We think the city authorities who have destroyed the tower of St. Benet's Church should be obliged to rebuild it exactly as it was before, and if not on the same site, that the tower should be carried beyond the present altar of the church and be there built, its lower part being added to the interior of the church as a chancel, around which could be placed the present finely-carved wainscot altar-piece: and we think the outside of the church should be restored and completed exactly as it was, and a new receding doorway like the former one should be made at the west end of the fabric.

We strenuously hope that the Bishop of London will enjoin these things, and will by

\* There are in the Royal Library in the British Museum some drawings of this church.

no means listen to the wretched project of destroying a crumb of what its greatest benefactor built for the adornment of the city.

If the steeple be rebuilt, it will shew pleasantly in the general north-west views of the Exchange; and let the citizens, who are proud of their steeples, remember that already their city has within a few years lost three of its church towers within half a mile of each other.

ft.

#### ON PAPER-HANGINGS.

BY MR. COWTAN.

*Read before the Decorative Art Society on the 9th Instant.*

AMONG the many articles of British manufacture that lay claim to our attention, few are of more importance than that denominated "Paper-hanging," and few have received less of the requisite care and study. Not only is it of importance in a commercial point of view, but it must be considered in some sort as a vehicle for the advancement and encouragement of the fine arts of the country.

The art of ornamenting the walls of apartments has been in use from a very distant period; among the ancient Egyptians the pictorial representations on the walls of their tombs may lead us to suppose that their houses were decorated in a similar manner. Among the Greek settlers in the south of Italy decorating the interior of their houses was paid great attention to; and the ruins of Pompeii and Herculaneum attest that the art was highly cultivated there: some of these designs, though wanting in artistic skill, yet possess remarkable brilliancy of colour. The houses of the rich patricians of Italy present numerous specimens of beautiful decorations; and the arabesques of Raffaello, and the rest of the Roman school, are perhaps the finest productions of this kind in the world.

Tapestries, as coverings to walls, were in great use for many centuries in Europe, and among the Eastern nations were known at a very remote period. Most tasteful and beautiful designs were employed in their manufacture; and the refined taste of Athens, and the talents of the first Italian artists, were called into requisition to furnish models from which to work these patterns; and those invaluable cartoons of Raffaello at Hampton Court, shew us how particular they were to procure the best designs and finest specimens of art to decorate and ornament their walls, a strong contrast with the character of taste of the present day, which is content with the productions of inferior artists whose taste and judgment have never been properly cultivated, and, except in some few instances, are totally deficient in those principles of true art which have been the study and direction of all who have arrived at excellence; and without a knowledge of these principles, no manufacture in which taste is required will ever reach even the length of mediocrity.

The capabilities of paper suggested the idea of applying it to the purposes of hangings for rooms, and though it has only been in use for little more than a century, it is nearly two hundred years since it was first applied to that purpose; and it has been used as a substitute for almost every other species of decoration. The varieties of subjects imitated in paper-hangings are very comprehensive, and successful attempts have been made to adapt them to the representation of architecture, sculpture, and painting, as well as arabesque designs, ornaments, and flowers. At first the aim seems to have been directed to imitations of tapestry, and to produce this a material called flock was employed, a kind of woollen cloth chopped small with a machine, strewed lightly with the finger and thumb over the paper, on which a pattern had been previously drawn with fat oil or varnish, and the different colour and tints being carefully blended, an appearance of tapestry was thus obtained. This method is said to have first originated in England, and was invented by Jerome Langer, who obtained a patent for it during the reign of Charles I., dated May 1st, 1634. We find, however, according to an old French work that a manufacture of this kind was carried on at Rouen some ten or fourteen years previously by a man named François, who was succeeded by his son, and who continued the business for fifty years after with great success. Originally the material was of an extremely coarse description, and

the flock projected considerably from the paper. At Hampton Court specimens of the early productions may still be seen, mostly painted over in distemper, but the pattern can be distinctly traced. I have been enabled to procure a specimen of flock-paper which I am assured is not less than 110 years old; in this the surface is very coarse, although a great improvement upon the older fabrics.

In the reign of Queen Anne, paper-hangings were largely imported from China, and continue in fashion down to the present day. These hangings, though the outlines may be executed with stencils, are almost wholly done by hand, the colours of which are very rich and brilliant, exceeding in beauty almost anything we can produce in England. Dr. Ure states that the idea of paper-staining was borrowed from the Chinese, among whom it has been practised from time immemorial. It is curious to observe how systematically the Chinese have adhered to the same patterns and devices to be seen among the earliest drawings of that remarkable people; we do not find the least advancement from the remotest period to the present time.

Mr. Jackson, a manufacturer of paper-hangings at Battersea, published in the year 1754 a work on the invention of chiaro scuro, and the application of it to paper-hanging, with prints in illustration. This book was probably used as a sort of advertisement of his own manufacture, and contained many just and well-sustained remarks, shewing a cultivated and well-directed taste. He proposed, instead of adhering to the old system (for it seems that paper-hanging had reached some degree of perfection even then), to employ subjects of more interest than the mere repetition of flowers and ornaments, which prevailed so much, that instead of being a principal, as they were, they should be merely an elegant auxiliary to designs of more dignified character; as, for instance, copies of the most celebrated classic subjects, statues, and landscapes; he remarks, "that the persons who could not purchase the statues themselves, might have these prints in their places, and thus gratify the taste of the possessor, which is not seen in the expense of the article, but in the selection."

In speaking of the vulgar and gaudy patterns, frequently selected instead of tasteful and harmonious designs, he says, "Persons who prefer the unmeaning paper so generally met with to those done in this style, would prefer a fan to a picture of Raffaello, Carracchi, Guido, or Dominichino; and those who choose the Chinese manner ought to admire, in pursuit of the same taste, the crooked, disproportioned, and ugly, in preference to the straight, regular, and beautiful."

It is by this very means of ill-judgment in furnishing apartments that the true taste of the person is unthinkingly betrayed; those little and seemingly distant things offer the clue which leads to discovering the whole mind, and undoes perhaps all that character of being a true judge of the polite arts which they are so fond of establishing. It seems impossible that any mind truly formed can, without distaste, be capable of letting such objects in upon it through the eye; where the internal senses are well-proportioned and just, these monstrous objects of the external must be displeasing and offensive. In that breast where the softer sensations of humanity are in any particular degree, the love of beauty generally accompanies them, and the approbation of natural objects is the proof of these sensations existing in an individual, as the contrary taste is of the ill-formation or perversion of that mind which approves of preternatural appearances; there is a close analogy between the love of beauty in external objects and a mind truly disposed to the feeling of all the softer and most amiable sensations.

The prevailing unfounded idea that the English, as a people, are inferior to other nations in the talents for artistic design and invention, are, I am very glad to observe, fast being overturned by proofs that we are quite as capable, and in some instances more so than the artists of other countries, of producing designs of exquisite taste and workmanship. And I may here mention that the encouragement given to the art of design by the rebuilding of the Houses of Parliament, is in every way praiseworthy, and will give an impetus to native art it has never received since the days when the royal patronage was

displayed on the very same spot, during the reign of Henry III., six centuries ago. It is sometimes necessary to bring to the recollection of those cavillers at British talent that, in many of the arts of design, we have far outstripped our contemporary brethren on the Continent. Among our early Saxon progenitors we find that they attained to higher proficiency in the art of MS. illumination than any Continental school. It is proved by early record that painting in oil was practised in England 200 years before the time of Van Eyke, who is called the inventor of it. And it is well known that until lately the French were far inferior to us in ornamental work. Why, then, do we now find that we are obliged to confess their superiority in this branch, when we know that patterns of paper-hangings (and I have myself seen them) exist, manufactured sixty years ago, equal, if not superior, to those executed in France at the present day? Several of the blocks used in the production I have also seen, and their beautiful workmanship far exceeds those in use for present purposes.

It is true that until within the last ten years a noxious tax, imposed during the time of Queen Anne, weighed down the spirit, and clogged the energies of the manufacturer; but the want of a proper national school of design was the grand evil, and kept in embryo the latent genius of English youth. These difficulties, it is pleasing to notice, are fast being overcome; and I hope soon to find our English name, proud as we all are of it, spoken of, not only as retaining its ancient glory, but being a pass-word to all other nations for all that is *talented and tasteful*, as well as for all that is noble and honourable.

About the year 1786, a Mr. Sherringham threw a new feature into the manufacture of paper-hanging. This gentleman, who had spent many years on the Continent, returned about this time to England, and established a business in Great Marlborough-street. His enterprising spirit and refined taste led him to engage a number of artists of first-rate ability—such men as Jones, Boileau, La Briere, and Fuzili; he was thus enabled to infuse into the art a style which for beauty and grace was unequalled before, nor has since been surpassed. Sherringham's productions were indeed characteristic of the true principles of art. From this establishment emanated the leading decorators of the present day, and the first houses in London built their fame upon the foundation he had constructed. Sherringham was, indeed, the Wedgwood of paper-stainers.

About this time the Messrs. Eclardt, who had a manufactory at Chelsea, produced designs of most exquisite workmanship. Besides the mode generally in use, they adopted a method of applying engraved copper-plates, to form the outlines, and by an underground of silver and gold, worked up by hand in varnish colours, effects of the most beautiful kind were obtained; they were highly illustrative of the ability of the English talent when properly applied. Their well-directed taste, their eager desire to advance as much as possible their undertaking, their steady endeavour to adopt only the most beautiful patterns, and their determination to get them up in the best manner, are lessons for some of our modern paper-stainers which it would be well for them to take to heart and learn, for they not only depreciate their own taste by producing, as in many cases they do, patterns which they are almost ashamed of when finished, but the character of the country suffers, and they lose the opportunity of improvement, while they prevent in a great measure the encouragement that would otherwise be bestowed.

The establishments of these gentlemen, though conducted with laudable spirit and enterprise, were destined to sink as they had risen; and the spirit of emulation ended with them.

From that time paper-staining in England kept on in its trodden path without much improvement, and without increasing taste. The French took up the ground that we had left, and their manufactures were in every way encouraged by the government of Napoleon, and they reached that standard of perfection their industry and perseverance so richly merited. But it is true, while speaking of the ability of the French in comparison with ours, and of their continuing in the road we had prepared for them, they had no such difficulties as we to contend with. While a heavy tax was laid on our productions, theirs were entirely free;

while their government gave them every facility, we had to fight our battles singly, and at our own hazard; while they had the best designs of great and illustrious men continually before their eyes to improve, and, in fact, create a taste, we were without any advantages of the kind, and had to depend solely upon our own resources.

Academies were instituted in France at which every branch was cheaply taught—our School of Design has only been in existence a few years. Still, with all these difficulties and drawbacks, we have kept on amazingly, and improvements from time to time have been issued, particularly among the minor branches of the art, which were formerly in a very low and wretched state.

I trust that our time has not been ill-spent in speaking of what our trade has been in comparison to what it is now, and how much is yet required to be done. To urge, that the example of those who have erected their temple of fame almost upon the ruins of ours should cause a spirit of inquiry into the means to be employed in attaining our lost position. It is not for me, as an humble individual, to point out any project by which this great desideratum is to be accomplished. The increasing facilities which we are every year receiving, and the attention that seems devoted to the fine arts at the present day, should also be an inducement to draw some important attention to the systems of improving paper-hangings in England.

If we cast our eyes towards the French, as our principal competitors, we find that the methods in practice here are precisely the same as they have in use; that in the mechanical branches we are superior, and the colours we employ are far more durable; that at one time we equalled their productions of the present day, and the only difference that exists is our want of proper artists, and of course the want of proper instructors to educate them for the profession. While they employ (as did our former manufacturers) men who understand the principles of design and the harmony of colouring, and who make it their aim to unite every beauty with taste and cultivated judgment, we throw all this important branch upon persons who, to gain a scanty living, require to unite the two professions of designer and dealer in block-cutting. It is not to be expected but that those men will throw off a number of patterns of most inferior quality; they cannot be supposed to pay the attention which is required to produce good work, nor have they ever had the means of educating themselves sufficiently to enable them to equal work which is the result of careful and indefatigable study and practice. This shews a great want of encouragement on the part of the English manufacturers that we must hope to see remedied. The designer in England is not deemed the man of talent—the man of genius—who is looked up to as possessing great and superior abilities, whose refinement of mind ensures him respect and honour wherever he goes;—no, he on whom the manufacturer depends for his success in trade—he on whom devolves the important task of creating from his practice or mind beautiful forms and elegant combinations, it is a melancholy fact, is paid less for his labour than the mechanic that is merely employed to print the pattern after it is prepared to his hand, who has no necessity for thought, nothing but that which is within the power of common animal strength to exert.

#### NEW METROPOLITAN BUILDING-ACT.

The Examiners appointed to grant certificates of qualification for the office of District Surveyor, have issued a notice, dated the 15th inst., to the effect that they are prepared to receive applications from persons desirous of being examined.

The last day for receiving preliminary statements for the present examination will be the 6th day of November next. Subsequent examinations will be held in the months of January, April, July, and October. The notice is signed Arthur Symonds, Registrar of Metropolitan Buildings.

MERSEY AND IRWELL NAVIGATION.—It is said that Lord Francis Egerton intends to approve the Mersey and Irwell Navigation, so as to admit sailing vessels of 200 tons, or iron steamers of 400, up to the town of Manchester.

#### THE WELLINGTON STATUE AT GLASGOW.

The inauguration of this statue took place on Tuesday, the 8th inst.

The pedestal, which is of Peterhead granite, is 8½ feet high. On this the statue is placed, resting on a floor of bronze. The horse is the work of a bold and masterly hand. The animal has just come to a state of repose, and seems as if listening to some distant sound. The head is that of an Arab, with the broad forehead and wide nostrils, and is standing with fore-feet a little in advance, in an easy posture, the reins lying slack. The position of the duke is that of a general reviewing his troops. The likeness is taken when the duke was in the prime of life, and the artist has avoided the very general fault of caricaturing the features. The likeness has been declared by his grace's brother, Lord Cowley, to be perfect. The hero is dressed in the full uniform of a field-marshal, with his different orders, the whole being most life-like and beautifully executed.

The bas-reliefs are the most wonderful pictures we have ever had the fortune to look upon. They are placed on the south and north sides of the pedestal, and represent the first and last victories of the duke,—namely, that of Assaye, fought on the 23rd of September, 1803, and Waterloo, on the 18th of June, 1815.

The scene to the left of the relief, in the victory of Assaye, represents the submission of the native chief to Colonel Wellesley, and it is portrayed with a force and a truthfulness far above all the praise which we can bestow. The dogged submission of the conquered old chief, as he slowly moves forward to obedience, is inimitable. He seems most unwilling to go through the humiliating task, although one of his own officers is whispering the necessity of the case in his ear. There is likewise the figure of a Highlander soldier, leading the horse of a captive prince, and one of Wellington's staff introducing him—very fine, especially the countenance of the Highlander. Colonel Wellesley is represented in the middle of the bas-relief on a beautiful steed, and holding up his hand in the act of receiving the submission. The right side of the picture represents the battle. In the foreground are two horses, in strong relief, drawing a piece of artillery on a carriage; and this seems no easy task. The driver is flogging the off-horse and spurring the near one at the same time, throwing his body well back, and the animals are evidently struggling to get the gun out of the difficulty. Behind the gun the troops are seen to advance, led on by an officer carrying a flag and cheering. The background is, of course, entirely Asiatic, with mosques, minarets, &c. We feel it quite impossible to do anything like justice to this section of the monument.

In the relief of the battle of Waterloo we have a representation of the Church of Waterloo, to the left, with Hogomont, in flames, in the distance, broken guns and carriages, &c. The monument seized upon is supposed to be that when the final charge was ordered, and when the duke is said to have exclaimed, "Up Guards, and at 'em!" A party of the Guards are in advance, with the duke in the centre, mounted, and wearing a military cloak. The Marquis of Anglesey (a very fine likeness), Lord Hill, and another officer, all mounted, follow behind in a group. The likenesses here are also excellent, and the horses are represented in action, with the greatest skill. There is a dying soldier attended by a surgeon, and troops following behind. This is also a most affecting and masterly group.

The small bas-reliefs on the east and west ends of the pedestal represent the soldier's return. The father is seen sitting in his armchair by the fireside, reading his Bible, and the wife is flying to meet her husband with uplifted hands, in token of joyful surprise, as the "poor but honest soldier" opens the door. This is a most touching piece, and tells its tale like one of Wilkie's pictures.

The other represents peace and agriculture, with the soldier at the plough, after all his labours, and after having saved his country from the inroads of the foe. The plough horses are exceedingly fine. The desire of the artist in this picture seems to be the cultivation of peaceful occupations, as the final and best remedy to war's alarms; and he has certainly succeeded to the life.—*Glasgow Constitutional.*

#### LONDON AS IT WAS, AND AS IT IS IN 1844.

(Continued from p. 516.)

In the reign of the Roman emperor Severus, London was called by Herodian a great and wealthy city; it was then, however, defenceless, without walls or other fortifications. About a century after this, a wall of heavy stone and British bricks was erected round it.

At this time it extended in length from Ludgate-hill to a spot a little beyond the Tower. The breadth was not half equal to the length, and at each end grew considerably narrower. Maitland ascribes the building of the wall to Theodosius, governor of Britain in 369; Dr. Woodward, on the other hand, ascribes it to Constantine, which latter, other writers observe, seems to be confirmed by the number of coins of the emperor's mother Helena, which have been discovered under it, placed there in compliment to her. The same emperor made London a bishop's see. The wall began with a fort near the present site of the Tower, was continued along the Mimories, and the back of Houndsditch, across Bishopsgate-street, in a straight line by London-wall to Cripplegate; then returned south by Crowder's-well-alley to Aldersgate, thence along the back of Bull-and-Mouth-street to Newgate-street, and again along the back of the houses in the Old Bailey to Ludgate, soon after which it probably finished with another fort, where the house formerly the king's printing-house now stands; from hence another wall ran near the river side, along Thames-street, quite to the fort on the eastern extremity. The walls were 3 miles 165 feet in circumference, guarded at proper distances on the land side with fifteen lofty towers; Maitland mentions one 26 feet high near Gravel-lane, on the west side of Houndsditch, another about 80 paces S.E. towards Aldgate. London-wall is now the most entire part left of that ancient precinct. The gates which received the great military roads were four: the Praetorian-way, the Saxon Watling-street, passed under one on the site of the late Newgate, vestiges of the road having been found in digging above Holborn-bridge: it turned down to Dowgate, anciently Dive gate, or Water gate, where there was a ferry to join it to Watling-street, which was continued to Dover. The Hermin-street passed under Cripplegate; and a vicinal-way went under Aldgate by Bethnal-green towards Oldford, a pass over the river Lee to Darnlinton, the modern Leiton, in Essex.

After being deserted by the Romans, it suffered much in the wars carried on between the Britons and Saxons; but recovering soon after, Bede terms it a princely mart town, under the government of a chief magistrate. When all the seven Saxon kingdoms fell under the power of Egbert, London became the metropolis of England, which it has ever since continued. During the invasion of the Danes, London suffered greatly, and in 849 those invaders entered the Thames with 250 ships, plundered and burnt the city, and massacred the inhabitants. In the reign of Alfred, the city began to recover from its former ruinous state; he rebuilt its walls, drove out the Danish settlers, restored the city to its former liberties and beauty, and committed the care of it to his son-in-law Ethelred, duke of Mercia; when in 893 it was unfortunately reduced to ashes, the walls only being left standing. It was again rebuilt, and the city divided into wards and precincts, and the office of sheriff instituted. At this time the houses were built mostly of wood, and a house built of any other material was looked upon as a kind of wonder; but Alfred having begun to raise his palaces of stone and brick, the opulent Londoners of the nobility and gentry, resident therein, followed the example.

In 1015 the citizens made a successful resistance against Canute, king of Denmark; but in the compromise which afterwards took place between this monarch and Edmund Ironsides, London was delivered over to the former, and owned him as its lawful sovereign. In 1046 we first hear of London sending representatives to Parliament. On the Normans, and received two charters from William I., confirming all the privileges they had under the Saxon king, and adding several new ones; but in this reign, A.D. 1077, it was again unfortunately reduced to ashes, the result of accident; and

scarcely had it recovered from this calamity, when another of the same kind began at Ludgate, and destroyed the best and most opulent part of the city, consuming, among other buildings, the Cathedral of St. Paul. Under the reign of William Rufus, London suffered considerably by fires, hurricanes, and inundations, and was likewise depressed by the tyranny of that prince; but Henry I. granted large immunities to the city, which were favourable to the progress of the arts, and again revived its trade; the appointment of portreeve, or chief magistrate, was, however, still in the hands of the king. In this reign such was the abundance of provision, that as much corn was sold for 1s. as would suffice 100 people for a day; 4d. would purchase as much hay and corn as would maintain twenty horses for a day, and a sheep could be bought for fourpence.

On the death of Henry II., the title of the first magistrate of London was changed from *portreeve* to that of *baillif*; and in 1189 its chief magistrate claimed and acted in the office of *chief butler* at the coronation of Richard I. In 1191 this monarch permitted Henry Fitz Ailnoe, the then *baillif*, to assume the title of *mayor*, and twelve aldermen were also then chosen by the discreeter men of the city in full hustings, to assist the mayor in appeasing contentions that might arise in the city, upon inclosures betwixt land and land. Almost the first act signalizing this body was the order that all houses, thereafter to be erected in London and the liberties thereof, should be of stone, with party-walls of the same, and covered either with slates or tiles, to prevent those dreadful calamities by fire, which were frequently and chiefly occasioned by houses built of wood, and thatched with reeds or straw; the dimensions of the party-wall were to be sixteen feet high and three feet thick.

The citizens of London were also much favoured by King John, who gave them three charters soon after his accession, the first confirming them in their former rights and privileges, and exempting them from tolls and customs on the payment of 3,000 marks annually; the second confirming the one granted by King Richard, by which the citizens have the jurisdiction and conservancy of the river Thames, and a clause extending this right to the river Medway; the third contains a fee-farm rent of the sheriffwicks of London and Middlesex at the ancient rent, granting them also the additional power of choosing their own sheriffs. In the reign of Henry III. the city was much oppressed, many of its citizens slain and others mutilated by having their hands and feet cut off by order of the chief justiciary, Hubert de Burg, who also degraded the mayor and all the magistrates, and placed a *custos* over the city, and obliged thirty persons, of his own choosing, to become securities for the good behaviour of the whole city. The general alarm which followed these arbitrary acts, extorted a confirmation of Magna Charta in full parliament in the year 1225, at which time the citizens were confirmed in their rights and privileges. In the nineteenth year of this king's reign, Walter le Bruin, a farrier, had a piece of land granted him in the Strand, in the parish of St. Clement's Danes, whereon to erect a forge, he rendering to the exchequer annually for the same a quit rent of six horse-shoes, with their nails, which is paid up to the present day. One hundred pounds was also granted in 1236 towards bringing water to the city from Tybourn; the town was also fortified, much to the alarm of the citizens. About the same time the heads of colleges of Oxford, with their scholars, were obliged to repair to London and do penance, and assembling at St. Paul's, they thence walked to Durham-house, the legate's palace in the Strand, undressed, bare-headed, and bare-footed, ere they could obtain absolution for killing the legate's cook, and compelling himself to take refuge in the church-steeples. In 1243 wheat was 2s. per quarter.

In the year 1248, on St. Valentine's eve, a terrible earthquake happened in London, destroying many houses. In 1252, the citizens, not being possessed with the chivalrous spirit of the king, refused to undertake the crusade, with the exception of three individuals, for which they were called by him a parcel of base, ignoble mercenaries and scoundrels, fined twenty golden marks, and otherwise ill-used by frequent arbitrary exactions. About

1257 Henry caused the mayor and sheriffs to be degraded, under a pretence of mal-administration, but in reality, to extort money. The wall and bulwarks of London having become very ruinous, the citizens were commanded to repair the same, which they some time after effected at a very great expense. Twenty thousand persons in London are reported to have died about this time from famine, a death being occasioned by a remarkably wet season. King Edward III., having come to the throne, confirmed all the rights and privileges of the citizens, and a convent being required for certain Black Friars, he granted the city a toll for three years to be raised in merchandize of various sorts, and the city was opened and carried out, by a new wall westward, to Fleet ditch, and thence southward to the river Thames. In the first year of his reign he not only confirmed the ancient rights and privileges of the city, but also conferred many other important privileges. In 1348 London was thinned of its inhabitants by a terrible pestilence, and some authors affirm that 50,000 persons were buried in the *Spittle-croft* (now the Charter-house) alone. In 1381 the then lord mayor, Sir William Walworth, distinguished himself by slaying Wat Tyler, for which great service he was knighted and had a fee-farm of 100*l.* per annum bestowed upon him.

In Henry IV.'s time the prison, called the *Tun*, in Cornhill, was converted into a cistern or conduit for Tyburn water; the liberty of St. Martin's-le-grand was petitioned against as a receptacle of murderers, thieves, bankrupts, &c.; a great plague carried off 30,000 of its inhabitants. In the reign of Henry V., the mayor, Sir Henry Barton, first ordered lanterns to be hung out for illuminating the streets by night. In the reign of Henry VIII. the streets constituting the chief thoroughfares into London were ordered to be paved with stone, and channels made in the midst thereof, at the charge of the ground-landlords. In the early part of the reign of Queen Mary, the citizens had acquired such luxurious habits, that it was found absolutely necessary to restrain them, and it was enacted, in common council, that thenceforth the mayor should have no more than one course, either at dinner or supper; and that on a festival, being a flesh-day, to consist of no more than seven dishes, whether hot or cold; and on every festival being a fish-day, eight dishes; and on every common flesh-day, six dishes; and on every common fish-day, seven dishes, exclusive of brawn, collops with eggs, salads, pottage, butter, cheese, eggs, herrings, sprats, and fruits, together with all sorts of shell-fish and fruits; the aldermen and sheriffs to have one dish less, city companies the same; swan, crane, and bustard were prohibited; and even at public entertainments no other extras were to be given than *ipocras* and wafers, &c. The number of taverns were limited to forty; and to Westminster three street bellmen were also instituted in this reign.

In the time of Elizabeth, 1556, Sir Thomas Cresham, a worthy merchant and citizen of London, proposed to the lord mayor and citizens to erect, in a convenient site, a commodious edifice for merchants to meet in; which being agreed to, and the place chosen being cleared by the removal of eighty houses, the building was erected within twelve months, and went under the name of the *Burse*. In 1582 Peter Maurier erected a machine in the river Thames for raising water, which, by suction and pressure, raised the water to a sufficient height to supply the uppermost rooms of the loftiest house in the metropolis; the number of these machines eventually increased to five. In this reign the suburbs of the city increased so fast, that it was thought proper by the government to put a stop to it by proclamation, whereby all persons were prohibited from building upon new foundations; the citizens suffered much from frequent outbreaks of the plague in this and the succeeding reign. In the reign of James the orders were again re-issued and enforced against building upon new foundations; and, in consideration of the great decay of wood, all persons were enjoined to build the fronts of their houses either with stone or brick; during the whole of this reign there was, in fact, a regular crusade against the old builders. Foot-pavements then came in fashion.

(To be continued.)

#### THE ART OF BRICKMAKING.

The art of brickmaking was extensively practised in the earliest ages on record, and was most probably derived from India, along with other arts mentioned by ancient writers. The book of Genesis informs us that burnt bricks were employed in the construction of the Tower of Babel; if such was really the case it is most probable that all vestiges of the ancient monument of the ambition of former times have been swept away in the revolutions of after ages, for the ruins mentioned by Buckingham and other travellers, and supposed to be of the ancient tower, consist of sun-dried bricks, and from the vitrified masses found among them, we should rather infer that they belonged to some magnificent temple destroyed by fire.

The Egyptians were well versed in the art of brickmaking, but many ages elapsed ere they began to use burnt-bricks. In the first dawn of civilization, when the Egyptians descended from their caverns in the hills, and from the increase of the alluvial deposits forming the Delta, the houses were chiefly mud cabins, such as even now exist in Ireland, the better sort being built of sun-dried bricks formed solely of the material deposited by the Nile: this mode of building was dictated by necessity, there being no timber in the country fit for building-purposes. At a much later date, when the Jews were in Egypt, the art of brickmaking had reached its perfected state; stubble was used with the river deposits, and bricks used in some of the public works, if not by the rich, underwent the process of burning. Some of the pyramids are built of brick, and one of them, called *Klonbe el Menshieh* (the bricks of Menshieh), is of unburnt brick, being composed of a black, sandy earth, with some pebbles and shells in it, and mixed up with chopped straw, in order to bind the clay together, as they now make unburnt bricks in Egypt, and many other eastern parts. Nineveh, built by Nimrod, and the famous walls of Babylon, were also built of the same material.

The Greeks, according to Pliny, made use of bricks of three different sizes, distinguished by the following names:—*dedoron* or six inches long, *tetradoron* or twelve inches long, and *pentadoron* or fifteen inches long. Vitruvius instances several celebrated structures, as the walls of Athens, the cells of the temples of Jupiter and Hercules, which were of brick, the surrounding columns and entablature being of stone. This writer also speaks of the Roman art of brickmaking, which had acquired great celebrity in his days, and gives the following directions for making unburnt bricks. They should not be made, he says, of sandy, stony, or gravelly loam, for such kind of earth renders them heavy, and upon being wetted with rain after being laid in the wall, they sweat and dissolve, and the straw which is put in them does not adhere on account of their roughness. The earth of which they are formed should be light, chalky, white or red. They should be made in spring or autumn, as being the best time for drying; for the intense heat of summer parches the outside before the inside is dry, which afterwards drying into the building, causes them to shrink and break. They are best when made two years before they are used, as they cannot be sufficiently dry in less time. If they are used when newly made and moist, the plaster-work which is laid on them, remaining firm and stiff, and they shrinking, consequently not preserving the same height with the incrustation, it is by such contraction loosened and separated. At Utica, therefore, the laws allowed no bricks to be used before they had lain to dry five years. He describes the same sizes as those of Greece, and also half-bricks of each sort; and in building, the whole bricks were laid in one course, and the half-bricks in the next. It was the boast of Augustus that he found Rome of brick and left it of marble; but this, it would appear, could only mean unburnt bricks, for the laws did not permit any walls in public places to be made thicker than one foot and a-half, while brick walls of that sort would not admit of more than one story. Accordingly, the walls were built of hewn stone, testaceous substances, or rubble. That these testaceous substances were tiles, is evident, for he observes, that it could not be known at first whether they were of good loam and well burnt, but that they should be laid in a roof during a winter and summer before they

were used in a wall. At this time the Temple of Peace, the Pantheon, and all the thermae were of burnt brick.

M. Quatremere de Quincy, in his "Encyclopedie Methodique," observes that in his researches among the antique buildings of Rome, he has found bricks of three sizes; the least were  $7\frac{1}{2}$  inches square and 1 $\frac{1}{2}$  in. thick; the medium ones 16 $\frac{1}{2}$  inches square and from 18 to 20 lines in thickness; and the larger ones 22 inches square by 21 to 22 lines thick. The smaller bricks were made to face walls of rubble-work; and to make a better bond with the wall, they were cut diagonally into two triangles, the longer side was placed on the outside, and the point towards the interior of the work. To tie more effectually the facing with the rubble, they placed at every four feet in height one or two courses of the large square bricks. The large bricks were also used in arches of openings or discharge, which were necessary in the building.

The material of Persian buildings in modern times, says Chardin, is bricks, either dried in the sun, or burnt in the fire. The tiles or bricks of earth are made in their wooden moulds, 8 inches long, 6 wide, and 2 $\frac{1}{2}$  thick. The labourers temper with their feet the earth, which is generally mixed with straw cut very small. They pass their hands over them to smooth them, after having dipped them in a vessel of water mixed with straw, still finer than was at first used. Then taking off the mould, they leave the bricks to dry for two or three hours, after which they are ranged over one another, where they remain till the drying is completed.

The baked bricks are made of two parts of earth and one of cinders, well tempered together, in moulds larger than for the others. They leave them then to dry in the sun for several days, then place them in a large furnace, ranged one over the other, at some distance, which they fill with plaster. They close the furnace, and light the fire, which is kept up for three days and three nights. Mr. Chardin has not, however, informed us what kind of cinder it is they use; the use of coal is not known among them, we, therefore, presume he means wood-ash, or the cinder of burnt bituminous bodies.

It is generally admitted that the Romans introduced the art of brickmaking into this country, for we have no account of any being used prior to the Roman Conquest. Nor does it appear that the Romans employed this material otherwise than when compelled to do so in the absence of other material. The Roman walls were generally built with cement and tiles, or flint stones laid in courses at convenient distances to bind the parts together, and at the external and internal angles, to strengthen them. These bands consisted of three or four courses of tiles or stones laid through the wall, and were placed at two or three feet from each other; the intermediate spaces being raised by a sort of cement composed of mortar and pebbles, and sometimes of rag-stones, or such materials as the country afforded. In this manner the walls of Verulam, Colchester, Chesterford, and other places, were built. Alberti tells us, on the authority of Varro, that the Gauls built their houses with baked brick, but this does not correspond at all with the ancient simplicity of those people, for the use of this material always implies a certain advance in civilization; on the other hand, in places where other material could not be procured, it is very probable they had recourse to unbaked brick or mud.

It is very certain that brick was scarcely used as a building-material in the towns and cities previous to the time of King Alfred, for we read that in his time the capital having twice been laid in ashes to his great grief and mortification, as defeating his efforts for civilizing and improving the social condition of his people, he therefore commanded after the second conflagration that the houses should in future be of brick or stone, he himself setting the example, by building his palaces of these materials, and the nobility following his example. The citizens, however, do not seem to have complied with this mandate, for it was not until the reign of Henry VII. that any considerable progress was made in brick building. In fact, in these dark feudal ages, stone was almost invariably chosen by the Saxon and Norman nobles, as being more adapted to the warlike habits, and affording greater strength

and consequent security. Mr. Essex remarks, "That the Saxons sometimes built of bricks and cement, after the Roman manner, and sometimes with squared stone, may be collected from Bede's description of the Hermitage built by St. Cuthbert in his retirement, the walls of which, he says, were not of squared stone, nor of tiles and cement, but of such rough materials as he could dig on the spot. In this description Bede intended to convey the meanness of St. Cuthbert's habitation, by comparing it with other buildings of that age, many of which were built of squared stones, and others with tiles and cement;" from whence we may conclude that the art of making tiles, or bricks as they are now called, was not forgotten from the time the Romans left Britain to the seventh century, when St. Cuthbert lived.

In the wall which went nearly round the city of Verulam, the Roman bricks are interlaid in separate courses between layers of flints. The quantity of mortar between the bricks is nearly equal to the thickness of the bricks themselves. Four layers were discernible; the lowest tier had four bricks, the next three, and the two uppermost of them two. The distances between the courses of bricks, which were filled up with flint and mortar, were 2 feet 8 inches, the bricks were 1 $\frac{1}{2}$  in. or 1 $\frac{1}{4}$  in. thick, 12, 16, 17, and 18 inches long. This deviation from the common Roman standard would lead us to infer that while the art of tile-making was received and carried out by the Romans, they neglected the measurement. Pliny, however, gives us an account of the Roman measures somewhat different from Vitruvius; he states that there were three sorts of brick, the lydion, 18 inches long and 12 broad; the tetradorus, and pentadorus; the dorus was a palm.

The earliest period fixed by the dean of Exeter for the revival of the art in Britain, was about King Richard II.'s reign, which, by the way, he observes confirms Dr. Ward's opinion, that the date on the brick chimney at Salford, in Bucks, should be read 1382, instead of 1182, which falls under the fifth of that king's reign. Leland says "That in King Richard the II.'s days, the town of Kingston-on-Hull waxed very rich, and Michael de la Pole, merchant there, was made Count of Suffolk; in whose time the tower was wonderfully augmented in building, and was enclosed with ditches, and the wall begun, and in continuance ended and made all of *brike*, as most part of the houses of the town at that time was. In the wall," adds the writer, "be four principal gates of brike; the north gate having four wardes, between the which and Beverle-gate be twelve tours (towers) of brike, yn one of them a posterne. Betwixt Mito-gate and Hazelle-gate there be three tours of brike, and from them to the Haven Moutb be five tours of brike. Michael de la Pole builded a goodly house of brike again the north end of St. Mary's Church like a palace, with goodly orchard and garden enclosed with brike. He also builded 3 houses beside in the towne, whereof every one has a tour of brike. Trinite Church, most made of brike, is larger and fairer a great deal than St. Mary's."

This fact goes far to prove that brick was extensively used, so far as regards the above town, in the reign of Richard II., but, from this time to the reign of Henry VII., we meet with no evidence of brick being employed as a building material; possibly it was confined to this place, for from all we can learn, with the exception of a few lordly mansions, London was chiefly built of wood. (To be continued.)

#### ON THE ADVANTAGES OF TURNING CANALS INTO RAILWAYS.

MR. T. BIRMINGHAM read a paper on the above subject at the recent scientific meeting at York. He commenced by observing that it was fortunate that the immense sums of money which had been expended on the canals in England and Ireland need not be entirely lost to the proprietors, and consequently in a great degree become useless to the country; but that, on the contrary, by the proper application of some of the various systems of railways at present proposed, the greatest blessing might be conferred upon the counties, if it could be shewn, as he thought he should be able to, that a cheap and expeditious, and, above all, a safe and easy mode of conveyance

could be made out of these great lines of canals. At the present moment, and in Ireland in particular, subsoil draining was most fortunately occupying the undivided attention of all classes of agriculturalists. He therefore proposed so to construct the railways as at the same time to make what was formerly a canal into a drain for the waters of the country, instead of, as now, in many places, especially in the case of the canal under consideration, acting as back-water upon the land, often to the very great detriment of all. His proposition was this: that the bottom of the canal should be levelled to a reasonable inclination at the various locks, that one of the present proposed systems of railways should be adopted, and that the waters which found their way into the canal should be made use of as the power, or in aid of the power, by which it should be determined that the trains should be propelled upon the railway. The advantages suggested were these: that the capital invested in canals would not be altogether lost; that though in many instances canals made a circuit between towns and districts at present populous, still the best levels had been taken, and the public had found their way to those canals; that instead of the waters in our lakes, and rivers, and streams, and springs being kept up for the purposes of the canals to a level injurious to the proper cultivation and management of our land, the canal itself would become the main drain for these very lands; that the adoption of this scheme would prove a source of employment for our peasantry, and be productive, by draining, of a vast increase of food for the sustenance of our people; and that considerable gain would ensue to the capitalists who might be induced to embark their money in the speculation.

#### BATHS AND WASHHOUSES FOR THE WORKING CLASSES.

ON Wednesday last a numerous and highly influential meeting was held in the Egyptian Hall, at the Mansion-house, to take into consideration the best means of promoting the establishment of baths and washhouses for the labouring classes.

The body of the hall was filled, and on the dais at the upper end of the room were the Lord Bishop of London, Lord Dudley Stuart, Archdeacon Wilberforce, Archdeacon Hale, Sir W. Clay, M.P., G. Byng, Esq., M.P. for Middlesex, J. C. Colquhoun, Esq., M.P., Sir Lionel Goldsmid, Mr. D. Salomons, Alderman Johnson, Dr. Russell, Mr. Moon, the late Sheriff, R. Cotton, Esq., the Governor of the Bank of England, Mr. G. F. Young, and Mr. D. Wire.

At two o'clock the Lord Mayor entered the hall, and took the chair, when various resolutions were carried, having for their object the establishment of an association to carry the proposed measures into effect. A president, trustees, and committee of management were appointed, and a public subscription determined upon.

The Bishop of London accepted the office of president.

**BENEVOLENT INSTITUTION FOR THE RELIEF OF AGED AND INFIRM CARPENTERS.**—The fifth annual meeting of the members of this excellent institution was held on Monday the 14th instant, at Radley's Hotel, Bridge-street, Blackfriars, when Mr. W. Shimeil, junior, took the chair. Mr. Wood, the secretary, read the directors' report for the last half-year, which stated that the institution was in a most prosperous condition, and would have been still more so had not the authorities of the Brighton Railway acted most improperly on the occasion of the last excursion. Thanks having been voted to those gentlemen who had most exerted themselves since the last meeting for the good of the society, the election of officers for the ensuing year took place, after which Mr. Munyard, in a neat and complimentary speech, drew the attention of those present to the untiring perseverance of their secretary, Mr. W. Wood, and attributed the prosperous condition of the institution mainly to his active and judicious superintendance.

**MILITARY PRISONS.**—Southsea Castle is ordered to be appropriated as a military prison, to contain 100 offenders. Another building at Wheedon, and a third elsewhere, are also to be fitted for the same object. The estimated outlay for these arrangements is 4,000.—Sun.

G L A S T O N B U R Y,  
THE FIRST CHRISTIAN CHURCH IN BRITAIN.

SIR,—I beg to send you the following extract relative to the foundation of the first Christian church in England:—

Saint Joseph of Arimathea, so honourably mentioned by the Evangelists for asking and obtaining of Pilate the body of our Saviour, and afterwards burying it, was for that noble action closely imprisoned by the Jews, the very night he performed that Christian duty, from which he was delivered by an angel the night of our Saviour's resurrection, which so enraged the Jews, that they not only turned him, with Lazarus, St. Mary Magdalen, and St. Martha, out of Jerusalem, but, putting them into an open vessel without stern or tackling, they tuned them to sea, where they were driven to *Marselles*, in France, whence Joseph came into Britain, where he died.

Old historians say, that he came hither in or about the year of Christ 63, and brought with him twelve companions, whereof one was his son, called also Joseph.

Protestant authors say he was sent by Philip the Apostle, but papists will not allow it, and say he was sent by St. Peter.

There is an old book called *Sanctus Grant*, which says that St. Joseph brought over with him 600 persons, amongst whom, besides his son, were his wife, his nephew, Uclaius, from whom it says our renowned King Arthur was descended, and a kinsman whose name was Peter; that St. Joseph was King *Oremin*, and that divers of this his great retinue were persons of the first rank, but it is said that this book is not to be relied on. (Mr. Broughton.)

It is said by an author of credit, that the first landing of St. Joseph in Britain was in North Wales, where he and his companions, preaching the faith of Christ, were not only denied all necessary relief and sustenance, but their doctrine rejected, and themselves sent to prison by the king or prince of that province, a pagan. At length, he and his companions being freed of their imprisonment, and seeing how fruitless it was like to be to make any longer stay amongst so obstinate a people, came into England. At his first arrival here, he assumed the confidence to go to the British king, *Aviragus*, to whom he gave an account of the design of his journey, which being gravely and modestly delivered by one of so venerable an appearance so wrought upon *Aviragus*, that he not only gave them leave to convert his subjects, but afforded them a place of retreat, commodious for their quiet and devotions, and sufficient sustenance that, without distraction and solicitude, they might attend to the worship of the true God, and give instruction to all those who were willing to take it. The place which the king assigned, then was an island, rude and uncultivated, called by the Britons *Inis-wohlyn*, that is, *Glossy Island*, surrounded by the bay, full of woods, bushes, and fens, situated in *Somersetshire*. Although the island being cleared of the briars, drained, and cultivated, it was by the inhabitants named *Avulthia*, from the abundance of apples and other fruit growing there; but in after ages, when the Saxons had possessed themselves of those parts, they called it in their own language *Glaston* or

*Glaston*. It is said by the same author (Mr. Broughton), that it is a continued tradition of the still inhabitants of *Glastonbury*, that when St. Joseph and his companions came into England out of North Wales, they divided themselves into divers companies, and that three only at first went to *Inis-wohlyn*, one of whom was St. Joseph himself, and that he and his companions coming tired and weary to a hill, within half a mile south-west of where *Glastonbury* now stands, rested themselves on the ridge thereof, for which reason that hill to this day is called *Weary-all-hill*, and that in the place where they rested, there sprang up a miraculous thorn tree, which every year at Christmas, in the coldest weather, frost, snow, or whatever else, never failed budding forth its leaves and blossoms. This thorn, it is said, sprung from St. Joseph of Arimathea's dry walking-staff, which was stuck by him in the ground at the time when he rested there.

When the rest of these holy men understood where St. Joseph and his two companies had taken up their settlement, they likewise repaired thither, and being all got together, they settled themselves in the adjoining place, where the late Abbey of *Glastonbury* stood.

A little while after this, they were admonished by St. Gabriel, the Archangel, in a vision, to build a church in honour of the Virgin Mary, upon which they immediately built an oratory of harked alder wicker wands, winded and twisted together with a roof of straws, or rather after the nature of the neighbourhood, of hay or rushes. Its length was 60 feet, and its breadth 26. The annexed woodcut is a representation of the oratory. It had a churchyard belonging to it, which was said to be sufficiently capacious to contain 1,000 graves, but the dimensions of it are not known at this day.

Some authors have it, that these holy men prevailed little by their preaching, and therefore at last gave themselves wholly to a monastic and solitary life; but this is contradicted by others (Dugdale and Dodsworth), who say that St. Joseph and his companions converted a great multitude of pagans to the Christian faith. After this manner of living they ended their days in the island of *Inis-wohlyn*, having been supported by the liberality of King *Aviragus*, who, for their subsistence, bestowed upon each of them a hyde of land, twelve hydies in the whole, which was confirmed to them after his death by two of his successors.

It is said that this island, which had been the abode of saints, became after the decease of St. Joseph and his companions a den of wild beasts, till King *Lucius*'s son, St. Joseph and his brethren having left disciples behind them, who continued Christianity in the island or its neighbourhood, and King *Lucius* spread it through all his kingdom.

Two holy legates, *Phaganus* and *Dameanus*, travelling throughout Britain teaching, preaching, and baptizing, having been informed that St. Joseph and his brethren had about 100 years before, in some measure, spread the seed of Christianity in the south-western part

of the kingdom, and that they had retired to *Inis-wohlyn*, and there died, and finding out where this sacred place was, about the year of Christ 183, penetrated into this holy island, where they, having found this oratory, were filled with joy, and upon searching diligently, they found the holy cross, the figure of our redemption, and which, together with several other signs, declared that that place had been formerly the habitation of Christians. After this they found the antiquity of the coming of St. Joseph and his brethren thither, and how three pagan kings ministered necessities for their maintenance. Afterwards, being admonished by a divine oracle, they added another oratory of stone, and dedicated it to the honour of our Lord and his Apostles St. Peter and St. Paul.\*

#### LECTURES ON ARCHITECTURE AND ANTIQUITIES.

Lecture V.

ROMAN ARCHITECTURE.

(Continued from p. 507.)

Many other theatres were erected in Rome to gratify the inordinate passion of the people for shows. The first buildings used for this purpose were constructed of wood, as were those of Curio, Pompey, and Caesar. Pliny gives an interesting account of the amphitheatre of Curio, a patrician, who lost his life on the side of Julius Caesar. To produce a gorgeous pageant on the occasion of his father's death, he "caused two theatres to be built of timber, of great size, so that they might be turned so as to make them approach or join to each other, or be removed to a distance, as he should desire, and all by the means of one pivot apiece, that they hung by, which bore the weight of the whole edifice, the balance being so equal, and the whole firm and safe. The contrivance was arranged thus—that in the forenoon he should exhibit scenical representations, when the two theatres should be placed back to back; and that when the audience was satisfied with that kind of show, the theatres should be turned about until the ends fronted each other (every man in the audience keeping his place and sitting still, according to his rank and order), until by the meeting of the corners of these two theatres, the compass made a fair round amphitheatre." After praising the skill and contrivance of the designer, Pliny rebukes in no measured terms the folly of his countrymen who trusted to such a frail and dangerous edifice—"the conquerors of the world, the disposers of empires at their pleasure; and the givers of countries and nations at their will; the vicegerents of the immortal gods under heaven, hanging in the air within a frame, at the mercy of a hook, and rejoicing and ready to clap their hands at their own danger."

This singular edifice was erected in rivalry of one of more costly materials, which had been built by Marcus Scourus; who, as Pliny says, "when he was adule, caused a wonderful piece of work to be made, exceeding every thing of the kind that had been seen before. It was a theatre, having three galleries, one above the other, wherein were 360 columns of marble; the base of the stage was all of marble, the middle of glass (an extravagant superfluity never heard of before or since). As for the uppermost, the boards, planks, and floors were gilded, the columns beneath were 38 feet high; and between these pillars there stood brazen statues and images, to the number of three thousand. The theatre itself could accommodate 80,000 persons to sit at their ease."

Pompey's theatre contained 40,000 spectators; it was finished 54 B.C., and was attached to the temple of Venus; Pompey exhibited 400 tigers and 500 lions, besides elephants. This building is said to have been in existence in the beginning of the fifth century, and its site is pointed out in the Campo di Fiore. Julius Caesar exhibited in his theatre (of wood) besides more lions and tigers than Pompey had done, twenty elephants, and 500 gladiators on foot, and 300 on horseback. In the time of Augustus, large theatres were erected by Cornelius Balbus, by Æmilius Lepidus, and by Statilius Taurus, whose immense mound still remains, and who, according to Strabo, built the first amphitheatre of stone.

\* Sammes' Antiquities, pp. 213, 214. Dr. Warner's History of Glastonbury, App. No. 1. p. 6.

\* William of Malmesbury's Chronicles.

Augustus himself built the theatre of Marcellus in honour of his nephew and son-in-law; it is not above one-third of the size of the Coliseum, and consists but of two stories, the lower Doric, and the upper Ionic, both of better design than seen in the same orders in the Coliseum. There are arches between the columns.

Many of the Roman emperors built amphitheatres, and splendid remains are still to be seen in various parts of Italy; the most considerable are at Pola, 436 feet long by 346 feet, and 97 feet high, and which contained 20,000 persons; at Verona, 450 feet long by 360 feet, and capable of holding 22,000 persons; at Capua, 520 feet in length, adorned with statues of the whole pagan mythology, and considered second only to the Coliseum. In smaller cities likewise and in the provinces subject to Rome, numerous theatres were built.

We now proceed to notice in detail some of the most remarkable triumphal arches, of which one of the earliest, simplest, and most beautiful is the arch of Titus, whose single opening formed the entrance to the Sacred Way; which, in its course, neither wide nor lengthened, passed between some of the most splendid temples of Rome.\* This arch was raised in honour of Titus by the senate and Roman people, as the inscription testifies, "Sonatus Populusque Romanus Divo Tito Divi Vespasiani F(ilio) Vespasiano Augusto," after the conquest of Judæa. Some writers have attributed its erection to the emperor Trajan, others to Domitian, who took a part in the triumph. The exterior of this arch is built of the white marble of Paros, beautifully wrought and fitted. It had originally four columns on each front, of the Composite order (herein for the first time employed); two only of the columns on each front remain. The archway is 17 feet 6 inches wide, and 27 feet high to the key-stone; the sides of the archway are decorated with bas-reliefs, representing, on one side, the triumphal entry of the emperor into Rome in a quadriga, or car drawn by four horses, led by the goddess Roma, and attended by senators andlictors, whilst a Victory behind holds a wreath over his head; on the opposite side is shewn the train bearing the spoils of Jerusalem, among which are discerned the golden candlestick, the golden table, "of the weight of many talents," silver trumpets, all of which are described by Josephus, an eye-witness of the splendid triumph. In the centre compartment (i. e. the placing among the gods) of Titus, borne to heaven on an eagle. On the frieze are figures of men in alto-relievo leading oxen to sacrifice, and two figures of Fame occupy the spandrels of the arch. No Jews will pass under this arch which so mournfully tells of the capture and destruction of their beloved city, yet affords collateral proof of the authenticity of the Scriptures.

At the termination of the Sacred Way, at the foot of the steps leading to the Capitol, stands the triumphal arch of Septimius Severus, erected by the Roman senate and people in honour of that emperor's many victories in the East, obtained in conjunction with his sons Caracalla and Geta, who are therefore also honoured in the triumph. The arch has one large central opening 21 feet wide, and two side doorways each 9 feet 8 inches wide; there are communications from the side passages to the central gateway; four fluted detached columns, of the Composite order, are ranged in each front with pilasters behind; between the pilasters are bas-reliefs of poor design and inferior execution, representing the emperor's victories over the Parthians, Arabians, and other eastern nations. Winged Victories are placed over the centre arch, and four river gods over the side openings. On the top of the structure, which was 63 feet high, was placed a quadriga, containing statues of Severus and his two sons. The shafts of the columns in single blocks, 22 feet 11 inches high, were 2 feet ten inches in diameter; and the whole length of the front was 76 feet. This arch, supposed to have been completed A.D. 204, served as the model for that erected by Napoleon Bonaparte in front of the palace of the Tuilleries in 1806; on the summit of

which was placed a car, whereto were attached the celebrated horses taken from the Place of St. Mark, at Venice, and restored in 1815.

The structure, called the arch of the Goldsmiths, is in reality not an arch, but a gateway; the upper part of the opening being formed by the entablature continued from the pilasters on each side, for it has no columns. It was erected in honour of and dedicated to Septimius Severus and his family, by the goldsmiths and merchants who inhabited the Forum Boarium, so called because a statue of a bull was placed in it of Ægina metal. Thus Ovid, in his Fasti—

*Area que posito de Bove nomen habet.*

At a short distance beyond the arch of Titus, but not in the Sacred Way, is the triumphal arch of Constantine, which exceeds in size that of Severus, having like it three openings, each front having four fluted columns of the Corinthian order, detached from the walls; the shafts are of yellow antique marble, behind the columns are fluted pilasters. With the exception of the columns, the whole of the edifice is of white marble, laid without cement, and cramped with bronze.\* This arch was decreed by the senate and people A.D. 312, on the occasion of Constantine having overcome Maxentius in battle, about nine miles from Rome, on the Banks of the Tiber. This victory of Constantine is called, by Gibbon, "the most splendid enterprise of his life." Over the entablature of the columns are placed statues of Dacian prisoners, which were brought from an arch erected to Trajan in his famous Forum, and which was entirely demolished to decorate that of Constantine; for the historian Gibbon tells us (vol. ii., p. 235) that it was not possible to find in the capital a sculptor capable of adorning the arch of Constantine.† In fact, the sculptures that were added to it, which belong to the age of Constantine, are very inferior to those which were taken from Trajan's arch, whose destruction is the more to be regretted, as it was most probably built from the design of the famous Apollodorus, to whom some have even ascribed the arch of Titus. The bas-reliefs under the central passage, and at the ends of the attic, represent the defeat by Trajan, A.D. 105, of the Dacians on the Danube; and the four medallions on the south front, each in one piece of marble, eight feet in diameter, represent Trajan going to and returning from the chase, and sacrificing to Apollo and Diana, the deities of field-sports. Other medallions shew the Emperor continuing the chase, and sacrificing to Sylva and to Mars. The centre medallions illustrate morning and the close of day. The arch erected in Piccadilly, at the royal entrance to the Green Park, is called a "free imitation" of the Constantine arch; it has, however, but one opening. And in this work, as well as in the opposite colonnades and arches leading to Hyde Park, may be seen the fault pointed out by Mr. Bartholomew, of entablatures sinking by the carrying of projecting architraves across the great arches with columns so prodigiously far apart as to be unequal to the passive support of the superincumbent work, instead of following the sound and legitimate Roman method of mitring the entablature round the columns, so as at once to find an apology for placing columns by far too distant, or "thin set," for correct ordonnance, and so prevent, by proper construction, the want of safety which must otherwise ensue.‡

Although we have not at Rome an arch of Trajan in existence, there are fortunately two remaining elsewhere in Italy, which are gene-

\* The Florentine architect, Andrea Orgagna, revived the ancient practice of joining marbles and stones in building with brass cramps instead of using cement or mortar. He died A.D. 1389.

† The historian thus speaks of this building: "The triumphal arch of Constantine still remains a melancholy proof of the decline of the arts, and a singular testimony of the meanest vanity. As it was not possible to find in the capital of the empire a sculptor who was capable of adorning that public monument, the arch of Trajan, without any respect either for his memory or for the rules of propriety, was stripped of its most elegant figures. The difference of time and persons, of actions and characters, was totally disregarded. The new ornaments, which it was necessary to introduce between the vacancies of ancient sculpture, are executed in the rudest and most unskillful manner." (Decline and Fall, &c., chap. xiv.)

‡ [In the Lottery Court of the Bank of England is an arch, by Sir John Soane, of considerable beauty, adorned with the Tivoli Corinthian order, somewhat modified and with the entablature mitred over each column.—Ed.]

rally considered to be in better taste than any in Rome, and they were most probably from the designs of the great architect of that emperor, Apollodorus. One is at BENEVENTUM, and very much resembling the arch of Titus at Rome; it was called the Porta Aurea (Golden Gate), and was erected A.D. 113, to record Trajan's achievements in the German and Dacian wars. It is one of the most beautiful and best preserved monuments of the kind, built of Parian marble, having a double soecle, on which rest eight fluted columns of the Composite order; the intervals between them are adorned with superb basso-reliefs. In the centre of the ceiling of the arch is a beautiful figure of Fame crowning the Emperor. The bas-reliefs in the upper compartments (which are better preserved than the others,) are very fine, and particularly the figures of Trajan, Hercules, Jupiter, and Minerva.

ARCH OF TRAJAN AT ANCONA.

The other arch of Trajan is at ANCONA, erected A.D. 116, by the Roman senate and people in his honour, not for a victory, but for the more praiseworthy deed of facilitating an entrance into Italy from the Adriatic, by forming the port of Ancona, with the magnificent mole, which protects the harbour. This arch, built of white marble, has four engaged columns to each front, and but one arched opening, 9 feet 10 inches wide. It is of the Corinthian order, and was not so much encumbered with ornaments as were the arches of later date in Rome. On the summit of the arch was placed a statue of Trajan, with that of his wife Plotina on one side, and of his sister Marciana on the other. The statues, bronzes, and decorations of this arch have long since disappeared. The emperor did not live to enjoy this triumph, having died at Selinus, in Cilicia, after a reign of 19 years.

G. R. F.

(To be continued.)

WESTMINSTER BRIDGE.—The approaches to this bridge, are about to be altered, it being in contemplation to remove a great quantity of earth from the crown of the arch and to add something to the extremes. The works commenced on Monday last, on which day the carriage-road was stopped.

\* Thus Le Grand observes, "Il se pourrait encore que l'architecte chargé d'exécuter l'arc de Bénévènt eût été tellement frappé de la perfection de celui de Titus, qu'il eût voulu le reproduire. Cette imitation subsiste aujourd'hui dans son entier, lorsque le monument qui a servi de modèle est en grande partie détruit."

\* The conqueror approaching the Capitol would, after passing through the arch of Titus, have on his left hand the temples of Jupiter Stator, of Concord, and of Jupiter Tonans; on his right, the temple of Peace, and of Antoninus and Faustina.

**TUDOR ARCH—FROM A DOORWAY IN CROYDON PALACE.**

*Shewing by fair Lines how the Present common mode of Drawing such Arches is, in my opinion, imperfect.*

THE interior line A B C is described at twice from the centres D and G, according to the data given by "T. L." in *THE BUILDER*, page 304; each portion being of uniform curvature, while the radius of the one is approaching to three times the length of the other. With this variation, two arches from different circles are patched together to form what many are taught to think, and appear to be satisfied, is a fair curve, proving that both mind and eye require instruction.

On each side of this middle line, thus drawn, is described another by simple continuous motion, with a continual variation of curvature from A to C; and it will be observed that a fair line of the same character half-way between them, would pass through the three points A B C of the approximate line, shewing that it (which from the mode of generation alone ought to be manifest) is too quick immediately below B, and too flat above that point. In short, the true line would deviate just so much from the approximate method as is necessary to produce a fair curve passing through the three points, and that a tangent to the point A be perpendicular to the horizontal or springing line.

The approximate method of producing an imitation of an ellipsis, by patching together portions of four circles, might, in a similar way, be made as obviously inaccurate to an untutored eye; and every eye, and mind too, must be untaught which cannot perceive the inaccuracy without such explanation; and, consequently, cannot contemplate any varying form of an object so as to acquire a true impression of the different parts.

On a small scale, without it is by a very delicate engraving, it is difficult to shew the precise character of either the approximate or the true curve. On the other hand, the larger they are drawn the more obvious the imperfection and the truth.

It is supposed, however, after seeing this, that there are few architects, if they will allow the eye, and the mind too, to dwell for a sufficient time on any arch, a large one especially, who will not immediately discover the character. In this way ancient forms ought to be compared with modern constructions.

But suppose the ancients had not arrived at a knowledge of a strictly fair line, does it follow that an imperfect line should be continued when an accurate one may be

applied with greater facility? Yet perhaps the fair line may be found to approach as nearly to the form of the Croydon arch as the approximate one, if a curve formed by

continuous mode of generation was applied to it.

JOSEPH JOPLING.

29, Wimpole-street.

**OPENING OF THE ROYAL EXCHANGE.**—Great preparations are making, not only in the Royal Exchange itself, but at the Bank and several houses in the vicinity, for the forthcoming visit of her Majesty to the City of London. The wooden pavement in Cornhill is nearly completed, and in a few days that thoroughfare will be re-opened. The area of the western front of the Exchange, whereon stands the Wellington statue, is nearly completed, and the hoarding will be shortly removed, when the whole building will be thrown open to the public. It is expected that the ceremony will take place on Wednesday, the 23rd instant. One thousand three hundred distinguished persons are to be invited to dine on the occasion. The Gresham and Corporation Committees have ordered Mr. Wyon to execute two medals commemorative of the event.

**INDIA-RUBBER PAVEMENT FOR STABLES.**—As a pavement for stables the caoutchouc preparation is said to be unequalled, preventing the lodging of stale matters, and their consequent noxious exhalations, requiring little litter, and preserving the knees and other parts of the horse from injuries which are apt to be received in stone-paved stables. By a little precaution, the ammonia, which now exhales to the injury of the horses' health, may be collected and sold as a manure, at from two to three pounds per horse per annum. The stables of the commissioners of Woolwich Dock-yard have been paved with this material for upwards of two years, and are allowed to be superior in point of cleanliness, freedom from smell, and healthiness, to what they were previous to the laying down of the elastic pavement.

**GIGANTIC SCHEME.**—We have heard that the practicability of connecting the opposite shores of the Mersey by a stupendous chain bridge is under consideration. It is said that, by the formation of a viaduct, on the principle of an inclined plane, on arches, commencing at the top of James-street to the margin of the river, a sufficient elevation may be obtained. A similar erection on the Woodside bank of the river would, of course, be requisite. Our acting and enterprising Cheshire neighbour would, no doubt, readily assist in promoting a project so magnificent. Such a work would throw all other suspension bridges into the shade, and be a world's wonder. Of its practicability no doubt, we believe, is entertained, and it will be allowed that the enterprise is worthy the combined energies of Liverpool and Birkenhead.—*Liverpool Albion.*

## Literature.

*Geology, Introductory, Descriptive, and Practical.* By DAVID THOMAS ANSTED, M.A., F.R.S., &c.—London: Van Voorst, Paternoster-row, 1844.

THE two elegant volumes now before us are highly complimentary to the learning and research of Mr. Ansted, and to the taste and spirit of the publisher, Van Voorst. With the high commendation of being comparatively free from the mysticisms of the science of Geology, they elicit our warm commendation for the methodical simplicity of arrangement and judicious selection of pleasing and important information brought down to the present period.

One century ago, geology, according to the definition given by Mr. Ansted, was unknown; the earth was never previously explored, unless for practical purposes, and when the organic phenomena of its strata first arrested the attention of men of science, the explanations given by them were conformable to the age in which they lived, crude, contradictory, and oft-times ridiculous. But this twilight of observation, however unsatisfactory to the mind thirsting after knowledge, was the infancy of geology, which, struggling into existence through almost insurmountable difficulties, soon made itself a name, increasing in beauty and utility, in wisdom as in years.

Mr. Ansted has most decidedly given the world the most pleasing, if not the most useful exposition of the science of geology of the present day; and, while we differ somewhat from him in the relative position and importance of mineralogy and chemistry, we can scarcely blame him, on observing that his object evidently is to render geology more extensively and practically useful, and by disrobing it of its strange and somewhat forbidding technicalities, to invite the young aspirant to scientific honours, to follow in the path of observation pointed out, that he may in turn be enabled to contribute his quota to the existing fund of human knowledge.

In considering geology in connection with architecture, Mr. Ansted informs the architect, that "the object of geology is to observe and describe the internal crust of the globe; and from the consideration of the phenomena there presented to view, to trace the successive changes that have taken place upon the earth, and the various laws or modes of action employed in effecting these changes." That it is absolutely essential to the architect and engineer to have some degree of knowledge thus defined as belonging to the department of geology cannot be questioned, for to readily comprehend what difficulties are likely to arise and what dangers are to be avoided, in forming roads, canals, railways, viaducts, and aqueducts, in building bridges or houses, is to enable ourselves the better to meet the one and overcome the other.

In introducing his readers to the technical expressions of geology, Mr. Ansted observes that "a very slight knowledge of mineralogy is sufficient to acquire geological knowledge," and that under this term "it is usual to designate all those substances which occur in masses, and which lie beneath the vegetable soil, by the general term *rocks*; and in this sense, clay and sand are called rock by the geologist, as well as granite and limestone." For all practical purposes this explanation should ever be borne in mind by the architect, otherwise, under this general term he may very often inevitably be led astray.

The Romans, not content with a climate favourable to the preservation of stone, carefully collected the results of experience, and placed them on record, for the benefit of future generations. In the writings of Vitruvius on Roman architecture, the most particular rules were laid down with respect to the selection and use of building stones and the cements employed by them; and every country then known to or under the rule of this warlike nation contributed the choice produce of its quarries for the advancement and grandeur of the great capital of the world. This desire of the ancients for building with durable materials ought to be fully participated in by modern architects, who, as part of their profession, should be enabled to classify and arrange building-stones, to apply, when required, the rules of chemical analysis, in order to discover their composition, physical character, and

powers of endurance of heat and moisture. As Mr. Ansted observes, it is the duty of the engineer to obtain a correct knowledge of the line of country through which he is to conduct roads, railways, canals, tunnelling, and embankments, and to do this effectually, he must have some knowledge of the leading principles of geology, as also of mineralogy, to which the former science is so strictly allied; still the engineer, in thus seeking aid from geology, must bear in mind that practical information is all he requires; to speculate on possibilities, and thereby involve large additional expenditure, is dangerous in the extreme. Geology, therefore, while, on the one hand, it commands his attention, and forms a part of his study, should, on the other, be carefully applied practically, lest it lead him into difficulties.

Mr. Ansted suggests the necessity of rigid attention to a system of drainage, in order to guard against landslips. That many evils have arisen from not taking proper precautions in this respect, is too true; but in behalf of the engineer, it is right to add that circumstances very often place these matters entirely beyond his control; for it often happens that the lands through which long cuttings are made, are of such a nature as to involve with the question of drainage that of vast expense; and this land seldom belongs to, or is under the control of the purchasers of the direct track in which the cutting is made, who have not power by Act of Parliament, or otherwise, to compel the proprietor to use Watson's draining pipes. Again, as practical men, it may be as well to observe that landslips as often occur in horizontal as in vertical strata; for there is always a tendency in clay beds, having great absorbing powers, to separate when saturated with moisture, or, on the evaporation of that moisture during the summer months, to contract in their parts, open into chasms, and either separate directly, or the seeds of separation would be sown against the rains commenced.

The observations of Mr. Ansted on the necessary attention of engineers to tunnelling are also good; but here, again, the geological engineer would be deservedly brought to book, if in conformity with Mr. Ansted's views, from mere suspicion, of hills of a particular shape having a nucleus of igneous rock, he should deviate from the direct line, and thereby interfere with the contract, and check the progress of the undertaking.

In the construction of harbours, breakwaters, quays, and bridges, a geological course of studies would greatly benefit the engineer, by enabling him to form a sounder judgment on the material to be employed, from whence it is to be procured, and of the beds on which the superstructure is to be raised. This Mr. Ansted recommends attaining by an attentive examination of the neighbouring rocks and quarries; and quotes the opinion of Sir H. De la Beche, who remarks, that "an observer may often obtain information on this head by studying the condition of the rocks on the banks and sea-shores." The valuable profile of the railways of the United Kingdom, first suggested by the geological section of the British Association, and now deposited in the Museum of Economic Geology, will long remain a monument of British engineering skill, and a proud triumph over apparently insurmountable difficulties.

"In architecture," says Mr. Ansted, "as in all kinds of engineering works, the benefit derived from a knowledge of geological science is shewn, not only with respect to the foundation of the building, but also in the selection of its site and of the materials of which the superstructure is composed. In the case at present before us this benefit is chiefly obtained in the selection of building materials, but it also has reference to the other parts of the subject, for there can be no doubt that the foundations of all buildings, more especially of those which are intended to last for centuries, should be most carefully selected, so as to possess the advantage of thorough drainage, and be unaffected by any changes that may take place on the surface by the action of ordinary causes."

Unfortunately for architects, they have seldom or never the choice of site left to them, their duty being to give plans for a building to be erected upon a *chosen* spot, and of necessity in prosecuting the work to provide for the imperfections and casualties as they think proper. Here they are necessitated to fall upon artifi-

cial contrivances for draining and securing the foundations, for excluding the wet.

In entering upon the subject of building material, Mr. Ansted relates an anecdote of a practical man who had been employed in selecting stone for an important public building about to be erected, that in looking out for good stone, he was accustomed to go to the churchyard in the neighbourhood of the quarries he wished to judge of, and examine on all sides the oldest tomb-stones that were there.\*

"A stone," says Mr. Ansted, "which resists exposure to the air, may be readily disintegrated by water; and on the other hand, a porous sandy rock will resist the action of water, but fall to pieces when exposed to frost and atmospheric changes. Many kinds of stone are sufficiently durable for sheltered situations, but crumble away when more exposed; others are durable in the country, becoming covered with lichens, which preserve them from atmospheric action, but are disintegrated in towns, where the covering of soot they soon obtain may assist in destroying their surface, and opening the way to a more mischievous, because a deeper-seated action.†"

The following quotations, though now old, cannot fail to interest some of the readers of THE BUILDER; they are principally drawn from the report of the committee appointed to select the stone for the Houses of Parliament.

## LIMESTONE.

"Of limestones," says Mr. Ansted, "there are two or three distinct kinds, each of which is worthy of notice with respect to its geological position, as well as its economic value. The first of these includes the argillaceous limestone, common in silurian rocks, and found also in Devonshire and Cornwall (in rocks of the Devonian period); but stone of this kind is not confined to any particular localities, being met with also in the cretaceous series.

"The second and most important group of limestones for building purposes comprises those (chiefly of the mountain limestone series) which are crystalline and compact, and often of a blue colour. The third series includes the oolites (which are the stones most commonly used, and the most convenient for ordinary purposes), abounding in the middle secondary groups of formations, and employed in most of the public buildings that have been erected in the middle, west, and south of England. These stones, however, vary greatly in relative value as building materials."

"The argillaceous limestones of the older rocks are so rarely of sufficient durability to be used for public buildings, that there is no quarry reported on by the commissioners, one excepted, an accidental variety of the lower chalk quarried at Totterhoe, near Dunstable, and formerly used in some kinds of external work, but now superseded by Bath stone; like other kinds of *chunch*, this bed forms an easily cut, and a very useful material for certain kinds of internal decorative work, and has often been used for such purposes in the interior of our cathedrals. The crystalline carbonates of lime that have been used for building are not very numerous, although they possess many advantages, among which great durability and resistance to decomposition may be ranked as the principal. Many of them, however, are too expensive to be generally employed, such as marble and ornamental stones, and the number of fossil remains found in those of Derbyshire and Devonshire sometimes tends to diminish their value, by exposing them to unequal decomposition in the parts where fossils chiefly abound."

"It is chiefly the oolite limestones that have been employed in England for building purposes; they are so called from the egg-shaped particles being cemented together by a calcareous matter of varied character: they will of necessity suffer unequal decomposition unless the oviform bodies and the cement be equally coherent and of similar composition. Of those

\* [There is a remarkable instance in Hornsey church-yard of a flat ledger of Purbeck stone (which is hard to work) placed over a bricked grave some half century ago, which has strewn the surrounding site with its splitting and dissolving fragments.—Ed.]

† [We do not find soot of itself injurious to the durability of stone, but, on the contrary, believe where it is not washed away the tool-marks generally remain.—Ed.]

best known and used in England are the Portland, Bath, Ketton, and the Barnack. Besides these, Caen stone was a good deal employed in some English buildings of an early date (among the rest in Canterbury Cathedral), and is a stone of great durability and utility.\*

The qualities of the Portland and Bath stone have been already treated on in the columns of THE BUILDER. The inferior oolites at Douling, in Wiltshire, appear to possess some good qualities.

The Ketton stone and the Barnack rag are both of them building-stones, obtained from the oolite strata of Rutlandshire and Northamptonshire. Ketton stone is even-grained and of a dark cream-colour, containing more than 92 per cent. of carbonate of lime and upwards of 4 per cent. of carbonate of magnesia. It absorbs one-fourth of its bulk of water, and its cohesive power is much greater than any other oolite. Many of the buildings in Cambridge are constructed with it.

"The Barnack stone more properly belongs to the shell limestone than to the true oolites; it is of a light whitish brown, consists of 93.4 per cent. of carbonate of lime, and 3.8 per cent. of carbonate of magnesia; it is a little heavier than Ketton stone, but its cohesive powers not more than two-thirds. It is, however, an excellent stone, several buildings of the twelfth and thirteenth centuries built of it being in admirable condition, and scarcely at all decomposed."

There are other varieties mentioned, as the oolite of Lincolnshire, most employed in that county; the remarkable siliceous limestone of Chilmark, in Wiltshire, noted for its extremely great cohesive power, which is, no doubt, owing to the quantity of silica it contains, more than 10 per cent. "The Bolsover quarries, from which the stone for the new Houses of Parliament is procured, and several others that have been recently opened in the neighbourhood, contain about 12 feet of workable stone, in numerous bands from 8 inches to 2 feet thick. This stone is of a light yellowish lemon colour. Its chemical composition consists of 51 per cent. of carbonate of lime, 40 per cent. of carbonate of magnesia, and more than 3½ per cent. of silica. Its specific gravity is 2.316, or considerably greater than that of limestone."

"This admirable stone is not expensive, being cheaper than Portland stone, and worked as easily; but it does not seem to have been much used at a distance from Bolsover, except in slabs for paving. Its qualities of durability are well tested in Southwell Church, Nottinghamshire, a building of the tenth century, and in admirable condition. In this church the Norman portions, built of stone similar to that of Bolsover Moor, are throughout in a perfect state, and the mouldings and carved enrichments are as sharp as when first executed."

"The Roche Abbey quarries, near Bawtry, in Yorkshire, exhibit another instance of semi-crystalline magnesian limestone, but the quality is not at all equal to the stone of Bolsover Moor; and although thick, the stone is so irregularly bedded as to give no certainty to large blocks. This stone contains only 39½ per cent. of carbonate of magnesia, and 57½ of carbonate of lime; and it is both the lightest and the least cohesive of all the magnesian limestones. Roche Abbey, built of it in the thirteenth century, is said to exhibit a fair state of preservation; but this is accounted for by its semi-crystalline condition, and the resistance which the stone therefore offers to the decomposing action of the atmosphere."

"There are two considerable magnesian limestone quarries in the neighbourhood of Doncaster, from both of which building-stone has been obtained, though they appear to differ very considerably in value. The Brodsworth quarries produce a friable stone, with a tendency to oolitic structure; the thickness of the beds is considerable, the price low, and blocks of great size can be procured; but it has not stood the test of time.

"The Park-nook quarries yield a much better stone than those of Brodsworth, and contain about fifteen feet of workable material, which may be obtained of any practicable size. There are buildings of this stone about a cen-

tury old in perfect condition; it is of a cream colour and partly crystalline.

"The Huddlestone quarries, and others in the neighbourhood of Sberburne, supply also a good semi-crystalline magnesian limestone of whitish cream colour, which has been very much and very long used for building purposes, and of which, indeed, parts of Westminster Hall are built. Jackdaw Craig, near Doncaster, and Smawse, in the same neighbourhood, are also well-known for their quarries, which have supplied the stone for public buildings in many parts of Yorkshire.

"The stone from Jackdaw Craig was employed in the building of York Minster, the transepts of which date from the thirteenth, and the tower, nave, &c., from the fourteenth century; but from the generally decomposed state of all this stone, more especially in the mouldings and enrichments, it is evidently not one that should be selected for durability. The upper beds, which are the worst, have been the most quarried, and many of the churches of York, besides the cathedral, are proofs of the want of judgment in the architect who selected a material so readily injured by exposure.

"The Smawse quarries, on Bramham Moor, contain a stone slightly crystalline, and probably for that reason more durable than the former. It is not, however, greatly to be depended on, as in Beverley Minster (of the twelfth, thirteenth, and fourteenth centuries), the west tower, the central tower, and other parts built of this stone are in good condition, while in other parts of the building the same material is decomposed.

"The Huddlestone stone, which is much more crystalline, is also a more uniformly excellent building material. Huddlestone Hall, built in the sixteenth century of this stone, is in excellent condition, as is also a church at Hemmingborough, built of a similar stone in the fifteenth century." Q.

#### DOVER HARBOUR.

In these days of improvements in all directions and of all manners and kinds, the ancient town of Dover is not entirely backward in the march of amendment. Not content with restoring the fine old church of St. Mary at a very large cost, and adorning the town and neighbourhood with new buildings of all classes, Dover will soon possess a vastly increased and improved harbour. It was, indeed, at one time contemplated to make it a harbour of refuge, and it is well known that the Duke of Wellington (who, as Governor of the Cinque Ports, has at different times taken so active a part in matters connected with the welfare and advancement of the town) has ever been in favour of such a desirable object being effected. The work, however, would be of so expensive a nature, that nothing short of national means could hardly hope to accomplish it. His Grace is understood to have remarked, "We will improve the existing harbour; but such a work as that must be done by the nation." Yet, it appears, it is not likely Dover will be converted into a harbour of refuge; but the town commissioners, it is declared, are determined to do all in their power to render the harbour as useful and perfect as possible. It is well known that at present it is not very good, yet it can now accommodate ships of 500 tons. It is chiefly used for sailing and steam packets to and from France. Immense sums have been expended upon this haven from the period of Henry VIII., but it is so imperfectly formed at the present time, that a vessel coming in with a direct south wind would be driven against the walls, as there is neither room to turn nor for the ship gradually to expend her force before reaching the extremity of the docks. The harbour has been undergoing repairs of various descriptions almost constantly for many years, but early in this summer an extensive improvement and enlargement was decided upon and commenced that is well calculated to remedy many of the most important objections now existing. Thus "the poor haven, such as it is" (rather derogatively termed in an old description thereof), is likely to be materially raised in the rank and utility of harbours upon the southern coast of England. It is to be so extended by another wing, as it were, being added, that a vessel may enter in full sail, and have room to turn and come gradually to its stoppage, an object that cannot now be attained.

A large piece of land to the east of the existing harbour and between it and the parade has been purchased for the purpose of enlarging the docks, and gates are to be added. Upon the land so appropriated stood, until quite recently, building yards, houses, &c. There also remains as yet upon the site (although they will be removed in the course of the speedily-approaching alterations) a battery, containing several cannon, and buildings that have been used as a magazine, guard-house, &c. A great portion of the space to be converted to the enlargement of the harbour is now in an advanced stage of excavation, and some parts are already being walled in. It was originally intended to have wooden walls for this addition to the haven, but a wiser, though more immediately expensive plan has been adopted, and stone is to be used instead of the former more perishable material. "Wooden walls" have for many ages proved good defences for Old England; but a harbour intended to endure requires something more substantial. Some notion of the important nature of these works may be formed when it is mentioned that no less a sum than 100,000*l.* is proposed to be laid out upon them, in addition to the large amounts that have been spent upon the docks during the last few years. The time which has been specified for the alterations to be completed is three years; but, having regard to the extent of the improvements, and the difficulties that are so often met with in like undertakings, it seems more than probable that they may not be finished until a somewhat longer period has elapsed. The effect, even now, is advantageous, as it gives more room in some portions of the harbour; but eventually it cannot fail to be most important to Dover, in advancing in no slight degree its prosperity as well as utility.—*Times.*

#### THE IRON TRADE IN SOUTH STAFFORDSHIRE—FALL IN PRICES.

THE ironmasters of this district have not been able to maintain the prices of last quarter, notwithstanding their previous resolutions to do so. It was hoped that they might have been able to sustain that advance which for the last few months they were getting, but they have not, and a reduction of no less than 1*l.* per ton has taken place. At their meeting in Birmingham on the 3rd instant, they resolved upon upholding the price, although it was evident that some under-current was at work to reduce it. Nothing but conflicting opinions were to be heard amongst the best informed representatives of the largest houses, and it was with difficulty that any thing like satisfactory information could be obtained upon the actual state of the market. The price, however, was then declared to be the same as last quarter, and it was reserved for the meeting held at Dudley, last Saturday evening, to make known the actual condition of the trade, and the necessity which existed for a reduction. Various causes are assigned for this fall, and amongst the most probable is the over-speculations of small makers. It would seem many of them, unable to keep stock, have, by underselling the large houses, rendered a sweeping reduction necessary on the part of those extensive proprietors, who have been endeavouring for their own sakes and the general interest of trade to retain something like a remunerating profit. The competition arising from the furnaces of other districts has also, no doubt, materially hastened the issuing of the circulars announcing the above fall of 20*s.* in the ton. It is a heavy reduction, one not usually made suddenly, and least of all not to be expected now, when the railway speculations would seem to hold out the prospect of an enormous demand for at least another year or two.

NEW CUSTOM HOUSE, IPSWICH.—On Friday, the 4th inst., the "raising treat" for this building took place in the large room of the Customs department. The architect, J. M. Clark, Esq., and the builder provided most amply for the entertainment. At 5 o'clock, nearly 100 persons, including several members of the Town Council, sat down to dinner; after which the mayor favoured them with his company for a short time, and who highly complimented Mr. Pettit upon the sound and workmanlike manner in which he had fulfilled his contract up to the present state of the edifice, and upon its near approach to completion.

\* Experience of ancient buildings shows this must be taken with very great limitation.—Ed.]

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*Eton College, Oct. 9.*—The western window in this beautiful chapel, which is the smallest window in the sacred edifice, situated over the inner entrance of the ante-chapel, and over the present organ-loft, has just been filled in with elegant specimens of stained glass, the liberal gift of the Rev. Edward Coleridge. It is understood that the assistant-masters of the school have arranged to fill in the easternmost window on the south side with stained glass containing figures descriptive of some part of Scripture history. It is believed that the easternmost window on the north side will also be filled in with stained glass, at the expense of a nobleman educated at Eton. It seems to be not improbable that in the course of a few years the whole of the windows of this beautiful chapel will be composed of stained glass, thus rendering it one of the most solemnly gorgeous places of divine worship in the kingdom. Active steps are being taken for having the roof, which is of wood, emblazoned with heraldic and other devices, in keeping with the sacred character of the chapel.

*Consecration of Trinity Church, Dilton's Marsh.*—On Monday last, Trinity Church, Dilton's Marsh, Westbury, was consecrated by the Lord Bishop of Salisbury. The building is of Norman design, being cruciform, the eastern end circular, and with a low tower. The north doorway and font are very good—the pulpit elaborate—the seats are low, open, and of good design, but, by a strange mistake, adapted only for seats, the under part of the seat having been blocked up to make sitting the more convenient, whilst kneeling is rendered totally impossible!! The windows in the chancel are of stained glass, representing the Incarnation, Crucifixion, and Resurrection of our Lord. They are the gift of Mrs. Phipps of Leighton, who also presented the altar cloth. The windows in the transept are also of stained glass of good pattern. The altar is a massive table of wood, supported on Norman pillars.—*Firley's Bristol Journal.*

*Consecration of the New Church at Welshpool.*—This church, erected by voluntary subscription in honour of the coming of age of Lord Viscount Clive, was consecrated on Wednesday week. There is room for 1,000 persons in the church, and one-half of the sittings are free. The sum of 6,000*l.* was subscribed for the building, but this, it appears, is not sufficient to pay the cost.

*Magnificent Gift.*—The late George Maude, Esq., of Middlewood Hall, near Darfield, has left the sum of 1,000*l.* to be appropriated to the repairs of Darfield Church.

## RAILWAY INTELLIGENCE.

*North British.*—The directors of the North British Company have made an offer of 4,500*l.* to the corporation of Berwick for the portion of their property required for the line (about 20 acres). The council, however, have resolved not to abate their demand of 6,000*l.*, considering that the property will be deteriorated by the manner in which it will be divided into two portions along its whole length.—*York Gazette.*

*Statue of George Stephenson.*—A splendid marble statue of George Stephenson, Esq., from the chisel of Gibson, will, it is expected, before long, form one of the ornaments of St. George's Hall, Liverpool, which is rising opposite the terminus, in that town, of Mr. Stephenson's first great railway.

*Prosper's Railway.*—This railway differs from the old wooden railway in having the wood indurated by the injection of an alkaline and metallic salt, and the employment of a levelled guide-wheel, fixed at an oblique angle before and behind each carriage.

*New Method of generating Steam.*—The attention of scientific men is directed to what is expected to prove a new method of generating steam, viz., by a galvanic flame directed with such force as to cause water to boil.

*Coventry, Warwick, and Leamington.*—The branch from Coventry to Warwick and Leamington is nearly completed, and it is intended to open the line to the public on the 2nd of December.—*Worcester Guardian.*

*Whitby and Pickering.*—The York and Scarborough Company, who have purchased this railway, through Mr. Hudson, is to take possession at Lady-day next.

## Correspondence.

## IMPROVEMENTS OF IPSWICH.

TO THE EDITOR OF THE BUILDER.

SIR,—A short time ago, in your list of competitions, there was a notice of an offer of a premium of ten guineas for the best design for laying out the old Shire-ball yard in this town, together with a design for some almshouses to be erected on part of the said ground.

I beg to inform you, and those of your readers who take an interest in the result of competitions, that the committee appointed for the choosing of the best design have, after a long and careful examination, awarded two premiums of ten guineas each to two designs sent in, they not being able to give the preference to either.

The first is a very excellent and chaste design, in the Tudor style, by J. M. Clark, Esq. (architect of the new custom-house at present erecting there), and which is exceedingly creditable to the taste of the committee; the second is a design by a Mr. Woolnough, and is a mixture of the common street-house and Elizabethan, and which, of course, is more suitable to the taste of the unlearned and unrefined.

I am happy to say, however, that the town-council have wisely determined to carry into execution the design of Mr. Clark.

Excuse my trespassing on the space of your valuable journal, but this competition deserves notice, because it is one of the few exceptions which are not, to use a slang phrase, a "done job."

I am, Sir, yours respectfully,

Ipswich, Oct. 10. A LOOKER-ON.

## BATH STONE MASONRY.

SIR,—Having seen in your valuable publication of last week, that you intend to give a survey of the Bath stone masonry of the metropolis, I hope you will notice in it, whether those stones which are placed on their "bed" (i. e. as they lie in the quarry) exhibit marks of decay.

In the three instances in which you mention its having been used only fifteen years ago, and being now in a miserable state of decay, were the men then employed to work the stone used, accustomed to work Bath stone? and did the architect take care that all the stones were set on their "bed"?

If these precautions are taken, why does not Bath stone stand as well in the metropolis as in the neighbourhood of Bath, where it has stood the test of ages?

I am, Sir, your obedient servant,

October 11th, 1844. G. D.

[We believe little care was taken to place the stone as it lay in the quarry, and that where it is so laid, it has not fared better while it has a still more seamy, striated, and disagreeable effect. We in London, accustomed to fine masonry in nearly all the buildings forty years old, could not be brought to admire the triflingly smaller quantity of decay to be found where more care is taken in selection and building: we beg to contrast the restoration of Henry VIIIth's Chapel, completed hardly twenty years ago, with that of the neighbouring church of St. John. The former, though of chosen stone, taken from a large quantity kept on hand for selection, and not done by contract, has already been the occasion of much admiration; while the latter, except on the weather lines, retains its superb marble-like original surfaces, and is likely to retain them while its frail foundation will bear its mass.—Ed.]

## HARDY MEMORIAL.

SIR,—I am glad to see your correspondent "Memorabilia" notice, in your last number, the shameful manner in which the Hardy Memorial affair has been conducted. Happening to be near Dorchester during the time it was in agitation, and feeling interested as an admirer of the late gallant admiral, I inspected the designs sent in, and made inquiries, but everybody was asking, Who is the "hon. sec.," and what are the committee about that nothing has been done during the whole summer? Now it appears to have been a preconcerted plan that one of the committee, a Mr. A— (who is always, I understand, endeavouring to cull fame from the labours of others), should make a design, the committee having advertised for plans to furnish materials for the

amateur to work from; but what a wretched production has he given birth to! There were several excellent designs sent, but the one selected appears to have been copied from some gas-house chimney; at all events, it will be a disgusting specimen, totally destitute of one architectural feature, and an insult to the memory of the worthy admiral. Who are the committee? They must be the slaves of the man in power to select a plan so unworthy. I trust that the public will be awakened, and stop the adoption of so disgraceful a proceeding.

I am, Sir, your obedient servant,  
VERITAS.

## Miscellaneous.

*LAYING THE FIRST STONE OF THE NEW DOCK AT WOOLWICH DOCKYARD.*—The laying of the first stone of a new dock at Woolwich, by Admiral Sir George Cockburn, Bart., took place on the 26th ultimo, in the presence of another Lord of the Admiralty, and a number of officers. Sir George, on arriving at the site, first inspected the drawings of the new work, submitted to him by Captain Dennison, R. E., the director of works at Woolwich, and conversed on its formation, &c. Immediately the immense block of granite was hoisted from its intended resting-place, the cement was spread by the gallant admiral in a very workmanlike manner, and Sir George set the stone, weighing between four and five tons, with the mallet, as it was lowered into the bed prepared for it. On the work being finished, this distinguished member of the Admiralty congratulated Captain Dennison on the first progression in the construction of the dock, after so much necessary preparatory labour, and expressed a hope that its completion would be as creditable to the eminent contractor, Mr. Rolt, as it will be advantageous to the public service. This work, important and extensive as it is, is a small undertaking comparatively to the great undertaking in which Mr. Rolt is engaged in constructing, the new steam basin at Portsmouth, which is rapidly progressing with satisfaction to the Admiralty. The following are the dimensions of the new dock at Woolwich, called the Eastern Dock:—From the centre of caisson to head of dock, being clear of coping, 300 feet 8 inches; width of ditto, 92 feet 4 inches; average depth from level of coping, 26 feet. Mr. Rolt in the evening entertained a party of his friends, at the Crown and Sceptre, Greenwich, when, after the usual loyal toasts had been drunk, "Success to the New Work," the healths of Sir G. Cockburn and the Admiralty, Sir P. Collier, and many other officers, were given and drank with much applause.—*Morning Herald.*

*OPENING OF THE LOCK AT DIGLIS.*—This morning, at 11 o'clock, the ceremony of opening the lock at Diglis took place in the presence of a considerable number of the citizens, J. Bailey, Esq., M.P., Richard Spooner, Esq., and several gentlemen forming the committee of management. The first vessel that passed through the cutting and the large lock (having on board the gentlemen above named) was the Sarah, belonging to Mr. Luke Maybury, of the Wherry; two others afterwards entered the lock (the Richard, of Droitwich, and a smaller barge) abreast; there was ample space for both, and the length between the gates is sufficient to admit two others of the same size. The length of the lock is 150 feet by 30 feet, and 34 feet deep. The lower gates weigh 32 tons the pair, and may be worked with ease by one man. This is, we understand, the first attempt that has been made to work gates of this magnitude by means of balance beams, and, as far as can at present be seen, it is likely to be most successful.—*Worcester Journal,* Oct. 10.

*ENCROACHMENTS ON THE REGENT'S-PARK.*—On Saturday, at a very numerous meeting of the vestry of St. Marylebone, for the purpose of considering what steps should be taken with respect to recent inclosures which have been made of portions of the Regent's-park, it was agreed, on the motion of the Rev. Dr. Fellows, that a memorial should be presented to the Commissioners of Woods and Forests, representing "that a part of the Regent's-park, in one of the green slips adjoining the ground attached to Hanover Lodge, has been inclosed with an iron wire fence, and thus taken from the public use; and that the green

slips which lay to the north of the park, between the canal and the road of the outer circle, are more prized by the public in general for the rural scenery which they exhibit, and for the shady walks which they afford, particularly during the hot summer months. Your memorialists, therefore, setting the highest value on these slips, are greatly grieved to see one of them fenced in and abstracted from the public benefit. —Times.

FALL OF A PORTION OF APPELEY BRIDGE. —On Saturday last, about 11 o'clock in the forenoon, the north-east end of the parapet-wall of Appley stone bridge gave way, and a large part adjoining the Coach and Horses Inn was thrown down into the river Eden. Fortunately, no one was upon the bridge at the time, although it is frequently occupied by loiterers looking over the sides into the river. Mr. Robinson, the bridge-master, was in immediate attendance, and by the aid of a sufficient number of workmen, a wooden fence with iron stays was substituted for present security; it is presumed that the old bridge which has withstood the storms of so many years, will now be quite removed, and one more in accordance with the taste and spirit of the times erected in its stead.

Orders.

TENDERS delivered for the restoration of the Parish Church of Kirk-Penton, Yorkshire.—Mr. George Fowler Jones, Architect, York. August 10, 1844. Noah Akeroyd, York £656 0 0 John Baxter, Leeds 660 0 0 John Shaftoe, York 721 18 0 John Powell, York 786 0 0 Holmes and Bateson, Leeds 856 1 9

TENDERS delivered for building a New Gaol at Aylesbury.—C. J. Pierce, Esq., Victoria-road, Kensington, Architect. Grassel and Peto £43,394 W. and J. Lee 42,870 Baker and Son 41,850 Hooman, Aylesbury 41,833 Ireson, Northampton 41,500 Plowman and Co., Oxford 41,150 Locke and Nesham 40,800

NOTICES OF CONTRACTS.

For some repairs to the Steeple of St. Luke's Church, Norwood.—Mr. Rogers, Architect, Palace Chambers, Lambeth. October 22. For Sloughing and Bottoming the Burton Pitssea West Drain.—Robert Gibson, Keyingham, or George Iveson, clerk to the Commissioners of the Keyingham Level Drainage. October 30. For the Erection of a new Barrack Establishment at Bristol.—C. J. Selwyn, Major and Commanding Royal Engineer, Exeter. November 7.

COMPETITIONS.

PREMIUM of 25 guineas for the best and another of 15 guineas for the second best design for laying out for building purposes a plot of land, containing about nine acres and a half, situate in the borough of Reading, having a frontage of upwards of 900 feet, and being of the depth of about 460 feet. Further particulars of J. J. Blandy, Esq., Solicitor, Reading; or of Messrs. Gregory, Faulkner, Gregory, and Bourdillon, 1, Bedford-row, London. November 15.

PREMIUM of 500*l.*, being a legacy bequeathed for a painting to be placed in the recess over the communion-table of St. James's Church, Bermondsey. The subject to be the Ascension of our Saviour. Further particulars of the trustees of that church.

NOTICE.

OUR next Number will be Double; and, besides containing our promised Cyclopædia of the New Building-Act, will be fully and beautifully illustrated.

TO CORRESPONDENTS.

A Subscriber.—The inquiry of our correspondent is very elementary. We refer him to "The Student's Guide to the Practice of Measuring and Valuing Architects' Works," published by Weale, of Holborn; price 7*s.* 6*d.*

A Constant Reader.—The kind of jamb and arch mentioned is principally to be found in early and very late specimens; but is, we think, to be avoided as mean, and to be seldom used except in workhouses.

A. E. I. Z. is referred to Mr. Manfred, No. 36, Palace-street, Finsbury; or should that locality not suit him, he may apply by letter to T. T., care of Mr. Pollitt, 63, Fleet-street; or to Z., Post-office, Charles-street, Middlesex Hospital.

Q.—We have not yet received the final report of the Master Carpenters' Society.

A Constant Reader.—The Contract referred to was extracted from a local paper; we know nothing further respecting it.

ADVERTISEMENTS.

POLONCEAU'S BITUMEN PAVEMENT for paving Footwalks, Terraces, Garden walks, Stables, Coach Houses, Granaries, Corn Stores, and Salt Warehouses. For the exclusion of Damp and Vermin in Basements it is particularly adapted, and for Roofing Dwelling Houses, Porticos, Balconies, and Sheds.

BITUMEN for covering the Arches of Bridges, Culverts, &c. &c. on Railways and other places (instructions for laying it down), may be had at the rate of 45*s.* per ton, by applying to JOHN PILKINGTON, 15, Wharf-road, City-road.

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, ARCHITECTS, &c.

MC KIBBIN'S improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY. The disadvantages attending other materials used in roofing, preventing, in agricultural districts, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impenetrability to water and damp, in covering Houses, Cattle-sheds, Workshops, Barns, &c. and the stables, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so light as to save its whole expense; it requires no other coating, and may be applied by any person of common ingenuity; being flexible and portable also, it is free from breakage, the expense of cartage is inconsiderable in comparison with slates, tiles, &c. and it is not liable to contraction or expansion. Sold in sheets 32 inches by 20, at 5*d.* each (being less than 9*s.* 6*d.* per square of 100 feet), with printed directions for applying them.

Orders will meet with prompt attention, if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall-street, London; or to the following agents:—Liverpool, Messrs. Gruber and Co., 11, Market-street; Manchester, Messrs. J. & W. Platt; Plymouth, Messrs. Thomas Stevens, esq.; Birmingham, Messrs. William R. Lloyd, esq.; Sunderland and Newcastle, Messrs. J. & W. Platt; Hull, Messrs. William Ward, esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitby, Messrs. W. & A. Whigham, esq.; Glasgow, Messrs. Malcolm Carmichael, esq. St. Enoch-square.

Cook, Messrs. Richard Wallis and Co., Belfast. Messrs. Gracher & Co., Dunbar's Quay.

Who have also on sale McKIBBIN'S improved SHEATHING, Boiler, Railway, and other FELT. The "Improved Roofing Felt" will be found much more durable than the common Felt made in lengths, and not subject, like it, or continuous sheets of other material, to be stripped by storm; it can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

TO ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MERCHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL.

JOHNS AND CO'S PATENT STUCCO CEMENT.—The following are the positive advantages possessed by this Invention over every Cement hitherto introduced.—It will effectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to Wood, Iron, or Glass. It will carry a larger Proportion of Sand than any other Cement, and will be equally as good and perfect when other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly, and is equally pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instructions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Portland Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy.

Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials, from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Chesham, London; of whom also may be had, JOHN'S AND CO'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over exterior Walls of Houses that have been covered with Roman or other Cements, and which have become dirty and discoloured. It is in every way better suited for this purpose than White Lead Paint, which will frequently come off in flakes, being in direct chemical opposition with Cement; whereas JOHN'S AND CO'S PATENT STUCCO PAINT, having an affinity for Stucco, binds itself with it, stopping the acretion, thereby rendering the wall proof against weather, and in the same producing a pure stone-like effect, producible by no other Paint whatever. It is cheap in its application, and may be used by any Painter, in any climate, even in the most exposed Marine situations.

WARMING BUILDINGS BY HOT WATER.—J. WEEKS and OAY, King's-road, Chelsea, having had a most extensive practice for 20 years in the erecting of HOT WATER apparatus for the heating of churches, mansions, warehouses, halls, lathes, horticultural buildings, &c., will be happy to give estimates for warming buildings of every description to which heat is applicable. The hot water apparatus is to be seen in action on their premises.

PAINTING BRUSHES.—TO PAINTERS, BUILDERS, &c.

J. J. KENT and CO., 11, GREAT MARLBOROUGH-STREET, LONDON, offer to Painters, Builders, and Dealers in Painting Brushes, goods of a quality far superior to those generally offered for sale, and to which they beg to call the attention of those who study quality and durability to cheapness. Lists and prices forwarded on application.

BUILDERS, PLASTERERS, and others should compare the Prices.—Yellow Ochre, 8*s.* per cwt. Lamp Black, 2*s.* 6*d.* per cwt. Blue Black, 16*s.* do. Venetian Red, 12*s.* do. Gold Size, 9*s.* per gallon. Copal Varnish, 12*s.* 8*d.* do. Oil of Turps, 11*s.* 14*s.* do. Paper Varnish, 11*s.* 14*s.* do. at PEISLEY'S noted Cheap Lead and Colour Warehouse, 58, JUDD-STREET, NEW-ROAD. Brushes, Varnishes, Dry and Ground Colours, at lowest prices.

VARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messrs. George and Thomas Wallis to produce Varnishes (both oil and spirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality.

Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Fine Oil Varnish, from 9*s.* per gallon; best White Spirit Varnish, 21*s.* ditto; Best Spirit French Polish, 16*s.* ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices.—WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1759.

H. BESSEMER'S PATENT GOLD PAINT. Sole Agents, R. TILLEY & GARROD, 245, Blackfriars-road, London.

The above METALLIC PREPARATION is intended to supersede the use of Gold Leaf, as it gives an equally beautiful effect; is extremely durable; will bear washing equally well with any other description of fine paint; and in comparison, costless, requiring only to be applied with an ordinary brush. It will be found particularly adapted for the following purposes:—

HOUSE PAINTERS and DECORATORS. For exterior and interior Decorations, Iron Works, Mouldings, Cornices, Centres, Brackets, Figures and Casts of every description, whether Plaster or Metal, Gilding, and all other uses to which Gold Leaf is required to be introduced.

SHIP PAINTERS and DECORATORS. For such Ornamental Work, either within or without, as may require the utmost and its cheapness affording an opportunity of embellishment so desirable, but which is frequently neglected from its great expense.

PLASTER FIGURE-MAKERS. For general use upon the Figures, Casts, and Metallines manufactured for ornamental purposes.

And for various other uses here undescribed, but which its low cost may likewise adapt it to. To be had wholesale and retail at most Colour Warehouses in the Kingdom. Sold in bottles, 6*s.* each.—A liberal allowance to the trade.

PLUMBERS, PAINTERS, BUILDERS, & OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures, Glazing, &c. &c. in any quantity, at Manufactory Prices.

TURPS, per gallon . . . . . 2*s.* 6*d.* LINED OIL, ditto . . . . . 18*s.* 6*d.* SHEET LEAD, in sheets, per cwt. . . . . 14*s.* 6*d.* Ditto, cut to sizes and PIPE . . . . . 19*s.* 6*d.* WHITE LEAD or Lead Genuine, per cwt. . . . . 16*s.* 6*d.* Colours, &c. &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to R. COGAN, 5, Princes-street, Leicester-square, London. PRINTING FRAMES, PICTURE FRAMES, AND GLAZING MAKERS can be provided with fitted Crown Glass Sheet, and the patent Sheet Plate, Lists of which, showing the price for any Square, from 14 by 12 to 40 by 30 of Best and Second quality, will be sent gratis upon receiving the address of any quantity and size of Crown Glass Sheet, and a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all quantities and sizes of Crown Glass Sheet, and Sheet-Plate, &c. Glazing estimated for, if required.

NURSERYMEN, MARKET GARDENERS, AND OTHERS receive, with a great variety of choice Stock of which is constantly on hand, than is kept by any other House in London.

COMMON SHEET AND CYLINDER. The advantages of Common Sheet over Crown for glazing are, that it is decidedly greener, and is generally used where strength or superior appearance is required; a light 6 feet 6 in. long, with openings of any width, needs only one lap. This Glass is considerably stouter than Crown, and may be had from 1*s.* 3*d.* per foot.

Also may be had, COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES, of every description. GAS CONTRACTORS, FITTERS, GLASS MERCHANTS and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

GLAZING MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS, supplied with FRENCH ORNAMENTAL SHADES, for covering Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application.

French Table Flowers, Chins Vases, Fancy Glass Ware, and every variety of French and English Cut Glass in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Bazaar keepers and others.

## NOTICE.

WE must ask the indulgence of our readers for postponing this week the Cyclopaedia of the New Building-Act, which arises from the indisposition of its author.

# The Builder.

NO. XC.

SATURDAY, OCTOBER 26, 1844.

AMONG the many subjects which have occupied our thoughts, but which time and space have not permitted us to follow during the present year, is that of fire-proof construction: we can, indeed, hardly undertake to go into the matter before next year, but we publish the following letter, which we have received upon that which is not merely an important branch of architecture, but which is, indeed, legitimate architecture itself.

SIR,—The other day, in looking over some of the former numbers of THE BUILDER, I observed in No. 30 your leading article was upon "Fire-proof Buildings," since that time I believe very little notice has been taken of that important subject in your journal; now, Sir, will you allow me to suggest that I think you would be conferring a great favour upon the building community at large, if you would become the vehicle by which some one of your numerous correspondents who would not think it too much trouble would send correct plans and sections, likewise a detailed account, of any fire-proof building at present existing; or if that should be considered inconvenient, probably some talented individual might be found kind enough to forward you a plan of his own on this most important, and at the same time badly understood subject.

If your own views of the case should at all correspond with the ideas of your humble petitioner, and this letter be deemed sufficient for the furthering of this good cause, please to give publicity to it.

A sincere well-wisher,  
Union-street, Borough, G. M.  
October 16th, 1844.

Some approaches are indeed being made towards fire-proof construction in various places, and some buildings have been executed, the construction of which has been guided by that intention; but, on the whole, as little has been done to render our buildings permanent against the ravages of fire, as against those of moisture and frost.

The roofs of the Houses of Parliament are being formed of metal instead of wood, and the country may be congratulated upon this circumstance, and may bless the wisdom which directed such a precaution; but the Royal Exchange, relative to which such daily panegyrics appear, and which has repeatedly been declared to be fire-proof, is no more so than a tar-barrel, or a gunpowder irkin; and the huge masses of timber in its roofs and floorings would, in a single night, repeat the havoc which destroyed its predecessor; the very ceiling of the merchants' piazza, about the painting of which the public has heard so

much, will, most probably within a hundred years, "try by fire," and overthrow in a few hours every pier around its court, as ignition played at skittles with the columns around the court of the former Exchange and won the game, leaving none standing before the bowls of flame which she rolled at them; hither and thither were they all staggered, as easily as the strong man overthrew the pillars, and as in that moment came down the house of Dagan, as easily was the merchants' house of pride reduced to atoms and fragments of disjointed stones.

This part of the error might have been avoided simply by the effect of a little correct architectural feeling; if, instead of in making only the paltry flat plaster ceiling (which will be bacon-dried in ten years, and which is a species of external decoration wholly unsuited to the climate of England, and to the carbonized atmosphere of her cities), the same expense had been incurred in honourably covering the piazza with legitimate, scientific, architectural, fire-proof vaulting, bearing its own ornaments, in solid form, as all true external architecture in England must; and surviving time, accident, neglect, and violence.

Those who have managed the erection of this building, it will be found, have travelled almost as widely as possible from caution.

F. D.

## NEW METROPOLITAN BUILDING-ACT.

REPORT OF A COMMITTEE APPOINTED BY THE GENERAL SESSION OF THE PEACE, AUGUST 15, 1844.

1. To examine and consider into what districts the new portion of an area pointed out by the Act within the jurisdiction of the court might be conveniently divided, and whether any, and what, alterations might be expedient in the districts subsisting and appointed under the former Building-Act; and to communicate with the Home Office, and all other authorities, on the subject, at their discretion; and report thereon to the Court, who might then consider such matter and report—and forthwith determine thereon. And.
2. To revise the present standing orders of the Court as to District Surveyors, and to consider what arrangements might be most conveniently made for obtaining the consents required by the Act from the Home Office; and to submit such revised rules to the Court, at their next meeting, for consideration and for adoption, if approved by the Court.

The committee so appointed perceived—

1. That the new Act, as to the districts and officers to be appointed in pursuance thereof, was to come into operation on September 1; and, as to buildings and other matters, on January 1, 1845. (S. 1.)

2. That (s. 3.) the operation in regard to localities was to be extended beyond the boundaries of the former Act (limited to the bills of mortality and the parishes of St. Marylebone, St. Pancras, and St. Luke, Chelsea) to an area including all places lying on the north side or left bank of the river Thames, within the exterior boundaries of the parishes of Fulham, Hammersmith, Kensington, Paddington, Hampstead, Hornsey, Tottenham, St. Pancras, Islington, Stoke Newington, Hackney, Stratford-le-Bow, Bromley, Poplar, and Shadwell; and to all such part of the parish of Chelsea as lies north of the parish of Kensington; and to all places lying within 200 yards from the exterior boundary of the district thereby defined, except the eastern part of the boundary bounded by the river Lea: so that the enlarged area would extend to the parishes of

Fulham,	Hornsey,
Hammersmith,	Tottenham,
Kensington,	Stoke Newington, and
Hampstead,	Bromley,

not being included in the former Act, and as to which, therefore, no districts or district surveyors had been heretofore appointed.

3. That it should be lawful for the justices of the peace for this county and the city and liberties of Westminster, at their General Quarter Sessions, respectively, or any adjourn-

ment thereof, with reference to their county and city and liberties, and they are thereby empowered, but subject nevertheless to the consent of one of her Majesty's Secretaries of State, to appoint the districts to which the respective places within their jurisdiction should belong for the purposes of this Act; and to unite, enlarge, and alter such districts for the more convenient distribution of the business. (S. 64.) And that it should be lawful for the said justices, in their General Quarter Sessions respectively, or any adjournment thereof, with reference to their respective counties, and they are required, but subject nevertheless to the consent of one of her Majesty's principal Secretaries of State, to nominate and appoint as surveyors such and so many discreet persons, of the full age of thirty years, and properly educated and skilled in the art and practice of building, as the said justices should think fit. But that the present surveyors (s. 70) should be continued in office; and that all surveyors thereafter appointed should be subject to a previous examination as to their practical qualifications by a Board of Examiners nominated by the Commissioners of Woods and Forests (s. 66), and should produce to the clerk of the peace a certificate of qualification from such Board of Examiners one week before an election of any such surveyor. And that every surveyor hereafter appointed should make a declaration of official fidelity, to be administered by the justices in their General Quarter Sessions, before any such surveyor should be competent to act.

4. That, in case of any vacancy by death or removal, the justices should, within one month, at their General Quarter Sessions, or an adjournment thereof, appoint a successor (s. 74); and that in the meantime the official referees appointed under the Act might appoint a competent person to perform the duties of the vacant district; and that such official referees (s. 75) may also represent to the justices any opinion they may form that a district is too extensive for any surveyor, and may appoint a competent person to assist any surveyor who cannot promptly and efficiently discharge the duties of his office. And.

5. That an appellate jurisdiction (s. 57) is given to the justices for the county of Middlesex and for the city and liberties of Westminster, at their Quarter Sessions respectively, as to certain convictions affecting nuisances situate within their respective county or city and liberties.

To these provisions of the new Metropolitan Building-Act your Committee have referred, that their proceedings and opinions may be rendered more generally intelligible to the Court. And they would therefore also state, that some difficulties were presented by the provisions of "The New Act (7 & 8 Vict. c. 71) for the better Administration of Criminal Justice in Middlesex," and which passed three days before the former mentioned Act. These difficulties were, that, by the 11th section of the Middlesex Act, it is provided that Sessions of the Peace in and for the city and liberty of Westminster should cease to be holden, and the Sessions to be held in and for the county of Middlesex, mentioned in the 2nd section, should be holden by adjournment within the said city and liberty, and should have full jurisdiction over all things cognizable by the Sessions for the said city and liberty; while, by the 57th section of the Metropolitan Building-Act (and which passed after the Middlesex Act), appeals as to premises in the city and liberties of Westminster are to be heard at the Quarter Sessions thereof; and, by the 64th section, the justices for the city and liberties of Westminster, at their General Quarter Sessions, or any adjournment thereof, are to appoint the districts to which the places in that jurisdiction should belong, and unite, enlarge, and vary the same, and, by the 65th section, are to nominate and appoint the district surveyors—and which occasioned doubts as to the course which the Middlesex magistrates might hereafter take as to the places within the city and liberties of Westminster, and the appointment of surveyors for those places. But as, with respect to those doubts, your Committee have been favoured with the opinion of The Registrar of Buildings under the Metropolitan Building-Act, and of the legal adviser of the Commissioners of Woods and Forests, "That the magistrates for Middlesex sitting by adjournment at Westminster

would have all powers as to appeals, districts, and the appointment of surveyors in and for the city and liberties of Westminster which the Sessions for Westminster might have exercised had not their Sessions been discontinued by the 11th section of the Middlesex Act; and as no practical question need at present arise on that matter, since no variations, or new districts, or appointments of new surveyors are immediately occurring in the city or liberties of Westminster, your Committee proceed to advert successively to the following topics referred to them by the Court:—being

1. The existing districts under the former Building-Act, and the propriety of variations in them.
2. The districts into which the new enlarged area, within the county of Middlesex, should be distributed.
3. The measures to be now taken by the Court for carrying the Act into effect. And,
4. The standing orders as to district surveyors which it might be expedient for the Court forthwith to adopt.

As to all these subjects your Committee may generally state, that, dependent as all their recommendations must eventually be on the opinions and concurrence of the high official authorities invested by the Act with a controlling power, they deemed it expedient, after collecting needful information from all accessible sources, to communicate with the Right Honourable the Earl of Lincoln, and, by his suggestion, with the official referees and the Registrar of Buildings; and that your Committee, acknowledging the most prompt and courteous attention from them, have the satisfaction to apprise the Court that they have reason to believe that their suggestions are perfectly approved, and that no difficulties in the way of the accomplishment will arise.

*As to the First Topic, or the Existing Districts.*—Your Committee present you a statement, which, from official returns and parliamentary papers, they have been able to prepare, and which will supply information that it will obviously be desirable to possess and preserve.

EXISTING DISTRICTS.

MIDDLESEX AND WESTMINSTER.—NOT AT PRESENT TO BE VARIED.

DISTRICT.	Surveyor, and Date of Appointment.	Number of Houses.	Income in 1842.	Whether Emoluments be in a declining, stationary, or progressive State.
St. Mary, Stratford-le-Bow	J. H. Good, November 1, 1838	4,285	£ s. d. 235 14 0	Declining.
All Saints, Poplar	Henry Flower, November 10, 1836	about 7,000	210 17 0	Progressive.
St. George-in-the-East				
St. Botolph without Aldgate				
St. John, Wapping	Edmund Woodthorpe, July 11, 1839	3,447	112 11 0	Declining.
St. Anne, Limehouse				
St. Catherine				
Ratcliff				
Mile-End, Old Town	John Davies, July 11, 1839	8,200	363 14 0	Progressive.
St. John, Hackney	Thomas H. Wyatt, April 12, 1832	7,294	372 15 9	Progressive.
St. Matthew, Bethnal-green	Edward N. Clifton, April 18, 1844	13,500	122 5 2	Declining, but probably will improve.
Mile-End, New Town	Charles Hanor Hill, January 16, 1817	5,253	53 5 0	Declining.
Christ Church and Shadwell	William Grellier, November 1, 1838	4,661	108 18 0	Declining.
Whitechapel	Matthew Wharton, July 15, 1802	14,409	541 18 6	Declining.
St. Leonard, Shoreditch	Rich. C. Carpenter, April 4, 1837	6,608	83 1 0	Stationary.
Norton Folgate	George Edwards, July 15, 1802	8,750	556 0 0	Progressive.
St. Luke's, Old-street	Robert Sibley, April 16, 1829	7,000	276 11 0	Declining.
Glass-house-yard				
St. Mary, Islington, and St. Sepulchre Without				
Clerkenwell				
Saffron-hill Liberty	Samuel Angell, April 14, 1831	1,491	69 1 0	Stationary.
St. Clement Danes				
St. Mary-le-Strand, and The Savoy				
St. George the Martyr	George Legg, January 18, 1844	2,943	44 0 0	Declining.
St. Andrew, Holborn, above Bars				
Liberty of the Rolls				
St. Giles-in-the-Fields	George Pownall, January 16, 1840	4,557	160 15 0	Declining.
St. George, Bloomsbury	Henry Baker, July 7, 1825	15,000	1,104 0 0	Progressive.
St. Pancras	John White, July 2, 1807	14,280	943 6 0	Progressive.
St. Mary-le-Bone	George Gutch, May 12, 1825	3,746	752 17 0	Progressive.
Paddington				
St. Luke, Chelsea	Samuel Beachcroft, May 12, 1825	about 6,000	363 7 6	Progressive.
St. Margaret and St. John, Westminster	William Pilkington, July 1, 1784	5,618	168 15 0	Declining.
St. Martin-in-the-Fields	Henry Ed. Kendall, April 15, 1823	3,933	170 4 0	Stationary.
St. Anne, Westminster				
St. George, Hanover-square	Edward M. Foxhall, November 3, 1827	7,567	Average 650 0 0	
St. James	James Gray Mayhew, November 1, 1823	3,774	172 10 0	Declining.
St. Paul, Covent-garden				
St. Clement Danes, and St. Mary-le-Strand, Westminster	Edward C. Hakewell, January, 1843	1,823	In 1838 it was stated to average 100 0 0	

With respect to these districts, your Committee, after much and anxious inquiry and consideration, cannot recommend any immediate alteration. No public convenience would result adequate to the individual injury that would be inflicted by a diminution of emoluments and districts on the present surveyors—who by the Act are continued; and especially as the provisions of the Act which enable the official referees to appoint assistants where needful will induce punctuality and execution, and careful fulfilment of duty by the present surveyors; while the increased powers of the Court to fine or dismiss surveyors will also secure all parties affected by their conduct from any causes for well-founded complaint.

But though your Committee do not advise any immediate interference in the subsisting districts, they would unhesitatingly suggest the following alterations as vacancies occur by removal or death.

To divide each of the under-named parishes into two districts, viz. Islington, St. Marylebone, Paddington, St. Pancras.

To separate the parish of St. Sepulchre Without from Islington, and add it to the district of Saffron-hill Liberty, St. Clement Danes, St. Mary-le-Strand, and the Savoy. And

To separate the parish of Shadwell from Spitalfields and Mile-End New Town, and add it to the district of St. Catharine's, Wapping, Ratcliff, and Limehouse.

The extent of the four parishes enumerated, and the information collected respecting them, induce your Committee to recommend the division of each of them into two districts, the limits of which can be determined by the Court when a vacancy shall occur; and as Clerkenwell intervenes between Islington and St. Sepulchre Without, and Whitechapel and St. George's-in-the-East between Spitalfields and Mile-End New Town and Shadwell, your Committee presume that the propriety of the alteration proposed can admit of no doubt.

*As to the Second Topic, or the New Districts Proposed.*—Your Committee feel sanctioned by the universal concurrence of those who have long and professionally considered the subject, and submit to the Court the adoption of the parochial system, or the establishment of each parish into a separate district, as most intelligible and generally convenient. In the case of Kensington only would they deviate from that practice; and the peculiar localities of that extended parish, now rapidly increasing on the northern and southern extremities, and which may readily be divided into north and south districts by the Great Western-road, thus effecting a nearly equal division with regard to the actual duties and prospective improvements, your Committee trust will induce the Court to approve that deviation from the general rule. And for their information as to the new districts they would introduce a table, which careful investigation has enabled them to supply.

PROPOSED NEW DISTRICTS.

All on the Parochial System, except as to Kensington; that to be divided by the Great Western-road into two districts—North and South Kensington.

Names of Districts.	Number of Houses.	As to probable Increase of Buildings.
Fulham	600	About thirty houses now in progress of building.
Hammermith	2593	There will be a greater number of houses erected in the three next years than there were in the three last years.
Kensing- (North ... South)	1543 2601	The number of houses will be increased very considerably in both districts, and especially in the north.
Hampstead	1434	There will shortly be an increase in the number of houses.
Hornsey	924	On the Eastern side, near Newington-green, new houses are likely to increase; as to the other parts of the parish, there is no probability that buildings will much increase, which may arise from the property being copyhold.
Tottenham	1510	There is a quantity of ground to let on building leases in eligible situations.
Stoke Newington	705	The number of new houses likely to be built may be fairly averaged by those of the three last years, which have averaged ten a year; but, though that district appears small, there are four candidates for that appointment.
Bronley	1135	The new houses likely to be built by this time next year, including those now building, may amount to 200.

Kensington should comprehend that part of Chelsea which is north of Kensington; also, a portion of St. Margaret, Westminster, which is detached from that parish, and nearly surrounded by Kensington.

Hornsey should comprehend an outlying portion of Clerkenwell at Muswell-hill, and abutting on the Coney-hatch-road.

And all, according to the Act, to include all places attached to each district lying within 500 yards of the exterior boundary of the whole area pointed out in the Metropolitan Building-Act.

*As to the Third Topic, or the Measures to be now taken by the Court for carrying the Act into effect.*—Your Committee would suggest, that, on the county day of the present Quarter Sessions (October 17), the Court may appoint the new districts before enumerated, and also order that the election of a surveyor to each of such districts shall take place on November the 28th, being the county day of the Middlesex General Sessions of the Peace, and which, as being the second Sessions in November (under sect. 2 of the Middlesex Act), would have the power of Quarter Sessions, at which surveyors are to be appointed. Your Committee presume that it will be understood that all the elections will take place on that day, and that all the justices may vote for each district separately, and for any qualified person who shall have conformed to the rules of the Court, and who shall have declared himself a candidate for such separate district. By the adoption of such course, the districts

will be all established, the surveyors to each will be nominated, and the Act may, as provided, come into full operation on the first day of the ensuing year.

*As to the Fourth Topic, or the Revised Standing Orders as to Districts and District Surveyors.*—They would—1. Declare the old and new districts, as mentioned in the report of the Committee.

2. Approve the alterations suggested in Islington, Marylebone, Paddington, Pancras, St. Sepulchre, and Stadhew, when vacancies occur.

3. Order, that as to the election of new and future district surveyors, no person be admitted a candidate unless duly qualified under the New Metropolitan Building-Act (7 & 8 Vict. c. 83), nor who shall be a builder, or engaged directly or indirectly in building in any department, or who shall be a dealer in building materials, or shall be surveyor or agent to any estate within the district for which he may be a candidate.

4. That, ten days before the day appointed for the election of any district surveyor, every person proposing to become a candidate shall personally attend before the Committee for General Purposes, and produce satisfactory evidence that he is of the full age of thirty years, and also a certificate from the Board of Examiners, appointed under the Act, of their approval, and such other evidence of qualification as the Committee may require, and then be authorized by the Committee to be admitted as a candidate.

5. That the Committee forthwith transmit to her Majesty's Secretary of State for the Home Department a list of all persons admitted as candidates, with duplicates of any necessary documents presented to the committee, so as to facilitate the obtaining the concurrence of the Secretary of State in the election of any candidate, and his making the declaration before the Court required by the Act.

6. That the names of all the candidates so admitted as qualified by the Committee for General Purposes be transmitted to the justices of the peace for the county three days, at the least, previous to the election; and that the election for such admitted candidates do take place at the appointed Court day in the usual manner.

7. That all surveyors appointed shall hold their appointments only during the pleasure of the Court, and subject to the provisions of the Act, and to such alterations in their respective districts as the Court may order from time to time.

8. That no surveyor appointed by this Court shall at any time be directly or indirectly concerned in building in any department, nor shall deal in any building materials, nor act as surveyor or agent of any estate within his district; and that any person so offending shall thereupon become disqualified for his office of district surveyor; and that such office shall be forthwith vacant by the Court, and a successor appointed as in case of death.

9. That every surveyor to any district appointed by this Court shall from time to time, within seven days after the first day of every month, deliver to the clerk of the peace, signed by him, a duplicate of the return by the 78th section of the Act required to be made by him to the registrar of metropolitan buildings; and that the same shall be duly filed and preserved by the clerk of the peace for this county.

10. That, as the Court are required to appoint a successor within one month after a vacancy shall occur by the death or removal of a surveyor, the clerk of the peace shall, unless as to districts in which a notice shall be given of an intention to alter such district, forthwith advertise such vacancy in four morning and two evening papers, and give notice that the election of a qualified successor will take place at the next practicable county day after such notice shall be given; and that all candidates must obtain the certificate of the Board of Examiners, and attend personally ten days before the time of such election before the Committee for General Purposes, who shall adopt the appointed proceedings thereupon.

11. That on the Court days of the Easter and Michaelmas Quarter Sessions the clerk of the peace shall present and read to the Court the lists of all the district surveyors, and of their respective residences, and of their offices within their districts, as approved from time to time by the Court; and that such list shall be

so periodically printed and transmitted to the magistrates for the county.

On these provisions your Committee will not dilate. They believe that they are suggested by experience, and that they will be practically serviceable. They know that they will meet the wishes of official persons, with whom it is desirable to co-operate when no principles or paramount duties forbid co-operation; and they are assured that they will facilitate that acquiescence in the acts and appointments by the Court which it is expedient to promote. And whilst upon that matter and the other subjects of their report, they offer their assurances, that they have devoted much laborious attention to the duty entrusted to their fulfilment, they will feel abundantly compensated if their labours should prove useful, and if their suggestions should be generally honoured by the approval and concurrence of the Court.

JOHN WILKS, Chairman.

October 7th, 1844.

[This report was received on the 17th inst., and was ordered to be adopted.]

#### KING WILLIAM THE FOURTH'S STATUE IN THE CITY.

It is generally expected that the city authorities will fix upon Monday next for the inauguration of this statue. The pedestal is completed; it stands about thirty feet high, and is composed of granite obtained from the Foggin Tor Quarry. Round the base of the pedestal the stone is chiselled out in the form of a high cable, midway there is a sunk scroll, and at the summit oak leaves. The colossal figure is sculptured out of the same granite.

#### METHODS OF PAINTING ADAPTED TO MURAL DECORATION.

BY C. L. EASTLAKE, ESQ.,

Secretary to the Royal Commission on the  
Fine Arts.

[THE great interest which has been felt relative to the decorations of the Houses of Parliament, induces us to lay before our readers the following valuable paper on the subject, written by one who is pre-eminently qualified for the task, and in which the various processes adopted by the ancients as well as by the moderns are fully detailed. Those who desire still further information respecting its capabilities and prospects, particularly in a cold and damp climate like our own, will find an elaborate article thereon in the current number of the *Quarterly Review*.]

Four modes of painting adapted for walls have been employed in ancient and modern times: Tempera, Encaustic, Fresco, and Oil-painting. The first three were known to the ancients; the fourth method, invented by the moderns and originally applied to moveable works, has been also employed in mural decoration.

Tempera is so commonly practised that it can hardly be necessary to enter into a minute description of its process. It has, however, an interest from its antiquity, and from its having been more generally in use in Italy than any other method, immediately before the introduction of oil-painting. This circumstance and certain difficulties in its practice appear, in some cases, to have led to a union of the two methods. Tempera is applicable to the surface of smooth, dry stucco, or to any similar levigated ground which has either been incorporated or covered with a due proportion of size or glue. It does not, like fresco, necessarily require to be executed at once, and admits of the use of all colours which are not prejudicial to each other. White lead is, however, excluded, because, being unprotected in tempera from the action of certain gases, it soon loses its brightness. The white used is principally *gesso marcio*,\* to which white earths are sometimes added. The binding vehicle may be formed of animal

\* Plaster of Paris stirred with much water till it loses the power of setting. In the early Florentine descriptions of the process of tempera, white lead is mentioned; this is a proof that paintings so executed must have been subsequently varnished, and accordingly the early Italian works in tempera are always found to have been so treated. See *Contini, Trattato*, &c., p. 79.

glutens, such as size, yolk of egg,\* &c., or o viscous fluids and gums procured from the vegetable world, such as the milky juice of certain trees and plants, solutions of gum-Arabic, gum-tragaecanth, &c.

The practice of tempera-painting may be said to be carried to perfection in modern scene-painting, in which imitation is chiefly confined to large effects. But in this application of the art the difficulty of blending tints to the extent required in figure-painting, so as to equal the completeness and finish of oil-painting, is not encountered. The thinness of the vehicle and the almost immediate change of the tints in passing from the wet to the dry state renders a certain abruptness of execution unavoidable. This peculiarity is compatible with great truth of imitation when the work is seen at a sufficient distance, and the crispness of execution which is the result, is, with the moderns, the characteristic of tempera.

The early Italian masters, when they painted altar-pieces in this method on cloth, endeavoured to attain the requisite finish by continually dampening the back of the painting. This enabled them to complete a given portion while in a wet state, and to give it any degree of softness that was desired. But this was only applicable to pictures executed on a thin and porous substance; tempera pictures on wood or on walls, in which finish is aimed at, cannot be so treated without some modification of the vehicle, or by continually moistening the surface in front. Some of the early Florentines and painters of the neighbouring schools adopted a more laborious method, but less satisfactory in its result. They attained the completeness they sought by minute hatchings. A tempera picture in the National Gallery, attributed to Perugino, is a specimen of this laboured process.

The varieties of practice in the early examples of tempera are also partly to be attributed to the varieties of the vehicle. The Greek illuminations in MSS. immediately preceding the 13th century, are generally painted in tempera with a very thick vehicle; and this system was adopted by the Italians, even for paintings of a much larger size, up to the time of Giotto. He appears to have been the first to introduce a thinner medium. In his works, while the tints are blended, the minute handling, which is almost unavoidable with the older practice, is not apparent. The thinner vehicle was composed of yolk of egg diluted with water, and combined with the milky juice of shoots of the fig-tree. It may seem extraordinary that this last material should have been detected by chemical analysis in an early Florentine picture; the result was, however, verified by the analysis of the milky juice of the fig-tree while fresh. A painting executed with this vehicle is not very easily affected by water or by oil; a varnish produces no other change than that of giving additional depth and lustre to the tints, and the colours do not dry so rapidly as in the ordinary practice of tempera. The fact that the more tenacious vehicle, with all its inconvenience, was revived or adhered to without change by other painters much later than Giotto, is not an uncommon instance in the history of art of attachment to habits, however defective, which time may have recommended.

The Italian artists of the 16th century had generally abandoned the practice of tempera as an independent art, and the examples of it are rare, especially when applied to the decoration of walls. An instance occurs at Trascotte, near Bergamo, in the private chapel of the Suardi family; the artist was Lorenzo Lotto.

It appears from various passages in the lives of the Flemish painters, that tempera-painting was commonly practised among them. On all occasions of great public festivals, this rapid art was put in requisition, and the tapestries which were executed in such abundance in Artois and Brabant, and which were wrought from cartoons coloured in tempera, had also greatly the effect of encouraging its practice.

\* The Italian writers restrict the term tempera to the vehicle of yolk of egg more or less diluted. The modern practice is to add, by degrees, a small wine-glass of white vinegar to a yolk well beaten.

† The Italian tempera vehicle, in which gums are the chief ingredients, is prepared as follows: take one ounce of gum-tragaecanth, half an ounce of gum-Arabic, one ounce of parchment shavings (of white goat-skin), half an ounce of isinglass, boil in two quarts of water till the fluid is reduced to half its bulk. Before it is quite cold, add half a pint of spirits of wine, stirring well.

The schools of tempera-painting were to the Flemish artists what the *Feria*, or market of Seville, was to Murillo and his contemporaries. For (though the latter uniformly painted in oil) such demands had the effect of promoting facility of execution and a large style of imitation, the influence of which may be traced in the more complete works of the respective schools, different as their tendency was in other respects. The rage for temporary decorations in the cities of Flanders, to do honour to distinguished individuals, had the additional effect of promoting a taste for allegory. The most extravagant combinations and allusions were excused in ephemeral productions, till by degrees the public were accustomed to such inventions; and the greatest artists, aware of the value of such materials as conducing to picturesque effect, ventured to introduce them in more permanent works, and recommended them by their talents.

The vehicles employed in tempera were sufficient to bind it when the colours were used in moderate thickness, but the danger of cracking prevented the application in much body. When, therefore, pictures in tempera appear to be executed with unusual substance, it may be suspected that other ingredients were added so as to give it sufficient tenacity, by which means it held a middle place between water-colour and oil-painting; the rapid drying which precluded the possibility of giving the work the requisite softness and completeness, was at the same time prevented. The colours prepared for painting in this method may be mixed either with water or oil.

There is every appearance in some unfinished pictures of the Venetian and other schools of the north of Italy that the tempera adopted by them was of this description, and it is also apparent, from such pictures, that the method was sometimes employed as a preparation for oil-painting. Various modes of this kind may be considered and described in an inquiry into the early process of oil-painting; but less too much importance should be attached to such preparations in tempera, it may be remembered that the practice of Rubens, Vanduyke, and Rembrandt, supposes no such system.

The tempera-painting of the ancients (although from passages in their writers evidently a distinct art from encaustic) appears to have been protected by a coat of wax, and thus may not be easily distinguished, in actual remains, from encaustic painting. But it is probable that in every case where a finished tempera painting was thus varnished, the surface was first covered with some glutinous application before the liquid wax was added. Without this precaution, the mutual relation or *keeping* of the tints would be in danger of being altered. Other methods of protecting tempera, so as to render it washable, have been discovered by modern chemists.

The ancient Egyptian paintings were executed on a stucco consolidated with an animal gluten, probably the serous portion of blood. On this was a thin coat of wax, and on this again the paintings were executed with the same vehicle of serum. The stucco of the Greeks was sometimes consolidated with thick milk, their tempera vehicle appears to have been gun-tragacanth (*Sarcocolla*), size, yolk and white of egg, &c.

In encaustic painting, wax was an ingredient from first to last. The precise process of this art among the ancients has been the subject of much controversy, but the actual remains of antique painting at Pompeii and Herculaneum, as well as numerous allusions in the writings of the ancients, prove that it was common among the Greeks and Romans. It was also occasionally employed during the middle ages, and it is even asserted that it is still practised, however rudely, by Greek painters of the present day.

The inquiries and experiments hitherto undertaken, seem to prove that two methods are practicable. In one, the wax is dissolved by a lixivium, and is then worked with water. In the other, it is mixed with a resin dissolved in spirit. In the first process a final coat of wax is essential to protect the painting. In the other method this varnish may or may not be used.

In the ancient encaustic, whatever were the ingredients, heat (as the term encaustic implies) was employed either during or after the process of painting. In the attempted revival

of this art, in the last century, the application of heat was also considered indispensable. The method practised was to apply a *cauterium*—a portable furnace, hot iron, or any similar instrument, so as gently to melt the coating of wax spread over the finished painting. The heat was sufficient at the same time to affect the wax incorporated with the colours, and thus a union was produced throughout the mass. If afterwards rubbed with a cloth the surface acquired a slight polish.

In the other process which, in its improved state, is more modern, heat is considered unnecessary, and the art is therefore properly called wax painting, not encaustic-painting. The application of heat might still serve to consolidate and give transparency to an external coat of pure wax, but the presence of resinous substances in the vehicle, and with the colours, is supposed to render such application superfluous as regards the consolidation of the painting itself.

The solution of wax by means of alkaline lixivia was probably not unknown to the ancients. This was the method of Bachelier, Walter, Requeno, and others, but the specimens executed according to their system have not been considered successful as regards durability.\* The following communication from Mr. King, of Bristol, may be considered an improvement on the process in question.

"The conversion of wax into a substance soluble in water is effected by the vegetable alkali, known by the name of potash, being combined with tartaric acid. This is the *Sale di Tartaro* of the Italians, and is sold by all chemists and druggists in this country under the proper name tartrate of potash, and more commonly salt of tartar or soluble tartar. When the acid predominates, it is called super-tartrate of potash, or cream of tartar. This is the best substance to be employed in my process, and in the following manner:—An indefinite quantity, say half a pound, of this salt being placed upon an iron shovel and exposed to the action of fire, becomes a black substance resembling coal, a sort of slag. It is to be thrown while hot into a vessel holding about six quarts of pure water, that is, filtered rain-water or distilled water. Shortly after it is quenched, it is to be ascertained that the fluid is saturated with the alkali by its taste, or better, by its effect upon the colour of test paper.

"No quantity of water can hold more alkali in solution than that which is sufficient to saturate the water at the same temperature. The undissolved portion is separated by filtering, and the residue will serve to saturate another quantity of water. By filtering, the saturated fluid is sufficiently freed from the dark colour which was caused by the burnt alkali. This saturated fluid is called a lixivium, and in it the purified wax is to be boiled until it is converted into soluble soap, and wholly dissolved so as not to separate from the fluid when cooled. According to the proportion of the quantity of wax to that of the water, the fluid will appear like milk when the proportion of wax is small, like cream or butter when it is greater; and even of the consistence of soft cheese when the wax is in excess. The consistence of cream is best suited for grinding the medium with more or less finely pulverized dry pigment body colours, such as ochres, raw or burnt terra sienna, raw and burnt umber, Cobalt, smalt, light red, red and white and black chalk, stone coal or anthracite, &c., answer best for dead colouring, and become brighter in the subsequent fusion and fixing by the use of the cauterium.

"Metallic colours, which are artificial oxides of metals, like vermilion or cinnabar, which is a sulphuret of mercury, red and white lead, chrome yellow, and others, are differently affected in the burning in, and the changes which they undergo are to be ascertained by previous trials. The latter class of pigments are more adapted to the finishing of pictures. Pigments of a vegetable nature, such as lakes, madders, &c. are altogether to be avoided, or very sparingly used, and not at all in masses. The connection of the medium (soluble wax), by grinding it with every pigment, is best performed in stone or earthenware (Wedgwood's) mortars and with pestles of the same materials,

and the colours thus prepared are to be kept for immediate use in glasses or common gallipots. Instead of a wooden palette, a plate-glass or stone slab is required for large masses, and a spatula of hard wood or horn.

"The surface to be painted on must be a solid dry coat of stucco ground with a mixture of such colours as will give a suitable tone of colour and depth. The first coat or ground is to be fixed by the *cauterium* with a moderate degree of fusion. The subject may be sketched on this ground with chalk or charcoal; and precise outlines, especially of minute forms, can be traced or sketched in with a metallic point or etching needle. The *cauterium* or salamander is not to be used again until the whole surface is covered and the effect advanced to a certain degree. It is clear that the manipulation of these materials, differing greatly from painting in oil, will succeed more readily in the hands of an artist who has had some practice in fresco or in distemper; and as the surface is in most cases perpendicular, some care is required to prevent the colour from running down.

"When the intusion by the *cauterium* is finished, and the whole surface of the picture cooled, it may be polished by friction with cloth or hard cushions, covered with some more or less rough texture, or with some of the implements used in polishing wood.\*

Those who recommend in preference the solution of wax in spirit, and the addition of resins, do not profess to have discovered the precise process of the Greeks, but they have not failed to remark that the ancient writers speak of resins as entering into the ingredients of painting.

The credit of having suggested the present systems of wax-painting, which are adopted with various modifications at Paris and Munich, is generally attributed to Montabert, who, in the eighth volume of his comprehensive "Traité complet de la Peinture," extols this art above that of oil-painting. In consequence of the difficulty of reviving the study of fresco-painting in France, the attention of many artists and chemists has been turned to the employment of wax-painting, and various churches and public buildings in Paris have been already decorated in this mode. In Munich, also, considerable works are in progress, executed in a method analogous to that of Montabert.

The advantage of wax as a vehicle is its durability. A wall painted white, partly with wax and partly with oil, exhibits the same tint for some days, but by degrees the oil colour darkens, and after some months the two portions are quite distinct; that which was painted in wax retaining all its brilliancy.

To this advantage is opposed, besides the difficulty of manipulation, the dull effect of dark shadows in pictures executed in wax. This is owing to the semi-opaque nature of the material, and is unavoidable as long as the absence of gloss on the surface is considered indispensable; but the colours become much more vivid after the surface is polished, and the admixture of resin tends to give clearness to the deeper shades.

Some of the French artists have gone farther; they have added a portion of oil to the cero-resinous medium, and by this means attain any degree of richness they please. In this last system the *mat* quality, or absence of gloss, is in a great measure abandoned, and the method is only to be considered a means of lessening the quantity of oil, and consequently of avoiding the danger of a horny and darkened surface.

Some German artists, again, have considered it essential that the resinous ingredient should predominate, and have recommended only a thirtieth part of wax, the rest consisting entirely of liquid resin (balsam).

Wax painting, properly so called, from its not admitting of much force (while its lights are assumed to be unchangeably bright), would suggest a particular style and choice of subjects; and as all colours (according to the French chemists) may be employed in it, it is considered to be particularly fitted for poetical subjects adapted to the lighter kinds of decoration. It is for such purposes that it has been chiefly employed in Munich.

The following is a description of the methods in general use at Paris and at Munich:—

\* Durosiez (Manuel du Peintre à la Cire, Paris, 1844, p. 18) assumes, that the presence of alkalis, such as ammonia and salt of tartar, in the substance of paintings must be especially injurious.

\* Extract of a letter from Mr. John King, chemist, 26, Mall, Clifton, Bristol. Aug. 21, 1842.

A wall which is to be painted in wax (and the same principle is applicable to all mural pictures) should not be quite perpendicular, but should incline inwards, with reference to the room, in its upper part. By this means the work is better seen, and dust is less apt to collect on it. The surface should be levigated; it is then to be thoroughly dried by heat, and lastly to be saturated with the following mixture: 10 parts of white wax, 2 parts of resin, and 40 parts of spirit of turpentine. This liquid is made to penetrate the wall or stucco by means of heat, and the application is repeated till the surface ceases to absorb. Holes or irregularities are to be stopped with a mastic composed of wax, resin, and whiting. Over this preparation a coat or two of wax colour is to be spread as a ground for the painting.

The wax used in painting should be bleached and perfectly free from extraneous matter.\* The resin recommended by Montabert is that called *eleni*; this, combined with wax and an essential oil, is the vehicle in which the colours are ground, and which serves to work them. The proportions are, 1 part of resin and 4 parts of wax, dissolved over a water-bath in 16 parts of essence of spike-lavender. The colours are ground in this gluten, diluted as may be required during the operation of grinding by the addition of the essence. They are then preserved in glass or earthenware vessels, and if they get hard (which can only happen after a considerable time) they may be dissolved with the essence or ground again, and are always fit for use. Instead of *eleni*, copal may be used by those who prefer hard resin.

The solution of wax alone is effected by the same essence, and this preparation is available when the artist wishes to increase the proportion of wax. The paste may be thinned with water by grinding it thoroughly with a muller, and gradually adding water to the amount of four times the weight of wax. This is called the milk of wax, and serves as a varnish for pictures executed in the above mode. The solution of *eleni* or other resins in the essence, without wax, may also be employed when the resinous ingredient is required in greater abundance. To these materials may be added the essential oil of wax (procured from wax by distillation), which evaporates more slowly than that of lavender, and may sometimes be of use in the practice of this art.

A process introduced in Munich by Professor Fernbach is not yet made known, but it is supposed to consist merely in the addition of liquid resin (balsam) to the wax, instead of artificial solutions of hard resinous substances.

The methods more commonly practised in Germany differ but little from the system of Montabert. The following descriptions have been obligingly furnished by the artists:—

“For large paintings it is desirable that the ground should be somewhat rough. In Munich it is prepared as follows:—A mortar composed of three parts of sand and one of lime is spread on the wall. When this is done, the whole surface, while moist, is rubbed with a linen cloth; the result is a granulated ground, like rough paper. For small works, ornaments, &c., the ground requires to be smooth, and in such cases finely-pounded white marble should be mixed with the lime instead of sand; the mortar so composed being then carefully spread and made even.

The encaustic vehicle is prepared as follows:—To one pound of rectified spirit of turpentine add half a pound of Damara resin and a quarter of a pound of wax. The resin should be pounded to powder, and the wax cut up in small pieces. Both are then to be put into an earthenware or copper vessel, and the spirit of turpentine poured on them. Place the vessel on a moderate charcoal fire, so that the solution may take place slowly. When the ingredients are dissolved, the vehicle is ready for use, and should be kept in a glass bottle well stoppered, to prevent the volatile oil from escaping. Should the mixture become too thick in time, spirit of turpentine may be added. The colours are ground in such a quantity of this vehicle as is necessary to saturate them. If during the grinding the pigment tends to *set* (dry), spirit of turpentine should be added. For extensive paintings the

colours are kept in glass vessels. For smaller works they may be tied up in bladders, like colours for oil-painting. The same colours which are employed in oil may also be used in encaustic-painting.

“It is essential that the ground on which the painting is to be executed should be quite dry. Then the whole surface to be painted is to be washed over with milk. When this is dry, a ground of encaustic colour is to be spread on the wall, the artist selecting any tone he pleases. This being done, the surface is suffered to dry well, which will require some days, as it is important that the colour should be in no danger of being dissolved by subsequent operations. The artist can then begin to paint.

“In executing ornaments on a coloured ground, the ground must be composed of two or three coats (not too thick), each of which should be allowed to dry separately. The time required for drying varies according to the state of the weather. As soon as the pigment used for the ground is no longer easily dissolved—a degree of hardness which it often attains in the course of a day—the painter may begin to work.

“When the painting, whether consisting of ornaments or other subjects, is finished and sufficiently dry, the whole is to be thinly passed over with the encaustic vehicle applied with a large brush, and after a day or two this varnish is to be heated with a charcoal fire, to such a degree, however, as not to injure the colours. The result is an equal but moderate shine over the whole surface.”

Another process, practised at Munich in 1843, may complete this list of recipes:—

To a pound of turpentine (resin), evaporated to dryness by heat, add half a pound of powdered Damara resin, and a quarter of a pound of bleached wax, cut into small pieces. To be heated as before; and, when used, to be diluted, when necessary, with spirit of turpentine.

A mode of cleaning wax paintings is described, together with the materials now used by the French artists, in Durosiez's pamphlet, before quoted.

The following description of the nature and advantages of wax, as adapted for general painting, was submitted to some German chemists by Dr. Roux, and received, among other statements by him, their written sanction:—

“Wax is, in chemical language a combination of cerine and myricine. It is a peculiar organic substance, resembling fat, but yet distinct from it. Wax is unaltered by exposure to air. It neither becomes harder nor softer, and therefore does not contract like the unctuous oils. Exposed to light, it becomes whiter. Grund, in his history of ancient painting, relates that he saw in an Italian church two large wax candles, which had been presented in the year 1445, and which he at first took for snow-white marble pillars. On breaking the surface, he found them equally white internally.

“Colours mixed with wax are entirely saturated by it. Wax and colours form together a more solid, less fusible substance than wax alone. The pigments remain closely united with the wax. No skin appears on the surface of the picture, even when the wax has been mixed in abundance with the colours. An under-painting executed with wax colours, has much more brightness than one executed in oil. A second painting on such a preparation appears bright and clear, on which account a painting in which wax has been used as the vehicle is always brilliant. When an oil-painting at twilight begins to become indistinct to the eye, a wax-painting next it is still clearly visible.

“Wax is dissolved in volatile oil, which is also used with the colours. This volatile oil evaporates in a short time, and assists the drying of the colours.

“Paintings executed with wax colours cannot crack (?), for the under-painting dries quickly from the ground. The ductility and tenacity of the wax prevent its cracking. This method of painting has also the advantage, that the dissolving power of the volatile oil which is used in the after-painting and finishing produces a union of the upper and under layers, by which means the whole coloured substance becomes intimately united.”

The statement that wax has no tendency to crack is true as regards the substance itself; but a painting thickly executed in wax, and varnished soon after its completion, would very probably crack. The Germans evade this difficulty, and consider resinous varnishes unnecessary to wax-painting. The French artists do not exclude a final varnish. If such an addition be desirable, it is of more than ordinary importance to select a resinous solution that has little tendency to crack. The Damara varnish of Lucanas, and the excellent varnish of Soehnée (which seems to be analogous to Field's lac-varnish), have this reputation. The latter has also the agreeable quality of being perfectly dry to the touch within a few hours after its application, and of remaining so. It never becomes discoloured. A coat of white paint, having half its surface varnished with this liquid, and the other half with mastic varnish, exhibits a great difference of tint in a short time; the portion varnished with the Soehnée varnish retaining its first appearance unaltered. Its defect is its want of sufficient body; there seems also to be a difficulty in removing it from the surface even of an oil picture. The Damara varnish has the same qualities of not changing colour, and never cracking; it has more body than Soehnée's preparation, but is certainly not so clear.

Sir Humphry Davy, in his analysis of some of the colours of the ancients, found some vitrified substances, and accordingly expressed his conviction that glass frits would be the most durable of coloured materials, if they could be so prepared as to meet the wants of the artist. Dr. Roux is of the same opinion, and suggests that “as a white frit possessed of sufficient opacity is not to be obtained, the oxide of zinc might represent it among the vitrified colours. It is equally unchangeable.” To these opinions is to be opposed a practical authority of great weight, who remarks that these colours, when ground to the degree of fineness necessary to render them applicable to painting, become liable to all the chemical changes and affinities of the substances which compose them.

The adaptation of oil painting to walls has generally found less favour with painters than any other method, from the numerous examples of a blackened surface which works so executed present. The process may be less objected to since it has been so ably employed in the Ecole des Beaux Arts at Paris.

In this mode of painting, as hitherto practised, all absorption from the ground is cut off by the application of the first coat or hydrofuge preparation; it is, therefore, essential that the quantity of oil should be diminished in the under painting. For this purpose the half tempera method, which, it appears, was sometimes employed by the northern Italian schools as a preparation for oil-painting, would be well adapted. But the application of a composition impervious to damp is not incompatible with an absorbent ground for the painting itself. Such a ground could be made to bind firmly to the hydrofuge by various means; indeed the same mode which the Italians adopted for panels would quite answer this end. These various methods are, however, so intimately connected with the general question respecting the early practice of oil-painting, that, to avoid repetition, they may be reserved till that inquiry can receive due attention.

A method invented by M. Ilussonot, called “Peinture à l'Huile en Feuilles,” consists in the preparation of very thin sheets of oil pigment (for example, white lead), which may be rolled like cloth. They may be made of any size, or may be fitted together so as to exhibit no joining. A sheet of paint, so prepared, is fastened in a temporary manner on a panel, or on cloth attached to a stretching-frame, and the artist completes his picture. When dry it is rolled up, carried to the place for which it is destined, and permanently fixed to the wall, being then made to adhere throughout its whole surface, probably by the application of a coat of white lead, to the wall. The objection to this mode (to say nothing of the oil ground) for important paintings, is the extreme danger of accident in the rolling and unrolling. For ordinary purposes it offers great facilities, since the application of decorations in oil on the walls of rooms or on shop-fronts can be accomplished in a few hours, the work having been prepared without inconvenience in the study of the artist.

\* The “punic wax” of the ancients was nothing more than bleached wax. Pliny l. 21, c. 11, and Dioscorides, l. 2, c. 102. Commune Requeno, lb. v. 2, p. 85. Bleached wax is easily procured, but the white wax sold for ordinary purposes is mixed with spermaceti.

ANGLO-NORMAN FONT AT YATESBURY,  
IN THE COUNTY OF WILTS.

PERSPECTIVE VIEW.

SECTION.

TO THE EDITOR OF THE BUILDER.

SIR,—A few months since, whilst stopping at the rectory of Yatesbury, in Wiltshire, I was so fortunate as to make a sketch of the beautiful font in the church at that place. Up to the period of my visit it had borne the resemblance of a plain, rude stone, so completely was it filled up by the repeated coats of white-wash and yellow ochre which it had received during the course of several hundred years. As far as I could learn, no sketch had ever been made of it; Mr. Buckler, F.S.A., the indefatigable illustrator of the county of Wilts, had not been able to gain admittance to the interior of the church when he visited it. We are indebted for the restoration of this fine font to the exertions of the present rector of Yatesbury, the Rev. James Sloughton Money Kyrle, a jealous member of the Antiquarian and Cambridge Camden Societies, who has applied himself most perseveringly since entering the living to the examination and restoration of his church. On first seeing the font, we considered it to belong to the late Norman or transition period; on closer examination Mr. Kyrle found that the early English base was a separate stone of a kind different from the basin itself, and as he had discovered under the plastering of the south wall of the nave a

very early Norman arch, evidence of the early period of the erection of the building, he considered the date of the bowl to be about the middle of the twelfth century, and that it had been remounted on this base at the first rebuilding of the church, early in the century following.

I am inclined to agree in this opinion from the curious half-scroll at the upper part of the font for in late Norman examples, a perfect scroll is generally seen. A cross  $\oplus$  is cut in the upper edge of the bowl; whether this be symbolical or is merely a mason's mark, I will not venture to determine. Mr. G. Godwin, in his interesting paper "On Masons' Marks," published in the "Archæologia," places this mark as peculiar to the early English period.

The font is very irregularly worked, the leaves on it not being parallel to the upper ornamented band; it is placed on the north side of the nave, against the western column, in its original situation, and has a drain for the emission of the water after baptism. Of this font I some months ago exhibited a drawing to the Society of Antiquaries.

The church is a picturesque edifice, consisting of a nave, north aisle, and chancel (the latter modern); it appears to have been rebuilt about the commencement of the thirteenth century, and very extensively repaired about the end of the fourteenth century, when the church was robbed of its south aisle. The patron of Yatesbury is the Rev. William Money Kyrle, of Much Marele, in Herefordshire, whose family has presented to the living ever since the early part of the fifteenth century. The church is distant from Calne about four miles east, and is in the immediate vicinity of the Druidical Temple of Avebury, and the other stupendous Celtic works which form so remarkable a feature of the Marlborough Downs.

I am, Sir, your most obedient servant,

C. J. RICHARDSON.

22, Brompton-crescent.

#### THE WOOD PAVING IN OXFORD-STREET.

At a vestry meeting of St. Marylebone parish, held on Saturday, the 12th inst.

Mr. Seacie, the parish surveyor, brought up a report which he had been directed to furnish by the vestry, as to the state of the 4,000 yards of wood paving laid down by the Metropolitan Company between Wells-street and Rathbone-place.

The report set forth that, pursuant to the orders of the vestry, the surveyor had minutely examined the state of the wood paving in question. The surface of the said paving was rather rough and uneven, and there were many holes in it. The workmen of the wood company had, at his request, opened the paving across the street in three places in Oxford-street. Opposite No. 51 the blocks, which are of fir, were worn from their general thickness of six inches to four and a quarter inches. The paving facing No. 50 is of elm, and was found worn generally from six inches to three inches; and opposite to 31, also of fir, it was found under the coach-stand worn from six inches to three inches. This portion of the street, although in moderate condition on the surface, is so much worn, that it was found difficult to raise a whole block. To put it into good condition, he considered the whole ought to be relaid, bottom upwards, about one-half or two-thirds of the old blocks being drawn out and new ones substituted.

At this stage of the proceedings a number of the worn blocks were produced and laid on the table for the inspection of the vestry.

Mr. Harbut said that he believed, even with that convincing proof before their eyes, there were some gentlemen so wedded to wood paving that they would not believe that wood paving was a failure. (Laughter.) He moved that the report of the surveyor be adopted by the vestry, and it be forwarded to the Metropolitan Company, together with an official notice that the vestry, in accordance with the terms of their contract, required them to put the 4,000 yards of wood paving, between Wells-street and Rathbone-place, in a state of efficient repair, to the satisfaction of the parish surveyor, forthwith. What, he would ask, was the history of this splendid wood paving? The fact was, this piece of paving had, at the outset, cost the vestry the

sum of 2,000 guineas, and although it had not been down four years, it had cost the vestry 210*l.* per year to keep it in repair, in all 2,710*l.*, which was at the rate of 3*s.* 6*d.* the superficial yard per annum. If the same space of Oxford-street had been paved with granite it would have

cost 600 per cent. less than this wood paving; and even the macadamized road had only cost 1*s.* 11*d.* per yard, whilst this rubbish had cost 3*s.* 6*d.*

[The resolution was carried by a large majority.]

#### GATEWAY-TOWER OF PORTHAML, WALES.

TO THE EDITOR OF THE BUILDER.

SIR,—The above perspective view is of the gateway-tower of Porthaml, which is a very picturesque object, situated in a delightful spot about ten miles from Brecon. It was probably built in the early part of the sixteenth century, by Sir William Vaughan, first sheriff of Brecknockshire, who resided there. His descendant, Walter Vaughan, left a daughter and heiress, who, in the year 1677, married John, first Lord Ashburnham, from whom this property is inherited by the present Earl of Ashburnham.

There is not much mention of the place, as far as I have been able to ascertain, in the records of the county; but I think, if we may judge from the remains, it was formerly a place of considerable strength and magnificence. The interior of the archway is finely groined, and its ribs are supported at the angles by enriched corbels. The mouldings are all very clearly executed in the Tudor or perpendicular style of workmanship, which is clearly shewn in the square drip to the window and the four-centered arch to the gateway.

It was doubtless originally much higher, as is seen by the one corner, upon which are placed some loose stones belonging to a battlement; and moulded stones from some other

parts of the old building are fixed along the top of the front to form a coping, after the taste of some country restorer. There is a staircase on one side in the thickness of the wall (the door to which I have shewn in my sketch), leading to a square room above the archway, with two windows opposite each other, and afterwards ascending on the same side to the top, where there is a narrow terrace around a pyramidal tiled roof, which is surmounted by a stone ball about a foot in diameter. The attached ivy is very luxuriant, and completely covers the three sides and part of the front of the tower, mellowly blending it with the surrounding scenery, giving it the semblance of having grown old with, and forming, indeed, a portion of, the natural landscape.

At the back of the tower, at the distance of about 20 yards, is a house of much more modern date, though still maintaining, in its principal features, a good deal of the manorial character.

It has been occupied by the family of its present tenant, Evan Prosser, Esq., for more than a century. I remain, Sir,

Your very obedient servant,

J. L. T.

Berkeley-place, Brecknock.

A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARKHAM, IN NORFOLK.—NO. VI.

WITH NOTICES OF THEIR ACTUAL CONDITION.

(Continued from p. 516.)

*Belough.*—In a spot of bow picturesque seclusion repose here, each one in his permanent abiding place, the forefathers of the hamlet! A tangled copse fills the small ravine on your left; in front the cemetery is nearly washed by an angle of the Wensun; behind, waving hay and corn robe the hill-side to its ridge, and far away to the right—although here perhaps the want of hedge-rows somewhat impairs the scenic effect—the mazy river flows through open pastures, which rise in the distance to where the fine church of Swanton Morley, with its embowering trees, closes the prospect. Reader, has the tomb never come over thy musings in wilder guise? Then hast thou not, like ourselves, a kinsman taking his latest sleep where the giant palms wave their green crests over him on the banks of the Camarons; never, as we, assisted to consign a poor sea-boy to his ocean-grave, after night-fall, in the latitude of the “still-vexed Bermoothes.” Far different the homestead of the departed environing the parish church of St. Mary the Virgin at Belough.

Would that we could write of it, in the words of the poet Mason—

“No modern art

Had marred with misplaced symmetry the pile.”

On entering, our attention was drawn at once to a mural tablet over the tower-arch, on which we read:—“A.D. 1809-10. The chancel of this church rebuilt; the north and south transepts added; the tower, buttresses, windows, roof, and battlements substantially built and repaired; and the interior of the church handsomely fitted up at the sole expense of Sir John Lombe, *Baronet*, patron.”\* We shall not quarrel with an old gentleman of fourscore for inclining to break Priscian’s head in this chronicle of his munificence: let us rather pass on to examine how far it was guided by a correct taste and Catholic principles.

And giving the restored church a cruciform character will hardly be deemed exceptionable, though for ourselves we would decidedly have preserved its original ground-plan. Modern builders are only too fond of resorting to this “apt and appropriate figure;” often, perhaps, in order to conceal the poverty of their resources, whether pecuniary or artistic. Transepts form a poor substitute for the well-developed chancel and nave, with or without aisles, of days when men without stint of means thought *most of all* on what was best adapted to the services and requirements of God’s household. Those sitting in the “cross aisles” for the most part lose sight of the priest in his ministrations at the Holy Table; but this is held light of by a generation that exclaims loudly against high-altars, and erects the scandal of high pulpits instead. We confess, however, that the transepts are in our view more bearable than is the vulgar plastering on the projecting turrets raised from the groundsel at each of their four external angles.

The roof of this church is slated at a low pitch, and at the time of its restoration was supplied with copper eaves-gutters, which have since been stolen. Three lofty windows, of as many lights respectively, are each of them charged in the central one with the Lombe escutcheon in painted glass; the mullions, simply crossing in the head without foliations; two fire-places have been supplied beneath the windows of the transepts, to which the turrets just mentioned are made to serve as chimneys.

