a shower, and the branches seem withered and dead, the trunk yields a nourishing milk with an agreeable taste upon being pierced. These vegetable fountains flow most freely in the early morning, at which time they are regularly visited by the Indians. A species of mimosa, the *zamang*, is remarkable for the immense extent of its branches, which form a hemispherical top like a vast umbrella, in some instances 600 feet round the rim. The chief objects of culture are coffee, cacao, sugar, tobacco, cotton, and indigo for export, with maize for home consumption. The exports also include live-stock reared on the llanos, sent to the West India market, with dried meat, hides, and leather. There appears to be no important amount of mineral wealth, though imagination fixed the original El Dorado on the banks of the Orinoco, the grand object of early adventurers. It led to the fitting out of many expeditions for its search; among others, to that of Sir Walter Raleigh in 1595, which contributed to his unjust doom upon the scaffold.

Venezuela contains an area of 426,000 square miles, and an aggregate population of 1,565,000, consisting of whites of Spanish descent, Indians, and Negroes, but principally of mixed origin. Thirteen provinces are enumerated, one of which, Margarita, is an island in the Caribbean Sea, formerly the site of a profitable pearl-fishery.

In the year 1848 the Venezuelan republic began to be disturbed by warring factions, and tranquillity was not restored till the month of October 1863, when Puerto Cabello, the last stronghold of the insurgents, surrendered to the existing government. New political arrangements have been adopted, converting the provinces into states, and increasing the number to twenty, but it remains for time to shew whether the constitution and the public peace will be permanent. Meanwhile, General Falcon, the president, has decreed

the abolition of the death penalty, the inviolability of private residences except in cases of crime, the freedom of the press, and the extinction of slavery.

| Provinces.      | Chief Towns.                  | Provinces.   | Chief Towns.                     |
|-----------------|-------------------------------|--------------|----------------------------------|
| Caracas, .      | Caracas, La Guayra, Calabozo. | Carabobo, .  | Valencia, Puerto Cabello.        |
| Maracaybo, .    | Maracaybo, Alta Gracia.       | Barcelona, . | Barcelona.                       |
| Coro, .         | Coro.                         | Cumana, .    | Cumana, Cumanacoa.               |
| Barquisimeto, . | Barquisimeto, Carora, Tucuyo. | Guiana, .    | Angostura, or Ciudad Bolivar.    |
| Truxillo, .     | Truxillo, Arauro.             | Apure, .     | Achaguas, San Fernando de Apure. |
| Merida, .       | Merida.                       | Margarita, . | Assuncion.                       |
| Varinas, .      | Varinas.                      |              |                                  |

*Caracas*, the capital, occupies an elevated site, sixteen miles inland from the Caribbean Sea, but carries on foreign commerce by means of two ports, *La Guayra* and *Puerto Cabello*, on the coast. It contains about 40,000 inhabitants, and has a large cathedral which withstood the terrible earthquake of Holy-Thursday in the year 1812, when most of the people were assembled in the churches, and 12,000 perished. The church of *Alta Gracia*, for the coloured population, is, however, the most imposing edifice. The city was the birthplace of the illustrious Bolivar. In the background the Saddle Mountain, *Silla de Caracas*, so named from the depression between its two peaks, rises grandly to the height of 8600 feet. *Cumana*, a seaport, the oldest Venezuelan city, was formerly the seat of great commerce. It had long been declining, when, in July 1853, an earthquake levelled the buildings, involving a large loss of life. *Maracaybo*, on the western side of the channel connecting the lake and gulf of that name, is a considerable town, well built, with a population of 20,000. In this part of the coast the early Spanish explorers met with native villages built upon piles on the flat shore, which originated the name of the country, *Venezuela*, or 'Little Venice.' The neighbourhood abounds with petroleum and asphalt, occasionally in ignition, forming the 'Lantern of Maracaybo.' The chief inland towns are *Valencia*, finely situated near the border of its lake; *Varinas*, known throughout Europe\* for the quality of its tobacco; and *Merida*, with a richly-adorned cathedral, near the divergent branch of the Andes, one peak of which approaches the snow-line, hence styled the *Sierra Nevada de Merida*. *Ciudad Bolivar*, formerly called *Angostura*, is the only place of consequence on the course of the Orinoco, 240 miles above its mouth, a small town, but a scene of active industry and some political celebrity. The new name was conferred in honour of the patriot leader, who, in 1819, here assembled the first Venezuelan congress. During the periodical rise of the river the streets are often under water; alligators have been seen tumbling about in them; and the unwary have occasionally suffered from their ferocity.

### III. BRITISH, DUTCH, AND FRENCH GUIANA.

GUIANA PROPER embraces the whole tract of country between the Orinoco, the Amazon, its affluent, the Rio Negro, and the coast of the Atlantic. But the larger part of this region is included within the southern limits of Venezuela, and the northern border of Brazil, while the maritime portion, still an extensive territory, is divided between three European powers. The name is either derived from an aboriginal tribe, the Guayanoes, or is a form of *Wai-ini*, a small tributary of the Orinoco. It appears to have been first adopted as a distinctive title for the district by the Dutch. The inland limits of these foreign possessions have never been decisively arranged, and portions nominally included in them, especially in the British, are claimed by the Venezuelan and Brazilian governments. Though long occupied by European settlers on the coast, little has been known till recently of the country at any considerable distance from the sea-board, and many of the more interior parts have yet to come within the range of exploration.

BRITISH GUIANA extends from the mouth of the Orinoco to the river Corentyn, by which it is separated from the Dutch colony. Inland, an area of 76,000 square miles is claimed, which considerably exceeds that of the other two territories taken together. Population 147,000, exclusive of aborigines. Three rivers traverse the surface from south to north, the *Essequibo*, the *Demerara*, and the *Berbice*. The first mentioned is much the largest, and expands into a noble estuary full eight miles wide for some distance above its mouth. The shores are low and flat, profusely clad with the brightly-green verdure of the tropics. Such is the depth and fertility of the soil that the same land has been productive annually through more than half a century without manure, without rotation of crop, and without a pause. But the whole maritime region is swampy; the rains are tremendous; and the heat is great. At the distance of from twenty to forty miles from the coast the surface becomes hilly, and is mountainous in

the far interior. All natural features are here developed on the largest scale, as in wide-spread savannahs and endless forests; rivers flowing deep and still, with streams foaming in rapids and roaring in cascades; while the profusion and variety of living things, animal and vegetable, strike the beholder with astonishment and admiration.

Two intrepid exploring naturalists, Schomburgh and Waterton, have graphically illustrated the rocks, the woods, and the waters, with their animal inhabitants, though many wilds remain to be penetrated. Roraima, or 'Red Rock,' in a remarkable sandstone group, rises 7500 feet above the sea. The upper 1500 feet form a mural precipice as perpendicular as if erected with the plumb-line, but overhung with low shrubs, while numerous cascades rush down the face. The Indians, alive to striking natural objects, sing of 'Roraima, the red rock, wrapped in clouds, the ever-fertile source of streams.' It is also called the 'Night Mountain,' in reference to the gloom which prevails when mists gather round the summit. The Ataraipu, or 'Devil's Rock,' remarkably isolated, is wooded for about 350 feet, above which rises a mass of granite devoid of every trace of vegetation, in a pyramidal form, for about 500 feet more. Masses of granite, fantastically shaped, occupy elevations on the banks of the Essequibo. These 'giants of the hill' are frequently found inscribed with hieroglyphics, the picture-writing of the Indians, consisting of rude outlines of men and women, birds, animals, and even large vessels with masts.

Prominent members of the forest include the dark-leaved majestic *mora*, the mimosa of the Western Hemisphere, equal to the best timber for ship-building; the scarcely less stately and useful *sawari*, bearing a rich and nutritious nut; the *sirwabally*, noted for resisting the attack of worms; the *cecropia*, or trumpet-tree; and the water *guava*, which replaces the mangrove of the sea-shore, and has an aromatic leaf useful in dysentery. Parasites and climbers, with glorious flowers, thicken and adorn the woodland. The wild vine, or bush-rose, twists itself like a cable round the loftiest trees; the wild fig occasionally takes root in the topmost branches of the *mora*, deriving nourishment for its sap; scarlet or snow-white passion-flowers appear in profusion; bignonia of various species, the most beautiful of climbers in the conservatories of Europe, hang in natural festoons; and the whole is rendered more gay by the brilliant blossoms of the incense-tree, which perfumes the forest at the same time with its odorous medicinal resin. In 1837, Schomburgh made his famous discovery of the giant water-lily, *Victoria Regia*, in the upper waters of the Berbice River. The wooded world is alive with howling monkeys, weeping monkeys, spider monkeys, preaching monkeys, fox-tailed monkeys, and squirrel monkeys. There are tiger-cats and wild dogs; deer, wild boars, tapirs, sloths, armadillos, ant-eaters, and opossums; birds of melodious song, of rich plumage, and game birds; arboreal and water snakes, venomous and harmless; alligators in the streams and pools; and insect nuisances are in full force.

The English were settled on the banks of the Berbice as early as the year 1634, but the territory was afterwards wholly resigned to the Dutch. It was reoccupied in 1796, resigned again in 1802, and resumed the following year, since which time it has been a British colony. Public affairs are administered by a governor invested with large powers, responsible to the Queen in council, aided by a peculiarly constituted colonial assembly. There are three counties, Essequibo, Demerara, and Berbice, which form a diocese of the Anglican Church. In 1861, excluding aborigines, troops, and seamen afloat, the population amounted to 147,700, of a very miscellaneous description, the descendants of Dutch settlers, free Negroes, a few English, with Portuguese, Chinese, and East India natives, imported in large numbers to supply the labour-market. The Chinamen are liked by the planters, who have an agent regularly stationed at Canton to procure recruits. Sugar, molasses, rum, and timber are the staple exports.

*Georgetown*, the capital, situated on the river Demerara, near its outlet, contains 25,000 inhabitants, the great majority of whom are Negroes or persons of colour. It is regularly built of neat wooden houses, embosomed in trees, with verandahs in front, and canals are in the streets after the Dutch fashion. There is an Episcopal cathedral and a Smith chapel. The latter commemorates the missionary who suffered in the cause of the Negroes during the struggle for emancipation. *New Amsterdam*, on the Berbice, is a much smaller town, of Dutch foundation as implied in the name. Settlements are scattered for some distance up the rivers, one of which has been recently planted on the Essequibo, with the name of Hyde Park. In the International Exhibition, London, 1862, the products of the colony were well represented. There was a collection of substances connected with food, of fibrous articles used in manufactures, and a display of not less than 225 native medicinal drugs, with a notice of their application in various maladies. The forest produce was illustrated by a loo-table, made of 913 pieces, from thirty-three kinds of ornamental timber.

DUTCH GUIANA, intervening between the British and French territories, is separated from the former by the river Corentyn, from the latter by the Marony, and traversed centrally by the Surinam, the name of which is often given to the colony. Population, 53,000. FRENCH GUIANA, the most easterly and the smallest district, extends from the Marony to the Oyapok, the boundary stream from Brazil, which has been the scene of tragic crimes and wild adventures. The entire region has generally the same physical aspect, soil, climate, native products and inhabitants, while the respective political divisions differ as to introduced population, special objects of culture, amount of social improvement, and the extent

to which natural advantages have been developed. A long rainy season sets in about the middle of April, and lasts till August, followed by a long dry season continuing till November. Showers begin to fall in December and prevail through January, to which a dry interval succeeds, lasting till the great rains commence. Thunder-storms are common and violent during the rains, but the hurricanes of the West Indies are unknown. Population of the colony, 21,400.\*

*Paramaribo*, the Dutch head-quarters, and the central seat of commerce, is situated on the Surinam, and contains about 20,000 inhabitants. The broad regular streets are traversed by canals, and lined with orange, lemon, and tamarind trees. Fort Zeelandia, in the vicinity, at the mouth of the river, is the residence of the governor. The export trade is considerable in sugar, molasses, rum, coffee, cacao, and cotton, with woods, gums, and drugs. Negroes, emancipated from slavery in 1851, are the most numerous class in the colony. Maroons, or runaway slaves, remain in parts of the interior to which they fled. There are several communities of Jews, both on the coast and inland, who have their synagogues.

*Cayenne*, the French capital, occupies a river-island of the same name, which is frequently given to the entire colony. The town is small and mean looking, containing about 8000 inhabitants. The name originates in a spice, Cayenne Pepper, made of the dried seeds of a native plant, a species of capsicum. It is also applied to a fruit esteemed for its flavour, the Cayenne Cherry. This colony at its origin bore the high-sounding title of 'Equinoctial France.' Its history presents an almost uninterrupted succession of misfortunes and crimes. The first immigrants settled on the river Sinnamary in 1624, and soon afterwards came under the control of a company formed at Rouen for the nurture of the infant settlement. But the violent proceedings of the governor sent out, led to an Indian revolt, and he was massacred, with most of his associates. Under the auspices of a second company formed at Paris in 1652, Equinoctial France was launched. The members, twelve in number, styled themselves the 'twelve lords.' They collected emigrants, and sailed across the Atlantic. On the voyage the commander was murdered. Within three months after landing, one of the 'lords' was executed, three were banished, three died from the effects of dissipation, and another Indian revolt nearly annihilated the entire colony. In 1763 the French government made a great effort to re-establish it at the cost of 30,000,000 francs. But of 12,000 emigrants despatched, 9000 soon perished of disease in the swamps, more than 2000 returned home, and only seventy families became permanent. A second effort failed as completely. During the revolution, political victims began to be transported to Cayenne, and French Guiana is now the principal seat of the penal settlements of the mother-country. It is divided into two cantonal districts—Cayenne and Sinnamary. All who are sentenced to eight years' penal servitude are doomed to remain for life in the colony. No returns of the death-rate among the prisoners are made by the French government, but the mortality is believed to be very considerable.

## CHAPTER VI.

BRAZIL—PARAGUAY—URUGUAY.

### I. BRAZIL.

THE Brazilian Empire, a compact dominion of gigantic extent, but of no commensurate political importance, embraces the central and eastern districts of South America, touches all its countries with the exception of Chili and Patagonia, and corresponds in general shape to that of the continent itself, a triangle, with the apex directed to the south. It embraces the coast of the Atlantic from French Guiana to Uruguay, a sea-board of 3700 miles; stretches through 2600 miles from north to south, by nearly the same distance from east to west; and comprehends an area falling but little short of 3,000,000 square miles, if not exceeding that measurement. But though nearly equal to the whole of Europe in size, the population is inferior in numbers to the aggregate found within the limited dimensions of Belgium and Holland. Northward are the Guianas, Venezuela, and Colombia; westward are Ecuador, Peru, and Bolivia; southward are Paraguay, Uruguay, and the Argentine Republic; eastward rolls the ocean. This vast empire lies between latitude  $4^{\circ} 30'$  north and  $33^{\circ} 45'$  south, and between longitude  $34^{\circ} 47'$  and  $72^{\circ}$  west. It thus passes north beyond the equator, and advances considerably in the opposite direction beyond the line of the southern tropic. Low levels, generally densely wooded, are in the north and west, with moderately high table-lands crossed by mountainous ridges in the east and south, which have likewise

woodland tracts, but include extensive pasture-grounds. These two regions divide nearly equal proportions of the surface between them. The greatest elevations are in the more maritime ridges, as the Sierra do Mar, or Sea Range, immediately in the background of Rio Janeiro; and a northerly continuation of it, the Sierra do Espinhaço, at a somewhat greater distance from the coast. But the highest points range only from 6000 to 7000 feet above the sea. The hydrography of the country comprises the great flood of the Amazon, travelling through its whole extent from west to east, with its numerous and mighty tributaries, of which the Negro from the north, and the Madeira, the Tapajos, and the Xingu, from the south, are the largest; the Tocantins, flowing from south to north, and entering the same estuary; the San Francisco, in the east, watering the provinces of Bahia and Pernambuco, on its passage to the Atlantic; and the Upper Parana and Paraguay in the south, which form by their united volume the Rio de la Plata. Before quitting the Brazilian territory, the channel of the Paraguay is contracted at a place called the Fechos dos Morros, or 'Barricade of Rocks,' where a vast temporary lake is formed, when the annual rains are unusually heavy, by the inability of the waters to effect at once their disengagement.

The occupied and cultivated districts in Brazil are chiefly maritime. At no great distance from the coast at any point, the country is largely in a state of nature, and completely so through an immense extent of the remote interior. But everywhere both animal and vegetable life is developed with astonishing profusion and diversity. The jaguar is lord of the woods and jungle, sharing the dominion with the boa-constrictor, the 'bush-master,' often of enormous length. The emu and the vulture are the largest of the birds; the various parrots are the most beautiful; the toucan the most eccentric-looking; and the humming-birds of many species the most interesting. The plumage of the latter, purple, crimson, and copper-coloured, taken from the breast and head, is used for the manufacture of feather flowers. Insect life, while including the class of tormentors in abundance, embraces the largest of all butterflies, splendidly arrayed; and fireflies abound, whose phosphorescent lustre has a magical effect in the forest at night. It is stated that the hum and noise of the myriads of insects in the woods may be heard on board a ship at anchor some distance from the shore.

The natural flora receives a distinctive physiognomy from the multitude of its palms, no fewer than a hundred species, and the host of myrtles which perfume the air with their exhalations. No language, it has been said, can adequately describe the glory of the Brazilian forest, the variety of the trees bearing brilliant blossoms; the contrast of their colour and size, and the thickets formed by the creepers hanging from branch to branch, with the endless diversity of the flowering-plants. Dye-woods are abundant among the forest produce. Some of the early cargoes being of a bright-red colour, were called *brazas*, literally meaning 'coals on fire,' and hence the name of Brazil-wood, *Cesalpinia echinata*, with that of the country. The parent tree of the well-known Brazil-nuts, *Bertholitia excelsa*, answers to its name, rising commonly to the height of 100 feet, and being two or three feet in diameter. The nuts are enclosed in a shell half an inch thick, hard as iron, and so neatly packed together, that when once disturbed, no human art could possibly re-insert them all. They are the castanhas or chestnuts of the natives, an article of food with them, and greatly relished also by the monkeys.

The mineral resources of Brazil include gold, diamonds, topazes, and other precious stones, with vast quantities of iron ore which compose almost the entire mass of several mountains. Gold is obtained from auriferous rocks connected with the Sierra Espinhaço, and from alluvial deposits on the slopes and at the base. The province has the name of Minas Geraes, or General Mines. It includes the principal diamond district, where also

the most valuable topazes are found in the sands and mud deposited by the upper waters of the river San Francisco and its feeders. The first diamonds were obtained in the year 1710, by the miners in washing for gold. They were preserved as pretty stones, deemed of no more value than beads, till recognised by an official who had been in the East Indies as diamonds of the purest water. This district has been, and still is, one of the richest on the earth in the costly gems; and the province of Matto Grosso is scarcely inferior to it. But the cultivated vegetable products constitute an item of far greater wealth than the minerals. They consist of coffee, sugar, and cotton, the staple exports, with cocoa, tobacco, indigo, dye-woods, balsams, almost all kinds of fruits, all sorts of scents and spices. Manioc, the flour of which is used for bread by the humbler classes, plantains, bananas, and rice are extensively grown; and hides are prominent in the foreign commerce. Since 1820 the Chinese tea-plant has been introduced with perfect success, and is now a highly-flourishing and remunerative branch of the national agriculture. The produce retains its oriental name, *chá*. Outside the vendas or restaurants the inscription is commonly seen, *Chá Nacional*, as well as one referring to the foreign commodity, *Chá da India*.

Brazil was accidentally discovered by a Portuguese navigator on the 3d of May 1500, who, while on a voyage to India, was wafted by the trade-wind to the shore, near Mount Pascal, on the south of Cape St Augustin. The country was gradually colonised, and remained a dependency of Portugal to the year 1808, when it became the refuge of the royal family, driven from the mother-state by the French, and was constituted a kingdom in connection with it. This tie was finally broken in 1822, and an independent empire created under a Portuguese prince, with a liberal constitution. The government is a hereditary monarchy limited by a representative assembly of two chambers, one of senators appointed for life, and another of deputies elected for four years. Each province has also a legislative assembly for local laws, taxation, and administrative purposes, under presidents appointed by the crown.

| Inland Provinces.           | Minas Geraes, . . . . .         | Ouro Preto, Joao del Rey, Piranga.          |
| " "                         | Goyaz, . . . . .                | Goyaz.                                      |
| " "                         | Mato Grosso, . . . . .          | Mato Grosso, Cuyabo, Diamantina.            |

*Rio Janeiro*, the capital of the empire, commonly called *Rio*, is the largest city of South America, containing perhaps a population of 400,000, situated in latitude 22° 53' south and longitude 43° west. It occupies the south-western shores of a landlocked and exquisitely beautiful bay, to which the name, signifying River of January, was originally restricted, first applied to it from the month of its discovery. The place itself was founded in the year 1556 by a French colony, with the name of San Sebastian. It was intended to be the capital of a region called 'Antarctic France,' but little more than ten years elapsed before the Portuguese took possession of the settlement. The bay, the city, and its rocky sentinels of remarkable form, the Sugar Loaf, the Gloria Hill, and others, bare at the summit, green on the sides, with the loftier Organ Mountains rising in the distance, form one of the finest panoramas in the world. Rio possesses no imposing street architecture, but has some good public buildings in the European style. The private houses are not outwardly attractive, but villas in the environs evince great taste, and are rendered extremely lovely by tropical flowers, fruits, and foliage. The royal palace at Boa Vista in the suburbs is a plain mansion,

picturesquely seated at the foot of mountains. An aqueduct seven miles in length brings water to the city, and fountains are numerous. Churches and convents crown the top of almost every hill, but their condition proclaims the relaxed hold of the Roman Catholic faith on the population, which is very apparent in every part of Brazil. Some have remained unfinished for half a century; others are dilapidated; and not a few are deserted. The public institutions include the Santa Casa da Misericórdia, or Holy House of Mercy, for the sick and destitute; the Hospital dos Lazaros, for the cure of cutaneous disorders, which are very prevalent; the Casa da Roda, or House of the Wheel, a foundling hospital; the Theological Seminary of St Joseph; a Medical College; Military and Naval Academies; the College of Dom Pedro II., a national university; and the National Library, containing 100,000 volumes, chiefly brought over from Lisbon, upon the retirement of the Portuguese court from it. The English residents have also an extensive and valuable library; and a Protestant chapel in the Rua dos Barbons, built in 1823.

Life in Rio presents many interesting phases to the stranger. The commerce is vast, and by day the streets are scenes of great animation. Vehicles are rarely employed in the transport of merchandise to and from the quays, but Negro porters who work in gangs of from ten to twenty, and are generally the most powerful men that can be found. The coffee-carriers are a celebrated race. Under a captain, a troop will hoist, each of them, a bag of coffee upon his head, weighing 160 lbs.; and unencumbered by any clothing but short trousers, will start off at a sharp trot which gradually becomes a rapid run. One hand steadies the load; the other grasps a kind of child's rattle, the noise of which is accompanied by a loud shouting song. In the great square the market presents a picturesque spectacle, with its choice fruits, vegetables, poultry, and fish, black cooks and housemaids chaffering with the vendors. Feather flowers are extensively made of the plumage of the humming-birds, to which the wing-cases of beetles are often added, and have the sparkling effect of precious stones. The 'padres' in the streets at once arrest the attention of the traveller, with large hats and close-buttoned gowns, dressed in the height of the tropical summer as if for a Canadian winter. *Petropolis* and *Theresopolis*, called after the emperor and empress, Peter and Theresa, are two new towns inland among the hills, containing many German colonists. *Petropolis*, reached by steamer across the bay and then by a railway, has become the most important, being the summer residence of the emperor, whose palace is in the centre. The diplomatic body and wealthy citizens annually repair to the place to spend the hot and unhealthy season. The population, 10,000, is rapidly increasing, owing to the beauty and salubrity of the site, about 2500 feet above the sea, surrounded by hills covered with the virgin forest, in which tree-ferns are prominent, with their drooping fronds of exquisite green, moulded into lace-like forms by nature's delicate working. Sparkling streams and cascades are in the valleys and glens. The Falls of Itamarity, 'Shining Stones,' in the vicinity, are remarkable for combined beauty and grandeur.

*Bahia*, 'Bay,' the second city and port of the empire, about 300 miles north of the capital, is very finely seated at the base and on the summit of a rock projecting into All Saints' Bay, and has a noble appearance from the sea. It is the oldest city in Brazil, having been founded by the first governor-general, was the capital until 1763, when the seat of government was transferred to Rio. It is also the only archiepiscopal city of the empire. The cathedral and some of the churches, erected by the Jesuits, are imposing structures. A *fabrica de imagens*, or image-factory, is said to carry on a flourishing trade. *Bahia* has the full name of *Cidade de San Salvador da Bahia de todos os Santos*, 'The City of the Holy Saviour of the Bay of All Saints.' But formerly St Anthony was held in such esteem, that in 1705, at the request of the town-council, the viceroy issued an order granting to the defunct the rank and pay of a captain in the fortress. The inhabitants are estimated at 125,000, among whom are a large number of Negroes from the coast of Benin. They are a powerful and independent race, occasionally turbulent; all Mohammedans, speaking a language unknown to the other Negroes. *Pernambuco*, a more northerly port, and the most easterly city of the empire, consists of three divisions; Recife, or 'Reef,' on a peninsula opposite a coral-reef which protects the harbour, the seat of foreign commerce; St Antonio, on an island approached by a bridge, where the shopkeepers reside in lofty substantial houses, with many windows and verandahs to admit the sea-breeze; and *Boa Vista*, on the mainland, from which villas extend a considerable distance into the country. The population is about 60,000. Sugar and cotton plantations are extensive in the neighbourhood, and yield the staple exports. The cotton known in the Liverpool market as Pernambuco, Bahia, and Maranhao is the produce of *Gossypium Peruvianum*. The plant attains the height of from ten to fifteen feet, has large leaves, yellow flowers, and yields a long stapled wool. Hides are also largely exported, the produce of the interior districts, where vast herds of cattle are bred. The city and the province contain a number of Sebastianists, found also in Portugal, a fanatical people who believe that the young king, Don Sebastian, slain in 1577 by the Moors in Africa, is still alive, and will reappear to inaugurate a millennium. They were guilty of dreadful excesses in the Pernambuco province in 1838, and had to be put down by the troops.

*Maranhao*, on a river-island of the north coast, with a population of 36,000, is the best built city in the Brazilian empire, and is a remarkably clean, gay, hospitable, and prosperous place. It has a remarkable rain-fall, amounting to an annual precipitation of 280 inches. *Para*, near the outlet of the river Tocantins, possesses the largest cathedral in Brazil, with other public buildings far beyond the wants of the inhabitants, therefore neglected. It exhibits a singular blending of town and country. The squares are green with grass, and studded with palm-trees. Vines and climbing plants have overgrown the theatre; and the dense forest presses close upon the houses. A considerable quantity of cacao is raised in the province, on the banks of the Amazon. The cacao-trees are not more than from fifteen to twenty feet in height, and have yellowish-green

leaves, in marked contrast with the full vivid green of the surrounding woods; three years after planting, the trees yield, and afterwards require no attention; a large berry grows direct from the trunk, and the branches contain the seeds which are the cacao of commerce. *San Paulo*, the largest inland city, in the southern part of the empire, is the seat of an old university, and contains about 40,000 inhabitants, who, together with those of the province, have long been prominent in Brazilian history for public spirit and influence. The ridge of the Sierra do Mar intervenes between the city and its port, the small town of Santos. Across the Sierra a railway is in process of being conducted, in the hands of English capitalists and contractors; it runs for eight miles from the sea over a swampy plain reeking with miasma, to the foot of the mountain-chain, which assumes its grandest proportions at the point where the *Sap Paoli* province is entered from the coast. Science has here been called in to grapple with the difficulty of carrying the line through the dividing ridge. This is done by a series of inclines up the gorges, one of which has the name of *Bocca do Inferno*, from its wildness and gloom. In the space of five miles the railway rises to the height of 2600 feet above the sea, and then passes out through an opening in the ridge, on to the table-land of the interior.

