

THE J. PAUL GETTY MUSEUM LIBRARY

# The Builder.

VOLUME II.

## TO OUR SUBSCRIBERS.

In compliance with the wishes of very many of our Subscribers, we have had prepared a cover for binding the copies of THE BUILDER for those who may be desirous of preserving them in uniform Volumes. These may be had on application at the office, at the price of Two Shillings; or our Publisher will undertake to get sets bound at a charge of Three Shillings per Volume.

## THE BUILDER,

NO. XLVIII.

SATURDAY, JANUARY 6, 1844.

WITH the opening year, we may be expected to announce our future intended course of proceeding; and although only a child of a year's growth, and as may be supposed by some, still swaddled about, yet would we, like the swathed Ilorus of the Etesian-wind-filled Nile, if not worshipped as of mythological power, yet be deemed an infant of athletic promise, and perhaps ere long, like the giant babe of Irish fairy-land, able to discuss with unbroken teeth such puerile baken-meats as may have been seasoned by a few grid-irons, worked up amid their component leaven, or by other like gentle condiments.

Long, long before our birth-day, had complaint been made of the urgent necessity on the part of the professions of architecture and building, of a sound, just, and cleanly vehicle for reviews, correspondence, and papers upon those subjects. We hope to see our columns become such a vehicle. We are sure the prince with the noble, the architect with the workman, alike appreciates the value of all practical matters relating to architecture and engineering; and by opening our pages according to this standard, we think the gentleman will not disdain to contribute, nor the workman be afraid to appear there in print. Hitherto the periodical literature of architecture has been lightly deemed of; for its comparatively confined circulation has not returned the outlay requisite for the employment of high talent: hence it has assumed a lowness of style, a coarseness of diction, a kind of *any-thing-arian* conscience; and, if it needed rightful vigour, it has made up by nerve of reproachful tongue for its puny-mindedness; from this cause almost every architect of ability has hung aloof, and has taken no part in it, conscious that he could not join therein without reaping a certain portion of disrepute.

But from the measures which we have taken for the avoidance of scandal in the literature of architecture, we trust an altered state of things will immediately commence.

We are determined that the balance of justice shall hang conspicuously over all our columns: facts shall be recorded, but no distorted opinions shall be ventured; good and natural taste shall be asserted; practical soundness shall everywhere drive out speculative pretence; genius we are determined to foster; but neither the malignant cunning of a depraved mind, nor the pitiless or unballasted flights of an imagination sublimated or distilled through the alembic of insanity, shall ever have place with us.

Our reviews of new works shall, to the best of our ability, record their beauties and commend their good maxims; and where we shall have occasion of disapproval, we trust that in putting the student upon his guard against pernicious doctrines, we shall not, like the copper-smith, be ambitious of finishing off our work with marks of the hammer. Under such a determination we hope surely that authors and publishers feeling confidence in our fairness, will early send us copies of their productions, accompanied by such wood blocks as may be proper for giving our subscribers a just idea of the value of the works so reviewed by us.

And we make promise that in commencing a series of retrospective reviews of literary and graphic works on architecture, we shall direct the mind of the student to a ready course of technical knowledge, and lead him at once to the cream of those vast stores of information which lie scattered in the many volumes of our noble art. Finding more trouble in the search for and correct re-printing of one page of old literature than in the writing of ten of original matter, we trust that whenever we quote from other works, this will not be esteemed as occurring from plagiaristic idleness, but from the desire of not doing again, perhaps badly, that which has already been done well, and of leaving the due honour to the first who broached the subject. And we invite all who are acquainted with curious and valuable works and graphic illustrations of architecture, to favour us with a knowledge of them, in order that their merits may be duly known throughout the scientific world.

With regard to the correspondence which will in future be admitted in our pages, we beg to say we desire to be select, select as to its propriety. If a workman address us or any correspondent, his address may have as much propriety as that of the finished gentleman;

born with equal cleanliness, one needs not to differ from the other in the essential quality of propriety, though they may in the degree of particular learning—the operative man being most learned in operative knowledge, and the gentleman-born holding the superiority in book-learning and speculative science.

Upon the subject of papers relating to architecture, both constructive and decorative, we have the brightest promise. Assistance of a very superior kind will be given to us; and but few months, or even weeks, will be required for marshalling our forces. Through society finding our integrity of purpose, we have every prospect of the portfolios of the antiquary, the architect, and the scientific and practical man, being opened; and we little doubt that from their vast stores, we shall have the power of selecting those gems of art and science after which the zealous of our profession thirst.

Declaring thus openly our sentiments and intentions, we have an assured hope that our views will be approved of by most of our readers, and will be seconded earnestly by very many of them holding rank in architecture, engineering, practical science, biography, archaeology, topography, and the fine arts generally.

## CLEANLINESS AMONG THE POOR.

The *Edinburgh Weekly Chronicle* thus graphically describes the difficulties that lie in the way of personal cleanliness among the poorer classes:—

“ Bathing is at once a luxury, and a remedy for disease. One would think it a very easy matter to get the body immersed in hot, cold, or tepid water, and so it ought to be, but as matters stand, it is very difficult; so difficult, indeed, that it is practised only by few, and by these but seldom. In the summer season, no doubt, many bathe in the sea and in rivers but, in general only a few plunges in the year are enjoyed in this way by such as enjoy the advantage at all. The great bulk of the population go unwashed, hands and face excepted, from year's end to year's end. And no wonder; think of the obstacles! A man begrimed with toil, or greasy with accumulated perspiration, feeling a desire to have a clean skin, begins to think of how he may accomplish the simple process of getting himself washed. Pent up by his occupation in the midst of a town, perhaps miles away from the sea, or any stream affording a sufficient depth of water, he can only on rare occasions find time to go the necessary distance. And when he does so, his difficulties are not at an end. He finds that the river banks are claimed as private property, and he is prohibited, under heavy penalties, from setting foot there. He may seek the sounding shore,” and snap his fingers at lauded proprietors. There are no

white boards prohibiting trespassers, and threatening prosecution—no spring guns and man traps within the tide mark of the sea. But there he finds other obstacles and annoyances. He does not choose to violate decency by denuding himself in sight of others, particularly females, and yet it is difficult for him to find a secluded spot, or to catch a moment in which there is not somebody in the way. Patiently does he loiter along the beach or rest him on

“A gluttony stane,  
Green wi' the dew o' the jaupin' main,”  
in the hopes of seeing the coast clear of strollers, but in vain. One troop of ladies, or of ‘bairns’ women’ with flocks of children, succeeds another almost without intermission, and he may wait hours before he finds an interval in which no gentle parasol-bearer or little gatherer of shells is within eye shot. At length, the wished-for opportunity occurs. Hurriedly and apprehensively, like one about to commit some horrid crime, does he strip and get into the water. But ten to one but he has half a mile to wade among stones and seaweed before he can get deeper than the knee; and long before he get into deep water, his feet are bleeding—his legs gartered with tangle, and his teeth chattering with cold. The ablution performed—out he comes faster than he went in, in spite of stones and seaweed—but, perhaps, only to find that his clothes have been floated away or stolen, or to shock and put to flight some of the fair promenaders.

“Such are a few of the *disagreeables* of sea-bathing for the million. No doubt, bathing-boxes are to be had at some favoured spots, from which a plunge can be effected comfortably and decently, but they are not to be found at every man's door, nor is the use of them to be had at a price which poor people can often afford to pay.

“If the difficulties of cold-bathing are great, what must we say of warm-bathing? Why, so far is the luxury of the warm-bath out of reach of the working-classes, that we are convinced two-thirds of them toil from the cradle to the grave without ever enjoying it. It is a costly luxury, the price in private establishments being usually from a shilling to half-a-crown, and few mechanics can afford to part even with a shilling as often as the bath would do them good. As to attempting to procure the warm-bath at home, it is never thought of, except when disease makes it necessary, and for the sufficient reason that it is not an easy matter to accomplish. A small-limbed child may be bathed without much trouble—bathing a little squalling; and many a cold, we believe, is cured in this way among the children of the poorer classes; but when full-grown people are to be immersed under the domestic roof, what a job it is! A birth in the poor man's house is nothing to it. How the children stare at the mysterious preparations! the largest tub is brought out—all the pots and kettles are put in requisition, and anxious precaution taken against deluging the floor. Then, the preparations being completed, and the gaping urchins sent off, the operation commences. But it is easier commenced than finished. Perhaps a six-foot man has to get himself crammed into a tub, already nearly full of half-scalding water, and not big enough, at any rate, to hold half his bulk, though he should coil himself up like a serpent. Then, what splashing, what knocking of knees and elbows, till John Meiklejohn jumps out, partly unwetted and partly par-boiled—declaring he will never again try the hot-bath at home, though his rheumatism should stick to him all his days. The mistress, too, declares, that so long as there is any virtue in doctors' drugs, she will have no more such doings in her house; and to crown the whole, the tenant of the house below comes up, and complains that she has had a *spate* of water sent down on her.”

The following observations are from the *Aberdeen Herald*:—

“To obviate the former class of these difficulties, which exist in this town as well as in Edinburgh, and to put an end to what people residing or walking near the Wellington-bridge must regard as a nuisance—open bathing by grown-up lads,—it may be necessary for the Bathing Committee, after effecting their primary object, to make some arrangement for

a swimming-bath in the river. An awning or shed, with sideboards, and a bottom sunk to the proper depth, is all that is necessary, and the admission might be by season tickets, sold at a cheap rate. Perhaps, some individual might be induced to get up such a bath as a private speculation. Besides promoting decency, it would be exceedingly advantageous in affording boys and young men a *safe* opportunity of learning the useful and healthy art of swimming.

“Some objections have, we understand, been taken to the use of engine-water for the hot baths, and indeed, to the plan of having baths in different parts of the city. It is argued that the engine-water will not be procured at the times when it is most required—and that, *perhaps*, the saving of expense, is, after all, not worth considering. These objections, we have no doubt, will be duly weighed by the Committee; but for our own part, we are inclined to think that they are not very insuperable. Taking into account the immense quantity of hot water that is thrown out from some of the public works, and the high temperature at which the boilers must be kept up till the very moment of stopping, it will not be difficult, we think, to make arrangements for the convenience of all classes. The water can easily be tested, and its purity established beyond the cavils of ignorance or prejudice; and as to the saving of expense, we believe it will be found, on inquiry, to be so very great as to shew that the scheme of cheap baths—baths at a penny or twopence—are impracticable unless engine-water be used.

“The objections to the plan of having the baths in different quarters of the city are exceedingly futile, and must not be listened to. It is said that, keeping up separate establishments will entail too much expense, and that one grand place in the centre of the city would be both more attractive and more economical. We do not admit the truth of either assertions. Each establishment—if there is to be more than one—will be large enough to give ample employment to an old couple or two in cleaning out the baths, washing towels, &c.; and, if a certain amount of work has to be done, there will be little more expense in doing it at two, three, or four places, than at one. Then, again, we have no faith in the attractiveness of a large central establishment. The novelty of the thing might cause a run to it for a time, but it would fall off, and the people would sink into their old Mrs. McClarty notions of staying away, because ‘*they could not be fished to go to a distance*.’ It is utility and not show that we want in our public baths; and we are anxious to bring them as near as possible to every man's door, and make the rate of charge exceedingly low, so that no one may have a shadow of excuse for not using them. There is an ample sea-beach here for bathing in the summer, but how many, even of the middle and upper classes, neglect to avail themselves of it, just because ‘*they cannot be fished*’ to go so far.”

#### MOON'S PATENT CHIMNEYS.

At this season, when the fire-side is so essential to comfort, a notice of any improvement in the construction of chimneys may not be considered out of place.

We have recently observed the enrolment of a patent taken out by Mr. Moon for flues of a circular form, and although we are perfectly aware that the same form has been patented many times before our publication was in existence, we do not think that any other plans have embraced the important principle of bonding in the materials with the general work, a desideratum of such importance, that the absence of such mode of construction has been fatal to the general adoption of the subjects of previous patents.

We consider the matter of so much consequence, that we have exemplified it by the annexed illustrations of the main features of the patent, in which it will be observed that although bricks of various forms are requisite for effecting the improvement, yet we believe they

will be found simplified to the greatest possible extent.

It is evident that in the construction of ordinary rectangular flues there are no fixed principles used in forming their most important parts, viz. their throats and gatherings. It is universally known that flues are mostly worked 14 in. by 9 in., with a half-brick division between flue and flue, but at their diversions or gatherings the flues are mostly crippled and diminished, whereas in the method set forth these irregularities are entirely obviated, as every flue is so perfectly complete in itself that in a series of flues, each may be carried up or taken down without interference with, or injury to, any adjacent flue.

Mr. Moon seems to have considered the whole subject-matter of chimneys, and has applied remedies for their present numerous defects; he has commenced (as all should) at the foundation; he gives us a bar of a peculiar formation, in fact it is an iron girder upon a small scale, this bar is furnished with hooks for a soot cloth, and has dowels to receive two bearing-bars which are also provided with hooks for a soot bag; these bearing-bars are destined to receive the moulded throat-lumps, which form the contraction with a most perfect and gradual receptacle for the smoke on its first emission, very different from the present gatherings, which are in most instances extremely irregular and leave far too much space for cold air; on these throat lumps commences a cylindrical flue, each course of which is formed of four bricks consisting of bonders and stretchers alternately, by which is effected a most perfect union with the general work, as well as a diminution in the number of vertical joints, for the bonding courses are without any external vertical joint. Now as the present old description of flue requires seven bricks to each course, it will be seen that the number of bricks used in Mr. Moon's flues is numerically only four-sevenths as many, and we may add that the old form could only be tolerated as allowing just sufficient space for the poor sweeper to exercise his miserable and degraded occupation; but, thanks to a more enlightened age, such a provision is no longer necessary. The best form for strength and emission of smoke is now the principal object.

We have now arrived with Mr. Moon as high as the chimney-shaft, and to this adjunct of a building, so important both with respect to appearance and safety from effects of wind, we find much consideration has been given; instead of connecting the flues, by which a large surface is presented to the wind, every flue of the shaft is perfectly distinct, so as to allow the wind to pass freely between shaft and shaft, the forms of which are various. We have shewn in the engravings those which may be thought desirable; they are in their plans, or horizontal sections, octagonal, hexagonal and circular, while some of them are of a square form, with their angles merely taken off. It may be observed those of the hexagonal plan require only three bricks to a course, or twelve bricks to a lineal foot in altitude, the present rectangular flue requiring twenty-eight bricks, which shews sufficient practical advantage, independently of external form. In addition to all these numerous advantages, Mr. Moon has constructed a metallic cap, and if it effect the objects for which it is designed, those who think proper to avail themselves of its use will have no smoky chimneys in future. This cap differs entirely from every other kind now in use; it will not present an unsightly appearance either in its application to new or to old shafts; the substantial material of which it is made will render it free from the objections arising from the great reverberation of sound so generally complained of, and which so frequently compels the removal of the present unsubstantial and unsightly contrivances made of thin sheets of iron, zinc, or tin, in the shape of funnels, cowls, and other external addenda to chimneys, none of which can be very suitably added to buildings, and which, from their fragile nature, often need renewal, attended by considerable expense and inconvenience, besides the frequency of the removal of such contrivances by the action of wind or by sweeping-machines.

This subject being one of considerable importance in building, we shall on a future occasion again recur to it.

## FREEMASONRY.

"Yet breth the skylle of nature, the understandinge of the mighte that po berayne; and of sondrye merkynge, sonderlyche, and skylle of retyenynge, of twygthes and meynynge, and of the manere of takinge up of thynges for mannes use; heylth, helth, and helthynge, and helthynge of all kyndes, and of other thynges that mate good to manne." \* \* \*

"Masons habite atemp, on everie tyme, from tyme to tyme, uncommuneable to mankynde soche of her secrettes as generallie myghte be usefull: they haue the keye backe soche alleine as shulde be harmfull to her comyn good, and punyssh handes. Macesse love eider odyr myghtyght, and y may not obteyne it: for gode minne and true, kenninge eider odyr to be such, beith always love the more as they be more good."—From a Manuscript in the hand-writing of King Henry the Sixth.

MEETING OF THE EPIPHANY-CHAPTER OF THE FREEMASONS OF THE CHURCH, will take place on Tuesday, the 9th January, at eight o'clock in the evening.

## TO THE EDITOR OF "THE BUILDER."

SIR,—Having just met with the subjoined very minute detailed list of the Grand-masters of the English Freemasons, permit me through one of your columns to ask, as I take a great interest in all historical and other matters relating to Freemasonry, upon what authority such a catalogue rests, how are the dates authenticated, and where lie the records concerning so circumstantial a document?

I am, Sir, your very humble servant,  
A Freemason of the Church.

- A. D.
- 597 Austin the Monk.
  - 680 Bennet, Abbot of Wirral.
  - 858 St. Swithin.
  - 872 King Alfred.
  - 900 Ethred, Prince of Mercia.
  - 928 Athelstane.
  - 957 Dunstan, Archbishop of Canterbury.
  - 1041 Edward the Confessor.
  - 1066 Gundulph, Bishop of Rochester.
  - 1100 Henry I.
  - 1135 Gilbert de Clare, Marquis of Pembroke.
  - 1155 The Grand Master of the Templars.
  - 1189 Peter de Colochurch.
  - 1216 Peter de Rupinus, Bishop of Winchester.
  - 1272 Walter Giffard, Archbishop of York.
  - 1307 Walter Stapleton, Bishop of Exeter.
  - 1327 Edward III.
  - 1357 William à Wykeham, Bishop of Winchester.
  - 1375 Simon Langham, Abbot of Westminster.
  - 1377 William à Wykeham, again.
  - 1400 Thomas Fitz Allen, Earl of Surrey.
  - 1413 Henry Chicheley, Archbishop of Canterbury.
  - 1443 William Waynflet, Bishop of Winchester.
  - 1471 Richard Beaucourt, Bishop of Salisbury.
  - 1500 The Grand Master of the Order of St. John.
  - Henry VII. Patron.
  - 1502 Henry VII.
  - 1513 Cardinal Wolsey.
  - 1530 Thomas Cromwell, Earl of Essex.
  - 1543 John Touchett, Lord Audley.
  - 1549 Edward Seymour, Duke of Somerset.
  - 1552 John Poynt, Bishop of Winchester.
  - 1560 Sir Thomas Sackville.
  - 1567 Sir Thomas Gresham, in the South.
  - Francis Russell, Earl of Bedford, in the North.
  - 1580 Charles Howard, Earl of Effingham.
  - 1588 George Hastings, Earl of Huntingdon.
  - 1603 King James I., Patron.
  - Inigo Jones, Grand Master.
  - 1618 William Herbert, Earl of Pembroke.
  - 1625 King Charles I.
  - 1630 Henry Danvers, Earl of Danby.
  - 1633 Thomas Howard, Earl of Arundel.
  - 1635 Francis Russell, Earl of Bedford.
  - 1636 Inigo Jones, again.
  - 1643 Henry Jern yn, Earl of St. Albans.
  - 1666 Thomas Savage, Earl of Rivers.
  - 1674 George Villers, Duke of Buckingham.
  - 1679 Henry Bennett, Earl of Arlington.
  - 1685 Sir Christopher Wren.
  - 1698 Charles Lenox, Duke of Richmond.
  - Sir Christopher Wren, again.
  - 1717 Anthony Sayer, Esq.
  - 1718 George Payne, Esq.
  - 1719 Dr. Desaguliers.
  - 1720 George Payne, Esq., again.
  - 1721 John, Duke of Montagu.
  - 1722 Philip, Duke of Wharton.
  - 1723 The Duke of Buccleugh.
  - 1724 The Duke of Richmond.
  - 1725 The Earl of Abercorn.
  - 1726 William O'Brian, Earl of Inchiquin.
  - 1727 Lord Coleraine.
  - 1728 Lord Kingston.
  - 1729 Thomas Howard, Duke of Norfolk.
  - 1731 Lord Lovel.

A. D.

- 1732 Anthony Brown, Viscount Montacute.
- 1733 The Earl of Strathmore.
- 1734 The Earl of Crawford.
- 1735 Thomas Thynne, Viscount Weymouth.
- 1736 John Campbell, Earl of Loudon.
- 1738 H. Brydges, Marquis of Carnarvon.
- 1739 Lord Raymond.
- 1740 The Earl of Kinton.
- 1741 The Earl of Morton.
- 1742 John Ward, Lord Dudley and Ward.
- 1745 James, Lord Cranstown.
- 1747 Lord Byron.
- 1752 John, Lord Carysfort.
- 1754 Marquis of Carnarvon, again.
- 1757 Sholto, Lord Aberdour.
- 1762 Washington Shirley, Earl Ferrers.
- 1764 Lord Blancy.
- 1767 Henry, Duke of Beaufort.
- 1772 Robert Edward, Lord Petre.
- 1777 George, Duke of Manchester.
- 1782 H.R.H. Frederick, Duke of Cumberland.
- 1790 H.R.H. George, Prince of Wales.
- 1813 H.R.H. Augustus Frederic, Duke of Sussex.
- 1843 The Earl of Zetland, Acting.

## APPOINTMENT OF OFFICERS IN THE SURVEYORS' DEPARTMENT OF THE COMMISSIONERS OF SEWERS.

## TO THE EDITOR OF THE BUILDER.

SIR,—The advertisement in your paper of Saturday relative to the Appointment of Officers in the Surveyors' Department of the Commissioners of Sewers, &c., induces me to trouble you with a few observations.

You are perhaps not aware that the Commission for Westminster, &c., extends to the parish of Hampton, embracing all the land affected by the tide or by outrageous waters from the uplands, excepting, indeed, that portion of the river Brent which was interfered with by the execution of the Grand Junction Canal as permitted by the Act establishing the Company, and the parish of Chiswick, which is not noticed in the commission.

The difficulties and expense which the commissioners have had to contend with in consequence of the extension of the town, have arisen from the deficiency or inapplicability of the powers to prevent improperly constructed sewers, and from inattention to the prospective wants of the public on ground yet unutilized upon. Previously to the year 1806, there only one surveyor, with no clerks of the works or other assistance; there was no descriptive plan showing the district upon which the commissioners exercised their jurisdiction till that made by Mr. Potter in 1816, and this showed only the main lines of drainages. The establishment was, in 1807, increased, and there has been a vast extension of the brick sewers, and many of the watercourses have been corrected and improved by inverted brick arches, the output since the year 1824 has exceeded 500,000L expended by the public, and a very much larger sum by individuals.

When it is considered that the commissioners have of late never exerted their authority or supervision beyond the border of the Counties Creek district, which includes only a small portion of the parish of Fulham, and hardly any of Hammersmith, it must be admitted that the additional officers advertised for are essentially requisite, and that the attainments of a practical architect, versed in engineering, are called for, as well as those of an honest clerk of the works, whose labours should be extended with assiduity over the distant district at least.

It may be pardonable to mention that the aid of the first of these officers should be applied to the prospective improvement of the existing sewerages, and in calculations as to the future demands of the whole of the districts now surveyed by the commissioners, those lying beyond them, and also those into which the commission does not at present extend. In looking at the condition of this populous and wealthy metropolis, and its noble river, polluted as they are by sewage waters, we must not cast away the hope that the views of one of our most enlightened builders, Mr. Thomas Cubitt, and of several of the commissioners, will be entertained, and so far at least as that the practicability of conducting all the sewage waters of the north side of the river eastward and westward by deep tunnels, without interfering with it, shall be seriously and fully considered. The proposition being that all the present sewers shall discharge themselves into deep under-ground courses tunneled through the blue clay stratum till they reach the flat lands eastward and westward, where they shall issue into deeper reservoirs, from which, by engine work, they may be elevated so as to be capable of distribution for agricultural purposes, and the redundancy, if any,

carried forward, so far as not to be likely to contaminate the waters.

It may be supposed that this plan is too visionary to be carried into execution, and that the expense, even if it were practicable, would be too enormous to be tolerated. A little reflection may probably induce us to think that neither of these circumstances really attends the idea.

The superficies drained, whether of land, streets, or houses, is easily ascertained. On the northern side of the Thames the largest surface is that of the lands having a current into the Fleet river; the dimensions of the arched sewer at Blackfriars-bridge have always been found adequate, and there is no floodgate or flap against the entrance of the tide which flows into it. The next largest surface, eastward of the summit of Hyde-park, &c., is drained by the King's Scholars' pond Sewer, which is of moderate capacity and unequal current, and issuing into the Thames, being ponded up every tide. Let us suppose that this last-mentioned sewer is intercepted where it crosses Piccadilly, and by some judicious contrivance made to pass its contents into a new deep sewer tunneled through the blue clay, and which deep sewer shall receive all the other sewers it shall meet in its eastward course to be continued under Piccadilly, the Haymarket, and Charing-cross, where it shall be, at least as to the extrados of its arch, not less than twenty feet below low water-mark; at this point it should receive another sewer constructed in some proper line so as to be calculated to convey all the waters of the low lands of Westminster, Pimlico, and Chelsea.

From this point, with increased dimensions, but with a duly regulated current, this main and tunneled sewer should proceed eastward, still through the blue clay, parallel to the river, avoiding St. Paul's, and whether under houses or not, to Aldgate, thence under Whitechapel-road to Mile-end, and so onward to Plaistow Meads, passing under the Poplar canal and the river Lea. In the neighbourhood of Plaistow, deep, spacious, and substantial reservoirs should be formed, capable of receiving the contents of this main sewer, and from which, by the operation of powerful engines, the same may be elevated and distributed either in the shape of liquid or as compressed manure upon the lands, the liquid portion being delivered into channels formed at such an elevation as would irrigate the meadows and at length communicate with the river, should any surplus water remain unused.

It is conceived that the branch sewer which would enter at Charing Cross would be capable of relieving all the district east of the Counties Creek, lying below high water, and perhaps be equal to take a portion of the Counties Creek sewer and of the Ranleigh in the event of an overflow, which the sewer about to be described as running westward could afford a discharge for, viz.

That of a new sewer, to commence at Knightsbridge, and thence to run westward at a moderate depth below the surface, but still with an increasing current, till it reached some selected spot, probably about Brook Green, whence its contents might be capable of distribution over the low lands, or even the upper agricultural lands northward and westward of the reservoirs, which should be formed similar but of less capacity than those described to be executed in the neighbourhood of Plaistow.

A map has been prepared by Messrs. Milner and Braithwaite, the engineers, showing all the deep wells in the vicinity of the metropolis, and which very distinctly describes the strata which would be intersected by the formation of these sewers, and of course facilitate the operation by the information it will afford, and by the avoidance of the reservoirs which are in existence.

It is a matter of tolerably easy calculation, as to what the magnitude of these sewers, and as to what their currents, as they proceed, should be, for it is obvious that if the blue clay is everywhere deep enough to admit of a rapid current, the amplitude of the sewer itself may be less in proportion than it would be were the current sluggish; information, however, is not at this moment at hand, but the matter is open for the commissioner of the four divisions, namely, the commissioners for Westminster, for Finsbury, the City, and the Tower Hamlets, to exert their faculties, and for their officers to enter upon the consideration of the importance and value of the improvement.

With regard to the expense, the present moment is favourable for the borrowing of money, as is evidenced by the high price of the public funds. An issue of a special parliamentary loan, secured upon the rates of the above-mentioned metropolitan districts, would in all probability be cheerfully met, the property assessable is so ample. Besides, the labour of the country is now little employed, and nothing is required but what our national resources furnish. The property of individuals and the public comfort will be so greatly benefited by the plan, that an

annual tax will be amply available to discharge the amount borrowed in annual payments, as that of the Bayswater Tunnel Sewer has been, until the whole loan shall vanish, leaving London in possession of *cloaca maxima* superior in extent and importance to the boasted constructions of Rome.

#### AN OLD COMMISSIONER FOR WESTMINSTER.

The Bayswater Tunnel Sewer is about half a mile, say 2,640 feet, it cost 6,300*l.*, or about 2*l.* 8*s.* 4*d.* per foot; the eastern line of sewer may be computed at eight miles, or say 43,040 feet, which at 10*l.* per foot would be 430,400*l.*; the double of this sum will doubtless effect the object of a perfect drainage without issue into the Thames, except as above attempted to be described.

#### INTERMENTS IN TOWNS.

It appears that Mr. Chadwick, the secretary of the Poor Law Commission, has, at the request of Sir James Graham, been inquiring into the subject of interments in towns, and the report upon the matter has this week been published. From this we conclude that the Government contemplate some legislative measure with a view to mitigate those evils which unquestionably exist, and remove the danger which results from the dead and the living being crowded together within a few yards of each other, as in most towns of consequence is found to be the practice. There is no doubt, as Mr. Chadwick states, that emanations from human remains are likely to produce fatal diseases, and depress the general health of those exposed to them. This has been shewn repeatedly by high medical authority. Instances of proof have been again and again pointed out; and it is impossible to tell to what extent disease and death have been spread abroad from the system of burial in the edifices in which hundreds weekly, perhaps daily, assemble—from the practice of using in tombs in which openings are left, wooden coffins only, which necessarily in a few years decay, and the air is impregnated with unhealthy effluvia—and from the constant up-turning of the soil, which, in a populous parish and a church-yard of limited extent, is little more than one mass of human remains. Besides, not only is the health of the people injured, but their feelings are often shocked, as we have lately heard in several disgusting instances in the metropolis, by the unavoidable disturbance of the sanctuary of the dead, long ere they have lost the marks and traces of humanity by crumbling again to their native dust. On these grounds, and looking to the importance and intricacy of the subject, the interests that may be brought into conflict, and the difficulties which have generally met private companies in the attempts to remedy the evils, we agree with Mr. Chadwick, that “the practice of interments in towns in burial-places amidst the habitations of the living, and the practice of interment in churches, ought for the future, and without any exception of places or acceptance of persons, to be entirely prohibited;” and that instead of the work being left to private associations, national cemeteries of a suitable description “ought to be provided and maintained.”

The mode in which it is proposed to effect this object is by providing for the expense of establishing national cemeteries by means of loans to be spread over a period of years; the burial fees and existing duties being collected and formed into a general fund, from which these loans should be repaid, and the compensation drawn which may be awarded to interests disturbed by the new arrangement. This seems practicable and fair, and thus far we are disposed to acquiesce in the plan.

But then come suggestions, some of which we are sure are repugnant to the general feeling of the community, and others are unnecessary and unjust. Here is one—

“That for the avoidance of the pain and moral and physical evil arising from the prolonged retention of the body in the rooms occupied by the living, and at the same time to carry out such arrangements as may remove the painful apprehensions of premature interments, institutions of houses for the immediate reception, and respectful and appropriate care of the dead, under superior and responsible officers, should be provided in every town for the use of all the classes of the community.”

If it be meant by this that on the death of a person the body shall be laid bold of by a

government officer, and *snatched* away from the sorrowing survivors to be deposited in a dead-house, under the care of parties whom the relatives neither appointed nor can control, then we say it is astonishing how any man could seriously propose such a violation of the settled habits and natural feelings of the people. An awful sanctity surrounds every thing connected with the dead; and those who have lost some cherished object—a child, a wife, a husband, or a father—know with what melancholy tenderness they have day by day visited and watched the loved remains till they were reluctantly yielded to the grave. This may be a weak feeling, but it is interwoven with the finest sensibilities of our nature, and we are quite sure that Sir James Graham will not attempt to violate it, by asking Parliament to enforce a regulation upon the whole community, which would only be justifiable, if justifiable at all, in extreme cases of cholera and fever.

Not content with interfering with the feelings of the people, Mr. Chadwick proposes to cut up root and branch the trade of the undertakers. He next suggests—

“That for the abatement of oppressive charges for funeral materials, decorations, and services, provision should be made (in conformity with successful examples abroad), by the officers having charge of the national cemeteries, for the supply of the requisite materials and services, securing to all classes, but especially to the poor, the means of respectable interment, at reduced and moderate prices, suitable to the station of the deceased and condition of the survivors.”

It is calculated that in England nearly five millions is paid annually for funerals. All this Mr. Chadwick proposes to take out of the regular currents of trade, and give to his officers of the cemeteries, thus seriously and unjustly injuring a large and most respectable class of tradesmen, amongst whom the natural course of competition prevents that “extortion” which is alleged as the ground of interference.

We regret that these and other objectionable propositions should be linked to the report, because they will excite a feeling against an alteration which is much needed, and if well and discreetly made, would be widely beneficial. It was a matter which required to be treated with great caution and delicacy; and to connect with it matters which would be regarded as an outrage on the living and an impertinent interference with trade, was most unnecessary and impolitic.

#### SCIENCE IN LANCASHIRE.

THE northern counties of England have been much noted for men of mathematical ability and general scientific information; even among the humbler classes of society the science of mathematics, and in particular that of pure geometry, seems to have been cultivated with the greatest success. The following extract which appears in the *Manchester Courier* of the 9th December, from a letter on this subject by George Harvey, Esq., F.R.S., to the British Association on its first meeting at York, will be read with interest.

“It was my intention,” says Mr. Harvey, “had I been enabled to enjoy the privilege of attending at York, to have drawn the attention of the meeting to the very remarkable circumstance of the geometrical analysis of the ancients having been cultivated with eminent success in the northern counties of England, and particularly in Lancashire. The proofs of this may be gathered from a variety of periodical works devoted almost exclusively to this lofty and abstract pursuit. I have now before me several beautiful specimens of the geometry of the Greeks, produced by me in what, for distinction sake, we call the inferior conditions of life. The phenomenon (for such it truly is) has long appeared to me a remarkable one and deserving of an attentive consideration. Playfair, in one of his admirable papers in the *Edinburgh Review*, expressed a fear that the increasing taste for analytical science would at length drive the ancient geometry from its favoured retreat in the British Isles; but at the time he made this despond-

ing remark, the professor seemed not to be aware, that there existed a devoted band of men in the north, resolutely bound to the pure and ancient forms of geometry, who, in the midst of the tumults of steam-engines, cultivated it with unyielding ardour, preserved the sacred fire under circumstances which seem, from their nature, most calculated to extinguish it. In many modern publications, and occasionally in the senate-house, problems proposed to the candidates for honours at Cambridge, questions are to be met with derived from this humble but honourable source. The true cause of this remarkable phenomenon I have not been able clearly to trace. A taste for pure geometry, something like that for entomology among the weavers of Spitalfields, may have been transmitted from father to son; but who was the distinguished individual first to create it, in the peculiar race of men here adverted to, seems not to be known. Surrounded by machinery, with the rich elements of mechanics in their most attractive forms, we should have imagined that a taste for mechanical combinations would have exclusively prevailed; and that inquiries locked up in the deep and to them unapproachable recesses of Plato, Pappus, Apollonius, and Euclid, would have met with but few cultivators. On the contrary, Porisms and Loci, sections of ratio and of space, inclinations and tangencies,—subjects confined among the ancients to the very greatest minds,—were here familiar to men whose condition in life was, to say the least, most unpropitious for the successful prosecution of such elevated and profound pursuits.”