A thought struck us during the survey, that we were inspecting the work of a Vitruvius whose exploits will find notice in their proper sphere, and inquiry proved that the conjecture was a correct one. But some fine antiques within the church shall first have our regard. And in the central avenue between the transepts, on a large slab of grey marble, the portraiture of a knight in complete armour, and his lady—their hands clasped in prayer—are graven on separate brasses, with an inscription: “Pray for the souls of John Curson, knight, and the lady Jane, his wife.” The first died, we are informed, on the feast of St. Fabian, 1471, and by his will, dated ten days previous, re-

\* Well were all this exchanged for the simple exclamation—“Behold, the heaven of heavens cannot contain Thee, how much less this house which I have rebuilt!”

quires to be buried in the church of Belough, at the chancel-door under the rood-loft, and to have a grave-stone of eight marks’ price. The female’s head gear, her caul ornamented with two projections like butterfly’s wings, bespeaks the reign of Edward IV.

A word also on the tower and the font. The first is circular in its lower portion, but forms above a *quasi* belvedere, which is octagonal and has a battlemented parapet, the bell-chamber being pierced with no less than eight large windows, although the alternate ones are now blocked. They are of perpendicular character, and evidently of later erection than the base part: a ladder supplies the want of staircase here, but we found it much lumbered with coals and other accumulations. The font, an octagon of moderate size, has the panels of its bowl charged with shields; the stem and circular base are recent and—we had almost said as a necessary consequence—mean. But we are yet suffered to rejoice over splendid, though comparatively rare exceptions.

On the north side of the chancel we find a mural tablet by Bacon, erected to the memory of the late Sir John Lombe, who died in 1807: it represents the east end of a Gothic church, with turrets at the angles, the altar window of course forming a chief feature. Generally speaking, our monuments savour altogether too much of worldliness. We had infinitely preferred seeing the baronet of the nineteenth century his simple effigies in like posture with the knight’s of the fifteenth—both thus confessing, as it were, that “Man can carry nothing away with him when he dieth, neither shall his pomp follow him.” The dead, as they are released from the cares, so they no longer need the insignia of life. In the grave the chancellor requires no woollack, the orator no tribunal, the general no soldiers, the admiral no shipping; all they have to do with—the last great Audit. “The semblances of the departed should seem either as men worshipping, or men that have fallen asleep.”\* Some may ask, when then may the *Saturday* hope for patronage? He has secular places in all their diversity—the palace, the house of parliament, the guild-chamber, the private mansion, the park, the square—to range over and adorn with the highest efforts of his art, without infringing on the sanctuary, the vestibule of another existence. The advantages of our present state of things would have been dearly purchased at one solemn lesson of a different kind, and they have cost us a thousand. Taking matters as they are, however, Sir John Lombe’s monument contrasts well with the heathen sarcophagus, *inane pondus*, which disfigures an inclosed grave in the churchyard.

We had gladly been spared the duty of further comment on the interior of this fabric, but the influence of evil example must, if possible, be arrested. The tokens of exclusiveness may not be so invidious and glaring as they are too often met with elsewhere; beyond this remains small scope for approval. The coved ceilings, relieved in the dome with flat *groinings*, which are continued down the chamfered angles of the lantern in shallow pilasters, were better seen, and we hope also appreciated, in a conventicle. A low wainscoting within the altar-rails, formed of Norman arches, already exhibits symptoms of decay: much good oak has been ill expended on the unsightly dossal or altar-screen, on the huge pulpit, desks, and pews. Every thing betrays the designer’s utter ignorance of what constitutes correct taste and ecclesiastical propriety.

Scem we to assume authority to ourselves in these strictures? *that* be far from us; but “before the mischief of past years can be remedied, the whole extent of the evil must be detailed.”

PROFITS OF TIMBER ON ESTATES.—The late Mr. Fleming, of Hampshire, was one of the largest landed proprietors in the county, owning at his death 15,000 acres, so richly wooded, that he is supposed to have cut 500,000Z. worth of timber, from first to last, and yet left the whole as full as the land will bear. Mr. Fleming’s expenditure in the town and neighbourhood of Southampton averaged 13,000Z. a year, and immediately after his departure for the Mediterranean the loss of such a large expenditure was most sensibly felt.—*Hants Advertiser.*

SPONTANEOUS COMBUSTION IN BUILDINGS.

The cause of the recent fire at New Cross has been traced to the spontaneous ignition of some vegetable black which was stowed in the paint-room. A few weeks back, we drew attention to a similar catastrophe, which originated in the accumulation of pigeons’ dung in the great tower of the Church of Pisa, and not long since we remember reading in one of the philosophical journals a statement that oil-paintings on canvas have been known, under certain circumstances, to generate heat sufficient to produce a flame. Having these facts before him, Mr. Booth, the lecturer on chemistry, has, in a most praiseworthy spirit, drawn public attention to the subject, and calls for a full and searching inquiry into the phenomena under consideration. He says, that “in the incipient decomposition which precedes ignition, gaseous compounds readily ignitable are formed, generating a highly-combustible atmosphere, so that when heat sufficient to generate flame is produced this will at once act along the whole surface of the area, producing, as with the fire-damp, a simultaneous blaze.” A full investigation of the subject, conducted by the first chemists of the day, would of necessity lead to most useful results, and surely the fire insurance companies would soon find their account in originating the inquiry and defraying every expense attending it.

CHURCH-BUILDING INTELLIGENCE, &c.

*Consecration of Christ Church, Clifton Park.*—On Tuesday last the Lord Bishop of Bristol consecrated the new church at Clifton-park. The situation chosen for the church is exceedingly beautiful, and, according to present appearances, will be the centre of numerous terraces, squares, and other dwellings for the more opulent class of society. The building itself, by its pretensions to a better style of architecture than has usually prevailed in our sacred edifices of modern construction, seems to invite criticism. We take the following from our contemporary, the *Bristol Gazette*:—“Christ Church is designed in the early English style of architecture, or in that style of architecture which prevailed in England between the years 1200 and 1250, as exemplified by parts of the cathedrals at York, Salisbury, Peterborough, Carlisle, and Durham. The church comprises a nave, 104 feet long by 36 feet wide, with an apsidal chancel 27 feet deep, and a north and south transept. The total interior dimensions of the church are 131 feet from east to west, by 36 feet from north to south across the nave, and 78 feet including the transepts; the height from the aisles to the ceiling is 50 feet, and from the plinth to the ridge of the roof, 64 feet. The chancel is ascended by five steps, and is separated from the nave by an arch 44 feet high. The transepts are also divided from the nave by arches 34 feet high; the characteristic features of the style, with disengaged columns and deeply-recessed mouldings, being carried out to the greatest extent that the funds at the disposal of the committee would permit. Sittings are provided for upwards of 1,000 persons, including 347 open sittings. The mason’s work was begun by the 1st of Feb. 1843, and the walls were ready to receive the roof in the month of September following; and the building was completed, fit for consecration, in about eighteen months from the commencement of the works, notwithstanding the loss and inconvenience to which the committee was subjected by the bankruptcy of the contractor for the mason’s work. The architect who superintended the whole is Mr. Charles Dyer, of Park-street; and the contractors for the principal works were Messrs. G. Strawbridge, G. Monk and Son, W. Edkins and Son, J. Fowler and Son, Williams and Gay, T. Allen, and H. B. Osborne.”—*Farley’s Bristol Journal.*

*Re-Consecration of Codford St. Mary Church.*—On Wednesday, Oct. 2, the church of Codford St. Mary was consecrated by the Lord Bishop of Salisbury. This church has been nearly rebuilt. The old tower and a small portion of the south wall appear to be all that belonged to the original structure externally. The south wall having fallen in the course of 1843, whilst the rubbish was removing from around the foundations, it was resolved to build an additional aisle. In carrying out this

intention, it was found necessary to take down the old walls, and thus various fragments of carved stone, clearly indicating the age of the original church, were brought to light. The date is supposed to have been about 1000. The additional aisle is built in the Decorated style, which pervades the entire building; the early English windows are formed on the north side of the chancel, and the east window is perpendicular. The term Decorated must not convey a notion of lavish expenditure—all has been done with a due regard to economy, but there is nothing which offends good taste, nothing deficient, nothing calculated to weaken the impression that this is the place where God hath set his name. The east window of the church is filled with stained glass of various allegorical and heraldic characters. The fittings are of stained and varnished deal, bearing a very ecclesiastical appearance, and harmonising well with the ancient oak, which has been carefully applied to use as far as practicable. The sittings are open, and to this outward demonstration of spiritual equality, if we may judge from a growing sense of its propriety, the church-builders and church-restorers of the present generation will speedily conform. The altar and pulpit hangings are of crimson cloth, beautifully worked by some young ladies, with suitable devices and emblems.—*Farley's Bristol Journal.*

*New Church near Farnborough.*—A small church has recently been erected on the heath, within sight of the Farnborough station, on the South-Western Railway, where her Majesty meets the rail from Windsor Castle. The edifice, which is now ready for consecration, is intended for the use of the inhabitants of Cove and South Hawley. It is built of heath stone, the materials of which Windsor Castle is composed, with the corners and ornamental work of pie stone, which gives it an imposing appearance. The architecture preserved throughout is the Norman style, from the design of Messrs. Stevens and Alexander. The eastern and side windows of the chancel are filled with painted glass, the gift of the Rev. C. Laurel, who has been nominated to the incumbency. Interiorly the church is plain, open seats and other conveniences being provided. The cost of erection has scarcely exceeded 1,200*l.* A lady residing in Bath, who admired the style of the church, presented the sum of 600*l.*

*Salisbury Cathedral.*—This cathedral is said to have as many doors as there are months in the year, that is 12; as many windows as there are days in the year, that is 365; and as many beams and columns as there are hours in the year, that is 8,766. What most struck me in the internal construction of the church was the extreme slenderness and fineness of the so-called "flying buttresses" supporting the steeple. The builders seem here to have spun their stone through the air in some inconceivable manner, like the silky thread of a spider. I wondered how these long, thin lines of stone could support themselves in the air; yet they have supported, not only themselves, but the entire steeple, for 600 years. The clusters of round columns, which support the roof, are also far more light, and less massive, than is usual in Gothic churches. This contributed much to the general effect of lightness and airy beauty which the whole structure of the cathedral conveyed.—*Kohl's England and Wales.*—[THE SECRET ART WAS A KNOWLEDGE OF ARCHITECTURAL DYNAMICS, WHICH TAUGHT THEM TO DRESS AWAY ALL BUT THE SUPPORTING MASS, THROUGH WHICH THE PRESSURE RUNS.]

*Church Bells.*—The *Irish Ecclesiastical Journal* informs the clergy that they can substitute cast-steel bars for the ordinary church bells with considerable advantage, as regards both tone and cheapness. Any clergyman can procure for thirty shillings a bar of cast steel producing a better tone than the ordinary small church bells, which cost from 4*l.* to 6*l.*—*Limerick Chronicle.*—[The change is similar to that in modern repeating-watches.]

*Parsonage, Sermerston.*—The Commissioners of Greenwich Hospital have given 200*l.* in aid of the erection of a parsonage-house at Sermerston, near Berwick-upon-Tweed. They have also promised a similar sum towards the building of a new church at Neut-head, in Cumberland.—*Newcastle Advertiser.*

*Calcutta Cathedral.*—The Bishop of Calcutta, in a letter to the secretary of the Society for Promoting Christian Knowledge, dated May 3rd, 1844, states that the tower of the new Cathedral of Calcutta "is now raised to the first tiers of stones above the lancet windows, about 90 feet from the plane of site, and presents a most commanding object. The internal scaffolding of the lantern is being removed with the centering, to allow of the stones being elevated with greater ease than they could from the outside. The building has not settled more than a quarter of an inch in the last six months, so that the walls of the choir and transepts will soon rise, the ornamental work being safe from disturbance. Up to April 1st, we had expended 209,028 C. rupees, 13 annas, 5 pice, about 21,000*l.*—not more than we expected."

*New Church near Newbury.*—It is intended to erect a new church at Kingsclere, near Newbury, Berks. The town contains a population of 2,730 souls, and there is only one church, with 600 sittings. The Earl of Carnarvon has generously consented to appropriate 100*l.* per annum, as an endowment to the church, out of her rectorial tithes, so long as his lordship retains possession of the property, and Lord Bolton has consented to appropriate 100*l.* per annum to the same purpose. The Ecclesiastical Commissioners have promised liberal assistance.

#### RAILWAY INTELLIGENCE.

*Windsor Junction Railway.*—The contemplated Windsor Junction Railway, which is to be constructed on the atmospheric principle, is to consist of two branches—one from Windsor, to form a junction with the Great Western Railway at Slough, and the other (the terminus being near Windsor Bridge, on the Berkshire side) to proceed direct to London; but in order to carry this plan into effect it will be necessary to obtain the consent of the Crown. By the present proposed arrangement it is intended to provide a private station for the exclusive use of her Majesty and the Royal Family, to which access may be obtained from the Home Park, and within a stone's throw of the Royal residence. It is not expected that any opposition will be made to the proposed plan on the part of the Crown, the more especially as it embraces a structure that will be rather an ornament to the Home Park, instead of the present boundary wall, which is, throughout the whole distance, not more than a few yards from the river, and from which it is divided by only the towing-path. Mr. Page, the civil engineer, has received instructions from the provincial committee to proceed with the surveys and plans, and to make his report without delay, which is to be submitted to the Queen.

*Caledonian Railway.*—The negotiations between the Caledonian Railway Company and the Monkland and Kirkintilloch, and Glasgow, Garnkirk, and Coatbridge Railway Companies, were brought last week to a successful and satisfactory conclusion, and formal deeds of agreement among the contracting parties were executed and delivered. Similar arrangements were completed some time ago with the Wishaw and Coltness Company. According to these agreements, the three existing companies have become bound to widen the gauges of their respective lines, so as to correspond with the gauge of the Caledonian Railway, and in all other respects to improve their works, to the satisfaction of the engineer of the Caledonian Company. The improvements are to be completed before the Caledonian Railway is opened to the public from Lanark to Garioch, where the junction with the Wishaw line is intended to be effected. By means of these railways, the Caledonian Company have secured, upon very moderate terms, an access to the north side of the city of Glasgow, and also a connection with the north of Scotland; and while they thereby confer a great benefit on the existing lines, they will save the cost of upwards of ten miles of railway through a difficult country. The Caledonian Company have also made advantageous terms with the promoters of the Clydesdale Junction Railway for the use of their line and stations for the traffic of the Caledonian. This completes the connection with the south side of the city, and with the

harbour of Glasgow and the Paisley and Greenock Railways. These preliminary arrangements being thus effectually made, the parliamentary notices of the Caledonian Railway will be published in a few days.

*Midland Railway Projects.*—A special meeting of the proprietors of the Midland Railway has been held for the purpose of deliberating upon the subject of their engaging in the construction of several new lines, to branch off from their own line in the following directions:—"1st. A railway from the Midland Railway, at Nottingham, to Newark and Lincoln. 2nd. A railway from the Midland Railway at Swinton, by Doncaster, Bawtry, and Gainsborough, to Lincoln, and thence passing near Boston, Spalding, and Wisbech, to join the Eastern Counties Railway, at March. 3rd. A railway from the Midland Railway at Syston, by way of Oakham and Stamford, to Peterborough. And for the purpose of considering in what manner the necessary capital for the construction of all or any of such lines of railway shall be raised," &c. &c. These important projects were adopted; and an additional capital of two millions and a half was ordered to be raised by the creation of 62,000 new shares of 40*l.* each.

*Edinburgh and Granton Railway.*—The extension line to Granton from the terminus at Trinity is progressing rapidly; it runs west from the Station house, immediately behind the Baths, where it crosses the public road, skirting the whole north end of the field to the west. At Wardie the line crosses the road which at this point is to be thrown a good way south, and for which the gardens have been carried back to the extent of about 40 feet. From near Wardie Hotel to the head of Granton Pier the line will proceed north of the road by an artificial breast-work erected along the beach. When finished, this will form one of the most compact and elegant lines of railway in the neighbourhood.—*Edinburgh Advertiser.*

*Dundee and Perth Railway.*—The promoters of this undertaking have effected an arrangement with the company carrying a railway through Fife, who have made an alteration in their plans, the effect of which will be, that the whole traffic of the north of Scotland to Edinburgh and the south must pass along the Dundee and Perth Railway. The whole traffic to Glasgow and the manufacturing districts in the west of England must also pass over the line, whether through Fife, to Edinburgh and Glasgow, or by the Scottish central line, with which it communicates.

*Railroads in Sweden.*—A letter from Stockholm, Sept. 23, says:—"Sweden will soon have railroads. An association of capitalists and merchants, at the head of which are the rich houses of Totti and Afweden, Miguelson and Co., Peyron, Bergmann, and Engelsfeld, has obtained permission from the king to construct a railroad from Engelholm, on the Bay of Kullen, by Helsingborg, Landsrona, Lund, and Malmö, to the port of Cimbriks-sham, in the province of Gothland. By this line it will be possible to avoid sending goods by water to Elsinore, and thus save the Sound duties, which are enormous.

**TWO NEW BRIDGES IN CONNECTION WITH THE LANCASTER AND CARLISLE RAILWAY.**—About three weeks ago the foundation-stone of the extensive bridge, which is to consist of seven arches of 60 feet span each, and the parapet of which will be upwards of 100 feet in height, was laid with the ceremony usual on such occasions. The pier was proceeded with to a considerable height above the bed of the river Lowther, over which it is intended to span at a place called Yew's Crag, behind the village of Clifton, from the London-road, and about two miles distant from the town of Penrith. It appears that the work of this pier will have to be undone, by reason of a mistake in the dimensions, or some alteration in the plan of the ground-work, the fresh one having to be upwards of a square foot more. This is an unfortunate circumstance, because of the season being so far advanced, and the river so sudden and violent in its rise and fall, it being fed by the mountain torrents of Mardale fells, and other mountainous districts. The other large bridge, which will cross the river Edmont, near Yanwath Hall, will be proceeded with forthwith.

## Correspondence.

THE PREVENTION OF OFFENSIVE SOUNDS  
IN ROOMS.

TO THE EDITOR OF THE BUILDER.

SIR,—In order to drown the sound between an upper and lower room of large dimensions, the usual plan of pugging, as advised under the head of answers to correspondents, in *THE BUILDER*, No. 86, has been adopted; but the sound is still audibly conveyed through the ceiling into the lower room. Now, what is the plan you would recommend to destroy the sound? T. W.

Cambridge, Oct. 5.

[We incline to think there must be some imperfection in the manner wherein the application has been made, as we have never found it fail except in cases where a direct and offensive concussion has been occasioned over the apartments required to be quiet. Perhaps some of our correspondents may be in possession of some secret for the prevention of the offensive effects of sound in rooms.—Ed.]

THE "JENNY" USED ON SCAFFOLD-  
FRAMES.

SIR,—I should be much obliged if one of your readers could inform me of the newest improvements that have been effected in the "jenny" used on the scaffold-frames, and where drawings of the same may be obtained.

I am, Sir,

X. Y. Z.

## Miscellaneous.

**FRENCH AND ENGLISH MINES.**—At the meeting of the British Association, for the promotion of science, held at York, Colonel Stokes, F.R.S., president, in the chair.—Mr. G. Porter read a long and interesting paper, compiled from documents furnished to him by the French government, "On the Mining Industry of France," which contained some curious and interesting comparisons with that of this country. In 1814 the quantity of coals raised in France was but 665,610 tons; in 1826 it amounted to 1,301,000 tons, whilst in 1836 it was 2,541,000. In 1841 the number of coal mines at work was 256, employing 29,500 workmen, who on the average raised 116 tons each. In 1836 the value of a ton of coals was 11s. 3yd., whilst in 1841 it was reduced to 7s. 9d. There was no data by which to ascertain the amount of mineral fuel which was annually raised in the United Kingdom, but it was probably ten times greater in quantity than in France. From parliamentary returns, it appeared that in 1841 the quantity of coal transmitted eastwise was 7,410,000 tons, and that exported 1,840,000, besides which a very large quantity was used upon the spot in various manufacturing districts where it is obtained. It is a curious fact that in England the average amount raised by one man is 253 tons, being 120 per cent. higher than in France. An elaborate memoir was then given in the paper on the iron districts, in which were 12, containing 894 establishments in 1836. In 1841 these had increased to 1023. In 1836 there were 57,537 men employed, who created property to the amount of 4,957,000l., whilst in 1841 the number of hands was reduced to 47,830, although the value of the production had increased to 5,671,000l. For one ton of pig iron manufactured in France there were four in England, although it was singular, that whilst in France 47,900 persons were employed, those in England were but 42,000. This extraordinary discrepancy the author attributed to the deficiency in the process of manufacture and the additional cost of fuel. The production of other metals was of small importance, and he considered that a very fair prospect of future legitimate and extensive commerce from this country might be looked forward to in France.

**NEW THEATRE IN SHOREDITCH.**—Several houses have been pulled down during the last few days opposite the terminus of the Eastern Counties Railway, High-street, Shoreditch, for the purpose of constructing a spacious theatre, which is to be under the direction of Mr. Nelson Lee. The works have already commenced.

## NAMING AND NUMBERING OF STREETS.—

(From the Herald.)—The new Metropolitan Building Act, which comes into operation on the 1st of January, creates a new board for the general superintendence of buildings in London. The new board would render the public an important service if they would undertake such a registration of houses that every house in a street should have a distinct number, and that no two streets should be called by the same name. Great inconvenience is now occasioned by the neglect of this very simple matter of municipal arrangement. The last Act for the registration of voters directs that in every claim to vote, the number of the house shall be inserted for which the vote is claimed; but in some streets many of the houses are without numbers, and the instances are numerous of two or more houses in a street having the same number. In Regent-street, St. John's, Westminster, there are five Nos. 13, and six Nos. 14. Equal or greater confusion arises from the multiplication of the same street names. We find in a London Directory 28 King-streets, 20 Queen-streets, 26 Charles-streets, 25 Church-streets, 23 John-streets, 4 Water-lanes, 2 Water-streets, &c. A serious loss, as well as inconvenience, arises to the public from this source. The expenses attending the delivery of letters are increased some thousands of pounds by the puzzling uncertainty of addresses. A letter from the country, directed "King-street, London," is, perhaps, first delivered in King-street, Cleapside, whence it may be returned with the words, "Try King-street, Holborn," and perhaps 20 district postmen may each have to walk a mile before the right King-street and the right person be discovered. Nor does the fault lie altogether with careless directions. A stranger to London cannot be blamed for ignorance of the extent to which the amplification of an address is necessary. Thinking to be both precise and explicit, he may direct a letter, "John Smith, Water-lane, City, London," and his letter may be sent to three different Water-lanes, all in the city, and all within a stone's throw of each other—Water-lane, Blackfriars; Water-lane, Thames-street; Water-lane, Fleet-street; and perhaps in each Water-lane there may be a John Smith. The evil is one which we believe the corporation of London and the commissioners of paving generally have power to remedy; and we may hope it will be the duty of the new registrar to call their attention to the subject.—[This duty could not well be performed by the board mentioned; it is the duty of Commissioners of Paving and their surveyors, upon whom it is cast.—Ed.]

## HAMPSHIRE HEATH.—(From the Times.)

—The inhabitants of Hampstead, who have been long threatened by Sir Thomas Maryon Wilson, the lord of the manor, with having their beautiful heath encircled with squares, streets, and courts, and for an Act to enable him to effect which, Sir Thomas has petitioned Parliament at intervals, ever since the year 1829, have been in much consternation during the past week, upwards of eighty workmen having been employed in levelling the fences between the various fields belonging to Sir Thomas, between the Vale of Health and Highgate. On the 12th inst. Sir Thomas commenced operations on the heath itself, which, as the copyholders have rights of common and other valuable rights therein, may still, it is hoped, be preserved to the public by the committee of copyholders. Sir Thomas's property immediately adjoins Coen-wood, the grounds of which will be commanded by the intended cemetery. The committee of copyholders will, it is supposed, call a meeting of the copyholders as early as possible, intimation having already been given to Sir Thomas that the copyholders dispute his right to interfere with the heath, which in his recent applications to Parliament he has always professed he had no intention of doing.

**RETRIEVING MUD LANDS.**—A proposal is on foot to establish a chartered company for retrieving the mud lands of Great Britain and Ireland, deepening the navigable waters abutting thereon, and appropriating the retrieved lands, and in some instances the waters, in remuneration. The capital it is proposed to raise for this great national object is 500,000l., in five thousand shares of 100l. each.

**PUBLIC WALKS, PARKS, &c.**—We are glad to find fresh proofs of the general interest manifested in this excellent object, in the rapidly augmenting subscription list, which, since the last list was advertised, has been increased by about 1,780l., and now amounts to nearly 22,500l. The most recent subscriptions include a handsome donation by Mr. W. Atkinson, of 500l., and one of 250l. by our representative, Mr. Milner Gibson, M.P. There are also several liberal subscriptions from a distance, from parties thus gratefully acknowledging and maintaining their connection with the town. Mr. J. Thomson, of Primrose, Clitheroe, has given 100l. Amongst the supporters of the measure in the clergy of the establishment, it gives us pleasure to see the names of two of the canons of Manchester, the Rev. C. D. Wray, and the Rev. R. C. Clifton, for 25l. each. There is another class of subscriptions of which as yet we have only the commencement, but which have a peculiar value, as the contributions of the working classes themselves. These subscriptions are by far the most significant and decisive answer that can be given to those who object, that when parks are provided, the people will not use them. Few will suppose this likely, when they find that the workmen in a calico-printing concern (that of Messrs. Thomas Hoyle and Sons) have subscribed 67l. odd; and those of a machine-making establishment (that of Messrs. Sharp Brothers and Co.) upwards of 50l., in aid of the fund for public walks and parks. If these are not satisfactory proofs of the earnest approbation and cordial support of those for whom these parks are mainly needed, we know not where to seek them.—*Manchester Guardian.*

**PROPOSED PUBLIC PARK IN LEEDS.**—Some of our benevolent townsmen, among whom we may mention our public-spirited mayor, are desirous that Leeds should not be behind other towns in the formation of public parks or walks for the healthful and rational recreation of all classes. It has been suggested that the zoological and botanical gardens, which comprise nearly 20 acres, in a beautiful situation and well laid out, might be purchased for this purpose. Some of the larger shareholders in the gardens are, we know, disposed to transfer their whole property in them to the town-council, or some other body, for the benefit of the public; and we think it likely that many others would follow this liberal example, thinking it more agreeable to see their fellow-townsmen of the humbler classes enjoying themselves in the gardens than to walk there in comparative seclusion. Those shareholders who took shares as an investment, and who could not afford to give them to the public, would probably accept a moderate sum for that which now yields them no dividend. A subscription would, therefore, be required to purchase the garden for the public; and we think this would be forthcoming, as the amount would probably not be very large. A yearly subscription would also be requisite to keep the gardens in order. We hope to be able shortly to report progress in this laudable attempt to promote the health and recreation of the industrious classes.—*Leeds Mercury.*

**NEW BREAKWATER AND HARBOUR OF REFUGE.**—We can state now, from unquestionable authority, that it has been decided by government that the port of Weymouth is to form one of the Harbours of Refuge about to be established in the Channel, and that a Breakwater will be built, extending from the eastern part of the island of Portland to a length sufficient to secure a protection for the shipping interest, as well mercantile as naval. This national undertaking will, we hear, be on a grand scale, and being about the centre position in the channel, will be a most efficient harbour of refuge between the two large naval depots of Plymouth and Portsmouth. It is expected the proprietors of the Great Western railroad will promptly avail themselves of this favourable circumstance for laying down a line from Bristol and Bath, through the most advantageous and convenient track of country, to Weymouth, as no doubt this latter port, from its peculiarly apt locality, and becoming a general depot for shipping, will be hereafter the chief entrepôt and link for commercial connection and transition, through the medium of the channel islands, from the midland counties of England to the Continent.—*Sherborne Journal.*

Tenders.

TENDERS delivered for alterations to a house in Duncan-place, City-road.—Mr. James Harrison, No. 1, Holford-square, Pentonville, Architect. October 17.

Bugg .....	£245
Hambrook .....	214
Locke and Nesham .....	238
Smith .....	225

TENDERS delivered for Repairs and Alterations at Mr. H. Weston's, 212, High Holborn.

Pearse and Gerrier .....	£346 0
Brighton .....	345 0
Watmore .....	309 0
Judd .....	291 8
Fawcett .....	280 0
Williams .....	263 0
Chesterman .....	259 0
Spikias .....	254 0
Harrop .....	247 0
Gerry .....	229 0

The tenders were opened in the presence of the contractors.

NOTICES OF CONTRACTS.

For the Building of Four Almshouses in the city of Ely.—T. and G. Archer, Solicitors, Ely. October 29.

For the supply of Guernsey Granite Chippings, and Kentish Ragstone to the Board of Guardians of the Parish of Camberwell, Surrey.—Thomas W. Plum, Clerk of the Board, Havil-street, Camberwell. October 30.

For the Construction of 1,000 Yards of the Glasgow, Garnkirk, and Coatbridge Railway, together with a Viaduct and a Swivel Bridge. Also of 1,120 Yards of the Eastern Extension of the same Railway, near Coatbridge.—Mr. Niel Robson, Civil Engineer, 51, St. Vincent-street, Glasgow. October 30.

For Sloughing and Bottoming the Burton Pitsen west Drain.—Robert Gibson, Keyingham, or George Iveson, clerk to the Commissioners of the Keyingham Level Drainage. October 30.

For the Construction of Lots 1 and 2 of the Great Southern and Western Railway (Ireland). Lot 1 comprises a distance of about 9½ miles; Lot 2 comprises a distance of about 10½ miles.—Sir John Macneil, Engineer to the Company, 28, Rutland-square, Dublin. November 1.

For the supply of Mansel, Red Pine, and Larch Timber to the Great Southern and Western Railway (Ireland).—Sir John Macneil, Engineer to the Company, 28, Rutland-square, Dublin. Nov. 2.

For the Construction of 1 Mile and 65½ Chains of the Ashton, Stalybridge, and Liverpool Junction Railway.—The Secretary of the Company, at the Manchester and Leeds Railway Offices, Palatine-buildings, Ilunt's Bank, Manchester. November 4.

For the supply of Paving, Flint, Winstone, and Bombay Granite, &c.—Frederick Tritton, Clerk to the Trustees for Lighting, &c. the South District of St. George the Martyr, 11, Three Crown-square, Southwark. November 5.

For supplying her Majesty's Dockyard at Chatham with White Lead, and her Majesty's Dockyards at Deptford, Woolwich, Chatham, Sheerness, Portsmouth, and Devonport, with Red Lead.—The Secretary of the Admiralty, Somerset-place, London. November 5.

For the Erection of a new Barrack Establishment at Bristol.—C. J. Selwyn, Major and Commanding Royal Engineer, Exeter. November 7.

For the performance of such Bricklayers', Carpenters', Masons', and other Works to be done in the Cleansing, Building, and Repairing of the several Public Sewers and Drains within the Ranelagh and Counters' Creek Districts.—Lewis C. Hefeleet, Sewers' Office for Westminster, No. 1, Greek-street, St. John's-square. November 8.

For Works in the Construction of a New Dock in Kingston-upon-Hull.—Mr. John B. Hartley, Civil Engineer, Liverpool. November 11.

COMPETITIONS.

PREMIUM of 25 guineas for the best and another of 15 guineas for the second best design for laying out for building purposes a plot of land, containing about nine acres and a half, situate in the borough of Reading, having a frontage of upwards of 900 feet, and being of the depth of about 460 feet. Further particulars of J. J. Blandy, Esq., Solicitor, Reading; or of Messrs. Gregory, Faulkner, Gregory, and Bourdillon, 1, Bedford-row, London. November 15.

NOTE.

The article inserted in our last number on "Paper-hangings" has the appearance of being the entire paper read before the Decorative Art Society on the 9th instant; this is by no means the case. In justice to Mr. Cowtan we feel bound to state that we simply gave what

PUBLIC BATHS IN BIRMINGHAM.—A meeting of highly influential inhabitants of this town and neighbourhood was held in the committee-room of the Town-hall on Tuesday morning last, Mr. W. Beale in the chair, for the purpose of making preliminary arrangements for a town's meeting to consider the best means of providing public walks and baths for the use of the inhabitants. Amongst those present were Messrs. James Taylor, James James, H. Luckcock, W. Chance, G. Barker, and William Scholsfield; Aldermen Beale, Phillips, and Cutler; Messrs. W. Phipson, Joseph Sturge, Clement Ingleby, James Turner, J. Tyndall, Abel Peyton, C. Geach, T. E. Lee, B. Chesshire, J. H. Beilly, T. R. T. Hodson, John Beale, Bourne, E. Aldridge, J. Plevins, M. Banks, T. Ragg, D. Barnett, C. Lawden, and H. Simons, and many other gentlemen. Alderman Cutler opened the proceedings by calling attention to the importance of the subject, and detailing the acts of the Select Committee of the House of Commons appointed to consider the best means of providing places of recreation for the inhabitants of populous towns. On the report of this committee being made, the House granted, at two different periods, the sum of 15,000*l.* to aid the inhabitants of large towns in the formation of public walks and places of recreation. Alderman Cutler also stated the correspondence which had taken place between the corporation and the Government on the subject. Resolutions in furtherance of the objects in view were passed, and a vote of thanks having been carried to the chairman, the meeting separated.—*Birmingham Gazette.*

DREDGING OF THE RIVER AT GLASGOW.—We are informed that, since the 29th March last, nearly 11,000 cubic yards of mud, sand, and gravel, have been dug out of the bed of the river, betwixt the Stockwell and Wooden Bridges, being fully more than one-third of the quantity necessary to be taken out by spade labour, before the introduction of the dredging-machine. This improvement, when completed, will be equally useful and ornamental, and will remove the unseemly appearance of the bed of the river being exposed at low water in the very centre of the city.—*Glasgow Herald.*

PROPOSED NEW ROAD FROM HUNGERFORD BRIDGE TO KENNINGTON.—It is in contemplation to create a new street or line of road from the terminus of the Suspension Bridge, in the Belvidere-road, Lambeth, to the main road commencing at the Asylum, leading to Kennington and Vauxhall. On Monday last surveyors were engaged in measuring the line of road, and ascertaining the value of the property through which it will pass. From the terminus the road will cross the York-road, through the Lower Marsh, and emerge at the corner of Oakley-street, in a direct line with the Kennington-road.

NEW BARRACKS.—The Board of Ordnance have in hand the erection of various new spacious barracks in the north of England, which will involve an enormous outlay. They also contemplate, if the contract for them has not been already taken, building barracks at Worcester and Bristol, in neither of which cities has there hitherto been any accommodation for troops.—*Hampshire Telegraph.*—It has been finally determined to erect a barracks capable of containing 1,000 men at Portsea.—*Hampshire Advertiser.*

ANCIENT THEATRE DISCOVERED UNDER GROUND.—In the city of Parma has been discovered at a great depth, and in good preservation, the theatre of the ancient town. The government has ordered further excavations to be immediately commenced, and has purchased a number of houses belonging to individuals, which stood in the way of complete exploration.

MARY-LE-BONE AND PADDINGTON HOSPITAL.—The munificent offer of 2,000*l.* has been made towards the funds of this hospital by an anonymous subscriber, upon condition that the committee are prepared to commence building within twelve months. The subscriptions already amount to 15,000*l.*, including 100*l.* from her Majesty the Queen Dowager.

NOTTINGHAM IMPROVEMENTS.—A new street is to be formed in Nottingham, from the end of Lister-gate to Wheeler-gate, an improvement much needed. Many improvements have, within the last few years, been made in Nottingham.

METROPOLITAN ASSOCIATION FOR IMPROVING THE DWELLINGS OF THE INDUSTRIOUS CLASSES.—The object of this association is to provide a remedy for great existing evils, by enabling the labouring man to procure a comfortable, clean, and healthy habitation, at a less expense than is at present paid for very inferior and unhealthy accommodation, arising from want of ventilation, bad drainage, and the crowded state of apartments. To effect this, it is proposed to erect—1st. Dormitories for single men, or large rooms divided into compartments, with a separate bed to each occupier, which could be afforded at as low a rate as is paid at present by each person when three or four sleep in one bed. 2nd. Well-drained and ventilated buildings to be let to families in sets of rooms with an ample supply of water on each story. We find among the patrons of this measure the names of Lord Ashley, the Earl of Devon, Viscount Ebrington, Lord Francis Egerton, Lord Robert Grosvenor, Viscount Morpeth, and the Marquis of Normandy.

THE SINKING OF THE CUSTOM-HOUSE QUAY, DUBLIN.—On Tuesday evening, the 15th instant, a very singular occurrence took place at the Custom-house quay, and immediately in front of the Custom-house—a portion of the quay, about 130 yards, having suddenly sunk from its usual level, upwards of 7 feet, and in some places 15 feet in depth. The breadth of the breach varies from 5 to 7 yards, and, what is very strange, the outer wall next the river kept its place, sinking a little, but not slipping from its original position. The breach was immediately filled with water, as the river rushed into it, and a good deal of apprehension prevailed for some time, as it was feared that additional damage might be done to the Custom-house itself, which is built upon piles, and the site was originally a marsh. It is the opinion, we understand, of very able engineers that the building has been erected too near the river; and a scientific gentleman said he had no doubt that the vast superincumbent weight of the immense pile has, in no slight degree, aided in the action of the water, in causing the occurrence. The appearance of the place is very curious, and several eminent engineers have stated that it is a singular circumstance how the outer wall stood while the back portion fell so low. We understand that the foundation of this portion of the quay was on a blue clay bottom, which must have been cut away by the constant ebbing and flowing of the tide; but the difficulty which arises here in reference to the preservation of the outer wall is not so easily solved. The wall, however, was built on a foundation sunk very low; and the materials of the wall too are all very heavy stone, while the back was filled in loosely without any precaution as to the foundation, and this may account for the accident to the latter. From the neglected state of the Custom-house sewers, scientific men are of opinion that the foundation which supports the building itself (one of the finest in Europe) must eventually suffer. This should be looked to in time, as further neglect may cause a serious calamity.—*Freeman's Journal.*

PUBLIC WALKS.—It would seem that the government intend to expend money on "public walks," and the example of Sir R. Peel, in his gift of 1,000*l.* for a park at Manchester, has attracted some attention to the subject. It appears that Parliament voted 10,000*l.* for public walks in the year 1840, and by a return printed in the session of 1843, only 500*l.* was stated to have been expended, in the following manner:—"The Provost of Dundee—Improving Magdalen-yard 300*l.*; and the Provost of Arbroath—improvements in the neighbourhood of that town, 200*l.*" It is added in the return "the remaining 9,500*l.* is still in the Exchequer."

Mr. James Dunning Harvey (second son of the late Mr. Harvey, master mariner and civil engineer for roads, &c.), has executed a survey of Weymouth, the north end of Portland and parts adjacent, with the line of the intended Breakwater; also of Weymouth and Portland, with Race and Shambles, and the line of the proposed Breakwater, on a scale of 4 inches to a mile. These surveys will tend materially to elucidate the important claims of Portland Roads, as the best position for a central harbour of refuge in the British Channel.—We understand the dockyard at Chisborough is increased considerably.—*Dover Chronicle.*

apparently were the most interesting and useful parts of it. We hope the Society will publish the essay in a complete form; it will prove an excellent pendant to Mr. Crabb's contribution on Design, and materially assist in diffusing the principles which ought to actuate those who have the power to improve the public taste.

TO CORRESPONDENTS.

T. R.—We cannot publish the problem: T. R. needs only to sum up the areas of the five triangles of his Pentagon, and extracting the square-root he will have his answer.

N. H.—We must beg of our correspondent to call to his mind the fable of the Old Man and his Ass. That portion of our paper to which he objects is exceedingly valuable to many of our readers, and, indeed, were it omitted, he would have to pay 6d. instead of 3d. for each number.

Communications from the following have been received, and are under consideration:—"Officiator," on the late land-slip in Dublin—"A Brightonian" on the Portico of the New Royal Exchange—"Joseph Jopling" and "T. L." on Tudor Arches—"J. P." on the construction of Sewers—"Thos. Faulkner"—"On the Priory of Holywell, in Shoreditch—"Vincent Yardley" on the Vaults for the new Houses in the line from Oxford-street to Holborn—"A Subscriber and Builder" on Webster and Johnson's newly-invented Saw.

Current Prices of Wood and Metals.

October 22, 1844.

Table with 4 columns: Item, £. s. d., £. s. d., £. s. d. Rows include Box, Turkey, bd. per ton; Cedar, Pencil, per foot; Cuba; N. S. Wales; Green, per ton; Ebony, Ceylon, large and small; Madagascar, small; Lignum Vitæ, Jamaica; St. Domingo; Mahogany, Cuba, per foot; St. Domingo; Honduras; Timber: Teake, African, per load; Oak, Quebec; Fir, Riga; Dantzic and Memel; Swedish; Pine, Quebec, red, per load yellow; Miramichi & St. Johns; Wainscot Logs, 18 ft. each; Lathwood, Memel, &c. fm.; Deals, Gelfe, 14ft. 3in. by 9; Stockholm; Gottenburg, 12ft. 3in by 9; Christiana, 1st & 2nd St. Peters'g; Dantzic, 12f. 11 in. 18; Quebec yellow Pine, first quality; second ditto; White Spruce, 120; Dantzic Deck, each; Plank, Dantzic Oak, load; Straves, Baltic, per 1200; Quebec Pipe, 1200; Punccheon; Copper: Brit. Cake, p. ton; Tile; Sheet, p. lb.; Old; South Amer., ton; Iron, British Bars; Rods; Hoops; Sheets; Cargo in Wales, Bars; Pigs No. 1, Clydes; Russian, C.O.S.D.; Lead: British, Pigs, p. ton; Sheet, milled; Shot, patent; Red or Minium; White; Litharge; Pig, Spanish; American; Steel: Swedish Keg; Fargot; Tin: In blocks, p. cwt.

Table with 4 columns: Item, Quantity, Price. Rows include Ingots; In Bars; Banca; Straits; Peruvian; Plates, p. box, 225 sheets; No. 1. C. 13 1/2 by 10 in.; I. X.; SPELTER; Delivery; Zinc, English Sheet; ORSIBEW; QUICKSILVER.

ADVERTISEMENTS.

E. G.'s TRACING-PAPER.—REMOVAL OF AGENCY.—The proprietor of the above unequalled article begs to return his grateful acknowledgments for the extensive patronage afforded by artists, surveyors, civil engineers, and consumers in general. It is warranted to take Ink, Oil, or Water colour, and may be had of MESSRS. ROBERTSON AND CO., SOLE AGENTS, 51, LONG-ACKE, at the following cash prices: THIN TRACING-PAPER: 60 by 40, at 14f. 9s. per Ream, or 15s. 6d. per Quire; 40 by 30, at 7f. 9s. " 7s. 6d. " 50 by 20, at 3f. 1s. 6d. " 6s. 6d. " THICK TRACING-PAPER: 40 by 30, at 14f. 9s. per Ream, or 15s. 6d. per Quire; 30 by 20, at 7f. 10s. " 7s. 6d. " N.B.—Every sheet is stamped with the Initial of the Manufacturer.

TO INVENTORS AND OTHERS. MESSRS. BINNS and Co., Civil Engineers, Mechanical Draughtsmen, &c., 27, CAREY-STREET, Lincoln's-inn-fields, London, beg to inform Inventors and others that they are now busy Preparing DRAWINGS and Descriptions to illustrate SPECIFICATIONS OF INVENTIONS and the REGISTRATION OF DESIGNS is effected by them at a very moderate expense. This office affords great facilities to those who, from its very extensive experience Messrs. Binns and Co. have had in the practical construction of every description of machinery. LITHOGRAPHIC and ZINOGRAPHIC DRAWINGS of every description executed with care and dispatch. Drawings made for the construction of Models and other Experimental Machinery.

\* \* \* Correct and copious ABSTRACTS, accompanied by a drawing of any particular part or parts of an Invention (the SPECIFICATION of which has been duly enrolled), may be had at a trifling cost on application at the office as above.

MOREWOOD'S PATENT GALVANIZED TINNED PLATE.—PATRONIZED BY THE ADMIRALTY and the HONOURABLE BOARD OF ORDINANCE, being extensively used in HER MAJESTY'S DOCK-YARDS, at the TOWER, and elsewhere, for every variety of ROOFING and other purposes, where a strong, light, cheap, and durable material is required. It has been found by experience that this article is beyond all comparison superior to zinc, possessing, as it does, all the advantages of zinc, without its weight and firmness of iron, combined with perfect immunity from rust; and is free from the very serious objection, which applies to zinc, viz. its contraction and expansion, and the consequent change of temperature, and from which circumstance leakage must of course result. This material is not likely to be destroyed by fire, as is the case with zinc and lead, which melt and run down, thus freely admitting fresh air to the fire, and causing it to burn more fiercely. It is, therefore, obviously well adapted for all the purposes above named, and most importantly so, when there is the possibility of fire. It is also peculiarly suitable for chimneys, gutters, standing and out-door work generally, possessing the strength of iron without its liability to corrosion. It is by far the most economical metal roofing that can be obtained, in consequence of its strength, as it may be laid without boards, and upon the lightest rafters. This mode of preserving metal from rust does not only apply to sheet-iron but also to manufactured iron in any form, as bolts, nuts, hinges, nails, &c. &c. S. HOLLAND, 31, GABRIEL-CHURCH-STREET, TO LANDOWNERS, AGRICULTURISTS, BUILDERS, ARCHITECTS, &c.

MCKIBBIN'S improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY. The disadvantages attending other articles used in roofing, preventing, in agricultural districts, many useful houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will in a great measure—and in some instances altogether—obviate them, and prove most serviceable from its lightness, durability, and impermeability to water and damp, in covering Houses, Cattle-sheds, Workshops, Rope-walks, &c. and for the sails, as well as roofs, of light structures for plants, being likewise a non-conductor of heat; besides its economy in repairs, the timber where it is used may be so tight as to save its whole expense; if required, no other coping, and may be applied by any person of common intelligence; being flexible and portable also, it is free from leakage; the expense of carriage is inconsiderable in comparison with slates, tiles, &c. and it is not liable to contraction. It may be had in sheets 32 inches by 20, at 5d. each (being less than 9s. 6d. per square of 100 feet), with printed directions for applying them.

Orders will meet with prompt attention, if addressed to H. C. BOWDEN, 18, East India Chambers, Leadenhall-street, London; or to the following agents:—Liverpool, Messrs. Gruber and Co., 11, Manchester-street; Plymouth, Thomas Stevens, esq., Birmingham; Sunderland and Newcastle, Messrs. John Ritson and Sons; Hull, William Ward, esq.; Bristol, Messrs. Moor and Hewitts; Ramsgate and Deal, Messrs. Edward Hodges & Co.; Whitehaven, Messrs. William Todd, esq.; Glasgow, Messrs. Malcolm Carmichael, esq. St. Enoch-square; Cork, Messrs. Richard Wallis and Co.; Belfast, Messrs. Gruber & Co., Dun-har's Dock.

Who have also on sale MCKIBBIN'S improved SHEATHING, Boiler, Railway, and other FELT. \* \* \* The "Improved Roofing Felt" will be found much more durable than the common Felt made in lengths, and not subject, like it, or continuous sheets of other material, to be stripped by storm; it can also be more easily repaired, and from the simple mode of application recommended, the wet cannot percolate through nail-holes, being only fastened down at the overlaps.

ORNAMENTAL WINDOW GLASS, 2s. per foot super.—CHARLES LONG having greatly improved his machinery for ornamenting glass, is enabled to offer handsome patterns at 2s. per foot super. glass included, 100 feet can be executed and delivered in two days. Address to Charles Long, House Decorator, &c., 1, King-street, Portman-square. For Cash only.

PAINTING BRUSHES.—TO PAINTERS, BUILDERS, &c. J. KENT and CO., 11, GREAT MARLBOROUGH-STREET, LONDON, offer to Painters, Builders, and Dealers in Painting Brushes, goods of a quality far superior to those generally offered for sale, and to which they beg to call the attention of those who study quality and durability to cheapness. Lists and prices forwarded on application.

BUILDERS, PLASTERERS, and others should compare the Prices.—Yellow Ochre, 8s. per cwt. Boiled Oil, 2s. 8d. per do. Lamp Black, 24s. do. Blue Black, 18s. do. Turpentine, 2s. 3d. per do. Venetian Red, 12s. do. Second do., 2s. do. Cold Size, 9s. per do. Third do., 2s. do. Copal Varnish, 12s. & 16s. do. Paper Varnish, 10s. & 12s. do. Town Gilt, 42s. do. PAINTER'S GENERAL CHEAP LEAD and Colour Warehouse, 58, JUDD-STREET, NEW-ROAD. Brushes, Varnishes, Dry and Ground Colours, at lowest prices.

BASTENNE BITUMEN COMPANY, B. Offices, Foultry. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in the erection of buildings, &c. Its application as a FLOORING will be found generally superior, and also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot square:—1 inch thick, 8d.; 2 inch thick, 1s.; 3 inch thick, 1s. 6d. Works not measuring 400 feet, 1d. per foot extra. Roofing executed at 6d. and 7d. per square. Concrete is charged on addition according to the thickness when required. Carriage and men's time are charged extra when works are executed beyond three miles from the General Post-office. Bitumen 2s. 6d. per ton, without grout. B. CHARLES F. TILSTONE, Sec.

H. BESSEMER'S PATENT GOLD PAINT. Sole Agents, R. TILLEY & GARROD, 235, Blackfriars-road, London.

The above METALLIC PREPARATION is intended to supersede the use of Gold Leaf, as it gives an equally beautiful effect; is extremely durable; will bear washing equally well with any other description of fine paint; and in comparison, costless, remaining only to be applied with an ordinary brush. It will be found particularly adapted for the following purposes:—HOUSE-PAINTERS and DECORATORS. For exterior and interior Decoration, Iron-work, Mouldings, Cornices, Centres, Brackets, Figures and Casts of every description, whether in Plaster or Metal, Writing and all ornamental work where gold is required to be introduced. SHIP-PAINTERS and DECORATORS. For the decoration of ornamental work, either within or without, as may require gilding, and from its cheapness, affording an opportunity of embellishment so desirable, but which is frequently neglected from its great expense.

PLASTER FIGURE-MAKERS. For general use upon the Figures, Casts, and Medallions manufactured for ornamental purposes. And for various other uses here undescribed, but which its low cost may likewise adapt it to. To be had wholesale only as above, and retail at most Colour Warehouses in the kingdom. Sold in bottles, 6s. each.—A liberal allowance to the trade.

PLUMBERS, PAINTERS, BUILDERS, and OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c. for Pictures, Glazing, &c. &c. in any quantity, at Manufacture's prices.

TURPS, per gallon, 2s. 4d. LINED OIL, ditto, " 2s. 4d. SHEET LEAD, in sheets, per cwt. " 18s. 6d. DITTO, in sizes and PLYS, per cwt. " 9s. 6d. WHITE LEAD (Genuine) per cwt. " 20s. 9d. Colours, Pipe, Brushes, &c. &c., equally low, and quality warranted. Complete Lists, priced, may be had on application to Messrs. PRINCE, Traders, Leicesters-square, London. PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS, can be provided with flatted Crown, flattened Sheet, and the patent Sheet Plate, Lists of which, showing the price for any quantity, from 14 by 12 to 40 by 30 of Best and Second quality, will be sent (gratis) upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for, if required.

SUBSERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London. The advantages of Common Sheet over Crown or Glazing Sky-lights is decidedly great, and is generally used where strength or superior appearance is required; a light 6 feet 6 in. long, with openings of any width, needs only one large Glass in a considerably stouter than Crown, and may be had from 1s. 3d. per foot. Also may be had, COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES, OF EVERY DESCRIPTION. GAS CONTRACTORS, FITTERS, GLASS MERCHANTS and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis. CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MORTLARS, AND OTHERS, supplied with PLASTER OF PARIS, PLASTER OF PARIS, for covering models of Public Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application. French Table Figures, China Vases, Fancy Glass Ware, and Alabaster Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Bazaar keepers and others.

## NOTICE.

THE Cyclopaedia of the Building-Act is now in type, and will be published in our next number, wherein, among other illustrations, it is our intention to give a drawing of the magnificent old carved Chimney-piece, taken from the ancient Ilickes's Hall, St. John's-street, and now in the south-east committee-room of the Middlesex County Sessions' House.

# The Builder.

NO. XCI.

SATURDAY, NOVEMBER 2, 1844.

HE movement which has taken place with regard to archite-

ture within these few years might occupy a large space in our columns, and still much remain to be said upon the subject. This movement, though it has at present produced little good, and has in some instances been the occasion of harm, is no doubt the forerunner of a regeneration of the true art and mystery of architecture. It has awakened public attention to the subject, and has enlisted in the cause many who are able as well as willing to assist judiciously, and to the purpose; and deducting the ordinary drawbacks from ill-advice and mere talkativeness, and making due allowance for the shackles and hindrances which they are sure to produce, it will be found that some sterling promise is opening to the cause, which must inevitably fulfil the wishes of the skilled and the sterling, who either devote their lives to the science, or admire and to their utmost foster it.

The various unprofessional societies which have lately sprung up, and which are devoted principally to ecclesiastical architecture, must in the end work a great deal of solid advantage, whether by awakening taste or arresting spoliation or demolition,—whether by improving new structures, or by restoring old buildings which would otherwise have gone to decay, or to violent destruction. It is true that much of the effect of these societies is lost by want of concert, and; as must be expected for some time to come, by a want of the scientific and technical attainments which relate to practical architecture. Some may say this at once incapacitates them from claim to touch any subject of architecture existing or to be formed: we cannot, however, go so far as that, for we are obliged to confess, that had the practising profession of architecture itself taken up the subject in earnestness, with a good heart, such societies would hardly have been necessary; but every one must admit that no party is indeed particularly to blame. The Reformation came as the natural consequences of the state of ecclesiastical matters at that juncture; had the fullness of time in that respect not come, the tyranny and cupidity of Henry the Eighth and the rapacity

of his courtiers would have been as powerless as the church then was to put off the humiliation which its sins had brought upon it; but the church being doomed to be humbled, the pride of its architecture was naturally humbled too. At that very critical time, the architecture of the ancient Romans was revived in Rome and other parts of Italy; and none were more active than the popes themselves in ousting the scientific Pointed Architecture, altering ancient Gothic edifices with a modern-antique masking, and setting the same example to all Europe,—notwithstanding Welby Pugin, who is as deficient in knowledge of history, secular and ecclesiastical, as in all the mechanical arts and sciences which were exercised by the Freemasons (even every joint of his carpentry being on false principles, and such as no competent carpenter ever practised),—would have one to believe ancient church architecture declined by the spread of Protestantism, carried on by that "Tyrant Elizabeth," as he is pleased to call her, no doubt admiring the sweet-souled Mary, her sister, the legs of whose very bed, up to the sacking, if it had any, were steeped in the blood of episcopal martyrs (a thing little heard of even in pagan times), and whose proceeding may be taken as a model of that which men of his class would fain try the experiment of reinstating: the popes having set the example, the ancient Roman architecture, under various phases of degeneracy, spread again from Venice to Ireland, and from the Mediterranean to the Baltic; and from the exact similarity of the curves in the Jacobine scrolls and filagree work with the moresco works of Spain, many of which indeed seem pricked off from the same moulds and templets, they thence appear to have been executed by the Moors, who were expelled from Spain by its Catholic sovereigns, for no doubt in the years 1609-10, when Philip the Third enforced his edict, and thrust out from the kingdom a million of souls, with the other Moors hosts of workmen, who, till then, had been busied on their own arabesques, became from their skill the employed carvers and artificers wherever they could obtain toleration or encouragement,—shewing, as far as any collateral testimony can, that Catholicism itself, in its zeal, caused a still further erratic movement from Christian architecture.

We wish all the legitimate power which could result from enthusiasm and activity, to be the crowning result of these societies; and that till they have obtained the requisite quantity of information and science they should be more pacific than active, confining themselves for the next five or six years principally to the acquirement of knowledge and the arresting of spoliation; so that in after-times they may have little cause for regret; and that in particular they should be very tender in the promulgation of dogmas, lest they inevitably lose repute for discretion, and be not esteemed of authority.

We caution them at present to doubt with themselves, till they find the truth; and especially to be careful, and even timid, in all matters of construction, not daring to utter opinions with regard to methods in carpentry and masonry which have obtained traditionally, practically, and scientifically; nor lightly to believe those who, in proportion to their want of practice, technical breeding, and abstruse study, esteem themselves entitled to reform, change, or restore. The most dangerous rock, upon which some of these societies are now falling, is the restoration of ancient things in new edifices, merely as examples of styles which once obtained, and because they had a certain descrip-

tion of taste (the best of the day) esteem them fit subjects for imitation; whereas nothing could, or at least should, be more notorious than the fact that improving science caused the free-masons to cease from particular methods, and to go on improving till architecture had attained a zenith; and that their master-masons would not have admitted, even into the rank of apprentices, those perverse enough not to follow the most advanced architect science, when the way had been pointed out by the genius of others.

We have not space at present for enlarging further upon so important a matter, but must defer doing so till another occasion.

M M M.

A SPECIAL meeting of the Oxford Society for Promoting the Study of Gothic Architecture was held on Wednesday, October 30th, for the purpose of receiving the report of the committee appointed June 17.

There will also be meetings on Wednesday, November 13th, and Wednesday, November 27th. All these meetings will be held in the society's room, at eight o'clock in the evening.

## DECORATIVE ART SOCIETY.

On Wednesday evening, the 30th of October, a paper was read by Mr. Fildes, "On Beds and Bedding." After noticing the varieties in use among the ancients, and the sleeping arrangements of modern times, both in foreign countries and England, the paper concluded with an account of the materials that enter into the composition of the various articles of bedding, with remarks on the possibility of improving them, so as to increase the comfort of this indispensable article of furniture. In the discussion which ensued, various suggestions were thrown out for the consideration of manufacturers on practical improvements in the preparation of feathers, horse-hair, spiral springs for mattresses, &c.

On Wednesday, the 13th inst., a paper will be read "On Colour and Gilding," in application to decorative purposes.

## INTERCOURSE BETWEEN ENGLAND AND HAMBURG.

Mr. Elmes's project of constructing wet docks, with a capacious lock and much enlarged harbour, at Gluckstadt, on the Lower Elbe, and connecting it by the recently opened railways to the Baltic, *via* Keil, and to Hamburg, *via* Altona, is not only one of the most important improvements in the intercourse between England and the countries adjacent to the Elbe and Baltic that have yet appeared, but will effect one of the greatest political and commercial revolutions of modern times. Gluckstadt is situated in one of the finest reaches of the Elbe, about 28 English miles from its mouth, with a clear channel of above a mile in width, and from 40 to 60 feet deep at high water, and from 30 to 40 feet deep at low water in front of the harbour, which is also protected by a natural breakwater, which is high and dry at every tide. In addition to the trading ships using this splendid new harbour, the steam-ships of London and Hull will make many more voyages a month than they now do to Hamburg, from the difficulty and danger of the navigation above Gluckstadt; and a new company, called the European Steam-Packet Company, is started for the purpose of effecting a daily communication from Harwich to Gluckstadt, which can be accomplished in 21 hours, and one hour by railroad to Hamburg will make 22 hours from Harwich to Hamburg; and when the branch railway from Colchester to Harwich is completed, 2½ hours more from London will make 24½ hours from London to Hamburg, which now takes from 50 to 70, and often in winter 80 hours.—*Observer*.

## THE BEST METHOD OF PROTECTING BUILDINGS FROM LIGHTNING.

WERE our houses, magazines, and ships, built of iron, or did they consist of a framework of iron filled up with stone, brick, or wood, they might bid defiance to the ravages of accidental or wilful fire, as well as to all the lightning of the tropics. Strike where it might, the deadly fluid would be conducted quietly to the ground. In the meantime, however, we must have recourse to a less perfect system of protection, till advancing knowledge and receding prejudice shall have introduced iron buildings, and iron ships, as well as iron ploughs, iron roads, and iron bridges.

As the conducting powers of lead, tin, iron, zinc, and copper, are as the numbers, 1—2—2·4—4 and 12, copper is the best material for conducting-rods. The quantity of metal in the rod should not be less than what is contained in a cylinder half an inch and two-tenths in diameter. The metallic rod should be flattened rather than round, so as to have the greatest surface that is consistent with strength. The conductor then formed, should communicate with all the detached masses of metal in the building, such as leaden ridges, gutters, and metallic pipes. It should be placed as near the wall as possible, and pass directly into the ground. It should be attached to the most elevated point of the building, and if the structure is to consist of numerous ranges, such as the new Houses of Parliament,\* long, pointed rods should project from the most prominent parts into the atmosphere.

In place of adopting the usual method of external conductors, we would recommend the introduction of a vertical iron bar into the thickness of the principal walls of the building. These bars should communicate with a horizontal wall-plate of iron uniting the whole, and from this wall-plate should rise all the external conductors which are to project into the atmosphere. These iron-plates and bars might be so united as to form a sort of carpentry which would add to the strength of the edifice.†—*Edinburgh Review.*

## LECTURES ON ARCHITECTURE AND ANTIQUITIES.

## Lecture V.

## ROMAN ARCHITECTURE.

(Continued from p. 531.)

ROME was adorned with an incredible number of fine buildings; temples were erected in honour of every deity in the pagan mythology, many of which have been swept away, but of which descriptions remain in the works of poets and historians, to enable us to judge of their splendour. Even in the days of the Republic, the private residences of the wealthy citizens began to display the utmost magnificence of architectural grandeur, and the palaces (for so they may be termed) of Pompey, of Caius Marius, of Lucullus, rivalled each other in sumptuous decorations; and Pliny states that there were at one time in Rome one hundred palaces of the greatest splendour. Great was the contrast, therefore, to those earlier times when these temples were only large enough to contain the statue of the god, when the houses were only cabins (*tecta*), with walls of mud, and roofs of boards, or, as in the time of Romulus, when even the palace of the king was thatched with straw, so that Ovid and Livy call the residences of the early kings, cottages.

The conquests of the Romans, by which they became acquainted with, and masters of, the finest works of antiquity, caused the simple buildings of their capital to make way gradually for more elaborate works. Yet even Julius Cæsar, in the height of his power, was obliged to obtain leave to erect a pediment in front of his private dwelling. We may suppose that some of the more early structures, in which Grecian architecture was attempted to

\* We earnestly hope that this splendid national structure, which is to be adorned internally by the genius of our artists, will be protected externally by the science of our philosophers. We fear, however, that the expression of this hope is not sufficiently early to enable the architect to embody a system of metallic conductors in the very walls of the edifice.—*Ed. Rev.*

† Bell-wires and metallic pipes for water and gas in modern houses require to be carefully connected with the principal conductors; without this precaution they are rificed directed against the lives of the inhabitants.—*Ed. Rev.*

be introduced, exhibited singular anomalies, and possessed but little of the refined taste of the Greeks. Thus Plutarch relates that columns brought from ancient temples to Rome were cut and repolished after their arrival, to produce a greater degree of elegance and lightness; but he adds that what they obtained in these qualities they lost in grandeur and symmetrical proportion. The ruthless conquerors, animated by avarice rather than by a true feeling of taste, despoiled the temples of Greece as well of their columns as of statues and paintings; thus Sylla carried away a great many columns from the Temple of Jupiter Olympius, at Athens, to adorn the temple of Capitoline Jove, at Rome; and forty columns of the Temple of Juno Lucina went to adorn some public building also at Rome; and numerous columns are to be seen in the different churches, which, in all probability, originally belonged to pagan temples of remote antiquity and destination.

Among the most useful and necessary works with which Rome abounded, we may reckon those in which the ARCH was a principal feature, viz. in her aqueducts, bridges, and cloacæ (sewers). For many hundred years the Romans had no supply but the turbid waters of the Tiber, or from its immediate neighbourhood. About 312 years B.C. (or 442 after the foundation of Rome), the first aqueduct was commenced by the censor Appius Claudius Crassus, and from him it was called the AQUA APPIA: he was also the originator of the famous road called the Appian Way. This aqueduct was eight miles long, and the greater part of the distance was along the ground, or by subterraneous lines, and for 193 paces it was carried upon arches. The higher part of the city was supplied by its waters.

The next aqueduct in order of time was constructed about thirty-nine years afterwards, by Marcus Curius Dentatus and L. Papirius Cursor, censors, from the spoils taken in war from Pyrrhus. It was brought from the environs of Tibur, at a distance of more than twenty miles, from the springs that flowed into the Anio, and thence it was called ANIO VETUS: it was chiefly underground.

After another lapse of 127 years, the AQUA MARCIA was brought into Rome by the Prætor Martius (although this supply is said by Pliny to have been originally commenced by Ancus Martius). It was brought from springs in the neighbourhood of Subiaco, twenty miles above Tivoli, and was reckoned the purest and coolest of all the waters that supplied the city:—

—“ Marsasque nives et frigora ducens Marcia.”

STATIUS.

Pliny says, “Of all the waters in the world, that which we call in Rome the Marcia carrieth the greatest name by the general voice of the citizens, in regard both to its coldness and salubrity, and we may esteem this water for one of the greatest gifts that the gods have bestowed upon our city.” About 460 paces were carried on arches.

The fourth supply of water was called the AQUA TEPULA, introduced by the censors C. Servilius Cæpio and L. Crassus Longinus; it commenced about eleven miles from the city, derived from springs connected with the Anio.

The AQUA JULIA was the work of the magnificent Agrippa, so called in honour of his wife, the daughter of his imperial friend Augustus, and widow of the lamented Marcellus. It was carried on arcades for a length of 6,400 paces.

Agrippa also conducted the AQUA VIRGO into Rome, so called from the circumstance of a girl having first pointed out, to the soldiers engaged in exploring, the source of the stream, ten miles from Rome; it supplied chiefly the Campus Martius, and the VIIth and IXth regions; its waters were in great request for bathing; thus Statius:—

“ Quas præcepit Anien, atque exceptura natatus Virgo juvat.”

For seven hundred paces this aqueduct was carried on arches.

The AQUA ALIETIENA was conveyed by Augustus from the lake Alietinus, a distance of twenty two miles, and it appears to have been intended entirely for the use of the Naumachia, or places for sea-fights, which

that emperor had formed in the XIVth region. For 355 paces it was carried on arches.

These seven aqueducts formed the supply of Rome until the time of Claudius, who finished two magnificent works commenced by Caligula, one called the AQUA CLAUDIA, which derived its source at a distance of thirty-eight miles from Rome, and 10,000 paces of it were carried on arches; the second, called the ANIO NOVUS, was forty-two miles long, whereof more than 6,000 paces were on arches.

As the Romans carried their architecture into their provinces, their useful works were therein introduced, as well as those which sprang from luxury or vanity. Some of the provincial aqueducts, in Gaul especially, were of extraordinary splendour and extent, many of which still supply the towns with their waters. The chief of these were at Lyons, the ancient Lugdunum, where were no less than four, erected during the reigns of Augustus, Tiberius, and Claudius, crossing valleys and rivers at a great height; at Metz; at Evora; at Bourgas; at Segovia, by Trajan; and the most superb of all at Nismes, whose origin is attributed to Agrippa, long the governor of that city. The whole length of this aqueduct is about six French leagues, and in the middle of its course is the famous *Pont du Gard*, which crosses the deep valley of the river Gardon, at a height of 150 feet above the river, in three tiers of arches, some of which are 60 feet wide.

There were eight BRIDGES over the Tiber into ancient Rome, now mostly in ruins; the most noted of them was the Pons Sublicius, which Florinus Cœles singly defended against the army of Porsenna; and the Pons Triumphalis, now called after the Vatican, by which those who had obtained victories in Gaul and Spain entered the city in triumph.

The emperor Trajan built a famous bridge over the Danube, which was demolished, some assert through envy, by Hadrian. It had twenty piers, 150 feet high and 60 feet wide, with arches between, 170 feet wide; it was designed by Apollodorus. The bridge of Alcantara over the Tagus, erected by a Roman governor in honour of Trajan, is 670 feet long, and 200 feet above the river, and consists only of six arches, each 80 feet wide. A famous single-arched bridge is that over the river Allier, near Brioude, in Auvergne (*Pons veteris Brivatis*); the piers stand on two rocks at the distance of 195 feet, the arch is 84 feet above the water.

The CLOACÆ, or Sewers, were also wonderful works; that called the Cloaca Maxima, planned and commenced by the elder Tarquin, was so large that a loaded cart of hay could easily pass through it. (Strabo.) It was about 1,500 feet long, 16 feet broad, and 30 feet high. Some authors are unwilling to refer to so early a period as that of the Tarquins the covering over of this sewer with the arch as it now exists, and they incline rather to ascribe it to Agrippa, who is known to have cleansed and repaired it, and who certainly had to reconstruct it for the distance which it passed under his superb Pantheon—an eighth part of the whole length of the Cloaca. But to enter further into this question will involve a discussion on the antiquity and discovery of the arch, for which this is not exactly the place.

The Roman “ways” or roads were also astonishing works, and extended not only from Rome itself to every corner of Italy, but into the remotest parts of their provinces, where neither fens nor marshes proved obstacles in their progress. In England, remains of their great military ways are numerous; of these the road known by the name of Watling-street is conspicuous; it extended from London to York.

In their monuments we see also proofs of the magnificence of this extraordinary people. The most stupendous of these are, the mausoleum of Hadrian, now the Castle of Saint Angelo, 250 feet in diameter,

—“ The Mole which Hadrian rear’d on high, Imperial mimic of old Egypt’s piers;”

BYRON.

the tomb of Scipio; the pyramid of Caius Cæstius; and the immense structure erected to the memory of

“ The wealthiest Roman’s wife,”

Cecilia Metella, wife of the rich Crassus, whose “love or pride” raised that

“stern round tower of other days,  
Firm as a fortress, with its fence of stone,  
Such as an army's hafted strength delays,  
Standing with half its battlements alone,  
And with two thousand years of ivy grown.”  
BYRON.

The private residences of the emperors and citizens of note corresponded with the magnificence of the public buildings. The ruins of the Palace of the Cæsars nearly cover the Palatine hill; it was begun by Augustus, considerably added to by Tiberius, and enlarged by Caligula, who formed the gigantic project of uniting the Palatine hill with the Capitol by a bridge. Nero extended the palace to an immense distance, as far as the Cælian and Esquiline hills, and was so profuse and extravagant in the decorations of this palace that it was called Nero's Golden House; the galleries were a mile in length, the ceilings of the dining-halls represented the motion of the firmament.\* Domitian rivalled him by enlarging this abode, and by the lavish expenditure he displayed therein. Trajan stripped it to adorn the Temple of Jupiter Capitolinus; it was destroyed or much injured by fire in the reign of Commodus, but was restored by him, and repaired and enriched by Alexander Severus and almost every succeeding emperor until the time of Theodoric. It is now a heap of undistinguishable ruins, and “the spider streaks the veil in the Palace of the Cæsars, and the owl stands sentinel on the Imperial mount;” and cabbages and artichokes may be purchased in the halls of those Cæsars who wielded the greatest sceptre ever held by the hand of man.

Hadrian's villa, near Tivoli, occupied an area of nearly five miles in extent, and its ruins still excite the wonder of the traveller. It resembles a city rather than a villa, for within its circuit were temples, baths, gymnasies, a theatre, and lodging-houses for his friends, his officers, and soldiers. In his palace he imitated all the best buildings of Greece, and the gardens were made to resemble the Elysian fields, and even the infernal regions. Among the admirable Greek sculptures found in the ruins of Hadrian's villa, are the Faun, the VENUS DE MEDICI, and the Flora; and that such matchless works of art were not confined to the chambers of the very highest in rank, we gather from the fact, that in the ruins of the villa of the historian Sallust were found the Silenus and Infant Bacchus, the Hercules and the DRYING GLADIATOR. Mr. Hope well observes that each of these imperial halls seemed a palace in splendour, and a city in size; whilst an early writer (Ammianus Marcellinus) compares them to provinces rather than to cities.

It would fill a volume only to mention the names of the hundreds of temples which once adorned Rome, of the circuses, gymnasies, thermæ, porticoes, naumachies (places wherein sea-fights were displayed), fora (in the time of Augustus to the number of forty-five), basilicas “for the administration of justice, and the despatch of business, vast and superb beyond description, and even shambles so sumptuous, that on a medal of Nero appears a building inscribed ‘Macellum Augusti,’ which, from the richness of its columns, might be mistaken for an amphitheatre.” (Hope.) Many extraordinary structures have been briefly noticed, and enough has been said to convey some notion of the magnificence of ancient Rome, of her pride and pomp, when pouring out her countless thousands

“along the Sacred Way  
The triumph came, and winding round  
With acclamation, and the martial clang  
Of instruments, and cars laden with spoil,  
Stopp'd at the sacred stair \* \* \*

And the victor springing from his seat,  
Went up, and kneeling as in fervent prayer,  
Entered the Capitol.” ROGERS.

“Now all is changed,”

“The Goth, the Christian, time, war, flood, and fire,  
Have dealt upon the seven-hilled city's pride;  
She saw her glories star by star expire,  
And up the steep, barbarian monarchs ride  
Where the car climb'd the Capitol; far and wide  
Temple and tower went down, nor left a site.”  
BYRON.

We need not wonder at the magnificence of ancient Rome, if we reflect that she was abso-

lutely mistress of the (known) world; that she came, and saw, and conquered; that monarchs trembled on their distant thrones lest they too should adorn a Roman triumph, and grace the victor's chariot-wheels; from which humiliation neither the Numidian monarchs Syphax and Jugurtha, nor the Asiatic queen Zenobia, nor the British Caractacus, nor the Macedonian Perseus, nor the Jewish Simon, were able to protect themselves:—

“Well might the great, the mighty of the world,  
They who were wont to fare deliciously,  
And war hut for a kingdom more or less,  
Shrink back, nor from their thrones endure to look,  
To think that way! Well might they in their state  
Humble themselves, and kneel and supplicate  
To be delivered from a dream like this!”

ROGERS' Italy.

Some invoked death, and so escaped the fearful trial: Hannibal by the poison, Cleopatra by the asp, and he\* who, when the fatal cup harmed not, fell on his own sword.

The spoils of the then known world were at the command of Rome, and the genius of the Roman people seemed to take a delight in expanding itself, like their all-conquering eagles, in rearing structures which should serve as trophies of their greatness and proofs of their claim to universal dominion. But the states of Greece were hardly larger than some of our English counties; their works were frequently interrupted by the enemy at their gates, and their democratic jealousy would not allow their citizens to erect any handsome private edifices; thus their magistrates, watched with a severe and scrutinizing glance, were hardly better lodged than the meanest citizens of Rome.† The resources of the two nations were widely different, yet the Greeks produced that faultless system of architecture upon which mighty Rome formed her own school, for her orders are but plagiarisms from the Greeks, engraving her blemishes upon their beauties.

G. R. F.

(To be continued.)

OPENING OF THE NEW ROYAL EXCHANGE.

The above spacious edifice was opened on Monday last by her Majesty in person, attended by Prince Albert, the Duchess of Kent, the Duke of Cambridge, the Duke of Wellington, the Bishop of London, the ministers of state, several members of the corps diplomatic, and a long list of the nobility, gentry, merchants and civic authorities. On this occasion her Majesty was pleased to confer the dignity of baronet upon the Lord Mayor, now the Right Hon. Sir William Magnus, Bart. During the inauguration, an interesting ceremony took place in the centre of the Merchants' Area, on the spot where the statue of her Majesty, by Mr. Lough, is to be placed; this was the naming of the Royal Exchange by her Majesty. The Lord Mayor, as he preceded her Majesty, stopped when he reached this point, and the members of the corporation, together with the chief ministers of state, formed a circle round her Majesty, who then in an audible voice said “It is my Royal will and pleasure that this building be hereafter called the Royal Exchange.”

We have so frequently during its progress had occasion to speak professionally of the building, that our readers will readily excuse us doing more on the present occasion than simply registering its opening.

IRON CHURCH FOR JAMAICA.—A church has been sent out to Jamaica, as a specimen, as many of the kind are likely to be required. The pilaster supports are of cast-iron, on which are fixed the frame roof, of wrought-iron, of an ingenious construction, combining great strength with simplicity of arrangement; the whole is covered with corrugated iron, and the ceiling formed in paneled compartments, covered with felt, to act as a non-conductor of heat. The body of the church is 65 feet by 40; the chancel, 24 by 12; a robing-room and vestry are attached. The windows are glazed with plate-glass, one-eighth of an inch in thickness; the two chancel windows, and four others, are of stained glass. The cost of this iron church is 1,000*l.*—*Glasgow Chronicle.*

\* Mithridates, King of Pontus, who had been in the habit of taking so many antidotes, that poison had no effect upon him.  
† Demosthenes accused Midias that he had built a house at Eleusis by which all the others were thrown in the shade.

THE BIRKENHEAD DOCKS.

THE occasion of laying the foundation-stone of the docks at Birkenhead, intended by the projectors as a kind of rival to Liverpool, has created a great sensation in this and the surrounding district. Although there has been no particular complaint of the want of dock accommodation at Liverpool, it has been deemed a matter of infinite importance to the Cheshire side of the river to form docks in that neighbourhood, whence projected railways and various other means of forwarding the views of commerce are contemplated. The town of Birkenhead itself, which comprises Woodside, Monk's Ferry, Tranmere, and a number of other places, has for some years been laid out in streets; and owing to the indefatigable exertions, industry, and perseverance of Mr. William Jackson, the township has risen to its present state of importance, and which now commands the general attention of the inhabitants at large of this part of the country. To day was appointed for laying the foundation-stone of these docks; and such a numerous assemblage of individuals, I may state with confidence was never previously congregated on the Cheshire shore. The cost after the first stone was laid may be estimated as follows:—

The docks at Wallasey Pool (by the commissioners), 400,000*l.*; dock warehouses (private company), 600,000*l.*; New Market (commissioners), 20,000*l.*; Town-hall dock, 10,000*l.*; Park dock, 25,000*l.*; Tunnel from Grange-lane to Monk's Ferry, belonging to the Chester and Birkenhead Railway, 20,000*l.*; making in all 1,075,000*l.* These are works finished, or intended to be finished, as in the case of the docks and warehouses, the market, the Town-hall, the park, and the tunnel are nearly wholly finished. Such a grand undertaking as this naturally has excited the utmost interest, and to-day may be considered as a memorable epoch in the annals of commercial enterprise.

So early as nine o'clock in the morning immense crowds of individuals flocked to the pier-heads, and the boats were so crowded by the curious from Liverpool, that the general passage by the boats for residents was quite impeded, and from their great loading serious apprehensions were entertained for the safety of the living cargoes. Fortunately, however, no serious accidents occurred; a few persons slipped into the river, but they were not injured beyond getting a mere ducking. In honour of the occasion, the ships of the Liverpool docks displayed their gayest colours, and various vessels in the river returned the compliment to the guns which were bombing from six o'clock in the morning from the Birkenhead shore. Many of the shops in Liverpool closed for the occasion, and various of the societies of trades, odd fellows, shipwrights, and others embarked for the Cheshire side, and joined in the general rejoicing. A grand procession was formed of the principal inhabitants and authorities to see the spectacle of laying the first stone of the docks, and every window in its line was filled, principally by the Lancashire and Cheshire witches. The procession left the Town-hall at eleven o'clock, and proceeded round the New-park; and after parading the principal streets, halted in a field beyond Mr. Case's house, where the first stone of the anticipated future prosperity of Birkenhead was to be laid. A vast number of individuals were congregated upon the spot, and on the approach of the procession, with Sir Philip Egerton at its head, the most enthusiastic cheers were given. The stone having been lowered into the place destined for its reception, containing, as it did, the coins and documents selected for the occasion,

Sir P. Egerton addressed the spectators at considerable length, after which the aristocracy of this and the surrounding neighbourhood partook of a sumptuous entertainment, served up in a spacious pavilion erected on a portion of the premises of the Chester and Birkenhead Railway, Mr. John Laird, ship-builder, of Birkenhead, presiding.  
Liverpool, Wednesday, Oct. 23.

MONOLITHIC TOMB FOR THE REMAINS OF NAPOLEON.—A block of porphyry, weighing upwards of 50,000 lbs., has been taken from the quarries at Morlaix, to be used for the sarcophagus of the Emperor Napoleon.

\* The architects of Nero were Celer and Severus.

A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARKHAM, IN NORFOLK.—NO. VII. WITH NOTICES OF THEIR ACTUAL CONDITION. (Continued from p. 544.)

*Billingsford.*—We are always gratified on meeting with indications that the parochial clergyman holds it not enough, in respect of the wants of the fabric in which he is called to minister, merely to

“Talk with churchwardens about pews;”

but both by precept and example promotes, as far as in him lies, the stability of its general condition, and the decency and order of its arrangements. Such indications are by no means wanting in the fine church of Billingsford, which in Parkin's time seems to have been in a very dilapidated state throughout.

We should like to know the orientation of this church, that is, the precise degree of its inclination towards the east: the pile was probably dedicated to either St. Mary the Virgin or the Holy Trinity, and the exact position would furnish us with an inference in favour of one or other of these; for our ancestors “used to make the church point to that part of the horizon in which the sun rose on the day of its foundation, the day also which should be remembered, of the patron saint.”\*

It consists of a nave with clerestory pierced on each side by three windows, formed of quatrefoils inserted in circular mouldings; two aisles, a spacious chancel, and an octagonal tower with one bell only. The ancient covering of lead over the nave and aisles has yielded place to pantiles; the chancel is flat-tiled. Cause for regret exists in that, at the period of the reparations, it was not yet received as a dictum that “flat ceilings are inconsistent with Gothic architecture,” and that, “next to a stone vaulted roof, none has so good an effect internally as an open roof exhibiting the timbers.” This is peculiarly obvious in the coved ceiling of the chancel here, rapid in itself, and far worse than that, rendering all but impossible the restoration of its once splendid east windows. Some of these, particularly one now blocked at the east end of the north aisle, are fine examples of the Perpendicular period; but that of the majority is geometrical tracery, approaching the Decorated. Shall we be excused in entering our protest against the “washings” to which the stone-work of these externally has been subjected? The lime-brush has done too much to impair the interior beauties of our churches—witness here the many-clustered pillars, with their finely-moulded capitals, and having the bases set on stilted polygonal plinths,—that its scope should be yet enlarged. Besides, we object to it on principle, as being an “irreverent” substitute for the mason's chisel.

This spacious and lightsome edifice is entered from a mean porch by crossing an ancient grave-stone, long ago “reaved” of its little commemorative brass. The floor here and in the central avenue, nearly co-extensive with the nave, is laid diagonally with pavements; those of the chancel, which mount in three platforms to the altar-rail, intersect at right angles with the building; the first step, set under a pointed chancel-arch—the place of the lost rood-screen—has its moulded nosing, and the riser under, wrought in Caen stone. The floor under the seats—for the most part open, but of debased character, and having the standards crested by very rude *feurs de lis*—is by no means in similarly good condition.

The font, which has been advanced from its former position in front of the tower archway more into the body of the nave, and there elevated on a high octagonal plinth, represents two distinct styles. The lower portion, a cylindrical stem set on a hexagonal base, and surrounded by four small round shafts, bespeaks the Norman period; while a capacious bowl of octangular form externally, where the compartments are paneled with double arches, and the spandrels supplied with quatrefoils, should denote a later era. The lining—it appears to have been once leaded—is gone, and the drain no longer serviceable, a point we should hope of undesigned omission at the time of removal.

In the chancel, the canopy of the sedilia, if they had a canopy, has disappeared: a pointed arch enriched with crockets surmounts the piscina, the orifice of which is foliated. The space within the altar-rails is “wainscoted”

by a low brick wall faced with cement, and built so as to admit a current of air at the back. The rail and table of varnished oak are, with some reserve on the style of the balusters, unexceptionable. A north door, communicating with the grave-yard, almost demands the erection of a sacristy. Between it and the chancel a curious perforation, in the form of a square-headed window, crossed by a transom below the centre, is thought to have formed the confessional of the Papal requisition; it is now partly blocked. The steps from the rood-loft seem to have had their *debouchement* in the south aisle. The holy table appears at present without a dossel or screen over it, but we were informed that the decalogue engraven on zinc is in course of preparation, and will be set up there in obedience to the eighty-second canon.

We must not leave the chancel without noticing the zeal for its good and sufficient reparation—as well as that of the edifice generally—shewn by the present incumbent. *Transact in exemplum!* Good it were if some who love to declaim against “superstitious filthiness at diriges, at month's minds, at trentals, in abbeys and chantries,”\* would confess that the real filthiness of the churches in which themselves minister is indeed *most foul and lamentable to behold*.

At an inquisition taken anno 34 Henry III., the jury find that Richard de Bec had no right to fish, except for eels, in the sluices of the two mills here; and the present worthy occupant of Bec Hall may aver that we also are devoid of right to impugn his large seat in the north aisle. Parkin mentions “the remains of a large and handsome pew of oak, with a cover,” as appertaining to the Hall in his time. Those which now disfigure the east end of this fine church have few claims to notice on the score of beauty; but they at least possess one merit—that of not being immoderately high. The finials of the ancient benches exhibited, it seems, in rude carving the armorial bearings of Curson and others. Full-length figures of the saints in fresco once adorned the walls; one of them discernible at no remote period over the north door might represent St. Christopher.

The panels of the reading-desk and pulpit contain portions of tracery, like that of the rood-screen at Weston: the former will be so far altered, we hear, that the minister may face southward. A lectern should by all means be introduced here, and two chancel stalls placed near it; one on each side, would have fine effect.

The tower, as already observed, is in form octangular: it has four perpendicular windows in the belfry stage, and a fine west window of similar design affords light into the nave beneath. The parapet is embattled, and the outline of its lower portions, by the introduction of massive buttresses continued within, relieved by the deep “responds” of the western piers. The set-offs of the buttresses at the chancel-end are curious.

The site may be dismissed in a few words—

“A gentle hillock crown'd  
With a peculiar diadem;”

and we were pleased to learn that its natural beauties will be enhanced by a judicious clumping of appropriate trees. Why should not there be a wish, yea a very earnest desire, for embellishing those places where “the field of God is sown with the seeds of the resurrection?”

**RIVER DON IMPROVEMENTS.**—On Thursday week, a deputation from the River Don Company met the committee of Town Council at the Mansion-house. The deputation stated the views of the company with regard to the improvements in the navigation. They proposed to make a still-water navigation of nine feet up to Doncaster with only one lock between the tide way, and to form a flood-drain extending from the Doncaster Mill as far as below Sandall weir, of dimensions capable of containing the whole of the flood waters. They also contemplate the embanking of Newton Ings and Crimpsall, in order to prevent the floods from coming into Marsh-gate. It is also a matter of impossibility to estimate these improvements too highly, because the prosperity of the town is intimately connected with the more efficient navigation of the river itself.—*Doncaster Gazette.*

#### BATHS AND WASHHOUSES FOR THE LABOURING CLASSES.

THE meeting which recently took place at the Mansion-house, and the interest it has excited, not only in London but throughout the country, may be taken as evidence of the impression made by the sanitary report and the other confirmatory inquiries as to the physical condition of the labouring population, and of the increasing anxiety they have created in the minds of persons of all parties to do all that may be done immediately, and in the order of practicability by voluntary effort, without waiting for those larger measures which can only be achieved by well-directed legislation. Undoubtedly, the erection of a cheaper and superior description of public baths and accommodation on a large scale, which shall remove the business of washing from the single room in which the whole of a poor man's family are born, work, live, sleep, and die, will be legitimate objects of voluntary exertion. Open thoroughfares, free ventilation, and good drainage are imperatively necessary for the preservation of the public health. It has been shewn, though the proof was unnecessary, that mortality is greatly increased by the squalid, ill-lighted, ill-ventilated dwellings of the poorer classes. Such dwellings are the nurseries of typhus, which dwells itself into the neighbourhoods where wealth, relying on superior arrangements, deems itself secure. Dr. Farr states that the health or unhealthiness of various districts is indicated uniformly by the ventilation and drainage of dwellings.

A profuse supply of water to the dwellings of the bumber classes is essential to public health. All vermin loathe a well-washed floor. Medical men have often told us that they consider cleanliness more fattening and more contributive to a healthy frame than a large supply of good food. We see the principle exhibited in the grooming of horses, washing of dogs, &c.

Already several thousand pounds have been subscribed, though the committee has scarcely yet entered upon their duties.

**MEMORIAL TO THE LATE EARL OF LONSDALE.**—At a meeting of the Westmoreland magistrates on Saturday last, the subject of the erection of a suitable memorial to the late Earl of Lonsdale was introduced by Mr. Wilson, of Casterton Hall, who advocated the establishment of an institution for the benefit of the most unfortunate of all sufferers, those who are deprived of their reason, and stated that the erection and endowment of such an asylum had frequently occupied the benevolent mind of his lordship. An example of distinguished munificence has already been set by the gentlemen in the neighbourhood of Kendal. James Gandy, Esq., of Heaves Lodge, and John Wakefield, Esq., of Sedgwick, each having declared his intention to subscribe the sum of 500*l.* towards the undertaking. A lady, whose name has not at present transpired, has contributed 190*l.* towards the same object.—*Westmoreland Gazette.*

**NEW METHOD OF BURNING TILES AND BRICKS.**—Mr. Hodges, at the meeting of the Staplehurst Agricultural Association, said, that before long, great facility would be afforded for the draining of land, by a contrivance which would shortly be made public. There were several machines for making draining tiles, but the burning them and other expenses would always prove a great obstacle to their general use. This having occurred to him, he had, with the assistance of an ingenious man in his own employment, found out a mode by which any farmer who lived too far from a kiln could burn his own tiles, at a very trifling expense. The kiln would not cost more than 5*l.*, and it made inch-tiles complete at the rate of 18,000 in a fortnight. It would not be necessary to have any permanent building, and when a farmer had done with it, he could dispose of it to his neighbour none the worse for wear.

**NEW NAMES FOR STREETS.**—As much injury is liable to be inflicted upon tradesmen by any alteration of the names of their respective streets, a correspondent suggests that wherever such alteration takes place, the old name of the street should be written up under the new one.

\* Paper issued by the Cambridge Camden Society.

\* *Homilies*, Vol. II., No. 3.

## TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.

(Continued from p. 520.)

116. **HOLLY.**—This, the hardest and most beautiful of our evergreens, is a native, and to be found growing wild in the woods—attaining a great age, with a height of 20 or 30 feet, and, under favourable circumstances, even known to reach from 40 to 50 feet. Every one acknowledges the enduring cheerfulness of its appearance; when every other tree has submitted to the wintry blast, and relinquished each vestige of its living beauty, this shines forth in sprightly relief from the frost-hound and snow-wreathed earth, or amid the driving sleet, its dark and glancing leaves and bright red berries strikingly contrasting with the bleak sterility which prevails around, seem to utter an eloquent homily on cheerfulness in adversity. There are many variegated varieties cultivated as ornamental shrubs, several of them surpassing beauty, their glossy and jagged leaves being bordered and streaked with gold and silver hues: for a permanent, beautiful, and impenetrable hedge, it is not to be excelled, the only obstacle to its being made thus available being its extremely slow growth. It flourishes best in a sandy loam, but it is not at all fastidious as to soil; the seeds are inclosed in the cells of the berry, which are four in number, each containing one horny, oblong seed.

117. A custom of great antiquity exists of ornamenting churches and dwellings with holly at Christmas, accompanied by some other evergreens; and the circumstance of the custom having been practised at Rome by the early Christians has suggested its derivation from the Romans, who used the holly in like manner in their great festival of Saturnalia, which took place about the same time. That it was emblematical of peace and goodwill, we learn from its being the custom of the Romans to accompany their gifts at that season with branches of it; and that it is regarded even now in an analogous light among ourselves, is proved by our knowing that there are many, young and old, who could hardly believe Christmas to have arrived, were the space of wall over the mantel-shelf not adorned with its sprigs and berries; and the former especially, if no fun-fraught Rubicon depended from the ceiling. The disciples of Zoroaster, the fire-worshipper, believed that the holly-tree had no shadow from the sun; and his followers now, in Persia and India, are said to throw in the face of a new-born child water impregnated with its bark. Young people used to be fond of casting it leaf by leaf into the fire, which produced a crackling and bouncing that afforded them great amusement; and a custom still lingers of beating the feet with a bough of it when afflicted with chilblains, a penance akin to, and no doubt equally efficacious with, the martyr-like self-castigation of other days. In the language of flowers, it is the symbol of caution and foresight.

118. The wood of the holly is white and hard, suitable for veneering, inlaying, and making mathematical instruments; it is also much used for the purposes of the turner, whip-maker, millwright, and engineer. Its bark is, by boiling and fermenting, converted into a bird-lime.

119. **HAZEL.**—This tree is very plentiful in England, and well known both in our hedges and woods; but rather as an underwood than as a timber-tree, although, if left to grow freely, it attains a very goodly size, especially the variety known as the Constantinople hazel, which was imported hither in 1665, and of which the fruit is twice as large as that of the common species. It is a pleasant, cheerful tree, when adorned with its flowers or catkins, depending gracefully from its branches, but has a still more enticing appearance when its boughs are loaded with the brown-shelled nuts, richly clustering on every spray:—the cob-nut is the produce of one variety, the rich filbert that of another: the squirrel climbs these trees and feeds on the nuts amongst their branches; the mouse and other small animals make free desert of them when they fall to the ground. The best soil for producing the filbert of a large size and free from maggots is a strong loam; for propagating by means of the nuts, they should be preserved through the winter in moderately dry sand; but when fruit is the object, the best method is by layers. The small coppice-wood of this species may be cut every seven

years; it is applied to the making of fishing-rods, hoops, spars, stakes, forks, hurdles, and a variety of other agricultural purposes; if left to grow without hindrance, it shoots up into poles frequently 20 feet in height.

120. **Box.**—This tree grows to fullest perfection in Turkey, but is here seldom grown to any considerable size, although under favourable circumstances it will attain a height of from 20 to 30 feet; when a dozen feet high it presents a stem girding from 12 to 15 inches. It is generally found as an evergreen in shrubberies; the small shrub forming the bordering to flower-beds is a species of it, but not such as affords any serviceable wood: that which we use for superior purposes, especially where a fine cross grain is essential, is imported from Turkey. The wood is of a yellow colour, extremely close, compact, and hard; also heavy, and susceptible of a fineness of finish equal to metal. It is used for wood-engraving, the specimens of art produced from which, especially of late years, are scarcely inferior to the impressions from metal plate engravings; it is also used for making mathematical scales, carpenters' rules, and musical instruments. It loses weight by long steeping in cold water.

121. **UPAS, or Poison-tree of the Island of Java.**—Amongst the marvels related by our earlier navigators, strange tales have been told of this tree—that it grows in a desert produced by its own pestiferous influence, its exhalations causing death to every living thing that approaches it, and the acrid milk or juice flowing from its stem when wounded being of the most deadly poisonous description, accompanied in its fatal certainty by the most excruciating tortures. The greater part of this is erroneous, but the virulence of its juice is unquestionable, a circumstance which, supposing the tree to be propagated in this country, must, or ought to, debar its common use, and would at least render it very unpopular amongst workmen. There is growing in the Horticultural Society's gardens at Chiswick, near London, an upas tree presented by the East-India Company, which, as it has not as yet killed or hurt any one, disproves the story of the poisonous influence of its exhalations; a strong sentiment of touch-me-not nevertheless pervades its immediate presence.

122. **BANYAN, BUR, or Indian Fig Tree.**—This tree is amongst the vegetable wonders of Nature, and is also one of the most beautiful of her productions; unlike any tree that grows in England, each forms a perfect grove, sometimes spreading to an amazing extent, being composed of many distinct stems, some of them of considerable magnitude, and probably never decaying so long as the soil continues to yield it sustenance. In the scorching clime of India it flourishes in more beauty and perfection than anywhere else; furnishing, as described by Milton,

“ a pillar'd shade,

High over-arch'd, and echoing walks between;” and the leaves of which, according to that sublime poet, became the first clothing of the human race. The branches from the parent stem each throw out slender fibres, which, bending towards the ground, strengthen, strike under the surface, take root, and become themselves parent trees, that shoot out new branches, and produce roots in their turn, and so multiply *ad infinitum*, forming a beautiful and cooling shade; with large soft green leaves of a lively hue, and a small description of fig, which when ripe is of a bright scarlet colour. On the shores of the Nerbuddah, one of the boundaries of the Deccan, there is a magnificent and long-celebrated specimen still growing, consisting of 350 large trunks, and upwards of 3,000 smaller ones, and measuring nearly 2,000 feet in circumference, presenting a canopy under the shade of which 7,000 persons might repose; amongst its branches green wood-pigeons, doves, peacocks, large bats, squirrels, and monkeys, find shelter, and some of them sustenance. According to the tradition of the natives it is 3,000 years old, and it is believed by some to be the same that was visited by Nearchus, one of the officers of Alexander the Great.

123. **CYPRESS.**—Amongst the trees of the south of Europe, this is one of those which live to the most advanced age; it is also remarkable for presenting examples of very gigantic dimensions, both in girth and altitude, some of which are met with in Mexico; of these, one at Chapultepec, said to girth about

118 feet, and believed to be considerably above 5,000 years old, may be regarded as at once the largest and most ancient tree hitherto discovered. The cypress still exists on Mount Lebanon, and flourishes in the gardens of Constantinople; in the United States of America, its largest stocks are 120 feet high, and from 25 to 40 feet round—the latter dimension taken above the conical base of the tree, which usually measures at the ground from three to four times the diameter as generally taken; it is grown in England chiefly as an ornamental shrub, nevertheless frequently attaining a considerable size. It is a tall, upright tree, of a dark green hue, and rather sombre character; very hardy-enduring amid the war of changeable elements, from generation to generation, alike unmoved whether assailed by summer's scorching heat or winter's blighting cold. Its scent and shade have been said to be unhealthy, if not dangerous; its leaf is bitter; its fruit round in form, not larger than a common nut, and of an olive colour.

124. The cypress was in ancient times much planted in church-yards, an appropriation for which it might be chosen on account of its great durability; being, amongst perishable things, the most fitting as an emblem of immortality. In Turkish scenery its application in this way is carried to so great an extent as to become a remarkable feature, far-spreading forests enooping with their dark waving boughs vast cities of the dead; it being the custom in their cemeteries, when a body is committed to the earth, for the priest to plant a cypress at both head and foot of the grave, the superstition being that those trees which grow with their tall heads pointing towards the sky, denote the salvation, while such as take a downward bend (as happens with not a few), imply, on the other hand, the damnation of the soul whose mortal integuments they overshadow.

125. The timber of the cypress is of a beautiful and excellent description, very compact, and valuable as resisting the worm and all putrefaction. Amongst old examples of its use may be cited the gates of the church of St. Peter, at Rome, which Alberti found to be whole and sound after having been up 550 years. The coffins of the heroes of Athens, and the statue of Jupiter in the Capitol—the ark also, which is described in Scripture as being made of gopher-wood, is by some believed to have been of Cypress.

126. **ELDER.**—This tree is well known on account of its bunches of juicy berries, or at least it ought to be so from the variety of purposes to which its produce is applied. Its wood is very similar to that of the box tree, and will therefore be fit for similar uses: the pith, which it possesses in large quantities in both stem and branches, is cut into toys for young people—of the inner bark ointments are made—the flowers, before opening, are gathered for pickles—the berries are boiled into a glutinous syrup for colds and sore throats, or when quite ripe made into wine, which is esteemed a very pleasant beverage when spiced and drunk hot. In the north it is called the *Boor* tree, perhaps corrupted from *bover*; it was much planted of old in hedges of barn-yards, &c. In earlier times many superstitions attached to the elder; it formed a charm for a variety of diseases, especially epilepsy; anulets were made of it, when grafted on the willow, &c., and the which properties are faithfully set forth in Blochwitz's “Anatomic of the Elder,” translated and published in London, 1655. A cross made of the elder and willow, mutually unwrapping one another, is hung by some about their children's necks.

(To be continued.)

**THE HARDY MONUMENT.**—Monday the 21st ult. being the anniversary of the battle of Trafalgar, was appropriately selected as the day for laying the foundation-stone of this testimonial, which was done in due form by the esteemed lady of the high sheriff, John Floyer, Esq., amidst the cheers of the numerous assemblage. The site is Blagdon-hill. There was a goodly array of ladies present, which added much to the animation of the scene. Mr. Henry Goddard, of Bridport, is the contractor for the erection of the monument, which, from its elevated position, will be seen at a great distance both by sea and land. —*Dorset Herald.*

ANCIENT STAIRCASE BY INIGO JONES,  
IN CHANDOS-STREET, WESTMINSTER.

TO THE EDITOR OF THE BUILDER.

SIR,—I beg to send you a sketch of one of those numerous relics still remaining in London (and which are so little known or appreciated) of the talents of Inigo Jones as an architect and artist. The subject is a portion of a staircase still remaining in the house of Mr. Diller, writing-desk and dressing-case manufacturer, No. 5, Chandos-street, Westminster.

The width of the staircase is rather small; there are four flights, commencing at the first floor, ornamented with this beautiful carved work; there can be little doubt that the first two flights had balustrading of a similar description, but, if so, it has been removed many

years. The sketch is a copy reduced from a drawing, exhibited by the late Sir John Soane, R.A., in one of his lectures at the Royal Academy, who, speaking of the subject, thus alludes to the architect:—

“Inigo Jones, whose superior knowledge in architecture I have often had the pleasure of noticing in these lectures, was particularly happy in his staircases, both as to convenience and artist-like effect, even when confined to very small spaces. How superior is the decoration in these staircases” (two drawings of this staircase and one of the staircase at Amesbury, in Wilts., were exhibited) “to what we are accustomed to see in modern

houses of a similar class;—what comparative magnificence in the former, what poverty and meanness in the latter! Whatever we have gained in lightness and effect we have lost more in importance and character.”

As soon as leisure permits, I will send you a sketch of the Amesbury example.

I am, Sir, yours, &c.,  
C. J. RICHARDSON.

22, Brompton-crescent.

P. S. Might not the house in Chandos-street have been the residence of Inigo? It is not far from St. Martin's lane, where Horace Walpole states he resided.

MONUMENT TO THE EARL OF LEICESTER.

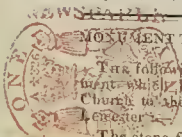

The following is a description of the monument which has been erected in Longford Church in the memory of the late Earl of Leicester.

The stone for the monument has been pro-

duced from the borders of Yorkshire, and is a fine magnesian limestone of a light cream colour.

The plan is a rectangular niche, slightly recessed in the wall, and projecting therefrom about one foot. It is fixed on a plain solid base, three feet high. The opening of the

niche in front is about nine feet high and four feet three inches wide, and is flanked by shafted jambs, having floral capitals, with the ball-flower in the hollow between the shafts, and the outer angles of the monument are strengthened by double buttresses, tabled in three stages. From the capital of

the outer shafts springs an equilateral moulded arch, with ball-flower enrichment; and from the inner shaft springs a trifoliated cinquefoiled depressed arch, the upper members of which form an ogive, connecting the under with the upper ribs. The spaces and spandrels between are filled with flowing tracery and carving. From the level of the top of the capitals the buttresses rise two stages higher, the lower one being paneled, and terminated with crocketed hoods; and above these buttresses are lofty pinnacles, graduated in two stages, paneled on every face with hooded and crocketed terminations. The whole height of the buttresses is fourteen feet six inches from the base. The outer arch is crowned by a high pitched pedimented hood, with carved pateras on the face, and also crocketed. The triangle formed by the above over the crown of the outer rib is formed into a large trefoil, in which the armorial bearings of the late earl, quartered with those of the families of Dutton and Keppel, are inserted. The arms, crest, and supporters are enamelled on a solid slab of china, executed at the Derby china manufactory. Between the jambs, and upon the base of the monument, a plain slab is fixed, upon which the following inscription is carved in black letters, with illuminated capitals:—

To the Reverend Memory of  
THOMAS WILLIAM COKE, EARL OF LEICESTER.  
Born May 6, 1754.

Died at Longford June 30, 1842.  
His public conduct as representative for fifty-seven years, of the county of Norfolk, was conspicuous for its decision, disinterested zeal, and unimpeachable integrity.

Pre-eminent  
no less for his generosity as a landlord,  
than for his skill and enterprise as an agriculturist,  
he secured the deep affection  
of an attached and prosperous tenantry;  
while by his exertion and influence  
he extended in a most remarkable degree the  
cultivation and rural improvements of the country.  
In his domestic relations  
he was most affectionate, kind, and hospitable.  
His charity was munificent, without ostentation, and  
his piety simple and unaffected, but warm  
and sincere.

This Monument is erected  
by persons of various classes and opinions connected  
with this county,  
as some record of an example so excellent and  
instructive.

From the centre springs an octagonal pedestal, flanked by panelings with foliated heads. A beautiful marble bust of the late earl, is fixed upon the pedestal, and the whole of the back of the niche, above the slab and panelling, is diapered. The extreme width of the monument is 8 feet 9 inches, and its height from the floor about 20 feet.

It is fixed on the north side of the chancel (which has been recently restored), and harmonizes with the architectural character of that part of the building, which is a specimen of the early Decorated style, prevalent in the latter part of the 13th and commencement of the 14th century.

The work has been executed by Mr. Hall, of Derby, from the design and under the superintendence of Mr. Henry I. Stevens, architect.

WARMING AND VENTILATION OF THE  
NEW ROYAL EXCHANGE.

The apparatus for warming is upon the mild hot-water principle, and is placed in the basement story of the building, but the arrangements are so contrived, that the fresh air which is drawn into the chamber containing the warming surfaces of the apparatus is, after being raised to a moderate but sufficient temperature, conveyed to the extensive suite of Lloyd's rooms in the upper floor of the building, and is there so equally distributed as to diffuse an equal temperature in every part, the general temperature being at the same time under easy and effectual regulations. The warmed and pure air admitted into the rooms is furnished in sufficient quantity to replace the amount of vitiated air which is continually passing away from the room by the ventilating channels in the roof, and also to supply all the air required by the draught of the open fire. The apparatus is intended to be used in conjunction with the warming apparatus, the union of the radiating heat of open fires with the admission of large

volumes of pure and only moderately-heated air being considered the perfection of comfort, and equally conducive to health when combined, as in this case, with a system of ventilation which sustains a constant renewal of the atmosphere of the room to an extent that answers the demand of every possible source of deterioration. Arrangements are also made for straining the outward atmosphere before it enters the chamber of the apparatus, and filtering it from those impurities which prevail in the London atmosphere to a great and injurious extent in reference both to healthful respiration and the tarnishing of interior decorations. The ventilation is effected by means of a system of flues for foul air which are placed in the roof, and which serve as chimneys for conveying all the vitiated air of the rooms to the ventilated tops, or windguards, which are placed upon the roof. The main air-flues run between the ceilings of

the rooms and the roofs, and the branch flues from each room conduct the foul air into the main flues; and as all the branch flues are furnished with valves, the ventilation or escape of air from the upper part of the room is effected with the same facility as the pure fresh air is admitted into them below.

The system of warming and ventilating of this suite of rooms is founded on what is termed the principle of natural ventilation, and the windguards referred to as being on the roof of the building act by exhaustion from the impulse of the wind on the exterior of the surface of the guards. The windguard here spoken of is Day's, which has been applied to very many buildings, both public and private.

The work has been executed by Mr. H. C. Price, civil engineer, and is founded upon the principle successfully applied by him to many other public buildings.

FONT IN ST. CLEMENT'S CHURCH, SANDWICH,  
IN THE COUNTY OF KENT.

TO THE EDITOR OF THE BUILDER.  
Sir,—As you are collecting examples of ancient fountains, in my opinion a most laudable pursuit, I send you a sketch of a fine and rather early example of the perpendicular branch of the Pointed or Gothic style; and instead of giving any description of my own, I cannot do better than quote the one given by William Boys, Esq., F.A.S., in his "*Collections for an History of Sandwich*," 1792.

The font consists of an ancient octagonal bason and shaft, raised on a base of two steps, all of stone. The bason is perforated at the bottom: its interior diameter is 24 inches, its exterior 34; its depth within nearly 10. The height of the shaft is 20 inches, and of its capital and bason almost 19 more. The eight faces are charged with shields of roses; alternately on the shields are first, the arms of France, three fleurs-de-lis, quarterly with those of England. 2nd. A merchant's mark; 3rd. The arms of the cinque ports; 4th. The arms of Ellis.\* Above these squares, at the eight angles of the moulding, are grotesque faces, except at the dexter side of the first shield, where the ornament is a bird like a heron, and on the sinister side is a coronet with balls between spires, terminated with fleurs-de-lis. At another corner is a small satyr mounted on the back of a larger. In the same member of the moulding, over the roses, are fruit and leaves, a satyr's face, four acorns salter-wise, with their stalks bowed, and a flower. The first shield is suspended from the head of a human figure, with two long extended feathers in the place of its arms and shoulders; the second hangs from a cask. The third from

\* William Elys was a commissioner of sewers in the third and seventeenth of Richard II., and the second and eighth of Henry IV. The arms of Ellis are by Philipps, said to be: Or on a cross sable, five crescents argent; but the arms on the font at St. Clement's, which I have seen, have been the gift of Thomas Elys, the founder of this (St. Thomas's, Sandwich) Hospital, are five crescent shells on a cross engrailed, with a crescent in the first quarter, perhaps for difference.

the flocks of an anchor; and the fourth from a hook. In the moulding of the capital of the shaft, at the angles, are oak-leaves; and under one of the roses is an angel holding a shield bearing a plain cross; under another is a wheel; under the remaining two are satyr's faces; under the shields are flowers. In the shaft are eight niches with demi-quatrefoil canopies between diminishing buttresses. At the bottom of the niches are pedestals ornamented at their bases with foliage, fruit, and flowers. The figures are removed. The feathers and coronet led me to think the font might be erected in the time of Edward the Black Prince, but there being only three fleurs-de-lis, it would seem of somewhat later date; perhaps the gift of Thomas Ellis, who was a commissioner of sewers in the third of Henry IV.\*

I am, Sir, your humble servant,  
Z.

[We should have preferred the sketch if it had been larger, and in plain elevation instead of in perspective: also if it had been accompanied by a plan, a section, and some details of its component parts. The delineations which we are now having executed of the fine early perpendicular example at West Drayton, Middlesex, which has an open stem, will at once exhibit our wishes on this subject.—Ed.]

STUPENDOUS CHIMNEY.—On Monday, Mr. J. Ashton, builder, of Blackley, commenced the erection of a chimney, which will, when completed, be the largest structure of the kind in this country. It is for Mr. Dobbs's chemical works at Wigan, and will be built entirely of bricks, with a coping of stone at the top. It will measure 50 feet across the base, 480 feet in height, 9 feet at the top, and will consume in its erection more than two millions of bricks.

—Manchester Courier.

\* See preceding column.

## TUDOR ARCHES.

No. II.

TO THE EDITOR OF THE BUILDER.  
 SIR,—The lines given in THE BUILDER (p. 532) are tolerably accurate, but had your engraver known how to describe the lines on each side of the approximate one by simple continuous motion, he would, no doubt, have produced them finer. The different characters of these lines may be farther shewn by dividing the distance A B and B C into any convenient number of equal parts, and drawing chord lines to each division. The versed sine of each on the middle or approximate line from A to B will be equal, and also those from C to D; but the latter will be much less than the former; while to the other lines the versed sine to each following division will be gradually different.

If the "septenary system" were fully illustrated it would be shewn:

*First*, as in the example referred to, that a line may be described by simple continuous motion, beginning at A with a *finite* radius of curvature, and, while constantly changing, rise to a given point, C, and have there also, although increased, still a *finite* radius of curvature; intermediately bowing out more or less than in the example at B.

*Second*. A line may be described to pass from *finite* radius at A to *infinite* radius at C; bowing out more or less.

*Third*. A line may pass from *infinite* radius at A to *infinite* radius at C, to any given height and opening; also bowing out more or less.

For practical purposes, it will be seen by the examples given that lines of the first character may be drawn sufficiently nearly parallel to each other.

Of these characters of lines there are several motions, which might regulate a plasterer's mould in running the mouldings of an arch.

To my remarks on the line formed by the common mode of drawing a Tudor arch, after the word "while it is too flat immediately above B," I beg to add; it is too quick as it approaches to C. This, in general, in such arches is very apparent, especially when executed.

Example No. II. contains a series of arches with different openings, rising nearly to the same height. They could as easily have been drawn exactly to the same height, but it was considered that each line would appear more distinct with a little difference. A chord, A B, is drawn to one arch, to explain that the versed line, *c d*, or greatest distance from the chord line, may be in different positions between A and B, as well as that the curve may bow out, more or less, between A and B, while at A a tangent to the curve is perpendicular to A C.

Perhaps some of your contributors will try to produce such gradation, or fill in a few lines between any two that will as perfectly harmonize with them as these lines do with each other.

JOSEPH JOPLING.

29, Wimpole-street, 30th Oct. 1844.

SIR,—There is no doubt that Mr. Jopling's lines for an arch of uninterrupted curvature are correct, and that the lines from double centres do not give a curve of equation; in large arches, such as bridges, vaults, &c., architects have therefore adopted the elliptic and parabolic curves in lieu of the double centre, but in Tudor architecture, and in designs of Gothic work, it is very doubtful whether the use of curves of the higher order lead to the true exposition of the style.

In the particular instance alluded to by Mr. Jopling, the curves delineated from the double centre and from the ellipsis nearly coincide, but there are many cases wherein an arch is very much depressed, or is very acute, to which the principles of the ellipsis will not apply, and certainly cannot afford a ready and quick means of solving the query of your correspondent, "how to draw a Tudor arch through three given points?"

For illustration of my opinion, that curves of the higher order are not conducive to the true exposition of Gothic architecture, I would refer to the system of groining adopted by the Gothic architects. It would be presumptuous to assert

that these masters were not acquainted with the art of projecting from the original curves by ordinates, the diagonal and other intermediate ribs thereby producing elliptic lines; but it appears evident that such was not their practice, though it was the system upon the revival of the style adopted by some modern practitioners; and to a mathematical mind it might at first appear to be the correct one; Professor Willis, however, in his interesting paper published in the "Transactions of British Architects" (who, by the by, are most indebted to non-professionals for their best papers), shews that this idea of the system is an error, and that the lines of these diagonal and intermediate ribs are segments of circles, producing by their variety of curva that play of light and shade which is lost in modern groining, where a correct mathematical uniformity is preserved.

There are three interesting chapters in the work of Philibert de L'Orme, who lived and wrote at a time when the practice of Gothic architecture could not have been wholly forgotten, and who expressly says that he derived his information relative thereto from the old masons. He states that the intermediate ribs of Gothic groining (which he calls "*tiernes, formerets, and tiercerons*") must follow the sweep of the compass, from which the principal branches of the vault are delineated—"suivant la circonférence du compas après lequel auront été tirés les brèches des voûtes." His illustrations also shew this principle, and though in the other parts of his stereometry he freely makes use of ordinates, in this case he uses segments of circles.

I am, however, trenching upon new ground; my only intention was to shew that the old Freemasonic architects thought of effects other than those produced by complex mathematical lines, and that an arch struck from four centres may have points of preference over elliptic or parabolic curves.

I am, Sir, yours, &c.

T. L.

## PUBLIC PARK AT HULL.

THE Mayor of Hull has within the last few days received the following letter from her Majesty's Woods and Forests in answer to an application made for a portion of the grant of public money set apart to aid in the formation of public walks:—

"Office of Woods, &c., Oct. 21, 1844.

"Sir,—I have, on the part of the Commissioners of her Majesty's Woods, &c., to inform you that they some time since had referred to them by the Board of Treasury for their opinion thereon, the memorial of yourself and

other inhabitants of Hull, praying that some portion of the grant of public money, for the formation of walks, &c., near populous towns, may be appropriated towards the improvement of Spring Bank, for the benefit of the inhabitants of Hull; and that having caused a survey to be made of the spot in question by their surveyor for the district, they feel inclined, from the report which he has made to them on the subject, to recommend a grant of money towards the proposed improvement; but as they understand that Spring Bank is not of sufficient extent to meet the wants of the inhabitants, many of whom are desirous of

having a park formed in the neighbourhood of Hull, to which Spring Bank would be the principal approach, I have to request that you will inform the Board whether there is any probability of that project being carried into effect, and what steps are being taken for the purpose; as if so, they would be disposed to recommend a larger grant than they would feel warranted in doing if the improvement of Spring Bank is limited to that spot alone, without any view to further improvements.

"I am, Sir, your most obedient servant,  
 "CHARLES GORE."  
 W. B. Carrick, Esq., Mayor of Hull.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*New Church at Douglas, Isle of Man.*—There will be 500 sittings reserved in this church for the poor. The project originated with a benevolent gentleman, who, during his sojourn on the island, being struck with the want of church accommodation for the poor of the town, voluntarily offered 250*l.* towards the erection of a new church; and another gentleman offered a donation of 200*l.* The bishop, on learning this, gave 250*l.* more, and by some other contributions the sum has swelled to the amount of 800*l.* for the object.—*Cambridge Chronicle.*

*New Church at Brockmoor, Staffordshire.*—The ceremony of laying the first stone took place on the 12th instant, by Lady Ward. All the sittings are to be free. The site of two acres for a churchyard was given by the trustees of the Earl of Dudley, and a sufficient sum from Lord Ward to enable the commissioners to build the parsonage; also 600*l.* from the Committee and Council of the National Society for the schools, on a site purchased by the rector.

*New Church at Iym.*—The intended new church, we hear, is to be immediately commenced, the committee having accepted the tender of Messrs. Bennett and Son from a number of others. Mr. Salvin has furnished the design.—*Cambridge Chronicle.*

The Marquis of Exeter has given directions for the chancel of St. Mary's Church, Stamford, to be repaired, which is being done in a chaste and costly manner.

## RAILWAY INTELLIGENCE.

*New Railway Schemes.*—The following is from the circular of Messrs. Raitton and Sons, share-brokers, Manchester, of the 14th instant:—"There are at the present time plans matured or preparing to carry before the Board of Trade upwards of 90 new schemes for railway extension, requiring a subscribed capital of upwards of 30,000,000*l.*—to which may be added 20,000,000*l.* for the authorised one-third additional to be borrowed. The present abundance and low value of money (there being no foreign attraction more alluring) is highly favourable to the extension of public works at home. No matter to what extent the rifeuess of speculation may lead individual adventure, a great national benefit will be secured, available to all, without infringing on the circulation of the country, so long as we continue blessed with a succession of good harvests as the mainspring of prosperity; but should a failure ensue, and we become impoverished by a foreign purchase for the repair, we shall be deprived, in a corresponding degree, of the advantages we now enjoy. Manufacturers and foreign trade we can expand or curtail at will, but no art of man can put seasons out of course or alter their result. The Board of Trade has an irksome duty to perform to suit all interests, and keep clear of the confusion to which we are exposed."

*Diss, Beccles, and Yarmouth Railway.*—This line, running from Yarmouth through Beccles, Bungay, Harleston, and Scole to Diss, will afford Yarmouth and the intermediate towns a direct communication with London, being a saving of about 20 miles over any other railway between Yarmouth and London, and a proportionate increased saving between Eastern Suffolk and the south. A railway through Diss to Norwich on the one hand, and the southern district of Suffolk and the county of Essex and London on the other, will be constructed by such of the competing lines as shall be approved of by Parliament. By this line, therefore, it is proposed to bring the agricultural trade of Harleston, Bungay, Beccles, and the neighbourhood, and the commercial parts of Lowestoft and Yarmouth, in immediate communication with the northern and southern districts of Norfolk, Suffolk, Essex, and Middlesex, and, by means of the Norwich and Brandon Railway, with the northern and western districts of the kingdom. The engineer is Captain W. S. Moorson.

*Norwich and Brandon Railway.*—There are four thousand persons at present employed on the Norwich and Brandon Railway, 2,700 of whom are labourers and excavators. In the neighbourhood of Beccles and Attleborough the

greatest activity is observable, and workmen are employed night and day to facilitate the completion of the bridges in that vicinity.—*Norwich Mercury.*

*Railways and the Iron Trade.*—In his evidence before the Select Committee on Railways, last session, Mr. Hudson stated that in the case of the York and North Midland Railway, of which he has been chairman from the first, the price of the iron used was 11*l.* 10*s.* per ton; whereas, in the case of the Newcastle and Darlington line, which, it will be remembered, owes its existence mainly to Mr. Hudson's exertions, the price was only 6*l.* 5*s.* per ton, the cost of delivery being in favour of the York line. Mr. Hudson added, that for forty-nine miles of a single line of railway, 4,500 tons of iron are required.—*Railway Record.*

## Correspondence.

## ARTESIAN WELLS.

TO THE EDITOR OF THE BUILDER.

SIR,—The propriety of forming artesian wells within the boundaries of the metropolis, in order to supply the inhabitants with warm water for public baths and other purposes, having been mooted in the *Times* and *Athenæum*, permit me to offer, through the medium of your valuable journal, a few observations thereon.

The London basin, particularly that part denominated the valley of the Thames, consists of beds of clay, sand, and gravel, resting on cavernous chalk strata; it is the grand receptacle of the drainage of the upper lands, of periodical rains, and of waters percolating through beds, over, or through which, the Thames flows; and, consequently, previous to the change produced by civilization, it was nothing better than a morass fringed by forests.

The rapid spread of this noble city, and the great attention paid to draining the subsoil has naturally had the effect of reducing the periodical supply of water to narrower bounds, and confining it in many districts to the lower beds; but still we have vast depositories in the chalk beds, and the covering soil is more or less saturated with water. Now, supposing the requisite number of artesian wells to be formed, the immense supply daily required for the wants of the metropolis would soon exhaust these internal reservoirs, and also drain the middle and upper beds; for every drop of water abstracted therefrom would, by passing into the river, be permanently lost to them. This general drainage of the strata may be considered a benefit, by those who scarcely look beyond the surface of things; and geologists, in particular, lay great stress on the necessity of drainage, which is good so far as applied to extensive areas not built over as London is.

Nearly the whole of London rests on the upper clay bed, and this clay having great absorbing powers, while it often renders underlying beds impervious to water, is strong, and possesses its cohesive powers only so long as it retains a sufficiency of moisture; remove this, it shrinks, cracks in innumerable directions, and becomes dangerous to heavy masses of bricks and mortar super-imposed upon it. It is from this cause that so many foundations of new buildings sink or partially give way almost as soon as the superstructure is raised, drainage taking place after the work is completed, instead of proper attention having been paid to drainage beforehand.

I have no doubt in my own mind that if the lower beds on which London rests were drained, as proposed, by artesian wells, a vast deal of mischief would arise from the general or local contraction of clay beds, occasioned by the lower as well as the subsoil drainage; and the cavernous chalk, deprived of its support, would in many places fall in, and occasion a corresponding depression of the surface. Were the subsoil and strata beneath, on which vast masses of building are disposed, thoroughly drained by all the appliances of art, much good might result, and greater stability be insured to the super-imposed masses; but, when a city like London rests on a bed of clay, the tenacity and strength of which depends upon its preservation of a certain degree of moisture, we ought to pause ere we give way to plans which in the end, in consequence of there being an *exhaustible* (not inexhaustible supply) of water, would recoil upon the pro-

jectors, and lay the seeds of great destruction of property.

Among the plans proposed for securing buildings from partially sinking, it is recommended to dig pits in the clay where foundations are intended, and to fill them in with sand well rammed in; but what, I ask, will become of the well-rammed sand when the clay cracks in every direction, so soon as it is deprived of its supply of moisture by general drainage of the subsoil and building thereon? Why, the sand would immediately disappear, together with the portion of building resting on them. It is true, the Romans sometimes used sand as a support for their foundations, but this applied only to thoroughly dry soil, in which no danger like this could possibly be apprehended. M.

Chelsea, October, 1844.

## LAND-SLIP AT THE CUSTOM-HOUSE QUAY, DUBLIN.

SIR,—It is to be hoped that some of your Irish correspondents will give us a professional account of the late land-slip on the Custom-house quay, and also the imagined causes of the accident, as well as the means resorted to for preventing further damage. It is also reported in the papers that fears are expressed for the safety of the Custom-house itself; perhaps we may learn from the same channel what danger is apprehended in that quarter. Some years since, I remember that great alarm existed on account of the Government warehouses, either at Sheerness or Chatham, being in a very dangerous state through the ruinous state of their foundation, and it was then contemplated to pull down and rebuild them, but Government was saved that expense through the talent of some professional person, who cut away the old foundations, &c. &c. Could you, or any of your very clever and obliging correspondents, furnish the information of the means resorted to on that occasion, as such knowledge at the present time might not only be interesting, but very important.

I think the following accounts amusing at the present time.

Monsieur Gautier relates the following:—Fortifications being built by order of the king (either in the Poles of Oleron, or Rhe), one face of the wall fell, or rather sunk down, notwithstanding it was built on a bank of rock, because the said rock had a hollow underneath that was not or could not be discovered.

Monsieur Blondel also relates that the vast walls of the church of Val de Grace sunk in on one side, though built upon a (supposed) good foundation, because there were underneath large hollows, which had been made in former times for taking out stones some fathoms lower, there having been a quarry there.

The supposed cause of the fracture of the dome of St. Peter's at Rome is the faulty state of the foundation, though M. Angelo caused the same to be laid with all possible caution. The damage arises, it is said, through the following:—the waters of a subterraneous spring which run down from the high mountains of the Vatican and the Janiculum, have washed the foundations of this huge edifice. I remain, Sir,

Yours very obediently,  
OFFICINATOR.

Oct. 23, 1844.

## ST. THOMAS'S NEW CHURCH, WINCHESTER. ARCHITECTURAL COMPETITION.

SIR,—I cannot but help remarking how very much to the letter your prophecy has been fulfilled relating to the competition for the new church of St. Thomas, in Winchester, which was the subject of your leading article a few numbers back.

There were in all about fourteen competitors who exhibited designs, and from this number three were selected. The advertisement for plans, as you are aware, restricted architects to the sum of four thousand pounds, as being the outside of the contemplated expenditure, and as regards accommodation, 1,000 sittings were to be provided upon the floor of the church.

The design which the committee have adopted, or rather the toy which captivates them, is by a Mr. Webb, of Camden Town, according to the signature, although apparently the property of Messrs. Emsley, and Co., one of that firm having had an interview with the committee; and although he does not lead the committee to understand that they are to have

a decorated tower and spire, as shown in his design, 150 feet high, yet, he wished to cram them with the belief that his design, consisting of nave, clerestory, aisles, transepts, chancel fitted with stalls and tower to the base of the spire, might be executed for the specified sum of 4,000*l.*, until his interview with the committee, when he hesitated to confirm this statement, but was actually allowed to take his competing plans home, in order to cut them down to the necessary sum, and to make the requisite alterations.

Messrs. Elmsley and Co. are permitted to amend, alter, and re-consider their design; so much so, that instead of retaining the tower (I cannot add spire) in the middle of the church, they may remove it to one of the aisles, or any other more suitable position, and instead of preserving the same number of intercolumniations in the nave, they may be reduced, in order to obviate the glaring impracticability of their plan as sent in.

How unjust is such a proceeding! If one competitor be thus allowed to alter, why are not the others placed upon the same footing; and if one design be found to exceed the amount specified, why is it not at once discarded from the competition as impracticable? I think, perhaps, I can answer these queries myself; namely, it is because such a false and unjust system (as in the present instance) has crept into architectural competition, that an architect, being well aware that to behave in an honourable and an honest manner would be absurd and utterly useless, in order to gain any chance of success, resorts to the mode (as in the present case) of introducing towers, spires, and other appendages to his design, which cannot possibly be built for the money, but which, at the same time, have such decided advantages on paper over their less pretending yet more honest neighbours', that in the eyes of a committee-man such a design is sure to captivate and mislead: such a system cannot, however, be too much reprehended, and I hope you will lend your assistance to overturn such a dishonourable course of procedure, and in the present instance to render it abortive.

I am, Sir, your obedient servant,  
A SURVEYOR AND LOOKER-ON,  
BUT NO COMPETITOR.  
Winchester, October 29th, 1844.

#### METROPOLITAN IMPROVEMENTS.

SIR,—It appears to me an extraordinary proceeding in the carrying out of the metropolitan improvements, that the Commissioners of Woods and Forests, or the surveyors under them, should have planned the vaults for the intended houses through the line from Oxford-street to Holborn without having provided a certain portion of the necessary drain to pass under the vaults from the houses towards the sewer, thereby doing away with the necessity hereafter, as the buildings may progress, of excavating the earth to the depth of 15 to 20 feet at the back of each vault (thus endangering the stability of the brickwork), for the purpose of constructing such drain from the house to the common sewer. I cannot help thinking that it would be useful in the formation of other lines in the intended improvements for some arrangement to be entered into between the above-named authorities and the Commissioners of Sewers, to enter the drains at once from the intended houses, and also those from the gullies in the line of street, and thus avoid the interminable excavations that otherwise will ensue for that purpose. I am induced to trouble you with these remarks in the hope that if they appear to you correct, you may be induced to offer some suggestions to those whom it may more immediately concern. Apologizing for intruding upon your time, I remain, Sir, your obedient servant,

VINCENT YARDLEY.

5, Thorney-street, Bloomsbury,  
October 23rd, 1844.

[We advise the parties concerned to make application to the office of Works and Buildings, and to the Commissioners of Sewers.—Ed.]

#### PUBLIC BATHS.

SIR,—Public baths are contemplated, and will undoubtedly be established in various parts of the metropolis; but as yet no details have been entered into, and few, if any, suggestions have been made beyond those of *Punch*, who

proposes the appropriation of Covent-garden Theatre, while *The Times* prefers the *Fleet Prison*, as the rendezvous of abolitionists. Seriously, Sir, I do sincerely hope for the honour of the nation that every populous parish in London will have its public baths for the rich as well as for the poor; that the buildings will be such as to do credit to the times in which we live, and to the architects employed in their construction.

It does not follow that the poor alone are to have baths. Let us copy the example of the Romans; bring public bathing into fashion, and in a few years it will become an essential necessary of life. A few architectural plans and suggestions would not be amiss at this juncture.

SENECA.

October 28, 1844.

#### DUTY ON BRICKS.

SIR,—Is there no possibility of having the duty taken off bricks? that on tiles and slates has been repealed many years. I have no doubt you, as well as all brickmakers, builders, and other consumers of this valuable material, will concur that the duty ought to cease; why should we not manufacture bricks for building as well as tiles and pipes for agricultural purposes, without being subject to a duty of 6*s.* 1*d.* per thousand? I think a strong effort should be made in order to obtain a total and immediate repeal of the same.

I am, Sir, your obedient servant,  
T. J.

[While we should be glad to see every possible reduction of taxation upon building-materials as upon all other useful commodities, we do not see that this particular tax bears harder than most others. The taxes connected with building, needing most repeal, are those upon glass, which interferes injuriously with its manufacture, and destroys our trade; on window-lights which, cut directly against health and comfort; and on fire-insurance, which discourages prudence, and, in most cases, makes it cost three as much as in-cantion, while the great capitalist who is best able to bear state burthens often chooses wholly to escape it.—Ed.]

#### GOthic ARCHES, QUATREFOILS, &c.

SIR,—You would greatly oblige me by inserting in your notice to correspondents of Saturday the 2nd November, if there is any Gothic work published which shews the centres for all Gothic arches, quatrefoils, trefoiled arches, cinquefoils, &c. If there is, where, and at what price may it be obtained for?

I remain, yours very truly,

Gloucester, Oct. 26, 1844. C. B.

[There is none. A portion of the information may be obtained from various works, among which are those of Billings and Brandon.—Ed.]

#### CAMERA LUCIDA.

SIR,—I have just purchased a camera lucida. Can you or any of your readers give me a hint as to properly using it?

I am, Sir, your obedient servant,  
Brompton, Oct. 27, 1844. F. PAGE.

#### Miscellaneous.

NEW DOCKS AT HULL.—The arrangements with the railway company, for removing the soil from the excavation at Dock-green, are completed, and the work of the railway dock will be commenced as soon as the necessary contracts are entered into, tenders for which are advertised to be sent in on or before the 11th inst. The site of the Victoria Dock is also marked out, and excavation for the purpose of procuring clay to make bricks for the new erections is already commenced there. The ground being now defined, affords a good opportunity of judging of the noble dimensions of this spacious dock. Its area will be 17 acres, with 3,390 lineal feet of quays, to be connected by basins with the river Humber on one side, and the Old Harbour on the other. It will abut closely upon the moat of the citadel, from which it will be separated by the present footway, to be protected by a substantial counterscarp wall. The new works are already creating a stir in that neighbourhood, and we observe that an inn near the spot has thus early assumed the sign of "The Victoria Dock Tavern."

PUBLIC BATHS IN BIRMINGHAM.—A meeting of highly influential inhabitants of this town and neighbourhood was held in the committee-room of the Town-hall on Tuesday morning last, Mr. W. Beale in the chair, for the purpose of making preliminary arrangements for a town's meeting to consider the best means of providing public walks and baths for the use of the inhabitants. Amongst those present were Messrs. James Taylor, James James, H. Luckcock, W. Chance, G. Barker, and William Scholefield; Aldermen Beale, Phillips, and Cutler; Messrs. W. Phipson, Joseph Sturge, Clement Ingleby, James Turner, J. Tyndall, Abel Peyton, C. Geach, T. E. Lee, B. Chesshire, J. H. Beilby, T. R. T. Hodson, John Beale, Bourne, E. Alldridge, J. Plevins, M. Banks, T. Ragg, D. Barnett, C. Lawden, and H. Simons, and many other gentlemen. Alderman Cutler opened the proceedings by calling attention to the importance of the subject, and detailing the acts of the Select Committee of the House of Commons appointed to consider the best means of providing places of recreation for the inhabitants of populous towns. On the report of this committee being made, the House granted, at two different periods, the sum of 15,000*l.* to aid the inhabitants of large towns in the formation of public walks and places of recreation. Alderman Cutler also stated the correspondence which had taken place between the corporation and the Government on the subject. Resolutions in furtherance of the objects in view were passed, and a vote of thanks having been carried to the chairman, the meeting separated.—*Birmingham Gazette.*

THE IRON TRADE IN AYRSHIRE.—We have just learned that Mr. Wilson, of Dundyan, has taken a lease of the extensive iron-fields on the estate of Sir James Boswell, Bart., of Auebinleck. The iron-stone consists principally of black-band, and is said, by competent judges who have examined it, to be equal to any existing in Scotland. The supply is most abundant; in some places the stratum is reported to be as thick as 20 inches, exclusive of horn-coal and other refuse. We also learn that the Kilbirnie Iron Company have, within the last few years, taken a lease of the iron-stone on the estate of Colonel Smith Neil, of Swindridgemuir, in the parish of Dalry; and that the Messrs. Baird, of Gartsherrie, have contracted for the minerals on the lands of some of the other proprietors in that neighbourhood; so that, with the works at present at Muirkirk, Blair, Kilbirnie, and Cessnock, we may expect ere long to see this county coping with, if not surpassing, all other mineral districts in Scotland. With so many railways in prospect, it must be allowed that the new works are commencing at a most auspicious period.—*Ayr Observer.*

A NEVER YIELDING GLUE.—Dissolve five or six bits of gum-mastic, each the size of a large pea, in as much spirits of wine as will suffice to render it liquid; and in another vessel dissolve as much isinglass—previously a little softened in water (though none of the water must be used)—in French brandy and good rum, as make a two-ounce phial of very strong glue, adding two bits of gum-galbanum, or ammoniacum, which must be rubbed or ground till they are dissolved. Then mix the whole with a sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used, set the phial in boiling water. This glue will strongly unite bits of glass, and even polished steel. It is used in Turkey by the Armenian jewellers for the purpose of uniting diamonds and other precious stones to silver or gold. The metal is first warmed gently, and has the glue applied, which is so strong that the parts thus cemented never separate.—*Dr. Ure's Cyclopaedia.*

MEMORIAL TO THROW OPEN ALL THE METROPOLITAN BRIDGES.—Mr. H. Cope, jun., solicitor to the Metropolitan Anti-Bridge Toll Association, presented last Monday to the Lords of the Treasury a memorial from 10,900 merchants, manufacturers, and householders, of the western and central districts of the metropolis, being one of several, containing upwards of 200,000 signatures already presented, for the free passage of Waterloo, Southwark, and Vauxhall bridges, as a paramount measure of metropolitan improvement, by the commutation of the imposts thereon.

**THE WASH LEVEL.**—We are now authorised to state that the capital necessary for the undertaking, vast as it is, has been provided.—*Norfolk Chronicle.*—The plan will be the modified one of Mr. Rendel, suggested by him to the town council in 1840, in his report of the plan of Sir John Rennie, which was considered as too extensive. Sir John Rennie's plan comprehended the inclosure of 150,000 acres of land, but Mr. Rendel's plan will extend to the inclosure of only about 70,000 acres. A new channel will be made crossing the North Lynn estate, and falling into the present channel below, in deep water; and by a similar extension of the rivers Nene from Wisbech, Welland from Spalding, and Witham from Boston, the united width of outfall of all these rivers at a point near the Bell Buoy would be about one mile.—*Cambridge Chronicle.*

**DAMP WALLS.**—The question of "damp walls" is one intimately connected with domestic economy, and in which the invalid is especially interested. When damp walls proceed from *deliquescence* in the case of muriate of soda, &c., an intimate combination with the sand used for the mortar, it is merely necessary to wash the wall with a strong solution of alum. This converts the *deliquescent* salt into an *efflorescent* one, and the cure is complete; or alum may be added to the plaster in the first instance. When dampness arises in the walls by capillary attraction from the foundation, it resolves itself into a question altogether different; but, in the majority of cases, the dampness springs from the employment of sea-sand, or, at any rate, sand impregnated with a deliquescent salt.—*Dr. Murray.*

**NEW HOSPITAL AT BERLIN.**—We learn from Berlin that the municipality of that capital, having entered into a contract with an English company for lighting the city with gas for upwards of 20 years, and finding that, consequently, there will be no expense created by forming the establishments which would have been required for that purpose, has resolved, instead, to erect a new hospital, sufficiently spacious to receive 600 patients, and suppress all the present smaller hospitals. The cost of the new edifice is estimated at 275,000 dollars.

**ENORMOUS YEW TREE.**—There is in the churchyard at the village of Gresford, Denbighshire, a yew tree which measures 30 feet in girth at the height of 4 feet from the base. The branches are in themselves large trees, and shade the ground to a great extent. It must be of incalculable antiquity, and it is not yet in a state of much decay, though it has for centuries perhaps attained its maturity. Other yew trees in the same place, which were planted (as the parish-register records) in the year 1727, are, on average, in girth somewhat more than 4 feet.

**WESTMINSTER BRIDGE.**—This bridge was re-opened to the public on Monday last; it was closed on Monday the 14th inst., in order to lower the carriage-way at the approaches, and get rid of the steep activities. The former steepest inclination, of 1 in 14, is now reduced to 1 in 25, which will render the ascent easier than that of Blackfriars-bridge. This alteration has been completed during the leisure season, and with a view to relieve the labour of horses in the winter months.

**NEW UNIVERSITY IN IRELAND.**—A ROMAN, says the *Dublin Statesman*, has been for some time gaining ground, that a sum of 100,000*l.* will be asked for and (as a matter of course) granted in next Parliament, for the erection of a great university in Ireland, in which cheap education will be afforded in a system of secular instruction, in which also professors of all denominations will be eligible, and where degrees of all kinds will be conferred.

**LORD PALMERSTON, M. DE CORNELIUS, AND FRESCO PAINTINGS.**—The Berlin journals state, that Lord Palmerston, previous to leaving that capital for Dresden, paid a long visit to M. de Cornelius, and conferred with him on the subject of the fresco paintings with which it is intended to adorn the new Parliament House, his lordship being one of the committee for directing the decoration of that edifice.

A superb mausoleum to the memory of M. Aguado has just been erected in the cemetery of Père la Chaise.

**THE NEW COUNTY COURTS, IPSWICH.**—The interior arrangements are now completed, and with the limited space at the disposal of the magistrates, ample accommodation appears to have been provided for all parties having business to transact in these courts. For our own parts, we do no more than justice in tendering our hearty thanks to the magistrates, who, under the sanction of the learned judges at the late assizes, have afforded the best possible accommodation to those whose duty it is to attend as reporters of the newspaper press. By the arrangements the convenience of other parties has been promoted to a great extent; the seats heretofore occupied by reporters at the table, six at least in each court, being now devoted exclusively to attorneys and barristers.—*Ipswich Journal.*

**WOOD PAVING.**—On Saturday last, considerable sensation was created in the Marylebone Vestry, in consequence of a notice of motion having been given, calling upon the vestry to renew their contract for three years with the Metropolitan Wood Paving Company, for keeping in repair and cleansing that portion of wood paving laid down by them between Wells-street and Bathbone-place. Mr. Wilson proposed the resolution, and was supported by Mr. Soder and Mr. Nichols. Mr. Harbut objected to it at great length. After a very stormy discussion a division was demanded, when there appeared for the resolution 21, against it 23, majority refusing to enter into the contract, 2. The vestry then separated.

**NEW BRIDGE AT TARMONBURY, LONGFORD.**—This bridge has been erected by the Commissioners for the Improvement of the River Shannon, and was thrown open to public traffic on Friday the 25th inst. It consists of four flat arches, 33 feet span each, and one swivel arch 30 feet, which is the intended navigable channel. The bridge is 200 feet in length.—*Irish Paper.*

**NEW THEATRE AT TAUNTON.**—It is in contemplation to build a new theatre at Taunton, the amount to be raised by shares. On the first mention of the project, one gentleman instantly offered to advance 200*l.* We understand that the design will be determined by an competition.

**AN OLD STREET NEWLY NAMED.**—The great improvements which have lately been made in Cateaton-street, have induced the city authorities to alter its name, and henceforth it will be known as Gresham-street. The new name is already affixed to the houses at each end of the street.

**RE-BUILDING OF THE NEW PRISON, CLERKENWELL.**—A notice has been issued by order of the Middlesex Magistrates to the effect that they intend forthwith to take such measures, either by contract, or otherwise as shall appear to them to be requisite and proper, for the rebuilding of the New Prison, Clerkenwell.

**A NEW FIELD OF IRON-STONE IN NORTHUMBERLAND.**—A field of iron-stone, of the richest quality, about 15,000 acres in extent, is said to have been discovered west of Hexham, Northumberland. It is likely to yield great profit to Sir Edward Blaetel, proprietor of the extensive royalties.

**ENORMOUS FOUNTAIN AT CHATSWORTH.**—The great fountain at Chatsworth is supplied with water from a reservoir which covers eight acres. The fall is 381 feet, and the height which the water is expected to attain from the fountain, when brought into full operation, is 280 feet.

**Tenders.**

TENDERS delivered for Building a Dwelling-house and Printing-office in Kennington-lane, for Mr. Kemshead.—Wm. Rogers, Esq., Architect, Palace Chambers, Lambeth.

Macey and Son .....	£973
Nolley .....	880
Travers and Son .....	796
J. and T. Ward .....	795
Downs .....	793
Gerry .....	793

TENDERS for a School-room to Sutherland Chapel, Walworth.—E. A. Jones, Esq., Architect.

Smith .....	£213 11
Marlsland .....	172 0
Harding .....	170 0
Cook .....	169 0

**NOTICES OF CONTRACTS.**

For the Construction of 1 Mile and 65½ Chains of the Ashton, Stalybridge, and Liverpool Junction Railway.—The Secretary of the Company, at the Manchester and Leeds Railway Offices, Palatine-buildings, Hunt's Bank, Manchester. November 4.

For the supply of Paving, Flint, Winstone, and Bombay Granite, &c.—Frederick Tritton, Clerk to the Trustees for Lighting, &c. the South District of St. George the Martyr, 11, Three Crown-square, Southwark. November 5.

For supplying her Majesty's Dockyard at Chatham with White Lead, and her Majesty's Dockyards at Deptford, Woolwich, Chatham, Sheerness, Portsmouth, and Devonport, with Red Lead.—The Secretary of the Admiralty, Somerset-place, London. November 5.

For the supply of 2,600 Tons of best Railway Bars, and 175 Tons of Plates and Spikes, for the Zealand Railway.—Address, "To the Directors of the Zealand Railway Company," Copenhagen, under cover to their Agent, Mr. John Lord, Friday-street, Birmingham. November 5.

For the constructing of various Workshops, Engine-houses, and other Buildings connected with the York and North Midland Railway.—Mr. Andrews, Architect, York. November 6.

For the erection of certain Walls, Gates, and Piers in the Land of Promise, Hoxton.—Mr. Tress, Surveyor, Wilson-street, Finsbury-square. November 7.

For the Erection of a new Barrack Establishment at Bristol.—C. J. Selwyn, Major and Commanding Royal Engineer, Exeter. November 7.

For the performance of such Bricklayers', Carpenters', Masons', and other Works to be done in the Cleansing, Building, and Repairing of the several Public Sewers and Drains within the Ranelagh and Counters' Creek Districts.—Lewis C. Hertsel, Sewers' Office for Westminster, No. 1, Greek-street, Soho-square. November 8.

For the Building of Four Almshouses in the city of Ely.—T. and G. Archer, Solicitors, Ely. November 9.

For the Construction of Lots 1 and 2 of the Great Southern and Western Railway (Ireland). Lot 1 comprises a distance of about 9½ miles; Lot 2 comprises a distance of about 10½ miles.—Sir John Macneill, Engineer to the Company, 28, Rutland-square, Dublin. November 11.

For the supply of Memel, Red Pine, and Larch Timber to the Great Southern and Western Railway (Ireland).—Sir John Macneill, Engineer to the Company, 28, Rutland-sq., Dublin. Nov. 11.

For Works in the Construction of a New Dock in Kingston-upon-Hull.—Mr. John B. Hartley, Civil Engineer, Liverpool. November 11.

For Building 600 feet of Sewers in Garden-street, Westminster.—Francis Giffard, Clerk to the Trustees of Tothill-fields, Westminster.—November 13.

For the erection of Gas Apparatus for lighting the Devon County Lunatic Asylum, also for Apparatus for Cooking, Washing, Drying, and Warming.—T. E. Drake, Clerk to the Visiting Justices, Exeter. November 18.

For the different Works to be done in erecting a New Gaol at the Borough of Banbury, under any of the following heads, viz.: 1. Mason, Brickwork, &c.; 2. Carpenter and Joiner; 3. Plumber and Glazier; 4. Slater; 5. Plasterer; 6. Ironfounder, &c.; 7. Painter.—Messrs. Hurst and Moffatt, Architects, Leeds or Doncaster; and James Beesley, Town Clerk, Banbury. November 21.

**COMPETITIONS.**

PREMIUM of 25 guineas for the best and another of 15 guineas for the second best design for laying out for building purposes a plot of land, containing about nine acres and a half. situated in the borough of Reading, having a frontage of upwards of 900 feet, and being of the depth of about 460 feet. Further particulars of J. J. Blandy, Esq., Solicitor, Reading; or of Messrs. Gregory, Faulkner, Gregory, and Bourdillon, 1, Bedford-row, London. November 15.

## BOOKS AND ENGRAVINGS RECEIVED DURING THE WEEK.

Wilson's Description of the New Royal Exchange, including an Historical Notice of the Former Edifices, and a Brief Memoir of Sir Thomas Gresham, Knt., with Eighteen Embellishments. Instructions for the Use of the Seyssel Asphaltic Mastic, Claridge's Patent, with Numerous Engravings.

A Lithograph of the Chapel erecting at the Nunhead Cemetery, Peckham, By Thomas Little, Esq., Architect.

## TO CORRESPONDENTS.

A Brightonian.—The Portico though it may in some respects resemble that of the Pantheon has not the same details. The other questions will probably be answered by some of the numerous public prints of the day. We cannot undertake to present to make the requisite admeasurements.

J. S. is referred to our charge for advertisements, which he will find above. We must decline inserting the paper on the Birmingham Thames Junction and West-London Railway.

J. P.—The article upon sewers came to hand too late even for perusal.

If the correspondent who writes relative to Fleetwood on Wyre will submit his article and sketches for inspection, they will, if approved, be inserted.

ERRATUM.—In our last Number, at p. 542, the Rev. Mr. Kyrie is called the "jealous" instead of the zealous member of the Antiquarian Society.

## ADVERTISEMENT.

## SALE BY AUCTION.

Freehold Building Ground, Old Kent-road, about 24 miles from the city.

**MR. SINGLE** will sell by AUCTION, at the Auction Mart, on Wednesday, November 6, at Twelve, **FREEHOLD BUILDING GROUND**, land-tax redeemed, comprising together several acres. The whole comprises nearly 160 plots, giving votes for the county, and presenting most desirable frontage on good roads. There is famous sewerage nearly all round the estate. Much has been let on building leases at 4s. per foot, and some of the lower parts of the estate were lately sold by auction at a fair price, and have since been re-sold for double the amount. This rapid and daily increase in the value, and the great demand for freehold ground in the neighbourhood for building, have caused the proprietor, Mr. H. England, to make up all the roads (except one which is not yet completed) in a superior manner, and to spare no expense in planting trees and otherwise improving the estate throughout. The situation is the centre of a healthy, pleasant, and respectable neighbourhood, near to three railway stations, and only about two miles from London-bridge.

Particulars may be obtained (14 days prior to the sale) of J. GIOVES, Esq., Solicitor, 25, Oldbath-street, Bedford-square; and at the Offices of Mr. SINGLE, Surveyor and Land Agent, 34, Coleman-street, City.

## PAINTING BRUSHES. — TO PAINTERS, BUILDERS, &amp;c.

**J. KENT AND CO., 11, GREAT MARLBOROUGH STREET, LONDON**, offer to Painters, Builders, and Dealers in Painting Brushes, goods of a quality far superior to those generally offered for sale, and to which they beg to call the attention of those who study quality and durability to cheapness. Lists and prices forwarded on application.

## BUILDERS, PLASTERERS, &amp; OTHERS

Should compare the Prices. — Yellow Ochre, 8s. per cwt. Bolbol Oil, 2s. 3d. per do. Lamp Black, 21s. do. Turpentine, 7s. 3d. per do. Blue Black, 16s. do. Best Ground Lead, 10s. per cwt. Venetian Red, 12s. do. Second do, 4s. do. Gold Size, 6s. per gall. Third do, 21s. do. Copal Varnish, 12s. & 16s. do. Town Gild, 42s. do. Paper Varnish, 11s. & 14s. do. at FINEYNS, NEW-BROAD-WAY, 59, JUDD-STREET, CHESEBURY-WARHOUSE, 59, JUDD-STREET, NEW-BROAD-WAY, Brushes, Varnishes, Dry and Ground Colours, at lowest prices.

## COMPOSITION FOR WRITING WITH STEELPENS.—STEPHEN'S WRITING FLUIDS

comprise the most splendid and durable colours, and the most infallible compositions, which art can produce; they consist of

A Blue Fluid, changing into an intense black colour. Patent Unchangeable Blue Fluids, remaining a deep blue colour. Two sorts are prepared, a Light and Dark Blue. A superior Black Ink, of the common character, but more fluid.

A Superior Carmine Red, for contrast writing. A Liquid Rouge Carmine, for artists and contrast writing, in glass bottles. A Carbonaceous Record Ink, which writes instantly black, and being proof against any chemical agent, is most valuable in the prevention of frauds.

A Liquid, Mechanical, and Architectural Drawing Ink, superior to Indian Ink.

Marking Inks for Iron. Select Steel Pens; Inkholders. Prepared by HENRY STEPHEN'S, the Inventor, No. 31, Stanford-street, Blackfriars-road, London, and Sold by Stationers and Booksellers in Bottles, at 3d., 6d., 1s. and 3s. each.

CAUTION.—The Unchangeable Blue Fluids are patent articles; the public are therefore cautioned against imitations, which are infringeable; to sell or use which is illegal. Also purchasers should see that they are not served with the Blue Black instead of the Unchangeable Blue, as these articles are often confounded.

N.B.—Black Ink, and imitations of the above articles, are constantly being announced as new discoveries, but on examination, they will be found to have some new name only.

## PREPARED FLOORING BOARDS.

ALWAYS ON SALE, A LARGE ASSORTMENT OF DRY PREPARED FLOORING BOARDS AND MATCHED BOARDING of all sorts, planed to a parallel width and thickness, from 1/2 inch to 1 1/2 inch thick. Rough Boarding for Plats.

TIMBER, DEALS, OAK PLANKS, SCANTLINGS, &c. &c. &c. Apply at W. CLEAVE'S Timber Yard, Smith-street, Westminster.

## PREPARED FLOORING BOARDS.

ALWAYS ON SALE at A. ROSLING'S, SOUTH-WARK-BRIDGE-WHARF, BANKSIDE, and G-BARGE-WHARF, Upper Ground-street, Blackfriars, a very large stock of well-seasoned Floor Boards of every variety.

A. R., in calling the attention of builders and consumers, confidently presumes on his being able to supply them on such advantageous terms, as will ensure and merit their favours and approbation.

## PLANNING BY MUIR'S PATENT MACHINERY.

HENRY SOUTHAM begs to call the attention of persons engaged in Building, to the great saving in time and labour effected by MUIR'S PATENT MACHINERY for preparing Flooring and matched Battens and Boards.

Orders punctually attended to by addressing to HENRY SOUTHAM, Mr. Herbert's Saw Mills, Gillingham-street, Piccadilly, N.B. Timber of the largest size sawn at these Mills.

## SASHES AND FRAMES, DOORS, &amp;c.

Manufactured for the Trade By CHAS. W. WATERLOW, 121, Bunhill-row, Finsbury.

Lowest Prices.—Terms: Cash.

N.B. Lists of prices had on application at the counting-house; by letter, pre-paid, inclosing postage-stamp.

## WINDOW BLINDS.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHERS.

F. A. DE WILDE, (Late Mills and De Wilde), 75, WELLS STREET, OXFORD STREET, LONDON,

MANUFACTURER of the much-admired SPANISH BLIND VENETIAN SHADES, adapted to either made or outside, so much in general use.

Blinds for Shop-fronts, Spring Roller Blinds, on the most improved Principle, PATENT ROLLER BLINDS, Mounted with the newly-improved Scotch Furniture.

PATENT WOOLLEN BLINDS, DWARF VENETIAN BLINDS, &c.

Verandahs to any Design. Transparencies, and every description of Sun Blind, on the most improved principle, and of the venetian blind, on well-selected materials.

F. A. De Wilde begs to observe he pays particular attention to the manufacture of Blinds for exportation; he also invites all parties to pay his Establishment a visit, where they may see every description of Blinds.

Holland Blinds Cleaned, Calendered, and re-made. Venetian Blinds Painted, Taped, and Lined. Estimates furnished. N.B.—Old Blinds renovated and made equal to new.

## SEYSSAL ASPHALTE COMPANY.

"CLARIDGE'S PATENT," ESTABLISHED 1838.

THIS ASPHALTE is a Bituminous Limestone, obtained from an inexhaustible Mine at Pyromont, in the Jura Mountains.

Previously to its introduction into this country, in 1833, the Material had been used in many royal palaces, public and others; in the Carriage Approach to Mansions, Gardens, and Terraces; the flooring of Kitchens and other basement offices; also of Coach Houses and Stables, Dog Kennels, Barn Floors, and House Pavements, Poultry Houses, Turn Rooms, and Matings. For Roofing, Covering of Railroad and other Arches, the Lining of Underground Cellars near Rivers to prevent the ingress of the Tides; also in covering the ground-line of Walls, to prevent frost rising (this application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts), thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Docks, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARRELL, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," Stangate Depot, London.

COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS. THE DIRECTORS OF THE SEYSSAL ASPHALTE COMPANY have much pleasure in recommending the notice of Architects, Builders, and others, the application of THE ASPHALTE OF SEYSSAL as the only effectual means of preventing DAMP rising in Walls.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18.

In 1839 I superintended the construction of a house of three stories on the Lac d'Engien. The foundation of the building is constantly in water, about 10 1/2 inches below the level of the ground-floor. The entire horizontal surface of an external and internal wall is covered, at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

"Since the above date no trace of damp has shown itself round the walls of the lower story, which are for the most part painted in oil of a gray stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 2 1/2 inches above the external surface of the soil, and only 1 1/2 at the utmost, above that of the sheet of water.

"The layer of Asphalt having been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp have been since remarked at the base of the door-posts."

## POLONCEAU'S BITUMEN PAVEMENT.

EMENT for paving Foot walks, Terraces, Garden walks, Stables, Coach Houses, Greenhouses, and Shop Warehouses. For the exclusion of Damp and Vermin in Basements it is particularly adapted, and for Roofing Dwelling Houses, Porticos, Balconies, and Sheds.

Price 3s. 6d. per square yard.

BITUMEN for covering the Arches of Bridges, Culverts, &c. &c. on Railways and other places (with instructions for laying it down), may be had at the rate of 45s. per ton, by applying to JOHN PILKINGTON, 15, Wharf-road, City-road.

## BASTENNE BITUMEN COMPANY.

Office, 31, Poultry. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot square:—1 inch thick, 8d.; 2 inch thick, 7d.; 3 inch thick, 6d. Works not measured in feet, 1d. per foot extra. Concrete is charged in addition according to the thickness when required. Carriage and men's time are charged extra when works are executed beyond three miles from the General Post-office. Bitumen 46 per ton, without grit. Bitumen 45 per ton, with grit. CHARLES F. TILSTONE, Secy.

VARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom to be met in the ordinary varieties of a varnish devoted exclusively to the manufacture of this article, and the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messrs. GOSNOLD, PHILIPPS, and COLOURS to produce Varnishes (both oil and spirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality.

Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit French Polish, 18s. ditto; White Lead Oil, Turps, and Colours of every description at the very lowest prices.—WALLIS'S Varnish, Japan, and Colour Manufactory, 61, Long-acre, one door from Bow-street. Established 1750.

## BESSEMER'S PATENT GOLD PAINT.

Sole Agents, R. TILLEY & GARROLD, 24, Ludlow-street, London.

The above METALLIC PREPARATION is intended to supersede the use of Gold Leaf, as it gives an equally beautiful effect; is extremely durable; will bear washing equally well with any other description of fine painting, and is, in comparison, costless, requiring only to be applied with an ordinary brush. It will be found particularly adapted for the following purposes:—

For exterior PAINTERS and DECORATORS. For exterior and interior Decorations, Iron Works, Mouldings, Cornices, Centres, Brackets, Figures and Casts of every description, whether in Plaster or Metal, Writing and all ornamental work.

For SHIP-PAINTERS and DECORATORS. For such ornamental Work, either within or without, as may require gilding, and from its cheapness, affording an opportunity of embellishment so desirable, but which is frequently neglected from its great expense.

PLASTURE FIGURE-MAKERS. For general use upon the Figures, Casts, and Medallions manufactured for ornamental purposes.

And for various other uses here undescribed, but which its low cost may likewise adapt it to. To be had wholesale only as above, and retail at most Colour Warehouses in the Kingdom. Sold in bottles, 5s. each.—A liberal allowance to the trade.

PLUMBERS, PAINTERS, BUILDERS, AND OTHERS, supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures, Glazing, &c. &c., in any quantity, at Manufactory Prices.

TUPS, per gallon . . . . . 2s. 4d. LINED OIL, do. . . . . 2s. 4d. SHEET LEAD, in sheets, per cwt. . . . . 18s. 6d. Ditto, cut to sizes and PIPE . . . . . 19s. 6d. WHITE LEAD (Genuine) per cwt. . . . . 25s. 4d.

Glazing, Lead, and Qualities, &c. &c., equally low, and quality warranted. Complete Lists, printed, may be had on applying to R. COGAN, 5, Princes-street, Leicester-square, London.

PRINT PUBLISHERS, PICTURE FRAME AND ORNAMENT MAKERS, can be provided with flattened Crown, flattened Sheet, and the patent Sheet Plate, Lists of which, showing the price for any Square, from 14 by 12 to 30 by 30 of Best and Second quality, will be sent gratis upon receiving the orders. Builders, Glaziers, and others, having to Contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for, if required.

NURSEYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London.

COMMON SHEET AND CYLINDER. The advantages of Common Sheet over Crown for Glazing Skylights is more brilliant light, and is generally used where strength or superior appearance is required; a light 6 feet 6 in. long, with openings of any width, needs only one flap. This Glass is considerably stouter than Crown, and may be had from 1s. 3d. per foot.

Also may be had, COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES, OF EVERY DESCRIPTION.

GAS CONTRACTORS, PAINTERS, GLASS MERCHANTS, and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

CLOCK-MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS, supplied with FRENCH ORNAMENT SHADES, for covering Models of Public Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application.

French Table Flowers, China Vases, Fancy Glass Ware, &c. &c. of Alabaster Figures in every variety.