The population of Brazil was estimated at 9,000,000 in the year 1863, consisting of whites chiefly of Portuguese descent, Negroes, mostly in a state of slavery, aboriginal Indians, and mixed races.

The aborigines are found in most of the provinces, but under different circumstances in the interior and the maritime districts. In the upper part of the basin of the Amazon there are tribes in a condition of wild independence, retaining the barbarous customs and superstitions of their ancestors, as if the foot of civilised man had never trod the soil. Some of these are undoubtedly cannibals, eating the flesh of their enemies, and preserving it smoked and dried. Others more contiguous to the chief settlements of the whites, have been partially civilised, brought into subjection to regular government, and are very stringently protected by the laws. Imprisonment has been inflicted upon the white man for striking his Indian neighbour. These natives, though disposed, like all the other members of the race, to look with aversion upon settled industry, yet till the soil, manage the boats which bring down produce on the rivers, compose part of the national army; and traces of intermarriage with them are observable in some of the town families. They make baskets, boxes, and india-rubber shoes neatly, and are unequalled in the production of feather-work. The Negroes are supposed to number nearly half the population, subject to a slavery where they are bondsmen of the mildest type; so much so, that many refuse to purchase independence when they have the means, and will decline to accept it as a gift. Not only are natives slaveholders, but foreigners, French, German, and English also; for instance, the great Anglo-Brazilian Mining Company of *St Joao do Rey* hold slaves. By law the slave-trade was prohibited in 1850; in 1853 there was not a single disembarkation; and it is probable that in a few years slavery itself will be extinct. It is a pleasant circumstance that throughout the empire colour has no influence upon social standing, and persons of every shade are eligible for official employment and political privileges.

The Brazilians proper, or native whites, amount to about one-third of the population. They are landholders, gentry, government employés, military and naval officers, or members of the priesthood; while Portuguese, who come over in youth to make money, and return home again, with other foreigners, have the principal management of trade and commerce. The established church is the Roman Catholic. But while sustained by the state, the hierarchy are controlled in the exercise of many important functions by the civil government; and toleration is enjoyed by other communions, subject to the restriction of not building steeples and ringing bells. Official statements are scarcely credible respecting the ignorance, sloth, and vices of the clergy, who are regarded with contempt by the better classes, and have recourse to shows and festivals to maintain influence with the populace. These are duly announced in the newspapers, in connection with some amusement to collect a crowd, as 'brilliant horse-racing, after which a *Te Deum*, and magnificent fireworks.' Several papers of large size, well printed, on good paper, appear daily in the capital,

without exception being made in favour of Sunday. There are two universities of law, one at San Paulo and another at Pernambuco; two medical universities, one at Rio and another at Bahia; an Imperial Academy of the Fine Arts; a Geographical and Historical Institute; and public instruction has an official superintendent. The people are in general keen politicians, and take a lively interest in the elections. Senators are chosen by provincial electors, who submit three candidates to the emperor, one of whom he selects. The party appointed takes his seat for life, and generally receives a title if without one. For the deputies every citizen of full age, in possession of a small property qualification, has a vote, with the exception of monks and domestic servants. By the constitution all elections are to be held in churches. This regulation the framers of it thought would give solemnity to the proceedings. But during severely-contested elections, when party-spirit has run high, a free use has been made of the metal candlesticks and statues, in the place of legitimate arguments.

## II. PARAGUAY.

PARAGUAY, formerly under the rule of Spain as part of the viceroyalty of Buenos Ayres, is now the only independent state of South America entirely inland; and maintained a singular attitude of political isolation relative to all other countries, from the formation of a separate government down to a recent date. It embraces the peninsular tract, lying between the two great rivers, the Paraguay and the Parana, above their junction; and is bordered by Brazil on the north and east, and by the states of the Argentine Republic on the west and south. This territory extends upwards of 400 miles along the east bank of the Paraguay, which was ascended considerably beyond its limits by the United States steamer, the *Water Witch*, in 1855. It has an area computed at 74,000 square miles, with a surface hilly towards the Brazilian frontier, flat and marshy in other directions, abundantly clothed with forests, in which not less than sixty varieties of serviceable timber are enumerated. The botanical product of the greatest commercial and social value is the *Ilex Paraguayensis*, found also in the Brazilian woods, which supplies a substitute for the tea of China, and is an article of export. The population, reckoned in 1857 at 1,337,000, consists of whites of Spanish descent, with a much larger proportion of Indians, nominally Christianised by the Jesuits, who established and conducted missions among them during the former part of the last century.

Upon shaking off the Spanish yoke, Paraguay refused to join the other states which formed the Argentine Confederation, and declared for a separate existence. In 1814 the celebrated Francia was appointed dictator for three years, and subsequently for life. He governed the country absolutely, forbade all intercourse with foreigners, and detained Bonpland, the companion of Humboldt in his travels, a prisoner for many years, who had ventured for scientific purposes within the sphere of his dominion, but otherwise displayed great administrative capacity. Soon after his death, in 1840, the rule excluding foreigners was relaxed. At present (1864) Paraguay professes to be a constitutional republic, but the president has almost dictatorial power. *Assumption* or *Asuncion* (Ascension), the capital, stands on the left bank of the Paraguay. It was founded by a Spanish colony in 1535, and rose to the rank of an archiepiscopal city, but is now a mean small town of 8000 inhabitants, yet with considerable trade in farming produce, and Paraguay tea. The *Ilex Paraguayensis* is a kind of holly growing wild in the forests, and covering literally many of the hills. The leaves and branches are broken off, kiln-dried in the woods, then pounded in a mill, and the coarse powder is the Paraguay tea of commerce. It supplies a beverage not only in daily use in the country, but with the lower classes in Brazil, Peru, and Chili, who call it meat and drink, and never travel without a supply for refreshment.

## III. URUGUAY.

URUGUAY is enclosed by the wide embouchure of La Plata on the south, Brazil on the north, the Atlantic on the east, and the river Uruguay on the west. This district was called Banda Oriental by the Spaniards, as it formed the eastern boundary of their possessions in South America. It contains an area of nearly 70,000 square miles, and has a level surface along the coast, destitute of wood, with an undulating interior, except in

the centre, which is crowded with heights, ravines, and forests, forming a southerly prolongation of the Sierra do Mar, or sea-range of Brazil. The greater portion of the country consists of pasture-land, distributed into grazing farms. Wealthy proprietors often possess thirty or forty square miles, with thousands of semi-wild cattle, besides horses, mules, and sheep. Hence live-stock, hides, horns, tallow, and jerked beef are the main exports, the commerce in which is very extensive with England, other parts of Europe, the West Indies, and Australia. The population, perhaps about 300,000, includes a number of industrious German settlers, with some Waldensians from their Alpine valleys.

After separating from Spain, the country was seized by Brazil, but recovered its independence in 1828, and became a republic. The constitution includes a president, elected for four years, a senate, and a house of representatives. *Monte Video*, the capital and chief shipping port, stands on the north bank of the Rio de la Plata, here more than sixty miles wide, and has its name from an abrupt hill by which it is overlooked. It has the best harbour on the broad estuary, though exposed to the *pamperos*, violent south-west winds, and is more favourably situated for foreign commerce than Buenos Ayres, on the south bank of the channel, being much nearer the Atlantic. The trade is very great, and rapidly increasing. Steam-communication is maintained with Southampton, Genoa, and other ports. The city is built in squares, in the old Spanish style, and contains a population of 45,700, including the small suburbs of Aguada and Cordon. From the want of wood and fresh-water springs, the inhabitants suffer great inconvenience. They collect the rain in cisterns placed in the courtyard of every house, and have water carted to them from a distance. The trade with the West Indies is in dried beef; with England in hides, horns, and tallow; and with Australia in mules.

The Alpaca.

Peunte del Inca, Chili.

## CHAPTER VII.

ECUADOR—PERU—BOLIVIA—CHILI.

### I. ECUADOR.

THE territory of ECUADOR is named from its position under the line of the equinoctial. It occupies the shore of the Pacific from Colombia on the north to Peru on the south, and extends inland on the east to the borders of Brazil. The coast-line embraces the Gulf of Guayaquil, a spacious and beautiful body of water studded with islands, the only inlet of importance on the western side of South America. It receives a river of the same name, which is the only stream between the whole chain of the Andes and the ocean, with any considerable length of navigation for large vessels. In two great ranges the mountains traverse the maritime region from north to south, which contain many of the loftiest and most magnificent masses of the entire series. Vast forests clothe the interior declivities, which slope gradually into extensive plains—still woodlands, but with interspersing savannahs. The drainage is conducted by many large rivers to the Amazon, the main channel of which forms part of the southern border from Peru. This inland country is through great spaces very imperfectly known, and exploration is beset with almost insuperable difficulties from the density of the woods and jungle, the myriads of mosquitoes and reptiles, annoying or dangerous, and the paucity of human inhabitants. Ecuador contains an area of 325,000 square miles, a population of more than 1,000,000,

of whom 665,000 are whites of Spanish descent, and has suffered from internal dissensions, like most of the sister-states.

Originally one of three states which formed the Colombian republic, Ecuador became a republic at their dissolution. The republic is divided into three departments.

|                              |                           |
|------------------------------|---------------------------|
| Quito, or Ecuador, . . . . . | Quito, Riobamba, Imbarra. |
| Guayaquil, . . . . .         | Guayaquil, Tumbes.        |
| Assuay, . . . . .            | Cuenca, Loja.             |

The western or maritime range of the Andes runs near the coast, and is distinguished by the mass of Pichincha, with an elevation of 15,976 feet above the sea; Illiniza, 17,330; and the dome-shaped

Cotopaxi.

Chimborazo, 21,424 feet, long regarded as the loftiest point of the globe, but not even the monarch of the Andes. The inland range has Cotopaxi, 18,875 feet, the most beautiful of all volcanoes, and one of the most terrible in its eruptions; Antisana, 19,137; and Cayambe, 19,386 feet, on the line of the equator. Many other summits are not much inferior in height, and have diversified features. The volcano of Macas is remarkable for its exactly conical outline, and the snow lying on it in longitudinal stripes, as well as for the cloud of smoke continually hovering over it. The truncated summit of El Altar is jagged with eight peaks of nearly equal elevation, and clad with an unbroken covering of snow.

Volcano of the Pichincha.

Tunguragua is a bluff irregular peak with a rounded apex capped with snow, which also descends in streaks far down its sides. Quito, the capital, the seat of a modern university, is an inland city, containing a full complement of old churches and convents, with about 76,000 inhabitants. They are said to be generally kind and courteous to strangers, but singularly deficient in enterprises involving any social improvement, a defect which specially applies to the government. The only road to the coast, which descends from highlands to lowlands, has undergone no repair for more than a century. Its termination in the low maritime region is nearly concealed by rank tropical vegetation, or so obstructed by fallen trees in various stages of decay as to be scarcely passable. Hence it has been said that though only 90 miles from the Pacific it might as readily be reached from the Atlantic, 3000 miles distant, owing to the navigable rivers. No city, perhaps, occupies such a remarkable position. It stands on a table-land 9528 feet above the sea. The particular site is a kind of ledge on the eastern side of the volcano of Pichincha. This mountain, 15,976 feet high, is crowned by a wall of trachytic rocks surrounding the crater, the depth of which is 2460 feet; and consequently the bottom, where volcanic agency is in active operation, is nearly 4000 feet above the level of the capital. The summit can at

no time be seen from the city, but from the great square no less than eleven snow-capped peaks are in sight. Such an elevation near the equator renders the climate very agreeable and salubrious. The thermometer never rises above 64°, nor sinks below 46°. There is a perpetual spring, and hence the common phrase of the 'evergreen Quito.' But by a very few hours' journey the traveller may ascend to the region of eternal frost, or descend into valleys where the heat is tropical. This variation of elevation and temperature, occurring within narrow limits, supplies the market with a diversity of vegetable produce, from plantains, pine-apples, oranges, and lemons, to the wheat, potato, and apple, with the other grains, roots, and fruits of Europe. But calamity from physical convulsions is at no time improbable. *Nueva Riobamba*, a town in the department, is the modern representative of old Riobamba, which, in 1797, was literally blown up by the mine-like explosion of an earthquake, the houses and inhabitants being hurled across the River Lican.

*Guayaquil*, the principal port, on the river of that name, forty miles above its outlet in the Gulf of Guayaquil, has the best harbour on the west coast of South America, contains 18,000 inhabitants, and monopolises nearly all the foreign trade of the republic. The chief exports are cocoa, straw hats, timber, bark, hides, and tobacco. But for one-half of the year there is an almost total suspension of commerce between the port and the interior. Goods arriving at the commencement of the rainy season, destined for Quito, must wait till it is over before they can be despatched, and the road becomes again in a passable condition. *Cuenca*, 8640 feet above the sea, the seat of an old university, and *Loxa*, 6760 feet, are inland towns in the department of the south. The Peruvian bark of medicine has been largely obtained from the woods on the Andes of Loxa, now extensively crippled by inconsiderate treatment from the collectors of it.

The Galapagos Islands, a volcanic group, upwards of 700 miles out in the ocean, belong to Ecuador. Ten of the more important have English names—Albemarle, Charles, Indefatigable, Chatham, James, Narborough, Hood, Barrington, Bindloes, and Abingdon. On Charles Island there is a small colony, consisting chiefly of persons of colour banished for political offences. The rest are uninhabited, but are visited for the turtles of immense size which frequent the shores. Hence the name *galapago*, the Spanish for 'tortoise.'

## II. PERU.

The territory of the Peruvian Republic, immediately southward of Ecuador, is a continuation of its superficial aspect with an ampler development. It embraces full 1500 miles of the coast-line of the Pacific, ranging from latitude 3° 30' to 21° 10' south, and has its greatest inland extension at a nearly intermediate point, where 700 miles intervene between the ocean and the Brazilian frontier. But the average breadth is much less, and becomes gradually contracted to very narrow limits at the south extremity along the border of Bolivia, where the great highland lake Titicaca is intersected by the boundary-line between the two states. The country has an area somewhat exceeding 500,000 square miles. It is traversed through the entire length by the Andes in two grand ranges, which enclose high valleys and table-lands of considerable width, but occasionally interlock and form mountain-knots. Three physically distinct regions are constituted, consisting of a narrow maritime plain, a central mountain-belt, and immense interior lowlands.

The maritime plain, between the Andes and the coast, has rarely more than a width of sixty miles, and is a dry, hot, sandy, and insalubrious region, intersected by chains of sand-hills, and frequently traversed by columns of sand drifting before the wind. Over the greater part of this district no rain ever falls, in the proper sense of the term, owing to the mountains obstructing the westward passage of the clouds which drench their inland slopes. But a veil of mist is formed for a few months on the immediate sea-board from which a slight precipitation occasionally descends. Fertility is hence confined to the borders of a few meagre streams, which are the inhabited sites, along with the coast-line. From this plain the central mountain-belt rises steeply and grandly, but has gradual declivities on the interior side. It contains numerous towns and villages in the high valleys by which it is penetrated, which have a delightfully genial climate and luxuriant vegetation; and spreads out in elevated table-lands ranging upwards to 12,000 feet or more, overlooked by many a peak from the bordering ridges, wearing a crown of perpetual snow. On these lofty levels the summer air is chill; the wind stormy; and the surface cheerless, only clad with a hard wiry grass, still succulent, though of a sickly hue. But

here, at sterile heights where vegetable life never looks verdant, and fearful tempests rage, while quadrupeds are few, and the condor alone seems to be in a congenial element, stores of the precious metal are buried beneath the surface, which have drawn a human population to comfortless wilds, wanting in every attribute to render their occupation agreeable. The third region, that of the interior lowlands, traversed by the head waters of the Amazon, is one of forests and savannahs, drenched with almost incessant rains. Here the clouds heaped up against the bounding-wall of the Andes by the trade-winds, descend in daily showers; and the more secluded woods are still rich in many of the most valuable species of *Cinchona* trees, yielding the Peruvian bark of medicine and commerce.

The Andes have been called the Treasury of Peru from their metallic wealth, especially in silver, which occurs in almost all its forms and combinations, from the pure metal to the argentiferous lead ore. The mines are all situated in the higher parts of the mountain region, which renders the working of them difficult and expensive. Some are now exhausted, and mining labour has been largely suspended by the political distractions of the country, but there is ample scope for the profitable employment of industry and capital. However much report may have exaggerated the accumulations of gold and silver in the palaces and temples of the old Peruvians, it is certain, from the experience of the early Spaniards, that they must have been enormous. Nor is it strange to read of twelve immense vases of silver, with corresponding utensils, in the interior of the great temple of Cuzco, a building constructed of stone and thatched with straw, having well-attested examples of extraordinary produce on record. Tschudi relates that the owner of the mines at San Jose, in the department of Huancavelica, requested Castro, the viceroy of Peru, who was his friend, to become godfather to his first child. The viceroy consented, but at the time appointed for the ceremony, affairs of state prevented him from leaving the capital, and he sent the vice-queen to officiate as his proxy. To honour his illustrious guest, the mine-owner laid down a triple row of silver bars along the whole way, and it was no very short distance, from his house to the church. Along this rich pavement the vice-queen walked, accompanied by the infant and attendants. On returning, the munificent host presented to her the whole of the silver road, as an acknowledgment of the honour she had conferred upon him. Since that time the mines and the district in which they are situated have borne the name of *Castrovireyna*. One of the most celebrated mining sites had its subterranean wealth accidentally discovered. History relates that in the early part of the sixteenth century an Indian shepherd tended his flock on a small pampa near the Lake of Ilauricocha, one of the feeders of the Amazon. Having wandered further from his hut than usual on one occasion, and being fatigued, he made a declivity of the Cerro de Santiestevan his resting-place for the night, kindled a fire to protect himself from the cold, and lay down to sleep. On awaking in the morning he was astonished to find the stone beneath the ashes of the fire melted and turned to silver. The shepherd communicated this intelligence to his master, a Spaniard, who immediately repaired to the spot, found indications of a rich vein of silver ore, and made preparations for working it. New veins were discovered by fresh adventurers, whose settlements and explorings originated the town and mines of Pasco. The original mine, still worked, has the name of *La Descubridora*, or 'The Discoverer.' The effectual concealment of rich metallic stores, so that all knowledge of their site has been finally lost, is an incident which has marked the history of mining in Peru. Quicksilver, copper, lead, and iron, with a limited amount of gold, are the other metals.

Peruvian bark, the only source of quinine, is the produce of trees growing on the eastern slope of the Andes, from Colombia on the north to Chili on the south. They do not form forests of themselves, but are interspersed with other trees; and appear to require a mean temperature varying, according to species, from 60° to 70° Fahrenheit, with an almost constant supply of moisture, and an elevation of from 5000 to 8000 feet, some kinds descending to a lower level. There are from twenty to thirty known species, differing greatly in appearance. Some attain a considerable height, and are fine umbrageous trees; others grow up as straight and branchless as palms; while a few are mere bushes. They have evergreen, laurel-like leaves, and bear flowers resembling those of the lilac, but more beautiful, and diffusing a delicious fragrance. According to tradition, the Indians were acquainted with the medicinal properties of the bark before the Spanish conquest. It was made known to the Count of Chincón or Cinchon, the viceroy of Peru, soon after the year 1636, whose wife was recovered by its use from an intermittent fever at Lima. It hence acquired the name of *Countess's Bark*, and also that of *Jesuits' Bark*, from the order recommending and vending it in Europe. The discovery of quinine, one of the five alkaloids which the bark yields to the chemist, and by far the most important of them, dates from the commencement of the present century. Vast quantities are imported for the preparation of the medicine. Not less than £40,000 are spent annually in supplying the military hospitals in India with it. The probable destruction of the tree in the South American forests by the recklessness of collectors of the bark, and its inestimable value, has properly led to its introduction into India, Ceylon, and Jamaica, where cinchona cultivation is now conducted. The Dutch have their plantations in Java.

In 1861, Mr Markham, on the part of the British government, visited the country, with which he had previously become well acquainted, for the purpose of procuring plants and seeds. The utmost secrecy was necessary respecting the object of his mission, as the Peruvian government had determined not to permit the

export of any more seedlings. He reached the virgin forests at the outposts of civilisation, the abode of bears and jaguars, secured the services of a *cascañero*, or bark-collector, and succeeded in carrying off upwards of 500 plants from their native region. The *cascañeros*, who regularly follow the occupation, are so called from the Spanish *casca*, 'bark.' They commonly ascend some lofty eminence, or climb the highest tree, in order to obtain an extensive view; and having readily recognised the cinchonas by their foliage, proceed with wonderful accuracy to the spot where they grow. Their life, if less exciting, is scarcely less perilous than that of the Alpine chamœis-hunter. Occasionally they lose themselves in the wilds, and perish of hunger and exhaustion. The word 'quinine' is a modification of the Indian name of the bark-trees, *quina* or *quinquina*.

Peru was conquered by the Spaniards under Pizarro in 1532, and remained for nearly three centuries a possession of Spain. It secured independence by the decisive defeat of the royalist forces in 1824, and adopted a republican form of government, but has experienced repeated political vicissitudes and great social anarchy. The constitution embraces a president elected for six years, a senate composed of two members elected for each province, and a house of representatives chosen on the basis of one member for every 20,000 inhabitants. The country is distributed into departments, and subdivided into provinces.

*Lima*, the capital, in latitude 12° south, longitude 77° west, six miles from the coast, occupies both banks of the small river Rimac, and contains a population of 60,000. It was originally called the 'City of the Kings,' *Ciudad de los Reyes*, from being founded on the day of the Epiphany, 1534. The cathedral, which has a splendid interior, contains the tomb of the founder, Pizarro. The houses are chiefly of one story, with flat roofs, as a precaution against the frequent earthquakes. No year passes without many slight shocks, and an average of two visitations occur in a century, more or less destructive. There are fifty-six churches and convents, with thirty-four squares or open areas. The grand square, *Plaza Mayor*, contains the government palace, formerly the residence of the Spanish viceroys, whose portraits from Pizarro downward, forty-four in number, the size of life, once adorned the interior. At the revolution they were removed to the museum, where they are now preserved. The capital is connected with its port, *Callao*, by a railway, the first work of the kind constructed in South America. This town is strongly fortified, and has a considerable shipping-trade, with a commodious pier and quay. It dates since the year 1746, when old Callao was destroyed and in great part submerged by an earthquake, which laid also a large part of Lima in ruins.

*Pasco*, a mining town, north-east of the capital, is seated on a plateau of the interior, which has a mean elevation of 11,000 feet above the sea, and is surmounted by the Nevada de la Vinda, rising to the total height of 16,000 feet. This is the chief silver-mining district. There are here two very remarkable veins. One of them, called the Veta de Colquirirca, runs nearly in a straight line from north to south, and has been traced to the length of nearly two miles, being 412 feet in breadth. The other, the Veta de Pariarirca, takes an opposite direction, and has a known extent of about a mile and a quarter in length, by 380 feet in breadth. The two veins are believed to intersect each other under the market-place. Both have smaller veins branching off from them in various directions, forming a net-work of silver beneath and around the town. So completely has the ground been burrowed into, that no very violent earthquake shock might be expected to bury the place in the mines. The population of Pasco has sometimes amounted to 18,000, but it fluctuates with the political circumstances of the country, and the condition of the works. There has often been a very promiscuous assemblage of human beings for such an elevated site, surrounded with wild mountains, where the air is chill through the greater part of the year, and the climate tempestuous. Even in the middle of the tropical summer, the ground at sunrise is white with hoar-frost. Creoles and Indians have here been grouped with Spaniards, British, French, and Italians. The first steam-engine in South America, sent out from England, was put up at Pasco, in 1816, for the drainage of the mines, which an influx of water had rendered unserviceable. Mr Trevithick, the well-known Cornish engineer, furnished the machinery. It was carried

up the mountains with great difficulty on the backs of mules, under the superintendence of his men. He visited the country in 1817, and was received with great distinction. The *Lima Gazette* announced the arrival of Don Ricardo Trevithick. The Lord Warden of the Mines attended him in command of a guard of honour; and it was proposed to erect his statue in massive silver on a suitable point in the argentiferous district. But the revolution broke out, when the royalists suspended all operations, and destroyed the machinery, as the merchants of Lima, who were most interested in the mines, espoused the cause of the patriots.

*Cuzamareca*, one of the northerly towns, is seated in a delightful Andean valley, and has a mournful interest attached to it, as the place where Atahualpa, the sovereign of the old Peruvians, last of the Incas, was barbarously put to death by the command of Pizarro. The gold to redeem the unfortunate prince was then on its way from Cuzco, borne by a herd of many thousands of llamas; but upon hearing of the deed, the natives secreted the treasure, and it was never discovered. *Cuzco*, south-east from Lima, is, next to it, the most populous and important city, containing 47,000 inhabitants. Though the capital of the empire of the Incas, still retaining an aboriginal name (said to signify 'navel' or 'centre'), and containing ruins that go back to an era before the Incas, the present city is almost wholly Spanish, has handsome edifices, and considerable manufactures. The site is 11,300 feet above the sea. *Huancavelica*, nearly midway between the ancient and modern capitals, and at an elevation of 11,000 feet, is distinguished by productive mines of quicksilver, gold and silver, in the adjoining hills. *Huamanga*, on the same route, also called *Ayacucho*, contains a cathedral and university. It was founded by Pizarro in 1539. On a neighbouring plain, General Sucre defeated the Spanish army in 1824, and secured the independence of the country. *Arequipa*, a southerly city, is the third in size with a population of 30,000, and has the small maritime town of *Islay* for its port, thirty miles distant, possessing one of the best harbours of the Republic. The great volcano of Arequipa, a truncated cone, towers to the height of 20,320 feet. *Puno*, on the north-west side of Lake Titicaca, is the most elevated town of Peru, 12,870 feet above the sea. *Tacora*, a village, goes up to 13,690 feet; *Ancocchallani*, a farm homestead, to 14,683; and *Rumihuasi*, a post-house, to 15,540 feet.

Peru contained in 1859, a population of 2,500,000, consisting to the extent of nearly three-fourths of aboriginal Indians. The remainder are Creoles, descended from the old Spanish families, and mixed races, with a small proportion of Negroes. The country possesses highly useful animals in the allied ruminants, the llama and alpaca, with their congeners, the vicugna and guanaco, sometimes popularly called Andean sheep, but anatomically belonging to the camel family. Their wool or hair figures in the exports, with chinchilla furs, the fever barks, sarsaparilla, gums, resins, and guano, with a limited amount of bullion, for the important items. But the want of roads impedes the foreign and internal trade, while peaceful pursuits have often been rendered well-nigh impossible by civil contentions and brigandage.

The Llama, common to the other Andean countries, and entirely domesticated, is invaluable to the Indian population, supplying them with food and clothing. It is in use also as a beast of burden, and was the only animal of that description in America prior to the introduction of European quadrupeds. The Alpaca, also domesticated, is somewhat smaller, and yields a finer fleece. The Peruvian government prohibited the export of these animals under heavy penalties. But following a route through Bolivia and Chili, a herd was safely conducted to Australia, and the restriction is now relaxed. The Vicugna, altogether wild, is handsomer than either the llama or alpaca, and furnishes a finer wool. It inhabits the heights of the Andes, on the verge of perpetual snow. The Guanaco, also wild, is the largest of the tribe, thrives at a lower level, and ranges southward to the Strait of Magellan.

Peruvian guano, an important government monopoly, is obtained chiefly from the Chincha Islands, three in number, known as the North, the Middle, and the South Islands, distant about ninety miles to seaward of the port of Callao. They are of very small size, but highly valuable, being covered with enormous deposits of guano, the excrement of birds, which have been accumulating for ages, and retain nearly the whole of their soluble constituents owing to the extreme dryness of the climate. Although in daily use as a manure in Peru for many centuries, the export of the deposit to foreign countries is comparatively recent, but upwards of a hundred vessels have since been seen at once taking in their cargoes. The income derived by the state from the guano amounted in 1860 to £2,809,000, and in 1861 to £2,961,000. It has been estimated, as the result of official surveys, that the quantity remaining on the three islands exceeds 7,000,000 tons, which, at the average net proceeds of £4 per ton, gives a total value of £42,000,000 sterling. Borings have been made which extend to the depth of 105 feet through the solid manure. Recently, these islands were audaciously seized by Spain, and are still retained.