In consequence of the poverty of several individuals of this humble class, residing in the neighbourhood of Manchester, who have distinguished themselves by their devotion to science, a meeting of persons favourable to the formation of a society for the relief and encouragement of scientific men in humble life, was lately held in that town under the presidency of the mayor, and was attended by many influential gentlemen. Resolutions for the formation and support of such a society were adopted, and the proceedings, which were reported in the *Manchester Courier*, of the 9th Dec., are of considerable interest.

Among other remarkable cases mentioned at the meeting are those of James Crowthorpe, of Salford, formerly a weaver, who has distinguished himself as a botanist, and John Butterworth, of Haggate, near Royton, also formerly a weaver, who has acquired much celebrity in the neighbourhood by his successful cultivation of several branches of the mathematics, and especially that of pure geometry. These men are now, in their old age, much distressed by poverty and sickness. Many interesting details were given in the course of the meeting respecting their scientific pursuits and progress. It appears that Butterworth, from the commencement of the 19th century up to the present time, has been a regular contributor to several of the mathematical publications of the day. Hundreds of his solutions have been inserted in the *Ladies' and Gentlemen's Diaries*, in the *Mathematical Companion*, and in *Leybourn's Repository*, in which may be found the names of many of the most eminent mathematicians of the present day. It is to be hoped that in this university a few may be disposed to render assistance to these humble cultivators of science.

**TUNNELING THE TYNE.**—An ingenious plan has been suggested of crossing the Tyne by passing through a tunnel under the river, on the principle of the centrifugal railway. The carriages would descend by their own gravity into the tunnel from one side, and rise up on the other by the momentum acquired in the descent. It is proposed to construct the tunnel of metallic tubing, and lay it just within the bed of the river, so as not to form an obstacle to the navigation; the tunnel to be constructed of such a bore, as to obviate the possibility of the carriages getting misplaced in their passage. Railway carriages and vehicles of all kinds, as well as passengers, would thus be safely and rapidly transferred from one side to the other. It is considered, that with the present low price of iron, three tunnels might be cheaply constructed, all starting from the station of the Brandling Junction Railway, one proceeding in the direction of Nevill-street, the other in that of the Castle-garth, and the third going towards the station of the Newcastle and North-Shields Railway.—*Newcastle Journal*.

THE DUTCH CHURCH, AUSTIN FRIARS.

This church stands upon the spot where in 1252 Humfrey Bohun, Earl of Hereford and Essex, built at his proper cost a church and conventual buildings for the reception of a superior and brethren of the order of Augustine friars. Hence it obtained its title of "The Augustine Priory of London;" and the site and vicinity of that religious establishment still are, and probably will continue to be, known by the appellation of Austin Friars. The history of the friarial institution in question is in complexity and events similar to those of the more celebrated abbeys; it bad during the interim between the dissolution and surrender (30th Henry VIII.) greatly extended its possessions, and had become to the citizens an object of especial veneration and regard, its prior having the rank and privileges of an alderman, and joining as such on public occasions and processions, with the single distinction of his civic costume being made in fashion to assimilate with his ecclesiastical vestments. After the surrender, the site, buildings, and lands, or the greater part of them (for we shall see presently there must have been some reservation with respect to a portion of the church itself), were granted to William Powlett, or Paulet, afterwards created Earl of Wilts and Marquis of Winchester. Great and Little Winchester-streets, in the city of London, and several others in that immediate neighbourhood, are built on the ground which formed the gardens of the first Lord Winchester, originally those of the Augustine Priory.

From the early date referred to there has been a church upon this spot, for although Paulet converted the greater part of the building to domestic uses, there was still a portion

of the older church reserved for public worship. The first Lord Winchester appears to have proceeded cautiously, if not reluctantly, in the work of demolition; but his son and successor, with less compunction, sold for 100*l.* the sacred pavement, and nearly the whole of the fine old monuments which covered the host of illustrious dead with whose remains the church and cloisters were crowded; and he further, for its price, stripped the roofs of their leaden covering, replacing it by tiles. The citizens feeling themselves outraged by this procedure, turned their attention to the preservation of the church, and in a petition, still extant, dated August 4th, 1600, signed by the mayor and principal civic residents, they solicited the Marquis of Winchester to stone in some measure by subscribing 50*l.* or 60*l.* towards repairing the remaining fabric, but this was refused. Hence, it seems the forbearance of Lord Winchester from altogether rasing the fabric was not voluntary, the Crown having, it would also appear, a reserved power over part of the ancient church; and this was eventually exercised by granting permission to the Dutch congregation in London to use it for their meeting and "preaching place." During the short reign of Edward VI., the grant was confirmed by letters patent, in which it is denominated a free gift, for the use of those of the Dutch or German nations who had fled hither on account of religion. This immunity has always been respected and acknowledged by the succeeding monarchs, and in the hands of the descendants of this respectable body, now much augmented by widely-extended and more stable commercial relations, it still remains.

It is an old custom for the Dutch congregation to present an address to each Bishop of London and Lord Mayor, upon their installation; and upon such occasions the party ad-

ressed receives the more substantial complement of a piece of plate.

We shall in another number recur to this interesting subject, and shall illustrate it, as well by engravings as by an architectural description of the church in its existing state.

**ON BREAST-SUMMERS IN BUILDING;**  
*How Abuse in the Frequent Use of them has Increased in Modern Times; Of their Inconvenience; Some Thoughts and Suggestions for Preventing the Evils Resulting from the Use of them; and Some Further Suggestions for Superseding on many Occasions the Use of them altogether.*

VIEWED as a principle of construction, the use of breast-summers is wholly inadmissible: for the superincumbent weight upheld by them acts upon them by direct cross-strain, a test to which no materials whatever should be put in a building formed upon a correct principle of construction.

It has been stated that from the shrinkage of the wood, the brickwork over a breast-summer usually cracks, falls, and becomes disjointed. But it must be admitted, that sometimes, though this be the case, a timber breast-summer is not itself defective further than happens from its shrinkage and yielding; for its fibrous nature imparts to it such toughness, that it will rarely break: but the inconvenience of leading to the disruption and distortion of the superincumbent wall is sufficient cause for its rejection.

At the present day it is in vain to argue with a trader, that his house of business would appear more respectable and elegant were it made with a due regard both to real strength and to strength of appearance: seeking only to expose his goods, and to undersell his neighbour, he little cares whether the fabric of his house be injured, or whether it be made in itself mean, provided his darling object be attained.

To such an extent is the description of house-breaking caused by cutting away the bottoms of houses for the imaginary necessary

BUILDER

15, N. B. MARKET  
ST. S. W.

purposes of trade, that many a trader not worth a shilling, will involve himself to the extent of several hundreds of pounds in putting in a breast-summer, and destroying all the stability of a good house, for the reinstatement of the damage to which he would be unable to pay.

Besides the shrinkage and deflexure of wood breast-summer, their liability to rot and to burn must be added; and if they be made of cast-iron, though they will not shrink or rot, yet when fire happens, they are (though said to be fire-proof) still more disastrous and less certain than those which are of wood.

Breast-summer of stone could hardly under any circumstances be relied upon.

The growth of the evil admission of breast-summer, of wood or of iron, has even lately extended largely into public buildings; hence we see the backs of porticos, raised upon high basements, fractured and sinking; and we observe them in many other situations, where a Wren, or other constructor who never lost sight of science, would have shuddered to use them.

The inconveniences resulting from the fracture of brickwork over breast-summer, for a long while caused the author very serious trouble: in all the examples where he used them, he had the timber cambered considerably, so as to counteract any of the effects of ordinary sinking; but this did not prevent fracture of the walling over the ends of the timber: it was a long while before it occurred to him, that this destructive effect was caused almost wholly by the shrinkage of the timber.

In forty instances where he used timber window-heads over the windows of printing-offices and manufactories, he found thirty-two instances of fracture: but in all these instances the posts between the windows were framed in one length from one window-head to another, and were braced or trussed between, so that though the brickwork became fractured outwardly, after the flaws were carefully stopped, no further inconvenience was suffered; in some of these instances it is true that the fracture was scarcely discernible; but the author has seen instances of heavy timber window-heads tier above tier, which have collectively so shrunk, that the brickwork over the upper windows sunk and fractured two and a half inches.

Influenced by the injury and disfigurement caused to brickwork by the shrinkage of breast-summer, the author has lately thought of a method of counteracting it: it is simply to slant off the ends of a timber breast-summer or of a window-head, as much as the quantity which

*a-b.* Breast-summer or window-head of timber.  
*c-d.* Part of ditto slanted off.  
*e-f.* A plate, or several bars of wrought-iron, laid upon the slanted part of the timber, and resting also upon the brick pier.  
*g-h.* Part of the brick-work, which throughout the whole height of the work is to be laid to the same slope as the timber.  
 Note. The slant must increase with the height and number of the breast-summer or window-heads: otherwise the upper timbers will sink more than the allowance.

it may be expected to shrink; and to place a plate of wrought-iron (or several bars of wrought-iron) out of level upon the slanting part of the wood, and resting upon the brick pier at the end of the timber; and to build the brickwork over the breast-summer or window-head of the same form as the upper side of the timber, that is, out of level for about two or three feet next the ends of the wood.

The object of this seeming malformation is, that when the wood has shrunk to its smallest dimensions, the top of the breast-summer or window-head may be exactly level with the top of the pier; and the iron upon which part of the brickwork will be supported having moved like a floating bridge with the fall of the tide,

will also become level, leaving a small triangular crevice between it and the end of the timber, which, when shrinkage has ceased, may be stopped by a wedge: and thus the shrinkage of timber will cause the courses of the brickwork to settle level, instead of causing them to fracture, sink, and become distorted.

But as the author conceives that the use of breast-summer is scarcely honourable in architecture, under any circumstances, and under any form, and of any materials, he recommends the discarding of them altogether upon every pos-

sible occasion; there can rarely be any plea for the use of them besides absolute necessity, or the modern false taste of supporting a heavy upward mass of fabric upon scarcely any thing apparent.

The author has lately used, for the reception of walls which could only admit supports at their ends, a kind of breast-summer (or rather arches) composed of brickwork, with stone abutments, and the whole contained within two long hoops of wrought-iron: and this has proved successful; for provided the hoops be

- P, P. &c. Story-posts of iron to be first let into the old brick-work.  
 H. Hoop of wrought-iron, welded completely and inserted in the brick-work, no more of the old work being removed than will be sufficient to admit the iron. When the hoop is inserted on one side of the wall, a second similar hoop is to be cut out for and inserted on the other side of the wall.  
 C. &c. Cradle-bars of wrought-iron which are to be cut out for and inserted within the hoops.  
 S. Skew-hack of stone which is next to be inserted within the hoops.  
 a. Another skew-hack of stone which is next to be inserted within the hoops.  
 1, 2, 3, 4, 5, 6, &c. The order in which the old brick-work is to be gradually removed, and to be replaced by a well-bonded arch of brick-work set in Parker's cement.  
 V. &c. Vacancy which may be eventually left between the hoops and the cradle-bars.  
 The old work between the story-posts is not to be removed till after all the other processes are complete.  
 If this mode be adopted in new work, much of the trouble and caution will be unnecessary.  
 The two hoops should be pitched over, to prevent corrosion; and some cross ties may be used, in order to prevent the two hoops from moving further apart.

completely welded together, and be sufficiently strong, and the arch be bonded so closely as to admit of no settlement, neither expansion nor sinking to any sensible degree can take place: this trial proving successful, he has since employed the same means in an old building; whereby much of the trouble, expense, and inconvenience of shoring were saved. In adopting this method in old buildings, success will

depend upon the care and address with which the work is performed.\*

The author also suggests the following

\* The author lately adopted this mode successfully at the premises of Messrs. Rivington, St. Paul's Churchyard, London; part of a back-front was to be removed, and though this was so ruinous as to be almost ready to fall, the new work was inserted with only the use of half the usual quantity of shoring; and the operation caused no damage whatever to the work above.

- P, P. Story-posts of iron to be first inserted.  
 S. Skew-hacks of stone to be in succession inserted.  
 A. Arch which is to be formed piecemeal, only a small part of the old work being removed at once.  
 G. Gothic arch, which may on some occasions be preferred to the one last described.  
 W. w. &c. The old wall upon which the arch is to be first marked out, and into which the arch is to be afterwards set.  
 p, p. Minor story-posts of iron, which may be afterwards inserted if required.

 T, t. Wrought-iron tie, to prevent the arch and the story-posts from expanding.

method, which he believes may with good success be adopted upon many occasions, both in new and in old buildings; and he intends to put it into practice upon an early occasion: this is by supporting all the chief super-incumbent weight by a strong arch of brickwork, or of masonry, semi-circular or Gothic as the case may require (but the latter always if the work is to be covered with stucco, and is in old buildings); in this, as in the last-described method, shoring is nearly if not entirely superseded; and if address and care be used, no fracture will occur. The mode to be adopted, is first to fix the story-posts of iron; then to proceed to mark out the great arch, which may be inserted bit by bit (without endangering the fabric), till the whole is complete.\* The tie across may be made very light, according to circumstances, and sometimes so as merely to be sufficient to hold the story-posts from being driven apart; and in lieu of a breast-summer, may be inserted one or several such assemblages of work as are described in § 542. —From *Decline of Excellence in the Structure and Science of Modern English Building*. By Alfred Bartholomew, Esq., F.S.A., Architect, Professor of Carpentry to the Free-Masons of the Church.

#### WESTMINSTER BRIDGE.

THE *Times* newspaper has published the subjoined remarks upon this structure:—

The late state of Westminster-bridge has excited, not without reason, a good deal of interest in the public. That interest has almost terminated in alarm and the apprehension of the destruction of the edifice, from the rumours that have arisen about what is going on, and the somewhat tremendous appearance of the excavations into the very body of the fabric, which have been partly seen through the hoarding by which the footpath is confined, and at the ends of the hoarding at those points where the foot passengers cross from one side of the foot pavement of the bridge to the other. To attach blame to any person or persons to whom the repair of the bridge has been intrusted, would be invidious, and, as far as we can at present judge, unjust. It would require a very complete knowledge of engineering and of the science of bridge-building, together with a very minute inspection of all that has been done and is still being done at this bridge, to enable any one to give a decisive opinion of the labours of Messrs. Walker and Burges; and it would be a piece of very impertinent presumption on the part of anybody not practically and intimately acquainted with all the details and difficulties of the proceedings and processes either to condemn or praise. As far as we can form an opinion, these gentlemen have done all in their power to remedy the defects of a bridge, which, we believe, it is admitted was from the time of its original construction by Labeleye, nearly 100 years ago, understood to be defective in its foundation, or at least so balanced on its foundation, as to be extremely susceptible of danger from any alterations in the bed of the river, or from any cause by which an alteration could be effected upon its pressure. The report presented by Messrs. Walker and Burges to the Speaker of the House of Commons last summer, and which is reprinted below, will explain what it was the business of these gentlemen to perform, and also some other matters by which the public may partly judge of what will be the state and appearance of the bridge when the repairs shall be complete, and the whole of what has been proposed carried out.

In the mean time, a few words as to what was, until Saturday last, the state and situation of that part of the bridge by which the alarm has been caused will be of interest. The pier, called, we believe, the "seventeen-feet east pier," has been repaired and widened. Its pressure on the bed of the river was found to be at the rate of five tons and a half to a square foot, and it was found that the timbers of the original caisson, which were very much decayed, had been on the edges of the stone work of the pier forced out of their horizontal position, and bent and broken upwards by the enormous weight. The engineers, amongst

\* The author has several times adopted the method above stated of inserting an arch in an old wall without shoring, and he has done so lately at his own residence. Since writing the above, he has been told that the same method was pursued in an alteration to a new church by the Regent's-park, London; but this method, so simple and obvious, he never heard of before he practised it himself.

other means to remedy this defect, enclosed the whole of the lower portion of the pier with sheet piling, driven seven feet into the clay of the bed of the river, and made watertight by the closeness of the piles one to the other. Between the piles and the pier stone-work closely cemented was introduced, and the work was submitted to the judgment of those who were considered competent to form an opinion, and who gave an opinion that the means adopted were the best that were available. Nevertheless, the pier began or continued to sink, and danger was apprehended for the fate of the arch which it supported. The plan adopted to prevent such a catastrophe, and which it is hoped will prove effectual, was this:—the pavement of the bridge was taken up, and the immense mass of Kentish rag-stone, cement, &c., composing a concrete, and weighing upon the pier 2,400 tons, was removed from the spandril of the arch. Since this has been done, the pier has remained firm, and the settling of the foundation appears to have ceased. The concrete has since been removed from the spandrils of all the arches, and, in the place of a solid mass, brick arches have been substituted between the spandrils, by which nearly a third of the weight of the bridge will be removed, and the consequent pressure of the piers on the clay bed of the river relieved. The enormous weight of the balustrades and the heavy recesses will be removed, by which a further reduction of weight will be obtained, and the future projected ornamental alterations facilitated. This will, of course, be a work of some time; but if the bridge be ultimately rendered secure and more slightly than at present, nobody will be much inclined to find fault with what is a temporary yet necessary obstruction to passengers.

The following is the

"REPORT TO THE SPEAKER, BY MESSRS. WALKER AND BURGESS, ON THE ALTERATIONS PROPOSED BY MR. BARRY.

Sir,—As that portion of Mr. Barry's report to his Royal Highness Prince Albert (on the decorations, additions, and local improvements connected with the new Houses of Parliament) which refers to Westminster-bridge may naturally lead to the opinion that our plans, made under the direction of the bridge Commissioners, were confined to the repairing and extending of the foundations, for our superintendence of which he kindly compliments us; we consider it therefore a duty to prevent such a mistake, by stating, that the designs, estimates, and the original contract with Mr. Cubitt, included the repair of every part of the bridge, the 'removal of the present steep and dangerous acclivities,' and the 'lowering of the parapet and road-way to the lowest possible level' that appeared at the time to be consistent with the safety of the present arches. The second contract with Mr. Cubitt is for lengthening the piers, which are being carried to above high-water level, to receive arches for widening the bridge 12 feet. It will then be of the same width as London-bridge. All, in fact, that we have done to Blackfriars-bridge is designed and contracted for\* to be done to this bridge, with the very important addition of the preparation for widening. The steepest part of Westminster-bridge roadway will, when the designs are executed, be as easy as that of Blackfriars-bridge. That which rises 1 in 14 will be reduced to 1 in 24, and even this rise will be for only a limited length.

To secure the foundations, which were in danger of being undermined by the scour consequent on the removal of Old London-bridge, has been the first object. The supposed difficulty of doing so effectually was increased by the opinion entertained by Labeleye, the original engineer, and others since his time, that, owing to quicksands, coffer-dams could not be applied; and the Commissioners have been desirous of removing all doubt on this point before proceeding with the spandrils, roadway, or parapet. Five out of the seven coffer-dams have been built; so far, we have been completely successful: and while the water was excluded, all the work which was required in repairing and lengthening the piers to above high-water has been done; 7 out of the 13 arches have also been repaired, as the coffer-dams gave facility for the scaffolding necessary for doing this. Thus far, therefore,

\* \* \* The Commissioners have power to suspend or supersede the contract in respect of any works not commenced."

our design proposed to, and approved by, the Commissioners, corresponds with, and has anticipated, Mr. Barry's; but the idea of taking down the present semi-circular, for the purpose of substituting pointed arches upon the same foundations, is not ours; and we beg to state shortly why we do not concur in the expediency of this proposal.

"Mr. Barry's first argument for this change is, 'that the pointed arch will enable the road to be lowered, by materially reducing the thickness of the crown of the arches within what is considered necessary for arches of a circular form.' Now, we consider that the whole thickness of the stone-work and covering of the present centre arch may be reduced to about seven feet, which is the same thickness as Mr. Barry's ribs, arch, and covering, measured upon his section; so that, even supposing the principle he states, of the pointed arch requiring less thickness than the circular arch, to be correct, he obtains no reduction in thickness, and only lowers the roadway, by lowering the soffit of the arch. The generally approved theory of arches is, however, directly at variance with Mr. Barry's. In *Pratt's Mathematical Principles of Mechanical Philosophy*—considered a standard work, and, as we are informed, a text-book at Cambridge—the theory is so clearly explained, that we give it in his own words:—'A pointed arch,' he says, 'must have a great pressure on its crown, to prevent its falling, because it may be considered as consisting of two extreme portions of a very large circular arch brought together, so that the pressure on the crown must at least equal the pressure of the portion of the circular arch which is removed. Flying buttresses always have a great pressure upon their highest part. The pointed arch will sustain almost any weight on its crown, provided the lower stones do not give way, and, consequently, the Gothic arch is stronger for lofty buildings than the circular; but the circular arch is far better adapted than the Gothic arch for bridges, since the pressure of weights passing over may act upon any part of the arch, not only on the crown.' Mr. Whewell comes, in different words, to the same conclusion; and the same can be deduced from Atwood, though not so clearly expressed. These are no mean authorities; indeed, we do not know an exception in any author, British or foreign, to the opinion, that the pointed arch requires a greater thickness of material at the crown than the circular arch to keep it from rising; and if so, the substitution of the pointed arch should, in place of allowing a reduction, demand an addition to the least thickness required for the present arches. Add to theory, the experience of every modern engineer of this or other countries, as shown in their bridges of any considerable size: for we are not aware of any example of a pointed arch for a bridge of any magnitude in the works of Smeaton, Rennie, Telford, Perronet, or indeed of any other.

"Mr. Barry's second argument for substituting the pointed arch, is 'the elevation of its springing above the level of high-water, by which the water-way of the bridge will be the same at all times of tide, in place of being contracted by the present spandrils at high-water nearly equal to 1-20th of its sectional area, occasioning currents, with a fall, and the bridge under the influence of high winds.' Mr. Barry appears here to have stated 'sectional area,' when he must have meant 'width or chord'; for we find that in the section of his scheme, the contraction of the middle arch by the spandrils is about 1-20th of the width at the level of Trinity high water; but as the contraction is only a few feet in depth before the arch falls into the vertical line of the pier, the diminution of sectional area is not 1-20th, nor more than 1-120th, and this at high water only; and even this small diminution is in effect reduced practically to nothing as respects the current, when it is considered that the greatest velocity does not take place until half ebb, by which time the water has sunk below the level of the spandril. It is, we think, therefore evident, that the proposed alteration will not produce any useful effect upon the currents or the falls. When the bed of the river is raised, the present current will also be a part of the contract), and the coffer-dams removed, the present current through the bridge will be materially lessened. Some

practical good would be effected by the higher point of springing of the pointed arches, in giving more head-room for craft near to the piers; and as the Westminster-bridge arches have less space for navigation than any of the four-city bridges, any increase of accommodation is desirable; unfortunately, however, while an addition is thus made for one-fourth of the width of the arch near the springing, a portion is taken away from the height of the remaining three-fourths, nearest the crown, where it is of the greatest importance; this diminution varies from 18 inches to 30 inches, so that the centre arch will not then have more height for navigation than the two arches adjoining the centre arch now have; and when we inform you that at high water of good tides the centre arch is the only one which some of the steamers can conveniently pass under, we think you will allow with us, that the proposed lowering will, in such cases, be rather a practical evil, as it will take from the convenience of what is now the least convenient bridge for navigation, to say nothing of the liability to the ribs being injured by masts and chimneys striking them.

"The 'artistic' point of view is the last insisted on by Mr. Barry; and on this, what we may say is with a due respect to his better judgment and taste in matters of architecture. The contract with Mr. Cubitt does not alter the present elevation below the crown of the arches; but, as you are aware, we have long since suggested that a new elevation for the bridge after the Norman style would be a great improvement. In this, however, we would not propose to reduce the magnitude of the features of the bridge, considering, that simple boldness and strength are essential qualities in a bridge over the river Thames, in London; and if so, that it is scarcely fair to reduce the parts of the bridge because those of the elegant florid edifice which is now being erected near it, are small. For palace architecture, the latter may be the best, and we do not venture an opinion as to the effect of Mr. Barry's great work, in which our professional employment was confined to the construction of the cofferdam and the river wall; but for a bridge, particularly in a city, with constant and heavy rough trade under and over it, the style of architecture ought, we conceive, to be more masculine. May not the new Houses be better displayed thus, than by accordance of style? The beauty of the detail of the new Houses is very great; the length 800 feet, without at present any striking feature or variety, also great; but we submit, whether an additional 800 feet of according composition and style, of still lower elevation, would not rather tend to render the ensemble dull and flat than effective? The style of the new buildings must stop somewhere. Can it do so better than at the bridge, which, as we have already said, appears to require a character different from the Houses of Parliament? If both faces of the arches are proposed by Mr. Barry to be alike, would there not be a want of accordance between the north face of the bridge and the buildings and mansions near to it, which there is, we presume, no intention of altering? Is a continuance of the same style required for so great a length as the Houses and the bridge together, although the 'pointed' may be the prevailing character of the building? Does not precedent reply to this in the negative, and prove it, by the fact that the periods of the original erection and of the additions that have from time to time been made to some of our finest buildings may be discovered by the style; the Saxon, the Norman, the pointed, and varieties of each being found in the same building, and yet the ensemble not inharmonious. We hope, therefore, that the superstructure of the bridge, though it may be different in style from the Houses of Parliament, may not be discordant.

"Westminster-bridge has been where it is, and as it is, for a century; it was there when the designs for the new Houses were made, and we never heard that to pull down Westminster-bridge to nearly low water was to be a necessary accompaniment to the adoption of any of the designs. If you and the other Commissioners had known that such alterations were contemplated, you would not, we are sure, have allowed the works to have proceeded as they have done, until nearly two-thirds of the whole to above high water had been completed, including the renewal or repair of the arch stones.

"We may name here an objection to the

form which Mr. Barry has proposed for the arches, as tending to lessen the stability of the bridge. Labely considered that by adopting the semi-circular arch, which presses vertically upon its piers, each pier might be considered an abutment, so that if one arch were to give way, the piers would support all the others. From the greater height at which the proposed pointed arches spring from the piers, and their greater lateral pressure or thrust upon the piers, the above would not be the case. On the contrary, the failure of one arch would, we conceive, cause the destruction of all the piers and arches. This consideration is not to be disregarded in a bridge the piers of which have been so badly founded, that to support them has been a constant expense, and is at this moment a source of considerable anxiety, although the works we have in hand, if as successful as hitherto, will render the piers much more secure than they have ever been; we hope perfectly so.

"On the whole, therefore, we have reason to be pleased that Mr. Barry approves the various improvements in the bridge which the Commissioners have contemplated, and with one exception, contracted for. The only addition he makes to them is the substitution of the pointed arch, which, for the reasons stated, we cannot advise. We agree to the advantage, in point of taste and utility, of keeping the roadway of the bridge low; we have designed doing this as far as can be done, having regard to the funds of the Commissioners, and therefore without disturbing the present arches. There is a way by which the height of the roadway might be reduced below what either Mr. Barry or we have yet proposed, at one-fourth of the expense of his plan (which would, we think, much exceed his estimate), and without lowering the soffit of the arch, or diminishing in any way the convenience of navigation; but we avoid entering upon, or committing ourselves to this, until we have considered the subject more in detail, and understand it to be the wish of the Commissioners that we should do so; for the works we have already recommended may go as far as their unassisted funds would justify.

"We have the honour to be, Sir,

"Your obedient servants,

WALKER and BURGESS.

"The Right Hon. Charles S. Lefevre,  
Speaker of the House of Commons,  
Chairman of the Commissioners of  
Westminster-bridge."

In our next number we shall give Mr. Barry's reply, and shall ourselves make some observations to the purpose.

#### THE TOWER OF LONDON.

EXTENSIVE alterations and improvements are to be made at the Tower, which was recently visited by the Duke of Wellington in his capacity of its chief officer, or constable, preparatory to their commencement. His Grace made a minute survey of the buildings and localities, attended by Captain Erlington. The two archways contiguous to the Salt Tower, at the eastern extremity, near the St. Catherine's Dock, and the houses extending in a northerly direction opposite to what are called the Irish barracks, are to be pulled down, in order to widen the thoroughfare for foot passengers and carriages. The tenements to the westward, now occupied by some of the warders and resident clerks of the Ordnance Department, and which are situate in the rear of the Small Armoury, are likewise to be razed. On their site are to be erected barracks of sufficient magnitude to accommodate one thousand men; the Map Tower is to be converted into officers' barracks. The Beauchamp Tower, or State Prison, which is at present the mess-room of the officers of the battalion of Guards on Tower duty, is to constitute the new Small Armoury, to be placed in charge of the warders, and to be opened to the public. The men's barracks will form the northern side of a new square, and face the White Tower; the eastern side will consist of the officers' barracks in rear of the Irish barracks. The intervening space is to be made into an esplanade for the recreation of the troops. The moat having been drained and levelled to low water mark, is to be planted with trees and evergreens (which latter are to be trained up the walls of the fortress to conceal them from the eye), and used for pleasure grounds and the occasional exercise of the men.

#### THE NEW ROYAL EXCHANGE.

The following are said to be the heads of the information contained in the last report sent in by Mr. Tite, the architect of the new Royal Exchange, to the Joint Grand Committee for Gresham Affairs:—

It states that, with respect to the external works, the grasshopper vane, repaired and regilt, was deposited in its place on the 8th of December last; that the tower was completed to the cleaning down of the stonework, a process which will be effected as the scaffold is being removed. At the west façade the columns and architraves of the great Venetian windows have been set, and the carved shields and festoons over the opening and over the whole of the central arch have been finished.

As to the internal works, the report touches first upon the basement, and states that the vaults over the basement have been completed, with the exception of an arch which is to be formed under the staircase leading to Lloyd's. In the London Assurance portion of the building, on the one-pair floor, the whole of the fire-proof arches have been turned, and the joists and partitions in the western end are in their places. In other parts the plates are laid. On the two-pair floor the joists have been laid all through. The roof has been nearly completed, both plumbers' and slaters' work being almost wholly finished.

In the Royal Exchange ground-floor the fire-proof arches have been turned throughout, and the joists and partitions have been nearly all deposited in their places. In the two-pair floor the joists have been all laid and the quartering is in a forward state. The leadwork to the roof of the portico has been within a third completed, and this department will require very little more labour generally.

In the unappropriated room on the one-pair floor the fire-proof arches have been completed as well as the joists and partitions. In the two-pair floor similar progress has been made.

In Lloyd's room on the one-pair floor all the fire-proof arches have been turned. The reading-room and other rooms on each side of the tower remain in the same condition in which they were represented to be at the time the last report was made. In the roof the plumbers' and slaters' work is throughout exceedingly forward, and but little remains to complete that portion of the work.

With regard to the sculpture, Mr. Tite expresses his satisfaction at being able to report that every figure has been transferred from the model to the stone, and that a month's labour will complete the work, so as that it will be ready for hoisting within that period. When the sculpture shall have reached its appropriate position, the finishing touches will be given to it by the sculptor. Judging from its present advanced state, the architect entertains no hesitation in assuring the committee, that if necessary, it could all be in its place and completely finished within two months from the stated date.

The dials and hands of the clock have been prepared, and will be placed as soon as the scaffold has been sufficiently removed to enable the men to place them with safety. The machinery of the clock is very nearly completed, and the only thing remaining unsettled is the arrangement with respect to the actual tunes of the chimes. Upon that subject Mr. Tite had consulted Professor Taylor, the Gresham Lecturer on music, and he hoped that before the next meeting of the committee he should be prepared to report the result. The moulds for some of the bells have been prepared, and in the course of a month several of the bells will be cast. Mr. Tite concludes with congratulating the committee, at the close of the third year of the work, on the generally favourable state of the seasons throughout the whole period. The mildness of last winter, and the unusually fine spring which followed, were greatly in favour of building operations, and though the early part of the summer was wet, yet since August up to the present time scarcely a day has been lost by interruption from the weather. He could see nothing at present, unless some unusually severe weather should occur after Christmas, to prevent the realization of his hopes that the contract would be completed within the time originally agreed upon.

## FIRES IN LONDON, 1843.

At a meeting of the directors of the principal insurance companies composing the committee of the London Fire Establishment, which was held at the chief station in Watling-street, Mr. Braidwood, the superintendent of the brigade force, made his annual report of the fires that have occurred in the metropolis and its suburbs during the past year. The report, which is extremely voluminous and interesting, commences by stating that the fires in 1843 as compared with the previous year have decreased by twenty; the average, however, for the last ten years shews an increase of 62. The number of fires and alarms which have happened from January 1 to December 31, 1843, at which the engines of the establishment have been called into operation, amounts to 901. It further mentions that the fires by which premises were totally destroyed numbers 29, buildings considerably damaged 231, ditto slightly 469, chimnies 53, and false alarms 79. Total 901. It also appears that large fires, providentially, have not been so extensive and numerous as those that have occurred in previous years. Mr. Braidwood observes, that the following were attended with the most serious loss of property:—On the night of the 16th January, the two large floor-cloth manufactories of Messrs. J. Rolfs and Gunstone, situated in the Old Kent-road, were totally consumed, together with two dwelling-houses. It will be recollectcd that some surprise was manifested at the great height which the fire attained, which he attributes to the factories being almost entirely composed of wood, and the great delay that arose in getting a supply of water after several of the engines had arrived. The next took place on the 10th of July at Mark's, the extensive marine-store dealers, in Leicester-place, Greenwich, and the great fire at Topping's Wharf, on the morning of the 19th of the same month, which, it will be remembered, destroyed four warehouses, besides St. Olave's Church, and Watson's Telegraph. The extent of this conflagration he accounts for by the fire breaking out in an oil warehouse having no party-walls, and an inefficiency of water. It will be recollectcd, that the church was sacrificed in order to preserve property which otherwise would have been destroyed to the amount of 400,000*l.* The report thus details the fires that occurred:—“At the turpentine distillery, Rotherhithe, in January; at the Golden Lion, Bexley-beath, in June; on the 16th of July, at Pinchin and Johnson's oil-works, St. Georges-in-the-East; at Newberry's the chymists', in Fetter-lane, where five lives were lost, on the 19th of August; the three that followed in rapid succession on the night of the 14th and morning of the 15th of September, at Limehouse, Wapping, and Westminster; the fatal fire in St. Martin's-court in October—three lives lost; and, lastly, those at the candle manufactory in Paradise-street Lambeth, and Bramah's engineering factory at Picnic, during the last month.” Of the 29 large fires which are noticed at the commencement of the report, the number of buildings consumed thereby amounts to 40. Further on it mentions the different trades at which fires have occurred and their causes. There are a great number of them, however, marked unknown, and it is too strongly believed that the principal part of them have been occasioned by incendiaries. 280 in private houses, chiefly caused by bed and window-curtains igniting through neglect of domestics, 59 lodging-houses, 30 licensed victuallers, 23 coffee-shops, 20 woollen and silk mercers, 23 sale shops, 20 cabinet-makers, 5 public buildings, 10 bakers, 7 lucifer manufactories, and three ships. A large number, however, are described to have originated in offices, sheds, &c. The chief causes are stated to be carelessness of servants, and defects in stoves and flues. The number of fires that have taken place since the formation of the establishment in 1832 up to the present time amounts to 6,523. The report then concludes by observing that the most valuable assistance has been, on all occasions, rendered by the police at the above conflagrations.