R. C. having just new Rooms for the above articles, begs to invite the inspection of the Public. A Liberal Discount to Bazaar keepers and others.

## NOTICE.

As it is our intention to publish almost immediately a Second Edition of Mr. Bartholomew's Cyclopædia of the Building-Act, accompanied by the whole of the Text of the Act itself, in a small pocket form, only  $5\frac{1}{2}$  ins. by 3 ins., we should be obliged by receiving, in the course of next week, any notices of corrections and suggestions for improvements.

It is also our intention to publish in THE BUILDER Mr. Bartholomew's Notes upon the Act, which will also be given in the pocket edition.

# The Builder.

No. KCII.

SATURDAY, NOVEMBER 9, 1844.

PERHAPS in no other branch of architecture is there more study re-

quired than in forming the ground-plans or horizontal sections of buildings. Comparatively few persons have ever become eminent in this. It requires a good head to arrange the various apartments of a pile of building, so as to be convenient, with all its details just where they should be; and it requires a still higher degree of skill to do this in such manner that a structure raised from such a ground-plot shall be sound, scientific, and architectural.

The good planner never forgets that his work has to be built and to be roofed over; he, therefore, is never at a loss in his construction, except some incompetent person interfere with his projects, and cause him trouble to overcome the unnatural difficulties which have been created. Direct passages, uniformity of the members composing the apartments, free access and lighting, chimneys placed advantageously for diffusing warmth the most uniformly, and husbanding the consumption of fuel in the best manner,—are some of the elements of good planning. When you see skew passages, slanted door-jambs, all manner of clever expensive contrivances by enrichments, false screen-work, a constant recurrence to blank sashes and doors, you may rest assured the man who planned all this is very inferior as an architectural designer, since he is unskillful in the highest, while at the same time the most necessary branch of architectural knowledge.

When you see domes raised out of flat ceilings, or ill-adapted to irregular apartments, by means of spandril ceiling-pieces at the corners, you may at once know their designer has much to learn, that he is as yet destitute of that integrity of feeling which can alone make him an architect; for he needs to have infused in him his profession's life and soul. He does not think masonically, for if he did, he would design and build nothing which could not be executed with stone: the bare attempt to rear his domes in masonry upon flat ceilings, would bring down the work over him. Every person who sins in this respect should be banished to a region where masonry alone can be procured; and he should be there nurtured to ar-

chitectural decency by being obliged to build masonically. The stone-roofed abbot's kitchen, at Glastonbury, outliving spoliation several centuries, yet remains. The Rotunda has, with its incombustible cupola, survived the sacking and burning of Rome during the greater part of two thousand years, and may perhaps last as much longer; and a variety of other buildings have been as fortunate from the same caution; but in modern times the example seems almost lost: prudence and science claim rigidly the dictates of legitimate architecture, yet with how little success may be seen by any one who will detail to himself what has been done among us in modern times. As long as the architecture of the empire is in inferior hands, all the deceitful advice which out-wits the public with its eyes open, will by address (which were better employed in planning legitimately) lay the employer under contributions for the priceless stuff, which the skilled conscientious architect will not palm upon the ignorant. As we proceed, what are our own particular views upon the subject will be amply seen.

Good architecture must be planned conveniently, soundly, elegantly, practically, and rationally. It has no petty whims about it; it must be geometrical, it must be regular, or if any thing irregular, then only with certain deviations from uniformity. The ground-plot, the elevation, the perspective effect, the construction, the use, the duration, the dimension, all go forward in the skillful planner's mind at the same time. None, therefore, but a superior mind can plan architecture. Cracks are rarely found in the walls of a good planner, because tie, union, and correct gravitation run throughout his constructions, by reason of the first planning. The passages of a good planner are never dark, irregular, nor tortuous; he places no water-closets in obscure corners, but ever brings them to the light and to open ventilation; the good planner is not in the habit of lighting several separate places, offices, or apartments from the same window; he seldom uses "borrowed lights," but gives to every place its own; you never see in the work of the able planner one apartment made irregular by sweeping out of it the fine shapes of another, for with him, whatever be the complexity, the walls are placed as exactly and as economically of space as are the parites of a honey-comb; you do not see in some parts of his work huge masses of walling or masonry, and in others thin mere cuticle-work, to fill up or to give space, just as maladroitness chances to render such necessary. But where you see great masses, the altitude and bearings of the elevation require them; no part of a good plan is stuffed, nor are the irregularities made up by the extravagance of solid work, nor do you see portions of the space battened off and left vacant for the mere purpose of creating regularity; the good planner never falls into dilemmas which render these costly blotches necessary. The ground-plan of a building is seldom understood by unprofessional persons, and how should it, since so many professional ones are themselves so deficient in this knowledge? and yet before a man builds a house it would be well were he to learn the language of plans; nothing can be more methodical, nothing can convey to the mind more exactly the details of which any person building usually desires to know so much.

In good planning, menial but necessary domestic offices are out of sight, yet nigh at hand. Excesses about buildings are mostly the result of desperately inferior planning; the confusion in inferior staircases comes from the same fault. When good plans are obtained, they should be esteemed as precious. Great genius and attainments made Wren the most illustrious planner of public edifices. The ground-plan of St. Paul's Cathedral, for beauty, geometrical expedients, vista, and harmony, transcends that of all other sacred edifices in the world. The disposition of the columns in avenues to produce the regular peristyle supporting the cupola of St. Stephen's, Walbrook, has in the world no competing rival. The plan of the Royal Exchange dares not exhibit itself with that of the little church of St. Benet-Finck, lately mentioned by us. Of the minor works of Wren little is known by the public at large; the plan of St. Antholin's, Watling-street, conformed, like that of St.

Benet-Finck, to the public way, is another master-piece. St. Swithin's, London-stone, where the rectangular plan is cast by diagonal architraves into the form of an octagon, bearing a dome of the same plan, is worthy of remark. Even the church of St. Mildred, Bread-street, the plan of which is a simple rectangle, gives a worthy instance of the manner in which a circular dome may be raised above a square pendentive, and by its rich band of fruit and flowers may throw into the shade our modern mean plastering. The interiors of St. Anne's by Aldersgate, Saint Martin Ludgate, and St. Benet's Paul's Wharf, each containing four interior columns, are worthy of remark. The plans of the steeple of St. Bride's, St. Vedast's, St. Stephen's Walbrook, St. Michael's Paternoster, St. James's Garlick-hill, St. Mary-le-bow, Christ Church Newgate-street, and of the turrets of St. Paul's Cathedral, are all different, and are all master-pieces of genius, made illustrious by the guidance of geometric art.

Among modern planners, Sir John Soane possessed no mean ability, though he was very inferior to Wren in science and acquirements; he seldom carried his works to any very great degree of high art. Many of the parts of the Bank of England exhibit great skill in planning, and one thing in it is greatly to be admired,—the prolongation of vista. He resorted successfully to many fine expedients for overcoming the difficulties produced by so great an establishment, growing up piecemeal upon an irregular increasing site, and constantly requiring change from the fluctuating and expanding nature of its departments.

The management of the turned passage from the Old Court into the Rotunda, which forms an alteration from the original entrance, has no rival. The shaping of the Bullion-court, so as to adapt itself to the lines of the apartments parallel to Thread-needle-street and to those parallel to Lothbury, is worthy of study. The Lothbury-court, which was built to accommodate itself to the site, before it was enlarged to Princes-street, deserves to be examined attentively, and the vista from the east alcove of this court through the offices into the Rotunda (now from a subsequent alteration not open to general access), is as fine in planning as any thing which has ever been done. The Bank of England is full of ingenious expedients to overcome irregularities of site, though they are not all scientifically worked out in the section and elevation. The Lothbury and Princes-street corner of the Bank, though only ornamental and for the purpose of concealing the acute irregular angle of the building at that part, is formed on a most masterly plan, which shews first-rate genius, and it would be well for Welby Pugin himself to learn how to plan before he utters any more trumpery relative to it. To overcome the difficulties and irregularities of site, requires calibre of mind different from the making of mere irregular masses, where the designer has free scope to work in any way he pleases. But the weak mind, always vain, mistakes for genius that vanity which occasions it to overlook the skill and science of others.

Planning has fallen, because the sciences applied to architecture have of late gone much into desuetude. At some future time we propose to collect the finest examples of planning, and we hope to be able to give in our columns some original designs, which we do not undertake to place in competition with those of the masters we have named, yet affording hints, we trust, for developing this neglected branch of true architect art. In small dwellings, the confined space often prevents its full development, yet much more may be done in this respect to beautify moderate habitations than is generally supposed.

## I P P.

THE KING OF PRUSSIA AND MR. HABERSHON, THE ARCHITECT.—The King of Prussia has been graciously pleased to confer on Matthew Habershon, Esq., of London, the great gold medal for science and literature, in token of his Majesty's high approbation of his work on the "Ancient Half-timbered Houses of England." Mr. Habershon, who is the architect of the church and other buildings erecting at Jerusalem, was honoured with a long private interview with the King of Prussia, relative to those extensive works, on his return from the Holy Land last year.

SIR BAPTIST HICKES'S CHIMNEY-PIECE,  
IN THE MIDDLESEX COUNTY SESSIONS' HOUSE.

(From a Drawing by Mr. C. J. Richardson, F.S.A.)

This relique is now in the south-east room on the ground-story of the County Sessions' House, Clerkenwell, having, upon the building of the New County Hall, been brought there from the former hall, built by Sir Baptist Hickes in the broad part of St. John's-street, opposite the Windmill Inn, a site still celebrated by the miles along the north road being measured from "the spot where Hickes's Hall formerly stood."

The chimney-piece itself is a good example of the style of the day which was shortly afterwards superseded by the improved Palladian architecture of Inigo Jones. The filling up of the space between the carved mantel and

the terminal jamb-pilasters is modern, and was most likely originally open.

The arabesques on the mantel, pilasters, friezes, and panels, very closely resemble Spanish-moresco work.

The double pilastered wings of the story above the mantel are not badly designed, though the inner pilasters appear to bear upon void. The termination of the central mass above the arms of King James I. wants connection with the wings, which might easily have been effected by some kind of surmounting pediment or arched cornice. Beneath the royal arms is the following inscription:—

SIR BAPTIST HICKES, OF KENSINGTON  
IN THE  
COUNTY OF MIDDLESEX,  
KNIGHTE,  
ONE OF THE  
JUSTICES OF PEACE OF THIS COUNTY OF MIDDLESEX  
BY HIS OWN PROPER DISPOSITION  
AND AT  
HIS OWN PROPER CHARGE,  
BUILT THIS SESSION HOUSE, IN THE YEARE OF  
OVR LORD GOD 1612, AND  
GAVE IT TO THE JUSTICES OF PEACE OF THIS  
COUNTY,  
AND THEIR SUCCESSORS  
FOR A SESSION-HOUSE FOR EVER  
1612.

And below this original votive-memento another panel has been somewhat awkwardly introduced across the framework bearing this record:—

ON THE FRONCH OF THE PRESENT SESSION-HOUSE  
ANN. DOM. 1782.  
THIS ANTIENT CHIMNEY-FRONT  
(A PART OF THE OLD HICKES'S HALL)  
WAS PLACED IN THIS ROOM, TO PRESERVATE  
THE MEMORY OF SIR  
BTS. HICKES,  
AS SET FORTH IN THE ABOVE INSCRIPTION.

The carved work above the mantel is finished with colours, and is heightened with gold.

Above the general work of the chimney-piece exist some remains of pilasters cut off abruptly, which seem to have formed a portion of the wainscoting of the old Hickes's Hall. This chimney-piece does not accord in any respect with the room in which it is fixed, which is a plain, uncarved, modern one. We think so worthy an act of munificence was worthily seconded by placing it in the present building; and that, to prevent it from seeming to be out of place, the whole room should be fitted up in the same style to agree with it. Few examples like that of Sir Baptist Hickes occur, comparatively few men having the means to accomplish so generous and praiseworthy a public service.

a e l.

FALL OF A NEW MILL AT OLDHAM.

ONE of the most extensively fatal catastrophes that has happened in the neighbourhood of Manchester for many years past—one, indeed, more terrific in its nature, and more fatal and disastrous in its consequences, than any thing that has occurred since a similar catastrophe at the fire-proof factory of Mr. Nathan Gough, near Oldfield-road, Salford, on Wednesday, the 13th of October, 1824, by which eighteen or nineteen persons lost their lives,—occurred on Thursday, the 31st ultimo, in a suburb of Oldham, named Lower-house, Greenacres-moor, at the mills of Messrs. Samuel Radcliffe and Sons, called the Lower-house Mills. The firm (now consisting of Messrs. Josiah Radcliffe and Brothers, the four sons of the deceased Mr. Samuel Radcliffe) had recently built a new mill adjoining one end of their old fabric; and about half-past three o'clock on Thursday afternoon the whole of this new mill fell in with a tremendous crash, at a time when there were thirty-two persons in it, of whom there is reason to fear that twenty-one have been killed, five more or less hurt, of whom one is not expected to recover, and six have escaped with little or no injury.

One of the assigned causes of this awful catastrophe is that an iron beam, from some cause, broke in two, in or near the middle, and thus the superincumbent weight brought down the other beams, and, indeed, the entire floor, which, in its fall, carried the others with it. This is the opinion of one of the Messrs. Radcliffe.

During Wednesday the millwrights had been engaged in putting-up and connecting shafting, &c., in order to prepare the rooms for the reception of the machinery which was to arrive in a day or two. The shafting was worked a little on Wednesday night; and the twist-ers in had placed several power-looms in the upper floors on the day of the accident. The only other machinery in the building consisted of twisting and drawing frames, which were all in the lowest room, over the boilers. Had the accident occurred six weeks later, the whole building would have been filled with machinery, and with a full complement of bands, in which case the loss of life might have been much greater. The principal beams, cross or short beams, and iron pillars, were all manufactured expressly for the new building, by Messrs. Savilles and Wolstenhulme, of Lower Moor Iron Works, Oldham. The beams were laid across the building, there being three separate beams or lengths in each range, the ends resting on and clipping the pillars. Each beam measuring about 14 feet in length, and was stated to be "of the form generally used for fire-proof buildings;" the ends being clipped together by wrought-iron straps. Messrs. Savilles and Wolstenhulme state that the beams

were partly Scotch, and partly from Staffordshire, and that it was used in the proportion of one-third of cold-blast iron to two-thirds of ordinary pig-iron. These beams average a weight of about three-quarters of a cwt. per foot, and some of their weights, as taken from the makers' books, are 22 cwt. 3 qrs. 20 lb.; 25 cwt. 3 qrs. 2 lb.; 24 cwt. 3 qrs.; 24 cwt. 2 qrs. 6 lb.; and two beams together weighed

49 cwt. 1 qr. 20 lb. Messrs. Radcliffe also stated, that each beam had been tested to bear a weight of eight tons, and Messrs. Savilles and Wolstenhulme shewed where the testing had been conducted, each beam having, according to their statement, borne a weight suspended from its middle, of 12 tons of pig-iron. The pillars are of cast-iron, and hollow, weighing about 6 cwt. each.

STAIRCASE-BALUSTRADE BY INIGO JONES,  
AT AMESBURY, WILTS.

TO THE EDITOR OF THE BUILDER.

Sir,—I send you another sketch to illustrate Inigo Jones's skill in designing staircases. It is from Amesbury, in Wiltshire, the building of which was designed by Inigo, but executed by his nephew and pupil, Mr. Webb. Two plans and an elevation are to be found in the 3rd volume of Colin Campbell's "Vitruvius Britannicus," wherein, however, the staircase itself is not sufficiently made out.

I should like to have accompanied the sketch with the plan and section of the staircase, which is a celebrated example, as it contains a back or servants' staircase within the principal one. I shall probably send you other sketches of it at a future opportunity.

I am, Sir, yours, &c.,

C. J. RICHARDSON.

22, Brompton-crescent.

**WANT OF AN EFFICIENT SURVEYING ESTABLISHMENT IN CEYLON, AND THE EVILS RESULTING THEREFROM.**

No time ought to be lost by the home authorities in sending out a sufficient number of young men who are conversant with land-surveying and tracing of roads through a difficult country, as well as possessing skill to make roads when a trace has been determined on. I am aware that the want of such persons is most severely felt in the island. I know of applicants being unable to have land surveyed for more than two years, entailing almost ruin on them; and the reply of the island authorities to complaints made on the subject was, that they had no surveyors to survey lands or trace roads, although people were ready to pay any sum which the Government might demand for their services; and that their repeated applications to the home authorities for surveyors were not attended to. Thousands of persons can be had in England too glad to be employed by Government, possessing the skill I mention; and their employment at a salary of suppose 200*l.* per annum, as surveyors in Ceylon, to the number of at least twenty, so far from entailing an expense on the Government, would, I am convinced, afford a profit, so highly would the planters pay for their services. In proof of my assertion, I may mention that I know of many who gladly paid to surveyors ten guineas per mile for merely pointing out a trace, which, in many instances, proved to be any thing but the best which could be determined on. The establishment of the Surveyor-General is acknowledged to be one of the most inefficient in the island; Mr. Norris's own exertions unassisted can, of course, do little. Another argument to be used to induce Government to send out an effectual establishment of surveyors is to be found in the fact, that Government has in more than one instance sold the same land to two purchasers; and to guard against the dangers to which similar acts would subject them, the island Parliament has had recourse to legislation to guard themselves against the consequences to which they were liable in having sold the same land to two different parties, and received payment of it from both.—*Extract from a Letter addressed to Lord Stanley, Secretary of State for the Colonies.*

**ON THE RESISTANCE OF RAILWAY TRAINS.**

A PAPER, by J. Scott Russell, Esq., on the above important subject, was read at the late scientific meeting at York; the substance of which, very much compressed, will be found in the following experiments made by the author on the Sheffield and Manchester Railway:—

1. Trains of carriages, empty, were put in motion at the summit of an inclined plane, at about 30 miles an hour, and were allowed to descend freely. 2. Trains of carriages, loaded, were tried in the same way. 3. The engine and tender were treated in the same way, being put to a velocity of between 30 and 40 miles per hour, and allowed to descend freely the whole length of the inclined plain without any train attached. 4. The engine and tender, with a train attached, were propelled to the top of the inclined plain, and then allowed to descend freely by gravity.

By these means the following results were obtained:—

1. The resistance to railway carriages at slow velocities does not exceed 8*lb.* per ton. 2. The resistance to a light railway train of six carriages, at 23.6 miles an hour, was 19*lb.* per ton. 3. The resistance to a loaded train of six carriages, at 30 miles an hour, was 19*lb.* per ton. 4. The resistance to a light train of six carriages, at 28 miles an hour, was 22*lb.* per ton. 5. The resistance to a loaded train of six carriages, at 36 miles an hour, was 22*lb.* per ton. 6. The resistance to a six-wheeled engine and tender, at 23.6 miles an hour, was 19*lb.* per ton. 7. The resistance to a six-wheeled engine and tender, at 28.3 miles an hour, was 22*lb.* per ton. 8. The resistance to a train composed of six light carriages, with engine and tender, at 32 miles an hour, was 22*lb.* per ton. 9. The resistance to a train composed of nine loaded carriages, with engine and tender, at 36 miles an hour, was 22*lb.*

Mr. Russell observed, that the subject was of considerable importance, inasmuch as the system adopted for laying down the gradients

of new lines was of necessity regulated chiefly by the opinion of the engineer on the question of resistance. How much mechanical force is required to move a given weight of train, along a given gradient, at a given speed, was a question of which the solution was essential to sound engineering; but the profession had long felt that they were not in possession of sufficient data to determine this question.

**BAD SPECULATION BUILDING.**

TO THE EDITOR OF THE BUILDER.

SIR,—The construction of the early habitations of mankind required little skill, and as little knowledge, and I think if any person were to attend and see the infamous works now being executed in the road leading from Battle-bridge (called the Chalk-road) they would say that neither one nor the other ever entered the mind of those who are erecting such wretched buildings. What, Sir, can the district-surveyor be about? I would call his attention to some of the party-walls where *bond timber is placed side by side in a 9-inch wall*. I need hardly say that it is quite contrary to Act of Parliament, and in case of fire dangerous; in fact, Sir, I consider such building to be an imposition upon the public. The walls are built of the veriest rubbish, they are covered over, and the house is beautified, and, to all appearance, one would say well-huilt. A person purchases, and after being in possession for a few years, he finds the beauty fade, and the carcass rotten, and he has been imposed upon.

I hope the new bill will put a stop to all such work. I am, Sir, yours obediently,

Nov. 7, 1844. DEDALUS.

**WINCHESTER NEW CHURCH.**

SIR,—Allow me to contradict an assertion made by "A Surveyor and Looker-On," viz.: that the drawings submitted by me for the new church at Winchester are the property of Messrs. Elmslie and Co., a firm with which I have not the honour to be acquainted, such assertion being perfectly erroneous and without foundation.

His remarks are evidently malicious; but this I can readily attribute to the sourness of the grapes.

Yours most obediently,

WILLIAM WEBBE, Architect.

Camden Town, Wednesday,  
Nov. 7, 1844.

**REMOVAL OF TWO BRICK HOUSES.**—A block of two brick houses in Lincoln-street, three stories high, was safely and successfully removed this morning ten feet and six inches from their old foundations to the rear. This novel work was accomplished on a plan furnished to Alderman Preston, a member of the committee for widening streets, by Mr. Moses Parker, who is justly entitled to great credit for the entire success of the new enterprise. The *modus operandi* was thus: concave cast-iron plates are prepared, the foundation of the wall cut away, and two plates facing each other inserted, with cannon balls between them. These plates and balls being placed under all the walls, the whole building rests upon them. Three screws are applied, and the whole building is rolled upon them any desired distance. These plates and balls are moved one by one, and the brick replaced, and the building left in the original state, without any injury to the structure. It is estimated that this block weighs 7,000 tons, and was rolled on 120 balls, and accomplished, after the plates were set, in about two hours' time.—*Boston Paper.*

A part of the tall chimney of Mr. Gill's alkali works at South Down, near Millbrook, was blown down on Wednesday night last. The chimney was 160 feet high, and was warped from the perpendicular, owing, we have been informed, to the unequal contraction of the mortar when drying up; the top, we understand, overhung the base several feet. Fortunately the chimney was situated in the middle of the field, the smoke being conducted to it by subterranean flues, and no injury was therefore done to the works, to life, or property, by the fall.—*West of England Correspondive.*

**Miscellanea.**

**YORKSHIRE ARCHITECTURAL SOCIETY.**—The general annual meeting of the Yorkshire Architectural Society was held in the Society's Museum, Minster Yard, York, on Thursday, October 24th, the venerable Archdeacon Wilberforce in the chair. The report was read by the Rev. J. Sbarp, one of the secretaries from which it appeared that several of the works which had been aided by grants from the society were entirely or nearly completed. Among these may be mentioned the stained-glass in some of the windows of All Saints' Church, in York, and the windows of the noble decorated church of Patrington. The formation of local committees throughout the county was strongly recommended, in order to advance the study of ecclesiastical architecture, and it was stated that of the committees already formed, only two—viz. Wakefield and Beverley—had shewn any fruits of their labours. Twenty new members have been admitted during the past year. The report was adopted and ordered to be printed. Notices were given that at the next quarterly meeting, to be held in January next, grants would be moved for the church of St. Mary, at Bridlington, and St. Sampson's, at York. After the reading of the report, two very interesting papers were read—one by the Rev. W. H. Teale, vicar of Roystone, on the church of St. John Baptist, at Sedburgh. This church, which has been lately erected, is one of exceeding beauty, and quite a model for modern church-builders. The other paper, which was communicated by a member of the Cambridge Camden Society, was read by the Rev. Thos. Egerton. The subject of it was Arbury Church, in Cheshire, which, from its very singular form, has given rise to a good deal of discussion on the part of Ecclesiologists. The church has been built at different times, the present north aisle having been the whole of the original church, the tower standing at the north-western corner. A nave and south aisle have been added of somewhat later date, the nave being wider at its western than at its eastern extremity, apparently with the intention of altering the orientation of the church, the patron saint having been altered at the time the addition was made to the church. The meeting went off very satisfactorily, and we are happy to find that the society appears in so flourishing a condition.—*Doncaster Gazette.*

**POSSIBILITY OF LARGE STONE ARCHES.**—Mr. Rennie is of opinion, that with our strong magnesian limestones and hard granites, arches of larger span than any hitherto built may be safely constructed. There are numerous examples, both in ancient and modern times, of very large arches—the bridge of Narni, in Italy, of Velle Brioude, in France, and of Alcantara, in Spain, by the ancients, and those of Gignac and Castel Vecchio, by the middle ages; but the most remarkable example of cylindrical vaulting (the remains of which still exist) is the bridge of Trezzo, over the Adda, in the Milanese. The span is 251 feet over the chord, and 266 feet over the semicircle. The stone beams in the church of the Jesuits at Nismes, and those between the towers of Lincoln Cathedral—the former equal to the segment of an arch of 565 feet span, and the latter to one of 262 feet span—prove how much can be done with materials of small dimensions. In modern times there are examples of bold vaulting in France, in the bridges of Neuilly, Mantes, St. Maixence, and Jena; in Italy, in the Ponte Sta. Trinita, Turin; in England and Wales, in the bridges of Llanrwst, of Pont-y-tu-Prydd, of Gloucester, of Chester, and those of London and Waterloo over the Thames; independently of numerous arches and viaducts, more recently erected for the use of railways. The radii of curvature of the centre arch of new London bridge, taken near the vertex, would equal in boldness an arch of 333 feet; and the length of the key-stone, at 4 feet 2 inches, would make the depth only  $\frac{1}{15}$ th of the whole span.

**DATE OF THE ARCH.**—Mr. Hoskins is of opinion that arches were constructed long anterior to the time of the Ptolemies; for in the pyramids of Ghehel Birkel and Dungalie, which are of more ancient date, both round and pointed stone arches were discovered.

# The Builder.

No. XCIII.

SATURDAY, NOVEMBER 16, 1844.

HOUGH all persons admit that good architecture should

have every adjunct in keeping, yet how rarely do we find the furniture of an edifice corresponding with the style of the fabric in which it is placed. The great expense of purchasing furniture all in one style may be sufficient excuse for those whose mansions are large, whose means are limited, or who

possess heir-looms, which dutiful respect, if not absolute conditions of inheritance, occasion to be kept. But even where means are abundant, the whole purchased at once, and no conditions or shackles are attached to the purchase, the choice, or the keeping, we constantly see the effects of evil taste.

We lately went into a mansion furnished under such circumstances, wherein all the ordinary faults had been fallen into, with the addition of some peculiar to the occasion. The style of decoration throughout the architecture partook of that of Grinling Gibbons, but evidently subdued in quantity and richness, so as to suit the restrictions of a limited expenditure. In the dining-room we found placed a chimney-glass in a plain frame, partaking of a Grecian character, over the windows were curtain-cornices, exhibiting an open outbreak into that branch of dry, hard Elizabethan or Jacobine carving, which consists of a curious interlacing of strap-work; the other furniture of the room betrayed as many changeable anomalies. In the drawing-room, which was more fully enriched in Gibbons's style, there was more of harmony among the furniture itself, which, however, being in the worst and most fallen state of decoration in the French style of the age of Louis XV., contrasted with the room most unfavourably, with its mean, broken, and tattered scroll-work, in which was not to be found one particle of ornament suited to any other purpose than a mere taudy shewing-off of gilding. In the principal chamber we found the chief piece of furniture absolutely a cabinet-maker's French-polished example of Gothic. The only room in the house not offensively furnished was the library, which, containing every thing plain and good, without any finery, was, without any pretensions to taste, really the most tasteful. Now, if in this house five hundred pounds' expenditure in finery had been saved, more honour and credit would have been justly due to the master, and half that sum would have carved every door and shutter throughout the whole, and have given an air of princely finish to which the upholsterer, with all his vagaries, cannot produce, however costly they may be.

We need an entire new school of upholstery-ware. We do not mean to say that much good furniture is not made; but we insist

upon it, that for one really good article, at least a hundred of frippery are manufactured; and this very frippery, because it is costly, finds its way into the houses of the rich, and not unfrequently into those of the noble. The design of furniture is a matter of genius; not every architect can design it, for not every one has sufficient invention; and cabinet-makers and their designers almost invariably hash up with it in a most ludicrous manner the tatters of different styles of architecture, which anomalies are rarely found in old furniture. Now we are not going to fall off into a high-mettled race after every article of household stuff, merely because it is old. We have no objection whatever to modern comfort; but we desire to have that, and taste conjoined: old furniture is often freely and elegantly designed, yet as often very rudely executed. What we desire is to see come into general use good, well-formed, substantial furniture, so well designed and executed, that a man having it left him by his ancestors may not desire to turn it adrift, but to value and keep it from the united motives of respect to the donors and value of its intrinsic merit. If the inundation of inferior old furniture which has during the last five-and-twenty years found its way to Britain from the Continent obtain so much praise, what should be the rank and appreciation of modern furniture of the character which we desire to be introduced and generally adopted?

What is now more common than the placing at the altar of a church a couple of polluted, worm-eaten Dutch chairs, of the age of William III., which, after having been applied to all manner of profane uses and having played flotsam and jetsam in old garrets and brokers' shops, at length come unpurged in their rottenness to the sanctuary?

What is now more common than the finding placed on the communion-table itself old dishes and vessels which, after having been treated worse than Belshazzar treated the sacred vessels of Solomon's Temple, after many a carousal, come in their filthiness from a Jew's store-house of curiosities, and are used for receiving the consecrated elements themselves, although they as little accord with the remainder of the vessels of the communion as the Dutch chairs do with the building or its other furniture?

Again, in the matter of stained glass there is a most lamentable barbarism going forward. Men who because they obtain their bread by painting, glazing, paper-hanging, composition application, and general knick-knack work, fancy themselves capable of touching higher things, are ruining, at as great an expense as they are allowed, the effect of some of our best churches. No matter is it to them whatever be the style of the field of their operations, they set up with their imagined improvements whatever comes to hand.

Thus we see in the church of Saint John the Evangelist, at Westminster, an old altar-window, not good of its kind and out of taste for the fabric, usurping the place of a good and suitable subject. Again, in St. George's Church, Hanover-square, which is a fine church of the second class, lately an immense altar-window, and two accompanying side-windows have been glazed with fragments of gaudy frippery taken from a still larger window of wretched character, and which even any novice ought to know, with its corrupt ornaments, is not even decently applied to such a place; and yet, no doubt, the self-satisfied parties who profaned the

church with this trash, admiring their own tasteless, perverted ignorance, would pull down the portico, and perform various other vagaries to the edifice, which we trust, however, will outlive them and their corruption, though perhaps the Protestant bishop catching sight of the Virgin Mary as the Queen of Heaven in this very glass will order its removal. We give this instance as one of a class whereby money is squandered, sacred architecture injured, and wreckers are let loose upon the temple, that if possible the plague may be arrested. Church furniture, church glazing, and church decoration require regeneration, but, as in the case of household upholstery, a particular education as well as genius are needed for the work.

Through man's perverseness, the history and practice of architecture are strange things: the Elizabethan practitioner spoiled Pointed architecture; the revived classical architect supplants it; in return, the zealot, ignorant of all architecture, as though fulfilling the terms of a lease, paints, glazes, purges, cleanses, and amends according to his imagination the classical architect's labour; and then in a few years will come another race, who, continuing the see-saw work, will undo more than all the mischief which the zealot has perpetrated; thus we have a constant succession of broken subjects of architecture, while we should have, from the same outlay and industry, purity, completeness, and twice as much in quantity. The taste of few zealots is pure, few zealots build well or soundly, few zealots do any thing which can last,—for the zealot is not steady enough to weigh in his mind matters of purity of taste, or of construction, or of fitness; calmer men at calmer times have to undo the zealot's work. The designing architecture, furniture, and decorations requires zeal, but not the zealot's zeal; the zealot's zeal despises all but his own fancy and opinions; the right zeal examines industriously the works of all men and all times, but despises none but the bad, the profane, the mean, and the impure.

b.

## ELECTION OF SURVEYORS TO THE NEW DISTRICTS IN THE COUNTY OF MIDDLESEX.

The election of surveyors to the nine new districts, viz. Fulham, Hammersmith, South Kensington, North Kensington, Hampstead, Hornsey, Tottenham, Stoke Newington, and Bromley, will take place at the Middlesex County Sessions' House, Clerkenwell-green, on Thursday, the 28th instant.

On future occasions, ten days before the day appointed for the election of any district surveyor, each person proposing to become a candidate must personally attend before the committee for general purposes, and produce satisfactory evidence that he is of the full age of thirty years; and also a certificate from the Board of Examiners, appointed under the Act, of their approval; and such other evidence of qualification as the committee may require, before authorizing him to be admitted as a candidate.

## THE CAMBRIDGE CAMDEN SOCIETY AND "THE ECCLESIOLOGIST."

It seems this society, alarmed at the dispute which the disgusting writings published under the above false title have brought upon it in the religious, the scientific, and the architectural world, has given the "right about" to the offensive issue, and disclaims all further connection with it.

IMPROVEMENTS IN GALWAY.—The drainage of Lough Corrib, Galway, will be commenced early in the spring of 1845, and there is to be a canal communication to the sea.

## THE NEW ROYAL EXCHANGE.

TO THE EDITOR OF THE BUILDER.

SIR,—The fact of a building being new seems with many critics a strong argument in favour of its excellence in an architectural light; the New Post Office when erected was extolled as a superior specimen of genius, the general feeling now hardly bears out the assertion. The critics of the day seem to have acted the same farce in their comments upon the Exchange; with but very few exceptions, every one seems to vie with others in the amount of praise and effusion of admiration. I am the more inclined to make a few observations on the Exchange in consequence of seeing a wholesale commendation of it in a late number of the *Morning Herald*; the writer, however, offers but little argument in support of his praise, generally giving one-sided reasons, and following the well-beaten track of noticing only the excellence of the portico and windows; he also, in condemning the severity of a critic in the *Athenæum*, and attributing it to private pique, seems to forget that the same reasoning holds good in his case, his remarks being calculated to raise doubts in the mind of the reader whether he is not in an equal degree prejudiced in favour of Mr. Tite, with this one difference, that in the first case the criticism produced some good effect, whereas in the latter it is only calculated to mislead the public taste. In regard to the choice of the design, in the first instance: it would now seem to be of but little consequence, except that it admirably exposes the present partial and incompetent system of employing non-professional judges; to shew the rejected design was the best, it would hardly be necessary to enter into so very minute an examination of the designs; the fact that the profession generally were in favour of the other one, is not a small argument for such a supposition; as in most other competitions, *interest* awarded the prize.

Before noticing the building, it may not be irrelevant to inquire how far the style is suited for such an edifice: my opinion is that the many great faults and solecisms of the Italian style render it unfitted for the purpose. A large building in the Italian style may be pompous, but can never appear dignified, in consequence of extraneous embellishment taking place of the more legitimate methods of architectural richness; for instance, columns are seldom fluted,\* friezes never ornamented, though the cornices are in most cases ornamented to the utmost extent; on the one hand, when it affects simplicity it approaches baldness, on the other fritter and heterogeneity are mistaken for richness and novelty; and at all times there is a triviality attending it which detracts from the breadth and repose which are necessary for a large building.

But to proceed to the principal view from the Mansion House: the general effect is displeasing; the portico has a clumsy and heavy appearance (which, by the bye, is lessened by the effect of the sculpture in the tympanum, though some hypercritics have objected to its use on the score of style); the effect of the pediment is injured by the chimney-shafts, which want repose and pure outline; at the same time they would have been better omitted, for an Exchange is not likely to associate ideas in the mind relative to fires;† these, together

\* [We do not subscribe to the opinion, that external columns should always be fluted, but think on many occasions those of the Corinthian order are best with their shafts plain, thereby giving an effect of repose, contrasting effectively and artistically with the richness of their capitals, reflecting clear light, avoiding the heaviness and seeming increase of bulk which columns assume when fluted, escaping the sooted appearance which external columns almost invariably acquire in London, and withstanding too the rough use of time and accident, which soon mutilate the fillets between their flutings. In the Tivoli example of the Corinthian order, the simplicity of the capital renders necessary fluting to the shafts of the columns, but in the Lothbury and Princess-street corner of the Bank, where the Tivoli order is used, the two interior columns, which are unfluted, contrasting with the others, have a wonderfully fine and artistic effect.—Ed.]

† [We think Exchanges, considering two in succession have been destroyed by fire, and the present one is well-prepared to share the fate of its predecessors, do bring such ideas; also we

with the lank appearance of the tower behind, entirely destroy repose, while at the same time they are not pleasing objects themselves. The whole view presents a ponderous mass, unrelieved by ornament, and produces an effect entirely different from that solid richness which unites strength and lightness, and which is a characteristic of this style. On a nearer approach, the effect is not better, the bareness and poverty of the soffit, the rough sculpture of the capitals, the overloaded cornice and general grossness of detail, do not tend to remove previous impressions. In fact, ordinary critics seem never to notice detail, contenting themselves with pointing out the beauty of the shade produced by the recessed pronao in the centre, and the magnitude of the portico compared with others in London.

Much has been written about the extreme beauty of the portico, and the writer in the *Herald* goes so far as to say that it is without an equal in London; now a portico happens to be a very marketable commodity, never costing the architect much thought, being very easily copied from originals, and which can never fail in producing a certain amount of effect. Admitting, therefore, that the portico has a fine appearance, the admirers of Mr. Tite can only claim the merit of a successful copyist; it is for them to point out where the effect lies, and in what particular points the portico possesses originality and genius. We might as well attempt to draw conclusions from the portico of St. Martin's of the delicate taste of Gibbs, as to argue the superior genius of Mr. Tite from the portico of the Exchange. When, however, the before-mentioned writer goes so far as to say that it is without an equal in the metropolis, he must have allowed his prejudice sadly to have blinded his judgment for overlooking the portico to the London University; in this the columns are most artistically arranged, which, together with the correctness of the style, the classical arrangement, and the beautiful and effective distribution of simplicity and richness most admirably combined, form an ensemble at once striking, on account of the pure original taste displayed, and, I think, in artistic effect unequalled.

But to make a few remarks on the south façade:—here the poverty in design of the shops is at once manifest, more especially when compared with the overburthening ornament above; this is more apparent in the two central shops, where the mass of sculpture above seems without support, and in the north front, where the two niches produce a most disagreeable effect of solid above void. Much as I deplore the frequent use of miscalled Greek dressings to windows, which are Greek in every thing but *spirit*, being generally of most meagre and poor design, I certainly cannot go to the other extreme of the Italian school, and countenance windows which have a striking likeness to picture-frames. The massiveness of the dressings to the windows of the Exchange, the immense cornices overburthened with ornament, together with the size of the frames, fail of producing a happy result, however praiseworthy the attempt of the architect at originality may have been. The pedestals to the pilasters have a dwarfish appearance, and want the addition of a connecting line at bottom, such as two or three steps leading to the shops, which would have formed a horizontal line for the eye, and have given to the pilasters an appearance of connection, which they now want. The tower, I think, has received universal disapprobation: it cannot be said to be composed of harmonious lines; it groups badly in every point of view with the building, and looks like most after-thoughts,—not a part of the original design. Every view of the Exchange presents the same heavy appearance; misplaced solidity and overburthened ornament in one part, the extreme of poverty in another. The building has the faults of the Italian style without that picturesque appear-

ance which sometimes proves a strong apology for its grossness of detail; the bad outline and unmeaning ornament, produce an effect massive but not grand, ornamented but not rich,—a number of parts fail by contrast to produce a harmonious whole.

These remarks must be considered rather as crude impressions than a studied criticism; the numberless praises lavished on the Exchange seemed to me so unfounded, that could not resist the opportunity of endeavouring to expose their fallacy. At some future time I may endeavour to give a more minute and enlarged criticism, together with some remarks on the interior; I have purposely omitted any mention of the east and north fronts on account of the numerous obstructions preventing a complete view of them.

One thing amuses me very much: in nearly every engraving of the Exchange that I have seen, the building is shewn as viewed from a position inaccessible without the removal of the Globe Insurance Office and several other buildings; this seems to me to be little less than a fraud, and one which has no excuse, for the draughtsman might as well have given us the Exchange in a natural position as in any other; or might it not suggest the hint that the building has so little aesthetic merit as to require a little help from the artist to be made bearable when served up upon paper?

I remain, yours, &c.,  
SCRUTATOR.

## COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. X.

## COLUMN—IONIC ORDER.

In the second of the Greek orders, the Ionic, the column is rendered more slender than the Doric, the proportion being from about 8½ to nearly 9½ diameters high. This order has been called the Asiatic Greek, in opposition to the Doric, to which the name of European Greek has been assigned; and Mr. Hosking inclines to call the latter the "Greek sacred or triglyphed style;" and the Ionic, "the voluted style."

"The invention of the Ionic order of architecture appears to have been coeval with that which prevailed in European Greece; and, although chiefly confined at first to the Asiatic states, it became in the progress of time more generally attractive than the severe beauties of the rival style. The earliest specimen of which any remains are to be found is the celebrated Temple of Juno, at Samos, which, in the time of Herodotus, was considered as the largest and most stupendous edifice ever raised by Grecian art." (Lord Aberdeen's *Inq.* p. 159.) Its architects were Rhacus and Theodorus, Samians by birth, and it was built about 540 B.C.

"The octostyle Temple of Bacchus, at Teos, is a heap of ruins, but enough remains to attest the exquisite beauty of the ancient edifice, and fully to justify the praises lavished by Vitruvius on the architect, Hermogenes of Alabanda. This artist seems to have effected a considerable change in the taste of his age by maintaining, with some others of equal merit, that the Doric order was unfit for temples. He was so deeply impressed with the truth of this notion, that he is said to have exchanged the materials which had been prepared for the construction of the Teian temple, in order that he might be enabled to complete the work in the Ionic style." (Lord Aberdeen's *Inq.* p. 165.) The date of this building is about 440 B.C.

The temple of Apollo-Didymæus, near Miletus, was built about 376 B.C.; the architects were Peonius, of Ephesus (who finished the famous temple there of Diana), and Daphnis, of Miletus. "Three columns entire and a profusion of marble fragments scattered around, are all that remain of this once magnificent edifice; but these are of a description amply sufficient to indicate its former beauty and grandeur, even if they had not been so highly extolled by the uniform voice of antiquity." (*Ibid.* p. 169.)

"No doubt is left of the origin of the temple at Priene, as the dedication of the building to Minerva-Polias by Alexander of Macedon remains inscribed on a fragment of the walls. The architect was Pytheus, or, as he is sometimes called, Phileos; he joined with Hermogenes in his proscription of the Doric order." (*Ibid.* p. 169.)

A magnificent temple must have existed at Sardis, of which five entire columns remained in Dr. Chandler's time, but of which two only now exist, not less than six feet in diameter, and Lord Aberdeen thinks the building may be referred to the age of Tiberius.

As in Athens the best examples of the Doric style are to be found, so also we there discover in the Temple of Minerva-Polias, one of the best patterns (as it is one of the most commonly applied in modern times) of the Ionic order, erected too, probably about the time of the Parthenon. But one example, earlier in date, is highly interesting from the simplicity of its character, viz., the little temple on the Ilissus, to which writers have ascribed various names, some calling it a temple of Diana-the-Huntress (as Le Roy), some that it was consecrated to Panops (as Plato), whilst the greater part incline to the belief that it was connected with the Eleusinian mysteries, and dedicated either to the goddess Ceres, or to Triptolemus.

The Ionic is the first of the Greek orders in which we see introduced the base, thus distinguishing it from the Doric. But the most important feature of difference is in the capital, in which the volute is the conspicuous characteristic. The flutings, divided from each other by fillets, are better suited to the greater richness of the Ionic than would be the simple channels of the Doric.

The examples which are chiefly followed by modern architects are those of the temple on the Ilissus, and the Erechtheum; the former, from its simplicity of detail and freedom from enrichment, is well adapted for situations where economy is studied; but many of the buildings executed in this country are imitated in their details from the triple Temple of Minerva-Polias, of which examples may be seen in the church of St. Pancras and the University Club-house, in Suffolk-street, whilst the General Post-office, in St. Martin's-le-grand, is designed after the style of the Temple of Minerva, at Priene. G. R. F.

CAUSE OF THE LATE ACCIDENT AT OLDHAM.

REPORT OF MESSRS. FAIRBURN AND BELLHOUSE.

REPORT:—

IN consequence of an unanimous expression of feeling on the part of the coronor's jury, that a full and satisfactory inquiry should be made into the causes which led to the death of Joseph Tweedale and others, at Messrs. Radcliffe's cotton mill, Oldham, on Thursday last;—we, the undersigned, have carefully examined the building, and, having noted every particular relative to the walls, foundations, iron beams, columns, and their fractures, are of opinion that the accident has arisen from one of two causes; namely, from the falling of one of the arches in the first instance, or, what is more probable, from the breaking of one of the large beams supporting the transverse and longitudinal arches at the extreme gable of the mill.

From the evidence already adduced, it appears that one of the arches in the top room (the fourth from the old mill) was observed to sink, some days previous to the accident which subsequently occurred; this arch, which had sunk about 4 inches, was considered unsafe, and the necessary preparations for refixing the centres were immediately taken for its renewal. During the rebuilding of the arch (of which about one-third was completed, the middle being removed, and the other remaining), the building at this critical period gave way; and, as stated by one of the witnesses, the beam broke short by the column, and the whole came down with a crash. Now in this view of the case (and assuming the evidence to be correct), it is obvious the beam must have broken from the lateral strain of the arches, and not from the weight acting vertically (as assumed) upon the beams which remained. In confirmation of this opinion, it will be observed that the middle beams were unprotected from the lateral thrust, unless we except an imperfect wooden stay, which, from its soft and fibrous nature, would easily split or crush by the force of the edge of a flange of only one inch thick pressing upon it.

Hence it follows that the thrust of two wide and flat arches would be quite sufficient to fracture the beam, and thus loosen or destroy the abutments on each side. The beam being

ruptured, it is easy to conceive the result which must inevitably follow such an event. From the breakage of this beam, we may infer a serious and extensive accident; but to our minds, it does not sufficiently clear up the full amount of injury sustained; nor does it account for the immense crash and total destruction of the building which ultimately took place.

One of the middle beams, or any one single beam of the building giving way, could not, in our opinion, have made the ruins so complete; and having reason to suspect some other cause, we were induced to institute a still more minute and searching inquiry into the strengths and proportions of other parts of the structure.

On a careful examination of the fractured beams, and more particularly of those which stretch transversely across the building, at a distance of 15 feet from the extreme gable of the mill, we found a more convincing proof of the cause which led to this unfortunate occurrence.

These beams carry the ends of four other beams, which extend longitudinally from the gable on which they rest, as shewn in the following sketch:—

From the above, it will appear evident that the beams *a a a* had to support a much greater weight than the beams *b b b*, &c.; and consequently they required to be made of proportionately greater strength. They were made stronger; but unfortunately, from inadvertency, or rather from want of knowledge, they were strengthened in the wrong place; and instead of adding the additional strength to the bottom flange, which is always subjected to the greatest strain, it was given to the middle of the beam, where it was not required.

It is well known, or it ought to be known, to every person giving instructions for the form and construction of iron beams, that the strength is nearly a proportional of the section of the bottom rib or flange; and, according to Mr. Hodgkinson's experiments, a bottom flange of double the size will give nearly double the strength.

These facts having been proved by direct experiment, it is important to all those concerned in the construction of fire-proof buildings, in which the lives of the public and the property of individuals are at stake, that the form of beams and the section of greatest strength should be perfectly and thoroughly understood; and to those unacquainted with the subject, we would beg to refer them to Mr. Hodgkinson's paper on the strength of iron beams, in the fifth vol. second series, of the "Memoirs of the Literary and Philosophical Society of Manchester." In ordinary cases, we should not have troubled the jury with these remarks; but, in a case of such importance as the present, where the lives of so many persons have been sacrificed to defective knowledge and skill in the construction of buildings, wherein considerations of such importance are involved, we have considered it our duty thus publicly to direct attention to the subject, not only as regards the present but in all future cases, and respectfully to urge upon the proprietors of

mills, and of other buildings containing work-people, the necessity which exists for a more secure and perfect system of building, and for a further development of the principles upon which fire-proof edifices are founded. If this suggestion is properly received and acted upon, we have reason to believe, that we shall not again have occasion to investigate occurrences of so lamentable and so distressing a nature. We have already observed, that the beams *a a a*, in the preceding sketch were strengthened; not, however, in the bottom flange, but in the middle part of the beam, where they are thickened, and where it was absolutely of no use. Had the same quantity of metal been given to the lower flange, these beams (the weakest in the building\*) would have carried nearly double the weight; and thus by a proper and judicious distribution of the metals, the building, as well as the lives of the people, would have been saved. These observations apply to all the other beams of the mill, which are also defective as respects their strength.

In computing the weights upon each beam, it was found that those supporting the arches of ten feet six inches, and those of eleven feet six inches span, had to support a load (without machinery) respectively of ten and eleven tons.

And those sustaining the ends of the longitudinal beams were acted upon with a load of 13½ tons.

Now, if we take the sections of these beams, and calculate the weights necessary, to break them, when laid upon the middle, it will be found that the breaking weights for the beams, *a a a*, and *b b b*, &c. will be nearly the same, or about 9½ tons. This is the breaking weight of an average quality of iron; and, allowing for the difference of metals, it could not be raised much above 10 or 10½ tons.

The breaking weight would therefore be about 10 tons when the beam is loaded in the middle, and 20 tons when equally distributed over the whole surface of the projecting flange of the beam.

Having ascertained the bearing powers of the beams, we shall next compare their strength with the actual loads they were called upon to sustain; and, in making that comparison, it must be borne in mind that the two beams, *a a*, next the side wall, had their loads unequally distributed, which reduced their bearing powers to 15 tons.

Now, the load which these had to support was 13½ tons, 8½ tons being supported on a single point on one side, and 5½ tons distributed over the surface of the opposite flange on the other. From this it will be seen that the actual load was the breaking weight as the numbers 1375 to 15, or as 1 to 109, being within a mere fraction, or one-tenth of absolute destruction.

Viewing the subject in this light, and taking the above calculations as data, we are no longer at a loss as to the cause of the accident. Even supposing the arches to have stood, it will appear obvious that so close an approximation of the breaking weight to the actual load was extremely unsafe; and that, under such circumstances, no precautions could have prevented the rupture of the transverse beams, *a a a*, whenever they happened to be subjected to the slightest impact, or any vibrating motion tending to disturb the parts under strain, and eventually, still further to lessen their already too much diminished powers of resistance.

Irrespective of the weakness of the iron beams, which we consider as the primary cause of the accident, we would beg to advert to the tie-rods, which, although sufficient in number and strength, were not judiciously placed as respects their position for resisting the strain of the arch, their maximum point of tension at the bottom flange of the beam; but, that being inconvenient, they should on no account be placed higher than the soffit of the arch; and in this position they would perforate the neutral axis, and give sufficient security to the arch without injuring the strength of the beam. Instead, however, of approaching this point, they were on the top of the beam, and 18 inches from the bottom flange.

As respects the arches, we found the versed

\* Mr. Fairbairn added, that these beams were rather weaker in original construction than the transverse beams; and that the whole of them were certainly not such as would be considered safe.

sine, or rise of the arch, too low: on most occasions they are  $1\frac{1}{4}$  inches to the foot. But, in order to insure perfect security, we should advise, in all future buildings of this description, that the rise be  $1\frac{1}{2}$  in. to every foot of span. In the arch which first gave way, the rise was only a small fraction above an inch, having a rise of only 12 inches in a span of 11 feet 6 inches.

On viewing the columns, several imperfections were observed in the variable thickness of the metal; but, in other respects, the pillars were satisfactory, and presented no features of weakness indicating danger from those parts: one inch more in diameter, with the same weight of metal would, however, have given greater security and greater strength.

We cannot close this report without advertising to the anxious solicitude of Messrs. Radcliffe, and the strong desire evinced by those gentlemen to have every part of the structure upon the first and strongest principle; and we should imperfectly discharge our duty if we neglected on this occasion to bear testimony to the superior strength of all parts of the building, except those we have just described, and on which it could not be expected they could form an opinion.

In conclusion, we have great pleasure in stating that it appears to us that no pecuniary considerations whatever were present to the minds of Messrs. Radcliffe in the due and perfect construction of these mills.

WM. FAIRBAIRN,  
DAVID BELLHOUSE.

Manchester, Nov. 6th, 1844.

#### ERECTION OF SCHOOLS AT WINDSOR BY COMMAND OF HER MAJESTY.

HER Majesty and Prince Albert have long contemplated the erection of schools in a convenient situation on the Royal domains, for the education of the park and gamekeepers' children. A spot well adapted for such a purpose having been selected at the west end of the gardens, at Cumberland Lodge, about a mile from the statue of George IV., the necessary plans of the intended building, executed by the Office of Woods and Works, were submitted to and have been approved of by her Majesty. The building, which will be erected at the cost of about 1,500*l.*, will have a frontage of 110 feet. It will be composed of red bricks, with a slated roof. In its centre will be two dwelling-houses for the use of the master and mistress, who will be appointed by the Queen, with salaries paid out of the privy purse. Each house will contain two bed-rooms and a sitting-room about 15 feet square, with necessary conveniences. Two school-rooms, 21 feet long and 16 feet wide (one for boys and the other for girls, the children of those employed in the Royal parks), will be erected at the sides of the residences of the master and mistress. The flooring will be laid with Hertfordshire tiles, black and white alternately. The ends of the gables of the two school-rooms will have ornamental barge-boarding, as will also the three principal entrances. The school-rooms, which will be 13 feet in height, will each contain eight large casements.

By the terms of the contract, which has been taken by Messrs. Bedborough and Jenner, of Windsor, the building is to be completed within three months. The expense of keeping up this praiseworthy establishment will be defrayed by her Majesty and his Royal Highness Prince Albert.

NEWARK CASTLE.—The ruins of this once renowned edifice are now undergoing a thorough renovation at the expense of government. Workmen are now employed to strengthening the foundation, in throwing open the grand northern entrance so as to expose to view from the road the interior of the castle, and in knocking out the composition of bricks and mortar with which the ruthless hand of modern innovation has blocked up some of the beautiful windows. These improvements, when completed, will no doubt render these ruins worthy the attention of the archaeologists. It has long been said that the castle crypt is connected with the priory, a building nearly half a mile distant, by a subterranean passage. The grounds for this rumour, we understand, are to be investigated.—*Lincolnshire Chronicle.*

#### TIMBER—ITS TREATMENT AND USES.

BY JAMES WYSON.

(Continued from p. 553.)

127. *WILLOW*.—Of this genus there are many varieties; indeed thirty are enumerated; amongst the best known are the following:—the White, or Huntingdon willow; the Weeping, or Babylonian willow; the Crack, sometimes called the red-wood, willow; the Russell, or Duke of Bedford's, willow; the Goat willow; and the Osier. All the species are commonly propagated by cuttings, or by offsets in the spring: they grow freely, generally delighting in a moist soil, of almost any description.

128. The *White Willow* is esteemed the finest of its species: it grows naturally to a large size, frequently with much graceful and picturesque beauty; its common haunts are the margins of rivers and minor streams, defining their course in the distant landscape; also the woods and hedge-rows in low, sheltered, and rural districts, where the soil happens to be of a moist description: its foliage has a whitish grey hue; the leaves lance-shaped and serrated, having both sides clothed with silky hairs, which impart the whitish tone to the tree—especially when its leaves are shaken by the passing wind, and glistening in the sunbeam. It is propagated with great facility by cuttings, branches as much as 8 feet long and 3 inches diameter taking root readily; but shoots of one or two years' growth, and about 2 feet long, are preferred, as producing the finest trees. The timber is of a good description, very white, not very durable; its peculiarly clean appearance recommends it for forming milk-pails, and for similar purposes, where that quality is desirable; young, or coppice-wood, is formed into hoops, the light handles of hay-rakes, hoes, &c.; the bark contains a large proportion of tannin, and is sometimes used as a substitute for Peruvian bark.

129. The *Weeping Willow* is of all the willow kind the most beautiful and arresting, forming an admirable accompaniment to any piece of smooth water, whether lake or winding brook; the reflection of its long, slender, and elegant tresses, which overhang, bend down to, and dip their ends in, the water, discovering additional beauty within its glassy surface; to a cascade, fountain, or rustic seat, it lends an essential charm; it is also frequently found in churchyards and cemeteries, scenes with whose chastened character it appears in peculiar harmony, whether drooping over the simple turf-clad grave, or forming an accessory to the urn, or more aspiring obelisk. It is of comparatively recent introduction, the one which Pope with his own hands planted in his garden at Twickenham, from twigs forming a Levantine fig-basket (now some years since cut down), being said to be the first planted in this country: it attains a large size, and lives to a considerable age: its leaves are narrow, spear-shaped, serrated, and smooth; its boughs long and pendulous, discharging from their points, in misty weather, drops of water, literally justifying the appellation by which the tree is distinguished. Of the wood, hurdles are made, which are found to be durable, and to resist long the alternations of wet and dry; also handles for hatchets and other tools, rake-teeth, &c.

130. The *Crack Willow*, like the rest of its tribe, is of quick growth, and becomes a tolerably tall tree, resembling, in many respects, the white willow: its foliage is graceful, and appearance altogether pleasing; its leaves very long, oval, lanceolate, serrated, smooth, and of a shining green on both sides, wider than those of the white willow, and with toothed glandular foot-stalks. Its wood is light, pliant, and tough, and of a pink or salmon colour: some are of opinion that it is almost valueless; whilst others assert that it has long been used in Scotland for marine carpentry, and aver that for small fast-sailing war-vessels, its characteristic properties render it unexceptionable. The tree is stated to make excellent pollards, furnishing every five or six years a large crop of poles, indispensable to the farmer. It derives its distinctive appellation from the brittle nature of the small shoots, which, if struck sharply, will break off at their springing.

131. The *Russell Willow* attains a great size, is in appearance and nature similar to those above described, resembling much the

crack willow in its foliage; its wood is fully equal to that of any of the others in toughness, strength, durability, and to possess in its fibres a strong lateral cohesion, peculiarly exempt from splitting; forming good joists, and, for manufactories and similar places where toughness is desirable, very excellent flooring; the same property rendering it also a capital lining for stone-carts and harrows; it is also of slow combustion, having the good property of being little liable to take fire.

132. The *Goat Willow*, or large-leaved willow, will attain, under favourable circumstances, a height of 30 or 40 feet, growing in almost any soil, but preferring a dry loam, in which it flourishes to its greatest perfection; it is readily distinguished from all others of its species by its large ovate or orbicular leaves, which are waved on the margin, indented towards the upper end, pointed, wrinkled, and dark green above, but downy and of a pale glaucous colour beneath. It has numerous nearly sessile catkins, which, expanding much earlier than the foliage, still recommend the tree to the notice of the lower classes, and to young people, who carry branches of it on the Sunday preceding Easter, under the honorary denomination of *palm*; the early walk undertaken for procuring it being denominated "*to go palming*." It ripens its seed readily, and propagates itself extensively. In some parts it bears the name of *Saugh*, which, indeed, is in Scotland the common name for all the willow kind. Its wood is elastic and tough, fine and smooth in grain, and of a pinkish white colour.

133. The *Osier*, or wicker variety, although we may simply mention it, does not reach the rank of a tree, but consists of slender and pliant twigs, cultivated in large crops in marshy places for the purposes of the basket-maker, for which they are properly adapted; they are raised from established *stooks*, and pay the owner as well as any other crop upon his farm. The wood of willows is, from its extreme pliability, rendered subservient in the milliner's art, being cut into thin strips, which are woven and formed into bonnet-shapes; they are also dyed and curled, and put to various ornamental uses, as filling fire-grates in summer.

134. *OLIVE*.—Of this tree as many as eighteen kinds are enumerated; but it appears that the chief distinction lies between the wild and the cultivated, the former of which is dwarfish, useless, and neglected, while the latter is eagerly propagated, valuable, and highly-esteemed. It abounds in the countries of the East, appearing to have been originally found in Asia, and thence transplanted into southern Europe. In the latter, and in Africa, it does not rise spontaneously as in Asia, but requires diligent attention in its cultivation: it is especially abundant in Syria and Palestine, springing up with its ancient freshness in the valleys of the Holy Land, cresting the mountains of Judea, and vindicating its paternal soil on the same spot at this day which bore the name of Mount Olivet and Mount of Olives eleven centuries before the Christian era; uninterrupted by the succession of Hebrews, Assyrians, Romans, Moslems, and Christians. During the siege of Jerusalem, all the trees growing near were cut down, but of course the roots were left undisturbed. It flourishes well on the shores of the Mediterranean; in several of the islands of that sea it is cultivated with much advantage, the wealth of their inhabitants depending in a great measure on its prosperity. In Greece it flourishes, contributing not a little to the riches of the infant state. In Great Britain it grows readily, especially in the south, bringing forth fruit on the wall if protected during frost. In Egypt the great endeavours of Ibrahim Pacha to promote its cultivation, with a view of increasing the revenue, have all but failed, owing to the indolent and sluggish habits of the people.

135. The tree is an evergreen, and runs up to a height of 20 or 30 feet; its trunk is knotty, its bark smooth and of an ash-colour; its leaves oblong, not unlike those of the willow, dark green above, and whitish beneath. In June its blossoms come forth in bunches, small, white, delicate, and beautiful, slenderly attached to the tree, and falling off in showers by the gentle breeze; the fruit which succeeds is of an oval form, at first green, then pale, and ultimately black. The disparity between the produce of the wild and the cultivated olive has been compared to that between the crab

and the choice apple, or the sloe and the plum. The tree, although one of great poetic fame, is nevertheless far from beautiful, its dusky hue giving it the appearance of being covered with dust. It will grow on the driest and most flinty soil; and, if not liable to be pruned, live to an astonishing age, in almost any country, although almost confined to those of warm, or at least temperate climate. It is frequently propagated by truncheons, that is, short pieces of the trunk, or of substantial branches, which, being planted, soon take root, and send forth goodly stems; it is also multiplied by grafting. In scripture times it was grown in gardens set apart for it.

130. The olive was formerly in Palestine contemplated as an emblem of prosperity and excellence; its tender boughs have by numerous tribes been viewed as sacred; by the ancient Greeks they were highly estimated, being on great occasions selected for ornament, brought forward in great profusion at the nuptial feast, adorning the apartments of the bridegroom on the marriage-day, and forming wreaths to crown the successful competitors at the Olympic games; the modern Greeks too, in emulation of the old times, have instituted similar pastimes, at which King Otho confers the chaplet of honour with his own hands. It is a symbol of peace and reconciliation, and was, amongst others, sacred to Apollo.

131. The olive was one of the principal fruits cultivated by the Jews, who used it for their daily food, and highly valued it for its nutritive qualities; in Canaan it constituted a very considerable proportion of the wealth. It is chiefly valuable on account of the plentiful supply of oil which is obtained from its fruit when ripe, and which, in all the oleaginous class of plants, excepting the present, is obtained from the seed, but in this is yielded by the fleshy part of the fruit. It is very useful in a variety of ways in a hot country; in the Levant and in Greece it is much esteemed as an ingredient in cookery, entering into almost every dish. In the small island of Corfu, in the Gulf of Venice, the produce in 1835 amounted to nearly 100,000 barrels, in value about 2,000,000 of dollars. Of old it was obtained by treading the berries under foot, also by pounding them in mortars; now, however, mills are employed for the purpose, some of which are erected in the vicinity of Athens. Besides its use by the Jew as an article of food, it was highly prized in the way of ornament, to "make his face to shine." Under the ceremonial law, it was an ingredient in a costly perfume, wherewith the sacred orders of the priesthood were anointed. A failure in the olive crop was regarded amongst the Hebrews as a severe calamity, its success materially affecting their temporal condition. It possesses a soothing influence in mitigating pain, and is said to cure the poisonous bite of the viper. Competent judges have asserted that it may be used with benefit to the constitution, especially with vegetables, in preference to artificial sauces, which, while palatable, are pernicious. The use of the fruit with us, during or after drinking much wine, is well known; there are three kinds used—the French, Spanish, and Italian, all differing in appearance and flavour, and which are chosen according to taste. To obtain the juice in greatest perfection, the fruit should be carefully gathered, and never shaken off, as the bruises occasioned by the latter mode injure the oil; the oil should also be expressed immediately the fruit is gathered. An admixture of beech-oil, which is procured on purpose, is found to preserve it from becoming rancid, to which in its unmixed state it is liable when sent on long voyages. For polishing metals olive-oil is the best, there being water in all other oils.

132. Of the application of the wood in modern times, there appear few records; but in sacred writ there is ample testimony to its usefulness, in doors, lintels, side-posts, and carvings. Its texture, however, is solid, its colour is yellowish, and there appears reason to suppose, being a tree of a hardy nature, and which lives to a great age, that it is adapted to superior uses.

The Gresham Committee propose removing the mosaic pavement at the Royal Exchange, and replacing it with Seyssel Asphalt.

## ANCIENT ROME AND MODERN LONDON CONTRASTED.

BY H. G. MONTAGUE, ESQ.

TIME, while it brings with it a continuous increase of wisdom, derived from the experience of observation and experiment, tends to give us a more just and rational conception of events and natural phenomena than could possibly be entertained by men of learning in the darker ages. The history of nations existing in the earlier period of the world, and of events seen through the dense cloud of ignorance and superstition, is rather an appeal to our wondering credulity than to our reasoning powers; and the few facts handed down to us, if there be any facts, are so veiled in metaphor and fable, so surrounded with the tinsel drapery of egotists, courtly parasites, poets, and philosophers, that reasonable doubts are thrown upon the whole, and in these enlightened days we are driven to the necessity of either rejecting many historical accounts, or of involving ourselves in an endless controversy of dates and names and incidents contradictory to each other, contradicted by contemporary writers, or so disfigured by successive interpolations as, like the existing state barge of Venice, to have lost all claims of early origin. The recorded events of our own times, when they administer to or wound the vanity of a nation, and become subservient to the uses and abuses of superstitions, are not to be depended on, and the passages of victory or defeat, of successful intrigue or disappointed rebellion, are as variously stated at the time these events happen as occurrences were 4,000 years ago.

We are a strange contradictory people; with the pride naturally resulting from our wealth, numbers, and intelligence, we combine thorough distaste for every thing national connected with arts and literature. Our scholars are infatuated with pagan literature, and in their admiration for poets, orators, and philosophers of times past, overlook the fact, that most of the works handed down to us are of a nature wholly unfit for the perusal of a Christian people, and would not be tolerated in an English dress; in their idolatry of the ancients, of sculpture, of architecture, and other branches of art, they are led to magnify the objects contemplated, forgetting that what has been done, may again be done; that excellence of design or execution ought to awaken emulation; and that the immense sums lavishly bestowed in collecting antiquated rubbish might be better and much more appropriately bestowed in encouraging native talent, and in ornamenting a capital most assuredly the largest and wealthiest that ever existed. Dazzled by the oratorical and poetical language of the Greek and Roman writers, they have greedily swallowed their absurdities and contradictions, and exalted their greatness at the expense of the moderns.

Who doubted the exaggerated splendour of the court of the Great Mogul before British conquests disclosed the tinsel reality? Read the histories of these Orientals; the hyperbolic language in which they are conveyed is such as was common to all nations of the earth in former times, and much of the reputed greatness of Rome is undoubtedly due to the servility and vanity of her poets and historians, whose exaggerated and conflicting statements have hitherto imposed upon the world. In the beginning of the eighteenth century a comparison between ancient Rome and London was instituted by a foreigner, and by no means to the disadvantage of the latter, and without depreciating the extent or population below its proper standard. Let us now institute a comparison of London in 1844, with Rome in its highest glory.

The Romans, says M. de Beaumont, were an obscure people, confined to a little corner of Italy; and the continued exercise of arms and husbandry, the only sciences they professed, hindered them from having the thought of transmitting the memory of events to posterity. They were, in fact, profoundly ignorant, and the knowledge possessed must have been exclusively confined to a certain few of the priesthood; the facts handed down by Livy and others all confirm the idea that they were a very illiterate people, resembling the Bohemian peasantry of the present day, their nobles alternately following the plough and taking up the sword. That they had some few existing

annals which escaped the devastation by fire of the Gauls we do not dispute; but those annals, when we consider the corrupted and ignorant source from whence they sprang, cannot be received by enlightened men of the present day without great distrust and suspicion. Well-grounded doubts are thrown on Livy and Dionysius Halicarnassus by learned commentators of the present day; and these writers in turn frequently complain of the disagreeing and fabulous statements of writers who preceded them, and on whom they were compelled to rely for all that they possessed in the shape of early history. Fabius, the principal writer of those earlier periods, and whom all the following historians copied, could have had little before him but priestly and family tradition; from both much truth might have been derived, but from the priesthood little could be expected beyond information connected with the order; and the great feature of family pride must have led to many strange and hyperbolic statements. "The foregoing part of my history," says Livy, "is full of obscurity and uncertainty, because the matters there treated are of too ancient date to have been transmitted with faithfulness and exactness by oral tradition, and because the contemporary writers were few, and the greater part of their writings perished in the fire that consumed the city." Again, he says, "all the memorials kept in the archives that were in private hands, or that made part of the books of the pontiffs, were involved in the ruin of the city." Again, Clodius, in a work entitled "Διεύθυνος χρόνων," complains that literary parasites had taken advantage of the destruction of the genealogical tables to frame descents in order to gratify the vanity of some private families, who would needs be thought of noble origin.

(To be continued.)

THE SMOKE NOISANCE.—In a course of lectures on architecture recently delivered by Mr. G. Godwin, F.R.S., at Manchester, he remarked, relative to the injurious effect produced on the public buildings by the deposition of soot, that he could not help wondering how it happened that in a town like Manchester, where the inhabitants had shewn taste and spirit in the erection of numerous public buildings, the vast chimneys of steam engines should still be allowed to vomit forth enormous volumes of smoke, to deface all that was ornamental, and injure much that was useful. The men of Manchester (continued Mr. Godwin) were rarely backward in that wise liberality, the true economy, which shinks from no amount of immediate outlay if followed by a proportionate advantage, and he was certainly much surprised, therefore, to find this abominable nuisance permitted there, when it had been unequivocally proved that manufacturers who consumed their smoke considerably lessened the expense of fuel, and that if this were universally effected many serious evils would be prevented, not the least of which was the destruction of all architectural beauty. This remark will apply to other places than Manchester.

VICTORIA PARK.—The contract for three miles of park paling has been retaken by a Mr. Marshall, its execution having been thrown up by Mr. Hull, of Godalming, who had previously taken it on terms of 1,500*l.* below the highest tender. Workmen are engaged in forming Old Ford-lane into a straight line of road, and a row of houses, called Kings' Arms-row, has been levelled. Within the last three weeks upwards of 700 loads of rubbish have been brought from the works in progress in the formation of the new road at Whitechapel to fill up the excavations, and for other purposes. A circle has been staked out in the Grove-road, which is to form one of the principal entrances into the park, and some progress has already been made in the drainage of many of the fields. The chief part of the tenants inhabiting the houses forming the remaining wing of Bonner's Hall have vacated their occupancy, prior to the demolition of this interesting structure, which will commence at once. This is one of the most picturesque parts of the locality, the venerable trees which still remain shewing it to have been the remnants of a formerly well-cultivated park. The active arrangements for its formation are under the directions of Mr. Pennethorne.

CHIMNEY-PIECE IN THE GREAT CHAMBER OF BOSTON MANOR-HOUSE,  
BRENTFORD.

TO THE EDITOR OF THE BUILDER.

SIR,—I need not inform you that in the olden time richly-decorative fire-places, composed of marble, stone, or wood, or of all these materials combined, were for centuries universal throughout Europe; they formed the principal feature in the apartments of the wealthy, were generally in two stories, ornamented with the arms of the sovereign, as well as those appertaining to their haughty possessors; scriptural and profane subjects, devices, monograms in endless variety, served to adorn these favourite centres of domestic intercourse. The appearance of chimney-glasses, and the introduction of coal as fuel, caused the disuse of these fire-places in England, while the iron grate has banished them from Germany. We have still remaining fine examples of the Gothic style, and of the transition period, and the fourteenth, fifteenth, and sixteenth centuries, we have immense numbers. Of the fire-places of the latter class, those that

approach nearest their Italian original, are wholly without that barbarous taste and rude execution, which are seen in the greatest number; but in the whole of them no admixture whatever of the Gothic style is to be found.

The ancient fire-place at Boston House, which the accompanying sketches illustrate, is a good example of the picturesque grandeur belonging to this class; but it is not without some of that grotesqueness which has caused the style to be so much censured. As the engraving is to a large scale, it will not be necessary to describe it, except to remark that the scroll ornaments surrounding the oval compartment in the centre appear to be copied from a small book of German designs of a similar character, by P. HINEVS, some plates of which are in my possession.

Boston House is a plain brick structure with three gables in its principal front; it is chiefly remarkable for the richly-ornamented

ceilings within. The great chamber on the first floor, or, in the language of the New Metropolitan Building-Act, the third floor, is 40 feet in length by 20 in breadth; the ceiling of it is composed of thirty-seven richly-decorated panels containing personifications of the five senses, the four elements, the three Christian Graces—Faith, Hope, and Charity, War and Peace, Peace and Plenty, the whole in the boldest relief, and not three parts of the decoration alike; small pendants drop at the intersection of the ribs. Leading out of this room is the state bed-chamber containing a superb bed of the reign of Queen Anne. The ceiling of this room is as rich as that of the great chamber, but of different design; plates of both these ceilings have been published.

The building was erected by Lady Reade who then held the manor, in the year 1622; her initials M. R., and the date 1623, are on the ceiling. The house was altered and repaired in 1671 by James Clitherow, Esq.,

PORTIONS OF THE CEILING AND CORNICE OF THE GREAT CHAMBER,  
IN BOSTON MANOR-HOUSE.

then lord of the manor, the ancestor of the late Colonel Clitherow, in whose family the property still remains.

I must here observe that very little is known of the very beautiful and interesting specimens of old architecture still remaining in the neighbourhood of London, and in the city itself. Topographical writers generally notice only the exterior of old buildings. Lyson, speaking of Boston-house, after stating when it was erected, merely remarks that it is "pleasantly situated on a rising ground, about three-quarters of a mile to the north of the town" of Brentford. Again, artists generally follow each others footsteps, to make views of Haddon-hall, Hardwicke, &c. &c., while in the neighbourhood of Kensington, Edmonton, Greenwich, and other suburban places, are to be found remains of old garden-terraces, balustrades, rich interiors and carved oak staircases equaling any of the country specimens.

Now I am on this subject, I will call your attention to an old house in Seven-step-alley, Gravel-lane, Houndsditch, which is expected almost immediately to be demolished. This house is described by Stow (Strype's edition), as being very pleasantly situated amidst hedge-rows and elm trees, with pleasant fields about to walk in. It is stated by him to have been the habitation of the stately Count Gondomer, ambassador from Spain (who was the cause of Sir Walter Raleigh's death) in the reign of James I. It was built, however, by Robert Shaw, of Southwark, a member of the Vintner's Company. The interior of this old building is of the richest description, the fire-places and ceilings are similar, though on a smaller scale, to those at Boston-house, and the sides of the rooms are lined with oak paneling, ornamented with carved pilasters, cornice, &c.\* The house is the freehold of Andrew Hutchison, Esq., and is well worth a visit; it is now in the hands of Mr. Arthur Ashpitt, the architect, whose building operations will very much improve that densely-populated neighbourhood; this

\* These fittings would be invaluable to any one re-building or enlarging an Elizabethan house.

DETAILS OF THE TERMINAL PILASTERS OF THE  
CHIMNEY-PIECE.

Side elevation, shewing the section of the cornice.

A portion (to a larger scale) of the front of the terminal part of the pilasters.

gentleman kindly permits the old house to be seen. Plates of the three principal ceilings have been published, and representations of the remainder of the edifice are well worth being so.

To return to the prints of the fire-place at Boston-house—the second shews a portion of

the cornice of the fire-place, with a part of the fine ceiling of the room; the third print are details which will serve to explain the two former.

I am, Sir, yours, &c.,  
C. J. RICHARDSON.  
22, Brompton-crescent, Brompton.

## Correspondence.

## ARCHITECTURAL COMPETITION.

TO THE EDITOR OF THE BUILDER.

"When knaves and fools combined o'er all prevail,  
When justice fails, and right begins to fail,  
E'en then the boldest start from public sneers,  
Afraid of shame, unknown to other fears,  
More darkly sin, by satire kept in awe,  
And shrink from ridicule, though not from law." BYRON.

SIR,—Architectural competition is, generally speaking, another term for robbing architects, in which the victims are not only fleeced of their brains and their money, but of that which is infinitely of more value, "their time," and I am convinced the period has now arrived for this corrupt practice to be put down; the newspapers teem almost daily with fresh instances, and persons of a respectable station in life do not scruple to lend their names and services to further these disgraceful practices; the clergy, too, are in many instances not a whit more careful to preserve "the unsullied sanctity of their laws," and principles and precepts that daily emanate from them in their pulpits are sacrificed and set at naught to gratify the wishes of a friend, or to further the worldly prospects of a relative. Churches, schools, town-halls, and public buildings of every description are in the present day subjected to the "competition ordeal," and in nine cases out of every ten it is a known fact (to a favoured few) who is the architect whose design will be selected, and he himself is quite aware of the circumstance; an architect must be devoid of all that is necessary to constitute a true follower of his art, one who looks upon honour and integrity but as a fiction, a man, in fact, a thorough disgrace to the profession, and withal an enemy to himself. No man who is possessed of any practice, however limited, will mix himself up in matters of this description, well knowing the character and "pursuits" of the men who constitute themselves his judges, and the fearful chance of his drawings, however meritorious, ever having a glance, much less a thought (unless he has friends who can in any way influence the decision) bestowed upon them.

But architects themselves are not to be entirely exonerated; they practise deception upon those who practise fraud upon them. The subject that I allude to is the cost of a building, and I have known designs submitted that would in reality cost three or four times the amount of the limit allowed by the committee, and if one of these designs happen to be selected, which generally is the case, the architect is sure of having abuse heaped upon his head, for either his design when executed costs considerably more than the committee had funds to meet, or else it is altogether unlike and inferior to the "chosen design." Competitions, in fact, are an admirable refuge for the destitute.

I would propose that in future all competitions when advertised should be accompanied with a list of the committee, so that all architects who compete should know the class of men before whom they are to exhibit their talents, and perhaps exposure would in a few cases influence an honest decision. But considerably more than this ought to be done; let the profession coalesce, and form some wholesome rules by which to guide themselves in transactions of this nature; the welfare of the profession is at stake, let those who are enthusiastic in the pursuit of their art turn their attention to this vital point, else architecture will dwindle into paltry insignificance, and architects themselves be made the tools and slaves of men vacant in honour and right mindedness, but vested with the rod of power, before whose nod unprincipled men will bend their knee.

Trusting that these lines will not be deemed an intrusion upon your columns,

I remain, Sir, your obedient servant,  
AN ARCHITECT AND SUBSCRIBER, and  
A VICTIM TO INQUITOUS COMPETITIONS.  
London, Nov. 5, 1844.

## COMPETITION, READING.

SIR,—In pursuance of an advertisement inserted in your valuable periodical, I applied for particulars relative to the 9½ acres of land in Reading, and per return of post received a lithographic plan and instructions. Having been successfully engaged in designing and carrying out an extensive plan in a fashionable

watering-place, my past experience prompted me to request an answer to sundry queries. To my surprise it was stated that the party referred to did not "consider himself at liberty to answer these questions," although they referred to locality, drainage, value of land in the immediate vicinity, &c. It was further added that the proprietor did not feel that justice could be done for him without personal inspection; and the spot being at a distance from my residence, he did not conceive it worth my risking the expense especially as upwards of fifty applications for particulars had been received. Now mark the liberality evinced towards the competitors. A journey is to be made to Reading to inspect the land, and a second to pronounce judgment on the designs which are to be submitted to the several candidates. If uniformity of elevation, or a certain scale of house, is considered desirable, a general plan and elevation with an estimate of cost are to accompany the design. The price to be required for each lot of land is to be stated, also the ground-fee to be reserved for ninety-nine or seventy-five years, if building-leases should be adopted. Any restrictions are to be suggested which it would be advisable to insert in the conveyances, and an opinion is to be given as to the mode of drainage, &c. For the mass of valuable information obtained by the proprietor, the two successful candidates are to be rewarded by the munificent premiums of twenty-five and fifteen guineas (inclusive of their travelling expenses), and the unlucky forty-eight are to rest satisfied with the honour of having assisted the proprietor in his selection of a plan by which he may probably realize a large sum of money. I have not the slightest intention of reflecting on the parties concerned, my wish being merely to shew the inconsiderate manner in which premiums are offered. I leave the matter in your hands, and remain, Sir,

Your obedient servant,  
No COMPETITOR.  
Leamington, Nov. 12, 1844.

## ST. THOMAS'S NEW CHURCH, WINCHESTER.

SIR,—From the circumstance of a Mr. Elmslie having met the committee, to receive their opinions and suggestions concerning the plans signed William Webbe, Camden Town, for the new church of St. Thomas, Winchester, I inferred (although it appears incorrectly) that the drawings belonged to Messrs. Elmslie and Co., whose names I have observed in the profession.

It still, however, remains to me (as also, I believe, to many gentlemen on the building committee) a perfect mystery why Mr. Elmslie should be connected with Mr. Webbe's design; and it does not appear that upon this point we are to be enlightened.

I am, Sir, your obedient servant,  
A SURVEYOR AND LOOKER-ON, BUT NO  
COMPETITOR.  
Winchester, Nov. 12, 1844.

## WESTMINSTER IMPROVEMENTS.

SIR,—Preliminary surveys are now in course of progress for the purpose of ascertaining the best route for a new street direct from Westminster to Picnic and near to the great western road, as the new line proposed by the Government surveyors does not appear so satisfactory to the inhabitants as they could wish, being in fact only a slight modification of the line known some years since as Rigby Wason's. This line starts from Abingdon-street, and takes a southerly course up to the Vauxhall-bridge-road, so that, in fact, it really leaves all the notorious "slums" of Westminster quite unscathed. It is true to a certain extent that a pretty good clearance of worthless houses will be made in the neighbourhood of Palmer's Village, through which it is proposed that the new Government line should pass; so far, perhaps, it may be well, as it will enable the commissioners to effect their so-called "improvements" at a trifling expense, when compared to the amount of capital required to perfect the new competing line, as now being surveyed. Messrs. Chawner and Pennethorne, the surveyors to the Woods and Forests, have been for some time past occupied very busily on this matter, principally in ascertaining the value of the property through which the line is to pass; we say *their* line because as the Woods and

Forests surveyors, they have a very prominent part to play in it,—but why, I ask, have they or the commissioners thrown the inhabitants of Westminster overboard, as if their convenience were of no consequence, or as if the real improvement of Westminster were not seriously intended by the Government at all? Is the line intended merely as an accommodation-road for members of Parliament who happen to live south of Vauxhall-bridge-road, for the especial accommodation of the fashionables of Eaton and Belgrave squares, or for the particular gratification of the Marquis of Westminster, whose property in that direction, already so enormously increased in value, will be rendered still more valuable? I repeat the question, why are not the interests and wishes of the inhabitants of Westminster taken into account? Are the "slums" of Westminster too redolent of filth and dust to receive the visits of the surveyors employed under the Woods and Forests, or are these gentlemen unaware of the mass of poverty, crime, and wretchedness accumulated and still accumulating on the property of the Dean and Chapter?

For some time past there has been much talk and splatter about improving St. Margaret's Church, but I cannot help thinking that it would be a better application of the money if it were used in sweeping away some of the wretched apologies for houses in Maidenhead-court, Jeffries' Buildings, St. Allow's-hill, and Blue Anchor-yard,—why are not these places properly looked after, and improved as they ought to be, or why not, indeed, pulled down altogether, and better places erected in their stead, more suitable for the residence of the labouring classes? If a new road be made in a westerly direction instead of the proposed southerly one, much of the nuisance, now so bitterly annoying to the inhabitants, would be materially abated, and the morals as well as the neighbourhood improved.

Yours most obediently,  
J. D.

[We hope soon to see both improvements in progress.—Ed.]

## CHURCH BELLS.

SIR,—Having seen in No. 90 of THE BUILDER an article, quoted from the *Limerick Chronicle*, stating that cast-steel bars may be obtained which will produce a sound superior to that of small church bells, at about one-fourth the expense, I should feel obliged if you or any one of your numerous correspondents can inform me, through the medium of your valuable journal, first, in what shape they are to be made; secondly, how they are to be fixed, or suspended; and, thirdly, how and with what they are to be struck to produce the sound.

I think a little information on this head might be useful, not only to myself, but to many more of your numerous readers, and if you can furnish it, you will, by doing so, greatly oblige your humble servant and constant reader,  
CAMPANOLOGUE.  
Titchmarsh, Nov. 6th, 1844.

## TINNED LEAD PIPES.

SIR,—I should feel gratified if any of your correspondents will inform me, through the medium of your increasingly valuable paper, whether there is such an article manufactured as a tinned lead pipe for the use of pumps and other domestic purposes; having been informed that water when remaining long in a lead pipe becomes impregnated with its pernicious qualities and unwholesome. I have also understood that some waters are more capable of receiving these poisonous qualities than others. Can you inform me by what method I can ascertain their peculiar tendency?

I seem inclined to think that the cast-iron flange pipe is far preferable where its use is practicable. A reply to the above inquiries would greatly oblige  
A SUBSCRIBER.

RESTORATION OF YORK MINSTER.—The Commission for superintending the restoration of York Minster have, after more than five years' labour, executed their task, and have in hand a balance, which they recommend the subscribers to permit them to use for the remedying of some defects not attributable to fire, but endangering the security of the building.

## MR. VALENTINE'S SUBSTITUTE FOR THE IRON RAIL.

At a recent meeting of the projectors of the Waterford and Kilkenny Railway, Mr. Valentine stated it to be his intention to substitute for the iron rail the wooden rail lately introduced; and this wood to be prepared by a process for chemically transmitting the timber by the injection of two salts, alkaline and metallic, which, by decomposition, produced insolubility, destroyed the vegetable quality, and, acting on the petrifying principle of nature, prevented the decay of the wood; but though it would seem thus petrified, still its elasticity was not destroyed. He would state an experiment which he made a short time since with hydraulic pressure upon a piece of beech  $3\frac{1}{2}$  inches square; he placed on it the segment of a wheel of iron, and then laid upon it the weight of 140 tons, which, had not the wood undergone the process before described, would have had the effect of completely crushing it: it was indented three-eighths of an inch, but when the weight was removed, the deflexion was lessened one-eighth of an inch, and in a fortnight it completely recovered its original figure. He considered that the result of the experiment fully justified him in saying that any weight to which it might be subjected, when laid down, would not crush the wood, because a rail would never be subjected to more than six or seven tons at a time. He further stated that it was allowed on all hands that not only the rails but the engines and the carriages could be constructed with the greatest economy, and it might be calculated that in the first formation of the line the expense would be reduced thirty per cent., with the same or even a greater degree of efficiency. There were also other advantages in this system; ground could be passed over which would render the formation of lines on other principles impracticable, and it also admitted of the use of curves of a small radius to allow of passing round the demesnes and houses of gentlemen; extensive excavations of embankments were avoided, and it was next to an impossibility that the carriages would run off the rails, as might be observed by examining the model. The wooden rail which he now produced had been subjected to the Kyanising process, and had absolutely for a length of time formed a portion of a line over which an engine had passed 28,000 times. It was a piece of Scotch fir, which in its natural state was well known to be one of the softest woods, and yet it might be seen that not the slightest friction or abrasion had taken place, and even the saw marks had not been obliterated. The rails should be formed square, and as soon as one side was worn the rail could be turned, till the whole sides had performed their duty.

## THE LIGHTNING CONDUCTOR OF THE ROYAL EXCHANGE.

The citizens of London must feel a satisfaction in knowing that their new Exchange is protected against one form of the element by which the former edifice was razed to the ground; it is to be hoped that the example set in this instance will be followed out as a general rule, and not be the exception; and that our temples and our national edifices may not stand, as they constantly do, boldly thrust up into the region of storms, as if during the fury of the tempest, and invoking down its vengeance.

Mr. Walker, the gentleman under whose superintendence the conductor in question has been erected, thus describes its construction, and the method adopted in fixing it:—

The lightning conductor of the Royal Exchange has been erected essentially as a conductor of lightning; it is not placed there under the idea that it will avert a lightning-flash by draining the cloud of its electrical contents; nor will it invite a lightning-flash by any attractive power inherent in itself; but it is there, ready to receive any flash that may strike it, and to conduct it in safety to the earth. It is presumed that the time may come when a cloud shall pass over the tower at the precise moment when its electrical contents are in such a state of "tottering equilibrium," that its inductive action on the conductive bodies there present will be sufficient to over-

throw this equilibrium and cause the discharge. The apex of the conductor is, therefore, so presented to the cloud, as to be more accessible to the flash than any other conductive body; and with the broad fact before us, that the flash is journeying onward to the earth, and will arrive there by the course opposing least resistance, every precaution is taken not merely that the conductor shall be the path presenting least resistance, but that it shall be a path large enough to convey away any lightning flash whatever. In other words, we presume that the conductor may one day be struck with lightning; and, knowing that the object of the lightning is to reach the earth with the least possible opposition, we provide for it a path, not only efficient in itself, but likewise more efficient than any other vertical path or paths.

The conductor is a copper rod three-quarters of an inch in diameter—a size more than sufficient to conduct safely the largest lightning flash; for experience has not furnished us with any cases wherein a mass of copper of only half an inch in diameter has been melted by lightning; while many instances are extant of heavy discharges being safely conducted by smaller rods. It commences with a rod of copper, tipped and pointed with platinum, erected on the back of the grasshopper vane, immediately over the spindle, and terminated in a furcated form within a pit sunk near the base of the tower. As a lightning conductor is a most dangerous appendage unless its base is very effectually connected with the subsoil, the greatest attention has been paid to this point. The pit was sunk through the concrete until the native gravel was fairly entered; the furcated terminating portion was then attached, so as to reach to the bottom of the pit; a ton or two of the graphite, obtained from gas retorts, was broken small, and thrown into the pit, so as completely to bury the furcations. The hole was then filled up. I may mention that this material, besides being indestructible, is an excellent conductor of electricity; and that it is employed in order to present as large a conducting surface to the soil as possible, and so to facilitate the escape of the charge, and thus make the conductor in every respect the path opposing least resistance.

**FALL OF A STALK AT ST. ROLLOX.**—On Friday week a stalk 240 feet in height, situated at the corner of the works at St. Rollox, immediately adjoining the Glasgow and Gairnkirk Railway, gave way at the foundation, and in an instant not one brick was left above another. This stalk, we understand, was only finished a few weeks ago, and about the same time it was discovered that its base was not secure. Means were accordingly taken to insure its stability by propping and otherwise, and little fear was entertained but that it would stand awhile. Its descent was almost perpendicular, and it therefore occasioned little additional damage, for although a portion of the bricks fell within the railway depot, and upon the rails, no further accident was the result. Several men who were working close by the stalk heard it cracking a few seconds before it fell, and, fortunately, having quickly left its vicinity, escaped.—*Caledonian Mercury.*

**NEW POWDER MILLS ON DARTMOOR.**—Last week an application was made to the magistrates at Quarter Sessions for permission to erect powder mills on Dartmoor. The court granted a license for this purpose to Messrs. George Frenn and Co., of Plymouth. These mills will be erected on the Cherry Brook estate. The site is ten miles from Two Bridges. The nearest point of the mills to the turnpike road is 728 yards. The nearest point of the magazine to the road is 520 yards. The distance between the mills and the magazine will be 1,200 yards.

**PUBLIC WALKS, &c., IN BIRMINGHAM.**—The mayor, in compliance with a requisition most numerously and influentially signed, has called a public meeting at the Town Hall for Tuesday, the 19th inst., "to consider the propriety of taking efficient measures for promoting the establishment of public baths, and the formation of public walks, or other open spaces, for exercise and active sports, for the use of the people of this borough."—*Birmingham Herald.*

## LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &amp;c., GRANTED FOR ENGLAND.

Furnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-Inn Fields.

[SIX MONTHS FOR ENROLMENT.]

Thomas, William, of Cheapside, merchant, for improvement in looms. (Being a communication.) October 3.

Newton, William, of Chancery-lane, civil engineer, for improvements in machinery for letter-press printing. (Being a communication.) October 3.

Ritchie, William Henry, of Lincoln's-inn, gentleman, for improvements in obtaining copper from ores. (Being a communication.) October 10.

Brown, John Bowyer, of Sheffield, merchant, for improvements in combining cast-steel with iron, and in the construction of carriage springs. October 10.

Chabert, Joseph Eugene, of Chancery-lane, gentleman, for improvements in preparing materials to be used in making picture and other frames, and for architectural and other purposes. October 10.

Robinson, Henry Oliver, of Old Jewry, engineer, for certain improvements in steam machinery, and apparatus, for the manufacture and refining of sugar. October 10.

Hurwood, George, of Ipswich, engineer, for improvements in apparatus for moving and fastening windows. October 14.

Hamond, Sir Graham Eden, baronet, K.C.B., of Norton Lodge, Yarmouth, for improvements in the mode of fastening on and reefing paddle-wheel, float-boards, or paddles. (Being a communication.) October 14.

Borrie, Peter, of Princes-square, St. George's in the East, civil engineer, for certain improvements in the machinery for the manufacture of sugar. October 17.

Parsey, Arthur, of Spur-street, Leicester-square, artist, for improvements in obtaining motive power. October 17.

Wright, Alexander, of Hale's-place, South Lambeth, engineer, for certain improved apparatus for measuring gas, water, and other fluids, and in the means of manufacturing the same. October 17.

Maberly, Frederick Herbert, of Stowmarket, clerk, Geary, Stephen, of Hamilton-place, New-road, architect, and Croucher, Joseph, of James-street, Buckingham-gate, gentleman, for certain improvements in the construction and arrangement of machinery or apparatus for clearing, cleansing, watering, breaking up, and raking of streets, roads, lands, and other ways. October 17.

Grieve, John, of Portobello, Scotland, engineer, for certain improvements in the production and use of steam applicable to steam-engines. October 17.

Nasmyth, James, of Parliercroft, Lancaster, engineer, and May, Charles, of Ipswich, engineer, for improvements in working atmospheric railways, and in machinery for constructing the apparatus employed therein. October 22.

Ransome, Frederick, of Ipswich, caster, for improvements in the manufacture of artificial stone for grinding and other purposes. October 22.

Osmond, George, of London-street, Tottenham-court-road, cabinet-maker, for improvements in fastenings for doors, drawers, window-sashes, and dining-tables, and in apparatus for suspending looking-glasses and other articles. October 22.

Poole, Moses, of London, gentleman, for improvements in machinery for emptying privies and cesspools. (Being a communication.) October 22.

Parkes, Alexander, of Birmingham, artist, for improvements in the manufacture of alloys, or combination of metals, and in depositing certain metals. October 29.

D'Harcourt, George Robert, of Old Jewry, gentleman, for improvements in ascertaining and checking the number of checks or tickets which have been used and marked, applicable for railway offices, and other places. October 29.

Fuller, Thomas (of the firm of Williams, Collier, and Co.), of Manchester, engineer, for certain improvements in machinery, tools, or apparatus for turning, boring, and cutting metals and other substances.

## LORIMER'S PATENT DRAWING APPARATUS.

MEN upon whom we might in some things rest our faith, often repeat the old proverbial saying, there is no royal road to learning, no short cut to science; daily experience, however, tends to lessen the force of this adage. Our attention is constantly being directed to systems, the object of which is to facilitate particular studies, and schemes for smoothing the rugged path of knowledge. Dr. Parris a few years since wrote a delightful little work, entitled "Philosophy in Sport made Science in Earnest," and in which he taught astronomy by means of toys. Goldsworthy Gurney, whose famous Bude light has lately been so much admired, attempted not long since to explain the phenomena of crystallization by means of beads and marbles, and Dr. Butter still more recently has removed from geometry some of its difficulties. Similar examples relating to other sciences might easily be adduced, all of them proving that as the subject of education is better understood, and new methods of imparting instruction devised, our schools will again become what they were in ancient time, and as the very word implies, places of ease and pleasure.

In accordance with the spirit of the times, Mr. Lorimer has invented a very neat, portable, and economical machine, to enable persons of moderate skill in drawing, to trace correct representations, in true perspective, of landscapes, models, &c. The instrument will be found useful by architects, artists, amateur designers, schools, teachers of drawing, and travellers, and to all others to whom a correct outline in true perspective is an object of importance. The operation is performed by tracing upon a medium of perforated paper the lines of objects.

**INSTRUCTIONS FOR THE USE OF THE SEYSSSEL ASPHALTE MASTIC—CLARIDGE'S PATENT.**—The general use of the asphaltic mastic has rendered a little work like the present indispensable, particularly to country builders and persons desirous of learning how to apply it. The causes of failure, where failure has occurred, are clearly explained, and their remedies pointed out. The instructions are short, plainly written, and illustrated by numerous woodcuts.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

**New Churches.**—In the charge of the Lord Bishop of Gloucester and Bristol recently delivered to his clergy, his lordship recommends a special fund to be raised for the purpose of erecting new churches in such poor districts as shall be constituted and endowed by the Ecclesiastical Commissioners for England within the present year. It is expected that the appointment of no less than ten such districts will take place, in all of which pecuniary assistance must be afforded to enable the inhabitants to build churches. His lordship has followed up his recommendation by paying into the hands of the commissioners the sum of 2,000*l.* for the furtherance of this object.

**New Chapel of Ease.**—We have been favoured with an inspection of a design, by T. D. Barry, Esq., of this town, architect, for the chapel of ease proposed to be built in the neighbourhood of Tangier, in the parish of Bishop's Hull. The plan, which is in the Decorative style, is worthy the well-known good taste of the designer, and we shall be glad to hear that it has been adopted. The nave of the chapel is proposed to be 40 feet by 31, and the chancel 20 by 19; the windows two-light, pointed and filled in with flowing tracery. The estimated cost of the building, complete, according to this plan, is only 900*l.*—*Taunton Gazette.*

**Burton Bradstock Church.**—The Rev. R. W. James, the rector, has, with his usual liberality, almost entirely rebuilt the chancel of the parish church; and has also put in a beautiful new window to correspond with the style of architecture of the sacred edifice. The work was ably done by Mr. Marshall, of Blandford.

**Rebuilding of Fisherton Anger Church.**—The Bishop of Salisbury has offered to contribute liberally himself, and to obtain liberal assistance from other quarters, in aid of the rebuilding, on a larger scale, the parish church of Fisherton Anger, near Salisbury.

## RAILWAY INTELLIGENCE.

**Kilkenny Junction Railway.**—The object of this undertaking is to facilitate the communication between the towns in the county of Kilkenny and the adjacent towns and districts in the counties of Wexford and Waterford with the cities and harbours of Dublin, Limerick, and Cork, by forming a railway from the commercial and manufacturing city of Kilkenny to the Dublin and Castlet Railway, near Abbeyleix. The towns thus conjoined in their communication with Kilkenny and the cities and harbours of Dublin, Limerick, and Cork, are New Ross, Lanistogue, Thomastown, Knocktopher, Kells, Collan, Ballyraggett, Castlecomer, Freshford, Johnstown, Urlingford, Durrow, Ballinakill, Clough, Abbeyleix, Ballyroan, &c. &c., which, with the extensive and populous districts in their respective vicinities, contain a population of upwards of 300,000. The length of line is 26½ miles, and the engineers are Charles Vignoles, Esq., and Messrs. Lealy and Carter.

**Proposed junction of Railways.**—The surveyors appointed to inspect and survey the proposed line of railway between the Bricklayers' Arms station of the Dover, Brighton, and Croydon Railway and Nine Elms, with a view of forming a junction with the South-Eastern and South-Western Railways (and which it is proposed shall include approaches from Ilfracombe, Waterloo, and Westminster bridges, with a view to the general convenience of the public), have been very active for several days past in the neighbourhood of the Surrey side of those bridges, and particularly the New-cut, York-road, and its immediate vicinity, in laying out and inspecting the property through which the proposed line passes, preparatory to the intended application to Parliament for an Act to carry out the intentions of the company.

**Lynn and Dereham Railway.**—It is proposed to commence this railway at the terminus of the Lynn and Ely railway at King's Lynn, and proceed thence, by way of Swaffham, to East Dereham, forming there a junction with such of the lines now in contemplation for connecting that town with the city of Norwich, as shall receive the sanction of Parliament. The line will connect the western division of the county of Norfolk with the city of Norwich and the ports of Lynn and Yarmouth, and, by means of the railways at each extremity, with all other parts of the kingdom. The length of line is twenty-six miles, and the engineer John Urpeth Raistrick, Esq.

**Cornwall Railway from Plymouth to Falmouth.**—The object of this undertaking is to connect the port of Falmouth with the naval station at Plymouth, and by the South Devon and Bristol and Exeter Railways, with Bristol, where the great lines of railway communication with the metropolis and the north of England now meet, and thus to bring Falmouth, the most westerly port in the Channel, within eleven hours of London, and fourteen hours of Liverpool and Manchester. The engineer is Captain W. S. Moorson.

**Tottenham and Farringdon-street Railway.**—This railway is proposed to commence from the Eastern Counties (Cambridge line), near the Seven Sisters at Tottenham, and passing near the City-road-basin of the Regent's-canal, proceed to a terminus at Farringdon-street, thus affording by means of the improvements now in progress or projected a central station easily accessible from all parts of the metropolis, and contiguous to Smithfield and other markets.

**City of London Railway.**—A notice has been issued by the provisional committee of the above project that surveys have been made for connecting the Great Western and the London and Birmingham Railway, and the proposed London and York, with the city, by a line of railway passing by Battle-bridge, and having its terminus in New Farringdon-street, immediately at the foot of Holborn-hill.

**Belgian Methods of preserving Wood and Iron used in the construction of Railways.**—All the sleepers now laid down on the Belgian railways are charred, the engineers having no faith in any of the pickling processes. Stands are fixed at convenient intervals for rails in reserve, which are preserved from rust by an anti-corrosive liquid.

## Miscellaneous.

**PARTIAL DESTRUCTION OF BIRKENHEAD MARKET.**—The new town of Birkenhead, so recently the scene of high festival on the occasion of laying the foundation-stone of the new dock, was visited by a tremendous storm on Saturday, the 2nd inst. At 11 o'clock in the morning, the storm then being at its greatest height, between fifty and sixty yards of the south-eastern wall of the new market, now in course of erection in that town, gave way before the fury of the blast to which it was opposed, and fell inwards with a crash so terrible, that the shock startled many persons who were at the time upwards of two miles from the spot. The Market Committee have presented the following report to the Birkenhead Commissioners relative to the contraction of the new market. "The committee have to report, that in consequence of the storm of Saturday last, a portion of the wall of the new market was thrown down. The committee express their conviction that the walls are quite adequate, both as to materials and thickness, for this description of building, there being pillars of two bricks in thickness, 4 feet in breadth, and 11 feet apart. And independent of the pillars there are cross walls to be built for the shops at distances of 10 feet, which, had they been erected, would effectually have prevented the accident." The surveyor's report was as follows:—"On examining the walls of Gill-street Market, I find that the walls are 22 inches thick throughout, built plain, without any projections or supports. The cross walls to shops are 9 inches thick at St. John's. There are pilasters every 10 feet of 22 inches. Then an intermediate panel of 18 inches and a centre panel of 9 inches. The cross walls to shops are 9 inches thick, and at every alternate pilaster in the inside there is a chimney carried up from the shops, which gives considerable support to the walls. The walls at Birkenhead Market are 22½ in the pilaster, 18 in the intermediate panel, and 9 in the filling-in panel. Arches are sprung from pilaster to pilaster, so that the whole weight of roof is carried by the strong pilasters, and not partly by the panel, as is the case in St. John's." Messrs. Fors and Henders, it is said, are the parties with whom the contract for the erection of the edifice was made; another account states that Messrs. Fox, Henderson, and Co. were the contractors.

**A WALL OF HORNS.**—In a dark, narrow lane, leading from the ancient town of St. Alban's, in Hertfordshire, to the back meads, which are watered by the River Veron, the way to Shefford Mill, is to be observed, although almost concealed by the obtrusion of ivy and other parasitical plants, a curious old wall, which, upon a close examination, proves to be composed wholly of horns of cattle. This singular structure has the appearance of being of very great antiquity; but no person living in the neighbourhood can give any correct account of its origin. Ramour asserts that some centuries ago, a tanner resided near the spot, who purchased a plot of meadow land contiguous to his factory to build upon, and that, either in spirit of eccentricity, or from penurious motives, with a view to avoid going to the expense of bricks, &c., he caused the wall in question to be erected from the accumulation of horns which he had had lying by him in his tanning yard for many years. Whether such was the case or not, the wall under consideration (such portion of it as is visible) presents a very curious and unique appearance to the eye of the spectator, and as a moral barrier appears to vie in strength and solidity with its neighbouring walls of ancient Verulam.—*Morning Post.*

**VALUABLE AND INGENUOUS INVENTION.**—We have been favoured by Mr. Lest, watchmaker, of this town, with the sight of a plan, similar in appearance to an ordinary map, which is so constructed as to enable him from an observation with a circumferenter, to ascertain in five minutes after the appearance of a fire in the surrounding district, the precise route and distance of the same. This must be of the utmost importance in facilitating the advance of fire-engines, and other assistance, to the spot, and have a tendency, by causing their prompt attendance, to check the ravages of the devouring element.—*Bury Farmer's Journal.*

**SUPPOSED OLDEST HOUSE IN THE METROPOLIS.**—Till within the last few days a very ancient house stood in Hoxton Old Town, which was believed to have been nearly five hundred years old, but which is now pulled down. The Parliamentary Survey, No. 73, as reported in Sir H. Ellis's "History of Shoreditch," of which Hoxton is one of the divisions, states that about this spot, during the interregnum, a house was in the possession of Charles Stuart, sometime King of England, in 1653, which was valued at 4*l.* per annum. It was of a very novel construction, and of large dimensions. The outward door, which was formed of wood, was beautifully carved and figured, with oak leaves, grape foliage, &c. In the course of the demolition of the mansion a brick was found dated above one hundred and fifty years back, but the greater portion of the bricks were of a much earlier period, being of a deep red colour and highly polished. Some artist, previous to its destruction, took designs from it. There was such a large quantity of bricks, that they were sufficient to build fourteen houses, and a sufficient quantity of wood to erect many more. The lead alone weighed above two tons. The report in the parish is that the house was formerly in the possession of Oliver Cromwell. This locality, from the 14th to the 17th century, was the resort of the nobility of that period.—[Such is the current report, but the style of this house did not exhibit such antiquity; it will be seen from the above description that a date more probable is that of the latter part of the reign of James I.—Ed.]

**CAPTAIN BULLOCK'S BEACON FOR GOODWIN SANDS.**—This beacon is now nearly ready in Deal Dockyard.—It consists of a stout mast, cleft on each side, with man-rope to assist in ascending to the top, and measures in circumference 25 feet 6 inches. The heel fixes into a cast-iron socket of 15 cwt., which is 12 feet long, and is intended to pierce the sand with a kind of screw-end. The mast, from the iron socket to the top, is 27 feet, and from the top to the mast-head 7 feet more, with a cap on its head. Above this is a stump topmast 6 feet high, with a truck on its head to hoist a flag, and the iron stays to support the mast are getting ready at the forges in the yard. The enterprising Captain Bullock is in the Downs on board the Porcupine surveying vessel, anxiously expecting the report of the chief engineer, who superintends the work in the yard, and who has promised to have every thing ready for placing during the present week.

**THE LONG AND DISGRACEFULLY NEGLECTED MONUMENT AT CARMARTHEN.**—We are glad to find that a subscription is on foot for the purpose of repairing, renovating, and conserving the monument or cairn erected in memory of General Picton at Carmarthen. It is intended that the ornamental entablatures, &c., designed by Bailey, and which, on the first occasion, were formed of Roman cement, shall now be erected in stone; and, if the funds prove adequate, to replace the present figure of the gallant Picton by one of bronze. The Right Hon. Lord Dynevor leads the list with a subscription of £0*l.*, and the Hon. Colonel Trevor subscribes the same amount. Captain Gwynne, the chairman of the old Welsh committee, and to whose activity on former occasions is due in a great measure the erection of the monument, has consented to take upon himself again the labour of the office.—*Carmarthen Journal.*

**DUNMOW BRITISH SCHOOLS.**—The new building, recently erected on a piece of ground near the Dunmow Downs, the gift of Beldam Johns, Esq., and calculated to hold about 100 children of each sex, was opened on Friday week, when a public meeting was held, Mr. W. I. Clayton in the chair; and there was, notwithstanding the unfavourable weather, a respectable attendance of between 200 and 300, including most of the subscribers and promoters of the institution. The school-rooms, which we understand cost 600*l.* in the erection, are now open for the admission of children.

**NEW LUNATIC ASYLUM FOR WARWICKSHIRE.**—It has been officially announced that the important subject of a county lunatic asylum for Warwickshire will be taken into consideration by the magistrates at the next Quarter Sessions, which are fixed to be held at Warwick, on Monday, the 30th of December next.

**COMPLETION OF THE SCOTT MONUMENT.**—On Saturday last this monument was completed by the placing of the topmost stone on the structure. On its being fairly placed in its position, by the W.G.M. of the Celtic Lodge of Freemasons, Mr. W. Donaldson, the workmen greeted it with three hearty cheers. The altitude of the building was taken at the time by Mr. Nicol, the master of the works, and proved to be 200 feet 6 inches above the level of Princes'-street, and about 5 feet above the spire of St. Andrew's Church, being 20 feet 6 inches above the originally contemplated level. There is still much to be done before the monument is out of the hands of the builders, and exposed, without the interruption of the scaffolding to the view of the public.—*Scotsman.*

**NEW SUSPENSION BRIDGE FROM CHELSEA HOSPITAL TO THE RED-HOUSE, BATTERSEA.**—The requisite surveys and estimates for this bridge were made last year by Mr. Bird, the engineer, and arrangements were conditionally made with several of the proprietors of land on the south side of the Thames for the purpose of approaches. The protected bridge, which has a communication in a direct line from Belgrave-square and the adjacent neighbourhood, having been approved of by the Lords Commissioners of Chelsea Hospital, and other parties whose land would be taken on the north side of the Thames, application will be made to Parliament in the ensuing session for an act authorizing the construction of the bridge.

**PREVENTION OF COLLIERY EXPLOSION.**—A committee will be appointed immediately on the assembling of Parliament for the purpose of investigating the causes of the numerous explosions that have lately taken place in the coal districts, and to ascertain whether means can be devised to protect the working collier and miner from the dreadful accidents he is at present liable to. A correspondent suggests the employment of the light obtained from electricity to illuminate mines, instead of lamps and candles, electrical light being produced without burning, that is independently of air, and confined in tubes hermetically sealed.

**IMMENSE OAK.**—The following are the particulars of the great Risca Oak, near Newport, Monmouthshire, purchased by Thomas Harrison, in 1814, at 100 guineas, converted and sold by him for more than 400*l.*—The body or bole of the tree was only 10 feet long, and measured 450 feet; there were in the limbs twenty nine pieces, one of which made a rudder for a 98-gun ship, and the whole of the sound timber in the tree was 48 loads and 11 feet, of 50 feet to the load. The bark was only about 4 tons.—*Gardeners' Chronicle.*

**SUBSTITUTION FOR WOOD AT CAPE TOWN.**—The bones of the whale seem almost entirely to supply the place of wood (which latter they are obliged to bring from a considerable distance), being used for rafters of houses and sheds, palings of gardens, for mile-stones, and in one instance I observed for the construction of a bridge. I was also told they occasionally use them for fuel.—*Captain Conynghame's Recollections.*

**ARCHITECTURAL AND MECHANICAL PREMIUMS.**—The Liverpool Polytechnic Society proposes to give prizes for communications of adequate merit on the following subjects:—A medal for the best mechanical or architectural drawing. A medal for the best mechanical or architectural model, shewing the latest improvements. A medal for the best model of a ship, shewing the latest improvements. All models and drawings will be returned.

**NEW BARRACKS AND STOREHOUSE IN THE TOWER.**—The Board of Ordnance has directed the foundations to be completely cleared by the 14th instant. The barracks are to be built somewhat after the style of the Wellington Barracks, in St. James's Park; and when finished, the garrison will afford ample accommodation for a whole regiment.

**FORTIFICATIONS OF RASTADT, IN GERMANY.**—The *Swabian Mercury* states that the works of the fortifications of Rastadt are on so extensive a scale, that although 6,000 men have been employed upon them for three years, six years more will be required for their completion.

**SURVEYOR TO THE HABERDASHERS' COMPANY.**—This office is at the present time vacant. Persons applying for the same must put themselves in communication with Mr. W. Nelson Beechey, Haberdashers' Hall, Maiden-lane, on or before the 23rd instant.

**Tenders.**

TENDERS delivered for rebuilding Coach-house and Workshops in Bridle-lane, Golden-square.—W. Cadogan, Esq., Architect.

Hall .....	£704 18
Johnson .....	698 0
Chesterman .....	693 0

TENDERS delivered for erecting two Houses and Workshops at Hoxton for Mr. Marlborough.—Mr. John Parkinson, Surveyor.

Little, Hackney-road .....	£1926
Hayworth, Kingsland .....	1750
Hort and Perry .....	1750
Norris, Hackney .....	1567
Little, Kingsland .....	1552
Elston, Wormwood-street .....	1400

Quantities supplied.

TENDERS delivered for building Trinity District Schools, Mile End.—Messrs. Ford and Gagan, Architects.

Furnival .....	£1608 0
Livermore .....	1557 0
Brown .....	1548 0
Hedges .....	1535 0
Darke .....	1525 0
Edwards .....	1520 0
Norris .....	1497 0
Cooper and Davis .....	1485 0
McLean .....	1482 0
Turner .....	1471 10
Gerry .....	1374 0

TENDERS delivered for the Erection of Eight Houses at Wapping.—Mr. H. Flower, Architect.

Jay .....	£2575
Curtis .....	2425
Wilson .....	2358
Habes and Co. ....	2375
Outwaite .....	2439
Trego .....	2560
West .....	2510

The tenders were opened in the presence of the Builders, November 14.

**NOTICES OF CONTRACTS.**

For the erection of Gas Apparatus for lighting the Devon County Lunatic Asylum, also for Apparatus for Cooking, Washing, Drying, and Warming.—T. E. Drake, Clerk to the Visiting Justices, Exeter, November 18.

For making a Cylindrical Sewer in the Town of Cambridge, to be 2 feet in diameter, 34 yards in length, and the average depth about feet.—Frederick Randall, Cambridge. November 19.

For Paving the Streets within the Manor of Southwark, or Clink Liberty.—Mr. Edmonds, Surveyor, Bridge-street, Southwark.—November 20.

For the different Works to be done in erecting a New Gasol at the Borough of Banbury, under any of the following heads, viz.: 1. Mason, Brickwork, &c.; 2. Carpenter and Joiner; 3. Plumber and Glazier; 4. Slater; 5. Plasterer; 6. Ironfounder, &c.; 7. Painter.—Messrs. Hurst and Moffatt, Architects, Leeds or Doncaster; and James Beesley, Town Clerk, Banbury. November 21.

For the supply of Four Pleasure Carriages and Six Second-class ditto, for the Manchester and Birmingham Railway. November 21.

For the supply of 800 yards of Angular Train Plates for a Railroad.—John Latham, 28, Princess-street, Manchester.

For building a Sewer in Ellison-street, Petticoat-lane.—Joseph Daw, Sewers' Office, Guildhall, November 26.

For supplying Iron Railing and Gates round the Birkenhead Park, about 34 miles.—The Chairman of the Improvement Committee, Town Hall, Birkenhead. November 26.

For the supply of First, Second, and Third-class Carriages to the Manchester, Bury, and Rossendale Railway.—James Smithells, Secretary, Railway Office, Bury. November 30.

For the construction of Locomotive Engines and Tenders for the Manchester, Bury, and Rossendale Railway.—Mr. C. E. Cawley, Engineer, Railway Office, Bury. November 30.

For the supply of 600 Coal Waggon to the York and North Midland Railway Company.—George Baker, Secretary, York, December 4.

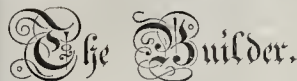

For the building of a Tunnel on the Edinburgh, Leith, and Granton Railway.—December 4.

## NOTICE.

IN answer to several inquiries by letter, we beg to state that a few copies of Mr. Bartholomew's Cyclopædia of the New Metropolitan Building-Act can still be had of our publisher, No. 2, York-street, Covent-garden, at the usual price of a double number.

No. XCIV.

SATURDAY, NOVEMBER 23, 1844.

REAT improvement has been made in the law with regard to the safety of buildings within the range of the

New Metropolitan Building-Act: the power to condemn edifices as ruinous is taken from court-leets and substitute constables, and is now placed in the hands of the district surveyors and official referees; but without that range, no power competent for the purpose exists, except under any local Acts which may not be generally known. If the provisions of the New Metropolitan Building-Act be extended in some modified form, so as to become general, no doubt much good may result.

It is not merely in the matter of the condemnation of ruinous buildings that amendment is needed, but in the construction of new works, more particularly in that lofty and thence often dangerous class of erections, which the carrying on of certain manufactures usually requires. Of late the public journals have teemed in a most extraordinary degree with accounts of the fall of buildings. One instance of which appears in the following account:—

**FALL OF TWO HOUSES IN THE LONDON-ROAD.**—Yesterday morning, about eight o'clock, the inhabitants of the London-road, Southwark, were thrown into considerable confusion and alarm by the falling of two houses, Nos. 32 and 33, on the west side of the street. It was at one time supposed that Mrs. Sears and her infant were buried in the ruins; but fortunately they slept in the attic, and the roof of the house falling inwards saved them, and they were extricated by the police. The houses that have fallen are tenanted by Mr. Sears and Mrs. Cohen, both dealing in china-ware. The accident occurred by Mr. Sears having undermined his premises, for the purpose of extending them. The foundations were disturbed on Monday for the purpose of erecting a wall at the rear; and the heavy rain that has fallen since has been the principal cause of the falling in of the houses.

Near the same time appeared the following:—

**FALL OF HOUSES.**—During the night of Tuesday last four houses which were in the course of erection in Gallow's Acre-lane, Clifton, fell to the ground, leaving but a small portion standing. It is providential that the event happened during the night, as had it taken place at a time when the workmen were engaged upon them, it is fearful to contemplate the serious consequences which must have ensued. It is supposed that at the erection of the wall was carried on during the wet

weather, the mortar was not properly tempered, which, added to the heavy rains, caused their downfall. It is somewhat remarkable that these houses were situated upon the same piece of ground as that upon which the house was erected, the wall of which a short time since fell, causing the death of a mason. Two other houses in the course of erection, one situated at Baptist Mills, and the other at Bedminster, have also fallen during the week."

Not only does frightful accident occur by the fall of buildings, but their temporary operative apparatus itself becomes as mischievous to life as the total ruin of edifices, as is evinced by the annexed quotation of a

**"FRIGHTFUL SCAFFOLD ACCIDENT.**—On Saturday, about noon, several men were employed upon some scaffolding erected in front of a house in Sellington-street, Vauxhall-road. It appears that a cornice which had just been fixed near the summit of the building, suddenly gave way and fell upon the scaffolding and workmen. The former was in consequence broken away, and the unfortunate men with it were precipitated to the ground. Several persons who witnessed the occurrence ran to the assistance of those beneath the fallen mass, and five individuals were, in a short time, removed therefrom, to all appearance dead or dying. The first was a female, whose name was ascertained to be Clack, and on her being conveyed to a surgeon's, it was discovered that she had escaped with only present deprivation of consciousness, and a few slight bruises by some of the materials falling upon her as she was passing underneath. She was in a short time enabled to proceed to her own residence; but the unfortunate man, named George Goodman, aged 40; George Goodman, jun. (son of the former), aged 17; Thomas Goble, aged 34; and William Baker, aged 40, were so much injured, that no time was lost in conveying the three former to St. George's Hospital, and the latter to Westminster Hospital, where they remain with at present but slight hopes of their recovery. The cause of the catastrophe is stated to have its origin in the dense humidity of the weather, which did not permit the work to set sufficiently to hear its own weight."

So it seems the dense humidity of the weather is to cause such ruin! A pretty kind of building truly! How much of such humidity, how much rain, how much storm have passed over the buildings of ancient Rome, or those of our own country, leaving many of them untouched?

Next comes "The late dreadful accident at Derby," the particulars of which may be gathered from the inquest held on Wednesday morning at the Town-hall, before Mr. B. T. Balfay, coroner, on the bodies of the six unfortunate labourers who were killed by the falling of an arch at the Slitting Mill Brook, to the following purport:—

"After the jury had been sworn, and viewed the bodies, the coroner addressed a few observations to them upon the duty they would have to discharge. The question they would have to inquire into was, by what means the unfortunate men came by their death, and whether any blame attached to any party—whether, in fact, it was a case of accidental death, or of manslaughter; and he (the coroner) was quite sure they would give the case a calm consideration, and arrive at such a verdict as would satisfy their own consciences.

"Mr. Alderman Johnson here stepped forward, and stated that he, as chairman of the committee appointed to see the works satisfactorily carried out, together with Dr. Baker and Mr. Jessopp, were deputed at a meeting of the committee, held the previous evening, to attend the inquest, and give every information in their power. They were prepared to lay the whole case before the jury.

"The Foreman of the Jury objected to Mr. Johnson being heard; and the coroner proceeded to call the first witness.

"Mr. Flewker took his seat at the table, stating that he appeared on behalf of the relatives of the deceased, and commenced taking down the evidence.

"Samuel Dawson sworn—I am a labourer, and reside in Queer-street. On Wednesday last I was employed by Mr. Harpur, the town

surveyor, to superintend the works going on at the Mill Fleam in the Morledge, and to see that the materials to be used were composed and properly mixed up. I was at the works yesterday morning; I went at six o'clock, left for my breakfast at eight, and returned to the works at half-past eight. I had been at the works after breakfast perhaps about twenty minutes, and was standing at the new arch on the side near to Sutton's wharf when the accident happened. I had control over the mixing of the materials for mortar, and was directed by Mr. Harpur to see that they were properly beat—the proportions were three of lime and one of sand. I have been used to mixing mortar before; that has been my principal employment. I was with Mr. Thompson four years. I had no reason to complain that proper quantities of sand and lime were not mixed. Yesterday morning was fixed for striking the centres of the arch, which has been completed since my superintendence. The persons employed on the occasion were the deceased Thomas Brown and others of Mr. Sims's workmen, namely, Thomas Walker, George Walker, George Bancroft, Joseph Wardle, and Charles Bagguley. My attention was drawn to the works, and I observed a settling just over the springers at the backing up of the arch; the settling was, however, not more than a quarter of an inch; I was watching to see if it got any wider, and my attention was taken off by hearing a crash. I cast my eye along the top of the arch, and saw the arch fall in. I was too near the arch to observe who were under it when it fell in. I saw Samuel Henchley and John Harlow come from underneath the arch not more than five minutes before the accident; and also saw deceased, Charles Bagguley, and Joseph Wardle, go under. I also saw Mr. Sims, the contractor, come from under the arch, probably two or three minutes after Henchley and Harlow. It could not be more than two minutes after Sims had left the arch that I heard the crash. Mr. Sims came and stood by me, and then returned to the head of the river to watch the men at work. Besides Bagguley and Wardle, I knew that others were under the arch at work, but who they were, of what number they consisted, I did not know at the time. I had not been under the arch myself; that was no part of my duty, which simply was to see if the materials were properly mixed. I no sooner turned my eye to the spot where I heard the crash I have spoken of than the arch fell in. Before it fell I saw the arch sway a little on the opposite side to where I was standing—that is, on the side near Mr. Evans's warehouse. All who were under at the time of the accident were buried in the ruins. At the time it fell there were two persons upon the arch, on the opposite side to where I stood; their names were Berresford and Whittingham. I assisted in extricating the bodies from the ruins, and saw the deceased Brown, the two Walkers, Bancroft, Bagguley, and Wardle got out; they were all dead. I do not consider any person to blame.

"Jacob Berresford—I am a labourer, and for the last two months have worked for Mr. Sims. I was working with him yesterday morning. I went at six o'clock, and remained on until eight, at which time I went to my breakfast, and returned at half past eight, when I recommenced work. I had been employed stacking bricks, and having finished, went to look at the men who were working under the arch. Thomas Walker, George Bancroft, Charles Bagguley, George Walker, Thomas Brown, and Joseph Wardle were the persons. I went under the arch about a yard. I saw Thomas Brown with a hammer in his hand, in the act of striking a prop underneath. I also saw Thomas Walker doing the same in another part of the arch. The other four were standing up looking on, as if to give their opinion. I did not exchange words with any of them, but in about two or three minutes withdrew, and returned to the top of the arch, on one side of which, near Sutton's, and the end near to the cast metals, I began levelling; and there was a man (I believe of the name of Whittington) ramming. Whilst so employed I felt something soft under my feet, as if I was going down, and on looking saw that the arch was going. I immediately gave the alarm and jumped off. As far as I can judge, the crown of the arch fell first. When the arch had fallen, I heard the deceased Thomas Walker, who

was underneath the ruins, cry out three times, 'I'm dying fast—I am nearly done for.'

"James Sims—I am a builder, residing in Traffic-street, and engaged to build an arch over the Mill Fleam in the Morledge, and had got one length of arching in, which was completed on Friday night. It remained for the purpose of setting, with the centres under, until yesterday morning. I considered that the centres might then be safely struck. On Monday night I received orders from Mr. Harpur to strike the centres; and yesterday morning my son-in-law, Thomas Walker, and Charles Bagguley were employed for that purpose. I superintended the work, and both Mr. Harpur and myself had been present from the first blow being struck. Mr. Harpur, who is the town surveyor, was appointed to superintend the work, and see that my work was done according to contract. From the commencement of the work he attended daily, sometimes four or five times a day, and at times half a day together. I considered I worked under his direction. We worked by plans and specifications, to which we strictly adhered, unless requested by Mr. Harpur to deviate from them. I meant trying one length of centres first to see what I could do with it, and to ascertain whether I should require any more. I was under the arch not more than half a minute before it fell in, and I did not observe any indication of danger. The first notice of this accident I had was the crash and falling in of the arch.

"After the examination of Mr. Samuel Harpur, surveyor to the Commissioners under the Derby Improvement Act, the jury retired to consider their verdict. In about five minutes they returned, and delivered in a verdict of 'Accidental death,' with a decend of 1s. upon the centre of the arch, the expression of a regret that two centres were not employed instead of one, in order that the work might have had more time to set, and a recommendation that in future all such works should be carried on with not less than two centres."

So that whether from the building, the scaffold, or the temporary centering, a large sacrifice of human life is doomed to occur, and the same to be again, and again, and again repeated.

Now, such accidents often occur to Norman arches, circular segmental arches, and elliptical arches; but such accidents were hardly ever heard of as occurring to pointed arches of proper construction.

But the fancy for building chimneys which shall rival in altitude the most celebrated cathedral-spires, has of late filled the public journals; and the fall of such "stalks," as the Scotchmen call them, forms almost as frequent an article of information as their building. We began with one of the comparatively moderate altitude of 160 feet, which nevertheless fell, as appears by the following account:—

"MILLBROOK.—On Wednesday night the upper part of one of the chimneys at Mr. Gill's Alkali Works fell, but from its having been erected in the centre of a field, no injury was occasioned beyond the inconvenience sustained at the works in consequence of the accident. The chimney, which, we believe, was 160 feet high, has from the time of its erection gradually sloped in the direction of the south, and for some time past the inclination of the top has been no less than three feet beyond the base, the attraction of cohesion merely enabling it to withstand the "rude winds" with which we have lately been visited. The overtopping height having fallen, the inclination of the other portion is considerably lessened, but it will be necessary to remove much of what still remains before the chimney can be raised to its former elevation."

Then we have an account of the fall of another chimney of about the same altitude described in the following passage:—

FALL OF ANOTHER CHIMNEY.—TWO MEN KILLED.—Tuesday, about noon, a most lamentable accident occurred at the Churchgate factory, Stockport, belonging to Messrs. Elkanah and Samuel Howard Cheetham, by

the falling of a large chimney attached to the works there, and which, in its decent, unfortunately caused the death of two men and seriously injured two or three others. The chimney stood in the yard behind the Churchgate factory, as seen from the public road. It and the surrounding buildings have probably been built between 40 and 50 years. It was originally perhaps about 40 yards high, square built, with a base of unusually large dimensions, which rested, we believe, upon arches and pillars of brickwork. Up each of these pillars ran a flue, and the chimney was divided down the centre by a partitioning of brickwork. We have also been informed that there were two small rooms at the base of the chimney. From what has already been said, it will be seen that this chimney was one of very old construction, and from its great age it had long been in a very dilapidated state. We should state, that on the north it was bounded by a declivity, leading to the Lower Carrs, and the projecting end of a building; on the east of the factory, which joined its base; on the south by another end of the factory; and on the west by two small reservoirs—walled round, and divided by a wall in the centre. Close by the base of the chimney was a boiler-house and boiler, at work at the time.

"On Monday, we believe, near a cart-load of bricks fell from the top on to the roof of a turning shop and factory below, in consequence of which the hands refused to work, and the engine was stopped. Yesterday morning it was determined to take it down, and several men were engaged for this purpose from an early hour. About noon, the time in question, they had probably taken down about five yards of it, and most of the men and factory hands had left for dinner, when the whole mass suddenly fell, in a south-westerly direction, carrying down the boiler-house, and almost entirely filling with bricks, timber, and rubbish, the yard and smaller reservoir. A sweeper, named Joseph Smith, aged about 40 years, was at the top of the chimney at the time, engaged in the work. Finding it going, he leaped off, but was followed by the mass of brickwork, and thrown with tremendous violence into the water at one corner of the reservoir, a great weight of bricks falling upon him. He was extracted from his situation as soon as possible, but remained insensible for a long time afterwards; indeed, it was understood that he was very much injured about his head, chest, and shoulders. The other two men, who were killed, were found under the brickwork quite dead."—*Manchester Guardian*.

Then our sympathies towards tottering chimneys are called forth by the

"FALL OF A HIGH CHIMNEY AT ARDWICK.—The chimney of the chemical works of Messrs. Tennants, Clow, and Co., at Ardwick-bridge, having for some time past shown a leaning to one side, it had been determined to take it down, when the late high south-easterly winds came, and during the night of Friday last affected it so much, that on the men coming to work on Saturday morning at six o'clock, its fall was dreaded every moment. It was found that at about 3 feet only from the ground it was completely cracked across, so that it was in imminent danger of falling with the next gust of wind. No time was lost; Mr. Statham, one of the partners, was soon on the spot, and was joined shortly afterwards by Mr. Young, the manager of the works; and the inmates of a number of cottages all round the chimney and within its falling range, were promptly awakened and removed, with their furniture and moveables, to places of safety. The horses were also removed from the adjacent stables, and all the workmen were strictly enjoined not to approach that part of the premises. All these precautionary arrangements having been completed with great care and promptitude, about nine o'clock the chimney at length fell with a tremendous crash, breaking through several buildings, all the inmates of which had been removed, and crushing the arches over the river which had been erected for the purposes of the works. On the whole, damage was thus sustained to the extent of 1,000*l*.; but fortunately, though one individual had a very narrow escape, no lives were lost; a result mainly attributable to the excellent precautions taken by Mr. Statham and Mr. Young. This chimney, it is stated, was built about

thirteen years ago, when the works were in the occupation of Mr. E. P. Thompson. Its form was polygonal, its height between 40 and 50 yards."

And we must not forget that when Birkenhead and its neighbourhood suffered from storm on Friday week last, about 80 feet of a wall 30 feet high, forming a portion of the market now erecting, was blown down, and three workmen were much injured.

The accident at Oldham described in our last number, which arose from a violation of one of the commonest and best-known principles of the strength of materials, and the fall of the 240-ft. chimney at St. Rollox, we must enumerate in our catalogue of disasters—no matter we altogether overlook that at Ipswich and after quoting all these instances, so many of them attended with very great loss of property, and some of them with most serious loss of life, we think no one can doubt that a power is required to be created, which shall restrain building within the limits of prudence. For it seems evident the construction of chimneys of two, three, or four hundred feet high, and some of them more, is not upon every occasion in competent hands; and even in the matter of floorings, the case at Oldham is but one of a multitude of such violations of prudence and constructive principles.

It is manifest that a police is required to protect life and property from the effects of the recklessness or the ignorance of those who, unqualified for the task, are rash enough nevertheless to enter upon such works.

At another occasion we shall return to this important subject.

#### CANDIDATES FOR THE NINE NEW MID-LESEX DISTRICT - SURVEYORSHIPS, ADMITTED BY THE MAGISTRATES.

(Election to take place on the 28th instant.)

##### FOR FELPHAM.

1. Mr. Henry Harrison.
2. — Andrew Horseley.
3. — Augustus Abraham Winterbottom.

##### FOR HAMMERSMITH.

4. Mr. Samuel Beazley.
5. — Samuel Charles Christopher.
6. — Frederick Claudius J. Parkinson.
7. — Martin Joseph Stutely.

##### FOR SOUTH KENSINGTON.

8. Mr. Thomas Leverton Donaldson.
9. — John Elore.

##### FOR NORTH KENSINGTON.

10. Mr. Charles Beachcroft.
11. — George Godwin, Junr.

##### FOR HAMPSTEAD.

12. Mr. Henry Edward Kendall, Junr.
13. — Thomas Bird.

##### FOR HORNSEY.

14. Mr. Alfred Bartholomew.
15. — James Harrison.

##### FOR TOTTEHAM.

16. Mr. John Henry Taylor.

##### FOR STOKES-NEWINGTON.

17. Mr. William Frederick East.
18. — William Lovell, Junr.
19. — James Moon.

##### FOR BROMLEY.

20. Mr. John Blyth.
21. — Henry John Hammon.
22. — John Morris.
23. — George Henry Simmonds.

LARGE OAK.—The dimensions of the trunk of an oak tree, growing in Yanwath Woods, near Lowther, taken a few days ago by Mr. Walls, principal woodman to Mr. Richardson, of Castle Eden, timber-merchant, were as follows:—Circumference, 20 feet; length of bole 3 feet; giving a content of 7½ cubic feet; and as a cubic foot of dry oak weighs something more than four stones, the weight of timber may be computed at about two tons.—*Westmoreland Gazette*.

ON THE DANGER OF SINKING ARTESIAN WELLS IN LONDON.

TO THE EDITOR OF THE BUILDER.

SIR,—The danger of sinking artesian wells in London, for the purpose of supplying baths and washhouses with hot water, having been mooted in your columns, and the subject having created considerable interest among engineers and geologists, I take the liberty of forwarding you a few facts of undoubted authority, which go far to prove that your correspondent "M." is perfectly correct in the principle he lays down with respect to the danger of sinking such wells in London as it now exists, covered with heavy masses of buildings, resting indirectly upon a stratum of

clay. In the third volume of the "Transactions of the Institution of Civil Engineers" is an article by Mr. Robert W. Mylne, entitled, "On the Supply of Water from Artesian Wells in the London Basin, with an account of the Sinking of the Well at the Reservoir of the New River Company in the Hampstead-road." This article refers to several failures of attempts to sink such wells in London, all of them attributable to the great quantity of sand rammed up with the water, thereby removing the support of the superincumbent clay, and causing a subsidence of the surface ground. The following are Mr. Mylne's own words:—"A very remarkable instance of the subsidence of the ground occurred at the Hampstead-road Well, where the quantity of sand raised by the engine through the 8-inch pump was such as to cause a very serious settlement in the large reservoir adjoining, by separating the high banks into two distinct portions, damaging a culvert, and snapping a line of iron pipes sunder. This no doubt would have affected the adjoining houses, had not the pumping been discontinued. A similar case happened at Messrs. Reid and Co.'s brewery in Ligon-street, where the well, after the engine was set to work, during the time of sinking it, was found to have created such a cavity below, that the proprietors were obliged to close it almost immediately, to save their buildings from ruin. At the vinegar works in the City-road, the well, from the same cause, was altogether abandoned for manufacturing purposes, as was also a large well at the brewery of Messrs. Ramsbottom and Co., in Broad-street. At White-chapel there was another well belonging to Major Rhode, where it was found on inspection that the withdrawal of the sand by pumping had formed an immense cavity underneath the plastic clay; this caused a material subsidence of the ground, and 20 feet of the lower part of the brick shaft disengaged itself, and falling to the bottom, the fragments were completely buried in the quicksand.

"Many other instances might be mentioned of wells having been abandoned from the quantity of sand raised, and occasioning great loss of property through the sinking of the surface-ground, but it will be needless to pursue the subject any further."

Mr. Simpson, the engineer to the Chelsea Water Works, in a report which he drew up on the same subject, and which is appended to Mr. Mylne's paper, thus writes:—"It has been stated to me that during the sinking of the lower cylinder at the Hampstead-road Well, the sand was continually forced under it to the well wherever the spring got vent, more especially on the side next the reservoir, and there are sufficient indications on the surface to shew that the subsidence of the earth has been very extensive. There is no doubt that the settlements in the reservoir have been caused by it, and from the appearance of the walls of the cottages, the subsidence has also proceeded in that direction; and although difficult to ascertain its precise limits, it seems to me we may conclude that it ranges from 100 to 200 feet round the well. The quantity of sand dug out from the bottom appears greatly to have exceeded the cube of the well at the depth of the lower sand stratum. From the state of the water I saw pumped out, it contained from  $\frac{1}{4}$  to  $\frac{1}{2}$  sand and clay, the colour of the latter being frequently discernible, and from the occasional gushes of clay, sand, and water through holes which had been bored in the lower cylinder to prevent its flowing over the top on the well-sinker, it is manifest there is great subsidence of the

soil round the curb now going on, and that it proceeds most rapidly when the water is pumped out of the well."

I do not consider it requisite to add another word upon the subject. I have adduced ample proof that danger of the most fearful character must, in our present state of engineering science, necessarily attend the sinking of deep wells in London, and I trust that prudence will induce those in authority to pause ere they adopt a plan which may lead to the destruction both of life and property.

J. H. H.

MINERALOGY.

BY HENRY G. MONTAGU, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 491.)

GYPSUM, in mineralogy carbonate of lime. *Gypsum* and *alabaster* consist of the same peculiar ingredients, varying in the modes of combination; the general character of the former is a coarse-grained and loose texture, commonly with a saline or crystalline appearance, its fracture uneven, its fragments amorphous and blunt, weight granitose, sometimes only carbonose, lustre glimmering, and opaque. Both are sulphates of lime, the sulphuric acid forming about one-half of their composition, as the carbonic acid does in the other calcareous rocks.

On the borders of the Red Sea, where there are immense saline deposits, uniting more or less with calcareous matter, the sulphurous acid generated by the vast decomposition of animal matter continually going on in those and the contiguous beds, chemically acts upon the crude chaotic masses, expels the muriatic acid from the calx, or earth of lime, and taking its place, gives the result gypsum, and the varieties of sulphate of lime, so common to regions where calcareous formations abound. Alabaster is merely compact gypsum, although readily distinguished from the latter by its crystalline structure. Gypsum, being simply a concrete, and belonging to the class of calcareous earths, stands in the intermediate position of petralogy and mineralogy, and may be divided into varieties, as earthy gypsum, gypseous earth, and mealy, farinaceous gypsum. Its colour is yellowish or greyish, and also of various shades between white and red; sometimes, when containing iron, it exhibits a brownish red ochreous appearance; like chalk, it is rough and meagre to the touch.

Compact gypsum is generally found of a yellowish and greyish white, sometimes nearly snow white, sometimes it exhibits shades of greenish, bluish, honey yellow, and brownish red. It occurs massive and disseminated. It is internally dull or faint glimmering, and its fracture is even partly splintery, sometimes passing into fine foliated and granular. The proportions of its constituent parts, according to Gerbard, are—

Lime .....	36.00
Sulphuric acid .....	48.00
Water .....	16.00
	100

It is found in Derbyshire, and other parts of England, in various parts of Europe, Asia, Africa, and America, being particularly abundant in the African and Asiatic deserts; it occurs in considerable strata, generally in company with other sub-species of gypsum, forming together particular fret mountains.

Fibrous gypsum is also variably coloured, the colours being often combined in spots, stripes, and veins, in the same manner as the compact gypsum. It also occurs massive, but generally only in thin layers, sometimes alternating with granular gypsum; it occurs, also, in small veins or strata of coal, &c. It is sometimes used for ornamental purposes, and is manufactured into small boxes; it abounds in both the primary and secondary states, that is to say, in the older and in the newer formations, and is extensively produced in the present day by natural causes in action.

One of the most remarkable gypseous hills in Europe is that of Montmartre, not only from its producing that well-known article of commerce termed Plaster-of-Paris, but from its peculiar construction, and the singular animal remains which have there been

discovered. The quarries may be considered as divided into three successive lower beds or masses. The first *haut-masse* is often more than 82 feet thick, and presents beds placed one on the other without any sensible interruption, although separated; they are seated on a bed of bluish argil spotted, about 12 feet thick, the argil being interrupted with marl. The second, *Pierre Franche*, is nearly 14 feet thick, and disposed in congruous layers on marl. The third, *basse carrière*, presents a gypseous mass of about 14 feet, divided into six beds, separated from one another by layers of marl. The whole, as well as the other hills of this part of the Isle of France, being incumbent on quarries of limestone, the gypsous mass only extending to the level of the soil.

These gypsum formations afford an instructive commentary on the changes and vicissitudes to which this planetary body we inhabit has been subjected. The limestone base, formed as it is, now forming within tropical waters, and extending over a long succession of ages, the superstructure rising by the conjoint operations of land and sea waters. Most of the shells found at Grignon, some of which retain their most delicate spines, and even their colours, are known now to belong to the South Sea, a portion of the Pacific, and but few to the Atlantic, or even the Mediterranean. The various beautiful kinds of selenite found at Montmartre, belong to lithology. Brongniart says that some of the marl beds contain cardites, venerites or deondites, tellurites, cerites or screws, and even bones of fish, and trunks of the palm tree. The superficial bed of gypsum is interrupted only by a small number of marly strata, and in some places, as at Dammartin and Montmorency, it is situated almost immediately under the vegetable mould. The lowermost beds of this first mass contain flints that appear to pass over into, and to be penetrated by the gypseous matter; the uppermost beds are penetrated by marl, have but little thickness, and alternate with strata of marl. In this first mass are found skeletons of unknown birds and quadrupeds. To the northward of Paris they occur in the gypseous mass itself; here they have preserved their solidity, and are only coated by a very thin layer of calcareous marl, while in the quarries to the southward they are often found imbedded in the marl that separates the stratum of gypsum; they have there a high degree of friability; also bones of tortoises, skeletons of fishes, &c., have been found in this mass, as likewise the remains of mammiferous animals in the uppermost mass.

On this uppermost mass of gypsum rest strong strata both of calcareous and argillaceous marl. In the lowermost bed is a white, friable, calcareous marl; petrified trunks of palm trees have been found of a considerable size, and in a horizontal position. Sage says, "The trunk of a tree agatised, which I found at Montmartre in 1778, serves to support my theory on the agatisation of vegetable substances. This trunk of a tree was 30 feet long and 9 inches in diameter; it was rather compressed, lying horizontally from north to south, and was at least 100 feet from the summit of the hill, between the two lowest beds of gypsum, of which the interior part was crystallized. The interstices of this agatised wood are ornamental, with little regular rock crystals of various colours; a part of this wood is brown and compact; this colour is owing to iron soil, principally of the woody substance.

In the same series of strata at Romainville have been found shells belonging to the genera *lymnea* and *planorbis*, and these appear not to differ in any respect from the species still existing in the marshes of France. Above these white marles are seen a great number of other strata of argillaceous and calcareous marl; the next is a small stratum of foliated marl, which, towards its lower surface, contains nodules of earthy sulphate of strontia, and a little above a thin layer. This stratum is remarkable on account of its considerable extent, combined with extraordinary thinness, and also because it serves as a limit to the fresh-water formation, and indicates the sudden commencement of a new marine formation, all the beds found beneath this formation being decidedly marine. This is succeeded by a stratum of greenish clayey marl, the four or five beds succeeding do not appear to contain any fossils, but covering these is a stratum

of yellowish clay marle, mixed with the fragments of shells belonging to the genera cerites, trochus, maetra, venus, cardium, &c., and the palate of a ray analogous to the sea eagle. Almost all the succeeding beds exhibit fossil sea shells, and the strata immediately below the clayey sand contains two pretty distinct oyster beds; this is succeeded by a stratum of whitish marle without shells, after which comes a second very thick oyster bed, but subdivided into several distinct beds, brown, smaller, and thinner than the preceding ones. The formation of gypsum is very often terminated by a mass of clayey sand without shells.

Of the animal remains found in the gypsum beds, Cuvier found the remains of three kinds of herbivorous animals approaching the nature of the rhinoceros, the hog, and the tapir.

The chemical character of gypsum is, generally speaking, the same in all the sub-species. It is almost infusible without addition, but the sparry gypsum undergoes partial decomposition under the blow-pipe. In a still more intense heat it appears to lose a great part of its sulphuric acid, fusing into a white glass, which soon falls into a white powder. It requires 500 times its weight of water to render it soluble, does not effervesce with acids, nor is it decomposed by any of them; it is dissolved on being boiled with fixed alkalies or barytes.

When converted into plaster, it is in considerable request for works of art, the coarser sorts are employed, with the admixture of common limestone, for cements. The gypsum which naturally contains carbonate of lime makes a very good cement, but that which contains clay and sands is of inferior quality. Gypsum is extensively used by the modeller; in scagliola, and for a variety of useful and ornamental purposes.

On the river Wolga, in Russia, the burning of gypsum constitutes one of the chief occupations of the peasantry. They calcine it on grates of wood, reduce the plaster to a powder, pass it through a sieve, and form it into small round cakes; in times of scarcity, they have mixed it with flour as an article of food, but its deleterious effects must be equally fatal as the famine itself; even the manufacturers of plaster of Paris suffer much from its pernicious effects.

The common way of burning this stone into marble is said to be too slight to give it all the hardness it is capable of. It is reported that a greater degree of heat renders it much superior in hardness; and, it is said, that the artificial marble, with which the whole palace of Munich is adorned, and which is esteemed more than marble, for which it is mistaken by all that see it, is made of the common gypsum, first burned in the ordinary way, and afterwards put on the fire again in a copper vessel, and suffered to boil as it will, like water, for a long time. When this boiling ceases of itself, the matter is taken out, and common colours such as are used in painting are mixed with it in various proportions, which on the wetting it with water and working it in the common manner of plaster of Paris, diffuse themselves, and imitate the veins of natural marble.

(To be continued.)

#### THE NEW SYSTEM OF LOCOMOTION PROPOSED BY M. ANDRAUD.

(Communicated to the French Academy of Science, on the 11th instant, by M. Arago.)

The system consists of a long flexible airtight tube, placed between the two rails on the whole length of the line. At the extremities of this tube are reservoirs filled with compressed air. A kind of flattening-mill is fixed at the head of the first carriage of the train, and the tube is pressed gently between the two rollers. This is the whole of his apparatus. When the train is to be set in motion, one of the reservoirs of compressed air is put into communication with the tube, which swells, and the air, meeting with the obstacle of the rollers, acts upon the mill, which performs the office of a piston, and the train is impelled with more or less rapidity, as the pressure upon the air is more or less violent, and according to the diameter of the tube. In this process there is, of course, no engine, and the carriages are carried with considerable rapidity up any moderate elevation, and can be made to ascend at a lower rate the highest hills.

#### THE NEW CLOCK OF STRASBURG.

WHAT brings the greatest number of strangers to Strasburg Cathedral is the clock. On Sundays and holidays, scores of country people sit on the flagged floor in front of this clock, waiting till the hour of noon shall set all its machinery in motion, and a notice is fixed to the walls, that they who go to see the clock shall depart by one particular door, to prevent confusion in the church. The present clock is new, and much more perfect than the old one, famous for many centuries, which may still be seen in a building near the cathedral.

The great clock of Strasburg consists of a tower, rising to an altitude of more than sixty feet, and flanked by two smaller towers, one of which contains a staircase, by which the different parts of the movement may be approached. The whole erection is inclosed by an iron railing. It is very handsomely decorated, and though the motions of the puppets are what attract the majority of visitors, we will first consider the scientific part of this machine, which is unique. The present astronomical clock was begun June 24, 1838, and was first set in motion on Sunday, October 2, 1842. Immediately in front of the clock is a celestial globe, rectified to the latitude of Strasburg, shewing, by its revolution, sidereal time, and the stars which are above the horizon at any moment. More than 5,000 stars are laid down on this globe. Behind the globe, and on the body of the clock, is a circle containing the calendar. A small statue of Apollo, on the right of this circle, points with an arrow to the actual day. A figure of Diana on the left corresponds to the former. The circle revolves on its axis, bringing a new day to the arrow of Apollo every twenty-four hours, and is so arranged as to shew not only the fixed feasts, but the moveable ones, and the intercalary day of leap-year. In the centre of this circle is a portion of a hemisphere of the terrestrial globe, shewing, by its revolution, apparent time. This division of the machine shews also the time of sunrise and sunset—true time—the true diurnal motion of the moon round the earth, or its true right ascension and time of southing—the phases and eclipses of the moon. As this circle is drawn within a square, triangular spaces are left, which are filled with figures emblematic of the four great monarchies. The clock also shews the year, the solar cycle, the golden number, the Roman indiction, the dominical letter, the epacts, and the feast of Easter. All the above indications are arranged for the period of 25,000 years. Above the circle of the calendar a very elegant contrivance shews the days of the week. Seven chariots, driven by the heathen gods to which the days were dedicated by the Romans, pass round in a circle, one only being visible at a time. The name of the day is written on the wheel of the chariot. Over this is an ordinary clock-dial, the machinery attached to which strikes the quarters, and turns an hour-glass at the end of every hour. Higher still is a planetarium, and still higher a moon, half silvered and half painted black, which, by revolving, shews the actual appearance of the moon at the time. A figure of death, armed with a scythe, stands in a recess above the moon, and at each quarter of an hour one of the personifications of the four ages of man passes before him, and strikes on a bell the requisite number of blows. Thus an infant strikes the first quarter, a youth (a hunter) the second, a man (a warrior) the third, an old man the fourth. These figures, in passing, move their arms and legs as if walking. The quarters are also struck by Death with the bone which he holds in his hand. The highest compartment is occupied by a figure of the Saviour, surrounded by his twelve apostles. Every day at noon, when death has sounded the hour, the apostles march round their master, each as he comes before him turning and making an inclination, as he receives the benediction; during this time a cock, placed on the summit of one of the smaller towers, crows, and claps his wings. There are several other figures, paintings, and decorations, which have not been mentioned here. The machinery of the clock is of a high degree of finish, and many of the contrivances are of beautiful simplicity. The whole is freely shewn and explained by an intelligent young man, who really understands

his subject, and does not parrot a monotonous drawl learned by rote, like the greater number of exhibitors. The name of the maker and contriver of this curious piece of mechanism is J. B. Schwigne.—*Sketches in Rhineland.*

[The whole, with its admixture of science and trumpery, paganism and Christianity, forms perhaps one of the drollest compound on earth.—Ed.]

#### ON THE CONSTRUCTION OF RIVER PIERS

THE numerous, and frequently fatal, accidents which have occurred for late years at the different landing-places for steam-boat passengers, on the banks of the Thames, have at last drawn public attention to the necessity of enforcing strong discipline in the management of them, and of exercising some adequate control over their construction. The Navigation Committee have approached this subject with zeal and determination; and have had submitted to their attention many plans well calculated to meet this expanding evil. It will be, however, well to bear in mind that the subject has before now been allowed to repose from year to year; the diminution of traffic being too readily interpreted into a disappearance of the danger.

There are two ways of approaching this most desirable work of reformation: the one, by insisting authoritatively upon a satisfactory revision of the existing piers; by which, whatever tended to danger, or inconvenience, little short of danger, should be removed, and safety and accommodation secured to the passengers;—the other, by vesting the entire control of the piers, as to locality, structure, and repairs, in the hands of those members of the municipal authorities within whose duties it could most aptly be placed. To the latter of these plans it may be objected that limits would be thereby set to the enterprise of the individuals or companies engaged in the steam-boat traffic; that vested interests are involved to a large amount, which must suffer deeply by so restrictive a system. To this we may answer, that the public have no other concern in the matter than that of insuring their own safety and convenience, to which the pier proprietors seem to have been hitherto indifferent. So long as these two prime wants were attended to; so long as one could hope to set his foot upon the planks of the barges, or dummies, without the prospect of perforating them; so long as it was unnecessary for the hands to be called to the pumps every tide; so long as one felt secure that the contending advocates of rival boats would not make a drawn game of their struggle for patronage, by immersing their voyager in the mimic surge created by the impatient paddles; so long, perhaps, the public might be presumed to be contented with the rude attempts at accommodation which the landing-places of the most wealthy city in the world presented. But this inert security has passed away. Time and "certain politic rats" have gnawed away at the dummies—the hammer and nail knows no rest—the arm of the pumper waxes faint—mayors and aldermen rise on the judgment-seat, and pronounce emphatically that "something must be done."

This annual step having been made some months back, we were prepared to find that the customary slumber had come over the civic authorities. We were consequently gratified at perceiving in the papers at the beginning of October, an extract from a report of the Navigation Committee, in which it was stated that Mr. Walker had submitted a plan for erecting a pier at Blackfriars' bridge, available for the public service, at the moderate cost of 2,200*l.* Now, save that Blackfriars' bridge was recently the scene of a most fatal accident, we know of no ground of preference upon which it can be deemed imperative to expend the sum of 2,200*l.* upon its landing-place or pier. There are, between London-bridge and Westminster, at least ten piers; each of which, although not so distinguished by casualty, might put in claims to attention, upon some one or more of the grounds which we have just stated. Here then should be an outlay of 22,000*l.*; for at each landing-place it may be presumed the passengers have an equal right to protection. Is such an expenditure necessary? Has due caution been exercised in the selection of the proposed pier? We are assured by the report,

that other plans ranged in their estimated cost between 4,000L and 10,000L. Of this, from our experience in estimates, we have no doubt. But looking to the nature of the traffic, to its fluctuating character, to the parties engaged in it, can we say that an expenditure of such magnitude out of the civic funds would be justified? Let it be borne in mind that the *low charge* is the great temptation to the use of these steam-boats; their functions depend upon it. The rise of one penny per head, would diminish their power of competing with the land conveyances to an enormous extent. And yet, unless some apportionment (the amount of which, if we may draw any inference from other corporation imposts, would not be "unassignably small") be laid on, how is the great outlay to be repaid? We are not blind to the extremely inconvenient and dangerous state of many of these piers. We are thankful to the municipal authorities for their interposition; which would, notwithstanding, have been more worthy of our thanks had it been exerted at a much earlier period.

To return to the question of construction, proposed in the plans submitted to the Navigation Committee by Mr. Walker: we find that the least expensive (2,200L), and, as would appear to be implied by the terms of the report, the most eligible on the ground of absence of ornament, is to be erected on "open piles," on the north-west side of "Blackfriars-bridge." We must confess that even the "not more necessary impeding" to the navigation of the river secured, by the promise of "water-way under the pier, in spaces of not less than 30 feet, with a head-way at high water of not less than 8 feet," will not wholly reconcile us to the defects of a structure which does not appear to have needed the sanction of so eminent a name as Walker.

We could have conceived the practicability of many plans, each at a very much less cost; but it is not our place to attempt to interfere with the decision of the Court of Aldermen, by distracting their attention from the plan submitted, by intruding any one of our own upon them. We have some before us which, hereafter, we may give to the public for the sake of contrasting them with the "Specimen of a Method for communicating between Steam-boats and the Shore," adopted by the Navigation Committee. It should be remembered, that whatever may be done under such sanction as that of the above committee or court, not only should be best in point of workmanship, but from their supreme authority should afford all the conveniences which unlimited choice of position can confer upon the plan. When we read, therefore, of "instructions to procure a plan for a pier from one of the piers of the bridge, or by a gallery outside the bridge," we can hardly concede our confidence to the plan, seeing the palpable inconveniences which would attend it, in respect of the precipitous descent of the stairs, or of the great projection into the river which will be inevitably necessary to avoid it. The plan laid before the Navigation Committee consists of two diverging flights of stairs, spreading over the arch, and descending from the level of the foot-way of the bridge upon two barges moored opposite the piers on each side of the staircase:—the barges projecting into the stream of the river, at least 120 feet. The descent by the stairs is broken about half-way by a platform, resting upon large buttresses, from which the descent is continued by a moveable fretted inclined plane, which is made to adapt itself to the rise and fall of the tide. The design is neat; but it is open to both the objections which we have urged above, as well as to others. For instance, the bastions, or buttresses, standing out about 10 or 12 feet from the piers of the bridge, will create an additional eddy, dangerous to the passage of smaller craft; and the whole projecting range of the pier will be liable to constant concussion from the swinging round of the inert and unwieldy vessels engaged in the carrying trade of the river.—*Polytechnic Journal*.

NEW BRIDGE AT BRISTOL.—Application is proposed to be made to Parliament in the ensuing session for the requisite powers to erect a new bridge at Bristol, to run from the parish of St. Mary, Redcliffe, over the Floating Harbour to the parish of St. Nicholas.

#### DESCRIPTION OF MR. BARRY'S IRON ROOFS FOR THE NEW HOUSES OF PARLIAMENT.

THE ROOFS are now in course of erection, and are as equally interesting to the engineer as to the architect, evincing at once the practical talent and the good judgment exercised in their design by the architect of this great national work. Of the superiority of iron over wood in the construction of roofs for buildings, the architects of the present day are becoming fully convinced, and the splendid example now set before them by Charles Barry, Esq., should at least induce all who have hitherto been indifferent to the advantages of this material in the essential qualifications of lightness, strength, durability, and safety in cases of fire, to examine the subject with all the attention it deserves, and the result may be looked for in the more rapid progress of the substitution of iron for wood in constructing the principals of roofs, especially when of large span. Not to the roofs only, but to the flooring joists or girders, the metal material is happily adapted also, where-ever resistance to fire, and great strength, with small section, are primary objects in their construction. Of those valuable properties the architect of this edifice has wisely and very fully availed himself; and he has, moreover, been, by this selection, enabled to offer facilities for carrying into complete effect the most complicated details of construction in flues, &c., required for the proposed system of ventilation for the extensive pile of building under his care. But beyond the use of iron in forming the principals of his roofs, Mr. Barry has ventured to a further step, of which those unacquainted with the experience that he is cognizant of might not fully understand the wisdom, but which is thoroughly approved by all practical and scientific persons who have examined the subject minutely. We refer to the covering of the roofs with cast-iron plates of a thin section, and galvanized by a process now admitted to present the best yet discovered means of protecting iron-work exposed to the air and weather from their otherwise injurious effects.