### III. BOLIVIA.

This region, formerly called Upper Peru by the Spaniards, now commemorates the South American liberator, Bolivar, who drew up its first constitution as a republic, and for a time presided over its destinies. It is chiefly an inland country, enclosed by Peru, Chili, Brazil, and the Argentine States, but includes a small maritime tract on the coast of the Pacific, subject to the disadvantage of being a sandy waste, with no good port, while separated from the important part of the territory by mountains of stupendous elevation.

A high plateau of great extent, formed by the main mass of the Andes, is the distinguishing physical feature. This is the table-land of Desaguadero, at a mean elevation of 13,000 feet above the sea, extending 500 miles in length, occupied by the basins of two lakes and a river-valley, while bordered east and west by longitudinal ridges towering far above it. The western ridge, or cordillera of the coast, contains the highest point in the peak of Sahama, rising to 22,350. In the eastern ridge the serrated summit of Illimani attains to 21,140, and that of Sorata to 21,286 feet, both of which overlook the waters of Lake Titicaca, and a large portion of the Peruvian territory. On the interior side of the plateau the surface declines into wooded plains, traversed by affluents of the Amazon and the La Plata, but very obscurely known to Europeans. Bolivia is estimated to include an area of 274,000 square miles, and a population exceeding 2,000,000, composed mainly of native Indians; but both calculations must be regarded as doubtful results. The mineral, animal, and vegetable productions correspond to those of Peru.

| Departments.                       | Chief Towns.                          |

*Chuquisaca* or *Sucre*, the capital, on the interior slope of the great plateau, 9300 feet above the sea, is chiefly important as the seat of government, but has a population of about 30,000. It was founded in 1538 by an officer of Pizarro, on the site of an old Peruvian town called *Choque Chaka*, or 'Bridge of Gold,' the treasures of the Incas having passed through it on their way to Cuzco. At one time it bore the name of *La Plata*, on account of the rich silver-mines in the vicinity. It has a cathedral of great magnificence, a university, a college of arts and sciences, and a mining school. *Cochabamba*, surrounded with forests, contains a population of 40,000, and has manufactures of cotton fabrics and glass-wares. But *La Paz*, an Episcopal city, south-east of Lake Titicaca, is the most populous place in the republic, with 76,000 inhabitants, and extensive manufactures of hats of vicugna wool, and cloths of llama and alpaca hair. *Potosi*, once a large and splendid city, now decayed, has a name which has become proverbial for wealth, owing to its silver-mines. It stands on the slope of a conical mountain of clay-slate, capped with porphyry, at the height of 13,314 feet above the sea. This is the elevation of the great square. Some of the sources of the river Plata, 'Silver,' are not far distant, a circumstance which originated the name of the river. The riches of the region are said to have been discovered by an Indian, who, while engaged in chasing some animals, laid hold of a shrub to assist his ascent. It yielded to his weight, and some metallic particles being found attached to the roots, disclosed to him a silver vein, afterwards called *la rica*, 'the rich.' Upon imparting the secret to his master, a mine was opened, and formally registered on the 21st of April 1545. The abundance of the ore speedily drew a concourse of adventurers to the elevated spot, where a stranger on his first arrival finds respiration difficult. The mountain was perforated in every direction; and Potosi, in the height of its prosperity, could boast of 130,000 inhabitants, with a stately cathedral, splendid churches, and various edifices devoted to the produce of the mines. The city is now but the shadow of what it was, even at the commencement of the present century, containing only a population of 22,800. Political disturbances have mainly contributed to this result, though the argentiferous veins, within reach, are considerably exhausted. From the opening of the mines, to the separation of the country from the crown of Spain, a period of somewhat less than three centuries, the silver which paid the royal duty has been valued at upwards of £230,000,000 sterling.

IV. CHILL.

The Chilian republic embraces a long narrow territory on the shores of the Pacific, extending southward from Bolivia to the Archipelago of Chiloe, which forms one of the provinces. The distance between these points is not less than 1200 miles, but the inland range of the country rarely amounts to 150 miles, and has in general much more contracted limits. The area is estimated at 140,000 square miles. In a single broad and majestic ridge, the Andes rise on the interior border, and form the boundary-line from

the western states of the Argentine Confederation. This mighty barrier on the east, with the sterile Desert of Atacama on the north, and the dreary wilds of Patagonia on the south, contribute to isolate remarkably the entire republic from the remainder of the continent. It is only accessible from the Atlantic side by a long sea-route, or by difficult passes across the mountains, which rise to heights where respiration is tried by the rarity of the atmosphere, while the cold is intense, the storms are terrific, and all are blocked up with snow through the winter months, with perhaps a single exception. Towards the centre of the chain stands the mass of Aconcagua, an extinct volcano, the culminating-point of the New World, towering to the height of 23,910 feet. Fourteen lofty volcanic peaks are enumerated, only a few of which are at present in a state of activity. But volcanic agency attests its power by frequent and occasionally tremendous earthquakes, which have twice during the present century altered the relations of the land and the ocean, by permanently elevating a large extent of the maritime region several feet above its former level. Lower longitudinal ridges occur between the Andes and the coast, sending off numerous lateral spurs in various directions. The general surface has hence a highly-diversified aspect, very beautiful in the central provinces, where every landscape has its hills, ravines, and watered valleys. Owing to the narrowness of the country, the rivers have short courses, and are confined by climatic causes to the southerly districts. Little or no rain falls in the northern, and there only a few streams are formed in the vicinity of the mountains, which are not perennial, being entirely dependent upon the melting of the snows.

The Cumbre Pass across the Andes, leading from Valparaiso on the Chilian to Mendoza on the Argentine side, is one of the principal thoroughfares over the range. It lies immediately south of the mass of Aconcagua, and attains the height of 13,000 feet above the sea. The mule is the beast of burden, sure-footed, instinctively selecting the safest path where the road is narrow and dangerous, while endowed with astonishing powers of endurance. After quitting the last town, Santa Rosa, the route follows for some distance the course of the Rio Aconcagua, a powerful torrent-like stream. In a wild picturesque spot on its banks stands the custom-house station of the Chilian government, a post abandoned in the winter, as traffic is then impossible, and the cold severe. A little further on is the last inhabited dwelling on the west side of the mountains, the Guardia Vieja, or old custom-house, used in former years by the Spaniards. This is a miserable hut, only occupied by the keeper in the summer. The road hence, gradually ascending, is rough and stony, and the *cauchas* speedily begin. These are places of refuge from the snow-storms, which the Spaniards erected. They are very strongly built of brick and lime, and have arched roofs, with entrances at some distance from the ground, to prevent them from being snowed up. Formerly they were supplied with firewood and a small quantity of provisions for overtaken and destitute travellers. They are met with at distances of from two to four leagues from each other in the lower regions; but in the higher parts of the road, where danger becomes more imminent, they are much more numerous. So sudden and violent are the storms, that baggage-mules are sometimes blown over the precipices, and passengers throw themselves on the ground to avoid sharing the same fate. Towards the end of April, or the beginning of May, when the winter commences, the snow is knee-deep, and the Pass is closed for the season.

The Portillo Pass, on the south, connects Santiago with Mendoza during the summer, and has an elevation of 14,300 feet. Considerably to the northward, where the snow-line is higher, the latitude being more tropical, the San Francisco Pass leads from Copiapo to Fiambala, and is crossed by travellers at all seasons, though it rises to the height of 16,000 feet. No difficulties are experienced from the snow, probably from local circumstances which prevent its drifting. Mr Wheelwright, the constructor of most of the South American railways, who has carried them up to greater heights than any other engineer, is sanguine respecting the possibility of economically laying down a line along this route, by adopting a system of steep gradients and sharp curves, as in his other works. Linked with railways in process and proposed in the Argentine States, it would connect the two oceans, from Caldera on the coast of the Pacific to Rosario on the Parana, an Atlantic river. The condor, common to the Andes from the equator southward to the Strait of Magellan, is specially distinctive of the Chilian portion of the range. It was figured on the first coinage of the republic as a symbol of strength. The birds are seen by scores, now soaring in the blue firmament above the loftiest peaks, then hovering over the passes, on the watch to make a meal of some overloaded mule, which may drop from exhaustion on the rough inclement track. Usually at the height of from 12,000 to 13,000 feet, the first symptoms of the malady, called the *Veta*, are observed, consisting of great weariness, dimness of sight and hearing, pains in the head, and nausea, from which domestic animals suffer as well as man.

Southern Chili, drenched with rains, has a profuse vegetation, and is extensively a forest region from which timber is exported. The central provinces have a smaller amount of rain-fall, gradually decreasing northward, and are largely occupied with agricultural and grazing farms. On the haciendas or estates of wealthy proprietors, nearly every product of the country may be seen. Flower-gardens and orchards surround the dwelling-houses. Plantations of walnut and almond trees are by the side of vineyards of the white and red grape. Fields of wheat, barley, and green crops form an exterior circle, with pastures for fine cattle and sheep, fenced round with closely-planted poplar-trees, affording an agreeable shade in hot weather. A striking contrast is presented by the entire northern province. This is a waterless and verdureless waste, with a surface of sand or rock bleached in many parts with saltpetre, forming the southern portion of the Desert of Atacama, which stretches for hundreds of miles through Bolivia into Peru, between the Andes and the coast. Yet even in this inhospitable region there are stored incalculable riches, consisting of veins of the purest silver ore, with copper, lead, iron, cobalt, bismuth, antimony, arsenic, quicksilver, and other minerals. Mines were originally opened in this district for copper under the superintendence of experienced and hardy Cornishmen, the produce of which is extensively sent round Cape Horn to be smelted at Swansea in Wales. The discovery of silver dates from the year 1832, and is chiefly worked, along with copper, by the Copiapo British Mining Company.

The republic is one of the most flourishing of the South American commonwealths, and has a less democratic constitution, the suffrage being restricted by important property qualifications. It is under a president elected for five years, with senators chosen for nine years, and deputies sitting for three years. The population, amounting to 1,648,000, consists of whites of Spanish descent, Indians, and mixed races, with a considerable number of Europeans. A southerly part of the country is occupied exclusively by the bold and warlike Araucanian Indians, who were never conquered by the Spaniards, and are still practically independent, but upon terms of amity with the Chilian government. Public instruction is provided by a system of free schools, and a National Institute for superior education is also sustained by the state. The people have the reputation of being intelligent and enterprising, yet fond of amusements, while the women are notorious for their attachment to the shows of the Romish Church.

| Provinces.            | Chief Towns.                               |
|-----------------------|--|
| Atacama, . . . . .    | Copiapo, Caldera, Chanarcillo.             |

| Valdivia, . . . . .   | Valdivia.                                  |
| Chiloe, . . . . .     | San Carlos, Castro.                        |

Chili originally belonged to the empire of the Incas of Peru. It was invaded by the Spaniards under Almagro in 1535, and subdued by Valdivia in 1541. The Spanish yoke was thrown off by a declaration of independence in 1810, which was finally secured by the battle of Maypo in 1818.

*Santiago*, the capital, a beautiful city of 80,000 inhabitants, nearly in the heart of the country, is delightfully placed upon a plain studded with acacia-trees, with the glorious Andes in full view. It contains a university, a cathedral, and numerous churches, which are crowded with the female part of the population on festival occasions. A great number belonging to the most influential families in the city perished in 1863, by the church in which they were assembled taking fire, which the draperies and other decorations put up in the fabric, with their own light dresses, at once rendered an irresistible conflagration. *Valparaiso*,

'Vale of Paradise,' the port of the capital, and the principal seaport of the republic, contains a population of 75,000. It numbers many British and French residents, engaged in the foreign trade of the country, the shipment of wheat, hides, wool, indigo, drugs, copper, and other metallic ores. Several genuine British institutions are here in full activity—a cricket-club, a boating-club, an amateur theatrical-club, and a pack of fox-hounds. A railway, ninety miles in length, connects Valparaiso and Santiago, passing up the rich valley of Quillota to the town of *San Felipe*, the head of one of the most fertile provinces. It stands close to the Aconcagua River, forms a regular square, is surrounded with avenues of poplars, and has a central plaza, around which the best houses are built, also planted with trees, which form a shaded promenade. *Concepcion* and *Valdivia*, southerly towns on the coast, are chiefly of note in connection with their earthquakes.

*Caldera*, northward, one of the stopping-places of the Pacific Company's steamers, is a recent creation. Twenty years ago it was a miserable spot, consisting of a few fishermen's huts upon the beach. In the brief interval it has become a rapidly-rising town, with a good landing-wharf and mole, a custom-house, shops, hotels, machine establishments, a convenient railway-station, which would do honour to the provincial town of any state. This change has been effected by English capital and enterprise. From hence a railway extends to *Copiapo*, fifty miles inland, the most northerly town in Chile, and the centre of a great mining district, where an excellent station greets the traveller. This railway was constructed in order to bring the two great mining districts of Chanarcillo and Los Tres Puntos into easy communication with the coast, facilitate the transport of provisions and water to the establishments, where the price was enormous, and for the conveyance of the ores to port. No localities can be conceived more arid and repelling in appearance than those which are the richest in subterranean wealth—sandy tracts, intersected by the most bare, rugged, and forbidding-looking mountains. In unfrequented places, human remains are sometimes found. The bodies of mules are more frequent, some in the most striking positions, having died in the very act of leaning against a rock for support, or while attempting to nibble a last atom from, here and there, a miserable and stunted thorn-bush.

*Chanarcillo*, a silver-mining town, fifty miles south of Copiapo, occupies a site which little more than thirty years ago was a perfect solitude. To this spot, on the 18th of May 1832, a muleteer was drawn while engaged in hunting a guanaco. Having wounded his game, he had pursued it till he was so utterly overcome with fatigue and thirst, that he could advance no further, and sank down upon a rock, leaving the chase to his dogs. In a short time he found that he was sitting on a rugged block of pure silver, which had crested out from a vein immediately beneath. From that period the fame of the place dates as a rich silver district. Immediately afterwards, a poor peon slept beneath a projecting crag, and in the morning found that his frugal fire had brightened the wall of his resting-place. That wall was the outside of an isolated mass of silver, which, when cut out, yielded 2800 mares to the fortunate owner. Chanarcillo is now in the hands of a British Mining Company. Five years have here sometimes passed away without a single shower. Hence the cost of water, brought on the backs of donkeys from the distance of many leagues, has formed a very considerable item in the accounts of the mines. This expense is now obviated by an extension railway from Copiapo, recently opened, by which also communication is established with Caldera on the coast. The line has been constructed in the face of great difficulties from the mountainous and rugged country. It is carried by steep gradients to the height of 4470 feet above the sea, and is at present the highest railway in the world.

The insular province of Chiloe was the last part of South America colonised by the Spaniards, and it retained their flag the longest. This archipelago, close inshore, was only very partially occupied by the whites, and has at present chiefly a population of Indian blood. It forms the northerly portion of the series of islands which fringe the shores of Patagonia, and terminate at Cape Horn. The most southerly member is sometimes called *El fin del Christendom*, as the extreme point of South American Christendom. The republic has outlying dependencies on the mainland of Patagonia, and the station of Punta Arenas, or Sandy Point, on the Strait of Magellan. It also includes the three small isles of Juan Fernandez, 320 miles nearly due west of Valparaiso, held by a few Americans and Tahitians under lease from the government. They are very closely grouped, and consist of one eastward, named *Mas-a-Tierra*, or more to the mainland; another westward, *Mas-a-Fuera*, more towards the offing; and a third southerly, *Isla de Lovos*, island of sea-dogs or seals. The cluster is of interest from having been for four years, 1704–1708, the solitary abode of a shipwrecked seaman, Alexander Selkirk, whose adventures are commonly supposed to have suggested to Defoe the idea of *Robinson Crusoe*.

Cape Horn.

## CHAPTER VIII.

ARGENTINE REPUBLIC—PATAGONIA—FUEGIAN ARCHIPELAGO—FALKLAND ISLANDS.

### I. ARGENTINE REPUBLIC.

THAT portion of Central and Eastern South America included between the Chilian Andes and the Atlantic, bordered by Bolivia on the north and Patagonia on the south, is occupied by the confederation of states forming the Argentine Republic, also called the United Provinces of La Plata. This region constitutes a rectangle of immense extent, lying between the parallels of  $22^{\circ}$  and  $41^{\circ}$  south, and the meridians of  $54^{\circ}$  and  $70^{\circ}$  west. The greatest length, from north to south, is not less than 1350 miles; the average breadth is rather more than half the distance; and the area comprises upwards of 1,000,000 square miles. But a large proportion of the surface is infertile; the natural features of the landscape are almost everywhere monotonous, except towards the slope of the Andes; and the total population gives little more than one inhabitant to the square mile. A north-eastern district is known by the name of El Gran Chaco, or the

Great Desert, and has a very spare vegetation, with a generally sandy soil, many parts of which are hopelessly barren from the want of rain and water. Another tract in the centre is called Las Salinas, from being coated with a thick saline efflorescence, where a species of *salsola* grows, from the ashes of which soda is obtained. Southward are the pampas, vast undulating plains, with no trees except near the dwellings of the inhabitants. But they are covered with coarse luxuriant grass, growing in tufts, mixed with trefoil, and contain extensive tracts annually converted into forests of gigantic thistles, which, when withered, serve for fuel in a country devoid of timber. Droves of cattle, horses, mules, and sheep, forming an aggregate of many millions, are reared on these levels, and constitute the main part of the national wealth. The climate generally is distinguished by great summer heat, and occasional long droughts. The latter have somewhat of a character of periodicity, occurring at intervals of about fifteen years apart, when the flocks and herds have perished by thousands from the want of herbage and water. During the hot months the pampas are visited by hailstorms of tremendous violence. They are swept also by the pamperos, or westerly winds, which rush furiously down from the heights of the Andes, bring along with them the cold temperature of the snow-crowned summits, and sometimes darken the streets of Buenos Ayres by the clouds of dust raised from the plains.

A vast proportion of the area is included in the basin of the Rio de la Plata, or River of Silver, whence the Spanish name of the country, *La Plata*, or Latinised, *The Argentine Republic*. It is, however, a complete misnomer, in relation both to the river and the territory. Only a trifling quantity of the precious metal is obtained; and that from mines in connection with the Andes, far away from the basin of the stream. None of the provinces yield any important amount of mineral produce of any kind, except salt, but have cattle-breeding estates and sheep-farms of great extent. All other pursuits are subordinate to the rearing of live-stock in the enclosures, or on the open plains. The Confederation includes thirteen provinces, under a president elected for the term of six years, a senate, and a house of representatives.

| Provinces.                      | Chief Towns.                                  |
|---------------------------------|---|
| Buenos Ayres, . . . . .         | Buenos Ayres, Lujan, San Pedro, San Nicholas. |
| Parana or Entre Rios, . . . . . | Parana or Badaja, Concepcion, Concordia.      |
| Santa Fé, . . . . .             | Santa Fé, Rosario, Coronda, Barrancas.        |
| Corrientes, . . . . .           | Corrientes, San Roque, San Lucia.             |
| Jujuy and Salta, . . . . .      | Salta, Jujuy, Hornillos.                      |
| Tucuman, . . . . .              | Tucuman, Pitos, Miraflores.                   |
| Catamarca, . . . . .            | Catamarca, Belen.                             |
| Santiago del Estero, . . . . .  | Santiago, Matara, San Francisco.              |
| Rioja, . . . . .                | Rioja, Chilcito, Guandacol.                   |
| Cordova, . . . . .              | Cordova, Rio Curato, Villa Nueva.             |
| San Juan, . . . . .             | San Juan de la Frontera, Jochali, La Huerta.  |
| Mendoza, . . . . .              | Mendoza, Uspallata.                           |
| San Luis, . . . . .             | San Luis de la Punta.                         |

This part of the continent was formerly a dependency of the Spanish viceroyalty of Peru. In 1775 it was constituted a separate government, and became independent of Spain in 1816, when a federal republic was projected, followed by great civil dissensions. In 1831 the title of the 'Argentine Confederation' was formally adopted. The province of Buenos Ayres seceded in 1853, and remained a distinct state till 1860, when it was re-united to the general body.

*Buenos Ayres*, the political capital, founded by the Spaniards in 1580, received its name, signifying 'good airs,' in allusion to the salubrious climate, and appears to deserve the epithet, the atmosphere being neither enervating nor chill, and never laden with miasma. It is situated on the south side of the Plata estuary, in latitude 34° 36' south, longitude 58° 24' west, and contains 120,000 inhabitants, many of whom are Europeans, chiefly British, Spanish, and French, who have newspapers regularly published in their own vernacular. Though 150 miles from the sea, the estuary has still at this point a sea-like aspect, being 36 miles wide, and hence only in very clear weather, and from lofty buildings, can the opposite shore be discerned. The city, seated upon a high bank, at some distance from the edge of the water, has an imposing appearance from its

surface, with its numerous spires, turreted houses, and the great dome of the cathedral standing out in bold relief against the sky. But close inspection modifies the impression made by the distant view. It covers a considerable space of ground, as the houses have generally ample court-yards, with corridors. The Plaza, or principal square, is planted with trees which bear beautiful lilac-like flowers, and form shaded promenades. Here is the Cabildo, or town-hall, a fine edifice, occupied by the municipal council and courts of justice; the cathedral, massive, sombre looking, but gorgeously adorned in the interior; the Colon Theatre, nearly equal to Covent Garden in size, and superior in decoration; and the Recoba Nueva, or New Market, a series of shops in the bazaar style. Buenos Ayres can also boast of a university and a military-school. Public industry embraces cigar and carpet manufactures, printing, and a very extensive foreign commerce. The exports consist chiefly of animal produce; as hides, horns, bones, tallow, wool, and horse-hair, with small amounts of the precious metals. But Buenos Ayres suffers from a long catalogue of local disadvantages. There is no direct embarkation and landing of goods and passengers, owing to the shallowness of the estuary. All the fresh water is brought from a distance in carts. No timber grows in the neighbourhood to serve for fuel and building material; and stone is equally absent. The streets are scarcely tolerable from dust in hot weather, and are sloughs of mud after rain.

Leaving the estuary for its great stream, the Parana, a few small places are passed on the way up to Rosario, one of which, *San Pedro*, had the honour of entertaining the present pope, in 1824, when a simple canon, attending the vicar apostolic. They had crossed the Atlantic from Genoa, and were bound upon a journey over the Pampas and the Andes into Chili, on a special mission from the Vatican. Pius IX. can now look back upon a night in San Pedro, when he slept in a shed, without doorway or flooring, and with the thatch so dilapidated as to convert it into an astronomer's cabin, for the stars were distinctly seen from his bed. It was a kind of stow-away place belonging to the post-master, containing joints of meat, maize, cheese, leather, undressed and untanned hides, and other articles, yielding a number of distinct scents. The sovereign pontiff was then Don Giovanni Mastei, thirty-one years of age, made archbishop of Spoleto upon his return. A narrative of the expedition was published at Rome, in four volumes, in 1827. *Rosario*, on the right bank of the Parana, recently a collection of mud-huts, is now a flourishing city, with broad streets lined with good houses, shops, hotels, and public buildings. British, French, and American consuls are resident. During the temporary secession of Buenos Ayres from the Confederation it became the chief port of the Republic, and the grand starting-point of travel into the interior provinces. Hence the change. The town contains upwards of 20,000 inhabitants, and is the Atlantic terminus of the great railway projected to cross the Andes to the Pacific. This line consists of the four following sections, the first of which is in process, while the last is in action:

|   | Miles. |
|---|--------|
| Rosario to Cordova, . . . . .   | 250    |
| Cordova to Fiambala, at the base of the Andes, . . . . .                  | 350    |
| Fiambala to the junction with the Tres Puntos Railway in Chili, . . . . . | 320    |
| Tres Puntos Junction, by Copiapo, to Caldera on the Pacific, . . . . .    | 80     |
|   | 1000   |

The Rosario and Cordova section was inaugurated by the president and ministers in the early part of the year 1863, and is to be completed within five years, under the direction of Mr Wheelwright. The government concedes to the company six miles of land in breadth through the entire extent of the line, equivalent to a total of about 1,000,000 acres. This land is arable, and capable of producing cereals, fruits, vegetables, and a superior kind of cotton, while adapted to grazing and pastoral purposes. *Cordova*, on the river Primero, the seat of a university formerly in repute, once possessed a valuable library belonging to the Jesuits, which, upon their expulsion, was transferred to Buenos Ayres.

*Tucuman*, in a central part of the interior, on an elevated plain, is the capital of one of the most fruitful provinces, called the 'Garden of the Argentine.' The first congress of deputies who declared for independence was held here in 1816. It has a population of 11,000. *San Juan*, near the spurs of the lower range of the Andes, is an increasing town of 20,000 inhabitants, some of whom are Italians, French, Germans, and English, attracted to the spot by the discovery of argentiferous lead ores in the district, since 1861. The houses are in the early Spanish style, dull and uninteresting, but the cathedral in the Plaza is a very fine old building, which seems to have experienced severe shakings from earthquakes, the walls being partially cracked and dilapidated. Speculation is alive respecting the metallic wealth of the locality, but sufficient data have not yet been acquired to warrant risk in mining adventures, to which the remoteness of the place, with the entire want of all tolerable means of communication, is adverse. *Mendoza*, on the south, recently a beautiful town, since most unfortunate, 4800 feet above the sea, communicates with Chili by two passes across the Andes, the Uspallata or Cumbre and the Portillo, both closed by the snow in winter. It has its Hôtel de Chili, the only house of entertainment remaining in 1862, after the fearful earthquake on the 20th of March 1861. The shock occurred without premonition about 8.30 P.M. It was very remarkable for its fatality and purely local effects, which did not extend beyond a radius of a few miles. Churches and houses were at once overthrown, and the place became an enormous graveyard. Only the theatre, which had a considerable quantity

of timber in its construction, was partially uninjured. Three-fourths of a population of 12,000 perished, among whom was Mr Green, the British vice-consul. Major Rickard, more than twelve months afterwards, found the survivors sleeping in the fields and gardens, afraid to pass the night in any dwelling. On inspecting the ruins, skeletons and limbs were seen protruding from the débris. In the country between Mendoza and the Plata, cattle and sheep farms are the most numerous and extensive. A coach, carrying the mails from the Andean region, travels to Rosario *en route* for Buenos Ayres, and performs the weary journey thither across the pampas in about a fortnight, if the cattle are good. The distance by the road, often a wretched trackway, is full 700 *m* les. A dozen horses are sometimes required to drag the cumbrous vehicle along. Towns are very few, but post-houses occur at varying intervals, and offer a scant accommodation to passengers.

The Argentine Republic contains a population estimated at 1,120,000, consisting of whites descended from the Spaniards, with a proportion of Indians, many of whom are fierce marauders, a few Negroes, and a considerable number of European immigrants. The whites in the pampas, called Guachos, engaged in rearing cattle, lead a very active life, are rude and uncultivated, and are probably not of pure blood. They are admirable horsemen; and throw the lasso with unfailling precision, by which their live-stock and the wild animals are captured. Their homesteads have generally a stockade, surrounded with a ditch, and further fenced with tall cacti, which from their thorny nature form an impenetrable barrier to the naked Indian's progress. These aborigines are on the alert to drive off cattle, rob the mails, and plunder the passengers, rendering it unsafe to travel in the interior except with a sufficient escort. The most troublesome are the Thistle Indians, so called from the peculiar vegetation of the pampas they inhabit, which facilitates by its high growth predatory incursions.