**KEGWORTH.**—The spire of the beautiful church at this town having been recently repaired, the newly-gilded vase was placed upon its summit on Monday last. The height of the spire is fifty-three yards.—*Nottingham Journal.*

## DR. SOUTHEY'S MONUMENT.

In consequence of a desire which has been generally expressed that a public testimony of respect to the late poet laureate should be placed in the church of Crosthwaite, near Keswick, in which parish he had spent the greater portion of his life, a meeting was held at Keswick, on the 31st of last October, when various resolutions, for the purpose of carrying the above purpose into effect, were unanimously agreed to. The first of these resolutions was, “That in accordance with what appears to be a general wish, a tablet, with a medallion of Mr. Southey, in white marble, be adopted as the monument to be erected; and that Wm. Wordsworth, Esq., poet laureate, be requested to write the inscription.”

With this request Mr. Wordsworth cheerfully complied, and having been favoured with a copy of the inscription, we lay it before our readers, for their gratification:—

“Sacred to the memory of Robert Southey, whose Mortal Remains are interred in the neighbouring Churchyard. He was born at Bristol, October 4, 1774, and died after a residence of nearly 40 years at Greta Hall, in this parish, March 21, 1843.

“Ye torrents, foaming down the rocky steeps,  
Ye lakes, wherein the spirit of water sleeps,  
Ye vales and hills, whose beauty hither drew  
The poet's steps, and fixed him here on you  
His eyes have closed; and ye, loved books, no more

Shall Southey feed upon your precious lore,  
To works that ne'er shall forfeit their renown,  
Adding immortal labours of his own:  
Whether he traced historic truth with zeal  
For the state's guidance, or the Church's weal;  
Or fancy, disciplined by studious art,  
Informed his pen, or wisdom of the heart,  
Or judgments sanctioned in the patriot's mind  
By reverence for the rights of all mankind;  
Large were his aims, yet in no human breast  
Could private feelings find a holier nest.

His joys, his griefs, have vanished like a cloud  
From Skiddaw's top; but he to Heaven was  
vowed  
Through a long life, and calmed by Christian  
faith

In his pure soul the fear of change and death.”

## OXFORD SUMMER CIRCUIT.

## EVANS V. OAKLEY, AND OTHERS.

**SALOP, Aug. 10.**—A surveyor of highways is not authorized to pull down fences erected within fifteen feet of the centre of the road, unless they be erected also on the highway.

It appeared from the evidence that the close in question was situate in the township of Stonev Sretton, on a road leading from Edge to Westbury. The road was a more country lane, almost covered with grass. Parallel with, and adjoining the road, was a strip of waste ground lying three-quarters of a yard above the level of the highway, and bounded on the other side by a fence which divided the wastes from the other land belonging to the plaintiff. About eighteen years ago, this strip of waste land was made the subject of negotiation between the parish and the plaintiff, and it was actually enclosed and used as the parish pound for three years, but no conveyance was ever executed, as the money agreed upon was not paid. Subsequently, therefore, the plaintiff took possession of the land—pulled down the pound, and erected on the waste land a fence of posts and rails for the purpose of separating it from the road, having at the same time thrown down the fence which had previously divided the waste from his adjoining field. It was admitted that for six years back the waste was not known as a road on which people had travelled. Opposite to the place in question, the road was fourteen or fifteen feet wide, which was rather under than the average breadth of the whole road. The width of the part enclosed was seventeen feet. The defendant Oakley was surveyor of the highways, and by his direction, the other defendant, one Phillips, pulled down the fences which the plaintiff had erected on the waste.

On behalf of the plaintiff it was urged that the surveyor was only required to maintain a waste of twenty feet for the cartway when the ground between the fences including it would permit; and submitted, that as the fence pulled down by the defendant was not erected on the highway, although within ten feet of its centre, the provisions of the statute did not

apply.—*Lowen v. Kay* 4 b. & c., p. 3, was precisely in point. There the question arose upon the 64th sec. of the statute 13 Geo. 3, c. 78, the provisions of which were almost identical with the terms of the 69th section of the present Highway Act, and the Court of B. R. held that unless the fence were on the highway, the party erecting it was not guilty of any offence against the statute, nor was the surveyor authorised to remove it.

Mande, J.—I cannot distinguish this case from *Lowen v. Kay*. Two things must concur to bring a fence erected under circumstances like the present within the provisions of the statute. The fence must be within fifteen feet of the centre of the road, and it must be erected on the carriage highway.—*J. P.* p. 660.

Verdict for the plaintiff, with damages and costs against the surveyor.

## CHURCH EXTENSION.

A MEETING of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels was held at their chambers in St. Martin's-place on Monday last, the Lord Bishop of London in the chair. There were also present the Lord Bishop of Landaff, Sir R. H. Inglis, baronet, M.P.; the Revs. Dr. Spry, H. H. Norris, J. Jennings, and B. Harrison; Messrs. N. Connop, J. S. Salt, Benjamin Harrison, S. B. Brooke, Wm. Davis, E. L. Badeley, &c. The reports of the sub-committee having been read, the board examined the cases referred to their consideration, and finally voted grants of money towards building additional churches or chapels at New Swindon, Wilts, the principal station of the Great Western Railway; at Norland, in the parish of Kensington, Middlesex; at West Hide, in the parish of Rickmansworth, Herts; and at Yeovil, Somerset; also towards enlarging and rebuilding existing churches at Bevingdon, Herts, and St. Alkmund's, Derby; also towards enlarging and otherwise increasing the accommodation in the churches of Burtlescombe, Devon, and Stoke Golding, Leicestershire. The population of these parishes is 43,231 persons, and the accommodation now provided in nine churches is 7,407 seats (being for less than one-sixth of the whole number), including 1,955 free seats, or one free sitting for 22 persons. The additional church room to be obtained by the execution of the works in aid of which grants are now voted by the society is 3,916 sittings, 2,716 of which will be free. One of the parishes assisted has, at present, church accommodation for less than one-sixth of its population, which is 17,000 souls; another, with 9,000 inhabitants, possesses church room for about one-twentieth of that number; and a third, with a population of 7,000 persons, can accommodate barely one-sixth. The requisite certificates of the completion of five additional churches, of the rebuilding, with enlargement, reseating, &c., of three other churches, were examined and approved, and orders were issued for the trustees to pay over to the treasurer the sum granted by the society in each case, in order that he may remit the same to the respective applicants. The population of these 13 places is 26,875 persons, and, before it was determined that the works now completed should be executed, the church accommodation provided in these parishes was 5,854 sittings, including 1,367 free seats. One of the parishes, with a population of upwards of 6,000 persons, had accommodation for about one-ninth of the number, and five others, each with a population of about 2,500 persons, possessed church room for from one-fourth to one-eighth. With the aid of the society's grants 3,015 additional seats are now provided at these places, 2,523 of which are free. Since the last meeting, the committee have received intimation that applications will be made for their assistance towards the erection of churches in six populous parishes, and towards rebuilding, enlarging, and otherwise increasing the accommodation in the churches of seven other places, as soon as the requisite plans, specifications, and other documents can be prepared for their inspection. In addition to which, the plans, &c., relating to six applications are now under the consideration of the sub-committee, preparatory to their being referred (if approved) to the general board.

## THE CHURCH OF THE HOLY TRINITY.

The following letter has been addressed to the editor of the *Hull Packet* :—

"Sir,—As a lover of ecclesiastical architecture, it was with feelings of regret that I saw mentioned in your columns the present dilapidated state of the church of the Holy Trinity, Hull.

"Nothing, surely, can be a greater sign of the religious degeneracy of our times, than the almost universal neglect into which our churches had fallen previous to the great movement which has of late been made in favour of Christian architecture. Those glorious structures (beautifully styled by Coleridge "Petrefactions of our religion") which, in their faded magnificence, bear testimony to the faithfulness of former generations, in raising temples worthy the honour of the High and Holy One who inhabiteth eternity, exclaim no less eloquently, through the decay into which they have willfully been permitted to fall, against the faithfulness of this degenerate age.

"It is, therefore, with feelings of no common interest that I would congratulate the inhabitants of Hull on the noble efforts they are making towards the restoration of the church of the Holy Trinity (knowing, as I do, the architectural merit it possesses) to its pristine beauty. But, at the same time, I would wish to remind them that, although the flame of church-building zeal—but lately so nearly extinguished—has in some measure been rekindled, there is, it is to be much regretted, much of zeal without knowledge abroad among us. Without wishing to dispute the talent and ability of the architects they have selected, I would merely suggest the advantage of subjecting their plan for the approval of one of the architectural societies, either the Yorkshire or Cambridge Camden Society. Thus acting upon the principle that 'in the multitude of counsellors there is safety,' they would be sure of procuring the best advice this age could afford them in the restoration of their church; at the same time ensuring that sacramentality of design which is the distinguishing mark of true Christian architecture.

The design of Messrs. Lockwood and Allom, which I saw in this year's exhibition at the Royal Academy, appeared to me highly commendable; but I cannot conceive, whoever the chosen architect may be, that he could fairly scruple to offer his plan for the criticisms of an architectural society. Wishing the good people of Hull success in their pious undertaking, and thanking you for the space I have occupied in your columns,

I remain, Sir, your obedient servant,  
AN ECCLESIOLOGIST.

London, Dec. 19, 1843.

CHANGE OF VALUE IN AGRICULTURAL AND MANUFACTURING PRODUCE.—A quantity of agricultural produce which, in 1694 was worth £100, would, at the present price, be worth £243; while a quantity of manufactured goods, which, in 1694, was worth £100, would now only be worth £40—so that a quantity of agricultural produce which, in 1694, would have exchanged for £100 value of manufactures, would, at the present relative value, command the same quantity that would, at that period, have sold for £600. Or, a quantity of manufactures which, in 1694, would have exchanged for £100 value of agricultural produce, would, at the present relative value, command only the quantity which would then have been worth £16. 9s. 2d. It may be curious and interesting to examine a few of the articles separately.

Butter and cheese have risen in price during that period 193 per cent.  
Corn, flour, &c., have risen 161 per cent.  
Cows have risen in price 209 per cent.  
Horses have risen in price 267 per cent.  
Wool has risen in price 169 per cent.  
While cotton manufactures have fallen in price during that period 73 per cent.  
Coals have fallen in price 60 per cent.  
Iron and steel have fallen in price 45 per cent.  
Linen manufactures have fallen in price 36 per cent.

And, what is very curious, while wool has risen 169 per cent., woollen manufactures have fallen 10 per cent. in price. It must be remarked that these calculations are in no way disturbed by any changes in the value of money during the interval; for, whatever change in this respect has taken place, refers as much to one class of articles as to the other. The comparison is equally true, whatever changes have taken place in the value of our currency.

## Correspondence.

"To whatever extent the physical strength and probable duration of the working man's life are diminished by noxious agencies, to the same extent so much productive power is lost; and in the case of destitute widowhood and orphanage, burdens are created, and cast either on the industrious survivors belonging to the family, or on the contributors to the poor's rates, during the whole period of the failure of such ability."—Mr. Chadwick, in *Gen. Law Rept.*

TO THE EDITOR OF THE BUILDER.

SIR,—Although the doctrine of the Poor Law Commissioners is not always to be received as gospel, I think no one can dispute the truth of the above remark, and as it appears to hear upon a subject I have long wished to see brought prominently before the public, and which is noticed in p. 513 of *THE BUILDER* (viz. Public Baths), I have thought proper to prefix it to these remarks, hoping that you will persevere in impressing upon the minds of "our pastors and masters" the necessity for such establishments until public baths are to be found throughout the length and breadth of the land.

In your article on Public Baths, I see that the working men of Edinburgh and of the metropolis are seeking to provide baths, but upon what principle is not stated. It seems therefore in this respect, as in most others, the working bees, alias the great multitude, are to be the pioneers in all that tends to improve the condition of the human race. From the present state of things one would almost imagine cleanliness and healthfulness to be a crime in all except those of patrician blood. The unwashed may certainly walk soberly and steadily in fresh health-giving fields and breathe the pure air provided alike for rich and poor (that is, if he can find time to do so, and then he must beware of trespassing and have the fear of the law before his eyes); he must be very careful not to refresh his dust-begrimed and toil-worn limbs in a bath prepared for him and to which he is invited by nature, for he has been most probably forewarned by a large board painted in staring characters that "all persons fishing or bathing in this water will be prosecuted as the law directs."

Now, Sir, it appears to me that if the laws and decencies of civilized life, ownership of the soil, &c. forbid the free use of those blessings provided by a God of Love for all his creatures, that they ought surely to provide an equivalent for the benefits of which they deprive them. This, I conceive, society fails of doing so long as any and every man has not an opportunity of effecting something more towards cleanliness and healthfulness (which are nearly allied) than by mere face-washing perhaps once a week, which I am sorry to see is the case too frequently in our manufacturing towns; and even in those towns where swimming-baths are provided, they are in the hands of private speculators, who of course require payment from all those who may be disposed to bathe, such sum being much more than a large majority of people can afford to pay oftener than once a week. People who can only avail themselves of the bath once a week, soon learn to do without it altogether.

Now it either is or is not the duty of a government to be watchful as to every thing that may tend to the benefit or injury of those placed under its charge. That it is the duty of our rulers thus "to be found watching," cannot, I think, be denied, and if the truth of Mr. Chadwick's remarks be admitted, I beg to submit that the question of public baths and gymnasia is one which ought to engage the most serious attention of those placed in authority over us. What, I would ask (in connection with proper bathing places), can be better calculated to raise up

"A bold peasantry, their country's pride," than the setting apart of a few acres of land as gymnasia, not only in every large town, where there should be several, but in every village? here all kinds of athletic games should be encouraged, and prizes might be given occasionally as at our agricultural meetings. The nations of old appear in their most high and palmy days to have been aware of the great advantages and happiness which a healthy high-spirited nation, not enervated by luxury, so derives. It was in the gymnasia of the Greeks when Greece was Greece, that the young were instructed in the arts of peace and war, and in all accomplishments calculated to make them useful citizens, and we are told that "as long as they were protected by the state, the sciences and the arts were cultivated with great zeal." The baths of Diocletian, Titus, Agrippa, Nero, Domitian, and others, bear testimony as to the great care taken by the ancient Romans to provide both for the minds and body of even the *populace*. They are described as having stood among extensive gardens and walks containing large halls for swimming and bathing, some for conversation, others for various athletic and manly exercises, some for the declamation of poets,

lectures of philosophers, &c., and for every species of polite and manly amusement. The Thermae were, at an immense expense, constructed chiefly for the use of the plebeian class. "For, supposing each cell of Diocletian's baths large enough to contain six people, yet even at that moderate computation 18,000 persons might be bathing at the same time."

Even the savage tribes of America, as we are informed by Messrs. Lewis and Clarke, make use of the vapour-bath, which they greatly esteem for all kinds of disease. Where must the labouring poor in England go for a vapour-bath? Now, Sir, it appears to me that the great mass of the people should not only have opportunities of healthful exercise, but should also be induced to make use of them. In order to this, might not every town containing above a certain number of inhabitants, say 5,000, be compelled to provide bathing accommodation for a certain proportion of its population free of charge? in connection with which there might be private baths, for which remuneration might be required; these, as bathing became general, would probably pay the expenses required in keeping up the public swimming-baths. Many different modes of carrying out the principle might be suggested, and trusting that some of your correspondents, who are much more capable than myself of doing so, will take up the subject.—Yours, Leamington, December 23, 1843. NORMAN.

LONDON, ITS SIZE AND POPULATION.

SIR,—Perhaps there is no way of really giving the mind a full comprehension of the size of any place better than the comparing such a place with others well known.

Most persons are acquainted with some of the following towns and cities, viz., Lincoln, Warwick, Dover, Boston, Winchester, Salisbury, Colchester, Yarmouth, Durham, Gloucester, Ipswich, Stafford, Hereford, Rochester, Doncaster, Carlisle, Canterbury, Wakefield, Hertford, Bedford, Bridgewater, Chesterfield, Darlington, Cirencester, Bury St. Edmunds, Devizes, Dartmouth, Beverley, and Grantham. Now we all know what a vast overgrown town is Manchester, but perhaps few would suppose that the whole of the population of the above cities and towns would be required to make another Manchester. If to the foregoing places, the last excepted, be added Gainsborough, Peterborough, Darford, Huntingdon, Shaftsbury, Ely, Stamford, and Lichfield (so gigantic has been the stride which the metropolis has made between the years 1831 and 1841, that a population equal to the thirty-seven towns named above has been joined to it within that short period, during which time London has increased nearly 400,000. If this calculation be extended, by adding to these thirty-seven towns the following great and important places, viz. Liverpool, Bristol, Birmingham, Nottingham, Newcastle, Brighton, Bath, Leicester, Cambridge, Chester, Halifax, Derby, Huddersfield, Norwich, Northampton, York, Exeter, Lancaster, Worcester, Ramsgate, Plymouth, Scarborough, Taunton, Leamington, Newark, Mansfield, Whitchy, Kidderminster, Sheffield, Tunbridge, Leeds, and Shrewsbury, making altogether sixty-nine of the principle cities and towns of England; yet so immense, so almost inconceivable is the population of the metropolis, that the whole of these places joined together would *not* make another London, for these sixty-nine towns make 1,873,189, when added together, whilst the metropolis alone is 1,873,676, leaving an overplus of 487 souls in favour of London. It would also require 534 towns as large as Huntingdon to make another metropolis.

So rapid is the growth of this queen of cities, that a population equal to that of Salisbury is added to its numbers every three months, but so overwhelmingly large is this Leviathan of towns, that this constant and progressive increase (standing as the fact may appear) is scarcely perceived, for it is almost like throwing a bucket of water into the ocean. Such is London—the city of the world.

N.B.—These calculations are based upon the last census. J. R. W.

16, Norton-street, 1st Jan. 1844.

SWISS COTTAGES & NORMAN.

SIR,—Your correspondent, "Norman," very justly calls the attention of your readers in general to the design for a Swiss cottage, given in page 471 of *THE BUILDER*, from the pencil of "P. T." After quoting from an article in the *Architectural Magazine* on the subject of Swiss cottages by Marie Phusin, and comparing the description therein given with the design of "P. T." and making a few remarks on the discrepancy of the two authorities; he concludes by expressing a hope that some of your readers, who have had opportunities of judging of the comparative correctness of Marie Phusin's description and of "P. T.'s" design, will favour him by giving judgment in the case. I have waited with all patience and respect the

appearance of a letter in your columns from some one of your correspondents more worthy of attention than myself on the subject, but as I do not find that such letter has as yet appeared, I will beg your patience for a few moments to the following remarks, which are drawn from notes made during a summer's pilgrimage through the greater part of Switzerland; which pilgrimage was made as much with the view of visiting the rustic cottages and *châlets* of the boors, as of beholding the vast natural beauties of this most interesting country.

I passed much of my time in observing the peculiar construction of their roofs, and the clever mode of framing their houses generally; and certainly, in my judgment, the design of "P. T." as much resembles a Swiss cottage, as the towering *chaco* of a Belgian officer resembles the hat of a cardinal, the only resemblance in either case being that they are intended to answer the same purpose. In the case of the design *versus* the Swiss cottage, each is intended as an habitation for man; and in the hat case, each is intended as a covering for the head of man,—*mais à nos moutons*.

The roofs of (genuine) Swiss cottages are invariably extremely flat, with their eaves projecting in the proportion of one-fifth or even one-fourth of the entire height of the walls. The walls are frequently of stone or rubble-work to the height of the lower story, above which they are formed of 2 or 3 inch plank fastened by spikes to the uprights of the partition, and are dovetailed together at the angles of the building. The principals of the roof rest on the story-posts, which are framed and doweled into them. The parts of the principals projecting with the eaves are strutted with grotesque brackets to the joists of the floor below, which project in the form of corbels to receive their thrust. Thus, when the tie-beam is fixed, the whole building from the first-floor inclusive forms a truss, or rather a mass of trusses. One reason for the great strength given to these roofs is, that the winter winds blow very violently in these districts, as also the fall of snow is extremely great in that season. Now, in the first place to meet the first difficulty, namely, the probable *enlèvement* of the roof, huge stones are placed on planks on the outside of the tiles, to give as much resistance as possible to the lifting power of the winds; and secondly, as the snow rests on the roofs to the thickness of many feet, the weight thereof, added to that of the stones before mentioned, makes it imperative that great strength should be studied in the formation of the roofs, to prevent the crushing powers of the combined weight.

I am, Sir, your constant reader,

BAUMEISTER.

Norwich, December 30, 1843.

#### THE LEICESTER MEMORIAL.

SIR,—It is most desirable that in all competitions of a public character, honour, plain-dealing, and impartiality in the judges should generate and justify perfect confidence amongst the competitors.

These premises being conceded, can all be true that I have heard on the subject of the proceedings in the matter of this memorial?

Can it be true, that, although Wednesday, the 20th ult., was named in the advertisement as the last day for the reception of designs, some one or more were actually received and allowed to be in time on Friday or Saturday, the 22nd or 23rd? If so, is this fair towards those, who, like myself, were much pressed for time, and hurried to complete our plans within the time prescribed?

Can it be true that one of the candidates (or perhaps more) personally paraded his designs to many of his friends amongst the subscribers and committee? If so, what secrecy or safeguard is there in the mottoes? It would be more straightforward at once to throw the matter open, and let the luckiest canvasser carry the day, than to induce those who either cannot, or will not, exert such undue influence, to enter into the lists with those who can and will.

Can it be true that a room has been taken in Norwich, in which all the designs have been arranged for public exhibition previous to the decision of the committee? If so, is it keeping good faith with those competitors who sent in their designs to a committee? I, for one, should decidedly object to such an exhibition at any time had I been consulted, and more especially to its taking place previously to the decision, and therefore subject to the "pressure from without" of private friendship.

Can it be true that a certain design having been injured in the journey, the designer and an assistant artist have been allowed to restore and beautify it in the very room where all the designs have been set out for exhibition? If so, whose design may they not, at least in part, adopt?

If these things be true, and I do not suggest them unduly, what man of character would in future engage in competitions where superior talent is not his only rival? and if irregularity is to ride paramount, and rules to be set at naught, what con-

fidence can any have in the honour, integrity, or impartiality of a committee who infringe the rules which they themselves have framed, and by which they are pledged to the public to abide?

Should my suppositions be false, I shall look anxiously for some denial of them in your columns, since it is a matter of much interest to many.

Trusting that you will give insertion to this letter, I remain, Sir, your constant subscriber and well-wisher,

London, January 1, 1844.

A COMPETITOR.

#### VALUATION OF PROPERTY.

SIR,—If it lies in your power, I shall esteem it as a great favour if you will furnish me (through the medium of your valuable publication) with a little information on the correct system to be pursued in the valuation of property, both leasehold and freehold. From the nature of my profession, I am sometimes called upon to give a valuation of property, and I must confess to you, that although up to the present time I have managed the matter pretty well, I am by no means satisfied with my present knowledge on the subject of valuation. I have oftentimes inquired of those who for their trade and the nature of their calling, I took it for granted knew all about it, but I found to my surprise, when I put the question to them, that they knew little more than myself. I found that their system, if it may be so called, amounted to little more than what is called a good guess. If you know of any publication which fully enters into the detail of the matter (you will see by this remark that I do not want merely a set of tables calculated in a way no one knows except the person who framed them), I shall be glad to purchase it; if you do not, perhaps yourself, or some of your talented correspondents, will be so kind as to throw a little light upon the subject. I have no apology to make for troubling you with this letter other than this, that I have read your truly interesting and valuable publication from its commencement. Wishing you much success now that we have entered upon another year, I remain,

Your obedient servant,

Birmingham, Jan. 1, 1844.

J. C. S.

[The subject of valuation is in a great measure kept secret by those engaged in profitable practice: Inwood's tables are those most used in London. To be a good valuer requires great experience and local knowledge, an intimate acquaintance with *interest*, reversions, leaseholds, and all the diversified cases which come before such a practitioner; the rental, real or estimated, is the foundation-work of every such calculation; then follows the discretion in assuming a per-centage of returns; and the number of years' purchase, whether for the ground, the buildings, or reversionary interest, or improvements, must depend upon circumstances, and can only be learned by practice and ability—out of one valuation many questions often arise, and no rule can be given.—Ed.]

#### CARPENTERS' AND JOINERS' WORK.

SIR,—As one of many who would wish to have a work of general information on carpenters' and joiners' work, those that are already published being very expensive, I would suggest to the proprietors of *THE BUILDER* whether it would not fully answer their purpose to get up such a work, as good and as cheap as possible, to be issued weekly. The want of it is greatly felt by the majority of the trade, and the small portion of work that falls to the lot of too many (I am sorry to say), myself among the number, renders it impossible to provide ourselves with one.

Several of my acquaintance have regretted that you have not issued an engraved frontispiece to the first volume of *THE BUILDER*; we would willingly pay sixpence if it could be got up for so small a sum.

I would also wish to ask if there is any possibility of obtaining work through the advertising columns of *THE BUILDER*, as unless I thought there was a good prospect of it, I could not afford to do so.

Heartily wishing you all the success possible for your very excellent *BUILDER*,

I remain, Sir, yours, &c.,

N. H.

[We recommend the works of Tredgold and Nicholson, and do not think them more expensive than any workman may easily purchase. Many who have advertised in our columns have reaped speedy benefit.—Ed.]

SIR,—Will you have the kindness to inform me in your next whether there is any duty on building materials used in building or making additions to a church or burial-ground.

I remain, Sir, yours, obediently,

AN INQUIRER.

[The government return the duty upon the materials used in the building of new churches

under her Majesty's Commissioners, but such duty forms a portion of the Commissioners' fund, and is not usually given up to the undertakers of any separate work, though sometimes upon petition to the Treasury, it has been so remitted, as in the case of St. Pancras New Church.—Ed.]

SIR,—Will you have the goodness to inform me in your next number where very fine steel pens may be obtained for the purpose of sketching profiles of cornices, capitals of columns, and other fine work in architectural drawing, crow-quills being too thick, and being also very troublesome on account of requiring continually to be mended.

I am, Sir, your obedient servant,

JOHN WADGE.

77, Great Russell-street, Dec. 30, 1843.

[We have been so much troubled ourselves for some time past by not obtaining either drawing-pencils or sketching-pens to our mind, that gladly would we be ourselves informed where those indispensable implements of superior quality are to be obtained.—Ed.]

SIR,—I shall feel obliged if you can inform me in your next *BUILDER* what the difference of price is between brickwork and that of ashler or freestone in or near London.

I am, Sir, yours very truly,

Liverpool, 2nd Dec. 1843.

J. M.

[This question cannot be answered without it is accompanied by an account of the descriptions of the kinds of brick and stone which would be paralleled with each other.—Ed.]

#### Miscellaneous.

STATUES FOR THE CITY OF LONDON.—The bronze equestrian statue of the Duke of Wellington, to be placed opposite to the entrance to the new Royal Exchange, is proceeding rapidly towards completion, under the direction of Mr. Weeks (the successor to the late Sir F. Chantrey), to whom it is intrusted. The statue of William IV., from the design of S. Nixon, to be placed at the junction of Gracechurch-street and King William-street, will be shortly raised upon its pedestal. The figure is colossal, being upwards of 14 feet in height. It is executed in Devonshire granite, and will cost when completed £2,000, which sum was voted by the corporation of the city of London for that purpose. His Majesty is represented in the costume of a high admiral. Upon the pedestal (a round one), is sculptured a wreath of laurel, in the centre of which an appropriate inscription will be engraved. A statue by Nixon is likewise in a forward state, of John Carpenter, the town clerk in the reign of Henry VI., founder of the City of London Schools, and executor to the celebrated Richard Whittington. This statue is six feet high, and will be executed in Roek Abbey stone, similar to that used by Bailey, Rossi, Westmacott, and others, for the friezes and pediments in front of Buckingham Palace. It is to be placed upon the first landing of the City of London Schools, and exactly opposite the principal entrance. There is further, in the same *atelier*, in active preparation, a statue of Sir John Crosby, to be placed in Crosby Hall, Bishopsgate-street. The model exhibits the knight in the "winged" armour of the period, examples of which may be met with in the Tower, &c., and of this particular suit at the tomb of the knight himself, in the church of St. Helen's, close by the hall of which he was the possessor.

LEAMINGTON CHURCH.—Notwithstanding the result of the Vestry meeting held some days since, and at which a rate towards the erection of an enlarged Bell Tower was disapproved of by a section of the parishioners, we are led to understand that so strong a feeling in favour of that object is prevalent amongst the friends of the Church, in this town and neighbourhood, that the required sum of £700 will be raised without difficulty by voluntary contributions. We really hope that the expectations which certain sanguine promoters of the good work have formed in this respect may be fully realized previous to our next publication.—*Leamington Courier*.

NORMAN TOWER, BURY ST. EDMUNDS.—We have much pleasure in announcing that His Royal Highness Prince Albert has been pleased to direct his name to be added to the subscription list for the restoration of the Norman Tower, for the sum of £20. Lord Manners, too, has expressed his anxious desire for the preservation of this fine edifice, and sent a donation of £20.—*Daily Post*.

## TO OUR SUBSCRIBERS.

In compliance with the wishes of very many of our Subscribers, we have had prepared a cover for binding the copies of THE BUILDER for those who may be desirous of preserving them in uniform Volumes. These may be had on application at the office, at the price of Two Shillings; or our Publisher will undertake to get sets bound at a charge of Three Shillings per Volume.

# The Builder.

NO. XLIX.

SATURDAY, JANUARY 13, 1844.

BEFORE we proceed further in the year, we take the opportunity of directing the attention of our correspondents to the nature of the co-operation on their part which we should most

esteem. We need hardly repeat that the vitality of "THE BUILDER" depends upon its being *entirely practical*. We do not desire to have our pages occupied by wire-drawn arguments upon alleged taste, the truth whereof no one can determine, and which, after all, however spiritual they may seem, are nothing but the operation of peculiar and grosser appetite for quarrelling about trifles for which the greater part of mankind have fortunately no relish.

Our endeavour is to be useful, and we desire to be usefully supported, believing firmly that such conduct on our part will be as well received by the learned as by the practical man; for both these classes dislike equally impertinent or useless disquisitions, which not only in their composition consume time, but, what is still worse, consume reprehensibly the time of many readers, the aggregate of which profitably employed might produce works of art, charity, and saleable value. We have inadvertently admitted in our columns one or two communications of this kind, and we find the better spirit of our correspondents, who desire writing of a higher character, has been somewhat offended thereby; we shall therefore take especial care to prevent a repetition of the occurrence.

We desire to be informed of, and to convey to our readers, all useful inventions on architectural construction; drawings and descriptions of such subjects will always be acceptable to us.

Papers upon discoveries of architectural antiquities we shall ever welcome.

All manner of good delineations, of genuine architectural ornaments, will also be highly prized; but we hope that in order to render of sterling value the publication of such representations, they will always be accompanied by such accurate plans, sections, profiles, and other details, as will enable workmen to reproduce them with exactness.

And we recommend for the furtherance of architectural practical science, that compliance be given by our correspondents as far as possible to the following regulation of the "*Freemasons of the Church*," viz.:—

"That in all delineations from existing buildings, the artists and contributors are requested to represent exactly the jointing of the masonry and other materials, and all other marks, indications, and pe-

culiarities of construction; and also to represent and describe all marks of failure or decay; to describe accurately the nature of the materials; and also to obtain from documents, and from the neighbouring clergy and other competent persons, all information relative to the origin, decay, repair, and other historical particulars connected with the subjects delineated: and it is recommended and hoped that all who shall favour the interests of the college, will put themselves in correspondence with such antiquaries, keepers of records, and others, as can furnish them with the requisite information."

And further,

"That the college adopt in admeasurements a duodecimal numeration, and that the words 'feet' and 'inches' be written in full, or their contractions *ft.* and *ins.*; or that over feet be set the mark (°) over inches the mark (′) and over twelfths of inches the mark (″)"

We shall on another and early occasion give some additional directions of the same *Freemasons*, for a modified heraldic mode of representing in prints and cameo drawings, by various positions of lines, &c., the colours of stained glass, Mosaics, and other subjects, a compliance with which we shall beg to recommend, as an easy and certain mode of imparting to workmen the most intricate patterns of party-coloured designs, without the expense of colouring such patterns.

We should also gladly be the vehicle of conveyance to our subscribers, of accurate information relative to local stone-quarries, and building materials generally; and it would give us great pleasure, if we could obtain a monthly supply of the prices of the various merchantable articles which are used in architecture.