Upon the many substantial advantages thus attained, we are induced to state briefly the impressions we have received from an attentive examination, we might say most interesting study, of the roofs in question. The cast-iron plates, being cast of sufficient size to span the distance between each adjoining pair of principals, dispense with the necessity for any kind of boarding whatever, thus saving not only a great expense, but also diminishing the chances of damage by fire, which would, by destroying this boarding, leave the slates without sufficient support, thus making the whole roof liable to be broken in by their derangement, or, in the case of lead covering, the fire from the boarding communicated to the lead, would speedily reduce it to a liquid state, and create the most disastrous or fatal consequences. Again, the cast-iron plates allow the formation of ornamental rolls on the exterior, and parallel with the rafter, at the same time having vertical joints beneath these rolls, which, together with the horizontal joints, are so contrived as to be perfectly impervious to the admission of water—the architect being thus enabled to communicate an architectural character to the very roof, which cannot fail to be highly esteemed when seen in connection with the striking features of the masonry below, when the edifice is completed. And these rolls, it must be remembered, which in slate covering would be impracticable, and in lead liable to considerable distortion and injury, are, when formed in iron, and cast as parts of the plates themselves, not liable to injury by any ordinary means or circumstances, and will always retain their form, position, and imperviousness to wet and weather. To whatever purpose the spaces or rooms within the roofs may be applied—and these spaces must, from the high pitch of the roofs, be very valuable for many purposes—it is evident that uniformity of temperature will be highly desirable; and this will be attained, it is believed, to a much greater degree by an iron covering than by one of lead, slate, or any other material. The corners of each plate being firmly secured by screws and snugs to the rafters on which they lie, a greater degree of lateral strength and stiffness is attained than can be had with any other kind of covering; in fact, the whole

roof, principals, and covering become one piece of framework, well knit and secured together at all points by metal connections, so that the longitudinal tie-rods, which are introduced at the intermediate points, are very much lighter than would otherwise have been advisable, and yet are abundantly sufficient for their purpose. Much greater facilities are likewise offered by this description of covering for the attachment of ornamental dormer windows, which the architect has introduced for the purpose of lighting the rooms within the roofs, and which could not in any other material have been so neatly, durably, or safely constructed and attached to the covering. In point of durability merely, if lead be allowed a comparison with iron thus prepared and adopted, the latter must be pronounced the better material. As to weight, little or no difference can be stated; and regarding their comparative expense, it is believed, allowing fairly for all circumstances, the preference must be awarded to iron. Slate, of course, cannot sustain a comparison of durability, has little advantage in lightness, and not much in point of expense. But the many valuable peculiarities belonging to iron for the purposes required, and at some of which peculiarities we have above glanced, should be held thoroughly decisive as to its employment in the erection of an edifice of which not only the architect in the present age, but the nation for many centuries, should be justified in feeling proud.—*Weale's Quarterly Papers on Engineering. Part 5.*

#### INSTITUTION OF CIVIL ENGINEERS IN IRELAND.

ON Tuesday evening, the 12th instant, there was a meeting of the members of this society in the room of the Geological Society at the Custom House, Dublin. The chair was taken by Bernard Mullins, Esq.

It was understood that there were two papers to be read, one by Mr. Forsyth, "On the Construction and Use of the Diving Bell," and the other by Mr. Mallet, "On the Artificial Preparation of Turf;" but the secretary announced that in consequence of Mr. Forsyth's paper not having arrived, the one upon the preparation of turf would be the exclusive subject of the evening.

Mr. Mallet then read his paper, which first treated of the formation both of coal and turf, and by stating the different natural processes which take place in the formation of each, explained the advantages which the former possesses over the latter, as being a more available fuel and one of superior quality. The paper next referred to the process of carbonizing peat, and enumerated the attempts made to carry it into practical effect. The first was by a French chemist, named Lesage, in 1796, but whose mode of operation had proved to be defective, as the material produced was found to be subject to spontaneous combustion. It stated that from that time no attempt to carry out the object in question had been made upon a scale of any magnitude in this country until the year 1837, when a patent was taken out by a gentleman named Lynning, of Edinburgh, for the preparation of peat fuel. Mr. Mallet next came to the description of a kiln used of late years in Germany for the drying of peat, and which it appeared was subject to disadvantages in point of economy. In conclusion, Mr. Mallet described, with the aid of a model, a kiln of his own invention for the drying of peat, and having shewn the advantages it possessed over those constructed by former experimenters, and adverted to the facility with which it might be profitably used in the boggy districts of the country, terminated by explaining the principle upon which a much greater quantity of good fuel could, by his kiln, be produced from a given quantity of peat, than was derived from the same quantity if used in the ordinary form in the working of a steam-engine.

The paper by Mr. Mallet met with the warm approbation of all present, and was ordered to be referred to the council, after which the meeting adjourned.

GLoucestershire ARchaeological ASSOCIATION.—A society in immediate connection with the British Association of London is about to be formed in Cheltenham for the purpose of preserving and illustrating the archaeological remains of the county of Gloucester.

TERRACE-STEPS AND PARAPETS,  
IN THE ANCIENT GARDEN OF GREAT CAMPDEN-HOUSE, KENSINGTON.

PERSPECTIVE VIEW.

TO THE EDITOR OF THE BUILDER.

SIR,—It is rather singular that out of the very few remaining gardens of James the First's reign to be seen in England, one specimen is to be found so near London as Kensington. The above view will prove that what does remain on the spot is well worth inspecting; this view represents the steps leading from a shaded walk by the side of what was formerly the bowling-green, to a raised terrace, which communicates at one end with the curious long gallery of the building, while at the other are the remains of a summer-house. The terrace is of considerable length, about eleven feet wide, and raised five feet six inches above the general level of the ground. It is situate in the old garden of Campden House, Kensington, built about the year 1612, by Sir Baptist Hickes, the eminent mercer.

The interior of the house is extremely curious, many of the rooms being lined with richly-carved woodwork, and nearly all the ceilings are ornamented. The arms of Sir Baptist Hickes with those of his sons-in-

law, Edward Lord Noel and Sir Charles Morrison, are in the large bay-windows in front of the mansion. Numerous celebrated individuals have lived and died in the house, which is one of the most interesting of the period to be found in the neighbourhood of London.

In 1691 it was hired of the Noel family by Queen Anne, then Princess of Denmark, who resided there about five years with her son the Duke of Gloucester. In 1705 the mansion was in the occupation of the Countess Dowager of Burlington, and her son, the earl, who proved afterwards a very accomplished nobleman, and a great patron of the fine arts. Some years afterwards Campden-house was sold to Nicholas Lechmere, an eminent lawyer, who became attorney-general, chancellor of the Duchy of Lancaster, and ultimately, in 1721, a peer of the realm.\*

A few years ago, the front of the building was much altered, the balustrades in the

upper part were removed, and the front covered with stucco. Lysons gives an elevation of it as it appeared in its original state. It is now occupied by Mrs. Teed, and is one of the largest boarding-schools for young ladies in England. I was very kindly permitted to make sketches there about six years since.

The small details I have added will explain better than any description the very ingenious design of the balustrade, and the effect of the whole is, as may be supposed, extremely good.

I am, Sir, &c.,

C. J. RICHARDSON.

22, Brompton Crescent.

Sir John Guise, whereupon Swift wrote his ballad, entitled "Duke upon Duke," from which the following is extracted:—

"Back in the dark, by Brompton-park,  
He turned up thro' the Gore,  
So slunk to Campden House so high,  
All in his coach and four.  
The Duke in wrath called for his steeds,  
And fiercely drove them on:  
Lord! Lord! how rattled then thy stones,

TIMBER—ITS TREATMENT AND USES.  
BY JAMES WYLSON.

(Continued from p. 569.)

139. **HORNBEAM.**—This tree is indigenous to England, abounding throughout Essex, Kent, and Norfolk, and is also common in the north midland counties, Lancashire and Wales; further southward it becomes scarce, and can hardly be deemed indigenous to Scotland. It is best known as an underwood or hedge-plant; but in favourable situations and a congenial soil, it is known to attain a girth of 6 or 8, and height of 40 or 50 feet. In exposed situations it will thrive where some other forest trees would dwindle away, or be of stunted growth; poor clayey soils, lying on sand or chalky gravel, are the most conducive to its growth. It is considered useful for forming screens or boundaries in gardens. In appearance it much resembles the beech, but with the head still closer and more rounded; it is of a scrubbed and tortuous growth, unless it has some pruning bestowed upon it when young; when of mature growth, it presents a trunk apparently composed of several stems twisted and grown together. Its leaves are pointed and doubly serrated, resembling those of the elm, and wanting that beautiful gloss which appears on beech leaves; before being fully expanded, they are folded delicately together, with a regular, plaited appearance; they continue attached to the boughs, and affording shelter when vegetation has long ceased. The tree is propagated by the keys or seeds which are small nuts, sown in autumn; of these, plenty are produced every year by old trees.

140. The wood is remarkably hard, tough, and durable, though but slightly flexible. It is used in making mill-clogs, and other parts of machinery, the beads of beetles, stocks, yokes, tool-handles, &c.; and is also invaluable to the plough-maker and the cartwright. It is excellent for fuel, burning long with a clear, bright flame, and affording much heat; it also makes good charcoal, and furnishes good potash.

141. Having now concluded our review of those trees which, in an early stage of this essay, we selected as most imperatively demanding our attention, and led perhaps, in some instances, by the attractive nature of our subject to be more diffuse than some readers might deem altogether warrantable, we should, however, not do justice to this division of it did we dismiss it without first making note of some of those illustrious examples which are scattered abroad, in our own island and elsewhere, testifying at once the capabilities of their several species,

and forming, with the venerable remains of mediæval art, links whereby we may connect past ages with the present. The circumstances in these patriarchs of the vegetable world which we esteem, and to which we propose to call attention as remarkable, are longevity, girth, stature, spread, and historical associations.

142. **Herne's Oak, Windsor.**

"There is an old tale goes, that Herne the Hunter, Sometime a keeper here in Windsor Forest, Doth all the winter time, at still midnight, Walk round about an oak, with great ragged horns. And there he blasts the tree.

—There want not many that do fear  
In deep of night to walk by this Herne's oak."

It stands close to an avenue of elms, in following the foot-path which leads from the Windsor road to Queen Adelaide's Lodge, in the Little Park; notwithstanding a story prevalent about its having been destroyed fifty years ago by George III., this is believed to be the tree; it is now dead. A little further to the left is a fine old pollard, measuring 27 feet round the middle of the trunk.

143. **Damory's Oak** stood not far from Blandford, Dorsetshire, and was probably five or six centuries ago in its maturity. During the civil wars, and till after the Restoration, the cavity of its decayed trunk, which was capable of holding twenty men, was inhabited by an old man, who sold ale in it; at the ground its circumference was 68 feet, and 17 feet above, its diameter was 4 yards. In the violent storm of 1793 it suffered greatly, many of its noblest limbs being torn from it. In 1755 it was cut down and sold for firewood.

144. **The Couthorpe Oak**, near Wetherby, in Yorkshire, is one of the most gigantic and venerable trees of its species. The late Dr. Hunter says of this celebrated tree, "the dimensions are almost incredible. Within 3 feet of the ground it measures 16 yards, and close to the ground 26 yards. Its height in its present ruinous state (1776) is almost 85 feet, and its principal limb extends 16 yards from the bole." It was the same in 1835.

145. **The Fairlop Oak**, a noble tree, stood in a glade in the Forest of Hainault, in Essex, about a mile from Barkingside; it was cut down not very many years since, and is traced by tradition half-way up to the Christian era. About a yard from the ground, where its stem measured 36 feet in circumference, it divided into eleven vast arms, more in the manner of the beech than of the oak. Its shade over-spread an area of 300 feet in circuit; and here an annual fair was long held on the 2nd of

July, no booth of which was suffered to be erected beyond the extent of its boughs. The pulpit, and some other parts of the furniture of St. Pancras Church, Euston-square, are veneered with the rich and beautifully mottled wood of this ancient tree.

146. **Elizabeth's Oak**, which grew at Heveningham, in Suffolk, and is mentioned by Gilpin, was of great dimensions, but in the time of that writer was greatly decayed. In Queen Elizabeth's time it was hollow, to which circumstance it was indebted for the honour of acquiring the name it bore: the queen used often in her youth to take her stand in it to shoot the deer as they passed.

147. **The Queen's Oak**, at Huntingfield, in the same county, about two bow-shots from the Hall, is that under which Elizabeth used to take her station to shoot the deer, tradition stating that from it she shot a buck with her own hand. It thickens upwards, and measures at 7 feet from the ground, 33 feet in girth: it is bold and picturesque, although considerably shortened by age and accidents.

148. **The Duke's Walking-stick** is another oak at Huntingfield, rising to the height of 111 feet, and girding 20 feet at the ground.

149. **The Shelton Oak** stands about a mile and a half from Shrewsbury, at the point where the Paule road diverges from that leading to Oswestry: near it the famous battle between Henry IV. and Hotspur was fought, 21st of June, 1403, and from it the celebrated Welsh hero Owen Glendower made his observations prior to the engagement. Its hollow trunk will contain about a dozen people; it is 37 feet in circumference at a foot and a half from the ground, and parts into two enormous limbs.

150. **The Shire Oak**, near Worksop, so honourably distinguished in name, and shewn in all the larger maps of England, from its standing on a spot where the counties of York, Derby, and Nottingham join, was one of the largest in the kingdom, and equalled by few in point of grandeur. It spreads its shade over a portion of each of these counties, extending 90 feet from the extremities of opposite boughs, being computed to cover an area of 707 square yards, and to be capable of covering a squadron of 235 horse.

DUNDEE PUBLIC BATHS.

THE following gratifying letter, announcing a handsome subscription by her Majesty and Prince Albert, has been received by the secretary:—

"Rosie Priory, Inchture, Nov. 8, 1844.

"Sir,—I have much pleasure in informing you that I have received a letter from Mr. Anson, stating that her Majesty and Prince Albert, having heard of the proposed erection of public baths for the working classes in Dundee, have signified their intention through him of contributing 100*l.* to the building fund. Mr. Anson moreover states that her Majesty and his Royal Highness have only hitherto contributed to the public bath funds of the metropolis, but make an exception in favour of Dundee, in consequence of their having so lately landed there. I am sure that this spontaneous donation on the part of her Majesty and his Royal Highness, shewing as it does that the orderly conduct of the people on that occasion was fully appreciated, will call forth the gratitude of those for whose benefit it has been contributed.

"I remain, Sir, your obedient servant,  
"Mr. John Irvine, "KINNAIRD.  
High-street, Dundee."

**PARTIAL DESTRUCTION OF DYSART HARBOUR.**—The extreme point of the pier here was partially demolished on Saturday last by the sea, in consequence of the severe easterly gale which continued during the greater part of last week. The harbour has sustained a considerable amount of damage by the gale. The fair way is half shut up by a large mass of broken fragments of stone and rubbish, which it will require considerable expense and labour to remove. The reconstruction of the pier will be an herculean task—too great, we fear, for the funds of the borough; although other ways and means may not be wanting in such an exigency to accomplish so necessary an undertaking.—*Fife-shire Journal.*

PROPOSED METROPOLITAN CLUB-HOUSES AND DORMITORIES FOR THE USE OF THE POOR.

Mr. D. O. Edwards, a respectable surgeon residing in Chelsea, one of the surgeons of the West London Institute for the gratuitous treatment of the diseases of the eyes, has published, in a letter addressed to L. T. Flood, Esq., deputy-lieutenant of the county of Middlesex, a plan for establishing a subscription hotel in the most suitable part of the metropolis, as an "improved method of insuring to the lower ranks of the people a due supply of food." Mr. Edwards appeals especially to the inhabitants of Chelsea, where he says he should like to see "the first seeds of the scheme sown." The mess-house is proposed to be capacious, suitable, and durable; to contain a suite of dining-rooms of ample dimensions, with the necessary offices and collateral apartments. A steward, contractor, or messman, who will undertake to supply a given number of rations daily at a given rate per head, to be appointed. Having carefully calculated the quantity and cost of the aliment necessary to maintain the human frame at all ages in perfect health, Mr. Edwards says he is of opinion that a club or society of 300 boarders, consisting of six classes, viz. single males, single females, married couples, youths of both sexes from twelve to sixteen years of age, children from six to twelve, and infants from birth to six years old, may be fed at rates descending from 5s. to 1s. 6d. per week. In considering these tables, observes the author, it should be recollected, that where several persons mess together with varying appetites, the excess of one ration over appetite compensates the deficiency of another, and thus an average is attained. The total weekly cost of 300 diets of the kind and quality Mr. Edwards enumerates in his table, he estimates at 34l. 17s. 4d., whilst the subscriptions, according to his scale, will amount to 44l. 12s. 6d., leaving a balance in favour of the treasury of 9l. 15s. 2d., applicable to the payment of rent, steward's, and servants' wages. We purpose giving at a future opportunity some further extracts from this proposition.

DISCOVERY OF A ROMAN TEMPLE AND OTHER BUILDINGS NEAR WEYMOUTH.

At a late meeting of the Ashmolean Society, Dr. Buckland gave a detailed account of the remains of many Roman buildings discovered recently by Mr. Medhurst, near Weymouth. The neighbourhood abounds with vestiges of Roman occupation. The large military station and Roman walls, Roman camp, and amphitheatre, at Dorchester, contiguous to the gigantic British Triple Camp of Maiden Castle, are well known. The situation of Weymouth Bay and Weymouth Harbour, close to the sheltered road of the Isle of Portland (Vindelis), and the distance of Dorchester from any other port, must have rendered Weymouth a most convenient and necessary naval station during the residence of the Romans in Dorsetshire. The nearest rising grounds on the north-west and north-east of Weymouth are strewed with fragments of Roman buildings, tesserae, bricks, pottery, and tiles, and small Roman copper coins. A large handsome Roman pavement was laid open, and covered up again by King George III.; and Mr. Medhurst has recently discovered the foundations of several villas, of a Roman temple, and of a Roman road. Dr. Buckland supposes these villas to have been occupied by the families of Roman officers or civilians connected with their great military establishment at Dorchester. The most remarkable discoveries made by Mr. Medhurst in 1843, and visited in October last by Dr. Buckland and Mr. Conybeare, were the foundations of a temple on the summit of Jordan-hill, and of a villa, a quarter of a mile distant, in the meadow between this hill and the village of Preston.

The temple appears to have consisted of a cella 24 feet square, surrounded by a peristyle, the walls of which inclosed an area 110 feet square. In the earth which occupies this peristyle Mr. Medhurst found more than four sacks of bones, and many horns (chiefly of young bulls), also many Roman coins, fragments of Roman pottery, cement, &c. Near the centre of the south wall were the foundations of steps, indicating the ascent to the door

of entrance, and four feet in advance of this wall are the foundations of four small columns. A layer of cement, which probably supported a pavement that has been removed, occupies the interval between these pillars and the foundation of the south front wall. Within the temple, in the south corner, was a dry well 14 feet deep, that had been filled in a very curious and unexampled manner. It was daubed all round with a lining or pargeing of clay, in which were set edgewise (like Dutch tiles round a fireplace) a layer of old stone tiles, which, from their peg-holes, appear to have been used or prepared for use on roofs of houses; at the bottom of the well, on a substratum of clay, was a kind of cist formed by two oblong stones, and in this cist were two small Roman urns, a broad iron sword, 21 inches long, an iron spear-head, an iron knife and steel-yard, two long irons resembling tools used by turners, an iron crook, an iron handle of a bucket, &c., but no bones. Next above this cist was a stratum of thick stone tiles, like those which lined the well, and upon it a bed of ashes and charcoal; above these ashes was a double layer of stone tiles arranged in pairs, and between each pair was the skeleton of one bird, with one small Roman coin; above the upper tier of tiles was another tier of ashes. Similar beds of ashes alternating with double tiers of tiles (each pair of which inclosed the skeleton of one bird and one copper coin) were repeated sixteen times between the top and bottom of the well; and half-way down was a cist containing an iron sword and spear-head, and urns like those in the cist at the bottom of the well. The birds were the raven, crow, buzzard, and starrling; there were also bones of a hare.

Dr. Buckland conjectures that this building may have been a Temple of Esculapius, which received the votive offerings of the Roman families and invalids who visited Weymouth for sea-bathing and for health, the bones of young bulls found in the peristyle being those of the victims offered in ordinary sacrifice, while the smaller birds, whose bones are found so remarkably arranged in the well, may have been the votive offerings presented by those who received their cure from sea-air and sea-bathing, and possibly from the mineral waters of Radipole and Nottingham, all in the salubrious vicinity of a temple which there is such professional reason for supposing to have been dedicated to Esculapius.—*Oxford Herald*.

PROPOSED ALTERATIONS IN GREENWICH-PARK.—Some months ago the Commissioners of Woods and Forests took it into their heads that a reservoir on the highest part of Greenwich-park would add much to the security of the Hospital in case of fire, to the beauty of the park, and the comfort of the inhabitants. The inhabitants, however, influenced as some people would say by local prejudices, took a very different view of the question; they looked upon the reservoir as likely to be a huge pond of water, filled with decayed leaves, and inclosed in unsightly walls of earth. The result was, that by dint of several public meetings, a good many speeches, and a quantity of ink spilt, the commissioners were induced to review their decision, the reservoir stopped, and the park was saved this degradation. Now a more formidable opponent has entered the field. Among the various schemes in existence are some for carrying a railway through the park from side to side, completely destroying its symmetry, and rendering it in a great measure useless as a place of relaxation for the labouring classes. It is unnecessary to say any thing on the hardship of spoiling one of the few green spots allowed to remain near London, and it is to be hoped that this project will not be allowed to pass through Parliament without a few words of remonstrance from some patriotic member.—*Times*.

IMPROVEMENT OF THE HULL PIER.—We understand that Mr. Simpson, joiner, of this town, has prepared a model of the pier, with safety railings, so ingeniously contrived as to be lowered in portions at a moment's warning, for the accommodation of vessels. If all we hear of this clever device be true, the inventor will most heartily deserve the thanks of his townsmen. The model, we learn, is to be submitted to some of the influential gentlemen of Hull during the week, and we shall in all probability call attention to it again in our next publication.—*Hull Packet*.

Correspondence.

NEW CHURCH OF ST. THOMAS, WINCHESTER.

ARCHITECTURAL COMPETITION.

To the Editor of "The Builder."

SIR,—I inclose you a letter which it has been deemed necessary to address to the editor of the *Hampshire Advertiser*. It is in reply to one of your correspondents, whose letter (conveying serious charges against the Committee for Rebuilding the Church of St. Thomas in this city) had been transferred into the columns of that paper.

I presume that your sense of justice will induce you to lay before your readers this refutation of the charges which you were the means of promulgating.—I am, Sir, your obedient servant,

ONE OF THE BUILDING COMMITTEE.  
Winchester, November 18, 1844.

"THE NEW CHURCH OF ST. THOMAS, WINCHESTER.

To the Editor of the *Hampshire Advertiser*.

SIR,—The insertion in your paper last week of a letter which had previously appeared in *THE BUILDER*, reflecting on the Committee appointed to rebuild the Church of St. Thomas in this city, is calculated to do injury to the good cause in which they are engaged.

So long as the reflections on their conduct were confined to the pages of a publication but little known or read by those who are interested in our local affairs, they might safely be left unnoticed; but since you have afforded them the extensive circulation which your paper enjoys, it becomes necessary to check the mischief which they are calculated to produce. I beg, therefore, as no meeting of the committee has since been held, to give, on my individual responsibility, the fullest contradiction to certain allegations contained in the aforesaid letter.

It is not true that the architect whose plan has been selected by the committee now shrinks from confirming what he led them at first to believe respecting the probable expense of carrying out his design.

It is also untrue that he was allowed to carry away his drawings, to reduce the design within the sum originally stipulated, which would have justly laid the committee open to a charge of unfairness towards his competitors. He was, indeed, requested to furnish them with some additional drawings, to illustrate certain suggested alterations in the plan, and to make estimates of the expense of carrying out such alterations. In that, surely, there was nothing which could be justly complained of, since it is quite certain that not one of the designs presented to the committee would have been approved of by them without alteration.

The fact is, that the committee have given offence to certain persons interested in the success of particular architects, whose plans have not been adopted. In a competition invited by public advertisement, they have selected, purely on account of its merits, the design of a person previously altogether unknown to them, and in favour of whom no impure motive can possibly be imputed to them. For doing so, they will doubtless receive no condemnation from an unbiassed public, which, it is trusted, will not be deterred by such groundless assertions as those of *THE BUILDER*'s correspondent, from aiding them in the accomplishment of their pious purpose.

I ask you, in justice, to give insertion to this, and I furnish you with my name, in order that you may be satisfied I am truly

ONE OF THE BUILDING COMMITTEE.

Winchester, November 14th, 1844."

[We think enough correspondence relative to this paltry church-business has been already inserted in *THE BUILDER*. The meanness of the premium, the unjust lure to unemployed young men to make away with a portion of their property or that of their friends in an almost causeless journey, the incompetence of the tribunal,—all remain. The whole system is a pest to society, and causes the waste of money, sets unchristianly at loggerheads the whole body of subscribers, committee, friends, and professionals, local and foreign; and almost invariably insures the production of architecture unsound in taste and construction. Such competitions violate peace, piety, purity, and prudence, and bring to their victims pain, poverty, and privation.—Ed.]

SIR,—Much has lately been written in your paper against architectural competition; it is but fair that some few words should be said in favour of it.

When conducted in a fair and honourable manner, I consider that much good would arise

from it. The young enthusiastic architect would by his exertions and abilities raise himself to honour in his profession, as many have done in days gone by. Bramante was the successful competitor against Giuliano di San Gallo and others, for the church of St. Peter, at Rome; Giovanni da Ponte against Palladio and Scamozzi, for the Rialto Bridge, at Venice; and should we not find splendid and noble ideas in the mind of the aspiring architect of the present day, if his talents were called into requisition; shewing that, in competition, he who submitted the best and most appropriate design, would have the honour of erecting the same, and calling forth the praises of this and future generations, as all bestow upon the magnificent works of the scandalously so-called dark ages.

It enlightened committees of the present day be entirely destitute of justice and fairness, let them depute some impartial architect who would not degrade himself by selecting any other than the best design: some encouragement would then be given to the "young aspiring," and much more good would arise to the profession, than entirely "putting down" architectural competition.

Trusting you will find room for these few remarks, I remain, your obedient servant,  
London, Nov. 18, 1844.

[We are glad our correspondent has sent the above communication, which, we think, will tend to strengthen the abhorrence felt by many against the false system of architectural competition. We believe it is pretty generally admitted, in the instances mentioned by our correspondent, corrupt architecture supplanted the more pure, and occasioned the superior artist to give place to the inferior.—Ed.]

BUILDING COMPETITION AND UNPROFESSIONAL JUDGES.

Sir,—There are so many atrocities committed upon the building community, that I think it incumbent upon its members to publish the most glaring acts of injustice that are perpetrated upon them. By pursuing this course some good may be gained. For when sapient committees formed by unprofessional men, parish boards, and the like, find that their ignorance and unfairness may escape beyond the limits of their court-house, or vestry-room, it is probable that fear of exposure, if no worthier motive, may keep their acts within the bounds of toleration.

In your notices of contracts of the 9th inst., there appeared one for "erecting a foot-bridge over the old river at Temple Mills," in St. John's parish, Hackney. Feeling disposed to contract for the work, I obtained the necessary particulars, and attended at the appointed time with my tender, and as the terms required that persons tendering should wait personally upon the Board of Surveyors of Highways, I remained to hear the result. After staying about an hour, the competitors were called in, expecting of course to hear the different amounts, and the selected tender declared, but to our utter astonishment and annoyance we were coolly informed by the chairman that the estimates were so far above what they considered the value of the work, that they had come to the decision of not having it done at all; and this decision was made with the proposed surveyor of the works at their elbow, and he, too, the son of a builder, as I understand, brought up in the business.

I beg to furnish you with the amount of my tender, and also the quantities in the work; you will perceive it is a trumpety and insignificant affair, and scarcely worth the trouble of this communication, but it is sufficient to illustrate the system I complain of, and will shew my fellow tradesmen what a doubtful sort of thing is a "Hackney Board of Highway Surveyors," so that in the event of there being any more work advertised for public competition, they may not be so misled as to suppose it will be carried into execution.—

The tender was 194*l.* The quantities are

- 4 25 ft. 1 ft. by 1 ft. Riga piles, sawn all 100 ft. cube round, and driven from a barge .. .. .
- Drawing eight piles, forming part of the old bridge .. .. .
- 1 1/2 rods stock brickwork in cement .. .. .
- 45 ft. run 1 ft. 2 in. by 9 in. granite coping .. .. .

- 264 ft. cube Memel fir in cambered ribs, braces, &c. .. .. .
- 500 ft. superficial 2 1/2 in. English oak battens, laid and ends rounded .. .. .
- 12 ft. 6 in. cube oak .. .. .
- 16 ft. in No. 8 oak posts .. .. .
- 2 tons 1 cwt. wrought-iron in bolts, plates, spikes, pile, shoes, railing, &c., principal part to be galvanized .. .. .
- Painting rails and tarring under side of bridge .. .. .
- Expense of getting a barge to the work, and hire of do., the river not being regularly navigable .. .. .
- Taking down old bridge, the materials not worth removing .. .. .

Now, at this time of the year, the marshes are generally flooded, the water in the old river is very high, and the current very rapid: at the time of inspecting the position of the bridge, the adjoining farms and lands were inundated. This and the out-of-the-way situation of the work must be taken into consideration, and then I submit to you and your readers whether the tender is unreasonable?

I do not pretend to know what this Board of Surveyors of Highways consists of, perhaps the genius of a Telford, or a Walker may exist in as yet undiscovered brilliancy amongst its members, or perhaps the retail acuteness of a grocer or a tallow-chandler may be the ground-work of their professional reputation; but this I do know that the aforesaid Board had a surveyor, who most likely made an estimate of the work previous to its being advertised, and who ought to have known that the tenders were not more than the work was worth. If the surveyor did make an estimate he has misled the Board, and if he did not, the Board had no right to reject the contracts until their correctness had been ascertained.

Under any circumstances I defy it to be proved that the tenders were exorbitant, the case is therefore one of unfairness, indiscretion, and hardship, and one deserving, through the medium of your columns, to be exposed.—I am, Sir, your obedient servant,

JAMES KNIGHT.

Limchouse, November 20th.

TUDOR ARCHES.

Sir,—“T. L.” has shifted his ground from the “Croydon Doorway” to “Groins,” and concluded his observations with stating that “an arch struck from four centres may have points of preference over elliptical or parabolic curves;” but to what other true curves his “may have” is applicable, your readers must conjecture. Cannot “T. L.” or any other of your correspondents assign a better reason than a “may have” for architects and builders remaining ignorant of the most beautiful forms, which can be described by simple continuous motion with much more ease than by any approximate method?

I suppose, however, that although “T. L.’s” letter follows mine, he may not have seen the contents of your No. 91 before his observations were written. Be this as it may, I can assure him that the lines for arches in the first and second examples are neither elliptical nor parabolic; and I must beg to differ from him in the statement he makes, in the particular instance alluded to, that the patch-work line delineated from the double centres can correctly represent an elliptical line, and much less those I have shewn. In the example No. II. a gradation from acute to depressed (to use “T. L.’s” own words) is shewn. By the same means, more acute and more depressed, to any degree, may be drawn by simple continuous motion for any purpose in architecture. I have shewn that this principle is applicable for drawing a Tudor arch through three given points.

In reference to “Groins,” I beg to refer to the 38th volume of the “Transactions of the Society of Arts,” &c. (published in 1821), for my observations and designs for their construction, shewing the true principles for producing true intersections, and some variety for the “play of light and shade,” which even the Goths had not arrived at; but had they done so, such examples would have been pointed out for imitation. It will then be seen that the Goths in their first groins did not know how to produce true intersections of the ribs (mouldings of the ribs) at the springing, but that at a later period they did so, when a very great change in their designs was effected, which produced that pleasing effect so much admired.

Although they went far in truth, there is room for going farther, and producing still more perfect examples.

True curves and true intersections must in all cases, when understood, be easier of execution and produce more pleasing effects than any patchwork approximations. It will be time enough for me to say more when “T. L.” or some other architect or builder who thinks with him, has pointed out a few examples where imperfect lines “may have points of preference” to true curves. I would beg to suggest that any examples for reference would be best in town, and if to arches in public buildings now executing, so much the better.

Not having seen Professor “Willis’s” paper, I do not know whether any of his ideas correspond with what I discovered more than thirty years ago, and which, as I have stated, was published by the Society of Arts, &c., more than twenty-three years since. Should you deem my communication to the Society of Arts worthy of your pages, I may possibly add something more, which from more experience and consideration I may be able to do, although I am not aware of any thing in the description and drawings then given that I now wish to have altered. JOSEPH JOPLING.  
29, Wimpole-street, 15th Nov. 1844.

“HASSOCK” SANDSTONE.

Sir,—The introduction of a sandstone, from the neighbourhood of Maidstone (provincially called “Hassock”), for inside walling of churches, &c., has induced me to address the following description of it to you.

It is found in all the quarries of Kentish ragstone, alternating in layers with the hard blue limestone, used for building, paving, &c. &c. It is of various thicknesses and texture, from a soft crumbling loose sand to a firm and tolerably hard freestone, which will take a good face, and, if dried before use, stand exposure to weather, as the surface becomes indurated in a few years, and will then resist the action of the elements.

In the Iguanodon Quarry, layers are found nearly three feet in thickness, and are very similar to the beds of upper green sand dug at Ventnor, in the Isle of Wight; in fact, it is a freestone, and appears to make up for absence of upper green sand about Maidstone. I have faced a wharf with it, which has stood the action of frost for three years, and shews but very slight indication of injury from so powerful an agent of destruction. It has been used for foundation-walls in this neighbourhood for many years, and is a most excellent material for that purpose, as the cost is so much less than brick, and it is equally durable. A great quantity is used for “hearth-stones,” and probably the term “Hassock” was given to it from that cause.—Yours, &c.,

W. H. BENSTED.

[The “Hassock” is not only found in layers, but is also very frequently attached to the ragstone, and from not being completely dressed away, generally forms those portions of blocks which seemingly decay rapidly; close examination, however, will generally prove that the loose “Hassock” only has fallen away, leaving the ragstone undecayed.—Ed.]

THE NEW ROYAL EXCHANGE.

Sir,—Allow me to tell your correspondent “Scrutator” that he is altogether mistaken in fancying the remarks on the Royal Exchange, which appeared in *The Herald*, to have been dictated by favouritism in behalf of the architect. I have no reason to entertain any partiality for Mr. Fife, nor do I seek to ingratiate myself with him. I do not even know whether he has seen the remarks; or if he has, he does not know by whom they were written.

I admit that the article touches upon only comparatively few points of criticism; but for that it may be some excuse to say that it was written off-hand for the occasion, without any time being allowed me, and that it was required of me to make it as popular in tone and as free from technicalities as possible. Besides all which, it was necessary that it should not appear to contradict what had been said in the same paper but a few days before on the subject of the building. Yet it must not therefore be imagined that I spoke contrary to my opinion; that I was equally ready to condemn or approve, as might be required of

me. More minute examination of the whole structure than I have yet had the opportunity of making, and to judge of its anatomy, plans, and sections, would be requisite, and may probably induce me to qualify some of my observations, which were intended to be, and no doubt have been received, as chiefly expressing general impressions.

"Scrutator" himself is not altogether impartial; he seems disposed to decry the building, and is evidently no admirer of its general style. As to the portico, if he considers that of the London University to be superior, I will not quarrel with him on that score, being quite as much disposed to admire it as himself. Both, I should say, are admirable of their kind; and there are beauties in that of the Exchange which the other does not possess, and *vice versa*. I did not argue from it any thing as to "the superior genius of Mr. Tite," for what he has there done might have been done again and again before, did they ever think of introducing inner columns. That you yourself consider them highly conducive to effect is apparent from what you say in a note respecting those in the small composition at the west angle of the Bank.

At all events, "Scrutator" has made one mistake; one of no moment otherwise than as it attributes to one publication what belongs to another, and may lead persons to suppose that it was the *Athenæum*, instead of the *Westminster Review*, which attacked Mr. Tite's design so severely.—I remain, Sir,

Yours, &c.,

THE WRITER IN THE MORNING HERALD.

VAULT DESTROYED BY PLACING BRICKS THEREON.

SIR,—I hope you will excuse me while asking you a question; I do so, believing that you are always willing to communicate information relating to the law of building in all its details.

I and another person purchased two carcasses of houses in July last, we having nearly finished ours, and had the paving done by the parish; but last week a man from the other side of the road, placed some bricks on the paving in front of one of the houses without my consent; the consequence was that, an excavation being made some time since, without a vault or any shores being placed against the last wall of the vault of my house, the abutment gave way, and in came the arch of the vault, and also the paving. The wall has stood since July; it was 14 in. thick, built in cement, but still gave way in one mass. This, doubtless, would not have occurred had the bricks not been placed there; neither do I believe the vault could have gone in without the abutment giving way. The person who placed the bricks there is willing to bear half the expense, but the other refuses to be any thing towards putting it up again, and I can ill afford to do so, as it is almost out of my power, being but a journeyman carpenter, and having had some difficulty in finishing it thus far.

Your experience will perhaps enable you to tell me how to act in this case, and you will greatly oblige a working man.—Yours respectfully,

November 18, 1844.

J. C.

[We suppose, as far as we can judge from the circumstances, as described, that the placing of the bricks upon the public paving was a public offence, and is punishable, and also that the offender ought fully to make good the damage.—Eo.]

NEW METROPOLITAN BUILDING-ACT.

SIR,—Though no builder, I have nevertheless taken in, for the last three months regularly, your very interesting and useful work *THE BUILDER*, till it has almost made me one; at all events, I think of building myself a six-roomed house before the new Act comes in force; but my means being very limited just now, I would rather defer it till after January, as I shall be then prepared more for the undertaking. But there are so many opinions about the new Act, even amongst builders themselves, some saying one thing, some another, that I scarcely know which to believe; however, I have purchased the Act as printed and published by you. To set all doubts at rest on my part, and as I am a poor man, I will consider it a lasting favour, if you will be kind enough to inform

me in your next whether old bricks by the new Act are prohibited to be used in dwelling-houses; I see nothing mentioned of it in your version of the Act; and if it is so, it appears to me an absurdity, for it is well known that many of the old bricks are infinitely better than half of what are at the present day called new stocks. Besides, when old houses are to be sold or pulled down, who will buy them? In conclusion, I entreat that you will please to answer my question in your next, as I shall then see my way better; because if old bricks are allowed to be used, I shall have no cause to involve myself by beginning before January. And may I ask as a further favour of you to let me know when the adjoining owner (as I intend building against the party-wall of another person) is entitled to come on me for my share of expense for such party-wall? Trusting you will oblige me on this *only* occasion, I beg to remain very respectfully

Your humble servant,

RICHARD DEFFIELD.

23, Britannia-street, City-road,  
Nov. 15, 1844.

[The use of old bricks is not forbidden by the new Act; but if any question arise as to their soundness, the official referees are to decide, being thereto required in writing. With regard to the time when old party-walls are to be paid for by adjoining parties, we are not at present clear, but will consider the subject, and report further.—Ed.]

ON PAYNISING TIMBER.

SIR,—In your last number, under the head of "Mr. Valentine's Substitute for the Iron Rail," I observe it stated that the wood he uses is prepared by the process called "Kyanising," yet the detail given of the process, and the experiment quoted, evidently shew that it is the patent process of Mr. C. Payne, and not that of Mr. Kyan, that is employed. The erroneous introduction of the term "Kyanising" (instead, as probably was intended, "Paynising") may mislead some of your readers unacquainted with the nature of the two processes, and I think it will be satisfactory to you to have thus the opportunity of rectifying the mistake.—I am, Sir,

Your obedient servant,

J. H.

CHURCH-BUILDING INTELLIGENCE, &c.

*Manificent Donation in Aid of the Restoration and Extension of St. Mary de Crypt Church.*—We have, upon many occasions, called the attention of our readers to the good work of restoration which, for the last year, has been steadily progressing in this fine old church, and have expressed our earnest wishes that the sanguine hopes of the Rev. A. Sayers, the rector, would be realized, and that he would meet with such support as would enable him to rescue this beautiful building, not merely from further dilapidation, but to restore it in all its parts. We have now the pleasing duty of announcing the truly liberal donation of 500*l.*, which has been presented, in the most handsome manner, to the rector, by the executors and devisees of the late James Wood, Esq.—J. S. Surman, Esq., and Jacob Osborne, Esq., the heirs of the late Sir M. Wood, Bart.; W. P. Price, Esq., and E. Shelton, Esq.—to enable him to complete his praiseworthy designs. The sum already subscribed, including the above donation, amounts to nearly 1,000*l.*, which, although not within the estimate of the architects, Messrs. Dawkes and Hamilton, by nearly 200*l.*, will fully justify the further progress of the works, as we have no doubt that a much larger sum, if required, will be forthcoming. The chancel, with the exception of the monumental window to the late rector, the Rev. J. G. Dowling, will be completed by Christmas; and the restoration of the nave, new paving, &c., will be commenced when the requisite facilities are obtained. We look forward with more than common interest to the restoration of St. Mary de Crypt: when fully restored, it will be one of the most perfect cruciform churches in the land.—*Gloucestershire Chronicle*.

*New Tower to Leigh Church, Essex.*—The Rev. Robert Eden, rector of Leigh, has lately expended nearly seven hundred pounds in the erection of a tower to his church.

*Queen Adelaide's Church at Malta.*—This church, which has been built at the sole expense of her Majesty the Queen Dowager, is placed on a commanding site, overlooking the Quarantine Harbour, and is one of the first objects which meets the eye of a stranger on approaching the island from the north or the west. The building has been brought into its present state by the skill of Mr. Scamp, the successor of the first architect. The spire, when finished, will be about 200 feet high, and about 300 above the level of the sea. The body of the church and portico are not much unlike those of St. Martin's-in-the-fields in their exterior aspect; and the beauty of the stone of which it is built gives it a very striking appearance. The internal effect is still better. It has a semi-circular chancel, and is divided into a nave and two side aisles by two rows of beautiful Corinthian pillars. With the exception of two pews, one for the Governor and the other for the Admiral, the seats are all open with backs. The whole of the seats, stalls, pulpit, and reading desk, are of English oak. The font, of white Carrara marble, is the gift of the late Mr. J. W. Bowden. The church was consecrated on the 1st instant, by the Bishop of Gibraltar, and is to be called "The English Collegiate Church of St. Paul, in Malta."—*Times*.

*Church Restoration in York.*—A gratifying sign of the times is exhibited in the attention which is now devoted to the restoration of our ancient ecclesiastical fabrics. The west front of the church of St. Helen's, York, has been repaired. St. Saviour's Church is being nearly rebuilt. On removing the old whitewash from the pillars and arches which separate the aisles from the body of the church, traces have been found of paintings on the walls—one of which, representing Moses bearing the Ten Commandments, is in a state of perfection hardly to be expected. The beautiful parish church of St. Martin-le-Grand is also undergoing some restoration. The church of St. Martin-cum-Gregory is undergoing an extensive restoration in its tower. In the church of All Saints, the three east windows of richly-stained glass have been re-glazed, repaired, and fixed in new stone mullions and tracery. The church of St. Sampson, which is in a serious state of dilapidation, has been closed, and steps are being taken for raising a requisite fund to undertake its complete renovation.—*Doncaster Gazette*.

*New Churches in Kingswinford.*—The population of the parish of Kingswinford, Staffordshire, having increased to nearly 24,000, the rector, Dr. Penfold, by the aid of the ecclesiastical commissioners, has succeeded in dividing the parish into six districts, containing 4,000 each, and it is intended each shall have its church (there are now three), its parsonage house, resident minister, and national schools. In one of the new districts, Brockmoor, a very interesting ceremony took place on the 12th ultimo, when the first stone of a new church, situated in the midst of a dense population, surrounded by coal and iron works, was laid by the Lady Ward, in the presence of the clergy, churchwardens, and numerous inhabitants.

*Boston Church.*—We understand that the order made some time ago by the Boston town council (who are the lay proprietors) for the re-glazing of the chancel windows with lozenge-shaped panes, cannot at present be acted upon, the proprietors having expended their large funds in lay objects. The massive Corinthian altar-screen should be replaced by a reredos, in keeping with the rest of the architecture, and if the east windows were to consist of stained glass, the effect would be very imposing. A separate subscription should be started for that express purpose: the required amount would soon be raised, as those who refused to contribute towards the repairs of the body of the church would doubtless gladly contribute towards the ornamenting this beautiful edifice.—*Lincolnshire Chronicle*.

*St. Martin's Church, Hereford.*—We understand that the consecration of this edifice is postponed to the spring, when the weather will doubtless be more favourable. The progress of the fabric in all respects satisfactory—alike creditable to the architect, builder, superintendent, and workmen; and will unquestionably form one of the greatest architectural ornaments to the city.—*Hereford Times*.

## RAILWAY INTELLIGENCE.

**Contract for the Railway Dock at Hull.**—Monday, the 11th inst., was the day appointed for deciding upon the tenders received for the construction of the Railway Dock and entrance. The dock directors met in the morning, and, after examining and considering the tenders sent in (fourteen in number), accepted that of Messrs. Bowers and Murray, of Liverpool, who have been engaged during the last seventeen years in contracts upon most of the docks constructed in that port within that period, and are now at work upon the Albert Dock. The contract includes the excavation of the dock and entrance, and the formation of the walls and quays. The work is to be commenced immediately, and it is expected to be completed, and the dock ready for use, in the spring of 1846.—*Hull Packet.*

**Employment afforded by Railway Undertakings.**—We have calculated, from data afforded us by gentlemen well conversant with the subject, that there are at present employed in merely making the necessary preliminary surveys for the numerous lines of railway now before the public in Ireland, some 520 engineers, sub-engineers, drafts-men, clerks, chainbearers, and their assistants. This is exclusive of labourers. The salaries of the above vary from 2*l.* to 13*s.* a week, while labourers employed get from 1*s.* to 1*s.* 6*d.* per day. Besides, such a staff of officials gives employment in their turn to carmen, &c. Should all the lines of railway now projected obtain acts of incorporation in the ensuing session of Parliament, and commence operations as soon as possible after, employment would be afforded, one way or another, to some 200,000 persons.—*Irish Railway Gazette.*

**Salisbury and Dorsetshire Railway.**—This line is proposed to commence near Salisbury (83 miles by railway from London), passing near Fordingbridge, through Wimborne and Bere Dorchester and Weymouth, with a branch from Wimborne to Poole; being at least 12 miles shorter between London and Dorchester than the Southampton and Dorsetshire line, and two miles shorter between Dorchester and the towns situate on the eastern coast line of railway. This advantage applies to Poole and other towns on the line.

**Rotherham and the Railways.**—The result of the interview between the Midland Railway directors and the deputation appointed at a public meeting recently held in Rotherham on the subject of the projected railways through that town is, that Mr. Stephenson has been appointed by the directors to survey the country, and report on the practicability of a direct line from Gainsborough to Rotherham. At a second public meeting the inhabitants of Rotherham sanctioned this arrangement.—*Railway Record.*

**Wexford, Carlow, and Dublin Junction Railway.**—The object of this company is to form a railway from Wexford to Carlow, to join the Carlow branch of a main trunk to Dublin; thus placing the port and county of Wexford in direct communication with the metropolis, and by the Great Southern and Western Railway with Cork, Limerick, and other parts of the south of Ireland. The line is about 40 miles in length; the engineer Sir John Macneill.

**Railway Tunnelling.**—At a meeting at Cardiff, Mr. Brunel stated that the Box Tunnel of the Great Western Railway cost 100*l.* per yard; the White Ball Tunnel on the Exeter Railway cost but 53*l.*; the Cheltenham Tunnel was estimated at 136*l.* per yard, and it cost but 34*l.* per yard; and to show the reduction in this department alone, he had lately contracted for tunnelling at 28*l.* per yard.

**HARBOUR OF REFUGE IN THE FRITH OF FORTH.**—We understand that the proposal of a harbour of refuge for the shipping on the east coast of Scotland, to be situated in the vicinity of Granton, has been for some time under the consideration of many influential parties in this quarter. The project, we hear, has been received in the most favourable manner, and we hope to be enabled, in a very short time, to discuss it in its several bearings, as the subject is one of the very greatest importance to the commercial classes and the public generally.—*Edinburgh Witness.*

## Miscellanea.

**WAYSIDE CHAPELS.**—Wayside Chapels were the only ancient places of public worship with which burial grounds were not locally connected. They had no walled inclosures, and could never have been more alone than many are now on the highways to Walsingham. Those near Hillborough have been planted on the bleak brows of elevated ground near the roadside, and are without particular architectural distinction, being little oblong buildings of equal breadth throughout, as plain in design as in their figure. The walls are roofless and broken, the cracks and chasms serving to channel away the water from the moss-grown summit. The interior, which could once afford rest to the weary, and a pittance to the distressed, is now too desolate to be sought as a shelter by cattle. No marvel then that travellers in later days have neglected to turn a few paces out of the way to visit these ancient relics: they would find them not altogether uninteresting, but overgrown with briars, and half filled up with heaps of old rubbish. No kind of sepulchral memorial has been discovered within or on the outside of any of these edifices, often as death must have overtaken the pilgrim on his way. Chances of this kind were not provided for by a consecrated space for burial, as the custom of entombing the dead around the sanctuary in which the living assembled for worship, was never extended to Wayside Chapels, neither was the administration of baptism, nor the celebration of matrimony included in the duties prescribed to them, as was sometimes the case in privileged instances in assistant chapels belonging to districts at a distance from the mother church.—*Remarks upon Wayside Chapels, &c., by J. C. and C. Buckler.*

**OPENING THE NEW BRIDGE AT ATHLONE.**—The new bridge at Athlone, built by the Shannon Navigation Commissioners, was opened on Saturday, the 9th instant, for public traffic. It consists of three stone arches, each 60 feet wide, with a portcullis 40 feet wide, to afford accommodation to vessels passing. Colonel Jones, to whom the bridge was formally given up, after commenting on its utility, adverted in complimentary terms to the contractor, for the magnificent structure which he had completed, and said that a stronger or handsomer bridge there was not in Ireland. It was the work of Irishmen, and it was delightful to know that from the commencement of the work up to the completion, not a life was lost in the operations, nor was a man one fortnight absent from his work by accident or hurt.—*Morning Herald.*

**THE NEW ROYAL EXCHANGE.**—On Saturday last a number of workmen in the employment of Mr. Jackson, the builder, were actively engaged in erecting scaffolding on the north side of the Royal Exchange, opposite St. Bartholomew-lane, preparatory to the statues of Sir Thomas Gresham and Whittington being placed in the niches over the shops in that portion of the building. The tessellated paving laid down by Messrs. Seager, of Vauxhall, in the merchants' area on the occasion of Her Majesty opening the Exchange, was also finally removed in the course of the same day, preparatory to supplying its place with the Seyssel asphalt. It seems strange that the authorities will not at once pave, and that properly, the area in question; the improper application of any material brings it into discredit with weak minds incapable of correct judgment.

**ELECTRICAL TELEGRAPHS IN FRANCE.**—The Minister of the Interior has just appointed a special commission to report on the advantages of the system of electrical telegraphs, and the possibility of their application. The minister had previously directed M. Alphonse Foy, the administrator-in-chief of the telegraphic department, and two of the principal employes, to inspect the model of Mr. Bain's electrical telegraph, which has been for some time privately exhibited in Paris.

**ENORMOUS PIECE OF PLATE GLASS.**—There is to be seen at the present time in Regent-street, at Mr. Saunders', a plate of glass containing upwards of 95 square feet, its dimensions being 12 feet 9 inches by 7 feet 7 inches, and its quality is so brilliant as to be generally understood to be the finest glass in the world.

**SUBSIDENCE OF THE SURFACE GROUND OVER A COAL MINE.**—An alarming occurrence took place yesterday (Friday) morning, at St. Peter's Quay, about three miles below Newcastle, the surface of the ground, for some acres in extent, having been affected with what in this district is called the creep, by which considerable destruction has been done to property in the neighbourhood, the extensive building-yard of Messrs. Thomas and William Smith, the eminent ship-builders, having been rendered for a time entirely useless. The first intimation of danger was observed a week ago, but it was very slight, amounting only to a rent in one of the houses to the north of the building yard, which was repaired, and matters continued in the same state till nine o'clock yesterday morning. It may be proper to state that the dock, though on the north side of the river, is completely undermined by the workings of the Friar's Goose Colliery, situate on the other side; and it is supposed the accident has been caused by the working or falling of the roof, or superincumbent strata. At the period above mentioned, the whole of the men and boys, nearly 200 in number, were at breakfast in the smith's shop and store, on the north side of the building-yard, when they heard a noise like thunder, and on looking out beheld the surface of the ground in motion. They ran away from the spot, and reached a place of safety, and there they were soon joined by the inhabitants of the neighbouring houses, who fled in the greatest consternation. In a few minutes the motion of the surface ceased, and, on the men returning to the building-yard, they found the ground rent in various directions, pressing chasms several feet in depth; the bottom of the spacious dry dock, capable of admitting vessels of the largest size, was thrown up in dreadful confusion; the sides rent; and the whole presented a scene of destruction which might well appal the stoutest heart. The windows in the neighbouring houses were broken, doors and frame-work split and crushed, and several walls were levelled with the ground. The movement was confined to the building-yard and the adjacent houses. The quay next the river has sunk several inches, and the bed of the river, which before was "high and dry" at low water, is now covered to the depth of from 18 to 24 inches. The water in the river was agitated, and the motion was felt on board the vessels lying near. The men employed in the building-yard have been discharged, and all work suspended, and it will be some time before the injury can be repaired.—*Newcastle Journal* of last Saturday.

**ORNAMENTAL STATUES FOR THE SCOTT MONUMENT.**—During the last few days the workmen have been employed in placing the stone figures intended to decorate the architecture in the principal niches assigned to them over the central arches. Two of them have been now fixed, one looking to the north, the other to the west. The former figure is a statue of Prince Charles Stuart, in the full Highland garb. He is in the attitude of drawing his sword, and has an expression of defiance in his countenance. It is, on the whole, well executed, particularly the head, and has a pleasing effect; it was executed by Mr. A. Ritchie, of this city. The other figure represents "The Last Minstrel," a reverend man, bare-headed, dressed in a flowing robe, in the act of touching his harp. This is a very picturesque and poetical figure, and does much credit to Mr. James Ritchie. We understand it is intended to place on the south or east side of the monument a figure of the "Lady of the Lake," which is already executed; she is supposed to be just stepping from a shallop, the prow of which, with oar, &c., is visible under her feet. This is the most pleasing figure of the three which has yet been executed. We believe the subject of the fourth is not yet decided upon, though a model of "Meg Merrilees" has been completed for the purpose.—*Edinburgh Evening Post.*

**THE LONDON ARCADE.**—The project is revived for opening a new street and erecting an arcade, to commence in Lothbury and Throgmorton-street, near the end of Bartholomew-lane, and to terminate near to London-wall and Finsbury-pavement south, together with a branch arcade leading from the last-named place, and terminating near to London-wall and Finsbury-circus.

**UNHEALTHFULNESS OF THE NORTHERN SUBURBS OF LONDON THROUGH THE EFFLUVIA OF PONDS.**—A vestry meeting of the parish of St. Pancras has been held, for the purpose of considering the application on the part of a body of the inhabitants of Highgate, to be permitted to divert the roadway, alter the drainage, and make such other improvements in the Highgate ponds as would be conducive to the better health and comfort of the neighbourhood. Mr. Bird, the parish surveyor, in submitting plans of the proposed alterations, said, a committee of gentlemen had been formed for this purpose, and, excepting a sum of 65*l*, which the directors and guardians had already agreed to give towards so beneficial an object, it would be carried into effect without expense to the parish. The water contained in the ponds was the only water the inhabitants could command in cases of fire. They were also very deficient there of water for household purposes, and when the drainage was diverted from its present course, the purity of the water would be much greater. A vestryman said that great effluvia arose from the ponds in their present state, and no doubt seriously affected the health of the inhabitants. The project would confer a great benefit on the district. Mr. Morris thought malaria very prevalent in the neighbourhood. The vestry, as conservators of the health as well as the funds of the parish, were bound to acquiesce in that which was likely to be a remedy for the evil. The consent of the vestry was given to the plan.

**DURHAM SCHOOL.**—A new building, in the neighbourhood of the Prebend's Bridge, has been devoted to the purposes of this ancient foundation by the munificence of the dean and chapter, and was opened on Monday last. It is built in that style of domestic architecture which commonly prevailed about the reign of our first James, and the school-room, with its projecting gable and long mullioned window, and the dormer windows and bell-turret of the other part of the structure, as seen from the south road and other neighbouring points of view, combine in a picturesque and pleasing manner with the dark masses of trees which form its back-ground. The school-room has an open timber roof, is lofty and well proportioned, and is capable of containing about 200 boys. A spacious cloister unites this with the house, which is henceforward to be occupied by the head-master, in which provision has been made for the accommodation of forty or fifty boarders. — *Durham Advertiser.*

**PAINTING ON GLASS.**—From Munich we learn that the king has ordered the formation of a special school of painting on glass, and the construction of a large workshop, to be entirely dedicated to that branch of art, and in which all who pursue it shall be admitted to labour.

**THE BRISTOL ATHENÆUM.**—A proposition has been made to establish an Athenæum Institution at Bristol, similar to the one at Manchester.

**ST. MARYLEBONE BANK FOR SAVINGS, 76, WELBECK-STREET.**—ESTABLISHED 5TH JULY, 1830. COMPARATIVE STATEMENT OF PROGRESS at specified periods during the last seven years.

	Open Deposit Accounts.	Sums Invested with National Debt Commissioners.
	£.	£.

D. FINNEY, Secretary and Actuary.

**Tenders.**

**TENDERS** delivered on the 18th inst. for building Two Houses in the Clapham-road, Kennington, for P. T. Torkington, Esq.—Mr. J. Barnett, 68, Chancery-lane, Architect.

Notley .....	£2,180 0
Pearse and Guerrier .....	1,993 0
Gleyn .....	1,990 0
Lawrence .....	1,987 0
Haynes and Co. ....	1,937 10
Locke and Nesham .....	1,875 0

The above tenders were opened in the presence of the builders

**TENDERS** delivered for building a new School at Rotherhithe. November 8, 1844.

Kelsey .....	£837
Piper .....	826
T. Anson .....	797
J. and T. Ward .....	790
Ashley .....	786

**NOTICES OF CONTRACTS.**

For building a Sewer in Ellison-street, Petticoat-lane.—Joseph Daw, Sewers' Office, Guildhall. November 26.

For supplying Iron Railing and Gates round the Birkenhead Park, about 3½ miles.—The Chairman of the Improvement Committee, Town Hall, Birkenhead. November 26.

For the supply of First, Second, and Third-class Carriages to the Manchester, Bury, and Rossendale Railway.—James Smithells, Secretary, Railway Office, Bury. November 30.

For the construction of Locomotive Engines and Tenders for the Manchester, Bury, and Rossendale Railway.—Mr. C. E. Cawley, Engineer, Railway Office, Bury. November 30.

For the supply of 600 Coal Waggon to the York and North Midland Railway Company.—George Baker, Secretary, York, December 4.

For the building of a Tunnel on the Edinburgh, Leith, and Granton Railway.—December 4.

For Lighting the Southampton Paving Trust with Naphtha or other strong Light for the period of eight months from the 1st of February next.—John Arnell, 10, Edmund-street, Hampstead-road. December 11.

For making a Survey and Valuation of Property in the town of Kingston-upon-Hull, for the better rating of the same to the relief of the poor.—John Moxon, Workhouse, Hull. December 12.

For the execution of Works necessary for the completion of the whole of the Railway from Shoreham to Chichester, being a distance of about 22½ miles.—Frederick Otley, Secretary, Brighton and Chichester Railway Office, 4, Dean-street, Tooley-street. December 17.

For the supply of 6,000 tons of Iron Rails, each rail to be 16 feet in length, and weighing 65 lb. per yard.—H. Parker, Secretary to the Great North of England Railway Company, Darlington. December 23.

**COMPETITIONS.**

The Committee of the Association recently formed in the Metropolis for the Construction of Baths and Wash-houses for the Labouring Classes, are desirous of obtaining Plans and Estimates for the Erection and Fitting-up of the First Establishment. The general basis of the plan can be seen at the Office, No. 3, Crosby-square. The author of the plan considered the best by the Committee will be selected to execute the work.

**TO CORRESPONDENTS.**

James Kendall.—We have made the inquiry, but have not yet received an answer.

To the correspondent who wishes to know from "actual knowledge" whether Job and Brothers' patent paper resists the damp in walls as thoroughly as the laminated lead, we answer we have not at present the knowledge, but recommend him to examine instances, or to depute some agent to do so: the chief difficulty lies in keeping attached to a damp wall any such separating medium; thus tin-foil applied to the same purpose, though at first appearing to be a cure, soon falls off, and forms no effectual remedy.

G. B. is quite correct. Mr. Locke, who is so much engaged in the construction of French railroads, is an Englishman, while Mr. Brunel is a Frenchman.

J. B. S.—We believe Martin's Cement was used and found to answer; it was also adopted in successing the interior of the Sun Fire-office.

Inquirer.—The system referred to is essentially faulty. Dr. Rees, in his report "On the Ventilation and Warming of the Cells" in the New Model Prison, at Pentonville, states that "Any required temperature once established, cannot be materially lowered in less than from ten to fourteen days."

The Communications of "An Architect," "A Draughtsman," "T. S.," and "A Subscriber," have been received, and are under consideration.

**PUBLICATIONS RECEIVED.**

*Description and Uses of the Ship Manowarer, by means of which a ship's head may be directed at all times to any point required.* Thomas Dean and Co., Threadneedle-street.

*Remarks on Ventilation and Warming, chiefly having reference to Prisons, and also applying to other Public Buildings.* By an Engineer.—Bradbury and Evans, Whitefriars.

**MEETINGS OF SCIENTIFIC BODIES**

*This day and during the ensuing week.*

**SATURDAY, November 24.**—Royal Botanic, Regent's-park, 4 P.M.

**MONDAY, 25.**—Geographical, 3, Waterloo-place, 8½ P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.

**TUESDAY, 26.**—Medical and Chirurgical, 53, Berners-street, 8½ P.M.; Zoological, Hanover-square, 8½ P.M.

**WEDNESDAY, 27.**—Society of Arts, Adelphi, (Exhibition Night).—Papers will be read "On Mr. R. Davison's Cask-cleaning Machinery;" and "On Mr. Higgs's Plan of Collecting the Contents of the London Sewers," 8 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.; Ethnological, 27A, Sackville-street, 8 P.M.

**THURSDAY, 28.**—Antiquarian, Somerset-house, 8 P.M.; Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico-Botanical, 32, Sackville-street, 8 P.M.

**FRIDAY, 29.**—Botanical, 20, Bedford-street, Covent Garden, 8 P.M. (Anniversary meeting.)

**SATURDAY, 30.**—Royal, Somerset-house, 8½ P.M. (Anniversary meeting); Westminster Medical, 32, Sackville-street, 8 P.M.

**ADVERTISEMENTS.**

**NEWLY INVENTED GLAZING FOR WORKSHOPS, WAREHOUSES, OFFICES, HORTICULTURAL PURPOSES, &c.**—Gerard Arney and Co.'s Transparent Waterproof Glaze Paper, Linen, and Calico, being substitutes for Glass for the above-mentioned purposes. The proprietors solicit the attention of Builders, proprietors of manufactories, &c., to the above-mentioned preparations. The Glaze-paper will be found the most suitable for windows from its superior transparency and great cheapness; it affords a light very similar to ground-glass, and the frames for its support need only consist of a lattice-work of wood or wire, the waterproof materials being affixed either with tin snails or cement. The Glaze-calico, being of stronger texture, will be found very suitable for sky-lights, glazing for conservatories, &c.

Having specimens of either of the above-mentioned materials, the proprietors will be happy to forward samples for their inspection, upon application by letter, post-paid, to their Manufactory, High-hill Ferry, Upper Clapton, Middlesex.

**Prices.**—Waterproof Glaze-paper at 6*s*. per yard, 23 in. wide; Waterproof Glaze-calico at 1*s*. per yard, 31 in. wide; Waterproof Glaze-linen at 1*s*. 6*d*. per yard, 28 in. wide.

**TO BUILDERS, CABINET-MAKERS, AND OTHERS.**

**SALISBURY GLUE** 60*s*. per Cwt.; fine Scotch do. 56*s*.; Town do. 4*s*., and 42*s*.; Best Glass Paper 104*d*.; Second do. 9*d*.; French Polish and Spirit Varnishes 1*g*s. per gallon; Naphtha do. 10*s*.; Genuine White Lead 26*s*.; Second do. 24*s*. and 22*s*.; Improved Stucco Paint 2*s*.; Invisible Green and Chocolate Colours 2*s*.; Fine Green, and all Colours used in House Painting, prepared by a new process to dry in six hours, 6*d*. per lb.; Turpentine 2*d*. 6*d*. per gal.; Linseed Oil 2*s*. 6*d*.; White Lead 3*d*. per cwt.; Stockholm Tar 1*s*. per barrel; Pitch 10*s*. per cwt. Gilder's Materials, Ladders, Bronze, Dutch Metal, Patent Gold Paint, Dies and Die-woods, Acids, Alkali, Gums, and Salts of every kind, and all articles at equally low prices. **W. NIXEY'S** Old-Established Warehouse, 22, MOOR-STREET, SEVEN-DIALS, LONDON.

**PLUMBERS, PAINTERS, BUILDERS, AND OTHERS** supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures, Glazing, &c. &c. at any quantity, at Wholesale Prices.

TURPS, per gallon . . . . . 2*s*. 4*d*.  
LINSEED OIL, ditto . . . . . 2*s*. 4*d*.  
SHEET LEAD in sheet, per cwt. . . . . 1*s*. 4*d*.  
Ditto, cut to sizes and PIPE . . . . . 1*s*. 6*d*.  
WHITE LEAD (Genuine) per cwt. . . . . 2*s*. 6*d*.

Colours, Pine, Brushes, &c. &c., equally low, and quality guaranteed. Lists may be had, on an application to R. COGAN, 5, Princess-street, Leicester-square, London. **PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS**, can be provided with flattened Crown, flattened Sheet, and the patent Sheet Plate. Lists of which, shewing the price for any Square, from 14 by 12 to 40 by 30 of Best and Second quality, will be sent (gratis) upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for, if required.

**NURSERMEN, MARKET GARDENERS, AND OTHERS** requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London.

**COMMON SHEET AND CYLINDER.** The advantages Common Sheet over Crown for Glazing Sky-lights is decidedly great, and is generally used where strength or superior appearance is required; a slight 6*ft*. 6 in. long, with openings of any width, needs only one flap. This Glass is considerably stouter than Crown, and may be had from 1*s*. 3*d*. per foot.

Also may be had, **COGAN'S PATENT CHIMNEY FOR GAS OR OIL**, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

**LAMP SHADES AND GAS GLASSES,**

OF EVERY DESCRIPTION. **GAS CONTRACTORS, FITTERS, GLASS MERCHANTS,** and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

**CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS,** supplied with FRENCH ORNAMENT SHADES, for covering Models of Public Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application.

French Table Flowers, China Vases, Fancy Glass Ware, and Alabaster Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Bazaar keepers and others.

NOTICE.

In answer to several inquiries by letter, we beg to state that a few copies of Mr. Bartholomew's Cyclopaedia of the New Metropolitan Building-Act can still be had of our publisher, No. 2, York-street, Covent garden, at the usual price of a double number.

The Builder.

No. 1007.

SATURDAY, NOVEMBER 30, 1844.

WE thought we had last week completed the catalogue of calamities to buildings, but we find, as if on purpose to place the subject in a stronger light, other similar misfortunes have just occurred, and the proportion of fatal calamity which has attended them has not been less than in the aggregate which we gave last week. The following form a small selection from those which have most recently happened:—

**"FALL OF A WALL.**—On Thursday, the 21st inst., a wall, about forty feet in height, suddenly fell at the corner of Showfield-street, in Chelsea-road, with a tremendous crash, burying underneath the ruins four individuals who were at the time at work upon it. The unfortunate men—John Newman, aged 30, a master bricklayer; William Lee, aged 45, journeyman; James Lardner, aged 28, journeyman; and Arthur Ellis, aged 16, an apprentice—were standing upon some scaffolding erected near the summit of the above wall, when the latter, which had recently been run up, gave way near its base, and the whole instantly fell. Assistance having promptly arrived, the men were got from among the rubbish, and three of them were conveyed in a sadly mutilated state to St. George's Hospital, whilst Newman, who resides near the spot where the accident happened, and sustained a severe injury of the skull and legs, was conveyed home. Each of the unfortunate men lies in a very precarious state. The cause of the occurrence is stated to have been the wet weather, which prevented the work from setting or drying."

**"FALL OF A HOUSE.**—On Thursday, the 21st inst., a new building, situate at the corner of Duke's-place, in Old-street, St. Luke's, fell, and buried a number of workmen, bricklayers and labourers, in the ruins. The accident is stated to have been occasioned by an overflow of water from an old sewer leading along the main road, which, becoming choked, the water rushed through it near to the new buildings, and flowing into the foundation; the mortar was washed from the brickwork, and the footing eventually yielding to the superincumbent pressure, the upper work fell perpendicularly into the excavation, scarcely a single brick falling outside of the base of the frontage wall."

So that we have still the same alleged causes, greenness, and mal-adroitness in the temporary management of the building-operations. Thus, more and more does there appear to be requisite an adequate controlling power, which shall watch over such affairs, and put in execution all means practicable for gaining the desired end.

ELECTION OF SURVEYORS TO THE NINE NEW DISTRICTS IN THE COUNTY OF MIDDLESEX.

(Thursday, the 28th instant.)

FOR FULHAM.

- No. of Votes.  
98. Mr. Andrew Moseley—elected.  
58. — Henry Harrison.  
7. — Augustus Abraham Winterbottom.

FOR HAMMERSMITH.

63. Mr. James Charles Christopher—elected.  
38. — Samuel Beazley.  
33. — Frederick Claudius J. Parkinson.  
30. — Martin Joseph Stately.

FOR SOUTH KENSINGTON.

138. Mr. Thomas Leverton Donaldson—elected.  
18. — John Blore.

FOR NORTH KENSINGTON.

134. Mr. Charles Benchcroft—elected.  
34. — George Godwin, Jun.

FOR HAMPSTEAD.

127. Mr. Henry Edw. Kendall, Jun.—elected.  
39. — Thomas Bird.

FOR HOARSELEY.

108. Mr. Alfred Bartholomew—elected.  
38. — James Harrison.

FOR TOTTENHAM.

115. Mr. John Henry Taylor—elected.

FOR STROKE-NEWINGTON.

128. Mr. William Lovell, Jun.—elected.  
15. — William Frederick East.  
12. — James Moon.

FOR BROMLEY.

56. Mr. John Blyth—elected.  
55. — Henry John Hammon.  
37. — John Morris.

- I. — George Henry Simmonds.

FOUR NEW-DISTRICT-SURVEYORSHIPS IN THE COUNTY OF SURREY.

The magistrates will meet at twelve o'clock on Monday next, to elect surveyors to the four new Metropolitan Districts in the county of Surrey.

SOCIETY OF ARTS.

Nov. 27.—W. Pole, Esq., V. P., in the chair.

The secretary read a paper by Mr. Robert Davison, engineer, "On the Manufacture of Casks, more particularly those used by Brewers, with remarks on the various methods adopted for Cleansing and Purifying such Casks."

The next paper was by Mr. Higgs, on his plan of collecting the contents of the London sewers.

The author proposes to form, at convenient stations throughout the metropolis, three parallel tanks or reservoirs, at levels sufficiently low to receive the contents of the sewers; each of these tanks to be furnished with a gate, somewhat resembling a flood-gate.

Into one of these reservoirs the soil to be allowed to enter until completely filled, the gate then to be closed, and the matter allowed to settle for one tide.

In order, to precipitate the phosphates, &c., hydrate of lime is proposed to be spread evenly over the surface by means of a hopper-formed waggon running to and fro on a moveable railway, placed over the reservoir.

The precipitation having been effected, the comparatively pure water would be let off or drawn off, and the valuable residue removed.

In the meantime, the second reservoir would be filled, and the process repeated.

The plans of Mr. Garling and Mr. Martin for effecting the same object were discussed at some length.

BUILDING SOCIETIES.

TO THE EDITOR OF THE BUILDER.

In the fifth number of THE BUILDER, a letter to the editor of the *New Zealand Journal* was inserted, detailing the operations of a Building Society, established for the purpose of enabling parties to purchase freehold or leasehold property, as follows:—

"A fund is raised by monthly contributions from each member or shareholder, out of which subscribers are assisted in their endeavours to become possessors of such property as may be best suited to their own interest or advantage. Each shareholder must contribute to the association (say, for example) ten shillings per month for each share of which he is the possessor, until these monthly payments shall, with the profits, amount to 120*l.* per share. The operations of the society will thus extend over a space of about ten years, and then cease altogether.

"When the funds become sufficiently large to make advances to the subscribers, due notice is given, and that member who will submit to the largest deduction or discount from the amount of his share of 120*l.* for priority of advance, is the one to whom the loan will be immediately granted; the property purchased with the society's funds to be mortgaged to the association, as security for the continuation of his monthly instalments, until the termination of the society.

"A few figures will illustrate this more clearly. Suppose a subscriber, living in a house for which he pays an annual rent of 35*l.*, subject to a ground-rent of 5*l.* per annum, wishes to purchase such house by means of the society, the method is as follows:—

He holds one share, which at the expiration of ten years would realize .....	£120 0 0
But for immediate cash he submits to a deduction from such share, of .....	50 0 0

Leaving a balance on one share in his favour, of .....

£70 0 0

"Now, as the sum of 70*l.* obviously cannot be sufficient to purchase property valued at 300*l.*, the subscriber avails himself of the society's resources to enable him to complete the purchase.

Surveyor's valuation of premises desired .....

£315 0 0

4½ Shares at the agreed price of 70*l.*, as before stated, makes ..

315 0 0

"The monthly payments to the society for such advance would be as under:—

4½ Shares at 10*s.* per share .....

£2 5 0

Interest or redemption money per share, 4*s.* per month .....

0 18 0

Monthly payments .....

£3 3 0

Which multiplied by months ..

12

Makes yearly payment to the society .....

£37 16 0

In addition to which, for ground-rent annually .....

5 0 0

Total amount cost .....

£42 16 0

"So that, instead of paying 35*l.* per annum to the landlord as rent, by paying the association 42*l.* 16*s.* annually, a difference of 7*l.* 16*s.* more, the freehold or leasehold property in ten years becomes the borrower's own; shewing that in ten years the house has been purchased for only 7*l.* more than in the same time he would have paid for rent alone."

Assuming this statement to be correct, the question of advantage or disadvantage to the parties interested may be thus viewed.

Let the company consist of 100 gentlemen, each of whom puts down 315*l.*; and that 100 other persons consent to become subscribers of 42*l.* 16*s.* a year, the company being able to locate these 100 subscribers at the beginning of the year in 100 houses, for which 31,500*l.* are paid.

Now, in ten years the company must get back these 31,500*l.*, with 5 per cent. compound interest; that is to say, they must receive 51,310*l.* 3*s.* 10*d.*, when the houses will belong to the subscribers. But they receive this by an annual rental of 4,250*l.*, which in ten years, as improved at 5 per cent. compound interest, will amount to 53,833*l.* 7*s.* 8*d.* There is, therefore, a bonus of 2,523*l.* 3*s.* 10*d.* to the 100 capitalists, or 25*l.* 4*s.* 8*d.* to each.

This goes on the supposition that none of the subscribers die in the course of these ten

years; and, moreover, that they one and all pay annually 42*l*. 16*s*.

With regard to the capitalists, we must dismiss from that side of the question all idea of mortality, as, in the event of any one of them dying, there would be heirs and assigns to represent him, and his share would stand as it originally did when he paid his 315*l*.

But with the subscribers the case is different; and if we suppose there will be a mortality commensurate with that published by the Registrar-General at Somerset-house, then we may estimate it at two deaths in the 100 annually.

Now, supposing two of the subscribers to die in the course of the first year, and the widows or families cannot continue the subscriptions or pay the rent, for that is the terms, then two houses would fall to the share of the capitalists, who could sell these again to two new subscribers, and so on till the end of the tenth year, when, by twenty deaths, they would have all the advantages of these windfalls, to enhance their gains and preserve their stock entire.

This is no imaginary case, but one that results from the course of nature, and which, to these capitalists, resembles lapsed policies in an assurance-office.

But the estimate we have quoted proceeds on the principle, not of an annual payment of 42*l*. 16*s*., but of a monthly payment of three guineas by the subscribers for the period of 120 months, and which the capitalists would improve at 5 per cent. compound interest.

It is manifest that if the buyer pays 3*l*. 3*s*. monthly to the capitalists, the question is reduced to this:—

To what sum would an annuity of 37*l*. 16*s*. for ten years amount, when received and laid up at interest in monthly portions of 3*l*. 3*s*. each, the interest, at the rate of 5 per cent., being converted into principal twelve times in the year?

Now, this amount is 479*l*. 5*s*. 4*d*. in ten years; but the buyer pays besides 5*l*. a year ground-rent, and we must suppose the capitalists to be the ground-landlords in such a case, therefore the buyer pays an additional annuity of 5*l*. a year for ten years, which at 5 per cent. compound interest amounts to 62*l*. 17*s*. 9*d*. in these ten years.

Therefore he pays the capitalists in ten years the sum of 542*l*. 3*s*. 2*d*. for his house.

And he has to pay this ground-rent of 5*l*. annually, unless there be some special agreement that it is redeemed by the ten payments of 5*l*. each, for which the prospectus does not afford any information to the contrary.

In the event of 100 capitalists clubbing in this speculation to provide 100 buyers at the beginning of the year with 100 houses, the problem is briefly this:—

The capital of 31,500*l*. invested at 5 per cent. per annum compound interest, would in ten years amount to 51,310*l*. sterling; the buyers would repay to the capitalists the sum of 54,215*l*. sterling; hence, the capitalists would divide a bonus of 2,905*l*. amongst them, or each would get 29*l*.; and be entitled besides to an annual bonus of 5*l*. in the shape of his ground-rent, after realizing all his capital, with compound interest at the rate of 5*l*. per cent.

But if we throw into the calculation the vicissitudes of fortune, and the stern law of mortality as impressed upon the buyers, there is no arithmetic strictly applicable to the enormous gains of these hundred capitalists, who always remain as a fixed quantity in the estimate, while the buyers are a fluctuating quantity, every increment of decrease in which yields a corresponding increment of augmentation, which enhances the gains of the capitalist in a ratio which time and circumstances can only develop.

I am, Sir, your obedient servant,  
WILLOUGHBY WILTON.

#### INSTITUTION OF CIVIL ENGINEERS.

TELFORD AND WALKER PREMIUMS.  
SESSION 1844.

The Council of the Institution of Civil Engineers have awarded the following premiums: A Telford medal in silver to William Fairbairn, M. Inst. C.E., for his paper "On the properties of the Iron Ores of Samakoff, &c." A Telford medal in silver to John Murray, M. Inst. C.E., for his "Description and Drawings of the removal of the Lighthouse on the North Pier, at Sunderland."

A Telford medal in silver to James Bremner, M. Inst. C.E., for his papers "On Pulteney Town Harbour," "Sarclet Harbour," "A new Piling Engine," and "An Apparatus for floating large stones for Harbour Works."

A Telford medal in silver to Andrew Murray, Assoc. Inst. C.E., for his paper "On the construction, &c. of Steam Boilers."

A Telford medal in silver to Alexander Angus Croll, Assoc. Inst. C.E., for his paper "On the purification of Coal Gas, &c."

A Telford medal in silver to James Braidwood, Assoc. Inst. C.E., for his paper and drawings descriptive of "The means of rendering large supplies of Water available in cases of Fire, &c."

A Telford medal in silver to Jacob Samuda, Assoc. Inst. C.E., for his "Account of the Atmospheric Railway."

A Telford medal in silver to Charles Ilutton Gregory, Grad. Inst. C.E., for his paper "On Railway Cuttings and Embankments."

A Telford medal in silver to Captain William Searth Moorsom, Assoc. Inst. C.E., for his "Description and Drawings of the Avon Bridge at Tewkesbury."

A Telford medal in silver to Thomas Crissell, Assoc. Inst. C.E., for his "Description and Model of a Scaffolding used in erecting the Nelson Column."

A Telford Medal in silver to Charles Manby, Secretary and Assoc. Inst. C.E., for the translation and arrangement of the "History of the Canal and Sluices of Katwyk," and the "Description of the Works of the Amsterdam and Rotterdam Railway," by the Chevalier Conrad, M. Inst. C.E.

A Walker premium, "The Transactions of the Institution of Civil Engineers," suitably bound and inscribed, to the Chevalier Conrad, M. Inst. C.E., for his "Description and Drawings of the Works of the Amsterdam and Rotterdam Railway."

A Walker premium of books, suitably bound and inscribed, to James Leslie, M. Inst. C.E., for his "Description and Drawings of the Iron Lock Gates of the Montrose Docks."

A Walker premium of books, suitably bound and inscribed, to John Ceale Thomson, Grad. Inst. C.E., for his "Description and Drawing of the Landslip in Ashley Cutting, Great Western Railway."

A Walker Premium of books, suitably bound and inscribed, to John Timperley, for his "Account of the building of the 'Wellington' Bridge, Leeds."

A Walker premium of books, suitably bound and inscribed, to George Willoughby Hemans, Grad. Inst. C.E., for his "Description and Drawing of a wrought-iron lattice Bridge on the Dublin and Drogheda Railway."

A Walker premium of books, suitably bound and inscribed, to William Evill, Jun., Grad. Inst., C.E., for his "Description and Drawings of the London Terminus of the Eastern Counties Railway."

A Walker premium of books, suitably bound and inscribed, to Arthur John Dodson, Assoc. Inst., C.E., for his "Description and Drawings of the Hydraulic Traversing Frame, used on the Great Western Railway."

A Walker premium, "The Transactions of the Institution of Civil Engineers," suitably bound and inscribed, to James Forrest, Jun., for his "Drawings and Diagrams illustrative of numerous Papers read at the Meetings."

The Council take this opportunity of calling attention to the importance of making the Institution the depository of drawings, descriptions, and models of works and machinery; also of books, papers, reports, and pamphlets, which latter, though apparently of only local or temporary interest, would, when collected, be of great value to the profession.

SESSION 1845.

THE Council invite communications on the following, as well as other subjects, for Telford and Walker premiums:—

1. On the Theory of Arches, Abutments, and Piers, comparing the hypotheses of different writers; with practical examples of the application of the theory.
2. The history of the invention of, and the improvements in, oblique Arches, with the theory and the practical methods of setting them out.
3. Experiments on the pressure upon every

- part of an oblique Arch, especially how the pressure varies as the angles become oblique.
4. On the construction of Retaining and Wharf Walls, with examples of failure and the causes.
5. A description of the Canal of the Helder (Holland), or of any foreign engineering works of a similar kind and importance.
6. The modes of Irrigation in use in Northern Italy; of Drainage adopted in the Lowlands of the United Kingdom; or works of a similar nature in Holland or in other countries.
7. On any of the principal Rivers of the United Kingdom (the Shannon), or of Foreign Countries (the Po, Italy,) describing their physical characteristics, and the Engineering works upon them.
8. An account of the waste or increase of the Land on any part of the coast of Great Britain, the nature of the Soil, the direction of the Tides, Currents, Rivers, Estuaries, &c., with the means adapted for retarding or preventing the waste of the land.
9. The principles and practice of constructing Cofferdams.
10. The best and most economical mode of raising large Stones or Rocks from the beds of Rivers or Harbours.
11. The application of Gunpowder as an instrument of engineering operations.
12. The conveyance of Fluids in Pipes, under pressure, and the circumstances which usually affect the velocity of their currents; with accounts of Water Works and Gas Works.
13. The most advantageous method of employing the power of a Stream of Water, where the height of the fall is greater than can be applied to Water Wheels of the usual construction.
14. Experiments on Water Wheels, Steam Engines, and other machines, with the friction brake.
15. The construction of Cranes for raising and lowering weights.
16. The proportions of large Chimneys, as affecting their draught; with examples and drawings of the construction.
17. The drainage of Mines, exemplified by a statement of the actual condition of some of the Coal-fields or Mining Districts of Great Britain.
18. The ventilation of Coal Pits or Mines in Great Britain or in Foreign Countries.
19. The construction of Spiral and Fan-blowing machines, and the power required to drive them, in relation to the pressure and volume of air delivered.
20. The smelting and manufacture of Metals in Great Britain or in Foreign Countries.
21. The comparative advantages of Iron and Wood, or of both materials combined, as employed in the construction of Steam Vessels; with drawings and descriptions.
22. The sizes of Steam Vessels of all classes, whether River or Sea-going, in comparison with their Engine Power; giving the principal dimensions of the Engines and Vessels, draught of water, tonnage, speed, consumption of fuel, &c.
23. The best forms for River and Sea-going Steam Vessels; with practical examples.
24. The various modes of propelling Vessels in actual or past use, and their comparative merits.
25. The results of the use of tubular boilers, and of Steam at an increased pressure, for Marine Engines.
26. On the best application of the principle of Expansion to the improvement of the Steam Engine; with examples of the effect of such application, from actual experiment, and a description of the Engines experimented upon.
27. On the term "Horse Power," as applied to Steam Engines.
28. Description of Pyrometers, for ascertaining the degrees and the fluctuations of the temperature of the Flues of Furnaces, &c.
29. The various modes adopted for moving Earth in Railway Tunnels, Cuttings, or Embankments with the cost thereof.
30. The proper slopes for Cuttings and Embankments in various soils.
31. Notice of the principal Self-acting Tools employed in the manufacture of Engines and Machines, and the effect of their introduction.
32. On the most effective and best adapted Machines for bruising or crushing the Sugar Cane, and for separating the juice from the vegetable fibre.

33. Memoirs and accounts of the Works and Inventions of any of the following Engineers:—Sir Hugh Myddelton; Arthur Woolf; Jonathan Hornblower; Richard Trevithick; William Murdoch (of Soho); and Alexander Nimmo.

Original Papers, Reports, or Designs, of these or other eminent individuals, are peculiarly valuable for the Library of the Institution.

The communications must be forwarded, on or before the 31st of May, 1845, to the house of the Institution, No. 25, Great George-street, Westminster, where copies of this paper, and any further information may be obtained.

CHARLES MANBY, Secretary.  
25, Great George-street, Westminster, 1844.

Extracts from the Minutes of Council, February 23rd, 1835.

"The principal subjects for which Premiums will be given, are—

"1st. Descriptions, accompanied by Plans and explanatory Drawings, of any Work in Civil Engineering, as far as absolutely executed; and which shall contain authentic details of the progress of the Work. (Smeaton's Account of the Edystone Lighthouse may be taken as an example.)

"2dly. Models or Drawings with descriptions of useful Engines and Machines; Plans of Harbours, Bridges, Roads, Rivers, Canals, Mines, &c. Surveys and Sections of Districts of Country.

"3rdly. Practical Essays on subjects connected with Civil Engineering, such as Geology, Mineralogy, Chemistry, Physics, Mechanic Arts, Statistics, Agriculture, &c.; together with Models, Drawings, or Descriptions of any new and useful Apparatus, or Instruments applicable to the purposes of Engineering or Surveying."

Note.—The communications should be legibly written on foolscap paper, on the one side only of each page, leaving a margin of one inch and a half in width on the left side, in order that the sheets may be bound.

The Drawings should give as many details as may be necessary to illustrate the subject, and should be to such a scale that they may be clearly visible when suspended on the walls of the Theatre of the Institution, at the time of reading the communication.

Papers which have been read at the Meetings of other Scientific Societies, or have been published in any form, cannot be read at a Meeting of the Institution, nor be admitted to competition for the Telford and Walker Premiums.

ON THE EXPENSE OF SURVEYS.

CAPTAIN TUCKER'S REPORT TO THE ORDNANCE DEPARTMENT.

In obedience to your order of the 22nd of February, 1844, I have the honour to submit the following estimates for the Health of Towns Commission, plans on the scale of five feet to one mile, shewing contour altitudes, or altitudes marked at equal vertical distances, in the streets of towns, contour lines without the towns, sufficient to be serviceable for the sewerage and drainage of them, and including

the expense of ascertaining sewers, water-pipes, and gas-pipes, arranged under the following heads:—

1st. Of towns of which the survey is completed.

2nd. Of towns of which the survey is in progress.

3rd. Of towns of which the survey has not been commenced.

No. 1. Towns Surveyed.—In the estimate under this head the expense of the surveying and levelling already done is not included, as I have considered them to have been performed for the Ordnance Survey; therefore, I have only charged the additional expense of marking contour altitudes in the streets, and contour lines outside the towns, ascertaining sewers, water-pipes, and gas-pipes.

The cost of making copies of the plans is inserted, to which the additional cost is added, to shew the cost of copies of the plans with the additional information for sanitary purposes.

No. 2. Towns in progress for the Ordnance Survey of England.—The estimate for levelling and marking contours in the streets is for the levelling which will be necessary for the improvement of the sewerage and drainage of towns, supposing it to be done for that purpose.

The cost of copies of the plans is the same as for Class No. 1.

No. 3. Towns of which the Survey is not commenced.—The surveying, plotting, and drawing are charged, shewing the cost of levelling, contouring, ascertaining sewers, water-pipes, and gas-pipes, as in No. 2.

The expense of fixing points is not included in the estimate.

The expense of surveying varies in proportion to the size or population and the compactness of the town.

The area or extent of the close or compact part of a large town being greater in proportion to the whole area or extent of the town, than the compact part of a small town bears to its whole area or extent, the cost of surveying will be greater in proportion to its area than the cost of a small town; therefore, I have estimated the cost of preparing plans of towns having a population of 10,000, 20,000, 50,000, 100,000, 300,000.

The levelling and marking contour altitudes in the streets embraces the shewing the water-shedding line, and the lines of natural drainage, as accurately as the sinuosities of the streets will allow of their being traced, and the levelling is supposed to be arranged for that particular object, as contour lines cannot be laid out within the towns; shewing also a sufficient number of contour altitudes to connect altitudes marked along the line of drainage with equal altitudes marked along the water-shedding lines.

The expenses of levelling and contouring are estimated for towns situated on gentle slopes. For abrupt slopes the expense of levelling will be nearly one-third greater, but the contour altitudes in the streets will be at greater vertical distances, and fewer contour lines will be laid out.

I have considered the towns of 10,000 and 20,000 inhabitants to consist of long branching streets with few cross streets, and requiring

less levelling than towns that are compact with numerous cross streets.

The expense of contouring or marking the contour lines outside the town is calculated on the supposition that one-third of the whole area, usually included on the Ordnance plans, will admit of their being laid out, and the expense shewn in the estimate is the average expense per acre for the whole area of the plan.

The levelling performed at Windsor cost 6d.5. per acre, including the levelling for four lines of sections, in addition to that which would have been sufficient for sewerage and marking the contours.

The contouring cost 2.75 per acre.

The contours above the datum mark at the bridge are laid out at four feet vertical distance from each other.

Those below the datum point at two feet vertical distance apart.

The expense of contouring was much increased by the necessity for laying out and surveying the lines before the plan was drawn, in order to complete them before her Majesty's return to the Castle, which caused an increase of 0d.75 to the expense.

The cost of contouring Windsor exceeds the expense per acre, shewn in the estimate for towns, arising from the large extent of country in proportion to the area covered by the town, the contoured area being three-fifths of the area of the plan; whereas, in the estimate for plans of towns, the space or extent of ground on which it will be possible to lay out contour lines is supposed to be one-third only of the area of the plan.

The cost of ascertaining the sewers, water-pipes, and gas-pipes of Windsor, and the Castle, and putting them on the plan, amounted to 1d.3 per acre for the space occupied by the town.

The sewers, water-pipes, and gas-pipes of Manchester have not been ascertained.

The cost of obtaining them for the town of Oldham amounted to 1d.1 per acre.

The sewers and water-pipes, but not the gas-pipes, have been ascertained for Bury at the expense of 0d.28 per acre.

The plans of Oldham and Bury are not sufficiently advanced for the insertion of the sewers; therefore the expense of putting them on the plan is not known.

The expense of ascertaining the sewerage, water, and gas-pipes, varies according to the facilities given by the local authorities in appointing persons to shew their position and the quantity of the sewerage; some places being very deficient, and few or none possess plans.

There is not a plan of the sewers of Oldham, and only one man, eighty years of age, could be found who knew the situation of a principal sewer.

I have not included contingent expenses, as office rent, conveying parties or stores, as should the commissioners wish to undertake the surveys of towns, these expenses will depend on the strength of the party or parties employed, each of which, I think, should consist of sixteen to twenty surveyors, to be divided into two parties, when the towns nearest to each other are small, or to be employed as one party if a town be large, that the survey may be promptly executed.

ESTIMATE OF THE COST PER ACRE OF FIVE FEET PLANS OF TOWNS.

Population of the Towns.	First Class. Copies of Plans of Towns of which the Surveying and Levelling are completed.					Second Class. Copies of Plans of Towns of which the Levelling is not commenced.					Third Class. Plans of Towns of which the Survey is not commenced.

## ANCIENT ROME AND MODERN LONDON CONTRASTED.

BY H. G. MONTAGUE, ESQ.

(Continued from page 569.)

Modern Rome, says a recent writer, occupies a triangular space, each side of which is nearly two miles long; the ground upon which it is built covers about 1,000 acres, or one square mile and a half; its walls form a circuit of about 15 miles, and embrace an area of 3,000 acres. Other writers make its circumference, including all the sinuosities of the walls, but 13 miles. This space embraces the seven hills, or mounts, on which ancient Rome stood, the names of which are still retained. Three of these only are covered with buildings, and are only thinly inhabited, the Trans-tiberine district, including the Borgo, contains the rest of the inhabitants. The ancient city, with its enormous palaces, amphitheatres, temples, baths, and other public buildings and gardens, most probably filled in the whole extent within the walls. But although it is asserted that the city was then thrice the extent, including vast suburbs without the walls, there is no proof that there existed any other than country-seats of the great and wealthy, who in the most palmy state of Rome were few in number. Modern Rome contains 54 parishes and 300 churches, 114 convents and monasteries, 335 noblemen's houses, 872 elementary schools, and in 1836 its population consisted of 153,678 souls. There are a great many villas in the immediate vicinity, and even within the walls.

That ancient Rome could not have occupied more space than the boundaries of the present city, is evidenced by numerous historical facts. Augustus Cæsar had two cohorts of soldiers posted in the Trans-tiberine region, which was then one of the suburbs of Rome, whose duty it was to put out fires, and suppress tumults; this region was connected with Rome as Southwark and Westminster are with London. Publius Victor gives it 423 streets. Pliny tells us that, in the time of the emperor Trajan, it consisted of 213 streets. Donatus says the walls of Aurelian were the same in compass as in his days. Olympiodorus observes that it was measured in the time of Honorius, 150 years after Aurelian, and that the city had been preserved in its extent and beauty. Victor remarks that every one of the fourteen regions, into which it was divided, being measured and taken apart, its whole compass did not make up 43 miles.

Seneca, Lucan, Aristides, and others speak of numerous country-houses in the suburbs, "Innumere nobilium villæ intra mœnia erant, quæ suburbanæ vocabantur," which seems to prove that the suburbs were walled about as well as the Trans-tiberine region, which was considered as suburban. Pliny, when he speaks of 213 streets, says, "We have seen the whole city surrounded by the houses of Caius and Nero, and even, that nothing might be wanting, the fine palace of the latter was of gold, or gilded over."

The streets of ancient Rome were always narrow and inconvenient, after the fashion of Oriental countries; even the Appian and Flaminian Ways were only broad enough for two vehicles to go abreast. The houses of the lower orders were exceedingly mean and poor, and seldom more than one story high, and the temples, theatres, and many of the domus or noble residences were built of wood when Augustus assumed the purple; he improved and rebuilt a great portion of the city, and added many splendid edifices to it, but in this and during the succeeding reigns the streets were still continued narrow and inconvenient, and the chief of the two largest, viz. Flaminia or Triumphalis, was not more than eight or nine feet broad, and not long within the city; yet it was in this street, Martial tells us, all Rome assembled on a day of triumph. Mardini tells us, after Donatus and Publius, that there were not above 42,000 or 46,000 houses, and that they were but one story high, the people lodging on the ground, and that the houses were extraordinarily mean. Lipsius also, who has so grossly exaggerated the grandeur and extent of Rome, reckons only 46,000 houses; among these were 1,700 or 1,800 domus or palaces for the senators and wealthy citizens

of rank, the rest being insulæ, and were inhabited by the common people.

After the conflagration in Nero's time, Tacitus tells us "The streets were made regular and wide, the height of the houses limited, with arcades and porticos in front, nor was timber used in their exterior parts, but stone only. Public reservoirs of water were provided in various places, and persons to assist in extinguishing fires appointed, and every edifice had its distinct party walls. These regulations, though dictated by utility, did not fail to give beauty also to the new city." From this we may conjecture that, previous to the conflagration, it was somewhat similar to London in olden times, the major part of the city consisting of mean, narrow streets and wooden tenements; and this is demonstrated by the then general destruction, the greater portion of the city having fallen a prey to the flames.

The Romans had few of the elements of wealth which we possess: divided into two classes, freemen and slaves, rich and poor, their nobility were wretchedly poor when put in comparison with the rank and wealth of the City of London. Their boasted temples, palaces, amphitheatres, and baths, their aqueducts and other public works, evidence the dejected and prostrate condition of the common people and the effects of successful war, which gave them slaves beyond count. Merchants, traders, and shopkeepers were held in no estimation, for the Romans were not a commercial people, nor had they any but woollen manufactures and a little linen. Architecture and sculpture were encouraged as administering to luxury, and not from a refined love of the arts, and the few trades followed to any extent were chiefly carving, joinery, gilding, goldsmiths', jewellers', and blacksmiths' works, and trades connected with their games and amusements and the army; also those of tailors, shoemakers, vintners, carpenters, fishermen, masons, cartwrights, and shipwrights, and linen and woollen weavers. Their chief source of wealth was war; from the foundation of the empire to the final close of its career, they could scarcely boast an interval of peace within themselves or with other nations; fortune favoured them on most occasions, and every victory contributed to increase their riches, and gave them, from the multitude of slaves taken in battle, a constant accession of wealth and a profitable investment for their capital. War supplied them with slaves to cultivate the soil in the absence of the citizen-soldiers; thus the desolating effects of war were unfelt by the citizens, who also participated in the advantages of every great victory, which threw such multitudes of slaves upon the market, that the meanest citizen, if so inclined, might purchase one or more of those human machines from whose industry they expected to extract wealth. Lipsius affirms there were no less than three or four millions of servants or slaves; and Vossius says there were more servants in Rome than there are inhabitants in any kingdom on earth, and no less than fourteen millions of inhabitants of all sorts; but this can only apply to the whole Roman territory, and not to the capital; and even then it is questionable whether the country, depending almost solely upon its own internal agricultural resources, was sufficiently fertile to supply such a population.

It is utterly impossible to reconcile to our minds the weak, insulated position of the Romans at the breaking out of the first Punic War, and the powerful fleets and armies brought forward during the twenty-three or twenty-four years of its continuance. Polybius, who is considered the most correct of Roman historians, tells us, that previous to the breaking out of that war the Romans had no ships either for war or commerce, and that a navy was created for the purpose of combating the Carthaginians. We are then told that under the conduct of Marcus Attilius Regulus and L. Manlius, they had a fleet of 350 ships, *naves longæ* triremes, quadriremes, and quinqueremes (vessels exceeding one another by one bank of oars), but even the exact nature and uses of these vessels are uncertain; that each galley had 300 rowers and 120 soldiers, the whole fleet consisting of 140,000 fighting men, and provided with the necessary munitions of war for land and sea. How are we to reconcile this with the knowledge of seamanship we at present possess? The

Mediterranean is no fish-pond, nor is an army of this extent a trifling one to be cruising about in open galleys; to each vessel must be attached many days' provision and water; the military engines were also very heavy and cumbersome. The dimensions of each galley must have been large enough to admit each man to have fighting room, and to have admitted the upper rowers to have full sweep between the lower ones, and the platform above must have had ample accommodation for 120 soldiers and their warlike implements. Again, if the Romans during the Punic War had attained to so great excellence in the naval art, how is it that this naval superiority was not maintained in the after periods of Roman grandeur? that the Romans in Polybius's time, when they were arrived at almost universal empire, could not fit out such fleets, and make such naval preparation? To this we have no answer, simply because no satisfactory answer can be given! The whole account is grossly exaggerated, and no doubt much of it fabulous.

Wherever memorials exist, we find the like exaggeration. When speaking of population, victories, and defeat, Polybius tells us, that in the time of the consuls M. Valerius Messala and L. Apustius Fullo, the force landed by the Romans to oppose the Gauls amounted to near 700,000 foot and 7,000 horse; and Polybius, on the occasion of the muster, expresses his admiration of the hardy enterprise of Hannibal to attack an empire of such prodigious strength with an army of scarcely 20,000 men; and how much more is this admiration increased when we find it reported to the Carthaginian senate that, in the course of his progress up to the conclusion of the battle of Cannæ, he had defeated six consular armies, slain 200,000 men, and taken 50,000 prisoners, 50,000 having also fallen at the battle of Cannæ!

(To be continued.)

## HARWICH RAILWAY AND PIER.

It will be interesting to know that the project for improving the harbour of Gloucester, and making it available for the purposes of the intended communication, is likely to be met by a corresponding effort on the part of the government with respect to the port of Harwich.—The report of Captain Washington is now before us, from which we learn that the present difficulties in the navigation are easily removable, and that a very moderate outlay will suffice to render Harwich available for every purpose which its geographical situation suggests; and we may speedily hope to see Harwich harbour once more "the only real Harbour of Refuge on the east coast of England, between the Thames and the Humber," as well as the "best point for steam communication with Holland, Hamburg, and the North of Europe."—The method proposed by Captain Washington is based on the proposal of the Eastern Counties Railway Company to give 30,000l. towards the construction of a pier, on the plan proposed by Mr. Rendel. This, with the breakwater as suggested, will not only afford a perfect shelter to vessels under stress of weather, but would also entirely protect the Government property, which is greatly jeopardised by the present state of the harbour. The plan, as laid down by Captain Washington, is extremely simple, and is comprised under the three following heads:—1. To put an immediate stop to the quarrying up and carrying away the cement stone from the foot of Beacon Cliff.—2. To replace, by an economical breakwater of rough stone, run out from Beacon Cliff, the natural barrier that has been taken away, so as to confine and guide the ebb tide against Landguard Point, and thus stop its increase.—3. To dredge a 15-foot channel (or if preferred, an 18-foot channel) in lieu of the former deep-water passage now lost.—These suggestions being carried into effect, the port of Harwich will present a perfect shelter, with a channel of 15 feet deep throughout a quarter of a mile along the whole length of the Suffolk shore. This will enable "large steamers at all times of the tide, frigates at a quarter flood, and the largest ships of the North Sea fleet at high water to enter the harbour by night as well as by day."—*Railway Times.*

## ON THE ARRANGEMENT AND CONSTRUCTION OF HOUSE DRAINS.

BY MR. JOHN PHILLIPS.

The attention of the public being now very much drawn to the subject of house drainage, it would appear to be extremely desirable that clear views of the elementary principles of the subject should receive the utmost publicity, to the intent that a better mode should speedily succeed the present had and inefficient system of building house drains. And as I have found much difficulty in procuring information upon many points which require elucidation, I have ventured, as a practical man, to throw together a few thoughts, being anxious to add my mite to the general stock of knowledge upon this subject.

A system of perfect drainage is, in a sanitary point of view, of paramount importance, for without it no habitation can be considered as a fit place of residence, the general health and comfort of the inhabitants of every dwelling being very sensibly affected by it. There are a great many confined and densely-populated localities in and about London where the want of house drainage is evidently very apparent. All the refuse water and matter at these places, from not being carried off, accumulate, saturating the whole extent of the adjacent ground to the depth of several inches, thus producing buggy tracts of black, stagnant, and putrid matter. The exhalations evolved from the decomposition of these accumulations are of the most noisome and intolerable description, infecting the surrounding atmosphere with pestilential impurities. In such localities, a shower of rain must be looked upon rather as an evil than as a means of doing good, for as the water cannot escape, it stirs up the vast amount of accumulated abomination, thereby producing the most dreadful effluvia. The interiors of dwellings in places of this description never become clean; they are kept nearly in the same state as the ground out of doors; thus the floors and walls of such dwellings are being continually luted over with foul matter, and the inhabitants, instead of keeping the floors cleansed by washing, actually endeavour to do so periodically by scraping them with a shovel or other instrument. In fact, these disgraceful dens of filth and neglect cannot be considered in any other light than as vast corrupt dung-heaps.

The building of cesspools and bottoms of drains is usually performed with bricks laid without mortar, the consequence of which is, that the surrounding earth becomes saturated from the permeation of the sullage matter through their interstices. This is frequently observable in making excavations, where, in taking up the old cesspools and drains, the ground adjacent and for some considerable distance is found blackened from the soaking of the sullage matter. The foundations of the walls, and the walls themselves, often become saturated from the same cause. Floorings also become rotten, from the acrid acid which is exuded, and a kind of oxidation is also found to gather on the surface of the ground and on the underside of the flooring. The fetid odour evolved by evaporation from the saturated ground and walls finds its way through the chinks of the flooring, and thus the whole atmosphere within the house becomes tainted; this process is continually going on, for as evaporation takes place, the ground is receiving incessant supply from the permeation through the interstices of the brickwork.

Besides the insalubrity of the atmosphere, produced from the evaporation of the stagnant accumulations on the surface of badly drained localities, as well as the saturated ground from cesspools and drains, the malaria emitted from the decomposed animal matter retained within the cesspools, is of a poisonous and highly noxious character, very frequently producing typhus and other infectious fevers. Considerations of public health, therefore, point out the immediate necessity of providing a wide and extended system of efficient house drainage. The use of open, permeable

cesspools ought to be entirely prohibited, as, by allowing the retention of the more solid matter within such receptacles, the effluvia emitted therefrom is productive of the most injurious effects, and for the future the construction of such ought not to be tolerated under any circumstances.

To insure perfect house drainage, it is most essential that a sewer be formed and carried up to the front of each tenement, and that a perfect and properly-formed drain be made therefrom, to communicate directly with such sewer. It is also essential that the sullage from each tenement be carried off through the drain into the main sewer as fast as engendered, and with the greatest despatch possible. The purpose of sewers is to afford ready means to receive and carry off the drainage of premises; but the pains taken in the construction of the sewers to give them the proper form and fall, are rendered entirely useless while cesspools and drains are not at the same time kept clear. This is best effected by an abundant and well-regulated supply of water passing through them, for no drain, however formed, can be effective in producing complete and rapid transmission of soil to the main sewer otherwise than by this power. Hence, no system of house drainage can be considered perfect that does not include the proper construction of and cleansing of both drains and sewers by an abundant supply of water, for they are so combined, that they may be considered as one.

Each individual is now allowed to carry a drain from within a few feet of the sewer, according to his own fancy, the part next the sewer being generally built by the Commissioner of Sewers, consequently drains are not made with that due consideration of their use which the nature of the subject demands. So long as a drain is made, it is considered sufficient, and being under ground and unseen, it is consequently less thought of. Proper construction is seldom or never attended to, and drains are made of all manner of shapes, and very frequently of the worst possible materials. The obtainable fall is scarcely even strictly regulated so as to produce the greatest effect; and the junctions with the main sewer and with each other are generally formed in a very imperfect manner. The usual workmanship of drains, after the first 3 feet, is executed in an improper and slovenly style, the interior surface of the brickwork being made very undulating and rough, and in turning the upper arched work, pieces of mortar fall from the joints to the bottom, where they lie and become hard, and in consequence present a series of obstructions along the whole extent of the drain. While the inventive faculties are usually put to the utmost test upon the other details of a building for the purpose of producing effect and good workmanship, this most essential adjunct is neglected, the proper form, size, construction, and general efficiency of drains being seldom considered.

From the examinations which are constantly being made into complaints of the stoppages of drains, the cause of stoppage is generally found to arise from the drains themselves, and not from any accumulations in the sewers; in fact, this is nearly always the case. The forms of the drains and the irregularities of their falls, the unevenness of the surface, and the pieces of mortar which lie on the bottom, as well as the badly-formed collateral junctions, are the general causes of stoppages, but the principal reasons arise from the drains being too large, and from an inadequate supply of water to carry off the soil; as it is, drains generally form receptacles for retaining within them matter which they were intended to convey away.

The size of every drain should be consistent with the size of the building, and the quantity of water and matter likely to pass through it; for if a drain be made too large, the water will be spread over a wide surface, the velocity of the stream will be diminished in proportion, and, in consequence, it will not have sufficient power to carry away the soil, and eventually the drains will become choked. A disproportionately large-sized drain is more likely to become choked with the same quantity of water and matter passing through it than one of a smaller size; for, when contracted, the water, having a greater depth and velocity, is better able to carry off any obstructions which it may meet with in its course.

Drains to sewers should be carried in direct lines right through premises, and their falls should be regulated so as to form perfect inclinations from their heads to the sewers. The lateral junctions of drains should be curved in the direction of the fall of the stream, otherwise deposits will be formed at those junctions. The interior surfaces of drains should be even, uniform, and smooth, for the purpose of facilitating the passage of the sullage water and matter, and also to prevent any adhesion to their sides. They should also, if possible, be formed perfectly water-tight, so as to prevent the permeation of the sewerage. Wherever an inlet is formed to a drain, an efficient trap air and water-tight should be constructed, to prevent the escape of any noxious and offensive smells; and the neck of the soil-pan of every water-closet should be connected immediately with a properly-formed water-tight trap, communicating with the drain.

The power of a stream running in a cylindrical pipe is the greatest at the axis, and gradually decreases from thence towards the surface of the pipe where it is least. The forms of drains should be made as much as possible in accordance with the natural action of running water. The circular form suits nearly that action, therefore flat-bottomed and upright-sided drains should never be made. The sectional area of a drain of twelve inches diameter is sufficient, if properly constructed and managed, to carry off the sewage of several houses; but, from conflicting interests, it is far preferable and much more convenient that each tenement have a separate drain communicating directly with the main sewer in the street. As was previously observed, the size of a drain should be in proportion to the area of the building, the adjacent ground to be drained, and the quantity of water conveyed thereto. If drains were thus proportioned, the present supply of water would be found nearly effectual in preventing any accumulations and consequent obstructions within them. The effect of the present supply of water is rendered of little avail in consequence of the size of the drains, as at present constructed. Therefore, in order to render the action of water more certain, when collected within drains, it is absolutely necessary that their size should be considerably reduced, which being done, accumulation would be next to impossible; the soil would be carried off into main sewers, instead of being retained within cesspools and drains; and by a proper and well-regulated system of sewerage, the refuse-water from every drain could be rendered available for keeping the sewers themselves perfectly clear from accumulations of soil.

Drains of from 4 to 8 inches diameter are of capacity sufficient to afford efficient drainage from any ordinary dwelling-house, and as the best and most effectual form is nearly that of a cylinder, and as it is not practicable to build them of such small sizes, and of such a form with common brick, we should look to another material for their construction. The ordinary common drain-tiles seem to answer the purpose extremely well; but, as it has become requisite to reduce the subject to a clearly defined system, in order to supersede the present ill-constructed brick conduits, these tiles do not afford any very great advantage over them. The most efficacious manner of constructing drains would be with thick, strong clay pipes, well burned, and glazed inside; made of an entire piece nearly of a circular form, and of a length convenient for use, so that the end of one pipe could fit into the next without forming a protrusion within it. Drains thus formed and carried in direct lines with regular inclinations to sewers, with proper curved junctions, all properly laid, and with an efficient and well-regulated supply of water, would be effectual in carrying off the sullage and keeping themselves perfectly free from accumulations, for the calibre being smaller, the stream would be more contracted, and in consequence would have greater velocity. The smoothness of surface produced by glazing would vastly facilitate passage through them. With proper apparatus they could be cleansed if required at any time, precisely in the same manner as chimneys are now swept, consequently breaking up floors and paving, with all the accompaniments of foul stench, and

matter distributed about, would be rendered unnecessary. The above method would insure the perfect cleanliness of drains; and a properly-constructed trap to every inlet would be a preventive to any noxious and offensive exhalations emanating from them. In laying the tubes, the ground should be cut as near as possible to their form, and the lower half should be thinly bedded with mortar to fill up any little irregularities in the cutting of the ground, the tubes would then have a solid foundation.

If a line drawn from the vertical and horizontal extremities of the diameters of the tube fall within its substance, it will support any external pressure short of crushing the materials. Therefore, the proper thickness, to insure the stability of a cylindrical tube drain, is determined thus:

Fig. 1.

Fig. 2.

Fig. 3.

Figure 2 is a section of a pipe of 6 inches diameter; *a a a* shewing the manner of forming the joints.

Figure 3 is a horizontal section, shewing

Let A B C (Fig 1) represent the interior semi-circumference of a cylindrical drain tube; join the extremities of the vertical and horizontal diameters at the vertex and side B and A, and draw the line E F parallel thereto, forming a tangent to the curve, cutting the diameters produced in E and F, either of those points will give the extent of the least thickness of the ring. With the radius D E or D F, draw the circle F E G, concentric to A B C. Thus the substance between the two circles is the proper thickness for a tube, for the lower half having the solid ground for its foundation, and being firmly bedded therein, any weight placed on E will be distributed through its substance because the line of pressure E F drawn from the two outer extremities falls within the substance of the tube.

According to the foregoing method for determining the proper substance for the tubes, the following are the thicknesses requisite for the several diameters, viz.—

	Inch.
For a pipe of 4 inches diameter the proper thickness is	0 2
" 5 "	" 1
" 6 "	" 1 1/4
" 7 "	" 1 1/2
" 8 "	" 1 3/4
" 9 "	" 2

Being made of entire pieces, they are better able to resist pressure; they are as durable, if not more so, and are far more efficacious in action, than common cylindrical brick drains. The cost of them would be about half the price of the present brick drains.

Wherever any alterations are being made to premises, and a desire is evinced to improve the drainage, or where drains are troublesome from often becoming stopped, cylindrical tube-drains should be immediately substituted for the present inefficient drains.

Fig. 4.

Figure 4 is a section of a portion of the sewer in use in the Westminster Commission, shewing the proposed manner for forming the connection of a tubular drain with the sewer. The tube is formed with a lip at the bottom, so that the water flowing from the drain into the sewer shall trickle down the invert, instead of being projected into the current. The junctions of drains with a sewer should be formed as near to the bottom of the sewer as is convenient, for when placed too high from the bottom, the water and matter, dropping from them into the main current, cause a retardation to take place, producing violent eddies, which prevent the heavier matter from flowing with the main current, and cause deposits to take place in the upstream, which, by increasing, eventually fill up the sewer.

Fig. 5.

Figure 5 shews the method of forming a trap to receive surface drainage; it is made of one entire piece, with a socket on the outlet end, fastened on to a tube. The stone paving is bedded on the stone, and a hole cut in the stone underneath the grating the same size as the pipe. It is evident no foul smell can escape from this trap while the bottom is kept filled with water, and in dry weather care should be taken to pour water into the trap, to make up for the water which the heat of the weather will have evaporated.

(To be continued.)

CHINESE GRANITE.—At the meeting of the highway board, on Thursday the 21st instant, an offer was made to sell the commissioners a quantity of Chinese Granite at 6s. per square yard, being about half the price generally paid. The granite is of very superior quality, and is of lighter colour than is found in this country. The specimen sent to the commissioners has been nicely squared by the Celestials, and it appears to have formed a portion of some building.—*Liverpool Paper.*

the lateral junctions formed in one piece. These junctions should be made of different sizes, so that smaller drains may branch from the main lines.

## NEW APPLICATION OF RAILWAYS TO SUPPLY TOWNS AND CITIES WITH WATER.

An agreement has been executed between a committee of inhabitants of Edinburgh and the committee of management of the Caledonian Railway, for the use of part of that line for the supply of the city with water.

The following extract from the proceedings of a public meeting in Edinburgh, the Lord Provost being in the chair, will serve to shew the view which is taken in Edinburgh on this subject.

Mr. Hunter, after having stated the position of the inhabitants of Edinburgh with respect to their present defective supply of water, thus proceeded:—From a report of Mr. Rankine, a young engineer of high promise,—it was thought a good supply of water could be brought along the line of the Caledonian Railway. You are generally aware that the line of that railway will, at a distance of 12 or 14 miles from Edinburgh, come along high grounds, saturated with the fluid of which we stand in need, and thus afford an ample supply of pure water to the city, provided the requisite measures be taken to render those sources effective. Mr. Rankine has made a survey of the line through which the railway is to pass, and I will now read to you his letters to Mr. Morton, the secretary, on the subject, giving an estimate of the probable expense of putting the plan into execution. [Here Mr. Hunter read the letters referred to, from which it appeared that the total sum required to bring a supply of water by the proposed line, which would give 226,800 gallons per day, or about 14 gallons to each inhabitant of Edinburgh and Leith, would not exceed (exclusive of the cost of distributing pipes in Edinburgh) 85,000*l.* or 90,000*l.*] This statement (continued Mr. Hunter) is made upon a rough estimate only, but I think it is sufficient for present purposes, and is perfectly satisfactory. The Lord Provost, along with the Provost of Leith, Mr. Morton, and other gentlemen who have taken a great interest in promoting this plan, highly merit the gratitude of their fellow-citizens for the manner in which they have acted. They knew no time was to be lost, for, as I shall immediately shew you, it is altogether indispensable that we should come to a final decision, and be ready to act when the Caledonian Railway Bill is before the House of Lords, which I hope will be at no very distant period of next session. After communicating with the Railway Company, the following heads of agreement were drawn up:—

1. That the said second parties (inhabitants' committee), or any public board of trustees, or company of shareholders, to whom they may transfer their right under this agreement, shall be entitled and have right, at their own expense, or having obtained Parliamentary or other sufficient powers for that purpose, to lay down or carry a conduit or pipe capable of delivering from 300 to 500 cubic feet of water per minute, along the line of the Caledonian Railway, from a point at or on the north side of its summit level near Cobbinshaw to the Edinburgh terminus; and to convey water thereby for supplying the city of Edinburgh and town of Leith and neighbourhood from such suitable springs or streams as they may acquire right to. The arrangements for forming said conduit or laying said pipe, and for connecting the same with the springs or reservoirs, shall also be made and executed according to plans to be submitted and approved of by the engineer of the Railway Company, and to his satisfaction, and the arrangements for maintaining, repairing, and using such works after they are executed, shall also be subject to the approbation of the Railway Company's engineer.

2. That any springs or streams of water that may be found in the line of the cuttings of the railway, may at convenient time and seasons be taken and collected by the said second parties, and also convey along said pipe or conduit, in so far as the said Railway Company may not require them—the said second parties always obtaining the consent of any parties having right to such springs or streams.

3. That the Railway Company shall be entitled to take from said pipe or conduit, if informed, a supply of water for their engines, or any other purposes, at such places or stations

as may be pointed out by the said company, such supply not exceeding in all 20 cubic feet per minute.

4. That the said second parties shall use their best endeavours to aid the Railway Company in procuring an Act of Parliament for the formation of the said railway.

5. That the agreement now made shall not be binding upon either party, unless the engineer of the railway shall be satisfied that the proposed conduit or pipe can be laid in the line of the railway, and maintained and made use of, without causing injury or risk thereto.

6. It is anticipated by the second parties, that the fulfilment of the plan proposed will not cause any material addition to the expense of forming the line of railway. But as the parties are not at present fully informed in regard to this point, it is farther agreed, that if the engineer of the Railway Company shall find that the expense of the railway will be thereby increased, the second parties shall pay the whole additional expense that may be incurred by the Railway Company, in consequence of the acts of the said second parties, as the same may be ascertained by the engineer of the railway.

7. That the second parties or their foresaids shall be bound to state, within eight days after the Bill for the railway shall have been read a second time in the House of Lords, whether they intend to take advantage of, and act upon, this agreement or not; and in the event of their failing to do so, they shall forfeit all right under it.

8. It being the object of the Caledonian Railway Company by thus lending the use of their line of railway, to assist in furnishing to the cities of Edinburgh and Leith a cheap and ample supply of water, through a public trust to be created for that purpose—but it being stated by the second parties hereto, that the contemplated works must probably originate in a private company; therefore it is conditioned, that in the event of a public trust being at any time created, and executing or using the contemplated works for the purpose aforesaid, the Caledonian Railway Company shall have the power of exacting a sum not exceeding 5*l.* annually in the name of lordship; but should the contemplated works be executed and carried on by a private company, then the Caledonian Company shall be entitled to claim annually from said company one-tenth of the nett surplus profits arising from said undertaking, whenever such nett surplus profits shall amount to or exceed 5 per cent. per annum on the capital laid out; or in the event of said surplus amounting to  $\frac{1}{2}$  per cent. and being less than 5 per cent., the difference between  $\frac{1}{2}$  and 5 per cent., whatever it may amount to, shall be paid to the Railway Company over and above said lordship of 5*l.* annually in all events to be exigible; declaring that if such company shall at any time transfer the concern and works to a public trust, then the right of the Railway Company to the said tenth of the nett surplus profits shall cease, and the payment shall be restricted to a sum not exceeding 5*l.* annually of lordship as aforesaid.

**THE TIMBER TRADE.**—It is said that the timber, wool, and guano trades are the only ones in which large sums of money have not been lost by importers during the present year, and it is a fact worthy of notice that in two out of three of these trades the protective system has been, in whole or in part, abandoned during the last four years. It will be remembered that one of Sir Robert Peel's earliest measures was to diminish the amount of protection on colonial timber, and it was most confidently predicted at the time that the colonists would be ruined by the change. The result has shewn that this was a false prophecy, for the timber trade has never been in a more healthy or prosperous state. This is partly the result of a breaking up of a system of speculation and overtrading, but still more of the revival of trade and commerce. People have once more begun to build houses, mills, warehouses, and ships, and the result has been to create a brisk demand for timber, and to shew that commercial and manufacturing prosperity are of infinitely more value in the timber trade than all the protecting duties ever invented.—*Liverpool Times.*

## ON THE PLAN ADOPTED IN VENTILATING THE CELLS OF THE PENTONVILLE PRISON.

BY DR. OWEN REES,

*Principal Medical Officer of the Prison.*

The report of Major Jebb on the Pentonville Prison, recently presented to Parliament by command of her Majesty, has once more drawn public attention to the various experiments now being made there. As the whole system must necessarily hinge upon the health of the prisoners, and as their health must be affected for the better or for the worse, according to the plan adopted in warming and ventilating their cells, much attention has been given to this important subject. There are various opinions alloat with respect to the efficiency of the plan adopted; some go so far as to condemn it *in toto*, others call only for a modification, while a few are to be found who confess that they cannot imagine the ingenuity of man to devise a more perfect system.

It will be well if these differences of opinion are cleared up, and the truth demonstrated, before the Government commence the proposed introduction of the same plan into the various prisons throughout the country; and it is with this view that we present our readers with the subjoined report, our object being to excite discussion, and to induce observation and experiment:—

“Having been desired to give my opinion in writing on the plan adopted for ventilating and warming the prison, I beg leave to state, that the former of these objects has been most effectually attained during every season of the year.

Prisoners employed at trades requiring great exertion have frequently, when questioned, spoken in terms of praise of their cells as a workshop, even during the warmest months of the summer.

During the winter complaints have occasionally been made, having their origin in an excess of warmth, rather than a deficiency of ventilation, the former producing distress under exercise, which was not always attributed to its proper cause.

The experiments which have been made on several occasions in order to test the purifying powers of the system in use, have shewn its superiority over the usual plan of stove and chimney ventilation, an advantage mainly to be attributed to the perfect diffusion obtained by the method applied to the cells, while the greater part of the fresh air entering a room and passing up a chimney, is productive of draught, and therefore less available as a purifying agent.

The bulk of air passing through each cell was ascertained at the commencement of last summer to be about 30 cubic feet, or 180 gallons per minute; but the quantity at present drawn through each cell must be more than this, in consequence of the flues having become thoroughly dry since the experiments were made.

The prison cells contain about 800 cubic feet of air, and 180 gallons per minute pass through every cell, with the advantage of perfect diffusion; thus all conditions appear to have been secured to render the ventilation in every respect satisfactory.

As regards the plan which has been adopted for warming the cells, some difficulty has been experienced in regulating the heat, any required temperature when once obtained not admitting of being materially lowered under from 10 to 14 days after the fires have been extinguished. This inconvenience is owing to the non-conducting nature of the materials of which the building is constructed, and the large extent of surface for radiating heat contained within the fresh-air flues; and in virtue of the same conditions, nearly a fortnight has been required even now, that the building is dry, in order materially to raise the temperature of the cells by means of the winter fires.

Notwithstanding the difficulty above alluded to, it is fully anticipated that when the properties of the apparatus are better ascertained in relation to its effects on the building, that the quantity of coal for consumption during the 24 hours will admit of being so adjusted, as to produce any required temperature within such limits as shall remove all likelihood of inconvenience being felt either from excess of heat or cold.

It might at first view be supposed, that since

so long a period was required either to decrease or increase the warmth of the cells, that it would be impossible to guard against those sudden changes of temperature so commonly experienced in England. This would certainly be the case, were it not for a property of self-adjustment possessed by the apparatus, in virtue of a law governing the radiation of caloric from heated surfaces. The influence of this property is shown by the fact, that when the external air is at 20 to 25 degrees, an increase of from 25 to 30 degrees upon that temperature is, without difficulty, obtained in the cells; but if the external air suddenly rise to 48 or 50 degrees, instead of obtaining, as before, that which would now be an inconvenient addition of 25 degrees, or more, by the effect of the apparatus, we find only from 10 to 12 degrees increase on the atmospheric temperature produced in the air of the cells, the combustion of coal in the apparatus remaining the same.

The following table, taken from the prison register, exemplifies the adjusting power of the apparatus:—

Date.	Minimum temperature of External Air.	Minimum temperature of the Cells.
1841	0	0
January 1	33	60
" 2	31	60
" 3	22	57
" 4	23	57
" 5	42	57
" 6	45	58
" 7	39	60

It appears by this table that when the external air was 31 degrees the cells were 60 degrees, and when the former was 46 degrees the latter were 58 degrees, so that when the external air was 15 degrees hotter the cells were 2 degrees colder. It also shows that the night temperature of the cells ranged between 57 and 60 degrees.

This property of self-adjustment has, up to the present time, shown a sufficient range to remedy the inconvenience felt on sudden accessions of warm weather.

At the commencement of the present winter the cells were brought to a higher temperature than could have been wished, owing to the unexpected increase of effect produced by the heating apparatus, which in consequence of the flues being dry, acted more powerfully when 1 cwt. of coal was consumed during the 24 hours, than it did last year with a consumption of 3 cwt.; nor did even 5 cwt. suffice to raise the temperature to its present height when the prison was first erected, as was shown by results obtained from experiments made during the winter of 1841 and 1842. This great difference in effect is undoubtedly to be accounted for by the present dry state of the building, the greater part of the coal used during former years having been expended in vaporization of water, and consequently productive of no effect upon the air passing into the cells. It had been anticipated that owing to this circumstance, some difference of effect would be found in the action of the apparatus, and the furnaces for the winter fires were consequently built in at the commencement of the season, so as to burn only 1 cwt. of coal during the 24 hours, a rate of combustion which will now suffice to guard against the frosts of the winter, but which proved somewhat too powerful in effect for the mild weather experienced at the commencement of the present season.

G. OWEN REES,  
Principal Medical Officer."

**LIGHTING OF THE CHAPEL ROYAL, BUCKINGHAM PALACE.**—Prince Albert inspected the lighting of the Chapel Royal at Buckingham Palace a few evenings since. The chapel has been fitted up with gas lights inclosed in large glass globes ornamented with appropriate inscriptions, and fixed upon handsome ornate columns. They are ventilated upon Professor Faraday's principle of conveying away from the lights all the noxious products of combustion, by means of a descending draught, which is obtained in this instance by the assistance of Dr. Reid's ventilating shaft and apparatus. The Prince expressed himself much pleased with the perfect success of this application of that invention, as well as with the chaste and brilliant effect produced by the lights.

### FIRE-PROOF WAREHOUSES AT LIVERPOOL.

THE noble pile of warehouses now being erected for Mr. Brancker, is unquestionably the largest yet erected in Liverpool, occupies the three fronts of Great Howard-street, Dublin-street, and Dixon-street, and covers 4,433 square yards of land, being only 407 yards less than an acre. It is divided into eleven warehouses, of something less than 400 square yards each, not including the walls. The external walls are 3½ bricks thick, and the division walls are three bricks. When completed, the warehouses will be 65 feet high, and will have six stories of rooms, besides the basement or cellar story. Every window throughout the pile is to be glazed with large sheets of plate-glass, and each is protected by a strong wrought-iron shutter, secured to an iron frame. The floors are formed by iron girders or beams, resting on columns of great strength, and are all secured together by wrought-iron coupling-bars. The bearing-beams rest on large blocks, made of Welsh fire-clay, and brick arches of 9 inches thick are to be thrown from beam to beam, the lateral thrust of the arches being counteracted by wrought-iron tie-rods, strongly secured to the beams, which are placed horizontally every 6 feet on the average. These connecting rods are 1½ in. square, and are tested to resist a tension of thirty-five tons each. Every bearing-beam is also tested by a lever press at the building, to bear on its centre a pressure of thirty-eight tons, which is equivalent to a weight of four tons on each square yard. The floors of the whole structure are to be laid with Welsh fire-tiles, bedded in Terras mortar, there being an intervening stratum of sand to prevent the fracture of the arches, should heavy goods be thrown down upon them. The entrance-doors are made double—that is, of two separate plates rivetted together, having a cavity of an inch between them, with six small air-holes, so that if either side of the door became heated, the other side would be comparatively cool. The various rooms have also iron double doors of communication, each door being placed on the internal face of the wall, so as to leave a space of two feet between them. The staircases are inclosed from the rooms by walls of two bricks thick. These staircases are 18 feet long, by 7 feet 6 inches broad, and all the steps are of Yorkshire stone. Each staircase is to be provided with an upright main, of 6 inches diameter, which is to be supplied with water from the mains about to be laid down by the Sewerage Commissioners, and which, from the pressure of the Low-hill reservoir, will always be full of water. On each landing there is to be a brass stop-cock screwed, to fit either the hose kept on the premises (60 feet long being appropriated to each room), or it will fit the hose of the Commissioners and Fire Police, so that in case of fire, there will be an abundant supply of water on each landing, and instantly available. Small apertures are provided through which the branch can be inserted, and as each room will be perfectly air-tight, it will be impossible, if a fire occurs, for it to break out into flame. The staircases are so admirably constructed, that if every room in the building was on fire, men may be placed in perfect security on each landing, and pour a continuous stream of water into every room. All the entrance-doors are recessed back from the fronts of the building, and there are no projecting cat-heads or pent-houses beyond the line of the edifice. The roofs are all to be formed of wrought-iron trusses, covered with Welsh slates; and parapet-walls are to be built between each warehouse for additional security. Great attention seems to be paid to the drainage, there being three large dry wells of 5 feet diameter and 20 feet deep, and barrel sewers are being carried from all parts of the cellars into these wells. The whole of these magnificent buildings have been designed, and are being erected, by Messrs. Samuel and James Holme.—*Liverpool Journal.*

### THE ALBERT DOCK AND WAREHOUSES, AT LIVERPOOL.

IT is impossible to view the extensive excavation of the dock itself, or the immense piles of warehouses upon its margin, without seeing that we have been making provision for the future upon a scale of magnificence, and at an outlay proportionably commensurate with the

importance of the vast estate under our control. The area of water space, for instance, to be gained by the construction of the dock, will be 7 acres 1,805 yards, or better than 7½ acres. Some idea of this extent of water space may be formed, when we state that the Albert Dock will be nearly as large as the King's. The area of the latter is 7 acres 3,350 yards; that of the George's is 5 acres 154 yards; and that of the Waterloo is 5 acres 2,790 yards. The Albert, as we have said, will be upwards of 7½ acres; and this is by no means an inconsiderable quantity of additional space, particularly when we take into consideration that the facilities expected to be afforded to the commerce of the town by the Albert Warehouses will enable it to despatch more business than a dock double its size. The subsoil which has been excavated, and the greater part of which has been waggoned, on an iron tramroad laid down expressly for the purpose, to Beacon's gutter, on the north shore, where it has been made available in filling up the strand and forming the outline of new docks, which are now, in point of fact, being carried out with the greatest vigour, amounted to about 440,000 cubic yards, at a cost of nearly 82,000*l.*

The dock is at present nearly excavated to the full extent, and from its immense depth will be capable of affording accommodation to vessels of the largest tonnage and draught of water. Its walls are constructed of solid masonry, principally of granite stone, with a slight inclination towards the top. The cement was manufactured by steam in a house erected for the purpose on the western quay, and the piles for the foundation of the warehouses were driven by steam, according to a simple and ingenious process, which the King of Saxony, during his visit to the dock, seemed particularly to admire. The entrance is 50 feet wide, and the gates are formed of the best material.

None of the warehouses are as yet completed. Some are in a state of great forwardness, others are being raised, and the foundation-stone of the remainder has still to be laid. Those which are approaching completion are the finest specimens of solid and substantial workmanship we have ever seen. There is nothing like them in Liverpool or any other port in England, with the exception perhaps of those round St. Katherine's Dock, in London. The Albert Warehouses consist of four spacious stories, each of which gradually diminishes in height as you ascend. For instance, the height of the first floor is 12½ feet, of the second 11½ feet, of the third 10 feet, and of the fourth 8½ feet. To this splendid pile of building immense vaults are attached, approachable by flights of stone steps. The vaults separately contain an area of 27,457 square yards. They are an average height of 8 feet, and will afford the amplest accommodation for the storage of wines, spirits, and other excisable articles. The area of the warehouse-room, inclusive of the vaults, and exclusive of the quay, amounts to the enormous number of 138,805 square yards.

Taking cotton as the basis of stowage, and limiting it to four floors of the warehouses only, omitting the vaults altogether, it is calculated they will contain about 234,550 bales. Supposing one-half of the quay should, in a time of great pressure, be temporarily used for stowage, an additional quantity of cotton may be accommodated to the extent of 32,037 bales, making a total of 266,987 bales.

The parliamentary estimate of the cost of the Albert Dock, basin, and river wall in front, was about 217,448*l.*, and that for the vaults and warehouses was 317,106*l.*, making together 534,554*l.* The cost of the land, inclusive also of the cost of Canning's graving dock, was 247,711*l.*, making a total cost of 782,265*l.*—*Liverpool Courier.*

**SUBURBY IMPROVEMENTS.**—The commissioners for improving the town of Sudbury are acting vigorously in the execution of their office; two more of the houses surrounding the church of St. Peter are in a course of demolition, and it is expected in a few months that venerable building will no longer be blocked up by the unsightly tenements, which could only have been erected in by-gone times, when, in the absence of all proper control, "every man did that which was right in his own eyes."

## BRICK MAKING MACHINE.

A PATENT has lately been enrolled by William Hodgson, of 42, King-street, Kingston-upon-Hull, for "A machine for making and compressing bricks, small paviors, floor bricks, flat tiles, ornamental bricks, &c., at one operation." The invention relates to certain arrangements of machinery or apparatus for making or moulding and compressing, &c. bricks and tiles; that part of the invention which relates to the making or moulding of bricks, consists in having a mould constructed in such manner that all its sides shall fall down so that the brick can be removed. The sides and ends of this mould are covered with moleskin, which is turned over the upper edge and fastened thereto by means of brass beading or plates and screws; this mould when in use is placed within an outer mould, which during the making of the brick keeps the sides of the inner mould in a vertical position. The outer mould here spoken of is fixed upon a table, on the underside of which there are two or more treadles to suit the convenience of the workmen when on different sides of the table; these treadles communicate with a vertical spindle, the upper end of which passes through the table and is attached to the inner mould having moveable sides; the object of this arrangement being that when a brick has been formed in the inner mould, in the usual way of making bricks, such mould is raised from the outer one by placing the foot upon some of the treadles; the sides of the mould at the same time falling down admits of the brick being removed by means of a pallet-board in the ordinary manner. Upon the same table, and near the machine just described, is fixed the compressing apparatus, which forms the second part of the invention, and consists of a mould having its two sides attached to the bottom part by means of hinges, the ends of the mould being moveable and capable of approaching each other; this mould is made to drop within another similar to that just described, and over the mould is a pressing-box having inclined ends, which come in contact with the moveable ends. This pressing-box can be raised or lowered upon an arrangement of levers, the parts being so arranged that when the pressing-box is lowered for the purpose of compressing a brick, the underside of such box comes first in contact with the upper face of the brick, the inclined ends of the pressing-box coming at or near the same time into contact with the moveable ends of the mould cause the same to approach each other, and thereby compress the brick which is contained in the mould. The inventor claims the arrangement of making bricks by means of a mould having falling sides and ends, and also the arrangement for making and compressing bricks, paviors, and tiles by a mould with falling sides and moveable ends, as above described.

## Correspondence.

## BUILDING-ACT.

SITUATION OF NEW PARTY-WALL WHERE PREMISES ARE NOW DIVIDED OVER THE CENTRE OF A WAY TO PUBLIC Mews.

To the Editor of "The Builder."

SIR,—Perhaps some of your numerous correspondents will inform me how I shall be situated when the New Building-Act, of which you have given so able an exposition in No. 32 of THE BUILDER, comes into operation? There is a house adjoining an opening leading from a street into a public mews, over the centre of which opening is a party-partition supported on breast-summers; now, it is intended to pull down the front of the house, and I wish to know *where* and *how* the new party-wall will be situated provided the works are not commenced before the 1st of January next, and what will be the thickness required of the walls on either side of the opening, and also of the arch. The wall that supports the breast-summer on the side of my neighbour was at one time the party-wall, and now runs up above the roof, but it has been cut through, and now half the space over the opening belongs to each house.—I am, Sir, your obedient servant,

November 12th, 1844.

T. O. M.

[This case must be left to the official referees, who, as parts of the adjoining buildings

project over the way to the public mews, have power, at discretion, to divide the freeholds, assign the site of a party-wall, and determine the sum to be paid by one party to the other for loss.—Ed.]

## COTTAGE CONSTRUCTION AND DECORATION.

SIR,—Intending to erect a cottage similar to the design in No. 44 of THE BUILDER, and there being none other near, I thought of using chamfered bricks for the window-jamb (they are near at hand), with a moulding of cement to run round the sash-frame, the mullion to be of wood. Would you advise me to have a label moulding over the windows? if any, would you have cement or bricks moulded, or bricks with stone knees? As stone coping is expensive, would you prefer barge-boards to a coping of bricks? Also, do you think that bricks coated with cement would answer for window-sills? and as you were recommending iron-hooping, instead of bond timber, would you advise the bond for the floor to lie on bricks corbelled to receive it, or the joists to lie on the hooping? If you would have the kindness to answer these questions, I shall be greatly obliged to you, and you will confer a great favour on a country carpenter.

Gedney. W. HALL.

[We do not advise a cement moulding in the situation stated, as it would be out of correct style. Chamfered bricks will serve very well for the window-jamb; label-mouldings of brick, if well-made, will answer the purpose: we should not recommend the use of stone in labels, without they be wholly made of it. The sills should be either of brick or of stone. Wooden barge-boards are improper to buildings of brick or stone, and suitable only for buildings of wood, or of timber, lath and plaster. "Bond" is a term improperly applied in this case; the article mentioned is "a wall-plate," and must be of a stiff material; therefore, iron hooping, which is only for receiving and restraining tension, is not proper. Corbelled work is excellent, particularly for ground-floors, as in case plates and joists rot, the walls still remain sound.—Ed.]

## INQUIRY RELATIVE TO A KNOWLEDGE OF MARQUETRY.

SIR,—Can you or any of your valuable correspondents inform me how I may gain a knowledge of marquetry-work? By giving this a place in this month's magazine, you will oblige.—I am, Sir, yours, &c.,

A SUBSCRIBER FROM THE COMMENCEMENT. Ellsmere, Nov. 24, 1844.

[We insert our correspondent's request, and shall be glad to avail ourselves of any original observations upon the subject.—Ed.]

## APPLICATION OF THAMES' MUD TO BRICK-MAKING AND OTHER USES.

SIR,—At the present day, when invention and discovery appear to occupy the minds of almost every individual, I think it strange that no one has thought of applying to some useful purpose the vast accumulation of mud for many miles on the banks of the Thames. It appears to me that if it were properly analysed, it would be found an excellent material for making bricks.

The great increase of building, and the consequent demand for bricks in the metropolis, as well as in all parts of the kingdom, would be a means of removing that great nuisance from the river, and, at the same time, render it worth the while of any speculative company engaging in so seemingly desirable an object.

Trusting this letter will induce an inquiry into the subject, and that I shall see your own opinion, with that of some experienced and practical men, in THE BUILDER.—I am, Sir,

Your obedient servant,  
Nov. 26, 1844. A SUBSCRIBER.

## LATHES FOR SPIRAL TURNING.

SIR,—I should feel obliged if some of your correspondents would inform me (through the medium of your valuable publication) what kind of lathe is generally used for spiral turning, and what the expense of such an article would be, and at the same time inform me if there is any work extant on the subject.—I am, Sir, yours, &c.

Nov. 23rd, 1844.

A WELL-WISHER.

[We insert this letter in order that any

correspondents who may have lathes with sliding-rests, or any other apparatus by which screw-cutting may be effected, may afford our correspondent information.—Ed.]

## SIEBE'S ROTATORY PUMP.

SIR,—I shall be much obliged if you or any of the numerous readers of THE BUILDER can, through the medium of that paper, give me any information respecting Siebe's Rotatory Pump, its merits, cost, and where to be purchased.—I am, Sir, your obedient servant,

A SUBSCRIBER.

Diss, November 22, 1844.

## ARCHITECTURAL COMPETITION.

THE CHORISTERS' SCHOOL, MAGDALEN COLLEGE, OXFORD.

SIR,—Having seen, from the careful perusal of your paper, the great desire you have always evinced towards exposing the present faulty mode of competing for new buildings, now so generally adopted, and frequently so unfairly terminated, I would call your attention to the subject of the late public competition for the Choristers' School for Magdalen College, Oxford, which has, I hear, been decided in favour of a design sent in by Mr. Derrick, architect of that city.

In the printed instructions issued to architects who might be willing to compete, it was distinctly specified that the designs must be sent in by the 1st of October, ample time being given (nearly two months) for completing the drawings in question.

In commencing a competition, two questions of the greatest importance naturally suggest themselves to the architect—first, the sum of money to be expended; secondly, the time allowed for preparing the plans; these are then considered as fixed points to be scrupulously observed, and he proceeds accordingly. However, on the present occasion all such general rules appear to have been treated with contempt by both parties; the facts of the case being simply these:—Mr. Derrick, who sends in his designs at least two weeks after the time specified, is appointed to carry out his designs, he being a resident at Oxford, and having access (as any one had who was taken in by a member of the college) to the room where all the drawings already sent in were exhibited. The sum of 200, to each, I hear, been voted to Messrs. Allom, Pugin, and another, the estimate of the former being 1,800*l.*, more than the sum mentioned to be expended (5,000*l.*)\* and the second only submitting a pen-and-ink perspective view of what he considered the building ought to be, instead of sending plans, sections, and elevations, as expected from the other competitors. I must say, I am much surprised at such a termination to a competition, which I hoped, knowing the high character of the parties who had to make the selection, would have proved itself a pattern of justice and impartiality; and can only attribute it to a want of knowledge of business on their part; and must, in conclusion, call upon the profession generally to come forward, and appeal to the Institute of British Architects to take the necessary steps to put an end to a system marked with such gross injustice. The Institute is an incorporated body, possessing a royal charter, and it is scarcely necessary to add that public bodies can easily accomplish that which a private individual would not venture to attempt.

Unless some remedy is found for this crying evil, these repeated acts of inconsistent conduct must necessarily tend to lower the profession in the eyes of the public, and will end by destroying its respectability altogether when they see such treatment as it constantly suffers borne with impunity, and without any measures being taken to remedy the evil, and at the same time protect professional men from wasting their money and valuable time in such an unprofitable manner.

By inserting the above in your very useful paper, you will put others on their guard in future, and at the same time oblige your obedient servant, AN OLD SUBSCRIBER.

London, Nov. 25, 1844.

\* This amount was not specified in the printed instructions, but that can be no excuse, for of course on so essential a point application would be made to the Bursar of the College, who named 5,000*l.* immediately as the sum to be spent on the proposed new building.

## THE NEW ROYAL EXCHANGE.

Sir,—I feel extremely obliged to "The Writer in the *Morning Herald*" for pointing out the blunder which I had the misfortune to make relative to the name of the publication mentioned in my letter—it was the more unfortunate arising solely through carelessness; the fact is, that my letter was written several days after I had seen the *Herald*, and writing from memory alone, I by some means made the mistake in the name. When I looked over my letter in THE BUILDER, I immediately discovered it, but supposing some remarks would be made on the subject by your correspondents, I deferred mentioning it till I should have occasion to write again.

It appears to me that "The Writer in the *Herald*" has not strengthened his position by the explanation he has given; there is not one word in his letter in support of his approbation of the Exchange, and the very faults which I pointed out as derogating from the value of his remarks, he has confessed. He writes, "It was required of me to make it as popular in tone and as free from technicalities as possible; besides all which, it was necessary that it should not appear to contradict what had been said in the same paper but a few days before on the subject of the building." Now what a prostitution of criticism is this, and what dependence can be placed on the opinions of a writer who, to join in a ready-made opinion, is obliged to bolster up the reputation of a building by passing over its numerous defects of taste, ascribing to it merits which it does not possess, and all for the purpose of making his criticism as palatable as possible to those competent judges of architecture—the public? But the writer evidently thinks this going too far, and adds, "Yet it must not therefore be imagined that I spoke contrary to your opinion, that I was equally ready to condemn or approve, as might be required of me; more minute examination of the whole structure than I have yet had the opportunity of making, and to judge of its anatomy, plans, and sections, would be requisite, and may probably induce me to qualify some of my observations, which were intended to be, and no doubt have been received as chiefly expressing general impressions." It is some time since I have seen any thing so *mal-a-propos* as this, and I have yet to learn that it is necessary, before a judgment could be offered on the external effect of a building, to study the internal arrangement; and will the writer advance further in his *reductio ad absurdum*, and attempt to maintain that a critic cannot express a competent opinion on the external appearance of the Exchange without examining "its anatomy, plans, and sections?" If so, it falsifies his own remarks, for he admits he has not yet had an opportunity of doing so. He further considers me "partial," and "disposed to censure the building;" I objected to the style employed for reasons which I gave, and I pointed out what seemed to me defects in the composition; rather would it have been more satisfactory to your readers had he pointed out some of the "admirable beauties" of the portico to the Exchange. The *onus probandi* lies with him, and he will excuse me for not placing much reliance on the mere assertion of a writer, although connected with the *Herald*; and I must contend that a writer who lauds the Exchange merely to please the public taste, together with the fulsome flattery with which his criticism was so plentifully besprinkled, can have the charge of favouritism for Mr. Tite imputed to him; and that the fact of ascribing merit to the Exchange does "argue for the superior genius" of the architect.

I will take the present opportunity to make an observation on the note you added to my letter; you have, I think, mistaken the meaning of my remark, "that columns" in the Italian style "are seldom fluted." It was my intention to have conveyed the idea that one radical fault of that style was, that the entablature (with the exception of the frieze) was invariably overloaded with enrichments, while the columns were seldom fluted; this is faulty for a two-fold reason; the first being that the eye is offended by the abrupt change from bareness to ornament; and the second, that the expense incurred by enriching the cornice to so great an extent would be more effectively employed by fluting the columns and lessening the mass of ornament above, thus producing a more subdued and pleasing

richness. My observation applied to external columns only, the inner ones being unfluted, carries with it its own reason; by their different aspect they avoid the confusion which would inevitably follow were they fluted, besides which they contribute materially to picturesque effect. And I still remain of opinion that it materially injures the effect of the Italian style, that in composition columns are seldom fluted; neither can I admit that fluting gives a heavy appearance to a column; on the contrary, they are used principally to remove the bare appearance an unfluted column, in many situations, possesses; and I think it bespeaks little for the impartiality with which "the writer in the *Herald*" read my letter, though he chimes in so admirably with you.\*

I ought here to break off my remarks, and give place to some one else; before I put down my pen I will trespass on your pages a short space further, and notice the letter of "T." in the last number of THE BUILDER, on architectural competition. He is certainly in error when he supposes that "much has been written in your paper against architectural competition;" undoubtedly much has been written against the *abuse* of competition, but he will find the majority of letters refer to the unfair, unjust, and partial decisions of committees. That "enlightened committees" cannot be found is manifest to every one connected with architecture, and it is pure nonsense to talk of selecting an "impartial architect;" such a method leaves most of the grievances untouched. Hardly would an architect commit himself by selecting a design with glaring faults; yet it is not to be supposed that Sir Robert Smirk (I mention the name as an illustration and not individually), if placed in such a position, would choose a design if the originality and genius displayed might seem to clash with his professional reputation at the British Museum or elsewhere; and another and more serious objection is, that an opportunity for jobbing would still remain. Competitions are allowed by most architects, when conducted upon fair and honourable principles, to produce beneficial effect, by drawing out talent in young architects which would otherwise lie dormant; but I will give credit to an architect for something more than *enthusiasm*, if he supposes it possible to raise himself to honour in his profession, with the advertisement in the last BUILDER, and others of the same class, constantly before him. This advertisement says, "the name and address of the author of each plan to be written on its right-hand corner;" this looks very suspicious, but it is surpassed by the continuation, which says, "the author of the plan considered the best by the Committee of Works will be selected to execute the work on his giving satisfactory references, and finding adequate security not to exceed his estimate." Truly, the Committee for Baths and Wash-houses have at the onset shewn a desire to wash their hands of any thing like the suspicion of making a job of their building; and perhaps they wanted to cleanse the profession of that feeling of importance which architects are so liable to consider their time worth, which induced them to offer no premiums. Very bright is the prospect for the aspiring architect, "though his noble ideas" may be occasionally damped by a wet blanket, in the shape of satisfactory references, adequate security, and no premium. I have no doubt that a large number of designs will be sent in; the authors, I cannot suppose expect to obtain the honour, and I do hope the profession generally will express their disapprobation by refusing to be made the tools of the committee; they may depend they will save money by it, and it may prove beneficial hereafter.—I remain, yours, &c., SCRUTATOR.

London, Nov. 25th, 1844.

OXFORD IMPROVEMENTS.—The President and Fellows of Magdalen College, Oxford, have determined on the erection, contiguous to the college, of a new choristers' school and masters' house attached.

\* [Our correspondent does not shew himself in this matter to be a master of architectural optics. We know for certainty that upright flutings do make the shafts of columns appear considerably thicker, and that spiral flutings make them appear considerably thinner. We imagined there never existed any question of this.—Ed.]

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*Salford New Church.*—This church will be in the Decorated style of Gothic architecture, which prevailed in England in the 13th and 14th centuries, the fine churches of Howden, Selby, and Newark, being the models principally studied in the preparation of the design. It stands on a commanding site, adjacent to one of the principal entrances to the town; the streets being wide, and the ground around the site level and open. The interior length is 130 feet, of which the chancel occupies 28 feet, the nave and transept 102 feet, the transept from north to south 99 feet, the nave 24 feet wide, the aisles, including the pillars, 17 feet. There will be a clerestory lighted with coupled windows of two lights, and a triforium passage in the thickness of the wall; the nave is shortened by the want of space, but there are instances of cross churches of equal size, as at Rotherham, where the nave is still shorter. The west, or principal front, is divided by four massive buttresses, crowned by open tabernacles of beautiful design; the great window is 40 feet high; the splay of the west door is 5 feet deep; the west wall is 5 feet thick, and we may here remark that the entire structure is of stone, built in the ancient manner; the nave is approached by a north porch, the site not admitting this important portion of the church on the south side. The organ will be placed over the screen, which separates the north transept of the church from the nave. The tower and spire, which are supported on four massive pillars of solid stone, rise to the height of 225 feet; the tower is lighted with coupled windows, having a gabled pediment with niches, in which are placed the twelve apostles, three on each front. The tower is 30 feet square; the spire has four stages of Louvre windows with crocketed gables, the whole surmounted by a cross and vane. The eastern end of the chancel will be occupied by a window of seven lights, 18 feet wide and 45 feet high, in which it is proposed to depict the genealogy of our Lord on the roof of Jesse. It is also proposed that the west window shall be occupied by subjects relating to the life of the patron saint. The whole interior will be painted and gilded in the ancient manner, for which purpose a design has been furnished by Mr. Taylor Bulmer. Mr. Benjamin Hollins, of Sheffield, is the builder; and the architects Messrs. Weightman and Hadfield, of that town.

*Rocliffe St. Mary's Church.*—This church has been erected and in great part endowed at the expense of Andrew Lawson, Esq., M.P., aided by contributions towards the endowment by Mrs. Lawrence, of Studley Park, and other benevolent persons, for the use of the inhabitants of Rocliffe, distant two miles from the ancient parish of Aldborough. It is 50 feet long, 22 feet wide, and 24 feet high, and contains sittings for 150 persons. It is entirely built and vaulted with stone from Mr. Lawson's own quarry, and from those of C. Duncombe, Esq., of Copgrove. The chancel and steps leading up to it are paved with marble from near the altar of York Minster, with some necessary additions. The vestry-door is also a relic of the same edifice, rescued from the disastrous fire of 1829. The scroll panels of the wainscot of the chancel are from Nun Monkton Priory. The cover of the font is copied from one in Charlton-on-Otmere Church, near Oxford. The pulpit is that from which Isaac Milner and John Scott preached in the church of the Holy Trinity at Hull. The fabric has been built from the designs and under the direction of Messrs. Sharp, architects, of York.

*Royal Donations.*—Among the Queen Adelaide's numerous donations and benefactions we have to mention that her Majesty has been pleased to transmit 30*l.* to the fund now forming for the erection of a church, a parsonage-house, and village school-room, on the moor, near Woodhall Spa, in Lincolnshire; 25 guineas towards the erection of a new church at Kingsclere, near Newbury; and 20*l.* in aid of the fund for rebuilding the ancient parish church of Bednall, Staffordshire.

*Munificent Bequest for the purpose of Church Restoration.*—It is said that the sum of 6,000*l.* has lately, by a bequest, been placed at the disposal of the Cambridge Camden Society, for the purpose of restoring old churches.

RAILWAY INTELLIGENCE.

**Railway Schemes.**—We copy the following striking statement from the monthly circular of Messrs. Railton and Son, sharebrokers, of Manchester, published last week:—“Since our last monthly circular of the 14th ult., there have been put forth forty-one new prospectuses of railway schemes, and the shares applied for in each have far exceeded the number to be issued. Taking the above forty-one lines into the account, the following will result:—On the 14th of August upwards of ninety new lines, requiring more than 60,000,000*l.* of subscribed capital to complete them, were put forward, to which add the above forty-one, stating a requirement of 35,265,000*l.*, together upwards of 131, needing an investment of 95,266,000*l.*, with the power of borrowing one-third more, devoted to the same object; making a grand total of 127,026,000*l.*!”

**Great Southern and Western Railway.**—The contracts for two lots on the Great Southern and Western (Dublin and Casbel) Railway, twenty-one miles in extent, were let on the 13th inst. Thirteen tenders were received by the directors, and three were retained—namely the tenders of Mr. McCormick, of Dublin; Mr. Dargan, of Belfast; and those of the firm of Hammond, Patterson, Murray, and Butler, of Dublin. The difference was very trifling, not exceeding 1,000*l.* on the two lots, and Messrs. Dargan and McCormick were declared the successful competitors, and Mr. Fagan, of Dublin, the contractor for the sleepers. We understand that the successful contractors for the works were guided in making their estimates by the quantities calculated by Mr. Kelly, architect and building-surveyor, of Upper Gloucester-street, Dublin.—*Railway Record.*

We learn from Berlin that the works of the railroad from Potsdam to Magdeburg have been commenced; and that, as the road will traverse a portion of the royal park, the king takes a personal interest in the undertaking, and occasionally superintends it.

Miscellanea.

**METROPOLITAN IMPROVEMENTS.**—The *Gazette* of last Saturday consists of fifty pages, and contains, amongst others, a notice of an application to Parliament for an Act to annex so much of the garden, ground, and buildings belonging to the Hon. Society of Lincoln's-inn, as are locally situate in the parish of St. Giles-in-the-Fields, to the vill or township of Lincoln's-inn. Also to stop up the present thoroughfare for carriages, horses, and cattle along the eastern side of Lincoln's-inn-fields, in the said parish, and to form a new footway, of the width of 20 feet, adjoining the iron-railing inclosing the garden of Lincoln's-inn-fields on the eastern side thereof, and to inclose the remaining portion of the carriage-way along the said eastern side of Lincoln's-inn-fields, and to annex the same to that part of the garden, ground, and buildings belonging to the said society as aforesaid, and to the said vill or township. There is also notice of a Bill to improve the streets, squares, &c., in the parishes of St. Margaret, St. John, and St. George, Hanover-square, in the city of Westminster. The others, with the exception of one or two relating to turnpike-roads, are railway notices. So that instead of opening a carriage-way from Holborn, it is absolutely proposed to injure, if not destroy, the present inefficient roadway; what probability can exist of the effecting of so absurd a project?

**STEAM BOAT PIERS ON THE THAMES.**—Two reports of the Thames Navigation Committee have been made lately to the city authorities. In one, relative to the pier at Blackfriars-bridge, the committee recommend the erection of a pier at the eastern side of the bridge, upon piers, according to the suggestion of Mr. Walker, the engineer. In the other they recommend that all piers in which due provision had not been made for the security of the public should be immediately removed, and that the corporation should act merely as conservators of the river, leaving the pecuniary business connected with the piers to private speculation. The first report was referred back to the committee to be carried into effect; the second was ordered to be printed and taken into consideration on a future day.

**THE STATUE OF WHITTINGTON AT THE ROYAL EXCHANGE.**—On Friday, the 22nd instant, the scaffolding was struck after the statue of Sir Richard Whittington was raised into the niche on the north side of the Royal Exchange. This piece of sculpture is from the chisel of Carew, and attracted during the whole of Saturday the notice of the crowds who visited the spot. The figure represents the distinguished citizen replying to an address in his robes as Lord Mayor of London, in the reign of Henry V. Whittington lived in the reigns of Richard II., Henry IV., and Henry V., and was knighted when sheriff. He was, as is known from all the little penny histories of him, and by the celebrated stone at Highgate, three times Lord Mayor of London. He built the Newgate part of Bartholomew's Hospital and part of Guildhall, and his last mayoralty was in the year 1413. Of the year in which he died there is no record amongst the citizens. An accident occurred in Mr. Carew's studio, which might have proved fatal to the workmen employed in removing this statue to the Royal Exchange. The figure was raised from the ground above its own height some feet when the tackle broke, and it fell amongst the men, but without injury either to those engaged in the removal, or to the statue itself.

**RESTORATION OF THE SALISBURY TOWER, WINDSOR CASTLE.**—These works have just been commenced. It being intended to raze to the ground, at an early period, the five residences of the military knights on the lower foundation, accommodation will be provided for three of the knights in the Salisbury Tower, when the necessary restorations and alterations have been completed. Accommodation for the remaining two military knights, on the lower foundation, will be provided in the upper tower of Henry VIII.'s gateway. The Salisbury Tower will be entirely gutted, and convenient apartments substituted for the dilapidated portions which have been removed. A noble terrace, to be open to the public, will be formed on the site of the houses on the lower foundation. The Salisbury Tower is the official residence of the Chancellor of the Order of the Garter. The plans about to be carried out are stated to be those of the late Sir Jeffery Wyattville.

**MONUMENT TO THE LATE COMMANDER OF THE PRESIDENT.**—A monument has just been erected to the memory of Captain Roberts, in Passage churchyard, Cork. The cenotaph is a large square building of rich cut stone, with a fine base and cap moulding, and having a bold pediment on either side. On the angles of the monument are represented in strong relief the sterns of the vessels which Captain Roberts commanded, viz. the Black Jack, the Sirius, the British Queen, and the President. The following is part of the inscription which the monument bears:—“This stone commemorates, in the churchyard of his native parish, the merits and premature death of the first officer under whose command a steam vessel ever crossed the Atlantic Ocean—undaunted bravery exhibited in the suppression of the slave traffic in the African seas, enterprise and consummate skill in the details of his profession, recommended him for that arduous service. Lieutenant Richard Roberts, R.N., in accomplishing it, not only surpassed the wildest visions of former days, but even the warmest anticipations of the present.”—*Herald.*

**ST. GEORGE'S NEW SCHOOLS, SHEFFIELD.**—The first stone of the above schools was laid, on the 21st instant, by the Right Hon. the Lord Warburton, lord president of her Majesty's council. These buildings are to consist of three separate schools, with suitable class-rooms. The Girls' School, fronting St. George's Church, 60 feet by 40 feet; the Infants' School, forming the centre division, and fronting Beet-street and Siddal-street, 60 feet by 40 feet. These dimensions do not, of course, include the class-rooms. There will also be comfortable dwelling-houses for the master and mistress; the basement of the buildings being occupied by library, soup-kitchen, play-grounds, &c. The estimated cost, without fittings-up, is nearly 4,000*l.*, which sum includes 1,200*l.* for the site alone. To meet this about 1,200*l.* has been raised by subscription, 1,393*l.* granted by the Privy Council, and 649*l.* by the National Society.