#### II. PATAGONIA.—III. THE FUEGIAN ARCHIPELAGO.—IV. THE FALKLAND ISLANDS.

The territory known by the name of PATAGONIA is a very extensive region, stretching from the Argentine and Chilian frontier to the Strait of Magellan, thus forming the southern extremity of the mainland of America. Apart from a few small settlements, it has no civilised inhabitants, nor any cultivated districts, but is a barren inhospitable wilderness, except on the borders of the Strait, where luxuriant vegetation has been noticed, and on the side of the Pacific, where the chain of the Andes lines the coast, ranging from 3000 to 8000 feet in height, densely clothed with woods, and possessing an excessively humid climate. The greater portion of the country consists of an arid shingle plain, sloping gradually towards the shores of the Atlantic, wholly destitute of trees, and supporting only a few thorn-bearing bushes, with coarse grasses. Some nomadic Indian tribes in wild independence occupy the surface, with the guanaco, the characteristic animal, which is hunted by them for food. There are also armadilloes, emus, deer, wild horses, hares, pumas, and wolves, with seals and other marine animals on the coasts. Both the Chilian and the Argentine governments claim the sovereignty. The FUEGIAN or MAGELLANIC ARCHIPELAGO, south of the Strait, includes a large number of islands—Tierra del Fuego, Staten Land, Land of Desolation, Londonderry, Hoste, Hermit Islands, and others—which form the southern extremity of the western world, terminating with Cape Horn. They are mountainous masses of granite, lava, and basaltic rocks, inaccessible in many places, separated by narrow channels and strong currents, with a climate of thick mists, drenching rains, and continual storms. Their higher regions are covered with perpetual snow, in connection with which, volcanic fires occasionally burst forth. On the side of the Strait and the Atlantic the declivities are gentler; verdure appears in the valleys; and thick woods clothe the lower slopes. But the opposite southern and western coasts are mostly barren and sternly precipitous. Seals abound in the bays; aquatic birds wheel about the cliffs, revelling in the tempest; and a few natives procure a miserable subsistence on the shores.

The Patagonian Indians were represented by some of the early voyagers as a race of giants. They are generally tall and stalwart, lead a wandering life, chiefly on horseback, in pursuit of the wild animals, and occasionally pass the frontier of the Argentine States on plundering excursions. The Fuegians, on the contrary, are of smaller stature than their northern congeners, the Esquimaux, and form one of the most degraded sections of the human family. They are perfectly naked, with the exception of a small otter skin thrown over the shoulders, though snow may be covering the ground; subsist chiefly on shell-fish and seaweed; have wretched wigwams for their dwellings, made of the boughs of trees, in which there is often not an article of any kind to be seen; and bury their dead in caves. All the labours of life are thrown upon the women, such as paddling the canoes and collecting food. Notwithstanding their miserable condition, they are cheerful and good-tempered, while peaceable and inoffensive. Captain Fitzroy, in 1830, brought a few Fuegians home with him, with a view to their civilisation, and the benefit of their countrymen on their return. Two died in this country of the small-pox. Three were sent back, after exhibiting considerable improvement, but lapsed into the barbarism of their tribe. In 1842, Sir James Ross had repeated interviews with a number of these people, while staying for magnetical observations in a cove of Hermit Island, but communication was difficult, owing to their unpronounceable language, which corresponds to a series of yells, and it could only be maintained by signs. Some small patches of ground were cleared, and sown with various kinds of vegetables, as parsley, cabbages, potatoes, peas, and beans, in the hope of their being eventually useful to the natives, and several pairs of rabbits, brought from the Falkland Islands, were turned loose with the same design. Hermit Island lies about ten miles north-west of Cape Horn, and is entirely of igneous origin, composed of syenitic greenstone resting on a base of granite, with scattered quartzose and felspathic rocks. The shores correspond to the west coast of Scotland in being penetrated by narrow arms of the sea, forming salt-water lochs, hemmed in by high mountains, clothed for half their elevation with low green woods. A bold perpendicular promontory at the south extremity has a crater at the summit, about a mile in circumference, and two hundred feet deep, with a half-frozen lake at the bottom.

The renowned headland of Cape Horn, the terror of early navigators, is the southern part of a small island, celebrated from its position as forming the south extremity of the western world. Under every aspect it presents a bold and majestic appearance, worthy of the limit to such a continent. It is a high, precipitous, black rock, conspicuously raised above the adjoining land, and extending far into the sea in bleak and solitary grandeur. Some scanty vegetation appears on the sides, and snow is generally seen on the summit. The white foam of the surf is in striking contrast with the dark cliffs against which it beats; and in the outline of the mass, it requires but little imaginative power to fancy the resemblance of 'a sleeping lion, facing and braving the southern tempests.' Sir James Ross, while off Cape Horn, had some bottles thrown overboard, hermetically sealed, in order to ascertain the direction and force of the current. Each contained a record of the position of the vessel, and the date of the immersion, April 4, 1842. One of these was picked up about the middle of September 1845, near Cape Liptrap, in the neighbourhood of Port Philip, Australia. Assuming that the bottle had newly reached the strand when discovered, it must have accomplished a course of nine thousand miles in three years and a half; but as it cannot be supposed to have been transported in a perfectly straight line, an additional thousand miles may be allowed for the detours.

The FALKLAND ISLANDS lie about 300 miles east by north of the Strait of Magellan, and are the only considerable cluster in the South Atlantic. There are upwards of 200 in the group, but East and West Falkland comprise between them more than half the area of the whole. They have excellent harbours, abundance of fish in the bays and creeks, with seals and penguins, which are killed in great numbers for the sake of their oil; droves of oxen, and horses, first introduced from the adjoining continent and now running wild; with numerous springs and ponds of fresh water; and are thus valuable for the victualling of whalers visiting the Southern Ocean, and ships passing round Cape Horn.

There are no trees in the islands worthy of the name, yet peat abounds to the depth of ten feet. The characteristic vegetation consists of grasses, some of which grow to a large size, particularly the succulent tussock-grass. This is the only conspicuous botanical feature of the landscape, found also in Tierra del Fuego, but more abundantly in the Falklands, supplying the wild cattle with fodder. It occurs in patches of a mile in extent, which have a striking resemblance to groves of miniature palms. Each plant forms a hillock of matted roots, often six feet in height, from the summit of which the grassy foliage is thrown out in profusion. The blades are full six feet in length, and droop on all sides. Those of adjoining plants meet so as to over-arch the spaces between them; and thus a tract of tussock-grass becomes a labyrinth, sometimes a dangerous one to the visitor, for being commonly close to the coast, these spots are the resort of sea-lions, which bite severely when incautiously disturbed. A small portion at the base of the blades may be eaten, and has a flavour like nuts. Two seamen subsisted chiefly upon this food for the space of fourteen months. They had wandered or deserted from their ship while at West Falkland, where there are no settlers, and had a grass-built hut for their only protection from the weather during the interval. A tiny insect depends upon the tussock for subsistence; a bird no larger than a sparrow robs it of its seeds; a few

sea-fowl build among the shelter of its leaves; penguins and petrels seek hiding-places among its soft and easily-penetrated roots; and sea-lions cower beneath the luxuriant foliage of this noble grass. Nowhere in the world are lichens more conspicuous, a beautiful species forming miniature shrubberies on rocks upon the tops of the hills, and coating their sides; and sea-weeds on the outer rocky coasts are of enormous size, resembling trees in their magnitude and mode of growth. The stem or trunk of *Lessonia*, called after the French naturalist, attains a height of eight or ten feet, and the thickness of a man's thigh. It branches upwards; and the ends of the branches give out leaves two or three feet long, which, when in the water, hang down like the boughs of a willow. In many places the plant forms a submarine forest, for on looking down from a boat through the transparent water where it grows, nothing but a mass of green foliage can be seen. The exuberant vegetable, though of little service to man, is of high utility to the lower orders of the animal kingdom, providing sponges, corals, and crustaceæ with a home and nourishment. The Falklands were occupied by the French in the last century, and received the name of Malouines from St Malo, the native town of the first adventurers. Being claimed by Spain, they were resigned to that power; and passing to the government of Great Britain, they now form the most southerly portion of the empire. In 1858 the settlers numbered 621, who are under a lieutenant-governor, and chiefly in the small town of Stanley, at the head of the inlet of Port William, in East Falkland.

Gibraltar Rocks.

## PART V.

### DESCRIPTIVE GEOGRAPHY OF OCEANIA.

#### GENERAL VIEW OF OCEANIA.

THE island-world of the Pacific Ocean constitutes a fifth great division of the globe, to which the name of Oceania, originated by the French geographers, is very appropriately given. It comprehends the large insular tracts and extensive archipelagoes of minute islets intervening generally between the south-eastern shores of Asia and the western coast of America. The entire series ranges in latitude from the parallel of  $28^{\circ}$  north to that of  $51^{\circ}$  south, and in longitude from the meridian of  $95^{\circ}$  east to that of  $110^{\circ}$  west. These limits include an extreme linear extent exceeding 10,000 miles, following the line of the equator, by more than half that distance in the direction of the meridian. The Bonin Islands on the north, the Auckland group on the south, Easter Island on the east, and Sumatra on the west, are the remote extremities of this vast region of land and water. Though the estimate is a vague approximation, it is probable that the aggregate land area does not fall short of 4,500,000 square miles, being one-fifth larger than the European continent; and the total population is perhaps not less than 31,000,000. Oceania may be conveniently distributed into the five subdivisions of Malaysia, Micronesia, Melanesia, Australasia, and Polynesia.

Mount Lamongan, Java.

## CHAPTER I.

### MALAYSIA—MICRONESIA—MELANESIA.

#### I. MALAYSIA.

- |   |   |
|---|---|
| 1. Sumatra, Java, and the Lesser Sunda Islands. | 3. The Moluccas and Bandas, or the Spice Islands. |
| 2. Borneo, Celebes, and their adjuncts.         | 4. The Philippine and Sulu Archipelagoes.         |

HIS system of island-groups is called MALAYSIA, from being extensively occupied by the yellow Malay race, though aboriginal tribes of dark complexion are numerous, and immigrant Chinese form a considerable proportion of the population. It is also styled the East Indian Archipelago, from its proximity to the two peninsulas of Hither and Further India. The series makes a close approach to the mainland of Asia at the tapering projection of Malacca, acquires great expansion from thence in an easterly direction, curves northerly towards the shores of China, and divides the basin of the Indian Ocean from that of the

Pacific. Borneo, the largest island, is, after the continent-like Australia, the largest in the world. Sumatra, the second in extent, exceeds the whole area of the British Isles. Celebes, the third, has ampler dimensions than England and Wales. Java, the fourth, closely corresponds to the size of England without its adjunct. Many more are scarcely inferior to the last, and are followed by a numerous train with scantier limits, while the little islets, dwindling down to fairy-like patches, are so multitudinous as to form a bewildering maze. Hence the 'lake of twelve thousand islands' is a phrase in local use with reference to these insulated tracts, and the space of sea they stud, in which a

definite is put for an unknown number. Java contains by far the largest population, upwards of 11,000,000, which the rest are supposed to raise to a total of 23,000,000. The channels by which some of the islands are separated are broad and deep; but generally they are closely grouped, forming narrow and sheltered seas. Though the navigation is often rendered intricate by submarine reefs and rocks, yet this peril is abated by the general steadiness of the winds and the regularity of the currents, subject in the direction of the China Sea to occasional disturbance from the typhoons. Hence a maritime life has been promoted among the native races, to whom the junk, the proa, or the canoe, is as indispensable as the camel to the Arab, the horse to the Mongol. But the seamanship acquired has been extensively directed to piracy as well as to legitimate pursuits.

Nowhere are the blendings of land and sea more frequent or exquisitely beautiful than in Malaysia. Though the coast-lines have their mangrove swamps and pestilential marshes, yet the marine localities are in general superbly lovely. Green, umbrageous, and flowery are the shores down to the edge of the wave, while shells of the richest tints lie on the beaches of white or golden sand, suggestive, in the bright tropical light of the landscapes beyond, of being the 'gardens of the sun,' as they are styled in eastern speech. Sea-breezes temper the heat of the climate; streams and rills are rarely wanting in the scenery; mountains rise to a high elevation; and the animal, vegetable, and mineral kingdoms are remarkable for the number, variety, interest, or value of their products. Spice-plants, prized by the civilised nations, not known elsewhere, or not produced in the same perfection, distinguish the flora, including various species of cinnamon and nutmeg, with the aromatic myrtle, the buds of which are familiar as cloves. Fruits comprise the mangosteen, or 'pride of the East,' the durion, jack, banana, yam, guava, and peculiar kinds of orange, citron, and lemon. With the exception of Brazil, no region has more diversified and luxuriant natural forests, prolific in timber-trees yielding valuable substances, as decorative and dye-woods, caoutchouc and gutta-percha, vegetable tallow and wax, camphor, resin for varnish and other gums, while flowering-plants charm or interest by their brilliant colouring, peculiar forms, and properties. Red and yellow are the prominent hues of the floral vegetation, but are often in connection with strikingly-contrasted tints. The Four Lights of Java, not unlike a single gilliflower in appearance, shew a superb red, but have four curved leaves, dark green inside, pale green without, variegated with stripes of different colours. The Pitcher-plants, a race of climbers, have crimson flowers, exactly resembling pitchers, capable of holding a pint of water, and are also furnished with lids. The Monkey-cup likewise bears a hollow flower supplied with a lid, which remains open till the cup is filled by the rain or dew, and then closes till a fresh supply is needed. The Tree of Morning opens its blossoms at sunrise, and shuts them in the evening; the pale Lady of the Night blows only after sunset; and the Tree of Melancholy never blooms but at midnight. Most of the wild animals of Southern Asia are found in the larger islands, with the addition in Borneo of the orang-outang, the huge hydrosaurus or land-alligator, the melanopsis or flying squirrel, and the megapodius, a mound-raising bird, common in Australia. Lines of powerful volcanoes, occasionally in violent eruption, and terrible earthquakes, are the formidable phases of nature. Malaysia is held by various native tribes under their own sultans or rajahs, and by the Dutch, Spanish, Portuguese, and British. Of the foreign occupiers, the first named possess the greatest extent of territory, which is often styled the Dutch East Indies.

The Sunda Isles, of which Sumatra and Java are the important members, form a very extensive chain, within sight of the Asian mainland at the one extremity, and advancing to the vicinity of Australian waters at the other. SUMATRA, elongated and narrow,

extends 1000 miles in a diagonal direction from north-west to south-east, and probably contains an area of 130,000 square miles, divided into two nearly equal portions by the equator. It is traversed through its whole length by a chain of mountains, one of which is said to rise to 15,000 feet, and is the highest point of all Oceania. JAVA, on the east, separated from Sumatra by the contracted Strait of Sunda, corresponds to it in form, and is likewise traversed throughout by mountains. But instead of being associated in a range, they rise from distinct bases, and are chiefly volcanic cones, many of which are extinct, while others emit clouds of vapour, and are sometimes in a state of fierce activity. High up the slopes the remains of noble woods are met with, blackened and calcined by the outburst of subterranean fires.

*Padang* and *Bencoolen*, on the west coast of Sumatra, are settlements of the Dutch, who also hold the island of Nias on the same side, with that of Banca, celebrated for its rich tin-mines, at the south-east extremity. *Acheen*, at the northern end, is a Malay town, the capital of a Mohammedan state under a sultan. A singular people, the Battas, under various chiefs, occupy an interior district, and exhibit traces of civilisation in connection with the rudest barbarism. They have a written language and literature, with ancient laws which compel cannibalism under particular circumstances. Persons condemned to death for a certain class of crimes are cut to pieces, and then eaten by the males. This is done as a solemn rite, and perhaps indicates more of obstinate superstitious adherence to usage than any native ferocity. Sumatra possesses the tiger, elephant, rhinoceros, and orang-outang. The extraordinary parasite occurs among the vegetation, named *Rafflesia Arnoldi*, after the discoverer, Sir Stamford Raffles, who was governor of Bencoolen, a British possession down to the year 1825. It has no leaves or stem, and only minute fibres for roots, which are inserted in a species of vine. Yet it produces an enormous flower of a brick-red colour, more than a yard in diameter, weighing 15 lbs., with petals of the size of cow's horns. South of Sumatra are the Cocos or Keeling Islands, a small low coral group, with some Malays and a few English resident, cultivating the cocoa-nut. They crown the summit of submarine mountains, since at a short distance from the shores the ocean is immensely deep.

*Batavia*, on the north-west coast of Java, is the principal seat of the Dutch in the island, who occupy other parts of the shore, and are politically supreme over all the native chiefs and princes. The latter are merely administrators of local affairs under official superintendents. The town is the capital of the Dutch East Indies, the residence of the governor-general, and the commercial dépôt of all their possessions in Malaysia. It contains upwards of 100,000 inhabitants, and the country for many miles round is extremely populous. The principal exports are coffee, sugar, indigo, tea, tobacco, rice, and other vegetable products, almost wholly taken in Dutch ships to Holland, and sold there for home consumption and re-export by the Netherlands East India Company. The annual value is upwards of £5,000,000. Batavia contains the governor's town palace, hospitals and barracks for the garrison, with a museum in which relics of Buddhism, Hindu deities, and native weapons are stored. The houses, which are as white as snow, are placed back in the streets, and the intervening space is filled with trees, alive with birds, and brilliant with flowers. *Sourabaya*, with 60,000 inhabitants, and *Samarang*, with 22,000, are the other Dutch towns, both on the north coast. The Javanese are of the Malay race, and generally profess Mohammedanism mixed up with Buddhism, the remainder being heathen. Annually a crowd of natives, with their priests, ascend the Bromok volcano, to propitiate the fire-spirit with offerings. This is done by throwing cocoa-nuts, pine-apples, plantains, and other fruits, baskets of rice, trays of cakes, coins of silver and copper, into the crater. Terrific and very fatal volcanic explosions, several of which are on record, may have given rise to the ceremony. Java has a Valley of Death near Batour, of an oval form, half a mile in circuit, in which no plant or animal can live, owing to the emission of carbonic acid gas from the surface. Its poison-tree, *Antiaris Macrophylla*, once of fabulous notoriety, is an ornament to the woods, but the juices which flow freely from the bark when tapped are fatal to life if they gain access to the animal system. Edible birds-nests are gathered for the markets of China from limestone caverns on the south coast, and yield a revenue, in the form of duty to the exchequer of the Netherlands, of about a quarter of a million sterling. The Chinese in the island number 138,000, and the Europeans 20,000.

The chain of the Sunda series is continued eastward by Bali, Lombok, Sumbawa, Flores, and Timor, separated by narrow channels, all subject to the Dutch except the last, on which the Portuguese have establishments. Cocoa-nut oil, sappan-wood, birds-nests, cinnamon, rice, and coffee are the commercial products. *Delly*, on the north coast of Timor, is the principal Portuguese settlement, and *Coepong*, on the south-east, that of the Dutch. The island of Sumbawa contains on its northern side the Tomboro volcano, the scene of one of the most tremendous physical convulsions on record in the year 1815, which lasted over three months. The sound of the explosions was heard in Sumatra, 1000 miles distant; the sky was darkened with clouds of ashes all over Java; the sea was covered for miles with a coating of them two feet thick, through which vessels with difficulty made their way; and violent whirlwinds added to the terror of the fiery tempest. Only twenty-six persons survived in the island out of a population of 12,000.

Kini Balu, Obsoken Bay, Borneo.

BORNEO, in the centre of the insular system, intersected by the line of the equator, is about 800 miles in length, 700 in breadth, and contains 286,000 square miles, equal therefore to the united area of France and England. It embraces a vast extent of surface which has never been penetrated by Europeans, but appears to be only very sparsely inhabited. The country in the known districts has a singularly fertile soil, abundant and varied mineral wealth, is well supplied with rivers, has a healthy climate except on the lowest grounds, and is hence adapted by natural advantages to be the seat of a large and prosperous population. The aborigines are the Dyaks, a different race from the Malays, mingling with them on the coasts, where there are Dutch, British, and Chinamen. It has been calculated that, if properly cultivated, Borneo would suffice to sustain 100,000,000 Chinese. Mount Kini Balu, on the north coast, is one of the high points of Oceania, rising to 13,698 feet, according to trigonometrical measurement. It was ascended by Mr St John in 1858. CELEBES, on the east of Borneo, separated from it by the Strait of Macassar, is estimated to contain 70,000 square miles, and is very remarkable in its conformation, consisting of four long, curving peninsulas, branching out from a central mass, the whole resembling a knot of ribbons. The MOLUCCA and the BANDA clusters, further to the east, consist of small constituents, but are the most valuable of the colonial possessions of the Dutch, as the Spice Islands.

*Brunei*, or *Borneo*, on the north-west coast, the capital of a native state, is seated on a river of the same name, ten miles above its mouth. It contains about 20,000 inhabitants, and has been called by an English visitor the 'most immoral city' of which he had ever heard. But being built on piles and rafts in the river, with canals intersecting it, the water scenery and the glorious vegetation render its appearance extremely pleasing, a kind of eastern Venice. The commerce is considerable with Singapore. *Sambas*, southerly on the same coast, is the residence of a sultan, who has several rajahs under him, and is a seat of the opium trade. Gold of the annual value of £500,000 is obtained in the district, which contains also important diamond mines. The Dutch have here a factory, and are also settled at *Pontianak*, *Banjarmassin*, and a few other maritime places. *Kuching*, the capital of Sarawak, a province under the government of Sir James Brooke, often called Rajah Brooke, is likewise western, and has rapidly increased under his auspices from a

small Malay community to a town of 15,000 inhabitants. The territory contains a population of at least 250,000. It was placed by the sultan of Borneo proper under the jurisdiction of the energetic Englishman, in return for services rendered in the suppression of piracy. The offer of it was afterwards formally made to the British government, but the latter declined it, being content with the possession of LABUAN. This small island, off the north-west shore, obtained by purchase in 1846, was then constituted a colony of the crown. It measures about ten miles by five, contains abundance of excellent coal, and is well supplied with wood and water. A specimen of the coal, which is worked by a company, weighing 280 lbs., is in the Museum of Practical Geology, London. The island had no inhabitants when it was incorporated in the empire. There are now miners, merchants, and a governor, forming the settlement of Victoria, which has been created a see of the Anglican Church. The trade is considerable, chiefly with Singapore, in the export of coal, gutta-percha, camphor, pepper, sago, spices, and bees-wax, with birds-nests, and the tripang or sea-slug, for Chinese gourmands.

*Macassar*, the head-quarters of the Dutch in Celebes, is on the coast of the southern peninsula. The town has about 12,000 inhabitants, possesses a good harbour, is surrounded by palisades, and further protected by Fort Rotterdam. The natives of the neighbourhood are Malays, under a sultan tributary to the Europeans. They are Mohammedans, and have mosques built of palm-wood. The Dutch have other settlements, and predominant influence throughout the island. A species of vegetable butter has the name of Macassar Oil from the district and place of export. It is the produce of the badeau-tree, found in great abundance in the woods. The commodity in our shops, to which the name is given, is an artificial preparation.

*Ambonya*, in one of the smaller Moluccas, bearing the same name, is, after Batavia, the most important centre of Dutch commerce in eastern waters. The town is the residence of the governor of the group, and has a neat appearance, on the shore of a bay protected by Fort Victoria. Broad streets intersect each other at right angles, and are planted with handsome trees. There are two Protestant churches, a hospital, orphan asylum, and theatre, a training-school for teachers, with which a printing-press is connected. The cloves of commerce are the staple crop in the island and some of its adjuncts. They are the flower-buds of a tree of the myrtaceous order, *Caryophyllus aromaticus*, plucked before they open, and dried in the sun. The evergreen is indigenous throughout the Moluccas. But to preserve their monopoly of the aromatic, the Dutch selfishly caused all the native growth in the other islands to be destroyed, and restricted the cultivation to Amboyna and a few adjoining sites. This restriction is now withdrawn, as the plant has been introduced into other tropical districts. The trees under culture number upwards of 500,000, but only a minor proportion of them are of the fruit-bearing age. The crop varies greatly. All the Moluccas are either governed directly by the Dutch, or by sultans under their supervision. Many of the natives, once extremely barbarous, have become Christians, and have a school in every village.

*Neira*, a charming little town, is the seat of the Dutch Residency for the Banda Isles, a very small group immediately south of the Moluccas. It has a sheltered and superb roadstead, is surrounded by nutmeg groves and cocoa woods, and is protected by two forts, Nassau and Belgica. But it has no defence against a dangerous neighbour, the Gugong Api, or 'Fire Mountain,' a volcano in the midst of the haven, which has often blasted the industry of the Dutch, threatened to destroy them utterly, and suggested the idea of abandoning the site. It forms an islet, rises with a gradual slope to the height of 2000 feet, and is clad with stately vegetation, under which lie the memorials of bygone convulsions, in courses of lava and the blackened trunks of prostrate trees. Though nutmeg cultivation is now somewhat widely diffused, nowhere is the fruit produced in such perfection as in these islands. The tree, *Myristica officinalis*, has an agreeable appearance, glossy deep-green leaves, and rises to the height of from thirty to forty feet. In 1861 the crop consisted of more than 1,000,000 lbs. of nuts, with 275,000 lbs. of mace, which covers the brown shining shell. Both the Moluccas and Bandas are volcanic. An eruption in Makien, one of the former, in December 1861, destroyed wholly or in part fifteen villages, with the loss of 326 lives.

The PHILIPPINE ISLANDS, separated from the Indo-Chinese peninsula by the China Sea, form the most northerly section of Malaysia. They include upwards of a thousand members, large and small; but the area of Luzon, the most considerable, 57,000 square miles, is probably equal to that of all the rest. They are generally mountainous and volcanic, subject to dreadful earthquakes, and are within the range of the typhoons; but the soil is highly fertile, the vegetation luxuriant, and the scenery lovely. The sovereignty is divided between the Spaniards, who are supposed to have a population of 3,500,000 subject to their sway, and the rule of independent native chiefs. Dark-complexioned tribes and Malays compose the mass of the people. The remainder consist chiefly of immigrant Chinese, Spanish settlers, and half-breeds. It is common in the Roman Catholic churches of the group for the shell of the gigantic Philippine oyster to be used for containing holy-water.

The Philippines were discovered by Magellan in 1521. They were named after Philip II. of Spain, and received the first colony from that country in 1570. *Manilla*, the capital of the Spanish East Indies,

the residence of the viceroy, and the seat of the European population, is situated on the west coast of Luzon, at the mouth of a river, in command of a noble bay and harbour. Though not so important as it was in the palmy days of the mother-country, when almost a monopoly of the commerce with Europe was enjoyed, it probably contains a population of 150,000. The city proper, or old part, the site of the cathedral, churches, monasteries, hospitals, and government buildings, is enclosed with ramparts. Without are extensive suburbs, forming what is called 'Manilla extra muros,' where are the merchants' residences, the warehouses, and principal shops. Foreign trade is extensively carried on, chiefly with Great Britain, the United States, China, and Australia. Sugar, hemp, cigars, tobacco, coffee, rice, and fine woods are the important exports. Manilla cigars are in as much repute in the eastern world as Havannas in the western. The manufacture, a government monopoly, as in Spain, is conducted on an enormous scale, giving employment to 20,000 persons, nearly all women. Frequently damaged by earthquakes, the city was half ruined by a convulsion on the 3d of June 1863. Two shocks were experienced in quick succession about 7.30 in the evening. The cathedral fell with its massive dome while the priests were chanting the vespers. All the churches were overthrown with only one exception, the Binondo in the suburbs, and that was cracked from top to bottom, so as to require pulling down. The viceroy's palace and the British consulate was destroyed; and at least 2000 persons perished. North of the Philippines are the BASHEE ISLANDS, an unimportant cluster, in which the Spaniards have an establishment. Southward, the SULU ARCHIPELAGO extends toward Borneo, containing some of the most picturesque spots in the world, rich in pearls and fruits, inhabited by a rude Mohammedan people, under a sultan, who, though often chastised, are incorrigible pirates, infest the neighbouring shores, and make a prey of legitimate trade on the seas.

## II. MICRONESIA.

Principal groups.—1. Bonin Islands. 2. Ladrone Islands. 3. Pelew Islands. 4. Caroline Archipelago. 5. Ralick, Marshal, and Radack Chains. 6. Gilbert Islands. 7. Sandwich Islands.