## NEW ROMAN CATHOLIC CHAPEL AT LAMBETH.

This building, which is situated adjoining the Westminster-road, opposite the Blind Asylum and Bethlehem Hospital, is progressing. The foundation-stone was laid in April, 1840, on which occasion the church was dedicated to St. George, the tutelary saint of England. It is the largest edifice devoted to the Roman Catholic worship that has been constructed since the Reformation, when Henry VIII. destroyed and reduced the majority of the Roman Catholic establishments.

Its external dimensions are 250 feet long by 24 feet broad. The height of the tower at the west end of the edifice is at present about 60 feet, but when completed its extreme elevation will, it is stated, be 330 feet above the ground level. The tower, which is of brick-work, with dressings of Caen stone, contains a belfry with space for a peal of eight bells. On each side of the tower are double belfry windows, ornamented with mitres and other decorations; and when funds shall so admit, the walls, it is stated, are to be ornamented by 100 statues of Roman saints and martyrs. The tower will be surmounted by a spire, terminated by a large cross. The interior height of the church, from floor to ceiling, is about 57 feet. The length of the nave in the clear is 160 feet, by 72 feet broad; the chancel is 40 feet long by 26 feet broad. Adjoining the chancel, on each side, are two small chapels for altars, over which are to be placed stained-glass windows. The chancel window measures 30 feet by 18 feet, and is to be filled with stained glass of various colours, containing a representation of the root of Jesse, or the genealogy of Christ, the gift of the Earl of Shrewsbury, and will cost 500*l.* The chapel contains in all 23 windows. The roof is supported by two rows of stone pillars, consisting of eight in each row. The pillars are 18 feet in height, and will be finished by capitals carved with foliage. The floor of the nave and aisles will be covered with red and blue Staffordshire tiles, each tile measuring six inches square. The chancel and side chapels are to be paved with encaustic tiles cast in different shapes and of various colours. At the south-west corner of the south aisle will be placed a large baptismal font carved in Caen stone. The interior of the chapel is not ob-

structed by galleries; the only projections are the organ-loft and the two small galleries for the choir over the two side doorways at the east end. No pews or closed seats will be allowed, but open benches will be placed down the aisles constructed with low backs, so as to afford an unobstructed view of the interior. The seats will yield accommodation for 3,000 persons. The bare cost of erecting the chapel will be 20,000*l.*, but it is expected that a sum of 40,000*l.* will be necessary to complete all the contemplated works. At the east end of the chapel is a sacristy, and adjoining at the north-east corner are cloisters, which connect the edifice with a presbytery, containing a dining-room, and affording accommodation for several priests. Abutting on this is a convent for the Sisters of Mercy, and a school for 300 children. The convent is fitted up with kitchens, a refectory, dormitories, a small chapel with a belfry, and will furnish an abode for thirteen *Sisters of Mercy*. The convent, with its accompanying buildings, will cost 7,000*l.* A considerable time must elapse before the great tower and spire will be completed. The subscriptions towards this undertaking have, for the most part, been raised in the provinces through the exertions of the Rev. Mr. Doyle, who is the officiating priest. The Earl of Shrewsbury and the late Mr. Benjamin George Hodges have been the principal contributors. A considerable sum has also been subscribed by the poorer classes inhabiting the parish of St. George. The names of the King of Sardinia, the King of Bohemia, and other foreign potentates also appear in the list of contributors. A liberal donation is expected from Louis Philippe, the King of the French.

We are not particularly pleased with the architecture of this chapel and of its adjoining buildings; its exterior being composed principally of a coarse brown-coloured brick, with some admixture of dark stone, the whole pile has a dingy appearance: the effeminate late Edwardine architecture, the last branch of that which is denominated by Rickman "*Decorated*," has been chosen. Well-selected specimens of the architecture of this period have frequently very great elegancies, but the style is rather disagreeable than otherwise, when applied on a large scale, as in this case: the whole pile has an ill-proportioned squat appearance of seeming assimilation with the extended flat marsh upon which it is founded. Most of the windows of the chapel partake of this same character of extended squatness; and in vain do you even search for that lofty character, that heavenward carrying away of the mind which overcomes you while viewing such fabrics as Westminster Abbey. We approve, however, of the diversifying of the window-trajectory, though some of the patterns which are adopted we think stiff and inelegant, as are some of those after which the pierced parapet is formed.

Many parts of this pile are *un-masonic*, as, for instance, its buttresses project very suddenly at their first or lower tablings, and have these tablings very flat. We shall not go now minutely into the philosophy of the subject, but content ourselves on the present occasion by saying this is unscientific and is without precedent, except in very inferior examples built by the unskilful, or in good examples which have been corrupted by being ignorantly restored. Again, we disapprove of the roof of this chapel as formed in violation of sound principles: but allowing it in its imperfect structure to partake, in some slight respect, of the nature of a vault, even here, in violation of prudence, the pinnacles remain for future addition; whereas the address of the genuine old freemasons was shewn by pinnacles and every other ounce weight of intended abutment, being fixed before vault or roof of any kind was erected; so that they contrived to do with half the abutment and half the strength of vaulting which moderns require. If the roof of the fabric stand firmly without the pinnacles, they are entirely useless in the design, and are therefore *un-masonic*, for no initiated freemason ever designed pinnacles and other great members of architecture which were not mechanically and constructively necessary. If, on the contrary, the pinnacles are essential to the architecture, no initiated mason would have been imprudent enough to have laid a stick of the roof-work before the top-stone of every pinnacle was set.

We also object to the metal-work surmount-

ing the eastern roofs of the chapel, as being alike had in superficial and constructive taste—in superficial taste, because it is mean and flimsy in appearance, not elegant in design, and having some resemblance to the *chevaux de frise* of a prison-wall—but in constructive taste, as being not only useless, but pernicious in operation, for, being of metal, its weight is considerable, and its mechanical effect is to expand the feet of the roof, already sufficiently suspicious: the eye connects this useless and disagreeable out-work with the bell-spire of the convent, which, though heavy enough for its size, being all covered with metal, nevertheless has a singularly thin, sharp-pointed, and unreal appearance.

We do not approve in a work pretending to architecture, that the conventual buildings should have many of their parts seemingly made ugly and irregular for self-willfulness alone: the portions of the buildings which back upon the Westminster-road, one of the greatest thoroughfares in the world, seem to have been set up in this improper spirit. All the chimney-shafts of the domestic buildings, though not built without considerable expense, are short and inelegant, and are not in accordance with fine old exemplars; and, moreover, being in the neighbourhood of much loftier erections, are the more likely on that account to make.

We make these observations from the great pretensions of the work in question, that our Anglo-Catholic churches may be freed from some heresies of construction.

It is a singular circumstance that when the Anglo-Catholic church had been corrupted by heresy, the science of Anglo-Catholic architecture corrupted too. It is also a singular circumstance, that with the cleansed Anglo-Catholic church began the restoration of Anglo-Catholic architecture; and if its deep science could not revive all at once, the merit of revival rests with the Anglo-Catholics, whether in literature and graphic art, or in ecclesiastical work. Lately, indeed, with the Anglo-Romanists some of the outward decorative forms of Catholic architecture have been attempted and partially restored, but we shall be able, hereafter, to prove satisfactorily that none of the buildings of the Romanists have been reared after the genuine *masonic* art of our forefathers, for indeed they are all built in violation of the sublime secret science of the Freemasons, and compared with their works are all child's play. And there is also another remarkable fact, that of those of the modern Anglican church, who are become somewhat unruly, and are suspected of heresy, their architecture also is unsound and unworthy of the science of the age.

We have so much to say on these heads, that we shall take an early opportunity of entering into the subject fully.

**INSTITUTION OF CIVIL ENGINEERS.**

The first meeting of the season was held on Tuesday evening, the 9th inst. During the recess several alterations have been made in the rooms of the society; along the sides of the gallery have been placed some handsome cast-iron open-work shelves and brackets, cast and presented by Messrs. Ransome and May, of Ipswich, for supporting a series of busts of eminent engineers and scientific men. The theatre, which was formerly oppressively hot, and but dimly lighted, has now two gaslights placed near the ceiling, which throw a powerful light into all parts of the room. The products of combustion are carried off by the open-jointed telescopic tubes which have been applied by Professor Faraday to lighthouse lanterns, and were described by him at a meeting of the Institution last year. This system of lighting and ventilation, which was, we understand, designed by Mr. Manby, the secretary, appeared to be perfectly under control, and was very satisfactory in its effects. Several very interesting papers were read, and the meeting adjourned to January 16th, when it was announced that the annual meeting would be held for the election of the council and officers.

**DUTY ON MATERIALS.**—By a recent order of the Lords of the Treasury, foreign deals are allowed to be removed from the bonding premises, for the purpose of being sawn for exportation, and subject to the April regulations.

**LIST OF DISTRICT SURVEYORS.**

**PROPOSED ENLARGEMENT OF SPRINGFIELD GAOL, NEAR CHELMSFORD.**

At the Essex Quarter Sessions the report of the committee appointed to consider what alterations were necessary in the gaol at Springfield, was read. It detailed the various proceedings of the committee, and stated that at their request Mr. Hopper had attended them with a plan and estimate; Mr. Tower had produced a plan for rendering the old gaol more fit for prisoners, and Mr. Bowyer Smyth and Mr. Lewis had also produced plans. The committee deemed it inexpedient to incur any expense on the old gaol, or any expense in the alteration of Springfield gaol, unless it were made to accommodate 500, and Mr. Hopper produced a plan for that purpose. Major Jebb was consulted on it, and at the last meeting the committee resolved to recommend to the court the adoption of the plan marked A which was attached to the report. This plan provides for an alteration of two of the radii for the introduction of the separate system, provision for the debtors and females, and the consequent abolition of the old gaol, the removal of the governor's house, and the improvement of the chapel. The cost is estimated at 30,000*l*.

Mr. Disney said, he rose for the purpose of distinctly moving that the court should adopt this report and the plan attached to it, and carry them into effect as soon as they conveniently could. In April, 1843, the committee of visiting magistrates, at the instigation of the inspectors of gaols, took into their grave consideration the state of the prison, the buildings included, at Springfield, and they reported that—

“In obedience to the order of the court of the last quarter session, they have proceeded to consider the defects of the prison, as pointed out in the inspectors' reports, and have satisfied themselves of its insufficiency to provide for the number confined there. with due attention to the order and discipline of the prison; and in proof of the correctness of this opinion they beg to adduce the statement of Mr. Neale, the governor—viz. that on the 7th of February there were 318 prisoners, and only 218 single cells; that on the same day there were 20 prisoners standing in the body of the chapel on the floor; and that on another occasion, since the last quarter sessions—viz. the 11th of February there were 318 prisoners, and

fifty-eight prisoners were in confinement in Springfield gaol."

The court received that report; there was a long and interesting discussion on it; and in July, 1843, they came to a resolution that such report was well founded. It was then resolved that the visiting magistrates of the several gaols, in order that on this great question there should be an enlarged investigation, and the whole of the other magistrates were invited to join them, should form an open committee, to revise that plan and carry it into effect, the necessity having been found. The court adopted the suggestion of a rev. baronet, that the plan should give way till this day—that they should take six months to consider the question; and the proposition was produced now for their consideration. The committee took great pains with the matter—they met many times, they had the attendance of Mr. Hopper and Major Jebb—several of the magistrates sent plans, so that the whole thing was well considered, and the plan finally adopted was this, by which two of the existing radii should be extended, that there should be parallel buildings on one side of each of these openings, and a vast hall in the middle, similar to the plan at Pentonville; that the chapel should be enlarged; that accommodation should be made for the debtors and for women; that there should be a walking yard, and that the separate system should be adopted. He thought they should first settle the question whether the separate system should be adopted or not; if they were to reject it, he considered they would fall into that which had so bad an effect on the moral habits of the country. There were gentlemen present who had given the money part of the question their attentive consideration, and they were prepared to tell them, that it would be beneficial even in the pecuniary effect attached to it. He should leave that to them; but he thought if they were to enlarge the gaol, and enlarge it they must, it should be done now. As to expense, if they shewed that the building would not exceed the sum talked of—if they shewed that for about 30,000*l.* they could have every class of prisoners under the same regulations, that they could have the debtors and women under better management and control, without injury to their health, it was not only then a duty incumbent on them to give the public, for whom they were trustees, the benefit of that system, but he thought they would also find it their duty for the credit of such a county as this. This plan was formed by their own surveyor to keep down the expense, under the assistance of Major Jebb, who took great pains to make out and save all that could be saved, so that the full and entire effect should be good and lasting. And they would be pleased to recollect that this was not a new system, but it was recommended by that great man, John Howard, who suggested that every man should be kept separate from the time he was taken till the time he was set at liberty. They had tried classification, which would not do; then the silent system, which was attended with a severity that never would be practised here. Therefore they must resort to the system of separation, which they might do with so much good effect. There was one thing connected with this so important, that they would excuse his making two or three observations on it. It had been the system to commit prisoners to the first gaol delivery, whether it were assizes or sessions, and this was done on the sound principle that men should be incarcerated as short a time as possible before trial. Now at the late special commission, the learned judge complained in Kent, that the magistrates of this county had done wrong in sending prisoners to be tried at the assize, instead of passing them over to the session; but he (Mr. D.) did not think that need affect their practice, because it was stated they meant to have a clause by which the judge at the special commission might try only those who were triable at the assize. Thus the magistrates might still commit as they did before.

Mr. W. Luard seconded the motion. Should the court adopt it, he was aware they would be laying a considerable burden on the rate-payers of the county, and he could only regret that they should be under that necessity. There were two points with which the court was acquainted—first, that it was the intention to remove the old gaol, and remove the debtors

and females to Springfield; and secondly, to make these such preparations as would enable them to carry out the separate system. To do that, the committee recommended that a plan should be laid before the court, which had been done, and he found the estimate would be about 30,000*l.*; Major Jebb said it might be done for less, and it was not likely it would exceed that. Now, he found that a farthing rate produced upwards of 1,000*l.*, and it would therefore require a rate of thirty farthings, or 7½*d.* to raise the amount proposed to be laid out. In point of fact the rate-payers for every 100*l.* would have to pay 2*s.* 1*d.* to every farthing rate that was raised. Whether it was desirable to do the whole of this at one time, or part now and part a year hence, would be for the court to consider. That part was desirable to be done immediately, he thought there could be no doubt; but as to the other part, the court would come to a decision and use their own judgment on it.

Mr. W. Cotton moved as an amendment to Mr. Disney's motion—

"That so much of the report as relates to the removal of the female prisoners and debtors to Springfield, and the enlargement of the gaol for that purpose,—the building of a governor's and chaplain's house, and the alteration of the centre building, be adopted, and the further consideration of the other recommendations in the report be postponed."

Mr. Leake begged to second the amendment.

The chairman then put Mr. Cotton's motion, when there appeared—

For it . . . . . 20

Against it . . . . . 16

Majority . . . . . 4

Mr. Cotton then moved that it be referred to the committee who had taken so much pains with the matter, to be carried out. (Cries of "No, no," from members of the committee.)

After some conversation, a committee, consisting of the visiting magistrates, the chairman of the session, the county members, Mr. Disney, Sir J. P. Wood, and Mr. Croft, was appointed to carry out the plan.

MONUMENT AT ST. REMI.

TO THE EDITOR OF "THE BUILDER."

SIR,—About a mile from the modern town of St. Remi, not far from Arles, in the South of France, stands the monument of which I herewith send a representation. It occupies a delightful situation at the foot of some fine limestone rocks of the principality of Baux, and the ground slopes from them into a fertile plain, which the eye entirely commands. The monument consists of a square plinth elevated on two stages, and supporting a pedestal filled with sculpture representing equestrian combats. Above these rises a square edifice with a three-quarter column at each angle, or perhaps rather more than three-quarters of the column are exposed. The architect has hardly any projection before the face of the work, so that the columns standing out beyond it for half their diameter do not appear to contribute materially to its support.

This peculiarity was perhaps the result of judgment, and not of carelessness or ignorance, as it tends to preserve the general pyramidal form of the monument, and the effect of the whole monument is very fine, though thus singularly obtained. Above this division of the edifice is a circular temple of six columns, by a conical or funnel-shaped roof; within the peristylum are two statues, one male, the other female. Upon this ancient work of art is the inscription which follows, viz.: "SEXIMVLIIICQ PARENTIBUS-SVEIS." But these letters do not help us to the date of the monument; they merely shew that the erection was an act of filial gratitude (*parentibus suis*). It probably belongs to the 2nd century. I should be glad to have from your correspondents further information on this interesting subject.

I am, Sir, your humble servant,  
AN AMATEUR.  
York, Dec. 10th, 1843.

Monument at St. Remi.

## WESTMINSTER BRIDGE.

To the report which we inserted in our last number, we add Mr. Barry's reply and report, as under:—

"TO THE EDITOR OF THE 'TIMES.'"

"SIR,—As, in the statement respecting Westminster-bridge, inserted in your paper of Tuesday last, you have appended a report from Messrs. Walker and Burges to the Speaker of the House of Commons, animadverting upon the suggestions which I ventured to offer in a report to the Commissioners for the encouragement of the Fine Arts, relative to the propriety of rebuilding the superstructure of that bridge, I trust you will do me the justice to publish the subjoined letter, which I addressed to the Speaker in consequence.

"It may be proper to observe, that since those communications were made to the Speaker, it has become notorious that the system pursued by Messrs. Walker and Burges for securing the foundation of the piers has failed, and the bridge is consequently in such a critical state as to cause an order to be given by the Commissioners to suspend all further works for the present. From what I have seen of the recent alarming dislocations of the present structure, it is now, in my opinion, no longer a question as to the propriety of rebuilding the superstructure alone, but the entire bridge.

"Your early insertion of this communication will oblige, Sir, your obedient servant,

"Great George-street, Westminster,  
Dec. 28."

LETTER FROM MR. BARRY TO THE SPEAKER, IN ANSWER TO A REPORT OF MESSRS. WALKER AND BURGESS UPON THE PROPOSED ALTERATIONS.

32, Great George street, July 10, 1843.

SIR,—As Messrs. Walker and Burges have thought proper to print and publish a letter, addressed to you as chairman of the Commissioners of Westminster-bridge, relative to the suggestions I ventured to offer for the improvement in that bridge, in a report which I made to the Fine Arts Commissioners, of the 22nd of February last, I feel called upon to address to you a few observations, for the information of the board over which you preside, chiefly with the view of removing several misconceptions which that letter is calculated to occasion.

Westminster-bridge has long been considered extremely inconvenient, as well as unsightly, and, from its proximity to the new Houses of Parliament, is generally felt to have a most injurious effect upon the appearance of that building. As a remedy for these defects, the main objects to be attained are obviously to lower the roadway, to increase the waterway and head-room under the arches, and to reduce the mass of the bridge to the greatest practicable extent. In order to accomplish these objects in the most effectual manner, it appears to me to be necessary to re-build the bridge; but as the Commissioners were incurring a large outlay in securing and extending the foundations, I recommended in my report above alluded to that the re-building should be confined to the superstructure.

Previously to noticing the several points of Messrs. Walker and Burges's letter, I would beg to observe that the suggestions contained in my report were offered merely as hints for the consideration of the Fine Arts Commissioners, and not as mature opinions founded upon a careful practical investigation with reference to execution, in which I stated most distinctly I did not wish to be engaged. I presumed that if the Fine Arts Commissioners deemed those suggestions worthy of attention, they would refer them to the Commissioners of the bridge, by whom they would be duly considered, and, if approved, carried into effect by their own officers.

I now proceed to notice the several observations of Messrs. Walker and Burges upon the suggestions contained in my report. With reference to those upon the relative properties of circular and pointed arches, and to the authorities which they quote in depreciation of the pointed arch as applied to bridge-building, I beg to state, that the hypothesis in which those authorities are said to concur, namely, that a pointed arch requires a greater pressure than a circular arch at the crown, is at direct

variance with the opinion of Professor Mosely, of King's College, one of the highest authorities in such matters, who, in a letter to me upon that subject, states, "that a pointed arch does not necessarily require a great pressure, or indeed any pressure, upon its crown, to prevent it from falling, and that the reasoning upon which an opposite conclusion is founded in Messrs. Walker and Burges's report is erroneous." But theory and practice confirm me in the opinion which I have advanced in my report, that a pointed arch requires less thickness at the crown than is usually considered necessary for a circular arch. As, however, it might possibly be inferred from the observations of Messrs. Walker and Burges that the arch which I have proposed is not strong enough for its purpose, although they do not attempt to prove that such is the case, I have thought it right to enter into a careful investigation of its properties; from which I am fully convinced that I have not carried the principle which I have advocated far enough; and that, considering the insignificant span of even the largest of the proposed arches, it would be no great effort of engineering science to reduce the thickness of its crown to nearly one-half of what is proposed by Messrs. Walker and Burges; by which means the lowering of the roadway over the centre arch might be carried to the extent of six feet six inches, instead of three feet six inches, even without reducing the clear height of the centre arch as I have proposed, if such reduction were deemed to be an objection of any importance. In this opinion I am confirmed by the examples of numerous stone bridges, both in this and other countries, and also by the judgment of several eminent engineers and mathematicians of the present day.

With reference to the loss of waterway which I stated was occasioned by the haunches or spandrels of the present arches at high-water, I ought perhaps to have explained that I referred to such portion only of the waterway as is affected by those obstructions, which might, however, I think, have been inferred. With regard to the removal of these obstructions, I do not agree with Messrs. Walker and Burges in thinking that it would be unproductive of any useful effect upon the "currents and falls;" and I consider the arguments in support of their opinion to be fallacious, inasmuch as they are founded upon the assumed level of high-water according to Trinity standard; whereas the present ordinary spring tides, as they must be well aware, rise considerably above that level; on one extraordinary occasion recently as much as 3 feet 6 inches. That some practical good would be effected in giving more head-room for craft near to the piers, by raising the springings of the arches according to my suggestion, Messrs. Walker and Burges admit; and I conceive that this advantage alone ought to be a sufficient inducement to remove the present arches and to substitute others of more convenient form; but when it is considered that the opportunity would be thereby afforded of lowering the roadway to nearly double the extent proposed by Messrs. Walker and Burges, without producing the slightest injury to the navigation of the river, the advantage as regards the convenience of the public is so much enhanced, that the propriety of re-building the superstructure cannot, I think, be doubted. With respect to my proposition of lowering the centre arch 18 inches, which it appears Messrs. Walker and Burges consider will be "rather a practical evil," as affecting the navigation of the river, it is necessary that I should call your attention to the clear height of the middle openings of some of the bridges above Westminster-bridge, as they have done to those only which are below that bridge. While the clear height of the centre arch of Westminster-bridge is 26 feet above Trinity standard of high-water, the centre openings of the modern bridges at Vauxhall and Hammer-smith are of the respective heights of 25 feet 4 inches, and 16 feet 1 inch, to say nothing of those at Battersea and Putney-bridges, which are much less, but which I admit are extremely inconvenient. As the largest steamers which pass up the river are those which ply between London-bridge and Richmond, and as their funnels are jointed, so as to allow of their passing even under Putney-bridge, the height of the centre opening of which is only 11 feet 2 inches above high water, it cannot be ima-

gined that the lowering of the centre arch of Westminster-bridge to the extent which I have proposed can really be an objection of any importance as regards the navigation of the river, while the great object that would be thereby gained by a further depression of the roadway, to the extent of 18 inches, reducing its inclination to 1 in 40, instead of 1 in 24, as proposed by Messrs. Walker and Burges, would be of the greatest advantage to the traffic over the bridge, as well as to the effect of the new Houses of Parliament when viewed from it; a point, which I submit, ought not to be disregarded.

Messrs. Walker and Burges state in their letter, as an objection to the form of arch which I have proposed, that the failure of one arch would cause the destruction of all the piers and arches; a consideration which they say is not to be disregarded in a bridge the piers of which have been so badly founded, that to support them has been a constant expense, and is at this moment a source of considerable anxiety; although they further state that the works they have in hand, if as successful as hitherto, will render the piers much more secure than they have ever been, they hope perfectly so. The part of this objection which is founded upon the lateral thrust of arches will apply with equal force to all arches of a segmental or elliptical form, which are generally adopted in modern bridges, and even to semicircular arches, of the lateral thrust of which I will not affect to suppose Messrs. Walker and Burges to be ignorant, although in the allusion which they make to Labeley's opinion upon that subject, they leave it to be so inferred. With regard to the other part of the objection—namely, the failure of the foundations, it may surely be assumed that Messrs. Walker and Burges would not have recommended the very serious outlay which is now being incurred in securing them, if they conceived there was any risk whatever of their ultimate failure; but if a possible failure is, notwithstanding, to be taken into consideration, can a more powerful argument be advanced in favour of a new superstructure than that the weight upon the piers might thereby be reduced at least one-third?

To Messrs. Walker and Burges's design for a new superstructure I object, principally because it does not accomplish the main objects for which a new superstructure is, in my opinion, desirable, namely, the reduction of the mass of the bridge and the lowering of the roadway to the utmost practicable extent; neither does it afford any improvement whatever in respect of the navigation of the river; the accomplishment of which object is, in my opinion, of far greater importance, both for the sake of public convenience and architectural effect, than the style of architecture to be adopted.

As to the principles which Messrs. Walker and Burges consider should govern the nature of a design for a bridge over the Thames in London, I entirely disagree with them. I conceive that the height of the opposite shores and buildings upon them should mainly determine the æsthetical character of the design. If, as in Waterloo-bridge, where the shores are high, one being naturally so, and the other raised, and the roadway is level, where the superstructure of a great public building like Somerset-house is wholly above the level of the roadway, and where the bridge groups with the substructure of such an important building, the character of the design cannot be too bold and massive; but if, as at Westminster, where the shores are low, and the bridge must in consequence group with the superstructure of an extensive work like that of the new Houses of Parliament, and where the parapet must, in consequence of the height required for the centre arch, assume a curve line, which is an element rather of elegance than of boldness, the character of the bridge should be light and graceful.

Upon the taste of Messrs. Walker and Burges's design for a new superstructure in what they term the "Norman style," I forbear to offer any criticisms in detail, as the conditions which should be observed in a bridge are, in my opinion, wholly at variance with the essential characteristics of that style; nor do I consider it worth while to make any remarks upon their observations relative to points of detail, including those especially which refer to harmony and contrast between the bridge,

the new Houses of Parliament, and the neighbouring buildings, as they seem to me to furnish their own comment.

In conclusion, I beg to add that I still remain in the same opinion as I expressed in my report to the Fine Arts Commission, as to the necessity of a new superstructure to Westminster-bridge upon the principles therein advocated; and as a favourable opportunity is now afforded of carrying into effect that great public improvement, at an outlay moderate when compared with its importance, I trust the commissioners will not be indisposed to take my recommendation upon this subject into their most serious consideration.

I have the honour to be, Sir,

Your very obedient servant,

CHARLES BARRY.

The Right Hon. Charles S. Lefevre,  
Speaker of the House of Commons,  
Chairman of the Commissioners of  
Westminster-bridge.

P.S.—To show the effect of the further reduction of the height of the bridge, which I have stated in this letter to be practicable, and to exhibit several modifications of my original design, partly with a view to economy, I forward to you the accompanying drawing for the consideration of the board.

Want of space compels us to postpone till next week our own remarks.

#### COLLIERY ENGINEERING — ITS RISE AND PROGRESS.

BY MATTHIAS DUNN, ESQ., C.E.

(Read at the Newcastle Mechanics' Institute.)

HAVING had the honour of being elected one of your vice-presidents, and having observed the great loss which the society sustains because of the want of scientific papers or lectures, whereby an impetus may be given, and the latent talent which exists among your body drawn out; I am induced to volunteer some observations upon the subject of colliery engineering, founded chiefly upon my own professional experience, both in this and other districts of the country, during the last forty years, coupled with traditionary and parole information as to the more early periods.

##### FIRST ERA.

STATE OF THE COAL-TRADE AT THE CLOSE OF THE SEVENTEENTH CENTURY AND THE COMMENCEMENT OF THE EIGHTEENTH CENTURY.

The only districts in the north of England from whence coal was shipped at this period, were the rivers Tyne, Wear, and Blyth. In the year 1699, the Tyne had two-thirds of the whole trade, employing about four hundred keels, and vending 300,000 chaldrons per annum. The over-sea trade, it is said, employed 900,000 tons of shipping. Sunderland, during fifty years preceding—viz., from about 1654, had risen into considerable importance. The districts then yielding the principal supply of Tyne coal were Ravensworth, and the numerous collieries delivering into keels at Derwenthaugh—viz., Pontop Pike, Marley Hill, Tanfield Moor, Garesfield, Gibside, Axwell, Blaydon Main, and the neighbourhood of Wylinton. Further west again were Grand Lease, (Stella,) Chopwell, Hedley, Wylam, Throckley, Walbottle, Denton, Benwell, Fenham, &c., above bridge; and below bridge were Felling, Gateshead, Heworth, Byker, Jesmond, Heaton, St. Lawrence, Banton, &c.; Hedley Fell was working in 1727, the coal being led down to Stella; in 1755, Jesmond colliery was laid in—it was at that time drained by two pumping engines. The river Wear was supplied from the collieries of the Lambton and Tenpest estates; the districts up Cbester Burn, Chattershaugh, Fatfield, Birtley, &c., all delivered into keels in the neighbourhood—the stails extending from Cox green to Chattershaugh. From the then state of the trade, it was necessary to hold, from time to time, large stocks of coals, and to be ready to give quick despatch, to suit tides and other emergencies; hence those extensive erections called stails, many of which remain to the present day. The scale of keel

does on the Tyne was fixed in 1710 as follows:—A vessel above Ouseburn, per tide, 6s. 4d.; below Ouseburn, 6s. 8d.; Shawdon's Hole, 7s. 6d.; Saint Anthony's 7s. 8d.; Wincolmeie, 9s.; Jarrow and Howden, 11s. 8d.; Shields, 13s. 4d. The coals were all brought from above bridge, or from the shore near Newcastle. Notwithstanding the great distances from which the coals in those days were brought, the waggon-ways were all of wood, and even the wheels of the waggons were of the same material. The waggon-ways were constructed of a double tier of rails (the top one always of oak or beech, as best constituted to stand the alternations of wet and dry) and laid upon wooden sleepers, to which they were pinned with wood. These waggon-ways were most rudely constructed, being laid nearly according to the undulations of the surface; for the idea of inclined planes had not at this period entered into the head of man. In 1745 the cost of a yard of wooden way was 4s. 2d.—viz., two yards of oak rails, 1s. 2d.; three sleepers, 2s. 6d.; pins, 1d.; laying, 3d.; filling and ballasting, 2d. The cost of a twenty-hull waggon in 1723 (then a good deal used) was 7l. 1s. 2d. The waggons were governed by convoys, hearing upon a single wheel; and, in order to prevent the wear of the wheels, which were extremely expensive to maintain, they were studded thick with nails, driven up to the heads; but the wear was proportionally great upon the breasts of the convoys, which was a source of great labour and expense; the breaking of the waggons down the many rude steepes was attended with continual loss of life, both to man and horse. Cast-iron rails for waggon-ways were introduced in 1767 at Colebrook Dale. In 1776, Mr. Curr invented his underground tramways. The coals were drawn from the mines by horse machines, called gins—the earliest construction (though, perhaps, it was an improvement on one still earlier) being called a cog and rang gin, the horse wheel being vertical and toothed; it turned a horizontal shaft, lying over the pit, to which the ropes were attached. This machine was then but of recent introduction, the more ebb pits being wrought by hand windlasses or jack-rolls. In 1746, the price of drawing by gins, with a sixteen-peck corf, for thirty fathoms, was 10d. per four tons and three-quarters, and 1d. for every five fathoms of additional depth. The whim-gin was an improvement upon the complex combination of the cog and rang, and has universally superseded it.

The drainage of the mines at the time we are speaking of mainly depended upon day-levels or adits; sometimes it was effected by means of horses and chain-pumps, and, in certain situations, where advantage could be taken of a running stream, or of water from a higher altitude, a water-wheel was employed—parts of Heaton and Jesmond, for instance, were won by means of a water-wheel, wrought by the beam of the adjoining burn. In 1690, Mr. Bald writes, that water-wheels and chains of huckets were commonly employed to drain collieries in Scotland. The axle of the wheel (he says) extended across the pit-mouth, and small wheels were fixed upon the axle, to receive endless chains of two or three tiers, which reached down to the coal; to these chains were attached a number of oblong wooden buckets or troughs, in horizontal position, which circulated continually with the chains, ascending on one side and descending on the other, alternately full and empty, discharging as they turned over the wheel on the great axtree. A smaller machine of the sort was occasionally worked by horses, as well as by windmills. The steam-engine for draining mines was introduced early in the last century; the first was erected at Oxcelse, the second at Norwood, near Ravensworth, and the third at Byker, in 1714; in 1720, it had come into general use. It was invented or introduced by the son of a Swedish nobleman, who taught mathematics in Newcastle. The art of self-government was not then discovered; the engine was wrought by the alternate opening and shutting of cocks by an attendant; but about four years afterwards (in 1718) a person of the name of Beighton invented the means of producing the desired effect from the machine itself. These engines were on Newcomen's principle—an open-topped cylinder, the vacuum being created underneath the piston by injecting cold water into the cylinder, and

realizing an effective pressure of from 4lb. to 5lb. per inch on the safety-valve. Mr. W. Brown, of Throckley, a celebrated viewer of that day (according to a manuscript in my possession), was remarkably conspicuous in the introduction of the steam-engine to this colliery district; in 1756, upon getting the management of Throckley colliery, he built one there—then a great rarity; in 1757, one at Birtley North Side, one at Lambton, and one at Byker; in 1758, two at Walker, and one at Bell's Close; in 1759, one at Heworth; in 1760, two at Shire Moor, and one at Hartley; in 1762, one at Oxcelse, one at Beamish, and one at Benwell (which had not only three boilers, but twenty-four inch wooden pumps formed of staves eighteen-inch diameter); in 1764, one at North Biddick, one at Low Fell, and three in Scotland—viz., one at Borrowstowness, one at Pittenweenie in Fifeshire, and one near Muselburgh; in 1766, one at Lambton; in 1772, one at Fatfield; in 1775, two at Willington, and one at Washington, with its house contrived to take in a second; in 1776, one at Felling. The present Allerden engine, at Ravensworth, was built about 1750, up to which period scarcely any pumps exceeded eight-inch or nine-inch diameter, and scarcely any engine had more than a single hay-stack boiler.