**SINKING OF THE SURFACE GROUND IN PARIS.**—About two o'clock in the morning of Tuesday, the 16th inst., a considerable mass of earth detached itself from the hill of Montmartre, on the side of the Barrier of Rochechouart, Paris, and fell upon a lime-kiln, a cartwright's factory, a weaver's workshop, and a dwelling-house, which were partly buried under it. The inhabitants were fortunately awakened by the cries of some dogs, and awoke in time. At six o'clock another house experienced a similar fate, and a third was surrounded with earth up to the first story. Fragments of earth and stone continued to roll down the hill, which is extremely steep on that side, during the whole day, and the alarmed inmates of a number of dwellings situate at the bottom of the declivity abandoned their homes, carrying away their furniture and most valuable effects. The event had been long foreseen from the extensive excavations made in the hill to procure “plaster of Paris.” The sinking (*coulement*) was still making progress at the hour of post on that day.

**PAINTED GLASS.**—There are some remains of painted glass in the churches of Ashhour, Bradley, Dronfield, Eggington, Hault-Luecknall (the burial place of Hobbs, the philosopher of Malmesbury, Sutton, and Sandiacre, in the county of Derby, and of sufficient consequence to merit particular notice. In the churches of Morley and Norbury the remains are considerable, very good in the chancel of the latter shewing very good taste, and evidently coneval with the building, which is in the style of the fourteenth century.

Tenders.

TENDERS delivered for building a new Gaol at Banbury.—Architects, Messrs. Hurst and Moffatt, Doncaster.

Haines, Cheltenham .....	£9,081
Sissons, Hull .....	8,476
Kirk, Slanford .....	7,940
Porter and Co. ....	7,840
Watson and Co., Birmingham ..	7,821
Claridge, Banbury, .....	7,747
Plowman and Co., Oxford ....	7,696
Waterfield and Co., Leicester ..	7,342

Tenders delivered on Saturday last for Building an Intended Public-house, at the corner of King's-row, Walworth, for Mr. Ireland. The tenders were opened in the presence of the Contractors, and were as follow, viz.:

Mr. Gerrey .....	£1,374 0 0
Waller .....	1,160 0 0
Mason .....	1,148 0 0
Hawkins .....	1,075 0 0
Brown .....	795 10 0

Mr. Brown had made an error, having left out one of the trades, his estimate was corrected, and settled at 1,050*l.* and accepted.

TENDERS delivered for the erection of a new public-house at Wandsworth for Mr. Ireland.

J. Brown .....	£795 10
Hawkins .....	1,075 0
Mason .....	1,148 0
H. P. Wallen .....	1,160 0
Gerrey .....	1,374 0

NOTICES OF CONTRACTS.

For the supply of 600 Coal Waggon to the York and North Midland Railway Company.—George Baker, Secretary, York, December 4.

For the building of a Tunnel on the Edinburgh, Leith, and Granton Railway.—December 4.

For the making of Sluices, Bridges, Excavations, and other works in the New Cut from the Sixteen-foot River to the Eau Brink.—George Game Day, Clerk to the Middle Level Drainage Commissioners, St. Ives. Plans and Specifications are being prepared.

For Paving and Repairing certain Carriage and Footways in the district of Knightsbridge, for one year from Christmas-day next, and also for Lighting the same district with Gas for the like period.—James Rogers, 22, Manchester-buildings, Westminster. December 9.

For building an Infirmary at the County Gaol and House of Correction, at Ipswich, Suffolk.—Mr. John Whiting, County Surveyor, Ipswich, or Mr. John H. Borton, Clerk of the Peace, Bury St. Edmunds. December 19.

For the erection of a new Barrack Establishment at Bristol.—C. J. Selwyn, Major and Commanding Royal Engineer, Exeter. December 11.

For Lighting the Southampton Paving Trust with Naphtha or other strong Light for the period of eight months from the 1st of February next.—John Arnell, 10, Edmund-street, Hampstead-road. December 11.

For making a Survey and Valuation of Property in the town of Kingston-upon-Hull, for the better rating of the same to the relief of the poor.—John Moxon, Workhouse, Hull. December 12.

For Building a Sewer in Hoxton Old Town, being a length of about 576 feet.—Messrs. Stable and Lush, Office of Sewers, Hatton Garden. December 13.

For the execution of Works necessary for the completion of the whole of the Railway from Shoreham to Chichester, being a distance of about 22½ miles.—Frederick Oley, Secretary, Brighton and Chichester Railway Office, 4, Dean-street, Tooley-street. December 17.

For the supply of First, Second, and Third-class Carriages to the Manchester, Bury, and Rossendale Railway.—James Smithells, Secretary, Railway Office, Bury.—December 21.

For the construction of Locomotive Engines and Tenders for the Manchester, Bury, and Rossendale Railway.—Mr. C. E. Cawley, Engineer, Railway Office, Bury.—December 21.

For the supply of 6,000 tons of Iron Rails, each rail to be 16 feet in length, and weighing 65 lb. per yard.—H. Parker, Secretary to the Great North of England Railway Company, Darlington. Dec. 23.

COMPETITIONS.

The Committee of the Association recently formed in the Metropolis for the Construction of Baths and Wash-houses for the Labouring Classes, are desirous of obtaining Plans and Estimates for the Erection and Fitting-up of the First Establishment. The general basis of the plan can be seen at the Office, No. 3, Crosby-square. The author of the plan considered the best by the Committee will be selected to execute the work.

Plans for an Agricultural College to be erected at Cirencester, to accommodate 200 pupils and 6 tutors. The style is left to the taste of the architect. A Premium of 10 Guineas to the author of the most approved plan.—Robert J. Brown, Esq., Hon. Sec. Cirencester. January 1.

TO CORRESPONDENTS.

"Spectator" is not a master-builder, or if one, little acquainted with his business; if he need the information which he mentions, he may seek it in those common, ordinary books where it is to be found, but retelling the contents of which would insure us few subscribers besides himself. If "Spectator" have no respect for fine, ancient examples of architecture, he is to be pitied, and probably has a little respect for fine modern ones. We indeed look for circulation among master-builders, and know that THE BUILDER has the largest proportion of circulation which is perhaps possessed by any technical periodical, and we know also the estimation in which it is held, by its steady increase. We imagine "Spectator" to be in need of information upon some of those common technical matters which, were we to fill our columns with them, would only create a smile from operative builders. If "Spectator" be judge enough, or inventive enough to produce to us any new information upon building technicalities, we shall, if we find them meritorious, give them immediate insertion. If "Spectator" need, however, only ordinary information upon common subjects of operative building, which every workman possesses, he must follow the means which they did—serve an apprenticeship.

A letter relative to the Hackney-bridge came too late for insertion this week, but will appear in our next.

A Subscriber is referred to our advertising columns.

Argus.—The terms of the proposition are, "to use for building or other purposes the open space or area of a certain court-way or passage, called Darby Court, leading from Jernyn-street to Piccadilly, in the parish of St. James, Westminster."

Cuddy Thomas.—We are obliged for his suggestion, and will act upon it. The error he points out will be corrected.

George Field, will obtain the information he seeks by addressing a note to Mr. Manfred, No. 36, Palace-street, Picnic.

J. Pickard, in our next number.

W. J. Short.—"A Plan for Alms Houses," is under consideration.

BOOKS RECEIVED DURING THE WEEK.

The British Almanac and Companion for 1845. Charles Knight and Co. The Church Restorers; a Tale, treating of Ancient and Modern Architecture, and Church Decorations. By F. A. Paley, M.A., Hon. Sec. to the Cambridge Camden Society. John Van Voorst.

MEETINGS OF SCIENTIFIC BODIES

This day and during the ensuing week.

SATURDAY, November 30.—Royal Society (Anniversary meeting), Somerset-house, 8½ P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

MONDAY, December 2.—Entomological, 17, Old Bond-street, 8 P.M.; British Architects, 16, Grosvenor-street, 8 P.M.; Chemical (Society of Arts, Adelphi) 8 P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 3.—Linnaean, Soho-square, 8 P.M.; Horticultural, 21, Regent-street, 2 P.M.

WEDNESDAY, 4.—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset-house, 8½ P.M.

THURSDAY, 5.—Zoological, Hanover-square, 3 P.M.; Royal, Somerset-house, 8½ P.M.; Antiquaries, Somerset-house, 8 P.M.

FRIDAY, 6.—Botanical, 20, Bedford-street, Covent Garden, 8 P.M.

SATURDAY, 7.—Asiatic, 14, Grafton-street, 2 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

Current Prices of Wood and Metals.

November 26, 1844.

Table listing prices for various materials like Box, Turkey, Cedar, Cuba, Ebony, Lignum Vitæ, Mahogany, Timber, Teak, Oak, Fir, Pine, Deals, Stockholm, Gottenburg, Christiansa, St. Petersburg, Quebec yellow Pine, White Spruce, Dantzic Deck, Plank, Staves, Quebec Pipes, Puncheon, Copper, Iron, Lead, Tin, Zinc, and Quicksilver.

ADVERTISEMENTS.

CAEN STONE. LUARD and BEEHDAM have a quantity of the above stone, of the best quality, direct from their Quarries at Arouques, which may be inspected at the Norway Sufferance Wharf, Greenwich.—Further particulars at Mr. G. GATES', 18, SOUTHWARK-SQUARE, SOUTHWARK.

TO ARCHITECTS AND BUILDERS. DOOR SPRINGS AND HINGES. GERISH'S PATENT DOOR SPRINGS, for CLOSING every description of DOOR, consist of the Single and DOUBLE-ACTION BUTT HINGES in Brass and Iron for Doors to open one or both ways, and Raising Hinges for the convenience of Doors opening on uneven Floors. Like-wise Swing Centres, which consist of a combination of power unequalled by any made at present. Manufactured by F. V. Gerish, East-road, City-road; and sold by all respectable Ironmongers in the United Kingdom.

E. G.'S TRACING-PAPER.—REMOVAL OF AGENCY.—The proprietor of the above unequalled article begs to return his grateful acknowledgments for the extensive patronage afforded by artists, surveyors, civil engineers, and consumers in general. It is warranted to take Ink, Oil, or Water colour, and may now be had of MESSRS. ROBEYSON AND CO., SOLE AGENTS, 51, LONG-ACRE, at the following cash prices:— THIN TRACING-PAPER. 50 by 40, at 14s. 6s. per Ream, or 15s. 0d. per Quire. 40 by 30, at 7s. 0s. " 7s. 6d. " 30 by 20, at 3s. 12s. " 4s. 0d. " THICK TRACING-PAPER. 40 by 30, at 14s. 0s. per Ream, or 15s. 0d. per Quire. 35 by 20, at 7s. 10s. " 8s. 0d. " N.B.—Every sheet is stamped with the Initials of the Manufacturer.

TO ARCHITECTS, BUILDERS, AND PAINTERS IN FRESCO.

MARTIN'S PATENT CEMENT. STEVENS and SON beg respectfully to announce that this beautiful cement has now arrived at a degree of excellence far surpassing their most sanguine expectations. For all internal work it possesses a great superiority over every article hitherto used. It is now being used extensively by Government in the British Museum and other public buildings. It does not throw out any salt, but presents a beautifully plain and perfect surface, which may be applied upon within four days without cracking. It is equally adapted for walls or lath, for mouldings, architraves, skirting, or flooring; and is admitted to form the best ground for fresco painting, having been used for many of the frescoes lately exhibited in Westminster Hall. It will bear an intense heat without cracking, and for hardness, durability, and economy, cannot be equalled. 186, Drury-lane, London.

KEENE'S PATENT MARBLE CEMENT.

This Cement has now been tested during six years, and in no case, where properly applied, has it failed to answer the purpose for which it is recommended. While most Cements trust for durability to a surface hardness, it is a distinguishing feature of Keene's Cement that it is alike hard through its entire thickness, and it is mainly owing to the quality of this interesting process that work executed in it can be painted in a shorter time than any other Water Cement.

It is now in extensive use at the British Museum, at the Royal Exchange and many other public and private Works, where it takes the place of wood for skirtings, architrave and panel mouldings, and of stone for the paving of halls, staircases, &c., for each of which purposes it is economical and efficient.

In the manufacturing towns this Cement is taking the precedence of other materials for the flooring, &c., of fire-proof buildings, in consequence of its lightness and durability.

The Patentees and only Manufacturers are J. B. WHITE and SONS, MILLBANK-STREET, WESTMINSTER.

TO ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MERCHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL.

JOHNS and CO'S PATENT STUCCO CEMENT.—The following are the positive advantages possessed by this invention over every Concholithero introduced.—It will effectively resist damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the case in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to Wood, Iron, or Glass.—It will carry a larger Proportion of Sand than any other Cement. It is more elastic, and becomes perfect when other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which it will cover over or painted directly. It will never be pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instructions for use being very clear and simple. The first cost of this material does not exceed that of the cheapest Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy.

Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred.

Specimens may be seen, and a Prospectus fully describing this Cement, and the mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheap-side, London; whom also may be seen, and who will supply JOHN'S and CO'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over exterior Walls of Houses that have been covered with Roman or other Cements, and which have become dirty and discoloured. It is in every way better suited for this purpose than White Lead Paint, which frequently comes off in flakes, being in direct chemical opposition with Cement; whereas STUCCO PAINT, JOHN'S and CO'S PATENT PAINT, having an affinity for Stucco, binds itself with it, stopping the suction, thereby rendering the wall proof against weather, and in the finish producing a pure stone-like effect, producible by no other fair whiter. It is cheap in its application, and may be used by any Painter, in any climate, even in the most exposed Marine situations.

# The Builder.

No. XCVI.

SATURDAY, DECEMBER 7, 1844.

**E**W cities, ancient or modern, contain more architectural beauties than London, and perhaps none.

The various objects of interest which it contains are too numerous to particularize; externally they unite to render it one of the most picturesque of places in the universe. It is true that artists by profession have uniformly little favoured it with their attention, and comparatively few architectural representations of its ancient glories have been produced. There have from time to time issued an abundance of coarse prints of buildings in it, and of the whole city, but that kind of artistic talent, whether of Englishmen or foreigners, which has illustrated most of the continental cities, has been lacking towards our own ancient metropolis. Everywhere, at the eye turns, some new view is presented, with an increased interest and picturesqueness.

In the city of London there be a narrow lane, some fine church campanile is seen terminating in a group of steeples of the most elegant outline; and such scenes as these are countless. If you enter the great court of St. Bartholomew's Hospital, West Smithfield, the most singularly rich and beautifully picturesque group of towers and steeples, accompanied by the dome and turrets of St. Paul's Cathedral, is seen through the narrow interval between two of the masses of building surrounding the court. If you go into Aldersgate-street, one of the most enchanting scenes in the world is presented in a view over the cemetery of St. Botolph's Church, in which the bell-tower of St. Sepulchre's Church, Snow-hill, with its four high crowning spires, and the numerous changeable gables and turrets of Christ's Hospital, and many other objects of interest present themselves, while in the foreground lies the new French Church, and at greater distance rises like an Alpine background almost the whole length and altitude of the huge and richly-decorated cathedral. If you go to the bridges over the Thames, more comprehensive and more varied views are in succession seen, perhaps each unrivalled in the world, and each greatly differing from the other.

Whether beheld from the interior of the city itself or from the Surrey hills, from the water, from the parks, from the country road, or from the close by-lane, the same evidences are shed abroad of changeful variety, architectural beauty, and the outlay of vast wealth, in the accumulation of such an amount of value.

Among some of the most interesting objects within the city itself, we may reckon the city companies' halls, most of which, though built

after the great fire of London in 1666, bear considerable marks of antiquity. Mercers' Hall has next the Poultry a front which is profuse in stone carvings, while the interior of the hall itself contains some of the most exquisite wood carvings in the world, jetting forth with more than the imagery of life. The costly Goldsmiths' new Hall is increased in value by a chimney-piece of marble which came from the former hall, and which is so wonderfully wrought over with fruit, flowers, butterflies, and other lively imagery, and with so masterly a hand, that we were told, when in the old hall it was valued at a thousand guineas.

The entrances to most of the ancient city halls present some architectural peculiarities; many of them are heavy in style, are incorrectly designed, and are of coarse execution; yet they exhibit magnificence, often rich though somewhat rude sculpture, and are the very subjects for displaying the effect of the painter, who generally fails when he attempts to imitate the classical and elaborate exactness of perfect specimens of architecture. Among such examples, are the street and court portals of the Haberdashers'-hall, in Maiden-lane, of Barber Surgeons'-hall, Monkwell-street, of Merchant Tailors' Hall in Throgmorton-street (which has lately received the addition of a duplicate copy of it in the same street), also of the Brewers' Hall, and the hall of the Tallow-chandlers; and many more lying in the neighbourhood of Thames-street, and other close and dirty parts of the city, are each possessed of some one beauty at least, whatever defects they may contain. Nearly all these fraternity halls are replete internally with sculptured oak, oil paintings, stained-glass, coat-armoury, fine ancient furniture, and collections of plate (some gilt, and some wholly of gold). Many of these old examples of architecture contain curious specimens of red brickwork, generally "gaged," and often a mixture of stone naturally light, or painted to appear so, and which, contrasting violently with the deep-coloured brick rendered half black through age and soot, gives to the whole a singularly motley appearance. Most of these halls consist of buildings surrounding a court-yard, some few of which still, after "improvement," remain paved with marble, and, if we mistake not, one or two, if not more, exhibit the pride of a fountain, and many of them still retain their ancient cisterns of thick, solid lead, cast all over with strange devices, and the arms of the company and donors, and still firm and sound, having been made when lead, weight sixteen pounds to the foot superficial, was laid upon churches, and thought to be none too thick or heavy: around these courts ranges many a column and pilaster, and is seen many a quaint device, sculptured with less of cunning than of drollery; and in some, as at Brewers' Hall, within the court-yard rises a mighty external staircase, leading to the principal apartment (properly termed the hall), on the one-pair story. The oaken doors of many of these halls are very curiously designed and carved, and, though still sound, have survived two or three generations of doors to the neighbouring houses.

If you want fine and interesting views, and so original that the world at large knows almost nothing of them, you must come into the heart of London, where the rough carman daily almost brushes them in passing, without noticing whether they have beauty or deformity, sculpture or plainness. About Tower Royal, in the neighbourhood of Wading-street, carved, quaint, and original doorways, whether to public or private edifices, meet you at every step.

At Saint John's Church, Clerkenwell, and St. John's Chapel, Bedford-row, there are examples worthy of appreciation. In Queen's-square, Westminster, are still remaining many of the original doorways, with carved open-work canopies stretching forward like bed- testers. In Bloomsbury-square, Great Ormond-street, and the neighbouring places, are many fine examples still in existence, each of which would furnish an excellent subject for a beautiful drawing. In Carey-street are several very peculiar specimens, one of which, near the entrance to New Buiswell-court, contains parts of remarkable beauty, and there is one in Old Boswell-court itself which has a curious piece of scroll-work, and a head in a compartment below the centre of the architrave which seems to be looped up for their reception. Opposite the House of Correction, Coldbath-fields, there was once a whole row of doorways with fine consoles, with flowers running down their fronts. Many of these are gone, though originally some of these examples extended down the neighbouring streets. In a narrow avenue leading from the western end of Great Marlborough-street, are two very quaint specimens, with fine consoles. At the comparatively modern doorway of St. Helen's Church, Bishopsgate, remains a pair of consoles, with trumping angels, projecting in a very singular way. In Rufford's-row, by Islington Church, are some doorways with consoles something like them, but less valuable and not so well executed. In Red Lion-street, Clerkenwell, are some very fine pierced door-trusses, and in Featherstone-buildings, Holborn, are examples exactly like them, these two places being probably built by the same person, as in each are the two same patterns of doorways many times repeated.

(To be continued.)

## ELECTION OF SURVEYORS TO THE FOUR NEW DISTRICTS IN THE COUNTY OF SURREY.

(December 2nd, 1844.)

## FOR CAMBERWELL.

	No. of Votes.
Elected—William Crawford Stow . . . . .	48

## FOR STREATHAM.

Elected—John Mullins . . . . .	25
Edwin Nash . . . . .	22
Charles Baalam . . . . .	1

## FOR CLAPHAM AND PART OF BATTERSEA.

Elected—Edward Hanson . . . . .	48
William Watson—Resigned.	

## FOR WANDSWORTH AND TOTTING.

Elected—Alfred James Hiscocks . . . . .	32
George Enoch . . . . .	10
John Turner . . . . .	5
Alfred Beaumont . . . . .	1

The surveyorship of the district consisting of Rotherhithe (vacant by the election of Mr. Stow to the Camberwell new district) and of the Surrey portion of St. Paul, Deptford, will be filled up on the 16th inst.

In our account last week of the "Election of District-Surveyors for the County of Middlesex," we inadvertently gave Mr. James Harrison's number of votes as 38 instead of 39.

## BUILDING SOCIETIES.

## LETTER II.

BY WILLOUGHBY WILTON.

*The Metropolitan Equitable Investment Association and Savings Fund; for enabling members to purchase residences for occupation, or other freehold or leasehold property for investment, by monthly subscriptions of 10s. per share.—Offices, 28, Leadenhall-street, London.*

"ALL persons upon joining this association are required to pay an entrance fee of 2s. 6d. per share, a monthly subscription of 10s. per share, and a postage fee of 1s. per annum to the general fund, until such subscriptions, with the profits, amount to 120l. per share, when the association will be dissolved: from the

experience of similar societies, this is computed to be in about ten years, but as the funds accumulate, members desirous of purchasing their own residences, or other freehold or leasehold property, for occupation or investment, previously to the expiration of the society, will have the amount of their shares advanced to them, on allowing an equitable bonus thereon and executing a mortgage of the property purchased, as security for the regular payment of their future subscriptions, &c., in accordance with the rules."

Such is the preamble of the prospectus put forth by this "Metropolitan Building Company," and in which there are four things to be considered and never to be forgotten in working the prospectus: 1st, The entrance fee of 2s. 6d. per share; 2ndly, The monthly contribution of 10s. per share; 3rdly, The annual postage fee of 1s.; and 4thly, The continuous payment of the subscriptions until they amount, with the profits, to 120l. per share. To these items we shall have to refer in the sequel; and in order, therefore, to bear the case from the lips of the directors, we shall now quote the advantages they offer additionally: thus,

"In other societies of this description, members, on having their shares advanced, are required to pay 4s. per share per month, as a redemption fee or interest, until the termination of the respective societies, which in the event of a protracted duration would subject them to a considerable loss: to obviate which, the redemption fees in this association will cease at the end of ten years, whether the whole of the shares are realized or not, and in order to prevent monopoly and to secure the advantages as nearly as possible in an equal degree to all members, none are allowed to subscribe for more than five shares on entering the association, but on having their shares advanced, members may take as many additional shares as will enable them to purchase any property they may desire."

The superior advantage here offered is stated to be, that the "redemption fees will cease at the end of ten years, whether the whole of the shares be realized or not;" for it cannot be argued that the subsequent portion of this notice holds out any advantage at all.

The directors further proceed to illustrate the principle of operation in this association, and we shall in justice set that illustration forth in their own words: thus,

"The following examples will act as a key to the calculations which form the basis of this association, and are given for the purpose of demonstrating the safety and eligibility of becoming a shareholder:—

"Supposing a member to occupy a house at a rental of 30l. per annum, and the landlord is willing to dispose of his lease, having sixty or seventy years to run, at a fair valuation; the ground-rent of such a house being 4l. per annum, and the purchase-money 240l. By subscribing for four shares, and allowing an equitable bonus to the association, or, in other words, a present discount of equal to 50 per cent. from the increased value of his shares, he would receive an immediate advance of cash from the association, sufficient to cover the amount of his intended purchase, thus—

Four shares, of 120l. each	....	£480	0	0
From which deduct 50l. per cent.				
per share, as above mentioned		240	0	0

Making the amount to be received for the four shares	.....	£240	0	0
--	-------	------	---	---

For the amount of 240l. received as above, the member will have to pay his monthly subscription of 10s. per share	.....	£2	0	0
And 4s. per share as interest or redemption	.....	0	16	0

Making a total monthly payment of £2 16 0

"So that instead of 30l. a year for rent to his landlord, by paying this association 33l. 12s. per annum for about ten years, in addition to the ground-rent, he has become the purchaser of his residence, which he could not have done on such advantageous terms, but through the medium of this or some similar association; and although at first sight 50l. per cent. may appear a large discount for immediate cash, instead of waiting the termination of the society, it will be found on calculation not to be so, because a payment of 33l. 12s. per annum

for ten years for the present receipt of 240l. is only at the rate of about 5l. per cent. compound interest; whilst the actual sum paid to the association for the use of the money is but 4l. per cent. thereon, thus—

A payment of	.....	£33	12	0
For	.....		10	years.

Amounts to	.....	£336	0	0
------------	-------	------	---	---

£4. per cent. on 240l.	.....	£9	12	0
Multipled by the number of years			10	

Add cash advanced, as above	....	240	0	0
-----------------------------	------	-----	---	---

£336 0 0

"From the above calculations, it is obvious that to become a member of this association must be highly advantageous to every tenant, because by paying to the association a trifle more per annum than he has been in the habit of paying for rent, he may by monthly instalments buy his present residence, or some other equally suitable for him, with the very money he would otherwise be paying to the landlord for rent only, while, if he is not a member of a similar institution to this, he may pay his rent for thirty or forty years, and never become the owner of the premises, although in the shape of rent he has paid their value several times over."

What is meant by the term *bonus*? Is it meant that the man surrenders 240l. to the association, when it allows or lends him 240l.? And that he binds himself to pay up the amount of the four shares of 120l. each? The prospectus leaves this point altogether unsettled, as far as an ordinary reader can understand it; and our conclusion is, that the borrower undertakes to pay, in the long run, the sum of 480l. If we are in error here, we shall be glad to be corrected; but believing we view the matter through the same medium it is seen in by the association, we proceed to the examination of the details in the prospectus.

To analyze this account, or the examples propounded, the party taking four shares of 120l. each covenants to pay the association in the long run 480l.; but if he elect to take a house, he consents to surrender one-half, and take 240l., with which he buys his house, which he mortgages to the association till he shall have paid for it in full the sum of 480l.

Moreover, he bargains to pay these 480l. by a monthly contribution of 2l. 16s., or an annual payment of 33l. 12s., which is written up as 33s. 12d. in ten years. But on the opposite side he owes the society 9l. 12s. per annum for interest on 240l. lent him, or 96l. in ten years.

The account is made fairly to balance, Dr. 336l., Cr. 336l., or *vice versa*, whichever you will.

Thus it is made to appear that the man gets a (freehold or) long leasehold house for 336l., exclusive of 4l. a year ground-rent, which in ten years would make a gross sum of 376l., as for the house, without any consideration of interim repairs, painting, and so forth, which, being his own landlord, he must have done, or allow his property to dilapidate fearfully.

The man, however, is not released from his obligation to the association by the payment of 336l. in ten years; he has still 240l. of a bonus to pay, which he surrendered for an immediate sum of similar amount. If he fulfil his contract, he has to pay this off by the continuous contribution, we presume, of 2l. 16s. a month, or 33l. 12s. a year; so that he must continue to pay for seven years and two months longer the same contribution. In other words, if our view of the case be correct, in seventeen years and two months he and the association will cry "quits."

But reasoning simply by the statement of the association, the man pays annually for ten years,

Annual contributions, including interest on loan of 240l.	.....	£33	12	0
Ground-rent	.....	4	0	0
Dilapidations (say)	.....	2	10	0

Total as to practice ..... £40 2 0

And for seven years more he pays off 240l. still in arrear.

This, we presume, is not the way to view the question, though it is the light in which the directors wish it to be seen by the public. The public see one item which we must now consider as an integral element in the calculations of the directors—we mean "interest" or the *improvement of money*. The man pays

4 per cent. per annum, or 9l. 12s., for the use of 240l. The directors receive from him 2l. 16s. a month. We throw out of the question the entrance-fees of 2s. 6d. per share, and postage-charge of 1s. a year, and deal only with the aggregates he pays as for his dwelling.

This payment of 2l. 16s. a month is a temporary annuity which, according to our view of the case, the man is bound to pay the directors for upwards of seventeen years or else have his mortgage foreclosed, and be stripped of his property at the valuation of the surveyor of the association acting for the directors. If he demur to this official's dictum, the solicitor of the directors will refer it to the litigant's own surveyor, or to an umpire, in the event of disagreement between the "professional men" on either side. But all this must be done at the man's cost, for he will have to settle the business with the solicitor, who acts for the association.

Let us, therefore, now see how the case stands by the improvement of money at 5 per cent. on the part of the directors, to whom the man pays monthly 2l. 16s. for ten years. This payment or annuity is stated to be yearly 33l. 12s. Be it so: in ten years the directors will have accumulated 429l. But if we allow him about the present value of 1l. for his loss of time in waiting upon the directors with his subscription, and say that he pays annually 34l. 11s. 2d., he will, or they will, have accumulated in ten years the sum of 441l. Thus the house stands him in the sum of 44l. a year for ten years, without consideration of two items, which, depend upon it, the directors will look after—to wit, ground-rent and dilapidations. With the addition of these items he pays annually 41l. 1s. 2d. for this period. This sum, if the ground-rent and dilapidations be payable also monthly, will amount to 524l. in ten years; and there is no reason why the directors should not exact these extra sums in this simple method, which might be "equally suitable" to the borrower,—

Paying £33 12s. a year, he pays £429	} in ten years.
Ditto 34 11s. 2d. " " 441	
Ditto 41 1s. 2d. " " 524	

Yet he is made to believe that he pays only 336l. in all; whereas

By the first he pays	.....	£93	} in ten years.
By the second	.....	105	
By the third	.....	188	

more than contemplated under the directors' statement of the case, or, in other words, they gain in that rate; and this last is the true estimate.

Moreover, the man has still to liquidate the bonus which he gave the association:—that is to say, he is in debt to the directors 240l. at the end of ten years, and in seven years and two months more he will have paid this off by an annual charge of 33l. 12s., but more properly by the temporary annuity of 2l. 16s. per month for seven years and two months.

Suppose now the directors as prudent men, well versed in the improvement of money, fructify these periodical payments at the rate of 5 per cent. for seven years and two months; the *unfortunate speculator* will have paid them, or they will have accumulated the sum of 306l.

But the "Speculator" will have to pay besides the sum of 4l. for ground-rent and 2l. 10s. for repairs and dilapidations, or annually 40l. 2s., which the directors will improve at 5 per cent. compound interest, and realize the sum of 365l. The man, meanwhile, fancying that he has paid in the one case 240l., and in the other 286l., whereas the account stands thus:—

Money paid	....	£240	} Directors' profit £66.
Ditto improved	....	306	
Ditto paid	....	286	
Ditto improved	....	365	} Directors' profit £79.

Let us next examine how the matter really exists as between the debtor-speculator, and the capitalist directors at the end of seventeen years two months:—

Dr.		Cr.	
To bonus	.....	£240	} By annual payments improved at 5 per cent. compound interest for ten years
To loan and interest	.....	336	
To ground-rent for seventeen years	.....	68	} By ditto for seven years and two months similarly improved
To repairs, &c., for same time	....	43	
To balance	....	202	365
		£889	£889

The man has now his house, and, if we have taken the proper view of the case, should have besides a balance of 202*l.* to share in with the association. But the prospectus does not take this view of the matter; yet it says, "To the capitalist this association affords additional facilities to realize property." Truly it does; yet not to the speculator. Will the directors be good enough to tell the speculator what portion of these 202*l.* they really will allot to him in the eighteenth year? it is a farce to tell the public that this society can comply with the "Act of Parliament" and close its operations at the end of ten years. It honestly tells the man it will exact 336*l.* in ten years; but to realize the debt of 240*l.* still owing by the speculator, it binds him hand and foot for seven years and two months longer. Verily this "Act of Parliament" gives room enough for a coach and six to ride through it, if a few men can thus elude its enactments. The preamble of the Act runs thus:—

"Whereas certain societies have been established in different parts of the kingdom, principally amongst the industrious classes, for the purpose of raising by small periodical subscriptions, a fund to assist the members thereof in obtaining a small freehold or leasehold property, and it is expedient to afford encouragement and protection to such societies, and the property obtained therewith; be it therefore enacted by the King's most excellent, &c.," and the prospectus tells the world that the association is "no speculation," yet it is to all adventurers who waste their resources in such a bubble. Yet, with a view of encouraging speculators, the prospectus states, that

"In the event of a member dying, his executors or administrators will have as much advantage from and under the rules as the deceased would have had if living; and any member may withdraw from the association, or transfer his share or shares thereof, or interest therein, to any other person or persons, in accordance with the rules and in conformity with the Act 6 & 7 William IV. cap. 32, passed expressly for the encouragement and protection of similar institutions. This Act of itself is sufficient evidence of the favourable opinion entertained by the legislature of these societies, as tending to diffuse more extensively the vested interest in the soil of the country, and benefit a class of persons above those who usually resort to savings' banks; in addition to many other valuable privileges, it exempts members from the expense of re-conveyances, and stamps on transfers, receipts, &c., and protects them from all liability beyond their monthly payments."

This is false, for it gives no "vested interest in the soil of the country" by merely enabling a poor man to encumber himself with a leasehold house; and if it "exempts him from expense of conveyances, &c.," it robs him effectually in an underhand way. Verily, the association takes both skin and fleece from off the flock.

It may, perhaps, be assumed that the Act of Parliament was passed as much to create a particular class of voters for the election of members as to benefit the poor man. For, let us suppose that the leading men, as directors, are of a party, then what is to hinder them operating on the members of the association, and bringing up to the hustings all their registered freeholders or leaseholders to give plumpers for A to the exclusion of B, who is not in the secrets of the association? A partisan might well expend a little money in meeting the calls of the association at the period of an election for a member of Parliament. This is an imaginary case, but realities daily occur which outdo the vagaries of imagination.

Suppose the man is not his own landlord, and pays at the rate of 30*l.* a year of rent, for seventeen years and two months; he pays 515*l.* in all, without the charge of ground-rent and the annoyance of repairs. By his arrangement with the association he pays in all the sum of 687*l.*; therefore he has paid 172*l.*, or above five years and a half more rent for his house than he would were he not his own landlord; for it is plain the sum he pays is  $\frac{3}{2} = 22$  years' and 9 months' rent.

Suppose he pay only the sum he borrows, the ground-rent, and the repairs, he will pay fourteen years' and nine months' rent, at the rate of 30*l.* a year, before he is free; for it is  $\frac{3}{2} = 14$  years 9 months.

It is manifest, that the whole depends on the question of the bonus, for, as to the balance, if it become divisible among the association, the speculator's share of it will be very small.

In handing this prospectus to the public, the directors enclose in it "Extracts from the first annual report of the London and Westminster Provident Association and Savings' Fund:—

"Offices, 23, Lendenhall-street, Aug. 7, 1844.  
"The number of members who have joined the association since the establishment amounts to 315, amongst whom 820*l.* shares have been subscribed for; from the above 32 shares have become forfeited, and 56*l.* shares have been transferred, by which the number of members have been reduced by 43, leaving the association at present to consist of 272 members, holding 788*l.* shares.

"Up to the present time 102*l.* shares have been advanced to members upon mortgage, the average bonus for such advance being 63*l.* 0*8.* 10*d.* per share, and the amount of capital paid off 12,270*l.*, in addition to which there are 20*l.* shares agreed to be advanced, which will secure a bonus of 1282*l.* 15*s.*; the number of shares, therefore, at present to be provided for, is thus reduced to 686*l.* As this number annually decreases, so the association will approach nearer to its dissolution; the directors, therefore, urge the members to assist them in obtaining this desired end as soon as possible, and with that view, they strongly recommend those who are desirous of purchasing their own residences, or other property for investment, to have their shares advanced to them during the early stages of the association.

"The success that has attended the association up to the present time, arising from the number of shares that have been taken up, induced the directors, at their last meeting, to fix a proportionate premium upon all new shares subscribed for after that period; so that members now joining the association, or requiring an additional number of shares, will have to pay an entrance-fee of 7*l.* per share, excepting those parties who take up their shares, to whom an entrance-fee of only 1*l.* 10*s.* per share will be charged."

Pray, gentlemen, trustees and directors of 23, Lendenhall-street, are you also associated with the "London and Westminster Provident Association and Savings' Fund?" or are these "extracts" stuck in the folds of your prospectus to make the public believe the two associations one? Which? is the "Report" a blind, or do you recognize it as your own banding? Whichever way, the "Report" presents matter of grave interest, which we must defer until another number of THE BUILDER.

#### A HINT TO PENCIL MANUFACTURERS.

CAST-IRON, it has been found, when subjected to the action of certain substances, assumes the condition and nature of plumbago; a circumstance which lays open an interesting field of inquiry, seeing that the supply of pure Cumberland lead has of late years been greatly on the decrease; and that artists, when complaining of the consequent deterioration which has taken place in cedar pencils, have only the satisfaction of being told that the quantity obtainable of pure plumbago is now so much reduced, that a greater proportion of admixture than before is necessary to render the supply equal to the demand. (Apropos of this source of complaint, some artists of the architectural profession were a few months ago mingling their sorrows on the subject, when one of them, a well-known and much-esteemed veteran of the illustrative department, exclaimed, "Ah, if they would but give me pure 'lumbago' I'd give them any price for it," a sentiment which, however opposed his more inexperienced listeners might be to its literal meaning, they could but subscribe to it in its intended sense: in the laugh which ensued at this *lapsus lingue* its author heartily joined.) The decomposition or corrosion referred to has appeared in numerous cases, and been found to proceed from various causes. A cast-iron gun which had been long immersed in sea-water, was found to be converted, to the depth of an inch, into a substance having apparently all the characteristics and properties of plumbago—being easy to cut, greasy to the feel, and making a

black streak upon paper. The same phenomena presented themselves in a cannon-ball that had lain forty-two years in ground kept constantly moist by sea-water; externally, to a varying depth of about half-an-inch, it was converted in like manner. On the removal of a cannon and cannon-ball from the wreck of a vessel that had been many years under water, and which were both found covered with oysters, the latter only was found externally to have undergone this change.

A transmutation similar to the above has been found to take place in some cast-iron cylinders used by weavers for applying the dressing to cloth, and that so rapidly, as to render it necessary to relinquish the use of them in favour of wooden rollers: the change in this instance was ascribed to the acid produced by the souring of the paste, which was made of wheat or barley flour. It has also been found that cast-iron, left in contact with muriate of lime or of magnesia, becomes reduced from its specific gravity of 7,207 to 2,155, being a near approach to that of plumbago, which is 1,860; and that its analysis under the circumstances gives chiefly plumbago, excepting certain impurities which usually occur in cast-iron. Here, then, are offered means of producing artificial plumbago, which, if the other mode of soaking the cast-iron for half a century in sea-water appear rather inconvenient, should be available, and must at least induce those concerned in the production of such a desideratum as a good drawing-pencil to pursue further the investigation of this important subject.

The facts here embodied are obtained from "Hodgkinson's edition of Tredgold's Essay on Cast-iron," wherein reference is besides made to an article by Mr. Daniell, "On the Mechanical Structure of Iron developed by Solution," in the *Quarterly Journal of Science*, vol. ii. p. 278; also to a Report by Mr. Mallett, "On the Action of Sea and River Water, whether clear or foul, and at various temperatures, upon Cast and Wrought Iron" in the *Transactions of the British Association*, vols. vii. and viii. J. Wn.

#### PROPOSED MUSIC HALL AT MANCHESTER.

THE committee appointed at the general meeting, held in the Town Hall, on this subject, at their first meeting appointed the Mayor of Manchester their chairman, and Mr. Alderman Neild, Mr. William Steuart, and Dr. Lyon, their vice-chairmen for the ensuing year. They also appointed a sub-committee of eleven gentlemen, including the four just named, to prepare a scheme for raising the requisite funds, to be submitted for approval to the general committee. We understand that the sub-committee have met, and have drawn up a scheme, which they have submitted to Mr. Brandt, the barrister, who had kindly undertaken to examine it. He has done so, and returned the scheme to the sub-committee with several suggestions; and we believe the sub-committee will shortly take the subject into consideration, with the suggestions of the learned gentleman, preparatory to laying the scheme before the general committee for approval. We understand that the scheme, which the sub-committee propose to recommend, contemplates the raising of a fund of 30,000*l.*, in 600 shares of 50*l.* each; and no doubt some provision will be made in it for such privileges as are compatible with the interests of the shareholders and the public. As all the gentlemen on the committees of management of our public charities are placed on the general committee, and as the proposed hall offers a large, valuable, and permanent aid to those charities, by affording the means of holding periodical musical festivals on a large scale, we may reasonably expect that the interest which the honorary officers of these charities take in the promotion of their objects, and in the extension of their usefulness, will lead them to take that active part in the proposed measure, and to give that extensive co-operation to its promoters, which alone are wanting to effect so desirable an object. It has been well said that there cannot long be any difficulty about the pecuniary means, if the public of Manchester are only satisfied that the scheme is sufficiently broad and comprehensive to deserve the support of the community.—*Manchester Guardian.*

A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARHAM, IN NORFOLK.—No. VIII.

WITH NOTICES OF THEIR ACTUAL CONDITION.  
(Continued from p. 552.)

"I.H.S., the Jesuit's badge in the chancel window, promised (to be defaced) by the minister, Mr. William Pell."<sup>28</sup>

*Bintry, or Bintree.*—Much has been done to impair what escaped the fanatic zeal of the Puritans, as well by the slow march of unresisted decay, as also by a yet more active cause. There occurs in this church an instance, unhappily by no means rare, of the mischief arising from repairs being intrusted to persons altogether incompetent. The roof, which was originally of remarkably high pitch, has been lowered many feet; so much so, that horizontal tie-beams ought to have been introduced immediately over the wall-plane. The result of neglecting to supply them is seen in a marked deviation from the vertical line in the piers and arches in the nave, where these open on the south aisle and adjoining transept. This last has a covering of flat tiles laid upon most paltry woodwork. The lead over the nave appears in a very decayed state; it rests on the primitive roof mutilated as just shewn. The chancel, at least the larger portion of it, fell to the ground in 1806; it has been rebuilt at half its former size, and with a low roof *cciled*.

Notwithstanding these dilapidations, the general effect is by no means displeasing. A handsome square tower, with a little spire rising from it, and a spiral stairs somewhat projected at the south-east angle (we were sorry to detect a boarded parapet) and a window with decorated tracery of good character in the transept-gable, offer tokens that, recently at least, some here have thought it "sin and shame to see a church ruinous and foully decayed." The interior presents the novel feature of a stone chancel-screen. We will essay to describe it.

The lower portion comprises a pointed doorway inserted within a square compartment, and having its label terminating in corbel heads. It is flanked on either side by two decorated windows, each of two lights, and having the space between pierced with quatrefoils. A bracket intervenes between those on the north side; it was, we imagine, once surmounted by a statue. The distinguishing feature of the upper part is a large aperture over the entrance; this was formerly blocked, but has been opened by the present minister, whose good taste dictated also the restoration of the transept window. The Decalogue was at that time removed from its position on the screen to a place under the east window. Two niches with pointed arches foliated are seen on either side of the aperture. The rood-loft seems to have been reached through a perforation in the south wall. The effect of the whole is much impaired by the lower level of the chancel ceiling within.

The only thing worthy of notice in the chancel is a very massive oaken chest, rudely shaped and hollowed from the solid tree, and thickly banded at right angles by straps of wrought-iron. In the nave before the screen we found a grave-stone despoiled of its brass; on three others the inscriptions are yet extant. A slab in the transept is poorly carved with a death's head and hour-glass; in the nave a mural tablet by Sevier has been lately erected in memory of the late Lord James Townshend. The sculptor has kept tolerably clear of "rostral crowns and naval ornaments, with beautiful festoons of sea-weeds, shells, and coral,"<sup>29</sup> but the style adopted is utterly incongruous with all about it. Besides, we would have the memorials of the dead ever rendered subservient to the edification of the living; and the patrician sailor could have told how "They that go down to the sea in ships, &c."

"Qui mare fluctisonum sulcat, cavisque carinis,  
Admovet externas vaga per commercia gentes,  
Non ignota illi divina potentia, nec que  
Monstrat in immenso miracula sepe profundo."<sup>30</sup>  
BUCHANAN.

The noble font was originally raised above the floor by three steps, but the pavement is now on a level with the first of these. Its octagonal bowl, which is sculptured with flow-

ing tracery, rests on a shaft of like figure supplied with a plinth and a capital both remarkably elegant. We were sorry to find the meetings of bats in its leaded cavity; why should our churches be so generally "defiled by rain and weather, with dung of doves and owls, stares and choughs, and other filthiness?" The font occupies a central position in the nave near the north door, outside which are indications of a large porch having once existed. The nave, at this end of it, would be much improved by taking away an unsightly platform which, although of no great elevation, spoils the fine effect of a lofty tower arch. It would also cause the immediate removal of a mass of rubbish now accumulated there.

The pews, open seats, pulpit, and desks possess few claims to a detailed notice from us; to good taste they have none whatever. Neither do some poppy-heads, finials, thrown by in the transept, speak much in favour of the more ancient furniture. We will not, however, leave the building without inviting the ecclesiologist to observe the square-headed windows in the south aisle, and to admire their delicate tracery—fain, where a sterner duty is not interposed, to have said of ourselves, in the words of the Mantuan,

"gemmas in fronte solebat  
Ponere."

ARTESIAN WELLS.

TO THE EDITOR OF THE BUILDER.

SIR,—In writing a few remarks under this head for the consideration of the readers of THE BUILDER, I was not aware that I was throwing an explosive mixture into the office of *Punch* or the *Morning Post* (singular conjunction!), or that my *aurum fulminans* would be mistaken by the witty editor or his shadow for a Warner's or a Normandy's destructive power. My object was to shew that partial subsidence of houses often takes place in consequence of the soil being drained after it is built upon; that as clay is deprived of moisture, so it concentrates and settles, and the heavy substantial building settles with it, sometimes partially, as testified by sundry separations or sinkings of the brickwork; at other times uniformly, without displacing any portion of the super-incumbent weight. Partial subsidence is demonstrated by a vast number of buildings on the Bedford and Southampton estates, and other properties in the parishes of St. Pancras and Marylebone, all of which have become prematurely aged by this partial settlement, houses of thirty years' standing exhibiting a state of decay equal to that of houses in the city which were built a hundred years ago on a well-drained and settled soil, and this, too, without reference to inferior materials.

It is remarked by Dr. Fordyce that "clay hardens upon drying, and does not diffuse so readily again in water as sand;" and indurated clay, although it crumbles and softens in water, will not diffuse itself therein. The nodulates of clay, termed clay balls, so commonly found resting beneath the London clay, and from which Parker's cement is made, are evidences of this, for it is in this stratum the waters are often deposited, some of which waters are highly mineralized, particularly in the track of the ancient stream through Camden Town and Bagnigge-wells. The tendency of clay is to settle and consolidate, and under lateral pressure its powers of expansion are exceedingly limited; deprived of its moisture, it passes gradually into indurated clay.

The editor of the *Morning Post* tells us that the annual fall of rain in the small county of Middlesex is sufficient for the supply of all England. But he does not add that the greater portion of this supply passes off by drainage, forms our brooks and streams, and contributes to the magnitude of our rivers. He tells us that the chalk beds of surrounding counties afford also inexhaustible supplies of water to the London basin, and consequently that the waters beneath this city are inexhaustible; but he does not prove to us that there is no uninterrupted chain of communication with these subterranean reservoirs. When Messrs. Meux formed their magnificent well at the expense of 7,000*l.* to obtain water, they were obliged to explore the strata by tunnels in every direction, at various depths, before they could gain the requisite supply; dig a similar well in their

immediate neighbourhood, and this supply will immediately and sensibly diminish.

The idea of well-digging being dangerous to the houses, or affecting the sub-soil, is treated with ridicule; let us give facts for sneers. When the New River Company formed the reservoir in the Hampstead-road, they thought to increase the supply of water by a well; they commenced their labours, and did not cease until compelled to do so, in consequence of the houses in the immediate neighbourhood giving unequivocal symptoms of sinking. Messrs. Reid, of Liquorpond-street, had a well sunk, but after proceeding to some depth, they were compelled to desist, because the foundations of their immense warehouses began to give way; had they continued the work after this warning, the whole pile of buildings would probably have fallen, and its fall would have been announced in the columns of the *Morning Post* under the head of "*Dreadful Catastrophe*," &c. In the latter instance, and probably in the former, the causes of effects produced were only local, but they prove that danger is to be apprehended where large and continuous supplies of water are abstracted from the soil; even though they do not bring up quantities of the earths composing the inner beds, they cause a gradual displacement and consequent change in the disposition, and sometimes in the character of these beds.

In tropical countries, as the moisture is withdrawn from the sub-soil, so the elevated clay-beds on the banks of rivers separate and fall with terrific violence into the stream, and boats on the Ganges are frequently overwhelmed by these avalanches. In dry seasons in America, the earth is rent asunder in all directions, and chasms are formed many feet in width, and extending to vast depths. In the numerous mines of England and Wales, most of the *faults* are occasioned by the sinking in of lower beds through which subterraneous waters formerly flowed, partial subsidence extending to the surface soil. Admitting that vast and continuous supplies of water can be abstracted from the bowels of the earth free of impurities, still changes must take place in the disposition of the lower beds, and the settlement of a mass of houses of only six or seven inches will sometimes occasion as great a loss as though it sunk as many feet. The question to be answered is, can a number of artesian wells be dug in the metropolis sufficient to administer to our wants, and without injury to individual properties? I confidently assert that they cannot. The waters are, generally speaking, blended with the strata; in dry seasons sufficient supplies could not be obtained otherwise than by forcing-pumps.

Chelsea, Nov. 19th, 1844.

ANCIENT ROME AND MODERN LONDON CONTRASTED.

BY H. G. MONTAGUE, ESQ.

(Continued from page 592.)

Again: another most incredible thing is the number of elephants in the army of the Carthaginians, 100 being employed against the Romans in the first Punic War. Now, whether we consider the enormous cost of procuring these animals from the distant regions of the East, the difficulty of subsisting them in the semi-desert regions of Carthage, and the little real service they could possibly render in return for the enormous expense they occasioned, we can come to no other conclusion than that the whole is a fable based upon the histories of Alexander, Darius, or Semiramis, whose conquests extended to the East, where only such an array of these very expensive auxiliaries could exist. Niebuhr remarks that many of the narratives of the history of Rome betray their fabulous nature by the contradictions and impossibilities they involve. The fact is, the greatness and glory of this nation has been grossly exaggerated; the works of Pliny and Dionysius of Halicarnassus are evidently written to gratify the vanity of the Romans, and Polybius is not a whit more to be depended on. Rome, seated on a barren ground, and in an unhealthy air, with a miserable muddy apology for a river running through it—without a good sea-port within any reasonable distance,—without commerce—without manufactures—could not by any possibility have had the population ascribed to

<sup>28</sup> Will. Dowling's *Journal*.

<sup>29</sup> *Spectator*, No. 26.

it. Aristias, Diodorus Siculus, and Menander make Alexandria larger than Rome; the population of this city is stated by Diodorus to be 300,000 souls, and this appears to come very near to the extent of population which could have been conveniently subsisted in Rome. Ancient maps do not make it greater than it is in the present day, nor are there any vestiges of further extension of its walls. It had thirty gates, a very small number for so large a city as it is represented to have been, and wholly inadequate for prompt communication with the provinces. The calculations of Gibbon are any thing but satisfactory. We are told, he says, that when the emperor Claudius exercised the office of censor, he took an account of 6,945,000 citizens, who, with the proportion of women and children, must have amounted to 20,000,000 of souls, and including slaves, have formed a grand total of 120,000,000. Elian, who lived in the time of Alexander Severus, says, ancient Italy contained 1,197 cities; to what extent are we, therefore, to apportion the inhabitants to the city of Rome? The Romans never mentioned more than fourteen regions or wards within the city, neither before nor after the emperors; they reckoned seven great clones, or commonsweers, which it is believed were built in the time of Tarquinius Priscus. History does not furnish us with any account of public buildings without the walls; the number of bridges does not appear to have been more than seven or eight, the three hills mentioned are at present within the walls; the seats of justice, forum publicum, were all in that part called *Pomerium Urbis*, which was of no further extent than modern Rome; they were in all eighteen or nineteen, one-half of which were market-places, and other meeting places for public affairs; and finally, as a learned writer on this subject says, had it been so greatly pretended, it would have included Mount Soracte and other mounts besides the seven, as well as the little hills, mentioned in history, upon which the city was then seated, as it now is; it must have extended as far as the Adriatic, and Mount Apennine must have been in its centre; Oriculum, Tibur, Ostia, and one or two other places had been also a part of it, which are but short journeys from modern Rome. Tusculum, Tully's country seat, is to this day only as far distant from Rome as of old. There is not the least evidence to support the notion that the walls were of greater extent than they now are, and it is recorded that the augurs always set their faces against any extension of the city. Again: there are no accounts handed down to us of magnificent, or even common temples, baths, &c. without the walls, nor are there the least vestiges to be found of extended walls or public edifices; there were, no doubt, country seats, as there are in the present day, but no villages such as surround London, and are becoming gradually absorbed in it. Honorius, after the plunder of the Goths, repaired the walls, and made them as they were before, but did not extend or diminish them. The *Transiberina Regio* was then walled about as well as the rest, as also the *Campo Marzo*, where now stands *Urbs Leonina*. Rome must have had its towns as well as other nations, and Pliny tells us that the houses are spread up and down about Rome, adding many towns to the city; and Dionysius also observes that all the places inhabited were without the walls, and it would be in vain for men, considering of them, to inquire into the greatness of the town, and that he would hardly find whence it begins or ends, so near do the suburbs approach and join the city, and make it look as if it were an immense length. This statement applies to all the cities, the leading roads to them being lined with houses and ornamented with country seats.

One great proof that the city of Rome itself was not very populous, is the state of its posts, which were established along the great Roman way; there were stations every five or six miles, with relays of forty horses only, which not only performed all the government work, but were also at the disposal of the nobility. And again: the public roads, so truly celebrated, appear to have been made for show more than for actual service, for even to the present day they exhibit little wear, although vast stores of fruits, grain, wine, and oil were daily conveyed into the city from all parts of the country.

Luxury was confined to the few, and was little beneficial to the community at large; the supplies of their tables were chiefly the produce of the farms, and of slave-labour; their rich estates were the produce of other lands; the poorer classes were dressed in a simple Bornease, like the Egyptian fellabs; and their food was scarcely so good as that enjoyed by the lazaroni of the present day.

The state of their trade was truly pitiful for such a mighty nation, and was far inferior to that of one of the petty states of Greece; nor had they, in fact, any convenient sea-ports, for *Ostræ* was wholly unworthy the name. Every year, about the time of the summer solstice, a fleet of 120 vessels sailed from *Myos horimus*, a port of Egypt in the Red Sea, and, by the periodical assistance of monsoons, they traversed the ocean in about forty days. On their return, the goods were transported on the backs of camels to the Nile, and thence to Alexandria. Silver was their only instrument of commerce, so that the Roman empire was drained of her bullion to the extent of 800,000*l.* per annum. These commodities realized enormous profits.

The splendour of public edifices, although attested by their remains, is little proof of the greatness of a city; they in general speak of barbarous times, when slaves were abundant, and the wealth of nations was apportioned out to a few individuals, whose love of rivalry induced them to rival each other in magnificence. Witness the pyramids and palaces of Egypt and other cities, nay, most of our own finest edifices were built in what we moderns term the dark ages of our forefathers. We are too enlightened now-a-days to do things well, improvements are commenced ere we have time to lay down our plans.

Laupredius tells us that the emperor *Helio-gabulus* ordered all the cobwebs in the city to be collected, which on being weighed amounted to 10,000 pounds; this proves the Romans to have been a dirty, rather than a numerous people.

The celebrated Roman roads were by the Roman soldiers formed for military purposes, and not for commercial intercourse. On the other hand, the *Tiber*, a narrow rapid stream, was of little real service to the city, being rather an effectual barrier to its expansion. It was much like one of our canals, horses having to draw the boats from *Ostræ*, which, as there is no mention made of docks, must have been but few, for this river extended very little into the city. When *Virgil* speaks of it as a gentle river, "*Leni fluit agmine Tiberis*," he speaks of it as a poet, not as a historian; a population such as London possesses would have drunk up as much water as that of the river, and extended to the Roman sea-coast.

Much of the space within the walls was occupied by public buildings; there were 276 granaries, being one to every street, 900 private bathing places, 1,350 great cisterns of water, 1,780 domus, every one of which great houses had within itself a cirque, portico, seats of justice, temples, wells, and several bathing places. It is said that the house of *Nero* had many porticoes, every one 1,000 paces long; there was a great pond like a sea, in addition to temples and spaces for the angurs, vineyards, pasture-grounds, and woods, with a multitude of cattle and wild beasts of every kind. The amphitheatres and cirques were large; there were also public walks.

The estimates of the present population of London carry it up to 1,900,000 souls. The extent of surface covered by buildings is estimated at about fifteen square miles, or nearly 10,000 acres, with considerably more than 200,000 houses. It is most advantageously disposed on the banks of a magnificent river, over which six beautiful bridges are thrown, and under which a tunnel is formed, rivaling in art any Roman work.

It contains 113 parishes, about 250 churches and chapels of the Established Church, 9 Scottish chapels, 14 Roman Catholic chapels, 18 foreign Protestant churches and chapels, 7 synagogues, and about 200 places of worship for dissenters.

The cathedral church of *St. Paul* may surely vie with any one of the most magnificent Roman edifices; our domus or palaces, among which may be included a vast number of private houses occupying the streets and squares, are almost beyond count, and the riches they contain in works of art and private fortune are greater than all Rome put together

in the days of its greatest prosperity. London has no fewer than fifty markets, consumes upwards of 1,500,000 sheep and 190,000 bullocks, 25,000 calves and 25,000 pigs, every year, exclusive of vast quantities of bacon and hams. The consumption of wheat may be estimated at 1,200,000 quarters. The annual supply of coals employs 2,700,000 tons of shipping; of her goods 80,000 or 90,000 vessels are employed in administering to her luxuries and wants. Instead of Roman roads, we command time and obliterate space. In addition to many magnificent buildings devoted to public amusements, our magnificent charities, colleges, halls, public schools, and hospitals, are the surprise and admiration of the world. Instead of seven sewers, London is intersected with them in every quarter. Instead of narrow, impassable streets, London boasts of an endless vista of open streets and squares, well drained, well lighted, and well paved. Built after the manner of ancient Rome or Canton, it would cover four times the extent of ground it now occupies. To conclude, it is a city, the head of a nation, from which a nation greater than Rome ever was, has sprung, governing regions where the Roman eagles never went, and myriads of people more than Rome could ever boast—a nation ruling by her arts as well as arms, and enriching as she is enriched by the spoils of all nations.

#### DECISION IN THE COURT OF EXCHEQUER THURSDAY, NOV. 28.

(*Nisi Prius* Sittings before the LORD CHIEF BARON.)  
LICENCES TO ERECT HOARDS AND SCAFFOLDS  
ON THE PUBLIC WAY.  
DEVEX V. WARNE.

THIS was an action brought by a bricklayer against the surveyor of pavements for the parish of *St. Ann, Westminster*, to recover damages for removing certain ladders which the plaintiff had erected in repairing a house situate in *Porter-street, Newport-market*.

*Mr. Corrie* (with whom was another learned gentleman) appeared for the plaintiff; and *Mr. Jervis* and *Mr. Ogle* for the defendant.

It appeared that a *Mr. Hay*, a licensed victualler, and the occupier of the house, *No. 14, Porter-street*, employed the plaintiff to colour the outside of this and the adjoining house, which was numbered 15. The plaintiff applied for and obtained licence to set up a ladder for two days on the foot-pavement of the house, *No. 14, Porter-street*. The house, *No. 14*, is a corner-house, one side of which fronts *Porter-street*, and the other side fronts *Newport-court*. The plaintiff set up two ladders, joined together by a cord or rope, on the pavement in *Newport-court*, against the house *No. 14, Porter-street*, and also a ladder against the house *No. 15, Porter-street*. The defendant, acting in pursuance of his authority as surveyor, cut the ropes which held the ladders together, and took the three ladders to the green-yard. In taking down the ladders, a pail with whitewash in it was broken, and its contents were destroyed. The defendant, by his pleas, justified under the statute 57 *Geo. III.* removing the ladders, and paid into court 20*s.* as compensation for any injury the plaintiff had sustained by cutting the cord, breaking the bucket, &c.

The defendant's counsel insisted that the ladders were not erected within the terms of the licence, which only authorized the plaintiff to set up one ladder on the pavement in *Porter-street*, opposite *No. 14*, instead of which he had erected a ladder on the pavement opposite *No. 15*, and two ladders joined together on the pavement of *Newport-court*.

The Lord Chief Baron was of opinion that the licence did not authorize the erection of the ladders in the places in which the plaintiff had set them up. He also expressed a strong opinion that when the 20*s.* was paid into court, the action should have been discontinued.

The jury returned a verdict for the defendant, under his lordship's direction.

[This is a strange case: if the plaintiff, defendant, counsel, judge, and jury had taken the trouble to read the *Street-Act*, they would have found a surveyor of pavements has only power to grant licence to erect hoards and scaffolds; any other description of licence under such circumstances could alone be legal under a peculiar local Act of Parliament.—*Ed.*]

## BELL-TURRET OF LEIGH DELAMERE CHURCH, WILTS.

PERSPECTIVE VIEW.

TO THE EDITOR OF THE BUILDER.

SIR,—The beautiful turret which I herewith transmit to you is from the Church of Leigh Delamere, near Chippenham, in Wilts. It is placed over the chancel arch, and its projecting angles are supported by transverse stones corbelled over.

There are several churches in Wiltshire and the neighbouring county of Gloucestershire with these turrets; Mr. Thomas Larkins Walker, architect, gave the measured details of two of them, viz. of Biddestone and Great Chatfield (both in Wilts), in his valuable continuation of Pugin's works, and views of the churches, with notices of them by the Rev. J. L. Peit, will be found in the first number of the *Archæological Journal*. I regret I could not take measurements of this turret when on the spot, but independently of my want of time, the church is in such a condition, that the placing ladders against it would have been attended with injury to the building, and almost certain danger to myself. I think the sketch is, however, sufficiently large and distinct to explain to the professional man the design as well as the construction of the turret. It has generally been described as having five columns at each angle; you will perceive that there are really only three; these are placed, perfectly formed, into circular recesses; the wall between each column being rounded off, to exactly the same diameter as the column, gives this effect of five; the string-moulding, the capital and the base of each column, are bond stones. Above the columns, which are united at each angle of the building by a continuous abacus, rise lofty arches bearing labels; almost immediately above the points of the arches is placed a string-course, which surrounds the whole turret, which at that part is of a square plan, with its corners cut off: from thence ascends the crowning spire, the plan of which approaches more nearly to the form of a regular octagon, and which has corbelled angles, and the whole is finished by a rude cap-stone surmounted by a metal cock of rude workmanship. Near the summit of the spire each of its thin stone side-panels is perforated with a plain quatrefoil, the four on the canted sides being lower than the four others. The ledges which occur from the transition of the upright work to the pyramidal spire-work, are occupied by four peculiar pieces of stone, finished with globose heads.

The peculiar manner in which this little work is perched upon the gable, with the alternating corbels, and the columns, alternately long and short, is very singular. Within the turret, which is open, may be seen the wheel of the bell, and which, though to some eyes bearing a homely appearance, adds to the picturesqueness of the representation. The turret at Leigh Delamere is the best of the yet discovered examples in Wilts, and I am sure the merit of it as an architectural composition will be fully appreciated by your readers.

One of the examples published by Mr. Walker lately fell down through neglect of repair; and persuasion on the part of the neighbouring gentry not having been effectual in causing its re-erection, it is now preserved in the beautiful terrace garden at Castle Coome. It would be a great pity if the one at Leigh Delamere is suffered to become so dilapidated as to meet a similar fate.—I am, Sir, yours,

C. J. RICHARDSON.

22, Brompton-crescent.

ON THE ARRANGEMENT AND CONSTRUCTION OF HOUSE DRAINS.  
BY MR. JOHN PHILLIPS.

(Continued from p. 594.)

The trap (Fig. 5, inserted in the last Number) can easily be cleansed at any time by taking up the grating and pouring three or four pails of water forcibly into it; the momentum of the water upon the curved bottom will stir up the sediment, which will be forced into the overflow drain. The common iron bell stench-traps are generally inoperative in consequence of often becoming choked where the bell dips. People submit to the

annoyance of the emitted effluvia and foul vapour from not knowing wherein lies the evil and remedy. They complain of smell arising from the sewer, when it is very often found to arise from the choking and inefficient action of these traps, and the bad construction of common brick traps with dip stones. The stench-trap represented in Fig 5 it is hoped will prevent these evils, it can be made of various sizes, from 4 to 9 inches diameter, and would be considerably cheaper and much more efficient than those formed of common bricks, the latter being generally constructed very imperfectly. It is to be hoped that some enterprising brick and tile makers will very soon set about preparing the various articles of tubes, stench-traps, and soil-pans herein recommended for the London market. Their efficiency would soon be appreciated, and they would quickly supersede the use of brick drains. I shall feel pleasure, at any time, in affording information as to the formation and construction of these articles to any one, on addressing a note for me to THE BUILDER Office.

For the humbler classes of dwellings it is essential in the construction of cesspools to all common privies, that they be built as small as convenient, in a sound and substantial manner, and perfectly air and water-tight, so as to prevent the noxious stench from escaping into the closet; and also to hinder the contents of the cesspools from permeating the surrounding earth. The bottoms and sides of cesspools should be combined together with an inverted arch, and built with sound, well-burnt, hard stocks. The bricks should be saturated with water and laid in Roman cement. The cross joints should be well flushed up, and the cesspools should have their interior surfaces properly rendered with Roman cement at least three-quarters of an inch thick. A cesspool thus formed would be as one solid mass, and perfectly water-tight.

It is impossible to make cesspools water-tight by building them with common mortar, for mortar becomes friable and rotten when in contact and impregnated with the acids contained in the urine. The carbonate of lime contained in the mortar combining as a base with the acids it may meet with from the urine, a lactate of lime is formed, which, being soluble, is carried away. Therefore, while the lime is being gradually removed, the silica remains unacted upon by the acids in general, and thus we may easily account for the rotten and friable state of the mortar.

An overflow tubular drain should be placed 1 foot 6 inches or 2 feet from the bottom of the cesspool, communicating in a direct inclination with the main sewer. The top of the cesspool may be covered over either with a brick arch, or with a sound Yorkshire paving stone, at least 3 inches thick, tiling 4½ inches on the walls, and properly bedded upon them. A cheap, strong, earthenware soil-pan with a funnel could be made in one piece, glazed inside, which, being properly fixed and bedded airtight into a hole cut in the arch or stone, the exact size of the funnel, and continued down and dipped 4 or 5 inches in the water below the overflow drain, would prevent the stench from escaping into the closet. The surface of the water in the immersed funnel would be the only portion of the cesspool exposed, which would be very trifling. All the rain water from the roofs should be conveyed into the soil-pan by the usual pipe, affording another means for reducing the impurities of the cesspool, and when the soil-pan is closed by a cover, all foul air evaporated from the surface of the water within the funnel would ascend up this pipe. The surface drainage of the yard or area should also be conveyed into the cesspool through a small drain properly trapped, and all the refuse water (and only the water, not vegetable refuse and ashes) that accumulates or can be collected upon the premises should be thrown into the soil-pan as a sink. Equal contents of the cesspool will be displaced and driven into the overflow drain by an equal amount of refuse water thrown down the soil-pan, which will be carried off into the main sewer much more swiftly by having the calibre of the overflow drain small and in proportion to the extent of the premises. By these means the water, &c., within the cesspool will continually be undergoing a purifying change.

Fig. 6.

Fig. 7.

Fig. 8.

The annexed figures, 6, 7, and 8, represent a plan and two sections of a portion of a privy and cesspool in accordance with the preceding observations. A represents the cesspool built and rendered inside with Roman cement; B the soil-pan and funnel 5 inches diameter, where it is immersed in the water within the cesspool. A round hole is to be cut through the stone E, the exact size of and to receive the funnel, which has a flange all round it at F, bedded into and on the stone cover. The funnel dipping 4 inches, as before described, into the water below the bottom of the overflow-drain C which is formed of clay tubes 6 inches in diameter, glazed inside. It will be seen that whatever enters the cesspool by the various inlets will be discharged by the drain C in a diluted condition, and the overflow escaping by this drain will be carried into the sewer. D represents a funnel with a trap and drain of clay tubing which convey the surface drainage into the cesspool A. G is a rain-water pipe entering the soil-pan B. The rain-water entering the pan by this pipe, as well as the refuse water thrown into the pan, will have a tendency to keep it clean. A privy thus soundly and properly constructed would be most effectual; the small tubular drain affording an easy transmission to the sewer of all the sullage nearly as fast as engendered, without the least stench emanating therefrom, except what may arise from the evaporation of the insignificant surface exposed within the funnel.

We should recommend in all cases the universal disuse of cesspools and privies, and would substitute proper water-closets in their stead. Every water-closet should be trapped in some way, to prevent the emission of the noxious effluvia. There are many excellent methods of effecting this by the application of soil-pans with traps, which communicate by a lead pipe with main drains. A noisome exhalation is sometimes found to arise from such apparatus, however well made. The emitted stench rises from underneath the seat and flooring, and if a pipe of iron or lead were to be placed somewhere in this locality, and be carried up direct, as high as possible, into the chimney most commonly used, the heat in the chimney would draw off through the pipe the foul air from the water-closet, and all the foul vapour would be carried upwards high into the air with the smoke. A pipe thus fitted to a water-closet would be a very effective appendage, and the means of ventilating and carrying off the exhalations which may arise therein. Nothing can be more annoying and unpleasant than for people to be continually inhaling air loaded with effluvia of the most intolerable and poisonous description. There is no doubt that many diseases among adults may be attributed to this cause, and that young children are thus hurried to a premature grave in consequence, their weak lungs not being of sufficient strength to counteract the sulphuretted hydrogen thus imbibed. The officers of the Courts of Sewers are constantly attending to complaints of foul smells which are found to arise universally from ill-constructed drains without proper stench-traps. By these sources streams of foul vapour are constantly being drawn from the sewers, with which the atmosphere of every room in a house becomes charged; many sewers which would otherwise have their air pent up, are by these means perfectly ventilated. In however nice and clean condition the paper and furniture may be kept, the corrosive acids contained in the foul vapour thus drawn from the sewers and drains are ever covering them, and therefore tend to destroy their brilliancy. The painting also becomes stained and discoloured from the same cause, in a manner which no washing can cleanse.

The pipes which convey the refuse water from kitchen-sinks into the drains are very often the conductors of foul vapour into the houses; such pipes are very frequently found not trapped; the consequence is, that the air of the apartment becomes loaded with noxious effluvia; and when the sink is not being used, a dish-cloth is sometimes placed over the mouth of the pipe to prevent the emanation of stench.

It is to be hoped that in future, builders generally will pay more attention to, and give their workmen stricter injunctions as to the proper construction of drains, for most assuredly the general health of the whole community at large is somewhat dependant upon such construction. The inefficiency of common

brick drains, their improper forms, and the dilapidated and rotten state in which they are universally found, ought immediately to lead to their re-construction where practicable, by using the cylindrical tubular drains, soil-pans, and stench-traps, recommended in this paper, or by any better means that may be devised. With these, however, escape of deleterious effluvia would be prevented, and consequently the atmosphere would remain pure.

#### INSECURITY OF THE IPSWICH COUNCIL CHAMBER.

Report of Messrs. J. M. Clark and George Mason.

THE Estate Committee of the Ipswich Corporation having referred the causes of the insecurity of the Council Chamber to Messrs. J. M. Clark and George Mason, those gentlemen reported that one of the girders in the principal floor had a permanent set of nearly 3 inches. This beam had a bearing of 21 feet between the points of support, and was of the scantling 13 inches by 12 inches; it carried near its centre one of the four columns of the Council Chamber, and, together with another girder of the same dimensions, a large portion of the floor. This was the beam which yielded so much to the pressure on the 9th ult., the remainder of the floor consisted of joists 4½ inches by 3 inches. There was no appearance of any settlement in the surrounding walls. The fracture observable in the plastering was occasioned by the regular settlement of the new work. The sinking of the floor was attributable to the insufficiency of the scantlings of the floor timbers, which were left without trussing. In the opinion of Messrs. Clark and Mason, the following means should be adopted to remedy the existing defects. The girder, immediately beneath the column, should be tied up by a wrought-iron rod 1½ in. in diameter, to a pair of trussed principals inserted between the beams of the roof, resting on the present principals, which should be strengthened to receive them, and on the outside walls, the rod being concealed within the column. The other girder should be trussed with cast and wrought iron. The joists should be removed, and others of a scantling 7 inches by 2½ inches inserted in their place. The present floor-boards should also be removed, and a new 1½ in. hatten floor substituted, the old boards to form a gangway in the roof, which was much needed. By these means the floor of the Council Chamber might be rendered perfectly secure.

[As far as we can judge from the description, these recommendations appear judicious: the failure appears to have arisen from the common fault of casting a burthen upon a beam at its weakest part; the cast iron girders at Oldham broke from the same cause.—Ed.]

THE LABOUR MARKET IN SOUTH AUSTRALIA. — Employment for blacksmiths, wheelwrights, bricklayers, and carpenters, is plentiful and well remunerated; and the increased demand for furniture of colonial manufacture is operating favourably for the really good workmen who have not embraced a rural life. The importation of wooden houses has ceased, and it is no longer necessary to bring household furniture of any kind. Domestic servants are extremely scarce, and obtain high wages. The mineral discoveries in various parts of the province, and the mines already in full operation, have furnished employment to all the miners here, who are not too firmly wedded to pastoral and agricultural pursuits to quit them for high wages. Strong inducements are being offered, through accredited agents, to miners in the neighbouring colonies, so that a large accession of mining operatives may be expected; but in all probability far too few for the employ at present afforded, and in sure prospect. But the undeniable advantages which present themselves to mining capitalists are, by this time, known in Britain, and will probably superinduce an influx of new employers, and a body of thrifty miners from the old country. For painters, plasterers, and sawyers, the great increase and improvement of buildings have wrought a most welcome change; but shipwrights (so called) are any thing but such, from the nature of their present employments, there being no ship-building, and few jobs of repair.—*Adelaide Observer*, June 10.

#### LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND.

Furnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-Inn Fields.

[SIX MONTHS FOR ENROLMENT.]

Newman, William, of Birmingham, brass-founder, for a certain improvement or certain improvements in window blinds. November 2.

Bewley, William, of Dublin, gentlemen, for improvements in fastenings for doors, windows, and other places where fastenings are used. November 2.

Jordan, Thomas Brown, of Cottage-road, Pimlico, mathematical divider, for improvements in the manufacture of blocks or surfaces, for surface-printing, stamping, embossing, and moulding. November 2.

Brunton, William, jun., of Pool, near Truro, Cornwall, engineer, for improvements in apparatus for dressing ores. November 2.

Thomas, Joseph, of Finch-lane, publisher, for a new and improved tube. (Being a communication.) November 5.

Geary, Stephen, of Hamilton-place, New-road, architect and engineer, for certain improvements in the machinery, apparatus, and arrangements for the supply and distribution of water for public and private uses, but more particularly in cases of fire. November 7.

Taylor, Henry Borriskill, of Piccadilly, lamp-manufacturer, for improvements in apparatus for transmitting light from lamp and other burners. November 7.

Auld, David, engineer, of Dalmarnock-road, and Auld, Andrew, engineer, of West-street, Tradestown, Glasgow, for an improved method or methods of regulating the pressure and generation of steam in steam-boilers and generators. November 9.

Prosser, William, jun., of Windsor-terrace, Pimlico, gentleman, for improvements in the construction of roads, and in carriages to run thereon. November 9.

Freeman, Mark, of Sutton, Esq., for improvements in working or dressing the surface of stone. November 14.

North, William, of Stangate, slater, for improvements in covering roofs and flats with slate. November 14.

Farrell, Isaac, of Great Brunswick-street, Dublin, architect, for certain improvements in machinery, whereby carriages may be impelled on railways and tramways, by means of stationary engines, or other power, including certain apparatus connected with the carriages to run on the same. November 14.

Watteu, Francis, of Finsbury-square, merchant, for improvements in preventing incrustation in steam-boilers and steam-generators. November 16.

Maudslay, John, of Lambeth, engineer, for certain improvements in steam-engines. November 16.

Reynolds, John William Backle, of Lymington, Devon, engineer, for improvements in obtaining motive power for working locomotive carriages and other machinery. November 25.

Derr, Ebenezer May, of Ludgate-hill, gentleman, for improvements in the manufacture of horse-shoe nails. November 25.

Higginson, Francis, of Rochester, lieutenant in her Majesty's Navy, and Coles, Edward Robert, of Rochester, aforesaid, merchant, for certain improvements in the construction of buildings generally. November 21.

Spencer, John, agent of the Phoenix Iron Works, West Bromwich, Stafford, for improvements in manufacturing or preparing plates of iron or other metal, for roofing and other purposes to which the same may be applicable. November 23.

Baillie, Benjamin, of Henry-street, Middlesex, glazier, for improvements in regulating the ventilation of buildings. November 25.

Millicham, George, of Birmingham, for improvements in the construction of axle-trees. November 25.

Leroy, Narcisse, of Paris, in the kingdom of France, merchant, for improvements in covering the tops of bottles, jars, and other vessels. November 28.

## Correspondence.

## THE DOMESTIC ARRANGEMENT OF SMALL VILLAS.

TO THE EDITOR OF THE BUILDER.

SIR,—There is one branch of building which demands the serious attention of architects at present, and which appears to be overlooked and neglected by most of them: I allude to the internal arrangement of the domestic offices in small villas, cottage-ornées, and the various ornamental residences which are so numerous in the suburbs of the metropolis. In mansions and villas of the first class, this department of building is generally well attended to, and every requisite convenience is afforded to the housekeeper and domestics in the shape of kitchens, still-rooms, stores, pantries, &c. &c., but in villas of a more humble character, where the lady is her own housekeeper, and perhaps not more than two, or at most three, servants are kept, a sacrifice of the domestic convenience is too frequently made in order to add to the appearance and effect of the entrance-hall, staircase, and principal apartments. Some months since I was visiting a lady who had just removed into a very pretty little villa erected for her residence under the superintendence of one of the leading architects of the present day. The site of the building was a beautiful one; a gently rising ground, commanding extensive views from three sides, over one of the most beautiful counties in England. The exterior of the villa was exceedingly pretty, in the Tudor cottage style, with ornamental verge-boards, pendants, &c. The interior, as far as the entrance and the principal rooms went, was also quite in keeping with the character and style of the building; but in the domestic department I found it quite the reverse, and the lady assured me that it was one of the most uncomfortable houses she had lived in, adding, that without detracting from the abilities of the architect, she still thought that had he consulted her taste upon the arrangement of a department which so especially came under her notice, it would have been so. 1st, There was no back-staircase to the chamber-story, and from the arrangement of the building it was impossible to get one, without building it on the exterior. This was a glaring error, as perhaps nothing else so much contributes to the real comfort of a house as two staircases, one public the other private. 2ndly, The door into the garden, was so placed that, should the kitchen door happen to be open, a person upon entering from the garden could see, and be seen by every one in the kitchen; this was pointed out to me as a very great annoyance. 3rdly, There was no pantry convenient for the use of the dining-room, so that the wine and dessert were obliged either to be brought from a distant part of the house, or to be placed upon the sideboard during dinner; this was certainly a great oversight. 4thly, There was not a single place which the lady could use as a still-room and store. This, she seemed to feel, was the greatest mistake of all, and from the arrangement of the house it was impossible to give her the conveniences which she required without spoiling the dining-room and back lobby. I have mentioned these as the principal defects in the arrangements, though there were several others of minor importance and I have myself so frequently seen other houses of this class similarly inconvenienced, that I am certain it is a common case. My sole reason for bringing it before the public is, to draw the attention of architects to the important fact, that upon the good arrangement of the domestic offices, depends the great comforts of a dwelling-house, and that no additional extent, or effect, in the arrangement of the principal rooms can warrant them in making a sacrifice of them.

In conclusion, I venture to suggest, that were a design shewn and explained to the lady of the house previous to its erection, I have no doubt that many valuable hints would be given by her to the architect, as it is a department so exclusively her own, and therefore she must be the best judge of what is really required for its convenience and comfort. I shall perhaps at some future opportunity resume this subject, and give my own ideas upon it, in the shape of a ground-plan for a small villa residence.

EDWARD MANFRED.

## HOUSE DRAINS.

SIR,—I have no idea who Mr. John Phillips is, who tells us in your last number that he has "ventured to throw together a few thoughts," but I shall be disappointed if his ability and modesty do not obtain more than mere respect.

If Mr. Phillips will permit one or two suggestions by an extensive manufacturer, they would be, first, whether his rule for determining thickness of earthen drain-tubes ought to apply arbitrarily in all cases, seeing that of tiles similar in dimensions some would bear a pressure of cent. per cent. (yea, and possibly five or ten times repeated) more than others? Secondly, whether his method of uniting them at the joints is practicable, and the best which may be devised?

Manufacturers are aware of the risk, when tubes are cut at the ends, both as to twisting and breakage; a weakness from which they are never free after the processes of forming, dressing, and firing are over. Would it not be better to leave the tiles perfect and square at both ends, and make them to fit almost air-tight? Then as regards an overlap, either form one end of each tube with a raised ring, or let one be supplied separately for each joint. As the tiles would abut upon each other, would not a little good stopping at the ends form the security of the joint, and render it a question of secondary importance what the socket or outer ring were filled up with? Thirdly, as respects glazing the inner surface, would it not be more satisfactory to use a material which either partially glazes over the surface naturally or sufficiently smooth, of proved durability and strength (and there is no lack of such), rather than adopt artificial glaze upon an exceedingly porous, weak, and perishing body?—Your obedient servant,

THOMAS PEAKE.

22, Water-lane, Fleet-street, 3rd Dec., 1844.

[Our correspondent's observations relative to the thickness of pipes are just, and having occurred to us, we stated them to the author. We also made the same objections to their jointing. To be secure the pipes must fit into each other; and to have sufficient strength, must have overlaps of the same thickness at least as the substance of the pipe. If not so inserted at their joints, they would become so deranged, as to create by their irregularity a succession of internal stoppages.—Ed.]

## MARQUETRY.

SIR,—Allow me to inform your "Ellesmere Subscriber from the commencement" that the construction and application of marquetry are fully and accurately described in two communications inserted in the ninth volume of the *Mechanics Magazine*, No. 242, pp. 169, 170, and 171, the one from Henry Provis, Sherington, Bucks, and the other from your humble servant.—I am, Sir, yours truly,

CHRISTOPHER DAVY.

3, Furnival's-inn, 3rd Dec. 1844.

## MATERIAL FOR BRICKS.

SIR,—Having an immense quantity of solid deposit (which I take to be a mixture of clay and mud) opposite to my villa, on the banks of the Thames, I shall be most happy to bear part of the expense of removing the same, should any speculator be bold enough to enter upon the experiment of trying his hand in converting it into bricks; a suggestion which I really think more worthy of attention than many other schemes now afloat.—I am, Sir, your obedient servant,

Z.

## DRAWING INSTRUMENT.

SIR,—I have taken in *THE BUILDER* some time, and wish to ask you a question, hoping it will be answered. Do you, or any of your correspondents, know any thing about an instrument to draw lines to an inaccessible vanishing point? If so, your answer in next week's *BUILDER* will oblige. G. N.

[There are, for ordinary purposes. The stock of a drawing square may be made with a circular curved piece of wood attached to it, which may be worked round another piece of wood fixed to the side of the drawing-board, and in its motion round, the blade of the square will produce perspective lines tending to a vanishing point.—Ed.]

\* In foundations, arches, and the like, some bricks easily crush; while there are others,—for instance, such as Mr. Telford used ten millions of in the Harecastle tunnel,—that never fail.

## STAINED GLASS.

SIR,—Will you or any of your readers be so good as to inform me of the best works on stained glass, with their prices, suitable to a person in the glazing business, and to a student in the arrangement of stained glass in windows of different sizes?—You will oblige, yours, &c. &c.,

A CONSTANT READER.

Preston, November 29th, 1844.

## ORNAMENTAL CAST-IRON ROOFINGS AND PROCESS OF GLASS-STAINING.

SIR,—Can you inform me if ornamental cast-iron roofings have been used in any church instead of wooden frame-work of olden time? it appears to me that such material would emduce much to the lightness of a building, economy of purse, and to beauty of structure.

I am anxious to emblazon upon glass some heraldic ornaments. If you or any of your correspondents will furnish me with the process, and also give me an insight into the colours and oils used, I shall be greatly obliged. Having been one of the first readers of your excellent journal, I hope you will insert my questions.—Yours, &c. AN AMATEUR.

London, Nov. 26th, 1844.

## ARCHITECTURAL COMPETITION.

## THE CHORISTERS' SCHOOL, MAGDALEN COLLEGE, OXFORD.

SIR,—My attention has been this morning directed to the following paragraph of an anonymous letter in your last *BUILDER*, headed "Architectural Competition—The Choristers' School, Magdalen College, Oxford:—

"Mr. Derick, who sends in his designs at least two weeks after the time specified, is appointed to carry out his designs, he being a resident in Oxford, and having access (as any one had who was taken in by a member of the college) to the room where all the drawings already sent in were exhibited."

Now, Sir, these words convey something very like an insinuation, it is therefore only fair to state that up to this very moment Mr. Derick has never had a single glance at any one of the numerous designs intrusted to his care, and laid before the college for its decision, and I may truly say that Mr. Derick had no facility or advantage allowed him which had been refused to any other competitor.

To the erroneous statements in the same anonymous letter, I think it quite unnecessary to trouble you with a contradiction.—I am, Sir, your obedient servant,

J. R. BLOXHAM, the Barsar of Magdalen College.

December 4th, 1844.

## BUILDING COMPETITION AND UNPROFESSIONAL JUDGES.

SIR,—Under this head appear, in the last number of your truly excellent and independent publication, a few observations addressed by Mr. James Knight, in reference to the public competition for the proposed foot-bridge over the Old River in the Hackney marshes, wherein he very justly expresses his "astonishment and annoyance" at the unlooked for decision come to by the board on the evening of their opening the tenders of the several competitors for the work in question. Believe me, if it can at all lessen the feelings of disappointment and surprise experienced either by Mr. Knight himself or his fellow-builders in the affair, at the result of their competition, I can assure them they have in me a most zealous sympathiser, for I do most sincerely declare that my amazement on the announcement of the chairman, when admitted into the room along with (not anterior to them) the several competing parties, that the board had come to the resolution not to have the work done at all, was quite equal to Mr. Knight's; and why they came to such a determination I really am at a loss to conceive, certainly not because they were taken by surprise at the amount of Mr. Knight's tender, for it was under the estimated sum which I had previously supposed the works would amount to, and therefore they must have been prepared for it.

The board were forewarned of the enftness of the season for the performance of such a work in so peculiar a locality; but then it was thought by them not to be impracticable.

But if, on reflection, they considered such a reason a good and sufficient one for postponing its execution, and which perhaps after all is the true cause, they ought to have assigned it in the presence of the parties concerned, and by all of whom I have no doubt it would have been received with a great deal more satisfaction than the one they put forth.

It is but justice to state that the decision in this matter was the act only of a portion of the highway board, and had OTHER members of it been present, perhaps quite a different one would have been the result; even as it was, there were some dissentients among them.—I remain, Sir, yours very faithfully,

SAMUEL FOX, Jun.,

The appointed surveyor to the proposed bridge. Morning-lane, Hackney, Nov. 27.

[There does not appear from the correspondence any valid reason for the non-performance of the work.—ED.]

#### CHURCH-BUILDING INTELLIGENCE, &c.

*Enlargement of St. Mary's Church, Kirkdale.*—The original building was a plain structure in the Gothic style, of brick with stone mouldings, &c., and had accommodation for a congregation of about 960. This has been retained, and additions have been made at each extremity, without destroying the due proportions of the whole. Sixteen feet of length have been added to the east end, by which 266 sittings have been obtained; and an alteration of the west end gives 146 sittings more, so that the church will now accommodate about 1,372 persons. The light and ventilation have also been greatly increased, the latter by the interior of the roof (which was before flat) being carried, in handsome Gothic wood and plaster work, above the principal beams, giving a greater interior elevation, and a readier means of escapement for the heated air, by means of two additional ventilators. The style of the additions is the "decorated Gothic," approaching, in some points, to the "floriated," though not so much so as, with the ornamental addenda to the original part of the structure, to destroy the harmony and consistency of the general pile.—*Liverpool Standard.*

*Nine New Churches.*—The Incorporated Society for the Building of Churches have lately voted grants towards increasing the church accommodation in seventeen parishes, including the erection of nine new churches. The society has recently received a donation from a lady of 1,000*l.*

*Bequest of 6,000*l.* for the purpose of Church Restoration.*—The gentleman alluded to as having bequeathed 6,000*l.* to the Camden Society is the late Mr. Maude, of Middlewood Hall, near Darfield, and nephew of John Maude, Esq., of Moor House, near Wakefield.—*Hull Packet.*

*CHIPPENHAM IMPROVEMENTS.*—A project is on foot for bringing a supply of water into the town of Chippenham, and to the railway station, from an extensive spring at Lockshill, the property of the late J. E. A. Starkey, Esq., of Spyc-park; and in connection with an ornamental fountain in the centre of the old Market-place, to remove the butchers' shambles, and several of the adjacent buildings. Two thousand pounds have been already raised for the former purpose, in shares of 10*l.* each, and several subscriptions are promised towards the accomplishment of the latter object. Mr. J. Provis has been appointed honorary secretary to the committee, and is the projector of the scheme.

*DISCOVERY OF A VAST CATACOMB.*—The Austrian ambassador, M. Prokesch, and Professor Rooz, in exploring the island of Milos, have discovered a vast catacomb, containing at least a thousand tombs cut in the volcanic tuffa. The walls of this subterranean cemetery are covered with Greek and Roman inscriptions of from the second to the sixth century. Most of the tombs themselves have been opened and are empty. This was done, no doubt, by the barbarians of the north, who in the middle ages destroyed so many Hellenic monuments, respecting the dwelling-places of the dead as little as those of the living.

#### Miscellaneous.

*THE STATE BED-ROOM AND FURNITURE AT BURLINGHOPE HOUSE.*—The bedstead is elevated upon a platform two steps from the floor, from which it is raised by a tripod pedestal, upon which there are three lofty carved and gilt columns. Above these is a spacious dome, surmounted by the crest of the noble house of Cecil. In the centre of the cornice is the coronet of an earl in richly burnished gold. The hangings contain 250 yards of beautifully striped coral-coloured velvet, of British manufacture. These, together with the tester, head, &c., are lined with 900 yards of white satin; the whole interspersed with a variety of ornaments in gold. Deep silk fringe coral-coloured trimmings, tassels, &c., give a finished effect to the drapery attached to this superb and costly couch, which from the ground stands upwards of 20 feet in height. The ceiling of the room containing this gorgeous piece of furniture is magnificently painted. It is one of Verrio's best works, and the subject it represents is, "Mars presenting Romulus to Jupiter to be deified." There are also in the same room sixteen other paintings by masters. The apartment is 23 feet 8 inches long, 23 feet wide, and 24 feet high. Three pieces of ancient tapestry adorn this room, each of which is 15 feet square.—The following are the subjects illustrated by them:—"Æolus, god of the winds," "Vulcan at his anvil," and "Neptune with his trident." Latin inscriptions are attached to each of these beautiful pieces of work. The state bed is one of the most gorgeous pieces of workmanship that can be imagined. Adjoining the above room is the state dressing-room, 21 feet long, 13 feet broad, and 16 feet high. This room, now completely renovated, was thoroughly fitted up in 1789, at a cost of 2,100*l.* The ceiling was painted by Verrio, and around the apartment hang paintings by Rubens, Caracci, Poussin, and other masters. A superb suite of silver-gilt dressing plate, formerly belonging to William III., and a commode, variegated most richly with tortoise-shell ornaments, form a portion of the sumptuous fittings of this ante-room. Next to these, and upon the same floor, is the jewel-closet, a repository of the most rare and valuable articles.

*THE GREAT UTILITY OF THE COCOA-NUT TREE.*—Nearly all the domestic wants of the Singhalese can be supplied by the cocoa-nut tree. He can build his house entirely of it. The walls and doors are made of ejans, the leaves platted; the roof is covered with the same; the beams, rafters, &c. are made of the trunk. He needs no nails, as he can use the coir-rope made from the outside husk. If he wants a spout, he follows the trunk split in two. It also supplies him with many of his household articles. He makes his oil from the kernel; the hard shell supplies him with spoons, and cups, and drinking-vessels, and lamps, and water-buckets; the refuse of the kernels, after the oil is expressed (called *panak*), serves for food for fowls and pigs; the milk from the kernel is used in his food. In short, if a man have a few cocoa-nut trees in his garden he will never starve. Arrack, a strong spirit, resembling whisky, is made from toddy, the juice of the flower, and brooms are made from the ribs (*iritia*) of the leaflets.—*Recollections of Ceylon.*

*PROPOSED AVENUE FROM FARRINGTON-STREET TO CHEAPSIDE.*—At a Court of Common Council, held on the 21st ultimo, Mr. John Dixon said, that having seen an advertisement in the papers, stating that the Fleet Prison was to be sold, he wished to know from the chairman of the London-bridge Approaches Committee whether there was any intention upon the part of the City of London to purchase the ground for the purposes of the great improvements which were in progress? when Mr. R. L. Jones said he certainly was of opinion that it would be extremely desirable that the purchase should be made by the corporation, with the view of forming an avenue through the ground into the heart of the City. He had called upon the Commissioners of Woods and Forests, and pressed the necessity of not making sale of the property until the corporation should have had an opportunity of taking the question into consideration and deciding upon it.

*THE COPPER TRADE.*—An article in the *Swansea Journal* directs attention to the great and increasing importance of the copper trade with India. It appears that in "the years 1835-6, 1836-7, and 1837-8, the importation of this article amounted on an average to the value of 2,575,000 rupees (257,500*l.*), but the last of these years had so heavy a proportion as to cause a glut in the market, which was felt to some extent in 1841, when the average of three years was 2,126,000 rupees, or 212,600*l.* The trade then recovered rapidly, the average of 1841-2 and 1843-4 being 3,243,000 rupees, and the proportion of the latter year amounting to no less than 42 lakhs, or 420,000*l.*" The writer goes on to observe, that as "the only use to which copper is as yet turned, is in manufacturing the domestic utensils of the Hindoos, who no sooner emerge from abject poverty, than they hasten to exchange their earthenware for dishes, and water-pots of brass," an increase in the demand for copper shews an improvement in the social condition of the natives, which opens further prospects for British commerce. The writer adds, "that the increase in the copper trade may be set down by some persons as the result of mere temporary speculation; but he adduces the increase in the trade carried on with America in the same article as a proof that our export may be set down as legitimate. We find that the export trade, from reference to the table of exports in metals, iron, and steel has shared in the prosperity which has attended every branch of our commerce in 1841. The excess of the exports in metals (including iron, steel, copper, brass, and tin) over those of 1843 amounts to 730,300*l.*"

*COMPLETION OF AN IMMENSE CHIMNEY AT LIVERPOOL.*—The large chimney at the works of Messrs. William Hill and Sons, manufacturing chemists, Vauxhall-road, is now completed, and is certainly the most lofty, and consequently the most prominent spiral erection in our town, forming, in fact, a conspicuous landmark from the river, as well as the opposite Cheshire shore for many miles round. Friday last was the "rearing day," when the apex of this huge and tapering shaft was surmounted by two British flags, which though large, appeared but the size of handkerchiefs. Throughout the day numbers of parties ascended in a bucket, hoisted by a winch in the interior, to the giddy top, whence they obtained a magnificent view of the town and neighbourhood of Cheshire, the sea to a vast extent, &c. They appeared to the spectators below to be no larger than dolls popping their heads over the top of capital. The height of the shaft is 309 feet, being about 80 feet higher from the ground than the spire of St. George's Church, but springing from land apparently rather lower. It is of a perfectly conical form, and was regularly plumbled by rule as the work proceeded, and not, as is sometimes customary, merely by the eye of the workman. The summer season of three years has been employed in erecting it. It is 40 feet in diameter at the base (on a level with the ground), and 9 feet in diameter at the top, where there is an ornamental cornice and blocking. The first course of bricks in the foundation was seventeen yards in diameter.—*Liverpool Courier.*

*THE DECK OF DEVONSHIRE'S PRIVATE ROOM AT CHATSWORTH.*—As this room is not shewn to the public, we will give our readers a brief description of it. It is richly furnished, and contains a fine whole-length portrait of his grace in his robes, by Hayer; a whole-length portrait of his grace's mother, the late Duchess of Devonshire, with her infant daughter, the present Countess of Carlisle, on her knee, is an excellent painting. The graceful turn of the head of the principal figure, the happy expression of countenance, the smiling face, and the uplifted out-spread hands of the infant, are exquisitely beautiful, and true to nature. This picture is entirely and essentially all that it professes to be—as mother and child mutually delighting and delighted with each other; it is painted in a full and brilliant tone of colour, and altogether it may be classed amongst the best pictures of Sir Joshua Reynolds; an equestrian portrait of the present Emperor of Russia, and the late Emperor Alexander in a drowski. The furniture, ornaments, &c., of this apartment are of the most magnificent and costly description.—*Doncaster Gazette.*

**CASTING OF ONE THOUSAND 32-POUNDEES.**—Having heard that instructions had been forwarded to the Low Moor Iron Works for the execution of the enormous number of one thousand pieces of ordnance of large calibre, we determined upon learning the particulars on the spot, and in so doing were fortunate enough to be present at the actual casting of them. Each gun is cast perfectly solid, in a clay mould, suspended perpendicularly in a metal casting, and such is the bulk of iron employed, and so great is its power of retaining the heat, that each piece takes nearly a week to cool before it can be further meddled with. For instance, on Monday evening last we could not bear to place the hand on the outer clay-covering of a gun cast on the previous Saturday morning, and several days must elapse before the metal itself can be touched with impunity. The guns are drilled out with powerful machinery, and if the bore, which is gauged with the nicest possible precision, is found to vary a hair's breadth, it is at once sent to the furnace, and melted over again. If, however, the bore is found to be mathematically true, it is polished, also by machinery, till it is as smooth as glass and as glittering as silver. The crown and royal initials are then chiselled out just above the touch-hole, and after receiving a final scrutinizing inspection, the gun is sent by the Manchester and Leeds Railway to Hull, and thence transported in coasters to Woolwich. Here it is subjected to the ordnance test. If it carry its true range, and without exhibiting any symptom of inferiority of material, and corresponds in all respects with the drawing, it receives the Government impress, and, being freed from the rust which it has most likely acquired in its transit, is pronounced fit for service, and placed in the stores accordingly. If, on the contrary, it should, in the minutest particular, fall below the ordinary standard, one of the trunnions is struck off, so as to render the gun utterly useless, and it is then returned at the cost of the maker.—*Liverpool Journal.*

**NEW MOTIVE POWER.**—M. Selligues, who some short time since reported to the Académie des Sciences a discovery of a motive power which he then thought would be a substitute for steam, and which consists of combining atmospheric air with hydrogen gas, by which an explosion is produced when ignited, has, at a recent meeting of the academy, made another communication, from which it now appears that the detonating power ceases under pressure. This phenomenon has proved an obstacle to the experiments of M. Selligues before the Committee appointed by the Academy. Notwithstanding the difficulties which have interposed themselves, M. Arago has convinced himself of the importance of the discovery, and has reported to the Academy that with so small a quantity as 3 to 5 litres (6 to 10 pints) of hydrogen gas, mixed with atmospheric air, a weight of 1000 kilogrammes (= 2205 lb.) was rapidly raised to the height of 3 feet.

**MONUMENT TO CRABBE, THE POET.**—It is the wish of some of the principal residents in the neighbourhood of Ipswich to erect a monument to the memory of the Rev. George Crabbe, to be fixed in the church of his birth-place, Aldeburgh, and to intrust the erection of the same to Mr. Thomas Thurlow, sculptor, of Saxmundham, believing that many would be gratified by the opportunity of contributing to a work intended to make known their feelings of his genius as a poet, and his character as a man. A subscription has already commenced; among the names most familiar to us we observe those of Samuel Rogers, Esq., Rev. Wm. Harness, Rev. Alex. Dyce, and the Hon. A. Thellusson.

**FOUNDATION WEAKENED BY RAILWAY EXCAVATIONS.**—Last Sunday week, during the performance of Divine service at the church of St. Cereais, at Rouen, a sudden cracking was heard, and most of the congregation, in alarm, left the church. It is supposed that the foundation has been weakened by some of the excavations of the Rouen and Havre Railroad near the spot.—*Galignani.*

**BRITISH ARCHAEOLOGICAL ASSOCIATION.**—At a full meeting of this association, held last Saturday, it was resolved that the second annual meeting should be held at Winchester, in the summer of 1845.

**THE METROPOLITAN IMPROVEMENTS.**—At the east end, the new street is completely marked out from Spitalfields' Church to the London Docks, the vaults for the buildings on either side, between High-street, White-chapel, and Spitalfields' Church, being erected, and a sewer above 1,200 feet in length having been formed. In Cranbourne-street, formerly Cranbourne-alley, several first rate edifices are being erected which will be finished in a few months, and south of Sidney-alley, where the opening will be, to form the line from Coventry-street, the houses are also nearly finished. Along the line between Oxford-street and Holborn, the gas-pipes are all laid down, and the water-pipes are being now placed in the ground. At the lower end of Plumtree-street three large houses are being built in the Elizabethan style, with red bricks and stone, under the direction of Mr. Pennethorn, the government architect, as designs after which others are to be erected in that neighbourhood. Nearly adjoining these, a French Protestant chapel, with school attached, will be raised, the ground being excavated for that object. During the last few days about a dozen houses have been cleared away to form the line into Broad-street from Great St. Andrew's-street, which has much improved that locality. In Belton-street, Christ Church, which is in the parish of St. Giles, and which is formed of Kentish rags and bricks, approaches completion.

**BETTER SUPPLY OF PURE WATER IN LONDON.**—Mr. H. Phillips, the common councilman, in the court of which he is a member, has moved, that it be referred to a committee to consider the best means of securing to all classes of the citizens of London a pure, abundant, and forcible supply of water, at a reasonable charge, and that they report thereon. After some observations upon the monopoly of the New River Company, the subject was referred to the Commissioners of Sewers. Upon the motion of the same gentleman, it was referred to the same committee to consider and report to the court the best means of providing for the poor a better supply of pure water in different parts of the city than is at present afforded to them.

**VICTORIA-PARK.**—The workmen have commenced laying down the oak posts and railings on the boundary adjacent to the Grove-road. The line of road has been struck out for the new iron ornamental bridge, which is to cross the Regent's canal at Bonner's-hall, and a circle has also been made for a handsome carriage-drive to the chief entrance from Bethnal-green. The improvements on the Old Ford-road, which partly runs through the site of the park, have been nearly completed.

**MODEL COTTAGES FOR LABOURERS.**—Twenty cottages are in progress of erection by the Society for Improving the Condition of the Labouring classes, on the estate of Lord Calthorpe, near the Gray's-inn-road, London. They will each be inhabited by one deserving labourer's family, and will be fitted up with the greatest regard to the comfort and cleanliness of the occupier. The main object of the society in the erection of these cottages is that they may serve as a model for such buildings to the aristocracy who may visit the metropolis.

**EXTRAORDINARY FIR TREE.**—Lately was dug from a field belonging to Mr. W. Cundall, of Crowe, an English fir tree of the extraordinary length of ninety-three feet, its girth in the middle being sixty-eight inches. It was discovered buried in the peat by Mr. P. Isle, who is in the habit of searching for wood in the immense subterranean forest which exists around Crowe.

**THE NEW DOCK AT HULL.**—We understand the intended site of the new dock has been definitely fixed on the east side of the present Outfall, and that several very important improvements are contemplated. A meeting of the dock company was to have been held yesterday, for the purpose of receiving Mr. Rendel's report, &c.—*Eastern Counties' Herald.*

**MODEL HOSPITAL IN PARIS.**—A large model hospital, to be called the Hôpital Louis Philippe, is about to be built by the municipality of Paris, near the station of the Northern Railroad, on the ground situated at the northern extremity of the rues du Faubourg, St. Denis, and St. Martin.

**ROYAL INSTITUTE OF BRITISH ARCHITECTS.**—The first ordinary meeting of the Royal Institute of British Architects took place on Monday evening last at the rooms of the society, in Grosvenor-street, Mr. Papworth in the chair. After some routine business, including the election of a new fellow, a list of donations was read, consisting chiefly of books and prints. The chairman said he was desired by the council to state that they were well aware that there existed a considerable amount of talent and information among the junior members of the institute, who were only withheld by modesty from imparting that information to others, and that they were desirous of giving these persons every opportunity of so doing whenever they chose to come forward. A paper was read by the secretary on the painted decorations of the early Italian churches.

**ACCIDENT AT NORTLEACH PRISON.**—On Wednesday the new wing of this building, recently erected, fell in with a tremendous crash, owing to the buttments giving way in consequence of the heavy fall of rain. Very fortunately no person sustained any injury by the accident, the workmen having left a few minutes before.—*Cheltenham Chronicle.*

**FIRES IN LONDON.**—From the records in possession of the London Fire Brigade, it appears that no fewer than 800 fires have occurred in the present year; but that they have not been of so extensive a character as in former years. The number of lives lost, however, is, we regret to say, much greater than the average.

**Tenders.**

TENDERS delivered this day for alterations, &c., at Dr. Riding's, Euston-square.—Henry Baker, Esq., 11, Upper Gower-street, Architect.

Messrs. Piper .....	£958
Mr. Winsland .....	897
Messrs. Cahill .....	890
Messrs. Purbitt and Guerrier .....	889

The above Tenders were opened in the presence of the Builders.

TENDERS for alterations and finishing Four Houses in Sussex-gardens, Bayswater.—R. P. Browne, Esq., Architect, Clement's-lane, City.

Ashby .....	£6,473
Haward and Nixon .....	6,340
Haynes and Co. ....	6,324
Piper and Sons .....	6,114
Trego .....	5,775
King and Co., Islington .....	5,678
Winsland .....	5,384

**NOTICES OF CONTRACTS.**

For the making of Sluices, Bridges, Excavations, and other works in the New Cut from the Sixteen-foot River to the East Brink.—George Game Day, Clerk to the Middle Level Drainage Commissioners, St. Ives. Plans and Specifications are being prepared.

For Paving and Repairing certain Carriage and Footways in the district of Knightsbridge, for one year from Christmas-day next, and also for Lighting the same district with Gas for the like period.—James Rogers, 22, Manchester-buildings, Westminster. December 9.

For building an Infirmary at the County Gaol and House of Correction, at Ipswich, Suffolk.—Mr. John Whiting, County Surveyor, Ipswich, or Mr. John H. Borton, Clerk of the Peace, Bury St. Edmunds. December 10.

For erection of a Warehouse upon the south side of the Old Dock in the town of Kingston-upon-Hull.—W. H. Huffam, Secretary, Dock-office, Kingston-upon-Hull. Dec. 10.

For the Works necessary in arching the public Sewer, and taking up a portion of the old Sewer, in length about 185 feet, in Mile-end Old Town. Also for building a barrelled Drain at the back of the Tyssen Arms, Dalston, in length about 505 feet.—John William Unwin, Clerk to the Commissioners of Sewers for the Tower Hamlets. December 10.

For the erection of a new Barrack Establishment at Bristol.—C. J. Selwyn, Major and Commanding Royal Engineer, Exeter. December 11.

For Lighting the Southampton Paving Trust with Naphtha or other strong Light for the period of eight months from the 1st of February next.—John Arndell, 10, Edmund-street, Hampstead-road. December 11.

For making a Survey and Valuation of Property in the town of Kingston-upon-Hull, for the better rating of the same to the relief of the poor.—John Moxon, Workhouse, Hull. December 12.

For the Repair and Re-pointing of Beoley Church, in the county of Worcester.—Mr. Woolston, Beoley, near Redditch; or Barney Eginton, Esq., Architect, Worcester. December 12.

For Building a Sewer in Hoxton Old Town, being a length of about 576 feet.—Messrs. Stable and Lush, Office of Sewers, Hatton Garden. December 13.

For Building the proposed Lock-up Cells and Turnkey's Residence, at Wooden Box, Hartshorn, Derbyshire.—John Mason, County Surveyor; or Mr. Dewes, Solicitor, Ashby-de-la-Zouch. December 17.

For the construction of Locomotive Engines and Tenders for the Manchester, Bury, and Rosendale Railway.—Mr. C. E. Cawley, Engineer, Railway Office, Bury.—December 21.

For the supply of First, Second, and Third-class Carriages to the Manchester, Bury, and Rosendale Railway.—James Smithells, Secretary, Railway Office, Bury.—December 21.

For the supply of 6,000 tons of Iron Rails, each rail to be 16 feet in length, and weighing 65 lb. per yard.—H. Parker, Secretary to the Great North of England Railway Company, Darlington. Dec. 23.

For making a Sewer in the Town of Cambridge, to be cylindrical and 2 feet diameter in the clear, length about 355 yards, average depth about 9 feet.—Frederick Randall, Clerk to the Commissioners, Cambridge. Dec. 26.

For the execution of Works necessary for the completion of the whole of the Railway from Shoreham to Chichester, being a distance of about 22½ miles.—Frederick Otley, Secretary, Brighton and Chichester Railway Office, 4, Dean-street, Tooley-street. December 31.

For the supply of 11,000 feet of nine-inch cast-iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31, 1845.

COMPETITIONS.

THE Committee of the Association recently formed in the Metropolis for the Construction of Baths and Wash-houses for the Labouring Classes, are desirous of obtaining Plans and Estimates for the Erection and Fitting-up of the First Establishment. The general basis of the plan can be seen at the Office, No. 3, Crosby-square. The author of the plan considered the best by the Committee will be selected to execute the work.

Plans for an Agricultural College to be erected at Cirencester, to accommodate 200 pupils and 6 tutors. The style is left to the taste of the architect. A Premium of 10 Guineas to the author of the most approved plan.—Robert J. Brown, Esq., Hon. Sec. Cirencester. January 1.

TO CORRESPONDENTS.

The delineations of the Pont at West Drayton, being now engraved, will appear in our next.

"A Subscriber and Builder."—The party from whom the mistake emanates.

"Thomas Wilkinson" has been mis-informed: our papers are sold, not given away. The other part of his letter will be attended to.

"Wm. W. Hemsley."—His request cannot be complied with.

"A. X., Cambridge."—Taylor's, Laxton's, or Skyring's.

Communications have been received from "A Subscriber," on "Drains;" "Charles Newnham," on the "New Metropolitan Buildings Act;" "Phi," on the "Hardy Testimonial;" "An Architect," on "Public Competition;" "W. E. Hickson," on "Window Duties;" "No Builder," on "petitioning Parliament to repeal the Window-tax, or to exchange it for a House-tax;" "Thomas McAnaspie," on the "Importance of having Disputes between Masters and Workmen arranged by Arbitration;" "A Well-Wisher and constant Subscriber," on the "Restoration of St. Mary's Church, Bury St. Edmund's, just completed;" "T.," on "Architectural Competitions."

"J. Picard's" machine will appear in our next. He will oblige us by transmitting to us a hand-sketched of the window in question, that we may see whether we have it in our portfolio. The work on "Perspective is out of print; we think it was originally published at about two guineas. A second-hand copy we have been told was lately sold for seven shillings, which we greatly doubt.

BOOKS RECEIVED DURING THE WEEK.

MEETINGS OF SCIENTIFIC BODIES

This day and during the ensuing week.

SATURDAY, December 7.—*Asiatic*, 14, Grafton-street, 2 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.

MONDAY, 9.—*Geographical*, 3, Waterloo-place, 8½ P.M.; *Medical*, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 10.—*Medical and Chirurgical*, 53, Berners-street, 8 P.M.; *Zoological*, Hanover-square, 8½ P.M.

WEDNESDAY, 11.—*Society of Arts*, Adelphi, 8 P.M.; *Graphic*, Thatched-house Tavern, 8 P.M.; *Microscopical*, 21, Regent-street, 8 P.M.; *Pharmaceutical*, 17, Bloomsbury-square, 9 P.M.; *Ethnological*, 27 A, Sackville-street, 8 P.M.

THURSDAY, 12.—*Royal*, Somerset-house, 8½ P.M.; *Antiquarian*, Somerset-house, 8 P.M.; *Royal Society of Literature*, 4, St. Martin's-place, 4 P.M.; *Medico-Botanical*, 32, Sackville-street, 8 P.M.

FRIDAY, 13.—*Astronomical*, Somerset-house, 8 P.M.; *Philological*, 49, Pall Mall, 8 P.M.

SATURDAY, 14.—*Royal Botanic*, Regent's-park, 4 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.

ERRATUM.

In answer to a Correspondent, in No. 94, we stated that Mr. Brunel, instead of his father Sir Isambard, was a Frenchman. We have received a note pointing out this error, and mentioning, in addition, "that Lady Brunel is of English extraction, being, as I believe, the daughter of Mr. Kingdom, the late Accountant-General for Stores, at Somerset-house."

ADVERTISEMENTS.

**ROYAL POLYTECHNIC INSTITUTION.**—The PHOTOSCOPE, a new apparatus for exhibiting OPAQUE OBJECTS in Nature and Art, shewing continued novelties. The PHYSICSCOPE, HYDRO-ELECTRIC MACHINE, DIVING-BELL and DIVER, DISSOLVING VIEWS, &c. &c. DR. RYAN'S LECTURE daily, and in the Evenings of Monday, Wednesday, and Friday. Professor Bachoffner's varied Lectures abound in interesting Experiments. Admission, 1s.; Schools, half-price. A new edition of the CATALOGUE, containing 300 additional Works of Art, &c. since the last revision, is just published, price 1s.

**POLNCEAU'S BITUMEN PAVEMENT.** For paving Foot walks, Terraces, Garden walks, Stables, Coach Houses, Granaries, Corn Stores, and Salt Warehouses. For the exclusion of damp and Vermin in Basements it is particularly adapted, and for Roofing Dwelling Houses, Porches, Balconies, and Sheds. Price 3s. 6d. per square yard.

BITUMEN for covering the Arches of Bridges, Culverts, &c. &c. on Railways and other places (with instructions for laying it down), may be had at the rate of 4s. per ton, by applying to JOHN PILKINGTON, 15, Wharf-road, City-road.

TO ARCHITECTS, BUILDERS, AND PAINTERS IN FRESCO.

**MARTIN'S PATENT CEMENT.** STEVENS and SON beg respectfully to announce that this beautiful cement has now arrived at a degree of excellence far surpassing their most sanguine expectations. For all interior work it possesses a great superiority over every article hitherto in use; it is now being used extensively by Government in the British Museum and other public buildings. It does not throw out any salt, but presents a beautifully plain and perfect surface, which may be painted upon within four days without peeling. It is equally applicable for walls or lath, for mouldings, architraves, skirting, or flooring; and is admitted to form the best ground for fresco painting, having been used for many of the price frescos lately exhibiting in Westminster Hall. It will bear an intense heat without cracking, and for hardness, durability, and economy, cannot be equalled. 185, Drury-lane, London.

WESTERN LIFE ASSURANCE

OFFICE, 49, PARLIAMENT STREET, WESTMINSTER. Directors, H. Edgeworth Bicknell, Esq., James Hunt, Esq., William Cabell, Esq., J. Arcott Letbridge, Esq., T. Smeaton Cooke, Junr., Esq., Edmund Lucas, Esq., George Henry Drew, Esq., George Kennet Pollock, Esq., William Evans, Esq., James Lys Scazer, Esq., William Freeman, Esq., John Bazley White, Esq., Joseph Fuller, Esq., Joseph Carter Wood, Esq., Joseph H. Goodhart, Esq., Physician, William Richard Basham, M.D., Surgeon, Alfred Leggat, Esq.; George D. Pollock, Esq., Bankers, Messrs. Coles, Bidolph, and Co., Solicitors.

Messrs. J. L. Bicknell and J. C. Letbridge. The attention of the unassured portion of the community cannot be too pointedly drawn to the unusual advantages offered to the Public by this Society over those of many others, as it enables all classes to effect life assurances in the manner most convenient to themselves, and amongst other its popular features that of allowing the assured by Table 2) to leave HALF THE ANNUAL PREMIUMS unpaid after seven years, will not be found undeserving public attention. Immediate and deferred ANNUITIES, and every description of Life Assurance business, undertaken by this Society. Prospectuses and all other requisite information will be furnished on application to the Secretary, or the Country Agents of the Society. EDWARD T. RICHARDSON, Secretary.

**KEENE'S PATENT MARBLE CEMENT.**—This Cement has now been tested during six years, and in no case, where properly applied, has it failed to answer the purpose for which it is recommended. While most Cements crack, and in some cases become so hard as to be distinguished by Keene's Cement, that it is alike hard through its entire thickness, and it is mainly owing to the nature of this indurating process that work executed in it can be painted in a shorter time than any other Water Cement.

It is now in extensive use at the British Museum, at the Royal Exchange, and many other public and private Works, where it takes the place of wood for skirtings, architraves, panel mouldings, and of stone for the paving of halls, staircases, &c., for each of which purposes it is economical and efficient.

In the manufacturing towns this Cement is taking the precedence of other materials for the flooring, &c., of fire-brick buildings, in consequence of its lightness and durability.

The Patentees and only Manufacturers are J. B. WHITE and SONS, MILLBANK-STREET, WESTMINSTER.

TO ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MERCHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL.

**JOHNS and CO'S PATENT STUCCO CEMENT.**—The following are the positive advantages possessed by this Invention over every Cement hitherto introduced into the world. It will not crack, blister, or peel off. It will never turn green, nor otherwise discolour. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It may be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to wood, Iron, or Glass. It will carry a larger Proportion of Sand than any other Cement. Its nature, by age, and by exposure perfect when other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be painted directly. Roofs laid or pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instructions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy.

Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred.

Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheapside, London: of whom also may be had.

**JOHNS and CO'S PATENT STONE-COLOUR STUCCO PAINT,** expressly intended for Painting over exterior Walls of Houses that have been covered with Roman or other Cements, and which have become dirty and discoloured. It is in every way better suited for this purpose than White Lead Paint, which will frequently come off in flakes, and in a direction which will be very objectionable; whereas MESSRS. JOHNS and CO'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the suction, and rendering the wall proof against weather, and in the finish producing a pure stone-colour effect, indistinguishable by no other Paint whatever. It is cheap in its application, and may be used by any Painter, in any climate, even in the most exposed Marine situations.

SEYSSSEL ASPHALTE COMPANY. "CLARIDGE'S PATENT."

**THIS ASPHALTE** is a Bituminous Limestone, obtained from an inexhaustible Mine at Fyrom, in the Jura Mountains.

Previously to its introduction into this country, in 1838, the Material had been used for many years in France, and from its great utility was extensively patronized by the Government of that Country.

Among the various uses to which it can be applied, the following may be enumerated:—For Foot Pavements in public and other; in the Carriage Approach to Mansions, Garden walks, and Terraces; the flooring of Kitchens and other basement offices; also of Coach Houses and Stables, Dog Kennels, Cow Houses, Pigsties, and Poultry Houses, Tun Rooms, and Maltings. For Roofing, covering of Railroad and other Arches, the Lining of underground Cellars near Rivers to prevent the ingress of the Tides; also in covering the ground-line of Walls, to prevent damp rising (this application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts), thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Docks, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARELLI, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," Stangate Depot, London.

COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS.

THE DIRECTORS OF THE SEYSSSEL ASPHALTE COMPANY have much pleasure in recommending to the notice of Architects, Builders, and others, the application of THE ASPHALTE OF SEYSSSEL, as the only effectual means of preventing DAMP rising in WALLS.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18.

"In 1839 I superintended the construction of a house of three stories on the Lae d'Enghien. The foundation of the building is constantly in water, about 194 inches below the level of the ground-floor. The entire horizontal surface of the external walls was covered at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread. Since the above date no trace of damp has shown itself round the walls of the lower story, which are for the most part painted in oil of a grey stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls painted in oil. At the pavement of the floor, resting on the soil itself, is only about 24 inches above the external surface of the soil, and only 194, at the utmost, above that of the sheet of water. The layer of Asphalt has been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp have been seen remarked at the base of the door-posts."

# The Builder.

No. XXVII.

SATURDAY, DECEMBER 14, 1844.

**A**MONG the ancient carved doorways still remaining in the metropolis, are many of the shell-pattern, which usually consist of carved jambs and lintels, frequently containing an elaborate door surmounted by a transom and a curious curved fan-light, and sheltered by a far-projecting circular pediment, rising from elaborately decorated trusses or consoles, and embracing beneath the curvature and projection of the pediment aspherical semi-dome, the whole concave surface of which is fashioned as a shell: frequently, however, armorial charges, cyphers, and other decorations, are there placed with a freedom of fancy which has no bounds. Choice specimens of this description of doorways are still to be found in Abchurch-yard, Lawrence Pountney-lane, and many obscure places in the city of London; in fact, he who will take the trouble to go up almost any avenue, the most obscure within the ancient part of the city, will be well rewarded by discoveries to him and to the greater part of the world entirely new, and of which little, if any thing, is to be found in print or manuscript. The writings by which these freeholds and tenures are holden, while they are singularly exact in the enumeration of "posts, pales, and wydraughts," of which some of them have none, mention not a word of their carvings, and their other beauties; so that the tenants in possession may dispose of the whole to the nearest dealer in old building-materials, and no difference be by the writings discoverable. Rood-lane, Mark-lane, Mincing-lane, Tower-street, Crutched-friars, and Leadenhall-street, are perhaps the richest in ancient beauties: almost every gateway, court, and outlet from these affords a display of the kind: they are most particularly to be found in these localities where the London merchants during more than a century immediately after the fire of London were wont to reside, and bestow a part of their great riches upon their united places of residence and business; many of these civic haunts are now either destroyed or are vulgarised by modern alterations or by sheer ignorance. Still, however, remains many an ancient mansion-house with its decorated front, its quiet, rich doorway ascended by a noble flight of steps, its more ample outer gateway, and its office-buildings disposed around the court.

Among these buildings still remain some doorways of the kind which we are at present describing. In St. Martin's-lane, Westminster, still exists a fine and very original specimen; in St. James's-walk, behind Clerkenwell Church, is another, though inferior; and in the oook of Clerkenwell-chase, opposite a small public-house, bearing the sign of "The

Jolly Coopers," existed a noble specimen of the same sort, belonging to a house which fell down through age and neglect, but occupied by the then parish clerk, ancient Penry, a notable character of the neighbourhood, and who so from thence ejected took shelter for many years in Bishop Burnet's house in St. John's-square,\* from whose immense nasal pyramid (a rival of the tomb of Caius Cestus) though baseless, the elected parochial amen came with thunder enough for a parish of its then forty thousand souls.

Kensington, Fulham, Chelsea, Paddington, Hampstead, Highbury, Islington, Hoxton, Hackney, Bethnal-green, Mile-end, White-chapel, Goodman's-fields, Wapping, Aldgate, and some of the close parts of Southwark, Bermondsey, Rotherhithe, Deptford, Greenwich, and other suburbs of the metropolis, contain many peculiar and worthy specimens, which should be delineated before the reckless hand of the improver supercedes them with his coarse and vulgar work in pine or plaster, ignorantly designed and ignorantly applied. And while we are upon this subject, we must not forget to notice that Walthamstow contains not a few specimens of fine character, execution, and preservation. And we earnestly advise those who have leisure and inclination to make a doorway pilgrimage; the collection to be thus obtained would repay the trouble: and it should be remembered that these form a widely varied class of architecture, which rose and fell within a century, having previously no prototype, and leaving no like successor; and even the most dry matter-of-fact person will admit the beauty of fancy which they exhibit, whether it have outbreak in door-jambs, as in Serle-street, Lincoln's-inn; or in consoles, as opposite the House of Correction, Coldbath-fields, or in Red Lion-street, Clerkenwell; whether it appear in shelters, as in Queen-square, Westminster, and in Well-street, Hackney; or in friezes and lintels, as in St. John's Church, and St. John's Chapel, already mentioned, or in fanlights, as at Walthamstow.

There is, however, another and quite different class, worthy of observation—doorways of gauged-work in red brick; of these the Temple, Fleet-street, contains many fine specimens, some of them in such preservation as to appear fabricated but yesterday, these are principally in King's-bench-walk and Hare-court. But wherever such are to be found, they should be most carefully delineated, and their several jointings should be marked: and, lest we forget the subject, it will be well for us to remember that among the many towns and villages which contain specimens of fine ancient brick-work, may be mentioned Farnham, in Surrey, where is to be seen a mansion fronted with gauged brick-work, in the form of cornice-mouldings, hollection architraves, and other decorations of very superior execution.

But the metropolis itself is peculiarly rich in this description of work, of which, though their number has of late been greatly reduced; Hanover-square, St. Martin's-lane, Lincoln's-fields, Great Queen-street, Winchester-street, and innumerable other places within the city of London, as also Kensington, and other suburbs, bear proud testimony, and shew how worthy a thing it would be to encourage this honourable style of building, in which a man needs hardly spend in fifty years a farthing on the mural part and external

\* The bishop's marble monument, taken from the former church, now graces the south-west porch of the present church of St. James', Clerkenwell.

decorations of his house; and instead of swamping his income by contiguous intercourse with the white-washer and other nasty men, be able liberally to patronize the mason, the skilled joiner, and every other artificer of meritorious cunning, whose right hand is worth reliance upon. This was the kind of work which used to be emphatically termed TRADE, and which was understood to include fine material, fine workmanship, and the exercise of the artificer's deepest skill; though the term is now most frequently applied to the sale of the largest mere quantity, good or bad, under puffs which, if any one can be found weak enough or dishonest enough to give them utterance in any serious publications, are immediately, to the injury of mankind, put forth as authority.

## beplea.

### ELECTION OF SURVEYORS TO THE METROPOLITAN DISTRICTS WITHIN THE COUNTY OF KENT.

WOOLWICH . . . . . Mr. George Aitchison.  
LEWISHAM . . . . . Mr. Badger.  
GREENWICH . . . . . Mr. Brown.  
CHARLTON, KID- } Mr. Collis.  
BROOK, and LEE }  
DEPTFORD . . . . . Mr. Martyn.

At a meeting of the District-Surveyors' Association, held on the 5th instant, at the Freemasons' Tavern, forms for the District-Surveyors' returns under the new Act were produced; and Mr. Baker (District-Surveyor of St. Pancras) having, through ill-health, resigned the office of secretary to the association, Mr. G. Pownall (District-Surveyor of St. Giles's, and St. George's, Bloomsbury), was appointed during the next year in his stead. A subscription (limited to one guinea each) for a testimonial of respect to Mr. Baker was opened, which immediately amounted to eighteen guineas and a half.

### THE WINDOW-TAX, OR DUTIES ON LIGHT AND VENTILATION.

(From the Westminster Review.)

The window-tax, or duties upon light and ventilation, may be briefly described as the tax which to multitudes of human beings shuts out the sun, and compels them to breathe in darkened rooms a poisoned air. The following is an extract from the evidence printed by the Health of Towns Commissioners,\* with their first report:—

"The window-duties, as now assessed, operate as a premium upon defective construction. The legislature now says to the builder—Plan your houses with as few openings as possible; let every house be ill-ventilated by shutting out the light and air, and as a reward for your ingenuity you shall be subject to a less amount of taxation than your neighbours. The board is of course aware that windows are now charged by a scale; the tax increasing at an average rate of about 8s. 3d. for every window, whether large or small. Hence the number of windows in a house becomes to builders of second and third class houses a very serious consideration. Supposing a house to contain twelve rooms, if, to make these rooms cheerful and pleasant, I have put two windows in each room, and thereby ensured a current of air passing from front to back, the window-tax for that house amounts to 7l. 5s. 9d.; but if I have put but one window in each room, the

\* See the evidence of Mr. W. E. Hickson, Esq., page 238 of the 8vo. edition, Vol. II.

window-tax is but 2l. 4s. 9d., shewing a difference of 5l. 1s. per annum; and I need scarcely say, that a difference of only 10s. per annum is quite enough to influence builders of cheap houses in trying to save such a sum. But the same considerations affect the building of even first-class houses. I have been offered a rent of 210l. per annum for a house unbuild, on condition that the plan should be altered so as to reduce the amount of the window-tax for which the house would otherwise be liable. The consequence is, that in the majority of new houses one large window, of the largest size allowed,\* is made to serve the purpose of two windows; and privies, closets, passages, cellars, roofs, the very places where mephitic vapours are most apt to lodge, are now left almost entirely without ventilation. An opening only a foot square, even if intended merely to admit the air, and not glazed against the weather, makes the house liable for an additional 2s. 3d. per annum.

"Houses having less than eight windows are exempt; but the window-tax is not therefore inoperative as regards the working classes of towns. In London the poor do not live in cottages, but several families occupy lodgings in the same house, and that, perhaps, a house built with the maximum of untaxed windows allowed by the law. One more window would possibly let a little sunshine into a sick room, but the landlord says "No, the house would then have eight windows, and I should be liable to a tax of 16s. 6d. per annum." If the commissioners would examine personally the houses in which the poor live in the close courts and alleys of the metropolis, they would be surprised at the number of dark staircases and filthy holes, which, although on upper floors, are quite as ill ventilated and unfavourable to health as the cellars of Liverpool. And the permanent cause of this state of things is the option given to builders and lodging-house keepers of saving money in taxation by shutting out air and light."

The cause suggests the remedy. The legislature have only to modify the mode of assessment in such a manner that the option referred to shall be taken away,—that the windows charged for shall be in proportion to the space inclosed or the number of rooms, and the power of evasion would cease. The occupant of a house who now blocks out the light from twelve windows to save 5l. 1s. per annum, could not or would not pull down or destroy twelve rooms to effect the object.

This simple mode of improving the healthfulness of the inferior class of habitations in great towns, was pressed upon the attention of the Earl of Lincoln when the new Building-Act was under discussion. The Earl of Lincoln declined to interfere with the province of the Chancellor of the Exchequer, and two applications made to Mr. Goulburn failed to convince him that the subject was one of the slightest moment.†

The reader will perhaps be of a different opinion if he will procure the two volumes of evidence published by the Health of Towns Commission (perhaps the most valuable work that ever emanated from a government board), and read there the testimony of Dr. Arnott, Dr. Guy, and Mr. Toynebe, surgeon of St. George's Dispensary, on the influence of defective ventilation as a cause of disease.

Their evidence (which every one should peruse who consults his own health or the health of his family) establishes the important fact that tubercular consumption, the disease which has been called the scourge of the English climate, is not traceable to climate, but chiefly to the impurities of air breathed by those who live by day in crowded workshops, or in ill-drained neighbourhoods, or sleep by night in close, ill-ventilated bed-rooms; and that fever and scrofula, where they prevail the most extensively, are to be referred less to low diet than to the same cause. Life or death may be inhaled by the lungs, according to the properties of the gases present in the atmosphere, or the minute morbid particles held in suspension at the time of inspiration. Hence "the pestilence which walketh in darkness,"

Dr. Southwood Smith and Mr. Toynebe,

\* This is especially the case with staircases, the walls are weakened by a narrow window 12 feet in length, instead of two or more smaller windows with a bond of brickwork between them.

† For a detailed account of the first interview with Mr. Goulburn, see *The Builder*, No. 65, published last May.

accompanied by a highly-respectable deputation, waited upon the Chancellor of the Exchequer on the 22nd of May, to explain these facts; and to urge that as one means of improving the ventilation of habitations, the window-duties might be so modified (not repealed) that there should no longer be the disposition or the power, on the part of occupiers or builders, to dispense with window openings in avoid taxation.

The deputation were received with courtesy, but, greatly to their disappointment, Mr. Goulburn intimated (in the politest possible terms) his entire disbelief in the statements of the professional gentlemen before him. "The window-duties," he said, "did not affect the cottager; and he had seen numerous instances of scrofula in his own neighbourhood among the families of the agricultural peasantry."

Doubtless he had seen them; but those who take more pains than a Chancellor of the Exchequer to learn how the families of the peasantry live, know that Mr. Goulburn's fact does not at all affect the theory he disputed, but rather confirms it.

A labourer, if he have two bed-rooms, will invariably, to make his 10s. per week 11s., let one of them to a single man. In the one room left are the beds of the labourer, his wife, and all the young children. Having no money to buy fuel, the family close up the chimney, if there be one, carefully paste over every crevice of the door or window to keep out the cold, and the fresh air being thus excluded, the atmosphere in a few hours becomes so vitiated by repeated inspirations that every breath carries with it the seeds of disease.

The tender nursing of the aristocracy often perishes from the same cause; is killed by misdirected kindness. It is known that a canary-bird in a cage, placed at night within the closed curtains of a tent-bed in which two persons are sleeping, will be found dead in the morning. We yet place childhood in similar situations, in which every breath inspired is nearly as fatal to health as if it contained the fumes of arsenic.

Granted that neither of these cases affected by the window-duties, is it not obvious, that whenever air and light are blocked out to avoid the window-duties, the same process is repeated, and that the process is death?

The Chancellor of the Exchequer, however, entrenched behind Mr. Wickham, the Chairman of Stamps and Taxes, who was present at the interview, had another answer to the deputation, which at the time admitted of no reply. Mr. Wickham stated that the deputation were in error upon a material point, and that houses might be ventilated by perforated plates of zinc, which would not be liable to duty, although placed in external walls.

We pray the reader to note this as an instance of those hasty and often wholly unwarranted assertions, common to official men, by which great measures of public improvement are often defeated for the mere object of getting a minister out of a temporary dilemma.

A correspondence ensued between Mr. Biers, the President of the Carpenters' Society, and the Board of Stamps and Taxes, in which Mr. Pressly, the secretary, stated, by order of the board, that perforated plates of zinc would be chargeable, "if so perforated as to afford light, but not if so as to serve the purpose of ventilation only."

The allusion here, it is supposed, is to some kind of zig-zag opening which should admit the air by a winding course, and prevent the light passing through in a direct line; but such a contrivance although practicable in a thick castle-wall, is obviously not so in the thin walls of a third-rate house. In reply to further inquiries from Mr. Biers, how perforations were to be made that would admit air, and yet exclude light, the Board declined to give any information.

A mistake had evidently been committed by Mr. Wickham, and one of such serious moment that it was deemed sufficient to lay it before the Chancellor of the Exchequer, to ensure the adoption of at least some partial and really practicable mode of relief. The case was stated by Mr. H. Gally Knight, on the part of the Metropolitan Improvement Society, in a letter which concluded with the following inquiries:—

"1. Whether her Majesty's government will introduce any measure corresponding in principle with the draft of the bill left with the

Chancellor of the Exchequer, of the 27th April alluded to, for fixing a maximum to the existing window-duties beyond which new openings might be made for light and ventilation without subjecting the occupants to additional charges?

"And should the Chancellor of the Exchequer not be prepared with any such measure, whether, 2. Government will pass a short bill to exempt from taxation, upon sanatory grounds, all unglazed openings in basement stories and closets of every description, that the evils complained of from defective ventilation may to some degree be palliated, if not wholly removed?

"Either measure might be so framed as to be attended with little or no loss to the revenue, and the former especially would be gratefully received by the public as a most valuable boon."

*Reply of the Chancellor of the Exchequer.*

"Downing-street, June 26, 1844.

"My dear Sir,—I have received the memorandum which you have enclosed to me from the Metropolitan Improvement Society. I can have no difficulty in declining to sanction either of the alterations of the law relative to the window-tax which they have submitted to me, it being evident that either of them, if acceded to, would enable parties to have windows without the payment of the tax.

"There has been no mistake, as the parties suppose, on the part of Mr. Wickham, in stating that openings for ventilation might be made which would not be chargeable as windows, and I cannot think it at all inconsistent with such a statement to decline expressing beforehand a general opinion as to whether certain openings, when made, would or would not be considered as windows, and as such liable to charge.—Yours ever, my dear Sir, most truly,  
HENRY GOULBURN.

"H. Gally Knight, Esq., M.P."

From the tone of the above, one might fairly infer that to desire the untaxed enjoyment of light and air, to any extent, however small, is a moral offence in the eyes of a Chancellor of the Exchequer; and that the Health of Towns Commissioners deserve to be put in the stocks. The letter would also appear intended to teach the public that it is wrong to seek such a clear explanation of the law as would guard them against its infringement; and that a government board is quite justifiable in "declining to give any opinion beforehand," but we will confine ourselves to the sentence in which Mr. Goulburn denies the mistake of Mr. Wickham, and repeats the statement, that openings may be made for ventilation which would not be chargeable as windows.

Unaccountable as it may seem, the Chancellor of the Exchequer and Mr. Wickham are both in error on this material point, so pertinaciously maintained; and the proof is so striking, that we doubt not we shall be able in a few words to demonstrate the fact.

In the first place, there is no special provision in any one of the Acts relating to the assessed taxes for exempting openings of any kind (zig-zag openings nor any other) made for purposes of ventilation in dwelling-houses, from the duties chargeable on windows.

In the second, the 33th Geo. III., chap. 40 expressly provides, that all openings in external walls not chargeable as windows or lights shall be stopped up with brick or stone, or the materials of which the walls are composed. Under this Act a gentleman at Croydon, who wished to rid himself of mice, was lately surcharged for a small hole in his cellar, made to admit a cat; and there is no exception in favour of perforated plates of zinc in any general Act.

In the third place, both these facts were admitted by the legislature this very last session, in the passing of a local Act for the protection of property in the borough of Liverpool from fire (7 & 8 Victoria, chap. 51). In this local Act a provision was introduced (clause 10) for allowing circular ventilating apertures of not more than 7 inches in diameter, "provided such aperture, if made in a direct line, is protected by a grating of cast-iron, the interstices of which shall not exceed one-quarter of an inch in width."

This, then, is the state of the law;—a circular aperture 7 inches wide, protected by an iron grating, may now be made in a cellar at Liverpool for the escape of foul air, but if made in a cellar in London, it is chargeable as an additional "window or light."

This trifling concession to the sanatory interests of the people of Liverpool, obtained through the interest of private parties, was, as we have seen, *formally refused to the public.*

But ventilation cannot be perfect without the influence of the sun's rays, to rarefy the air and produce a current, and we cannot have darkness and gloom without dirt and filth. The sanatory properties of light, apart from the question of ventilation, form another important consideration.

The public are familiar with the fact that light is essential to vegetation—that the fruits of the earth will not ripen without the rays of the sun, and that their influence is sensibly felt in an exhilaration of the animal spirits. But it is now beginning to be understood by medical practitioners, that a deficiency of light is as injurious to the health of animals as it is to the growth of plants, and is a check to the full and perfect development of all organic structures, vegetable or animal. Upon this head some important testimony was given by a distinguished surgeon, Mr. Ward, to the Health of Towns Commissioners.

"Dupuytren (I think) relates the case of a lady whose maladies had baffled the skill of several eminent practitioners. This lady resided in a dark room (into which the sun never shone) in one of the narrow streets of Paris. After a careful examination, Dupuytren was led to refer her complaints to the absence of light, and recommended her removal to a more cheerful situation. This change was followed by the most beneficial results; all her complaints vanished. Sir James Wyllie has given a remarkable instance of the influence of light. He states that the cases of disease on the dark side of an extensive barracks at St. Petersburg, have been uniformly, for many years, in the proportion of three to one to those on the side exposed to strong light. The experiments of Dr. Edwards are conclusive. He has shewn that if tadpoles are nourished with proper food, and exposed to the constantly renewed contact of water (so that their beneficial respiration may be maintained), but are entirely deprived of light, their growth continues, but their metamorphosis into the condition of air-breathing animals is arrested, and they remain in the form of large tadpoles. Dr. Edwards also observes, that persons who live in caves and cellars, or in very dark and narrow streets, are apt to produce deformed children; and that men who work in mines are liable to disease and deformity beyond what the simple closeness of the air would be likely to produce."

(To be continued.)

#### THE ART OF BRICKMAKING.

(Continued from page 529.)

WITHIN the period of the wars of Edward I. and II., wall-tiles, which before were made of uncertain dimensions, were then made after the Flemish manner, and often used in building walls. The lower part of these walls, about 2 feet above ground, were generally made of rag-stones, laid in the common manner; but their upper parts were faced with brick on the outside, and on the inside with soft stone, elunch, or any materials the country afforded; others were faced with brick on each side, half a brick thick, and the space between was filled with rough stones and mortar. About this time it was customary to chequer the fronts of brick and stone buildings with black flints. In 1530 Hans Holbein built a gate opposite the Banqueting-house, Whitehall, in this manner, and ornamented the fronts with busts in circular recesses, with mouldings round them of baked clay in proper colours, and glazed in the manner of delf ware. The brick buildings of this age may be distinguished by being chequered with glazed bricks of a colour darker than the rest of the face-work, which was generally of bricks of a deep red, hard and tolerably well burnt. In the reign of Charles I. brick buildings were well executed under the direction of Inigo Jones. The rate of wages of bricklayers in 1610 set down and assessed at Okeham, Rutlandshire, was, for a bricklayer from Easter to Michaelmas, 5d. per diem, with meat, or 9d. without; after Michaelmas, 4d. with meat, and 8d. without: a bricklayer's apprentice, before Michaelmas, 3d. with meat, and 7d. without; after Michaelmas, 2d. with meat, and 6d. without: a tiler or

slater earned from 4d. to 5d. with meat, and from 8d. to 10d. without.

In the present century the art of brick-making is very little attended to for the common buildings of London and other large cities. Houses in the neighbourhood of London are seldom reared with a view to durability; raised on speculation, and let on lease for a certain term of years, which seldom exceeds 99 years, it is supposed to be the interest of the builder to construct a house so that it shall last the term of the lease, or, as is oftener the case, it is built for sale, without any reference to its durability. Again, in this brick-building age, competition leads to furnishing bricks at as cheap a rate as possible, without the least reference to their durable qualities. The evils of the system prevail over the advantages of occasionally rebuilding at the same cheap rate, for they very often entail upon the householder so large and continuous an outlay as to render the property all but valueless and unmarketable. Since the extensive introduction of stucco these ephemeral structures have become more abundant.

The best material for making bricks is undoubtedly *loam*, a term usually applied to a natural mixture of sand and clay, this is a yellowish, or reddish-coloured, fatty earth, and generally produces a red brick, much harder and compacter than any other kinds of common brick. Marl, which is a natural mixture of chalk or lime and clay in variable proportions, is perhaps the next best material for common bricks, but the less lime it contains the more suitable it is to the brick-maker, for a mixture of silica, lime, and alumina, is very fusible, and consequently bricks when burned, if great care be not taken, are apt to melt and run into each other.

It is presumed that the best mixture for making common bricks is three parts of clay and one part of limestone or chalk in powder; but previous to this mixture being used, it ought to be first ascertained what the nature of the clay is, for under this general term we find an endless variety in composition and character. Where durability is the object, excess of silica is undoubtedly advantageous, as being better calculated to resist atmospheric action, less absorbent, and giving greater density; alumina ought to be less abundant than in potter's clay, for aluminous earths, however dense their structure after burning, have great absorbing powers, and consequently are sensibly affected by a moist, cold climate; lime is also a powerful absorbent, and should the chief constituents be alumina and lime or chalk, it is very questionable, even when aided by incipient fusion, whether it form a durable brick. All clays contain silica in various proportions, which, with alumina, form the bases and chief ingredients of these earths; all contain some portion of lime, which being neutralized by mixture with the other earths, will not effervesce with acids; the latter, when the clay beds are from natural causes deprived of their moisture, very often separates from the other mixtures, and is found intersecting undurated clay in veins and net-like tracery. In burning it acts as a flux to the former, it is therefore an essential ingredient when partial vitrification is required. Bergman examined several clays made in the neighbourhood of Upsal, and made bricks, which he baked with various degrees of heat, suffered them to cool, immersed them in water for a considerable time, and then exposed them to the open air for three years. They were formed of clay and sand. The hardest were those into the composition of which a fourth part of sand had entered. Those which had been exposed to the fire for the shortest time, were almost totally destroyed, and crumbled down by the action of the air; such as had been thoroughly burned had suffered less damage, and in those which had been formed of clay alone, and were half vitrified by the heat, no change whatever was produced. Here then we have decisive evidence that silica should be in excess, as tending to produce that glassy appearance or semi-vitrification so essential to its durability, and this was the kind of bricks so much used in chequer-work, as noticed above. Where the vitreous crust may be deemed necessary, Bergman recommends the projection of a due quantity of salt into the furnace, which would produce the effect in the same manner as is seen in the fabrication of stone-ware.

It is of considerable importance to examine clay previous to working it up in bricks, which Bergman advises may be done as follows:—Nitrous acid poured upon unburned clay detects the presence of lime by producing an effervescence. In the next place a lump of clay of a given weight is to be diffused in water by agitation. The sand will subside, and the clay will remain suspended. Other washings of the residue will carry off some clay, and, by due management in this way, the sand or quartzose matter may be had separate. Nitrous acid by digestion will take up the lime from a part of the clay previously weighed, and this may be precipitated by volatile alkali. The clay, the sand, and the lime, may thus be well enough ascertained by weight, so as to indicate the quantity of sand or other material requisite to be added, in order to form that compound, which, from other experiments, may have been found best adapted to produce good tiles and bricks.

In Dr. Percival's Essays we have the following experiment of the effects of brick on water: two or three pieces of common brick were steeped four days in a basin-full of distilled water; the water was then decanted off and examined by various chemical tests. It was immiscible with soap, struck a lively green with syrup of violets, was rendered slightly lactescent by the volatile alkali, and quite milky by the fixed alkali and a solution of saccharine saturni. "This experiment," he observes, "affords a striking proof of the impurity of lining wells with bricks, which cannot fail of rendering the water hard and unwholesome."

As a preliminary to the manufacturing process, the clay should be dug up in autumn, spread over as large a surface as possible, and in this state lie during the whole of the winter exposed to the frost; in this state it greedily absorbs atmospheric air, which, penetrating and dividing the particles of the earth, facilitates the subsequent operations of mixing and tempering. During this time the earth should be repeatedly turned and worked with the spade. In the spring the clay is broken in pieces and thrown into shallow pits, where it is watered and suffered to remain soaking for several days; it is then tempered, and upon the due performance of this process depends in a great measure the quality of the brick, for unless the several ingredients be intimately united, we cannot hope for an uniform material. So important is this part of the process, that it has been recommended to dry and pulverize the clay, and then mix; but this process would involve large additional expense. By well heating the clay, M. Gallow succeeded in making a brick of much greater strength and density. On placing one of these bricks with the centre on a sharp edge, and loading the two ends, the bricks formed with the well-tempered earth were broken with a weight at each end of 65 lb., or 130 lb. in all, while others were broken with 35 lb. at each end, or 70 lb. in the whole.

Fire-bricks made from Stourbridge clay mixed with a quantity of old fire-bricks, or crucibles, or glass pots, reduced previously to powder, contain an excess of silica over alumina. ARGIL.

#### TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLLSON.

(Continued from p. 583.)

151. *The Grindstone Oak* in the Holt, mentioned by White of Selborne, which has been deemed the largest in this island, measured at 5 feet from the ground full 36 feet in circumference; it was computed to contain in 14 feet of length, 1,000 feet of timber. *The Buck's Horn Oak*, another great tree in the same place, is stated to be not yet entirely dead.

152. *Guff's Oak* stands on Chesnut-common, about five miles beyond Enfield, through Bull's Cross, and about the same distance from the railroad station at Waltham. The tradition is that it was planted in 1066 by Sir Thomas Godfrey or Goff, who came over with William the Conqueror. The girth is 20 feet at 3 feet from the ground; the trunk is hollow, and several persons can stand in the cavity.

153. *The Galyms Oak* stood about four miles from Newport, Monmouthshire. When

standing it overspread 452 square yards; the main trunk measured 9½ feet in diameter; it contained 2,426 feet of timber; five men were employed twenty days in stripping and cutting it down, and a pair of sawyers were constantly occupied 138 days in its conversion: a stone 6 inches in diameter was found in the body of the timber. The cubical contents of this tree so nearly correspond with those of the *Great Risca Oak*, near Newport (2411), described in No. 93 of THE BUILDER, that we are disposed to think they are one and the same tree.

154. *The Winfarthing Oak*, which is asserted to have been at the time of the Conquest an old tree, is still existing.

155. *The Greenole Oak* we find described as being pierced by a road, over which it forms a triumphal arch, higher by several inches than the poet's postern at Westminster Abbey.

156. *Wallace's Oak* in Torwood, Stirlingshire, measured in the trunk in 1771, 22 feet in circumference; it is now completely gone: in it the hero generally slept when his army rendezvoused in the Torwood, during his war with Edward.

157. *Wallace's Oak* at Elderslie, Renfrewshire, wherein, when it was in full leaf, he and a large party of his followers hid themselves from the English, is still a noble tree, covering 19 poles of ground, and girth 21 feet at the ground.

158. *The King of the Wood*, on the estate of Fernyhurst, near Jedburgh, is a beautiful tall straight tree, girth 18 feet above the roots, and 1½ feet from the ground; it is 80 feet high, and tapers gradually for nearly three-fourths of its height.

159. *The Kepping or Trysting Tree*, growing near the preceding, is of a more spreading and picturesque character; it is upwards of 70 feet high, and covers an area of 90 feet in diameter: it girths 22 feet above the roots, whence it soon parts into two branches, girthing respectively 14 and 1½ feet. These two trees are considered to be remnants of the great forest of Jedwood.

160. *Cowper's Oak*, near Olney, Bucks (but in Northamptonshire, on the Earl of Northampton's estate), so called from the poet's having frequently written under it, would accommodate in its hollow trunk a party of perhaps a dozen.

161. At Magdalen College, Oxford, close by the gate at the end of the Water-walk, there grew an oak to which William of Wainfleet expressly referred when ordering his college to be founded "near the great oak." Gilpin considered that it could hardly merit that distinction if less than 500 years old, and it was therefore probably a sapling when Alfred the Great founded the university in 836; its height was 71 feet, its girth 29½ feet, its contents 751 feet; its branches extended to a radius of 16 yards on every side, and under it 3,000 men could have sheltered themselves with ease. On the 30th of June, 1788 or 1789, it fell to the ground; from its remains a chair has been made for the president of the college.

162. In the New Forest, Hants, survived, till about the middle of last century, the oak against which glanced in 1100 the arrow of Sir Walter Tyrrel which killed William Rufus; it was of exceeding large dimensions, and was, probably, at the period of its final decay, 900 years old. To preserve the memory of its site, the late Lord Delaware caused a monumental stone to be erected thereon, bearing appropriate inscriptions.

163. In Windsor Great Park, near Cranbourne-lodge, there are two magnificent oaks, one just within the park piling, and about 300 yards from the lodge, the other at the point of the road leading up to, and nearer it. The former at 6 feet from the ground measures 38 feet round, the latter at 4 feet from the ground 36 feet.

164. In Hampton-court-park, near the old stables, is perhaps the oldest oak in England; it measures 33 feet round.

165. In Amphill Park, Bedfordshire, is an oak which girths at its base upwards of 40, and at its centre nearly 30 feet; it is hollow, and would admit four or five persons to stand upright in it; it is evidently very aged: on a plate affixed to it is a poetic inscription.

166. In the Lower Charente, in France, about six miles W.S.W. of Saintes, on the road to Cazes, and in the court-yard of a modern mansion, stands a very remarkable example. See BUILDER No. 64.

167. In the *North American Review*, a writer remarks that the largest oak he has seen in that country is about 27 feet in circumference at the smallest part; he computes its age at not less than 500 years, so that it must have been a majestic tree when Columbus discovered the western world.

168. Dr. Platt, in his "History of Staffordshire," mentions one standing at Rycote which would overshadow by its boughs 4,373 men.

169. In Loch Lomond, on Inch (or island of) Mariv, is one remarkable for its fine expanse of head; in 1786 it girthed 18 feet 1 inch.

170. At Earl Cowper's, Penshanger, Herts, there was growing in 1820 a fine healthy tree girthing nearly 18 feet at 5 feet from the ground, and exceeding 75 feet in height.

171. At Lochwood, Annandale, not less than 900 feet above the level of the sea, one of a number of oaks of similar size girthed 15 feet at 6 feet above the root.

172. At Blairquhish, Strathblane, Stirlingshire, one girthed 15 feet at 4 feet from the ground; its spread was 90 feet in diameter.

173. At Yester, the Marquis of Tweeddale's, Haddingtonshire, one girthed at 1 foot from the ground about 15½ feet, and at 6 feet about 14.

174. In Sherborne-park, the Earl of Digby's, in the autumn of 1843, a limb which contained upwards of five tons of sound timber dropped from an oak; yet its loss was scarcely noticed—so magnificent are the venerable trees there.

175. In Sherwood Forest, in felling and sawing up, within the last few years, some of the old oak trees, the letters K1 and a crown were distinctly visible in the centre of them; indicating that they were saplings in the reign of King John, and had these characters then cut in their exterior layer of wood.

176. In Bushy-park there are some hexes, or ever-green oaks, of very large size.

177. In Cobham-park oaks of the following large dimensions were girthed at 3 feet from their roots:—

14 ft. 7 ins.	17 ft. 3 ins.
15 " 7 "	20 " 7 "
16 " 3 "	21 " 7 "
16 " 5½ "	25 " 5½ "

178. Early in the last century, the solid trunk of a gigantic oak was found beneath the level of Hatfield Chase, Yorkshire, which measured 120 feet in length, and whose circumference was 36 feet at the largest part, 30 feet in the middle, and 18 feet where the trunk was broken off; at a moderate calculation it was conjectured it might have been 240 feet in height.

179. In Loch Donelchfour, in deepening the line of the Caledonian Canal, amongst some large masses of oak which were brought up from under a 16-foot bed of gravel at the bottom of the lake, one fragment measured 37 feet round, and contained the estimated cubic quantity of 220 feet, though evidently but a small portion of the original tree; the wood was black as ebony, hard, and perfectly fresh.

180. A remarkable instance of durability when buried in the ground, was afforded by a emoe found at a depth of 8 feet from the surface, in cutting drains through the fens of Lincsire, and which was hollowed out of an oak tree, of remarkably fine free-grained timber. Piles too were dug from the foundation of old Savoy-palace, London, built six centuries and a half before, and found to be in a state of perfect soundness.

181. The inner roof of the chapel of St. Nicholas, King's Lynn, Norfolk, was constructed upwards of four centuries and a half ago. The roof of Westminster Hall is about 450 years old. The rich carvings which ornamented the ceiling of the king's room in Stirling Castle, 300 years old, are still in good preservation. The staircase in Moreton-hall, Cheshire, winds round the trunk of an immense oak tree; the building is about 290 years old. The celebrated table in Dudley Castle is formed of a single plank, longer than the wooden bridge that crosses the lake in the Regent's-park, London.

182.—SWEET, or SPANISH CHESNUT.—*The Totsworth Chesnut* is the oldest example in England: it stands in a garden at Totsworth, Gloucestershire, belonging to Lord Ducie; and is mentioned as a famous tree in the time of King John (born 1199, died 1216), who held a Parliament under it, and at which period some say it was a boundary-tree, while others say the reign of Stephen (born 1105,

died 1154); tradition, however, carries it back to the days of the Saxon King, Egbert, who reigned from 799 to 837; and this much appears certain, that when used as a boundary mark, it must have attained some age, since saplings were not employed for that purpose. It is 19 yards in circumference; in 1788 it continued to produce fruit in considerable quantities, and of good flavour, though small.

183. *The Great Chesnut*. Bosc mentions one near Lancerre, 30 feet round, which has borne this title for 600 years.

184. In Bushy-park, near the Queen's house, is a very fine one, said to have been planted by Charles II.

185. At Buekland there exists a remarkably fine specimen.

186. Of its durability, the roofs of King's College, Cambridge, and Notre Dame at Paris are cited as examples. Rondelet, however, doubts the latter, and says Buffon and D'Aubenton thought it a species of oak. Piles were found under old Savoy-palace, London, in a state of perfect soundness.

187. *Elm*.—*The Trysting Tree* at the Friars, near the old castle of Roxburgh, Teviotdale, where, in 1547, the Protector Somerset was met by the lairds of Cessford and Fennyhurst, with a number of the Scottish gentry, to swear homage to the young King of England, Edward VI., was, in 1796, found to measure 30 feet in girth. Its ruin still remains.

188. *King Charles's Swing*, in Hampton-court-park, is likely to become a stupendous tree. Two great limbs spring up from the trunk, which latter at 8½ feet from the ground measures 38 feet round; each limb is 40 feet high.

189. Near the last-mentioned there is another elm, estimated as containing 796 feet of timber; its trunk is 44 feet in height and 18 feet in circumference.

190. *The Giants*.—In the same park there are the remains of two elms known by this name, which must have been of enormous size; the trunk of one of them measures 28 feet in circumference.

191. Evelyn in his "Sylva" informs us of a wych elm which grew in the park of Sir Walter Bagot, Staffordshire, which was 17 feet in diameter at the base, and extended, when felled, 120 feet. It was estimated to contain 97 tons of timber.

192. Deandalle mentions a specimen which grew near the town of Marges, in Switzerland, measuring 17½ feet in diameter, and estimated at 335 years old; he informs us that it grew on the average 3½ lines yearly (that is, ⅓ of an inch), beginning with 6, and diminishing to 2½.

193. White, in his "History of Selborne," mentions a broad-leaved elm, or wych hazel, which, though it had lost a considerable leading branch in the storm of 1703, was, when felled, too bulky for a carriage, and contained eight loads of timber.

194. At Brignolle, near Foulon, is one under which a dance was performed before Charles IX. of France in 1561. Chancellor Michel de l'Hopital of that period speaks of it as an object worthy the attention of travellers.

195. *The Queen's Elm*.—At the north-west angle of Richmond Green may be seen the trunk of an ancient one, so called from having, it is said, been a favourite tree of Queen Elizabeth.

196. In St. James's Park, one of those near the entrance of the passage leading into Spring Gardens was planted by the Duke of Gloucester, brother to Charles I. As that unfortunate monarch was walking with his guards from St. James's to Whitehall, on the morning of his execution, he turned to one of his attendants, and mentioned the circumstance.

197. As a proof of the durability of elm when constantly wet, mention may be made that it was used chiefly for the piles on which Old London-bridge was founded, and these, though upwards of 600 years old, were found sufficiently sound to build upon again. Piles of it were also found under the old Savoy Palace perfectly sound.\*

*Erratum in No. 94*.—In description of Hornbun, 5th line, for "southward," read "northward."

\* [But we believe these and other piles, on exposure to the air, almost immediately decayed.—Ed.]

## MINERALOGY.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR  
OF NATURAL PHILOSOPHY.

(Continued from p. 580.)

The uses of gypsum are various; in the Canaries it is used by a remedy for their wine, and about Malaga a large quantity is tinned up with the juice of the grapes; this custom is most probably derived from the ancients, for we learn by different passages in the Greek writers on husbandry that it was used as a clarifier. They threw gypsum into their new wine, stirred it often around, then let it stand for some time, and when it had settled, poured off the clear liquor. It would appear, however, that gypsum caused the spirituous part to evaporate, that the wine acquired a certain sharpness which it afterwards lost, but the good effects of the gypsum were lasting. This custom is very little followed at the present day. It is sometimes found an admirable remedy for renovating beer when pricked. As a manure it is invaluable, and the most surprising evidences are given of its renovating and invigorating powers. It is found to answer best in sandy or gravelly soils. From 7,000 to 10,000 tons used to be shipped annually from Nova Scotia to New York, Pennsylvania, and other parts of the United States; and, according to the reports given, its effects were wonderful, particularly on grass. The crops of corn and Indian corn were more than doubled by its use instead of stable manure. Its effects have been great when employed in the proportion of one bushel to the acre annually. It is, however, so varying in its nature, that great care should be taken in choosing it for agricultural purposes, being variably saturated with sulphuric acid, and sometimes containing metalline substances inimical to its use, either in manuring lands, or in refining wine or beer; for the two latter purposes in particular, when used, the greatest care ought to be taken to ascertain that it is a pure sulphate.