These insular systems embrace a prodigious number of components, but almost all are of small dimensions, while many are inconsiderable patches, and have hence the collective name of MICRONESIA. They are situated generally in the western part of the North Pacific basin, and the majority stretch in a long band of no great breadth, east and west, immediately north of the equator. A few are of volcanic origin, rise to a commanding elevation, and are eminently distinguished by picturesque beauty. But the vast majority are low reefs of coralline construction, with superficial features of gentle loveliness. So slightly indeed are the purely coral islands raised above the sea, that large portions are in many cases deluged by it in storms, or overflowed by the tidal rise. They are usually of circular or semicircular shape, and enclose a lagoon of smooth water, which is connected by an opening with the outlying ocean. The convex part of the reefs is always turned to windward, while the openings are invariably placed to leeward. The mass rises abruptly on the side of the tempestuous deep, but presents a gradually sloping face towards the lake-like engirdled water. In other cases, coral-reefs appear in connection with the volcanic or mountainous islands, either attached to the main body of the land, or encircling it, leaving a space of still water between them protected from the winds and waves, but accessible by navigable passages through the belt. Intermediate to the true coral and volcanic islands, there is a class called crystal, comparatively few in number, cliffy and cavernous, rising to a moderate height above the sea. They are composed generally of crystallised carbonate of lime, doubtless coralline rock altered and elevated by volcanic agency.

Around the coral islands submarine pictures of extreme beauty frequently meet the eye on looking overboard a vessel. Through the transparent water of the tropical ocean the tree-like fabrics appear interweaving their branches, and present the exact image of a stony forest rising up from the depths, mingling hues of pink, white, blue, and yellow, while fish of brilliant colours and varied shape slowly thread the labyrinths, or, when alarmed, dart rapidly into the numerous recesses of the rocky thickets for shelter. Both classes of islands, the coralline and the volcanic, abound in Oceania, within the tropical zone on each side of the equator, and are hence characteristic of Polynesia in common with Micronesia. Both have a rich though not a very varied vegetation. It includes many plants with nutritive roots, and some fruit-bearing trees, which are to the natives as the cereals to ourselves. The Bread-fruit tree, *Artocarpus incisa*, has its natal seat in the isles of the Pacific, from which it has been taken to the West Indies and South America. This is one of the most important gifts of nature to the islanders, first noticed by Dampier, in

1688, who met with it in the Ladrone group. It is a beautiful object in its prime, a household tree, like our own elm, which it resembles in height, in the wide spread of the branches, and in venerable aspect. The leaves are large, glossy, and dark green, with edges cut and scalloped as elaborately as those of a lace-collar, but brilliantly tinted with nearly all the prismatic colours when verging to decay. The fruit is heart-shaped, often almost spherical, about the size of a child's head, and when roasted, it supplies agreeable and highly nutritious food. It hangs singly, or in small clusters, and in such abundance that two or three trees will suffice for the support of an individual. Clothing is made of the fibrous inner bark of the trunk. A milky juice, and the soft light timber, which assumes the appearance of mahogany on exposure to the air, are also used for economical purposes. Equally important is the Cocoa-nut Palm, *Cocos nucifera*, common in all tropical regions, but specially characteristic of the low coral islands of the Pacific, where it is most luxuriant, and sometimes forms the only arborescent vegetation. It rises from sixty to eighty feet high, delights in a maritime situation, and attains the greatest perfection directly on the sea-shore, where the roots are actually washed by the waves. No saline flavour is perceptible in the nut produced in such a position. The tree needs no culture, pruning, or attention of any kind. Its varied utility is as remarkable as its fruitfulness. Year after year the islander reposes beneath its shade, eats its fruit, and finds a delicious drink in the acidulated cream of the nut. With its boughs his cabin is thatched, and they are also woven into baskets. His head is shielded from the sun by a bonnet made of the leaves, and the young leaflets are plaited into a fan with which he cools himself. A balsam for his wounds is compounded from the juice of the fruit, and the oil extracted is employed both to anoint the living and embalm the dead. The noble trunk is sawn into posts to uphold his dwelling; converted into charcoal it cooks his food; and paddles for his canoe are formed of the wood, with clubs and spears for the battle.

The BONIN ISLES, about 500 miles south by east of Japan, are a volcanic group, named by the early Spanish navigators the *Arzobispo* or *Archbishop Islands*, for some unknown reason, as no natives to be comprehended in a diocese have ever been heard of. They were rediscovered by Captain Beechey in 1827, who formally took possession of them for his country, and supplied several with distinctive names borrowed from his countrymen, as Peel, Parry, Bailey, and Buckland. A small community engaged in whaling has been collected on Peel Island, both men and women, including some runaways from ships, among whom the Englishman, the Dane, the Italian, the American, and the Sandwich Islander have been observed.

The LADRONE ISLANDS, on the south, mountainous and volcanic, form an important possession of the Spaniards, included in the government of the Philippines. They are fertile and picturesque, well supplied with European animals, and possess the llama, introduced from Peru, which thrives on the mountains. Though once densely peopled, the natives are now reduced to a remnant. The largest island, Guajan, which has a circuit of about ninety miles, contains the principal Spanish settlement, *San Ignacio de Aganna*, a town of 3000 inhabitants. At Tinian, another of the group, Anson landed his sick and weary crew, while on his voyage round the world, in 1742; and lost the anchor of his ship during his stay. Nearly a century afterwards this was hooked up by a whaler, and found to be very little corroded after the long submergence. The Ladrone, discovered by Magellan, received that name from him, signifying 'robbers,' owing to the thievish propensity displayed by the natives. Jesuit missionaries supplied the name of Mariana Islands, still in use, in honour of Mary Anne of Austria, wife of Philip IV. of Spain.

The CAROLINE ARCHIPELAGO, immediately north of the equator, consists of numerous groups of chiefly coralline formation, which occupy an immense space of the ocean, and comprehend thousands of components. They extend in a broad belt through nearly forty degrees of longitude, or a distance of 2500 miles, and are sparsely inhabited by Malays, skilful mariners, who undertake distant voyages in very frail canoes, and subsist on fish, cocoa-nuts, and other fruits. The Spaniards claim the nominal sovereignty by right of discovery, but have never been able to establish a permanent settlement. The name refers to Charles II. of Spain, but they are sometimes called the New Philippines. At the west extremity the PELEW ISLANDS under a native government, have a different aspect, being hilly and well wooded. The triple series of the RALICK, MARSHALL, and RADACK ISLES are eastern appendages of the Carolinas, first met with by Saavedra, a Spanish navigator, in 1527. He named different portions *Los Pintados*, from the natives being painted or tattooed, and *Los Buenos Jardines*, from the abundant vegetation. The *pandanus*, bearing a juicy aromatic fruit, grows plentifully through the whole Archipelago, as well as in the GILBERT ISLANDS, on the south-east, directly under the equator.

The SANDWICH ISLANDS, an important chain, volcanic and grandly mountainous, occupy a very isolated position in the eastern part of the North Pacific, 3000 miles from the coast of America, and at a greater distance from any other considerable mass of land. There are thirteen islands ranged in a curving line, but only eight are inhabited. Hawaii, the largest, contains about 4000 square miles, or two-thirds of the entire area. It is distinguished by the stupendous summits of two volcanic mountains, that of Mowna Kea, towering to the height of 13,950 feet, and that of Mowna Loa, which reaches nearly the same elevation, 13,760 feet. The appearance of the latter from the sea, with its abrupt upward start, and peculiar dome-like top, is majestic in the extreme. On its eastern slope, at the altitude of 4000 feet, yawns the crater of Kirauca, a fearful gulf, 1500 feet in depth, more than two miles in circuit, at the bottom of which is the red-hot lava ever boiling and steaming, as if gathering strength to escape from the abyss, and descend in a fiery deluge upon the surrounding country. Mowna Loa, at other points, sent forth destructive eruptions in 1855 and 1859. These islands form a state under hereditary monarchical government, limited by a legislative assembly,

the independence of which is acknowledged by all important foreign powers. The inhabitants, once pagans and cannibals, are nominal converts to Christianity, chiefly owing to the influence of American missionaries. They have a written language, regular laws and civil institutions, a small fleet, with considerable commerce in victualling ships, exporting sandal-wood, and other products. *Honolulu*, the capital, a seaport in the island of Oahu, is the only entrepôt between opposite shores of the North Pacific, visited by whalers and other vessels for supplies and repairs. It contains about 10,000 inhabitants, mostly natives, but with many foreign merchants, who represent as consuls nearly all the states of Europe. The town, regularly built, has its theatre, hospital, music-halls, billiard-rooms, taverns, daily newspapers, and a fashionable drive. Though an increasing place, owing to the arrival of foreign recruits, yet the general population of the insular kingdom has much diminished, and is in process of reduction. Captain Cook, upon the discovery of the islands, estimated the inhabitants at 400,000. In 1849 the number had fallen to 80,000, and a further dwindling to 67,000 was shown by the census of 1860. This extraordinary decrease has been caused mainly by the introduction of European diseases, and the great number of young men who leave their country in whalers and other ships, and never return. Two mournful incidents are connected with Hawaii Island—the death of Cook, in 1799, from an attack of the natives, and of Mr Douglas, the Scotch botanist, in 1834, from a shocking accident. In the course of his rambles he incautiously approached a bullock-trap, fell into the pit, and was horribly mutilated by an infuriated captured animal.

### III. MELANESIA.

Principal Groups.—1. New Guinea and Louisiade Archipelago. 2. Admiralty Islands. 3. New Britain and New Ireland. 4. Queen Charlotte and Solomon Islands. 5. New Hebrides and New Caledonia. 6. Fiji Islands.

This region, immediately east of Malaysia, north and north-east of Australia, is very little known apart from the shores, except by the report of natives. It has the name of Melanesia from the dark complexion of the inhabitants, who are often styled Austral and Oceanic Negroes from their physiognomy, and have lighter-coloured Malays and Polynesians intermingled with them at the opposite western and eastern extremities, giving rise to mixed breeds. The features are decidedly Negro, of coarse cast, stupid and brutal expression, the natural deformity of which is increased by the insertion of pieces of bone and wood through the cartilage of the nose. The skin is universally of a deep chocolate hue; the hair crisp; and hence the Malay term, Papuan, signifying 'crisp-haired,' applied to the race. But instead of being spread equally over the head, it grows in separate tufts, each assuming a spiral form, and stretching out to an enormous length, when not curtailed. The descriptive phrase of the 'mop-headed Papuans' is true to the reality. The Dutch, French, and British have limited influence in different parts of the insular series.

NEW GUINEA, called Tanna Papua, 'Land of the Crisp-haired,' in the language of the Malays, the largest island of our globe, if we except Australia. It extends from north-west to south-east through twenty degrees of longitude, equal to a distance of 1200 miles, but has no greater breadth than about 300 miles, and consists of a narrow projection at the south-east extremity traversed by the range of the Owen Stanley Mountains, the principal summit of which appears to have an altitude of 13,200. The interior has not been visited by any civilised traveller, nor has the coast-line yet been thoroughly surveyed, though it is known to embrace many deep bays and magnificent inlets. According to information received from the natives, and the commercial products, the surface is generally mountainous, clad with forests of camphor-trees and sago-palms, and yields many of the precious productions of the tropics. The only quadrupeds known to exist are wild hogs, dogs, rats, and some new species of marsupial animals. Birds of great beauty and variety abound. Among them are the gorgeous birds of paradise, which periodically leave their breeding-grounds for the Spice Islands in the flowering season. At Doreh Harbour, on the north-west coast, the natives come into contact with Europeans, and trade is carried on thence with the Moluccas by the Dutch, who claim the sovereignty of the western half of the island. Mr Wallace, an Englishman, resided three months at Doreh in 1858, and found the climate wretched from excessive rains, though it was nominally the dry season during part of the period. He brought away interesting and new specimens of the natural history.

The groups named in connection with New Guinea extend over an immense space on the east and south-east, and form collectively the Papuan Archipelago. They are inhabited by the same dark family of the human race, a description which will apply to habits as well as colour; and are so correspondent in their general features, as far as known, that separate detail respecting them may be dispensed with, except in a few instances. Though scenes where nature always wears a benignant aspect, and the freshness of spring is constantly seen associated with the fruits of autumn, they are eminently the 'cannibal islands,' where many a shipwrecked seaman, it is said, has been disposed of at a banquet. Population of this group estimated at 800,000.

NEW CALEDONIA, about 720 miles east-north-east of Queensland in Australia, is a colonial possession of France, and a valuable acquisition, being very fertile, and containing excellent coal. It extends 200 miles in length, by 30 in breadth, and is supposed to contain 60,000 natives, some of whom are under the instruction of Roman Catholic missionaries. The French took possession of it in the year 1854, as well as of the small adjoining Isle of Pines, so called by Captain Cook, from the stately arancarias seen among the vegetation. *Port de France*, the infant settlement, is on the Bay of Noumea, which forms a safe harbour, easy of access and defence. The NEW HEBRIDES, on the north-east, are a long volcanic chain, abounding with the odoriferous sandal-wood, which the Sydney ship-owners convey to China, where it is burned as incense in the temples. The inhabitants, numbering about 200,000, are fierce, and massacred the missionary Williams on his visit to Erromanga, one of the series. The FIJI or VITI ISLANDS, on the east, mark the limit where the dark Papuans and the lighter Polynesians intermingle. This group is likewise volcanic, and contains upwards of 200 members, 60 of which are inhabited, but two only are of important size. These are Viti Levu, or 'Great Fiji,' and Vanna Levu, or 'Great Land,' respectively 360 and 300 miles in circuit. They have good harbours, fine rivers, a rich loamy soil, abundance of sandal-wood; and cotton of excellent quality is raised. The inhabitants are supposed to number at the least 133,000, and are a superior race with reference to several constructive arts. But cannibalism, human sacrifices, and infanticide prevailed horribly among them till the Wesleyan missionaries commenced their labours in 1835, since which time a great social reformation has been effected, and is promoted by the present king. This potentate, for his own security and that of his people from invaders, wished to place his insular kingdom under British protection. Early in 1859 Mr Consul Pritchard arrived in England with a deed of cession to the Crown, from 'Ebenezer Thakombau, by the Grace of God Sovereign Chief of Bau and its Dependencies, Vunivalu of the Armies of Fiji and Tui Viti.' But it was not deemed expedient by the government to accept the sovereignty. On state occasions, when Europeans are received, the Queen of Fiji appears in the attire of civilisation, wears a neat Paris bonnet, a coloured silk dress with crinoline, and a black mantilla trimmed with lace; but is said to be very glad to get the clothes off as soon as official interviews are over.

Megapolis, one of the Possession Islands.

Booby Island, Torres Strait.

## CHAPTER II.

### GENERAL VIEW OF AUSTRALASIA.

THE term AUSTRALASIA, equivalent in its meaning to Southern Asia, has no special relation to the region it popularly denotes, that of Australia and its adjuncts, as it is equally applicable to the southern districts of the continent and the greater part of Malaysia. Ethnologically, also, it is Melanesian, the natives proper being a dark-complexioned race. But they are so few in number, while rapidly passing away before the intruding white population, as to justify a separate classification, which the vast extent of the territory renders convenient. The whole is British ground.

AUSTRALIA, the largest island in the world, is so extensive that the compound phrase of island-continent is very commonly applied to it, and may be accepted as descriptive of the relation it bears to the other principal land masses of the globe. It is situated between the parallels of  $10^{\circ}$  and  $39^{\circ}$  south latitude; between the meridians of  $112^{\circ}$  and  $153^{\circ}$  east longitude; and is divided into two nearly equal parts by the southern tropic. From Cape York, the north extremity, to Wilson's Promontory, the southern limit, the distance in a direct line is close upon 2000 miles. From Cape Byron on the east coast, to Steep Point on the west, the extent is greater, measuring not less than 2600 miles. The coast-line is estimated at 10,000 miles, and the area comprises 2,900,000 square miles. It may be roughly stated to be one-fifth less than Europe, the next larger continent. But a large portion of the surface is doomed to hopeless sterility, and can never be available for colonisation, though, after making this

abatement, it may still be regarded as offering a land of promise to many millions of the Anglo-Saxon race.

The shores are washed by two oceans, the Pacific on the east, and the Indian on the west. They communicate by two channels, north and south, which separate the territory from smaller insulated lands. Bass's Strait, the southern channel, more than 100 miles wide, divides Australia from Tasmania, and is a great thoroughfare for shipping between Sydney, Melbourne, Adelaide, and the mother-country. \* Torres Strait, the northern channel, about 90 miles wide, separating it from New Guinea, offers the nearest route from Sydney to Singapore, India, and China. But though much frequented, the navigation is so intricate and critical that the circuitous course round the entire south and west shores is commonly preferred. Among the indentations of the coast, the Gulf of Carpentaria, on the north, penetrates 500 miles inland, with an almost invariably low shore, of an extremely uninviting character. Nearly opposite, on the south, the great Australian Bight presents its vast concavity, as if scooped out by the swell of the Indian Ocean, to which it is exposed; and exhibits through about 600 miles a singularly unbroken line of horizontally-stratified cliffs, from the summit of which the country stretches away inland in apparently boundless plains of sand and scrub. A barrier so long and so entire is without example elsewhere, and the remarkably unfortunate peculiarity attends it of not contributing a single drop of water to the adjoining ocean.

The north-east coast has a very remarkable feature in a linear series of coral-reefs, which run parallel to it through upwards of 1000 miles, and are collectively called the Great Barrier Reef, from acting as a bulwark to the shore against the roll of the Pacific Ocean. This formation is the grandest specimen of the kind of which we have any knowledge, and a wonderful example of minute individual parts producing by combination a magnificent result. The reef rises on the outside perpendicularly from unfathomable depths. It fluctuates considerably in width, from thirty or forty miles to less than one, approaches and recedes again from the coast, but averages the distance of about thirty miles from it. With the wind blowing from the east, the arm of the sea within the reef is tranquil, while on the outside the waves dash with tremendous fury against it. The long ocean swell being suddenly impeded by this barrier, lifts itself in one great continuous ridge of deep blue water, which, curling over, falls on the edge of the reef in an unbroken cataract of dazzling white foam. Each line of breakers runs often one or two miles in length, with not a perceptible gap in its continuity. There is a simple grandeur and display of power and beauty in the scene that rises even to sublimity. The unbroken roar of the surf, with its regular pulsation of thunder, as each succeeding swell falls, is almost deafening, yet so deep-toned as not to interfere with the slightest nearer or sharper sound. A few openings occur which admit of ships passing through this enormous barrier, and there are several intricate boat channels. A circular stone tower, on a small islet off the best passage, stands as a beacon to guide the mariner to it, with cocoa-nuts and other plants on an adjoining plot of ground for the benefit of shipwrecked seamen.

Highlands run parallel to many parts of the coast, but at some distance from it, and send off spurs both towards the shore and into the interior. The most important and continuous heights, at present known, traverse the eastern side of the country, from sixty to seventy miles inland, and consist of several ridges, variously with peaked, serrated, and rounded summits. They include also great table-lands, which are furrowed with precipitous gulleys, and often present on the seaward side nearly perpendicular escarpments. In the opposite direction they decline in vast downs, very thinly timbered, but clothed with grasses and herbage, which form admirable sheep-walks, and are the great grazing-grounds of New South Wales. These highlands, to the back of Sydney, are

known as the Blue Mountains, and do not rise above 3500 feet. In their northerly extension they have the name of the Liverpool Range, and acquire a greater general altitude. In their southerly course, under the denomination of the Australian Alps, the highest points occur. Mount Kosciusko, the loftiest, situated 120 miles inland from Cape Howe, raises its sienitic cone 6500 feet above the sea, retains the snow through nearly the whole year upon its summit, and furnishes a permanent supply of water to the Murray River from its melting. It was ascended, in the year 1840, by Count Strzelecki, the indefatigable explorer of the Australian cordillera, who submitted specimens of the rocks collected in his wanderings to Sir R. Murchison, which enabled the sagacious geologist to infer, from their correspondence to those of the Ural Mountains, the existence of gold, and announced it prior to the discovery. No active volcanoes are known to exist, nor have earthquakes occurred within the term of colonial experience. But traces of extinct volcanic action appear in various parts of the country in true crateriform hills and veritable lavas.

In its water supply Australia is essentially defective. This is the prime disadvantage of the country. There are many locally important rivers, but in the settled districts they are not of magnitude proportionate to the vast extent of the

territory, comparable with the great drainage systems of other regions in volume of water and capacity for navigation. The Murray is the largest river of the country at present fully known, and the most persistent in its features. It rises on the inner slope of the Australian Alps, in the neighbourhood of the loftiest heights, forms the boundary between New South Wales and Victoria, receives from the former colony the Murrumbidgee and the Darling, with the Ovens, Goulburn, and Loddon, from the latter, but has its lower course and entrance into the ocean within the limits of South Australia. Though inaccessible to ships of any size from the sea, it admits of internal navigation through a distance of 1800 miles, following the windings. Steamers began to ply regularly in 1853. In its mean state the breadth is nowhere greater than about 300 yards, and generally much less. But the depth is very considerable, varying from 12 feet at the shallowest, to 20 and commonly to 40 feet, even close to the edge of the water. The stream rises from the melting of the snow around Mount Kosciusko, and falls periodically. The rise commences in the early part of July, and proceeds at a very gradual rate till the bordering creeks

Falls of Glen Stuart, Moriarty Creek.

and lagoons are filled, and many of the adjoining flats are laid under water. The explanatory remark may here be made, that by a somewhat absurd nomenclature in Australia, small inland water-courses, the beds of temporary streams, completely dry some parts of the year, are commonly styled 'creeks,' a term which we exclusively apply to the lesser inlets of the sea.

While poverty marks the general water-system, it is further subject to alternations of superabundance and complete exhaustion; and both extremes are in a varying degree calamitous. Rain descending literally in sheets of water on the highlands gives rise to floods, remarkable for their sudden occurrence and great extent, occasionally destructive to the homestead of the settler, unless care has been taken to place it above high-water mark. Trees standing on the borders of insignificant rills, or near almost dry channels, frequently proclaim that a deluge has swept along, by a residue of grass, weeds, and rubbish left in their branches at an extraordinary height above the existing stream. When Sturt, on his central exploration, reached the Darling, he found its bed all but empty, without any perceptible current. In a few days it began to flow rapidly, and quantities of grass and bark came floating down, covering the surface. It soon swelled considerably, and rolled its turbid waters along with violence. In a single night it had changed its character completely, from an obscure and languid brook to a broad and rapid river, laden with large trees and drift. While following the channel of the Macquarie, where water was only to be found in holes, Sir Thomas Mitchell was startled by a report that a flood was coming down from the Turon Mountains, but that it travelled slowly, and would not arrive until the following evening. At the time mentioned a murmuring sound was heard like that of a distant water-fall, mingled with occasional cracks, as if produced by breaking timber. The noise increased gradually, and the flood came at length in sight, glistening in the moonbeams, and filling the empty bed of the river. But it was soon dispersed in a thousand lagoons, and the channel became as exhausted as before. The Hawkesbury, near Windsor, has been known to swell to the enormous height of eighty feet above its general level. During the hot and dry summer the opposite feature of exhaustion is very visibly impressed upon most of the inland waters. The larger rivers shrink in volume; the smaller lose their continuity, and become a series of detached ponds; the mere rivulets altogether fail. In New South Wales irregularity attends the occurrence of both drought and flood. Sometimes the dry season monopolises the entire year, as from July 1838 to August 1839, during which not a drop of rain fell at Sydney, and the cattle perished by hundreds, either from inability to obtain water, or to extract nutriment from the parched surface. Neither are the floods confined to what is usually called the rainy season. Fifty-seven visitations of the kind have been recorded in relation to the Hawkesbury through the historical period of seventy years since 1788. Fourteen of the number occurred in spring, eleven in summer, seventeen in autumn, and fifteen in winter.

The remarkable peculiarity of a series of deep depressions appears in the structure of many of the river-beds. This arrangement meets the condition of a country where the waters rapidly run off the surface, and the native tribes have little constructive capacity, for these nature-formed tanks or reservoirs retain a supply of the vital element long after it has disappeared from other parts of the channels. The depressions are very striking in the Swan River of Western Australia, which undergoes great seasonal changes. A writer speaks of meeting with a pool, two hundred yards long, thirty wide, and thirty-six yards deep, full of water to the brim, while just beyond each end the bed of the river was dry, or had only a little winding rill trickling among the grass and pebbles. A series of these 'water-holes' marked the course of the stream. One of vast size was noticed, three quarters of a mile long, thirty or forty yards wide, and of great depth, full to the margin of beautifully clear water. A stranger to the country, coming suddenly upon it, would have imagined that it might be traversed to the sea in a boat. Yet it abruptly ended each way, with a steep square termination, and the bed of the river beyond was a grassy hollow slightly elevated above the pool. The arrangement is precisely as if parties had set to work at different points to deepen the channel, and, after excavating various spaces to a considerable depth, had simultaneously suspended further labour. The rivers of this description have channels used *in extenso* in the rainy season, which present a succession of ponds in the dry, either connected by a thread of water, or wholly detached. It has often been suggested that an adequate supply of water might be secured in all seasons by artificial excavations where the natural 'water-holes' are wanting.

The climate, referring chiefly to the principal colonised districts, is distinguished by a high summer temperature, with little or no winter, according to English ideas of the season, except in the upland districts. But ordinarily the heat experienced in summer causes comparatively little personal inconvenience, neither producing bodily languor nor mental inertness, and not interfering with toil out of doors. In the winter months at Sydney, the early morning air has a bracing sharpness, and the evenings are cool, rendering a fire welcome at those hours; but there often intervene a warm sun and clear sky, which lead to deserted hearths in order to sit by open windows. Snow is almost wholly unknown. A shower on the 17th of June 1836 is mentioned by Dr Lang as quite a phenomenon, for

the children were greatly surprised to see 'white rain' falling, never having beheld a flake before. It falls plentifully on the loftier highlands, and lies for a short time on the downs of Bathurst, Argyle, and other elevated sites, where also the ground is often found in the early dawn covered with bright hoar-frost. Many climatic circumstances, and industrial occupations dependent upon them, are directly opposed to our own experience. The north winds are hot; the south are cold; and the east are healthy and invigorating. Harvesting is in process when the fields of Northern Europe are frozen hard, and the rivers are choked with ice. June, July, and August are the winter months; December, January, and February the months of summer. Hence the Christmas festival falls at midsummer, when oak branches and flowers in their fullest bloom take the place of our holly and the mistletoe-bough in the festivities.

The summers have one evil hard to bear, but fortunately it is not of frequent occurrence, or of long duration. This is the hot wind to which all the colonies are exposed, blowing from the interior of the country. The thermometer rises to 130°, and even 140°, during its prevalence. In New South Wales and Victoria, especially the latter, its direction is from the north-west; in South Australia, from the north; at the head of the Australian Bight, from the north-east; and at the Swan River, from the east. Though protected by a wall of mountains, the fiery gust is annually an unwelcome visitor at Sydney, and is experienced on an average about four times every summer. It lasts each time commonly from twenty-four to thirty-six hours, and is comparable to the blast of a furnace. At Melbourne, where similar protection is wanting, it is more intense, and also at Adelaide, under the same circumstances, where it sometimes continues for nine days together. Though no injury is done to the human constitution, yet a sense of great personal discomfort is generally produced, and the effect upon the cultivated vegetation is extremely pernicious. The prime annoyance is not so much the burning temperature of the current, as the impalpable dust it sweeps along, with gritty matter large enough to strike on the face with painful acuteness. Strzelecki, on a voyage from New Zealand to New South Wales, was prevented making the harbour of Sydney for two successive days by the strength of the blast; and when sixty miles from shore the heat exceeded 90°, while the sails of the ship were coated with dust laid on by the breeze. Every object in its path assumes a livery of monotonous drab, or deep brown tinged with red, from the minute particles with which it is loaded. At the first symptom of the visitation approaching, servants fly about every house to see that windows are closely fastened and blinds drawn. The streets become intolerable, and are quickly deserted. Everywhere, right and left, up and down, there is nothing but dust.