The enals in the early period of mining were invariably drawn in corves or baskets; the trams had broad wooden wheels; the tramways were constructed of three planks, the upper one forming an elevated ledge, for the guidance of the tram. Horses were as yet scarcely introduced under-ground; but when they were, the roads were constructed in the same manner as those above-ground, the rollers carrying two or three corves each. Screens were not at this time invented. All the produce of the mines was sold, save what was consumed by the engines and workmen. The first screen is said to have been introduced by Mr. W. Brown, at Willington Colliery, about the year 1740. The coal prices did not exceed 10s. per Newcastle chaldron; yet from the lowness of wages, and the cheapness of materials, collieries were productive of profit, and after the introduction of steam-engines, became objects of general attention. Hewers' wages were from 1s. 6d. to 1s. 10d. per day, and those of other workmen in proportion. In 1744, Friar's Goose coals sold for 11s. per chaldron, and the cost of a chaldron waggon was 9d. In 1745, the heaving price of Lumley Main coal was 1d. per peck, or 1s. 9d. per four tons and three-quarters—the twelve-peck corf was used, for the convenience of drawing with gins; the Byker Main coal (twenty-peck corf), 1s. 6d. per four tons and three-quarters—putting, 10d.

The art of ventilation was little known, especially the underground furnace; but the working of the coal was confined to the seams at shallow depths, and in which inflammable air existed in any small degree; still, because of the ignorance of ventilation, explosions were frequently happening, even in those days, and gradually called into existence air-tubes, ventilating furnaces, &c. In 1732 fire lamps or furnaces were first known at Fatfield Colliery, where many serious explosions took place. In 1756, the first air-tube was built at North Biddick Colliery, Mr. William Allison being then the viewer. The cost of boring in 1746 was 5s. per fathom for the first five fathoms, and 5s. per fathom extra every successive five fathoms; a three-inch hole cost 26s. for thirty-one fathoms. Blasting by gunpowder was then in its infancy—many pits and drifts having been executed simply by the back and the wedge. Whilst the steam-engine was imperfectly understood, the collieries in operation were necessarily those whose seams were lying a short way from the surface, and not burthened with any considerable quantities of water—for the only pumps in use were bored from solid wood, and the diameter was consequently confined to eight or ten inches; the joints were spigot and faucet, and there was a difficulty in keeping them tight when the pressure exceeded twenty-five fathoms. As no means were devised of stopping backshaft water, the only relief that could be made available was by means of off-take drifts—the engine-pits being, where practicable, sunk convenient for such purposes. The coal keels or barges on the Tyne and Wear were nearly of the same construction as at present; but their rig, not only at the time first mentioned, but

for many years afterwards, consisted of a lug-sail, and the coals were carried in bulk in the hold—not piled up, as at present, by means of timberings—the collier vessels being of much smaller burthen than at present, and their port-holes proportionably low. Round ropes were universal in the north of England—chains never having found the favour which they have enjoyed throughout Scotland, Wales, and other coal districts. Women were employed underground, but not generally, nor in great numbers; but about the pit-heaps and staiths much of the labour was performed by them, both in cleaning the coals, and barrowing them from the depôts or staiths into the keels; their standard price for such work was one penny to three-halpence per ton.

During this epoch—it being considered that where the coal lay beyond the depth of sixty fathoms it was next to inaccessible—there was great eagerness to monopolise those districts lying within the known powers of winning. The "Grand Allies," consisting of the Ravensworth, Strathmore, and Wortley families, under the advice of their far-seeing agents, leased many of the available tracts of coal; but improvements of the steam-engine and application of cast-iron to the various purposes of mining, produced a new era, paving the way to the opening of those extensive and valuable collieries below Newcastle-bridge, in the Wallsend seam, and the deeper collieries upon the river Wear—whilst the monopolists were saddled with long and costly leases, of which they were not able to rid themselves for many years afterwards. Notwithstanding the limited powers of production then known, so confined was the application of coal to the purposes of life, that the trade could always be overdone, and the sale constantly demanded a similar artificial restriction to that which now prevails—for, even early in the seventeenth century, when not more than a dozen collieries supplied the Newcastle trade, the owners were obliged to buy each other out of the market, or use other expedients for curtailing the over supply. The winters were then much longer and more severe than now-a-days—so that, for the period of six or eight weeks, about Christmas, every branch of the trade pits, keels, and ships all settled at rest—the people at the respective markets being obliged to lay in beforehand suitable stocks of coals whereupon to work during the winter months.

Previous to the year 1765, the art of ventilation had not progressed further than to produce a good current along the flank of the working places, leaving the internal parts of the waste in a state of stagnation, which often produced explosions. This mode of airing continued to be practised in the collieries of the river Wear long after the coursing system was adopted upon Tyne, being maintained at a much less expense—the additional charge being thought unnecessary. Mr. Spedding has been said to be the inventor of the coursing system, but according to a record in my possession, it was first put in practice at Walker Colliery, by Valentine Carter and W. Morris, who had been sent for from the river Wear after an explosion. They ventilated all the wastes by coursing the air alternately up and down a pair of hoards; and the system was constantly pursued afterwards in the Tyne Collieries.

#### OF BEAUTY OF OUTLINE IN BUILDINGS.

*Of the Inferiority of the Moderns, compared in this respect with the Ancient Masters; and of the Inutility of Decoration, without Goodness of Outline.*

THAT for which the ancient masters are so eminently superior to the modern architects, is elegance of outline; almost every one of the old buildings, however exceptionable in point of details, has a grand, a neat, and a picturesque outline. The Gothic steeples of all countries, the dome of Saint Paul's, and the bell-towers of Wren, and numerous other old buildings, both in England and abroad, whether viewed from afar or near, all have almost universally an imposing and agreeable appearance; their considerate architects seem at once to have designed the elegant outward shell of the building so as to

contain amply all the internal requisites, without unsightly additions; or, if from any necessity enlargement of the pile afterwards became necessary, the picturesque massing and grouping together of the buildings were never lost sight of.

But what is the mode now pursued? In most instances very different. A debased exterior copy of some old building is made on a small scale, in base materials; this pretended economical crust, in nine cases out of ten, is discovered eventually to be neither high enough, long enough, nor broad enough, to contain properly all the accommodations and internal details of the building; hence are added the external incumbrances of lantern-lights, ugly dormers, chimneys, and other deforming excrescences, for which modern buildings are so celebrated.

Nature always contrives to place every necessary apparatus within the compass of the

general outline, but most modern buildings exhibit the same contrivance as birds would if their ribs, being omitted within, were afterwards skewered upon their backs.

If a building at a distance appear ugly, 'tis in vain that it have delicate enrichments, and that it be composed of rich materials; it cannot please either the vulgar or the tasteful, nor can the scientific give it commendation.

The qualities of form and outline stand apart from all the petty quarrels about orders and styles, by which unskilful professors have peetered and lowered a once noble art.

The most picturesque edifices of all countries have a wonderful similarity in their outline. The most perfect architectural composition is that which forms one immense pyramid of decoration consisting of many minor sub-servient pyramidal masses;—such are the celebrated Indo-moslem Tombs of Akhar at Secundra, Shere Sha at Sossaram, Humaioun at Delhi, and the Taj Mahal at Agra; such are St. Paul's Cathedral, the steeples of St. Mary-le-bow, St. Bride's, and those of all the others of Wren's churches.

Bow Steeple.

St. Paul's Façade.

St. Bride's Steeple.

The same principle is to be found governing all Gothic steeples.

Salisbury Cathedral Façade.

St. Peter's, Caen.

Façade of the Cathedral of Freiburg, in the Breisgau.

The same delicate and refined principle pervades Gothic turrets and Moslem minarets.

Four great angle Turrets of King's College Chapel, Cambridge.

Shaking Minarets of the Mosque at Ahmedabad.

large in diameter as their tambours, shew as little mastery of the picturesque as of construction, and, violating the principles of natural taste, have become so unpopular, as to have obtained for themselves the cognomen of "Pepper-boxes;" and the same title but too often applies to bad copies of the ogive domes of King's College Chapel, from their not being built with the graceful and spiring elegance of their prototypes.

Outline of St. Paul's Cupola.

The principle of the picturesque in architecture absolutely requires that if a mass have not a plain square outline, it should appear to be hewn out of an exact pyramidal or conical block.

The principle appears to have been first discovered in Egypt, and to have spread over all nations, from China to the farthest extremity of Europe.

The same principle pervades the Egyptian pyramid, the Egyptian needle, and those vast noles of masonry which ascend to an enormous elevation before the Egyptian temples; it pervades the Grecian and the Roman temple, the Athenian choragic monument, the pagoda of China, the mysterious edifices of Mexico, the temple of ancient Hindostan, the mosque and the tomb of the Moslem, and the Christian steeple.

The Greeks, whose several states were inconsiderable, and therefore incapable of raising such ample funds as powerful kingdoms like ancient Egypt or modern Britain, never erected buildings which were not small and low; most of their edifices, therefore, not breaking above the general altitude of their dwellings, they did not require that strict attention to perfect pyramidal outline which was always attended to in the lofty buildings of other nations. They made no advances whatever in the more lofty departments of science which were requisite, and which were of necessity called into use in the construction of such gigantic edifices: they contented themselves with a mere triangular façade.

Both Greeks and Romans, however, appear to have been well aware of the upward diminution requisite in order to correct the otherwise overhanging appearance of the upper part of a building, whether from optical illusion or from the projection of a cornice; hence, we find many of their finest edifices were formed with the plain faces of their architraves receding, as if to continue the upward diminution of their columns. But the proper display of sculpture in the frieze of an order in general forbade that member to recede, except in small buildings, such as the choragic monuments of Lyciocrates and Thrasyllos, which were fully taken into the eye at one view. Of the following ancient buildings the faces of the architraves recede: at Athens, the Parthenon, the temples of Theseus and Erectheus, and the arch of Adrian; at Salonicia, the "Incantada;" at Rome, the external and internal orders of the Pantheon, the temples of Jupiter-Tonnant, the frontispiece of Nero, the reputed temple of Pallas in the forum of Nerva, the arch of Constantine, and the Ionic and Composite orders of the Coliseum; at Tivoli, the reputed Temple of Vesta: all these examples shew the possession of the same knowledge, but different degrees of skill in making use of it; and there is at Agrigentum a remarkable monument, shewn by Mr. Wilkins in his "Magna Græcia," the order, entablature, and other members of which, all converge upwardly in a very peculiar

While upon the subject of outline, the author cannot refrain from contradicting, as far as in him lies, the opinion put forth with regard to spires by Mr. Britton, in his exquisite work upon "The History and Antiquities of the Cathedral Church of Salisbury," (p. 74). "Although this spire is an object of popular and scientific curiosity, it cannot be properly regarded as beautiful or elegant, either in itself, or as a member of the edifice to which it belongs. A may-pole or a poplar tree, a pyramid or a plain single column, can never satisfy the eye of an artist, or be viewed with pleasure by the man of taste. Either may be a beautiful accessory, or be pleasing in association with other forms. The tall thin spire is also far from being an elegant object. Divest it of its ornamental bands, crockets, and pinnacles, it will be tasteless and formal, as we may see exemplified in the pitiful obelisk in the centre of Queen-square, Bath; but associate it with proportionate pinnacles, or other appropriate forms, and, like the spire of St. Mary's Church in Oxford, and that of the south-western tower of Peterborough Cathedral, we are then gratified."

Very odd reasoning this, and quite at variance with the in-born feelings of nearly every native of Christian lands. The author would have deemed it unnecessary to refute such a passage if it had been put forth by any other than an antiquarian gentleman to whose taste and perseverance we owe so much.

By the denuding process mentioned by Mr. Britton, every thing accounted beautiful in the world might be rendered both uncouth and ugly: thus, take away the features of the finest head and face, you have remaining a raw skull; take away the sauce garniture and cookery of a feast, and you leave but crude flesh, raw vegetables, and a few other things equally untempting.

The builders of the Christian steeples, those outward beacons of a religious country, so caught from the true sublime one of the chords holding mastership over the human heart and feelings, that the tottering child and the snowy-headed old man, the religionist and the scoffer, the churchman and the sectarian, alike pay the tribute of admiration to the beauty of form of the church spires built by our forefathers on principles the mechanism of which, perhaps, they cannot understand, and from feelings, which though some of them cannot possess, yet cannot but revere.

But the truth is, the myriads of these glorious outward church adornments, which told at every step the alien as he came to Europe, in this land Christ is great, now deemed useless though sublime, employed industriously and

profitably that portion of our Christian population which from the want of employment now begs or tenants the workhouse and the goal.

No object exists more sublime than the steeple of St. Peter's Church at Caen, unless it be that of St. Michael's Church at Coventry—none more sublime than St. Michael's, unless it be that of Louth—none more sublime than Louth, unless it be that of Chichester Cathedral—none more sublime than the steeple of Chichester Cathedral, unless it be that of Antwerp Cathedral—none more so than Antwerp steeple, unless it be that of Strasbourg Cathedral—none more so than Strasbourg steeple, unless it be that of Freiburg in the Breisgau—none more sublime than Freiburg steeple, unless it be that of Salisbury Cathedral, which, tapering up to heaven in beautiful proportion till it seems more lofty than it really is, appears as though it had drawn down the very angels to work over its grand and feeling simplicity the gems and embroidery of Paradise itself; and, indeed, the most gorgeous of the English folk works of architecture always retain such a peculiar character of sacredness that they always unfold a truly religious appearance.

The pyramid is Nature's own form; her mountains, the grandest of earthly masses, diminish to heaven; architectural science requires that a building to endure should end in a pointed summit: a mere heap of sand will by its own gravity assume a pyramidal form, and so endure for thousands of years, and long outlive a wall of granite reared perpendicularly.

The feeling of love for the scientific and picturesque form of the pyramid is so inherent in man, that any modern steeple which is erected, is immediately universally condemned if its outline be not strictly pyramidal, and the most illiterate, who knows not why he condemns it, is strictly correct in his condemnation.

A pyramidal outline is of such importance, that if even a dome do not conform to it, ungraceful clumsiness, and disgust to every class of beholders, are the sure results. In this may be seen the wonderful art of Wren, in proportioning the dome of St. Paul's Cathedral. The cupola is placed a great distance within the tambour, so as at once to suit the particular scheme of its construction, and to form a pyramid. De Quincy says it appears very harmonious notwithstanding this peculiarity; but the truth is, that the perfection of its form emanates from this diminution. Indeed, many of the modern cupolas, built by Sir John Soane and others, being almost as

manner, not altogether unlike some of the spires of Norman architecture, as at Rochester Cathedral. This structure is reputed to be the tomb of Theon, tyrant of Agrigentum.

In buildings to be viewed from a great distance, the great art consists in making them appear pleasing from every point of view. Wren was in this as great a master as in geometry and construction; not only do his steeples bear the test of a front view, but when viewed diagonally and in various other ways they still conform to pyramidal outlines, whether passed down their utmost breadth, or through the distended open parts of them which appear in a side view.

Diagonal Outline of the Spire of St. Dunstan's in the East, London.

How ill the moderns have succeeded in steeple-building by piling one discordant heap upon another, may be gathered from the almost universal contempt with which the architect, the architectural critic, and the public in general, view our modern steeples; to raise upon each other, to coarse broken outlines, imitations of delicate small works of ancient architecture which stood on the ground, cannot satisfy the mind or the eye; these things all require to be designed on purpose; the higher the stages of the work ascend, they are more and more restricted in general magnitude by the outlines of the pyramid, yet from their superior altitude they require to be designed in a larger and simpler style, otherwise, not being read by the eye, they become confused, and thence tasteless. The steeple of the new church at Shadwell, from being formed with a good outline, has received almost general praise, although its details are coarse and its materials are mean and fragile; the easy labour of drawing two pencil boundary lines, meeting at its summit, gained for its designer this praise, and saved him from the reprehension given to many works, the details of which would rank higher if placed in proper situations. The author always knew that good steeples were formed on this principle, and he has been much pleased by finding the boundary lines remaining in pencil upon ancient drawings of them.—*Essay on the Decline of Excellence in Modern English Buildings.* By Alfred Bartholomew, F.S.A.

ANTWERP AND LONDON.—In 1342, when the disputes between the Archduke Maximilian and the bourgeoisie of Bruges ended in his blockading Sluys, and thus striking a fatal blow at the prosperity of a city that had been the great depot for the productions of the north and south of Europe, its trade was transferred to Antwerp, which had long been a formidable rival; and this, added to its previous advantages, gave it a preponderance in the scale of commerce, and it became the warehouse of the civilized world, where merchants from all lands congregated to buy and sell. To accommodate these visitors in the transaction of their business, "the Bourse" was constructed in 1351, which building furnished Gresham with his idea for the Exchange in London, which was originally styled "Britain's Bourse." In the same manner the ancient processions of the trades of Antwerp furnished us with the prototypes of much of the pageantry formerly exhibited in the early mayoralty processions of London; for the similarity between them is too striking to be the result of accident.—*Fairholt's Lord Mayor's Pageants.*

#### METROPOLITAN IMPROVEMENTS, &c.

The following are extracts from the 20th Report of her Majesty's Commissioners of Woods, Forests, Land Revenues, &c., being the 14th annual report:—

##### HYDE PARK AND VICTORIA PARK.

The report also contains a schedule of property purchased under the authority of the act of 5 Victoria, sess. 2, cap. 19, to empower the Commissioners of Her Majesty's Woods, &c., "to form a new opening from the Knightsbridge-road into Hyde Park, and a new opening from High-street, Kensington, into an intended new road across the Palace-gate;" the total purchase-money for which property amounts to 1,080*l.*; and a schedule of property purchased under the authority of the act of 5 Victoria, sess. 2, cap. 20, to extend an act passed in the 4th and 5th years of her present Majesty, for enabling Her Majesty's Commissioners of Woods, &c., to purchase certain lands for Victoria Park.

##### NEW HOUSES OF PARLIAMENT.

In the appendix will be found a report from Mr. Barry of the progress made, up to the present time, in the erection of the new Houses of Parliament. The following is that gentleman's report:—

"*Architect's Report as to the Present State of the Building.*

"The curtain portions of the river front and a considerable portion of the north and south fronts are carried up to their full height in readiness for the roofs. The central portion of the river front and the wings of the building are a little above the same level, and probably will attain their full height in about four months from this time. Considerable progress is made with the superstructure of the western portion of the south front, the Victoria tower, the Royal Gallery, the House of Lords, the central tower and adjoining corridors, and the west front towards New Palace-yard, all which portions of the building are upon an average about 15 feet above the level of the Trinity standard of high-water.

"The stone continues to be supplied in great abundance from the neighbourhood of Austin, in Yorkshire, for the external masonry, and there is no deficiency of supply of a stone which has recently been employed, from Caen, in Normandy, for the internal masonry. The contractors have increased their number of hands at the quarry to about 300 men, and have provided additional tackle, horses, &c., by which and other arrangements the supply of stone for the future will be even still more certain and abundant than it has hitherto been. The work executed and the contractors' arrangements for the progress of it at the building still continue to merit my entire approbation."—*CHARLES BARRY.*

"Westminster, August 12, 1843."

##### METROPOLIS IMPROVEMENTS.

In our last report we stated the progress which had been made in purchasing the interests in the property in the several lines of improvement authorized to be made under the Acts 3 & 4 Victoria, c. 87, and 4 Victoria, c. 12; and we have now to state that on those several lines, up to the 5th of January last, we have completed purchases to the amount in the whole of 300,755*l.* 5*s.* 8*d.*, and have contracted for further purchases to the amount in the whole of 194,641*l.* 13*s.* 6*d.*; viz.:

1. In the line from Oxford-street to Holborn we have completed purchases to the amount of 166,851*l.* 12*s.* 10*d.*, and we have contracted for further purchases to the amount of 15,906*l.* 15*s.*
2. In the line from Bow-street to Charlotte-street, Bloomsbury, we have completed purchases to the amount of 35,464*l.* 11*s.*, and have contracted for further purchases to the amount of 26,485*l.*
3. In the line from the London Docks to Spitalfields Church we have completed purchases to the amount of 44,157*l.* 16*s.*, and have contracted for further purchases to the amount of 71,102*l.* 18*s.* 6*d.*
4. In the line from Coventry-street to Long-acre we have completed purchases to the amount of 54,281*l.* 5*s.* 10*d.*, and have contracted for further purchases to the amount of 78,477*l.*
5. In the line from East Smithfield to Rosemary-lane we have not completed any purchase, but we have contracted for purchases to the amount of 2,670*l.*

A statement is appended to the report showing our receipt and expenditure in respect of monies applicable to these improvements, by which it appears, that of the sum of 500,000*l.*, mentioned in our last report to have been borrowed of the Equitable Assurance Company for the purposes of these improvements, upon the security of certain portions of the land revenue of the Crown in the county of Middlesex, there remained a balance of 166,918*l.* 1*s.* 10*d.* on the 5th of January last.

##### THE PARKS.—KENSINGTON, REGENT'S PARK, &c.

It having been deemed expedient that the Crown should possess the freehold of the property to a certain distance immediately eastward and westward of the new entrance from the Knightsbridge-road into Hyde-park (now called the Albert Gate), for the purpose of obtaining and exercising a controlling power as to the style and character of the buildings to be erected on the ground adjacent to that new entrance, we have to report, that agreements have been entered into for such intended purchases, and for letting to Mr. T. Cabbit the disposable building-ground eastward and westward of the new entrance.

We have also to report that, under the powers given by the same Act, we have agreed for the purchase of the three houses in the High-street at Kensington, required for opening the intended new communication between Kensington and Bayswater; which not only forms an essential part of the plan for letting for villas the site of the late Royal kitchen-garden at Kensington, but will be a great accommodation to the rapidly increasing population in that district.

In furtherance of that plan, a new sewer for the drainage of the intended houses has been nearly completed; but, owing probably to a very great suspension of building speculations which has existed during the past year, we have as yet agreed to let only two out of the thirty-three sites designed for new buildings to be erected on this ground.

It was mentioned in our last report, that the value of this ground to be let on building leases would be sufficient to form a fund for acquiring and establishing a new kitchen-garden, to be attached to Windsor Castle, as well as for the improvement of other royal kitchen-gardens; and that approved plans for forming such new kitchen-garden on part of the Crown's estate at Frogmore were then in progress.

Under the Act which authorized these arrangements, the monies required for "forming, improving, laying out, planting, and enclosing this new royal kitchen-garden, and in erecting, making, and completing all requisite houses, buildings, walls, sewers, drains, and other works connected therewith," have in the mean time been defrayed out of the land revenues of the Crown, as the funds to arise from the value of the late kitchen-garden at Kensington have not, for the reasons before mentioned, yet become available for this service.

The new bridges for connecting the Regent's Park with that portion of the Primrose-hill estate which, under the authority of the 5th & 6th of Victoria, c. 78, we had lately purchased from the provost and fellows of Eton College, having been completed and open to the public since the date of our last report, we are now in negotiation with the lessee of the college, with a view to the purchase of his interest, which will not expire till the year 1859; and if we fail in obtaining such terms as shall appear to be reasonable, it is our intention to avail ourselves of the powers of the Act in question, to have the value assessed by a jury.

Since the passing of the Act of 4th & 5th Victoria, cap. 27, which vested in us all the requisite powers for acquiring the lands intended to form a new park in the eastern part of the metropolis, we have agreed for the purchase of the freehold interests in 101 acres out of 290 acres comprised in the plan, and authorized by the said Act to be purchased for forming such new park; and having given the proper notice to all the parties whose lands or interests will be required, we are proceeding as expeditiously as possible to complete the purchases of all the still outstanding freehold interests, before we begin to deal with those of leasees, sub-leasees, or occupiers; and for the present the monies set apart for this service remain invested in Exchequer-bills.

The payments into the Exchequer out of the "Growing produce," or surplus yearly rents, arising from the land revenues of the Crown, amounted within the year ended 5th January, 1843, to the sum of 133,000*l*.

The balances of the different accounts standing in our names, and in the hands of receivers, deputy-surveyors, and other officers, on the 5th of January, 1843, amounted to 94,207*l*. 15*s*. 8*d*.

LINCOLN,  
A. MINEE,  
CHARLES GORE,

Commissioners of Her Majesty's Woods,  
Forests, &c.

Office of Woods, &c., Aug. 21, 1843.

#### VICTORIA RAILWAY-STATION, MANCHESTER.

The Victoria station of the Manchester and Leeds and Liverpool and Manchester Railways at the junction in Manchester just opened, is the largest in the kingdom. It covers a distance from Hunt's Bank to the Ducie Bridge of 852 feet, with an average width of 130 feet; having five main lines of rails from end to end, three of which are appropriated for the main lines, and two are sidings. In addition to this there are other sidings, which may hereafter be used for goods; and the departure lines for the two railways are also sidings, on the south side of the other rails. To the length of 700 feet from Great Ducie street, the station is covered in with an iron roofing, erected in three compartments, the centre one being 59 feet 6 inches span; that on the north side, 28 feet; and that on the south side, 26 feet 3 inches. This roofing, with a length of 700 feet, and an entire width of about 114 feet, forms the largest extent of railway roofing in the kingdom, being little short of 80,000 square feet of iron roofing. This immense roof is supported by the north boundary wall of the station, and by a number of iron columns; and the south side is protected by a similar wall, forming also a retaining wall for the approach road from Hunt's Bank. The walls bounding this approach road are surmounted by ornamental cast-iron railing, instead of stone parapets. The *coup d'œil* of this splendid avenue, viewed from either end, is very striking. The interior of the roof is not left bare, as in some railway stations; but beneath the slates the whole has been boarded, and the joints of the boards covered with laths. During the day, the station is well lighted by skylights in the roof; and, during the night, by a series of gas lamps, fitted with burners for the new light, formed by a radiating combination of the flat flame burners, invented by Messrs. Hall, of King-street. The skylights are glazed with Chance's patent glass, which is a strong, thick, and cheap glass, in panes of about four feet in length by one in width, two of which in length include the extent of the skylights from the ridge downwards. The gas lights consist of a number of radiating tubes, like the spokes of a carriage wheel, perforated with orifices for the flat flame burners. Of these lights there are 15 within the covered station, a large one opposite each booking-office, and several others round the boundary wall down to Hunt's Bank. Connected with them is an arrangement of the utmost importance for such establishments as railways. One central tap at the station regulates and adjusts all the lights there, both along the railway and approaches, and also within the several booking offices, waiting and refreshment rooms. When a train is arriving or departing, the fullest illuminating power is required and used; but, in the intervals between that and the next departure or arrival, the smallest modicum of light is sufficient, and a single turn of the tap will reduce all the lights to any required degree. This will, of course, be the means of considerable saving in the consumption of gas. Every care has been taken to provide ample accommodation for the great traffic which must come on the line. Altogether, it is computed the company possess at the goods' station, Oldham-road, not less than eight acres of land, all applicable to the purposes of the goods' traffic. At and around the Victoria station, notwithstanding its centrality, the company possess no less than about thirteen acres.

At the official inspection of the station and extensive line, General Pasley and the directors were conveyed in two carriages, which, from their novelty, may not be unworthy of notice. Both these carriages are constructed from

designs of Mr. Houldsworth, the chairman of the directors, and are intended chiefly for summer use. The Tourist forms one apartment, with a high *dais* occupying the centre third of the floor from end to end. On this *dais* are placed at intervals two seats, hacked by others, in all 16 on the *dais*. On the lower floor there are five seats on each side, which turn up, and then leave a passage all round. Four other seats are in the corners, making a total of 11 on the lower floor, the occupants of which, when seated, do not at all obstruct the view of those seated on the *dais*. The carriage is thus capable of containing 30 passengers. Besides the windows at the side, there are wooden slides in the coving of the roof, which, when drawn down, open with gauze ventilators, which let in the air, without admitting those draughts which are sometimes so injurious in the second-class carriages. For this application of wire-gauze we believe a patent has been obtained. The *dais* is fitted up with carpets, &c., and each end of the Tourist is lined with looking-glass, and has small ventilators for winter use. The other carriage, named the Gondola, is somewhat different in construction. It has open ends, like "stand-ups," from which doors open into a small but elegant saloon, each side of which is occupied by a sofa, covered with crimson velvet, and capable of seating six persons. There is a let-down seat within each door, so that this little centre will seat a party of 14, who may have greater freedom of movement than in the ordinary railway carriages, and may from time to time walk out into the air, either in front or rear. The junction or extension line of the Liverpool and Manchester Railway, from Ordsall-lane to Hunt's Bank (through Salford), to connect with the Manchester and Leeds extension, will be completed in March next.

#### USE OF IRON IN SHIP-BUILDING.

Among the new employments found for iron must be mentioned ship-building. Iron was first used about the year 1810 for the construction of vessels employed in canal and river navigation. After this, the next employment of this material occurred in 1820, when a steam vessel, called Aaron Manby, was constructed at the Horseley iron-works, and made the voyage between the capitals of England and France without unloading any part of her cargo; this vessel is still in good condition, although twenty-two years old, never having required any repairs to her hull. In 1825, a small iron steam-boat was placed on the river Shannon, where she is now employed, in good condition. In 1832, the Elburkah—an iron steam-vessel built by Messrs. Macgregor, Laird, and Co., in Liverpool, made the voyage from that port to the coast of Africa, and twice ascended the river Niger. This successful experiment led to the construction of many other iron steam-vessels. One builder, Mr. John Laird, of Birkenhead, near Liverpool, has built forty-five iron vessels, of the aggregate burden of 12,600 tons. The total number launched since 1830 is said to exceed 150. The largest iron vessel yet finished, and in use, is the *Guadaloupe*, a steam-frigate of 788 tons, carrying sixty-eight pounders, and belonging to the Mexican government; but her dimensions are insignificant when compared with those of the Great Britain, now building, and nearly finished, at Bristol. The length of this vessel, from her figure head to her transom, is 330 feet; the breadth of beam 51 feet; the depth of her hold 31 feet; her draught of water, when loaded, is calculated to be 16 feet; and her burden 3,500 tons. The engines will have a force equal to that of 1,000 horses, and will be used to keep in action, as the means of propulsion, an Archimedean screw. The draught of water will be seen to exceed that of a first-rate West-Indian. At present, this vessel can only be considered as an experiment; and should it fail, an abundance of ridicule will no doubt be cast upon the proprietors by men whose genius would hardly have sufficed for the invention of a wherry. A great part of the steam navy of the East-India Company consists of iron vessels, twenty-five of which are now in use in India, among which are the *Nemesis*, the *Ariadne*, and the *Medusa*—names well known to the British public, from the conspicuous part which the vessels performed in the war with China. The advantages of iron over timber

for naval architecture are—the absence of "wear and tear" in the hull, no necessity for caulking or coppering, no possibility of injury from dry rot, greater lightness, and increased capacity; and, what is of even far more importance, greater safety. This last point has sometimes been questioned, but not by any one having knowledge on the subject. When a timber built ship takes the ground with any violent shock, the whole framework of the vessel is strained, and in a measure dislocated, so that, by the mere buffeting of the waves, she will in all probability soon be made a complete wreck; but when an iron-built vessel strikes, however violent the blow, it is only the part that is brought into collision with the rocks that will be injured. The plan of building these ships in water-tight compartments, then proves its efficacy; for, should the injury amount even to the tearing away of the plates, the resulting mischief will only be to fill with water that particular compartment of the vessel to which the injury has occurred, so that the ship will be scarcely less buoyant than before; and experience has shown that damage of this kind is easily repaired. The first cost of iron vessels is somewhat, but not much, less than that of the timber-built vessels; their comparative cheapness results from the greater durability. After years of constant employment, they are found to be as sound and as clean as when first built. Their weight, upon which depends the displacement of water, is as a general rule three-fifths the weight of wooden vessels of the same capacity. The weight of metal used in proportion to the burden of the ships varies of course with the size. A sea-going iron steam-vessel will take from nine to twelve cwt. of iron per ton register. Boats intended for river traffic, which do not require an equal degree of strength, of course take a less weight of metal. The building of iron ships is fast becoming an important branch of national industry; it is one which our mineral riches, and our great mechanical skill, will secure to us as a virtual monopoly.—*Porter's Progress of the Nation.*

#### THE NORTHERN COAL TRADE.

In 1770 there were only 13 collieries on the Tyne, and in 1808 there were upwards of 30. In 1828 the number was increased to 41 on the Tyne, and to 18 on the Wear, making in all 59. The estimated powers of working possessed by these collieries—that is, the quantity of coals they are able to raise in a year—are calculated by the late Mr. Buddle, the most accurate and experienced viewer ever known in the trade, at 5,857,522 tons. In 1836 the number of collieries was again augmented on both rivers, and their powers of working extended to 8,133,922 tons yearly, being an increase in seven years of 2,236,400 tons, or nearly 38 per cent. In addition to this there were in that year new collieries already shipping coals, but not in the regulation, capable of producing another million of tons, which swells the increase per cent. to nearly 55, or considerably more than half. Still the Tees is not included. From the year 1826, when coals first began to be shipped on the Tees, up to 1835, the quantity increased, year by year, from 18,581 to 357,726 tons, conveyed along the Stockton and Darlington Railway alone. But in 1836 the Clarence Railway was in operation, and we may assume the powers on the Tees in that year to have exceeded 500,000 tons. Thus, then, from 1826 to 1836, the aggregate capabilities of the whole district has sprung from 5,941,512 (including the Tees) to 9,623,922, showing an increase of 3,682,130 tons, or fully 62 per cent. Taking the next septennial period, from 1836 to 1843, the ratio is equally progressive. Hartlepool, in the interval has become a great and flourishing port; and all the collieries shipping there, with the exception of Thornley, are creations belonging to this cycle. Lord Londonderry's own snug little harbour of Seaham has grown into magnitude, and tripled its trade within the time. Two joint-stock companies have, during the while, been formed, each with a capital of nearly 500,000*l*. sterling, and which have sunk nearly the whole of their funds in exploring new coal-fields. Moreover, on the Blyth, the Tyne, the Wear, and the Tees, multitudinous fresh winnings have been made by private individuals and compa-

nies, whilst an entirely new district around Warkworth has been called into existence. In the same period, or nearly so, seven additional public railways, for the conveyance of coal, have been opened in the county of Durham alone. The impulse, has, in truth, been attended with amazing consequences. The region of developed coal-fields has been extended in every direction, until it describes a vast circuit, stretching from the Coquet, in the remote north, to the sterile waste of Cockfield Fell in the far west, sweeping round Middleham on the extreme south till stopped by the German Ocean on the east. We cannot estimate the increase of powers thus obtained at less than 3,000,000 of tons yearly, so that the aggregate capabilities of the district may be now assumed at upwards of 12,500,000 tons per annum, being much more than double the quantity that could have been raised in 1828.—*Newcastle Advertiser.*

#### PRESERVATION OF CHURCH ORGANS.

To those who take an interest in the means of obtaining church music, the subjoined letter to the editor of the *Hereford Times* may be interesting:—

"SIR,—It is to be feared that though the repairs of the Cathedral are progressing with certainty, they are also an exemplification of the saying—*slow and sure*. But though the slow and sure is a vexatiously dull pace, irritating the temper and exhausting patience, it is much better than a more rapid one, when the latter cannot be adopted safely. Considering that it appears by no means certain that the restoration of the Cathedral will be so far completed as to admit of the erection of the organ and the celebration of the Triennial Musical Festival within its walls in 1846, it becomes a matter of extreme importance to save that valuable instrument from inevitable ruin. An organ is always better circumstanced in churches where divine service is solemnized daily, and not merely on the first day of the week. I am of course supposing that the organ is regularly played on every day, except on Ash Wednesday and in Passion Week. But if the organ used for divine service daily is better circumstanced than that which is used but weekly, what shall be said of one which is not even used once a month or once a year? What shall be said of an organ which has been removed under the inspection of a competent person, but which has been treated like mere lumber and rubbish? The matter is too serious to treat with levity or indifference. A plain question is at issue. Shall the cathedral organ *exist*, or shall it not? The dean and chapter are the persons who have to decide its fate. Let them at once send for an organ-builder of well-known and justly-merited celebrity (I care not whether it be Mr. Hill, or Messrs. Gray and Davison, but it should be one of these), who should, under his personal inspection, see the organ placed in the Shire Hall. As for the expense, I have to observe that *any expense* is better than the destruction of a valuable instrument. A stitch in time saves nine. I hope it will do so now. Let the organ be erected in the Shire Hall; let Mr. Smith exhibit its powers once a week in public, as Mr. Stimpson does those of the Birmingham organ, and let the price of admission be the same. This, with the exhibition of the instrument to Mr. Smith's friends, and such others as he may admit at any time he may think fit, will save a noble instrument from the calamity which otherwise awaits it."