If chalk, limestone, spar, or any other species of calcareous earth, containing fixed air, be exposed to continued ignition, they give out carbonic acid gas and water, to the amount of nearly one-half of their weight. The remainder, consisting chiefly of lime, has a strong tendency to combination, and attracts water very powerfully. The addition of water to lime produces a very considerable heat, attended with noise and agitation of the parts, which break asunder, and a phosphoric light is seen if the experiment be made in the dark. Water dissolves about one seven-hundredth part of its weight of lime, and is then called lime-water. This solution has an acid taste, and turns syrup of violets to a green colour. If lime-water be exposed to the open air, the lime attracts carbonic acid gas, and is by that means converted into chalk; which, not being soluble in water, forms a crust on the surface, that, when of thickness, breaks and falls to the bottom, and in this way in time the whole of the lime will be separated.

Mortar has a degree of adhesion and ductility much less than clay. When dry, it is more or less friable, like chalk. A mixture of sand or broken earthen vessels greatly increases its firmness. If dry quick lime be mixed with mortar, it gradually absorbs the superfluous water, and the mass becomes solid in very short time; this latter fact ought to be borne in mind by builders.

**CALCAREOUS BODIES.**—The vast importance of the earths in the harmony of nature, and the many difficulties placed in the way of truly comprehending their nature and the uses to which by nature as by art they are applied, lead me to give them more than an ordinary consideration, and to point out the absolute necessity which exists that the lover of science should begin by observation of vital phenomena.

Earths are defined as bodies simple, with respect to the present powers of chemical analysis, brittle, incombustible, infusible by the heat of furnaces, not soluble in many hundred times their weight of water, and destitute of that opaque brilliancy which characterizes metals; taken substantively, they are called silice, lime, clay, barytes, and magnesia, soda, &c. Of these silice and lime take the precedence in the order of events manifest in the organic, fossil, and mineral kingdoms. From the earliest dawn of natural

philosophy up to the present epoch, fossil and mineral bodies, and stratified and amorphous masses, have been considered without reference to organic existences and vital phenomena; but, since geology has turned its attention to the phenomena of fossil and mineral beds, the close connection of organic and inorganic matter has been observed, a new field of observation has been opened to view, embracing the varied and eventful history of past ages, in which the remains of animals and vegetables, no longer existing on the earth, have united their aggregate remains to form hill and mountain masses, and many of the previously inexplicable phenomena of fossil and mineral bodies.

As animal and vegetable bodies are the primitive fountains from whence the earths are derived, and time and a perpetual succession of generations add to the quantities of those earths, so the earths in return become the source and origin of organic existences, the bases on which they exist, and the sources from whence they derive their varying capacities and powers; thus, by this reciprocity of action, a positive and continuous increase takes place generally and locally,—generally, as applied to the whole planetary body; locally, as measured out by periods of disturbance and repose, of generation and decay. The one general law governs the production of all the earths.

Vegetable mould is the product of decomposition of vegetable bodies; proofs of its origin are continually before our eyes, and are open to all men who choose to experiment thereon, or to watch the progress of forming earth on the rock or belibelled stone, as mosses or lichens perpetuate their generations. It is a product peculiar to vegetables not to be imitated by art, nor yet to be distinctly understood by chemical analysis. Lime or animal earth is as distinctly marked in its origin as it is by its peculiar qualities; and as vegetable mould is characteristic of land vegetation and atmospheric and aqueous action, so lime is equally characteristic of oceanic animals, and of the vital processes by which it is elaborated: both are produced by the same laws, but by modified and variable action; both are subservient to the one great end, the increase of this planetary body, the difference being, the one is elaborated in the medium in which man, the intelligent power, is disposed, and therefore appeals directly to the cognizance of the senses; the other is disposed in a denser medium removed from immediate observation, and comes not therefore so directly within the scope of our discoveries.

That lime is elaborated by animals within the ocean is a fact admitted, and not in the least invalidated by the readily ascertainable circumstance, that it is also received into both animal and vegetable systems of *terru firmi* by absorption from the soil, or as a constituent of the animal food: the lesser fact is demonstrable by experiment, and, being proved, is an admitted truth; but the greater fact is the gathering of observation as well as individual experiment, a truth of induction passing through a chain of reasoning which none but the philosophic observer can follow, and which, not being generally received, is still a disputed truth.

The reasons we have for believing that lime is elaborated by animals, as vegetable matter is elaborated by vegetables, are wise and powerful, although they may not be found convincing by men wedded to previous opinions. It is observed that as polypi, mollusca, and crustacea approach and are disposed within the broad tropical belt, so they secrete the greater abundance of lime; and as they advance towards the polar circle, so many species become partly or wholly divested of this earth. That stony coral formations are peculiar to the middle regions, and are governed in their increase of species and general quantities by latitude, dip, and inclination, and the absence of disturbing and destroying causes: that in tropical seas they cover areas of many thousand square miles, constituting hill and mountain chains and groups; whereas in temperate regions there are but few calcareous species, and within the polar seas none: that the whole bed of the ocean in these regions, independent of disturbing causes, is chiefly composed of calcareous matter like a fine chalk generated by the digestive processes of the living occupants, or by the partial or entire decomposition of these various tribes, of hill and mountain chain, of coral rock building in every variety,

of mollusca, crustacea, and finny inhabitants of the deep; the whole being interspersed with beds of coral and other sand, and beds of animals and vegetables as is the earth on which we tread, whose allotted duties, in like manner, are to contribute in life and in death to the material on which they are disposed.

(To be continued.)

## SOCIETY OF ARTS.

DECEMBER 11th.—W. Hughes Hughes, Esq., V.P. in the chair.

M. Lassus, architect to the French Government, was elected a corresponding member.

The Secretary read a paper "On Mr. J. P. Chatten's Improved Dead Eyes." A model and diagrams to illustrate which were placed before the meeting.

The next paper read by the secretary was "On the Kamptulicon Life-boat," by Lieut. G. Waller, R.N.

The third paper read was "On the Hydraulic Ram," by Mr. Freeman Roe; a model and diagram accompanying the communication.

Several specimens of the earthenware, and other manufactures of the Mexicans, were placed on the table and partly described by Dr. Thompson. This subject will be brought forward in a more interesting form after Christmas.

## SOCIETY OF MASTER CARPENTERS.

On Wednesday evening last, a meeting of this society was held at the Freemasons' Tavern, Great Queen-street, Mr. Biers, the president, took the chair, and was supported by the vice-president, Mr. Sparks. The minutes of the previous evening having been read and confirmed, and the usual business of the society transacted, it was determined that a special general meeting be convened for the 23rd inst., for the purpose of taking into consideration a petition to Parliament to abolish the window-taxes, or to so modify them as to lead to a better system of ventilation. Among the members present, were—Mr. Stevens, Mr. Higgins, Mr. W. Hutchins, Mr. Cahitt, Mr. Burstall, Mr. Davey of Stanmore, Mr. Outwaite, and Mr. Lover. From the great interest taken in the forthcoming question by the society, and by the trade generally, as well as by the public at large, a numerous attendance is expected next Monday week.

## HEALTH OF TOWNS.

On Wednesday last a numerous and highly influential meeting took place at Exeter Hall, for the purpose of forming an association to promote legislative and other measures for the improvement of the health of towns. The Marquis of Normandy occupied the chair; and among those on the platform were the Earl of Shelburne; Sir R. H. Inglis, Bart; Sir W. Clay, Bart.; Mr. Sheil, M.P.; Mr. Ewart, M.P.; Mr. Hawes, M.P.; Dr. Southwood Smith, &c. The meeting was addressed by the noble chairman at considerable length on the paramount importance of the objects they had in view, and the following resolutions were introduced by their respective proposers and seconders in neat and effective speeches:—

1st. That the want of proper sewerage, drainage, and cleansing of towns was the cause of sickness, suffering, and a high rate of mortality, as well as of the moral and physical deterioration of the people.

2nd. That an association be formed for the purpose of improving the condition of the dwellings of the poor in towns.

3rd. That a subscription be opened to carry out the objects of the proposed society.

4th. That the condition of burying-grounds be considered.

Dr. Southwood Smith then read a petition, which he had drawn up for the purpose of being presented to both Houses of Parliament. It set forth the present condition of the poor in respect of their dwellings, the various means by which they might be improved, and prayed for legislative interference. The presentation of the petition was entrusted to the Marquis of Normandy and Lord Ashley.

FONT IN WEST DRAYTON CHURCH, MIDDLESEX.

ELEVATION.

PLAN.

(The upper part shewing the basin, the lower part shewing the base and shaft.)

Scale  $\frac{1}{2}$ " = 1' 0" 6" 3" 0" 1" feet.

FONT IN WEST DRAYTON CHURCH.

TO THE EDITOR OF THE BUILDER.

Sir,—Among the many advantages arising from the great improvement in travelling made during the last few years, not the least is the great facility given for penetrating into some of the nooks and corners of England hitherto unknown or unthought of. Nearly every village of our country still possesses its ancient church, and it must be poor indeed if it does not contain something worthy of notice; and in very many cases subjects worthy of illustration are to be found, as in the church of West Drayton, which is about ten minutes' walk from the station of the Great Western Railway, very prettily situated, and, with its ivy-lad tower, presenting altogether a very picturesque appearance, though of no extraordinary architectural beauty. The interior of the church is a good plain specimen of the ecclesiastical architecture of the fourteenth century; it has its timber roof supported on stone corbels: there is a water-drain of early date and good design: in the chancel are remaining some fair specimens of brasses and throughout it has suffered less from the application of paint and whitewash than most of our village churches. But the object perhaps most worthy of attention in the church is the subject of the present illustration. This font may be fairly considered one of the best remaining in the kingdom, and it is much to be regretted that it was not included in the very beautiful collection lately published by Mr. Van Voorst. Its general plan is an octagon with an irregular base raised on one step, and having grotesque figures ranged around it; whom or what they are intended to represent must be left to the reader's imagination or to the learned in allegory to determine. The pedestal is very beautifully designed; it consists of a

circular pier in the centre, around which are a series of open arches with buttresses at each angle of the octagon; the whole effect of this part of the work is particularly light and pleasing. The pedestal is surmounted by a spreading band of very bold foliage, interspersed with figures, some of which, from their costume, seem to be intended to represent the privileged fool of the olden time; around the bowl of the font are eight panels filled with sculpture: the panel in the centre of the elevation has an angel bearing a shield; the next to the right one of the Maries, with the body of Christ after the Crucifixion; the next following, is a mason engaged in carving; the next, the Crucifixion; then another angel bearing a shield; and the three remaining panels contain angels holding scrolls. The whole composition is completed by a plain bold moulding; the font is lined with lead, and has a pipe down the centre pier for letting off the water, but this is now in disuse in consequence of the pipe being stopped up. It is very much to be regretted that some great lover of cleanliness, who was much annoyed by seeing the stains caused by time on the font, had the eyesore removed by the application of sundry coats of paint, which every lover of architecture must deplore. It is much to be wished that something could be done to remove the superfluous coating. There is no document to decide the date of the workmanship, but from its whole character, I should feel inclined to place the date at about the latter part of the fourteenth century. I feel sure that it is quite needless to say any thing as to the beauty of this specimen; it will be allowed by all; but I would advise every person going near the place to see it; it contains many beauties that cannot be given in merely geometrical drawings, however accurate. I visited and delineated it at the request of Mr. Bartholomew, the architect. The elevation and section need no explanation. One half the plan is taken across the top of the font, and the other half across the pedestal, showing the base and step.—I am, Sir, yours, &c.

W. CAVLER.

ON THE CONSTRUCTION OF HANDRAILS OF STAIRS.

BY MR. GEORGE RIDLEY.

General Remarks.

1. In the theory of handrailing, the circular well-hole of a staircase may be compared to a cylindrical space, around which the ends of the steps are made to abut: and the wreathed portion of the rail may be said to occupy the position of a spiral quadrilateral solid winding round the cylindrical space at an angle of inclination adapted to range parallel to the nosings of the steps immediately underneath.

2. This spiral quadrilateral solid would therefore form a detached portion of a hollow cylinder, circumscribing the cylindrical space we have already described. It is formed out of the solid plank, in lengths seldom exceeding one-fourth of the entire revolution around the cylinder, the thickness of the plank being sufficient only to embody within its surfaces the wreathed form of the rail.

3. In its formation, the method of procedure usually adopted is by the application of such moulds to the surfaces of the plank as approximate nearest to the required outline of the quadrilateral solid itself, and which are requisite for the guidance of the workman during the progress of the work.

4. Let the lines ABCD (Fig. 1) represent the base of a portion of this hollow cylinder, whose shell we shall suppose to be formed of wood of the same thickness and radii as are required for the plan of the handrail. Let the lines EFGH represent the elevation of the cylinder, upon the convex and concave surfaces of which are marked off the risers and treads of the radiating steps. Let the points 1 2 3 &c. represent the nosings of the steps, and the lines  $\delta$   $\delta$  the lines of inclination of the handrail. These lines thus drawn upon the shell of the hollow cylinder will shew the position and form of the quadrilateral solid, as embodied in the shell of the hollow cylinder; but as this solid is to be obtained out of plank, it is necessary in practice that the inclination of the plank should be so adapted as not only to comprise within the limits

of its surfaces the body of the solid, but also that its fibres should range as nearly as is practicable with the direction of the curve of the rail.

railing, is that of the ellipse, which is produced by a plane cut through the body of the cylinder in an oblique direction. There are various methods of forming the curve of the ellipse upon a plane surface, which our limits prevent us from entering upon; the following method, for the purposes of handrailing, appears to us to be the most effective. Let ABC (Fig. 2) be the

semi plan of a cylinder, the line ML its axial line, and the parallelogram AB EF the vertical plane passing through the axial line. Let the line GH be the position of a plane cut through the cylinder at right angles to the plane of the parallelogram AB EF; then, to describe the ellipse, or the sectional outline of this cutting plane through the points GH: procure a beam compass with three sliding points: let  $a$  and  $c$  represent the two extreme points of the compass, and the intermediate point  $b$  a sliding-stock in which a black-lead pencil is fixed; make the distance from  $b$  to  $c$  equal to half the length of the ellipse, as shewn by GI, and the distance from  $a$  to  $b$  equal to the line LC. From the point I draw the line IK at right angles to GH, on each side of the line IK affix two straight edges, leaving a space between in which the point  $c$  of the beam-compass may slide, and on the side of the line GH place a similar straight edge; having proceeded thus far, place the point  $c$  of the beam-compass in the groove in the line IK, and the point  $a$  of the compass on the line GH. Then, by the motion of the beam-compass, as indicated by the dotted line, the pencil in the socket at  $b$  will describe the section of the cylinder.

10. The surface of a cylinder is also a parallelogram, whose base line is equal in length to the circumference of the cylinder, and the height thereof equal to the height of the

5. If the thickness of the plank were inserted in the body of this hollow cylinder at the inclination required for that purpose, and the lines of the intersections of the cylindrical surfaces, with the plane surfaces of the plank, were marked on the plank, we should, by the removal of the plank from its place in the hollow cylinder at once perceive the position at which the moulds should be marked on the faces of the plank, and the direction in which the vertical surfaces should be cut to form a solid out of the plank similar to the space formed in the hollow cylinder for its reception. The outlines marked on the faces of the plank would represent the section of the cylinder cut by a plane in the direction of the surface of the plank; and the outline thus obtained is well known by the name of the *face-mould*.

6. From these premises it is clear that the theory of handrailing, as applied to the circular wells of staircases, is to a certain extent depending upon the sections of the cylinder. The cylinder, as every one knows, is a solid body formed by the revolution of a parallelogram round one of its fixed sides; or, in plainer language, a portion of a cylinder may be compared to the space which is passed over by a door revolving upon its hinges. The axial line of this cylindrical space is a line conceived to pass vertically through the centres of the hinges, and its base would be represented by the circle which the revolving edge of the door would form upon the floor.

7. By the cylindrical sections are understood the sections produced by cutting the cylinder with a plane; thus, a circle is a cylindrical section, because if we cut a cylinder parallel to its base, the section would be a circle.

8. Again, if we cut a cylinder by a vertical plane at right angles to its base, the section will be a parallelogram.

9. But the section of the cylinder, as more particularly referred to in our remarks on hand-

cylinder. A spiral line, is a line drawn upon the surface of the cylinder at any angle of inclination which might be required, and the development of a spiral line upon a plain surface would represent the hypthenuse of a right-angled triangle. Thus let A B C (Fig. 3) represent the base of a semi-cylinder, and the figure D E F G its elevation. The development of the cylindric surface upon the line A C B will be a parallelogram whose base line H I is equal in length to the circle A C B, and whose height I K is equal to the height E G of the cylinder. In the development, the hypthenusal line H L will form the development of the spiral line F K upon the surface of the cylinder. The projection of a spiral line upon the elevational surface of the cylinder may be performed by dividing the circle A C B into any number of equal parts as indicated by the points *a a*, &c. Having transferred these divisions to the base line H I of the development as shewn by the points *b b b*, &c., draw the vertical lines *b f*, *b f*, &c., cutting the development of the spiral line K I in the points *f f f*, &c. upon the elevational surface of the cylinder, and from the points *a a a*, &c., on the plan of its base, draw the vertical lines *a g*, *a g*, &c., intersecting the horizontal lines *f g*, *f g*, &c., in the points *g g*, and through which trace the line F E, which is the projection of the spiral line winding round the surface of the cylinder as developed by the line H L.

11. On reverting again to the hollow cylinder, which we have already mentioned, as formed of wood, upon both surfaces of which we shall suppose the student to have marked off the araises of the upper and the lower surfaces of the quadrilateral solid, it will be observed that any straight line taken at right angles to the axial line of the cylinder will coincide with any radiating line upon the upper or the lower surfaces of the solid respectively; but as the inner and the outer araises of these inclined surfaces are ranging at different angles of inclination, it therefore follows that the mean inclination of either the upper or the lower surface between their respective araises is in a central line between the two araises respectively, and the true development of this line would be the hypthenuse of a triangle in the developed surface of a cylinder whose radius is equal to the distance from the centre of the cylinder to the central line of the quadrilateral solid.

12. If, however, as is generally the case, where this quadrilateral solid, which constitutes the handrail round the cylindric ends of the rail well-hole, is joined by the straight portions of the rail connected with the flyers, and which are ranging at an angle of inclination different from that round the cylinder. The junction of the inclinations of both will to avoid deformity, require to be eased of by a curved line.

13. The simple and beautiful outline of the parabolic curve is the best adapted to this purpose; it is already well known, from its having been in use for more than a century. Our article, however, requires us here to enter into its detail. Let the lines *a b* and *b c* (Fig. 4) repre-

sent the intersection of the two inclined surfaces of the rail; let *a* and *c* represent the points at which the curve is to commence; divide the lines *a b* and *b c* each into any number of equal parts 1 2 3 4, &c., which being done, draw lines from the points marked 1 2 3, &c. in the lines *a b* to the corresponding points

1 2 3, &c. in the line *b c*; and from the intersection of these lines the curve may be adjusted by the hand to the greatest accuracy. The dotted lines *d e* and *f g* represent the upper and lower araises of the rail, from the different curvatures of which it will be observed that the upper and the lower surfaces of the rail are not in the same angle of inclination; therefore, the mean between both surfaces, as shewn by the line *a c*, will be the correct inclination of the rail.

14. We are, therefore, not only as regards the diameter of our cylinder, on the surface of which we shall conceive our line of heights to be placed, but also in the development of the line of heights, to confine ourselves to those dimensions which pertain to the centre of the rail only.

15. By the line of heights is meant the inclination of the handrail, as laid down upon the developed surface of the cylinder. Its use is to enable us to ascertain the correct height or position of our cutting-plane in the cylinder, as we shall hereafter treat more at large.

16. If we divide the length of our quadrilateral solid into parts not exceeding one-fourth of a revolution round the cylinder, we shall find that the proximity between the line or arais produced by winding the development of the line of heights round the surface of the cylinder, and that produced on the same surface by the intersection of a cutting-plane made to pass through any three points approximating nearest to the general line of heights, is such as will enable us to ascertain with certainty in what position the plane of our face-mould should cut through the cylinder. Thus, let the circle A C B (Fig. 5) represent a portion of the base

of a cylinder, and the lines D E F G its elevation; also let the parallelogram H I K L represent the development of the cylindric surface, and the line P Q the line of heights; suppose then that the lower portion of the development of the cylindric surface up to the line P Q is wrapped round the cylinder, we should find the perpendicular heights I P, R S, and I Q in the development to coincide with the perpendicular heights D N, T O, and E G on the cylindric surface respectively; but the straight line P R Q would produce the spiral line on the elevation of the surface of the cylinder. And, moreover, as the cutting-plane for our face-mould would, in passing through the cylinder, as shewn by the dotted line N O G, cannot in this case be made to pass through the entire spiral line, it is sufficient for our purpose if it be made to pass through the nearest approximating points, N O G, as shewn in the diagram.

17. Again, if, as in Fig. 6, where the line of heights P Q R in the development is represented on the surface of the cylinder by the curved spiral line N O M, our cutting plane in such a case would not only be required to pass through the straight line N M, but its direction from thence should also be made to pass the point O on the cylindric surface. This intermediate point O is first to be determined on the development by drawing the tangent line U V parallel to the line P R, but touching the curved line of heights in the point Q, which

being transferred to the surface of the cylinder, as seen in the point O, we have then obtained three points, N O M, on the surface of the cylinder through which our section is to pass. The theory for determining the relative position of this plane, with a vertical plane passing through the axial line of the entire cylinder, so as to obtain the contour of the face-mould, and the bevils for its application to the surfaces of the trihedral and its solid angles, which we shall next enter upon previous to our delineation of the various details connected with this branch of science.

(To be continued.)

SLIP OF CHALK AT EAST CLIFF, DOVER.

EVERY observer of the cliffs of Dover will behold the same weather-beaten face that terrified the army of Caesar, with very little alteration, in this locality, till you come some fifty or seventy yards beyond the Jetty. The same flints, had they eyes, would have seen the glorious lord of day rise for the last 2,000 years. The builder of certain premises on the cliff, from an error in judgment, and following the example of others, continued the line of buildings, not observing or regarding the mound of loose chalk thrown down when the moat round the castle was enlarged; and, finding the foot or bottom in his way, removed it. Consequently, the late heavy and incessant rains, lodging on the top or table, so saturated it, that the part above slipped, and filled up the space which he had made, and on which a part of the building stood. I have been an accurate observer of the cliffs for half a century. There never has been, properly so called, a fall of the cliffs in that time, but virtual slips have been occasioned by the sea washing away the bottom, or by some excavations of man at the foot; otherwise the cliff cannot slip (or fall, if you please), but from one or other of these joint causes. I call the attention of the scientific, or my contemporary observers, as well to the present slip as to the different ones along the railroad—the great one at Shakespeare's Cliff in 1800, or thereabout, and the one on the 12th of November, 1810, when the pig that survived for months under the ruins was buried. Here not only was the foot of the cliff cut away, but a piece of ordnance was placed immediately above, the plane and mounds of which retained the rains, and occasioned the slip. It will be found universally that a greater quantity of earth or loose soil is found at the top of all slips of chalk that retain the rains, which, by the joint action of gravity and the attraction of the sun, descend on inclined planes which they form; and if that inclined plane reaches the face of the cliff before it gets to the base, there, and there only, can a slip of our far-famed cliffs happen. I consider all the houses in the locality of East Cliff, facing the sea, as safe as Snargate-street; for it would require a great projectile force to send from the apex of the cliffs any portion thereof. The nine tons of gunpowder, used at the great blast at Round-down, did not project farther. I am informed that a Government survey has been made, and that it is their intention to remove the objectionable points, and then every part of that locality will be safe.—Dover Chronicle.

## STEAM-BOAT PIERS AND THAMES EMBANKMENT.

Last week Mr. Deputy Hicks moved the Court of Common Council to agree to the report made by the Navigation Committee on the subject of the existing steam-boat piers between London-bridge and Chelsea. The report stated that the committee had directed a survey to be made by Mr. Walker, the civil engineer, by Mr. Leech, the clerk of the City works, and by the water-bailiff, and that those gentlemen had certified that those piers were in general unsafe, and impeded the navigation of the river. They were for the most part as unsafe as had been that at Blackfriars-bridge at the time the recent fatal accident happened. The committee also stated that they had been furnished with a plan on which those piers ought to be constructed, the expense of erecting each of which would be about 1,750*l*. The committee added that they had caused notices to be served upon the owners and proprietors of the present piers, calling upon them to construct them on the plan furnished, and according to the regulations of the committee, or that they would be removed. If the notice were not complied with, the licences granted to private individuals to erect piers would be withdrawn.

Mr. R. L. Jones hoped the court would not agree to this report. There were in perspective two great measures which approached consummation, which the recommendations of this report, if carried into effect, would interfere with. He alluded to the projected embankment from Blackfriars-bridge to Westminster, and again from Westminster-bridge to Chelsea. To the first proposition (to effect which the bill was actually printed) this court had assented, provided the government carried the plan into execution at its own expense; and he submitted, that pending the matter, parties ought not to be permitted or encouraged to erect these landing-places along the very line the embankment was proposed to be carried. The government ought not to be interfered with in the matter. He also contended that neither the committee nor the court had the power to grant licences for the erection of these piers. The right to the soil of the river was a question now pending between the Crown and the corporation in the Court of Chancery. The report of the Navigation Committee was ultimately agreed to by a large majority, only three hands being held up against it.

## IMPORTANT TO SURVEYORS OF HIGHWAYS.

THE decision in the following case which was tried, on the 27th ult., in the Queen's Bench, will, we hope, operate as a caution to surveyors of the highways to abandon the practice, so prevalent, of leaving heaps of materials for mending the roads, and of scrapings of mud from the roads, in such situations as to endanger travellers. It will show the public that the practice is illegal and may be prevented.

DAVIS v. CURLING.

This was an action against the surveyor of the highways of the parish of Tottenham, to recover damages for the consequences of an accident which had been occasioned, as was alleged, by his neglect. The plaintiff on the 1st January, 1843, drove from Lambeth to Tottenham in a one-horse chaise, accompanied by his wife, to the house of a Mr. Newzone, where he remained to supper. On his return home his gig was upset in Marsh-brook, in consequence of driving over a heap of gravel, the gig being broken to pieces, and Davies and his wife both seriously injured. The former was confined to bed for three weeks, and was for six weeks disabled from attending to business. It appeared that on each side of the lane there was a track of greensward, on which it is customary to place heaps of gravel for the repair of the road, where they are left until they are required. The heap in question extended from the greensward into the road. Several of the plaintiff's witnesses swore positively to this fact, and also stated that they had, before the accident occurred, frequently drawn the attention of the defendant's servants to the dangerous state of the particular gravel heap which had occasioned the accident.

Mr. Justice Wightman, in summing up, left these questions to the jury—First, were they satisfied that the defendant ever knew that the gravel was in the place where it was? Secondly, if he did so know it, was it negligence and want of due care on his part to leave it there? Thirdly, if they answered the other two questions in the affirmative, were they satisfied that the accident had been occasioned by such negligence?

The jury returned with a verdict for the plaintiff, answering each of these questions in the affirmative, and assessing the damages at 35*l*.

## CORRESPONDENCE.

## ARTESIAN WELLS.

TO THE EDITOR OF THE BUILDER.

SIR,—It has been publicly announced in the London journals that an artesian well was to be formed in the rear of the National Gallery, in order to furnish water for the fountains in Trafalgar-square. Naturally inquisitive on this subject, I have occasionally visited the chosen site, and watched, at a respectful distance, the progress of the work. I say at a respectful distance, Sir, for there has hitherto been an attempt to mystify proceedings, and the organ of communicativeness appears to have been as chary of the required supply of information, as the chalk beds have evidently been of their supply of water. All the information I can obtain is, that they have sunk the well 300 feet, dipping into the chalk; all that I can see is, an expensive edifice, raised before they were quite certain it would be wanted; and, by the aid of a powerful engine, they have been able to pump up water enough to fill the huge cisterns crowning the new building; and they are now vigorously attacking the subterranean reservoirs in front of the National Gallery, with the intent, I presume, of draining the first well, and thus forming a kind of canal navigation beneath that venerable building. We are not to have an artesian well at all, but the fountains are to play by the aid of steam: they had better have come to terms with one of the water companies. So much for the plea of economy. Perhaps some of your readers will throw a further light on the subject.

Since my former communication a rather curious exemplification of the effects of drainage by main sewers has been thrust upon my attention. Large avenues of trees at Bow have lately perished in consequence of sewers being formed in their immediate neighbourhood; the cause and the effect are equally palpable to the resident inhabitants, although singularly against the draining mania of the day: perhaps "Jenkins' Geology" will explain this.

## GOTHIC ARCHITECTURE.

## GOTHIC TEARS.

SIR,—I am ready to admit that the island where I have had my origin has had the reputation of producing every thing which is barbarous, and that I shall hardly be believed when I claim of the present age any thing which may ginsay the deeply-imbibed belief that no art could emanate from such a remote part of Scandinavia. Yet let my public cry be heard by the builder; and let my almost unheeded remains at Wisby call attention to my claims. Why should the University of Christiania publish, at the expense of government, the architectural remains of the Cathedral of Drentheim (beautiful though they are) and my much earlier efforts in the fourteen ecclesiastic buildings in the city above-mentioned be neglected? Are they too ruinous? Not so. Are the materials, the workmanship, the magnitude and elevation of the edifices contemptible? The reverse. Let not then fashion, ignorance, or prejudice do me injustice. Examine my claims, and pronounce whether the church of All Saints was built in 1030; of the Holy Ghost and St. Lawrence in 1046; St. Drotten in 1086; St. Catherine, with its facade and arches, in 1160; and have any thing to constitute a claim to containing the first pointed arches in Europe.

Perhaps, Sir, I ought to console myself in recollecting that the late Sir John Soane was called the modern Goth, because he made use of a most beautiful order of architecture at the Bank of England in an admirable

manner, but which the author of the appellation had not taste to comprehend.—I am, Sir, your barbarous servant,  
Goru.  
From the Island of Gotland, in the Baltic,  
September 30, 1844.

## DRAWING INSTRUMENT.

SIR,—In answer to "G. N." of last week, I would say the instrument alluded to is called a Centralmead, invented by Mr. P. Nicholson, and was improved on by the late Mr. A. Nicholson; it is in form like a T square, with the stock forming an obtuse angle instead of a right line, working round two pins found at certain points, which will draw lines to any vanishing point, 50, 100, or 200 yards off. It is an instrument very little known, but should you wish a further explanation, I will give it.—I remain, Sir, yours,  
J. W. W., Jun.  
44, Stanhope-street, Hampstead-road,  
Dec. 9, 1844.

## MACHINE FOR CUTTING TRAOERY.

SIR,—Having some time ago seen an account of tracery being cut by machinery for a new church in London (I think Camberwell), I quite expected some of your correspondents in London would have given us in the country a description of it; but being disappointed, I take the liberty of offering to the notice of your readers, by your permission, one I constructed some time ago for the same purpose.

The annexed sketch shows the method of piercing the plank A, the cross-bar with handles at the ends. The socket in the centre is dished out at top to receive oil for supplying the screw B, the thread of which should be very fine, which, with the socket in the bar, are steel, hardened to resist the wear by friction. C C, two cutters, one forked, and about 1/4th longer than the other, which is chisel-pointed and bent, to throw out what is cut by the other. The plank D will be necessary to steady the plank and apparatus when nearly cut through.

If you think this worth inserting in your columns, I will send you the method adopted in channelling after being cut.—Yours respectfully,  
JAMES PICKARD.  
Newport, 1844.

## DOMESTIC DRAINAGE.

SIR,—A copy of your valuable journal, containing an article headed "On the Arrangement and Construction of House Drains," by Mr. J. Phillips, was kindly forwarded to me from London by a gentleman high in office, who takes much interest in all matters relating to health of towns and sanitary improvements. I consider the article to be a well-written and valuable contribution, calculated to effect great public benefit, and I have no desire to detract from the merits of its author, but I cannot resist requesting that you will do me the favour, I might almost say the justice, to insert in your periodical, at your earliest convenience, this note, together with my letter to the Commissioners on Health of Towns, on *Tubular Sewering*, which appears in the Appendix of their first Report, and which, although it does not contain all the suggestions that I had the honour to submit to the commission on 17th June, 1843 (these, however, will be found in the body of my evidence), nevertheless contain sufficient to shew Mr. Phillips that he need have been at no loss for information on the subject of *tubular sewerage*.—He says, "As I have found much difficulty in procuring information upon many points which require elucidation, I have ventured as a practical man to throw together a few thoughts, being anxious to add my mite to the general stock of knowledge upon this subject." Now, Sir, I think no one can peruse either my evidence or the letter referred to without at once ad-

mitting that I had, at all events, completely anticipated Mr. Phillips; but whether he has added much original or valuable matter to the subject as such had been previously detailed before "the Royal Commission on Health of Towns," by myself, in Croydon-house, on 17th June, 1843, and afterwards by J. Butler Williams, Esq., on 21st March, 1844, I leave it to competent and impartial inquirers to decide.—I am, &c.,

WILLIAM DYER GUTHRIE,  
A.M., F.R.C.S.L., &c.

3, Downie-place, Edinburgh.

[Mr. Guthrie's letter reached us rather too late in the week to allow of our inserting in the present number his communication on Tubular Sewering. It will appear in our next.]

SIR,—Excuse me for mentioning that in the "Penny Cyclopaedia," vol. xxi. p. 319, Fig. 4, under the article "Sewer," there is a description by Mr. Cuff of a drain, which appears to be much more adapted for the purpose intended than that described in your journal of last week; because amongst other features, the solid matter, entering with the water, is collected, and does not escape into the main drain.

I have no sort of interest in any way of forming sewers, but it struck me that it was right to mention the above for the mutual benefit of your numerous readers.—I am, Sir, your humble servant,

Dec. 5th, 1844.

A SUMNER.

#### ARCHITECTURAL COMPETITION.

SIR,—In THE BUILDER of November 23rd, you inserted a letter of mine relative to "Architectural Competition," which your correspondent "Scrutator," in last week's number, wishing to find fault with, says, that "it is pure nonsense to talk of an impartial architect," to select the best design in competition, and that it would hardly be supposed that Sir Robert Smirke, if placed in such a position, would select a design which "would clash with his professional reputation at the British Museum." (Some say that the new buildings should be taken down, instead of the old, with its painted ceilings, inlaid floors, &c., &c.) Now, Sir Robert Smirke, however bigotted he may be to pagan architecture, when called upon to give his opinion of the best design for the Cemetery Chapels at Nunhead, laid aside his prejudices, and decided upon one of pointed style, allowed, I think, by every one, to be the best design out of the sixty-five sets of drawings he had to make a selection from.

So that I think we may safely say that Sir Robert Smirke is an "impartial architect," and not the reverse as your correspondent suspects. In the advertisement of the "Baths and Wash-houses for the Poor," "Scrutator" thinks it "looks very suspicious" to have the name and address written on the corner of the drawings. I do not see why he should object to this, for if there is to be any jobbing in this affair, it will be done just as well with a private mark as with the name and address of the architect on the designs. If a "Committee-man" should happen to have a relation or friend who intends to "send in," he will find out his design by instinct without troubling himself to look at the corner. Hoping you will insert this, I am, Sir,

Your obedient servant, T.  
London, Dec. 4, 1844.

[We think no competition should be entered into without the names are all openly exhibited; as long as matters are conducted otherwise, the private assassination in the dark of true design, construction and integrity will still be perpetrated.—Ed.]

#### HARDY TESTIMONIAL.

SIR,—Knowing from past, I might say painful, experience the corruptness of the present system of architectural competition, it is with much pleasure I have noticed of late in your valuable periodical several letters calling attention to the subject, and offering various suggestions for its amelioration. Among your correspondents, I find one who says (in No. 93), "All architects who compete should know the class of men before whom they are to exhibit their talents; and perhaps exposure would in a few cases influence an honest decision."

And again, "Let the profession coalesce, and form some wholesome rules to guide themselves in transactions of this nature." This view of the subject so perfectly accorded with my own, that I determined for the future (having put my own construction on the former part of the quotation) to do my utmost to expose any chicanery in architectural competition that should come under my notice.

Agreeably to such determination, I shall briefly as possible relate the particulars of a case that I unhesitatingly designate as grossly corrupt, and alike disgraceful to the committee and unfair to the competitors. Some weeks back I submitted a design (in common, I believe, with many others) for a monument proposed to be erected to the late Admiral Sir Thomas Hardy. The design was forwarded to the honorary secretary for the honourable committee—for they are "all honourable men." In due time my drawings were returned, and I thought no more of the matter, till last week I happened to be looking over the *Illustrated London News*, when I was no less surprised than disgusted to learn by a paragraph in that publication the astounding fact that the monument now erecting to Sir Thomas Hardy was from a design of Henry Dyke Acland, Esq., of Killerton, an unprofessional gentleman and a member of that committee appointed to decide on the merits of the different designs previously submitted to them.

The following extracts from the paragraph will, however, best explain this barefaced transaction:—"Designs were solicited from the most eminent architects, and numbers were sent in for the decision of the committee. The choice fell on the plan of Arthur Henry Dyke Acland, Esq., of Killerton, Devonshire. This gentleman is a magistrate of the county of Devon, son of Sir Thomas Dyke Acland, Bart., M.P. for the county, and brother of Thomas Dyke Acland, Esq., M.P. for West Somersetshire. Although an independent gentleman, and no architect by profession, he is most ardently attached to architectural pursuits; and although he was on the Hardy Committee himself, yet, on having sent in the design anonymously, and it being selected by the committee without the least knowledge of the designer, he left the committee, hoping they would put the superintendence of the structure into the hands of those who had sent in other good designs for competition. This, however, met with difficulty, and that of Mr. Acland, with the aid of an experienced builder, Mr. Goddard, of Bridport, has been proceeded with most favourably and expeditiously.

Now, Sir, may I ask, did you ever meet with a more disgraceful case, or one more strongly militating against all preconceived rules of fair and honourable competition?

A pretty story that of Mr. Acland's extreme sense of delicacy. What filthy nonsense is this? Let me ask Mr. Acland one question; what part did he, could he act on the committee?

With regard to Mr. Acland's design, the commentator above quoted, after saying it is *without pretension*, continues, by way of definition, to say, it is every thing that it should be, and that a more appropriate emblem to a naval warrior could not have been selected.

I can hardly offer an opinion on this part of the subject, only having seen the small sketch given in the *Illustrated News*; and, if I may judge from that, so far from subscribing to the panegyric bestowed on it by our worthy critic, I think I never beheld a more shaft-like, common-place affair; and must confess myself at a loss to discover the slightest monumental (not to say naval) feeling in it, or the least affinity to the subject to be commemorated.

Let me recommend, in conclusion, that Mr. Acland inscribe on the base the epitaph of his great prototype:

"Si monumentum requiris circumspice."

*Circumspice* might be translated, look aloft.\*

I am, Sir, yours obediently, R.  
London, Dec. 5th, 1844.

#### COMPETITION AND CONTRACTS FOR STONE.

SIR,—In your valuable paper you have frequently exposed the methods which committees, &c. employ to enable them to get the

\* [Perhaps our readers will remember the verger's translation which appeared in the newspapers a few years ago—*Sir! come! spy! see!*—Ed.]

cream of some fifty or sixty designs by offering a paltry premium to architects, although there is little doubt but they have settled to whom it is to be given before the competition is advertised; but previous to seeing the advertisement which I inclose, I had no idea that the same means would be used to obtain a supply of materials for erecting a whole building, for if each quarryman in Yorkshire send a ton (value about 25s.), there will not be much more required. I suppose, in like manner, the timber and brick merchants and others must contribute their portions, delivered on the ground free of expense, and then it will be a cheap building forsooth. Yorkshiremen are greenish (?); but if they are to be imposed on in this manner, they are more so than I took them for, and will soon be fit inmates of the proposed building. A little of your advice might be of service to them.—Yours, &c.,

Dec. 11, 1844. TAY AND BAY.

The advertisement referred to appeared in the *Leeds Intelligencer*, and is as follows:—

"TO STONE MERCHANTS, CONTRACTORS, AND OTHERS.—The Committee of Justices of the Peace appointed for the North and East-Ridings of Yorkshire, for the building of a Pauper Lunatic Asylum for the said Ridings, are ready to receive specimens of rough, flat-headed walling stone, suitable for foundations and rough walls, varying from three to nine inches in thickness. Sealed Tenders for supplying the same to be delivered to Mr. John Holby, Solicitor, Low Ousegate, York, the Clerk to the Committee, on or before the 18th of December instant, and a duplicate copy to be sent to Messrs. Scott and Moffat, 20, Spring-gardens, London, the Architects. Specimens containing not less than One Ton Weight or Cube Yard, to be delivered Free of Expense, before the above date, on the Building Site at Clifton, near York. The architects will be glad to see Specimens of Stone suited for the general walling. Any further information may be obtained from the Architects. York, December, 1844."

#### Miscellanea.

##### ARCHITECTURAL IMPROVEMENTS, PERTH.

—The terminus of the Scottish central line of railway is proposed to be on that part of the town's property lying between the Waterworks and Princes-street, now occupied by Messrs. Hepburn and Grahams, as wood and coal yards. The situation will be very convenient, and ornamental to the city, occupying, as the buildings probably will, the whole extent of the ground facing the South Inch from the Edinburgh road to the river, as the terminus will also be that of the Strathmore Railway, as well as of the Dundee and Perth, provided the line by the Garse throughout be adopted. The latter, after passing Kinfauns, crosses the Willowgate near its mouth, and runs up Moncreiffe Island to the top, where it would cross the Tay immediately opposite to the joint terminus.

THE NEW GRAVING-DOCK AT ALEXANDRIA.—This dock is rapidly approaching completion, after ten years of labour, and after several millions of dollars having been spent upon it. The public may not be aware this has been cut out of artificial rock, formed of lime, pulverised brick, and pozzolani, raised on piles driven closely together to a depth of 30 feet in the sand. The chief cause of difficulty and delay arose, in the first instance, from the operations having to be conducted under water by means of diving apparatus at a depth of five fathoms (there being here no ebb or flow of tide of any consequence); and, in the second place, from the difficulty of giving sufficient stability to the formation, so as to enable it to resist the enormous pressure from below when excavated. Its length is 260 feet and breadth 60.

DISINFECTION OF SEWERS, CRESSPOOLS, &c.—M. Siret finds that a mixture of coppers, charcoal, and gypsum, in the following proportions, if thrown into a sewer or cesspool, will purify it to a remarkable degree:—sulphate of iron (green coppers), 200 lb.; sulphate of zinc (white coppers), 25 lb.; vegetable charcoal (common or wood charcoal), 10 lb.; sulphate of lime (gypsum), 265 lb.

Messrs. Bowers and Murray, of Liverpool, are the successful competitors (from among fourteen in number) for the excavation of the Railway Dock at Hull. It is expected that the dock will be ready for business in the spring of 1846.

**IRON HOUSES.**—The late frightful earthquakes in the West Indies, in which the brick and stone buildings of whole towns have been levelled with the ground, and the wooden ones consumed by the fires which usually burst out after the overthrow of the other buildings, have drawn the attention of many persons residing in districts subject to those awful visitations to the advantages of houses constructed of iron, which have been found to stand the shocks of the severest earthquakes uninjured, and which are, of course, proof against such conflagrations as that which swept away at Point-a-Pitre, in Guadalupe, all that the earthquake had spared. Mr. W. Laycock, of Liverpool, who recently built an iron palace for one of the chiefs of the African coast, has just completed an iron cottage for the use of two maiden ladies, residing in the island of St. Lucia. It consists of three rooms, each 9 feet high—viz. one room 20 feet by 14 feet, and two rooms 12 feet by 10 feet. There are six large jealousy windows and two small ones over the front and back doors; these and the floor are the only parts made of wood. There is an inside ceiling of iron in panels, and the roof is in a wrought-iron frame and covered with galvanized plates of iron. The walls are formed of double plates of iron, with a thin stratum of air between them, an arrangement which will prevent the passing of the solar heat into the interior of the building, at least through the walls, and keep the interior delightfully cool. The weight of the building is 14 tons, and the cost rather more than 200*l*.

**THE PROPOSED GRAND PROMENADE, OR AVENUE AROUND HULL.**—This magnificent project has been received with a degree of favour and support that promises highly for its accomplishment at no distant day. The object is to lay out a grand promenade or avenue, extending from the Humber on the west, in a regular course round the town of Hull to the Humber on the east, having a carriage-way of seventy feet in width, with two footpaths of about forty feet wide each, and to be separated by rows of ornamental trees. To accomplish this grand design, it is proposed to purchase ground, 150 yards wide, along the whole line; and to dispose of the fifty yards in width, remaining on each side of the promenade, for building purposes. The financial part of the plan is stated to be promising. The expenditure required for land, draining, tunnelling, planting, &c., is estimated at about 50,000*l*; and the proceeds from the sale of building-ground is calculated in the end to realize nearly twice that amount, leaving a profit to the shareholders of cent. per cent.

**FALL OF A NEW BUILDING, SCAFFOLDING, &c.**—An accident happened lately at the new school-room, in the course of erection at Halstead, near the new church (Trinity), where the steeple fell on the 10th of July last. Several persons were employed carrying up an end of the building, when it suddenly gave way, and fell with a tremendous crash, carrying with it in its fall the scaffolding, &c.; the workmen experienced a most providential escape. The weight of the ruins was calculated at twenty tons. One of the bricklayers, whose escape when the steeple fell was truly providential, was at work at the school-room, and again experienced the same protecting care.—*Bury Post*.

**NEW THEATRE AT TAUNTON.**—The contemplated site for this building is the premises in Paul-street, lately occupied as livery stables by Mr. Hatchwell. The situation is the only spot left unoccupied in the town. It is intended that the undertaking shall be carried out by shares, a great many of which have already been applied for. Should the scheme be successful, we hope the structure will be such as to do honour to the taste of the age, and a credit to the town and neighbourhood.—*Somerset Gazette*.

**PERRIN'S METHOD OF HEATING THE AIR IN BUILDINGS, &c.**—Angier March Perrin, of Harpur-street, who had patents granted to him for the above purpose in 1831 and 1832, intends to petition for a prolongation of the respective terms of sole using and vending the same. A notice has appeared in the *London Gazette* to this effect, and application will be made to the Privy Council on the 11th of January next, to fix a day for the hearing of the matters contained in the said petition.

**CABINET FIRE ENGINE.**—An ingenious and useful description of engine, for the suppression of fires occurring suddenly in dwelling-houses, &c., has lately been invented, which, from its compactness, its extraordinary power, and the facility with which it can be brought to bear in cases of emergency, is deserving of public notice. In outward appearance the engine in question resembles a small cabinet or ornamental chest of drawers upon casters. Upon removing the mahogany top, however, a complete powerful fire-engine is discovered worked by a folding handle, and ready fitted with a hose long enough to reach from the first floor to the garret, or to the basement of a large house, and also furnished with pipes and all necessary apparatus, so contrived as to be available at a moment's notice, and when not in use to be easily stowed away upon the partition which divides the water from the external covering of the cabinet. The reservoir of this engine contains nearly a hogshead of water; and the whole affair, which may be easily worked with merely the strength of one woman, another directing the stream of water, does not occupy a space exceeding four feet square. It admits of being made and fitted up in any ornamental shape which may be desirable, and may be kept ready charged within a room or in any passage or corridor, where it would assume the appearance of rather a handsome piece of furniture, and from whence it can be wheeled in a minute, and in another minute be distributing such a stream of water as would effectually drown any incipient fire whatever. As a proof of its powers a small engine, not exceeding three feet square, and worked by a lad, threw a powerful stream of water completely over the house of the inventor, Mr. Crewther, of Long-acre.

**DISCOVERY OF ROMAN BUILDINGS, &c.**—There was lately discovered in a field near Lilleyhorn, Gloucestershire, an extensive range of Roman chambers, whose communications with each other were distinctly marked, and which in part exhibited the supports and bases of tessellated floors. They were bounded on one side by a wall of great thickness, but the limits of the whole have not yet been ascertained. There were various sorts of ancient brick-work, &c., and there were picked up many fragments of red and coloured glazed pottery, having various figures on them, antique glass, many little implements, &c., numerous coins in good preservation were also found, from the reigns of Valerian to Allectus inclusive, comprehending the Roman British empire.—*Gloucester Chronicle*.

**IMPROVEMENTS AT CLETHORPES, LINCOLNSHIRE.**—Great improvements are now going on at this favourite watering-place. Upon the lands lately set out and sold for building-ground, a great number of workmen are employed. The row of houses now being built near the High Cliff, at the Upper Thorpe, will command an extensive view of the German Ocean, and the opposite coast of Holderness. Building operations have also commenced on the property of the Rev. Mr. Mantell, of Louth, situate between the Upper and Lower Thorpes, and a street is formed, of the width of fifty feet, on both sides of which houses are to be built, for the accommodation of families of the first respectability.

**A LARGE ORDER FOR BRICKS.**—We learn that the Birkenhead Warehousing Company have engaged by contract the partners of a celebrated brickmaking firm of the south of England (who, we believe, made the bricks for the Eastern Counties Railway) for the supply against the next summer of 50,000,000 bricks, for the building of their warehouses on the southern margin of Wallasey Pool; and that within the last week 300 operative brickmakers have been sent from Kent to Birkenhead, and have already commenced operations there.—*Liverpool Paper*.

**GAS.**—A new gas company has been started at Liverpool, under the title of the "Liverpool Guardian Gas Company." The company proposes to fix the maximum selling price of gas at 4s. 6d. per 1,000 cubic feet, and to limit the maximum dividend to 7*l*. 10s. per cent. on the capital. It is in contemplation to form a new gas company in Hull, the profits of which are to be devoted to the general improvement of the town. A similar plan has been in operation for some time in Manchester, and works, we are told, exceedingly well.

**LIGHTHOUSE ON THE GOODWIN SANDS.**—Mr. Bush has at length established in his caisson upwards of 20 feet of the iron shaft or column on the summit of which the lighthouse will be placed. It is now above high-water mark, and there is nothing to prevent its being finished and ready to be illuminated by the 1st of January next. This shaft penetrates through the various iron chambers of the caisson, and is firmly sustained in its perpendicular position by two iron plumber blocks of great strength. It is also further secured by iron stays or braces, which are bolted to the outer part of the caisson, and attached to the top, as well as the centre of the column. The new light is proposed to have an elevation of 33 feet above high-water mark, and to be approached by a light, iron spiral stair, winding round the exterior of the column, within an octagon of about 10 feet diameter, surmounted by a plate-glass lantern. It appears that the caisson, which is 30 feet in diameter, has remained undisturbed in the same position in which it was sunk, when occurred the untoward accident of the American bark being driven against it, shortly after Mr. Bush had partially fixed it, which completely frustrated his original plan of making the superstructure of solid masonry. The caisson is, however, to be filled up with blocks of stone and concrete; the naval authorities of Deal have reported to the Admiralty that they expect mainland will be formed, the caisson forming a nucleus for accomplishing this most desirable object.

**MANCHESTER IMPROVEMENTS.**—The committee have laid before the public the outline of their scheme for giving to the people of Manchester the means of recreation by the opening of parks and walks. They propose the formation of four places of recreation, of about thirty acres each; that a gymnasium, on a large scale, be erected in each, free of charge; that, where possible, spaces be obtained for ball-alleys, quoits, skittles, archery, and other active sports, and available to players at a charge merely to cover the implements of play that may be used; that each park contain one or more fountains of pure water; that numerous seats be erected in proper situations for general accommodation; that buildings be erected where tea, coffee, and other refreshments may be obtained, but where no intoxicating liquors of any kind shall be allowed; that such parks be open to the public on all days of the week; and that the gymnasium, ball-alley, quoit, skittle, or archery grounds shall be closed on Sundays. The committee add that they have every reason to expect that a public baths, wash-houses, &c., free, or at a merely nominal charge, will be erected simultaneously with the promotion of the parks and play-grounds.—*Manchester Times*.

**MACHINES FOR DRYING CLOTHES.**—Machines for this purpose are used in the large cotton-print works in the neighbourhood of Manchester. These machines, which are generally made of copper, somewhat resemble a large or deep washing-tub, with the sides perforated all over with holes about the size of those in a common cullender. The goods to be dried are placed in this machine, which is then made to revolve with great rapidity, causing the contents to fly to the sides, against which they are pressed by the centrifugal force, and the moisture they contain is thus sent off through the holes, leaving the cotton or whatever it may be in a few seconds nearly dry.

**THE IRON TRADE.**—The men in Stourbridge district, instead of wanting work, have now more than they are inclined to execute. This and similar cases are the result of the improved condition of the iron trade, in every branch of which, with the exception of nailing, the greatest activity prevails: employment is plentiful, the men are getting better wages, and, consequently, many of them are disposed to do less work. We believe there is not an iron work in this district now standing; and the price of iron, of almost every description, has advanced since the last quarter-day, and has still a tendency upwards.—*Worcester paper*.

**NEW COLLEGE AT GLASGOW.**—Nineteen individuals, ten of whom are resident in Glasgow, have subscribed towards the building of the projected college, in connection with the Free church, the sum of 19,000*l*.

**THE TOPOSCOPE, A NEW INSTRUMENT TO DETERMINE DURING THE NIGHT THE TRUE POSITION OF A FIRE.**—A curious instrument, the invention of M. Schwilgine (the mechanist of the far-famed clock of Strasburg Cathedral), is about to be established on the platform of the same edifice; its object being to determine, during the night, the true position of lighted objects in the distance, false impressions on the subject being often of disastrous effect, as, for example, in the case of conflagration. The apparatus in question, to which the inventor has given the name of *toposcope*, is composed, according to the description, of two graduated circles, with subdivisions marked by an infinity of numbers. These circles, by their rotary movement in inverse directions, furnish a multitude of numerical combinations. A telescope, moving with the upper circle, is fitted to the apparatus; and, on directing this to the place of the disaster, the instrument itself furnishes, in measured numbers, its distance from Strasburg Cathedral.

**ST. JAMES'S PALACE.**—To increase the accommodation requisite on state occasions, and to complete the suite of apartments appropriated to drawing-rooms and levees, the Queen has been pleased to give instructions to the Office of Works, and workmen are now busily occupied in the embellishment and restoration of two more of the state rooms at this ancient palace. The first is situate at the top of the grand staircase, and was formerly called "Queen Charlotte's Guard-room;" the windows of this apartment look into the Colonnade. The other is a spacious noble saloon, looking into the Ambassadors' Court, and was anciently called the Ball-room. It was most magnificently fitted up by George IV., in the style of Louis Quatorze, as a gorgeous Banqueting-room. When finished the state-rooms at St. James's Palace will be the most complete in Europe, and he at all times ready for every ceremonial which the Queen may be called on to give in support of the honour and dignity of the British throne.

**GIOVANNI BATTISTA, THE ARCHITECT AND MONK.**—The celebrated monk of Mount Carmel, Giovanni Battista, has arrived in Berlin, in order to raise a fund for enlarging his establishment, which is similar to the one on Great St. Bernard. This individual, who was originally an architect, obtained many years ago the permission of the Sultan Mahmud to rebuild the monastery which the Turks had destroyed, for fear it should be turned into a fortress by the French. Having obtained this permission, Battista made twelve journeys throughout Europe, in order to collect the necessary funds for reconstructing the convent. He is now in his 60th year. He intends to add an hospital to the charitable asylum.

**GRIMSBY NEW DOCK.**—A public meeting of the Grimsby Dock Company was held, pursuant to notice, at the Queen's Head Inn, in Grimsby, on the 24th ult., to receive the plan and report of J. M. Rendel, Esq., the engineer of the intended new railway dock and works at this port, the Right Hon. C. T. D'Eyncourt in the chair. The plan was unanimously adopted by the meeting. To meet the expenditure in completing these works and other purposes, a capital of 320,000*l.* is proposed, and the dock company has agreed to raise the same by shares of 100*l.* each.

**TAX ON AIR, LIGHT, AND PRESENCE.**—A hundred years hence it will perhaps be scarcely believed that a government existed in the nineteenth century which prevented, by taxation, the light of heaven from entering our dwellings, and the free air from ventilating and cleansing them; and which also prohibited, by impost, the possessors of property from insuring it against destruction by fire.—*Edinburgh Review* for October, 1844.

**SOFTENING OF WATER FOR DOMESTIC USE.**—It is calculated that the softening of the London water for domestic use by the precipitation of its lime would effect a saving of 200,000*l.* a year in soap alone.

**NEW HOSPITAL FOR CONSUMPTION AT BROMPTON.**—These works are proceeding rapidly; and it is expected that, in a few months, the western wing will be roofed in, and the interior ready to receive patients.

**NEW EXETER CHANGE.**—This building is now complete, and thrown open to the public. It is lighted by the bude light.

**QUEEN ELIZABETH'S HOSPITAL, BRISTOL.**—The new school-building belonging to this charity is, or rather will be, for it is but just commenced, another edifice somewhat similar to the Bristol Guildhall in regard to its style of architecture, but of very different character, far less ornate—indeed, rather plain—but very far more extensive, since the total length of its front will be 400 feet. Its site is a sloping field of about four acres, on the side of Brandon-hill, between Bristol and Clifton; and the building will stand about twenty-eight feet above the level of the road, raised upon a terrace extending along the main front, and to which there will be an ascent by a flight of forty steps in the centre. The architects employed are Messrs. Foster and Son, of Bristol.—*Companion to the Almanack.*

**THE CARTOONS IN DANGER.**—A correspondent of the *Times* sounds a note of warning respecting the risk to which the cartoons are exposed, which cannot be too soon attended to. The buildings in which such treasures of art are preserved should be placed beyond the chance or the possibility of fire.—"Some days since, a person passing through the gallery in which they are placed observed a dense smoke to pervade the apartment, proceeding apparently from the wainscotted partition behind the cartoons. An alarm was given, the wainscot was torn down, and it was discovered that a beam in the wall, communicating with the flue of a copper chimney, was, if not in a state of flame, so much ignited as to have endangered the Palace, if it had not been discovered in that opportune manner.

**CONSTRUCTION OF ICE-HOUSES.**—Ice has become a great article of export in America. 60,000 tons are annually sent from Boston to southern parts, the East and West Indies, &c. The ice-houses near the lakes and ponds are immense wooden buildings, holding 10,000 to 20,000 tons each; some of them, indeed, cover half an acre of ground. They are built with double walls—that is, with an inner wall round, two feet from the outer one; and the space between is filled with sawdust—a non-conductor, making a solid wall, impervious to heat and air, and of 10 feet in thickness.—*Madras Athenæum.*

**NEW SCHOOLS AT DUNKINFIELD.**—These schools are rapidly approaching towards a state of completion. The style of architecture chosen by the architect, Mr. Sheppard, of Manchester, is the Tudor English. The schools are being built partly from funds granted by the National Society and the Board of Privy Council, and partly by donations raised by the late incumbent, the Rev. Joseph Taylor. They are calculated to contain upwards of 600 children, and there is a house erected for the master and mistress.

**NEW THEATRE AT MANCHESTER.**—The corner stone of the Theatre Royal, Manchester, was laid on Monday last, by Mr. John Knowles, the proprietor, and holder of the letters patent.

### TENDERS.

TENDERS delivered Dec. 7, 1844, for building a Public-house, to be called the Three Tuns, in New-street, Fetter-lane, for Messrs. Meux and Co., brewers. The quantities were delivered to each contractor.—Samuel Beazley, Esq., Architect.

Mr. Nicholls .....	£1,687
Mr. Brown .....	1,650
Mr. Wisland .....	1,517
Mr. Unwin .....	1,520
Mr. Reynolds .....	1,500
Mr. Williams .....	1,497
Mr. Gerry .....	1,433
Mr. Soden .....	1,410
Mr. Parkyn .....	1,387
Mr. Bodger .....	1,284

The above were not opened in the contractors' presence; and Mr. Bodger's tender was accepted.

TENDERS delivered Dec. 6, 1844, for the erection of Dwelling-houses, situated at Star-corner, Bermondsey, for G. Drew, Esq.—G. Porter, Esq., Architect.

Messrs. Locke and Nesham .....	£3,530
Mr. Wilson .....	3,494
Mr. Wisland .....	2,486
Mr. Bant .....	3,339
Messrs. B. and D. Young .....	3,396
Mr. Gerry .....	3,386
Mr. Jay .....	3,312

### NOTICES OF CONTRACTS.

For 1,200 Tons of Wrought-iron Rails.—George King, 62, Moorgate-street. Dec. 16.

For Building the proposed Lock-up Cells and Turnkey's Residence, at Wooden Box, Harthorn, Derbyshire.—John Mason, County Surveyor; or Mr. Dewes, Solicitor, Ashby-de-la-Zouch. December 17.

For the performance of the following works in Harwich Harbour and the neighbouring Coast from January 1, 1845, to December 31, 1847. Carpenters, Masons, Bricklayers, Plasterers, Slaters, Plumbers, Painters, Glaziers, and Smiths.—The Commanding Royal Engineer, Harwich. December 17. For the performance of the like works, with the addition of Paviers, and for the like period, in the Ipswich Station.—Same address and date as above.

For the supply of about 20,000 one year old Wood, to be Ash, Hazel, Oak, or Hornbeam.—Messrs. Dawson and Son, 74, Cannon-street.

For performing the Carpenter's, Bricklayer's, Plumber's, Painters', Glaziers', and Slaters' Works at the St. Marylebone Workhouse for the year ensuing.—Thomas Thorne, at the Workhouse. Dec. 18.

For the several works required in the erection and completion of two Wings to the New Gaol, Leeds; Residence for Schoolmasters and Matrons; Entrance Building and Chapel; Out Offices; and Court Walls.—Messrs. Parkin and Backhouse, Architects, 10, Albion-street, Leeds. Dec. 18.

For the erection of a Church at Eccleshill, near Bradford, Yorkshire.—Mr. Rawthorne, Architect, North-parade, Bradford. Dec. 19.

For the construction of Locomotive Engines and Tenders for the Manchester, Bury, and Rosendale Railway.—Mr. C. E. Cawley, Engineer, Railway Office, Bury.—December 21.

For the supply of First, Second, and Third-class Carriages to the Manchester, Bury, and Rosendale Railway.—James Smithells, Secretary, Railway Office, Bury.—December 21.

For the supply of 6,000 tons of Iron Rails, each rail to be 16 feet in length, and weighing 65 lb. per yard.—H. Parker, Secretary to the Great North of England Railway Company, Darlington. Dec. 23.

For making a Sewer in the Town of Cambridge, to be cylindrical and 2 feet diameter in the clear, length about 385 yards, average depth about 9 feet.—Frederick Randall, Clerk to the Commissioners, Cambridge. Dec. 26.

For the execution of Works necessary for the completion of the whole of the Railway from Shoreham to Chichester, being a distance of about 22½ miles.—Frederick Otley, Secretary, Brighton and Chichester Railway Office, 4, Dean-street, Tooley-street. December 31.

For the erection of an Organ in the City Hall of Glasgow, cost not to exceed 1,500*l.*—Mr. G. W. Muir, Glasgow. January 1.

For Four Locomotive Engines and Tenders.—George King, 62, Moorgate-street, January 8.

For a Survey Plan and Valuation of the Township of Knaresborough, in Rotherham Yorkshire.—Mr. George Taylor or Mr. Richard Rhodes, Overseers of the Poor. January 8.

For completing the Railway from Bishopstoke to Salisbury.—Alfred Morgan, Secretary, Nine Elms Station, Vauxhall. January 10.

For the supply of 11,000 feet of nine-inch cast-iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolari, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31, 1845.

### COMPETITIONS.

The Committee of the Association recently formed in the Metropolis for the Construction of Baths and Wash-houses for the Labouring Classes, are desirous of obtaining Plans and Estimates for the Erection and Fitting-up of the First Establishment. The general basis of the plan can be seen at the Office, No. 3, Crosby-square. The author of the plan considered the best by the Committee will be selected to execute the work.

Plans for an Agricultural College to be erected at Cirencester, to accommodate 200 pupils and 6 tutors. The style is left to the taste of the architect. A Premium of 10 Guineas to the author of the most approved plan.—Robert J. Brown, Esq., Hon. Sec. Cirencester. January 1.

Plans and estimates are required for a Pauper Lunatic Asylum for the County of Somerset; the building to accommodate 300 patients, and to contain two Stories. The Committee of Visiting Magistrates wish it to be of a plain, cheerful character, but will not further fetter the architect by suggesting any particular arrangement as to the interior, its ventilation, warming, or otherwise. The ground selected contains 36 acres.—The Clerk of the Peace, Taunton. A Premium of 100*l.* will be adjudged for the best plan, and 50*l.* for the next best.

# The Builder.

No. XXVIII.

SATURDAY, DECEMBER 21, 1844.

**M**AVING discussed at some length the more minute beauties of London and its environs, we must now make a few observations relative to those mansion-houses which anciently did, and, in some cases, still form such conspicuous suburban objects. These are each generally designated, in the writings by which they are held or are underlet, as "the capital mansion-house," and capital mansion-houses most of them were. In these, red brickwork forms a constituent part; they are replete with

carvings, both within and without; around their eaves is mostly to be found a curved oaken Corinthian modillion cornice, which, while many stone edifices of the neighbourhood have gone to decay, still remains sound, having escaped rot and fire. The fronts of such mansion-houses usually contain quaint carvings in brickwork, stone, or wood, and frequently all those materials combined. There are many fine specimens of window-dressings still extant, to be found amid this description of buildings; their doorways were almost invariably beautiful, and sometimes their chimneys were magnificent. Such mansions usually contained court-yards, or at least halls paved with marble, with such excellence of workmanship as to be discoverable except from diversity of colour; and around their courts frequently exist covered colonnades. Floors of marquetry, superbly carved chimney-pieces, curious rich plastering, and carved doors and window shutters formed some of their most prominent features. Most of these houses were built by the rich merchants of London between the early parts respectively of the reigns of Charles II. and George II.; after then, house architecture grew more formal, and exhibiting less invention, it gradually lost its carvings. The doorways and windows were generally mere copies from one and the same source, and becoming, as it was termed, more regular, they ceased to be so interesting. Perhaps more than half this description of fine dwellings have ceased to be occupied by the class that built them, and are now occupied, at moderate rents, as schools and private lunatic asylums. All the outskirts and villages of London, in fact all the towns of England, contain many such houses, and they are to be found in all the places where fine doorways are to be met with; they generally had lofty apartments and an unnecessary abundance of window-shutters; not unfrequently one superb staircase of oak or mahogany; and where they were grouped architecturally with their office-buildings, often presented a splendid appearance. This class of mansions has given way to the modern plain villa, with its roof decorated with zinc gutters, and its chimneys

with zinc tubes. Waltham-stow, Enfield, Camberwell, and Greenwich contain fine specimens. The magnificent pride of the iron-work, wrought and beaten into the forms of leaves, flowers, and armorial charges and cyphers, in the gates leading up to these mansions is incomparable; in fact, the execution of the patterns of such ancient iron-work would be a good undertaking. Where such mansions still remain, we think they should be carefully upheld, and if any slight alterations should be required to suit them to modern ideas of comfort, such might be effected without direct mutilation. But we think something like this description of building ought to be restored, the principal prominent materials of which might be of white brick, stone, and red brick; those unaccounted to the endeavour, know not what can be produced in brickwork alone.

b.

## ELECTION OF SURVEYOR TO THE DISTRICT OF ROTHERMITHE AND HATCHAM.

(December 16, 1844.)

	No. of Votes.
Elected—George Allen	27
Henry Clutton	16

## THE LATE ACCIDENTS AT OLDIHAM AND NORTBLEACH.

THE Queen has been pleased to appoint Sir Henry Thomas De la Beche, Knt., and Thomas Cubitt, Esq., to be her Majesty's Commissioners for inquiring into the causes of the falling of a cotton mill, at Oldham, and as to the failure of part of the prison at Northleach.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary general meeting of the season was held on Monday evening last, Mr. Papworth in the chair. Several valuable donations were announced to have been received, and were laid on the table. James Walker, Esq., F.R.S., was elected an honorary member of the institute, and Mr. John Whitehead, jun., of Maidstone, was elected an associate.

A model and drawings were exhibited illustrative of the removal of the lighthouse at Sunderland, by Mr. Murray; and an abstract of a paper that had been presented to the Institution of Civil Engineers on the subject was read by one of the honorary secretaries. This extraordinary work was undertaken in consequence of the necessity that arose for lengthening the pier. A wooden cradle was fixed underneath the building, which weighs three hundred and thirty tons, and it was then moved on a temporary wooden railway a distance of seven hundred and seventy feet. The work was the more difficult in consequence of an angle round which the lighthouse had to be moved, and it had to be elevated nearly two feet above the level it previously occupied. The far greater part of the distance was accomplished in thirteen hours, after all the preparations had been completed. The lighthouse did not deviate in the least from the perpendicular during the removal, and the gas lights were kept burning all the time. The thanks of the meeting were voted to Charles Manby, Esq., secretary to the Institution of Civil Engineers, for communicating the abstract, and sending the models and drawings.

A very interesting paper, describing some remarkable tombs in the Valley of Jehoshaphat, near Jerusalem, was read by Mr. J. I. Scoles. The tombs more particularly noticed were the pillar of Absalom and the tomb of Zechariah. The latter is cut entirely out of the solid rock. It consists of a square base, decorated with Ionic columns, and has a pyramid on the top. The whole mass is supposed to be solid; it is the height of the surrounding rock from which it has been excavated, and is separated from it by a space of ten feet. The pillar of Absalom is near to the tomb, and is also partially cut out of the rock, but on the solid square base there is erected a conical cup, the interior of which is hollow. Near to these ancient monuments is the cemetery within which the apostles are supposed to have retired during Christ's agony on the mount. Absalom's pillar and Zechariah's tomb have

given rise to much speculation respecting the periods of their erection. Some travellers have ascribed them to the periods in which the individuals whose names they bear lived, but Mr. Scoles is of opinion that they are of much more recent date, and from the mixed styles of architecture they exhibit, he conceives them to have been constructed by the Romans about the time of Augustus: being situated in the deep valley of Jehoshaphat, that they have escaped destruction during the many sieges Jerusalem has endured. At the entrance of the cemetery there are four columns, and the interior consists of many chambers excavated in the rock. The paper was received with much applause, and the thanks of the meeting were cordially given to Mr. Scoles for his description of these interesting monuments. The meeting then adjourned till the 13th of January.

## ROYAL ACADEMY OF ARTS.

ON Tuesday, the 10th inst., being the seventy-sixth anniversary of the foundation of the Royal Academy of Arts, a general assembly of the Academicians was held at their apartments in Trafalgar-square, when the following among numerous other premiums were awarded:—

To Mr. George Low, for the best drawings of the Church of St. Mary, Woolnoth, the silver medal.

To Mr. William Wood Deane, for the next best drawings of the Church of St. Mary, Woolnoth, the silver medal.

Sir M. A. Shea, the President, complimented the students generally, on the ability and diligence displayed; such indeed was the merit of the copies in painting and in architectural drawing, that two medals instead of one had been awarded in each class; but he regretted to add that in the other classes a proper zeal had not been manifested.

## BUILDING SOCIETIES.

### LETTER III.

BY WILLOUGHBY WILTON.

To begin, where we left off in our last letter, with the "First Annual Report of the London and Westminster Provident Association and Savings' Fund," in order not to mislead our readers, or be misled by DATA, we shall again repeat the synopsis of this report, on which it is our purpose to discourse.

"The number of members who have joined the association since its establishment amounts to 315, amongst whom, 820½ shares have been subscribed for; from the above, 32 shares have become forfeited, and 56½ shares have been transferred, by which the number of members have been reduced by 43, leaving the association at present to consist of 272 members, holding 788½ shares."

From this it appears that some members have forfeited their shares; or, in other words, whatever moneys they might have paid thereon. These unfortunate speculators would not have lost their money had it been deposited in a Savings' Bank: but on the contrary would have received it back with interest after the rate of more than 3½ per cent. per annum: for at the time this society published its report, the interest on deposits in the Savings' Banks had not been reduced by the Legislature. However, such is the force of circumstances upon improvident or misdirected members of your building societies.

Again, "56½ shares have been transferred," which shows either the inability of the members holding them to continue their subscriptions, or an acquisition of good sense which had dictated a wiser course of proceeding, and some more profitable and safer channel of investment. Perhaps they had learned to follow the precept, "Thou shalt not follow a multitude to do evil." Exodus xxiii., 2.

There lies no mean between these hypothetical inferences: either may be right, both will scarcely be wrong.

But, still, with a reduction of 43 members, the association consisted of 272 members holding 788½ shares, or 2.88½ shares a piece at the time the report was promulgated.

"Up to the present time 102½ shares have been advanced to members upon mortgage,

the average bonus for such advance being 63l. 0s. 10d. per share, and the amount of capital paid off 12,270l.—in addition to which there are 20½ shares agreed to be advanced, which will secure a bonus of 1,282l. 15s.; the number of shares, therefore, at present to be provided for, is thus reduced to 686½. As this number annually decreases, so the association will approach nearer to its dissolution; the directors therefore urge the members to assist them in obtaining this desired end as soon as possible, and with that view, they strongly recommend those who are desirous of purchasing their own residences, or other property for investment, to have their shares advanced to them during the early stages of the association."

This paragraph merits serious consideration, as from the very beginning of the institution, "102½ shares have been advanced to members upon mortgage, the average bonus for each advance being 63l. 0s. 10d. per share, and the amount of capital paid off 12,270l."

The reader will observe here the slow progress made by the directors in getting poor men to take up their shares; for while the "subscribing" for shares of 120l. each, gives a "holding" to members, provided 10s. a month be paid, the cautious,

"Holding out to tire the others down,"

become gainers in these 102½ shares to the extraordinary amount of 6,446l. which is prudently added to 5,824l., which the man, ambitious of house-property, further contributes to make the amount of capital paid off 12,270l.; that is to say, 102½ multiplied by 120l. In other language, the parties who have taken up these 102½ shares upon mortgage, have covenanted to discharge a debt of 12,270l., by monthly instalments, which the directors improve at compound interest, and which, after all the explanations of these offered in our second letter, we shall not again enter upon. A debt, more than one-half of which they have wildly sacrificed for the empty boast of being "owners of property," which, after all is not yet theirs, and in this "untoward" age may never be theirs, nor their children's either, as we have pointed out in our former letters.

We desire we may not be misunderstood, as if we reasoned to dissuade men from labouring with all their might to acquire wealth. We beseech all men to work hard, to live economically, to provide for their families, to gain a good name in life, and bequeath an honourable reputation to their posterity. We entreat the poor man—no, he is not poor—he is rich in independent power who is the man we mean—the mechanic, the artisan, the day labourer, the man who is some hours afoot before December's sun gilds the morn, and who toils for hours after his glorious beams have tinged the western seas to salute the New World with another day—this is the man whom we endeavour to persuade that he can gain nothing from becoming the associate of the wealthier members of these building societies. Let him hear our oracle—the "Report" itself of "The London and Westminster Provident Association and Savings' Fund."

"The success that has attended the association up to the present time, arising from the number of shares that have been taken up, induced the directors, at their last meeting, to fix a proportionate premium upon all new shares subscribed for after that period; so that members now joining the association, or requiring an additional number of shares, will have to pay an entrance-fee of 7l. per share, excepting those parties who take up their shares, to whom an entrance-fee of only 1l. 10s. per share will be charged."

From this let him "read, mark, learn, and inwardly digest" what we say. But in making this honest and conscientious appeal to aspirants after house-property, we have well nigh forgotten what the previous quotation from the report saith:—"In addition to which there are 20½ shares agreed to be advanced, which will secure a bonus of 1,282l. 15s., shewing that these shares yielded each a bonus of 62l. 11s. 6d. nearly." Here again we trace the monomania of house-property. The parties who have been indulged covenant to pay 2,460l. for 20½ shares of 120l., of which 1,282l. 15s. is a bonus, and

1,177l. 5s. may be considered the ashes of the holocaust!

What is the meaning of these next words, "therefore, at present, the number of shares to be provided for is thus reduced to 686½?" Is it meant that this huge mass is to be advanced to members upon mortgage, at the awful sacrifice of 63l. or 62l. per share? We pause for a reply. As there is no fixed number by which the series is to decrease till the last share shall vanish, no man can tell when "the association will approach nearer to its dissolution," though it requires no conjurer to divine how "its dissolution" may be brought about. The directors had need, therefore, to urge the members to assist them in obtaining this desired end as soon as possible, lest "both should grow together until the harvest," when that stern reaper, Time, shall put in his scythe, and mow them down.

The last quotation we made from the report is very rich. 102½ shares have been taken up, and elated with this success, the directors require "an entrance fee of 7l. per share from members now joining the association." This is rather a *bull*—*uay*, it is one—for the man desirous of "holding" a share is a *member* before he joins the association, and he will enjoy the felicity of companionship on agreeing to pay 127l. for a share; or, if he takes up a share, of giving the monied men 64l. 10s. 10d. of a bonus. Truly this is playing at rich and poor with a vengeance.

But to return to the calculation; let us suppose a man takes four shares of 120l. each, then the amount stands thus:—

£120 × 4 = £480 Amount of shares.  
63 × 4 = 252 Do. of bonus.

Sum received by the borrower } £228  
to be paid off in ten years at 4 per cent. per annum.

If we take the man's loss of time, the contingency of fines and office expenses, we may consider the society gets full 5 per cent. in the improvement of its capital. The amount is simply 22l. 10s., to be repaid yearly by monthly instalments; and also 9l. 2s. 6d. of interest on the sum of 228l. borrowed. This makes a monthly contribution

Borrowed money paid off .. £1 18 0  
Interest on sum borrowed .. 0 15 6

2 13 6

or annually the sum of 31l. 18s. 5d. The man pays for 120 months 2l. 13s. 6d., which the directors improve at 5 per cent. compound interest, and make 404l. 14s. 4d. out of it, thus gaining 176l. 14s. 4d. out of the original sum of 228l.

But take 102½ shares at 120l. = 12,270l., from which deduct bonus, = 6,446l., and divide these 5,824l. by 120, the number of months within which this sum must be repaid, adding thereto the annual interest of 4l. per cent., amounting to 232l. 10s. 5d., or in round numbers 233l.; then we have a monthly annuity for 10 years of 50l. 9s. 6d., or of 603l. 14s. a year.

This sum improved at compound interest as a monthly annuity of 50l. 9s. 6d. would in ten years amount to the sum of 7,679l. 14s. 6d.; to this add the bonus, 6,446l., without improvement, and we have 14,125l. But improve the bonus at 4 per cent. only, and we have the sum of 9,541l. 13s., which, added to the improved monthly annuity, gives the sum of 17,221l. 7s. 8d., being about a gain of 11,397l. on 102½ shares.

We have taken no account of the ground-rent and repairs, which must be paid yearly; but take these on a house purchased for 228l. at 5l. per annum, and the poor man would have to pay 36l. 18s. 5d. for 10 years; that is to say 3l. 1s. 10d. monthly; which in 120 months the directors would improve at 5 per cent. compound interest and make 458l., thus gaining the sum of 230l. on a transaction which originally cost them 228l. as the sum lent to the poor man.

Sufficient is here shewn to satisfy any unprejudiced mind that the *legislature* has been grossly misled in sanctioning the proceedings of these building societies.

The ancient Mexican physicians had a peculiar mode of curing diseases: they had conical hovels built, in which they sweated their patients to exude the virus by the pores of the

skin. Few people among us voluntarily take physic; probably few of the Mexicans crept into the sweating hovel of the doctors out of sheer amateurism; and *mutatis mutandis*, it doth appear that few of the members holding shares in the "London and Westminster Provident Association and Savings' Fund" covet the sweating chambers of the *capitalists*, or *pretended* capitalists, in this little stock exchange jobbing concern. God grant, men say to him with the Psalmist, "my times are in thy hands," and thus enjoying a healthier tone of mind, they may trust rather to the good will of Heaven, the resources of honourable industry, and the wise security of other modes of investing their savings, than in an association wherein it is manifest that the benefits lay all on one side.

With these remarks we close our present letter; but shall add as a postscript a note that has been sent to the editor on our first letter. Had we worked out the problem on Mr. Short's data, the unfortunate speculator would have been in a much worse predicament than the society actually blazoned him in.

"SIR,—Mr. Wilton, in his first letter on the building societies, forms his calculation on the supposition that the borrowers can obtain 70l. on each share, which is an error in practice. The shares being put up to competition, they are frequently sold for a much less sum, and perhaps the average would be more correctly stated at 55l., so that the profits of the capitalists will be considerably more than shewn in his statement. If 500l. is borrowed on this basis of the building societies, the calculation will be as follows:—9 shares at 55l. per share will produce 495l., nearly the sum required, for which will be paid—

"9 shares, at 10s. per share per month ..... £4 10 0  
Interest 4s. per share ditto ..... 1 16 0

Total monthly payment ..... 6 6 0  
Multiplied by ..... 12

Making yearly payment to society 75 12 0  
10

Total amount to be paid to the society for 495l. .... £756 0 0

"If we borrow 500l. of a private individual, the calculation will amount to the following:—

500l. at 5l. per cent. per annum interest is .. £25 0 0 } per annum interest is .. }  
And to pay off the capital in ten years .. £50 0 0 ditto.

75 0 0  
Multiplied by 10 years ..... 10

A trifle in favour of this plan ..... £750 0 0

"And as the building societies will not close their accounts until each share has produced the 120l., instead of ten it may be twelve or thirteen years, which of course will add much to the borrower's expenses, as they would have to continue their subscriptions and interest up to that time.

"With regard to the plan of borrowing of a private individual, there is no risk, besides the advantages of paying 5l. per quarter interest, requiring only six attendances instead of twelve, no fines; also the 50l. per annum to be saved for paying the principal, might be employed beneficially, or at least put out, with some of the banking companies, as a permanent deposit, and produce 2 per cent., which would pay the expenses of the mortgage deeds.

Your most obedient servant,  
"W. J. SHORT.

2, Spring-terrace, Lambeth.

We must observe on Mr. Short's letter, that if the man pays 75l. 12s. a year by monthly instalments of 6l. 6s., he will, as the directors improve his contributions at 5 per cent. per annum, by the conversion monthly of his unites into capital, have contributed in ten years the sum of 958l. 10s. 10d., being 202l. 10s. 10d. more than Mr. Short's figures come to, to the transaction between the borrower of 500l. from this building society and its wary directors.

The transaction as between the private individual and the borrower is simply an annuity of 75l., which would at 5 per cent.

amount to 943l. 6s. 9d., being improved at compound interest.

But we have done for the present with this London and Westminster Building Society. We shall review its operations more in detail in conjunction with some others which greatly resemble the small loan societies, of which we shall have occasion to say something to our readers, among the class of borrowers; and we trust our remarks shall work on their consciences, as regards their families, like a well-digested homily.

THE WINDOW-TAX, OR DUTIES ON LIGHT AND VENTILATION.

(Continued from page 615.)

The author of a philosophical work of somewhat rare merit,\* in dwelling upon the influence of light upon animal formations, remarks that—

"Some poor people having taken up their abode in the cells under the fortifications of Lisle, the proportion of defective infants produced by them became so great, that it was deemed necessary to issue an order commanding these cells to be shut up."

Here in England we think it no evil to turn living rooms above ground into dark cells, by our fiscal enactments. In the crowded lodging-houses of the poor there is not a dark closet that does not contain a bed; and there would be no dark closets, where they adjoin an external wall, but for the window-duties.

It is much to be regretted that both the public and the government, in the days of the Reform Ministry, were so ill-informed upon the subject discussed, that when Lord Althorp was Chancellor of the Exchequer, the repeal of the house-tax was preferred to that of the window-duties. The repeal of both taxes, however, was called for; and the government of the day, not being wholly insensible to the injurious operation of the latter, a pledge was given to remove the evils complained of in the case of all houses then built, and a bill (the 4th & 5th of Wm. IV. c. 54) was actually introduced and passed to carry out the object.

This pledge has been broken, and the clear unmistakable intention of Lord Althorp's act has been deliberately evaded for the sake of revenue. A brief reference to the discussions which preceded the Act, and its subsequent history, will show that we do not make this statement without foundation.

Thursday, July 17, 1834.

"Mr. Hume.—I hope there is no occasion to remind the noble lord the Chancellor of the Exchequer of the pledge he gave us some time ago relative to the tax on windows. I am quite sure that the noble lord is desirous of rendering it as little oppressive as possible, and that if he cannot reduce its amount now, he will endeavour to do so next session. If the noble lord would limit the tax to its present amount, and allow every man who has paid the window rate for an entire year to continue to pay the same composition and to open additional windows, it would be a very great relief. It is not at all uncommon in old-fashioned houses which contain a greater number of windows than modern buildings, to see many windows blocked up for the purpose of avoiding the tax. If the noble lord would redeem his pledge, he would confer a very great boon upon those parties."†

In reply, Lord Althorp stated that he did not remember having given any distinct pledge on the subject, but that he should be prepared to discuss the question when the Bill was in committee.

The House resolved itself into committee the following week, Wednesday, July 30, when Lord Althorp rose and said—

"I have now to beg leave to bring up a clause which was suggested to me by the hon. member for Oxford, enabling persons to open fresh windows in houses at present existing without any additional charge. As I apprehend there will be no objection to the clause, it will be unnecessary for me to trouble the committee with any observations upon it. I will, therefore, only say that it cannot occasion any loss to the revenue; its only effect is to prevent an increase of the revenue in the case of houses already existing."‡

We direct the attention of the reader to the words in italics, because one means by which the Commissioners of Stamps and Taxes have evaded the Act has been by constraining it to refer not to houses then existing, but to then existing occupiers. So that in every case where an occupier of 1835 has opened additional windows under the 4th & 5th Wm. 4, c. 54, and then removed to another residence, the commissioners have caused the new occupier to be surcharged for all the additional windows; and this Mr. Goulburn (who had not referred to the precise terms of Lord Althorp's speech, explained, to the deputation of May last, was both the meaning of the law and its design.

"Lord Althorp's words were, 'its effect will be to prevent an increase of the revenue in the case of houses already existing.' What effect upon the revenue has really been produced?"

Produce of the window-duties for the years ending

	£	s.	d.
April 5, 1835	1,177,656	8	9
April 5, 1842	1,613,774	1	0

A large portion of this increase is of course occasioned by the new houses erected since 1835, but the full amount of the difference is not to be thus explained. The increased produce of the window-duties, it will be seen, is in the proportion of nearly two-fifths within seven years; but the population returns show that the increased number of houses within a period of ten years, including the fourth-rate tenements which pay no window-duty, is only in the proportion of less than one-fifth, leaving a sum of at least 200,000l. per annum to be accounted for by the rigid assessments of late enforced; assessments more severe, vexatious, and exacting than have ever been known since the window-duties were placed upon the statute-book.†

Prior to 1835 the duty of assessment had been somewhat negligently performed, and perhaps there were few persons in the country charged to the full amount of window-duty for which they were liable. This, be it observed, was not the fault of the public, if fault it were, but of the government of the day. The occupiers of houses do not assess themselves to the window-duty; no returns are left with them to be filled up with the number of chargeable windows, as in the case of other branches of the assessed taxes. Indeed, not one person in a thousand is at this moment aware for what number of windows he is really liable, shop-windows, dairy-windows, and some others being exempt; and there being more than a dozen Acts relating to the subject.‡ The assessor is a government officer, whose duty it is to count the windows of every house, and charge accordingly.

It is important to note this fact, to estimate correctly the value of state morality when it gets entangled in a question of finance.

By accident, or more probably by the sinister design of some underling,—a design to which Lord Althorp could not have been a party,—the words *duly assessed* were introduced into the 4th & 5th William IV., chap. 51. Clause 7 provides that additional windows may be opened free of duty "by every person who is or shall be *duly assessed* for the year ending 5th of April, 1835." Without suspecting the interpretation that would be put upon these words, many thousand persons in all parts of the country set about improving the comfort and healthfulness of their habitations by opening additional windows; and what then did the government? A time had come when the treasury was empty; ministers were perplexed about ways and means; "the prince of the power of the air" flew from Somerset House to Downing-street, and whispered into their ears this advice:—"A vast number of silly people have put themselves in your power by a blind credulity in the faith of an Act of Parliament. None of these persons were *duly assessed* in 1835; the mistake was your own, but you may profit by it; take their money."§

The advice was followed. In the history of modern governments we

have never met with a parallel case to this gross violation of the spirit of an unrephealed act of legislation. The people of Pennsylvania have renounced repudiation; shame at last has reached them; but British statesmen have adopted the principle and yet defend it.

Every person, without a single exception, who opened additional windows upon the faith of Lord Althorp's Act, was surcharged for the increased number, some on one pretence, some on another; this being a very common ground of surcharge, that former window openings had been stopped up with lath and plaster, and not with brick, as required by the law.\* The case was brought before the judges in innumerable shapes, but in vain. The judges ruled in favour of the injustice, deciding that whatever might be a fair and reasonable excuse for a wrong assessment, the words of the Act "*duly assessed*" were imperative.

The Act was loosely and carelessly worded; but what is said in private life of the honour of a tradesman who, in making out a bill of charges, allows himself to take advantage of clerical errors in his own favour, instead of hastening to correct them?

That the errors in this case have not been rectified, and public faith kept, is not, of course, the fault of Lord Althorp, he has retired from public life; but the present Earl Spencer is fully aware that no man is at liberty entirely to renounce responsibilities he has once assumed. Earl Spencer pledged the faith of government on the window-duties, and to Earl Spencer the public may not unreasonably look for some explanation of the sense in which that pledge was given; or less unreasonably from the fact that whatever blame the public or the present ministry may seek to throw upon the Chairman of Stamps and Taxes, as a wrong interpreter of the Act, or an unsafe adviser, the appointment of that gentleman originated with his lordship, and not with any member of the cabinet of Sir Robert Peel.

The revenue derived from the window-duties we do not desire to see wholly abolished. The burden falls upon the owners of houses property, and would be borne without a murmur if imposed in a less objectionable form. To remedy the late injustice committed, we would reduce assessments to the standard of 1835, and collect them (as was proposed) in the shape of a modified house-tax, or of the present *occupancy* tax, which might be increased for the purpose, and which is, in part, but the old house-tax under a new name.

We submit the case as one of grave interest in itself, and as belonging to a large question of sanitary improvement which we had proposed to discuss, but the apparent hopelessness of the task has induced us, for the present, to relinquish its further prosecution. Of what avail has been all the recent agitation upon the subject of cemeteries, drainage, abundant supplies of water, or upon a really efficient plan of medical reform? A few laborious investigators, to whom posterity will decree statues, have shewn how the annual mortality of the population may be diminished and the physical enjoyment of life increased by the most simple and economical arrangements, and they address a government beset with the ignorant, the doubting, and the mercenary, who exclaim at every step of contemplated progress, "There is a lion in the path!" and who see no moral turpitude in a measure which, from mere indolence or incapacity, robs their fellow-creatures of the pure air of heaven, and the light of the sun.

ARTIFICIAL MARBLE.—A large factory is about to be established in Berlin for manufacturing from plaster of Paris and solutions of alum, a species of composition said to be equal to the finest marble.

\* One of these surcharge papers is now lying before us, dated 28th October, 1811, and its printed form, as issued from Somerset House, will prove the fact to which we have adverted,—that the public have nothing to do with their own assessment to the window-duties, and practically, therefore, could but rarely be acquainted with the fact, whether they were or were not "*duly assessed*." The printed words over the money column are these:—

Amount of Charge, being the Sum you would have been liable to (for the Windows hereby charged) if the Assessor had *duly assessed* you.

 † One contrivance is to get rid of the exemption of farm-houses where a farmer takes in a lodger. The farm-house in such cases is assessed as a lodging-house.  
 ‡ The occupier is only bound to give notice of the opening of new windows.

## TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLLSON.

(Continued from p. 616.)

198. **BAUBRAB.**—These trees have been known to acquire a perimeter of 435 feet, from which it is inferred that they must live many thousand years. A certain example in Africa was, though erroneously, considered by Humboldt as the oldest organic monument of our planet. Adanson, a distinguished botanist, made a deep cut in the side of its trunk, from which, on counting the concentric rings, he ascertained the thickness which the tree had acquired in three centuries; and, being already acquainted with the growth of young trees, he was thus enabled to make out an approximate to its age, which was 5,150 years. The enormous dimensions of the trunk are stated as bearing a striking disproportion to the other parts; and examples are alluded to which, with a trunk 90 feet in circumference, were only 12 feet in height.

199. A still larger example than the above, namely, 34 feet in diameter, was seen by Mr. Golberry, in the valley of the two Gagnacks, in Africa.

200. Grew, in the year 1100, cut his name on two baobabs; and Petiver did the same thing 149 years afterwards. In 1749 Adanson saw these trees, and in the period which had elapsed since Petiver saw them—200 years—they had increased 7 feet in circumference.

201. **CYRUSSES.**—At Chapultepec, in Mexico, there is one measuring 117 feet 10 inches round, which is spoken of as composed of a single trunk: this the younger Decandolle considers even older than the baobab of Adanson.

202. At St. Maria del Tuli, in the province of Oaxaca, there is one 148 feet in circumference, but which, on a narrow examination, proves to consist of three united trunks.

203. At Ateixo there is one 76 feet in girth.

204. In Persia there was one, mentioned by Strabo, the girth of which was as much as five men could span: that writer guessed it to be 2500 years old.

205. It is stated by Hunter, that in 1776 there existed, in the garden of the palace of Grenada, expresses which were celebrated in the time of the Moorish kings, and were named *Capresses de la Regina Sultana*, from a sultana who was seen sitting under them with a liver, who was one of the Abencerrages: their supposed age is between 800 and 900 years.

206. Michaux, a Frenchman, in his splendid work on the forest trees of the United States, states the size of the largest stocks to be 120 feet high, and from 25 to 40 feet in circumference above the conical base, which at the surface of the earth is always three or four times as large as the continued diameter of the trunk.

207. The largest now known is near the Lago Maggiore.

208. **LIMES.**—Decandolle mentions a lime at Trons, in the Grisons, which had been already celebrated in 1424, and measured, in 1795, 51 feet in circumference: this tree he calculated to be 583 years old.

209. That at the Chateau of Chailly, near Melles, in the department of the Deux Sèvres, and which, in 1804, measured 15 metres round (about 50 feet), Decandolle supposed to be then 538 years old.

210. That author notices one at Depeham, near Norwich, which, in 1664, was 8½ yards in circumference; but it seems probable that in this instance he is in error, as Sir Thomas Browne mentions a lime at Depeham 48 feet round at a foot and a half from the ground, and 90 feet in height, and which most likely was the same tree.

211. The same author also informs us that "that which was planted at Fribourg, in 1476, on occasion of the battle of Morat, has now a diameter of 134 feet."

212. Another example, and which is also mentioned by Decandolle, is that at Heinstadt, in Wurtemberg, which in 1550 was so large as to have need of props, and in 1664 measured 37 feet 4 inches in circumference.

213. The largest now known in England grows in Moor Park, Herts.

214. From a list in No. 76 of THE BUILDER, it would appear that the lime has been known in one instance to reach the age of 1,147 years.

215. **YEW.**—That at Hedsor, Bucks, mea-

sures above 27 feet in diameter; and, according to a ratio of growth deduced by Decandolle, from careful observation of the annual deposits of yew trees, must have attained the astonishing age of 3,240 years. It is in full health, surpassing all others at once in antiquity and magnitude.

216. That in Brabourne Churchyard, Kent, has attained the age of 3,000 years.

217. That at Fortingal, Perthshire, mentioned by Pennant, in 1770 was 2,588 lines in diameter, and would therefore be from 25 to 26 centuries old.

218. Those of Crowhurst Churchyard, Surrey, the same probably which are mentioned by Evelyn as measuring 1,237 lines in diameter, must, according to the same authority, be 14½ centuries old.

219. Those of Fountain's Abbey, near Ripon, Yorkshire, were well known as early as 1155. Pennant says they were, in 1770, 1,214 lines in diameter (≈ 10 feet 13 inches, nearly), and which, according to Decandolle's method of computation, makes their age at that time to have been above 12 centuries.

220. That in Grosford Churchyard, Wales, is upwards of 31 feet in circumference, and is probably not surpassed in the principality.

221. That in the Churchyard of Didden, a parish in the parishes of the New Forest, Hants, and the larger portion of which was uprooted and laid prostrate during the severe gale of Tuesday, the 30th of November, 1836, is stated by Gilpin, in his "Forest Scenery," in 1794 to be in the decline; its trunk hollow, supporting three vast stems, and measuring below them about 30 feet in circumference. Long before its destruction a fissure had taken place, dividing the trunk into two parts; and of the ivy which had grown up against the interior portion of the trunk, one stem measured at its base 2 feet in circumference, and was found when the tree fell to have upheld it for many years, the larger roots being quite decayed.

222. White, in his "History of Selborne," mentions one in the churchyard measuring 23 feet in girth.

223. **BEGONS.**—In Windsor-park, one near Sawyer's Lodge measured, at 6 feet from the ground, 36 feet in circumference.

224. Near Oxenford Castle, Edinburghshire, a beech was measured on the 6th of June, 1763, and found to girth 19½ feet at 3 feet from the ground. It then was in progress of decay.

225. At Ormiston Hall, Haddingtonshire, a beech was measured on the 10th of May, 1763, and found to be 18 feet 10 inches in girth. This tree existed of late years, and was entire when blown down in a storm. The trunk was artificially scooped out into a shelter-house, which probably hastened its downfall.

226. At Newbattle Abbey, the seat of the Marquis of Lothian, a few miles south of Edinburgh, Professor Walker measured a beech in 1789 which he was of opinion must have been planted between 1540 and 1560; its trunk measured 17 feet in circumference at the thickest part, and the span of the branches was 89 feet; it contained 1000 feet of measurable timber. This tree was blown down shortly before 1809.

227. At Taymouth, one similar to the above, and apparently coeval with it, was blown down when it had attained a girth exceeding 16 feet.

228. The following large beeches in Cobham-park, Kent, were measured in girth at 3 feet from their roots:—

31 feet 8 inches.	25 feet 9 inches.
30 " 3 "	25 " 4 "
30 " 2 "	25 " 2 "
29 " 8 "	15 " 4 "

229. Under Old Savoy Palace, London, piles of beech were found in a state of perfect soundness. After exposure to air, however, a few weeks under cover, a coating of fungus had spread over their surface.

230. **VINES.**—In Windsor Great Park, in the gardens attached to Cumberland Lodge, there is one that fills a house 235 feet long, and the produce of which is prodigious.

231. The celebrated Hampton vine at Hampton Court has existed for upwards of a century, and covers a space of 116 square yards; it is the exclusive property of the Queen, and its produce is invariably sent to the palace. It has been known one year to produce 2,200 bunches, of nearly 1 lb. each, realizing almost a ton weight.

232. A writer in the "North American Review" mentions wild grape-vines of enormous size. He says that whilst in the eastern states, and, he might have added, in Europe, "it rarely grows larger than a stout walking-stick. In our western states it sometimes surpasses in diameter the body of a full-grown man. This fact we have verified by actual measurement."

233. **THORNS.**—In Dalham-park, Suffolk, there is one remarkable for its great size and antiquity, as well as the manner in which it grows—parted into separate stems.

234. Those in Busby-park, from which it has been thought to have probably derived its name, are generally supposed to have been in existence at the time of Oliver Cromwell.

235. At Jardine Hall, Dumfriesshire, there are two hawthorns upwards of 130 years old.

236. The following were measured in their girth at 3 feet from the roots:—

9 feet 0 inches.	7 feet 8½ inches.

## A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARHAM, IN NORFOLK.

No. IX.

WITH NOTICES OF THEIR ACTUAL CONDITION.

"Rebuild the spire! did you say, Sir?—the spire, Sir? Why, the thing's impossible: the art has been lost for centuries."

Paget's St. Antholin's

**Twyford.**—This church appears embedded in the bosky glen—or heek, as the local phrase is—through which trickles one of the earlier affluents of the Wensum. A wicket near the north-east angle of the chancel affords picturesque access to the venerable pile from the lawn of a fine mansion immediately adjoining. The edifice comprises a nave and a chancel, but without external indication of this; also, a brick-built porch, with diagonal buttresses, over which has been raised a low steeple, crowned by an open bell-cot of wood, where hangs a single bell. The tower of this church—portions of which warrant us in assigning to it a Norman origin—stood at the west end, where a doorway into it may yet be traced. The primitive roof has wholly disappeared, giving place to a meagre frame-work of tie-beams, king posts, and struts, unrelieved by the least attempt at ecclesiastical character: it is covered throughout with pantiles.

The pointed doorway within the porch has its archivolt set under a dripstone, or wind moulding, springing from sculptured heads, the hollow being enriched with little flowers. Opposite the door we find a square Norman font, supported on a round central stem without base or capital, which features, however, occur on the four corner shafts encircling it. The bowl is lined with lead and has a drain—the cover a wretched affair indeed.

The windows are more than commonly varied in style. Adjoining the porch in the south wall occurs a single-light window, widely splayed on both sides. Two others nearly similar to this are met with—one in the north wall at the extremity of the nave by the pulpit seems to have afforded light into the roof-loft; the other is at a much lower elevation in the south-west corner of the chancel, and were the *voiced guesio* of lychscopes more fully established, we should have no doubt as to the object supplied by this not uncommon feature. A pointed window in the north wall of the nave has three cinquefoiled lights below, its upper portion being wrought in tracery that approaches the flamboyant style. The east window is a lancet-shaped triplet with perforated spandrels, the whole comprised under an equilateral arch; we need hardly refer to the symbolism of the Trinity here. A double lancet window occurs in the nave, and on the south wall opposite are two perpendicular ones, each of three "days," and headed by segmental arches within.

We have spoken of a lychscope: nearly fronting it in the north wall of the chancel is found a wide niche under an obtuse Tudor arch, the jambs and soffits simply chamfered at their edges; it occupies a low position immediately under a square-headed window of the character already described. This niche has every indication of having been placed there to serve the purpose of an Easter or Holy Sepulchre; it may, without affecting this view, be at the same time the site of the

founder's interment. We were pleased to find a portion of one of the millions restored in stone, but heartily wish that the sordid brick-work in the crockets had been at the same time replaced by glazing. The heads are inserted in projecting weather-mouldings, with plain horizontal returns.

With the exception of a spacious oak pew lined with moreen, and appropriated, we suppose, to the occupants of Twyford Hall, the features of this church are less indicative than ordinary of

"The scandal  
That desecrates our age,  
An evil great as ever  
Iconoclastic rage."

The open seats, which, together with other portions of the furniture, have elm for their material, range longitudinally in the manner of stalls in a cathedral choir. They are without ornament of any kind; but the back seat, which is somewhat elevated above the others, has a wainscoting of arabesque panels, the remains of a former arrangement. On the north side of a chancel some features of a higher order constitute all that is now left of its screen. A polygonal pulpit, with sounding-board over it, and reading-desk beneath, occupies the north-east angle of the nave, which is supplied with a coved ceiling, the chancel being open to the ridge.

The furniture of this last somewhat exceeds the average condition. The altar table, a slender fabric, the rails of more substantial form, and a plain church chest, have been recently painted and groined; the former is supplied with a handsome covering of dark blue cloth, trimmed with black fringe. It is devoid of a dossal or altar-screen; but the decalogue appears on the south wall opposite the pulpit, where a line engraving exhibits Moses, Aaron, and Joshua grouped, with the hallowed tablets in the foreground beneath. The date does not appear, but we read the imprimatur of "John Oreston, at the White Horse, Without Newgate, London." We scarcely need remark that the position is not in accordance with the rule laid down in the 82nd canon.

The pavement is unusually barren of interest; only one brass can now be discovered; its inscription being hidden by the square pew—a shield once under it no longer courts inspection of the genealogist. We were told that several colossal figures on the walls, fresco paintings, have vanished at no distant period beneath the triennial washings of lime, applied with no sparing hand. Would that it were more generally known and felt that "clergymen are in no small degree answerable for the havoc that has been perpetrated by the churchwardens." A benatura, or holy-water-stoup, thrown into a dark corner as you enter, and the saddle of the ancient cross lying, slighted as if the token were altogether worthless, in an outer angle of the porch, are instances in point which might very creditably have been dispensed with. Twyford Church is dedicated to St. Nicholas, and therefore, if the supposed rule of orientation were strictly adhered to should point 30 degrees south of east.

#### MINERALOGY.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 617.)

It is in the nature of man to advance in discovery, and every new fact elicited by observation or experiment serves as an additional stimulant to urge him on his way. Our acquired knowledge of the surface of the earth has also brought with it a more extended knowledge of the material of which it is composed, and led to a series of inquiries at once pleasing and instructive to the philosophic observer, and to the community at large. The phenomena of calcareous beds have not been neglected, and it is to the careful examination of those we are indebted for a knowledge of many extinct species, or species analogous to those now existing; and it is not the least singular to find that a vast portion of the British strata on which we tread, and from which our agricultural and mineral riches are derived, is wholly composed of the remains of oceanic animals and vegetables peculiar to tropical seas, and so disposed in their generations

as to display an unbroken sequence of events, extending over many ages, and embracing epochs of years of which man previously could form no conception. Calx, or the earth of oceanic animals, its properties as an earth, its varied forms and combinations, were then more strictly attended to by mineralogists and chemists. Sir Humphrey Davy was the first to discover its relationship to the metals.

Geologists within these few years past, as its vast importance in the economy of nature was forced upon their notice, have made some feeble attempts to account for its disposition and phenomena: thus Mr. Lyall attributed its presence in such vast formations in the Pacific, Southern, and Indian Oceans to submarine springs, not taking into consideration their imensity of breadth, and length, and depth; the circumstance that such springs could not possibly exist; that latitude, and dip, and freedom from disturbing causes marked their origin and increase. His conjecture, that rivers might supply them, is still less tenable, for the Red Sea, rapidly filling up with calcareous deposits and coral formations, has not a single river communicating with it; neither are there any rivers to supply calx for the vast formations in the Pacific; nor could all the rivers in the world administer to the rapid and insatiable requirements of these immense repositories of calx.

On the other hand, it is well known that the ocean waters hold very little lime in solution or suspension, and that the suspended particles in rivers are deposited within the immediate area of action; that the lime-secreting animals become more abundant and much more diversified as they near the surface of the water, light and heat being as essential to the production of lime, as to the production of vegetable earth, both being governed in the sum of their increase by the sum of light and heat and local co-operative causes, and both being influenced in their disposition by moving causes. Many calcareous animals are exclusively confined to particular zones, and can exist only in particular temperatures; others change or modify their form and qualities, diverge into species, decrease in size and density of structure, and become partly or wholly divested of their calcareous coverings.

Our leading chemists and geologists, unable to trace effects to their first causes, contend that the earths are produced by the disintegration and decay of rocks, nay, they go so far as to assert that such is the origin of vegetable earths, which embrace so vast an extent of the surface beds of the earth, and are more particularly abundant in the extensive deltas and plains of the earth. This, however, is reversing the order of nature, for every species of rock known to us, either contains, or wholly consists of, animal remains, or is so mechanically constituted as to exhibit an exact conformity with the varying sedimentary positions now taking place within the ocean waters, lakes, and rivers, or in depressed portions of the earth. It is repugnant to our reasoning powers to travel out of nature in search of primary causes, when those causes are manifest in nature, and open to the observation of all men. Men of science begin their labours of discovery where they should end, and end where they should begin. Examining, for instance, shell marble, or limestone; does not common sense teach us that it is composed of marine animals, and the remains of animals? in many specimens the form, the internal configuration is not lost, the brilliant display of colours is not impaired, the disposition of the beds has remained since the period when these creatures existed unchanged, within seas and in zones favourable for their propagation and increase; here we are compelled to stop, or enter into the interminable field of conjecture and speculative science.

Let us begin with organic nature, examining its powers of elaborating earths, and its varying phenomena of action and result. Take, for instance, the mosses on walls, the vegetable bodies on the hills and plains; varying in form and in earthy constituents, they increase and propagate at the final expense of the elements, and from them mould the earths. They exist, and pass through the allotted stages of life, but not for themselves alone; they support the animal creation, and during the whole period in which the vital processes are carried on, they contribute to the increase of the earth:

devoured by animals, their elaborated particles are not lost—causing to exist, their consolidated matter is added to the earth. The peats and mosses exemplify this amazing increase in a wonderful manner; springing up in narrow valleys, depressed basins, and low lands deserted by the sea, they continually add to the lower bed on which they rest, but do not abstract therefrom; foot after foot they rise, every new vigorous shoot springing forth at the expense of its lower branch whence it sprang; the vegetable fibre, as removed from atmospheric influences, and subjected to lateral pressure, passes into the state of earth, and thence into the state of plastic clay, and sometimes into the state of coal. Is it possible, I ask, by our examining it in the latter states, that we can form correct conceptions of its beginning? Most assuredly it is not.

The like operations are manifest in the formation and increase of calcareous matter from the sandy or rocky bed of the ocean; the coral architect springs up, and, like the lichens and mosses, every successive living shoot builds upon its predecessor, and so far from abstracting its material from the base, it communicates its vital juices thereto until the whole base becomes converted into solid limestone-rock; and in that rock who shall retrace the vital phenomena long since passed away? Why should we entertain a doubt that lime is generated by the vital process any more than that vegetable earth is? There must have been, there must be still, a beginning for all compounds, and ignorance of chemistry, or contracted views of geology, ought not to stand as a barrier to discovery. The four elements of earth, air, fire, and water, of ancient philosophy, have made way for the four elements of oxygen, hydrogen, nitrogen, and carbon, of the moderns, and every day's discovery threatens further modifications and changes. Natural philosophy has not at present an universally acknowledged base on which to rest itself.

M. C. Fischer, the proprietor of the manufactory of porcelain at Pirkenhammer, near Carlsbad, has observed that the substance resembling silicious concrete, which occurs in the peat bogs near Frangensban, in Bohemia, consists almost exclusively of the armour of some species of navicula: this Ehrenberg confirmed; he also found other *Baccillaria* intermixed. Original specimens of the silicious concrete of the Isle of France and of Santa Fiora, in Tuscany, which were analyzed by Klapproth, shewed that they likewise consisted almost exclusively of the envelopes of infusoria of several genera of *baccillaria*, yet sometimes of the same and almost all still living species, in conjunction with rare silicious specula of fresh and sea-water sponges, without any intervening binding material. Ehrenberg also discovered that the ochraceous slimy substance which sometimes covers the bottoms of marshy brooks and moats, and which appears to have been considered as a deposit of the oxide of iron, is a very delicate *baccillaria*, which at a red heat becomes like a red oxide of iron, and contains much iron, but does not lose its form either by the heat or upon being treated with acids, and consequently possesses silicious armour most approximating to that of the genus *gallinella*. Numerous discoveries have been made by the microscope of substances previously known only as particular earths, and clays, and rocks, being almost wholly composed of particular species of animals; are not these to be added as proofs that the earths derive their origin from vital phenomena; the fixed and insoluble residues of animal substances, silicious shells, honey coverings of shell-fish, containing a large proportion of calcareous earth, &c.?

NEW NAUTICAL INVENTION. — A useful invention is now in the act of being applied to one of our men-of-war; it is called a "manœuvrer," and is the proposition of R. Foulerton, Esq. It consists of an Archimedian screw, fitted through the dead-wood of the ship at right angles with the keel, and set in motion by the capstan, for the purpose of turning the ship round, when, from calm weather, the helm has no effect upon the vessel. It does not project in any degree, so as to impede the ships way through the water; and must be highly useful in the case of a ship being attacked by steamers or gun-boats, in bringing the broadside to bear on them; or it may even assist a ship in the act of staving.

## OLD ENGLISH CHAIRS.

OLD ENGLISH CHAIRS.

TO THE EDITOR OF THE BUILDER.

SIR,—The above represents two of four genuine Old English chairs belonging to Thomas Charles, Esq., of Chillington-house, Maidstone, Kent, who has an exceedingly curious collection relating to English antiquities.

The sketches are copied from drawings made by Mr. Pretty of Northampton.

Little needs be said respecting these chairs, except, that they are rather superior specimens, and that a great number of them is to be obtained in the cottages and farmhouses in Wiltshire and Gloucestershire, and I have no doubt in other parts of the county.

I am Sir, &c.,

C. J. RICHARDSON.

22, Brompton-crescent.

SOCIETY FOR IMPROVING THE DWELLINGS OF THE LABOURING CLASSES.

THIS society has lately put forth a statement, accompanied by an engraved plan of the fifteen houses now in course of erection in the Lower-road, Pentonville. The following extract fully explains the humane objects they have in view, and the means by which they propose to carry them out:—

“The committee, feeling that no description or reasoning, however accurate, is likely to make such an impression on the public as an actual experiment, have resolved to build a certain number of houses, as models of the different kinds of dwellings which they would recommend for the labouring classes in populous towns.

“In the arrangement of these buildings, the object has been to combine every point essential to the health, comfort, and moral habits of the industrious classes and their families, reference being had to the recommendations of the Health of Towns Commission, particularly with respect to ventilation, drainage, and an ample supply of water.

“The buildings are of three different classes, and designed to accommodate in the whole twenty families and thirty single persons.

“1. Eight of the families are to occupy

each an entire house, with a living-room on the ground-floor, having an enclosed recess or closet large enough to receive beds for the youths of the family, and two bed-rooms on the upper floor.

“2. The remaining twelve families are to be distributed in six houses, each family occupying a floor of two rooms, with all requisite conveniences; and as the apartments on the upper floor are to be approached through an outer door distinct from that belonging to the lower floor, their respective occupants will thus be kept entirely separate, and each floor be virtually a distinct dwelling.

“3. The centre building on the east side is intended for the accommodation of thirty widows or females of advanced age, each to have a room, with the use of a wash-house common to them all. It is proposed that the general supervision of this establishment shall be entrusted to a responsible resident.

“The contracts entered into for the buildings warrant the committee in the confident expectation that, whilst securing a remunerating rate of interest on the outlay, they will be enabled to afford to the occupants accommodations of a very superior description to those at present attainable by the labouring classes, and that at a rent considerably lower than is now commonly paid. The committee hope and believe also that the detailed statement, which it is their intention at the proper season to lay before the public, will encourage many benevolent individuals to promote the erection in their own neighbourhood of similar dwellings, and thereby conduce to the moral as well as the physical welfare of a large class of their poorer brethren, who at present have not the opportunity of bringing up their families with a due regard even to the decencies of life, and are thus placed in circumstances tending greatly to counteract the influence of all religious instruction.

“The committee deeply regret that the limited amount of funds hitherto placed at their disposal obliges them to pause, and to question how far they may be justified in undertaking the erection of the whole of the buildings contemplated by the society; but they are strongly encouraged to hope that the marked expression of public feeling in reference to the improvement of the dwellings of the labouring classes, will lead to such a prompt

and liberal increase of contributions as will enable them to complete their projected plan by the approaching spring, and also to direct their attention to the equally-important object of model dwellings adapted to the agricultural districts.

“They think it right to add that the income derived from the proposed buildings will be devoted to the promotion of the general objects of the society, and accounted for in their annual report.”

METROPOLITAN IMPROVEMENT SOCIETY.

THE meetings of the Metropolitan Improvement Society have been resumed, and will in future be held on the first Thursday in every month, at the offices of the society, 20, Bedford-street, Covent-garden. At the meeting on the 5th, the attention of the members was chiefly directed to the contemplated new street, which is to lead from the Houses of Parliament to the neighbourhood of Belgrave-square. This street will be one of noble dimensions,—somewhat wider than Regent-street, and, as originally proposed, the western front of the Abbey and the Tower of the New Houses of Parliament, would have been visible throughout the whole line. This object has been lost sight of in the plan now adopted. The new street will make a crooked bend at its eastern extremity to avoid pulling down St. Margaret's Workhouse, and the bend will be such as entirely to exclude the view of the Abbey and Mr. Barry's tower. This mutilation of the original plan in its most important architectural features has been occasioned by an anxiety to avoid an increased expenditure of about 15,000*l.*, a sum quite insignificant as compared with the magnitude and importance of the contemplated improvement. A remonstrance has been addressed by the Society to the Commissioners on the subject. A resolution was also passed at the meeting to oppose a Bill about to be submitted to Parliament for enclosing a portion of the public roadway in Lincoln's-inn-fields, adjoining the new law courts. The project is to convert this roadway into a narrow foot-path instead of completing the carriage communication between the Strand and Holborn, by widening the approaches to the south and north!

THE DWELLINGS OF THE WORKING CLASSES INFERIOR TO THOSE OF THE PAUPER AND THE PRISONER.

WITH how many comforts, how many decencies, how many virtues, a clean, well-ventilated dwelling is associated, nobody needs to be informed; such is to a family what personal cleanliness is to an individual—a means of health, recreation, rest, and enjoyment. Nor is it unimportant in a moral sense—

“For with the body’s purity, the mind Acquires a secret, sympathetic aid.”

If your business leads you to the dwelling of an artisan—one of the great race whose hands make our wealth, our luxuries, our comforts—where are you likely to find them? In a guttery back street, or stench-abounding alley, you climb a filthy stair; and in a close non-ventilated room, parlour, kitchen, and all, you find the entire family huddled together, for cooking, eating, and sleeping. All the air admitted is through the key-hole, or the broken pane of a window that will neither open nor shut. Neatness is impossible, and with the hest housewife her task is the pursuit of cleanliness under difficulties; for how can cleanliness be attained where its first elements, air and water, are with difficulty attainable? The husband, driven away by the noise, the stench, and the discomfort of his little place, which ought to be his home, is probably at the public-house; the children are in the gutter, and the wife in suds, straw, or saucapans. The dilapidated habitations of the rich, abandoned by their advance in the comforts and decencies of life, degenerate into abodes of the poor. There is no such thing thought of, with all our thinking, of providing the poor with habitations fitted to their wants or means, unless they become chargeable to us as paupers; then indeed an Elizabethan palace rises proudly from some dry and salubrious site. Commissioners, with a thousand a year, see that it is provided with baths, infirmaries, and every necessary of health. Doctors devise plans for its ventilation; the best of clothing, and food, and every thing else is advertised for. But, unless a man is either wealthy or a pauper, no care is taken to give him a decent abode; humble industry may hide its head where it can; as long as it is in working order we take no heed of it; but the minute it is demoralised or depauperised, we have the most elegant model-prisons to correct it, and the most beautiful union-workhouses to lock it up in!—*Bentley’s Magazine.*

RAILWAY INDICATOR.

THERE has just been published in Paris an account of an instrument for indicating the speed of trains, and registering any undue excess; this, it is expected, will act as a wholesome monitor to engine drivers, and lessen the risk of railway travelling, by rendering it impossible to escape detection where a dangerous velocity has been attained. This contrivance consists in a governor, such as is commonly used in steam-engines, and set in motion by the customary gearing from one of the axles of the locomotive. To the vertical sliding portion of the governor an index is attached, which passes along a graduated vertical scale, and by the height to which it reaches shews the degree of speed attained; any excess of speed produces a further elevation, and brings into play a second index, which is unconnected with the first, and which on the fall of the governor remains at its maximum height—a standing testimony against the negligence and recklessness of the engineer. As a further precaution, it is arranged that one of the balls of the governor carries a hammer, which strikes a bell, and loudly calls for the attention of the driver. To prevent tampering with the indications of the instrument, the second or tell-tale index is locked up, and the key remains in the possession of some superior officer, who alone, at the termination of a journey, can replace it in its original position, ready for a new indication. The first index, which only takes a recognition of speed within the regulated limit, is left open to the inspection of all in its neighbourhood; and, if this be neglected or concealed, the bell protests most clamorously against the danger and the wrong.

ON THE CONSTRUCTION OF HAND-RAILS OF STAIRS.

BY MR. GEORGE RIDLEY. No. II.

18. THE TRIHEDRAL SOLID.—Any figure consisting of three plane faces beside its base, is a trihedral: thus the three faces of a triangular pyramid is a trihedral. We have not space to explain to the utmost extent the properties of all the cases of this solid. In carpentry, the nature of its angles has been long known in the formation of the hipped roof. In masonry, its principles are applied with equal success in the construction of plain oblique arches. Its uses are equally indispensable in the principles of perspective, projection, dialing, &c.

19. In the science of hand-railing, the late Mr. Peter Nicholson has the merit of first adapting its principles, in determining the obliquity of the ordinates, required in tracing out the contour of his face mould; he also with equal ingenuity applied the properties of its solids angles, in determining the position of the face mould upon the surfaces of the plank, out of which the rail was cut.

20. It may be necessary here to observe, that the angles of the trihedral are of two kinds, one of which is that which forms the angle or bevel of any two of its arrises which constitute the sides of its superficial surfaces; the other is the angle, or bevel, formed by the intersection of any two of the surfaces which constitute the solid itself. This last is sometimes called the dihedral angle, but is more generally known by the name of the solid angle, and is always considered as taken with the legs of the bevel at right angles to the arris which is common to both surfaces. Let the lines A, B, B C, and A C (Fig 7) be the three sides of a right-angled triangle, which forms the base of a trihedral solid. Let the right-angled triangle A B D, represent the development of its vertical side, and the triangles A D E, and B F B, the superficies of the two remaining slanting sides. In this figure the line A E, will require to be equal in length to A C, D B equal to B F, and D E equal to F C, moreover the line A D will require to be square to, or at right angles to D B; B F at right angles to B C; and D E at right angles to A D. Suppose, then, that the planes of the triangles A B D and B C F are turned up on the lines A B and B C, as if on hinges, until the lines B F and B C meet each other; and the triangle A D E turned over upon the line A D until the point E falls upon C; we should then have before us the form of a trihedral solid. If this solid be formed in wood, upon the

surfaces of which the letters of reference are marked to correspond with those upon the development of its surfaces, as shewn in the figure, by a careful attention to the model, it will be seen that the dihedral, or the solid angle across the arris of the vertical surface, A B D, and the inclined surface A D E will be the angle or bevel B F C, as shewn by the development of the triangle B F C. And the lines A E and A C when united will form the arris of intersection of the slanting surface, and the plane of the base of the trihedral.

21. In carrying the use of the trihedral into practice, let us suppose that its vertical face A B D is but a portion of the face of a plane passing vertically through the body of the cylinder, as already described by Article 9, and more particularly delineated in Fig. 8, wherein the slanting surface A D C of the trihedral is conceived to form a portion of a plane cutting obliquely through the body of the cylinder, and the base A B C of the trihedral form, forming a portion of the same plane as that of the base of the cylinder, we shall then perceive the body of our cylinder encircled by the body of the trihedral solid.

Fig. 8.

22. Now, as the plane of our cutting section is to pass through three points given in position on the surface of the cylinder, which, as we have already observed, must agree with three corresponding points on the line of heights, as laid down on the development of the central line of the rail; and as the slanting

surface of the trihedral and the cutting plane through the cylinder are both in the same plane. It is, therefore, by laying down the development of this plane, that we are enabled to apply the use of the beam-compass in describing the contour of the face-mould with certainty.

or the construction of conduits for sewerage, it was apparent no brick building or mason work (if my data be correct, of which I have no doubt) could at all be made available or sizes so small as that which I contemplated introducing. I therefore consulted with the manufacturer of tubes of Terra Cotta and different other kinds of clay as to their expense, and the probable strength which might be given to tubes of from two to eighteen inches diameter, and the result was, in all respects, so satisfactory, that I soon came to the conclusion, that no house drains or private sewers could, by possibility, be perfect in their operations, if built either of brick or stone, and that the substitution of strong tubes of small calibre made of indestructible materials could be found an invaluable improvement. As the strength of the tubes which I propose using as conduits for sewerage has frequently been questioned, I beg to submit the following facts, which prove indisputably that objections to my system, founded on this basis, are perfectly untenable. A few specimens of fire-clay tubes were manufactured in the neighbourhood of Glasgow by the Gaonkirton Coal Company, and these were, in the presence of a number of scientific and interested gentlemen, tested by hydraulic pressure, when it appeared that it was not until a greater pressure than that equal to a perpendicular column of water 900 feet had been applied, that they could be burst! I was not present when the experiment was made, but Mr. Smith of Deanston, and several distinguished persons who were, informed me of the fact. But a moment's consideration will serve to convince me that a conduit for any fluid must be stronger, if formed in complete circles, than made up of numerous small fragments which have no affinity for each other; in fact, which only preserve a form or shape by their sheer force of their surrounding and superincumbent pressure. Two years have elapsed since I first mooted this idea, and I have much satisfaction in now being able to state that the principle was at once conceded by scientific persons while I was in London; and that since my return to Scotland, there has not been a single sewer built either of stone or brick in the town of Ayr—clay tubes have invariably superseded them. The Ayr arrangements, however, I am sorry I cannot altogether approve of, because no principle seems to have been recognized; all that appears to have been thought necessary, was the adoption of circular clay tubes, instead of the old expensive rude brick or rubble-built drains. Notwithstanding this, the people are unanimous as to the great advantage which the tubes possess over the old system. The sizes employed are from nine to eighteen inches dimensions, which, for reasons here stated, and which also appear in the body of my evidence, I entirely disapprove of for the purposes of mere house drainage. The tubes should be made of fire-clay and glazed; the glazing does not add sensibly to the cost, and would be a great improvement. It may be interesting here to remark, that I was particularly struck during my stay in Ayr by observing the loss which a community sustains from the want of combined action.

If public companies, curators of local trusts, and private persons, were to digest properly their schemes, and cordially to co-operate, it is easily demonstrable, that much economy in every sense of the term would invariably be experienced. In the town of Ayr they have no Act empowering the authorities to cause inhabitants to adopt such arrangements as have recently been shown to be indispensable for the protection and preservation of public health; therefore every man who desires to improve his premises, entertains not desire from a conviction of the necessity for making certain alterations, in order that the health and comfort of his family may be secured. But as there have, in this place, been no public meetings to discuss the merits of those suggestions, which have been offered for the general improvement of the town, every one must proceed as his own architect. The builder may choose to dictate, irrespective of his next door neighbour's operations. Each who desires to lead his soil-drain into the drain, must make his own direct communication with the main. I have endeavoured to point out the folly of such proceedings, by shewing to the parties the vast saving, which would

be effected if neighbours would only consult each other, and harmoniously co-operate.

I shewed, to the satisfaction of competent persons in Ayr, that if proprietors in the lower and descending parts of streets would allow the landlords on the higher grounds to make connections with the private drains of those as they descended, each bearing his own expenses, or such proportions might be required to convey the tube past his property, that then one connection only with the main would be necessary for a number; the expense of making which, if divided amongst a number, would be comparatively trifling. This system which I propose, I have no doubt will, ere long, be universal, as its advantages are obvious. Having sufficiently and satisfactorily established the principle that all drains or sewers ought to bear positive reference to the quantity of water, &c. which it can be calculated they would be required to convey, and having ascertained that in the case of small or house drains, this was matter of easy accomplishment, I next directed my attention to the common or main receiving sewers, and with a view to shew that the same principle which prevails in the small, will also be found to regulate the large, I consulted scientific and practical men as to the possibility of constructing sewers into two, or three, or four pieces, instead of the common tedious, imperfect, and expensive mode of brick building in cement or mortar. I proposed the adoption of pieces of fire-clay moulded in the most unobjectionable forms, and of great strength, which requisite, I was assured by the manufacturers, thickness and high temperature would, in the case of this material being employed, be certain to secure. The fixing upon the best configuration, now started up as a new difficulty; at last, however, I succeeded in convincing myself and such scientific friends as took interest in my pursuits, that the section of the form represented in the accompanying sketch

is decidedly more perfect than any thing that has hitherto been employed for sewer purposes. It has also been asked what pressure externally and internally would such a construction as this withstand, the answer is simple,—no superincumbent weight whatever could crush it (this the manufacturers one and all guarantee); the pressure which it would bear from within would be in the direct ratio of that from without; a glance at the diagram will shew, that, like a brick-built circle, it has no strength save that which it derives from the pressure of the surrounding materials. The cost of a sewer of the dimensions marked on the diagram, would be about 18s. or 17. per yard. I find that fire-clay tubes 12 inches diameter, and 12 inches in length, can be purchased in Glasgow for 9d. per foot, or 2s. 3d. per yard, which is exactly half the prices furnished to me by the London manufacturers. The manner in which small or side drains are connected with this kind of sewer is simple; circular openings of various diameters are left at the time they are made in a great proportion of the side pieces, a little above that part where they rest on the invert, into which a tube of from 3 to 12 inches may be inserted, as the case might be.

The following is a calculation which I made while in London in April 17th, 1843, with a view to shew the economy which would be effected by the adoption of small strong tubes instead of brick-built sewers:—

Brick-built, first class, 24. 10s. per yard = 4,400l. per mile.

Brick-built, medium class, 14. 10s. per yard = 2,610l. per mile.

These are the prices of the Holborn and Finsbury metropolitan district of sewers, furnished to me by my friend Mr. Rue, Civil Engineer.

Tubes of terra cotta or fire-clay:—  
Tubes of 1 foot 6 inches diameter, at 15s. per yard = 1,320l. per mile.

Tubes of common brick clay:—  
Very best, 1 foot diameter, at 3s. per yard = 246l. per mile.

Prices of drain-tubes in Glasgow, of common clay, including flange of from one to two inches:—

- 3 inches diameter, 6d. per yard.
- 6 inches diameter, 9d. per yard.
- 9 inches diameter, 1s. per yard.
- 12 inches diameter, 1s. 3d. per yard.
- 18 inches diameter, 2s. per yard.

Tubes of cast-iron, of 12 inches diameter, would weigh about 24 cwt. per yard, the cost of which would be 6s. 6d. per cwt., or say 14s. 6d. per yard, of a strength equal to 300 feet pressure, which would be = 1,276l. per mile.

These prices, it is to be understood, are merely approximations, as the manufacturers were especially requested by me not to furnish me with quotations less than the present wholesale prices of the articles; so, of course, if a great demand were to take place for extensive sewerage operations, there can be no doubt the materials could be had for little more than half the prices I have mentioned, more especially when it is known that the tubes can be manufactured with great rapidity by machines, driven either by steam or horse power. I have myself a working model for this purpose, which I invented three years ago, and which operates beautifully.

Earthenware pipes from the Shropshire Pottery may be obtained through Messrs. Darby and Co., Coal Brook Dale, Shropshire.

Fire-clay pipes, 4 inches diameter, 1s. per yard, and 6 inches diameter, 1s. 6d. per yard, from the Garmkirk Fire-bricks, Glasgow.

There are a great many niceties to be attended to in the reducing this system to practice, so that its perfection may be completely brought out, and its efficiency of operation secured. The manner, for example, of connecting small tubes with each other, and these again with the great receiving or common sewer. The mode of keeping sewers free from deposit by flushing I have sufficiently explained in my evidence. I may, however, remark that if the tubular system of sewerage were to be properly conducted, that no such flushing apparatus as that described by me, or any other contrivance for this purpose, would ever be required; and I am convinced that in a few years brick-built sewers will be but the rare exceptions; whole towns and cities will be sewerage at small cost, and more perfectly than it is possible to accomplish by brick building. I propose as speedily as possible publishing a small treatise on sewerage, in which I mean to shew the objections which pertain to those clumsy constructions that exist, and continue to be made in the metropolis; the means best calculated to remedy their defects; and lastly, describe the kind of sewerage which I think unobjectionable, and what I would, therefore, recommend for adoption in all cases where new sewers are required.

In the mean time I shall only add, that it will afford me great pleasure to communicate with such parties as may desire to be informed on this interesting and important subject, and to furnish them with every information they may require, or that I am possessed of.

**NEW SOLDER.**—Dissolve zink in muriatic acid to saturation, add pulverised sal ammonia to this solution, and after boiling it for a short time it is ready for use. In using this compound no cleaning of the metal is necessary, however oxidized, and oil and other materials are dispensed with. It is only necessary to apply with a piece of sponge upon a stick, or a feather, this solution to the part to be soldered in place of the material now used, to prevent oxidation and facilitate the flow of the solder. Such is the efficacy, that if two pieces of bar, possessing considerable surface, be wet with this solution and pressed together, upon the application of the soldering tool, the solder will at once flow between the plates throughout. —*Mechanics' Magazine.*

## CAUTION TO BUILDERS.

On Saturday last a case was tried in the Court of Common Pleas, before Lord Chief Justice Tindal, involving the responsibility of builders for accidents resulting from their not carting away the excavated soil of a newly-formed drain.

The defendant (Gray) in the earlier part of the present year was engaged in making some extensive alterations—pulling down, repairing, and rebuilding houses; and it happened that in the course of these alterations it became necessary to make a drain communicating with the main sewer. A drain was accordingly dug for that purpose, but the gravel and excavated soil which came from it were, instead of being carted away, placed in the road, at a distance of several feet from the kerb. The defendant was expropriated with on the subject, who said that he would remove it as soon as he could. Unfortunately, however, for the plaintiff (Burgess), the heap of gravel was still in the same place on Sunday, the 28th of July last. It appeared that about half-past 9 o'clock in the evening of that day the plaintiff, accompanied by a friend named Crofts, was on his return homeward in a chaise-cart, when one of the wheels ran upon the heap of gravel in question, and the plaintiff, who was driving, was thrown by the shock into the road. The horse in the cart being frightened, immediately started off at a gallop with the cart and Crofts, who contrived to retain his seat, from which he was soon, however, dislodged by the smashing of the cart against the Mile-end turnpike gate. The cart was broken to pieces and the harness much damaged; and upon going back to the plaintiff himself, it appeared that his leg was broken just above the ankle joint. The plaintiff was laid up for six or eight weeks in consequence of the accident, and his surgeon's bill amounted to about 12l.

The jury found a verdict for the plaintiff—Damages 45l.

## Correspondence.

## ON IRREGULARITY OF DESIGN IN ARCHITECTURE.

TO THE EDITOR OF THE BUILDER.

SIR,—Consistency is the soul of design; and in writing upon the above-mentioned subject, I wish it to be distinctly understood that my remarks will only refer to certain kinds of architectural design, such as the Italian, the Tudor, the Elizabethan, &c., and will not apply to architecture generally; for nothing could possibly be more absurd than to erect a Grecian temple (for instance) with the portico on one side, and the building filled in with similar eccentricities, as it would be in direct opposition to the leading principles and features of that particular style of architecture for which ancient Greece is so celebrated. The Italian, the Tudor, the Elizabethan, &c., are, however, quite the reverse of this, and the architect is left quite free to indulge his taste and fancy, and in the generality of cases more effect is produced by an irregular building, more art displayed, and more comfort gained in its arrangements than by a regular one. In nature there is no such thing as uniformity; no two hills are exactly alike, no masses of water or groups of foliage are precisely similar, and the landscape is as varied as it can possibly be, and yet as beautiful as it is varied; ought we not then to remember this fact when about to erect a building in the country (for of course it is out of the question in a town), and act accordingly? Take, for example, a mountainous district; what erection can look better than a noble castellated building, with its massive towers, its lofty turrets, embattled parapets and machicolations, its walls of various elevations, its great diversity of windows,—in short, every thing as irregular as possible, and yet as a whole presenting a very imposing appearance? Contrast this with the effect of a Grecian building in a similar situation, its straight, horizontal lines and rows of columns, all very beautiful in themselves, but quite unsuited for such a locality. Take another instance: a small country villa in the Tudor style, situate in a beautiful valley, and surrounded by wood and water; imagine this building to be of red brick, with white stone dressings, with a porch to the entrance doorway, with square and bay

windows filled in with quarry lights and stained-glass, above them lofty roofs and projecting gables, with carved verge-boards and pendants, and crowning all, the stacks of red brick chimneys, with their shafts clustered together, each shaft differing in pattern. Contrast the picturesque and rural effect of such a villa with another erected in a square form, with plain windows, flat roofs, and low chimneys, and then judge which would form the most pleasing object, and be most suited to the surrounding scenery. Besides, in an irregular building, a stranger will naturally feel curious to know its internal arrangement, and how it is contrived, so as to have a picturesque elevation, without any sacrifice of the usual domestic conveniences; and this feeling occasions him to look upon an irregular building with peculiar interest. Again, what can be more fitted for an elevated situation than an Italian building, with its lofty companions, its curious tiling, its rich ornamental and overhanging cornices, its diversity of windows, some grouped together and others in single lights, and its ornamental balconies, verandahs, and terraces? I do not know any thing which more improves the features of a fine landscape than a commanding pile of building, and nothing which injures it more than a dull, heavy structure, as stiff and uniform as a regular, unbroken series of straight lines can well make it. During the last few years, many beautiful villas have been erected in different parts of England, but there is much yet to be done towards improving the public taste. It is not long since that I looked over a large mansion in the course of erection, the cost of which would be nearly 20,000l., and yet the external appearance more resembled an hospital or barracks than any thing else. This ought not so to be.—Yours, &c.

EDWARD MANFRED.

## WINDOW DUTIES.

SIR,—In furtherance of the exposition of the objectionable impost on light and air in dwelling-houses, making dungeons of the habitations of the middle and working classes, I beg to call your attention to a fact existing at the present moment in King William-street, Strand. The inhabitants of the south side of that street, after a vain attempt with the Commissioners to get that tax mitigated upon a certain portion of their windows (which are curiously situated), by representing their plan of avoidance, if this tax was pressed for, have, I believe, universally, covered with a skylight, the well-hole of an area at the back of each house reaching from the leads even with the first-floor down to the basement, into which no less than six or seven lights besides doorways open, including the ventilators of two water-closets, thus making horrowed lights of them, avoiding the tax, and half poisoning themselves with the impure air arising from their drains and cesspools, and their ill-ventilated lower apartments.

If you think this fact worthy notice in your valuable publication, it may be confirmed by application to any of the residents; while, for certain reasons, I remain, Sir, yours,

Dec. 16, 1844.

ANONYMOUS.

## RED BRICK-WORK.

SIR,—On reading over in last week's number, your notice on red brick-work, I cannot let the opportunity pass without a remark which is due to the town of High Wycombe, Bucks, where there are several fronts the brick-work of which is brought to the greatest perfection; large cornices, architraves, two fluted columns part of the way down, and then reversed with capital and base mouldings, and a fine doorway, very lofty, projecting forward, differing wonderfully from its almost next door neighbour. The ceiling in the entrance-hall of one is beautifully enriched, pains being taken to preserve it from the whitewash brush,—which is too often the case through employing inexperienced persons.—Yours, &c.

A SUBSCRIBER, R. B. W.  
Kensington.

## THE NEW HOUSES IN HOLBORN.

SIR,—I have been rather surprised to see that in the three model houses, in the course of erection at the bottom of Plumtree-street, now Bloomsbury-street, they have got

cast-iron breast-summers without providing them with a wrought-iron straining-bar or bolt. The trifling expense that this addition would have been, could not be of any importance, and it is of such material consequence to the safety of the houses, either in case of fire or excessive weight. Had the girders in the mill at Oldham been provided with this, the accident which happened there could never have taken place.—I remain, Sir, your obedient servant,  
Dec. 17, 1844.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*New District Churches.*—Great efforts are being made for the erection of churches in the new districts constituted under the Parliamentary measure of last session, which provides for the division of the larger parishes with a view to more extensive and efficient superintendence. Since the 1st of April last grants have been made in twenty of these cases amounting to the sum of 5,225l., and the total sum contributed during the same period for the purpose of obtaining increased accommodation throughout England and Wales is 15,583l.—viz. for the erection of forty-one new churches, and the rebuilding, enlarging, &c., of fifty-one existing churches, by which means 32,248 additional sittings will be obtained, including free seats for 25,550 persons.

*The New Church in Lambeth.*—The new church which has lately been erected at the corner of Little York-street, and Lower Marsh, Lambeth, in a densely-populated neighbourhood, is nearly completed. It is built of white brick, and of very neat appearance. The building is fire-proof, the rafters and pillars supporting the roof being composed of iron. The entrance is in the Lower Marsh, where a neat square tower has been erected capable of holding eight bells, which will shortly be hung. There are 300 free-sittings, and room for 600 more persons.—*The British Magazine.*

## RAILWAY INTELLIGENCE.

*The Warwick and Leamington Railway.*—On the 2nd inst., this newly-formed line was opened to the public. The time occupied in its construction, under the superintendence of Mr. Stephenson, has been eighteen months. The gradients are rather heavy, the steepest being 1 in 100. Messrs. J. Jackson, London, and J. Cumming, Birmingham, were the contractors. The Kenilworth, the only intermediate station, on the outskirts of the town, is constructed of Kenilworth stone. That at Leamington, in the Roman Doric style, is situate on the main road between Leamington and Warwick. The first feature of interest, and one of the principal works, is that of the Milborne Grange viaduct, composed of seventeen arches, of 31 feet span, built of red brick, faced with stone and supported by stone piers; it cost 2,400l. The Castle Gutter Brook Bridge is of three arches, of 60 feet span, composed of blue brick, and cost 1,400l. The timber bridge, spanning three roads, is formed of wood-work, with stone piers, 50 feet span, and has cost 940l. The viaduct over the Avon consists of nine arches, of 60 feet span, and is the chief work upon the line. It is built of blue brick, has cost 4,650l., and commands a fine view of the Avon, and of the demesne of the Hon. C. B. Percy, at Guy's Cliffe.

*Edinburgh and Granton Railway.*—The directors of the Edinburgh, Leith, and Granton Railway having made application to the sheriff to nominate and appoint a competent person to superintend the working operations of the tunnel through the city, we understand that Mr. George Buchanan, civil engineer, has been appointed for that purpose. Mr. Buchanan's qualifications are well known, and it is to be hoped that his appointment will have the effect of allaying any fears that may have been engendered in the public mind.—*Edinburgh Evening Post.*

*Tunnel Bridge.*—On Saturday last, the keystone of the tunnel bridge, near Sedgwick, was put in by Mr. John Sefton, builder, who, we believe, has the construction of the railway bridges between Sedgwick and the Sedburgh road. This is the first bridge yet keyed on the Lancaster and Carlisle line. The work has been inspected by Mr. Stephenson and Mr. Mould, and highly commended.

**New Railway Projects.**—It is understood that 246 schemes are lodged at the Board of Trade. The next consideration is, how will the Board of Trade deal with these matters? It seems now to be understood that the Board is engaged in dividing the lines into classes—that *that* done, it will express an opinion on each project, and present it in the shape of a report to parliament—but that an intimation will be given to the promoters of the general views of the Board sufficient to enable them to determine for themselves whether they will go forward or retire from the field.—*Railway Times*.

**Goliath Engines.**—Four of the largest locomotives ever constructed are about to be built for the Sheffield and Manchester Railway. The cylinders are to be eighteen inches, the stroke two feet, the wheels, six of them four and a quarter feet diameter, and all six coupled. The weight of the engine alone, when loaded with fuel and water will be 24 tons. It is calculated that on a level they will draw separately from 1,000 to 2,000 tons.

### Miscellaneous.

**ANCIENT ROMAN ARCHITECTURE.**—Last Thursday week, as some men were employed digging for the purpose of forming a new sewer in the New North-road, Hoxton, they discovered, at a depth of about 20 feet below the surface of the ground, a remarkable Roman structure. The first presentiment they had of approaching something wonderful was to find themselves standing upon a hard flat surface instead of the usual rough earth and stone. The fact was immediately communicated to the surveyor, who, in company with about a dozen men, repaired to the spot. After some little delay, it was determined that the tiles, &c., should be taken up, and for that purpose six men were selected to descend, who, after some considerable delay, succeeded in raising several large pieces of stone and tile, underneath which was discovered a small cellar or vault, the dimensions of which were 3 feet in length by 2½ feet in width, and 3 feet 7 inches in depth, strongly tiled throughout. Several small vessels of earthenware were found, as also a small urn, supposed to be of gold. The excavation was immediately covered over, and men placed to guard it. A more wonderful specimen of ancient Roman architecture has never been discovered.—*Times*.

**PROPOSED IMPROVEMENTS IN CONNECTION WITH HUNGERFORD BRIDGE.**—Last week, at a meeting of the proprietors of the Hungerford and Lambeth Suspension Bridge Company, the chairman said the original estimated cost of the bridge was 104,500*l*. The directors were now able to inform the proprietors that the work would be completed, including every expense, for the net sum of 102,800*l*, which they would see was less by 1,700*l*. than the estimate of 1838. But the directors had now to ask the proprietors to give them a sum of money to do that which was not originally contemplated—that they wanted to pass from the Belyedere-road to Sutton-street (a fine thoroughfare of 35 yards wide, and built since the bridge was projected), so as to obtain a good access to the York-road. The directors found they would be able to carry out this desired approach for less than 5,000*l*., including all expenses, and since the report was written negotiations had taken place which led the directors to hope that the property required would be obtained without the expense of going to Parliament for an Act for the purpose.

**IMPORTANCE OF A PLENTIFUL SUPPLY OF PURE WATER IN TOWNS.**—It is, perhaps, too much to expect that people will be induced to return to the natural beverage, so long as it is supplied to them in the impure state in which it reaches the inhabitants of London, and of most large towns in this country—in fact, such water is neither palatable nor wholesome, and it is one of the evils affecting the public health which calls most loudly for correction and the remedy for which is by no means difficult. Filtering does not purify water, as it can only remove the impurities which are mechanically suspended in it, and not such as are in a state of solution. Filtering cannot be successful in depriving it of its deleterious properties; we might as well attempt to remove the poison from a solution of arsenic by filtration.—*On the Care of Health, by J. H. Curtis, Esq.*

**TESTING OF AN IRON BRIDGE IN IRELAND.**—The lattice bridge which is built over the Royal Canal, on the Dublin and Drogheda Railway, and whose span is 144 feet 6 inches, was the subject of an interesting experiment on the 13th inst. After taking out all the wedges under the two west beams, by running one engine and three carriages across three times, the greatest deflection was two-tenths of an inch, and each time the bridge resumed its original position. The bridge was tested a second time the same day by running a coupled engine across, the weight of the tender, eight carriages, and three trucks, averaging from eighty to ninety tons. This train of carriages and engine was allowed to stand upon the bridge until Mr. Hamilton, Sir J. Macneill, and Mr. McCormick, measured the deflection, which was two-tenths of an inch, and when the train moved off the bridge, it resumed its original position.—*Drogheda Conservative*.

**PROPOSED TUNNEL UNDER GLASGOW.**—The city of Glasgow is surrounded by great lines of communication; on the north by its great canals, the Forth of Clyde and Monkland, and the Edinburgh and Glasgow and Garnkirk Railways, and on the south by its magnificent river and harbour, with its communicating lines of railway. But these are cut off from all means of communication with each other by the densely populated city which intervenes. At present an enormous traffic passes over the streets in heavily-laden carts and waggons, and the proposed scheme is to connect by a great tunnel the southern with the northern side of the city. This enterprise is promoted by some of the most respectable and wealthy citizens of Glasgow, and by the great companies whose immediate interests it will so directly promote. The estimate is under 150,000*l*.

**EXTRAORDINARY BRICK-MAKING.**—Mr. Hodson's patent machine for making bricks is truly wonderful when compared with the amount of labour it is capable of accomplishing, and the perfect manner in which it completes its work. The stock-brick dies will throw off four thousand bricks in a day, equal in all respects to the first-rate article in the market; whereas the ordinary number of bricks produced by one man in a day, in the usual mode of making them, is eight hundred!—*Hull Packet*.

**ROYAL PALACE OF LINLITHGOW.**—It will be gratifying to learn that the ancient and royal palace of Linlithgow has lately undergone extensive repairs, under the sanction and at the expense of the government. This venerable building forms one of the noblest piles of ancient architecture in Scotland, and, with the sweet and placid loch reposing amidst the graceful undulations of the neighbouring landscape, forms altogether an object of much beauty and interest.—*Edinburgh Witness*.

**COLCHESTER IMPROVEMENTS.**—A public meeting, convened by the Mayor of Colchester, was held last Thursday week for the purpose of forming an institution embracing the following objects: A public reading-room, a library for reference and circulation, a museum, a lecture-room, and an observatory. The project has the support of most of the influential inhabitants both in the town and neighbourhood.

**DUNDEE TRIUMPHAL ARCH.**—The triumphal arch to be erected at Dundee to commemorate the landing of her Majesty and the Prince Consort at that Royal borough, last autumn, is commenced. The subscription, with the liberal donations of Lord Panmure, Lord Douglas, and Viscount Duncan, at present exceeds 1,500*l*.

**NEW NATIONAL SCHOOLS AT HULL.**—The expense of erecting these schools was 1,600*l*. They are built in the most substantial manner, in the Tudor style, under plans furnished by the Committee of Privy Council on Education, and the National Society, and will accommodate 650 children.

**LORD PEMBROKE'S TOWN RESIDENCE.**—The Earl of Pembroke's splendid mansion on Carlton-terrace, which has been so long undergoing a course of decorative repair, is not expected to be ready for the reception of his lordship and establishment for a twelvemonth at the earliest.

**USE OF THE ARCH AMONG THE GREEKS.**—Series of drawings made by the late Mr. Dodwell during his travels in Greece display the various doorways of Pelasgic fortifications, from the lintel of single stones resting on upright jambs, to the overlapping of the stones until they reached each other, in the form of a triangle, as in the gates of the lions, the entrance into the treasury of Atreus, &c. But the most remarkable monument is the subterranean chamber: complete plans and sections of that extraordinary building are given by Mr. Donaldson in the supplement to the "Antiquities of Athens," from which it appeared to have been constructed in the form of a parabolic cone, of 48 feet in diameter at the base, and 44 feet 6 inches in height, by means of rings of regular masonry, overlapping each other until they reached the apex, where the aperture was closed by a flat stone. From this and other buildings of a similar kind, there is reason to infer that the ancient Greeks had very imperfect notions of the arch. As Mr. Kinnaird, in his "Description of the Antiquities of Delos," gives a representation of a portal or gateway on the ascent of Mount Cynthus, formed to support the wall of the ancient fortifications. The entrance was constructed with ten large stones inclined to each other, like those at the aperture into the great Egyptian pyramid. It was perhaps the earliest specimen of Pelasgic architecture in Greece, displaying the first step towards the principle of the arch. That it was known by the Etruscans seems evident from the remains of arches and bridges now existing in the country of the Volsci, in Italy; and the researches of travellers in that country, within the last few years, have brought to light many curious examples, anterior to the period of the Cloaca of Rome, and the tunnel of Albano by Aneus Marcius. Mr. Ronnie is of opinion, from his examination of the subject, that there exists no sufficient evidence to establish the knowledge or use of the arch among the Greeks.—*Railway Chronicle*.

**INDESTRUCTIBLE CARBONIC PAINT.**—A patent has recently been taken out in America by J. Weisman, of Philadelphia, for an indestructible anti-corrosive pigment. The patentee says:—"The nature of my invention consists in combining the metal of carbon, or purified graphite, with caoutchouc and shellac, together with a small portion of acetate, or sugar of lead; the ingredients being mixed with linseed oil and spirits of turpentine." *Claim*:—"What I claim as my invention, and desire to secure by letters patent, is the combination of carbon, or pure graphite, with caoutchouc and shellac, together with acetate of lead, linseed oil, and spirits of turpentine, for the purpose set forth, forming a perfectly indestructible anti-corrosive pigment, which also serves the purposes of anti-abrusion."—*Franklin Institute*.

**THE SMOKE NUISANCE.**—Manchester is to be reformed as to its smokiness. It seems that last session an Act was passed by Parliament imposing a penalty of 40*s*. a week on all furnaces in Manchester and Salford that should not, after the 1st January next, consume their own smoke; and at a recent meeting the town council undertook to enforce the Act. Some manufacturers have already adopted a very simple and efficacious contrivance for the purpose by driving a stream of atmospheric air into the furnace.

**TWO NEW POLICE COURTS.**—An order has passed the Privy Council appointing Monday, the 30th instant, as the day when the Union Hall Establishment will be removed to the new court at Stones-end, Borough; and that of Lambeth-street, Whitechapel, to the one just finished in Kennington-lane. A considerable change has been made in the districts attached to each of the metropolitan police-courts.

**NEW SESSON COLLEGE, EDINBURGH.**—The college for the new session from the Established Church of Scotland is to be in Edinburgh. The sum required was 20,000*l*, and 19,000*l* of this sum has been raised from as many subscribers of 1,000*l* each.

**PROPORTION OF HOUSES TO POPULATION BETWEEN THE UNITED STATES AND ENGLAND.**—The total number of houses in the United States is 1,300,000, while in England we have 819,117—not half the quantity in proportion to the population.

**PATENT SELF-ADJUSTING RULER.**—The round common rulers necessarily soil the paper upon which the pen acts, by transferring the ink to it. To obviate this inconvenience, a Mr. Schlesinger has invented a ruler which he very properly calls self-adjusting, in which the revolving part is concealed under a brass barrel, so that the pen slides and leaves the ruler perfectly clean and free from ink. This improvement is so manifest, not only for the advantage it affords in point of cleanliness and the superior accuracy it gives in parallel ruling, but for the speed with which it is used in shading drawings. On the side opposite the brass barrel is a scale for pencil ruling, divided into inches and parts, and true as a parallel ruler.

**IMPROVEMENTS IN SUMMERLAND.**—The Lords of the Treasury have granted 750*l.*, part of the Parliamentary grant for public works, &c., to the corporation of Summerland, in aid of a plan for providing a place of recreation for the inhabitants, the only condition of the grant being, that the ground, when purchased, shall be legally and permanently secured as a place of recreation for the people. It is intended by purchase and by out-building-hill. The estimated cost is about 3,000*l.*, the remainder of which will be raised by public subscription.

**STRASBURG CATHEDRAL.**—The *Presse* states that the belfry of the Cathedral of Strasburg has deviated considerably from its perpendicular within a short time, and has inclined more than 6 feet, calculating between the elevation of the summit and the base.

### TENDERS.

**TENDERS** delivered for Works proposed to be done at Forest Hill in Alterations and Additions to the House, and in the Erection of a Lodge and Stable, for—Dimmock, Esq.—Mr. Porter, Architect, Bermondsey.

Messrs. King and Co., Islington £1,520  
Mr. Jay, London-wall . . . . . 4,132  
Messrs. Young . . . . . 4,120  
Mr. Plimmer . . . . . 4,970

The quantities collected and supplied to the builders, the tenders opened in their presence.

### NOTICES OF CONTRACTS.

For the supply of 6,000 tons of Iron Rails, each rail to be 16 feet in length, and weighing 65 lb. per yard.—H. Parker, Secretary to the Great North of England Railway Company, Darlington, Dec. 23.

For making a Sewer in the Town of Cambridge, to be cylindrical and 2 feet diameter in the clear, length about 385 yards, average depth about 9 feet.—Frederick Randall, Clerk to the Commissioners, Cambridge, Dec. 26.

For the several works in the erection of the East and North Walcot Dispensary, Bath.—Mr. H. E. Goodridge, Architect, 7, Henrietta-street, Bath, December 28.

For the execution of Works necessary for the completion of the whole of the Railway from Shoreham to Chichester, being a distance of about 22½ miles.—Frederick Oley, Secretary, Brighton and Chichester Railway Office, 4, Dean-street, Tooley-street, December 31.

For a supply of Iron Rails and Chain.—William Taylor, Secretary of the Great Southern and Western Railway, 3, College-green, Dublin, December 31.

For the erection of an Organ in the City Hall of Glasgow, cost not to exceed 1,500*l.*—Mr. G. W. Muir, Glasgow, January 1.

For Re-pewing Leverington Church, near Wisbeach.—The Rev. Henry Jackson, Leverington, or Mr. W. Adams, Architect, Wisbeach, January 7.

For Four Locomotive Engines and Tenders.—George King, 62, Moorgate-street, January 8.

For a Survey Plan and Valuation of the Township of Kimberworth, in Rotherham Yorkshire.—Mr. George Taylor or Mr. Richard Rhodes, Overseers of the Poor, January 8.

For taking down the present Bridge at Carrick-on-Shannon, and constructing a Stone Bridge of five segmental arches, with its approaches; building quays and harbour, forming wharfs, and deepening the bed of the river.—Edward Hornby, Secretary, Shannon Commissioners' Office, Custom-house, Dublin, January 8, 1845.

For completing the Railway from Bishopstoke to Salisbury.—Alfred Morgan, Secretary, Nine Elms Station, Vauxhall, January 10.

For the erection of the Railway Works between Leeds and Bradford, including fencing, earthwork, masonry, roads, and permanent way.—William Clarke, Secretary, Hunslet-lane Station, Leeds, January 27, 1845.

For the execution of Works on the Chester and Holyhead Railway.—1st. A distance of eighty miles, or thereabouts. 2nd. A distance of twenty-two miles, or thereabouts. 3rd. A Tunnel through the promontory of Penmaen Beck, near Conway.—George King, Secretary, 62, Moorgate-street, January 29, 1845.

For the supply of 11,000 feet of nine-inch cast-iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolari, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta, March 31, 1845.

### COMPETITIONS.

The Committee of the Association recently formed in the Metropolis for the Construction of Baths and Wash-houses for the Labouring Classes, are desirous of obtaining Plans and Estimates for the Erection and Fitting-up of the First Establishment. The general basis of the plan can be seen at the Office, No. 3, Crosby-square. The author of the plan considered the best by the Committee will be selected to execute the work.

Plans for an Agricultural College to be erected at Cirencester, to accommodate 200 pupils and 6 tutors. The style is left to the taste of the architect. A Premium of 10 Guineas to the author of the most approved plan.—Robert J. Brown, Esq., 110n. Sec. Cirencester, January 1.

Plans and estimates are required for a Pauper Lunatic Asylum for the County of Somerset; the building to accommodate 300 patients, and to contain two Stories. The Committee of Visiting Magistrates wish it to be of a plain, cheerful character, but will not further fetter the architect by suggesting any particular arrangement as to the interior, its ventilation, warming, or otherwise. The ground selected contains 36 acres.—The Clerk of the Peace, Taunton. A Premium of 100*l.* will be adjudged for the best plan, and 50*l.* for the next best.

The directors of the Manchester and Birmingham Railway Company have offered a premium of 20 Guineas for the best design for Carriages suited for excursion trips and for private parties.

### TO CORRESPONDENTS.

Communications have been received from the following, and are under consideration—"An Amateur," on a new Material for making Bricks—"T. H. Cash," on Window Glass—"An Old Subscriber," on the best Method of Book-keeping for Builders—"A Subscriber," on Perforated Zinc—"A Regular Subscriber," on the Reading Competition—"A Subscriber from the First," on the Various Styles of Architecture—"T. P.," on the best form for Pot Kilns for common red-ware—"W.," enclosing a sketch of a Chapel lately erected at Byers-green, Durham.

"Ignis."—We have not seen either the "Fire Annihilator" or a description of it; the patent, we believe, is only just enrolled.

"Economy and Improvement."—The Manchester Corporation cleared upwards of 30,000*l.* during the past year by supplying the inhabitants with gas. The profits have been, or will be, applied to local purposes.

The Minutes of Proceedings of the Institution of Civil Engineers have been received.

"A Heretofore Builder" wishes to know where "Vitrious Cloth," and "Jeffery's Patent Marine Glue," can be obtained.

### APPROACHING SALES OF WOOD, &c.

BY AUCTION.

January 7, 1845.—At the Hall of Commerce, Threadneedle-street; 1,225 logs of St. Domingo Mahogany of superior quality and large dimensions.—Thomas Edwards, Broker, 1, Pinner's-lane, Great Winchester-street.

January 17, 1845.—At Garraway's Coffee-house, Cornhill; 10,000 Baltic and Swedish Deals and Batten; 10,000 Colonial Yellow Pine and Spruce Deals.—E. D. Warrington, broker, 15, New City Chambers.

BY TENDER.

Pear, Apple, Plum, and Cherry Trees now growing on the site of Victoria-park, being together 683 Trees.—Particulars of each lot may be had at the Office of Woods and Forests, 2, Whitehall-place, and at Mr. John Greig's, Hackney-wick, who will also show the trees. December 31.

### MEETINGS OF SCIENTIFIC BODIES

During the ensuing week.

MONDAY, December 23.—Geographical, 3, Waterloo-place, 8½ P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 24.—Zoological, Hanover-square, 8½ P.M.