The plague is over, usually after a sharp but short contention between the hot wind and a gust from the south, in which the latter triumphs, and being a cold wind, rapidly depresses the temperature. Mr Dutton, in South Australia, thus graphically describes the conflict: 'You look out, and perceive to the southward a dense column of dust rising perpendicularly into the air—the two winds have met! The south wind, fresh from the sea, being many degrees colder than the north wind, is violently precipitated on to the ground, the lighter hot wind rising in proportion. This is the cause of the column of dust being raised so high. Now the two winds are engaged in fierce struggle! It lasts but a moment. With gigantic strides the column breasts its way northward—the hot wind is fairly vanquished, and with a blast, before which the mighty gum-tree breaks, and your house quakes, the south wind proclaims its victory, and in half an hour it settles down to a cool steady breeze. The dust subsides, and "Richard is himself again." This is the chief summer disagreeable, along with an intense development of insect life. Through the remainder of the year, for eight or nine months, the weather is peculiarly delightful; and during the hot season, except when the sirocco blows, the mornings and evenings are deliciously cool. In point of salubrity the climate is one of the finest in the world. Camping out at night, sleeping on the ground with a saddle for a pillow, and the stars looking brilliantly white through the trees—a common incident of a squatter's life—is followed by no injurious consequences, though in most other countries fevers, agues, and affections of the lungs would be the result. Notwithstanding an endless series of morasses and reedy swamps, covered with stagnant water and rank vegetation, no part of the globe is more exempt from that class of disorders which originate in deleterious exhalations.

Australia is remarkably distinct from all other regions in its native botanical and animal productions, while far from being distinguished in either case by variety of species, profusion of individuals, or utility to man. With scarcely an exception, the trees belong technically to the class of evergreens. But this term is a complete misnomer with reference to the colour of the leaves, which have generally dull, brownish, and leaden hues, are of a leathery texture, and wholly without gloss. In many instances also both sides of the leaves are alike, and possess the same organs, with the further peculiarity of being inserted in a vertical instead of a horizontal direction. Hence, by presenting their

edges to the light, but little shade is afforded. This result is aided by the foliage of all the timber being scanty, while the branches tend more to shoot upward than to spread out laterally; and the trees are often thinly distributed over the surface, or arranged in park-like clumps, instead of forming a continuous forest. The woods have therefore no

Coast near Illawarra.

glades of profoundest gloom, but are light and airy scenes. Yet a desolate appearance is given to them by some species which have long wiry branches entirely leafless, and by others which annually shed their bark. Streamers of the epidermis may be seen, twenty or thirty feet long, hanging like 'a beggar's garment from the stems, or rolled up on the ground precisely like great sticks of cinnamon.'

The two families of *Eucalypti* and *Acacia* are predominant among the vegetation. The former are the 'gum-trees' of the colonists, so called from their resinous exudations. The latter are the 'wattle-trees,' some species of which were used by the early settlers for the purpose of wattling the partitions of houses. Intermingled with these genera are many cedars and cypress-like casuarinas, furnishing valuable timber, with enormous wild figs, noble pines, luxuriant underwood, reeds, ferns, and nettles of arborescent habit in moist situations. A nettle, *Urtica gigas*, rises to the height of forty feet, and has a stem nine or ten feet in girth, with large leaves, the sting of which is said to be painful enough temporarily to paralyse a limb. In the more northern districts, palms, bananas, and other tropical productions, connect the vegetation with that of South-eastern Asia. The fan or cabbage-palm occurs on the east coast in the Illawarra, a belt of land sixty miles south of Sydney, but is not seen in the interior. A slender branchless stem, from sixty to a hundred feet high, surmounted with a crown of leaves, waves gracefully to the breeze as it rustles through a round tuft of foliage at the top. The leaves are made into a kind of hat, very generally worn by the colonists, and the tuft at the summit is eaten by the natives—whence the name of cabbage. Owing to these uses the beautiful tree has been subject to reckless destruction in the district, and is now scarce. The edible and fruit-bearing plants indigenous to the soil are few in number, and of no importance to civilised man, either for food or the gratification of taste, though several afford useful provision to the aborigines, and it is possible that some grasses of the pastures might be introduced to cultivation with advantage in dry climates for the support of stock. Mere flowering-plants are numerous, worthy of the florist's care as objects of beauty or curiosity, though most are scentless. Such is the Waratah, or native tulip, a tall, stately, and right regal-looking product, growing on the slopes of the hills, well entitled to be called the Queen of the Bush. Its woody stem rises straight as an arrow from five to ten feet high, and is clothed all the way up with richly-green oak-like

leaves, which are surmounted by a noble cone of vivid crimson. The Gigantic Lily, or spear flower, has a stem of fifteen or twenty feet, rising from the centre of a group of long, broad, curving leaves, which is crowned with a huge cluster of gorgeous crimson lilies. Of the humbler but more useful vegetation, as the succulent natural grasses, they do not uniformly clothe the surface by forming a continuous turf, but grow in separate tufts like the strawberry-plant, with spaces of bare ground between them. A minute pink convolvulus, and a hardy kind of everlasting with a yellow flower, intermingling with the herbage, and occupy the place of our daisy and butter-cup.

The zoology is characterised by few species of mammalia in comparison with the total number known; and there is a general paucity of individuals likewise. Hundreds of miles may be traversed in the interior of the country without rousing a single quadruped, or even meeting with the trace of one. Three of the great natural orders are entirely unrepresented, the quadrumana, the pachydermata, and the ruminantia. Most of the mammalia are marsupials, so called from the females being furnished with a peculiar pouch for the reception of their young, which are born in a more immature state than the young of other viviparous animals.

The most important marsupial is the kangaroo, a vegetable feeder, inoffensive and timid, moving by a succession of bounds by means of the hind-legs, yet capable of outstripping for a time the fleetest steed. The natives hunt it for food, as well as the colonists for sport; but this is only at the outskirts of the settled districts, and even there the gun and dog have rendered the animal scarce. But the most anomalous creature, according to its name, *Ornithorhynchus paradoxus*, is a non-marsupial, and seems to form a kind of connecting-link between quadrupeds and birds. No beasts of prey of consequence occur, except the dingo or native dog, which is generally distributed, and justly dreaded by the sheep-farmer as the scourge of the flocks at remote stations. This marauder, fierce, courageous, and insatiable, is somewhat larger than the shepherd's dog. It never or very rarely barks, but howls or yells dismally at night. Reptiles abound, harmless lizards and iguanas, with various snakes, some of which are venomous. Flies, mosquitoes, and other entomological mites, are through six months of the year a perfect torment, comparable to any similar plague of the Egyptians.

Among the birds, the emu represents in Australia the ostrich of Africa, and ranks next to it in stature, many standing full six feet high. The birds of prey, eagles, falcons, hawks, and owls, are plentiful; with those of beauty, paroquets, cockatoos, and lories; but in birds of melody the country is deficient. The notes are more generally monotonous, discordant, or peculiar, than musical; and many are familiarly styled after their tones. The black swan, remarkable for its colour and glossy plumage, has a voice which one of its early civilised hearers could only compare to the 'creaking of a rusty sign on a windy day.' The Bell-bird has the name from its single silvery 'ting,' curiously loud and metallic, the harbinger of water in the desert. The Organ Magpie has a soft sad tone, said to resemble the notes of a flutina, touched by a timid and uncertain hand. The Coachman gives a long clear whistle, finishing with a noise exactly like the crack of a whip. The Knife-grinder's Song is sufficiently discriminated by the name. The extraordinary chant of the Laughing Jackass defies description. Several species, as the Talagalla or brush turkey, and the Satin Bird, are remarkable for their habits.

Vast accessions have been made to the botany and zoology as the consequence of colonisation, and are still in process. All the cereals grown in Europe are raised, with the usual green crops for cattle and garden vegetables for the table. Some of the latter are produced in greater perfection than in the mother-country, as the cauliflower and the broccoli, while a few degenerate, such as the bean. The more valuable may be sown or planted at any time with the certainty of a good crop, and hence Sydney possesses what London cannot boast, a supply of green peas throughout the year. Tropical products are cultivated with complete success, maize, tobacco, and cotton. The vine flourishes luxuriantly, as well as the olive; and the choicest fruits of warm latitudes are reared, the orange, lemon, citron, almond, loquat, fig, and pine-apple. The domesticated live-stock, introduced towards the close of the last century, which might then be represented by a few units, have multiplied to many millions. Recently, the experiment has been tried with success of increasing the number of wild and domestic varieties. To give home melodies to the fields, woods, and gardens, black-birds, thrushes, larks, and other songsters have been imported, and turned loose, with some game birds, as pheasants and partridges, for the benefit of sportsmen, and to diversify the fare at table. A few camels, obtained from India, are in the colony of Victoria; but by far the most important addition are llamas and apacas from Peru. Jealous of other countries possessing such wealth-producing animals, the Peruvian government issued an edict in the year 1845 prohibiting their export; and the penalty was imposed of forfeiture of the flock, and of ten years' labour in chains at the Chincha Islands, on any owner or driver found with them within a certain distance of the coast. In spite of this enactment, through the enterprise of Mr Ledger, a large flock was landed at Sydney in November 1858. The apacas spent the first year of their colonial existence at Sophienburg, about twenty-three miles south of the city, where fleeces such as Peru had never seen were taken from them in November 1859, and where the first apaca meat killed in Australia was partaken of on the 7th of September 1861 by a party of colonial notables. A premium has

for some time been offered for the introduction of salmon, which it is hoped may find a suitable abode in the rivers of Tasmania. After several failures in the attempt to transport the ova, a successful one has been reported. Trout, salmon, and the other *Salmonidae*, are absent from the whole of the Southern Hemisphere.

Among the mineral treasures of the country, coal has been known for some time in New South Wales, and is now extensively worked in the basin of the Hunter River, where several beds crop out at the surface. It also occurs in Western Australia, near Perth. The discovery of copper in South Australia dates from the year 1842. Immense masses of ore of the richest quality have been obtained, and lead is abundant in the same district. Iron exists in such profusion in several of the mountains on the north coast, that they violently affect the magnetic-needle. Manganese, zinc, quicksilver, and antimony have likewise been met with, as well as good specimens of the gems used in secondary jewellery, jasper, chalcedony, and opal. Roofing-slate may be had in any quantity; marbles, valuable for ornamental purposes, are plentiful; and kaolin, or porcelain-clay, is a constituent in the mineralogy. To the economic minerals attention will doubtless be more fully directed as population increases, and exhaustion occurs with reference to the supply of the precious metal.

For some years the gold which has rendered Australia so famous was seen without being recognised, much to the subsequent chagrin of the parties who were thus hoodwinked. Not only did farmers turn up the auriferous alluvium with the plough, but pebbles of gold-bearing quartz were used for garden-walks, and it is even said that a person ornamented his garden-walls by building into them masses of white quartz variegated with portions of the undetected yellow metal. Some curious reminiscences were indulged upon the true state of the case being disclosed. Thus it was known to a few that an old Scotch shepherd, named Macgregor, had been in the habit of bringing small pieces of gold to Sydney, which he disposed of to a jeweller. But no person could ever learn from him where he found his treasure, and the suspicion arose that it was the melted-down produce of robberies. The shepherd at length disclosed the secret when it was useless keeping it any longer. He had accidentally met with the prize in the first instance, and then at intervals searched the spot for it, a place called Mitchell's Creek, in Wellington Valley, about 200 miles west of the capital. It was also remembered that a convict labourer had been sentenced to receive fifty lashes for having a lump of gold in his possession, as it was deemed to be stolen property similarly disguised. Public announcement of the discovery of gold-fields was made in New South Wales in May 1852, and in Victoria the following August. The auriferous rocks belong to the Lower Silurian system, and in the heaps of debris or old alluvium derived from their denudation the gold has been principally obtained.

A native population is thinly distributed over the surface of the country, consisting of various tribes of Austral or Oceanic Negroes, the 'black fellows' of the colonists, who rank with the types of humanity most removed from personal sightliness, judging according to the European standard. Though differing in some respects among themselves in different localities, they appear to have had a common origin, but no monuments, records, or traditions throw the faintest light upon their migrations and history. The complexion is generally a sooty brown, varying to shades approaching to chocolate and a deep earthy black. The flat nose, large nostrils, and thick protruding lips of the true Negro are observable, but the hair is long and coarse, only very occasionally assuming a woolly texture. While of short stature, the limbs are uniformly slight, the head small, the forehead low, the eyes large and far apart, with the iris invariably of a dark brown, and the pupil jet black. In athletic exercises, as running, climbing, and dancing, remarkable flexibility of limb is exhibited, with agility and adroitness—the common accomplishments of the savage—and when in the act of throwing the spear, the posture assumed is both commanding and graceful. Nowhere is the soil made available for support by tillage, but is searched for what it spontaneously supplies. Particular districts are considered the 'sit-down' or territory of certain tribes or families, to which their hunting excursions are confined, and into which the intrusion of other natives would occasion strife. They have no permanent dwellings, but construct temporary hovels of the branches of trees, thatched with leaves of the grass-tree, or roofed with bark to keep off the rain. Though generally destitute of clothing, those in the neighbourhood of the white settlements are

compelled to wear blankets, which are distributed to them at certain seasons by the colonial authorities.

That the native Australians, though once considered incorrigible barbarians, are capable of being civilised in a measure, is proved by the organised troops of black mounted polices in the south-eastern colonies, and the frequent employment of them as shepherds and herdsmen. In a few instances they have learned to read and write. Estimates of their number are quite conjectural, but it is certainly very inconsiderable when compared with the area over which they are spread. In and around the colonised territories, it is beyond doubt that they are rapidly diminishing, though squatters and settlers now endeavour to conciliate their sable neighbours, and humane provisions have been adopted by the authorities, not only to protect them from wrong, but secure sufficient subsistence. Whole communities have already become extinct. The tribe inhabiting the country around Botany Bay and Port Jackson in 1788, which Governor Philip supposed to comprise about 1500 individuals, has not a single representative remaining. The last died in 1849, little more than sixty years after the first occupation of the land by the whites. This has been occasioned by various causes, as the positive inhumanity with which they were treated in the early days of the settlement, the loss of the wild animals upon which they depended for food, both destroyed and scared away by firearms, and the immoderate indulgence in intoxicating liquors, to which all savage races resign themselves, whenever practicable. Another very potent cause of decay, and quite beyond all human control, is the introduction of diseases, which, though very rarely fatal to Europeans, and commonly of a mild nature, exhibit a malignant and destructive character in connection with the native constitution. However melancholy the result, it seems inevitable that the man of Australia is doomed to pass away from the face of the land as civilisation takes possession of it, and he will leave behind him no temples, towers, or palaces to inform future ages of his existence once within its borders —no memorial of any kind originating with himself, except a few names which the new-comers have adopted, attached to sites where he encamped, and to streams of which he drank.

Five British colonies are constituted on the mainland of Australia; a sixth embraces the island of Tasmania; and a seventh is in process of formation, to bear the name of North Australia.

|                  | Founded. | Area in Sq. Miles.                   | Population. | Census. | Capitals.    |
|------------------|----------|--------------------------------------|-------------|---------|--------------|
| New South Wales, | 1788     | 478,000                              | 348,546     | 1861    | Sydney.      |
| Queensland,      | 1859     | 559,000                              | 30,115      | "       | Brisbane.    |
| Victoria,        | 1851     | 87,000                               | 540,322     | "       | Melbourne.   |
| South Australia, | 1836     | 300,000                              | 126,800     | "       | Adelaide.    |
| West Australia,  | 1829     | 1,000,000 (settled district, 45,000) | 15,593      | "       | Perth.       |
| Tasmania,        | 1825     | 22,600                               | 90,000      | "       | Hobart Town. |

Public affairs are administered in each colony by a governor of imperial nomination, assisted by a parliament, which consists of a council and an assembly. Any one of the local governors may be appointed by the crown governor-general. No religious communion is established by law, but all sects in favour of state aid may receive proportionate grants from the public revenues.

The great majority of the colonists are British, but a considerable number are now of Australian birth. The latter exhibit the features usually observed in a transplanted British race, though they are not so strongly marked as in the United States, for which the difference in the length of time during which exposure to new circumstances has subsisted will sufficiently account. Out-of-door habits of life do not produce the ruddy complexion noticeable in the mother-country. The stature is tall, but the form is spare, the face pallid, and the voice less sonorous. It is remarkable that the pronunciation of English, as well as other European languages, always suffers after having been spoken for some time in a new region. The nasal drawl, so common across the Atlantic, is an accompaniment of the English spoken in Australia, Tasmania, the Cape, and other parts of the Southern Hemisphere. The Anglo-Australian males are popularly called 'Cornstalks,' in allusion to their lank appearance. The females are styled 'Currency Lassies,' while true Englishwomen are distinguished by the epithet of 'Sterling.' In the population of South Australia a Germanic element is rather prominent, while Victoria, in consequence of the gold discoveries, has received a very miscellaneous nationality. The most striking addition is that of the Chinese, both as to numbers,

appearance, and habits. They poured in by successive ship-loads, and marched into the interior, betaking themselves at once to the gold-fields. A few engaged in mercantile pursuits at Melbourne, some of whom betokened their existence by the appearance of their names, Lo-Quat or Cum-Quot, in the records of the Insolvency Court. Though inoffensive even to timidity, and outwardly well conducted, the presence of a race in every respect so alien occasioned great general dissatisfaction. It found expression at last in disgraceful attacks upon them, with a view to their expulsion, and led the legislature to impose special payments upon this class of immigrants in order to prevent their increase. The excess of males over females was considerably increased during the earlier years of gold-mining. It still exists, though in process of redress. It is marked in New South Wales, and much more so in Victoria. In South Australia the balance has been adjusted, and the sexes are in nearly equal proportions.

Mount Adolphus.

Shoalhaven Gully.

### CHAPTER III.

#### AUSTRALASIAN COLONIES.

##### I. NEW SOUTH WALES.

THE parent colony of the Australian group, NEW SOUTH WALES, is indebted for that name to Captain Cook, who applied it to the whole eastern seaboard of the country, from its fancied resemblance to the South Wales of his native land, as seen from a vessel off-shore. In its present restricted application, it denominates that part of the east coast extending from Point Danger on the north to Cape Howe on the south; and the district stretching inland from the ocean to the meridian of  $141^{\circ}$  E., which forms the boundary from South Australia. The provinces of Queensland and Victoria are respectively on the northern and southern frontiers. The coastline, along which the great South Pacific, especially with an easterly wind, rolls its tremendous surge, is bold and rugged, presenting a wall of steep cliffs to the waves, fringed with rocky ledges, but with very few sandy beaches. It is broken, however, at intervals by bays and inlets of varying magnitude, which form excellent harbours for shipping, often so shut in by narrow mouths as not to shew their capacity till they are actually entered, and scarcely visible at an inconsiderable distance seaward.

For a few miles inland from the shore the country wears a bleak and barren aspect, the soil being composed mainly of drift-sand, scantily covered with stunted trees and shrubs. But the interior is very largely an open forest, interspersed with brushwood thickets, generally hilly, occasionally mountainous. Rich and fertile valleys lie in the lap of the

ranges, with extensive undulating grassy plains on their slopes, or at their base. Parallel to the coast, north and south, runs a highland chain, the prominent feature of the surface, known as the Blue Mountains in the latitude of Sydney, from the appearance presented in the distant view, but commonly referred to as the Dividing Range. It separates the streams flowing inland, often to lose themselves in marshes, from those which have an opposite direction, and a more immediate descent to the ocean; and also divides the agricultural and longer settled maritime districts on the east from the wide pastures of the squatters in the western interior. These highlands are generally of moderate elevation. They are physically remarkable for the gulf or bay-like valleys with which they are penetrated, vast and immensely deep, bounded on either hand by precipitous cliffs, and terminated by a similar facing of perpendicular rocks. To descend into them, it is frequently necessary to go round from fifteen to twenty miles; and they can only be left by the way in which they are entered. The most extraordinary feature in their structure is, that though they expand to a width of several miles in the interior, they are generally so contracted at their mouths as to be almost impassable. In these 'sunk valleys,' as they are often called, there is usually magnificent timber, but the tops of lofty trees, many hundred feet below the spectator standing on the boundary-walls, appear like brushwood.

Numerous streams descend the eastern slope of the highlands in tortuous channels to the ocean, subject to the fluctuations from flood and drought which have been noticed, but admitting generally of steam-navigation for some distance above their mouths throughout the year. The most southerly of importance, the Shoalhaven, is remarkable for the tremendous gullies through which it flows, some of which are from 1200 to 1500 feet deep, with precipitous sides, composed of granite or dark-coloured limestone, forming scenery of the grandest description. The Hawkesbury, which disembogues to the north of Sydney, is formed by the junction of the Nepean and Grose, at the base of the mountains, and has some of the oldest and most flourishing farms of the colony, with the towns of Windsor and Richmond, on its banks. The Hunter, further to the north, flows through a valuable agricultural and pastoral country, has a course of upwards of 200 miles, and enters the sea at the port of Newcastle. It is the Tyne of Australia, as carboniferous formations occupy an extensive area of its basin, and supply a coal which ignites readily, burns with a bright reddish flame, swells and agglutinates, like the Newcastle coal of England. The Manning, Hastings, Macleay, and Clarence Rivers are in succession more northerly. The inland flowing waters, on the western side of the mountains, either terminate in marshes, or contribute to form the Murrumbidgee and Darling, which, after a long course, with a generally diminishing volume, reach the Murray, some 400 miles distant from their sources.

Drought is the special defect of the climatology, and occasionally a great disaster. The annual amount of the rain-fall is rarely deficient, but generally copious, though irregularly distributed. When it does rain, the showers descend in torrents, often carrying away roads, gardens, walls, palings, and bridges. Every highway becomes a river, every by-path a brook, and every bank a cataract. Then, for months together, not a drop falls, and the sky seems as if it had never known a cloud. During unusually long droughts the cattle frequently perish both for want of water and the fodder which it sustains. The rotting carcasses and the bleached skeletons of draught-bullocks may be seen at the exhausted water-holes, or in the dry beds of streams, to which they had rushed in a fury of thirst. During these seasons, when the vegetation is like tinder, bush-fires, accidentally kindled by the natives, or by a stockman throwing the contents of his pipe upon the ground, are of common occurrence, and become vast conflagrations if there is a breeze, endangering the life and property of the settler. The spectacle is often singularly striking in the

Camden Cow Pastures.

interior wilds, and rises to the sublime. Huge volumes of flames rush along with headlong speed; kangaroos bound out of their path; snakes and lizards issue out of their hiding-places to escape; birds fly with screams from the destruction; bandicoots, opossums, and emus hurry away from the devouring element; and the smoke of the country goes up like the smoke of a furnace. For years afterwards the trees of the forest exhibit memorials of the event in their charred and blackened trunks. The traveller has often met with them deforming the landscape, but occasionally strange objects, clothed with the livery of death below, and exhibiting the evidences of life in the foliage above. At Sydney, in January 1850, the north shore of the harbour was on fire for ten or twelve days. At night the scene resembled a line of huge furnaces extending over some fifteen miles. The city and its suburbs were shrouded in smoke, and the air was pervaded with the aromatic odour of the burning gum-trees.

NEW SOUTH WALES was originally planted as a penal settlement, intended to relieve the overcrowded jails and hulks of the mother-country, at a time when not a single white man existed in the vast range of Australia. A fleet of eleven sail took out 757 convicts, of whom 192 were women; 208 marines, with 40 of the soldiers' wives and children; a chaplain; and Governor Philip. It reached Botany Bay on the 20th of January 1788. But that site proving ineligible, and the adjoining Port Jackson being discovered, the shore of one of its coves was occupied, to which the name of Sydney was given, after Viscount Sydney, then secretary of state for the colonies. Immense difficulties were encountered by the infant settlement, being dependent entirely upon the arrival in time of supplies from England. More than once the whole community was upon the verge of starvation. The first free emigrant, a German, arrived in 1791, and married a Scotch woman who had been transported for arson. Divine service was performed in the open air till 1793, when a wooden church was put up. Government orders were usually proclaimed by the bellman. Under the third governor, Captain King, prior to 1806, the first brick church was erected, the first colonial ship was built, and the first Australian newspaper was published by authority. It was begun by George Howe, a prisoner, under the title of *The Sydney Gazette and New South Wales Advertiser*. Chiefly by the exertions of Captain M'Arthur to improve the breed of sheep, and the public spirit of Governor Macquarie, 1810—1821, the colony began to prosper. Transportation ceased practically in 1839, when the last convict ship arrived. The number of prisoners deported during its term was about 70,000, great numbers of whom merged in the general mass of society upon the expiration of their sentences.

*Sydney*, the capital, is beautifully situated on the southern shore of Port Jackson, about six miles from the South Head at the entrance, where the light-house is in latitude  $33^{\circ} 51'$  south, and longitude  $151^{\circ} 18'$  east. The port is a long expanse of lake-like water, which, for scenery, capacity, and safety ranks with the finest of all harbours. On either side are coves with wooded shores, besprinkled with neat cottages, homesteads, and villas in ornamental grounds, which with vessels constantly cleaving the blue waters, studded with a few islands, form a singularly lovely spectacle. Including the suburbs, the city contains a population of 93,000, and is said to be the most English-looking of all the Australian towns. It has a complete system of sewage, and is lighted throughout with gas. The streets are lined with substantially-built high houses, are well paved or macadamised, and are furnished with numerous public drinking-fountains. The government house, first occupied by Sir George Gipps in 1845, is of white freestone in the Elizabethan style, fitted up with the finest colonial marble in the interior, and staircases of carved cedar. It presents a striking contrast to the canvas dwelling of the first governor, who, on giving an official dinner, when provisions were short, intimated to the guests that they must bring their own bread with them, as he had none to spare. A humorous officer marched to the banquet holding up a puny loaf on the point of his sword. The university, founded in 1851, confers degrees in arts, law, and medicine. A mechanics' school of arts, subscription library, museum, botanic garden, Hyde Park, and the Domain, are places for public instruction and recreation. Sydney is intensely loyal in the nomenclature of its streets, which were mostly laid out in the later years of George III. George Street, the principal thoroughfare, preserves the name of the sovereign. York, Clarence, Kent, Sussex, Cumberland, and Gloucester Streets have the names of royal dukes; and Pitt, Bathurst, Castlereagh, and Liverpool Streets those of ministers. The trade of the capital, both foreign and inland, is very great, as nearly all the exports and imports of the colony pass through it.

*Paramatta*, at the head of a river-like prolongation of Port Jackson, 15 miles from Sydney, is connected with it by steamers and a railway, and contains 5000 inhabitants. It was founded soon after the original settlement, with the name of Rose Hill, properly superseded by a native denomination. The route by water is extremely picturesque. Colonial tweeds, 'Paramatta cloths,' and salt are manufactured. *Bathurst*, in the interior beyond the ridge of the Blue Mountains, 125 miles from Sydney, is the centre of an important pastoral district, and contains a population of 4000. Being at a considerable elevation, 2300 feet above the sea, the climate is temperate, and attracts invalid visitors from the hot coast region. In the early days of gold-finding this town witnessed the arrival of the first remarkable nugget. It weighed 102 lbs., and was sold at Sydney for £4160. Bathurst is reached partly by railway, from Paramatta to Penrith, and then by an excellent road across the mountains constructed by convict labour. Strangers commonly stop at the Weatherboard Inn on the route to visit Prince Regent's Glen in the vicinity, one of the extraordinary sunk valleys before referred to. 'This kind of view,' remarks Mr Darwin, the attentive observer of nature in many lands, 'was to me quite novel, and extremely magnificent.' These wayside inns are numerous in the older parts of the colony, and are often somewhat picturesque, at least those which retain their primitiveness, being built of weather-boards, on a frame of wood, with a plot of garden in the rear. There is the old-fashioned horse-trough, hollowed from the trunk of a tree, in front, and a tall sign-post bearing some long-standing familiar inscription, 'The Traveller's Home,' 'The Cottage of Comfort.' But such humble accommodations for passengers have now been largely superseded by more pretentious taverns, as in the mother-country.