"AN ADMIRER OF OLD ORGANS."

**SUPERFICIAL MEASUREMENT OF THE GREAT WELLINGTON GROUP.**—Bronze casting:—Drapery, 128 feet; head of horse, 29 feet; neck, 120 feet; hand, 12 feet; hind quarter, 291 feet; fore quarter, 261 feet; hat, 26 feet; body of duke, 150 feet. Of the colossal head of his grace, cast from a cannon taken at Waterloo, we have not the dimensions, nor of the limbs from the foot to the knee; but it will appear from the above to be little less than 1,100 feet!

**ROYAL EXCHANGE CLOCK.**—Mr. Dent, the well-known chronometer maker in the Strand, has obtained the contract for making the Royal Exchange clock. His tender was for 800*l.*, but it having been ascertained by the committee that he could not execute it with chimers, quarters, &c., as was intended, for that price, they have ordered it to be made 500*l.* more, making together 1,300*l.*, and of this it is supposed Mr. Dent can scarcely clear himself.

#### WILTS HILARY SESSIONS.

**COLESHILL BRIDGE.**—The County Surveyor reported that he had examined this bridge, and he estimated that the cost of repairing and widening the old bridge would be 250*l.* The expense of building a new bridge at a different point of the stream, with the approaches, would be 450*l.* Looking to the future expenses of repairs, &c., and to the accommodation of the public, he would recommend the building the new bridge.

The Earl of Radnor stated that the Berkshire magistrates had appointed a committee to confer with the magistrates of Wilts, with authority to decide on building a new bridge, or to repair the old, as might be thought best.

The Clerk of the Peace stated that the approaches to the bridge would be liable to be repaired by the parties who repaired the present road,—the Commissioners.

It was then agreed on the motion of Lord Radnor that the present committee be requested to meet the magistrates of Berks to ascertain what place will be most convenient to build the bridge.

**BOREHAM BRIDGE.**—The committee appointed at the last sessions reported that they had examined the bridge and the evidence bearing on the question, and that in their opinion the county is liable to repair the bridge. The bridge was now in a very dilapidated state, and they recommended that the county surveyor be directed to examine it and take the usual necessary steps for its repair.

#### ASSESSED TAXES CASES.

*Determined by the Judges on Appeal.*

May 18, 1841.

Windows—Bakery-house.

*A bakehouse in a back yard and disjoined from the dwelling-house, and having no communication with it, is not a manufactory within the 48 Geo. 3, c. 55, and 50 Geo. 3, c. 104, and is liable for its windows.*

At a meeting of the commissioners held at the Red Lion Inn, in Dorling, on Monday, the 29th of September, 1840 (48 Geo. 3, c. 55, schedule A, rule 3), John Brown, of Dorling, baker, appealed against two windows in a bakery, which bakery is situated in his back yard, and is disjoined from his dwelling-house, and has no communication therewith. Mr. Brown is by trade a bread-baker, and claimed to be exempted from such windows on the ground of his bakery being what he considered a manufactory, and exempt by the 8th section of 50 Geo. 3, c. 104. The commissioners relieved the appellant for the windows in question: with which decision the surveyor was dissatisfied, and requested a case thereon for the opinion of Her Majesty's judges. He referred to case 191, and submitted that, under the circumstances stated, the bakery in question was not such a manufactory as the law contemplated to relieve. The cases of Thomas Rose and John Saunders being similar cases to the above, the surveyor demanded the judges' opinion on their cases also.

W. CRAWFORD, } Commissioners.

E. KERRICK, }

We are of opinion, that the determination of the commissioners is wrong.

J. PATTERSON. T. COLTMAN. W. WIGHTMAN.

Windows—Solicitor's offices.

*Appellant (a solicitor) residing elsewhere, occupied premises as offices, underletting a part to his clerk, who lived there. A door was in front of the premises, opening into a passage common to master and clerk, the offices being on one side, and the rooms on the other: Held, not exempt for the windows, the offices and clerk's premises forming but one house, and being inhabited in the night-time.*

At a meeting of the commissioners of assessed taxes, held at the Wynnstay Arms Inn, in Llanfyllin, on the 11th of September, 1840, for the purpose of hearing appeals against the first assessments, for the year ending 5th April, 1841, (48 Geo. 3, c. 55, sch. (A); 57 Geo. 3, c. 25, s. 1; 5 Geo. 4, c. 44, s. 1).—Mr. T. Lloyd Royle, of Llanfyllin aforesaid, solicitor, appealed against an assessment for fifteen windows.

The appellant stated that the windows are charged for premises occupied by him as offices; that he is the tenant, and underlets a part of the said premises to his clerk, who he (his clerk) occupies as his dwelling-house. That there is a door in front of the premises which opens into a passage common to both, and the appellant's offices are through a door on the right hand, and his clerk's dwelling through a door on the left hand of the said passage, he

therefore contends that his offices are exempt, as they are separated from his clerk's dwelling by the passage before stated; and as he resides in another house, upon which the windows are duly charged, he the commissioners relieved the appellant, but the surveyor demanded a case, urging that the passage before mentioned is not any thoroughfare, for instead of leading through the premises, it leads up stairs, and that upon the passage (which is nothing more than a front entrance to the house) there is only one door, and that in the front, which is sometimes closed by day, and always by night, and then shuts all as in one dwelling; he therefore submitted that the appellant could not be exempted under the Act of 5 Geo. 4, c. 44, s. 4, in consequence of a part thereof being occupied as a dwelling-house.

EDWARD FOULKES, } Commissioners.

JOHN DAVIES, }

We are of opinion that the determination of the commissioners is wrong.

J. PATTERSON. J. GURNEY. T. COLTMAN.

Windows—Attorney's office.

*Appellant lived in a house, three rooms of which she let as offices to an attorney, who lived elsewhere; there was one front door, and no communication therewith. Held, not exempt for the windows of the rooms let as offices, they being part of an inhabited dwelling-house.*

At a meeting of the commissioners of land and assessed taxes, acting for the division of the town of Cambridge, on Monday, the 9th day of November, 1840, the following case was heard and determined (48 Geo. 3, c. 55, sch. A.):—Mrs. Ann Peed, of this town, appealed against five windows in her dwelling-house. Appellant being sworn, states, "she occupies a house containing eight rooms, including a kitchen under ground; there are fifteen windows, including the kitchen window. Appellant lets three of the rooms to Mr. A. Peed, an attorney, in which there are five windows, which Mr. Peed uses exclusively as offices, his dwelling-house being in another part of the town; there is one front door communicating with all the rooms in the house. Mr. Peed's dwelling-house is in Trinity parish, and is duly assessed. Appellant contends she is not liable for five windows in Mr. Peed's offices."

The surveyor contended that as the offices formed a part of the dwelling-house, and had communication therewith, the appellant had no ground for claiming any exemption from the five windows in the rooms so used or occupied, and produced cases 506, 507, and 508, in support of his opinion.

The commissioners, notwithstanding, were of opinion that as Mr. Peed occupied a dwelling-house as stated, and was duly assessed for the same, the appellant was not liable, and relieved her from the five windows. The surveyor being dissatisfied, requested a case for the opinion of Her Majesty's judges, which we sign accordingly.

Samuel Evans, } Commissioners.

Wm. Bishop, }

We are of opinion that the determination of the commissioners is wrong.

J. PATTERSON. T. COLTMAN. J. GURNEY.

Windows—Shop.

*A shop window on the left side of a baker's house, and looking on a carriage way running into an inn yard, such way being also a public way to the bakehouse and to the back premises of an adjoining house: Held, exempt as a shop window under the 4 Geo. 4, c. 11, s. 1.*

At a meeting of the commissioners, held at the Red Lion Inn, in Dorling, on Monday, the 28th day of September, 1840, (48 Geo. 3, c. 55, sch. (A))—John Sanders, of Dorling, baker, appealed against the charge for the shop window on the left side of his shop. The bow window (chargeable as two from its size) in the street front of the same shop was previously allowed him by the surveyor, and had not been assessed. The window in question is situated on the left side of the house, and looks on a carriage way running into an inn yard, and which way is also a public way to the bakehouse of the appellant, and also to the back premises of another adjoining house. The surveyor submitted that under such circumstances the side window in question did not come within the meaning of the act 4 Geo. 4, c. 11, s. 1; but the commissioners being of a different opinion, relieved the appellant, whereupon the surveyor requested a case for the opinion of Her Majesty's judges.

W. CRAWFORD, } Commissioners.

Edward Kerrick, }

We are of opinion, that the determination of the commissioners is right.

J. PATTERSON. J. GURNEY. T. COLTMAN.

**EXCHANGE BAZAAR.**—A society is in the course of formation on the Surrey side of the water, having for its object the raising of capital of 1,000*l.*, in small shares, in order to establish a bazaar for the mutual exchange of goods for provisions and other necessaries on equitable terms, chiefly for the purpose of enabling small tradesmen to find a fair market for their goods. The whole, in fact, is in some respects on the principle of the Labour Exchange formerly established in Theobald's-road, but some defects in which are proposed to be remedied, and every objection removed. Preliminary meetings are at present being held in Stamford-street, and shortly a public meeting will be called, with a view to put the proposed plans in operation.

## Correspondence.

## MEASURING ROUND TIMBER.

SIR,—On page 559 of your last volume, a correspondent subscribing himself "L." complains of what he terms "a curious discrepancy in two ways of measuring a stick of round timber," and expresses a wish "to see it explained." He instances a piece 80 feet long, 6 inches diameter at one end, and 6 feet at the other, and informs us that "the contents, taking the centre of the length for the quarter girth, will be found to be 521.22050080," but that if the piece be cut into three pieces of 35 feet, 10 feet, and 35 feet long respectively, and each piece be measured separately in the same manner, their contents added together will be found to be 624.5597643390548525. Permit me to inform him that the discrepancy between the two operations (for they are not different methods) arises from the simple fact of their being both of them wrong; and that the difference between their results *proves* them to be so; for had they been correct, it is self-evident that the sum of the contents of the parts must be equal to the contents of the whole. It is absurd to "take the centre of the length for the quarter girth." If "L." was computing the superficies of a triangle, he might measure at the centre for a multiplier of the length with propriety, but the mensuration of the "stick of round timber" is a cubical affair, and, to do it properly and scientifically, he must consider it (what in its geometrical capacity it is) the *frustum of a cone*, and proceed as follows, viz.: find the mean area (not by girthing it in the centre, but) by adding together the squares of the two diameters, and the product of the two, and multiply their sum by .2618, the one-third of .7854 (which is the area of a circle whose diameter is 1), then multiply the main area thus found by the length, and the product is the contents of the frustum.

Or the mean area may be found, by adding together the areas of the two ends, and the mean proportional between them, which is the square root of their product, and divide their sum by 3.

Measured in this way, the contents of the piece given is 822.052 feet, or 822 feet 89.856 inches cubic; and if the three divisions he names are each measured in the same way, "L." will find that no discrepancy exists between the sum of their results and the contents I have given.

Though the question seems of a rather whimsical character, yet as it belongs to the important subject of timber surveying, on which a great many erroneous notions prevail, I deem it not undeserving of notice in a publication for builders; perhaps you will agree with me, and give insertion to this reply in the columns of your next. Should "L." wish to see the solution at length, I shall be happy to furnish it. I am, Sir, your obedient servant,

Liverpool, 9th Jan. 1844. S. HUGGINS.

## ARCHITECTS' COMMISSION.

SIR,—You will oblige an early subscriber, an architect, by inquiring through the medium of your paper, whether an architect's commission of 2½ per cent. can be substantiated for a series of drawings, and a report describing the same, with estimate of the probable expense. Any subscriber or correspondent having, in the course of his professional career, had the unpleasant necessity enforced on him of establishing his just claim by recourse to litigation, will confer an obligation by asserting the result thereof, by which an immense benefit may be derived, not only by myself, but by almost every member of the profession.

I remain, Sir, yours faithfully,

A SUBSCRIBER.

The drawings consist of four elevations, two sections, and plans of four stories; the estimate was £2,000.

[We think that within the charge of 2½ per cent. should be included the making a detailed specification of the work.—Ed.]

## THE LEICESTER MONUMENT.

SIR,—The chairman of the committee having informed the competitors of the result of this competition, in a circular expressed in terms of courtesy and fair dealing, and giving the name of the successful candidate, I would suggest that your correspondent in last week's paper should plainly state whether his remarks apply to the design No. 40, stated to be the one selected.

## ANOTHER COMPETITOR.

London, January 10, 1844.

## BLUE LIAS LIME.

SIR,—I shall be glad to be informed, through the medium of your valuable magazine, whether blue lias lime can be obtained any where in Yorkshire or on any of the rivers which branch from the Humber convenient for shipment; or if not, where the stone can be procured.

I am, Sir, your obedient servant,  
Bridlington, Jan. 6th, 1844. INQUIRER.

## Miscellanea.

MR. JOSEPH'S STATUE OF SIR DAVID WILKIE.—A private view was afforded to the friends of Mr. Joseph, to several of the nobility and persons of distinction, and to those more immediately connected with the Fine Arts, of the statue, just finished, of the late Sir David Wilkie, by Mr. Joseph, now placed in the National Gallery, in Trafalgar-square, and open to public view. The statue is a representation of the late eminent artist in an attitude of contemplation: in the right hand, which crosses the heart, is a pencil, whilst the left holds a portfolio of designs or drawings. The figure is in a modern costume, the angles of which are kept down; and the whole is rendered classical in its appearance by a cloak, or robe, which falls in broad folds over the shoulders. The likeness is correct; it may be somewhat idealized and flattered, but not beyond what is allowable, or at least what every sculptor allows himself. The figure is dignified and simple; it is happily free from any exaggerations, neither is it made up of littleness, or frittered into detached portions. The drapery of the gown, or robe, is very good. The statue is placed upon an elegant and massy pedestal of polished veined marble in a shallow recess, upon one side of which, covered by plate-glass, is preserved a favourite palette of the deceased painter, and forms not only an elegant ornament to the National Gallery, but a proof that sculpture in this country is by no means on the decline. It is one of the best, if not the best, statue which Mr. Joseph has produced.

ARTESIAN WELL.—An artesian well has been recently completed at the Middlesex Pauper Lunatic Asylum at Hanwell, under the superintendence of Mr. F. Bullen, of London, which, from the quantity and the quality of the water which it yields, as well as the height to which the water rises, may be reckoned as one of the most powerful in the kingdom. The shaft to a depth of 31 feet is 10 feet in diameter, and thence to a further depth of 200 feet is six feet in diameter, making 231 feet. At that point a small auger was driven below into a sand stratum, strongly charged with water, through which it was found necessary to force cast-iron cylinders into the clay beneath a depth of 12 feet. The whole of the shaft is constructed of brickwork in cement, and the cylinders are also lined with the same material. At the depth of 243 feet a guide rope was inserted, and secured with brickwork, and the boring commenced with pipes of 14 inches internal diameter, which are carried down into the flints immediately overlying the chalk, a depth of 290 feet, whence the water now rises and overflows the surface at the ratio of 100 gallons per minute, and at 26 feet above the surface at the ratio of 23 gallons per minute. The following is a description of the strata through which the well has been sunk and bored, with the exception of a few veins of septasia:—vegetable soil, 1ft. 6in.; gravel, 7ft.; sand, 2ft. 6in.; gravel and sand, 9ft.; brick clay, 2ft.; blue or London clay, 169ft.; indurated mud, sand, and clay, with pieces of wood and shells embedded, 2ft.; pebbles and shells, 3ft.; plastic clay, 29ft.; sand, 2ft.; plastic clay, 4ft.; indurated mud, sand, and clay, 8ft.; dark brown clay, 9ft.; green sand and clay, 7ft.; oyster bed, 2ft. 9in.; pebbles and yellow clay, 2ft. 3in.; bed of flint stones into which the bore is carried, 3ft. The temperature of the water as it overflows the surface is 55 deg. of Fahrenheit.

HEALTH OF TOWNS.—Sir H. De La Beche, one of the Commissioners appointed by Government to ascertain the best mode of improving the health of towns, paid an official visit to Bath during the week before last, accompanied by Mr. Hobhouse, the Secretary to the Commission. The several registrars of births, deaths, and marriages, within the borough, are busily engaged under the Commissioner's direction, in preparing well-arranged statistical tables from July 1842 to July 1843, in order that the sanitary regulations of that city may be duly brought before the Commission.

SALISBURY RAILWAY.—It is now stated that the proposed line is to be carried out solely by the South-Western Railway, irrespective of any local shareholders. The bill will be applied for early in the session.

## RAILWAYS CROSSING COMMON ROADS.—

A few days since, the gates across the railway at Beeston station were not open when the first train from Derby came down the line, and the morning being very dark, the engineer did not see the obstruction, nor abate the speed of the train, which was then going very fast; the consequence was, that the engine knocked the gate all to pieces; and the force with which some part of it was thrown back, dashed to the ground the palings which enclose the station-house, breaking off the bars like so many matches. Fortunately the extent of the damage done is confined to the gate and paling; but this should be one more warning of the culpable inhumanity of railways passing common roads: the bare necessity of the removal of gates and barriers from across a railway insures, notwithstanding all possible care, the frequent occurrence of accident; and we dread to contemplate the cruel loss of life which will sooner or later ensue from the possibility of persons while going along a common road being cut down by a tornado of railway vehicles.

PROJECTED RAILWAY BETWEEN MARYPORT AND WHITEHAVEN.—A new railway has been projected, and will be brought before Parliament in the ensuing session, for constructing a line between Maryport and Whitehaven, in Cumberland. This forms a portion of the great north line from Lancaster, before the public a few years ago, which was to cross Morecombe Bay, but did not at that time meet the requisite support of capitalists, probably from a fear of the embankment in the sea across the bay from Lancaster to Ulverstone. It has now assumed a more practicable shape, being confined to a single line of rails along the coast from Whitehaven to Maryport, where it will unite with the railway to Carlisle, and thence to Newcastle-on-Tyne, and when completed, there will then be a continuous line of railway from Whitehaven to Tynemouth, Shields, Sunderland, Hartlepool, Stockton, and all places in connection with the railways in the county of Durham. The country has been examined, and the line pointed out, by Mr. George Stephenson, and his oldest assistant, Mr. John Dixon, formerly resident engineer of the Stockton and Darlington Railway, and afterwards, for several years, of the Liverpool and Manchester Railway, has been to Whitehaven preparing the necessary plans and sections for depositing with the clerk of the peace for the county of Cumberland. The present project meets with the approbation and support of the Earl of Lonsdale, through whose property the line runs for many miles, so that there is little doubt but ere long this projected line will be added to the existing railway communications in the kingdom.

## CENTRAL LINE OF RAILWAY INTO SCOTLAND.

—A report on a central line of railway to Scotland, by Messrs. Johnson and Wood, has been addressed to the directors of the Newcastle and Carlisle Railway Company. The line proposed is to take a central route, commencing at the Rose Hill station of the above-named line, and proceed by Gilsland, Askerton Castle, Cramcrook, New Castletown, Shields, Hawick, Melrose, and Galashiels to Edinburgh, at about an equal distance from the proposed Caledonian line on the west, and the Great North British on the east. The proposal of this line appears to be brought forward not from any spirit of opposition, but to endeavour to shew that the central line will prove of equal accommodation to the public at less expense than the other two lines, and in the working an annual saving of 227,333. will be effected, paying 5 per cent. on the capital expended, and opening a line of communication through a mineral, manufacturing, and agricultural country, whose resources have never yet been developed.

RAILWAY JUNCTION.—At the meeting of the Hull and Selby Railway shareholders, the terms of junction with the Manchester and Leeds line were agreed to, so that it only remains to be carried out under the sanction of Parliament for the benefit of the general body. The principle of amalgamation, which at the present moment is the great feature in the railway world, will tend to consolidate interests, and destroy the evil of competitive management, if properly regulated with the view to public convenience as well as individual benefit.

STEAM THEATRE.—A great theatre is about to be erected at Brussels, in which the machinery of the scenes and decorations is to be moved by steam, with little or no aid from manual labour. The gradations of day and night, the effects of storm, moonlight, configuration—even the movements of the clouds—are to be effected by optical illusions and the various combinations and contrivances of the ingenious mechanic.

**PASSENGER DUTIES ON RAILWAYS.**—From a return made to the House of Commons in the course of last session, it appears that the railroads in England and Wales, 56 in number, have paid in the year ending January 5, 1843, no less than 152,663*l.* 13*s.* 0*d.*, as passenger duty. The amazing increase of railway traffic within the last ten years may be gathered from the fact, that in the year ending January, 1833, the whole sum paid to Government as passenger duty was 630*l.* 16*s.* 10*d.* The amount paid in the year ending January, 1842, was 148,204*l.* 13*s.* 10*d.* In Scotland, in the year ending January last, 20 railroads paid 15,125*l.* 1*s.* 6*d.*, being an increase of 3,468*l.* 0*s.* 11*d.* over the preceding year. The gross amount paid by all the railroads in the kingdom during the last year was 167,788*l.* 14*s.* 7*d.* The amount paid in the previous year was 159,861*l.* 14*s.* 6*d.*, showing an increase in 1843 of 7,927*l.* 0*s.* 1*d.* The ten railroads having termini in London paid 82,447*l.* 4*s.* 5*d.*; the three largest amounts being paid by the London and Birmingham, the Great Western, and the South-Western, which paid respectively 25,940*l.* 14*s.* 1*d.*, 25,801*l.* 5*s.* 2*d.*, and 12,043*l.* 19*s.* 7*d.*, or more than two-fifths of the whole amount.

**STEAM PLOUGH ON LOCHAR MOSS.**—This machine, which has occupied so much public attention in Dumfries for twelve months past, is now completed, under Mr. W. J. Curtis's management, and fully realizes all that was expected from it. The plough, governed by the peculiar apparatus invented by Mr. Curtis, turns over the soil in the most perfect manner; and the ploughman or steersman, seated on the plough, draws a furrow so straight, that no ploughman on the most favourable soil could surpass it. The moss is exceedingly soft, and full of holes and hillocks alternately; but notwithstanding this, the plough passes over the surface as majestically as a ship through the water. This result is likewise due to an improvement made in the figure of the plough by Mr. Curtis. A beautiful contrivance, also the invention of Mr. Curtis, is employed for reeling the wire rope upon the drum, by which the rope, although weighing on the aggregate upwards of a ton weight, is coiled up as evenly and easily as a skein of silk for a lady's work-box. The next step in the progress of reclaiming moss lands, viz., laying the subsoil upon the surface of the ploughed and levelled moss—an idea due to the intelligence of Mr. Curtis—will be next proceeded with; when the county of Dumfries, as well as the kingdom generally, will have reason to congratulate itself upon one of the most beneficent and useful applications of mechanics to the wants of society which the history of science can furnish.—*Correspondent of the Dumfries Herald.*

**SUBSTITUTE FOR STEAM.**—*La Réforme* announces that an operative at Ruel has discovered a substitute for steam. The experiment is to be made in a few days on the Versailles railroad. "Figure to yourself," says the *Réforme*, "an enormous wheel, five yards in diameter, between the spokes of which you place a horse with his rider. This large wheel being fixed on four ordinary wheels, placed on the rails of a railroad, it is sufficient to turn the large wheel to make the carriage advance. But what motive force does the inventor employ? It is the horse placed in the interior of the wheel, and yoked, by means of two bars of iron placed perpendicularly under the axle. The horse, by drawing, causes the wheel to turn in the same manner as a mouse or a squirrel in a cage. In order to permit the horse to enter into this singular wheel, it has been found necessary to dig an excavation near the station of the railroad, into which the horse is let down. The inventor pretends that he can modify his wheel so as to admit three horses, and that, in this case, the heaviest train may be propelled along a railroad with a velocity more rapid than that caused by steam."

**ACTS OF PARLIAMENT.**—By a return made during the session, it appears that from the year 1834 to 1842, both inclusive, no fewer than 2,451 Acts of Parliament were passed, of which 913 were public Acts, and 1,538 local, personal, and private. Last year was the largest number, there being 123 public Acts, and 172 local, personal, and private. Of the Acts passed in the session of 1842, one related to Scotland, seven to Great Britain, fifty-three to Great Britain and Ireland, and twenty-one to Ireland, of the public Acts; whilst twenty-one of the others related to Scotland, twenty-seven to Great Britain and Ireland, and eight to Ireland. More Acts were passed in 1842 than in any other session since the year 1834; there were 294.

**LONDON DOCK COMPANY.**—At the last half-yearly meeting of the proprietors of this company, held at the Dock-office, New Bank-buildings, it appeared that the revenue of the company for the last half-year, including wharfage and other dues, amounted to 137,164*l.* 7*s.* 7*d.*, and the expenditure 108,568*l.* 9*s.* 5*d.*, a dividend of two per cent. was declared.

**ANCIENT AND PRESENT STATE OF THE CITY OF LONDON.**—We quote the following interesting passage from Mr. Macaulay's writings, on the subject of the present state of the city of London, compared with its former state:—"The city, properly so called, now consists, in a great measure, of immense warehouses and counting-houses, which are frequented by traders and their clerks during the day, and left in almost total solitude during the night. It was then (in former days), closely inhabited by 300,000 persons, to whom it was not merely a place of business, but a place of constant residence. This great capital had as complete a civil and military organization as if it had been an independent republic. Each citizen had his company, and the companies, which now seem to exist only for the sake of epicures and antiquaries, were then formidable brotherhoods, the members of which were almost as closely bound together as the members of a Highland clan. How valuable these artificial ties were, the numerous and valuable legacies anciently bequeathed by citizens to their corporations abundantly prove. The municipal offices were filled by the most opulent and respectable merchants in the kingdom. The pomp of the magistracy of the capital was inferior only to that which surrounded the person of the sovereign. The Londoners loved their city with that patriotic love which is found only in small communities like those of ancient Greece, or like those which arose in Italy in the middle ages. The numbers, the intelligences, the wealth of the citizens, the democratical form of their local government, and their vicinity to the Court and Parliament, made them one of the most formidable bodies in the kingdom."

**CHURCH EXTENSION.**—On Monday, the 8th inst., the venerable Archbishop Snelgar laid the first stone of the new church of St. John's, Kensington. The site of the church is on an eminence opposite to Notting-hill, where the "Hippodrome" was projected some time since, and commands a view of the whole surrounding country. The building will be in the Pointed style of architecture, and if the funds prove sufficient, will include a tower surmounted by a spire. Provision will be made for the accommodation of 1,500 persons. On Sunday last the archdeacon opened for divine service the new National School-rooms in the potteries of Kensington, preparatory to the erection of another church for the north-western portion of the parish.

**MOLIERE.**—The monument erected to Molière, in the Rue de Richelieu, is to be inaugurated, the 15th inst., under the auspices of M. de Rambuteau, Prefect of the Department of the Seine. Four speeches are to be delivered on the occasion, the first by M. de Rambuteau, the second by M. Etienne, in the name of the French Academy, the third by M. Samson, as representative of the actors of the French Theatre, and the last by M. F. Arago, the president of the committee of subscription to the monument. All the members of the Institute, the municipal councillors of Paris, and deputations from all the dramatic and literary societies and institutions are to attend at the ceremony.

**FICTITIOUS BRONZES.**—All the deceptions practised on the public, in connection with the fine arts, are far surpassed by a new invention of forming figures, groupes &c., in zinc, which, being bronzed have all the appearance of real bronzes, while the malleability of the material renders their formation so easy, that a figure thus produced would cost but fifty shillings, while one cast in brass would cost thirty guineas. Several collectors, both here and in Glasgow, Dublin, Liverpool, and Manchester, and, indeed, in most of the provincial towns, have been deceived by these counterfeiters, which have such a genuine appearance, that they can only be known by their lightness and the ease with which they can be bent.

**PUBLIC SCHOOLS.**—At the Committee meeting of the Huntingdonshire Education Board, on Tuesday last, grants were made in aid of building schools in the following places:—Abbotsey, 30*l.*; Great Stukely, 20*l.*; King's Ripton, 30*l.*; Great Gidding (for a Sunday School), 5*l.* A committee was appointed to prepare a form of questions to be sent to the different clergy having schools in connection with the Board, respecting the average attendance and state of their schools. The secretaries were also requested to apply to those members of the Board who have received assistance towards the erection of schools and masters' houses to report to the Board for its future guidance whether the buildings were completed for the estimated sum, or if not, to what extent and for what reasons the estimate was exceeded.

**PUBLIC HEALTH.**—It appears that on account of a want of proper draining at Kentish Town, an alarming epidemic prevails there. It was stated last week, at a meeting of the St. Pancras board of Health and Sanitation, that in one street alone there were no less than thirteen families some portion of whom are suffering from fever.

**MUNIFICENT BEQUEST.**—Dr. Beckwith, senior physician of York, recently deceased, has bequeathed his ample fortune in aid of the various charities and public institutions in this city. During his lifetime he made the generous donation of 2,000*l.* to the funds of Dame Middleton's Hospital in Skeldergate, and by his will he has bequeathed more than 40,000*l.*

Yorkshire Philosophical Society.....	£10,000
York Dispensary.....	2,000
Parishes of St. Mary, Bishophill Senior, and Bishophill Junior, St. Mary, St. Martin-Je-Grand, each 200 <i>l.</i> , the interest to be applied to the purchase of coals at Christmas.....	600
Wilberforce School for the Blind.....	5,000
Church of England Sunday Schools in York.....	1,000
Blue Coat Boys' School.....	2,000
Grey Coat Girls' School.....	2,000
Infant School out of Skeldergate Postern.....	1,000
DEAN AND CHAPTER OF YORK FOR A NEW PEAL OF BELLS, AND THE REMAINDER TO REPAIR THE CHAPTER-HOUSE.....	5,000
York Charitable Trustees, in augmentation of St. Thomas' Hospital, out of Micklegate-bar.....	2,000

**FOR THE FOUNDATION OF A PENITENTIARY IN YORK.**..... 5,000  
Some of the above charities, which have legacies under 5,000*l.*, are appointed residuary legatees of the testator's personal estate, from which it is probable they will derive further considerable benefit.

**CONDITION OF THE LABOURING CLASSES IN ENGLAND AND OTHER COUNTRIES OF EUROPE.**—We are on the whole inclined to think, that the labouring classes of this island, though they have their grievances and distress, some produced by their own improvidence, some by the errors of their rulers, are on the whole better off as to physical comforts than the inhabitants of any equally extensive district of the whole world. For this very reason suffering is more acutely felt and more loudly bewailed here than elsewhere. The distress which has lately been experienced in the northern part of Germany, one of the best governed and most prosperous regions of Europe, surpasses, if we have been rightly informed, any thing which has of late years been known among us. In Norway and Sweden the peasantry are constantly compelled to mix bean flour with their bread; and even this expedient has not always preserved whole families and neighbourhoods from perishing together by famine.

The rate of subsistence to which the labouring classes are reduced in the kingdom of the Netherlands is miserably low, and very far inferior to the English paupers. No distress which the people here have endured for centuries approaches to that which has been felt by the French in our own time. The beginning of the year 1817 was a time of great distress in this island. But the state of the lowest classes here was luxury compared with that of the people of France. We find in "Majendie's Journal de Physiologie Experimentale," a paper on a point of physiology connected with the distress of that season. It appears that the inhabitants of six departments were reduced first to oat-meal and potatoes, and at last to nettles, bean-stalks, and other kinds of herbage fit only for cattle; that when the next harvest enabled them to eat barley bread, many of them died from intemperate indulgence in what they thought an exquisite repast; and that a dropsy of a peculiar description was produced by the hard fare of the year. A surgeon dissected six of these, and found the stomach shrunken, and filled with the unwholesome aliments which hunger had driven man to share with beasts.—*Essays by the Right Hon. T. B. Macaulay.*

**ADHEWENESS OF TIMBER.**—At one of the sectional meetings of the British Association, Mr. Eaton Hodgkinson read a table of different species of wood, and the power which they possess to resist a force tending to crush them. The following are a few of the principal woods, and number of pounds which they would sustain on the square inch, without sinking under the pressure. The weight was applied in all instances in the direction of the fibres. Yellow pine, 5,375 lbs.; cedar, 5,674 lbs.; red deal, 5,748 lbs.; poplar, not quite dry, 4,307 lbs.; green larch, wet, 2,501 lbs.; green larch, dry, 5,368 lbs.; plum tree, green, 5,364 lbs.; beech, rather green, 7,733 lbs.; beech, dry, 9,363 lbs.; dry ash, 9,363 lbs.; English oak, 5,364 lbs.; Spanish mahogany, 5,198 lbs.; elm, 10,331 lbs.; box, from 9,365 to 10,000 lbs.; kingwood, 12,645 lbs.