### ADVERTISEMENTS.

**TILE TILES** to suit slate roofs in colour; Ridges, with plain or related joints, roll tops, and vertical ornaments; drains, many sizes, with plain or angular joints; paving, in courts, passages, &c., different colours; roofing, in Grecian or Italian styles; other colours also, or plain; conduits, which do not require pure water; fire-bricks and tiles; chimneys, and cast-iron paving; sundry wall-coping, garden-borders, chimney-tops; also tular and other fines of peculiar material. No agent, but a depot at WHITEFRIARS, and 22, WAPDRILL-LANE, FLEET-STREET, LONDON, under Mr. PEAKS' post, usual care, to some genuine FERRO-METALLIC ANS at 4*l.* per piece as per quality.

The TIGERIES, TUNSTALL, STAFFORDSHIRE, are near the centre of England, whence boats are sent direct to any inland place, or to the Mersey for the coast, the colonies and elsewhere.

TO ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASON, AND PLASTERERS, MR. QUANTER, SHIPPERS, AND THE PUBLIC IN GENERAL.

**JOHNS AND CO'S PATENT STUCCO CEMENT.**—The following are the positive advantages possessed by this invention over every Cement hitherto introduced.—It will effectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any building covered with it. It is closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Seaside. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, such as Wood, Iron, or Glass. It will cure a large Proportion of Sand than any other Cement. It matures by age, and becomes perfect when other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the inner Walls of new Houses, which may be plastered over or painted directly. Roofs laid or pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it. The Instructions for use are printed and sold with it. The first cost of this material does not exceed that of the cheapest Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy.

Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred.

Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to JOHN AND CO., Agents for the Patent, 4, Baldwin-lane, Queen-street, Cheap-side, London; of whom also may be had,

**JOHNS AND CO'S PATENT STONE COLOUR STUCCO PAINT** expressly intended for Pointing over exterior Walls of Houses that have been covered with Roman or other Cements, and which have become dirty and discoloured. It is in every way better suited for this purpose than White Lead Paint, which will invariably erode, off in flakes, being in direct chemical opposition with Cement; whereas MESSRS. JOHNS AND CO'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the surface, and thereby rendering the wall perfectly weather-proof, and in the finish producing a pure stone-like effect, procurable by no other Paint whatever. It is cheap in its application, and may be used by any Painter, in any climate, even in the most exposed Marine situations.

### SEYSSSEL ASPHALTE COMPANY.

"CLARIDGE'S PATENT."

ESTABLISHED 1838.

**THIS ASPHALTE** is a Bituminous Limestone, obtained from an inexhaustible Mine at Pyromont, in the Jura Mountains.

Previously to its introduction into this country, in 1838, the Material had been used for many years in France, and its great utility was extensively patronized by the Government of that Country.

Among the various uses to which it can be applied, the following may be enumerated:—in the Carriage Approach to Stations, Garden-walks, and Terraces; the flooring of Kitchens and other basement offices; also of Coach Houses and Stables, Dog Kennels, Barn Floors, Cow Houses, Pigeon-holes, and other Buildings, and Stables. For Roofing, Covering of Railroad and other Arches, the Lining of underground Cellars near Rivers to prevent the ingress of the Tides; also in Covering the ground-line of Walls, to prevent damp rising from the application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts, thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Dock, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For Lining of Tanks, Fish-Ponds, and other Hydraulic works.

J. FARRILL, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," Stangate Depot, London.

COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS. THE DIRECTORS OF THE SEYSSSEL ASPHALTE COMPANY have much pleasure in recommending to the notice of Architects, Builders, and others, the application of THE ASPHALTE OF SEYSSSEL as the only effectual means of preventing DAMP rising in WALLS.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18.

"In 1830 I superintended the construction of a house of three stories on the Lacépede. The foundation of the building is constantly in water, about 19½ inches below the level of the ground-floor. The entire horizontal surface of the external and internal walls was covered, at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

"Since the above date no trace of damp has shown itself round the walls of the lower story, which are for the most part painted in oil of a gray stone colour. It is well known that the least moisture produces more or less of spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 2½ inches above the external surface of the soil, and only 19½, at the utmost, above that of the level of the water.

"The layer of Asphalt having been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp have been seen, marked at the base of the door-posts."

# The Builder.

No. XCIX.

SATURDAY, DECEMBER 28, 1844.

WO years have passed away since we committed the first Number of our Journal to the public, and we have striven

during that time, we hope not vainly, to improve its efficiency and render it more and more worthy of its purpose and the kind and growing favour with which it was received. Its circulation and influence have become great, and we might perhaps be pardoned if, pointing to some of our later articles, and to the

illustrations, we indulged in certain self-congratulations. So far, however, from this, or from being in any degree disposed to relax in our endeavours and remain satisfied with *THE BUILDER* as it is, we have been actively engaged in making such arrangements for the ensuing year, as will enable us to set before our readers earlier and more varied information, and to increase in many other ways its value. We have obtained the assistance of a gentleman well known for his energy and professional ability, and will spare no pains to render this journal complete in all respects. Of the intentions of our editor we shall not speak now, leaving him to set them forth at length in the ensuing Number. Suffice it to say that they are more extensive than we have yet avowed, and cannot fail to interest a larger class of readers.

The proceedings of the various societies connected with architecture, practical science, and art, especially of the Royal Institute of Architects, will be carefully reported by one moving amongst them, and acquainted with their working, so as to present in our journal a faithful record of their proceedings (and it will be the *only* one), which may safely be referred to hereafter.

We have now only to offer our grateful thanks to friends and correspondents; and, with a confident hope that they will rally round us with increased numbers, respectfully wish them, and assure for ourselves,

A Happy New Year.

## SOCIETY OF MASTER CARPENTERS.

A MEETING of this society was held at the Freemasons' Tavern, Great Queen-street, last Monday evening, for the purposes of electing officers for the ensuing year, and taking into consideration a petition to Parliament to abolish the window-duties, or to so modify them as to lead to a better system of ventilation. Mr. Biers, the president, took the chair, and was supported by Mr. Sparks, the vice-president. With the exception of the treasurer and the auditors, no alteration was made in the election of officers. Mr. Higgs was appointed treasurer in the room of Mr. Lever, from whom a

letter was read, stating that after having served the society to the best of his ability for a period of thirteen years, severe ill health at last compelled him to tender his resignation. Several members present spoke in very complimentary terms of the way in which Mr. Lever invariably discharged his duties. A vote, expressive of the regret which the society feel both as to the resignation and the cause which led to it, was unanimously passed, and, as a testimony of the highest respect, Mr. Lever was elected an honorary member. The auditors chosen were Mr. Stephen, Mr. Burstall, sen., Mr. Locke, and Mr. Gooch.

Mr. Biers introduced the subject of the petition above referred to in a long and able speech, pointing out the evils which spring from the present system of window duties, which press with particular severity upon the labouring classes, and expressing a firm belief that an alteration for the better would take place during the ensuing session, if means such as they were then about to carry out were generally adopted. Several members joined in the discussion, particularly Mr. Stephens, Mr. Burstall, sen., Mr. Locke, Mr. Thomas Ridge, Mr. Higgs, and Mr. Gooch; after which the following petition was determined upon, and at once received the signatures of all present:—

"To the Honourable the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled.

"The petition of the undersigned Master Carpenters and Builders residing in and near the metropolis,

"Humbly sheweth,

"That your petitioners are desirous of adopting every improvement in construction which may tend to promote the healthfulness of dwelling-houses, in accordance with the valuable evidence laid before your honourable House by Sanitary Commissions, but that your petitioners have daily reason to observe that a fatal obstacle exists to the improvements most needed, in the present mode of assessing houses to the window duties.

"That the window duties, as now assessed, operate as a premium upon defective construction, the occupier having a direct interest in blocking up every opening intended for the admission of light and air that can possibly be dispensed with, to lessen the burden of taxation.

"That under the existing system, an unglazed aperture only 7 inches wide cannot be made for purposes of ventilation in a cellar in London without the payment of an average duty of 8s. per annum, although such an opening is now permitted to be made free of duty in the town of Liverpool, by a local Act of last session, 7 & 8 Vict. cap. 51.

"That your petitioners are deeply impressed with a conviction that the influence of light and air are intimately connected with the moral as well as the physical state of the whole population. That the exclusion of light is unfavourable to habits of personal cleanliness, and that the crowded lodging-houses of the poor become necessarily abodes of disease when rendered by fiscal enactments gloomy receptacles of dirt.

"Your petitioners therefore pray your honourable House to put an end to the serious evils arising from this cause, by either a repeal of the window duties or by such a limitation of their present burden, that taxation may no longer keep pace with improvement, and that there may be no check or hindrance to the construction of light, cheerful, and well-ventilated dwelling-houses for any class of the community.

"And your petitioners will ever pray, &c."

## BUILDING SOCIETIES.

### LETTER IV.

BY WILLOUGHBY WILTON.

My first letter\* on these societies was founded on data which supposed that the borrower paid no more than the surveyor's valuation of the premises, to wit, 315*l.*: that the buyer or borrower took 41 shares at 70*l.*, which he was to liquidate in ten years by monthly instalments of 3*l.* 3*s.*, and a ground-rent of 5*l.* a year. It assumed besides that 100 capitalists and 100 borrowers constituted the society:

and at the end of ten years it shewed a profit of 20*l.* with 5*l.* a year for ground-rent to each of the capitalists.

I purposely omitted in that letter the calculation of the bonus of 50*l.*, which the borrower gave to the capitalists; but in my second letter\* I included the bonus in the calculation, and shewed that the "debtor-speculator" would be compelled to continue his subscriptions for seventeen years and two months, before he could get rid of his obligations to the "Metropolitan," or any other building society; and in that time his repayment of 480*l.* would amount to 889*l.* in the hands of the capitalists; and that he would thus pay the capitalists "twenty-two years and nine months' rent" for the pleasure of being his own landlord.

My third letter touched upon the "London and Westminster Provident Association and Savings' Fund;" and demonstrated that the borrower does not participate in the profits, but is compelled to allow usurious discount to pay an illegal rate of interest; and also to incur liabilities which no prudent man would knowingly risk; and, as in the former, that these societies cannot terminate in ten years.

I had founded all my calculations upon the data furnished by the Prospectuses of these loan societies; and my third letter was in type before I had read any of the numerous pamphlets that have been published for and against these building societies, save and except some notices of them which appeared in *THE BUILDER*, and for which I refer my reader to the particular numbers in which those notices are to be found.

I have endeavoured to reduce the question to one of figures; and if I have uttered a hard word against these societies, its appearance was not required to guarantee the representations which the doctrine of numbers made of the statements exhibited in the prospectuses.

I must now advertise the reader that in these societies, as at first established, the shares were fixed at 150*l.*, in conformity with the Act of Parliament; the monthly subscriptions were 1*l.* a month per share; and when there was money in hand, a meeting was called, and any shareholder wishing to purchase property sent in a tender, stating how much less than the *ultimate* value of his share he would take in consideration of receiving immediate payment; and the tender offering the largest discount was entitled to the preference; the property was purchased, and mortgaged to the society, the shareholder kept up his subscription of 1*l.* per share monthly until these, with their profits, amounted to 150*l.* per share, when those members who had not borrowed received the 150*l.* also. The deeds were then given up, and the society, the mortgages having been paid off, was dissolved.

I understand that in the manufacturing districts, some of these societies did well, and closed their transactions in ten years. But this success raised up new societies, in which the shares were fixed at 120*l.*, and the monthly payments at 10*s.*, and it has been to these last I have hitherto directed my attention, and to these I shall still confine my remarks. Now, while it is perfectly true that a monthly subscription of 1*l.*, if improved at 5 per cent. compound interest for ten years, would be sufficient to meet the loan of 150*l.*, it is equally fallacious to assume, as the prospectuses do, that when the shares are reduced 4*th*, and the monthly payments 3*rd*, the societies can close in ten years, but must endure the full term which the figures give in my second letter. The position of those members who do not borrow, but allow their monthly payments to accumulate on the principle of compound interest until these and the profits from the borrowers make their shares 120*l.*, requires no illustration—there is to them a certainty of profit without difficulty or risk; they pay 10*s.* a month per share for a period of from nine years and two months, says "COMMON SENSE," and are then to receive 120*l.* per share, or interest at the rate of about 20 per cent. per annum on the money paid in. This is the share received by gentlemen well known for their ability and habitual caution,—who will not neglect their duty in a speculation from which such enormous profits are to be realized,

\* *THE BUILDER*, No. 96, pp. 601, 602, 603.  
† *Ibidem*, No. 99, pp. 623, 626, 627.

—who must know that the borrower cannot purchase a house in ten years for 98*l.* more than he would have paid in rent in that time,—who require security for the nominal value of the 4*l.* or 8 shares a man may purchase, each at 12*0l.*—who declare the borrower's deposit of 1*l.* per share forfeited if he is unable to complete his purchase. Now, as the only security which the Act of Parliament contemplates is the property bought, it is plain, these societies are not *building*, but *loan* societies; they cannot benefit the necessitous, nor enrich, or even assist the industrious man in obtaining a small property: for if he take 8 shares at 12*0l.* each, he bargains for 96*0l.*: if he allow discount 5*0l.* per share, he takes 48*8l.*, and the property bought with this his mortgages, and lends sureties for the payment besides of 472*l.* to the capitalists, or members who do not take up their shares. Here, then, it appears that the Act of Parliament is set at naught, and that these societies are *loan*, not *building* societies. Thus, without attempting to balance the account, the transactions are epitomized:—

8 shares at 12 <i>0l.</i> each	£960 0 0	20 annual payments of 48 <i>l.</i>	£960 0 0
Discount, 5 <i>0l.</i> per share	472 0 0	Or 14½ years' subscription of 48 <i>l.</i>	696 0 0
Balance borrowed	£488 0 0	Ditto of interest at 10 <i>l.</i> 4 <i>s.</i>	278 8
Subscription on 8 shares at 6 <i>l.</i> each	48 0 0	Total sum paid	£974 8
Interest on ditto, or redemption money 2 <i>l.</i> 8 <i>s.</i> each	19 4 0	Less sum borrowed	488 0 0
Total annual payment	£67 4 0	Leaves a sum of £486 8	paid above the sum which had been received.
Subscription of 48 <i>l.</i> in 10 years' interest at 10 <i>l.</i> 4 <i>s.</i>	480 0 0		
10 years' interest at 10 <i>l.</i> 4 <i>s.</i>	192 0 0		
Total payments for 10 years	672 0 0		

It is abundantly manifest from this rough estimate, in which I have not looked at the improvement of the monthly contributions, as in my second letter, that these societies are *loan*, not *building* societies, and cannot terminate in ten years. If, however, a member wishes to close his dealings with the directors at the end of one year, to redeem the mortgage, on which he has borrowed 48*8l.*, he can do so by paying 912*l.*, which, with the year's subscription of 48*l.*, will make 960*l.*, which is the full amount expressed to be secured in and by the mortgage. This statement has been controverted; but its truth appears indisputable. The borrower, however, would gain little, even if his first year's subscription were allowed him.

Moreover, I have learned that members holding unpurchased shares, who withdraw during the first four years, not only do not receive any portion of the profits, but incur a forfeiture by so doing; for if the borrower fail in his monthly payment, call it 5*l.* 12*s.*, he is fined as follows:—

	Non-payment of subscription.	Non-payment of interest.	Total of fines.
	£. s. d.	£. s. d.	£. s. d.
1st Month	0 4 0	0 2 0	0 6 0
2nd do.	0 12 0	0 6 0	0 18 0
3rd do.	1 8 0	0 14 0	2 2 0
4th do.	2 12 6	1 6 3	3 18 9
5th do.	4 4 0	2 2 0	6 6 0
6th do.	6 4 0	3 2 0	9 6 0

And it appears by the rules of these societies, "Should the borrower neglect to pay such fines until they amount to 12*s.* per share, he shall be chargeable with an additional fine of 1*s.* per month per share until the same amount to 20*s.*, and afterwards with a fixed fine of 2*s.* 6*d.* per month per share on such arrears until liquidated."

"Half of the above fines to be imposed for the non-payment of interest."

Here is a pretty smart series which I will leave the managers of these societies to answer for, reminding them that about 113 years ago, there flourished a "CHARITABLE CORPORATION," whose professed intention was to lend money to the poor at legal interest, upon small pledges, and to persons of a higher rank upon proper security, but the cashier, who was member for Marlrow, and the warehouse-keeper disappeared in one day; 500,000*l.* was lost to the members—the petitioners were reduced to extreme distress—for the deluded masses now came to Parliament—a secret committee investigated the matter—many persons of rank and quality

were implicated in "this infamous conspiracy," and no fewer than six members of Parliament were expelled for the "most sordid acts of knavery." It is often said there is no evil to the person, or property, or character of individuals in "happy and merry England," for which there is not a remedy. I will not now venture my opinion on the foregoing quotation, but state what the fixed fines will amount to in six months, on a monthly payment of 3*l.* 12*s.*, as I find them in the little work referred to above; merely observing that these fixed fines are exclusive of ordinary fines and additional fines.

	Non-payment of subscription.	Non-payment of interest.	Total of fines.
	£. s. d.	£. s. d.	£. s. d.
1st Month	1 0 0	0 10 0	1 10 0
2nd do.	2 0 0	1 10 0	3 10 0
3rd do.	5 0 0	3 0 0	8 0 0
4th do.	10 0 0	5 0 0	15 0 0
5th do.	15 0 0	7 10 0	22 10 0
6th do.	21 0 0	10 10 0	31 10 0

I venture to assert now that no borrower who has once fallen into arrear with his payments can ever overtake this increasing series; people talk of screws having so many threads to the inch; how much is the gain per cent. in this score of fines? But there is a remedy for this, for the rules provide that if the borrowers neglect to make these payments for six consecutive monthly nights the society may—nay, are to—take possession of the property mortgaged as security, absolutely to sell the man's "freehold," and "out of the proceeds, in the first place, discharge all costs, charges, and expenses incurred; secondly, reimburse the society all subscriptions, fines, and other payments due, owing, and payable under and by virtue of the rules, or mortgage deed, or both; and the surplus, if any, is to be paid to the borrower."

The borrowers have no voice in this or any other question which may be agitated, resolved on, or carried into force by the lenders; for as soon as a member has borrowed money—

"He shall be deemed to have withdrawn from these societies in respect of any share or part of share he may have purchased, and shall cease to have or take any interest therein; but shall, nevertheless, be subject to those rules as a member."

He is repudiated if he show his face to speak or vote, or use the privileges of the members who remain lenders; and if he fail in six payments his "castle" is sold, and all his fine speculations end in the words of Adam—

—"Yet well if here would end  
The misery; I deserved it, and would bear  
My own deservings; but this will not serve;"

and, lifting up his eyes, he sees the only house in which to seek shelter—the *union workhouse*.

It is shewn above that an annual payment of 48*l.* as for subscription for ten years, and interest or redemption money of 19*l.* 4*s.* per annum, will in that time amount to 672*l.*, as the sum paid by the borrower; but if the lenders improve the monthly contributions of 5*l.* 15*s.*, or the 12ths of 67*l.* 4*s.*, for 120 months, at 5 per cent. per annum compound interest, they will make 857*l.* 8*s.* out of the borrower's contributions, which gives a profit of 185*l.* 8*s.* 1*d.* And suppose the lenders consider that the borrower has paid 672*l.* in ten years, he will still have to pay 285*l.* But this is not the proper view of these 14½ years' subscription of 48*l.* a year, and 19*l.* 4*s.* of interest. These items, amounting to 67*l.* 4*s.*, improved for 14½ years at 5 per cent. compound interest, will give the lenders the sum of 1,395*l.*, or thereabouts; the payments being 5*l.* 15*s.* for 174 months consecutively.

This is the true and legitimate way of viewing the question; and I recommend the Lord Chief Justice of the Court of Common Sense to call the attention of the "counsel for the plaintiffs" to this point when the examination of the witnesses shall be undertaken.

Hence, I infer, the counsel for the plaintiffs in this court are below the mark by the sum of 421*l.*; and this makes all the difference in the improvement of money, in which the borrower is *tax et præterea nihil*.

There are yet some nice points to be considered in regard to the way in which interest is charged and paid, which I reserve until another opportunity.

DESCRIPTION OF THE IRON SHED AT THE LONDON TERMINUS OF THE EASTERN COUNTIES RAILWAY.

By WILLIAM EVILL, Jnr., Grad. Inst., C.E.

(Read at a Meeting of the Institution of Civil Engineers.)

This station, which was commenced in 1810, and has proceeded in its present state, as the funds of the company permitted, contains the engineering, directoral, booking and other offices, of the joint companies of the Eastern Counties and the Northern and Eastern Railways:—

The trains of each company run on the same line for upwards of three miles; the Northern and Eastern Railway branching off from the Eastern Counties at Stratford.

The station is entirely built on arches; those supporting the columns of the roof are semi-circular, each of 25 feet span, and consist of five rings of brickwork. They are detached from the arches supporting the station, in order that they may not be affected by the vibration caused by the trains.

The station itself forms three sides of a rectangle, inclosing the shed on the north, south, and west sides; the trains running into the shed from the east.

The shed consists of three elliptical roofs of corrugated iron supported on columns. The span of the centre roof is 36 feet, with a rise of 9 feet; the height of the springing line, above the rails, is 22 feet 6 inches. The span of each of the side roofs is 20 feet 6 inches, with a rise of 4 feet; the height of the springing line being 17 feet. The entire length of the shed is 230 feet.

There are two rows of seventeen cast-iron columns on each side. The columns are 13 feet 9 inches apart, and are connected immediately over the capitals by a cast-iron elliptical open girder, ¾ inch in thickness. On this girder runs a gutter, also of cast-iron, from which the sides of the roof spring. The other sides rest on a cast-iron gutter, let into the brickwork of the station, supported by iron brackets, and strengthened by wrought-iron tie rods, running down through the brickwork.

The columns, which are continued above the first girder, are connected by cast-iron semi-circular open panelling, and from the gutter upon this the centre roof springs.

The corrugated iron is bolted to flanches running the whole length of these gutters. The columns are cast in two parts, the upper being let 3 feet into the lower part. Pieces are cast on the columns to let into the girders and panelling; thus, in connecting the columns with the girders, panelling, and gutters, no bolts whatever are used.

The base of each column rests on a stone, which is firmly hedged in concrete; the circular part is continued through the stone to the backing of the arches, where it is fixed in a cast-iron shoe. At the end of the shed the columns are doubled, and are cast stronger, as they support one wall of the building.

There are three lines of rails, with a gauge of 5 feet, under the centre roof, and one line of rails and a platform, under each of the side roofs.

The corrugated wrought-iron roof is composed of sheets of No. 16 wire gauge, or 7/16 inch in thickness. The arch is formed by curving the sheets of iron, in the transverse direction to the corrugated arches, and riveting them together longitudinally.

The weight per foot of the corrugated iron is 3 lb.; the whole weight of the centre roof, which measures 10,235 superficial feet, being scarcely 13½ tons, and each of the side roofs, which measures 5,495 superficial feet, weighs 7½ tons.

The roof is thoroughly drained, the water running down the curve of the corrugation into the gutters, and thence through the columns, to their base, whence drains are carried down the backing of the arches below and through the piers to the ground.

The roof was erected by Messrs. Walker and Sons, of Bermondsey, who purchased the patent of Mr. H. R. Palmer, the inventor and patentee of the corrugated iron, at a charge, including fixing, of 6*l.* 10*s.* per square of 100 superficial feet, the whole cost of the three

\* Building Societies.—Proceedings in the Court of Common Sense, p. 29.

roofs being 1,3657. They might, however, now be erected for nearly half that cost, as the patent has expired, and increased facilities for manufacture have been provided.

The castings were made by Messrs. Braithwaite, Milner, and Co., and the shed was designed by Mr. John Braithwaite, the engineer to the Eastern Counties Railway, and was erected under his superintendence.

Lightness and strength appear to be attained by the corrugation of iron, inasmuch as a single sheet, so thin that it will not stand alone in an upright position, will, after undergoing the process of corrugation, bear in a vertical position, upwards of 700 lbs. without bending. Its economy is manifest from the saving it effects in other materials usually used in building, and the roofs already erected appear to have tested its durability. This roof has stood perfectly firm, and is not in the slightest degree altered in form, although of a large span.

Many corrugated roofs have been erected. There is one of 40 feet span and 225 feet in length in the entrance basin at the London Docks; one in the St. Katherine's Docks, and others on the Birmingham, Great Western, and Blackwall railways; they are, it is understood, generally approved.

Mr. Palmer has lately taken out a patent for corrugated cast-iron, which is now being used for erecting a bridge near Swansea, in South Wales. It consists of three arches; two of them 48 feet span, and one of 50 feet span. This corrugation requires no riveting, as the joint is cast on the plate, and the construction of the bridge is stated to be much simplified by the use of iron in that form.

#### TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.

(Continued from p. 628.)

237. **FIR AND PINE.**—Near Astoria, in the territory of Oregon, eight miles from the embouchure of the river Columbia, exists a fir measuring 46 feet round and 155 feet high.

238. Another, on the banks of the Umpqua, measures 57 feet in girth, and is 246 feet high.

239. At Roseneath Castle, Argyleshire, there is, with many others of magnificent dimensions, a silver fir upwards of 125 feet high, and the stem of which, at 6 feet from the ground, measures 7 feet in diameter: another nearly equals this.

240. There has existed on the Inches at Aberdeen, beyond the memory of any living individual, an immense trunk of Deeside fir, girthing perhaps 25 feet at the largest part, and supposed to have been carried down the Dee by some flood, and hauled on to one of these little islands, which are now connected with the main shore.

241. There is a noble tree of Scotch fir growing on the estate of Brodie, in Morayshire, 15 feet in circumference.

242. There is a specimen of the Fir tribe worthy of notice in the main street of Yaxford, in Suffolk.

243. At Gordon Castle, a plank from an immense tree, some 7 or 8 feet wide, is kept in the hall, as a sample of Spey or Rotheniusdus growth.

244. Brindley said that Red Rign Deal, or Pine-wood, would endure as long as oak in all situations.

245. The trusses of the old part of the roof of the Basilica of St. Paul, at Rome, which were framed in 816, were sound and good in 1814, say a thousand years afterwards.

246. The large dormitory of the Jacobins' Convent, at Paris, lasted 400 years.

247. Pontey, in his "Forest Pruner," states that some natural grown Scotch fir was known to have been 300 years in the roof of an old castle, and was as fresh and full of sap as timber newly imported from Memel, that in fact part of it was actually wrought up into new furniture.

248. At Fulham Palace, there is in the garden a pinaster upwards of 80 feet high, and exceeding 12 feet in circumference.

249. **ORIENTAL PLANE.**—About three miles from Constantinople, in the valley of Bujik-dere, there is an example which measures 150 feet in circumference, and incloses a space 80 feet round.

250. Pliny mentions a plane tree in Lycia, the hollow trunk of which was sufficiently

commodious to afford a night's retreat to Licinius Mutianus and eighteen followers: the cavity measured 75 feet round, and the summit of the tree was likened to a small forest.

251. Flint, the distinguished geographer, mentions, under the appellation of Sycamore, an example near Marietta, Ohio, measuring 153 feet in diameter; also one which he had seen on the Big Miami river, apparently larger.

252. At Utica, in the State of New York, the hollow trunk of an enormous specimen was fitted up and used as a retail shop; afterwards it was carried to New York for exhibition, and is probably that which follows:—

253. A Number of the *New York Traveller* relates that "A Sycamore tree of most singular and extraordinary size has been brought to this city from the western part of this state. The interior is hollowed out, and will comfortably accommodate some forty or fifty persons. It is splendidly furnished as a sitting-room, and contains every article of elegance and usefulness. It has a handsome piano, sofas, glasses, and mirrors of fit and becoming style, and is decorated with pictures and fancy articles." An English journalist thinks it probable that the apartment was obtained in the lengthway of the trunk, the diameter of it affording a sufficiency of height from floor to ceiling.

254. Judge Tucker, of Missouri, fitted up an ample and convenient study from a portion of a hollow trunk, providing it with roof, stove, &c.: in this instance the building was regularly cylindrical.

255. Clark and others mention very large examples, and Mr. Quin, in his late voyage down the Danube, refers to one of vast dimensions.

256. Herodotus informs us that Xerxes when he invaded Greece, reposed a whole day under an enormous plane, with the colossal form and pleasant shade of which he was so much delighted that he encircled it with a collar of gold.

257. **POPLAR.**—Sir Thomas Browne, in mentioning the lime tree referred to in Art. 210, describes also a poplar near Harling, as of nearly the same dimensions.

258. In Hampton Court Park there is one 97 feet in height, and the branches of which are so great, springing, as they do, near the ground, that they give to the tree the appearance of a group: it is 14 feet in circumference.

259. **IVY.**—At Gizean, near Montpellier, Decandolle saw one whose trunk near the base measured 6 feet round, and the immensity of which, he says, was truly astonishing. If still in existence, this tree is computed at 41 centuries old.

260. Another, known to be forty-five years old, was but 7½ inches round; this was taken as the datum from which the age of the preceding was estimated.

261. The writer saw about twelve years ago, in the ruined castle of Rothsay, in the island of Bute, ivy of very strong and abundant growth; many of the stems, from recollection, being as much as 7 or 8 inches in diameter, and some of which had, when twigs, penetrated small crevices in the massive walls, and grown there till they rent the latter quite through.

262. See also Art. 221.

263. **OLIVE.**—In the Garden of Olives, at Jerusalem, there are now eight that are believed to be at least 800 years old, there being ancient documentary evidence which proves their having existed anterior to the taking of Jerusalem from the Saracens by the Turks in 1043; according to other authorities, however, all the trees near, during the siege of Jerusalem, were cut down, although most probably their roots, and among them those of these eight, were left undisturbed.

264. The largest mentioned in Italy by Poggio in *de Peseio*; this tree, according to Moschetti, must be 700 years old.

265. **CEDAR OF LIBANON.**—Some now growing there are said to be more than 30 feet in circumference, in 1787 they were supposed to be about 800 years old.

266. Pliny mentions its use in the temple of Apollo at Utica.

267. **MAHOGANY.**—About October, 1843, Messrs. Broadwood, the piano-forte manufacturers, gave 3,000*l.* for three logs, the produce of a single tree.—*BUILDER*, p. 496.

268. Honduras logs are occasionally as much as 5 feet square.

269. **PEAR.**—There is one growing in the garden of the parsonage at Homelacy, in Herefordshire, which once covered half an acre of ground; now it occupies an amazing space, the branches delving into the ground, taking root, and springing up into fresh trees, after the manner of the banana-tree.

270. **AGACIA.**—In the *European Magazine* for October, 1811, the Rev. James Willis, writing to Sir John Sineclair on this tree, says, "the largest growing in this country is on a bed of pure chalk, in the gardens of Whitsbury House, near Fordingbridge, belonging to Lord Shaftesbury."

271. **DRAGON-TREE.**—In the Island of Teneriffe, in 1822, a tempest laid prostrate a colossal and celebrated specimen of this tree, which measured 45 feet in circumference near the roots, and about 50 or 60 feet in height; and which gigantic dimensions it had attained as early as the fifteenth century. The trunk parted into many branches in a candelabrum-like fashion, each terminated with tufts of leaves; the tree had continued to bear fruit as well as leaves, and to evolve during the dog-days the deep red liquor called *dragon's blood*, which, when dried and become brittle by the atmospheric action, is vended by the apothecaries.

272. **ORANOE.**—It is stated that that in the convent of Santa Sabina at Rome was planted by St. Domenico in 1200; and that of Fondi by St. Thomas d'Aquinas in 1278.

273. **APRICOT.**—A fine specimen, planted in 1714, is growing in the garden of J. M. Deighton, Esq., Harston; it has a stem 3 feet in circumference, and bears an abundance of fine-flavoured fruit.

274. **ASH.**—One is recorded which was 24 feet in circumference, and another upwards of 40.

275. In Cohlham Park, Kent, two trees measured respectively, at 3 feet from the roots, 13 feet 7 inches, and 12 feet 3½ inches in circumference.

276. **MULBERRY-TREE, SHARPENERS.**—Perhaps some reader of *THE BUILDER* can contribute some information respecting this.

277. **BANIAN.**—See Art. 122, No. 91.

278. **ALDER.**—See Art. 90, No. 84.

*Erratum in Art. 181, 5th line.*—For "about 450," read "considerably above 300."

#### NOVEL PROPOSITION TO KEEP DOVER HARBOUR CLEAR OF SHINGLES BY MEANS OF STEAM.

It is manifest that the shingles forming the bar occasionally in front of Dover Harbour would be removed by a continuous torrent of water acting with a force against them exceeding that by which they were brought there, and that the present tidal force cannot be effective by any increase of water, because such force is limited by the tidal height, and by the time of the tide, and is doubly diminishing force—first, in its advance and descent to the points of its operation, and secondly, by the opposition of the reflux of the tide in its rise after the ebb; and that the force of the ebb water at mere tidal height can never be equal to the influx water at the same height, augmented by winds and currents.

It is also manifest that a force exceeding that which brings the shingles in the front of the harbour's mouth could be obtained by steam-engines with a system of pipes, stop-cocks, and valves, to be served with the penned water, and could be made to operate successfully in keeping the entrance of the harbour clear; and consequently, that the depth of the outer harbour, now left dry at low water, would be thereby augmented. For example, if the 380 yards of cast-iron pipe, 7 feet in diameter (which, at 11*l.* per ton, cost 10,000*l.*), when taken up, had been laid at a depth of two or three fathoms below low water, in lengths, radiating from a steam-engine power fixed on the south-western pier head, or if pipes at such a depth had been added to the present sluices, and a stream of water forced by steam power through them with a velocity several times greater than that of the tide and currents, there would not have been any cause for the recent memorials to the Warden of the Port and to his assistants.

It has been proved upon the best evidence, that an extension of the south-western pier into three or four fathom water at low water,

would screen off the south-westerly gales, and cause the shingles in their tangential passage round the pier so extended to go in the direction of Hope Point, and that a breakwater refuge for shipping would be thereby effected in storms. By such a work one side of a refuge harbour would be provided. The only objection started to the extension of this pier has been the difficulties of getting vessels to sea with the winds from the southward and eastward. The question at issue is that of getting vessels into the harbour, not out to sea.

It is suggested, as a preliminary to any works in front of the harbour, that soundings at equal distances from the coast, in the fronts of the harbour and parade, in the direction of fixed lines, marked out by stationary posts, set out by certain bearings of the compass on the shore, to the extent of eight fathoms water, should be taken at various times of winds, tides, and seasons, and registered on blank maps prepared with the compass, bearing lines, and points of distance drawn on them; by which proceeding it is thought that some knowledge might be obtained of what should be done, and much expense in speculative projects avoided. Sketches of such blank maps, with the compass direction of the lines, would be acceptable. If such maps, containing the soundings taken in the manner before mentioned, were seasonably, and tidably, with the various winds, published, they would be as useful maritimately, as with reference to the works necessary to remedy the defects of the entrance to this harbour.—*Correspondent of the Dover Chronicle.*

#### IMPROVEMENTS IN THE TOWER OF LONDON.

This ancient fortress is about to undergo extensive alterations and improvements. A new grand entrance will be made facing Upper Thames-street, and will be approached by a drawbridge. The Warders'-hall, now fronting the Stone-kitchen, is to be destroyed, and a new one to be erected, which, together with the ticket-office and guard-room, will form the buildings at the grand entrance. The two archways almost at the extreme eastern end of the fortress, leading to what is termed the Irish barracks at the south-east angle, are to be removed. The entire row of buildings on the opposite side of the way is also to be demolished, and the whole space of the rampart wall will be cleared away. The houses fronting the barracks in a line with the King's Arms public-house, about forty in number, are to share a similar fate. The alterations intended immediately adjacent to the grand parade are equally extensive. The houses on the right, after passing under the Bloody Tower to the parade, now the residence of some of the warders, will be destroyed, also the guard-room; all the buildings contiguous to the White Tower are to be swept away, so as to throw that interesting and stately structure open to the view of the spectator, many of its beauties being hidden by the unsightly buildings that are attached to it. On the ruins of the grand store-house is to be erected a magnificent building for the accommodation of 500 soldiers, the style of which is to be in strict keeping with the White Tower. Extensive excavations are now going on in order to secure a good foundation, for which purpose the whole of the burial-ground attached to St. Peter's ad Vincula has been devoted, the bodies therein having been removed and deposited in a spacious vault. Some of the buildings to the west of the parade are to be pulled down to make room for more substantial erections. The houses on the terrace, known as the Map-office, are to be used as officers' residences, the roofs of which will be made to correspond with the White Tower and the intended new barracks. The Beauchamp Tower, which stands on the west side of the parade, will be thrown open to public view, and when the records are removed to the New Houses of Parliament, the White Tower will be open for public inspection.

ST. MARTIN'S CHURCH, HEREFORD.—A prospect exists of the speedy completion of this edifice under the superintendence of Mr. Jenard, the architect. A committee has been formed, a subscription entered into, and the consecration will probably take place early in the ensuing spring.

#### STONE CONFESSORIAL CHAIR, LENHAM CHURCH, KENT.

PERSPECTIVE VIEW.

(From a Drawing by C. J. Richardson, Esq., F.S.A.)

#### STONE CONFESSORIAL CHAIR, LENHAM CHURCH, KENT.

The above relic of very ancient days is worthy the pencil of a Cattermole; it can hardly be looked upon for an instant without suggesting the dark figure of a monk reposing in the seat, and listening to a kneeling penitent beside him. These stone confessional chairs are very uncommon. As this is a complete example with the kneeling stone and elbow ledge by the side of the seat, we give, besides the view, a plan, elevation, and section of it. The date is probably early in the 13th century. It is very nearly perfect, and stands against the south side of the chancel, at Lenham Church, near Maidstone, in Kent. At the west end of the chancel, which is a very large one, are sixteen stalls, which were formerly appropriated to the monks of St. Austin when they visited their estate in this parish.

An interesting controversy took place a few years since between the Rev. Samuel Denne and David Wells, Esq., on the subject of stone seats in the chancels of churches. Mr. Wells' paper was published in the 3rd volume of the "Vetusta Monumenta" of the Society of Antiquaries, while that of his opponent appeared in the 10th volume of the "Archæologia."

Mr. Wells entertained the opinion that the stone seats now occasionally to be found in chancels were originally intended for the officiating priest to rest himself on during the performance of his sacred duties; his words are, "such seats are only to be found in the chancel choir, of some distinguished chapel where only the sacramental rites could be performed with great solemnity, and they are invariably placed in the south wall; whence it is clear that these stone seats were originally designed for the officiating priest." And further on he says, "The number of these stone seats varied according to the dignity of the place: in small rectories one, in others two; some have three, &c."

One of the general rubrics of the Roman missal is, that when the celebrant is allowed to rest himself, he shall be seated a CORNU EPISTOLÆ JUNTA ALTARE, i. e. near the altar, and at the south horn of it.

Picart, in his "Religious Ceremonies," refers to a rule in the Roman Catholic Church, which directs that "The confessor must hear the confession in the church at that part of it which is furthest from the high altar, i. e. at the bottom of the nave, which is most exposed to the view of the people."

ELEVATION.

SECTION.

#### ON THE EXCAVATIONS OF THE ROCKY CHANNELS OF RIVERS BY THE RECESSION OF THEIR CATARACTS.

DURING the late meeting of the British Association at York, Mr. Featherstonhaugh drew attention to the manner in which extensive swampy districts upon the continent of North America have been drained and rendered fit habitations for man. During his researches in that part of the western hemisphere, he found evidences upon all the rivers whose valleys were bounded by lofty escarpments, that the gorge in which each river flowed had been cut out of the land by the recession of a cataract. The river Mississippi flowed in a valley of this character. From the Falls of St. Anthony to its mouth in the Gulf of Mexico, the distance was about 2,000 miles, during the first 1,200 of which these escarpments, varying from 100 to 450 feet in height, were everywhere found, divided from each other by a width varying from one to two and a half miles, the valley being during the greater part of this course thickly studded with well-wooded islands, amongst which the waters of the river flowed. Upon a level with the surface of these islands were extensive plains connected occasionally with lateral

valleys coming through the escarpments, the soil of which was identically the same with that of the islands, being a light vegetable sandy soil much mixed up with decayed fresh-water shells; shewing that these soils were the old muddy bottom of the river, deposited when it occupied the whole breadth of the valley from escarpment to escarpment. These, and analogous appearances upon the courses of other American rivers, especially the immense lacustrine deposits separating Lake Erie from Lake Huron, seventy miles in breadth, were adduced as proofs of a great diminution of the quantity of fresh water once occupying the lakes, and the fluvial courses of that continent: indeed, from the difference of level between a point on the Wisconsin River and the channel of upper Fox River, over which boats now pass in time of great floods, the water communication betwixt the Mississippi and Lake Erie seems to have been uninterrupted. This portion of the paper was intended to shew, that the quantity of water in the rivers in ancient times so far exceeded the quantity flowing in them at present, that the cataracts in the rivers must have been much more powerful, and that therefore the process of excavation of the rocky channels of

rivers by the recession of their cataracts, must have been then effected in much shorter periods of time than at present. From all these considerations, and from the known fact that the Falls of St. Anthony had not receded more than twenty yards in the last 100 years, the author drew the deduction that the whole valley of the Mississippi, from the Falls of St. Anthony to the point where the escarpments terminate, had been excavated by the recession of that cataract, and that the excavation had proceeded at a much more rapid pace than it does in our times. The author next proceeded to explain the peculiar mechanical power which streams employ in forming their channels by the operation of cataracts, and divided it into two methods, the *molar* or grinding process, most common in mountainous countries constituted of primary rocks, and the *subtracting* or undermining power exercised upon strata of a softer quality. To illustrate the first of these methods, Mr. Featherstonhaugh exhibited a beautiful pictorial view of a remarkable cataract in the Cherokee country, called Ovnay Kay Amah, or White Water, which he visited in 1837, and which had not attracted the attention of any other traveller. This cataract was at a point

several miles from the extreme edge of the mountain, and was upwards of 600 feet high, the water falling in various pitches and declined planes from the top to the bottom. Wherever the water found a depression in the surface of the gneiss it lodged there, and on the first fortuitous pebble coming into cavity the work of destruction would begin, the current incessantly whirling about the pebble, and grinding the sides of the rock until a *pot-hole* was formed. These were there in great numbers, some of them four feet in diameter, and six feet deep. Where great numbers abounded, and parietes became at length weak, and giving way, all the *pot-holes* would coalesce in one. This process being repeated in various portions of the rock, the cohesion of the mass became diminished; and at the season of periodical floods, huge masses, weighing forty tons and upwards, would be precipitated to the bottom. This was the state of the great fragments at the bottom of the ravine, all of them bearing evidence of having been dislocated by the power of the water exercised upon the *pot-holes*. Such was the method by which this gorge, several miles long and about 600 feet in depth, had been ground out of this mountain of gneiss. At this locality were the evidences of the volume of the river having once been at least ten times larger than at present. A semi-circular ledge of gneiss, at the top, east of the stream, and 1,200 feet wide, was worn bare for a great distance, and down its perpendicular face was concave, as if the river had been projected over the top, and the screen of water in face of the concavity, and the concussion, and the moisture, had produced the usual effect, of peeling off the coats of the rock. It presented much such an appearance as the rock at the Horse-Shoe Fall at Niagara would do if the water were to be so much diminished at that point as to abandon it, and to be projected only from the comparatively small fall of the Schloss, on the American side of the river. For the other example of the *subtracting*, or undermining power exercised in the recession of cataracts, the Falls of Niagara were taken, of which a flat view was given, together with a section of the rocks. Mr. Featherstonhaugh had published a paper, in 1831, explaining the recession of this cataract. It is well known that the river Niagara flows upon a bed of limestone from which it projects itself, and that this rock is supported by a strong bed of friable shale upwards of seventy feet thick. The moisture arising from the screen of water, the current of wind behind it, and the concussion, loosen and remove the shale, and the superincumbent limestone losing its support falls down. In this manner the cataract has receded at least six miles from the Queenston heights. Mr. Featherstonhaugh expressed an opinion that this operation of excavating long channels of rivers, as in the instance especially of the Mississippi, may be considered in the class of providential arrangements, since by it the lakes, swamps, and immense swampy surfaces become drained, and rendered salubrious and productive habitations for man. There were many other interesting points brought forward in this paper, of which we have only room for this abstract.

**COLCHESTER LITERARY AND SCIENTIFIC INSTITUTION.**—We referred last week to the formation of this institution. Since then, a public meeting has been held, at which various resolutions were agreed to, among them the following:—"That the requisite funds be raised, partly by donations and partly by shares of 10*l.* each, bearing interest at 4 per cent. per annum; and that as soon as the sum subscribed be sufficient to justify such a step, a convenient site be selected, on which to erect an appropriate building for the purposes of the institution." Before the meeting separated, donations and subscriptions were announced amounting to upwards of 700*l.*

**COST OF FRENCH AND ENGLISH RAILWAYS.**—The cost of the Paris and Rouen Railway is put down by Mr. Laing, of the Board of Trade, at 24,000*l.* per mile; Paris and Orleans, 24,000*l.*; English passenger railways generally, 34,000*l.*; and the average of the Birmingham, Great Western, and South-Western lines, 47,000*l.*

#### SOCIETY FOR PROMOTING THE IMPROVEMENT OF COTTAGES.

SOME months since a society was formed on the Northumberland and Durham borders of Scotland for the improvement of the cottages of the peasantry. The persons chiefly instrumental in forming the society were Dr. W. S. Gilley, of Durham, Mr. Ralph Carr, and the Rev. Edward Fielde, of Rennington. The inauguration meeting was held at Alnwick, Charles Bosanquet in the chair, and the following resolutions were carried:—

"That a society be formed for encouraging and recording the improvement of cottages in the northern division of Northumberland.

"That the thanks of the meeting be given to Ralph Carr, Esq., for his exertions in promoting the present meeting; to Mr. Fielde, for his cordial advocacy of the measure; and to Lord Frederick Fitzclarence, for his practical illustration of cottage improvement at Etal."

Dr. Gilley, while writing last week to the editor of the *Morning Herald*, says:—"I am happy in being able to add that the cause continues to advance in Northumberland and on the borders of Scotland, and I was lately informed by an architect, who has had considerable experience, that a spirit prevails which leads him to expect a general improvement in the habitations of the labouring classes.

#### Correspondence.

##### ARCHITECTURAL COMPETITION.

TO THE EDITOR OF THE BUILDER.

SIR,—Your Lumington correspondent's condemnation of the Reading competition, I consider rather premature; as far as I can judge, every thing has been conducted with perfect impartiality and fairness, with but one exception, and that is, that several designs, in which the conditions contained in the printed instructions *have not been complied with* (and which are, therefore, incomplete), have been admitted, and are submitted for the opinions of the competitors, together with those in which *every condition has been complied with*, and all the required information as to value of freehold ground-rents, drainage, &c., has been furnished. These should, I think, have been rejected, as each will naturally be inclined to give the preference to those designs which most resemble his own, and therefore, those who have been at considerable trouble and expense in obtaining information and preparing their designs will labour under considerable disadvantage, there being no instructions given for the guidance of the competitors in delivering their opinions, which might have obviated the difficulty. Trusting you will excuse this intrusion upon the space of your valuable journal,—I remain, Sir, your obedient servant,

A REGULAR SUBSCRIBER.

Dec. 18, 1844.

##### THE CHORISTERS' SCHOOL, MAGDALEN COLLEGE, OXFORD.

SIR,—The Bursar of this institution, in his letter to you of the 4th inst., states that the successful competitor for the choristers' school never had a *single glance* at any of the designs sent in to the care of the Bursar, and that he had no facility or advantage allowed him which had been refused to any other competitor. I would briefly ask, whether the circumstance of Mr. Derick's being allowed to send in his design *fourteen days* after the others had been forwarded, as required by the instructions, can be called no facility or advantage? It is mere Jesuitical sophistry to argue that such advantage had not been refused to any other competitor; *it never was asked for*, for who, in the name of common sense, would ever have dreamt of asking from the commission permission to send in his design fourteen days after time, unless under the request for a prolongation, which should be, as usual in such cases, *made known to all the competitors*?

When such sophistry as this is put forth in exculpation of a palpable injustice, it is not pressing the point logically too far to remind Mr. Bursar that a *useful hint* communicated respecting designs unseen, may be quite as valuable as a *single glance* not permitted.—"*Verbum sapienti.*"—Your obedient servant,  
Dec. 24, 1844. φ

#### Miscellaneous.

**ANNUAL DESTRUCTION OF PROPERTY BY LIGHTNING.**—The amount of damage occurring annually to our public and other buildings by lightning is of a very serious character. A writer in *Nicholson's Journal of Science* has estimated it at 50,000*l.* The following are a few instances of its effects:—The beautiful spires of St. Michael's and St. Martin's, at Liverpool shattered; Christ's Church, Doncaster, ruined; Spitalfields and Streatham Churches set on fire; St. Martin's, St. Clement's in the Strand, and Brixton Churches; the fine old church of Exton in Rutland; Stanington Church; the beautiful tower of Magdalen College, Oxford; the tower of St. Michael's Church, at Cork, laid in ruins; the fine granite chimney at the Royal Victualling-yard, Plymouth; flax and cotton mills at Hull. The greater part of these were so shaken and damaged, as to demand very extensive repairs. A thousand pounds did not cover the expense of renovating the spire of St. Martin's, damaged by lightning in 1842.

**INTERIOR OF THE EARTH.**—The increase of temperature observed in mines is about one degree Fahrenheit for every fifteen yards of descent; and, should the increase go on in the same ratio, water will boil at the depth of 2,430 yards; lead melt at the depth of 8,400 yards; every thing be red hot at the depth of seven miles; gold melt at the depth of twenty-one miles; cast-iron melt at the depth of seventy-four miles; soft iron melt at the depth of ninety-seven miles; and, at the depth of 100 miles, there must be a temperature equal to the greatest artificial heat yet observed—a temperature capable of fusing platinum, porcelain, and indeed every refractory substance we are acquainted with. These temperatures are calculated from Guyton Morveau's corrected scale of Wedgwood's pyrometer; and if we adopt them, we find that the earth is fluid at the depth of 100 miles from the surface; and that, even in its present state, very little more than the soil on which we tread is fit for the habitation of organized beings.

**THE SAGO-PALM TREE.**—Of all the palm-trees which are natives of Asia, the Sago-palmist is one of the most useful and interesting. The trunk and large leaves of the sago-palmist are a powerful resource in the construction of buildings; the first furnishes planks for the carpenter, and the second a covering for the roof. From the leaves are also made cord, matting, and other articles of domestic use. A liquor runs from incisions made in its trunk, which readily ferments, and is both salutary and agreeable for drinking. The marrow, or pitb of the tree, after undergoing a slight preparation, is the substance known by the name of sago in Europe, and so eminently useful in the list of nutritious food for the sick.—*Dictionnaire d'Histoire Naturelle.*

**THE STATE BED OR SCARLET ROOM AT CHATSWORTH.**—This room was so named from containing the bed on which George II. died. The bed and furniture are of crimson silk damask. This, with the chairs and foot-stools used at the coronation of King George III. and Queen Charlotte, were the perquisites of the fourth duke, as lord chamberlain of his Majesty's household. On the ceiling is the painting of Aurora, or the morning star, chasing away Night. In the centre compartments between the windows are Diana turning the Country People into Frogs, Diana Bathing, Diana turning Actæon into a Stag, Diana Hunting. In the corner compartments are—Bacchus and Ariadne, Venus and Adonis, Melæger and Atalanta, Cephalus and Procris. Tapestry—Jupiter and Leda, Perseus and Andromeda, Apollo and the Nymph Isis, Minerva and Vulcan.

**HEREFORD IMPROVEMENTS.**—The Hereford Town Council contemplate the enlargement and improvement of their Guildhall. Last week, at a special meeting of the council, Mr. Leonard Johnson produced a plan of the proposed alteration, which met with very general approval. After various opinions had been advanced with respect to the plan, it was determined that as this was not the period of the year to enter upon the work, the question be further taken into consideration at the quarterly meeting in February next.

**ARCHEOLOGICAL MUSEUM AT ATHENS.**—A letter from Athens, of November 14, says:—"The Government has conceived the idea of founding a national Archeological Museum, in which are to be placed the various antiquities at present deposited in the Temple of Theseus, as well as all that may be hereafter discovered or purchased by the state. It is intended to unite models of the ancient Greek buildings still existing in Greece and elsewhere, as well as casts of all inscriptions that are now to be seen either in Greece or other countries, copies of paintings, &c.; so that the new museum will contain, either in original or copies, the most remarkable objects remaining of ancient Greece. Funds are to be applied for to the chambers for carrying out this design, and the new museum is to be placed in the Acropolis."

**COST OF SALTWOOD TUNNEL.**—Preliminary works and previous expenses, 36,383l. 4s. 6d.; payments under contract, 72,332l. 19s. 7d.; inspection, rent of land, sorting bricks, &c., 820l. 1s. 5d.; assumed value of plant, 3,000l.; total cost of Saltwood tunnel, 112,512l. 5s. 6d. Being at the rate of 118l. per lineal yard for the whole tunnel; 953½ yards in length, or half-a-mile and 73½ yards; but upon a very careful measurement the tunnel proved to be very little short of 954 yards. The bricks for Saltwood tunnel were made at Folkestone, averaging five miles distant from the works; and the cost when delivered was 51s. per thousand. The quantity of bricks used in the construction of Bleehingley and Saltwood tunnels, including the entrances, culverts, shaft towers, and all contingent works, was as follows:—Bleehingley, 14,696,003, or 11,099 per lineal yard; Saltwood, 10,186,246, or 10,677 per lineal yard.—*Practical Tunnelling, by F. W. Simms, C. E.*

**THE NEW DOCK, &c. AT HULL.**—Since the issue of the prospectus of these works, a very neat and well-finished lithographed plan has been published, which is intended to be widely circulated. Judging from the appearance of this plan, we may hope to see a very spacious dock, with a commodious basin, and every useful facility for carrying on the most extensive mercantile concerns. It is expected the dock will be about 800 yards long, and averaging about 200 yards wide, with a splendid promenade from the lock to the mouth of the basin. The outfall is to be deepened and widened, and plenty of land is laid down for building purposes on the east side; a breakwater pier is to be erected on the Bureum sand, nearly 1½ miles in length.—*Hull Packet.*

**COLD-DRAWN IRON TUBING.**—M. Hector Ledru recently laid before the French Academy of Sciences some specimens of cold-drawn iron, and other tubing. A few years ago the only tubing made in France, for gas and other purposes, except lead tubing, was made by hand. In England, iron-drawn tubing (by heat), without soldering, was first made, and was imported, by special permission, into France on account of its vast superiority over hand-made soldered tubes. Within the last two years the French have, in this branch of manufacture, eclipsed the English, for they now, by pressure, draw tubing cold, and it is in every respect perfect, indeed much more perfect than the hot-drawn tubing.

**PUBLIC WALKS, BATHS, &c.**—The subscriptions for public walks, baths, &c., at Manchester, amount to 28,824l. The Town Council of Hull have granted 500l. towards making public baths, adjoining the new water-works in that town. A highly influential meeting has been held in Bristol, "for the purpose of taking into consideration the propriety of establishing public baths and wash-houses" in that city; all parties were unanimous in their support of such a measure, and the Bishop of the diocese took an active share in the proceedings of the day.

**LEAD MINES IN DERBYSHIRE.**—It is gratifying to learn that further speculations in the lead-mining business in the Peak have just emerged from contemplation to actual commencement. The Watergroove Mine, Eyam, greatly celebrated for its mineral riches, will eventually be relieved from water by a sough or level, which will branch off from the Morwood sough, Middleton Dale, an expedient which will undoubtedly require considerable outlay.—*Derbyshire Reporter.*

**BRIDGE AT ATHLONE.**—Last month a bridge was opened across the Shannon at Athlone. The design is by Mr. Rhodes, engineer, to the Shannon Commission, and the contractor was Mr. McMahon. The bridge consists of three elliptic arches of 63 feet span each, and a cast-iron swivel bridge of 45 feet span, and 24 feet breadth of roadway. In forming the coffer-dams considerable difficulty was experienced from the loose gravelly nature of the soil. The swivel bridge was constructed by Messrs. Mallett, of Dublin, and notwithstanding the immense weight of the framing, said to be nearly 300 tons, each leaf can be opened or closed in about a minute, by the efforts of one man. The traverse rings, which are of cast-iron, 24 feet diameter, and weighing each about 16 tons, were turned in the lathe. The style of the bridge is the massive Roman, somewhat similar to that of London-bridge.

**BATHS AND WASH-HOUSES IN LONDON.**—It is the intention of the committee to commence with forming four model establishments in populous districts—three on the Middlesex side, and one on the Surrey side of the river Thames, the number of such establishments to be increased from time to time as circumstances may permit; and it is also intended to afford assistance to such districts or parishes as may be disposed to form similar establishments in their respective localities. The first of the four model establishments will be erected within about a hundred yards of the city, at an expense of from 7,000l. to 10,000l., and it is intended to have about 100 baths and 150 wash-tubs, with every accommodation for drying the clothes of the poor when washed. The amount of contributions already received is 6,500l., to which may be added 200l., voted last week by the Court of Common Council.

**THE ROYAL EXCHANGE.**—On Monday, the 16th inst., the long closed up avenue at the east end of the 'Change, formerly Freeman's-court, was opened to the public. By this opening, all sides of the new building were cleared, and the shops and offices all round became accessible. On the following Wednesday a further step was made for public accommodation by the throwing down of the barriers of the postico at the west end, and the opening of the merchants' area to the free access of the public. This interesting circumstance took place at eleven o'clock, and the building remained open until dusk. On the 1st of January it will be given up to the merchants for their use.

**FLEET PRISON.**—The Corporation of London appear strongly disposed, we might say determined, to purchase the Fleet Prison, partly to prevent its passing into the hands of individuals who might convert it into rookeries and tenements which would be a disgrace to the city, and partly for the purpose of erecting a spacious avenue on its site, as a relief to Ludgate-hill in the event of the erection of a viaduct over Holborn-bridge. Mr. R. Taylor last week, in the Court of Common Council, moved that a communication be opened with the Commissioners of Woods and Forests to ascertain upon what terms the prison can be purchased. The subject was ultimately referred to the City Lands Committee.

**NEW CHURCHES.**—At a meeting of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, held on the 16th instant, grants were voted towards the erection of six new churches, viz. at King's Cross, Halifax; Little Drayton, Market Drayton; Rhos-y-Cae, near Holywell; South Milford, near Sherburn, Yorkshire; Armitage-bridge, Huddersfield; and North Moor Green, North Petherton. At the same meeting it was determined to enlarge the churches at Coniscliffe, near Darlington; Maross, near Langhame; Arceley Kings, near Sturport; and Great Wilbraham, near Cambridge.

**PROPOSED NEW CHURCH AT HEREFORD.**—At the meeting of the Hereford Diocesan Church Building Society, held on the 20th instant (the bishop in the chair), the dean called attention to various plans of a proposed new church for the parish of St. John's. The bishop of the diocese had kindly offered to give 100l., the Queen Dowager 10l. and other friends of the church had expressed their intention of aiding in the work.

**KING WILLIAM'S STATUE IN THE CITY.**—This colossal statue is at last on its pedestal in King William-street, fronting London-bridge. The figure is 15 feet 3 inches in height, and weighs twenty tons. It was cut out of two enormous blocks of granite, and the work has occupied the artist (Mr. Nixon) nearly three years. The dress of the statue appears to be that of an admiral's uniform, a cloak hanging gracefully over the shoulders. The right hand bears a scroll. The likeness is considered admirable. Subsidiary pillars, intended as points of refuge for the public in crossing the open space of Eastcheap, will be erected forthwith.

**ENLARGING OF DEPTFORD DOCKYARD.**—There has been for some weeks a rumour that it was the intention of the Government to increase the dockyard establishment at Deptford. The general activity which now prevails in that yard proves that the rumour was well founded. Two new building slips are being made, and the erection of large timber sheds, mould lofts, and other buildings for stores have been ordered to be forthwith commenced.

**PROPOSED RAILWAY STATION IN THE CITY ROAD.**—The Eastern Counties Railway Company propose to extend their line from the Shorelitch station to the City-road, near Old-street.

**HARWICH PIER.**—No less than three applications will be made to Parliament during the approaching session for leave to construct a pier in the port of Harwich.

**DOVER LANDING JETTY.**—These works are to be commenced forthwith, the South-Eastern Railway Company having taken 300 shares in the speculation.

MEETINGS OF SCIENTIFIC BODIES

During the ensuing week.

THURSDAY, January 2.—Zoological, Hanover-square, 3 P.M.

FRIDAY 3.—Botanical, 20, Bedford-street, Covent Garden, 8 P.M.

SATURDAY, 4.—Asiatic, 14, Grafton-street, 2 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

TENDERS.

TENDERS delivered for the third Contract (C) of the Leeds Borough Gaol, consisting of the Juvenile and Female Cells, Chapel, &c.—Hirst and Moffitt, of Doncaster, Architects. Perkin and Backhouse, of Leeds, Inspectors for the Committee.

MASONS.

Wood and Tredell..... £7,270  
Hogg and Tilney..... 6,499  
Cliff and Huslor..... 6,002

JOINERS.

Winn and Pawson..... 1,998  
Wilson..... 1,987  
Bulmer..... 1,750  
Woodhead..... 1,600  
Gill..... 1,500

BRICKLAYERS.

B. Woolley..... 3,799  
W. D. Boothman..... 3,612  
Samuel Atack..... 3,500  
T. Longley and Sons..... 3,445  
I. and W. Garland..... 3,398

TENDERS delivered for erecting Seven Four-rate Houses in Mount-gardens, Westminster-bridge-road, for Mr. Godfrey.—Messrs. Willshire and Parris, Architects, Lambeth.

Messrs. B. and N. Sherwoods .. £2,830  
Mr. Robert Hicks..... 2,294  
Mr. Robert Armstrong..... 2,290  
Mr. John Wilson..... 2,194

The quantities taken out and supplied to the Builders, and the Tenders opened in their presence.

NOTICES OF CONTRACTS.

For the execution of Works necessary for the completion of the whole of the Railway from Shoreham to Chichester, being a distance of about 22½ miles.—Frederick Otley, Secretary, Brighton and Chichester Railway Office, 4, Dean-street, Tooley-street. December 31.

For a supply of Iron Rails and Chairs.—William Taylor, Secretary of the Great Southern and Western Railway, 3, College-green, Dublin. December 31.

For 500 tons of hard Guernsey Granite.—G. Clark, Clerk to the Guardians of the Brentford Union, New Brentford. December 31.

For 10,000 Larch Sleepers 9 feet long and 10 inches thick for the Glasgow and Ayr Railway.—December 31.

For the erection of an Organ in the City Hall of Glasgow, cost not to exceed 1,500£.—Mr. G. W. Muir, Glasgow. January 1.

For laying the Pipes required in the Hull New Water Works.—Thomas Thompson, Esq., Town Clerk, Hull, or Mr. Thomas Wickstead, Old Ford, near London. January 6.

For the supply of the following stones for pavements, namely, York Flag of 3 inches and 2 1/2 inches thick, at per yard superficial; Castle Hill Stone, 2 1/2 and 1 1/2 inches thickness, at ditto; Rock-hill of like respective thicknesses, at ditto; Aberdeen Granite, half sovereigns, at per ton; Devonshire Kerb, at per yard run, &c.—Francis Southgate, Clerk to the Paving Commissioners, Milton, next Gravesend. January 7.

For Re-pewing Leverington Church, near Wisbech.—The Rev. Henry Jackson, Leverington, or Mr. W. Adams, Architect, Wisbech. January 7.

For Four Locomotive Engines and Tenders.—George King, 62, Moorgate-street, January 8.

For a Survey Plan and Valuation of the Township of Kimberworth, in Rotherham Yorkshire.—Mr. George Taylor or Mr. Richard Rhodes, Overseers of the Poor. January 8.

For taking down the present Bridge at Carrick-on-Shannon, and constructing a Stone Bridge of five segmental arches, with its approaches; building quays and harbour, forming wharfs, and deepening the bed of the river.—Edward Hornsby, Secretary, Shannon Commissioners' Office, Customhouse, Dublin. January 8, 1845.

For completing the Railway from Bishopstoke to Salisbury.—Alfred Morgan, Secretary, Nine Elms Station, Vauxhall. January 10.

For the erection of the Railway Works between Leeds and Bradford, including fencing, earthwork, masonry, roads, and permanent way.—William Clarke, Secretary, Hunslet-lane Station, Leeds. January 27, 1845.

For the execution of Works on the Chester and Holyhead Railway.—1st. A distance of eight miles, or thereabouts. 2nd. A distance of twenty-two miles, or thereabouts. 3rd. A Tunnel through the promontory of Penmaen Back, near Conway.—George King, Secretary, 62, Moorgate-street. January 29, 1845.

For the supply of 11,000 feet of nine-inch cast-iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31, 1845.

COMPETITIONS.

THE Committee of the Association recently formed in the Metropolis for the Construction of Baths and Wash-houses for the Labouring Classes, are desirous of obtaining Plans and Estimates for the Erection and Fitting-up of the First Establishment. The general basis of the plan can be seen at the Office, No. 3, Crosby-square. The author of the plan considered the best by the Committee will be selected to execute the work.

Plans for an Agricultural College to be erected at Cirencester, to accommodate 200 pupils and 6 tutors. The style is left to the taste of the architect. A Premium of 10 Guineas to the author of the most approved plan.—Robert J. Brown, Esq., Hon. Sec. Cirencester. January 1.

Plans and estimates are required for a Pauper Lunatic Asylum for the County of Somerset; the building to accommodate 300 patients, and to contain two Stories. The Committee of Visiting Magistrates wish it to be of a plain, cheerful character, but will not further fetter the architect by suggesting any particular arrangement as to the interior, its ventilation, warming, or otherwise. The ground selected contains 36 acres.—The Clerk of the Peace, Taunton. A Premium of 100£ will be adjudged for the best plan, and 50£ for the next best. January 22.

The Committee of the Art Union of London offer the sum of 500£. for an Original Picture illustrative of British History. Cartoons, six feet by four feet six inches, are to be sent in (as will be hereafter notified) by the 1st day of January, 1846, and from these the selection will be made. Artists must send specimens of their abilities as painters, if required so to do. The successful candidate must undertake to complete the finished picture, of the same size as the cartoon, by the 1st of January, 1847, and to superintend the engraving. The Committee wish it to be understood that their object in giving so long a period for the preparation of the cartoon is for the purpose of affording artists sufficient time thoroughly to study the various details of their compositions, and to produce in the cartoon a completely finished and well-wrought study for the picture. The Committee reserve to themselves the right of withholding the premium if works of sufficient merit be not submitted.

APPROACHING SALES OF WOOD, &c.

BY AUCTION.

January 7, 1845.—At the Hall of Commerce, Threadneedle-street: 1,225 logs of St. Domingo Mahogany of superior quality and large dimensions; also 3 logs of Satin Wood.—Thomas Edwards, Broker, 1, Pinners'-hall, Great Winchester-street.

January 17, 1845.—At Garraway's Coffee-house, Cornhill: 10,000 Baltic and Swedish Deals and Battens; 10,000 Colonial Yellow Pine and Spruce Deals.—E. D. Warrington, broker, 15, New City Chambers.

BY TENDER.

Pear, Apple, Plum, and Cherry Trees now growing on the site of Victoria-park, being together 683 Trees.—Particulars of each lot may be had at the Office of Woods and Forests, 2, Whitehall-place, and at Mr. John Greig's, Hackney-wick, who will also shew the trees. December 31.

Current Prices of Wood and Metals.

December 24, 1844.

Table with columns: Item, £. s. d., and £. s. d. Items include Box, Turkey, bd. per ton; CEDAR, Pencil, per foot; Cuba; N. S. Wales; Green, per ton; EBONY, Ceylon, large; small; Madagascar, small; LIGNUM VITÆ, Jamaica; St. Domingo; MAHOAGANY, Cuba, per foot; St. Domingo; Honduras.

TIMBER—

Table with columns: Item, £. s. d., and £. s. d. Items include Teak, African, per load; Oak, Quebec; E. Riga; Antic and Memel; Swedish; Pine, Quebec, red, per load; yellow; Miramichi & St. Johns; Wainscot Logs, 18 ft. each; Lathwood, Memel, &c. fm.; Deals, Gefse, 14ft. 3in. by 9; Stockholm; Gottenburg, 12ft. 3in by 9; Christiania, 1st & 2nd; St. Petersburg, Memel; Dantzic, 12ft. 1 1/2 in.; Quebec yellow Pine, first quality; second ditto; White Spruce, 120.; Dantzic Deck, each.; Plank, Dantzic Oak, load.; STAVES, Baltic, per 1200.; Quebec Pipe, 1200 65; Punctureon.

Table with columns: Item, £. s. d., and £. s. d. Items include COPPER—Brit. Cake, p. ton; Sheet, p. lb.; Old; South Amer., ton; IRON, British Bars; Rods; Hoops; Sheets; Cargo in Wales, Bars; Pigs No. 1, Wales; No. 1, Clyde; Russian, c.c.N.D.; Swedish; LEAD—British, Pig, p. ton; Sheet, milled; Shot, patent; Red or Minium; White; Litharge; Spanish Pig; STEEL—Swedish Keg; Freggot; TIN—In hocks, p. cwt.; Ingots; In Bars; Banca; Straits; Plates p. box, 225 lbs.; No. 1, C. 13 1/2 by 10 in.; I. X.; SPELTEN—On the spot, ton; Delivery; ZINC, English Sheet; ORSIDEW; QUICKSILVER.

APPOINTMENT.

The Commissioners of Sewers for Westminster and part of Middlesex are about to appoint a Fourth Clerk of the Works at a salary of 120£. per annum. The appointment in the first instance will be for one year only, and take place at the Office, No. 1, Greek-street, Soho-square, on Tuesday, January 14.

ANNOUNCEMENT.

We perceive from a prospectus just sent to us that the author of the papers which have appeared from time to time in our pages headed "Glances at the Interior of the Churches in the Deanery of Sparham, in Norfolk," intends republishing the same with very considerable additions, under the title of "Sketches for an Ecclesiology of the Deserites of Sparham and Taverham, in Norfolk." The work will be published in post 8vo. monthly numbers, each containing descriptive accounts of from seven to ten churches, and will be rendered at the lowest possible rate consistent with a bare return of the charges incurred, that is, at certainly not more than 8d. per No. The deaneries of Sparham and Taverham comprise forty-six churches, among them several of very high architectural interest. The work will be published by subscription.

TO CORRESPONDENTS.

"H. E. Kendall, jun."—We are obliged for the suggestion; it will be acted upon in our next number.

"φ."—We received several communications on the subject referred to in our correspondent's postscript, and selected that one for insertion which apparently contained all the leading points of the remainder.

"F. Richardson."—We have answered his note by post.

"A Subscriber."—Perforated plates of zinc are chargeable to the window-duties "if so perforated as to afford light, but not if so as to serve the purpose of ventilation only." For additional information on this subject, we refer our correspondent to No. 97 of THE BUILDER.

"T. H. Cash."—The rate of duty on Crown Glass is 73s. 6d. per cwt. The quantity charged with duty in 1829 was 114,862 cwt.; in 1830, 96,565 cwt.; in 1831, 100,086 cwt.; and in 1832, 103,902 cwt. It is difficult to form any precise estimate of the value of the glass annually produced in Great Britain; we believe, however, that it cannot amount to less than 2,000,000£, nor employ less than 50,000 workmen.

"A Constant Reader."—We have not seen either the names or the amounts of the parties willing to contract for the erection of the Bristol Barracks.

Communications have been received from "Dartford" on Architectural Competition; and from "George Snowball" on Flooring Dogs, with a model. Both are under consideration.

ADVERTISEMENTS.

NOTICE TO INVENTORS—OFFICE FOR PATENTS OF INVENTIONS AND REGISTRATION OF DESIGNS, 20, Half-moon-street, Piccadilly. Patents obtained for the United Kingdom and Foreign Countries; Designs registered; printed instructions, containing the charges, forwards gratis; and every information given by application, if by letter pre-paid, to Mr. M. Jaccelin Cooke, 20, Half-moon-street, Piccadilly.

NOTICE TO INVENTORS. OFFICE FOR PATENTS OF INVENTIONS AND REGISTRATIONS OF DESIGNS, 14, Lincoln's-inn-fields.—The printed INSTRUCTIONS gratis, and every information upon the subject of PROTECTION FOR INVENTIONS, either by Letters Patent or the Design Acts, may be had by applying personally, or by letter pre-paid, to Mr. Alexander Ponce, at the office, 14, Lincoln's-inn-fields.

TO ENGINEERS, DRAUGHTSMEN, &c. STEPHEN'S RULING AND MECHANICAL DRAWING INK, for Engineers, Artists, and Designers. This article will be found superior to the best Indian-ink for the above purposes. It does not smear with Indian-rubber, or wash off with water. It flows freely from the drawing-pen, and never corrodes or encrusts it. It dillutes it with water, or thickening it by drying, as required. It has the advantage of being ready for immediate use. Sold in conical-shaped Bottles, convenient for using from without any stand, by the inventor, Henry Stephens, 54, Stamford-street, Blackfriars-road, and by Booksellers and Stationers, 6d. each.

E. G.'S TRACING-PAPER.—It is warranted to take Ink, Oil, or Water colour, and is sold by MESSRS. ROBERSON AND CO., SOLE AGENTS, 51, LONG-ACRE. At the following cash prices:—THIN TRACING-PAPER. 60 by 40, at 14£. 0s. per Ream, or 5s. 0d. per Quire. 40 by 30, at 7£. 0s. " " 7s. 6d. " " 30 by 20, at 5£. 15s. " " 4s. 0d. " " THICK TRACING-PAPER. 40 by 30, at 14£. 0s. per Ream, or 5s. 6d. per Quire. 30 by 20, at 7£. 10s. " " 8s. 0d. " " N.B.—Every sheet is stamped with the Initials of the Manufacturer. This beautiful and unequalled article is allowed to be the cheapest and most useful Paper hitherto introduced to the public, as will be best proved by a trial.

# SUPPLEMENT TO THE BUILDER.

SATURDAY, NOVEMBER 9TH, 1844.

## A CYCLOPÆDIA

OF

## THE NEW METROPOLITAN BUILDING-ACT,

IN WHICH ALL THE DETAILS OF THE STATUTE ARE ARRANGED ALPHABETICALLY,

SO AS TO BE INSTANTLY FOUND,

AND ACCOMPANIED BY EXTENSIVE REFERENCES AND COUNTER-REFERENCES TO THE SECTIONS OF THE ACT ITSELF, AND ITS MINUTE PROVISIONS.

By ALFRED BARTHOLOMEW, Esq., F.S.A., ARCHITECT.

A.

**ABUTMENTS.** See *Public way, buildings over*; also *Chimneys hereafter built.*

**ACCOUNT** in writing for party-structures, within 21 days after the completion of the work it is the duty of the person by whom the expense has been incurred to deliver, to the adjoining owner of the building or premises in respect of which such expense shall have been incurred, to include all preliminary and incidental operations; and if the work shall have been executed by authority of the official referees, a copy of such account is to be delivered to them at their office, subject to appeal within 10 days to the official referees; and if, within 10 days after the delivery of such account to the party liable to pay the same, such party do not either appeal against such account or pay the same, or if, within 10 days after the demand thereof, in conformity with the certificate of the official referees, the amount thereof, together with the costs of the examination of the account as the official referees shall certify, be not paid, then it shall be lawful for the person entitled thereto to recover the same, or so much thereof as shall be then due, by the summary proceeding provided in this Act. s. 47. See also *Expenses of works.*

**ACT** (This new Building-) to come into operation as to the districts and the officers to be appointed in pursuance hereof, on the 1st September, 1844,—and as to buildings, streets, and other matters, on the 1st January, 1845; and on the said 1st January all the Acts mentioned in the schedule A, annexed to the Act, except so far as in the said schedule is otherwise provided, are repealed. s. 1.

**ACTS** rules of, may be modified by the Commissioners of Works and Buildings after being reported upon by the official referees, either at their own suggestion, or that of any interested party. s. 11.

**ACTS** repealed. s. 1, and schedule A.

**ACTS** for Damages. See *Informalities in Districts.* Actions for penalties, limitation of. Proceedings for penalty or forfeiture incurred under this Act must be brought or commenced within six calendar months next after being incurred. s. 106.

**ACTS** against person acting under this Act—Regulation of. After the expiration of 6 calendar months next after the fact committed it shall not be lawful to bring any action or suit against any person in respect of any act or thing done or intended to be done in pursuance of this Act; and if, 21 days at the least before the commencement of the action or suit, notice in writing of an intention to bring such action or suit, and of the grounds of action, he not given to every person against whom such action or suit shall be brought, it shall not be lawful for any person to bring any such action or suit against any person in respect of any such act;—and the cause or matter of any such action or suit shall be the said city of London or the Liberties thereof, such action or suit must be laid in the city of London, and not elsewhere; and if the cause of any action or suit arise in any part of the limits aforesaid out of the said city of London and Liberties thereof, then it must be laid and tried in the county of Middlesex, and not elsewhere;—and in every such action or suit the defendant may plead the general issue, and at the trial to be had thereon to give this Act and the special matter in evidence, and to prove that the matter or thing for which such action or suit is brought was done in pursuance and by the authority of this Act;—and if upon the trial of such action it appear that the said matter or thing has been done by the authority or in pursuance of this Act, or if it appear that such action or suit was brought before the expiration of 21 days after such notice given as aforesaid, or if it appear that sufficient satisfaction was made or tendered before such action was brought, or if upon plea of payment of money into court it shall appear that the plaintiff

has not sustained damages to a greater amount than the sum paid into court, or if any such action or suit be not commenced within the time herein for that purpose limited, or if it be laid in any other county or place than as aforesaid, then and in every such case shall be the duty of the jury to find for the defendant; and if a verdict be found for the defendant, or if the plaintiff in any such action or suit become nonsuited, or discontinued or suffer a discontinuance of any such action or suit, or if judgment be given for the defendant therein, on demurrer, or by default or otherwise, then the defendant shall be entitled to have judgment to recover full costs of suit, and to such remedy for recovering the same as any defendant shall have by law. s. 108.

**Security for costs of such action.** If the defendant apply to the superior court at Westminster in which any action in respect of any matter or thing done or intended to be done in pursuance of this Act, is pending, or to any judge of any of the said courts, it shall be lawful for such court or any such judge to require the plaintiff to give such security as such court or judge shall think fit for the payment of all costs, charges, and expenses incurred or to be incurred in and about the said action, and which shall be or become payable by him in the taxation thereof by the proper officer. s. 109.

**ADDITION** to any building. Two days' notice to be given to the district surveyor before the commencement of. s. 13. See *Penalty.*

**ADJOINING OWNER.** s. 20.

**ADJOINING OWNER** liable to pay expense of party fence-walls, if s. 32.

**ADJOINING OWNER** to pay for party-walls raised by another party, if used. s. 31.

**ADJOINING AND NEIGHBOURING PROPERTY** not to be injured by raising of party fence-walls. s. 32.

**ADJOINING PROPERTIES**—Execution of Party-structures on, viz.—

Reparation of the party-walls by which premises are parted:

Pulling down and rebuilding of party-walls:

Raising of party-walls:

Reparation of party fence-walls:

Rebuilding of party fence-walls:

Raising of party fence-walls:

Pulling down of timber partitions which part buildings the property of different owners or occupied by different persons, and building in lieu thereof proper party-walls:

Pulling down of buildings built over public ways, or having rooms or stories the property of different persons, or occupied by different persons, lying in front of the respective entrances of building proper party-walls or party-arches:

And generally the performance of other necessary works incident to the connection of such party-walls or party fence-walls with the premises adjoining:

If the adjoining owners shall have consented thereto, or if, without such consent, the respective owners of such work shall have been given by or on the part of the building owner to such adjoining owner, then, subject to such modification as shall be made by virtue of the provision in that behalf, and subject to the provision for supplying the want of consent of the owners, the person or persons to be respectively authorized hereby prescribed with regard to such works respectively, as well as to the payment of the cost of such works, and to the sanction or to the award of the surveyors or of the official referees, as hereby prescribed in reference thereto, it shall be lawful for every such building owner as he is hereby authorized or required to execute such works. s. 20.

**AGENT** for any owner of houses within the limits of the Act disqualified from being official referee or registrar. s. 95.

**AGREEMENTS AND LEASES** (Building), existing modification of. See *Building-leases, &c.*

**AIR**, free circulation of. s. 32. See *Party fence-walls.*

**ALDERMEN.** See *Lord Mayor.*

**ALLEY** (the word) to include any court, alley, passage, or other public place which can be used as a footway only. s. 2. See *Widths.* Alleys and streets made or laid out before 1st January, 1845. See *Already built* (the term).

**ALLEYS** must each have two entrances of the full width of the alley, and one of the two at the least open from the ground upwards. Schedule I.

**ALREADY BUILT** (the term) used in reference to buildings, to apply to buildings built before the 1st January 1845, or commenced before that day, and covered in and rendered fit for use within 12 calendar months thereafter; and, used in reference to streets and alleys, to apply to all streets or alleys made or laid out before that day, and which shall be formed and rendered fit for use within 12 calendar months thereafter. s. 2.

**ALTERATION** of any building. Two days' notice to be given to the district surveyor before the commencement of. s. 13. See *Penalty.*

**ALTITUDE**, buildings of the 2nd or warehouse class are rated by only; the other classes by area and number of stories, as well as by altitude. Schedule C.

**AMENDS**, tender of. See *Informalities in Distress.*

**ANGLES OF FLUES.** See *Flues, angles of.*

**ANGLE-CHIMNEYS.** See *Chimneys hereafter built.*

**APERTURES**, how affecting the thicknesses of external walls. See *Inclosing-walls.*

**APPEAL** to the official referees, any person may, within 10 days from the delivering of an account for party-structure. s. 47.

**APPEAL** of lord mayor and aldermen, or of overseers, against district-surveyor's certificate in case of ruinous buildings. See *Ruinous buildings.*

**APPEAL** from convictions as to penalties—Proceedings thereon. If any party be dissatisfied with the decision of the justices in any case in which such penalty may be proceeded for by conviction for any offence in respect of which a penalty is by this Act imposed, and if within 4 days after such decision notice be given by or on behalf of such party to the party appealed against of his intention to appeal against such decision, and of the grounds of such appeal, and if the appellant enter into a recognizance, with two sufficient sureties, conditioned to prosecute such appeal, and to abide the order of the Court, and to pay to the party appealed against such costs (if any) as shall be awarded against him, it shall be lawful for such party so dissatisfied to appeal against such conviction to the justices of the peace at their general Quarter Sessions of the peace to be holden within 4 calendar months after such conviction; and if within such period of 4 days such appellant have entered into such recognizance as is herein required, then it shall be lawful for such justices and they are hereby empowered to proceed to hear and examine on oath into the cause and matters of such appeal, and to determine the same, and to award such costs to be paid by either of the said parties as they think proper; and the order, judgment, and determination of the said justices shall be binding and conclusive. s. 105.

**APPLICATION** to official referees to modify, in certain cases, the thicknesses of external walls. See *Inclosing-walls.*

**ARCHES** separating buildings from public ways. See *Public way, buildings over.*

**ARCHITECT**, If an official referee act as, to any building within the limits of the Act, some other competent person must be appointed by the Com-

missioners of Works and Buildings to act in that case in conjunction with the other official referees. s. 80.

**ARCHITECT OR BUILDER** of 1st rate buildings of the 2nd class, and of all buildings of the 3rd class, to give notice to the official referees according to the form (No. 6) in the Schedule of Notices, or to the like effect; that all the walls of any building over which they have control are built to their full height, and all the timbers of the floors, roofs, and partitions are fixed:—within 7 days after such notice, the official referees shall survey the same, and shall within 7 days after survey certify to such architect or builder their approval, or if any part of the walls, timbers, roof, or internal supports appear to such official referees defective, insufficient, or insecure, then within the said 7 days after such survey they are to give to such architect or builder notice of such parts as shall so appear to them defective, insufficient, or insecure, which notice must be in writing;—and upon the receipt of such notice it shall be the duty of the said architect or builder to amend and strengthen such defective, insufficient, or insecure parts;—and during or within a period of 7 days after notice has been given to the official referees that such works have been amended or strengthened as aforesaid, it shall be the duty of the official referees and they are hereby required to inspect the same, or in default thereof the said parts may be covered up;—and upon completion of every such building it shall be the duty of the architect or builder to give fresh notice to the official referees, according to the form (No. 7) in the Schedule of Notices, or to the like effect;—and thereupon, or within 7 days after such notice, it shall be the duty of the official referees to survey the same; and if upon such survey it shall appear that such building has been built sufficiently strong, and is sufficiently set to be safe, then within 14 days after such survey it shall be their duty to certify accordingly, which certificate must be under their hands and the seal of office of Registrar of Metropolitan Buildings;—and until such certificate shall have been made, or until 14 days after such survey have elapsed without the official referees having given notice in writing that they are not satisfied, it shall not be lawful to use such building for any purpose whatever: without the express authority in writing of the official referees under their hands and the seal of office of the Registrar of Metropolitan Buildings. s. 15. See Penalty for use.

**Architect or Builder** to give notice to the official referees before the builder begins to build any building comprised in Schedule B, Part I. (See *Supervision, special*); and also, at the same time, to transmit for their inspection the plans, elevations, and other drawings which have been made for the same;—and forthwith the official referees shall proceed to survey the situation of the intended building, to ascertain whether such building can be erected on such situation with due regard to the security of the public;—and from time to time the official referees shall inspect the same to ascertain the sufficiency thereof; and if such building or any part thereof appear to such official referees defective, insufficient, or insecure, then they are to give to such architect or builder notice of such parts as shall so appear to them defective, insufficient, or insecure, which notice must be in writing;—and upon the receipt of such notice the architect or builder shall amend and strengthen such defective, insufficient, or insecure parts;—and within 7 days after such notice has been given to the official referees that such works have been amended or strengthened, the official referees shall inspect the same, or in default thereof the said parts may be covered up;—and upon completion of such building the architect or builder shall give fresh notice to the official referees;—and within 7 days after such notice the official referees shall survey the same; and if upon such survey it shall appear that such building has been built sufficiently strong, then it shall be their duty to certify accordingly under their hands and the seal of office of Registrar of Metropolitan Buildings;—and until such certificate shall have been made, or until 14 days after such survey shall have elapsed without the official referees having given notice in writing that they are not satisfied, it shall not be lawful to use such building for any purpose whatever without the express authority in writing of the official referees under their hands and the seal of office of the Registrar of Metropolitan Buildings; and if before the certificate of satisfaction shall have been made, or if such 14 days shall have elapsed without due notice in writing being given as aforesaid, any such building shall be used for any purpose without such express authority, then, on conviction thereof before two justices of the peace, the occupier or other person by whom such building shall be used shall be liable for such offence as a non-resident 100l. for every day during which such building shall be so used without having obtained such certificate of satisfaction or such express authority as aforesaid. s. 16. See Penalty for use.

**AREA** of building, to be determined by the number of squares contained in the surface of any floor which shall contain the greatest number of squares at or above the principal entrance to such building; including in such surface all the external walls and party-walls belonging to such building, but excluding from such surface the area of any attached building, or office, area, balcony, or open portico. Schedule C, Part I. s. 5.

**Area**, rates of buildings of the 1st or warehouse class determined by, but become of a higher rate by

increase in altitude or in number of stories. Schedule C, Part II. See *Toll-houses and buildings built for the purposes of trade*.

**Area**. See *Back-yard*.

**Areas** required behind houses, Commissioners of Works and Buildings have power to modify the strict letter of the Act relative to, in cases of buildings upon old sites, and upon the report of the official referees therein. s. 12.

**Areas**. Every lowermost room or cellar in any existing building used or intended to be used as a separate dwelling, must have an area of not less than 3 ft. wide in every part, from 6 in. below the floor of such room or cellar to the surface or level of the ground adjoining to the front, back, or external side thereof, and extending the full length of such side. And such area, to the extent of at least 5 ft. long and 2 ft. 6 in. wide, must be in front of the window of such room or cellar, and must be open, or covered only with open iron gratings. Schedule K.

**ASSISTANT-DISTRICT-SURVEYOR**. If at any time it appear to the official referees that on account of the pressure of business in any district, or on any other account, the surveyor of that district cannot discharge his duties promptly as regards the builders and others engaged in building operations, and efficiently as regards the purposes of this Act, such official referees shall appoint any other district surveyor to assist the surveyor of such district in the performance of his duties, or if no district surveyor can be spared from his duties, or if no such assistance;—and such assistant-surveyor shall make returns and act in all respects as if he had been appointed by the Lord Mayor and aldermen, or by the justices, to be the surveyor of such district; and every such person shall be entitled to receive the fees payable in respect of the services performed by him. s. 75.

**ASSISTANT SURVEYOR** in any county may not act as justice of the peace for the same county. s. 69.

**ATTACHED** buildings and offices now built or hereafter built (except greenhouses, vineries, aviaries, or such like buildings), whether such buildings or offices be attached to or detached from the buildings to which they belong to be deemed, in respect of the walls thereof, and all other requisites, as buildings of the rate to which they would belong if they had been built separately. Schedule C, Part VII. District-surveyor's fee for attached or detached building, distinctly rated (except any such attached or detached building built at the same time as the building to which it is attached, and carried up and covered in within 21 days after such building shall have been covered in within the meaning of this Act), is such fee as is imposed in respect of additions to or alterations of buildings of the rate to which such attached or detached buildings shall belong.

**ATTENDANCE** of district-surveyor, or of some other person in his behalf, at his office, to be from 10 o'clock in the morning till 4 o'clock in the afternoon, daily, Sundays, Christmas-day, and Good Friday excepted. s. 72.

**ATTIC ROOMS**, in the roof of any building hereafter built or rebuilt, there must not be more than one floor of; and such rooms must not be of a less height than 7 ft., except the sloping part, if any, of such roof, which sloping part must not begin at less than 3 ft. 6 in. above the floor, nor extend more than 3 ft. 6 in. on the ceiling of such room. Schedule K.

**AVIARIES**. See *Attached buildings and offices*.

**AWARD**, official referees', relative to ruinous buildings. See *Ruinous buildings*.

**Awards** exempt from stamp-duty. s. 119.

**Awards**, certificates, and other documents, to be deposited in the registrar's office chronologically and in classes, according to their subjects. s. 83.

**Awards**, recovery of money under—Distress—Imprisonment. If any party claim any sum of money by this Act, or by any award or certificate or other proceeding in pursuance of or in accordance with this Act, charged upon any person in respect of any work done in pursuance of or in accordance with this Act, it shall be lawful for any one justice of the peace to summon the person on whom such sum is alleged to be charged before any two justices, or, if the matter arise within the district of the metropolitan police, then before any police magistrate having jurisdiction within that district; and if such award or certificate be produced, or if such other proceeding be proved by the oath of the party claiming, or of any other credible witness, and if it be proved by the oath of such party or other witness that such sum of money is still due, then it shall be lawful for such justices or such police magistrate, and they respectively are hereby required, to issue a warrant to levy the amount thereof, and also the costs of the proceeding, to be levied by distress of the goods and chattels of the person in default; and if such person have no goods and chattels whereon to distrain, or if such goods and chattels be insufficient for that purpose, then it shall be lawful for such justices or police magistrate, or for any other justice or police magistrate, to commit the person in default, until the amount of such sum so due, and of such costs, shall have been fully paid, or until the party shall be discharged by or in accordance with the provision of any Act for the relief and discharge of insolvent debtors. s. 102.

**BACK-YARD**. Every house hereafter built or rebuilt must have an inclosed or open space of at least one

square, exclusive of any building thereon, unless all the rooms of such house can be lighted and ventilated from the street, or from an area of the extent of at least three-quarters of a square above the level of the second story, into which the owner of the house to be rebuilt is entitled to open windows for every room adjoining thereto. And if any house already built be hereafter rebuilt, then, unless all the rooms of such house can be lighted and ventilated from the street, or from an area of the extent of at least three-quarters of a square, into which the owner of the house to be rebuilt is entitled to open windows for every room adjoining thereto, there must be above the level of the floor of the third story an open space of at least three-quarters of a square. Schedule K.

**BALCONIES**. See *Roof-coverings*.

**BANK OF ENGLAND** is under special supervision. Schedule B, Part I.

**BARONS OF THE EXCHEQUER**, one of, to administer declaration of official fidelity to official referees. s. 87; and Registrar, s. 90.

**BASEMENT**. See *Lowermost rooms*.

**BETHLEHEM HOSPITAL** is under special supervision. Schedule B, Part I.

**BODIES OF PERSONS** to be understood as meant by the Act, although an individual only be mentioned. s. 2.

**BOILER-FURNACES**. See *Chimney-shafts*.

**BOOK** for registering all notices, informations, and complaints, district-surveyor to keep at his office, and to enter therein every notice, information, or complaint which shall be delivered or made to him, and any proceeding thereon by him taken. s. 65.

**BOUNDARY-WALL**. s. 32. See *Party fence-walls*.

**BREAST-SUMMERS** fixed to carry any front wall of a building, if bearing at one end upon a party-wall, must be built upon a template or corbel of stone or iron built at least two-thirds through such wall; and such end must not be fixed into, and must not have its bearing solely upon, such party-wall, but must be supported by a sufficient pier built of brick or stone, or by an iron column, or iron or timber story-post fixed on a solid foundation. And if any such breast-summer have its bearing at each end upon a party-wall, it must be supported by at least two sufficient piers built of brick or stone, or by iron columns, or by iron or timber story-posts fixed on solid foundations, and standing within and clear of the party walls. Or any such breast-summer may bear upon constructed returns in the direction of its length of 4 ins. at least, coursed and bonded with the substance of the party-wall or party-walls; and such constructed returns must be increased 1 in. at least for every 6 ft. in length of the breast-summer may be otherwise unsupported. And if the height of the under side of any breast-summer laid from party-wall to party-wall to carry any external wall exceed 15 ft. from the surface of the public foot pavement in front of the building, there must be constructed returns in the direction of the length of the breast-summer from the inside of each party-wall of 8 ins. at the least, and at the least of the full thickness of such breast-summer; and every such return must be increased 1 in. at the least for every foot or part of a foot the breast-summer may be in height from the surface of the public foot pavement more than 16 ft., whether otherwise supported or not. Schedule D, Part II.

**BREWERY**. See *Chimney-shafts*.

**BRIDGES** are under special supervision. Schedule B, Part I.

**BRITISH MILE** is under special supervision. Schedule B, Part I.

**BROMLEY PARISH** (Middlesex) included within the operation of the Act. s. 3.

**BUILDER** whose duty it shall be to give two days' notice to the district-surveyor at his office before commencing or altering any building is to be understood, both in this provision and elsewhere throughout this Act, as the master builder or other person employed to execute any work; or if there be no master builder or other person so employed, then the owner of the building or other person for whom or by whose order such work is to be done. s. 13.

**Builder**, in relation to special supervision of first-rate buildings of the second class and of buildings of the third or public building class. See *Notice to builder*, *Official referees*, and *Penalties for use*.

**Builders** who shall refuse to cut into or pull down any work for the inspection of district-surveyors are to be required by the official referees to open and amend the same. See *District-surveyor*, s. 14.

**BUILDINGS**, streets, and other matters regulated according to this new Act, from 1st January, 1845, s. 1.

**Building**, new and old. And upon sites of former buildings, and the enlarging and altering of buildings of what nature soever, within the limits of the Act, hereafter to be built (except the building comprised in schedule (B), and except sewers made by or under the direction of any Commissioners of Sewers), so far as relates to building the same, and with regard to every such building either already or hereafter built (except the said buildings comprised in the said schedule (B), and except the sewers), so far as relates to rebuilding the same, and whether such buildings be built or rebuilt on old or new foundations, or partly on old and partly on new foundations, notwithstanding any thing contained to the contrary in any Act of Parliament now in

force, every such building shall be built, rebuilt, enlarged, or altered in reference to the walls, whether external or party, and to the number and height of the stories or rooms therein, the chimneys, the roofs, the timbers, the drains, the projections, and to all other parts or appendages of every such building, and in the manner of the materials, and in every other respect in conformity with the several particulars, rules, and directions which are specified and set forth in the several schedules (C), (D), (E), (F), (G), (H), (I), (K), according to the classes of buildings, and the rates of such classes to which such buildings are by the schedule (C) declared to belong; subject to any other rules and directions in this Act contained in the same behalf; and subject in every case of doubt, difference, or dissatisfaction in respect thereof, either between any parties concerned or between any party concerned and the surveyor of the district, to the determination of the official referees, upon a reference of the matter in question, according to the provisions of this Act in that behalf. s. 5.

**Building,** before any is begun, and after 3 calendar months' suspension of the work, and in case of a change of the builder, 2 days' notice to be given by the builder to the district-surveyor at his office, under penalty to him in the first case only of treble the amount of his fees, and also under penalty in each of the three cases not exceeding 20l. s. 13.

**BUILDING-CONTRACTS** (Existing), modification of. It shall not be lawful to execute any such contract otherwise than in conformity with the provisions of this Act; but either party may deviate from such contract so far as any part thereof may remain to be executed after the Act shall have come into operation; and the alterations rendered necessary by this Act shall be performed as if this Act had been in force when such contract was entered into; and if the parties thereto shall disagree about the difference of the costs and expenses of the works when performed according to the provisions of this Act, the works as stated in the contract in such contract, upon notice being given in writing by one party to the other, either may refer the matter to the district-surveyor, who shall determine the same, subject to appeal to the official referees; and the award of such referees shall be final and binding on all the parties, as if such award had formed part of the contract, and the costs of the reference shall be borne by all or any or either of the parties in such manner and proportion as the surveyor, or in case of appeal, as the referees shall appoint.

**BUILDING-LEASES** and agreements for leases (Existing), modification of. If it be made to appear to the official referees that any rules by this Act prescribed will prevent the due observance of or be at variance with any such lease or agreement, and that the objects of this Act may be obtained by modifying such rules, either entirely or partially, in conformity with such lease or agreement, it shall be lawful for the said official referees by their award to authorize such modification, subject to the approbation of the Commissioners of Works and Buildings; and subject to such modification, (or in default thereof), it shall be the duty of each person (so bound) to erect every building agreed to be built by such lease or agreement according to the conditions rendered necessary by this Act, in the same or like manner as if this Act had been passed and in operation at the time of making such lease or agreement; and on such completion of the works, and on giving to the lessor or other owners of such building 14 days' notice of his intention to apply to the official referees on this behalf, the lessee or tenant may require the official referees to ascertain what loss, present and prospective, has been occasioned thereby, and having regard to the respective terms and interests of the lessee or tenant, the lessor and other owners of such building, and to the benefits, or advantages, which may have accrued to such lessee or tenant since the execution of such lease or agreement, and which may appear to the said official referees not to have been in the contemplation of the parties to such lease or agreement at the time of the execution thereof, to determine whether he is entitled to any and what compensation, by payment of money, reduction of rent, or both, or otherwise; and on receipt of such requisition, and on proof of due notice thereof having been given to the lessor and other owners of such building, the official referees are to proceed to ascertain if any and what loss has been so occasioned, having regard as aforesaid to the benefits, or advantages, to be paid, and in what proportions, and their decision in the matter shall be final. s. 10.

**BUILDING-OWNER.** s. 20.

C.

**CALENDAR** month to be always understood under the Act by the word *Month*. s. 2.

**CANBERWELL** parish included within the operation of the Act. s. 3.

**CARRIAGE-WAY**, the existence of, brings public places within the denomination of *Streets*. s. 2.

**CASHER** of the Commissioners of Works and Buildings to receive annually from the Chamberlain of London and the county treasurers of Middlesex, Surrey, and Kent, the contributions towards the expenses of the official referees and registrar. s. 96.

**CEILING**, plastered, not to be formed over any public way. See *Public way, buildings over*.

**CELLARS.** See *Lowestmost rooms*.

**CERTIFICATES**, awards, and other documents to be arranged in the registrar's office chronologically, and in classes according to their subjects. s. 93.

**Certificate**, district-surveyors' and official referees' relative to ruinous buildings. See *Ruinous buildings*.

**Certificate** of qualification from examiners to be produced to the town clerk of London, or to the county clerk of the county, one week before the election of *district-surveyor*. s. 66.

**Certificate**, official referees', of work done by builder contrary to Act. s. 18. See *Nuisance*.

**CERTIORARI.** See *Removal of orders, &c*.

**CESSPOOLS.** If there be a common sewer within 50 ft. from any front or from the inclosure about any house or other building, then a cesspool must not be made for the reception of drainage from such house or other building, unless there be, or shall be built, a good and sufficient drain from such cesspool to such sewer. And cesspools under houses or other buildings must be air-tight. Schedule H.

**CHAMBERS.** See *Ins of Court*.

**CHAMBERLAIN** to receive and return, if claimed within 6 years, surplus arising from sale of materials of ruinous buildings, and from the city and liberties of London. s. 41.

**Chamberlain** of London to pay annually 100l. towards the expenses of the official referees and registrar. s. 96.

**CHANGE** of builder, in case of, two days' notice to be given to the district-surveyor at his office under penalty of not exceeding 20l. s. 13. See *Builder*, for definition of the term.

**CHAPEL-DOORS.** See *Official referees and Overseers of parishes*.

**CHARGING-CROSS.** The council has power to extend the operation of the Act to any place within 12 miles from s. 4. See *Gazette, Districts included, &c*.

**CHARLTON** parish included within the operation of the Act. s. 3.

**CHASES** and recesses. In every story, recesses may be formed, but only with the consent and authority of the official referees, and so that such recesses be arched over, and the back of any such recess be full 7 ins. from the centre of the party-wall in the first or lowest story, and full 4 ins. from the centre of the party-wall in any other story, and so that the stability and sufficiency of such party-wall be not injuriously affected thereby. Chases required for the insertion of rads of walls, piers, chimney jambs, wibes of flues, metal pipes, or iron story-posts, must not be left or be cut nearer to the centre of a party-wall than 4 ins. at least, nor within a distance of 9 ins. at least from any front or back wall, and no two such chases must be made within a distance of 7 ft. 6 ins. at least from each other on the same side of a wall, and no such chase must be formed wider than 9 ins. Schedule D, Part IV.

**CHELSEA** parish entirely included within the operation of the Act. s. 31.

**CHIMNEYS** HEREAFTER BUILT OR REBUILT:—*Rules concerning construction.* The foundations and footings of every chimney and chimney-stack (except angle-chimneys) must be built similar to those of the wall in or adjoining to which it shall be. And every chimney and chimney-stack must be built from the foundation to the top thereof without any corbelling over, whereby any upper part of the brick-work thereof shall overhang any lower part of the brick-work on the front thereof. But in buildings of the 1st rate and of single 1st rate, the jambs, breast, and flue of any angle-chimney may be built of brick, stone, or iron corbels above the ceiling of the 3rd story; and in buildings of the 2nd and 3rd rates, the jambs, breast, and flue in any single chimney may be built upon brick, stone, or iron corbels above the ceiling of the 2nd story thereof; but the projection both of such jambs and breasts must not in any case exceed 9 ins. before the face of the wall or stack to which the same shall adjoin. And angle-chimneys may be built in the internal angle of any building, with the breast thereof not wider than 5 ft.; and properly supported on iron girders, with brick arches, or on strong stone landings, not less than 4 ins. thick, tall at least 9 ins. into each of the two walls forming an angle.

*Dimensions and materials.* The jambs of every chimney must not be less than 8½ ins. wide on each side of the opening. The breast of every chimney, and the front, back, withe, or partition thereof, must be at the least 4 ins. thick of sound bricks, properly bonded, and the joints of the work must be filled in with good mortar or cement, and all the inside thereof, and also the outside or face thereof next the interior of any building, must be rendered or parge-ted. And no flue may be used for a smoke-flue which is in any section of less internal diameter than 8½ ins.

*Timber or wood-work.*—No timber must be placed over any opening for supporting the breast of any chimney, but there must be an arch of brick or stone over the opening of every such chimney, to support the breast thereof, and an iron bar or bars must be built into the jambs, at the least over the breast projects more than 4½ ins. from the face of the wall, and the jamb on either side of it be less width than two-thirds of the opening. And no timber or wood-work must be placed or laid in any wall under any chimney-opening within 18 ins. at least of the surface of the hearth to the fireplace of such chimney-opening. If timber or wood-work be affixed to the front of

any jamb or mantel, or to the front or back of any chimney or flue, it must be fastened by iron nails or bolts, or other iron fixed-nails, not driven nearer than 4 ins. to the inside of any flue or to the opening of any chimney; and such timber or wood-work must not be nearer than 9 ins. to the opening of any chimney. And no timber must be laid or placed within 3 ins. of the face, or breast, back, side, or jamb of any flue, or of any chimney-opening, where the substance of brick-work or stone-work shall be less than 8½ ins. thick; nor must any flooring-board, battens, ground, skirting, or other lining or fitting of wood, nor any wood staircase, nor any thing else of wood, be fixed or placed against or near to the face, or breast, back, side, or jamb of any flue, fireplace, or chimney-opening, unless and until the brick or stone-work constituting the same shall have been thoroughly and efficiently rendered or parge-ted with proper mortar or stucco, and such rendering must be in every case in addition to 4 ins. at least of solid fire-proof structure. Schedule F, s. 5.

**Chimney** (Opro), with proper flue, every underground room or cellar let as a separate dwelling must have. Schedule K.

**Chimneys**, ruinous, repair of, &c. If a chimney-shaft, chimney-pot, or other thing thereon, the eaves, or parapet or coping, or slates or tiles on the roof, or any projection from the front walls of any building, be in danger of falling, the district-surveyor shall require the occupier of such building, or if there be no occupier the owner thereof, to take down or secure the same within 30 hours after notice;—and if within the time specified such occupier, or some other person interested in such building, do not begin to take down or secure the same, and as soon as the nature of the case will admit complete such taking down or securing of the same, then such surveyor shall give information thereof to a justice of the peace, who shall proceed to cause such chimney-shaft, chimney-pot, or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or projection from the front or side wall of such building as shall be considered by such surveyor in danger of falling, to be forthwith taken down or secured; and if there be no occupier or known owner, then such justice shall direct that the reasonable expenses, to be certified by the official referees, be paid by the overseers of the parish or place in which such building shall be situated; and if thereafter the owner of such building become known, or if the building become occupied, then the overseers of the poor shall recover the amount of such expenses from such owner or from such occupier as in the case of ruinous buildings;—and if within the time limited the occupier, or some other person interested in such building, do not take down or secure the same, then for every day's default such occupier, or the owner if there be no occupier, shall FORFEIT and pay a sum not exceeding 5l.; and such occupier or owner shall also pay the surveyor's fees, and all other costs, charges, and expenses attendant upon any such taking down or securing the building; and all such surveyor's fees, and other costs, charges, and expenses, may be recovered and levied in the same manner as such penalty; but if the occupier of such building be not bound by any lease or other instrument to repair, reinstate, or secure the premises, such occupier may retain out of the rent payable in respect of such premises all penalties, costs, charges, and expenses attendant upon or arising out of the taking down or securing, or the repairing or rebuilding the same, as in the case of any other works the costs of which he is hereby required to pay in the first instance. s. 43.

**Chimneys**, recovery of costs of. See *Expenses of works*.

**Chimneys**, if raised at the expense of one party, to be paid for by the adjoining party if afterwards used by him to a raised building. s. 31.

**Chimneys, &c.** Compensation for injury by fall of. If at any time any injury or damage be caused to any part of an adjoining building, or to the internal decorations and furniture, goods, wares, and merchandise in such building, by the falling down from any other building of any chimney-shaft, chimney-pot, parapet, coping, or other thing (except any such part of a party-wall as shall belong to and be used conjointly by the owners or occupiers of the buildings parted thereby), then the owner of the building from which such part shall fall shall reimburse the expense to which the owner or occupier may be put in making good such injury or damage, in like manner as herein directed concerning the reimbursement of the expenses of ruinous party-walls; and such costs shall be recoverable in the manner hereinafter directed for the recovery of the costs and expenses of executing works in pursuance of this Act. s. 44.

**CHIMNEY-BACKS.** The back of every chimney-opening of every building (except backs of chimneys in the lowest story of buildings of the 4th rate) in the lowest story to be at the least 13 ins. thick, and in every other story at the least 8½ ins. thick from the hearth to the height of 12 ins. above the mantel. And the backs of chimney-openings in the lowest story of buildings of the 4th rate, to be at least 8½ ins. thick. But chimney-backs in walls not party-walls may be 4½ ins. less in thickness. If two chimneys be built back to back, the thickness between them is to be at least of the thickness hereinafter directed for the back of one chimney-opening. Schedule F.

**CHIMNEY-BREASTS, &c.** in new party-walls. Instructions for, by adjoining owner. When the owner

of any piece of vacant ground shall have obtained the consent of the adjoining owner to build a party-wall on the line of junction of their respective premises, then, 10 DAYS at the least before beginning to build such party-wall, it shall be the duty of the building owner to give the adjoining owner notice thereof, according to the form (No. 16) in the Schedule of Notices, or to the like effect; and if in due time the adjoining owner give instructions in writing, or a plan and elevations or other sufficient drawings, then it shall be the duty of the building-owner to construct, IF PRACTICABLE, such and so many chimney jambs, breasts, and flues of chimneys in all such parts of such party-wall as shall be by such instructions required, and to leave such recesses in every such wall as may be so required, but so that they be conformable with the directions of this Act concerning party-walls and chimneys; and thereupon the building owner may claim and recover from the adjoining owner the expenses of such work. s. 39. District-surveyor's fees for attending to the cutting away of chimney-breasts for external walls.—

	£	s.	d.
1st rate . . . . .	3	3	0
Ditto extra . . . . .	3	3	0
2nd ditto . . . . .	2	2	0
3rd ditto . . . . .	2	2	0
4th rate, containing more than 2 stories . . . . .	1	1	0
4th rate, not containing more than 2 stories . . . . .	0	10	6

Not chargeable where the ordinary fees for building, or addition, or alteration are paid. Schedule L.

**CHIMNEY-POTS, RUINOUS.** See *Chimneys, ruinous*.  
**CHIMNEY-POTS, TUBES, &c.** Earthen or metal chimney-pots, tubes, funnels, or cowl of any description whatsoever, higher than 4 ft. above the brick or stone-work, must be fixed 2 ft. at least into the brick or stone-work of the supporting flue. Schedule F.

**CHIMNEY-SHAFTS.** Every chimney-shaft or flue hereafter built, raised, or repaired must be carried up in brick or stone-work all round, at least 4 ins. thick, to a height of not less than 3 ft. above the highest part of the portion of the roof, flat, or gutter adjoining thereto, measured at the point of junction. And the brick or stone-work of any chimney-shaft (except that of a steam-engine, brewery, distillery, or manufactory), must not be built higher than 8 ft. above the slope, flat, or gutter of the roof which it adjoins, measured from the highest point of junction, unless such chimney-shaft be built of increased thickness, or be built with and bonded to another chimney-shaft, or be otherwise rendered secure. And the chimney-shaft for the boiler-furnaces of any steam-engine, or for any brewery, distillery, or manufactory, may be erected of any height, so that it be built in such manner and of such strength and dimensions as shall be satisfactory to the official referees, upon special application in each case. Schedule F.

**CHIMNEY-SHAFTS, RUINOUS.** See *Chimneys, ruinous*.  
**CHIMNEY-SHAFTS, JAMBS, BREASTS, OR FLUES, ALREADY BUILT, OR HEREAFTER BUILT,** shall not be cut into for any purpose other than the repair thereof, or for the formation of soot-doors, or for letting in, removing, or altering stove-pipes or smoke-jacks, except as directed for building an external wall against an old sound party-wall. Schedule F.

**CHIMNEY-SLABS AND HEATHS.** A slab or slabs of brick, tile, stone, slate, marble, or other proper and sufficient substance, at least 12 ins. longer than the opening of every chimney when finished, and at least 15 ins. in front of the arch over the same, must be laid before the opening of every chimney. And in every floor, except the lowest floor, such slab or slabs must be laid wholly upon stone or iron bearers, or upon brick trimmers; but in the lowest floor they may be laid on a brick fender, or bedded on the solid ground. And the hearth of every chimney must be laid and bedded wholly on brick or stone, or other incombustible substance, which must be solid for a thickness of 9 ins. at least beneath the surface of any such hearth. Schedule F.

**CHIMNEY-STACK.** Two days' notice to be given to the district-surveyor at his office before begun to be built, pulled down, rebuilt, cut into, or altered. s. 13. See *Penalty*.

**CHRISTMAS-DAY.** District-surveyor's office not required to be attended on. s. 72.

**CHRONOLOGICALLY,** as well as classed, all awards, certificates, and documents, to be arranged in the registrar's office. s. 93.

**CHURCH-DOORS.** See *Official referees and Overseers of Parishes*.

**CHURCHWARDENS.** See *Parish* (the word).

**CIRCUS,** for meaning of, see *Street*.

**CLASS, alteration of.** If any room, whether constructed within any other building or not, or included in the aforesaid classes or not, be used at any time for the public or general congregation of persons, then the building containing such room is to be deemed a building of the 3rd or public building class. Or if a building originally built, or subsequently altered, so as to bring it within any one class, be subsequently converted into or used as a building of another class, then it is to be deemed to belong to such other class; and, as to it, all the conditions prescribed with regard to buildings of the same rate of such other class must be fulfilled, as if it had been originally built of such class; subject to such modifications as shall be sanctioned by the official referees on a special supervision thereof. Or if a building be used partly as a dwelling-house

and partly for any purpose which would bring it within the 2nd or warehouse class, then it is to be deemed to belong to the 2nd class; and as to it all the conditions prescribed with regard to buildings of the same rate of such class must be fulfilled as if it had been originally built of such class, subject to such modifications as shall be sanctioned by the official referees on a special supervision thereof. Schedule C, Part I. s. 5.

**CLASSES and rates of buildings,** to be, in cases of doubt, difference, or dissatisfaction, determined by the official referees. s. 5.

**CLASSES or Rates, buildings not within.** Buildings not by this Act expressly assigned to any class or rate of a class, shall be built in accordance with such class and rate as shall be directed by the surveyor, subject, as in other cases of doubt, difference, or dissatisfaction, to an appeal to the official referees. s. 8.

**CLASSES of Buildings are three—First, or Dwelling-house class; second, or Warehouse class; third, or Public Building class,** which articles see.

**CLASSED,** in order, of the subjects, as well as chronologically, all awards, certificates, and documents, to be in the registrar's office. s. 93.

**CLERK of the Peace for the county to receive one week before the election of a district-surveyor the examiner's certificate of due qualification.** s. 66.

**CLOSE FIRES.** Every oven, furnace, coke, or close fire used for the purpose of trade or manufacture, must be distant 6 ins. at least from any party-wall, and must not be upon nor within a distaunce of 15 ins. of any timber or wood-work. And the floor on or above which such oven, furnace, coke, or close fire shall be built or fixed must be formed and paved under, and for a distaunce of 2 ft. round the same, with stone, brick, tile, or slate, at least 2 ins. thick, or other proper incombustible and non-conducting materials. Schedule F.

**COCKLE.** See *Close fires*.

**COMMISSIONER, for any owners of houses within the limits of the Act, disqualified from being official referee or registrar.** s. 95.

**Commissioners of Sewers.** See *Drainage of houses, also Buildings, new and old*.  
**Commissioners of the Treasury to appoint such fees to be paid in respect of the services to be performed by the official referees or by the Registrar of Metropolitan Buildings,** as shall be deemed requisite to defray the expenses of office, or incident to such services, and the salaries or other remuneration of any persons employed under the registrar in the execution of the Acts with the sanction of the Commissioners of the Treasury, and which are not otherwise provided for by this Act; and the balance, if any, shall be carried to the consolidated fund of the United Kingdom, and be paid accordingly into the receipt of her Majesty's Exchequer at Westminster; and the said commissioners to regulate the manner in which such fees are to be received, and in which they are to be kept, and in which they are to be accounted for; and the registrar to cause a list of the fees so appointed to be fixed up in some conspicuous part of his office. s. 98.

**Commissioners (the) of Works and Buildings.** The expression to mean the Commissioners of her Majesty's Woods, Forests, Land Revenues, Works, and Buildings. s. 2.

**Commissioners of Works and Buildings to appoint, during their pleasure, a Registrar of Metropolitan Buildings, and to appoint, if he be ill, or otherwise unable to discharge the duties of office, or be absent, some other person to act temporarily in his behalf, remunerated out of the registrar's salary, or otherwise, as the Lords of the Treasury shall appoint.** s. 89.

**Commissioners of Works and Buildings to make rules for regulating the execution of the duties of the office of Registrar of Metropolitan Buildings.** s. 89.

**Commissioners of Works and Buildings.** If it shall appear to the Registrar of Metropolitan Buildings that any documents made by the official referees are contrary to law, or not complete in any of the requisite forms, or beyond the competence of the said referees, either with regard to the provisions of this Act, or any rules or regulations prescribed for their guidance by the said commissioners, then it shall be the duty of the said registrar to refuse to affix the seal; and thereafter, if the said referees shall so require, he shall refer the matter, and the particular grounds and reasons for his refusal, to the said commissioners; and upon the receipt of such report the said commissioners shall authorize the said registrar to affix the seal, or to confirm his refusal. s. 89.

**Commissioners of Works and Buildings, Cashier of, to receive annually from the Chamberlain of London, and the county treasurers of Middlesex, Surrey, and Kent, the contributions towards the expenses of the official referees and registrar.** s. 96.

**Commissioners of Works and Buildings are, in case an official referee act as architect to any building, to appoint some other competent person to act in that case in conjunction with the other official referee.** s. 80.

**Commissioners of Works and Buildings to appoint three or more architects, surveyors, or builders, to examine, together with the official referees, candidates for the office of district-surveyor, and from time to time to prescribe such course of examination as to them may seem fit, and to make any other rules for the regulation of such examination, and the granting of certificates, subject to the approval of the said Commissioners of Works**

and Buildings; and when such rules shall have been registered by the Registrar of Metropolitan Buildings, they shall continue to be in force until they shall be amended, altered, or rescinded by other rules to be made by such examiners and so registered as aforesaid. s. 66.

**Commissioners of Works and Buildings to determine, in case of appeal, if buildings are liable to the special supervision of the official referees.** s. 6.

**Commissioners of Works and Buildings, (subject to the restrictions and regulations of) the official referees may appoint one of their number, under their hands and seal of the Registrar of Metropolitan Buildings, to make any inquiry or any survey which shall appear to them either necessary or expedient in order to enable them to determine any matters in reference.** s. 85.

**Commissioners of Works and Buildings, with the sanction of the official referees, may modify the rules of the Act either entirely or partially, in conformity with an existing building-lease or agreement.** s. 10.

**Commissioners of Works and Buildings, or any two of them, empowered to modify rules of the Act generally for the purpose of preventing its express provisions from hindering the adoption of improvements, and of providing for the adoption of expedients either better or equally well adapted to accomplish the purposes thereof, if in the opinion of the official referees the rules by this Act imposed shall be inapplicable, or will defeat its objects, and that by the adoption of any modification of such rules such objects will be attained either better or as effectually, such official referees reporting their opinion thereon, stating the grounds of such opinion to the Commissioners of Works and Buildings; and although such official referees shall be of opinion that such modifications are not requisite or admissible, yet if any party interested present to the official referees a representation, setting forth the grounds whereon such modification is claimed, the official referees are to report such representation, as well as their opinion thereon, to the said commissioners, with the grounds of such their report and opinion; and thereupon, if the said commissioners think fit, it shall be lawful for them or any two of them to direct the official referees to make such order in the matter as may appear to them to be requisite. s. 11.**

**Commissioners of Works and Buildings have power to modify the provisions of this Act as to existing buildings to be rebuilt in respect of the required area, or in any other respect than the required height and thickness of walls, if a full compliance with its provisions would be attended by great loss and inconvenience,—subject to the report of the official referees, and to such terms as the said commissioners may impose in that behalf, and provided such buildings are on the site of the old buildings be as near as may be practicable to statute. s. 12.**

**COMMIT, justices may, such persons as have no goods, &c. upon which sufficient distress can be made. See *Awards, recovery of money under*.**

**COMPANIES to be understood as meant by the Act, although an individual only be mentioned.** s. 2.

**COMPENSATION by neighbours, parts of whose buildings may fall. See *Chimneys, ruinous*.**  
 Compensation, reasonable, the official referees may award to be paid to adjoining parties by parties who rebuild a sound party-wall not condemnable. s. 26.

**COMPLAINTS (all) and proceedings thereon to be entered by district-surveyor in his office register-book.** s. 68.

**CONCRETE-WORK, cost of, may be claimed from adjoining parties.** s. 47.

**CONDEMN (The district-surveyor is to) party-walls made ruinous or dangerous by cutting away.** s. 29.

**CONSENT of adjoining owners. See *Notice to, &c.***

**Consent of adjoining owners, supplying want of.** If adjoining premises be unoccupied, or if the owner thereof cannot be found, or if the owner although found cannot, by reason of legal disability or otherwise, consent to the work, or if the owner will not consent thereto, or if differences arise amongst the parties concerned, then the notice required to be given in respect of such work must be served both on the district-surveyor and on the official referees, in addition to such other parties existing as to notice under this Act upon whom such notice can be served, which must be according to the form (No. 9) in the Schedule of Notices, or to the like effect; and on the receipt of such notice the district-surveyor shall give notice to the parties by whom such work is to be executed, and to any one or more surveyors or agents by them appointed, as to the day and hour when he will view the premises, according to the form (No. 10) in the Schedule of Notices, or to the like effect; and at such time the surveyor of the district shall proceed to inspect such premises accordingly, and to certify to the official referees,

**FIRST,** whether such work ought to be done or not;

**SECONDLY,** if the same ought to be done, whether it ought to be done in the proposed manner;

**THIRDLY,** the site whereon the party-wall should be built; and with regard to intermixed buildings, what party-arches may be necessary over or under any rooms of such buildings so intended to be rebuilt;

**FOURTHLY,** the quantity of the soil or ground or other parts of the premises (if any) neces-

sary to be laid to or taken from the house of the person desirous to rebuild to the house of the person permitting him to erect a party-wall or party-arch;

FIFTHLY, the compensation (if any) which should be made and paid by either the building owner or the adjoining owner to the other in lieu of the lessening either of the said buildings by such party-wall or party-arch, or as a satisfaction for such other injury (if any) as shall be done or occasioned thereby to any of the said parties;

And upon receipt of such certificate the official referees shall cause notice thereof to be given to the parties or to such of them as are known; and if within 7 days after such notice to the parties the certificate be not appealed against, and if the official referees be of opinion that the work is proper to be done, and the compensation is fair, then the official referees shall confirm such certificate, and authorize the building owner to proceed with the works as if the consent of the adjoining owner had been obtained;—and if any party concerned shall appeal against the certificate of the surveyor as to the work to be done, or as to the compensation, or as to any other matter referred to in such certificate in pursuance of the above proviso, then the official referees shall appoint one of their number to survey the building in question; and for that purpose the official referee so appointed shall give notice to the parties, and to any one or more surveyors or other agents by them appointed, as to the time when he will view the premises;—and at such time it shall be the duty of such referees to view such premises accordingly, and to inquire into the matters appealed against, and to certify to the official referees his opinion thereon;—and upon such certificate being made it shall be lawful for the official referees to make their award, whereby either confirming or reversing or modifying as to them the case may seem to require, the certificate of the surveyor, and appointing by whom and in what proportions the expenses of the surveys and of the reports thereon are to be paid, and such award shall be final;—and with regard to any works by such award authorized, so far as relates to the proceedings of the building owner, if upon the making of the award the periods of the notices by this Act prescribed with regard to works of that nature have elapsed, then immediately upon the making of the award, but if such period havenot elapsed, then as soon after the making of the award as such periods shall have elapsed, it shall be lawful for the building owner, his agents, servants, and workmen, to proceed to execute the works. s. 24.

Consent of one of the principal Secretaries of State requisite to render valid magistrates' appointment of districts and district-surveyors. ss. 64, 65.

Consent of the parties. In default of, the official referees may authorize the pulling down of party-structures and the laying together parts of intermixed buildings. s. 34.

Consents by incapacitated persons. Consents by this Act required to be given by the owner or occupier of any building or ground on behalf of incapacitated persons. If such owner or occupier be a married female, not being a cestuique trust in regard to the property to which such consent relates, must be given by her husband; or if such owner or occupier be an infant, idiot, or lunatic, or cestuique trust, then by his or her guardian, trustee, or committee; or if such owner or occupier be a husband, trustee, guardian, or committee, he not known or cannot be found, then to protect the interests of such parties, as well as to facilitate the purposes of this Act, the official referees are, by writing duly sealed by the Registrar of Metropolitan Buildings, to give such consent as may be requisite, upon such terms and subject to such conditions as may seem fit to them, having regard alike to the nature and purpose of the subject-matter in respect of which such consent is to be given, and to the fair claims of the parties on whose behalf such consent is to be given. s. 117.

CONSTATABLES. See Parish (the word).

CONSTRUCTION and meaning of terms, used in this Act, when not altered by the context. s. 2.

CONTRACTS. See Building contracts (existing) modifications.

CONTRIBUTIONS of parties liable to bear the expense of party structures, official referees to settle the proportions of. s. 50.

COPIES of the awards, certificates and other documents of the official referees, the registrar is to give under his hand and seal to parties requiring the same, upon their tendering the expenses and fees relative thereto. s. 91.

DANGERS in danger of falling. See Chimneys, ruinous.

DEEDHOLDER. s. 50. See Expenses of works.

DEPRECIATIONS to be understood as meant by the Act although an individual only be mentioned. s. 2.

DETRIMENTORS of 3rd class buildings, floors of, must be fire-proof. Schedule C, Part VI.

DEISTS. See Awards, recovery of money under.

DISTRICT (her Majesty in) has power to extend the operations of the Act to any place within 12 miles from Charing Cross, one month's notice being given in the first instance by the mayor, corporation, and notice being affixed by official referees

and overseers on the doors of the churches and chapels of the locality 3 weeks before any such extension be taken into consideration by the Council. s. 4.

COUNTING-HOUSES. See Inns of Court.

COUNTY-RATES to be raised for defraying the contribution towards the expenses of the official referees and registrar. s. 96.

COURTS, and other public places which can be used as footways only, are by this Act denominated alleys. s. 2.

Court of Mayor and Aldermen of the city of London. All the powers and authorities by this Act vested may be exercised by the Court of Mayor and Aldermen in the outer chamber of the Guildhall of the said city. s. 45.

Court (Inns of). The rooms or chambers in Sergeants', Chancery-lane, or in any of the four Inns of Court, or any of the Inns of Chancery, or any other inns set apart for the study or practice of the law, and other buildings divided into rooms or chambers, offices, or counting-houses, let out or to be let in separate suites or sets, so far as relates to the building of party-walls, the walls or divisions between the several rooms and chambers in such inns, or such buildings, belonging to and communicating with each separate and distinct tenement, shall be deemed to be party-walls within the meaning of this Act, and as such must be built in conformity with the regulations and clauses herein contained relating to party-walls. s. 35.

COVENANTS to repair. See Chimneys, ruinous.

COVENT GARDEN MARKET is under special supervision. Schedule B, Part I.

COVERED in, when roof is. See District-surveyor, relative to fees becoming due.

CRESCENT, for meaning of, see Street.

CROSS-WALLS, how affecting the thicknesses of external walls. See Inclosing walls.

CUTTING into and pulling down work. The district-surveyor may order, for his inspection; and on refusal thereof by the builder, he is to give information to the official referees, who are to hear the matter, and determine relative thereto, and as to the expenses thereof, and of application to them. s. 14.

CUTTING away, party-walls made ruinous or dangerous by, district-surveyor is to condemn. s. 29.

D. DAMAGE caused by the work of party fence-wall to be made good by the person performing the same. s. 32.

Damage to be made good by neighbours, parts of whose buildings may fall. See Chimneys, ruinous. Damage arising from erection of external wall against party-wall—Cutting into footings and chimneys. If he be necessary to be the ground against the wall of any adjoining building for the purpose of erecting a wall thereon, or for any other purpose, it shall be lawful for the building owner so to do, on condition that he at his own costs shore up and underpin such wall, or such part thereof, to its full thickness and to the full depth of such excavation, with good and sound earth, bricks and tiles or slates bedded in cement, or with other proper and sufficient materials, in a workmanlike and substantial manner; and if for the purpose of erecting such external wall it be necessary to cut away part of the footings of such party-wall on the side next to the wall so to be built, and any part of the chimney-breasts and chimneys belonging to the building about to be rebuilt as shall project beyond the perpendicular face of such party-wall in the lowest floor thereof; on giving notice of such intention in writing to the owner of the adjoining building at least one calendar month before commencing operations, according to the form (No. 15) in the Schedule of Notices, or to the like effect; and on the expiration of such notice, it shall be lawful for the building owner and he is hereby authorized to cut away such portions of the footings, breasts, and chimney-shafts aforesaid, but so that the same be done, and the brick-work where cut be again made good in cement, under the superintendance and to the satisfaction of the surveyor. s. 28.

DAMAGED party wall, making good of. If a party-wall be so damaged and injured by such cutting away as in the opinion of the adjoining owner or occupier to be ruinous or dangerous, then, upon application for that purpose, the district-surveyor shall survey such wall; and if, upon the survey thereof, it be found ruinous or dangerous, then condition it, it shall be the duty of the building owner to pull down and rebuild such party-wall;—and if in the opinion of the district-surveyor or of the official referees such damage or injury shall have been occasioned by want of due care on the part of the building owner, then it shall be the duty of such building owner, and he is hereby required, to pull down and rebuild such party-wall at his own costs and charges, including therein all the costs and expenses incident to such survey, and the pulling down and rebuilding of such party-wall, and the reinstating and making good all the internal finishings and decorations damaged thereby; and if the owner of the building to be rebuilt do not proceed with all due despatch to pull down and rebuild such party-wall, and to reinstate and make good all the internal finishings and decorations of the adjoining premises, and to pay the costs and charges and expenses of the survey, it shall be lawful for the adjoining owner so to do, and to recover all the costs and expenses in respect thereof from such owner, his heirs, executors, administrators, or assigns. s. 29.

DECLARATION of official fidelity, district-surveyors to make, before acting, under penalty of 5l. per day. s. 71. official referees, s. 87; registrar, s. 90.

Declaration, before lord mayor or justices of peace, of notice to repair or pull down ruinous building not being complied with. See Ruinous buildings.

DECORATIONS, internal, to be made good by neighbours, parts of whose buildings may fall. See Chimneys, ruinous.

Decorations, internal, to be made good by a party who rebuilds a sound party-wall not condemnable. s. 25.

DELAY of work to suit adjoining owner. If the adjoining owner, at any time within 3 calendar months after the receipt of notice from the building owner, give notice of his desire that work be delayed, so as to cause it to be executed at a more reasonable or a more convenient time in reference to the business or to the family or domestic arrangements of such adjoining owner or his tenants, according to the form (No. 18) in the Schedule of Notices, or to the like effect, then within 7 days after the receipt of the notice thereof, the building owner shall signify his consent to or dissent from such modification or delay; or if the building owner do not within such 7 days signify his consent to such modification or delay, then it shall be lawful for the adjoining owner and he is hereby entitled to require the building owner to delay the work until the official referees shall have determined thereon; and if within 7 days thereafter application be made in writing to the official referees, according to the form (No. 19) in the Schedule of Notices, or to the like effect, and notice thereof be given to the building owner, according to the other form (No. 20), then within 10 days after such application it shall be the duty of the official referees to signify their decision thereon, and it shall be the duty of the building owner to delay the same till the decision of such official referees shall have been given; and if within the period of 3 calendar months from the date of the first notice such adjoining owner do not make any objection or any requisition in conformity with this enactment, then, subject to the provisions of this Act with regard to such works, it shall be lawful for the building owner to proceed to execute the same. s. 22.

DEPTFORD parish included within the operation of the Act. s. 3.

DEPUTY official referee. See Architect, also Commissioners of Works and Buildings.

Deputy district-surveyor. If any surveyor be prevented by illness or unavoidable circumstances from attending to the duties of his office, it is his duty, subject to the previous consent and approval of the official referees, to appoint some other surveyor, duly qualified as, to perform his duties so long a time as he shall be so prevented from executing them; and during such time such deputy shall perform all the duties of such surveyor, in all respects as if he were the surveyor appointed or confirmed under this Act; and such deputy surveyor shall receive the fees payable in respect of the services so performed by him. s. 73.

Deputy surveyor, in any county, may not act as justice of peace in the same county. s. 69.

DETACHED buildings, district-surveyor's fees for. See Attached buildings.

DIGGING, cost of, may be claimed from adjoining parties. s. 47.

DISCHARGED or fined, district-surveyor, upon the complaint of any person in writing under his hand to the lord mayor and aldermen of the city of London, or to the justices of the county, may be, who demands or lawfully receives any higher fee than entitled to under this Act, or if in his capacity of surveyor he receive a fee for any act or omission in respect of which he is not entitled to receive any remuneration, or if he refuse to refund any fee wrongfully received by him in respect whereof the official referees shall have made an order to that effect, or if at any time he wilfully neglect his duty, or behave himself negligently or unfaithfully in the discharge thereof. s. 79.

DISTILLERIES. See Use of buildings; also Chimney-shafts.

DISTRESS, informalties in. See Informalties in.

Distress, justices to issue, in case of default of payments under awards or certificates. See Awards, recovery of money under.

DISTRICTS parochial. See Parish (the word).

Districts included within the operation of the Act.—All such places lying on the north side or left bank of the river Thames as are within the exterior boundaries of the parishes of Fulham, Hammersmith, Kensington, Paddington, Hanappstead, Horescy, Tottenham, Saint Pancras, Islington, Stoke Newington, Hackney, Stratford-le-Bow, Bromley, Poplar, and Shadwell.

Such part of the parish of Chelsea as lies north of the said parish of Kensington:

All such parts and places lying on the south side or right bank of the said river as are within the exterior boundaries of the parishes of Woolwich, Charlton, Greenwich, Deptford, LCC, Lewisham, Camberwell, Lambeth, Streatham, Tooting, and Wandsworth:

And all places lying within two hundred yards from the exterior boundary of the district hereby defined, except the eastern part of the said boundary which is bounded by the river Lea. s. 3.

If, from the growing increase of the population, or otherwise, it shall appear to her Majesty in Council to be expedient that the provisions

of this Act should be extended to any place within twelve miles from Charing Cross in the city of Westminster, then it shall be lawful for her Majesty in Council to direct, by order in Council, that at or from a time to be named in such order the provisions of this Act shall apply to such places; and at or from such time all such provisions, of whatever nature, whether penal or otherwise, so far as they shall be capable of application to such places shall be and are hereby declared to apply thereto as if such places were expressly named herein; and notice of the time that any such extension, is to be taken into consideration by the Privy Council, shall be published in the *London Gazette* one calendar month at least before such extension shall be so taken into consideration; and 3 weeks at least before such matter shall be so considered it shall be the duty of the official referees, and the overseers of the parishes within which such parts or places are situate, to cause copies of such proclamation to be fixed on the doors of the churches and chapels within such parishes; and every order in Council made in pursuance of this enactment shall be published in the *London Gazette*. s. 4.

Districts and officers to be appointed, this new Act to come into operation relative thereto on the 1st September, 1844. s. 1.

Districts. At any time after this Act shall come into operation, and from time to time, the lord mayor and aldermen of the city of London, with reference to the city of London and the liberties thereof, and the justices of the peace for the county of Middlesex, the county of Surrey, the county of Kent, the city and liberties of Westminster, and the liberty of her Majesty's Tower of London, in their General Quarter Sessions respectively, or any adjournment thereof, with reference to their respective counties, city, and liberties shall, subject to the consent of one of her Majesty's principal Secretaries of State, appoint the districts to which the respective places within their jurisdiction shall belong for the purposes of this Act, and may unite, enlarge, and alter such districts for the more convenient distribution of business. s. 64. (No provision is made for the appointment of districts within the county of Essex, although a portion of the county is included within the extent to which the Council may cause the Act to operate.)

Districts: If the official referees so deem, they are to make representation to the justices that they are too extensive, and are to transmit with such representation copies of the Register of Notices. s. 75.

Districts, in cases where any building, matter, or thing may be deemed to be in several, or the district may be doubtful, the official referees are to determine which is to be considered the district. s. 82.

DISTRICT-SURVEYORS must be discreet persons, educated and skilled in the art and practice of building, and full 30 years old (s. 64), to be appointed by the lord mayor and aldermen of the city of London, with reference to the city of London and the liberties thereof, and by the justices of the peace in their General Quarter Sessions respectively, or any adjournment thereof, with reference to their respective counties, subject to the consent of one of her Majesty's principal Secretaries of State. s. 65. Unless candidates for the office of district-surveyors hereafter appointed, except present district-surveyors appointed to new districts, one week before the election of a surveyor for any district created by this Act, or for any district in respect of which the office of surveyor may become vacant, produce a certificate, certifying that they have been examined, and found to be duly qualified for such office, to the town clerk of the city of London, or to the clerk of the peace for the county, city, or liberty, it shall not be lawful for any justices to appoint any such person to be surveyor. s. 66.

Tenure of office. District-surveyor to hold office during the pleasure only of the said lord mayor and aldermen and of the said justices respectively. s. 67.

Functions generally. Every district-surveyor shall see that all the rules and directions of the Act are well and truly observed in and throughout his district; and for that purpose, proceed from time to time, upon the receipt of notice, or if from ignorance or neglect, or from any other circumstance, notice of any work intended to be done has not been given, then upon such work being observed by or being made known to him, to inspect the works intended to be done, or which shall have been commenced, and to cause all the rules and directions of this Act in respect thereof to be strictly observed; attend and perform every thing required of him by this Act, whether with or without notice; inspect ruinous buildings and projections in danger, at all times when needful, and take all necessary measures thereupon; survey all buildings built, rebuilt, enlarged, or altered by or under the superintendence of a district-surveyor within any other district to which he shall be appointed by the official referees for that purpose, cause a hook for registering notices, informations, and complaints to be at all times kept at his office, and enter in such hook every notice, information, or complaint which shall be delivered or made to him, and any proceeding thereon by him taken. s. 68.

Disqualifications. During the time any person shall act as a justice of the peace for the county in which his district shall be situate, it shall not be lawful for him to hold the office of surveyor or

of deputy or assistant surveyor for any district. s. 69.

Continuance of present surveyors, 14 Geo. 3, c. 78.

The surveyors who at the time of this Act coming into operation shall have been appointed under the Act 14 Geo. 3, mentioned in the schedule (A) to continue to be the surveyors for the purposes of this Act, and for the districts assigned to them at the time this Act shall come into operation, subject to such alteration of such districts as may be made by virtue of any power in that behalf, and to act in all respects as if they had been appointed under this Act; and every provision in this Act applicable to district-surveyors, so far as relates to the exercise of the office of surveyor, and to their remuneration in that behalf, shall apply to them. s. 70.

Declaration of official fidelity — Penalty for acting without. Surveyors before acting in pursuance of this Act shall make a declaration of official fidelity, administered by the lord mayor and aldermen in their Court of Aldermen, or by the said justices of the peace in their respective General Quarter Sessions. s. 71. (See form of declaration in same section); and if before making such declaration any such surveyor act in pursuance of this Act, he shall pay for every day's offence 5s. s. 71.

Regulation of Duties; Offices—Attendance—Return of name and residence. Every surveyor for the city of London and the liberties thereof, to have an office at his own expense, in such public situation as shall be approved by the lord mayor and aldermen; and it shall be the duty of every other surveyor and he is hereby required to have an office at his own expense in some central part of the district to which he shall be appointed, as shall be approved by the justices of the peace in Quarter Sessions within whose jurisdiction he shall act; and every such surveyor shall by himself, or by some other person in his behalf, attend at his office every day (Sundays, Christmas Day, and Good Friday excepted) from 10 o'clock in the morning till 4 o'clock in the afternoon; and immediately upon his appointment, and from time to time upon every change of his residence or of his place of business, or oftener if required, every surveyor shall make a return to the Registrar of Metropolitan Buildings, and to the overseers of the poor of every parish, the place within his district, of his name and place of abode, and the place where such office shall be. s. 72

Surveyor pro tempore—Duty of deputy—Fees. If any surveyor be prevented by illness or any other unavoidable circumstances from attending to the duties of office, then forthwith he shall (subject to the previous consent and approval of the official referees) appoint some other surveyor, duly qualified as aforesaid, as his deputy, to perform his duties for so long a time as he shall be so prevented from executing them; and during such time aforesaid, such deputy-surveyor shall perform all the duties of such surveyor, in all respects as if he were the surveyor appointed or confirmed under this Act; and such deputy-surveyor shall receive the fees payable in respect of the services so performed by him in such district. s. 73.

Vacancies—Occasional serivets—Fees for services. If any vacancy happen through the death or removal of any surveyor, then, within one calendar month thereafter, it shall be the duty of the lord mayor and aldermen, or of the justices of the peace in General Quarter Sessions or any adjournment thereof, as aforesaid, to appoint a successor; and in the meantime the official referees shall direct the surveyor of any one or more of the other districts to perform the duties of surveyor for the vacant district, or if no district-surveyor can be spared from his own district, appoint some other competent person duly qualified as aforesaid for that purpose; and every such surveyor is hereby entitled to receive the fees payable in respect of the services so performed by him in such vacant district. s. 74.

Regulation of business—Assistant surveyors—Duties of assistants—Fees. If it shall appear to the official referees that the district appointed for any surveyor is too extensive for the prompt discharge of his functions, it shall be their duty to represent such their opinion to the lord mayor and aldermen of the city of London, or to the justices of the peace with whom the appointment of a surveyor for that district may rest, and for that purpose to transmit with their letter of representation a transcript of their Register of Notices, with the results; and if at any time it appear to such official referees that on account of the pressure of business in any district, or on any other account, the surveyor of that district cannot discharge his duties promptly and efficiently, they shall appoint any other district-surveyor to assist the surveyor of such district in the performance of his duties, or if no district-surveyor can be spared from his own district, then appoint some other competent person to give such assistance; such assistant-surveyor to make returns and to act in all respects as if he had been appointed by the said lord mayor and aldermen, or by the said justices, to be the surveyor of such district; and every such person shall be entitled to receive the fees payable in respect of the services so performed by him. s. 75.

Superintendence of surveyors. It shall not be lawful for any district-surveyor to survey for the purposes of this Act any building built, rebuilt,

enlarged or altered by or under his professional superintendence, but such building must be surveyed by another district-surveyor, or by another surveyor to be appointed by the official referees for that purpose. s. 76.

Surveyor's fees—Fees to be paid only for work done agreeably to Act. Upon the expiration of one calendar month after the roof of any building erected and surveyed under this Act shall have been covered in, and all the walls thereof have been built to their full heights, and the principal timbers and floors shall have been fixed in their places, and upon the expiration of 14 days after the completion of any addition, alteration, and repair, and upon the expiration of 14 days after each special service shall have been performed, and upon delivering to the owner of the building an account of the fees incurred, and upon tendering a receipt, signed with his christian and surname, and stating the amount of such account, and the work done, it shall be lawful for the surveyor and he is hereby entitled to receive from the builder, or from the owner or from the occupier of the building, for his time and trouble, and expenses in the causing the rules, regulations, and direction of this Act to be observed, the several fees specified in the schedule of fees (L); and if on tender of such receipt any builder, owner, or occupier who shall become liable to pay any such fee shall refuse to pay the same, then, upon application, a justice of peace shall summon the party complained of in the first instance, and if he do not appear, or fail to satisfy the justices as to the refusal of payment, such justice shall issue his warrant to levy the amount of such fee by distress and sale of the goods of the party so refusing, and if such fee be paid by the occupier, he shall be entitled to recover the amount thereof from the owner; but if the work have not been done in every respect agreeably to this Act, it shall not be lawful for any surveyor to receive such fee; and if he shall so receive it, upon application to the official referees by any party interested in the building in respect of which such work shall have been executed, and upon its appearing that such fee has been received wrongfully, it shall be lawful for such official referees and they are hereby authorized (if they think fit) to order the said surveyor to refund such fees. s. 77.

Surveyor's returns—Inspection of—Authentication and effect of returns. Within 7 days after the first day of every calendar month, every surveyor shall make a return to the Registrar of Metropolitan Buildings, enumerating therein the number and nature of all the several works executed within the previous calendar month under his superintendence, and the fees paid to him for the same, and a copy of the list or Register of Notices served upon him, with the results thereof, and keep in his office a copy of such return; and if any person shall apply to inspect the same, then on the payment of one shilling it shall be open for inspection at all reasonable times. Every such return must be signed by such surveyor, and if so signed, it shall be deemed to be a certificate that all the works enumerated therein have been done in all respects agreeably to this Act, according to the best of his knowledge and belief, and that they have been duly surveyed by him; but no such return shall be any protection from or hindrance to any future proceedings in respect of works not executed according to the provisions of this Act, though it may have been done before the making of such return. s. 78.

Penalty for extortion, negligence, or unfaithfulness. If any district-surveyor demand or wilfully receive any higher fee than he shall be entitled to under this Act, or if in his capacity of surveyor he receive a fee for any act or omission in respect of which he is not entitled to receive any remuneration, or if he refuse to refund any fee wrongfully received by him in respect whereof the official referees shall have made an order to that effect, or if at any time he wilfully neglect his duty, or behave himself negligently or unfaithfully in the discharge thereof, then and in every or any such case it shall be lawful for any person to present a complaint in writing under his hand to the lord mayor and aldermen of the city of London, or to the Court of Quarter Sessions having jurisdiction over the district for which such surveyor shall act for the time being, at any sessions of the peace, quarter or general, either original, intermediate, or adjourned, and which complaint shall set forth the nature and particulars of the offence charged by the complainant against any such surveyor; and the said lord mayor and aldermen or Court of Sessions, as the case may be, shall by order of court appoint a time for hearing the said complaint, and a copy of which order and of the said complaint shall be served by or for the said complainant on the said surveyor 10 days at least before the time appointed for hearing such complaint; and the said surveyor shall appear before the said lord mayor and aldermen or Court of Sessions, as the case may be, at the time and place so appointed for hearing the said complaint, to answer the same; and if, upon the hearing of the complainant and of the surveyor, and the evidence respectively produced by or for them, it shall appear to the said lord mayor and aldermen or Court of Sessions, as the case may be, that such complaint in whole or in part is well founded, then it shall be lawful for the said lord mayor and aldermen, or the said Court of Quarter Sessions, as the case may be, and they are hereby

respectively required, either to *fine* such surveyor in such sum of money not exceeding 50*l.* as they shall think fit, or to discharge him forthwith from his said office; and if for any such cause such surveyor be discharged, he shall be incapable of being appointed a surveyor for the purposes of this Act. s. 79.

District-surveyor to have 2 days' notice given to him by the builder—(by which term it is to be understood, both in this provision and elsewhere throughout this Act, the master builder or other person employed to execute any work, or, if there be no master builder or other person so employed, then the owner of the building, or other person, for whom or by whose order such work is to be done), and he is hereby required to give to the surveyor, at his office, notice in the terms specified in the form (No. 1) contained in the Schedule of Notices annexed to this Act, or to the like effect,—*before* the following acts or events, that is to say,—*before* any building shall be begun to be built;—and also before any addition or alteration, which by this Act is placed under the supervision of the surveyor, shall be made to any building;—and also before any party wall, external wall, chimney-stack, or flues shall be begun to be built, pulled down, or altered;—and also before any opening shall be made in any party-wall;—and also before any other matter or thing shall be done which by this Act is placed under the supervision of the surveyor, except as herein is provided;—and if any builder neglect to give such notice, or begin to build, or alter, or pull down, or commence any work, or before the expiration of such period of 2 days, in every such case the party offending shall for every such default forfeit and pay to such surveyor *treble* the amount of the fees which such surveyor would have been entitled to receive for his trouble in inspecting the same, and shall also be *liable* for every such default, *such not exceeding 20*l.**; and if for any period exceeding 3 calendar months any builder, having duly begun any building requiring compliance with the provisions of this Act, suspend the progress of such building, and again go on with the same, or if during the progress thereof the builder be charged, then 2 days before such builder shall enter upon the performance of the work, it shall be the duty of such builder to give notice to the surveyor, and such notice must be in the terms specified in the forms (Nos. 2 and 3) contained in the Schedule of Notices annexed to this Act, or to the like effect, and to be given to the surveyor, or left at the surveyor's office, in like manner as is required upon beginning any new building;—and if any builder make default, or neglect to give or leave such notice, he shall forfeit for every such offence a sum not exceeding 20*l.*:—and if any such building, chimney or wall be begun to be built, pulled down, rebuilt, cut into, or altered as aforesaid, or be proceeded with after any suspension of the progress thereof before such notice has been given; or if such surveyor or the official referees be refused admittance to inspect the same premises,—then such building or work shall be liable to be abated as a nuisance under the provisions herein contained;—and if any surveyor or any surveyor, or thing placed under the supervision of the surveyor be required to be done immediately, or before notice can be given to him, it shall be lawful for the builder or any person to do such act, matter, or thing so requisite, upon condition, that within 48 hours after beginning to execute such work notice thereof be given to the surveyor. s. 13.

District-surveyor (in case of irregular building) to give 48 hours' notice according to the form (No. 4) in the Schedule of Notices, or to the like effect, to the builder, foreman, or principal workman on the premises, to amend any irregularity which he shall have been notified to be committed in building, pulling down, rebuilding, cutting into, or altering any part of any building, or party-wall or external wall, or chimney-stack or flue, drains, cesspools, or any work or other thing, and forthwith after the expiration of such notice to proceed to inspect the work;—and if the work be so far advanced that he cannot ascertain whether any irregularity has been committed or not, or exists or not, it shall be lawful for him and he is hereby empowered to order any work to be cut into, laid open, or pulled down, which shall in his opinion prevent his ascertaining whether any such irregularity exists or not;—and if within 48 hours the builder to which any such notice shall have been given refuse to amend any irregular work, or if any such builder, when ordered by the surveyor, refuse to cut into, lay open, or pull down any work which shall in his opinion prevent his ascertaining whether such irregular work exists or not, then, as soon as conveniently shall be, it shall be the duty of the surveyor to give notice thereof to the official referees;—and upon the receipt of such information it shall be the duty of such official referees and they are hereby required to proceed to hear the matter, and if any breach of the rules, regulations, and directions of this Act be found to have been committed, or if there appear good reason to suppose any such breach has been committed, and it is conceded, it shall be lawful for the official referees to direct by their award that such building, party-wall, external wall, chimney-stack, flue, or other thing, or such part thereof as they shall deem necessary, shall be amended, removed, cut into, laid open, or pulled down;—and all the costs, charges, and expenses of the said work, and of the said application to the official referees shall be borne by such party or parties as the official referees shall determine. s. 14.

District-surveyor, in case any doubt, difference or dissatisfaction arise with any parties relative to the classes and rates of buildings, as determined by,—the official referees are to decide. s. 5.

District-surveyors, official referees may not act as assessors. s. 60.

District-surveyors as well as official referees to have the supervision of buildings of the 1st rate, of the 2nd or warehouse class, and buildings of the 3rd or public building class. s. 6. See for exceptions Schedule B, Part II.

District-surveyors may enter on premises. See Enter on premises.

District-surveyors, refusal to admit, to inspect premises, renders work liable to be abated as a nuisance. s. 13.

District-surveyor and the overseers for the time being of the parish or place in which the same shall be, upon receiving information of any building being in a ruinous and dangerous condition, shall apply forthwith to the official referees to authorize a survey to be made thereof;—and thereupon the official referees shall direct the surveyor to make such survey;—and then it shall be the duty of such surveyor to act in all respects as in the case of a ruinous party-wall;—and upon the receipt of the certificate of the surveyor the official referees shall cause a copy thereof to be transmitted, if the premises be within the city of London, to the Court of Lord Mayor and Aldermen, and if they be elsewhere, then to the overseers of the poor of the parish or place in which such premises shall be.

District-surveyor, if a chimney-shaft, chimney-pot or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or any projection from the front walls of any building, be in danger of falling, shall require the occupier of such building, or if there be no occupier thereof the owner thereof, to take down or secure the same within 30 hours after notice thereof shall have been given;—and if within the time specified such occupier, or some other person interested in such building, do not begin to take down or secure the same, and as soon as the nature of the case will admit complete such taking down or securing of the same, then it shall be the duty of such surveyor to give information thereof to a justice of the peace;—and thereupon it shall be the duty of such justice of the peace to proceed to cause such chimney-shaft, chimney-pot or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or projection from the front or side wall of such building as shall be considered by such surveyor in danger of falling, to be forthwith taken down or secured;—and if there be no occupier or known owner, it shall be lawful for such justice to direct that the reasonable expenses, to be certified by the official referees, be paid by the overseers of the parish or place in which such building shall be situated;—and if thereafter the owner of such building become known, or if the building become occupied, then it shall be lawful for the overseers of the poor and they are hereby entitled to recover the amount of such expenses from such owner or from such occupier as in the case of ruinous buildings hereinbefore provided for;—and if within the time limited the occupier, or some other person interested in such building, do not take down or secure the same, then for every day during which the same shall so remain unrepaired or not sufficiently secured such occupier, or the owner if there be no occupier, shall forfeit and pay a sum not exceeding 5*l.*:—and such occupier or owner shall also pay the surveyor's fees, and all other costs, charges, and expenses attendant upon any such taking down or securing the building;—and all such surveyor's fees, and other costs, charges, and expenses, may be recovered as a debt due in the same manner as such recovery;—but if the occupier of such building be not bound by virtue of any lease or other instrument to repair, reinstate, or secure the premises, then such occupier is hereby entitled to retain out of the rent payable in respect of such premises all such penalties, costs, charges, and expenses attendant upon or arising out of the rebuilding the same, as in the case of any other works the costs of which he is hereby required to pay in the first instance. s. 43.

District-surveyor, upon application for that purpose by an adjoining owner, to survey and condemn a party-wall made ruinous or dangerous by cutting away, and thereupon the party who has injured the wall is to rebuild it at his own expense, is to make good internal finishings and decorations, and is to pay all attendant fees and costs; and if he neglect promptly to rebuild such wall, the adjoining owner may do so, and recover of the other all the like expenses. s. 29.

District-surveyor, separate between buildings and public ways to be approved of by. See Public way, buildings over.

District-surveyors to determine between parties, subject to appeal to the official referees, the difference of costs and expenses of performing works according to this Act, and which may be done contrary to any existing building-contract. s. 9. See Building-contracts, existing.

DIVIDING BUILDINGS for separate occupation. See Party-walls for dividing buildings.

DIVISION, after, how affecting insulated buildings. See Insulated buildings.

DOCK COMPANY, St. Katharine, warehouse buildings of, in New-street, Cutler-street, and Hayden-

square, are under special supervision. Schedule B, Part I.

DOCK COMPANIES, St. Katharine, near the Tower of London, London, East and West India, and others, by Act of Parliament, warehouses of, exempt from supervision. Schedule B, Part II.

DOCUMENTS and official records to be registered by the Registrar of Metropolitan Buildings. s. 89; to be arranged in the registrar's office chronologically, and in classes according to their subjects. s. 93.

DOOR-CASES of warehouses to be recessed 2 ins. Schedule D, Part II.

DOORS and DOOR-FRAMES of turrets, dormers, lantern-lights, and other erections on roofs may be of wood. See Roof-coverings.

DRAINAGE OF HOUSES. With regard to the drains, cesspools, and privies to buildings hereafter built, so far as relates to the making thereof, from the passing of this Act all the conditions, regulations, and directions contained in the schedule H, shall be duly observed and performed; and any person offending in respect thereof shall be liable to all the penalties and forfeitures by this Act imposed in respect of any buildings, either contrary thereto, or without due notice to the surveyor appointed in pursuance of this Act to inspect such buildings;—such drains are to conform (so far as relates to the communication thereof with the sewers under the jurisdiction of the Commissioners of Sewers), to the regulations of such commissioners now or hereafter in force, in conformity to the directions contained in such schedule, and to the extent to which such regulations are not so repugnant. s. 51. Schedule H.

DRAINED properly, every under-ground room or cellar to be a separate dwelling must be. Schedule K.

DRAINS into sewers, of buildings of any class, and of every addition thereto. Before the several walls of any such building shall have been built to the height of 10 feet from their foundations, the drains thereof must have been properly built and made good (that is to say), if there be within 100 feet from any front of the building, or from the inclosure about the building, a common sewer into which it is lawful and practicable to drain, then into such common sewer;—and if there be not in such situation and within such distance any such common sewer, then to the best outlet that can be obtained,—so as to render in either case such drains available for the drainage of the lowest floor of such building, or addition thereto, and also of its areas, water-closets, privies, and offices (if any).—And the inside of the main drains under and from every building for carrying off soil must be in transverse section at least equal to a circular area of 9 ins. diameter. And every such drain must be laid to a fall or current of at least half an inch to 10 feet, and so that the whole of every such drain within the walls of such building shall be wholly covered over under the lowest floor, and independently thereof.—And every such drain within the walls of such building must be built and covered over with brick, stone, or slate, so as to render the drain air-tight. And every part of such drain inside and outside the walls of every building must be built of brick, tile, stone, or slate, set in mortar or cement. Schedule H.

DRAWINGS of buildings comprised in Schedule B, Part I., to be by the architect or builder transmitted for inspection, with notice, to the official referees. s. 16. See Architect or Builder, also Official referees, and Chimney-breasts.

DWELLING-HOUSES. See First class.

E.

EAVES in danger of falling. See Chimneys, ruinous.

ELECTION of district-surveyor, void, if he have not one week previously produced to the town clerk of London, or to the county clerk of the peace, the examiners' certificate of due qualification. s. 66; or unless consented to by one of the Principal Secretaries of State. s. 65.

EMBANKMENT-WALLS are under special supervision. Schedule B, Part I.

ENTER on premises. The district-surveyor and official referees may, at any time whilst any building is in course of construction, demolition, alteration, or re-construction,—and if any person refuse to admit them, during the customary working hours, to inspect such building, or refuse or neglect to afford such surveyor or official referees every assistance which may be reasonably required in and about such inspection, then in every such case an conviction thereof the party offending shall forfeit for every such offence a sum not exceeding 20*l.*; and if at any time during such customary working hours the surveyor or the official referees be refused admittance to make inspection of any work, then for that purpose it shall be lawful for such surveyor or for such official referees, accompanied by a peace officer, to enter upon the ground, building, and premises where the same shall be. s. 17.

ENTRY on premises to effect works. For the purpose of facilitating and regulating the execution of any works authorized by this Act, at any time between the hours of six in the morning and seven in the afternoon (Sundays excepted), the building owner or any other person acting in his behalf, may, accompanied by a constable or other officer of the peace, enter on the premises of the adjoining owner, so far as may be necessary for executing such work; and if the outer door of such building be shut, and being thereunto required the person therein refuse

to open the same, or if such building be empty and unoccupied, may break open such outer door;—and if any fixtures, goods, furniture, or other thing obstruct the building of an intended party-wall or party-arch, or the pulling down any wall, partition, or other thing necessary to be pulled down and removed in order to the building such intended party-wall or party-arch, remove such fixtures, goods, furniture, and things to some other part of the same premises, or if there be no room on the premises sufficient for that purpose, to remove them to some other place of safe custody;—and from and after such entry, and at all usual times of working, it shall be lawful for the builder employed to erect such intended party-wall or party-arch, and for his servants and all others employed by him, to enter into and upon the premises, and abide thereto the usual times of working, as well for the shoring up of the said building so broken into and entered upon, and for taking down and removing any party-wall, partition, wainscot, or other thing necessary to be taken down and removed for the purpose aforesaid, as to build such intended party-wall or party-arch;—and if in any manner any such owner or other person hinder or obstruct any workman employed for any of the purposes aforesaid, or wilfully damage or injure the said works, every such person so offending shall forfeit for every such offence a sum not exceeding 10*l.* s. 36.

**EVIDENCE.** The official referees may, by their summonses in writing sealed with the seal of office of the Registrar of Metropolitan Buildings, require the attendance of any person who may be able to give evidence in any matter of any reference to them, and may require by such summonses the production of any documents to be mentioned therein;—and if in addition to the service of such summonses, an appointment of the time and place of attendance in obedience thereto, signed by one at least of the official referees before whose attendance is required, be served either together with or after the service of such summonses, then, if the party so summoned do not attend in obedience thereto, such party shall be liable to be proceeded against as for a contempt of court;—and every person whose attendance shall be required shall be entitled to the like conduct-money and payment of expenses as for and upon attendance at any trial;—and no person shall be compelled to produce under any such summons any writing or other document that he would not be compelled to produce at a trial,—or to attend on more than two consecutive days to be named in such summonses.—The official referees are respectively authorized and required to administer an oath to such witnesses as may come before them, or, in cases where affirmation is allowed by law instead of an oath, to take their affirmations;—and upon such oath or affirmation any person making the same wilfully and corruptly give false evidence, then every person so offending shall be deemed to be guilty of perjury. s. 85.