*Newcastle*, at the outlet of the Hunter, 75 miles north of Sydney, is after it the most considerable port, shipping coal and agricultural produce. The river here expands into a broad estuary, forming a very secure harbour, which has been improved by artificial means. The town has 3800 inhabitants. It contains a school of art, a telegraph station, six churches, and gives its name to an Anglican bishopric, which embraces the northern districts. The southern are included in the metropolitan see of the capital. *Maitland*, a few miles up the river, divided into east and west, is the second town of the colony in size, containing a population of 7800. It is in the centre of the principal coal-bearing region, and publishes two newspapers, one of which, the *Maitland Mercury*, is the oldest of the provincial class. *Camden*, 50 miles south-west of Sydney, is a small township in the famous Cow Pastures, a name which refers to an event in early colonial history. Among the live-stock brought by the first squadron to the shores were five cows and two bulls, which broke loose, and escaped into the woods. The stray cattle multiplied; and after some years, this wild drove was heard of near the Nepean River. The first knowledge of its existence was obtained in a singular manner. Upon a party of the aborigines coming to the neighbourhood of Sydney, they so closely imitated the butting and bellowing of the strange animals, as to enable the settlers to identify their lost property. After remaining unmolested for many years the herd was destroyed by order of the government, being of a very inferior breed, and annoying proprietors by mingling with their stock. In this district Captain M'Arthur obtained a grant of land from Lord Camden, then the colonial minister, for the purpose of improving the flocks by the importation of superior sheep. The estate, named after the grantee, comprising a neat residence, substantial farm-buildings, thriving gardens and orchards, is now occupied by descendants of the original proprietor. It will ever be memorable as the spot where the first fine-woolled sheep were bred, and the first vineyard was planted on Australian soil. *Wollongong*, on the adjoining coast-line, is an outport of the Illawarra, the native name of a long belt of land on the shore, remarkable for its rich soil and tropical vegetation. Lofty cedars, graceful tree-ferns, and stately palms, raise their heads above a thick undergrowth of wild vines, creeping plants, and shrubs. Grassy meadows are interspersed throughout, and coal is worked.

NORFOLK ISLAND, 900 miles from the coast, is included in the colonial government. During the transportation system, the worst criminals, doubly or trebly convicted, were deported to this spot, and a paradise was converted into a pandemonium. It is now the home of the industrious and virtuous Pitcairn Islanders, whose singular history is hereafter noticed. Their principal settlement is at Sydney Bay. The island contains about thirteen square miles, exhibits very beautiful scenery, and is noted for its fine vegetation. The characteristic tree, one of the coniferous family, *Araucaria excelsa*, of majestic height and appearance, yielding valuable timber, has the name of the Norfolk Island Pine, but is not peculiar to the site. It has been seen with a diameter of twelve feet rising to the height of 270 feet.

Agriculture is confined chiefly to the coast region, but is only of secondary importance. Wheat, maize, fruits of different kinds, tobacco, and wine are the principal crops, and a small quantity of excellent cotton is raised. Pastoral husbandry is the staple industry, conducted on the vast grassy downs interior to the Dividing Range. The first export of wool to England, 245 lbs., was in the year 1807. It now amounts annually to upwards of 20,000,000 lbs. Gold is an important item of the colonial wealth, and has risen to the estimated value of £2,200,000, according to the last annual return. The localities in which the precious metal is found are either on the table-lands or in connection with the mountain-ranges branching from them. From the Illawarra district and the basin of the Hunter the annual produce of coal is nearly 500,000 tons, which, after supplying the home demand, is shipped to the other colonies, to India, and to China. At the close of the year 1862 the population was estimated at 367,495. The number of ministers of religion was 354, more than one-third of them clergymen of the Anglican Church, and one-fifth Roman Catholic. Upwards of 42,000 children were attending schools.

#### II. QUEENSLAND.

This province, the youngest of the colonial daughters of Great Britain, said to be the fairest, extends northward of the frontier of New South Wales, with which it was formerly associated, but detached by petition of the inhabitants in 1859. It has a coast-line marked with features of greater variety and beauty than belong generally to Australian shores. Enormous tracts lie beyond the range of the settlements, and have never indeed been touched by the footstep of civilised man. But as far as the surface is at present known, it consists of an alternation of forest-clad mountain-ranges and grassy plains, while the climate combines ample moisture with a tropical temperature. No gold-fields here attract by their dazzling glitter, but ample space is open for pastoral and agricultural industry, with a fair prospect of success to those who would enjoy

‘The pride to rear an independent shed,  
And give the lips we love unborrowed bread.’

Some of the most beautiful cotton ever seen has been grown; the vine is cultivated; fisheries are conducted; coal is raised; and Queensland figures in the wool-market with an annual export of more than 6,000,000 lbs.

The natural vegetation embraces noble trees and valuable timber for building purposes, the Moreton Bay pine, the iron-bark, blue-gum, and box, with the red cedar, violet-wood, tulip-wood, and cypress for cabinet-work. A species of pine, the bunya-bunya, is almost peculiar to the district, serviceable to the blacks. It may be recognised at the distance of some miles from its form, like that of a large umbrella mounted upon a very long stick. Once in three years it bears fruit, when the aborigines gather to feast upon it. The cones are about a foot long, so covered with sharp points that a hedgehog, or a ball of ten pounds-weight bristling with needles, may as readily be handled. The edible part of each seed is about the size of the kernel of a Brazil nut. Formerly the government in New South Wales prohibited the felling of the tree, in order to secure the natives in the enjoyment of their triennial banquet. On the shores of the colony the herbivorous dugong is captured. This ‘daughter of the sea,’ the fabled mermaid of the East, is common in the Indian Archipelago, where the flesh was formerly reserved for sultans and rajahs, as too delicious to be used by ordinary mortals. The fish is found in large herds at the mouth of the Brisbane, and is caught for the oil procured from the blubber. Dugong oil has curative properties, and is sought to be substituted for cod-liver oil. It contains no iodine, but, on the other hand, it is sweet and palatable, and does not produce nausea. The profusion of reptile and insect life is the prime natural disadvantage of the district. Accidents are, however, rare from the snakes, which will be extirpated as the land is occupied. But swarms of ants and beetles in the houses cause great annoyance, and the mosquitoes are everywhere a torment.

*Brisbane*, the seat of government, on the river of that name, contains a population of 9000 within municipal limits, and has its daily paper, botanic garden, and Anglican bishop. The river, about twenty miles below, discharges in the long and broad expanse of Moreton Bay, dotted with islands. Good coal is worked on its banks, and has for some years been used by the steamers. *Ipswich*, on the Bremer, navigable up to the town, has 5000 inhabitants. *Maryborough*, a small seaport, is doubtless the only place in the British Empire with a Chinaman in its municipal council. Alderman Cham suitably returned thanks on his election to the dignity. While discountenanced in the other colonies, the Chinese are at present welcome in Queensland, owing to the great demand for labour. Aborigines are found near most of the towns and settlements, though in some places not permitted to enter within their boundaries.

### III. VICTORIA.

This wonderful colony occupies the south-eastern corner of the great insular territory. Its inland limits are defined by a straight line from Cape Howe to the nearest source of the Murray, and then the course of that river, the boundary from New South Wales, as far as the meridian of 141°, where it meets the frontier of South Australia. Though somewhat closely circumscribed between the spacious areas of the two sister-provinces, the distance measures about 500 miles from east to west, by 250 from north to south. This district has a varied coast-line of 700 miles, distinguished by two prominent features, a bold headland, and a securely-sheltered and capacious bay. The headland, Wilson's Promontory, is the south extremity of the province and of the mainland of Australia. It is worthy of the position, being an enormous projection of granite, twenty miles long by from six to fourteen wide, connected by a sandy tract with the main shore. The summits rise to the height of 3000 feet, often veiled with a canopy of clouds or gray mist, as often seen with their outline distinctly defined against the clear blue sky. The bay is the world-famous Port Philip, discovered by Lieutenant Murray, in the *Lady Nelson*, in January 1802, and soon afterwards visited by Captain Flinders, in the *Investigator*. It is a magnificent landlocked harbour, containing more than 800 square miles of open water, communicating with the ocean by a very narrow channel, and therefore comparatively smooth at all times, while the shores are beautiful. At the north extremity the recess of Hobson's Bay is the anchorage-ground of vessels for Melbourne, while on the western side a branch forms the harbour of Geelong.

Sir Charles Hardy's Island, off Cape Upstart.

An agreeably diversified aspect marks the interior of the country. There is an alternation of bold heights, gentle hills, and sweeping valleys, open prairies and beautiful woodland, with rich grassy vegetation clothing a large proportion of the surface. The eastern districts have an alpine character, being entered by the Dividing Range from New South Wales under the name of the Warragong Chain, or the Australian Alps. It follows generally a south-west direction, gradually diminishes in height, and ramifies over an extensive area, till it meets the sea at the south extremity of the province, in the headland of Wilson's Promontory. The central portion is traversed by hills of moderate elevation; some bare, others wooded and grassy to their summits. Thirty-five miles north-west of Melbourne, a range commences with the syenitic Mount Macedon, of which it is the crowning height. This noble-looking eminence rises about 3000 feet, and forms a conspicuous object over a wide landscape, being visible from the east and west hills which adjoin the capital. Stately trees of the blue gum and other species clothe its slopes to the summit, which is so easily accessible as to admit of being reached on horseback. More to the west are the Pyrenees and the Grampians. The southern extremity of the latter has the name of Mount Abrupt, from presenting on one side an almost perpendicular precipice of 1700 feet.

Though better supplied with water than New South Wales, the extremes of failure and superabundance mark most of the streams. Northward, subject to these conditions, flow the Mitta Mitta, the Ovens, the Goulbourn, and the Loddon to the frontier river Murray. Southward, the Glenelg, the Barwon, the Latrobe, and the Yarra Yarra descend to the coast. The latter is of importance as having the capital on its banks. It has been appropriately permitted to retain its native name, which signifies 'flowing, flowing,' an allusion to its permanent character. The stream rises in one of the offshoots of the Australian Alps, issues from an insignificant spring, and pursues a very tortuous course, especially towards its termination in Hobson's Bay. It is liable to sudden floods from heavy rains and the melting of the snow in the range of hills where its sources lie. They are generally 'short, sharp, and decisive,' specially serious, when coincidently with the rise of the river strong southerly gales blow up the waters of Port Philip to the northern extremity, and thus check the egress of the stream. This took place in the night of October 2, 1844, when the Yarra Yarra rose with such rapidity that the inhabitants along its banks with difficulty escaped the danger. Owing to its southerly latitude, the climate is more temperate than that of the sister-colonies, and the long droughts of New South Wales are rarely, if ever, experienced. Sudden and great changes of temperature occur, and the hot summer wind, with its dust-storm, is an occasional infliction.

The history of the colonisation of the district has considerable interest. It dates from May 1835, when the first permanent settler arrived, so that one of the most important parts of the empire is not yet quite thirty years old. The emigrant was Mr Batman, a resident in Tasmania, known from his humane exertions to befriend the aborigines of that island. He landed on the shore of Port Philip, near the mouth of the Werribee River, about half-way between Melbourne and Geelong, accompanied with some domestics. In an interview with the natives he expressed the wish to reside among them, and to purchase a portion of land on which to depasture his stock. A bargain was finally concluded and formally ratified, by which an extensive tract was ceded to him.

The first immigrant was speedily followed by others, part of whom took up a position on the banks of the Yarra Yarra. Though both the governors of New South Wales and Tasmania discouraged the movement, the admirable grazing capabilities of the country had become known, and the 'squatters' poured in. In June 1837, the year when Queen Victoria ascended the throne, the embryo capital of a province destined to bear her name consisted of a collection of huts with 250 inhabitants. Two wooden houses served the purpose of inns. A small square wooden building, with an old ship's bell suspended from a tree, was used for a church or chapel. Two years later, 1839, the territory was constituted a dependency of New South Wales, under a lieutenant-governor, with the name of the Port Philip district. A long straggling village then made its appearance, with a population of 3000, which speedily became a singular-looking town. Stumps of gum-trees

stood up in the streets, while enormous ruts were cut in the soft soil by ponderous bullock-drays. Arrested by such obstacles, the surface-water collected in pools after heavy rains, and the newspapers of 1842 chronicled the incident, 'Another child drowned in the streets of Melbourne.' In 1851 the dependency was made a distinct colony, with the name of Victoria, since which period, owing to the discovery of auriferous wealth, its progress has been a perfect marvel in the annals of civilisation.

Victoria, though by far the smallest of the five colonies on the mainland of Australia, is the richest and the most populous, connected with the mother-country by the most extensive commerce. Its agriculture is of no mean importance; its pastoral industry produces wool of the annual value of more than £2,000,000; its gold-mining has realised sums varying from £8,000,000 to £13,000,000 per annum; and public improvements have been made with almost magical celerity, yet with a due regard to permanence. In the early stages of mining industry, the great centres were covered with calico tents, and not a single mile of macadamised road existed. Now, the sites of these old camps are occupied by large towns, with houses of stone or brick, ornamental public buildings, and miles of paved streets, while upwards of £5,000,000 have been expended upon roads and bridges, £3,400,000 upon public edifices, and railways have been put in hand to the value of £9,000,000. During the ten years between 1851 and 1861 municipal government was extended to forty-six towns; a net-work of telegraphs was spread over 1500 miles, communicating with sixty stations; the camel was obtained to aid explorers in their task; birds of English note were introduced to share the boughs of the forest with the songless native species; and the interior of the island-world was crossed from south to north, revealing habitable lands where only a great central desert had been supposed to exist. In the same interval the population rose from 77,000 to 540,000, at first an incoherent mass of strangers gathered from different countries, apt to indulge a wild licence under novel circumstances, but gradually reduced to the dominion of law and order, which are now as strictly maintained as in an English village.

The gold produce of the colony was illustrated at the International Exhibition, in London, 1862, by a pyramidal trophy, gilt to resemble bullion. An inscription informed the visitor that this pyramid, '44 feet 9½ inches high, and 10 feet square at the base, represents the quantity of gold exported from Victoria, from the 1st of October 1851 to the 1st of October 1861, viz., 26,162,430 oz. troy, equal to 1,793,995 lbs. avoirdupois, or 800 tons 17 cwt. 9½ lbs.; equal in solid measurement to 1492½ cubic feet, of the value of £104,649,728 sterling.' The largest single masses of gold ever seen have been obtained from the Victorian fields. The 'Blanche Barkly' nugget, found at Kingover, in 1857, weighed 145 lbs., and sold for £6900. The 'Welcome' nugget, the finest of which any record exists, found at Ballarat in 1858, weighed 184 lbs., and was sold in Melbourne for £10,500.

*Melbourne*, the capital, named after the British prime-minister at the time of its foundation, is situated chiefly on the north bank of the Yarra Yarra, about nine miles above its entrance into Port Philip, following the winding river, yet under three miles overland. Large vessels come up to the mouth, but two bars obstruct further passage, except to steamers, brigs, and small-craft. The city is commercially the most important in the Southern Hemisphere, and has attained considerable magnitude, with the appearance of a place of much longer standing. It lies principally in a valley, with the extreme ends rising over two picturesque eminences, known as the East and West Hills, verging on a beautiful park-like country. The streets are regular and remarkably wide, adorned with good houses and shops, richly ornamented banks and hotels. The post-office, treasury, parliament-houses, with some of the churches and other public buildings, are of imposing architecture. Popular institutions include a Zoological Society with gardens, mechanics' institutes, theatres, music-halls, and a public library of 30,000 volumes. A university, opened in 1855, is a large building in extensive grounds, amply endowed from the colonial exchequer. Water is brought by works upon a scale of great magnitude from a distance of eighteen miles, and distributed to the private dwellings. Three daily newspapers are published, and a considerable number weekly. The population, including the suburbs, amounts to 140,000. St Kilda and Brighton are marine appendages of the capital, on the shore of Port Philip, visited for the sea-air, bathing, and occasional recreation. The important lines of railway diverging from Melbourne lead to Geelong and Ballarat, to Castlemaine and Sandhurst. The latter is in process of being continued to the frontier of New South Wales.

*Geelong*, the second town of the colony, stands at the head of a westerly branch of Port Philip, on picturesque green cliffs overlooking the waters of the bay. It contains a population of 25,000, and is a principal mart for the export of wool. *Ballarat*, of auriferous celebrity, seventy-eight miles north-west of Melbourne, has 22,000 inhabitants. But only a shepherd's hut occupied the site, built of slabs of wood,

roofed with bark, in the year 1851; and within a circle with a radius of forty miles, the population then consisted of a few sheep-farmers and their dependents, which now numbers upwards of 105,000. The town is the centre of important gold-fields, and of one of the principal agricultural districts. It furnishes the implements with which the soil around is tilled, brews its own beer, and grinds its own corn. The merchants have their chamber of commerce; the mechanics, their institute; the volunteer firemen, their brigade-house; the farmers, their agricultural society; and the gardeners, their flower-shows. *Castlemaine*, seventy-three miles on the Northern Railway from Melbourne, with 10,000 inhabitants, and *Sandhurst*, thirty miles beyond on the same line, with 13,000, are the next most advanced towns called into existence by the golden soil of the neighbourhood. Prior to its discovery their sites were only visited by a few shepherds, stockmen, and natives. The latter, in the entire colony, probably do not exceed 1500 persons. One of them figured by her handiwork at the Exhibition of 1862, as 'Her Majesty, Mary Queen Dowager of the Bacchus Marsh and Melton Tribe of Natives.' The article exhibited was a basket made of Victorian grass in her leisure hours.

## IV. SOUTH AUSTRALIA.

This province, immediately to the west of New South Wales and Victoria, has a maritime frontier on the south, and artificial lines for its inland limits, the meridians of 132° and 141° east longitude, and the parallel of 26° south latitude. These boundaries include a considerable portion of unprofitable country, consisting of scrub, sandy or stony tracts, with saline mud-lakes. But there is a sufficient range of admirably fertile soil to sustain a numerous population, chiefly situated on the south-eastern side. A coast-line of more than 1500 miles falls to the share of South Australia, owing to two deep indentations which interrupt its continuity, for the direct distance between the meridional lines which form the eastern and western frontiers does not measure half that extent. One of these great oceanic inlets, the Gulf of St Vincent, is forty miles wide at the mouth, and runs up into the land about a hundred miles in a northerly direction, gradually narrowing towards the upper extremity. It has deep water throughout, no hidden dangers, and the settled districts are chiefly on its shores. The gulf is well protected from the roll of the Southern Ocean by Kangaroo Island, which lies off the entrance, and forms with the main coast the channels of Investigator Strait and the Backstairs Passage. The former is the route of ships between Adelaide and Europe; the latter for vessels to or from Sydney, Melbourne, and Hobart Town. The island, of large size, received its name from the number of kangaroos found by its early visitors on the surface, which, never having been disturbed by man, were so tame as to allow themselves to be approached and knocked down like sheep. It was selected by the founders of the colony for their first location, but speedily abandoned for the mainland, where a tall thorny bush is now cultivated, originally confined to the island, which makes excellent hedges on the farms. Spencer's Gulf, the second opening, much more extensive, is west of the preceding, separated from it by York Peninsula. This narrow tract was only known a few years ago as a region of sheep-runs, but has now its Cornish miners developing the richness of the ores of copper.

Though without the bold mountain features of the sister-colonies to the eastward, the surface is diversified with hilly ridges and gently-undulating grounds, pleasant valleys intervening, and great alluvial plains lying at their base. A range of high lands runs parallel to the east coast of Gulf St Vincent through its whole extent, of which the principal summits are Mount Lofty, with an elevation of 2334 feet, at the back of Adelaide, with Mounts Arden and Brown, further north, each rising to the height of 3000 feet. There is no lack of stately and beautiful timber in the settled districts, generally arranged in clumps, but the want of running water is severely felt in the summer season. The Murray has the lower part of its course within the province, but the river enters it to come to a somewhat ignoble end, after a long and useful ministry. It discharges in Lake Alexandria, a vast expanse of shallow water, which communicates with the sea by a

narrow channel, not navigable, except by boats, and highly dangerous from the violence of the surf. The colony has no other permanently flowing water, rivers, or lakes. But there are numerous streams full to the brim and overflowing during the winter rains, and in most places, water is to be obtained by sinking wells to the depth of from twenty to a hundred feet, and often much nearer the surface. This spring water has frequently a brackish taste, derived from the aluminous nature of the sub-soil, not agreeable to new-comers, but there is nothing unwholesome in its quality, and after a time a predilection for it has been acquired. For nine or ten months of the year the climate is highly agreeable, the weather fine, and the sky gloriously serene. On the coldest days, which are in July, the thermometer seldom falls below 48°. Snow is unknown, and frost nearly so. A thin ice is only to be witnessed in the hilly districts, and is there a very rare occurrence. The only unpleasant season is the middle of summer. December and January, when the heat is formidable, and the north wind blows at intervals with a fiery temperature, carrying along with it particles of hot impalpable dust.

A large portion of the country is occupied for pastoral purposes, and wool is a principal export. The great plains between the coast and the range of hills at the back of Adelaide are the chief agricultural districts, where wheat of the finest quality is raised. It has been sent to the English market and shipped to Singapore, but the surplus is now absorbed by the increased population of Victoria and New South Wales. In an early stage of the settlement, when hands were few and crops were heavy, ladies and gentlemen turned out, armed with sickles and some with scissors, to save the standing corn. The military and police also formed in rank to attack the fields white unto the harvest; yet in spite of every effort many acres of wheat rotted on the ground. This led to the invention of the reaping-machine by Mr Ridley, an ingenious colonist, manufactured at Adelaide. Driven by bullocks or horses through the standing corn, it plucks off the ears, beats the grain from the husks, and winnows the produce as it proceeds. A handsome silver candelabrum was presented by the colonists to the inventor, which appeared at the Exhibition, London, in 1862. The choicest fruits are grown in astonishing profusion. Great attention is now paid to the culture of vine for wines. The vines in bearing number nearly 3,000,000, and there are about as many not yet in bearing. A thousand tons of table grapes are annually sent to Melbourne by steamer. Single bunches weighing from nine to twelve pounds are not uncommon. Though no gold discoveries of consequence have been made, the useful metals are in vast abundance. Copper, lead, iron, tin, antimony, and manganese occupy a large but unknown area, with the earthy minerals, jasper, agate, chalcodony, opal, and other varieties. Of these, copper is the most important product from its quantity and quality, obtained in the first instance more by quarrying than ordinary mining. The ores are the common sulphurets, the blue carbonate, the red oxide, and the green carbonate or malachite, of which splendid specimens have been found.

South Australia received the first band of colonists in 1836, who, after a temporary abode in Kangaroo Island, established themselves on the plains of Adelaide. They numbered about 300, and have since been multiplied to 136,000 by the successive arrival of immigrants of the steadily industrial class, with persons of capital. The governor, appointed by the crown, is assisted by two chambers—the Upper of eighteen, and the Lower of thirty-six members—all elective. The members of the Upper House are returned by voters in possession of certain property qualifications, and those of the Lower by universal suffrage.

*Adelaide*, the capital, occupies an inland site four miles from the nearest point of St Vincent's Gulf, but seven miles from the harbour, or Port Adelaide, with which it is connected by railway. In the opposite direction rises the beautifully wooded range of Mount Lofty, the highest summit of which has been stripped of its trees, and surmounted by a flag-staff as a signal-station. The city contains a population of 20,000, grouped upon either side of the Torrens, an impetuous stream in the rainy season, but a series of detached ponds through the greater part of the year. Both divisions are separated from the immediate banks by a belt of ground planted with trees, reserved for public recreation; and are further environed by a common demesne for the same purpose, called the Parklands. The town on the southern side is Adelaide proper, by far the most important section, containing the government offices and the seat of commerce, while North Adelaide consists principally of the private residences of the wealthy. These have a very beautiful appearance, furnished with verandahs covered with climbing plants, nestling in flower and fruit gardens, in which brilliantly-coloured birds sit to and fro. The city is under municipal government, and has recently been lighted with gas. The exchange, post-office, court-house, banks, churches, and chapels are highly creditable buildings. But few of the latter are supplied with clocks, and there is said to be in the country districts no church or chapel possessing an organ or a peal of bells. Norwood, Richmond, Kensington, and Islington are

pleasant suburban villages. Glenelg and Brighton are marine retreats on the coast, with good beaches. *Port Adelaide*, on the shore of a sheltered creek, is accessible to large vessels, and furnished with every convenience for shipping. Lines of rail are laid down from the principal wharves to the terminus of the city and port railway.

A northern railway, fifty miles in length, leads from the capital to *Kapunda*, the largest provincial town, a mining site and an agricultural centre. The first discovery of mineral wealth in the colony was accidentally made here in the year 1842. While gathering wild-flowers, a youth had his attention arrested by a peculiar appearance of the ground, which might have been mistaken for a tuft of vegetation from its brownish-green hue. But taking home a specimen, it was recognised as green carbonate of copper cropping out from the surface. About the same time, near the spot, Mr Dutton, a well-known South Australian, while looking after his stock, noticed an apparently moss-grown shattered rock, but was sufficiently acquainted with mineralogy to detect the metallic character of the mass. Keeping their secret, the two parties readily obtained possession of eighty acres of the ground, at the fixed government price of 20s. per acre. But at a subsequent period, wanting an additional hundred acres, they had to pay £2120 for the allotment, the quality of the land having transpired. The property has been a splendid fortune to its possessors. For the original site, which cost only £30, the enormous sum of £27,000 was offered and refused in London. *Koorinqua*, farther north, is the market-town of the Burra-Burra Mine, of world-wide notoriety for its produce. Though copper ore was here found at the surface in large masses of many thousand tons-weight, a squatter had been living and folding his sheep on the ground without detecting its presence. Upon the discovery being made in 1845, a company was formed at Adelaide for the purchase of the land. An original £5 share has since been a small independence. The table of malachite from the Burra Burra, at the Exhibition of 1862, completely eclipsed the famous Russian door which attracted so much admiration at the Exhibition of 1851. More than 1100 workmen are employed, who have attracted an agricultural and trading population exceeding 8000, all engaged in ministering to the necessities of the miners. The quantity of ore brought to the surface in the first twelve years amounted to 126,281 tons, valued at £1,712,370, which, after deducting the cost of production, yielded a net profit of 63½ per cent. For some time the miners and their families lived in subterranean tenements, which they scooped out in the sides of the Burra Creek. These cave-dwellings were made astonishingly comfortable. They frequently contained several rooms, fire-places, good furniture, neat prints, and ornaments of polished malachite, with specimens of copper ores. But they sometimes proved a snare to strangers, who tumbled into the holes which were the chimneys of the inmates. Occasionally also great floods occurred, when the stream rose high enough to enter the family mansions, dislodge the occupiers, and spoil the interior. They have therefore been abandoned for habitations in the upper air. *Kadina*, at the Wallaroo mines in York peninsula, has risen up since 1860, when the great metallic wealth of the district was discovered. The site is six miles from Wallaroo Bay, the shipping-place, connected with it by railway. Handsome stone-houses testify to the confidence of the inhabitants in the permanent prosperity of the new township. The want of springs in the district is the great disadvantage, for even the water brought up in the mines is salt, and hence recourse is had for fresh water to distillation, and the storing of the rain in tanks.

The names of pleasant villages in various parts of the colony proclaim the mother-country of the settlers. Nairne and Strathallyn recall Scotland. Wakefield, Saddleworth, and Macclesfield revive the memory of England. In like manner Klemzig, Hansdorf, Lobethal, Langmeil, the German Pass, and the Rhine rivulet indicate the Germanic origin of the inhabitants. These colonists have built their houses on the plan of those in their fatherland. They contrast agreeably with the general style. Klemzig, three miles from Adelaide, is said to be as thoroughly Prussian in its aspect as if it had been transported entire from that country.