**COST OF FUNERALS.**—It is estimated that the probable annual expense of the total number of funerals in England and Wales, is 4,871,493*l.*, taking the average expenses of the funerals of the city at 100*l.* for adults, and 30*l.* for children; and the average expenses of the funerals of the second and lower classes, 27*l.* 10*s.* and 7*l.* 15*s.*, artisans, &c., 5*l.* and 1*l.* 10*s.*; and paupers, 13*s.*

## TO OUR SUBSCRIBERS.

In compliance with the wishes of very many of our Subscribers, we have had prepared a cover for binding the copies of THE BUILDER for those who may be desirous of preserving them in uniform Volumes. These may be had on application at the office, at the price of Two Shillings; or our Publisher will undertake to have sets bound at a charge of Three Shillings per Volume.

We also take this opportunity to inform our Subscribers that, with a view to the additional embellishment of the Volume just completed, we have had printed an ornamental Title page, which may be had gratis, on application at the Office, by all those who would like to substitute it for that issued with the Index at the close of the year.

# The Builder.

NO. 1.

SATURDAY, JANUARY 20, 1844.

SINCE our last publication, so many subjects of grave importance have pressed upon us, that we had at first some difficulty in determining which we should earliest grapple with; but during the week, we were appealed to for aid in the cause of the widow of a deceased member of the architectural art, and this at

once determined us in making selection of the subject for our opening-address.

We greatly regret, at present, those devoted to architecture have, for an old-age of need, less chance of asylum than perhaps persons of any other profession in existence; and probably their widows may be worse off than the relicts of any other class of men devoted to learning, arts, or commerce.

For members of almost every branch and "art and mystery" of the building-trade, and for their widows and families, there are alms and almshouses, coals and clothing; for builders generally, there is a "Benevolent Institution;" but for architects, surveyors, and architectural-draftsmen, and for their families, there exists little beyond the tender mercies of the workhouse: indeed, as if to satirize this state of things, some few years ago, a crack-brained man used to wander about the metropolis, leaving at architects' offices his address-card, upon which was written "Mr. Fisher, Architect, Wapping-Workhouse."

So small being, indeed, the provision for decayed members of this profession, what, in truth, is there left for them in place of the amenities of respectable life, but the rudeness, the jail-like provision, with which paupers-born are dissatisfied? What for the comfortable chamber, but the huge night-warehouse in such establishments denominated a dormitory? What for the couch of luxury, but the niggard pallet, shared perhaps with the disgusting, perhaps with the felonious? What for the

meditative quiet of the library, rich in the lore of delighting art, but the noisy assembly-room of coarse ignorance? Could the man nursed from childhood upon the treasured volumes of graphic art, or could his faithful partner, chosen for her elegant acquirements, find repose in the unfurnished apartment? Could they rest there exposed to the gaze of a hundred observers? Could they slumber on the same mattress with the repulsive?

The eleemosynary resources which have existed in the architectural profession, are of the smallest and least effective nature. The frail architectural institutions which have from time to time succeeded each other, seem to have taken no heed of this pressing matter, and failing in the initiative branches of the art, as in this necessary feature of every fraternity, they have expired after a few lingering years of half-dead existence.

But one of the prominent features of the architectural "College of the Freemasons of the Church," which will, no doubt, invigorate it, and cause it to outlive every other architectural institution, is the law by which

"One-fifth part of the ordinary revenues of the college shall be laid out and invested in the names of trustees in some or one of the public stocks or funds of Great Britain, or at interest upon government securities, so as to form, with such particular donations as shall otherwise be made, a permanent principal fund; to be denominated the "Charitable Fund," but no distribution of the interest, dividends, and revenue to arise therefrom, shall be made (except for the endowment of almshouses founded in connection with the college,) until such permanent principal fund shall consist of, or be equal to 3,000*l.* 3 per cent. Consolidated Bank Annuities, when the council shall prepare and present for consideration at some chapter of the College, a scheme for the application of the revenue arising therefrom."

Such a regulation, we are convinced, will cause more useful results from this institution than have emanated from any other architectural society in existence; and were there not the high scientific inducements of this fraternity to extend its influence, we are bound to say that this would be sufficient for every respectable member of the profession becoming enrolled with such a brotherhood.

But the particular case in behalf of which our aid has been sought, is that of the relict of the late Mr. Maddox, who recently died in extreme old age, even three years beyond fourscore, he leaving, without provision, after such a lengthened life, devoted to the teaching of architectural drawing, a widow considerably younger than himself. It was intended that this appeal should be confined to the pupils of the late master, but as application was made to us, without indeed our having had the benefit of the deceased one's instruction, we take occasion to remind those concerned in architecture, that it is possible for a man's instructing to be more beneficial to others than to his own family.

D.

## REGISTRY FOR MASTERS AND WORKMEN.

SHORTLY after the commencement of THE BUILDER, it was announced that a Registry of vacant situations, and of persons seeking employment, would be kept at our publishing office. This plan was accordingly adopted; and the very numerous applications on the part of masters and of workmen furnished abundant evidence of its great utility to both. Circumstances, however, occurred, which rendered it inconvenient to continue this accommodation; but, in consequence of the numerous solicitations which have been made at the office of THE BUILDER by those who have experienced the advantages arising from this description of

Registry, the proprietors have been induced to accede to the wishes of their numerous subscribers; and arrangements have accordingly been entered into by which such Registry will be re-commenced on Monday next, the 22nd instant.

This Registry will embrace the names of masters and workmen in all trades connected with building—namely, Clerks of the Works, Foremen, Carpenters, Bricklayers, Plasterers, Masons, Slaters, Plumbers, Painters, &c. &c., and will be open for gratuitous inspection, or insertion of names, &c., to all persons requiring workmen, or seeking employment. As this Registry will be kept by our publisher, and no charge whatever made, or gratuity in any shape accepted, it is hoped that all parties communicating by post will be careful to state precisely the description of situation or workman required, with the necessary references as to character and ability, &c.

The time of the publisher being wholly occupied on the day of publication, viz. Friday, it will be obvious to our friends that no application whatever should be made, or can meet with attention, on that day.

## THE "TIMES," MR. BOWEN, AND JOINT-STOCK BUILDING-SOCIETIES.

"We have before us a very successful exposé of 'A Joint-stock Building Society Bubble—by John Bowen.' The society in question is located at Bridgewater, and calls itself the 'Bridgewater Accumulating Fund and Building Society.' Mr. Bowen has an indubitable nose for a job, and shakes his victim mercilessly. There is no mistake about it.

"The primary design of this society professes to be semi-charitable—so very knowing and refined are we become in the art of humbug; it is to enable persons who want capital to borrow money at an easy rate. A person who wants money is invited to buy one, two, or more shares in this concern. He gives up the premium which would fall to him in course of time, if he waited, for the sake of so much ready money, with which the society supplies him instead; and he simply clears off his debt to the society by the monthly payment of his shares, spreading over a period of ten years, which is the calculated time of the duration of the society. A tabular explanation is given, and it is proved arithmetically how very advantageous such a plan as the proposed one must be to the borrower.

"Very fair and very good; but now we come to the lender. The society consists of two sides, borrowers and lenders; it does not profess to trade with its money; so all the advantage that it gives is simply derived from the money as it passes, within itself, from one side of the society to the other. Accordingly, if the borrower is benefited, it must be at the expense of the lender. Oh! no, the "Bridgewater Accumulating Fund Society" comes to a very different conclusion. While this plan is so advantageous to the borrower, it is still more so to the lender. It is calculated that the member who keeps his share to the last receives for his 60*l.* share 120*l.*; thus doubling his money in the course of ten years. The Bridgewater Society thus by the most curious luck and skill that were ever known, both lends its money at the easiest rate, and also receives the most enormous interest for it at the same time. This is a most wonderful result, and cannot be accounted for on any other supposition, except that money actually multiplies in its passage from one hand to another, and that the relation of borrower and lender is a creative one. As Mr. Bowen says, 'If any given number of men, by the mere process of borrowing and lending among themselves, can actually contrive so to double their common stock, there is an end to all the financial difficulties of the state. The whole national debt may at once be brought under the operation of this doubling process; for if 500 men can produce this result on their common stock, why not 5,000 or 50,000?'

"With this extraordinary combination of advantages the Bridgewater Society puts itself off in its prospectus. To the poor borrower it is a kind of 'merry charitable club; to the

rich capitalist it 'offers a very beneficial investment—a more advantageous investment than either the public funds or any other of the ordinary securities.'

"And now comes the question, how such a self-evident mare's nest and swindling *felo de se* as this,—how a statement that contradicts itself and cuts its own throat before you touch it, can get even an outside and surface to pass itself with? Mr. Bowen has gone into this point very accurately, and makes the hedgehog unroll itself.

"This is done, then, by a sort of legerdemain and sleight-of-hand movement. One set of figures appears in one part, and this re-appears in another with just a little alteration that would hardly be observed by a superficial eye, but which, when it runs up and is multiplied by four or five shares, makes all the difference. Thus they coolly start with telling the borrowing member of the society that he pays for his ready money by a deduction, 'averaging, according to the experience of similar societies, from 50*l.* to 65*l.* per share.' Now, every one must see, that where the borrowed sums are as small as these are here, the difference between the 50*l.* and 65*l.* must make all the difference as to the advantageousness of the terms to the borrower. Multiply 15*l.* per share by four or five shares, and you will find the amount make a good hole in two or three hundred pounds. Now, when they come to their explanatory table, which they mean to catch the eye of the needy borrowing man, they of course take their smallest deduction,—50*l.* Mr. Bowen simply takes their highest—65*l.*, and this makes all the difference. For, whereas their table shows that a man can borrow 350*l.* of them, and repay the same at an interest of only 7*l.*, Mr. Bowen's shows that his 350*l.* will cost him an interest of 300*l.*! The difference between the 50*l.* and the 65*l.* to begin with, makes the difference between 70*l.* and the 300*l.* in the event. And so far from Mr. Bowen's scale of deduction being too high a one, he declares it is frequently a full 10*l.* higher in such societies.

"But the terms on which the society lends its money speak for themselves, and make the principle of the whole apparent:—

"As the association is from time to time in a position to make advances, notice thereof will be given to all the members; and those of them who are desirous of receiving their shares for any of the purposes contemplated by the association, will then state the largest amount they will deduct from the final value; in other words, for how much less than 120*l.* they will, in consideration of an immediate advance, sell to the association the ultimate value of each share; and if more than one member require an advance, that member who will consent to the largest deduction—that is, to receive the smallest sum, will be entitled to priority."

"Can any thing," remarks Mr. Bowen, "more detestable in principle, more degrading to our common nature, be presented to the world than this nefarious scheme for transferring the little savings of the frugal poor into the pockets of ravenous capitalists? Here are the inexperienced, the sanguine, and the needy encouraged to bid one against another! Advantages are taken of the pressing necessities which sometimes induce men to submit to a ruinous loss for a present accommodation, and thus a bonus is wrung from the very recklessness of despair! Ignorance, misfortune, and distress, are converted into a Joint-stock Bank, for the benefit of speculating shareholders, under the base pretence of 'opening a channel for the fruits of industrious labour and of affording a rich reward to economy and prudence.'"

Lately has appeared, from the pen of Count de St. Priest, an interesting work, illustrated by numerous large and beautifully coloured plates, upon American antiquities: it describes the wonderful monuments of architecture which nations long since extinct have left behind them, in the remains of Xochicalco, Mitla, Palanca, and other places.

A work on the Egyptian Museum at Rome will shortly appear; the execution of the plates has been entrusted to the architectural engraver, Troiani, to whom a sum of eight thousand crowns has been allowed for the purpose; and the letter press will be from the pen of Bernabite P. Ungarelli.

#### CHANTREY'S STATUE OF GEORGE IV.

This statue, which was originally intended to surmount the marble arch in front of Buckingham Palace, but which has been placed on the pedestal at the north-east corner of Trafalgar-square, is now uncovered, and attracts a great deal of attention. The likeness is at once characteristic and elegant, as all Chantrey's are; the rider is well seated in the saddle, and has an air of dignified ease; the left hand holding the bridle loosely, and the right gracefully holding a baton, which rests on the thigh. The drapery is the conventional compromise between modern and classic dress, by means of which Sir Francis Chantrey got rid of the alleged difficulty of treating in sculpture the modern costume; and covers the upper part of the figure, on which it hangs in light and graceful folds, that leaves sufficiently expressed the form beneath; and the lower limbs are clothed in a sort of close pantaloons. The thin and close covering of the legs gives them a naked and unfinished appearance, which is increased by the absence of stirrups. The horse stands firmly in an attitude of rest, all four feet being planted on the ground, and seems by far too unimpassioned for a public work of the kind. The head is small and animated in expression, the neck arched, the chest ample, the limbs muscular and finely formed, the hind quarters are spare, and seem somewhat small compared with the full development of the fore-part. We do not question the correctness of the animal's proportions; Chantrey would scarcely be wrong in so important a point. Perhaps, however, the form of a horse of the Arab breed is not so well suited to sculpture as that of the Flemish breed which figures in the battle-pieces of Rubens; this is the type of the horses in equestrian statues, including that on which Charles I. is seated at Charing-cross. In modelling the horse standing upon all four legs, Chantrey has made an innovation on the old custom of representing horses in statues either curvetting or ambling. On the whole, we do not think this fine statue will add to the reputation of the great artist. The raising of the man upon the huge quiet horse, and building him up as it were firmly upon the four sound legs, has, we more the appearance of exhibition than of high art, which delights in seizing, and with one jet of bronze to render eternal as it were the graceful and rapid action of the great.

#### LEICESTER MEMORIAL.

On Thursday, the 11th inst., the committee met to decide upon the adoption of a design for the Memorial to Lord Leicester. There were 76 plans and models exhibited. One, No. 48, was chosen, subject to certain arrangements with the architect, Mr. Donthorne, of Hanover-street, London. We subjoin a description of the design:—

No. 40.—"To him whose pride it was to render the Farmer independent."

This design is composed of a pedestal, on which is erected a fluted column, surmounted by a wheat-sheaf. Three sides of the pedestal are bas-reliefs: one representing the late Earl granting a lease to a tenant; the second representing the Halkham sheep-shearing, through which the great stimulus was first given to agriculture; the third to indicate irrigation. The fourth side of the pedestal is left for the inscription. The four corners of the pedestal show the means by which cultivation and production were improved and increased by the late earl. At the first corner, an ox, with the inscription under it, "Breeding in all its branches." At the second corner Southdown sheep, with the inscription under them, "Small in size, but great in value." The third corner, the plough, with the inscription, "Live and let live." The fourth corner, the drill, with the inscription, "The improvement of agriculture."

The Minister of Public Instruction has just succeeded, after considerable opposition on the ground of expense, in obtaining from the Chamber of Deputies a vote for the removal of the *Bibliothèque de Sainte-Genève*, at Paris, from the fine but ruinous gallery which it occupied over the College Henri IV. to a new building to be erected for its reception. The new building is valued at 1,000,000 francs, or 160,000 pounds sterling.

#### TRANSACTIONS OF THE OXFORD ARCHITECTURAL SOCIETY.

At the meeting held Nov. 29th,

Dr. Richards, the rector of Exeter College, read a paper on the history and origin of Rural Deaneries in England, and on some of the duties of the office of rural dean, with especial reference to the deanery of Woodstock, of which an account is about to be published by the society in their "Guide to the Architectural Antiquities in the Neighbourhood of Oxford." He shewed that the office of rural dean was in use in England in the eleventh century, and in the Christian church as early as the sixth century; that the probable origin of the name was that this officer originally presided over ten parishes, although in the subsequent increase of parishes, and the union of two or three deaneries into one, this origin has been almost forgotten. One great use of the office at the present day is to prevent further mischief being done to our churches; and as no alteration can be made without the consent of the ordinary, the rural dean may, by an appeal to him, prevent the introduction of galleries, the conversion of open benches into close pews, the removal of screens, and the performance of other injuries; but that the restoration of our churches to a decent state where the mischief has been already perpetrated, he must rely rather on persuasion, repeated admonitions, and appeals to the better feelings of the parties interested, than on the expensive processes of ecclesiastical law. In his own deanery, great credit is due to the incumbent and parishioners of Steeple Aston for the very beautiful restoration of their church. The manner in which it has been effected was also very creditable to Mr. Plowman, the architect. Much credit is also due to the incumbent of Cassington, for his zealous efforts to effect the same object, though he had been but ill-seconded in general by the parishioners. The churches in this deanery are not generally what would be called fine churches, although perhaps Kidlington, Handborough, and Stanton Harcourt, might deserve that distinction, but almost all of them are ancient, and possess features of interest, and are worthy the attention of the architectural student.

#### CEMETERY AT OXFORD.

At a meeting held at Oxford on the 2nd January, the Rev. Dr. Buckland, Canon of Christ Church, begged to call the attention of the meeting to Mr. Chadwick's Report on Interments in Towns, full of most frightful and curious details. He cited also Mr. Chadwick's account of the parish of St. Margaret, in Leicester, in which is a population of 22,000 persons, whose average age of death, in 1840, was, in the whole parish, at 18 years. In the different streets of this parish the average being as follows:—

	Years of Age.
In streets drained, but not perfectly, at 23½	
In streets partially drained, at . . . . . 17½	
In streets entirely undrained, at . . . . . 13½	

The inhabitants of all this parish are chiefly stocking-weavers. The fact of the average duration of human life in the tainted air of one undrained street being only 13½ years, was quite appalling. His (Dr. Buckland's) attention had been called that morning, by a magistrate of Oxford, to a certain foul drain, in narrow parts of this city, that may, in unhealthy seasons, become the source of pestilence and death. He considered facts of this kind to be very pertinent to the business of the present meeting, inasmuch as the pestilential effects of putrid air, from the decomposition of bodies in over-crowded cemeteries, had been recently demonstrated, by inquiries made by commissioners appointed to report on the sanitary condition of the labouring population, and on the health of towns; who further state, that "the occurrence of fever is frequently connected with near proximity even to a small amount of decomposing organic matter." He was therefore gratified at the prospect of witnessing the removal to an appropriate spot without the city of those occasional sources of contamination to the air, and injury to the living, which may sometimes arise from the putrid bodies of the dead. The example of all large cities on the Continent, and of the most populous towns in England, has shewn the expediency and facility of providing a

common cemetery for the inhabitants, occasionally divided by a wall, or a deep trench, into compartments assigned to different sections of the inhabitants. The difficulty and expenses of procuring one fit place for a cemetery are usually great, and must be proportionally greater if more than one were required; and this difficulty is magnified in Oxford by the great scarcity of freehold property in its environs. The decomposition of dead bodies was usually completed before the entire decay of the wood in which they are enclosed; so that the miasmata that escaped slowly from the crevices of the coffin ascend gradually upwards, and are imperceptibly mixed with the atmosphere. If interments are made in clay, the impermeability of this earth to water and air retards the decay both of coffins and the bodies enclosed in them to a length of time inconvenient in a cemetery destined to be the dormitory of successive generations, and in which it is therefore desirable that our bodies should as speedily as possible return to their dust, when the spirit has returned to God who gave it. Under these circumstances, Dr. Buckland rejoiced to hear that a negotiation had been opened between the authorities of the city and New College for the exchange of some land which may be convenient for a cemetery on the north of Oxford.

#### LITERARY AND SCIENTIFIC INSTITUTE, BRECON.

##### MR. THOMAS'S LECTURE ON SCULPTURE.

MR. THOMAS having apologized for the seeming presumption of one so young in years venturing publicly to discourse upon so distinguished a subject, commenced his lecture by remarking that the art was coeval with the existence of mankind in a state of society, and that our knowledge of their history and institutions is principally derived from hieroglyphical sculpture; but that, having now become the object of national attention in England, it is making rapid advances to attainable perfection. He was surprised that many should think sculpture alone serviceable as an ornament, and not choose to acknowledge the moral benefit it conferred upon mankind; as, by so doing, they must think that sense, genius, and talent were given to man by chance and perished with him as did the instinct of brute animals. He thought it was a precious gift bestowed by the Wisdom of Providence for the purpose of continuing the glorious intellect with which man is distinguished. He also thought that the art had an effect in harmonizing the manners and softening the temper; and, although those who were devoted to the luxury, and pleasures, and grosser enjoyments of this life, could not, properly, appreciate those impressions, yet, the professors of sculpture returned from their studios to society, with manners polished, and hearts more disposed to feel and reverberate the endearments of social life and reciprocal benevolence. It was an art designed by the All-wise Being to perpetuate the pride of man's reason, and to excite laudable emulation in others. He thought, that as man's imagination is so unbounded, it seemed to instance more clearly than his reason the knowledge of his immortality. Such being the case, those who excited the imagination to noble thoughts—the painter, the poet, or the sculptor, who, by their works, tended to raise man to a higher state of being, were, themselves, of a more exalted nature, and held intercourse with more exalted powers, and ought to be distinguishedly placed amongst the benefactors of the human race. He instanced many who sought to depress man into a state of debasement, by levelling him with the inferior animals, but was indignant at their presumption; and said it was duty and interest of all, who attempted the moralization of man, to shew him that he is of more dignity than to rank with brutes, and that being designed by Providence for future happiness, it was his duty to cultivate virtue, truth, and honour. He then proceeded to say, that having shewn the moral benefits conferred by the arts, he begged to recommend the study of drawing to all, as it was not only a graceful and agreeable employment, but one of actual utility; for it frequently occurs, that in our descriptions of things we find words inadequate to convey a correct idea, when a few strokes of the pencil would elucidate the whole at a glance. He instanced many who had travelled far and long, who had viewed dangers and seen wonders, to bring

home journals, and after all, the best part of the story is untold; and all for want of a pennyworth of Indian ink, properly distributed over a few scraps of paper. He afterwards proceeded to compare the effect of the different liberal arts upon the human passions, and first cited the opinion of a writer of much credit, to the effect, that a sculptor, to become a worthy one, must possess many liberal arts, and be also a curious artificer, whereby he becomes superior to those possessed of but one. This being the case, when so many influences were wanted, he would not hesitate in affirming that the works of an Angelo were equal in merit to the Iliad of Homer—the Eneid of Virgil—the historical writings of a Thucydides and a Livy—the orations of Demosthenes and Tully—the Paradise Lost of Milton—the Macbeth of Shakespear—or the Messiah of Handel. He then spoke in high and flowing terms of poetry, and proceeded in a strain of eloquence to illustrate its charms and its beauties—its tendency to support virtue and good actions—its captivating powers, and its pleasant illusions; and yet, with all these graces, he proved that his own favourite art had one transcendent advantage—and that is, that it gratifies the sight—the most pleasant sense we possess, for we see that which is only described by the poet. He for some time proceeded with the argument, and concluded by putting the subject to the judgment of the audience, by asking who would not prefer seeing the Alexander of Apelles, in the character of Jupiter, to reading Shakespear's beautiful description of Denmark's King? After giving some interesting anecdotes of the influence of sculpture on Julius Caesar, Publius Scipio, and Quintus Fabius, which tended to prove the vast superiority of the art, that it had an enchantment which kindles in the human heart higher feelings—feelings which fully corroborate its kindred to Heaven,—he proceeded to go through a regular analysis of the processes used in the mechanical part of sculpture, and the clear and concise manner in which they were elucidated, proved that the lecturer was quite at home with the subject. Mechanical aid is brought to bear upon the marble, and the province of the master-mind is chiefly to execute in clay or wax a model of the intended work; and after the pointer has completed his labours, to bring the resources of his mind and genius into play for the production of these wonderful specimens, which exalt his labours to such a high rank, and which, said he, “forms the true aristocracy of nature, for ‘Lord’ can be stamped on any clay, but inspiration only on the finest metal.” The spectator, contemplating this wonder, rising as if reluctantly from a shapeless mass, through the enchanting wand of a magician, cannot help involuntarily exclaiming, as the illustrious Michael Angelo did to his Moses, “Speak, speak, if thou canst.”

He then entered into a comparison between sculpture and its sister art—painting. He next gave the history of sculpture from its earliest period to the present day, reviewing in succession the wonderful works given to the world by the Egyptians, and the sculptors of Greece and Italy, concluding with a tribute to the departed genius of our most celebrated modern artists—Canova and Chantrey. He likewise interspersed this historical sketch with reflections on the influence which the fine arts had upon the glory of the great nations who cherished them.

He then thought it not out of place to mention the high estimation in which some of the celebrated painters were held by the Emperor Charles V. and Francis I. of France, and related some very pleasing anecdotes in proof of the same. He afterwards alluded to the quality called genius, and hoped none would think application was unnecessary, because they fancied they possessed this intuitive excellence; and enumerated all the studies and qualifications the student must go through, and be possessed of, before he can properly carry out the minutiae of the conceptions of his brain; and in support of his assertion quoted the great Michael Angelo, who encourages every student to soar as high as his competitors, and obtain that fame which cannot be purchased by the riches of Mexico and Peru. For this purpose the splendid works of the ancients should be resorted to, and after becoming conversant with those specimens of

dignified inhumanity, the student will be able to form a style peculiar to himself. He then proceeded to give a detailed account of the Royal Academy of London, which was highly entertaining, and proved it to be a well-regulated institution, and greatly conducive to the promotion of art in Great Britain. He apologized for treating the subject in such a general manner, and would have kept himself more particularly to sculpture, had he not thought the plan he had adopted would be more interesting to the generality of his audience. He concluded with fervent wishes that the principality may also become famous in future ages for its encouragement of arts which have so pleasing an influence on society.

The lecturer then sat down, after occupying the attention of his audience for the space of nearly one hour and a half, having been frequently interrupted by bursts of applause, which were renewed at the conclusion.

#### GOthic WOOD CARVING.

Elevation.

Plan.

#### TO THE EDITOR OF THE BUILDER.

SIR,—I beg your acceptance of the above sketch, which I trust you will deem worthy of a corner in your excellent paper; it is one of the panels in the pulpit of the Priory Church, Brecon, and is valuable as an interesting relic of that beautiful style of wood carving so much in practice with our ancestors in church decoration, but which, it is to be greatly lamented, occurs so rarely in the present day. It is worked in 1½ inch stuff, and lined with green cloth, which as a ground forms a pleasing contrast to the rich colour of the oak.

Trusting that the style may speedily be revived, I am, Sir, your obedient servant,  
J. L. T.

## ROYAL ACADEMY PRIZES.

THE President and Council of the Royal Academy have announced the following premiums for distribution on the 10th of December next, viz.:—Gold medal and the discourses of the Presidents Reynolds and West, for the best historical picture in oil colours, subject, "Themistocles taking refuge at the Court of Admetus;" the picture to consist of at least three figures; size of the cloth to be a common half-length; the principal figure to be not less than two feet in height. Gold medal and the discourses of the Presidents Reynolds and West, for the best finished designs in architecture; subject, design for a metropolitan Music-hall and Royal Academy of Music; the whole comprised in one general and regular composition; the designs to be as large as an entire sheet of double-elephant will admit, and to consist of plan, elevation, section, and a perspective view. A number of silver medals will be given for the best drawings and models of academy figures, done in the Royal Academy, and for the best accurate finished drawings of the portion of Greenwich Hospital by Inigo Jones, done from actual measurement, carefully finished and washed, as large as a whole sheet of double-elephant will admit, with a rough outline giving the dimensions, attested to be their own performance by any one of the academicians, or any other professor of reputation resident in London. The first medal in each class will be accompanied by a copy of the lectures of Professors Barry, Opie, and Fuseli, bandsomely bound. Three silver medals will also be given for the best drawings; and three silver medals for the best models of a statue or group in the Antique Academy, to be selected and set out by the keeper for this purpose. The first medal in each class will be accompanied by copies of the lectures of Professors Fuseli and Opie, bandsomely bound. Two silver medals for the best copies made in the School of Painting, between the time of its opening after the exhibition and the 1st of November; the first medal to be accompanied by the lectures of Professors Barry, Opie, and Fuseli, unless the student to whom the premium may be adjudged shall have before acquired them in the Academy. A silver medal will also be given for the best metal die to be cut in steel, from the head of the Belvedere Apollo in the Royal Academy; the size to be not less than one inch and a quarter in diameter, to be accompanied with an impression in wax.

## SOCIETY OF ARTS.

THE first meeting of the members of the above society, for the present year, was held on the 10th January, in the theatre of the institution, John-street, Adelphi. Dr. Roget, V.P., F.R.S., in the chair.

The secretary (Mr. Whishaw) commenced the proceedings by reading an interesting paper on the very important subject of cleansing the streets of the metropolis. The paper, after dwelling upon the importance in a sanitary point of view of keeping the streets and public thoroughfares in a state of cleanliness and comfort, proceeded to describe the mechanical operations and advantages of the newly-invented street-sweeping and cleansing machines, lately introduced by Messrs. Whitworth and Co., and now daily employed on the wooden pavement at the West-end, under contract with the Commissioners of Woods and Forests, and also in Cheapside and the neighbourhood, under contract with the civic authorities. (A very unique model of the machine was placed upon the table.)

Mr. Croucher called the attention of the members to a newly-invented machine for similar purposes, which, he stated, would be brought before the notice of the public in a few days, and which, he had no doubt, would be found equally efficient, and could be worked with a considerable reduction both in labour and cost; it would sweep both longitudinally and transversely, which must be of considerable advantage to wood paving, whilst it was equally applicable to Macadamised or stone pavement.

Mr. Thompson then exhibited his newly-invented apparatus for the preservation of life

from fire, the simplicity of which, as a means of escape, added to its cheapness, placed it within the reach of every housekeeper, and which, from its being deposited at the various station-houses, might always be advantageously used by the police.

Mr. Whishaw lastly read a paper on the construction of wooden railways, as being principally applicable as feeders to the great lines of railway. The chief recommendation of the proposed system was that these lines could be constructed at a considerably less cost than the iron rails hitherto in use. It was stated that a trial line had lately been laid down near Vauxhall-bridge, and that the experiments which had been made upon it had been most successful. In consequence of this, it was now proposed that the branch railway from the Woking Station, on the South-Western Railway, to Guildford, should be constructed on this principle.

Votes of thanks were unanimously awarded to the authors of the above-named papers and inventions, with the exception of a person of the name of Mr. Higgins, who appeared in every instance to place himself in collision with all the other members present.

## PRIVATE CHAPEL AT WINDSOR.

THE Queen's new private chapel at Windsor, consecrated December 19th by the Bishop of Oxford, in the presence of her Majesty, Prince Albert, the Duchess of Kent, and many members of the royal household, has been fitted up in an apartment adjoining St. George's Hall, occasionally also used as a chapel in the reigns of George IV. and William IV. Its extent is about forty feet from north to south, and about thirty feet from east to west; the flat ceiling of the fabric, which is in the form left by Sir Jeffrey Wyattville, is enriched with Gothic mouldings and other decorations. Pendent from the centre of this ceiling is a massive Gothic chandelier for eight lights, of elaborate workmanship, and gilt. The pulpit of carved wainscot is in two stories, the lower one having flying-butresses and pinnacles: at the angles of its cornice are figures of saints; the reading-desk is in accordance with the pulpit, at the south-west angle of the chapel, opposite the pulpit, is placed her Majesty's closet, in dimensions about eighteen feet long and thirteen feet wide; it is approached from the corridor and private apartments, through the vestibule at the top of the visitors' staircase, at an elevation of ten feet from the floor of the chapel. Behind this apartment is a large Gothic window receiving a subdued light from an outer window, and glazed with stained glass, containing the arms of the Queen and Prince Albert, the garter with its motto, red and white roses, the thistle, the shamrock, and other insignia and decorations. The communion-table is of carved wainscot; the window behind the communion-table, and two other windows at the sides of it, are filled with stained glass of a dark orange colour. On the floor of the chapel, around the south, east, and west sides of it, are seven pews, with fronts of carved wainscot, affording accommodation for fifty or sixty persons; of these seven pews, three are for members of the royal household in attendance upon the Queen and Prince Albert, and the remaining four are for the royal domestics; besides these, six wainscot seats are placed on the floor opposite the communion-table, for upwards of forty servants in livery.

The chapel is warmed by hot air, conveyed from the basement of the castle. In a recess behind the screen on the north side of the chapel, has been erected King George the Third's favourite organ, formerly in the private chapel at Buckingham House, and built by Samuel Green about the year 1770, with one row of keys, and six stops now increased to ten.

PICCADILLY IMPROVEMENTS.—The Commissioners of the Woods and Forests, on the meeting of Parliament, intend to apply for a Bill to carry into effect the long-projected improvements in the above street. Government, we understand, has offered to pay the whole expense of widening the street from the mansion formerly the Marquis of Herford's, where the road is only 31 feet wide, to Hamilton-place, taking the ground from the Greenpark, and making the whole of a uniform width of 70 feet; and the parishes of St. Martin and St. George are to keep it in repair.—*Standard*.

## ETON COLLEGE IMPROVEMENTS.

THE architectural improvements now in progress at the College are of a very important character, and seem to bid fair to render this ancient seat of learning as celebrated for its external beauty as its classical renown. Two very spacious and elegant houses, in the Elizabethan style of architecture, are in the course of erection on the site of the mean pile of houses recently razed opposite to the principal entrance to the College. These houses are already sufficiently advanced to enable some opinion to be formed of their external character.