**Evidence, effect of awards as.** If on the trial or hearing of any cause or matter in any court of law or equity, or elsewhere, any copy of an award, signed and sealed with the seal of the registrar, be produced, then all judges, justices, and others, are to receive the same as *prima facie* evidence of the matters therein contained. s. 86.

**EXAMINERS** appointed by the Commissioners of Works and Buildings, being three or more architects, surveyors, or builders, together with the official referees, are to examine any persons who may present themselves for the purpose of obtaining certificates of qualification, to become candidates for the office of *district surveyor*;—and for that purpose such examiners shall from time to time appoint such times as to them may seem fit, and from time to time prescribe such course of examination as to them may seem fit, and to make any other rules for the regulation of such examination, and the granting of certificates in respect thereof, subject to the approval of the Commissioners of Works and Buildings; and when such rules are registered by the Registrar of Metropolitan Buildings they shall continue in force until they shall be amended, altered, or rescinded by other rules to be made by such examiners and so registered as aforesaid; and unless, one week before the election of a surveyor for any district created by this Act, or for any district in respect of which the office of surveyor may become vacant, there be (by or on the part of any person being a candidate for the said office) a certificate of such examiners, certifying that he has been examined, and that he was thereby found to be duly qualified for such office, produced to the town clerk of the city of London, or to the clerk of the peace for the county, city, or liberty, it shall not be lawful for any justices to appoint such person to be such surveyor, and if such person be so appointed his election to such office shall be void. s. 66.

**EXCHAMBER,** one of the barons of, to administer the declaration of official fidelity to the official referees. s. 87; to the Registrar of Metropolitan Buildings. s. 90.

**EXCHEQUER.** See *Commissioners of the Treasury*.

**EXCEPTION OF BUILDINGS** from special supervision of the official referees. See *Special Supervision, special*.

**EXPENSES** of cutting into and altering works, and of application to official referees, upon the information of district-surveyor, to be borne by such parties as the official referees shall determine. s. 14. Expenses, persons summoned by the official referees to give evidence entitled to. s. 85. See *Evidence*. Expenses of surveying, condemning, shoring, hoarding, repairing, and demolishing ruinous buildings. See *Ruinous buildings*.

thereof, or of the occupier thereof, shall in the first instance bear all costs and expenses by this Act imposed on the owner, and shall perform all duties by this Act imposed on such owner; subject to any right or claim which such person or such occupier may have to recover such costs and expenses, and to be indemnified in respect of such duties, according to the provisions of this Act, according to the nature and extent of the covenants or agreements under which such person or occupier may hold such premises, as fully and effectually as if such covenants or agreements were herein recited. s. 111.

**EXPENSES OF WORKS IN PARTY-STRUCTURES:—** (Repayment of). s. 46, viz.—**FIRST,** Any party-wall hereafter built on the line of junction of any two buildings;—**SECONDLY,** Any party-wall hereafter built on the line of junction of any building and any vacant ground or of vacant premises belonging to different owners or occupiers;—**THIRDLY,** A ruinous and defective party-wall pulled down and rebuilt, either with the consent of the adjoining owner, or in pursuance of the condemnation thereof according to this Act;—**FOURTHLY,** One or more timber-partitions between any two or more buildings pulled down, and a party-wall built in lieu thereof;—**FIFTHLY,** A new party-wall or party-arch built in lieu of any party-wall or party-arch between intermixed properties pulled down, either with the consent of the adjoining owner, or in pursuance of the condemnation of such party-wall or party-arch;—**SIXTHLY,** Any party-wall built on the site of a party fence or party fence-wall, and used otherwise than as a party fence-wall by the person who shall not have built the same;—**SEVENTHLY,** Every other case of reimbursement in respect of any party-structure.

The building owner at whose expense such work shall have been executed may claim and recover from the person who is entitled to the immediate possession of the adjoining building or ground, or who is in the immediate occupation thereof, the following compensations:

If a new party-wall or party-arch built on the line of junction by one owner, made use of either wholly or partially by the adjoining owner, then the sum of money proportionate to the value of so much of such party-structure so made use of, as chimney-jambs, chimney-breasts, and flues, set up in any party-wall, in pursuance of the instructions of the owner of any adjoining vacant ground, then a sum equal to the value thereof;

If an unsound party-wall or other party structure pulled down and rebuilt, then a sum of money equal to a proper proportion of the value of the new party structure, to be made for a due proportion of the aid materials, and also a proportionate part of all expenses which shall be necessary for pulling down the old party structure in lieu of which such new party structure shall be built;

If a party-wall built in lieu of a timber partition or other party structure, and made use of by the adjoining owner, then a sum of money proportionate to the value of so much of such party structure so made use of, as chimney-jambs, chimney-breasts, and flues, set up in any party-wall, in pursuance of the instructions of the owner of any adjoining vacant ground, then a sum equal to the value thereof;

If a party-wall or party-arch already built or hereafter rebuilt be used by any adjoining owner, then a sum of money proportionate to the value of so much of such party structure as the adjoining owner shall use, deduction being made, where proper, for the value of aid materials;

In every case the whole of the reasonable expenses of shoring up the adjoining building, and of removing any goods, furniture, or other things therein, and of pulling down any wainscot or partition thereof;

And such surveyor's fees and any other fees payable in respect of any acts performed by the official referees, and also such other costs (if any) as may have been awarded by the official referees as aforesaid in any of the cases provided for by this Act;

And until such expenses shall be so paid every person at whose expense such party structure shall have been built is hereby entitled to and shall be possessed of the use and property thereof, and of the ground whereon it stands, and the same shall be vested entirely in such person. s. 46.

**Recovery of costs.** (s. 47).—Account. Within 21 days after the completion of the work it shall be the duty of the person by whom such expense shall have been incurred to deliver to the adjoining owner an account in writing of the expenses of the work, including all preliminary and incidental operations; and if the work shall have been executed by the authority of the official referees, a copy of such account shall also be delivered to the official referees at their office; and every such account must contain—

FIRST, the number of rods and parts of rods of brickwork, and all digging, and concrete, stone-

work, and other requisite materials, and the labour required in executing so much of the work as the owner of the adjoining building shall be liable to pay, and of the respective prices thereof;—**SECONDLY,** any deduction which such adjoining owner shall be entitled to make thereon in account of the old materials of so much of the wall or other structure pulled down which shall have belonged to him;

Also a true account of the expenses of all other preliminary and incidental operations; and all such works must be estimated and valued at such rates and prices as shall from time to time be fixed by the official referees;

And if within 10 days from the delivery of such account any party dissatisfied with the proportion of the amount thereof charged to him appeal to the official referees, then upon the receipt thereof (or if in cases of want of due consent as aforesaid, such account be delivered to the official referees as aforesaid), the official referees shall examine such account, and certify whether they approve or disapprove of the items thereof, and whether the rates and prices are duly charged, and whether the proportion of the account charged to the party appealing be duly charged, and also appoint how and by whom the expenses of such examination are to be borne, and also appoint the time or times at which the amount of such account and of such expenses payable by any party are to be paid;—and if they certify their disapproval of the said charges are not duly made, or the amount fairly apportioned with regard to the party appealing, then, before any demand be made or any proceedings be taken thereon, the account must be amended, and again examined by the official referees, and certified as aforesaid; and if the official referees certify their approval, then at the time or times appointed by the said official referees it shall be lawful for the person entitled to such costs and expenses to demand the amount thereof;—and if, within 10 days after the delivery of such account to the party liable to pay the same, such party do not either appeal against such account or pay the same, or if, within 10 days after the demand thereof, in conformity with the certificate of the official referees, the amount thereof, together with the costs of the examination of the account as the official referees shall certify, be not paid, then it shall be lawful for the person entitled thereto to recover the same, or so much thereof as shall be then due, by the summary proceeding hereby provided. s. 47.

**Reimbursement to occupiers.** Unless there be some covenant or agreement to the contrary between the parties, the occupier may deduct from the rents due or becoming due from him to his lessor or landlord the amount of any such costs, charges, and expenses payable by his lessor or landlord, and the costs, charges, and expenses of any distress and sale made on him through the default of his lessor or landlord; and the receipt for such payment shall be a sufficient discharge to any occupier for so much money as he shall have so paid, or which shall have been so levied on his goods and chattels in pursuance of this Act, and shall be allowed by such lessor or landlord in part of any payment (as the case may be) of the rent due to him by such occupier. s. 48.

**Recovery of expenses from different party owners.** When costs and expenses shall have been ascertained and paid by the owner upon whom the payment thereof shall have first fallen, then, as to any building or tenement held under any lease or agreement for a lease, or other agreement for the occupation thereof, made before the coming into operation of this Act, such owner may recover the same from the persons now bound or liable by law or by any existing contract to maintain and repair such buildings in respect of which such costs and expenses have been incurred;—but if any dispute or difference arise as to the persons so bound or liable, then every such dispute shall be referred to the official referees, who shall ascertain and determine the persons bound or liable to pay such costs and expenses, and in what proportions they are to be paid, and that provision shall be final;—and as to any building or tenement to be held under any lease or agreement for a lease, or other agreement for the occupation thereof, made after the coming into operation of this Act, except a lease renewable for ever on a fixed fine or other customary payment, all such costs and expenses shall be charged upon the lessor granting such lease or making such agreement, and not upon any lessee or sub-lessee, holding under any such lease or agreement, subject, nevertheless, to any express covenant or agreement made between any such lessor and lessee or to that behalf;—and in case of such excepted lease such costs and expenses shall be charged upon the lessee instead of the lessor, subject, as aforesaid, to any express covenant or agreement in that behalf between any such lessor and sub-lessee holding under such lease upon other than a fixed fine or customary payment as aforesaid;—and in default of such costs and expenses being duly paid it shall be lawful for the party to whom the same shall be payable and he is hereby entitled to receive from the occupier thereof the rents and profits of such building or tenement, and for that purpose to give notice to such occupier to pay over to him such rents and profits; and thereupon, if such occupier fail to pay such rent and profits accordingly, then it

shall be lawful for the person to whom such costs and expenses shall be payable to recover the same from such occupier by the summary proceeding hereby provided, in such proportions and at such times as shall be appointed by the award of the said official referees in the behalf;—and after such notice shall be given, and before such costs and expenses shall be paid, it shall not be lawful for any person otherwise entitled to receive such rents and profits and he is disabled from bringing any action, and from taking any proceeding at law or in equity to recover such rents and profits;—but if on the hearing of the application for the warrant to levy such costs and expenses by distress, according to the provision of this Act in that behalf, the occupier, not being an owner, shew that he is not bound to pay in respect of such building or tenement any rent or profit, or that the amount of the rent or profit payable by him is not sufficient, then it shall not be lawful to issue such warrant, if there be no rent due or accruing, or, if there be rent due or accruing, then to the extent only of the amount of such rent;—and if such costs and expenses or any part thereof remain unpaid, and if the same, or any future occupier be or become liable to pay rent in respect of such building or tenement, then, from time to time until the same be paid, it shall be lawful to levy the same by distress, according to the provisions of this Act in that behalf, upon the same or any such future occupier, s. 43.

**Official referees to determine proportional contributions.—**Recovery of excess paid by any contributor. With regard to such costs and expenses of works executed under this Act, so far as relates to contribution thereto by persons bound or liable to make contribution, for the purpose of enabling the party upon whom the payment of such costs and expenses shall fall, either in the first instance or subsequently, to obtain contribution from other persons, being owners according to the meaning of this Act, in like degree, and so bound or liable to make contribution, every such first-mentioned person, (whether he be freeholder, copyholder, leaseholder, mortgagee in possession, and whatsoever may be his interest, or the nature and extent of such his interest, and whether he hold in his own right or in right of others, and whatever may be the kinds and degrees of their respective interests), is entitled to a contribution from every other person having as owner an interest in the premises, of whatever kind or degree,—which contribution is to be computed according to the amount of his interest in proportion to that of other persons interested, so far as such persons may be known, or can be reached by process of any court of law or equity;—and it shall be lawful for any party so interested to require the official referees to settle and determine the same by their award, and their decision shall be final;—and if the person upon whom the payment of such costs and expenses shall have fallen have paid in respect of the interest of another or others, either unknown or who could not be reached by process of any court of law or equity, more than his own just proportion, then, on the production of such award, duly made, signed, and sealed, it shall be lawful for such persons to sue and recover against other parties against whom such award shall be made the like remedies to compel payment of money as are given for compelling the first payment of such costs and charges of such expenses, s. 50.

**EXTERNAL-WALL** (the term) to apply to every outer wall of buildings now built or hereafter to be built, which (excepting the footing thereof on one side) shall stand wholly upon ground of the owner of such buildings, and shall not be used or intended to be used as a party wall under the definition thereof contained in this Act, whether the same shall adjoin or not to other outer or to party-walls, s. 2.

**External wall against a party-wall.** If the owner of one of the buildings perted by a party-wall rebuild such building of a higher rate than that of the other such party-wall and build a proper wall in lieu thereof, then it shall be his duty to build up an external-wall against such party-wall, s. 27.

**External-wall, 2 days' notice to be given to the district-surveyor,** at his office, before begun to be built, pulled down, rebuilt, cut into, or altered, s. 13. See *Penalty*.

**External-walls, stopping illegal openings in.** See *Openings in external walls*.

**External-walls to buildings of whatever class must be built of sound bricks or of stone, or of such bricks and stone together, laid in and with mortar or cement, in such manner as to produce solid work; and every such wall must be carried up of its full thickness to the under side of the plate under the roof.—**Nevertheless, in such walls, besides all requisite openings for doors and windows, recesses may be formed, so that the back thereof be 8 ins. at least thick, and so that the mortar and sufficient of the work be not injuriously affected by making such recesses in such walls.—There may be such wood and iron as shall be necessary.—Every plate, lintel, board, corbel, being of wood, and every wooden joist, and any external wall, and all ends of joists, girders, and ends of the heads and sills of partitions running into any external wall, must be fixed at a distance from the external face of the wall of 4 ins. at least.—The frames of doors and windows must be fixed in reveals at a

distance from the external face of the wall of 4 ins. at least.—And shop-fronts must be fixed in such manner as herein specially directed.—The tiers of door-cases to warehouses must be fixed in the openings left in such walls at a distance from the external face of the walling of 2 ins. at least.—But no timber must be laid into any external wall in such manner of such length as to render the part of the wall above it wholly or in great part dependent upon the wood for support, or so that any such wood might not be withdrawn without endangering the safety of the superincumbent structure, except in the case of breast-summers, Schedule D, Part II.

**External-wall used as a party-wall to any building adjoining thereto** (except an attached building or office): If the external wall of any building have not such footings, or be not of such heights and thicknesses, or be not built in such manner and of the materials directed for party-walls of buildings of the highest rate to which such wall shall adjoin, then such external wall must not be used as a party-wall for any such building; but there must be a distinct external wall, built as herein described for external walls, of the rate to which it shall belong.—But if such external wall to any building already built be at least 8 in. thick in every part, and be of sound and proper materials, and in good condition, then such wall may be used as a party-wall;—but if the house of which such wall forms a part be rebuilt within 5 years from the time at which the wall shall have been so first used as a party-wall, then such wall must become subject to the provisions of this Act in respect of party-walls, according to the class and rate to which the said wall did first belong, Schedule D, Part II.

**EXTRA-PAROCIAL places.** See *Parish* (the word).

**FAMILIES**, different, occupation of buildings by, brings separating walls within the denomination and regulations of party-walls, s. 2. See *Party-walls* (the term).

**FEES.** If any district-surveyor demand or wilfully receive any higher fee than he shall be entitled to under this Act, or if in his capacity of surveyor he receive a fee for any act or omission in respect of which he is not entitled to receive any remuneration, or if he refuse to refund any fee wrongfully received by him in respect whereof the official referees shall have made an order to that effect, he shall be fined in such sum of money not exceeding 50*l.* as the justices shall think fit, or he discharged forthwith; and shall be incapable of being again appointed a surveyor for the purposes of the Act, s. 79.

**Fees of district-surveyor to be paid by party-rendering ruinous or dangerous a party-wall by cutting away,** s. 29.

**Fees of deputy district-surveyors, duly appointed, entitled to receive,** s. 73.

**Fees, assistant district-surveyors to receive all, payable in respect of their services performed,** s. 75.

**Fees of district-surveyors and official referees in respect of party structures recoverable,** s. 46.

**Fees appointed by the Commissioners of the Treasury to be paid for the services of the official referees and Registrar of Metropolitan Buildings, the registrar to cause a list of, to be fixed up in some conspicuous part of his office,** s. 93.

**FEMINE gender to be taken as intended by the Act, although the masculine may alone be mentioned,** s. 2.

**FENCES and FENCE-WALLS, how affecting insulated buildings.** See *Insulated buildings*.

**FENDERS brick.** See *Chimney-slabs*.

**FILE, notices to the official referees the registrar is to,** s. 92.

**FINISHINGS, internal, to be made good by a party who rebuilds a sound party-wall, not condemnable,** s. 26.

**FIRE-PROOF, questions relative to the meaning of the term, official referees are to decide, being thereto required in writing,** s. 82.

**Fire-proof accesses and stairs to buildings of the First and Third Classes.** Internal stairs of stone or other incombustible substance to buildings of the first class, must be set in, or fixed to, and be wholly upborne by, fire-proof constructions, and must be connected with the floors of the floors of which are fire-proof, and wholly upborne and supported by fire-proof constructions, and must be connected with the exterior entrance by passages, the floors of which are fire-proof, and wholly upborne and supported by fire-proof constructions.—And in buildings of the Third class, the floors of the halls, vestibules, lobbies, corridors, passages, and the stairs and landings, and all other ways of ingress and egress within the building to and from all rooms or apartments used for public congregation, and to and from all galleries being part of, or being connected with, any such room or apartment, must be wholly upborne, constructed, formed, made, and finished fire-proof, Schedule C, Part VI.

**FIRE-PLACES** required to under-ground rooms and cellars let as separate dwellings. See *Chimneys, open*.

**FIRST or DWELLING-HOUSE Class.** Buildings built originally as dwelling-houses, or occupied, or intended to be occupied as such, Schedule C, Part I, s. 5. See *Class, alteration of*. Every building of, must be built with some roadway, either to it or to the roadway above it, of such width as will admit to one of its fronts of the access of a scavenger's cart of the ordinary size of such carts, Schedule K.

**FIRST-RATE, 1st or dwelling-house class (district-surveyor's fee, new building, 3*l.* 10*s.*; addition or alteration, 1*l.* 15*s.* Schedule L)**

covering more than 10 squares, and not more than 14 squares,	if containing 7 stories,	if in height more than 70 feet, and not more than 85 feet,
--	--------------------------	--

thickness of the external walls (subject to modification, as *Inclining walls to stories*, which article see) must be at the least 21 1/2 inches from the top of the footing up to the under side of the floor next but three below the topmost floor; and at least 17 1/2 inches from thence up to the underside of the floor next below the topmost floor; and at least 13 inches from thence up to the top of the wall;—the thickness of the party-walls must be at least 21 1/2 inches from the top of the footing up to the under side of the floor next but three below the topmost floor; and at least 17 1/2 inches from thence up to the under side of the floor next below the topmost floor; and at the least 13 inches from thence up to the top of the wall, Schedule C, Part II.

**First-rate, (Extra) 1st or dwelling-house class (district-surveyor's fee, new building, 5*l.* 5*s.*; addition or alteration, 2*l.* 10*s.* Schedule L)**

covering more than 14 squares,	if containing more than 7 stories,	if in height more than 85 feet,
--------------------------------	------------------------------------	---------------------------------

thickness of the external walls (subject to modification, as *Inclining walls to stories*, which article see) must be at least 21 1/2 inches from the top of the footing up to the under side of the floor next but two below the topmost floor, and at least 17 1/2 inches from thence up to the top of the wall;—thickness of the party-walls must be at the least 21 1/2 inches from the top of the footing up to the under side of the floor next but two below the topmost floor; and at the least 17 1/2 inches from thence up to the under side of the topmost floor; and at the least 13 inches from thence up to the top of the wall, Schedule C, Part II.

**First-rate buildings of the 2nd or warehouse class are subject to provisions of schedule C, placed under the special supervision of the official referees as well as of the district-surveyors,** s. 6.

**First-rate, 2nd or warehouse class, in height more than 66 feet (district-surveyor's fee, new building, 3*l.* 10*s.*; addition or alteration, 1*l.* 15*s.* Schedule L)** thickness of the external walls (subject to modification, as *Inclining walls to stories*, which article see) must be at the least 26 inches from the top of the footing up to the level of 76 feet below the topmost ceiling; and at the least 21 1/2 inches from thence to the level of 36 feet below the topmost ceiling; and at the least 17 1/2 inches from thence up to the top of the wall;—and the thickness of the party-walls must be at the least 26 inches from the top of the footing to the level of 76 feet below the topmost ceiling; and at the least 21 1/2 inches from thence up to the level of 36 feet below the topmost ceiling, and at the least 17 1/2 inches from thence up to the level of the topmost ceiling; and at the least 13 inches from thence up to the top of the wall, Schedule C, Part III.

**FIT, question relative to the meaning of the term, official referees are to decide, being thereto required in writing,** s. 82.

**FLAT.** See *Roof coverings*.

**FLOOR** (the word) to mean the horizontal platform forming the base of any story, and to include the timber or bricks or any other substance constituting such platform, s. 2. [We apprehend that as floors are frequently placed purposely out of level, the dispensing power of the Commissioners of Works and Buildings will, on the requisite occasions, direct the word "horizontal" to be omitted as tending to defeat the obvious intention of the Act; and we apprehend the medium level should be taken in all measurements of altitude.]

**Floor (basement). Areas must extend 6 in. below, Schedule K.**

**Floors separating buildings from public ways.** See *Public way, buildings over*.

**FLUES, two days' notice to be given to the district-surveyor at his office before begun to be built, pulled down, rebuilt, cut into, or altered,** s. 13. See *Penalty*.

**Flues, angles of any flue be built with sufficient openings in it of size not less than 9 ins. square, and with proper close iron doors and frames inserted in such openings, so that every part of such flue may be swept by machinery, then every angle in such flue may be of any degree. But if it be not so built, then every such angle must be 135 degrees at least. And every salient or projecting angle within a flue must be rounded off 4 ins. at least, and be protected by a rounded stone or iron bar, Schedule F.**

**FOOTINGS.** See *Foundations of walls*.

**FOOTWAY, unaccompanied by carriage-way, brings a public place within the denomination of an alley, s. 2. See *Alleys, also Widths*.**

**FOUNDATIONS, old, buildings erected upon. See *Buildings, new and old*, for general regulations relative thereto.**

**FOUNDATION of Walls.** Every external wall, party-wall, and party fence-wall, must be built upon a constructed footing, based upon solid ground, or upon other sufficient foundation.

**FOOTINGS.—** Materials. Sound bricks or stone, or such bricks and stone together, laid in and with mortar and cement in such manner as to produce solid work.

**Width.** The bottom of the footing of every external wall and party-wall of the first rate at least 17½ in. wider than the wall standing thereon; and the bottom of every footing of every external wall and party-wall of the second and third rates at least 13 in. wider than the wall standing thereon; and the bottom of the footing of every external wall and party-wall of the fourth rate, and of every party fence-wall, at least 8½ in. wider than the wall standing thereon. The top of the footing of every party fence-wall, and of every external wall and party-wall, must be at the least 4 in. wider than the wall standing thereon.

**Height.** The footing of every external wall and party-wall of the first rate at least 11 in. high above the foundation. Of every external wall and party-walls of the second and third rates, at least 8 in. high above the foundation. The footing of every party fence-wall, and of every external wall and party-wall of the fourth rate at least 6 in. high above the foundation.

**Depth below ground.** The top of the footing of every party fence-wall and of every external wall and party-wall at least 3 in. below the surface of the lowest adjoining area or ground.

**Depth below surface of lowest floor.** The top of the footing of every external wall and party-wall at least 9 in. below the surface of the lowest floor of the first class the surface of the earth or of any paving on the outside (except the pavement of any public way) must not at any time be raised to within 6 in. of the surface of the lowest or first floor of such building. Schedule D, Part I.

**FOURTH-RATE, 1st or dwelling-house class (district-surveyor's fees, new buildings more than 2 stories, 2l. 2s.; less, 1l. 10s.; addition or alteration to buildings more than 2 stories high, 15s.; 2 stories high, or less, 10s. Schedule L):**

not covering if not containing more than 4 ing more than 4 squares, more than 4 stories, more than 38 squares, ft.,

thickness of the external walls (subject to modifications, as *Inclusing walls of stories*, which article see) must be at least 13 in. from the top of the footing up to the under side of the floor next below the topmost floor; and at least 8½ in. from thence up to the top of the wall;—thickness of party-walls must be at least 13 in. from the top of the footing up to the under side of the floor next but one below the topmost floor; and at least 8½ in. from thence up to the top of the wall. Schedule C, Part II.

**Fourth rate, 2nd or warehouse class in height not more than 22 ft. (district-surveyor's fee, new buildings, 2l. 2s.; addition or alteration, 1l. 1s., Schedule L), thickness of the external walls (subject to modification, as *Inclusing walls of stories*, which article see) must be at least 13 in. from the top of the footing up to the level of 9 ft. below the topmost ceiling; and at least 8½ in. from thence up to the top of the wall;—thickness of the party-walls must be at least 13 in. from the top of the footing up to the level of 16 ft. below the topmost ceiling; and at least 8½ in. from thence up to the top of the wall. Schedule C, Part III.**

**FREEHOLDER.** s. 50. See *Expenses of works*.

**FRONT,** one, of a building if taken down the height of one story, or from the level of the second floor upwards, party timber partitions, and the wall under and over the same, are to be taken down and party-walls substituted, notice being given to adjoining owner. s. 33.

**FULHAM** parish included within the operation of the Act. s. 3.

**FURNACE.** See *Close fires*.

**FURNITURE,** expenses of removal of, for performing party structures, recoverable. s. 46. Furniture to be made good by neighbours, parts of whose buildings fall thereon. See *Chimneys, ruins*.

### G.

**GAOLS** are under special supervision. Schedule B, Part I.

**Gaol,** workmen, labourers, and servants to be sent to, for any term not exceeding a calendar month, in default of paying fine. s. 19. See *Penalty*.

**GAS-WORKS.** See *Use of buildings*.

**GAZETTE** (the London), publication to be made in, 3 weeks before the operation of the Act is to set to any other places within 12 miles from Charing-Cross, be taken into consideration by the Council, and every order in Council pursuant thereto to be published in the *London Gazette*. s. 4.

**GOOD,** questions relative to the meaning of the term, official referees are to decide, being thereto required in writing. s. 82.

**GOODS,** furniture, wainscot, partitions, and other things, expenses of the removal of, for performing party structures, recoverable. s. 46.

**Goods,** damage to, to be made good by neighbours, parts of whose buildings fall thereon. See *Chimneys, ruins*.

**Goods,** distress upon. See *Awards, recovery of money under*.

**GOOD Friday,** district-surveyor's office not required to be attended on. s. 72.

**GRATINGS,** iron, to areas. See *Areas*.

**GREEN-PARISHES.** See *Attached buildings and offices*.

**GREENWICH** parish included within the operation of the Act. s. 3.

**GROUND,** as well as party structures standing thereon, sole property of, vests in the persons at

whose expense the work has been performed, till due contribution of the expenses and of the fees of the district-surveyor and official referees. s. 46.

**GUILDHALL** is placed under special supervision. Schedule B, Part I.

**GUTTER.** See *Roof-coverings*.

### H.

**HACKNEY** parish included within the operation of the Act. s. 3.

**HALLS** of third-class buildings, floors of, must be fire-proof. Schedule C, Part VI.

**HAMMERSMITH** parish included within the operation of the Act. s. 3.

**HAMPSTEAD** parish included within the operation of the Act. s. 3.

**HEARTHES.** See *Chimney-slabs*.

**HEIGHT,** How affecting insulated buildings. See *Insulated buildings*.

**HEIGHTS** of stories, how affecting thicknesses of external walls. See *Inclusing walls*.

**Heights** of buildings to be ascertained by measuring from the surface of the lowest floor to the under side of the ceiling of the topmost story, at the highest part thereof, whether within the roof or not. And if there be no ceiling made, or intended to be made, to the topmost story, or to the under side of any tie-beam, collar-beam, or other substitute for a tie-beam, to or within the roof of the building, and to the highest part of such roof; and the level of the under side of such tie-beam, or such substitute for a tie-beam, is in such case to be taken to mean the ceiling of the topmost story. And if there be no tie-beam, collar-beam, or other substitute for a tie-beam to or within the roof of any building, then up to 3 feet below the under side of the ridge-piece or substitute for a ridge-piece, to the roof of such building. Schedule C, Part I. s. 5.

**HEREAFTER** to be built (the term), used in reference to buildings, to apply to all buildings to be built or commenced after 1st January, 1945, or which, being commenced, shall not be covered in within 12 calendar months thereafter;—and, used in reference to streets and alleys, to apply to all streets or alleys not laid out before the said 1st January, or which, being laid out, shall not be rendered fit for use within 12 calendar months thereafter. s. 2.

**HOARDING** or shoring. Lord Mayor and Court of Alderman, and overseers without the city and liberties, to cause to be done to ruinous buildings immediately upon receiving from the official referees a copy of the district-surveyor's certificate, or to appeal to the referees for confirmation or annulling thereof. See *Ruinous buildings*.

**HORIZONTAL** platform. See *Floor*.

**HORNSEY** parish included within the operation of the Act. s. 3.

**HOUSES** of Correction are under special supervision. Schedule B, Part I.

### I.

**ILLNESS** of Registrar of Metropolitan Buildings. s. 89. See *Deputy-registrar*.

**Illness** or unavoidable circumstances, in case of, district-surveyor may appoint as his deputy some other duly qualified surveyor (subject to the consent and approval of the official referees), who is to act and receive fees as a district-surveyor. s. 73.

**INCLOSING-WALLS** to stories of buildings of whatever rate (thicknesses of). Of the first and second classes, each wall of any such story throughout the whole height thereof, from the top of the footing up to the top of such story, and with all the sets-off in addition required for such wall, to whatever rate or whichever class it may belong, and throughout at the least one-third of the whole length of such wall, in *piers properly distributed*, must be of the following dimensions (unless cross or return walls, *coured and bonded* with the inclosing walls, shall in the opinion of the official referees, upon special application to them in each particular case, give sufficient strength with less thickness in such inclosing walls): to *first-class buildings*—1 story more than 11 feet high, at least 13 inches; story more than 16 feet high, at least 17½ inches. To *second-class buildings*—1 story more than 9 feet high, at least 13 inches; story more than 12 feet high, at least 17½ inches; story more than 15 feet high, at least 21½ inches; story more than 18 feet high, at least 26 inches. NEVERTHELESS as to any external wall of any building of the first class in which there are no apertures or recesses, and if there be another external wall and a cross-wall of not less than 8½ inches thick coursing and bonding with such external wall, or if two such cross-walls occur within a length of 24 feet of such wall, such external wall may be built of the thickness of 13 inches, of any height not exceeding 18 feet, within any story, although the rate of the wall may require a greater thickness, but always upon condition that the substructure of such wall be 4 inches thicker at the least than such superstructure, and vertically under it.—And also if any such wall be abutted by cross or return walls within a length of 12 feet, and if not more than one aperture or recess occur within such length of 12 feet, and not more than one-half the quantity in length be taken out of such compartment of a wall by any such aperture or recess, such external wall may be built of any thickness not less than 13 inches, notwithstanding the rate of such wall may require a greater thickness. Schedule D, Part I.

**INCLOSURE.** See *Toll-house*.

**INFORMALITIES** in distress. Notwithstanding

any defect of form in the proceedings relative to any distress for any sum of money to be recovered by virtue of this Act, neither the distress itself shall be deemed unlawful, nor shall the party making the same be deemed a trespasser *ab initio*; but if any irregularity be committed by any party, then, subject to the conditions in this Act prescribed with regard to actions brought for any thing done in pursuance thereof, the person aggrieved by such irregularity is to recover full satisfaction for the special damage only, so that, by action on the case, and not by any other action whatsoever. s. 100.

**Tender of amends.** If, before any action for any irregularity or other proceeding be brought, the party who committed or caused to be committed any such irregularity or wrongful proceeding make or cause to be made tender of sufficient amends, then the plaintiff shall not be entitled to recover in such action; and although such tender shall not have been made, yet if at any time before issue joined the court in which such action shall be depending, or a judge of any of the superior courts, grant leave, it shall be lawful for the defendant to pay into court any sum of money, by way of compensation or amends, in such manner, and under such regulations, as to the payment of costs and to the form of pleading, as is and are customary and in force in the said superior courts. s. 101.

**INFORMATIONS** (all), and proceedings thereon, to be entered by district-surveyor in his office register-book. s. 68.

**INFORMATION** (district-surveyors to give) to justices of the peace, of chimney-shafts, chimney-pots, or other thing thereon, or the eaves, or parapet, or coping, or slates, or tiles on the roof, or any projections from the front walls of any building in danger of falling, not begun or secured within 36 hours of notice. See *Chimneys, ruins*.

**INJURY** to be made good by neighbours, parts of whose buildings fall. See *Chimneys, ruins*.

**INNS** of Court, exempt from rules with regard to party-arches between intermixed buildings. s. 34.

**INSOLVENT** debtors. See *Awards, recovery of money under*.

**INSPECTION** of the awards, certificates, and other documents of the official referees, the registrar is to give to parties requiring the same, upon their tendering the office-fees. s. 91.

**INSPECTORS** of prisons, places of confinement under the inspection of, are under special supervision. Schedule B, Part I.

**INSULATED** buildings of the first or dwelling-house class, and of the second or warehouse class, are such as are distant from any public street or alley one-third of the height thereof at the least; and if the building do not exceed 24 feet in height, and be distant at the least 8 feet, or distant from any other building, or from ground not in the same possession or occupation therewith, or connected therewith only by a fence or fence-wall, at the least 30 feet; such buildings are not liable in respect of the dimensions and materials thereof to the rules and directions of the Act. Schedule C, Part VII.

**Insulated** buildings afterwards divided. But if any such building be hereafter divided into two or more distinct buildings, and the several parts of such buildings so divided be not at the aforesaid distance from each other, and from other buildings and ground, then such several parts must be separated from each other by such party-walls as are herein prescribed for the rates to which such several parts, if adjoining, would belong. And if such requisites be not observed, then such several parts of such buildings in respect of which they are not so observed shall be deemed a public nuisance, and as such be taken down, according to the provisions of this Act in that behalf. Schedule C, Part VII.

**INTERMIXED** buildings, pulling down. Buildings built over public ways, or having rooms or stories, the property of different persons lying intermixed (except Inns of Court herein provided for), so far as relates to the pulling down and laying the parts thereof to each other, if a party-wall or party-arch cannot be built without pulling down such buildings, and so laying parts thereof to each other, and if in default of the consent of all proper parties the official referees authorize such works, then it shall be lawful for the owner of either of the said buildings to execute the same, but so that the party-walls or party-arches be conformable to the provisions of this Act, and the directions of the said official referees in their award made in that behalf. s. 34.

**INTERNAL** finisings and decorations of adjoining building to be made good by the party who, injuring a party-wall, causes its condemnation by the district-surveyor. s. 29.

**IRON** girders. See *Public ways, buildings over*.

**Iron** gratings to areas. See *Areas*.

**ISLINGTON** parish included within the operation of the Act. s. 3.

### J.

**JOINT** expense—Repairation and rebuilding of any party-wall, party-arch, or external wall, used wholly or in part as a party fence-wall, of the owners of the buildings parted thereby, if such party structure be so defective or so far out of repair as to render it necessary to pull down or rebuild the same, or any part thereof, then the notice being given by the owner of one of the buildings to the adjoining owner, according to the form (No. 5.) in the Schedule of Notices, or to the like

effect, it shall be lawful for the building owner to require a survey, certificate, and award, authorizing the execution of such reparation or rebuilding, according to the provisions in that behalf s. 25.

**JUSTICE OF THE PEACE** (the expression) to mean a justice of the peace for the county, division, or liberty within which a building or other subject-matter, or any part thereof, is situate; or unless it be situate within the city of London or the liberties thereof, in reference to which any matter or thing elsewhere required or authorized to be done, either by one or by two or more justices of the peace, may be done, either by the lord mayor of the city of London, or by any one, two, or more justices of the peace for the said city; or unless the subject-matter be situate in the district of any police-court of the metropolis, in reference to which any matter or thing elsewhere required or authorized to be done by two or more justices may be done by one magistrate. s. 2.

**Justices of the peace** to appoint, alter, and change as they deem fit (subject to the approval of the principal Secretary of State) the districts and district-surveyors under this Act. s. 64. See *Districts, and District-Surveyors*.

**Justices.** The official referees to represent to, if they think any district too extensive, and to send them a copy of the Register of Notices relating thereto. s. 75.

**Justices, viz.—**The lord mayor and aldermen of the city of London, with reference to the city of London and the liberties thereof, and the justices of the peace in their General Quarter Sessions respectively, or any adjournment thereof, with reference to their respective counties, are at any time after this Act shall come into operation, and from time to time, subject, nevertheless, to the consent of any one of the principal Secretaries of State, to nominate and appoint as surveyors district persons, of the full age of thirty years, and properly educated and skilled in the art and practice of building. s. 65.

**Justices of peace.** Within one calendar month after vacancy in any district by the death or removal of any surveyor, the lord mayor and aldermen, or the justices of the peace in General Quarter Sessions or any adjournment thereof, shall appoint a successor;—and in the meantime the official referees shall direct the surveyor of any one or more of the other districts to perform the duties of surveyor for the vacant district, or if no district-surveyor can be spared from his own district, appoint some other competent person duly qualified;—and every such surveyor shall receive the fees payable in respect of the services so performed by him. s. 74.

**Justice of peace,** no district-surveyor, or assistant or deputy surveyor, may act as, in the same county. s. 69.

**Justices** lord mayor, and aldermen, district-surveyors to hold office only during the pleasure of. s. 67.

**Justices of peace** for counties to approve of in quarter sessions of situation of district-surveyor's office, in public, central parts of districts. s. 72.

**Justices of peace** for counties and lord mayor and aldermen of the city of London shall, if any surveyor demand or willfully receive any higher fee than he shall be entitled to under this Act, or if in his capacity of surveyor he receive a fee for any act or omission in respect of which he is not entitled to receive any remuneration, or if he refuse to refund any fee wrongfully received by him in respect whereof the official referees shall have made an order to that effect, or if at any time he willfully neglect his duty, or behave himself negligently or unfaithfully in the discharge thereof, if any person present to them a complaint in writing, under his hand, to the Court of Quarter Sessions having jurisdiction over the district for which such surveyor shall act for the time being, at any sessions of the peace, quarter or general, either original, intermediate, or adjourned, and which complaint shall set forth the nature and particulars of the offence charged by the complainant against any such surveyor;—and the said lord mayor and aldermen or Court of Sessions, as the case may be, shall by order of Court appoint a time for hearing the said complaint, and a copy of which order and of the said complaint shall be served by or for the said complainant on the said surveyor 10 days at the least before the time appointed for the hearing of the said complaint;—and the said surveyor shall appear before the lord mayor and aldermen or Court of Sessions as the case may be, at the time and place so appointed for hearing the said complaint, to answer the same;—and if, upon the hearing of the complainant and of the surveyor, and the evidence respectively produced by or for them, it shall appear unto the lord mayor and aldermen or Court of Sessions, as the case may be, that such complaint in whole or in part is well founded, then the said lord mayor and aldermen, or the said Court of Quarter Sessions, as the case may be, shall either fine such surveyor in such sum of money not exceeding £50, as they shall think fit, or discharge him northward from his said office;—and if for any such cause such surveyor be discharged, he shall be incapable of being again appointed a surveyor for the purposes of this Act. s. 79.

**Justice of peace,** the district-surveyor is to give information to, within 36 hours after notice, the occupier or other person interested in a building, do not begin to take down or secure a chimney-shaft, chimney-pot, or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or any projection from the front walls of any building in danger of falling, and as soon as

the nature of the case will admit, complete such taking down or securing of the same;—and thereupon it shall be the duty of such justice of the peace to proceed to cause such chimney-shaft, chimney-pot, or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or projection from the front [or side] wall of such building as shall be considered by such surveyor in danger of falling, to be forthwith taken down or secured;—and if there be no occupier or known owner, then it shall be lawful for such justice to direct that the reasonable expenses, to be certified by the official referees, be paid by the overseers of the parish or place in which such building shall be situated;—and if thereafter the owner of such building become known, or if the building become occupied, then the overseers of the poor are to recover the amount of such expenses from such owner or from such occupier as in the case of ruinous buildings;—and if within the time limited the occupier, or some other person interested in such building, do not take down or secure the same, then for every day during which the same shall so remain unrepaired or not sufficiently secured such occupier, or the owner if there be no occupier, shall forfeit and pay a sum not exceeding 5*l.*; and such occupier or owner shall also pay the surveyor's fees, and all other costs charges and expenses attendant upon any such taking down or securing the building; and all such surveyor's fees, and other costs, charges, and expenses, may be recovered and levied in the same manner as such penalty. s. 43.

**Justices of peace,** if upon builders being summoned by district-surveyors they do not appear, are to issue warrants to compel their attendance, and if they fail to enter into recognizances to amend the work, they are to be committed to gaol till they do enter thereinto, or till the building is amended, and expenses and costs are paid;—justices may order district-surveyor or other persons to demolish irregular buildings, sell materials, and pay costs, charges, and expenses,—return surplus to such owner as official referees shall direct, and to recover deficiency, if any, from occupier. s. 18.

**Justice of peace,** if, on tender of a receipt, to any builder, owner, or occupier liable to pay any fee, he shall refuse to pay the same to a district-surveyor, is to summon the party complained of in the first instance, and if he do not appear, or if he fail to satisfy the justice as to the refusal of payment as aforesaid, such justice to issue his warrant to levy the amount of such fee by distress and sale of the goods and chattels of the party so refusing, in like manner as poor's rates are by law recoverable; and if such fee be paid by the occupier, he shall be entitled to recover the amount thereof from the owner; *But if the work in respect of which such fee shall become payable have not been done in every respect agreeably to the directions of this Act, it shall not be lawful for any surveyor to receive such fee; and if he receive it, then, upon application to the official referees by any party interested in the building in respect of which such work shall have been executed, and upon its appearing that such fee has been received wrongfully, it shall be lawful for such official referees, and they are hereby authorized (if they think fit) to order the said surveyor to refund such fees.* s. 77.

**Justices,** two, may levy by distress on goods of owner or occupier, present or future, the amount of deficiency after the sale of materials, to defray the expense of surveys, appeal, hearing, repairing, securing, and pulling down ruinous buildings. s. 42.

**Justices** may fine, and, in default, commit to gaol, workmen, labourers, or servants. See *Penalty*.

**Justices of Peace** may fine not exceeding 100*l.* per day, persons who occupy or use buildings in Schedule B, Part I. before certified or authorized by the official referees for use. s. 16. See *Supervision, special*.

**Justices** to fine persons occupying or using buildings of the first rate of the second class, and of the third or public building class, before duly certified by the official referees, or in default thereof, before the lapse of certain time. See *Penalties for use, Official referees, and Architect or builder*.

**Justices** to summon defaulters under any award, certificate, or other proceeding; issue warrant of distress, and, if levy be insufficient, commit to prison. s. 102. See *Awards, recovery of money under*.

## K.

**KENSINGTON** parish included within the operation of the Act. s. 3.

**KENT,** the county of, to contribute by way of rate, annually, the sum of 50*l.* towards the expenses of the official referees and registrar. s. 96.

## L.

**LABOURERS** may be fined, and in default, be committed to gaol. See *Penalty*.

**LAMBETH** parish included within the operation of the Act. s. 3.

**LANE,** for meaning of, see *Street*.

**LEA** (the River). No extra extension of 200 yards from the boundaries of parishes under the operation of the Act, to apply to the eastern boundary, next the River Lea. s. 3.

**LEASES AND AGREEMENTS,** building, modification of existing. See *Building leases, &c.*

**Leases,** repairs under. See *Chimneys, ruinous*.

**LEASEHOLDER.** s. 50. See *Expenses of works*.

**LEE** parish (Kent) included within the operation of the Act. s. 3.

**LESSEES AND TENANTS** under any existing lease or agreement, on giving 14 days' notice to lessors and other owners of their intention, may require the official referees to ascertain what loss, present and prospective, has been occasioned by the observance of the provisions of this Act, and having regard to the respective terms and interests of the lessee or tenant, the lessor and other owners of such building, and having regard to any profit, benefit, or advantage which may have accrued to such lessee or tenant since the execution of such lease or agreement, and which may appear to the said official referees not to have been in the contemplation of the parties to such lease or agreement at the time of such execution thereof as aforesaid, to determine whether he is entitled to any and what compensation, whether by payment of money or reduction of rent, or both, or otherwise;—and on the receipt of such requisition, and on proof of due notice thereof having been given to the lessor and other owners of such building, the official referees to proceed to ascertain if any and what loss has been so occasioned, and, having regard, as aforesaid, to such terms and interest as aforesaid, and to such profit, benefit, or advantage as aforesaid, to determine if any and what compensation as aforesaid is to be paid in respect thereof, and by whom the same is to be paid, and in what proportions;—and their decision in the matter shall be final. s. 10.

**LESSORS** and other OWNERS to have 14 days' notice before the application of lessees and tenants to the official referees to award compensation for loss in complying with the Act, or in modifying any existing building-lease or agreement. s. 10.

**LETTING** as separate dwellings under-ground rooms and cellars. See *Lowermost rooms*.

**LEVY,** on goods of owner or occupier, present or future, two justices may, the amount of deficiency after sale of materials, to defray the expense of surveys, appeal, hearing, repairing, securing, and pulling down ruinous buildings. s. 42.

**LEWISHAM** parish included within the operation of the Act. s. 3.

**LOBBIES** of 3rd class buildings, floors of must be fire-proof. Schedule C, Part VI.

**LOCAL jurisdiction.** See *Officers, hearing, &c.*

**LONDON,** city, liberties, and suburbs of, to contribute annually 100*l.* towards the expenses of the official referees and registrar. s. 96.

**LORD MAYOR AND ALDERMEN** to appoint, alter, and change as they deem fit (subject to the approval of the principal Secretary of State) the districts and district-surveyors within the city and liberties of London. s. 64. See *Districts*.

**Lord Mayor and Aldermen** to approve of public situation of district-surveyors' offices for the city of London. s. 72.

**Lord Mayor and Aldermen,** proceedings of relative to ruinous buildings. See *Ruinous buildings*.

**LOSS** and inconvenience (great), in case of by compliance with the provisions of the Act, on rebuilding upon old sites, the Commissioners of Works and Buildings have power, after the report of the official referees, to permit modification, except with regard to heights and thicknesses of walls. s. 12.

**LOWERMOST** rooms of houses, being rooms of which the surface of the floor is more than 3 feet below the surface of the footway of the nearest street or alley, and cellars—of buildings hereafter to be built or rebuilt; if any such room or cellar be used or intended to be used as a separate dwelling, then the floor thereof must not be below the surface or level of the ground immediately adjoining thereto, unless it have an area, fireplace, and window as required for rooms and cellars of existing buildings let separately and used as a separate dwelling, and unless it be properly drained. And every such lowermost room or cellar in any existing building used or intended to be used as a separate dwelling; must have an area not less than 3 feet wide in every part, from 6 inches below the floor of such room or cellar to the surface or level of the ground adjoining to the front, back, or external side thereof, and extending the full length of such side. And such area, to the extent of at least 5 feet long and 2 feet 6 inches wide, must be in front of the window of such room or cellar, and must be open, or covered only with open iron gratings. And there must be made for every such room or cellar an open fireplace, with a proper flue therefrom. And there must be a window-opening of at the least 9 superficial feet in area, which window-opening must be fitted with a frame filled in with glazed sashes, of which at the least 4½ superficial feet must be made to open for ventilation. Schedule K.

## M.

**MANSION-HOUSE,** the, is under special supervision. Schedule B, Part I.

**MANUFACTORIES.** See *Chimney-shafts*.

**MASCULINE** gender, when used in this Act, to apply also to the feminine gender. s. 2.

**MATERIALS,** questions relative to, official referees are to decide, being thereto required in writing. s. 82. Materials of ruinous buildings, sale of. See *Ruinous buildings*.

**MEANING** and construction of terms used in this Act. s. 2.

**MERCHANTILE,** damage to, to be made good by neighbouring party whose building may fall thereon. See *Chimneys, ruinous*.

**METROPOLITAN** Police. See *Awards, recovery of money under*.

**MEWS,** for meaning of the term, see *Street*.

Mews. See *Alley*, also *Wildths*.

MIDDLESEX, the county of to contribute by way of rate annually the sum of 1,000*l.* towards the expenses of the official referees and registrar. s. 96.

MODIFICATION of work to suit adjoining owner. If the adjoining owner, at any time within 2 calendar months after the receipt of notice from the building-owner, give notice of his desire that any modification be made in the work, so as to render it suitable to his premises, according to the form (No. 18) in the Schedule of Notices, or to the like effect, then within 7 days after the receipt of such notice it shall be the duty of the building owner to signify his consent to or dissent from such modification or delay;—and if the building-owner dissent from, or do not within such 7 days signify his consent to such modification, then the adjoining-owner may require the building-owner not to commence the work until the official referees have determined thereon;—and if within 7 days thereafter application be made in writing to the official referees, according to the form (No. 19) in the Schedule of Notices, or to the like effect, and notice thereof be given to the building-owner, according to the other form (No. 20), then within 10 days after such application it shall be the duty of the official referees to signify their decision thereon, and it shall be the duty of the building-owner not to commence the work till the decision of such official referees shall have been given;—and if within the period of 3 calendar months from the date of the first notice such adjoining-owner do not make any objection or any requisition in conformity with this enactment, then, subject to the provisions of this Act with regard to such works, the building-owner may proceed to execute the same. s. 22.

MONTH—the word to mean a calendar month. s. 2.

MORTGAGEE in possession. s. 50. See *Expenses of works*.

### N.

NEW and old buildings. See *Buildings new and old*, relative to general regulations.

NEIGHBOURING or adjoining property not to be injured by raising of party fence-walls. s. 32.

NOTICE, though neglected to be given, the district-surveyor shall act as usual. s. 65.

Notice, 36 hours', district-surveyor to give to the occupiers of buildings, or to the owners in case of vacancy, to secure chimney-shafts, chimney-pots, or other things thereon, or the eaves or parapet, or coping, or slates or tiles on the roof, or any projection from the front walls of any building. See *Chimneys, ruinous*.

Notice, in writing, any party may give to another, of his intention to refer to the district-surveyor any disagreement relative to the costs and expenses of works performed according to the provisions of this Act, differing from the works stipulated for in any existing contract,—subject to final appeal to the official referees. s. 9.

Notices to official referees, the registrar to receive, file, and number. s. 92.

Notice, 14 days', from Lord Mayor and Court of Aldermen, or from overseers to be given to owner, to repair or pull down ruinous buildings. See *Ruinous buildings*.

Notice, 14 days', to be given by lessors and tenants to lessors and other owners before requiring the official referees to award compensation for loss in complying with the Act, or in modifying any existing building lease or agreement. s. 10.

Notice, 1 calendar month's may be given by the owner of any premises parted by a fence-wall, to the adjoining-owner, of his intention to repair, pull down, and rebuild the same; and if the wall be below the height of 9 feet from the ground on either side, then he may either raise it to that height or pull it down and rebuild it to that height, upon condition that he pay all the expenses thereof. s. 32.

Notice to, or consent of, adjoining owner. Unless the adjoining owner consent, it shall not be lawful for the building-owner to execute work until he has given notice thereof to such adjoining owner;—and every such notice with regard to the pulling down, rebuilding, or repairing of party-walls or party fence-walls must be given 3 calendar months at least before the work is to be commenced;—and every such notice with regard to the pulling down and rebuilding intermixed walls and timber partitions must be given 3 calendar months at the least before such work is to be commenced;—and every such notice must be in the form or to the effect of the notice (No. 8) for that purpose contained in the Schedule of Notices. s. 21.

NOTICES (all) and proceedings thereon to be entered by district-surveyor in his office register-book. s. 68.

### NOTIFICATIONS:—

*Married females—Infants, idiots, or lunatics—Owners unknown—Buildings unoccupied—Immediate landlord—Part ownership—Service of notices—Damages arising from defective service—Requisites of notices.* Notices by this Act required to be served upon the owner or occupier of any building, fence, land, ground, or tenement, must be given as follows:—If such owner be a married female, other than a cestuque trust in regard to such property, then to the husband of such married female. If such owner be an infant, idiot, or lunatic, or cestuque trust, then to the guardian, trustee, or committee of such infant, idiot, or lunatic, or cestuque trust. If such owner, husband, trustee, guardian, or committee is not known, or cannot be found, then to the occupier

of such building, fence, land, ground, or tenement to which it shall relate. If such building, fence, land, ground, or tenement be unoccupied, then such notice must be affixed to some conspicuous part of such building, fence, land, ground, or tenement, at a height of not more than 9 feet from the ground. And if the person in the occupation of any building, fence, land, ground, or tenement, in respect of which notice is to be given, allege that he is a tenant from year to year, or for any less term, or a tenant at will, and not the owner thereof, within the intent and meaning of this Act, then such notice must be given to the immediate landlord of such occupier; and such occupier is to inform any person by whom such notice shall be required to be given, or any other person applying on his behalf, of the name, place of residence, or place of business of such owner or landlord, or of his agent or other person by whom the rent of such building, fence, land, ground, or tenement shall be received;—and if such owner or landlord be not in the receipt of the whole of the rents or profits of such building, fence, land, ground, or tenement, and if any notice shall be served upon such owner or landlord, then, immediately upon the receipt thereof, it shall be his duty, and he is hereby required, to transmit to his immediate landlord or his agent, and also to any other person being part owner in such building, fence, land, ground, or tenement, or in receipt of the rents or profits thereof under the same immediate landlord, or to the agent of such person, a copy of such notice;—and so on in this behalf, shall be the duty of every landlord, agent, or other person by whom such notice shall be received to transmit it to any such landlord, agent, or other person, being part owner of any such building, fence, land, ground, or tenement, to the intent that every person affected by the work or proceeding in which such notice relates may have the due notice thereof. But if it be served upon the immediate landlord of the occupier, or upon his agent, by or on behalf of the person by whom it is hereby required to be served in the first instance, then, although it may not be served by such immediate landlord upon any other landlord or owner, such service is to be deemed to be sufficient service;—nevertheless, if any owner suffer damage by the failure of any other person, being either the occupier or any person holding under such owner, to serve such notice, then such owner shall be entitled to recover the amount thereof against such person by whom such damage shall have been occasioned; and every notice served under this clause on any person must contain a copy of the provisions thereof, so far as they require him to transmit the same to his immediate landlord, or the agent of such landlord. s. 112.

Mode of service upon occupier. If such notice be intended for the occupier of any building or ground, it must be given either personally or by leaving the same with some inmate at the premises, or it must be affixed as aforesaid. s. 113.

Mode of service upon owners by delivery—Effect of notice. Every such notice (except such notice as may according to the provision in that behalf be sent by post) must be given either personally or by leaving the same with some inmate at the usual place of abode of such party, or if that be not known, then at his last known place of abode;—and every such notice, when so given to such persons respectively as aforesaid, or left at the last known place of their respective abodes, or when so affixed as aforesaid, according to the cases hereinbefore mentioned, shall have the same effects and consequences as if given to the actual owner. s. 114.

Mode of service upon owners by transmission. If any owner upon whom notice is required to be served be not within the limits of this Act, or have not within the limits of this Act any agent acting in his behalf in the matter of the premises to which the notice refers, then it shall be lawful to give notice by post letter, duly registered according to the practice for the time being adopted with regard to letters transmitted by post, but so that nevertheless such letter be posted in such manner as shall afford to the person addressed, after the receipt of such letter, the full period of notice required in the case. s. 115.

Notices for surveyors and official referees. If the notice relate to the surveyor, then such notice must be served at the office of the surveyor; and if to the official referees or any of them, such notice must be left at the office of the Registrar of Metropolitan Buildings. s. 116.

NUISANCES, all buildings not according to Act declared to be, viz. buildings, drains, timber buildings, chimneys and flues, party-walls, party fence-walls, external walls and projections, and every other part of every building of every class, or rate of any class, which shall be hereafter built, rebuilt, enlarged, or altered within the limits of the Act, contrary to the provisions hereof: if the same be not built, rebuilt, enlarged, or altered in the manner and of the materials, and in every other respect according to and in conformity with the several rules and directions which are in this Act particularly specified; and if any person abate or begin to build, or cause the building or beginning to build, or alter or cause to be altered, or use or cause to be used, any part of any ground or building, projection, drain, or other thing, contrary thereto, and if in either of such cases it so appear by the certificate of the official referees, then the said building, projection, drain, or other thing, or such part

thereof so irregularly built or begun to be built, or so irregularly altered or begun to be altered, or so used, shall be deemed a nuisance; and thereupon it shall be the duty of the district-surveyor to summon the builder before any two justices of the peace;—and if at the time and place appointed on such summons such builder fail to appear, then the said justices, are authorized, to issue a warrant under their hands and seals to compel such builder to appear before such justices, or any other two justices; and thereupon such builder shall enter into a recognizance, in such sum as the said justices shall appoint, for abating and taking down the same within such convenient time as the said justices shall respectively appoint, or otherwise for amending the same and also for paying the costs, charges, and expenses incurred by the surveyor in laying the information and obtaining the conviction, including such compensation for the surveyor's loss of time as the said justices shall think fit;—and if the party so required fail to enter into such recognizance, then such justices or any justice shall commit such builder to the common goal of the city, county, or liberty where the offence shall be committed;—and here to remain until he shall or may be lawfully released, or until he shall or may be mantrized until he shall have entered into such recognizance as aforesaid, or until such irregular building shall have been abated or demolished or otherwise amended, or such nuisance shall be abated or demolished by order of such justices respectively, and until the costs, charges, and expenses thereof, and of all operations and proceedings in relation thereto, shall have been paid;—and further, if application be made to any two or more justices, then thereupon it shall be their duty, and they are hereby empowered, to order the surveyor or any other person to abate or demolish such nuisance, and to order the persons authorized by them so to abate or demolish the same, to sell and dispose of the materials thereof, and out of the moneys arising by such sale to pay to the justices, and all persons by them employed for such purpose, the reasonable charges for abating or demolishing such nuisance, and also such costs and expenses as aforesaid, and to pay the surplus moneys arising by such sale (if any) to such owner of the building as the official referees shall determine to be entitled thereto;—and if the moneys arising by such sale be not sufficient to pay such charges, then it shall be the duty of the person entitled to the immediate possession of such building, or the occupier, to make good the deficiency, subject to reimbursement as hereinafter provided; and if he fail, then he shall be liable to the same remedies for the recovery thereof as are by this Act provided concerning the expense of taking down ruinous buildings, and putting up hoards for the safety of passengers. s. 18.

Nuisances. See *Use of buildings*.

### O.

OCCUPATION of buildings by different families, brings their separating walls within the denomination of, and under the regulations of, party-walls. s. 2.

Occupation, separate, of buildings. See *Party-walls for dividing buildings*.

Occupation of ground or tenement otherwise than as a tenant from year to year, or for any less term, or as a tenant at will, constitutes the tenant an owner for the purposes of the Act. s. 2.

Occupation of different grounds and buildings, how affecting insulated buildings. See *Insulated buildings*.

OCCUPIERS and persons using first-rate buildings of the second class and buildings of the third class before duly certified by one official referee, to be subject to fine. See *Penalties for use*.

Occupiers of buildings (or if vacant, owners) to secure chimney-shaft, chimney-pot, or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or any projection from the front walls of any building, if in danger of falling, under penalty and liability to make good all damage. See *Chimneys, ruinous*.

OFFENCES, prosecution of. Complaint—Summons—Compulsory appearance—Distress—Imprisonment. It shall be lawful to proceed by complaint before any one justice of the peace or before a police magistrate with regard to all offences against the provisions of this Act for which no other proceeding is provided;—and it shall be lawful for such justice to summon the party against whom such complaint shall be made; who failing to appear in pursuance thereof, it shall be lawful for such justice or magistrate, or any other justice or magistrate, to issue a warrant under his hand and seal to compel the appearance of such party;—and on conviction of the offender before two justices or before any police magistrate, such justice or magistrate shall cause the amount of the penalty imposed in respect of such offence, and of the costs of any such proceeding in respect thereof, to be levied by distress of the goods and chattels of the offender; and if such offender have no goods and chattels whereon to distress, or if they be insufficient for that purpose, such justices or magistrate, or any other justice or magistrate, shall, either on failure of such distress, or in the first instance, commit the offender, for any period not exceeding 3 calendar months, or till he shall have paid the full amount of such penalty and such costs. s. 103.

OFFENSIVE objects and neighbourhoods. Party fence-walls may, with consent of official referees, be raised to screen from view. s. 32.

OFFICE, district surveyor's, to be surveyor's expense, in such public situation as shall be approved by the lord mayor and aldermen; and in each district with-

out the city and liberties of London in some central part of the district to which he shall be appointed, as shall be approved by the justices of the peace in Quarter Sessions within whose jurisdiction he shall act; and every surveyor shall, by himself, or by some other person in his behalf, attend at his office every day (Sundays, Christmas Day, and Good Friday excepted) from 10 o'clock in the morning till 4 o'clock in the afternoon;—and immediately upon his appointment, and from time to time upon every change of his residence or of his place of business, or oftener if required, surveyor shall make a return to the Registrar of Metropolitan Buildings, and to the overseers of the poor of every parish or place within his district, of his name and place of abode, and the place where such office shall be. s. 72.

Office of Registrar of Metropolitan Buildings, list of fees to be fixed up in. s. 98.

Offices. See Inns of court.

Offices, attached. See Attached buildings and offices.

OFFICERS having local jurisdiction are intended by this Act whenever referred to, without mention of the locality to which the jurisdiction extends, and such reference is to be understood to indicate the officer having jurisdiction in that place within which is situate the building or other subject-matter, or any part thereof, to which such reference applies. s. 2.

Officers and districts, this new Act to come into operation relative to the appointments of, on the 1st Sept. 1874. s. 1.

Officers generally, appointments of, subject to regulation by any future Act. The officers appointed by virtue of this Act, so far as relates to their functions, appointment, and tenure of office, are subject to any provision that may be made by any Act of Parliament hereafter to be passed for assigning other duties than those to be imposed by virtue of this Act; and such officers shall be held not only subject to the pleasure of the officers and justices by whom such appointments shall be made, but also subject to the provisions of any future Act of Parliament in relation thereto. s. 99.

OFFICIAL fidelity, to make declaration of before acting, district-surveyors under penalty of 5*l.* per day. s. 71; official referees, s. 87; registrar, s. 90.

OFFICIAL REFERENCE (the term) to mean the persons appointed in pursuance of this Act to be official referees of metropolitan buildings. s. 2.

OFFICIAL REFERENCE.—

Appointment of.—One of her Majesty's principal secretaries of state, to appoint two persons, being of the profession of an architect or surveyor, to be official referees of metropolitan buildings, and from time to time, as he shall think proper, to remove such official referees, and in their place to appoint other persons so qualified;—and while any person shall hold the office of official referee he shall not act as district-surveyor, either alone or with any partner or by an agent, or act as official referee in the case of any building or matter in which he shall act as architect;—and if an official referee be employed as architect as to any building or matter within the limits of the Act, he shall report thereon to the Commissioners of Works and Buildings, who shall appoint some other competent person to act in conjunction with the other official referee as to such building or matter. s. 80.

These functions generally.—Each official referee shall superintend the execution of this Act by the several district-surveyors, and perform the several matters to them respectively assigned by the provisions of this Act, and determine all questions referred to them, whether expressly by this Act or at the instance of any one or more of the concerned. s. 81.

Remuneration, Disallowance, Fees.—See Registrar, Matters of reference.—One referee may act.—If any doubt, difference, or dissatisfaction in respect of any matter within the limits of this Act arise between any parties concerned, or between any party and any surveyor, or between any two surveyors, as to any act done or to be done in pursuance of this Act, or as to the effect of the provisions thereof, in any case, or as to the mode in which the provisions and directions of this Act are or ought to be carried into effect,—and particularly as to whether the requirements implied in terms of qualification applied to sites, soils, materials, or workmanship, or otherwise, and denoting good or bad, fit, proper, fit, proper, or sufficient, are fulfilled in certain cases,—or as to the district in which any building, matter, or thing is to be deemed to be situate, especially in cases where such building, matter, or thing is partly in one district and partly in another,—or as to any expense to be incurred by the respective owners of premises parted by the same party-walls, or the proportions thereof,—or as to the proportions of the expense to be borne by the occupier or by the owners of premises in respect of any work executed, or any other matter whatever,—THEN it shall be lawful for any party concerned to require the official referees to determine such matter, but so that such requirement be made in writing, and that it set forth, either generally or otherwise, the matters in respect of which the determination of the official referees is required;—and the determination of such referees, or one of such referees, with the assent of the Registrar of Metropolitan Buildings, as to all or any of the points in reference to which such referees shall make their award, and as to the costs, charges, and expenses of such reference, shall be binding on all parties to such reference. s. 82.

Award and powers of referees.—The official referees shall exercise such powers of arbitrators as they would have had in cases they had been appointed under an order of her Majesty's Court of Queen's Bench at Westminster; and if such award be given in writing, and be sealed by the official referee by such court, and shall be enforced by the said court in all respects as if made under an order of such court;—and it shall be binding and conclusive against every person, including the Queen's Majesty, her heirs and successors, claiming in any estate, right, title, trust, use, or interest in, to, or out of the said premises or any part thereof, or expectancy, and against every other person whomsoever. s. 83.

Revocation of authority not to affect their award.—

The power and authority of the official referees shall not be revocable by any party to any reference, without the consent of all parties thereto; and although any party shall not attend upon such reference it shall be lawful for such official referees to proceed with the reference, and to make their award. s. 84.

Taking of evidence.—The official referees may, by summons in writing sealed with the seal of office of the Registrar of Metropolitan Buildings, require the attendance of any person who may be able to give evidence in relation to any reference to them, and to require by such summons the production of any documents to be mentioned therein;—and if, in addition to the service of such summons, an appointment of the time and place of attendance in obedience thereto, signed by one at least of the official referees before whom the attendance is required, be also served, either together with or after the service of such summons, then, if the party so summoned do not attend in obedience thereto, such party shall be liable to be proceeded against as for a contempt of court;—and every person whose attendance shall be required shall be entitled to the like conduct—money and payment of expenses as for and upon attendance at any trial;—and no person shall be compelled to produce under any such summons any writing or other document that he would not be compelled to produce at a trial, or to attend on more than two consecutive days to be named in such summons;—and the official referees shall administer an oath to such witnesses as may come before them, or, in cases where affirmation is allowed by law instead of an oath, take their affirmation; and if upon such oath or affirmation any person making the same wilfully and corruptly give false evidence, then every person so offending shall be deemed to be guilty of perjury. s. 85.

Effect of awards as evidence.—If on the trial or hearing of any cause or matter in any court of law or equity, or elsewhere, any copy of an award, by the official referees, signed and sealed with the seal of the said registrar, be produced, then it shall be the duty of all judges, justices, and others, and they are hereby required, to receive the same as *prima facie* evidence of the matters therein contained. s. 86.

Declaration of official fidelity.—Before any official referee shall act in pursuance of his appointment, he shall make a declaration of official fidelity, to be administered by the Chief Baron or any other of the Barons of her Majesty's Court of Exchequer. For form see s. 87.

Regulation of business.—Delegation of powers.—Any matter by this Act required, directed, or permitted to be done by the official referees may be done by either of the referees with the assent of the Registrar of Metropolitan Buildings, unless express provision to the contrary be made, and if done by any one of them with such assent, it shall be as valid and effectual as if done by both of them; and, subject to such restrictions and regulations as may be made in that behalf by the Commissioners of Works and Buildings, it shall be lawful for the official referees to appoint one of their number, under their hands and the seal of the Registrar of Metropolitan Buildings, to make any inquiry or any survey which shall appear to them either necessary or expedient in order to enable them to determine any matters in reference to. s. 88.

Official referees as overseers of parishes to cause copies of proclamation made in the *London Gazette* to be fixed on the doors of the churches and chapels within parishes 3 weeks before the Council take into consideration the extending of the limits of the operation of the Act to any other place within 12 miles from Charing-cross. s. 84.

Official referees, if they think any district too extensive, are to represent the same to the magistrates, sending them also a copy of the district register of notices, with the result;—and if the official referees are of opinion any district-surveyor, on account of the pressure of business in any district, or on any other account, cannot discharge his duties properly, they may, in regard to the builders and others engaged in building operations, and efficiently as regards the purposes of this Act, they shall appoint any other district-surveyor to assist the surveyor of such district in the performance of his duties, or if no district-surveyor can be spared from his own district, then appoint some other competent person to give such assistance. s. 75. See Assistant-surveyors.

Official referees by their award may authorize such modification (subject to the approbation of the Commissioners of Works and Buildings) in the

rules of the Act as they may deem fit, in cases of existing building-leases and agreements. s. 10.

Official referees have power, on application to them, to modify in certain cases the thickness of external walls. See *Including walls*.

Official referees to report to the Commissioners of Works and Buildings relative to the propriety of modifying the strict provisions of the Act relative to areas and other matters (except the height and thickness of walls) where buildings are to be rebuilt on old sites. s. 12.

Official referees to determine whether buildings are liable to their special supervision, subject to appeal to the Commissioners of Works and Buildings.

Official referees to determine in case of doubt, difference, or dissatisfaction relative to the classes and rates to which buildings belong. s. 5.

Official referees, in case of appeal from the district-surveyor, to determine the classes and rates according to which buildings not comprised by the Act within any class or rule shall be created. s. 8.

Official referees to report to the Commissioners of Works and Buildings if modifications should be made in the strict rules of the Act; whether from their own suggestion, or from that of any interested party. s. 11.

Official referees, immediately on any district becoming vacant, and until the justices appoint a successor, are to direct the surveyor of any one or more of the other districts to perform the duties of surveyor thereto, or if no district-surveyor can be spared from his own district, to appoint some other competent person duly qualified;—and every such surveyor is hereby entitled to receive the fees payable in respect of the services performed by him in such vacant district. s. 74.

Official referees' approval requisite for the due appointment of deputies by district-surveyors. s. 73.

Official referees may order district-surveyors to refund fees wrongfully received, under pain of discharge or fine by the justices. s. 79.

Official referees, on the information of district-surveyors, in cases of irregular building, to proceed to hear the matter, and if any breach of the rules, regulations, and directions of this Act be found to have been committed, or if there appear good reason to suppose any such breach has been committed and is concealed, to direct by their award the building, party-wall, external wall, chimney-stack, flue, or other thing, or such part thereof as they shall deem necessary, to be amended, removed, cut into, laid open, or pulled down; and all the costs, charges, and expenses of the said work, and of the said application to the official referees, shall be borne by such party or parties as the official referees shall determine. s. 14.

Official referees may enter on premises. See *Enter on premises*.

Official referees, refuse to admit, to inspect premises renders work liable to be abated as a nuisance. s. 13.

Official referees, in default of the consent of all proper parties, may authorize the pulling down of party structures and laying together parts of internal buildings. s. 94.

Official referees, if any party desire to raise a party fence-wall so as to screen from view any offensive object or neighbourhood, may authorize the same, but not so as to obstruct the free circulation of the air, or to injure the property adjoining to or in the neighbourhood of such wall. s. 32.

Official referees, consent of, relative to materials of floors and arches separating buildings from public ways. See *Public way, buildings over*.

Official referees, buildings under supervision of, all buildings of the 1st rate of the 2nd or warehouse class, and all buildings of the 3rd or public building class (except buildings excepted by Schedule B, Part II.), subject to the provisions in Schedule C, and elsewhere in this Act made in respect thereof; as well as under the ordinary supervision of the surveyor; and if any difference arise as to whether any such building be liable to such special supervision, the same shall be determined by the official referees; subject to an appeal, at the instance of any party interested, to the Commissioners of Works and Buildings, whose decision in the matter shall be final. s. 6.

Official referees. Special supervision of 1st-rate buildings of the 2nd or public building class, and of buildings of the 3rd class (except buildings excepted by Schedule B, Part II.) When all the walls of any such building are built to their full height, and all the timbers of the floors, roofs, and partitions are fixed, it shall be the duty of the architect or builder, and he is hereby required, to give notice thereof to the official referees, according to the form (No. 6) in the Schedule of Notices, in duplicate effect; and if the official referees be of opinion that such building is subject to special supervision, then, within 7 days after such notice, it shall be their duty to survey the said building;—and if they approve of the same, then, within 7 days after such survey, to certify such approval, under their hands, to the architect or builder;—and if any part of the walls, timbers, roof, or internal supports appear to such official referees defective, insufficient, or insecure, then, within the said 7 days after such survey, they are to give to such architect or builder notice of such parts as shall so appear to them defective, insufficient, or insecure, which notice must be in writing;—and upon the receipt of such notice it shall be the duty of the said architect or builder to amend and strengthen such defective, insufficient, or insecure parts;—and, during or within a period of 7 days after notice has been given to the official referees that such works have been amended

or strengthened as aforesaid, it shall be the duty of the official referees, to inspect the same, or in default thereof the said parts may be covered up;—and, upon completion of every such building, it shall be the duty of the architect or builder to give fresh notice to the official referees, according to the form (No. 7) in the Schedule of Notices, or to the like effect;—and thereupon, or within 7 days after such notice, it shall be the duty of the official referees to survey the same;—and if upon such survey it shall appear that such building has been built sufficiently strong, and is sufficiently set to be safe, then within 14 days after such survey it shall be their duty, and they are hereby required, to certify accordingly, which certificate must be under their hands and the seal of office of Registrar of Metropolitan Buildings;—and until such certificate shall have been made, or until 14 days after such survey shall have elapsed without the official referees having given notice in writing that they are not satisfied, it shall not be lawful to use such building for any purpose whatever without the express authority in writing of the official referees under their hands and the seal of office of the Registrar of Metropolitan Buildings;—and, if before the certificate of satisfaction shall have been made, or if such further 14 days as aforesaid shall have elapsed without due notice being given in writing as aforesaid, any such building subject to special supervision shall be used for any purpose without such express authority in writing, then, on conviction thereof before two justices of the peace, the occupier of such building or other person by whom such building shall be so used, shall forfeit for such offence a sum not exceeding 200*l.*, for every day during which such building shall be so used without having obtained such certificate of satisfaction, or such express authority as aforesaid;—and in determining the amount of any such penalty, the justices shall have regard to the size and character of the building, and to the nature and extent of danger involved in the use of such building, and to the amount of profit which might be derived from such use thereof. s. 15.

**Official referees.** Special supervision of buildings in Schedule B, Part I.—Before the builder begins to build it shall be the duty of the architect or the builder to give notice thereof to the official referees, and also, at the same time, to transmit for their inspection the plans, elevations, and other drawings which have been made for the same; and forthwith the official referees shall proceed to survey the situation of the intended building, to ascertain whether such building can be erected on such situation with due regard to the security of the public; and during the progress of such building, such official referees shall inspect the same to ascertain the sufficiency thereof; and if such building or any part thereof appear to such official referees defective, insufficient, or insecure, they shall give to such architect or builder notice of such parts as shall appear to them defective, insufficient, or insecure, which notice must be in writing;—upon the receipt of such notice it shall be the duty of the said architect or builder to amend and strengthen such defective, insufficient, or insecure parts; and during or within a period of 7 days after notice has been given to the official referees that such works have been amended or strengthened, the official referees shall inspect the same, or in default thereof the said parts may be covered up;—and upon completion of every such building it shall be the duty of the architect or builder to give fresh notice to the official referees; and thereupon, or within 7 days after such notice, the official referees shall survey the same; and if upon such survey it shall appear that such building has been built sufficiently strong, then it shall be their duty to certify accordingly, which certificate must be under their hands and the seal of office of Registrar of Metropolitan Buildings;—and until such certificate shall have been made, or until 14 days after such survey shall have elapsed without the official referees having given notice in writing that they are not satisfied, it shall not be lawful to use such building for any purpose whatever without the express authority in writing of the official referees under their hands and the seal of office of the Registrar of Metropolitan Buildings;—and if before the certificate of satisfaction shall have been made, or if such 14 days shall have elapsed without due notice in writing being given, any such building be used for any purpose without such express authority in writing, then, on conviction thereof before two justices of the peace, the occupier or other person by whom such building shall be so used shall forfeit for such offence a sum not exceeding 100*l.*, for every day during which such building shall be so used without having obtained such certificate of satisfaction or such express authority as aforesaid;—and in determining the amount of such penalty, it shall be the duty of the justices to have regard to the nature and extent of danger involved in the use of such building, and to the amount of profit which might be derived from such use thereof. s. 16.

**Official referees** to determine between parties, in cases of appeal from the district surveyors, the difference of costs and expenses of performing works according to this Act, and which may be contrary to any existing building contract. s. 9.

**Official referees** are, upon the requisition of any lessee or tenant, under any existing building lease, or agreement (14 days' previous notice being given to the lessors and other owners), to ascertain what loss, present and prospective, has been occasioned by the observance of the provisions of this Act, and having regard to the respective terms and interests of the lessor or tenant, the lessor and other owners of such building, and having regard to any profit,

benefit, or advantage which may have accrued to such lessee or tenant, since the execution of such lease or agreement, and which may appear to the said official referees not to have been in the contemplation of the parties to such lease or agreement at the time of such execution thereof as aforesaid,—to determine whether he is entitled to any and what compensation, whether by payment of money or reduction of rent, or both, or otherwise;—and on the receipt of such requisition, and on proof of due notice thereof having been given to the lessor and other owners of such building, it shall be the duty of such official referees to proceed and ascertain if any and what loss has been so occasioned, having regard to such terms, interest, profit, benefit, or advantage as aforesaid, to determine if any and what compensation is to be paid in respect thereof, and by whom, and in what proportions;—and their decision in the matter shall be final. s. 10.

**Official referees** to fix from time to time the rates and prices according to which accounts for work and materials in party structures are to be made out. s. 47.

**Official referees** to have delivered to them at their offices a copy of every account for party structures done by their authority. s. 47.

**Official referees** to settle the contributions of all parties liable to bear the expenses of party structures. s. 50.

**Official referees**, if within 10 days from the delivery of any account for party structures any party dissatisfied with the proportion of the amount thereof charged to him, appeal to,—or if in cases of want of due consent, such account be delivered to the official referees, it shall be their duty to examine such account, and to certify whether they approve or disapprove of the items thereof, and whether the rates and prices are duly charged, and whether the proportion of the account charged to the party appealing be duly charged, and also to appoint how and by whom the expenses of such examination are to be borne, and also to appoint the time or times at which the amount of such account and of such expenses payable by any party are to be paid;—and if they certify their disapproval, or the charges are not duly made, or the amount fairly apportioned with regard to the party appealing, then, before any demand is made or any proceedings are taken thereon, the account must be amended, and again examined by the official referees, and certified as aforesaid;—and if the official referees certify their approval thereof at the time appointed by the said official referees it shall be lawful for the person entitled to such costs and expenses to demand the amount thereof. s. 47.

**Official referees** to settle, in case of dispute, the proportions of the materials of party-walls when pulled down, and of the site, belonging to each owner where an external wall has been built against such party-wall. s. 30.

**Official referees** to order district surveyor to survey and certify state of ruinous buildings, upon the respective application of himself and of the overseers,—to cause copy of certificate to be transmitted to the Court of Lord Mayor and Aldermen of the city of London, or to the overseers in other places,—and if the Lord Mayor and Aldermen, or the overseers, appeal against such certificate, the official referees are themselves to stop up any opening in an external wall made without consent in writing. s. 37.

**Official referees** to award reasonable compensation to be paid to adjoining parties for loss by reason of the rebuilding of a sound party-wall not condemnable. s. 26.

**Official referees**, on application of either party, are to determine and certify the expense which an owner may claim of an adjoining party, who, after notice, has himself neglected to stop up any opening in an external wall made without consent in writing. s. 37.

**Official referees** to decide proportions and recipients of division of surplus arising from sale of materials of ruinous buildings. s. 41.

**Old and new buildings.** See Buildings, new and old, relative to general regulations.

**Old foundations, buildings erected upon.** See Buildings, new and old, for general regulations relative thereto.

**Old materials, value of,** to be allowed for in claims for the recovery of costs of party structures. s. 46.

**OPENINGS** in external walls abutting on other premises, stoppage of. If, without the consent in writing of the owner of any ground or building, any opening be made in any such wall, it shall be lawful for such owner, to require the owner of the premises in which such opening shall be made to stop up the same with brick or stone-work, as the case may be, according to the form (No. 5) in the Schedule of Notices, or to the like effect; and if within one calendar month after such notice such stoppage be not effected, then it shall be lawful for such owner, either by himself or his workmen, with tools, implements, and materials, to cause such opening to be repaired the costs thereof; and with regard to such costs, as far as he refuses to the adjustment thereof, if such owner refuse to make payment, or if there be any dispute as to the amount thereof, then, on application for the purpose to the official referees, by either of the parties concerned, it shall be lawful for the person by whom they have been incurred to refer the matter of such dispute to the official referees;—and to have their determination thereon;—and it shall be the duty of such official referees to give to the applicant a certificate in relation thereto;—and if any party liable to pay any sum of money under such certificate fail to do so, then it shall be lawful for the party entitled to such costs to recover the same in the manner hereinafter provided for the recovery of the costs,

charges, and expenses of executing any works in pursuance of this Act. s. 37.

**Openings in party-walls** may be made whereby two or more dwelling-houses shall be united. And with regard to any dwelling-houses which when so united will contain more than 14 squares, if such dwelling-houses shall be and continue to be the same occupation, then upon its being declared by the official referees that in their opinion the stability and security from fire of any or either of such dwelling-houses will not be endangered by making such openings, they may be made accordingly. Schedule D, Part IV.

**Openings in party-walls,** to buildings of the 2nd class, must not be made wider than 6 ft. nor higher than 8 ft. unless in each case, and upon special evidence of necessity for convenience or otherwise, the official referee shall previously authorize larger openings. And the floor, jambs, and head of every such opening must be composed of brick or stone, or iron-work, throughout the whole thickness of the wall; and every such opening must have a strong wrought-iron door on each side of the party-wall, fitted and hung to such opening without wood-work of any kind; and such doors must not be less than 1 1/2 inch thick in the panels thereof; and each of such doors must be distant from the other not less than the full thickness of the party-wall. Schedule C, Part IV. District-surveyor's fee for inspecting formation of openings in party-walls, 10*s.*; not chargeable where the ordinary fees for building, or addition, or alteration, are paid.

**ORDERS.** See Removal of into superior Courts.

**Other districts,** surveyors of particular districts to act in when specially appointed thereto by the official referees. s. 63.

**OVEN.** See Close fires.

**OVERSEERS.** See Parish (the word).

**Overseers of parishes and official referees** to cause copies of proclamation made in the London Gazette to be fixed on the doors of the churches and chapels within any parish 3 weeks before the Council take into consideration the extending of the limits of the operation of the Act to any other place within 12 miles from Charing-Cross. s. 4.

**Overseers of the poor,** of every parish or place within his district,—every district-surveyor is, immediately upon his appointment, and from time to time upon every change of his residence, or of his place of business, or often if required, to make a return to, and to the Registrar of Metropolitan Buildings, of his name and place of abode, and the place where such office shall be. s. 72.

**Overseers,** upon receiving information of any building being in a ruinous and dangerous condition, shall, with the district-surveyor respectively, apply forthwith to the official referees to authorize a survey to be made thereof; and the official referees shall direct the surveyor to make such survey; and such surveyor shall act in all respects as in the case of a survey of party-walls;—and upon the receipt of the certificate of the surveyor, the official referees shall cause a copy thereof to be transmitted, if the premises be within the city of London, to the Court of Lord Mayor and Aldermen, and if they be elsewhere, to the overseers of the poor of the parish or place in which such premises shall be;—thereupon such Mayor and Court of Aldermen, and overseers, shall cause with all convenient speed such ruinous building to be securely shored, or a proper and sufficient hoard to be put up for the safety of all passengers,—and to cause notice in writing to be given to the owner of such building to repair or pull down the same or any part thereof, as the case may require, within 14 days then next ensuing;—and if within the said 14 days the repair or demolition be not begun, and be not completed as soon as the nature of the case will admit, then, on a declaration being made before the said Lord Mayor or a justice of the peace of such notice having been so given, the said Lord Mayor and Court of Aldermen, out of the cash in the chamber of London, and every such overseer out of the money in his hands, with all convenient speed, shall order and cause such building, or such part thereof so certified to be in a ruinous and dangerous condition as shall be necessary for the safety of the passengers, to be repaired or pulled down, or secured in such manner as shall from time to time be required; but if such Lord Mayor and Aldermen, or such overseers, apply against such certificate, the official referees shall proceed to survey, to certify, and to award in all respects as in the case of an appeal from the certificate of the surveyor with reference to party-walls or intermixed buildings; and if such official referees certify that the said premises are ruinous and dangerous, it shall be the duty of the said Lord Mayor or the said overseers to repair or pull down such building. s. 40.

**Overseers** to receive and return, if claimed within 6 weeks, surplus arising from sale of materials of ruinous buildings without the city and liberties of London. s. 41.

**OWNER** (the word) to apply generally to every person in possession or receipt either of the whole or of any part of the rents or profits of any ground or tenement, or in the occupation, or such ground or tenement, other than as a tenant from year to year, or for any less term, or a tenant at will. s. 2.

**Owner, adjoining.** s. 20.

**Owner, building.** s. 20.

**Owner or occupier, present or future,**—two justices may levy by distress on the goods of, the amount of deficiency after sale of materials, to defray the expense of surveys, appeal, hoarding, repairing, securing, and pulling down ruinous buildings. s. 42.

Owners, who propose to build party-walls or party fence-walls between their vacant ground and other vacant ground, or ground in a different occupation, are to give one calendar month's notice to the adjoining owner, with a description of their proposed work, and without the consent in writing of the latter the work cannot be built as party-structure on two estates, but must be wholly on one, the footings excepted. s. 35.

Owners and lessees to have 14 days' notice before the applications of lessees and tenants to the official referees to award compensation for loss in complying with the Act, or in modifying any existing building lease or agreement. s. 10.

Owners of vacant buildings to secure chimney-shaft, chimney-pot, or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or any projection from the front walls of any building, or in danger of falling, under penalty, and liability to make good all damage. See *Chimneys, ruinous*.

Owners to have 14 days' notice from Lord Mayor and Court of Aldermen, or overseers without the city and liberties of London, to repair or pull down ruinous buildings. See *Ruinous buildings*.

Owners to pay deficiency, if sale of materials of ruinous buildings be insufficient to defray expenses of surveys, certificates, condemnations, shuttings, boardings, or millings, or other ruinous buildings. s. 42. See *Ruinous buildings*.

Owners of adjoining premises to stop up within a calendar month openings in external walls made without consent in writing on receiving notice (in form No. 5), or the other owner may do so at the expense of the former; but either party may, in case of dispute relative to the expense, claim the determination and certificate of the official referees. s. 37.

**P.**  
PADDINGTON parish included within the operation of the Act. s. 3.

PALACES, royal, are under special supervision. Schedule B, Part 1.

PANCRAS (St.) parish included within the operation of the Act. s. 3.

PARAPETS in danger of falling. See *Chimneys, ruinous*; also *Chimneys, compensation for injury*.

Parapets, if adjoining a gutter, must be carried up 1 ft. at the least above the highest part of such gutter, and above the level of the under side of the gutter-plate must be, at the least, in the extra 1st rate of the 1st class, and in the 1st rate of the 2nd class, 13 ins. thick; and in every other case, 8½ inches thick. Schedule D, Part 11.

PARGETTING. See *Chimneys hereafter built*.

PARISH (the word) to include all parochial districts and extra-parochial places in which separate churchwardens, overseers, or constables are appointed; and where two parishes have been united for ecclesiastical purposes, then to include such united parishes. s. 2. By s. 3 of the Act its operation is extended to all places lying within 200 yards from the exterior boundaries of the external parishes over which it is to operate, except the eastern boundary by the River Lea.

Parishes and other places within districts. See *Overseer*.

PARTIES interested may require the official referees to report to the Commissioners of Works and Buildings whether modifications should be made in the strict rules of the Act. s. 11.

PARTITIONS, expense of pulling down, for performing party structures, recoverable. s. 46.

PARTY ARCHES. See *Party-walls for dividing buildings*.

Party-arches, costs of. See *Expenses of works*.

PARTY FENCE-WALLS, by which term it is to be understood any boundary wall parting the grounds belonging to different owners or occupied by different persons, if the owner of any of the premises parted thereby give one calendar month's notice of his intention to the adjoining owner to repair, pull down, and rebuild the same, it shall be lawful for him so to do; and if the wall be below the height of 9 ft. from the ground on either side, then either to raise it to that height, or to pull it down and rebuild it to that height, but upon condition that he do pay all the expenses thereof;—and if a building be to be erected against such party fence-wall, and such wall be not so normally to be requisites prescribed for a proper party-wall for a building of that class and rate, then it shall be lawful for the building owner to pull down such wall, but upon condition that he pay all the expenses thereof, and make good every damage which shall accrue to such adjoining premises by such rebuilding;—but if the intention of the adjoining owner use such party fence-wall for any purpose to which, if it had not been pulled down and rebuilt, it would not have been applicable, then to such extent as such adjoining owner shall so use such wall the building owner shall be entitled to be reimbursed the expenses of so pulling down and rebuilding such wall.—But if any party desire to raise such wall so as to screen from view any offensive object or neighbourhood, then on application to the official referees they may authorize such work, but not so as to obstruct the free circulation of the air, or to injure the property adjoining to or in the neighbourhood of such wall. s. 32.

Party fences or walls between vacant grounds of different owners or in different occupations, are not to be built as party-structures without one owner give to the other a calendar month's notice, with a description of his proposal, and obtain his consent thereto in writing. s. 38. District-surveyor's fee for condemning a party fence-wall, 10s. 6d.

PARTY timber partitions, pulling down, costs of. See *Expenses of works*. If one building be rebuilt, or if one of the fronts of any such building be taken down to the height of one story, or for a space equal to one-fourth of such front from the level of the second floor upwards, then without the consent of the adjoining owner, but upon giving the requisite notice according to the forms (Nos. 11, 12, 13), in the Schedule of Notices, or to the like effect, it is the duty of the building owner to pull down such timber partitions, and the walls under or over the same, and in lieu thereof to build a proper party-wall, at the expense of the owners of all the premises parted thereby. s. 33.

PARTY-STRUCTURES, costs of. See *Expenses of works*.

Party-structures, property of, and of the ground whereon they stand, vest in the persons at whose expense they are performed, till due contribution of their expenses and of the fees of the official referees. s. 46.

PARTY-WALL (the term) to apply to every wall which shall be used, or be built in order to be used, as a separation of two or more buildings with a view to the occupation thereof by different families, or which shall be actually occupied by different families,—and also every wall which shall stand upon ground not wholly belonging to the same owner to a greater extent than the projection of its footing on one side. s. 2.

District-surveyor's fee for inspecting and reporting to the official referees on party-walls, and intermixed buildings:—

Building party and party fence-walls next vacant ground. Consent of adjoining owner, on vacant ground at the line of junction of premises belonging to different owners or in different occupations. One calendar month before the owner of any piece of vacant ground, or ground not hitherto built upon, shall build any building adjoining to another piece of vacant ground, or ground not hitherto built upon, or build a fence-wall for such piece of ground, he is to give to the owner or occupier of such adjoining vacant ground notice in writing, setting forth his desire to build a party-wall or party fence-wall, and describing the thickness and dimensions of such desired party-wall or party fence-wall, according to the rules laid in the Schedule of Notices, or to the like effect;—and if within such period of one calendar month such adjoining owner shall signify his consent in writing, then the same must be built party on the ground of one of the said owners or occupiers, and partly on the ground of the other, and such rule is herein directed by such other owner or occupier;—but if he do not signify such consent, then it shall be the duty of the building-owner to build an external wall for such building, and fence-wall for such ground, entirely upon his own ground, except as to the footings thereof. s. 38.

Sound party-walls not condemnable.—Rebuilding of. If the owner of one of the adjoining buildings desire to rebuild a sound party-wall, then, on giving to the adjoining-owner the required notice of 3 calendar months, according to the form (No. 14) in the Schedule of Notices, or to the like effect, such building-owner may pull down the wall of the party-wall, but upon condition that he reinstale and make good all the internal finishings and decorations of the adjoining premises, and pay all the costs and charges thereof, and also all the expenses incidental to the execution of the work, including therein the fees and expenses of the surveyor, and the fees of any services required by the official referees, and also such reasonable compensation as to the said official referees may seem proper for any loss which the adjoining-owner shall have incurred by reason of such work. s. 26.

Reference to official referees. If while a sound party-wall (against which an external wall shall have been built, and which shall have been suffered to remain) continues sound, the adjoining building be pulled down or rebuilt, and such party-wall be pulled down, then the owner of such adjoining building shall not be entitled to more than his just proportion of the materials of the ground on which such party-wall was built, nor shall he build on more than his just proportion of the said ground, unless he shall have agreed with and satisfied the owner of the building so previously rebuilt for his half thereof;—and if the said owners cannot agree concerning the division of such materials, or of such ground, or

of the building thereon, or concerning the reimbursement of the party first rebuilding as aforesaid, then the price and all matters in difference, including the sale and purchase of the ground in question, shall be settled by a reference to the official referees, whose award shall be final. s. 30.

Site of party-walls. If buildings be of equal rate, a party-wall must be built on the line of junction of such buildings, one-half on the ground of the owner of one, and one-half on the ground of the owner of the other of such buildings. If such buildings be of different rates, then such wall must be built on the line of junction thereof, to the extent of only one-half of the thickness of a wall required for the building of the lower rate on the ground of such minor building. And if such building of the lower rate be thereafter enlarged or altered so as to become a building of a bigger rate, then the owner of such first-mentioned building of the higher rate for the time being shall be entitled to receive from the owner of such building of the lower rate such sum of money as shall be a sufficient compensation for the ground occupied by that portion of the party-wall, which according to the rate of the building enlarged ought to have been built by its owner on his own ground, as well as the value of so much of the wall itself as may be more than the portion of such building of the lower rate had already paid for. Schedule D, Part 11.

Construction and materials of party-walls. Every party wall must be built of sound bricks, or of stone, or of such bricks and stone together, laid in and with mortar and cement in such manner as to produce solid work. And the bearing ends of wooden beams, breast-summers, girders, trimming-joists, the ends of partition heads and sills, the bearing ends of the main timbers of a roof, and wood-bricks, may be laid into the substance of a party-wall, but not within 4 in. of the centre of any party-wall; and no other wood-work of any kind must be laid into, placed upon, or be run or driven into any part of the substance of any party-wall. But if the ends of timbers be carried on iron shoes or stone corbels, then such iron shoes or stone corbels must be built into the wall at least one-half of the thickness of such wall. And the top of every such party-wall must be finished with one course of sound stock-bricks, set on edge with good cement, or by a coping of any other properly secured and sufficient waterproof and fireproof covering. Schedule D, Part 11.

Height of party-walls above roof. If a party-wall adjoin to any roof, it must be carried up and remain 15 ins. at least above the part where the party-wall and roof adjoin, measured at a right angle with the back of the rafters of such roof. And if any party-wall in any building of the 1st class adjoin a gutter, it must be carried up, and remain 2 ft. at least above the highest part thereof. And if any party-wall in any building of the 2nd class adjoin a gutter, it must be carried up, and remain 3 ft. at least above the highest part thereof. If there be fixed within 5 ft. of a party-wall upon the flat or roof of the building, any turret, dormer, lantern-light, or other erection of combustible materials, then every such party-wall must be carried up next to every such turret, dormer, lantern-light, or other erection, and must extend 18 ins. higher and 18 ins. wider than such erection on each side thereof. Schedule D, Part 11.

Party-walls for dividing buildings. Every wall to divide any building into two or more distinct parts, must be built as a party-wall, in the manner and with the materials, and of the several heights and thicknesses for party-walls of the highest rate of building to which such party-wall shall belong or adjoin, as prescribed in reference to the thicknesses of party-walls in Schedule C. And if any building already built, or which shall be hereafter built, be converted, used, or occupied as two or more separate buildings, each having a separate entrance and staircase, then every such building shall be deemed to be two or more separate houses, and such separate houses shall be divided from each other by a party-wall or party-arch or arches, built in the manner and with the materials required for party-walls or party-arches for the class and rate to which the largest of the buildings so divided shall belong. Schedule D, Part 11.

Party-walls, if raised at the expense of one party, to be paid for by the adjoining party if afterwards used by him. s. 31.

Party-wall, party fence-wall not to be used as, unless of stated dimensions. s. 32.

Party-wall, 2 days' notice to be given to the district-surveyor before begun to be built, pulled down, rebuilt, cut into, altered, or any opening be made therein. s. 13. See *Penalty*.

Party-walls, costs of. See *Expenses of works*.

PASSAGES, public, of 3rd class building, floors of, must be fire-proof, schedule C, Part 1.

PEACE-OFFICER, district-surveyors and official referees accompanied by, may enter premises where they are refused admittance. See *Enter on premises*.

PENALTY, 5s. per day, district-surveyors liable to, for acting before making declaration of official fidelity. s. 71.

Penalty, Not exceeding 20s. for commencement (or re-commencement after 3 months' delay), or after a change of the builder, will fees 2 days' notice, and in the first case only 10s. if fees to the district-surveyor, except in cases of emergency, wherein the notice is to be given to the district-surveyor within 48 hours after the commencement of the work. s. 13.

Penalty not exceeding 20l. for refusing or neglecting to admit and assist district-surveyor and official referees. See *Enter on premises*.

Penalty not exceeding 5l. per day, and expenses, to be paid by occupiers, or by owners of various buildings, if roofs, chimneys, and projections from front walls be not begun to be secured within 36 hours after notice from district-surveyors. See *Chimneys, ruinous*.

**PENALTIES** for use of 1st rate buildings of the 2nd class, and of buildings of the 3rd class. Until certificate shall have been made by the official referees of their approval, or until 14 days after survey by them shall have elapsed without their having given notice in writing that they are not satisfied, it shall not be lawful to use any such building for any purpose whatever, without the express authority of the official referees under their bands and the seal of office of the Registrar of Metropolitan Buildings;—and if before the certificate of satisfaction shall have been made, or if such further 14 days shall have elapsed without due notice being given in writing, any building subject to special supervision shall be used for any purpose without such express authority in writing, then, on conviction thereof before two justices of the peace, the occupier of such building, or other the person by whom such building shall be so used, shall forfeit for such offence a sum not exceeding 200l. for every day during which such building shall be so used without having obtained such certificate of satisfaction, or such express authority as aforesaid; and in determining the amount of any such penalty, the justices are to have regard to the size and character of building, and to the nature and extent of danger involved in the use of such building, and to the amount of profit which might be derived from such use thereof. s. 15.

**Penalties, or forfeiture.** Any party may sue or proceed for the same; and if not otherwise specifically appropriated, the person so suing or proceeding is entitled to receive one-half thereof for his own benefit, and the other half shall be applied to her Majesty's use, and shall be paid to the sheriff of the county, city, or town where the same shall have been imposed; and all convictions before justices shall be returned to the Court of Quarter Sessions, under the provisions of Act. 3 Geo. 4, c. 46, for the more speedy Return and levying of Fines, Penalties, and Forfeitures, and Recognizances estimated, and shall be paid to the sheriff of the county, city, or town, and shall be duly accounted for by him. s. 107.

Penalty not exceeding 50s. to be paid by any workman, labourer, servant, or other person employed in any building, or in the alteration, fitting up, or decoration of any building, who wilfully, without the direction, privity, or consent of the person causing such work to be done, shall do any thing in or about such building contrary to the rules and directions of this Act, upon conviction thereof before any two justices of the peace, upon the oath of one or more credible witness or witnesses; and if upon or immediately after such conviction any such forfeiture be not paid, then it shall be the duty of any two justices of the peace to whom application shall be made to commit the offenders, by warrant under the hand and seal of such justices, to the common goal for any term not exceeding one calendar month, at the discretion of such justices. s. 19.

**PIERS**, how affecting thicknesses of external walls. See *Inclosing walls*.

**PIPES** of metal, or any other pipe or funnel for conveying smoke, heated air, or steam, must not be fixed against or in front of any face of any building in any street or alley, nor on the inside of any building nearer to any timber or other combustible material than 14 ins. Schedule F.

**PLACE**, for meaning of, see *Street*.

**PLATFORM**. See *Floor*.

**PLURALITY**. See *Singular number*.

**POLICE** magistrate. See *Accords, recovery of money under*.

**POPULAR** parish included within the operation of the Act. s. 3.

**PORTICOES**. See *Projections, external*.

**PREJUDICED**, no other person to be, through disqualification of official referee, or registrar. s. 95.

**PRISONS**, and places of confinement under inspection of Inspectors of Prisons, are under special supervision. Schedule B, Part I.

**PRIVY**, if built in the yard or area of any building, or under any street or alley, must have a door, and be otherwise properly inclosed, screened, and fenced from public view. Schedule 11.

**PROFITS** or rents, of ground and tenements, persons in the receipt of, taken within the meaning of the Act to be owners. s. 2.

**PROJECTED** buildings beyond the general line of buildings and from other external walls. Bow windows or other projections of any kind, from buildings already built or hereafter to be rebuilt, must neither be built with nor be added to any building on any face of an external wall thereof, so as to extend beyond the general line of the fronts of the houses (which general line may be determined by the surveyor) (except so far as is herein provided with regard to porticoes projected over public ways, and with regard to projections from face-walls and shop-fronts), nor so as to overhang the ground belonging to any other owner, nor so as to obstruct the light and air or be otherwise injurious to the

owners or occupiers of the buildings adjoining thereto on any side thereof. Schedule E. s. 5.

**PROJECTIONS** in danger, the district-surveyor to inspect at all times when needful, and to take the measures necessary thereupon. s. 68. District surveyor's fee for the inspection and removal of projections, 10s.

**PROJECTIONS, external, rules concerning.** Porticoes projected over public ways. The portico or porticoes of any church, chapel, theatre, or other public building of the 3rd class: If the building of the same shall have been previously sanctioned by the official referees, by writing under their bands, and if objection be not made by any party interested within one calendar month thereafter, and if upon such objection or appeal, her Majesty's principal Secretary of State acting for the Home Department do not decide in favour thereof, then such projections may be built over the foot pavement of any street or alley which shall be 50 ft. wide at the least. Schedule E. s. 5.

**Projections from face walls of buildings hereafter to be built or rebuilt.** Copings, parapets, cornices to overhang roofs, blocking courses, cornices, piers, columns, pilasters, entablatures, facias, door and window dressings, or other architectural decorations, forming part of an external wall, may project beyond the general line of fronts in any street or alley, but must be of the same materials as are by this Act directed to be used for building the external walls to which such projections belong, or of such other proper and sufficient materials as the official referees may approve in writing. And all balconies, verandahs, porches, porticoes, shop-fronts, open inclosures of open areas and steps, and water-pipes, and all other projections from external walls not forming part thereof (except such part of shop-fronts, and the frames and sashes of the windows and doors, in reference to the necessary wood-work thereof), may stand beyond the general line of fronts in any street or alley, but they must be built of brick, tile, stone, artificial stone, slate, cement, or metal, or other proper and sufficient fire-proof materials; and they must be so built as not to overhang the ground belonging to any other owner, and so as to obstruct the light and air or be otherwise injurious to the owners or occupiers of the buildings adjoining thereto on any side thereof. Schedule E. s. 5.

**Projections from front walls in danger of falling.** See *Chimneys, ruinous*.

**Projections from walls of buildings over public ways.** The walls of all buildings hereafter to be built or rebuilt must be set back so that all projections therefrom, and also all steps, cellar-doors, and area-inclosures, shall only overhang or occupy the ground of the owner of any such building, without overhanging or encroaching upon any public way. Schedule E. s. 5.

**Projections from insulated buildings.** If such projections be at least 8 ft. from any public way, and at least 20 ft. from any other building not in the same occupation, they are excepted from the rules and directions of this Act. Schedule E. s. 5.

**PROPER**, questions relative to the meaning of the term, the official referees are to decide, being thereto required in writing. s. 82.

**PROPERTY**, sole, in party-structures (with that of the soil whereon they stand), vests in persons at whose expense they are performed till due contributions be made of their expense and of the fees of the district-surveyors and official-referees. s. 46.

**PROSECUTIONS** for preventing neglect or evasion of this Act.—Notice of action. At any time within 3 calendar months after penalty or forfeiture by any default in complying with the provisions of this Act, shall have been incurred, any surveyor appointed or confirmed by virtue of this Act, and all other persons, may commence and prosecute proceedings for the recovery thereof, or for the recovery of the expenses of pulling down or altering of any building, against any owner, occupier, builder, workman, or other person, or for any default made in complying with the provisions of this Act: But if such proceedings be taken by any person except one of the surveyors, or except the official referees, then 7 days' notice of the intention to commence such proceedings must be given at the office of the surveyor of the district, and at the office of the Registrar of Metropolitan Buildings. s. 110.

**PROVISIONS** of Act, modification of, in cases of rebuilding upon old sites. See *Commissioners of Works and Buildings*.

**PUBLIC** buildings. See *Third class*.

**Public way, buildings over the part thereof which extends over such way, if rebuilt,** must be separated from such public way, either by a floor or arch formed of brick or stone, or of other incombustible materials, subject to the consent of the official referees, or by a floor formed of iron girders and brick arches or stone landings, or by an arch formed of brick or of stone, which arch, if the span thereof do not exceed 9 feet, must be of the thickness of 9 inches at least, and if the span exceed 9 feet, 13 in. at least; and such floor or arch, with its abutments, must be built in such manner as shall be approved of by the surveyor; but there must not be formed over any public way a ceiling of lath and plaster, or of lath and cement. Schedule D, Part V. District-surveyor's fee for inspecting arch or stone floor over public way, 10s.; not chargeable where the ordinary fees for building, or addition or alteration, are paid.

**Public way, water from roofs, flats, gutters, projections, balconies or verandahs, not to drop upon.** Schedule C.

Q.

**QUARTER** Sessions, general. See *Appeal from convictions for penalties*, for proceedings before.

**QUAY-WALLS** are under special supervision. Schedule B, Part I.

R.

**RAILWAYS**, buildings of, exempt from supervision. Schedule B, Part II.

**RAISING** of buildings, hereafter built, lawful, provided the party and external walls and chimneys thereof, when so raised, be of the prescribed materials of and the several heights and thicknesses of the rate such buildings shall be of when so raised;—and buildings already built, although the walls thereof be not of the thicknesses prescribed by this Act, if, in the opinion of the district-surveyor, such walls be sufficiently secure to allow of the raising thereof, it shall be lawful to raise any such building already built to any additional height not exceeding 10 FEET;—and if any building be raised, the owner thereof shall build up, at his own expense, the party-walls between his own and any adjoining building, and all flues and chimney-stacks belonging thereto;—and if at any time the owner of an adjoining building make use of any portion of the part raised of such party-wall by building against it, or otherwise, the owner of the premises so first raised may claim and recover the cost of a proportionate part of the portion which shall be so used, together with the cost of such parts of the chimney-stacks as belong thereto. s. 31.

**RATES** of buildings of the 1st or dwelling-house class to be ascertained by area of plan, and by altitude, and by number of stories: of 2nd or warehouse class by altitude only. See *Area of buildings, Heights of buildings, Stories, number of*; also the several rates, 1st, extra 1st, 2nd, 3rd, 4th.

**RATES AND CLASSES** of buildings to be, in cases of doubt, difference, or dissatisfaction, determined by the official referees. s. 5.

**Rates or classes, buildings not within.** See *Classes or rates*.

**REBUILDING**, materials to be used in. If any external wall or inclosure be at any time hereafter taken down or otherwise demolished for the height of one story, or for a space equal to one-fourth of the whole surface of such external wall, every part thereof not built in the manner and of the several materials by this Act directed for external walls must be taken down, and rebuilt in such manner, and of such materials, and in all respects as by this Act directed for external walls hereafter to be built, according to the class and rate of the building to which such external wall or inclosure shall belong. Schedule D, Part II.

**RECEIPT**, signed with the Christian and surname of district-surveyor, fees to be paid by builder or owner upon tendering of. s. 77.

**RECEIVER** for any owner of houses within the limits of the Act, disqualified from being official referee or registrar. s. 95.

**RECESSES**, how affecting thicknesses of external walls. See *Inclosing walls*. May be left in certain cases in walls, for which see *Chases and recesses*.

**RECOGNIZANCE**. See *Appeal from conviction for penalties*.

**RECOMMENCEMENT** of work after 3 calendar months' suspension, notice of must be given by the builder to the district-surveyor in the form Nos. 2 and 3, under penalty not exceeding 20l. s. 13. See *Builder, for default of the term*.

**REFUSAL** to admit the district-surveyor or official referees to inspect premises renders the work liable to be abated as a nuisance. s. 13.

**REGISTER** (The registrar is to), all notices to the official referees, and all matters which come under their cognizance.

**REGISTERED**, rules prescribed by the examiners for examination of candidates for the office of district-surveyor, and granting them certificates, to be, by the Registrar of Metropolitan Buildings, after being approved of by the Commissioners of Woods and Works. s. 66.

**REGISTRAR OF METROPOLITAN BUILDINGS**.—Appointment.—Tenure of office.—Rules.—Seal.—Report of objections.—Authority of Commissioners of Works.—Interim registrar. For the purpose of duly recording relaxations of the requisitions of this Act, made in pursuance of the provisions hereof, and of providing for the revision from time to time both of such relaxations and requisitions, and of providing against the partial exercise of the powers of this Act, and for the more effectually providing for the due recording of the Acts of the official referees, and for exercising a due control thereon, the Commissioners of Works and Buildings shall appoint a Registrar of Metropolitan Buildings to hold his office during their pleasure;—and subject to the provisions of this Act, the said commissioners shall make rules for regulating the execution of the duties of the office of the said registrar;—and such registrar shall keep a seal, and affix such seal to all documents made by the said official referees, and required to be sealed, and shall keep all the documents and records relating to the business of their office, and register the same: but if it appear to such registrar that any such documents are contrary to law, or not complete in any of the requisite forms, or are beyond the competence of the said official referees, either with regard to the provisions of this Act, or any rules or regulations prescribed for their guidance by the said Commissioners of Works and Buildings, the said registrar is to refuse to affix the seal, and thereafter, if the

said official referees shall so require, it shall be his duty and he is hereby required to report to the said commissioners the matter, and the particular grounds and reasons for his refusal; and upon the receipt of such report it shall be lawful for the said commissioners to authorize the said registrar to affix the seal, or to confirm his refusal—if such registrar be ill, or otherwise unable to discharge the duties of his office, or if he be absent, the said Commissioners may appoint some other person to act temporarily in his behalf, and assign to such person such part of the remuneration of the said registrar, or otherwise remunerate him, as the Lords of the Treasury shall appoint in that behalf. s. 89.

**Declaration of official fidelity.** Before any registrar shall act in pursuance of his appointment, he is to make a declaration of official fidelity, to be administered by the Chief Baron, or any other of the barons of her Majesty's Court of Exchequer. For form, see s. 90.

**Custody and inspection of records—Copies of awards, certificates &c. to be given therefor.** Awards, certificates, and other documents relating to the business of the official referees shall be kept in the office of the Registrar of Metropolitan Buildings;—and for the purpose of evidence or otherwise, any party may, on payment of the expense thereof, and of such fees as may be prescribed in that behalf demand from the registrar an inspection thereof, or a copy thereof or extract therefrom; and on such payment and demand such registrar shall give, under his hand and seal of office, a copy of any such award or any other document to the person so demanding the same. s. 91.

**Official referees.** The Commissioners of Works and Buildings to appoint, in some central and convenient situation within the city of London or the city of Westminster, an office for carrying on the business of the Registrar of Metropolitan Buildings, and registering all documents relating to such business; and in such office such registrar shall keep a register of all matters referred to the official referees, and of all matters which shall come under their cognizance in pursuance of this Act; and also keep and preserve all documents connected with the duties of official referees; and also receive all notices requiring any act to be done by them; and file and number them in the order in which they are received. s. 92.

**Registration of awards, &c.** All the awards and certificates, and all documents relating to the business of the official referees shall be registered, not only chronologically in the order in which they are received, but according to the subject-matter thereof, and also according to the order in which they are received, and in relation to the provisions of this Act. s. 93.

**Remuneration of official referees and registrar.** Her Majesty to grant to each official referee and to the registrar a salary not exceeding £1,000, by the year, in four equal quarterly payments; and if any such official referee or registrar shall be appointed, or shall die, resign, or be removed from office, in the interval between two quarterly payments, then he shall be entitled to a proportionate part of the salary for the period of the interval during which he shall hold such appointment. s. 94.

**Disqualification of official referees and registrar.** If any person shall become commissioner, receiver, steward, or agent for or on behalf of any houses within the limits of this Act, then such person shall not be eligible to the office either of official referee or of registrar under this Act; and if after having been appointed thereto he shall become such commissioner, receiver, steward, or agent, he shall cease to be qualified to hold such office of official referee or registrar, and thereupon such office shall be vacant, without prejudice, nevertheless, to any acts done by any such person in his capacity of official referee or registrar, so far as other persons are affected thereby. s. 95.

**Funds for defraying expenses of the official referees and registrar.** The lord mayor and aldermen of the city of London to direct the chamberlain of the said city, and the justices of the peace for the several counties of Middlesex, Surrey, and Kent, to direct their treasurers to pay, by two half-yearly payments in the months of June and December, to the cashier of the office of the Commissioners of Works and Buildings, an account of the said official referees and of the said registrar, by way of contribution to such salaries, viz. :—

The city of London and the Liberties and the suburbs } the sum of	£ 100
Thereof	80
The county of Middlesex	1,000
The county of Surrey	80
The county of Kent	320
	1,500

And the said justices are to levy the same by a rate upon the several parishes and places within the limits of this Act, in such amounts as to such justices may seem proper, having regard to the assessed value of the inhabited houses and the buildings in such places respectively, in addition to the county rate in respect thereof; and for the purpose of levying such sums they shall be deemed to be part of the county rate, and leviable by all the ways and means by which a county rate is leviable, subject in all respects to the legal incidents of a county rate. s. 96.

**Payments of official referees and registrar.** The balance of the salaries to the official referees and registrar shall be paid out of the consolidated fund of the United Kingdom of Great Britain and Ireland. s. 97.

**Fees of office—List to be hung up in registrar's office.** The Commissioners of the Treasury shall appoint such fees to be paid in respect of the services to be performed by the official referees or by the registrar as shall be deemed requisite to defray the expenses of the said office, or incident to such services, and the salaries or other remuneration of any persons employed under the registrar in the execution of this Act, with the sanction of the Commissioners of the Treasury, and which are not otherwise provided for by this Act; and the balance, if any, shall be carried to the consolidated fund of the United Kingdom, and be paid accordingly into the receipt of her Majesty's Exchequer at Westminster; and it shall be lawful for the Commissioners of the Treasury to regulate the manner in which such fees are to be received, and in which they are to be accounted for, and in which they are to be accounted for; and the registrar shall cause a list of the fees so appointed to be fixed up in some conspicuous part of his office. s. 98.

Registrar of Metropolitan Buildings may consent to one official referee acting, except in any case in which the Act provides otherwise. s. 88.

Registrar of Metropolitan Buildings, each district surveyor is, immediately upon his appointment, and from time to time, upon every change of his residence or of his place of business, or oftener if required, to make a return to, and to the overseers of the poor of every parish or place within his district, of his name and place of abode, and the place where he shall be. s. 72.

Registrar of Metropolitan Buildings to register rules prescribed by the examiners for the examination of candidates, and for granting them certificates for the office of district-surveyor, after they are appointed by the Commissioners of Woods and Works. s. 66.

REGISTRAR'S office to be in some central or convenient situation within the city of London or the city of Westminster, and all awards, certificates, or other documents of the official referees are to be kept therein. s. 91, 92.

REINSTATEMENT, parties who rebuild a sound party-wall not condemnabie are to make, of all the internal finishings and decorations of the adjoining building. s. 20.

REMOVAL of orders, &c. into superior courts—Certiorari. Any person may remove by certiorari, or any other writ or process whatsoever, into any of her Majesty's Courts of Record at Westminster, any order which shall be made by virtue of or under this Act, and any other proceeding to be had touching the conviction of any offender against this Act (except proceedings touching the conviction of any person offending for carrying on a trade or business offensive, noxious, or dangerous, contrary to this Act, other than those herein-before specified), and every such order and other proceeding is hereby declared not to be so removable. s. 104.

RENTS or profits of ground and tenements, persons in the receipt of, taken within the meaning of the Act to be owners. s. 2.

REPAIR, COVENANTS to. See *Chimneys, ruinous*.

REPAIRS, materials used in old external walls or in the external walls of any building, or ready built (except the inclosure of roofs, and the flats, gutters, dormers, turrets, lantern-lights, and other erections thereon), may be at all times of the same sort as those of which such external wall or inclosure has been already built. Schedule D, Part II.

REPAIRS, materials used in old external walls or in the external walls of any building, or ready built (except the inclosure of roofs, and the flats, gutters, dormers, turrets, lantern-lights, and other erections thereon), may be at all times of the same sort as those of which such external wall or inclosure has been already built. Schedule D, Part II.

REPEAL of Acts, and Schedule A.

RETAINING-WALLS are under special supervision. Schedule B, Part I.

REVEALS. See *External walls*.

ROAD, for meaning of, see *Street*.

ROADWAY must be made to admit of a scavenger's cart of the ordinary width to one of the fronts of every building of the first class, or to the inclosure about it. Schedule K.

ROOF-COVERINGS. The external parts of any roof, flat, or gutter of any building, or of any projection therefrom, and of any turret, dormer, lantern-light, and other erection on the roof or flat of any building hereafter built or rebuilt, stripped, ripped, or uncovered (except the door-frames and shop-doors, window-frames and sashes of such turrets, dormers, lantern-lights, or other erections), must be covered with slates, tiles, metal, glass, artificial stone, or cement (and such excepted parts may be made of such wood as shall be necessary), and be the same and any projection therefrom, and also the balconies, verandahs, and shop-doors, must be arranged and constructed, and so supplied with gutters and pipes, as to prevent the water therefrom dropping on to or running over any public way. Schedule G.

Roof, one month after covered in, walls built to full height and principal timbers fixed, and 14 days after completion of addition, alteration, or repair, and 14 days after performance of special services, the district-surveyor's fees become due from builder or owner, and payable on the tender of a receipt signed with the Christian and surname of surveyor. s. 77.

ROOFS, RUINOUS. See *Chimneys, ruinous*.

ROOMS or CELLARS not constructed according to Schedule K, not to be let separately or to be occupied as dwellings after 1st July, 1948.

Rooms in all attics and each other used or intended to be used as a separate dwelling must be

of at least the height of 7 feet from the floor to the ceiling. Schedule K.

ROW, for meaning of, see *Street*.

ROYAL Exchange is under special supervision. Schedule B, Part I.

RUINOUS buildings and projections in danger, the district-surveyor to inspect at all times when needful, and to take the measures necessary thereupon. s. 68.

RUINOUS BUILDINGS.—

**Application to official referees—Survey—Notice to lord mayor, &c. and to overseers—Hearing, hearing—Notice to parties—Repair—Appeal against survey—Demolition.** Upon receiving information of any building being in a ruinous and dangerous condition, the district-surveyor and the overseers for the time being of the parish or place in which the same shall be, shall apply forthwith to the official referees, and authorize a survey to be made thereof,—and thereupon the official referee shall direct the district-surveyor to make such survey;—and thereupon such surveyor shall act in all respects as in the case of a survey of party-walls;—and upon the receipt of the certificate of the surveyor, the official referees shall cause a copy thereof to be transmitted if the premises be within the city of London, then to the Court of Lord Mayor and Aldermen, and if they be elsewhere, then to the overseers of the poor of the parish or place in which such premises shall be,—and thereupon such mayor and court of aldermen, and overseers of the poor, with all convenient speed any such ruinous building to be securely shored, or a proper and sufficient hoard to be put up for the safety of all passers, and to cause notice in writing to be given to the owner of such building to repair or pull down the same or any part thereof, as the case may require, within 14 days then ensuing;—and if within the said 14 days the repair or demolition thereof be not begun, and be not completed as soon as the nature of the case will admit, then, on a declaration being made before the said lord mayor or a justice of the peace of such notice having been so given, the said lord mayor and court of aldermen, or of the cash in the chamber of London, and every such overseer of the poor out of the money in his hands, shall, with all convenient speed, order and cause such building, or such part thereof so certified to be in a ruinous and dangerous condition as shall be necessary for the safety of the passengers, to be repaired or pulled down, or secured in such manner as shall from time to time be requisite;—but if such lord mayor and aldermen, or such overseers, appeal against such certificate, the official referees shall proceed to survey, to certify, and to award in all respects as in the case of an appeal from the certificate of the surveyor with reference to party-walls or inter-mediate buildings; and if such official referees certify that the said premises are ruinous and dangerous, the said lord mayor or the said overseers shall repair or pull down such building. s. 40.

**Disposal of materials to pay costs—Payment of money on demand—If no demand—City of London or overseers to refund within six years.** Lord mayor and court of aldermen, or the overseers, may sell and dispose of such of the materials as they shall judge necessary, and out of the moneys arising from the sale thereof reimburse to themselves, the surveyors and other referees, and every person by them respectively employed for the purposes aforesaid, all the charges of the survey and appeal, and of putting up every such hoard, and of repairing, pulling down, and securing such premises, and of making good the pavement, and of selling the said materials as aforesaid, or so much thereof as the moneys arising by such sale will extend to;—and if there be any surplus, after payment of all expenses, then, upon demand thereof made by such owner, it shall be the duty of the lord mayor, or of the overseers, to account for and pay such surplus of the moneys arising by such sale to the owner of such building;—or if there be any question as to the person entitled to such surplus, or as to the priority of title to such sum of such persons so entitled, or as to the proportions to which such persons are so entitled, then it shall be lawful either for the lord mayor or the overseers, or for any person claiming to be so entitled, to refer the matter to the determination of the official referees, and their decision shall be final;—and if no such demand be made, then such surplus shall, as regards places within the city of London and the liberties thereof, be paid to the chamberlain of the city, and as regards all other places such surplus shall be paid to the overseers, and added to the moneys raised as rates for the relief of the poor of the parish or place, and accounted for accordingly;—but at any time within 6 years from the deposit of such surplus, any such owner, his executors or administrators, may claim, and he and they are entitled to recover such surplus;—and the said lord mayor and aldermen of the city of London, as regards the said city and liberties thereof, are hereby required to pay such surplus out of the cash in the chamber of London; and every overseer, as regards places not within the said city or the liberties thereof, is hereby required to pay such surplus out of the moneys raised or to be raised by any rate for the relief of the poor. s. 41.

Deficiency to be paid by the owner; or occupier to pay and deduct from rent—Payment of money to

**Chamberlain or to the overseers.** If the moneys arising from such sale be insufficient to repay all such expenses, then from time to time such deficiency shall be paid by the owner of every such building, being the person entitled to the immediate possession thereof, if known; and if, on demand thereof, such owner fail to pay such deficiency, then it shall be lawful for the lord mayor for the time being, if such ruinous building in question be within the city of London or the liberties thereof, or if elsewhere, for two or more justices of the peace, to levy the amount thereof by warrant under their hands and seals, by distress and sale of the goods and chattels of such owner, if any such can be found; and if no such owner can be met with, or, being met with, shall not on demand pay the said deficiency, and no sufficient distress of the goods and chattels of such owner can be found, then it shall be lawful for the person who shall at any time thereafter occupy any such building, or the ground where the same stood, and he is hereby authorized and required, to pay and defunct the same out of the rent thereof; and if he neglect or refuse to pay such deficiency, then the lord mayor, or two or more such justices of the peace, shall cause the same to be levied by distress and sale of the goods and chattels of any occupier of the premises, together with the costs of every such distress and sale;—and if the premises be situate within the city of London and its liberties, it shall be the duty of the person by whom the same shall be received, and he is hereby required, to pay the amount to the chamberlain, to be by him from time to time placed to the credit of the cash of the said city of London; and if the premises in respect of which such money shall be received or recovered be not situate within the said city of London and the liberties thereof, then to pay the amount received to the overseers of the poor for the time being of the parish or place where the premises shall be situate, to be by them placed to the account of the said parish, in aid of the poor-rate of the parish or place. s. 42.

**Ruinous chimney-shafts, pots, or other things thereon, eaves, parapets, copings, slates, tiles, projections from front walls in danger of falling.** See *Chimneys, ruinous.*

**RULES of the Act may be modified by the Commissioners of Works and Buildings after being reported upon by the official referees, either at their own suggestion, or that of any interested party. s. 11.**

**RULES of the Act (except heights and thicknesses of walls) may, after the report of the official referees, in cases of rebuilding upon old sites, be modified by the Commissioners of Works and Buildings. s. 12.**

**RULES prescribed by the examiners for the examination of candidates, and granting them certificates for the office of district surveyor, to be approved of by the Commissioners of Works and Buildings, and to be registered by the Registrar of Metropolitan Buildings. s. 66.**

**S.**  
**SALE of materials of ruinous buildings.** See *Ruinous buildings.*

**SCAVENGER'S cart of the ordinary width, every building of the 1st class must have some roadway which will admit such to one of its fronts, or to the inclosure about it. Schedule K.**

**SEAL, the Registrar of Metropolitan Buildings to keep one, and to affix the same to all documents made by the official referees required to be sealed; but if it shall appear to the said registrar that any such documents are contrary to law, or are not complete in any of the requisite forms, or are beyond the competence of the said official referees either with regard to the provisions of this Act, or any rules or regulations prescribed for their guidance by the said Commissioners of Works and Buildings, then it is the duty of the said registrar to refuse to affix the seal,—and thereafter, if the said official referees shall so require, it shall be his duty to report the matter, and the particular grounds and reasons for his refusal, to the said commissioners; and upon the receipt of such report the said commissioners shall authorize the said registrar to affix the seal, or to confirm his refusal. s. 89.**  
**Seal of office of Registrar of Metropolitan Buildings to be attached to official referees' certificates of sufficiency of strength of buildings. Schedule B, Part I. s. 16.**

**SECRETARIES of State, one of the principal, to appoint two architects or surveyors as official referees. s. 80.**  
**Secretaries of State, one of the principal, the appointment of districts and district surveyors by magistrates must have the consent of. ss. 64, 65.**

**SECOND or WAREHOUSE Class.** Buildings built originally as warehouses, storehouses, granaries, breweries, distilleries, manufactories, workshops, or stables, or occupied or intended to be occupied as such, or for a similar purpose. Schedule C, Part I. s. 6. See *Class, alteration of.*

**Capacity of 2nd class buildings; Rates of, determined by altitude only. Schedule C, Part III.**  
**Cubical contents, to be ascertained by measuring according to the rule for ascertaining area, and from the surface of the lowest floor up to the under surface of the roof-covering. Schedule C, Part I.** If any building of this class hereafter built or rebuilt contain more than 200,000 cubic feet, it must be divided by party-walls, so that there be not in any one part of such building more than 200,000 cubic feet without party-walls. Schedule C, Part IV. See *Openings in party-walls.*  
**District-surveyor's fees: A further fee, equal to one-half of the ordinary fees, to be paid in respect of every ad-**

**ditional 200,000 cubic feet, or any portion of 200,000 cubic feet, in any such building.**

**ROOFS, to buildings of the 2nd class (in order to prevent the formation of curved roofs thereto), the plane of the surface of must not incline from the external or party-walls upwards at a greater angle than 40 degrees with the horizon. Schedule C, Part IV.**

**SECOND-RATE, 1st or dwelling-house class (district-surveyor's fee, new building, 3l. 3s.; addition or alterations, 1l. 10s., Schedule L), covering more than 6 squares, and not more than 10 squares; if containing 6 stories; if in height more than 52 feet, and not more than 70 feet;**

**thickness of the external walls must (subject to modification as *Inclining walls of stories*, which article see) be at least 17½ inches from the top of the footing up to the under side of the floor next but one below the topmost floor; and at the least 13 inches from thence up to the top of the wall. Thickness of the party-walls must be at least 17½ inches from the top of the footing up to the under side of the floor next but one below the topmost floor; and at the least 13 inches from thence up to the top of the wall. Schedule C, Part II.**

**Second-rate, 2nd or warehouse class: more than 44 feet, and not more than 66 feet in height (district-surveyor's fee, new building, 3l. 3s.; addition or alteration, 1l. 10s., Schedule L), thickness of the external walls (subject to modification as *Inclining walls of stories*, which article see) must be at least 21½ inches from the top of the footing up to the level of 58 feet below the topmost ceiling; and at the least 17½ inches from thence up to the level of 22 feet below the topmost ceiling; and at the least 13 inches from thence up to the top of the wall. Thickness of the party-walls must be at least 21 inches from the top of the footing up to the level of 58 feet below the topmost ceiling; and at the least 17½ inches from thence up to the level of 22 feet below the topmost ceiling; and at the least 13 inches from thence up to the top of the wall. Schedule C, Part III.**

**SEPARATE dwellings, underground rooms and cellars, used as. See *Lowest rooms.***

**Separate entrances, how affecting division of buildings by party-walls. See *Party-walls for dividing buildings.***

**SEVANTS, workmen, and labourers may be fined, and in default he committed to gaol. See *Penalty.***

**SEWERS: see *Drains.* Commissioners of: see *Drainage of houses, also Buildings, new and old.***

**SHADWELL parish included within the operation of the Act. s. 3.**

**SHERIFF: see *Penalties, recovery of*, relative to his receipt thereof.**

**SHOP-FRONTS. See *Roof-coverings.***

**Shop-fronts, with their cantilavers, shutters, pilasters, and stall boards made of wood, if the street or alley in which any such front is situate be of less width than 30 ft., no part of such shop-front must be higher than 15 ft.; nor must any part, except the cornice project from the face of a wall, whether there be an arca or not, more than 5 in.; nor must the cornice project therefrom more than 13 in. If the street or alley be of greater width than 30 ft., no part of such shop-front, except the cornice, must project from the face of a wall, whether there be an arca or not, more than 10 in.; nor must the cornice project therefrom more than 18 in. And the width of such street or alley must be ascertained by measuring the same, as hereinafter directed with regard to the widths of streets and alleys. And the woodwork of any shop-front must not be fixed nearer than 4½ ins. from the centre line of a party-wall. And if such wood-work, be put up at such distance of 4½ ins., then a pier or corbel built of stone or of brick or other incombustible material, and 4½ ins. wide at the least, must be fixed in the line of the party-wall, so as to be as high as such wood-work, and to project one inch at the least in front of the face thereof. And the height of every shop-front must be ascertained by measuring from the level of the public foot pavement in front of the building. And every sign or notice-board fixed against or upon any part of any house or other building standing close to any public way must be so fixed that the top thereof shall be within 18 ft. at the most above the level of such public way. Schedule E. s. 5.**

**SHORING-UP adjoining buildings, expenses of, recoverable. s. 46.**

**Shoring or boarding, Lord Mayor and Court of Aldermen in the city and liberty of London, and overseers in other places, to cause to be done to ruinous buildings immediately upon receiving from the official referees a copy of the district-surveyor's certificate, or to appeal to the referees for confirmation or annulling thereof. See *Ruinous buildings.***

**SIGN-BOARDS. See *Shop-fronts.***

**SINGULAR number, when used in the Act, to be understood to apply to a plurality of persons and things. s. 2.**

**SITES, questions relative to, official referees are to decide, being thereto required in writing. s. 80.**

**Site of party-wall and party-fence boundary-walls. s. 32. See *Party and party-fence walls.***

**SLATES in danger of falling. See *Chimneys, ruinous.***

**SOILS, questions relative to, official referees are to decide, being thereto required in writing. s. 82.**

**SMOKE-JACKS and SOOT-DOORS. See *Chimney shafts.***

**SOVEREIGN, buildings in possession of, or employed for the use of, are under special supervision. Schedule B, Part I.**

**SPECIAL services, district surveyor's fees for, not exceeding 2l. as the special referees shall, by writing under their hands, order and appoint, with the consent of the Commissioners of Works and Buildings.**

**SOUND, questions relative to the meaning of the term, official referees are to decide, being thereto required in writing. s. 82.**

**SQUARE (public). For meaning of the term, see *Street.* Square (the word) applied to any area or building, contains 100 superficial feet. s. 2.**

**STABLES. See *Second class.***

**STAIRCASES, how affecting division of buildings by party-walls. See *Party-walls for dividing buildings.***

**STAIRS, internal, to buildings of the first class, if of stone or other incombustible substance, they must be set in, or be fixed to, and be wholly upborne by, fire-proof constructions, and must be connected internally by landings, the floors of which are fire-proof, and wholly upborne and supported by fire-proof constructions, and must be connected with the exterior entrance by passages, the floors of which are fire-proof, and wholly upborne and supported by fire-proof constructions. Schedule C, Part VI.**

**Stairs and landings of third-class buildings, floors of, must be fire-proof. Schedule C, Part VI.**

**STAMP duty. Every certificate and every award required to be made or signed by the surveyor or the official referees, exempt from. s. 118.**

**STEAM-ENGINE. See *Chimney shafts.***

**STEWARD, by any owner of houses within the limits of the Act disqualified from being official referee or registrar. s. 95.**

**STOKE-NEWINGTON parish included within the operation of the Act. s. 3.**

**STOPPING of illegal openings in external walls. See *Openings in external walls.***

**STORIES, inclosing walls to. For modification of ordinary rules relative to thicknesses of external walls generally, see *Inclining walls.***

**STORIES, number of, to be counted from the foundation upwards. And if the space in height between the top of the footings and the level of the lowest floor exceed 5 feet, then such space is to be considered the lowest or first story; and in that case the level of the lowest floor is to be considered 9 in. above the top of the footing. Schedule C, Part I. s. 5.**  
**Buildings of the 1st or dwelling-house class are rated by the number of stories as well as by area and altitude. Schedule C, Part II.**

**Story (the word) to include the full thickness of the floor, as well as the space between the upper surface of one floor and the under surface of the floor next above it; or if there be no floor, then the space between the surface of the ground and the under surface of the floor next above. s. 2.**

**STOVE-PIPES. See *Chimney shafts.***

**STRATFORD-LE-BOW parish included within the operation of the Act. s. 3.**

**STREATHAM parish included within the operation of the Act. s. 3.**

**STREET (the word) to include every square, circus, crescent, street, road, place, row, avenue, or place along which carriages can pass or are intended to pass, and that whether there be or he not, in addition to the carriage-way, a footway, paved or otherwise. s. 2.**

**Streets, buildings, and other matters regulated according to this new Act from January 1st, 1845. s. 1.**  
**Streets and alleys made or laid out before 1st January, 1845. See *Already built* (the term).**

**Streets, alleys, and other ways. From the passing of this Act, all the conditions, regulations, and directions contained in Schedule I, shall be duly observed and performed; and if any person offend in respect thereof he shall be liable to all the penalties and forfeitures by this Act imposed in respect of any buildings, either built contrary thereto, or without due notice to the district-surveyor. s. 52. See *Widths.***

**SUFFICIENT, questions relative to the meaning of the term, the official referees are to decide, being thereto required in writing. s. 82.**

**SUMMONS, official referees may issue, to any person able to give evidence. s. 85. See *Evidence.***

**SUNDAY, district-surveyor's office not required to be attended on. s. 72.**

**SUPERIOR COURTS. See *Removal of orders into.***

**SUPERVISION, special, and exemption. Every building or other structure mentioned in Schedule B, Part I., shall be subject to special supervision by the official referees, according to the provisions of this Act in that behalf, and every such building or other structure mentioned in the said Schedule B, Part II., shall be exempt from supervision. s. 7.**

**Supervision, special, of buildings in schedule B, Part I.—Notice of deficiencies—Amendment—Approval by official referees—Notice of completion—New survey certificates—Prohibition of use—Penalty. Buildings comprised in schedule B, Part I. Before the builder begin to build the same, it is the duty of the architect or the builder to give notice to the official referees, and also, at the same time, to transmit for their inspection the plans, elevations, and other drawings made for the same;—and forthwith the official referees are to proceed to ascertain the sufficiency of the intended building to such situation with due regard to the security of the public;—and from time to time during the progress of such building, the official referees are to inspect the same to ascertain the sufficiency thereof;—and if such building or any part thereof appear defective, insufficient, or insecure, then they are to give to such architect or builder notice in writing of such parts as do appear to them;—and upon the receipt of such notice it shall be the duty of the architect or builder to amend and strengthen**

such defective, insufficient, or insecure parts;—and during or within a period of 7 days after notice has been given to the official referees that such works have been amended or strengthened, the official referees are to inspect the same, or in default thereof the said parts may be covered up;—and upon completion of every such building the architect or builder is to give fresh notice to the official referees;—and thereupon, or within 7 days after such notice, the official referees are to survey the same; and if upon such survey it shall appear such building has been built sufficiently strong, then it shall be their duty to certify accordingly, which certificate must be under their hands and the seal of office of the registrar;—and until such certificate shall have been made, or until 14 days after such survey shall have elapsed without the official referees having given notice in writing that they are not satisfied, it shall not be lawful to use such building for any purpose whatever without the express authority in writing of the official referees under their hands and the seal of office of the registrar;—and if before the expiration of such period of 7 days, or if such 14 days have elapsed without due notice in writing, any such building shall be used for any purpose without such express authority in writing, then, on conviction thereof before two justices of the peace, the occupier of such building, or other the person by whom such building shall be so used, shall forfeit for every offence so committed, or for every day during which such building shall be so used without having obtained such certificate of satisfaction or such express authority; and, in determining the amount of any such penalty, the justices are to have regard to the nature and extent of danger involved in the use of such building, and to the amount of work which might be derived from such use thereof. s. 16.

Supervision, special, buildings, of whatever class, placed under: bridges, embankment-walls, retaining walls, and wharf or quay walls; and her Majesty's royal palaces, and any building being in the possession of her Majesty, her heirs and successors, or employed for her Majesty's use, or the fortifications thereof, or arsenals, prisons, houses of correction, and places of confinement under the inspection of the inspectors of prisons; Bethlehem Hospital and the house of occupations adjoining; the Mansion House, Guildhall, and Royal Exchange of the city of London; the offices and buildings of the Governor and Company of the Bank of England already erected, and which now form the edifice called "The Bank of England," and any offices and buildings hereafter to be erected for the use of the said governor and company, either on the site of, or in addition to and in connection with, the said edifice; the buildings of the British Museum already erected or to be erected for the like purposes; the erections and buildings authorized by an Act, 9 Geo. 4, for the purposes of a market in Covent Garden; the warehouses of or belonging to the Saint Katharine Dock Company, commonly called the New-street and Outer-street Warehouses, and the Haydon-square Warehouses, purchased by the said company from the East-India Company; and all other buildings erected by the Building-Act (14 Geo. 3), and by this Act repealed, except buildings included in the second part of this schedule. Schedule B (see ss. 5 & 7), Part I.

Supervision, buildings, of whatever class, exempted from: the warehouses of or belonging to the Saint Katharine Dock Company, situated in the ward of Saint Botolph-without-Algate, and in the precinct of Saint Katharine, near the Tower of London, in the county of Middlesex; the warehouses and buildings of or belonging to the London Dock Company, comprehended within the wall of the said company, as set forth in Act 9 Geo. 4; the warehouses and buildings of or belonging to the East and West India Dock Company, established by an Act made in the first year of the reign of her present Majesty; the buildings erected, or to be erected, by the London and Birmingham Railway Company, established and incorporated by Act 3 Wm. 4, within and in connection with the works of their railway, by virtue of the several Acts relating thereto; and the buildings and structures belonging to any other dock or railway authorized to be executed by any Act of Parliament. Schedule B, Part II.

SURETIES. See Appeal from conviction for penalties. SURPLUS from sale of materials of ruinous buildings, in respect of. See Appeal from conviction for penalties. SURVEY, the county of, to contribute by way of rate annually the sum of 320l. towards the expenses of the official referees and registrar. s. 96. SURVEY may be made by one official referee. s. 88. SURVEY of ruinous buildings, official referees to authorize the district-surveyor to make, upon the respective applications of himself and of the overseers, and in case of appeal, by the Mayor and aldermen, or by the overseers, from the district-surveyor's certificate, are themselves to re-survey the premises. s. 40.

SURVEY CERTIFICATE and AWARD, one owner desiring to repair or rebuild any party-structure, may require. s. 25.

SURVEYOR (the word) to apply to all surveyors to be appointed in pursuance of this Act, or whose appointment is confirmed by this Act, and also to all deputy or assistant surveyors to be appointed under this Act. The words "the surveyor," used without addition, to mean the surveyor in whose district the buildings, street, or alley, or other structure or works, shall be surveyed by an assistant surveyor duly acting in his behalf. s. 2. See District-surveyor.

SUSPENSION of buildings for 3 calendar months.

See Re-commendation, and relative to requisite fresh notice, see District-surveyor.

T. TEMPORARY Registrar of Metropolitan Buildings to be appointed by the Commissioners of Works and Buildings (if the registrar be ill or otherwise unable to discharge the duties of office, or be nisent) remunerated out of the registrar's salary, or otherwise, as the Lords of the Treasury shall direct. s. 89.

TENANTS, otherwise than as from year to year, or for less terms, or at will, considered under the Act as owners. s. 2.

TENDER of amendments. See Informalities in distress. Tender of district-surveyor's receipt. See District-surveyor.

TENURE of office. See District-surveyor.

TERMS used in this Act, meaning and construction of. s. 2. See them severally.

THICKNESS of walls and footings to be ascertained by measuring only the thickness or width of which such walls or footings shall have been originally built. Schedule C, Part I.

THIRD or PUBLIC BUILDING Class: Buildings, built originally as churches, chapels, or other places of public worship, colleges, halls, hospitals, theatres, public concert-rooms, public ball-rooms, public lecture-rooms, public exhibition-rooms, or rooms occupied or intended to be occupied as such, or for similar purposes; or otherwise used or intended to be used, either temporarily or permanently, for the assembling of persons in large numbers, whether for public worship, business, instruction, debate, diversion, or resort. Schedule C, Part I. s. 5. See Class, alteration of. Requisites for determining the rate of: If buildings of the 3rd or public building class correspond in form or structure or disposition with dwelling-houses, then the rates thereof are to be determined by the same rules as the rates of the 1st or dwelling house class; and the thicknesses of the external and party walls, and the width of the footings thereof, are to be at least 4 ins. more than required for the external and party-walls, and the footings thereof, of buildings of the same rate of the 1st or dwelling-house class, unless the official referees, on special supervision in each case, shall otherwise appoint: But if they correspond in form or structure or disposition with warehouses, or buildings of the 2nd class, then the rates thereof are to be determined by the same rules as the rates of the 2nd or warehouse class; and the thickness of the external and party-walls, and the width of the footings thereof, are to be at least 4 ins. more than required for the external and party-walls, and the footings thereof, of buildings of the same rates of the 2nd or warehouse class, unless the official referees, on special supervision in each case, shall otherwise appoint:—But if they do not correspond in form and structure, (or in either), with buildings of the 1st or 2nd classes, or any of them, then such buildings are to be subject, as to walls or other construction, to the special approval of the official referees. Schedule C, Part V.

Third, or public building class, buildings of, are (subject to provisions of schedule C) placed under the special supervision of the official referees, as well as of the district-surveyors. s. 6.

THIRD-RATE, 1st or dwelling-house class (district-surveyor's fee, new building, 2l. 10s.; addition or alteration, 1l. 5s.)

covering, [if containing 5] if height more than 4 squares, [if stories,] than 39 feet, and not more than 6 squares, [if stories,] and not more than 52 feet, thickness of the external walls (subject to modification, as including walls of stories, which article see), at least 17½ inches from the top of the footing up to the level of the floor next but two below the topmost floor; and at least 13 inches from thence up to the top of the wall; thickness of the party-walls at least 17½ inches from the top of the footing up to the under side of the floor next but two to the topmost floor; and at least 13 inches from thence up to the under side of the topmost floor; and at least 8½ inches from thence up to the top of the wall. Schedule C, Part III.

Third-rate, 2nd or warehouse class more than 22 feet, and not more than 44 feet high (district-surveyor's fee, new building, 2l. 10s.; addition or alteration, &c. 1l. 5s., Schedule L), thickness of the external walls (subject to modification, as including walls of stories, which article see), at least 17½ inches from the top of the footing up to the level of 25 feet below the topmost ceiling, and at least 13 inches from thence up to the top of the wall; thickness of the party-walls at least 17½ inches from the top of the footing up to the level of 25 feet below the topmost ceiling; and at least 13 inches from thence up to the level of the topmost ceiling; and at least 8½ inches from thence up to top of the wall. Schedule C, Part III.

TILES, in danger of falling, see Chimneys, ruinous.

TOLL-HOUSES and buildings built for the purposes of trade, if situate 15 feet at least from any other building, and not of an area of more than one square and a half, and the height whereof does not exceed 15 feet from the ground to the highest point of the roof, may be inclosed with any material whatsoever; but the roof thereof must be covered as herein directed with regard to roofs, and the chimney and flue (if any) must be built as herein directed with regard to chimneys and flues. Schedule C, Part VII.

TOTTENHAM parish included within the operation of the Act. s. 3.

TOTTENHAM parish included within the operation of the Act. s. 3.

TOWNS-CLERK to receive, one week before election of any district-surveyor for the city of London, the examiner's certificate of candidate's due qualification. s. 66.

TRADE, detached buildings for the purposes of, see Toll-houses.

TRIMMERS-BRICK. See Chimney-stabs.

TREASURY, the Lords of the, may assign temporary Registrar of Metropolitan Buildings remuneration out of the registrar's salary, or otherwise, as they may direct. s. 89.

U. UNDERGROUND rooms let as separate dwellings. See Government rooms.

UNITED parishes. See Parish (the word).

USE OF BUILDINGS:—

Occupation of cellars or rooms unfit for dwellings. From and after the 1st July, 1846, it shall not be lawful to let separately to hire as a dwelling, any such room or cellar not constructed according to the rules specified in the schedule K, nor to occupy or suffer it to be occupied as such, nor to let, hire, occupy, or suffer to be occupied any such room or cellar built underground for any purpose (except for a warehouse or store-room) —and if any person willfully let or suffer to be occupied in manner aforesaid any underground cellar or room, contrary to the provisions of this Act, then, on conviction thereof before two justices of the peace, such person shall be liable to forfeit for every day during which such cellar or room shall be so occupied not exceeding 50l. —and one-half of such penalty shall go to the person who shall sue for the same, and the other half to the poor of the parish in which such cellar or room shall be situate;—and on or before the 1st January, 1845, it shall be the duty of the overseers of the poor, and they are hereby required, to report to the official referees such number and situation of the dwellings within their respective parishes of which any underground room or cellar shall be so occupied, and thereupon the official referees are to direct such notices to be given to the owners and occupiers of such dwellings as shall appear to such official referees to be best calculated to give to such owners or occupiers full knowledge of the existence, nature, and consequences of this enactment;—and the district-surveyors are to give full effect to the directions of such official referees in this behalf. s. 53.

Buildings near dangerous businesses as to fire.—New businesses—Prohibition after 20 years. It shall not be lawful hereafter to erect any building of any class nearer than 60 ft. from any building which shall be in use for the manufacture of gunpowder or of detonating powder, or of matches ignitable by friction or otherwise, or other substances liable to sudden explosion, or of gunpowder or ignition, or of vitriol, or of any pentone, or of naphthol, or of varnish, or of fireworks, or printed table-covers, and any other manufacture dangerous on account of the liability of the materials or substances employed therein to cause sudden fire or explosion;—but if a building already existing within 50 ft. from any such building be hereafter pulled down, burnt, or destroyed by tempest, such building may be rebuilt;—and it shall not be lawful for any person to establish or newly carry on any such business, either in any building or vault or in the open air, at a less distance than 40 ft. from any public way, or than 50 ft. from any other building, or any vacant ground belonging to any other person than his landlord;—and if any such business be now carried on in any situation within such distances, then from the expiration of the period of 20 years after the passing of this Act it shall not be lawful to continue to carry on such business in such situations;—and if any person erect any building in the neighbourhood of any such business contrary to this Act, then, on conviction thereof before two justices, he shall forfeit a sum not exceeding 50l. for every day during which such building shall so remain near to such dangerous business;—or if any person establish anew any such business, or carry on any such business contrary to this Act, then, on conviction thereof before two justices, such person shall be liable to forfeit for every day during which such business shall be so carried on a sum not exceeding 50l. as the said justices shall determine, and it shall be lawful for the justices also to award to the prosecutor such costs as shall be deemed reasonable;—and if the offender either fail or refuse to pay such penalty and costs immediately after such conviction, then they may be levied by distress of the goods and chattels of the person convicted; or if there be no such distress, then such person shall be committed to the common gaol or house of correction for any time not exceeding 6 calendar months, at the discretion of such justices, and that by warrant under the hands and seals of two or more justices of the peace. s. 54.

Buildings near noxious businesses.—New businesses—Prohibition after 30 years. It shall not be lawful hereafter to erect any buildings of the first or dwelling-house class nearer to than 50 ft. from any building which shall be in use for the business of a blood-boiler, bone-boiler, soap-melter, slaughterer of cattle, sheep, or horses, fell-monger, tallow-melter, tripe-boiler, and any other like business offensive or noxious;—but if a building already existing within 50 ft. from any such building be hereafter pulled down, or destroyed by tempest, such building may be rebuilt;—and it shall not be lawful for any person to establish or newly carry on any

such business, either in any building or vault or in the open air, at a less distance than 40ft. from any public way, or than 50 ft. from any other such buildings of the 1st or dwelling-house class;—and if any such business be not carried on in any situation within such distances, then, from the expiration of the period of 30 years from the passing of this Act, it shall cease to be lawful to continue to carry on such business in such situation, save as is hereinafter provided:—and if any person erecting a building in the neighbourhood of any such business contrary to this Act, then, on conviction thereof before two justices, he shall forfeit a sum not exceeding 50l. for every day during which such building shall remain near to any such offensive or noxious business;—or if any person establish anew any such business, or carry on any such business contrary to this Act, then, on conviction thereof before two justices, such person is hereby made liable to forfeit for every day during which such business shall be carried on a sum not exceeding 50l. as the said justices shall determine; and the justices may award to the prosecutor such costs as shall be deemed reasonable:—and if the offender either fail or refuse to pay such penalty and costs immediately after such conviction, then they may be levied by distress of the goods and chattels of the person convicted; or if there be no such distress, then such person shall be committed to the common goal or house of correction for any time not exceeding 6 calendar months, at the discretion of such justices, and that by warrant under the bands and seals of two or more justices of the peace. s. 55.

**Penalty enforceable only at a Special Sessions.—Mitigation of noxiousness of businesses.** Every such penalty herebefore imposed shall be enforceable only at a special sessions of the peace summoned for that purpose, or on an appeal as hereinafter provided, or on a trial as hereinafter provided; and notwithstanding the said term of 30 years shall have expired, if any party charged with carrying on such business shew that in carrying on such business all the means then known to be available for mitigating the effect of such business in any such respect have been adopted, then such justices may receive evidence thereon, and according to such evidence mitigate the penalty, notwithstanding the said period of 30 years shall have expired, if it shall appear to the justices, whether at petty sessions as aforesaid, or on appeal, or on trial by jury, as herein provided, that the party carrying on any such business shall have made due endeavours to carry on the same with a view to mitigate, so far as possible, the effects of such business, then, although he hath not adopted all or the best means available for the purpose, yet justices may suspend the execution of their order or determination, upon condition that within a reasonable time, to be named, the party convicted do adopt such other or better means as to the said justices shall seem fit, or before meeting of said Sessions, and without consulting the prosecutor, to make such order touching the carrying on of such business as shall be by the said Court thought expedient for preventing the nuisance in future. s. 56.

**Mitigation of penalty by superior Courts.**—But if the matter in respect of which, such penalty shall be incurred come before any superior Court it shall be lawful for such Court to exercise such power of mitigating such penalty, or of suspending the execution of any judgment, order, or determination in the matter, or to make such order touching the carrying on of such business, as to the Court shall seem fit in the case. s. 56.

**Conviction and appeal as to certain trades not specified.** If any person be dissatisfied with the decision of such justices with regard to any business offensive, noxious, or dangerous, and to any building erected or continued within any such distance as aforesaid therefrom, and if within 4 days after such decision, notice be given to the party appealed against, by or on behalf of such person, of his intention to appeal, and if he enter into a recognizance, with two sufficient securities, conditioned to try such appeal, and to abide the order of the Court, and to pay to the party appealed against such costs (if any) as shall be awarded against him, then it shall be lawful for such party so dissatisfied to appeal against such conviction to the justices of the peace at their general Quarter Sessions of the peace to be holden within 4 months after such conviction for the place in which such premises shall be situated:—and if the premises be situate within the city of London and liberties thereof, then the appeal must be to the Quarter Sessions thereof; or if the premises be situate in the counties of Middlesex, Kent, or Surrey, or in the city and liberties of Westminster, or in the liberties of her Majesty's Tower of London, then to the Quarter Sessions thereof respectively, as the case shall be:—and if within the above-mentioned period such appellant shall have entered into such recognizance as herein required, and if within one calendar month thereafter he give notice of the grounds of such appeal, then it shall be lawful for such justices, and they are hereby empowered, to proceed to hear and examine on oath into the causes and matters of such appeal, and to determine the same, and to award such costs to be paid by the said parties as they think proper:—and the order, judgment, and determination of the said justices in their respective sessions shall be binding and conclusive upon all parties. s. 57.

**Trial by jury at Quarter Sessions.** If before conviction by two such justices the party complained against desire to have the matter tried by a jury, and enter into a recognizance to try such matter without delay, and to pay all costs of trial if a verdict be found against him, then such matter may be tried at the next practicable Court of Quarter Sessions, or whenever the court shall appoint; and thereupon, or on the application of such party, the said Court of Quarter Sessions shall issue their warrant or precept to the sheriff or other proper officer (as the case may be), requiring him to return a competent number of persons qualified to serve on juries according to the provisions of 6 Geo. 4; and the said Court of Quarter Sessions shall, by precept, from time to time as occasion may require, call before them respectively every person who shall be thought proper or necessary to be examined as a witness before them on oath concerning the premises.

**View of the premises.** And if the Court think fit, they may authorize the jury to view the place in question in such manner as they shall direct, and command the attendance of such jury, and of all such witnesses and parties as shall be necessary or proper;—and the said jury shall inquire and try, and determine by their verdict whether the business in question be offensive or noxious, and whether the party in question has done any act whereby the penalty hereby imposed in respect thereof has been incurred;—and, subject to the power herebefore conferred of mitigating such penalty, or suspending their judgment, order, or determination thereon, or making such order touching the carrying on of the business aforesaid, the said Court of Quarter Sessions shall give judgment according to such verdict, and shall award the penalty hereby imposed by the defendant, and shall and may (if they see fit) award to either of the parties such costs as they may deem reasonable; which verdict, and the judgment, award, order, or determination thereupon, shall be binding and conclusive. s. 58.

**Appeals to Quarter Sessions for Surrey, to Sessions at Southwark; for Kent, to Sessions at Greenwich.** If an appeal be made to the General Quarter Sessions of the peace for the county of Surrey or the county of Kent, the jury (if any) to be impanelled in pursuance of this Act, and all parties required to attend the Quarter Sessions for the said counties, pursuant to such application, shall be impanelled and required to attend at some general or special adjournment of the said Quarter Sessions to be held within weeks before the original sessions:—and if the matter relate to the county of Surrey, such adjournment shall be to some convenient place in the borough of Southwark; and if the matter relate to the county of Kent, such adjournment shall be to some convenient place in the borough of Greenwich:—and such times and places shall be appointed by the justices of the said counties respectively assembled at such original sessions; and from time to time every further meeting of the said sessions, for any thing to be done upon such application, shall be appointed at or within the space of 3 weeks from the last meeting; and from time to time the justices of the peace for the said counties of Surrey and Kent respectively, shall make such adjournment and hold such sessions as there shall be occasion. s. 59.

**Common law and statutory remedies not affected.** This Act shall not be deemed to authorize any person to carry on any such business either within such limits or otherwise, or any business which it is unlawful to carry on within any limits or in any manner contrary to any public, local, or private Act of Parliament, or otherwise contrary to law; nor to affect, abridge, or restrain the right, the duty, or the power of any person, whether private person or public officer, to prosecute, either civilly or criminally, any person who shall carry on within the limits of this Act any offensive, noxious, or dangerous business. s. 60.

**Regulation or removal, by purchase, of trades deemed nuisances.** If two-thirds in number of the inhabitant householders of any parish in which any offensive, noxious, or dangerous business shall be carried on, present a memorial to her Majesty's Council, stating the existence of such offensive, noxious, or dangerous business in such parish or the neighbourhood thereof, and praying the removal of such business therefrom, and thereby engaging to provide compensation to the persons carrying on the same, either at the expense of the memorialists, or by means of a rate to be levied on the inhabitants of the said parish, or such part thereof as may be affected by such business, it shall be lawful for her Majesty to refer the matter to the Lords of the Committee of Privy Council for Trade to consider the character of such business, whether it be offensive, noxious, or dangerous; and if it appear to be so, and that there are no means of rendering it otherwise by the adoption of methods available, without unreasonable sacrifice on the part of the person by whom it is carried on, then it shall be lawful for her Majesty, by order in Council, to direct that the removal of such business may be purchased, either at the expense of the memorialists or by means of a rate as aforesaid, as to her Majesty shall seem fit, and also to direct the sheriff of the county or other proper person in the parish or liberty in which such business is carried on to summon a jury, according to the provisions of an Act, 4 Vict., intitled "An Act to enable her Majesty's Commissioners of Woods to

make a new Street from Coventry-street to Lo<sup>g</sup> Acre, and for other Improvements in the Metropolis," to determine what compensation shall be paid to the party carrying on such business for the removal thereof, and to the owner and occupier of the premises for the restriction of the use of his buildings for such purpose; and if within 3 calendar months after the verdict of such jury shall be given, and judgment thereon, the inhabitant householders of such parish or neighbourhood pay or tender such compensation, then within 3 calendar months from the payment or tender of such compensation it shall cease to be lawful for the party carrying on such business to continue the same, and for any owner or occupier thereof either to carry on or to permit to be carried on such business in the same or any part of the same premises. s. 61.

**Funds for defraying compensation.** If her Majesty by such order direct the compensation to be paid by means of a rate, it shall be lawful for the overseers of the parish to raise such sum as shall be necessary, either as a separate rate in the nature of poor's rate, or as part of the poor's rate; or if in pursuance of the memorial of the inhabitant householders of such part of the said parish as shall be affected by the said business it be appointed by such order in Council that such last-mentioned inhabitant householders defray such compensation, then it shall be lawful for the said overseers to raise such sum as shall be necessary for that purpose. s. 62.

**Exemption of public gas-works.** The provisions of this Act in reference to businesses dangerous in respect of fire or explosion, or offensive or noxious, shall not be deemed to apply to any public gas works heretofore established within the limits of this Act; and if by any Act of Parliament now in force relating to gas companies to which such works belong, any extension of such works, or any additional works, or any other works, he authorized to be erected or substituted, such provisions shall not be deemed to apply to any such extension, addition, or substitution within the limits of the district now lighted from such first-mentioned works. **Distillers.** And such provisions shall not be deemed to apply to any premises entered or used for the purpose of distillation or the rectification of spirits under the survey of the Commissioners of Excise or their officers. s. 63.

**V.**  
**VACANT districts, justices to appoint new surveyors to, within one calendar month.** s. 74. **See Justices of the peace, also Official referees, for appointment, permanent and temporary.**

**VENTILATION.** See Back-yard.