#### V. WESTERN AUSTRALIA.

Though by far the largest colony, and the second in point of date, WESTERN AUSTRALIA, formerly called the Swan River Settlement, is the least important, having through mismanagement in the early stages of its history encountered a series of disasters which brought it into disrepute, and prevented immigration after the real difficulties had been surmounted. Recently also, or since 1850, it has been made a penal settlement; and this measure cannot fail to restrain the influx of the well-disposed, while a cause of strife between the home-government and the other colonial dependencies. The vast territory embraces the whole country between the meridian of 129° east and the Indian Ocean, 800 miles from east to west, 1300 miles from north to south, comprehending a coast-line of 4000 miles. But these gigantic proportions are merely nominal, as the greater part of the surface has never been explored, and the range of settlement is limited to a comparatively small south-western section on the Swan River and King George's Sound, where the entire white population is under 16,000.

The settled districts have no high mountains, large rivers, deep gulfs, or good harbours. Though the coast-

line has many inlets, they are all more or less encumbered with sand-banks at their entrances. Grassy downs are prominent in the general surface, occupied as sheep-runs, but some localities have poisonous plants among the herbage which are hostile to pastoral husbandry. The sameness of the downs is broken occasionally by hills of moderate elevation, yet steep and rocky, covered with magnificent woods. Timber is one of the most valuable products. It embraces the fragrant sandal-wood, and the raspberry-jam tree, one of the Eucalypti, so called from the similarity of its scent to that article of confectionary. The jarrah-wood, remarkable for its strength and endurance, defies alike the attacks of the white ant and the augur worm, and preserves from corrosion any iron which passes through it. Large quantities are therefore exported to the eastern colonies and to India, to serve for railway-sleepers, piles, and all other purposes demanding special durability under exposure to weather or water. But a considerable extent of land is under cultivation, on which grain crops, grasses, olives, and tropical fruits are raised. Over an area of at least 4000 square miles, copper and lead ores are known to be distributed in various places, and mines are successfully worked. Whales abound on the coast, and the whalebone and oil are staple exports. Horses are likewise bred for the use of the Indian cavalry. *Perth*, the seat of government, an inconsiderable town, is on the north bank of the Swan River, eleven miles above its port, *Freemantle*, where the principal convict establishment is situated. *Albany*, a mere village on King George's Sound, is the calling station of the Australian mail-steamers, having the best harbour in the colony.

#### VI. TASMANIA.

This fine and fertile island is an outlier of the south extremity of Australia, in much the same manner as Ceylon outlies the mainland of Southern India. It is separated from Victoria, the nearest adjoining province, by Bass's Strait; extends about 180 miles from north to south, by 160 from east to west; and contains an area of 22,600 square miles, less than three-fourths of the area of Ireland. The surface exhibits every variety of mountain, hill, and dale, of forests and open meadows, of lakes, rivers, and inlets of the sea, forming safe and commodious harbours, that can render a country valuable or agreeable; and being at a higher latitude than the Australian mainland, with no part distant from the sea, it enjoys a more temperate climate, akin to that of the south and south-west coasts of England, but less subject to changes. Government Hut, the highest habitation, on the central downs, is 3949 feet above the level of the ocean; Mount Wellington, at

Swan River.

the back of Hobart Town, rises 4195 feet, cloud-capped in summer, snow-capped in winter, throwing its grand shadow, as the sun declines, right across the city and harbour; the craggy greenstone peak of Ben Lomond, in the north-eastern section of the island, attains the height of 5000 feet; and Mount Humboldt, in the south-western, 5520 feet.

From the precipitous sides of Ben Lomond the streams of the North and South Esk descend, and unite to form the Tamar, which has a northerly course to Bass's Strait, where it forms Port Dalrymple. The Derwent, the other principal river, issues from Lake St Clair, on the high central downs, and flows in a south-easterly direction, entering the sea at Storm Bay. It previously spreads out into a noble estuary several miles wide, navigable by ships of the largest size. The valley of this river is remarkable for its erratic blocks, composed of cylindrical columns of basalt, confusedly heaped together, with a detritus of pebbles; and also for its fossil-trees, which appear to have been coniferous, occur exposed on the plains and vertically imbedded in rocks, with the structure of the woody tissue retained in a very perfect manner. The native vegetation corresponds generally to that of Australia, consisting of gums, acacias, mimosas, pines, and myrtles; but it is more luxuriant, owing to greater moisture. Forests not only furnish valuable timber for building purposes, but ornamental woods in great variety, among which that of the myrtle-tree is remarkable for the beauty of its veins, as well as the dog-wood, pink-wood, and musk-wood, for rich and varied tints. Coal is known to exist in large quantities, with ores of iron, copper, and lead. The indigenous animals correspond to those of the neighbouring country, but are rapidly thinning, especially those of the destructive class, being perseveringly hunted. The dingo has already been exterminated. Two species linger in reduced numbers which are formidable to the flocks—the hyena-opossum, or local 'tiger;' and an animal of the same genus, the 'devil' of the colonists, of small size, but singularly fierce, strong, ugly, and untamable. The native inhabitants are all but extinct.

The island, formerly called Van Diemen's Land, received that name from its first visitor, Tasman, the Dutch navigator, in honour of Anthony Van Diemen, the governor of Batavia, who fitted out his expedition; but posterity has appreciated the merits of the discoverer, by substituting a denominative derived from him for the one referring to his patron. Criminals, with their guards, formed the first white population. They were sent out from Sydney in 1803. Successive batches of the same class arrived from the mother-country, many of whom, upon the expiry of their sentences, spread themselves over the interior. Military officers serving at the station also settled on grants of land, and free emigrants poured in, invited to the island by the fineness of the climate, the fertility of the soil, and the beauty of the landscapes. In 1825 the settlement was released from its connection with New South Wales, and declared to be an independent colony; and in 1853, after an existence of half a century, transportation to its shores ceased, owing to the determined opposition of the colonists, who formed a numerous, intelligent, and wealthy community. Tasman's Peninsula, a tract of singular conformation, at the south-east extremity of the estuary of the Derwent, was devoted to the more desperate criminals, admirably adopted to keep them in durance. It is surrounded on every side by the sea, except at the connecting isthmus of Eagle Hawk Neck, a narrow natural causeway, where a military guard was stationed, strengthened by a chain of dogs, to bar all egress and ingress. In the vicinity of the isthmus is Tasman's Arch, a bridge of nature's construction, spanning a deep chasm open to the sea, in which the surf thunders, and throws its spray high into the air in tempestuous weather. The peninsula terminates to seaward with Cape Pillar, an abrupt basaltic rock, whose tall upright columns bear a resemblance to the pipes of a huge cathedral organ.

At the time of its first colonisation by the whites there were a few thousands of natives, of the same race, language, and habits with those of Australia. In 1830 an attempt was made by the government to capture them, with a view to their protection and preservation, but it was not successful. At length the survivors surrendered in despair, and were humanely treated, fed, clothed, provided with medical aid, and established in Flinder's Island, as a suitable location for them. In 1835, the epoch of their deportation, they numbered 210 persons; in 1842 these were reduced to 54; and in 1848 to 45, consisting of thirteen men, twenty-two women, and ten children. The unfortunates were then removed to a station at Oyster Creek, on the south-east coast of Tasmania, prepared for them by the colonial authorities, where they had dwindled down to eight persons by the close of the year 1861.

The colony of Tasmania is divided into counties, rural municipalities, and police districts. It contained in 1861 a population of nearly 90,000, chiefly engaged in

agriculture, but wool is raised for export, and the whale-fishery is prosecuted with great spirit all the way to the Antarctic Ocean. Public interests are superintended by a governor, a legislative council, and house of assembly.

*Hobart Town*, the capital, contains 19,000 inhabitants, and is conveniently situated on the right bank of the Derwent, about twelve miles from the sea. The harbour is easy of access, well sheltered from all winds; and the scenery of the neighbourhood is very striking. The range of Mount Wellington, bristling with fine trees and underwood, forms a grand background to the town, close in its rear, wearing a winter diadem of snow. An ice-house is established near the summit. Mount Nelson, nearer the sea, is a signal-station commanding a delightful view of isles, isthmuses and peninsulas, wooded and cleared uplands, the river, the harbour, and the town, with the numerous villas in shady seclusions which form the suburbs. At the chief telegraph-office a blue flag is hoisted when it is known that the English mail has arrived at Adelaide. The sailing distance from Melbourne is about 300 miles, from Sydney 800, and from Adelaide upwards of 1000. A Parliamentary Library, of 7000 volumes, is open to the public on the order of members during the recess. *Launceston*, at the head of the estuary of the Tamar, contains a population of 10,300. It forms a kind of provincial capital for the north division of the island, and as the nearest port to the Australian mainland it is much used for commercial and passenger intercourse with the other colonies. The two towns, 121 miles apart, are connected by an excellent turnpike-road, which is traversed by stage-coaches in well-appointed style. This is the main artery of the country, leading through the best part of it from south to north, and passing by or near some oddly-named places, Brighton and Bagdad, Jericho and Jerusalem, the Jordan and the Styx.

Tasmania, in its longest settled and most cultivated districts, has perhaps a more thoroughly English aspect than any of the other foreign possessions of the empire. There the fruit-trees, shrubs, plants, and flowers of our temperate clime, to which the heat and aridity of Australia are fatal, or which can only be raised as impoverished specimens, thrive luxuriantly, owing to the cooler air and moister soil, and seem to benefit by the transportation. Broad patches of the scarlet geranium colour the landscape; hundreds of yards of fuchsia bloom; hedges of sweet-brier appear in the town-gardens and country enclosures, decked with delicate roses; closely-clipped mint-borders supply the place of box; the hawthorn, only known to the Australian as a rare exotic, forms impervious fences upwards of twenty feet high; and to the casual English visitor the yellow gorse upon the downs looks like home.

Hobart Town.

The Punice Hills, New Zealand.

## CHAPTER IV.

### POLYNESIA.

#### I. NEW ZEALAND. II. MINOR ARCHIPELAGOES.

OLYNESIA, 'Many Islands,' is simply a term of convenience used to denote the insular tracts of Oceania, eastward of those occupied by tribes of dark aborigines. They are inhabited by a race of brown complexion, allied in features to the Malays, who speak dialects analogous to their tongues, and are hence frequently styled Malayo-Polynesians. With one prominent exception, these islands are separately small. They vary in their aspect and structure from the mountainous and volcanic to the low and coralline; are arranged in groups and chains; and are most numerous in a belt of the South Pacific, between the parallel of  $10^{\circ}$  and the southern tropic. But the exception referred to, or New Zealand, lies considerably apart from these limits, and probably embraces in itself an area nearly equal to twice the

aggregate of the remainder.

#### I. NEW ZEALAND.

The British colony of NEW ZEALAND consists of three principal islands, the North, the Middle, and the South, arranged in a curving chain, situated between latitude  $34^{\circ} 15'$  and  $47^{\circ} 30'$  south, and extending in longitude from  $166^{\circ}$  to  $179^{\circ}$  east. They are about 1200

miles to the south-east of Australia, nearly midway between the Cape of Good Hope and Cape Horn, and make a close approach to the antipodes of the United Kingdom. Estimates of the area by recent authorities are considerably higher than those formerly given. The Middle Island, much the largest, is supposed to contain 72,000 square miles, and forms a tolerably regular oblong. The North Island, separated from it by the noble channel of Cook's Strait, is the next in size, embracing 42,000 square miles, and is remarkably different in its outline, being singularly torn and contorted. The South Island is comparatively very small, and wholly unimportant. Following the sinuosities, the shores have a total length of not less than 4000 miles, and exhibit a succession of bays, creeks, coves, and estuaries, adapted to form some of the finest naval and commercial harbours in the world.

Essentially of volcanic formation, the interior is largely a highland country. It contains many extinct craters, surrounded on all sides with scorie, bearing witness to fiery explosions in bygone times. They are specially prominent in the North Island, where the still active volcano of Tongariro, towards the centre, rises to the height of 6000 feet, but is overtopped by its quiet neighbour, Mount Ruapahu, which, being crowned with perpetual snow for some distance from the summit, has probably an elevation of 9000 feet.

Loftier mountains are in the Middle Island. Warm lakes and pools, with springs in a state of ebullition, forming beautiful geysers, sending off clouds of steam, are further evidence of the existing action of subterranean heat. Earthquakes are likewise of frequent occurrence; but though occasionally alarming, they have not been calamitous during the term of colonial experience, nor do the natives appear to have any tradition of destructive visitations. Broad valleys are associated with the highland ranges, but long, narrow, and deep sequestered dales are far more general, with which grassy plains are at intervals intermingled. Valley, dale, and plain are alike amply irrigated with river, brook, or rill, running in currents of the clearest and softest water over pebbly beds, not unlike the trout and salmon streams of England and Scotland. The native vegetation includes dense and extensive forests of evergreen trees, supplying serviceable timber. Some species flower abundantly in summer, and, with their dark-green massive foliage, render the forest scenery strikingly beautiful. Native flax, obtained from the fibres of a large leaf, forms a valuable substitute for hemp and real flax, and is a material for cordage and canvas. The woods are remarkably still, as the indigenous forms of animal life are extremely limited, both as to species and individuals, not only in relation to quadrupeds, but to birds and even insects. No venomous reptiles are known. Hares, rabbits, fallow deer, pheasants, partridges, and some song-birds have been introduced; and rewards are offered by an Acclimatisation Society for the further import of healthy pairs of black-birds, thrushes, skylarks, and others, not forgetting the cuckoo. Coal of good quality is widely distributed; gold to an important amount is obtained from the Otago diggings; iron, lead, tin, copper, are known to occur; but agriculture, sheep, and stock-farming have hitherto proved so advantageous to the majority of the colonists, that the mineral stores beneath the productive surface have been only feebly illustrated. Ranging through a considerable extent of latitude the climate varies, being warmer in the far north than in the south, but it is exempt throughout from the extremes of heat and cold, bracing and salubrious. Heavy rains distinguish the mid-winter in July on the plains; snow falls plentifully among the hills; and boisterous winds are more prevalent throughout the year than in England, though not more violent, while the fine days are more numerous.

The colony comprehends nine provinces, and contains a white population of nearly 200,000, rapidly augmented during recent years by the influx of gold-diggers from

**Australia.** It is under the jurisdiction of a governor appointed by the Crown, with a nominated legislative council of twenty-four members, and a house of representatives of fifty-three elected by the people.

New Zealand was discovered by Tasman in 1642, who seems not to have landed, but merely to have seen and named the north extremity. Captain Cook, in 1770, went round the islands, illustrated the shores with great accuracy, and passed through the strait which bears his name, taking possession of the territory for Great Britain. An aged native, recently alive, had a distinct remembrance of the landing of the great navigator in Mercury Bay. About the year 1814 the Church Missionary Society established a station on the east coast of the North Island, favoured by various chiefs. Under similar protection, in 1822, the Wesleyans established themselves on the west coast; and in 1839 a Colonisation Society was formed in London for the purpose indicated by the name. But in 1840 a treaty was concluded with the native chiefs, by which the sovereignty was ceded to the British Crown, while full possession was guaranteed to them of their lands and forests, so long as they desired to retain them. In the following year New Zealand was proclaimed a British colony.

| " "            | Southland,   | Invercargill, Campbell Town.      |

*Auckland*, the seat of government, is the largest and best built town, lighted with gas, and containing a population of 8000. It has a completely landlocked harbour, studded with islands of various size and form, with a main shore broken by numerous deep bays and projecting headlands. A regular mail-service by a powerful steamer is established with Sydney, and coasting steamers leave the harbour at stated times for the southern settlements. Picturesque spots in the suburban district are occupied by neat-looking private houses. For some distance the ground has been thoroughly cleared for cultivation, or laid down in permanent pasture; and owing to the removal of trees of foreign aspect, the country has all the appearance of a home-like English landscape. In every direction may be seen grass and clover paddocks, not divided by temporary posts and rails, but substantially fenced with stone walls or hedges of whitethorn and furze. The soil is volcanic. Not less than from twenty to thirty extinct craters are in sight from the town; but only of very moderate elevation. The port is supplied with everything requisite for the refitting and victualling of ships; but on account of some local disadvantages, chiefly the position towards the north extremity of the colony, it is understood that a more central town will be selected for the capital. The province contains Albertland, recently constituted a special settlement of Congregationalists. *New Plymouth*, on the coast, is small and rustic-looking, snugly planted on the margin of the beach, but lacks the accommodation of a harbour. The snow-crested Mount Egmont, rising to the height of 8000 feet, is a grand object in the vicinity. The province contains by far the greater part of the native population. *Wellington*, the oldest established settlement, is seated on the fine inlet of Port Nicholson. It contains good shops and warehouses, banks, clubs, building societies, a chamber of commerce, and communicates with the neighbouring district by roads equal to any in the mother-country.

*Nelson*, on the northern side of Middle Island, is situated on a sheltered harbour, almost a lake, at the bottom of an inlet called Blind Bay, and has a population approaching to 4000. Protected from rough winds by a semi-amphitheatre of lofty mountains, the climate is charming and the scenery picturesque. A cathedral-looking church, prominent over the white wooden houses, with nursery-grounds, hop-plantations, and patches of vineyard in the environs, are pleasant features of the place. The town is the seat of a copper-mining company, whose mines are on the Dun Mountain, reached by a tramway of twelve miles, which ascends to the height of 4000 feet. A good macadamised road, between a growth of tall hedges, leads to Richmond, which boasts its 'Star and Garter' equally with its namesake in England. *Christchurch*, some miles inland from its port town, *Lyttleton*, contains about 5000 inhabitants, and has accommodation for a much greater number. The Canterbury province, of which it is the head, occupied by the first batch of settlers in 1850, was intended to be strictly a Church of England territory. But in a very short time it was found necessary to abandon the principle of ecclesiastical distinction, and admit all parties irrespective of their religious profession. The town stands on either side of the Avon, the banks of which are lined with bulrushes of enormous growth, and high tufted grass, with which the flax-plant intermingles. The stream is beautifully clear, and abounds with fish. *Christchurch* rapidly assumed a good and stirring appearance, put up street-lamps, provided cabs, established iron-foundries, an agricultural implement manufactory, a pottery, brick-yards, nursery-grounds, and well-stocked shops. *Dunedin*, founded by members of the Free Church of Scotland, is about twelve miles distant from *Port Chalmers*, so called after their illustrious divine,

the leader in the Free Church movement. The two towns contain between them upwards of 7000 inhabitants. A great impetus was given in 1861 to the province in which they are situated, Otago, by the discovery of gold-fields, which have been very profitably worked.

The New Zealand aborigines, or the Maories, as they style themselves, were fierce savages in the early stages of European acquaintanceship with them, and many retained that character down to a recent date. They drank the blood of their enemies as it flowed

Boiling Lake of Rota Mahana, New Zealand.

on the battle-field, and feasted with avidity upon their dead remains baked in ovens scooped in the earth. The last known instance of cannibalism occurred about the year 1843, in the case of Taraia, an old chief, who subsequently abandoned the barbarism of his ancestors, and cultivated friendly relations with the whites. A large proportion of the natives have more or less adopted the habits of civilised life, and till the soil according to European methods, bringing the produce to market as regularly as the peasants of other lands. The men are tall, muscular, and well proportioned. They vary in colour from olive to dark brown, have glossy black curling hair, and are not unlike burly, well-bronzed gipsies. The women are generally inferior. Marrying early, and performing a large amount of field-labour, they soon become bent, are old at forty, weird and witch-like at sixty. Extremely sensitive on all points affecting their personal consequence, and doubtless often justly aggrieved, while mistaking the intentions of their neighbours, the Maories have signalled their independent spirit and bravery by a series of bloody and sometimes perilous wars with the colonists. They are nearly all now in the North Island, and number about 56,000, but are rapidly diminishing, and seem destined to extinction as a pure stock, being represented only by a race of half-breeds. If ever the historic vision is realised, of a New Zealander sketching the ruins of St Paul's from a broken arch of London Bridge, it may be confidently predicted that he will have Anglo-Saxon blood in his veins.

The New Zealand region includes several insular groups and solitary isles. Eastward, at the distance of about 350 miles, are the CHATHAM ISLANDS, enumerated as a colonial dependency. They were discovered by Lieutenant Broughton, in 1791, in the brig *Chatham*, and are visited occasionally by sealers and whalers. The islanders numbered upwards of 1000 harmless natives in 1830, but have since been brought to the verge of extinction by barbarous aggression from the New Zealanders. ANTIPODES ISLAND is on the south-east, discovered by Captain Pendleton in 1800, and so called from being the nearest land to the antipodes of Greenwich. It is in latitude  $49^{\circ} 40'$  south, and longitude  $177^{\circ} 20'$  east. The AUCKLAND ISLANDS, on the south, are entirely volcanic, of wild appearance, but densely clothed with vegetation, and are valuable as a whaling station for the purpose of refitting and refreshment. They were discovered by Captain Bristow in 1806, who introduced the domestic pig, now found wild in great numbers. The Antarctic Expedition under Sir James Ross, in 1840, added sheep and rabbits to the live-stock; and several kinds of edible vegetables. A permanent settlement was commenced by a whaling company in 1849, but was subsequently abandoned.

#### II. MINOR ARCHIPELAGOES.

1. Friendly Islands. 2. Samoan Group. 3. Austral and Cook's Islands. 4. Society Islands.
5. Low Archipelago. 6. The Marquesas.

These groups are included between the meridians of  $130^{\circ}$  and  $175^{\circ}$  west, and occupy the southern part of the torrid zone. They have therefore a hot climate, but it is seldom oppressive, and generally salubrious, as the high temperature is modified by a vast expanse of ocean on all sides, and exposure to the sea-breeze. The natives are a branch of the Malay family; have pleasing features, are naturally intelligent, and expert in various domestic arts; have learned English, and been taught the rudiments of general knowledge. Yet, notwithstanding the check put by the change upon infanticide and murderous wars, formerly prevalent, their numbers have greatly diminished from the introduction of foreign diseases. The indigenous vegetable productions include tree-ferns and esculent roots, the cocoa-nut and coral-tree, the bread-fruit, plantain, and pandanus, while the sugar-cane, tobacco and cotton plants, with all tropical fruits, flourish in the islands to which they have been introduced. When first visited by Europeans, no quadrupeds were seen but the dog and hog; and no reptiles are known but a harmless kind of lizard. Annually, in certain strictly-defined and limited localities, in the seas close to the shores, the annelidan, *Palolo viridis*, appears in prodigious numbers, under the government of some mysterious law. These gelatinous creatures are seen with the early dawn, and vanish soon after sunrise. The natives are on the look-out for them in their canoes, as the annelidan is a prized delicacy, is eaten by them raw, and held as the Italians do their macaroni. At certain periods also, generally at the full and change of the moon, the land-crabs march out of the bush in myriads to take a dip in the sea, and crawl back again, unless captured on the way, as they likewise are relished fare. Hurricanes are of frequent occurrence, as well as earthquakes, but only the former are experienced with destructive effects.

The FRIENDLY ISLANDS, intersected by the meridian of  $174^{\circ}$  west, are immediately east of the Fiji cluster. The name originated with Captain Cook, and arose from the hospitable bearing of the natives. They are frequently styled the Tonga group, from the principal member of the Archipelago, Tongataboo, or Sacred Tonga, which is about twenty miles long, by ten wide in the broadest part, and nearly a dead level. Others are high and of volcanic origin, but the majority are coralline. One has an active volcano. Including those of the small class, there are not less than 180 islands, but only about thirty are inhabited. The natives are almost all Christians, united under the government of a Christian chief, King George. They are deemed the flower of the Polynesian race. Admiral Wilkes, the American commander, affirmed that there were few spots on the face of the earth where such a number of handsome people could be seen together as in Tonga. The men are tall, have fine intelligent features, and are of a light-brown complexion.

The SAMOAN, also called the NAVIGATORS' ISLANDS, are on the north-east, and received the latter name from Bougainville, who considered the canoes of the natives of superior construction, while very dexterously handled. But in neither respect is any special distinction warranted. There are four principal islands, with many of smaller size, hilly and volcanic, fertile and beautiful. Savaii, the largest, is forty miles in length by twenty in breadth. Another, Tutuila, has Massacre Bay upon its shore, where eleven officers and men of La Perouse's expedition perished in 1787. An outlier of the group has the ominous name of Danger Island. Here, upon a coral-reef, the missionary ship, *John Williams*, built at Harwich, was totally wrecked, in May 1864, after eighteen years of active service. Population of the group about 56,000. The Samoan islanders

are under the government of confederate chiefs. They are largely Christian converts, contribute to sustain many chapels and schools, with a printing-press and an institution for the training of native teachers. The natural history includes a rare bird, *Didunculus strigirostris*, of dodo-like form. It is one of the pigeon family, with very brilliant dark-blue plumage, nearly extinct, owing to the cats which are now wild in great numbers on the mountains.

COOK'S ISLANDS, a somewhat scattered series, named after the great navigator who discovered them in 1773, are under a more easterly meridian, all lofty and volcanic, but of inconsiderable size. One of them, Rarotonga, was for many years the mission-station of Williams; where he officiated as preacher, teacher, husbandman, builder, and blacksmith, ready for all work likely to be useful. The AUSTRAL ISLES, on the south-east, have the name from their position under the line of the southern tropic. They are insignificant specks with a scanty population, but one of them, Toobouai, surrounded by a coral-reef on which the surf beats violently, is of interest from its temporary connection with the mutineers of the *Bounty*. This vessel was despatched to Tahiti in 1787, under Captain Bligh, in order to obtain plants of the bread-fruit tree, and other vegetable productions of value, for introduction to the West Indies. During a stay of eight months, the greater part of the crew became demoralised, and resolved on mutiny. After turning the captain and officers adrift in a boat, who, by singular good-fortune reached the Dutch settlement at Timor, the mutineers made their way to Toobouai, but were finally obliged to quit it by the hostility of the inhabitants. Returning to Tahiti, some of them settled there, but in a few years were apprehended by the British government. The rest, accompanied by a number of native men and women, sailed away, and no account was heard of them for nearly twenty years, when obscure reports were circulated of their existence in PITCAIRN'S ISLAND.

This spot, very small and solitary, far to the eastward, was first sighted by a young officer of the name of Pitcairn, on board Captain Carteret's ship, the *Swallow*, in 1767. It appeared like a great rock rising out of the sea, covered with trees, but without any appearance of inhabitants. The surf, which broke with great violence on every side of it, forbade a landing. Here the remnant of the mutineers sought a retreat under the guidance of a leader more intelligent than the rest. It was well adapted for their purpose; approach was difficult; it was not occupied; there was a supply of fresh water; and the trees shewed it to be fertile. They found indeed everything which could well be desired from external nature, and, after many social vicissitudes, gradually became a remarkably moral and respectable set. Their islet, of volcanic formation, only two miles long by one broad, having become too confined for their growing numbers, their descendants were removed by the British government, with their own consent, to Norfolk Island, as a more convenient location. There they retain their uniform virtuous behaviour, and the primitive simplicity of their tastes and habits; have a chaplain, schoolmaster, and chief-magistrate; and numbered 268 souls in 1861, when they were visited by Sir John Young, the governor of New South Wales.

Island of Tahiti.

The SOCIETY ISLANDS, named by Cook in honour of the Royal Society, and the adjoining GEORGIAN ISLES, are north of the Austral series; and are now commonly called, the former the Windward, and the latter the Leeward Islands. They are the most frequently visited of the groups in the Pacific by Europeans and Americans, and since 1842 have been French possessions. Tahiti, the largest, has a circuit of 140 miles, and contains about 600 square miles. It consists of two rounded peninsulas united by a narrow isthmus, and has a highly-diversified surface, towering to the clouds in the majestic peak

Thus, by the nearest route at present followed, via Suez, New Zealand is placed at an artificial distance from England nearly 2000 miles greater than by the way of Panama; and the eastern Australian colonies share to a smaller extent the same disadvantage. The latter route departs very slightly from a perfectly straight line. On the Pacific side of the Panama Railway it leads through seas which are familiar to English navigators, where the winds are moderate, the temperature is pleasant, and adverse currents have not to be encountered. As every year is adding largely to the population of the antipodal colonies, and increasing their commercial connection with the mother-country, there can be no doubt that the shortest thoroughfare will ultimately be traversed.

The Aurora Borealis as seen in very High Latitudes.

(This Cut was accidentally omitted at its proper place.)