We understand that another building, precisely similar in the style of its architecture, will be erected close by in the course of the ensuing summer. The whole are being built by the College. There has also recently been built at the northern end of the long-wall walk, a gateway and a lodge, thus effecting an improvement on the old dead wall which previously existed at this spot. But it has been generally remarked that it is not clear what it is a lodge to. As a lodge it seems misplaced; indeed, it has more the appearance of the grille of a cloister. It has a small tower which is octagonal, while every other of the College is square. The lodge runs into, rather than up to, the tower of the head master's chambers, at a very unusual angle, and with a most unpleasant effect. The architect appeared anxious to interfere with this portion of the ancient edifice as little as possible, and has therefore reduced the height of the lodge before it reached the tower. There are great general improvements, however, whatever in some cases may be their defects. We hear that there is a plan in contemplation for materially altering the whole front of this building, so as to harmonize with the simple character of the Long Chamber and the Lower School. A sanatorium for the exclusive use of the Etonians, at Eton-wick, about a mile from the College, is now nearly completed, and also a handsome and spacious hexagonal building, in the immediate vicinity of the College, intended for a mathematical school, and occasionally for the delivery of lectures. In all the extensive improvements now being effected and contemplated, every possible precaution will be taken to secure an effectual drainage and a thorough ventilation of the premises, thus being the means of materially contributing to the general healthfulness and salubrity of the College.

## TOMB OF NAPOLEON.

IT is the intention of the French government to surround the tomb of Napoleon with a pavement, constructed on the same plan as the famous pavement of the Duomo of Siena, which was designed by Domenico Beccafumi, and executed under his direction, between 1520 and 1550. The construction of this pavement resembles the manufacture called *pictura dura*, a kind of mosaic, in which the figures are composed of pieces of white, black, and grey marble, artificially put together in their natural shades, so as to produce the effect of chiaroscuro. In this material, which, from its gravity and durability, is peculiarly fitted for the architectural decoration of a building devoted to solemn purposes, Beccafumi executed those sublime groups from the Old Testament, which are well known by the fine old wood-cuts and engravings which exist of them. The original cartoons are preserved at Siena. Few, however, have seen the whole of the pavement displayed at once; it is, or was till lately, boarded over to preserve it from injury, and only one or two compartments removed from time to time, to gratify travellers and amateurs. We are not aware that any imitation on a large scale of this colossal work has ever been attempted; the idea, therefore, of surrounding the tomb of Napoleon with a pavement on which the memorable events of his life are to be represented in this grand and imperishable style, appears to us magnificent in taste and spirit. The execution of this national work is confided to M. Henri de Triqueti, the sculptor—an excellent choice—both as regards the talent of the artist and the particular direction of that talent. The characteristics required in such a work belong to sculpture rather than to painting, and those works of M. de Triqueti, already before the public, display such a profound knowledge of art in the abstract, and in his own particular province of art, such a degree of grandeur and

severity and purity of taste, as to give earnest of his success. It is not often that an artist in the prime of life, and animated by very noble views in his own art, and a deep feeling of the moral responsibility attached to the gift of surpassing genius, has been afforded such ample space in which to embody his conception of the beautiful and the true. The contemplated pavement, as far as we can understand, will form a circular frieze or hand round the tomb, about 8 feet in width, and about 220 feet in its extreme length. On this area the figures will be represented in marbles of different shades, as in the pavement at Siena. The adaptation of the treatment of the subject proposed to the especial locality, the application of a material so novel, presents difficulties to alarm the most sanguine and enthusiastic temperament; but the result, if successful, will be glorious, and form an era in the history of modern art. The composition and arrangement must have the simple severity of a bas-relief; and, from the immense scale of the figures, will require the utmost correctness as well as largeness of style. Beccafumi was assisted in the execution of his great work by two able sculptors; but the designs were entirely his own. We may return again to the consideration of this famous pavement, and the imitation of it, or, rather, adoption of the same material by M. de Triqueti. The contemplated decoration of our Parliament House renders every suggestion of the kind at this moment particularly interesting and important. —*Athenæum.*

PORCELAIN TOWER AT NANKING.

A BRITISH officer obtained some particulars and a printed paper from a person in charge of the above edifice, which, being translated, has recently arrived in England, from which we are enabled to give a brief description of it. It exhibits, in a striking but melancholy manner, the gross incredulity and superstition of the Chinese. Subjoined is an extract from the literal translation:—

“After the removal of the imperial residence from Nanking to Peking, this temple was erected by the bounty of the Emperor Yunglo. The work of erection occupied a period of nineteen years. The building consists of nine stories of variegated porcelain, and its height is about 350 feet, with a pineapple of gilt copper at the summit. Above each of the roofs is the head of a dragon, from which, supported by iron rods, hang eight bells, and below, at right angles, are eighty bells, making in all 152. On the outside of the nine stages there are 128 lamps; and below, in the centre of the octagonal hall, twelve porcelain lamps. Above they illuminate the thirty-three heavens, and below they enlighten both the good and the bad among men. On the top are two copper boilers, weighing 1,200 lbs. and a dish of 600 lbs. weight, placed there in order constantly to avert human calamities.

“This pagoda has been the glory of the ages since Yunglo rebuilt and beautified it; and, as a monument of imperial gratitude, it is called the ‘Temple of Gratitude.’ The expense of its erection was 2,485,484 Chinese ounces of silver, equivalent to 150,000*l.* sterling.

“There are in this pagoda, as a charm against malignant influences, one carbuncle; as a preservative from water, one pearl; from fire, one pearl; from wind, one pearl; from dust, one pearl; with several Chinese translations of Sanscrit books relating to Buddha and Buddhism.”

Lecompte, in his journey through China, says, “The wall at the bottom is at least twelve feet thick. The staircase is narrow and troublesome, the steps being very high; the ceiling of each room is beautified with paintings, and the walls of the upper rooms have several niches full of carved idols. There are several priests or bonzes attached to the building to keep it in order, and illuminate it on festival occasions. This is effected by means of lanterns made of thin oyster-shells, used by the Chinese instead of glass. These are placed at each of the eight angles, on every story, and the effect of the subdued light on the highly reflective surface to the tower is very striking and beautiful.”

THE IRON TRADE.

BIRMINGHAM, Thursday, January 11.—The usual ironmasters' quarterly meetings have taken place during the present week at Walsall, Wolverhampton, and in this town. The assemblage in our Town-hall to-day was numerous, the great majority of the most extensive ironmasters from the surrounding districts and many from Wales being present.

During the last week it was reported that an attempt would be made to effect a reduction of the price of iron; and yesterday, at an adjourned meeting of masters held at Wolverhampton, in accordance with this prediction, a gentleman from London, largely interested in the iron trade, moved that bar-iron be reduced at the rate of 10*s.* per ton. The motion found a seconder, and that was all, for upon its being put to the meeting, the proposed resolution was, with the exception of its authors, rejected by the entire assembly. The prices, therefore, remain the same as last quarter—bar-iron from 5*l.* 10*s.* to 6*l.* per ton; pigs, according to their quality, from 2*l.* 15*s.* to 3*l.* 5*s.*; hoops, 6*l.* 10*s.*; and sheets, 7*l.* to 7*l.* 10*s.* Many of the most extensive works are in full employment, and altogether the trade presents a more cheering appearance than was anticipated about a month ago.

It is to be regretted, however, that a great proportion of the mining and iron workmen in the Staffordshire fields are joining the Northern Union for the attainment of a higher rate of wages and the reduction of the time of work. This is the more to be regretted, as during the present year the masters in these districts, upon the first symptom of improved trade, generously came forward, and raised the amount of remuneration for some descriptions of labour 6*d.* per day. At the present time there are delegates from the neighbourhood of Newcastle-upon-Tyne prowling about Staffordshire, and daily and nightly employed in enlisting recruits into the Union. 6*d.* is paid upon the receipt of the admission, and 2*d.* per week as a subscription to the Union.

A circumstance in connection with the Northern Union has recently occurred, and is worthy of note. It has been the immemorial custom in the Staffordshire iron-ore districts for a fortnight's notice to be given, either by masters or men, previous to the termination of an engagement. Within these two or three weeks a number of men refused to work in a pit belonging to Messrs. Williams, Darlaston, because one of the men employed on the same works was not a member of the Union. Messrs. Williams retained the non-unionist; and the consequence was, all the rest left work. Three of the ringleaders were apprehended, and committed to Stafford Gaol. An attempt is now being made to set aside the conviction as bad in law; and should the judges refuse to commit, the consequences will be very serious in the Staffordshire iron districts.

PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c.

Granted between the 24th November and the 23th December, 1843.

[SIX MONTHS FOR ENROLMENT.]

William Irving, of Regent-street, Lambeth, engineer, for improved machinery and apparatus for cutting and carving substances to be applied for in-laying and other purposes. Nov. 25.

Edward Tann the elder, Edward Tann the younger, and John Tann, of Minerva-terrace, Hackney-road, iron safe manufacturers, for certain improvements in locks and latches, and in iron rooms, doors, safes, chests, and other repositories. Nov. 25.

Alexander Vivian, of Gwennap, Cornwall, gentleman, for an improved apparatus for dressing ores. Nov. 25.

Joseph Rock, jun., of Birmingham, factor, for certain improvements in locks and latches. Nov. 25.

Thomas Drayton, of Brighton, gentleman, for improvements in coating glass with silver for looking-glasses and other uses. Nov. 25.

John Hick, of Bolton-le-moors, Lancaster, engineer, for certain improvements in steam-engines, and an apparatus to be connected therewith, for driving machinery, part of which improvements are applicable to forcing, lifting, and measuring water. Dec. 5.

Joseph Robinson, of Old Jewry, solicitor, for certain improvements in the construction and mode of working engines by the agency of air or gases, for obtaining or reproducing motive power. (Being a communication.) Dec. 5.

William Newton, of Chancery-lane, civil engineer, for improvements in extracting certain metals from ores and other compounds of these metals, some part or parts of which improvements are also applicable to obtaining another product or other products from such ores or compounds. (Being a communication.) Dec. 5.

Lawrence Holker Potts, of Greenwich, doctor of medicine, for certain improvements in the construction of piers, embankments, breakwaters, and other similar structures. Dec. 5.

Joseph Bishop, of Poland-street, Westminster, jeweller, for improvements in paving roads, streets, and other places. Dec. 8.

William Baddley, of Lombard-street, civil engineer, for certain improvements in rotary engines. (Being a communication.) Dec. 8.

Henry Purser Vaile, of Blackfriars'-road, gentleman, for improvements in manufacturing metal combined with other matters, for covering floors and other surfaces. Dec. 13.

William Young, of Queen-street, Cheshire, lamp-maker, for improvements in the manufacture of lamps and gas-burners. Dec. 13.

Thomas Murray Gladstone, of New Swan Garden Iron Works, Wolverhampton, for certain improvements in machines for cutting or shearing iron or other metals. Dec. 28.

DESIGNS FOR ARTICLES RELATING TO ARCHITECTURE, ENGINEERING, &c.

Registered under 5th & 6th Vic., cap. 65.

Date of Register, 1843.	No. in Register.	Proprietor's Name.	Address.	Subject.
Nov. 27.	73	Alexander Milner.	50, Garden-st., Sheffield.	Ventilating drawer for perforated ventilating hearth-plates.
— 28.	75	Thomas Walker.	Wednesbury.	Bar-iron for bolt nuts.
— 29.	78	Frederick Finlay.	34, Bloomsbury-square.	Cast-iron fire-proof strong-room.
Dec. 5.	84	Henry Cobby.	General Steam Navigation Company's Office, Kingston-upon-Hull.	Apparatus for causing the paddle-wheels of a steam-vessel to revolve in a contrary direction to each other, and thereby to turn the vessel round.
— 7.	85	John Richardson.	62, Edgware-road.	Improved Chimney-cowl.
— 13.	90	William Middleton.	Birmingham.	Wheel for railway-carriages
— —	91	Jeakes and Willis.	Great Russell-st. Bloomsbury.	Improved Roasting-jack.
— 14.	93	John Middleton.	Birmingham.	Wheel for railway-carriages
— 23.	97	James Boyd.	78, Welbeck-st., Cavendish-square, London.	The Himalaya Funnel for the cure of smoky chimneys.

## SCHOOL AND COTTAGES.

TO THE EDITOR OF "THE BUILDER."

SIR,—Observing in your publication remarks upon Cottage Economy, and being anxious to contribute my mite towards the furtherance of a knowledge of the subject, I inclose sketches illustrative of the general external character and internal arrangement of some cottages, with a school, to which is attached the house of a school-mistress, which I have lately erected in the village of Bourton, near Shrivenham, Berks, upon the estate of Henry Tucker, Esq., and which I am enabled to say meet, in all points of economy, the wishes of their inhabitants, and I may add that to "cottage comforts" some little attention has been paid in order to revive, even in this humble particular, the true spirit of by-gone days.

The cottages are each provided with a lobby, a living-room, a scullery, a pantry, an open staircase, with a closet under the stairs; on the chimney-piece are two large comfortable bed-rooms. The mistress's house is a more spacious dwelling, with three bed-rooms. The school is provided with two lobbies, one of which is

available to the house, the other is used as a general depository for cloaks, hats, &c.; the timbers of the roof are entirely exposed with circular framed ribs, and boarded under the slates; in the gable over the larger end window is formed a cross in stained glass; the windows are otherwise of ground glass; the walls are constructed of a hard lime-stone, their dressings being of Bath stone.

I am, SIR, yours respectfully,  
T. W. ORDISH.  
Bourton Village, Dec. 11, 1843.

## METROPOLITAN IMPROVEMENTS.

THE following letter upon this subject has been addressed to the editor of the *Times*:—  
"SIR,—The public, and especially the inhabitants of different localities where metropolitan improvements are in progress, have just cause of complaint. The *modus operandi* is as follows:—They pull down one house here, and another there, in places unconnected with each other. The Act of Parliament directing these improvements passed in August, 1841, yet they have not built one house, nor cleared a spot that one might be built. This is very injurious to the inhabitants of the locality, who

not only sustain great inconvenience, but serious loss. Every house untenanted diminishes the number of the customers to the tradesmen in the vicinity, whilst the public lose the amount of the rents of those houses, which, if received, would go in part liquidation of the improvements.

"At the end of Plumtree-street twenty houses have been pulled down for twelve months. All the houses in Broad-street required have been settled with some time, yet these are lying empty. No cause is assigned for delay, yet individuals applying for the terms of rebuilding obtain no answer.

"The means by which these improvements are to be carried out is by a heavy tax on coals, therefore these delays and losses will be seriously felt by the public at large.

"The last paragraph under the head of 'metropolitan improvements' states that they have commenced pulling down houses opposite St. Andrew-street, St. Giles's. Why commence there until they have finished the upper end of St. Martin's-lane, or Plumtree-street?

"In addition to the losses sustained by the obstructions caused by pulling down, by the departure of customers to other places, the

parish authorities have been forced to levy an additional penny in the pound on the poor-rates, the number of inhabitants who pay being in this neighbourhood so much diminished.

"On reference to the books of the parishes of St. Giles and Bloomsbury, I find that the estimated loss of rental is 15,000*l.*; this is calculated by the rates, which are much less than the sums paid by occupants. At a rough calculation the real loss is 25,000*l.* Any parishioner may ascertain the truth of this statement by examining the books, open for inspection at the vestry of St. Giles's.

"I remain, Sir, your very humble servant,  
"AN OLD INHABITANT OF ST. GEORGE'S,  
BLOOMSBURY.  
"Bloomsbury, January 4."  
We beg to remind "An Old Inhabitant of St. George's, Bloomsbury," of the benefit to the rating of this particular district which will be occasioned by the breaking up of such a horrid accumulation of filth and poverty.

WESTMINSTER BRIDGE.

INSTEAD OF OUR OWN observations, which require illustrative cuts that could not be executed in time to appear in our present number, we this week insert the following communication from a correspondent:—

TO THE EDITOR OF THE BUILDER.

SIR,—At a time when a warfare of opinion is waging upon the reparation and embellishment of Westminster-bridge, between those eminent gentlemen of their respective professions, Messrs. Walker and Burges, the civil engineers, and Mr. Barry, the celebrated architect, it is with every sense of deference and respect to those gentleman, and with no disparagement to the plan of either, that I beg, through the medium of your highly valuable and instructive publication, to submit to the public the accompanying design, which as a practical man, I have for some time past contemplated as a desideratum in this (almost national) improvement.

Although this project does not participate in the features of either of the above parties' designs, in my opinion it more than embraces the desired objects of both; for whilst its character in *artistic effect* somewhat assimilates with the style of the new Houses of Parliament (though in a far less elaborate degree), it, at the same time, not only affords a greater water-way, but considerably reduces the present steep road-

way. This suggestion presented itself some time since, when it may be remembered that one of the piers on the Middlesex side of the bridge sunk suddenly several inches, and this, I believe, after the execution of the work by Messrs. Walker and Burges to the foundations of the piers, rendering them, as they state, much more *secure* than they had ever been before.

During the formation of the Thames Tunnel an opportunity was afforded of witnessing the substrata of the bed of the river, in which there is a considerable vein of silt, or quicksand, and which proved the greatest enemy (with the exception of the water), that that intrepid engineer, Sir I. M. Brunel, had to cope with, and which vein extends below as far as the Nore, and, there is but little doubt, as far up the river. With this impression, and the knowledge of Labeyle's (*caison-constructed*) piers, it occurred at the time that the ballast-dredging machine completed cutting the low-water channel for the steam-boats (nearly fronting the pier which sank) at this period, that having tapped the strata of silt or quicksand, there is but little doubt that its exit from under the caison caused the sudden settlement which occurred.

Upon examining the costly and stupendous barriers of the coffer-dams which Messrs. Walker and Burges so ably and substantially erected around each of these piers, that with this bulwark, had they been applied only to every other pier, and had those been underpinned (despite of the caison) progressively to the whole depth required, so as to obtain a sound and substantial foundation on such a stratum as might be relied upon for carrying the most massive erection. Having by these means strengthened and lengthened the piers for the requisite additional width, it is presumed by the increased water-way thus gained (*i.e.* by the removal of the intermediate piers), that the springing of the arch, which is described of Tudor form, might, for additional strength and security, spring from a little above the low-water mark, so that the largest or centre arch would in its span be about 140 feet, with a rise not exceeding that of the present centre arch, which is proposed to be united with that of the adjoining one on the Surrey side, so as to embrace more of the actual current as it at present ebbs and flows.

For the practical execution of these works, without interfering with the traffic during the progress of the proposed alterations, it was intended to relieve the bridge throughout of the present balustrading, and to extend over one side of the bridge a footpath 6 feet wide, supported by cantilivers of timber, which might be buried in the roading, and, if necessary, might be strutted from the piers and spandrels. By this addition, a space equal to the present width of roadway might be retained during the progress of the works; and as soon as the alternate piers were extended to the additional width and length required, and the present portion underpinned to the depth of the proposed addition, and carried up as high as the springing, so much of the arches of the present bridge might be removed as the width of roadway would admit. The arches are proposed to be composed of cast-iron perforated Gothic ribs, five feet apart, cast with flanges and fillets to secure cast-iron plates behind them, to form the sinking of the panels in the spandrels, and fair soffits to the arches, which would shew upon every rib archivolt-mouldings traversing longitudinally from springing to springing.

Stone relieving-arches might, for additional security, be constructed between the iron ribs, avoiding the braces and iron-work throughout, and turned upon sand cores, so as to allow of any action in the iron-work by expansion and contraction. By this design it is proposed to widen the bridge to the total width of 60 feet; and the *additional width* is proposed to be *made wholly* upon the *lower side*, as I deem the present bridge to be already too near to the new Houses of Parliament, and by following this plan, the line of the present approaches on either side of the bridge would be better conformed to.

When the above works should be completed to the height of the intended roadway, a similar temporarily-constructed footpath might be applied, and the rest of the present bridge be so far removed, as to complete the remaining portion of this proposed re-construction, even to the balustrading or parapet, which might be either of plain masonry or of cast-iron in ornamental or perforated Gothic panels; the opposite side might then be similarly completed, and the intermediate piers removed.

It may be seen by this arrangement, that on the score of economy, a considerable saving would have been gained by the requisition of only eight of those expensive items in engineering works, called *coffer-dams*, instead of the fifteen required in the *partial*, and since proved *abortive*, reparation of the present defective and incompetent bridge. With every apology for this lengthened trespass on the pages of your instructive work, and with a view that it may bring forth a more eligible design, I remain, Sir, your obedient servant,

A PRACTICAL OBSERVER.

PRESENT ELEVATION OF WESTMINSTER BRIDGE.

PRESENT ROADWAY.

EXTENDED ROADWAY.

PROPOSED ELEVATION OF BRIDGE.

## Literature.

*Illustrations of Stone Church, Kent. With an Historical Account by EDWARD CRESY, Architect, F.S.A. Published for the Topographical Society, by H. Hooper, Pall-mall East, 1840; fol. 16 pp., 17 plates, 13 wood-engravings.*

THIS work, elucidated by copies of beautiful drawings, the work of Mr. Cresy, the accomplished Professor of Pointed Architecture to the College of the "Freemasons of the Church," and other members of the Topographical Society, we most particularly recommend to the student, the educated architect, and the antiquary, on account of its exact

graphic merits, the beauty and elegance of the subjects which form the prototypes of its illustrations, for the clear and admirable historical and descriptive matter which it contains. The work, though small or thin, is all pith, and gladly should we, if decently we might, quote every word of its text; from it we indeed draw copiously, knowing its sterling merit, and that it is one of those compressed works out of which not only the juvenile learner, but the hoary practitioner, may acquire largely due information relative to his craft. It is in verity a true masonic work of the highest class, as may be seen by the columnar diagram here given, which we have had engraved after the one inserted in the work itself.

"Stone is a small village on the high road from London to Dover, seventeen miles from the metropolis, bounded on the north by the river Thames;—it is to the hundred of Axtane and diocese of Rochester.

"Stone Church is dedicated to St. Mary, and anciently paid ninepence Christ rent to the mother church of the diocese; and in the 15th of King Edward the First, was valued at thirty marks, and the vicarage at seven marks.

"It is not improbable that, during the life of the first rector, all the works in this church which bear the marks of the 13th century were executed, and that the previous church mentioned in the Domesday survey, resembled others erected by the Saxons. These Saxon churches differed little from those of Normandy, and some time after the Conquest, religious edifices were constructed in a similar manner to those erected previous to the invasion by the Normans.

"At Mapplescombe are the ruins of one of these early churches, having its east end terminated semicircularly. Its total internal length is 53 feet, and breadth 22 feet, the walls being three feet thick. At South Darent, now a hamlet, though formerly a parish, paying ninepence Christ rent, are the walls of a similar church, now converted into a malthouse; a few years ago, another, with a singular tower, partly constructed with Roman bricks, remained in a field at St. Margaret's at Hills, but of which the plough has now destroyed every vestige.

"In the reign of Richard the First, or about the latter end of the 12th century, the parish churches throughout the kingdom underwent a general reconstruction. A new style was introduced, and a decoration, not before indulged in, everywhere displayed itself. It being adopted simultaneously throughout Christian Europe has occasioned its introduction to be attributed to the Crusaders, who possessed Palestine from the years 1095 to 1291. Among those enthusiastic warriors, the most distinguished for science were the Knights Hospitallers of St. John of Jerusalem, and possessing 19,000 manors in Europe, could easily have carried any improvement wherever their influence extended. They were established about 1101, and held considerable lands in the adjoining parishes to Stone. On an estate given to them by Robert Basing about 1110, at Sutton-at-

Home, was one of their commanderies established, which formed their principal resting-place when they visited their possessions in this part of the county, situated in the middle of the beautiful valley of Holmsdale, and watered by the clear and pellucid Darent; surrounded by meadows and rich lands, few situations could vie with it either for fertility or beauty. That this establishment was upon an extensive scale may be inferred from walls built of flint, six feet in thickness, extending as far as South Darent, being discovered by the writer when superintending the construction of the present iron bridge. Similar walls have also been traced along the banks of the river in many places.

"In the 12th century the knowledge of geometry was revived by the monk Athelard or Adielard, who, after travelling through Spain and Egypt, translated, about 1130, the books of Euclid from the Arabic into Latin. This science was ardently taken up by the learned men who immediately followed; particularly by Grossete, Bishop of Lincoln, and others employed on the great buildings in England as well as on those of the Continent.

"The abbey church of St. Denis near Paris, commenced by Eudes Clement in 1229, and finished by Matthieu de Vendome about 1281, the fine chapel at Vincennes, and the Sainte Chapelle at Paris, built from the designs of Pierre de Montereau, who died in 1266, are early examples of the change that architecture underwent after the revival of the study of geometry; and Eudes de Montreal, who accompanied St. Louis to the Holy Land, left many similar works.

"Salisbury, Lincoln, Westminster, Winchester, and other buildings of this time, no longer exhibited the round arch or features borrowed by the Normans from Roman constructions, but a new style altogether, having principles essentially geometrical; and it is in vain that we attempt to imitate the tracery or mouldings belonging to this style correctly, unless we consider them to emanate from some simple figure. However confused the mouldings, they never appear confused, which entirely arises from the order observed in their arrangement; this may be better expressed by the subjoined diagram, taken from the mouldings which form the trefoil arches round the chancel of Stone Church. The points of intersection of the two equilateral triangles are

the centres for the hollows, and the more prominent parts of the moulding are set out with the same radius at the points of the triangles; or, in other words, four circles are encircled within a circle, and by omitting each alternate one the figure is formed. From the equilateral triangle are readily produced the hexagon and duodecagon; and the rose windows of the churches and cathedrals of France, many nearly fifty feet in diameter, and exhibiting a great variety of figures in their designs, are among the most beautiful examples which can be cited of the early and later application of the equilateral triangle to the figures of architecture. From the trefoil, sexfoil, and their multiples, as shewn at St. Denis, proceeded the flowing tracery, simply produced by omission of portions of the regular geometrical figure, that which remained being so combined that the manner of its setting out was concealed, probably for the purpose of exciting wonder in the spectator, and thereby adding to that air of mystery which the craft delighted to spread around them. The system depending on the equilateral triangle for its variety of form continued in use till the beginning of the 15th century in France, when it underwent a great and important change by the introduction of the isosceles triangle, and its compound the pentagon. A pupil of Alexander de Berneval, architect to the church of St. Ouen at Rouen, proved that these figures could furnish novelties in design, and that all beauty was not confined to the long used favourite triangle. We can well imagine how displeasing this innovation must have been to the whole fraternity of masons; their reverence was invaded, and their very prejudices would lead them to doubt the practicability of any new thing. The result seems to have been fatal to the ingenious artificer. Dom. Pomeraye, in his History of the Abbey of St. Ouen, mentions that the master was so incensed at the clergy preferring the northern rose window of the transept executed by his pupil, where this innovation was first introduced, to that of the south, of his own execution, upon the ancient triangular system, that, in a fit of jealousy, he killed his rival, and was himself condemned to be hanged.

"To the common observer this theory may appear fanciful, but the writer does not hesitate to assert that the holdest mouldings, and the most delicate tracery, were gently flowing lines seem the result of a sportive fancy only, equally emanate from the same sources, and that it is to the neglect of the application of the rules of geometry that we may attribute the defects and failures wherever an imitation of this early style has been attempted in the present day, which neglect has been greatly fostered by the too prevailing opinion that all the beauty we admire is produced by art alone unaided by the science of geometry, the time devoted to line and rule being considered lost. The beautiful tracery, called by some, *par excellence*, the decorated English, cannot accurately be displayed without a knowledge of these principles. Many examples have been tested to prove this fact. On some future occasion this subject may form a portion of a more copious essay, "On the first principles of Gothic architecture," if not taken up by more able hands.

"This church at different periods has undergone various alterations; but the plan remains as the result of one design. The foundation walls of the tower are the most ancient; they are arched on the north and south sides, as well as towards the nave, forming a vestibule to the church, an arrangement not commonly found, but in this instance adding much to the beauty of the interior. The upper part of the tower is more modern, and once was surmounted by a lofty spire; the flying buttresses contrived to steady the work, have their mouldings in a style as late as the time of Edward the Third, and may be attributed to Johannes Lumbarde.

"The windows which light the side aisles of the nave are not all placed in the middle or opposite the main arches, and those which terminate the east ends of the two aisles are walled up. The outer walls of the church are two feet four inches in thickness; the buttresses attached to them are not of a strength to resist the thrust of a vaulted roof. Those of the chancel are of much greater solidity, and are calculated to bear up against a groined vault, which, without doubt, it once had, and which

must have remained when Wiltshire's chantry was thrown out, as the flying buttress spanning the whole addition was apparently introduced to supply the use of that necessarily removed.

"Roman tiles 12 inches long, and two inches thick, are seen bedded in various parts of the walls, which are rubble, and generally composed of flint.

"The three main arches on each side that separate the side aisles from the nave are light and well proportioned, and set out with great regularity. Their extent, comprising the entire of the cluster pillars, is 40 feet 6 inches, and their height from the pavement to the top of the mouldings 27 feet; each of these divisions is thus formed of a double square. The pillars are arranged with great regularity, and their height is equal to many of the classic age, being nine and a half diameters in height, and placed at six and a half diameters apart. Including capital and base, their height is 16 feet 7 inches.

"The arch of the tower is of a different character, and belongs to a later period. The capitals are enriched with the oak leaf, and the mouldings are not so elegantly formed.

"Around the outer walls under the range of windows, a dado or series of arches similar to those of the chancel, perhaps rested upon the seat or plinth which projects so considerably, and was contrived for the purpose of supporting them.

"The main arches are of Reigate stone, or some similar, and the variety of mouldings into which they are cut, proves that there was no poverty of invention in the architect, and that he could preserve symmetry without adopting strict uniformity. Each pair of arches corresponds in design, and the two eastern ones have in their soffits that elegant enrichment, the quatrefoil or dog's tooth. The four small columns of the cluster pillars are of Bethersden or Petworth marble; the capitals with their enrichments, as well as the bands and bases, together with the larger column in the centre, are of the same stone as the arches. The modern pews, pulpit, &c. are omitted, as they take away from the view of the lower part of the chancel, and destroy the fine proportions of the church.

"The windows walled up at the east end of the side aisles, and once glazed as well as the present with coloured glass, produced a richness difficult to describe and rarely imitated in modern days. There is a fashion in glazing which appertains to the era of Henry the Third and his successor's reign, some fine examples of which are to be seen at Canterbury Cathedral and York Minster, and it would be well, in the introduction of this material, at all times that the style of architecture to which it is applied was considered.

"Shields and coats of arms are of a more recent introduction into windows. The early English, composed of small pieces of glass, resembled mosaic, and was comprised in quatre-foils or circles, one above the other, within a border of scroll work. Armorial bearings, whenever introduced, are always rich, and accompanied with a great variety of design.

"The polished Petworth marble columns had their delicately carved capitals above those of the nave, and when sustaining the cross springers of the vault, would have left nothing wanting to render this chancel a beautiful model of the early pointed style.

"The present windows are not of good proportions, and admit too great a body of light. They are the work perhaps of Johannes Sorewell, who died in 1439, and were certainly commenced some time after the time of Johannes Lumbarde, who died in 1408.

"The curious and enriched portal bears a great resemblance to many in Sicily erected by the Normans soon after the year 1072, when they settled themselves in that island, where they usually adopted the pointed arch upon which to display their favourite mouldings. In Girgenti and its neighbourhood abound examples in which the zig-zag in all its variety of form are in conjunction with the purest ornaments of classic Greece. The opinion of the present inhabitants is, that these Norman portals are of Caen stone, and were executed in Normandy and brought by the invaders from their native shores. But that a portion of the semicircle should be omitted, and the pointed

arch adopted instead, is singular, and cannot be accounted for unless we suppose that from the descendants of the Mahomedans, already established there, they acquired this new feature in construction."

We feel heartily indebted to the gentlemen who have combined to furnish the drawings, and who have executed the engravings for this sterling volume, among which we find the names of W. S. Wilkinson, J. Johnson, Bailey, S. Bellin, Owen Jones, G. Hawkins, jun., and Edwin Nash.

With them we know it was a labour of love. It contains fine exemplars of windows, columns, archivolts, spandrels, and other sculptures; and many of its elegant details, being of that peculiar character of genius-begotten inventions, which, amid the involutions of any degree of antiquity, still remain fresh and removed from and far above the common and vulgar, are particularly worthy of re-appearing in modern fabrics of the highest class. No architectural, topographical, or antiquarian library should be without this intrinsic book. Its sixteen pages of quiet, manly literature will teach truthfully more of genuine architecture than a hundred times as much of quarrelsome controversial diction, which, indeed, instead of leaving on the mind an impress of architecture, writes there only a sense of commotive irritation.

F.

## CHURCH BUILDING INTELLIGENCE.

*Worcester Diocesan Church Building Society.*—A quarterly meeting of the committee of this society was held on Wednesday afternoon, the 10th inst., at the Guildhall, the Lord Bishop of the Diocese in the chair, when the following grants were made for the building, enlarging, and repairing of churches in the diocese of Worcester:—150*l.* towards the erection of the new chapel at Barnard's Green; 80*l.* towards the erection of a new church at Trimpey, near Kidderminster; 10*l.* (second grant) towards the enlargement of Broughton Hackett Church; and 40*l.* for repairing Beoley Church. The 100*l.* granted at a former meeting towards the erection of the new chapel at Whittington, near this city, was directed to be paid, the building being now completed; and after the secretaries' report, which was of a very satisfactory nature, had been read, and other business of a routine character transacted, the meeting broke up, first voting the usual thanks to the right rev. chairman and secretaries.

*Kingston Church.*—The progress made in rebuilding this church is surprising. The contractor and builder, Mr. Nicholson, of Wandsworth, began taking down the old parish church on the 10th July, 1843, and intends the new erection to be ready for consecration by the 10th of next March; therefore, excepting the time employed in taking down and removing the old materials and remains, little more than six months will be required by him to rebuild and finish the present handsome and substantial large parish church, although the terms of contract allowed him ten months.

*New Church at Lynn.*—The committee for building the new church appear to be undecided where that building shall be placed, a meeting was held last week, when it was agreed that the committee should view the site offered to them by the corporation, as also some others, and determine thereupon.

The Warden and Fellows of Winchester College, Oxford, have contributed 200*l.* towards the erection of a new tower for the new parish church of Portsea.

*Opening of the New Baptist Chapel, Myrtle-street.*—On Wednesday, the new Baptist Chapel, erected at the corner of Hope and Myrtle-streets, was opened for public worship for the first time. This chapel has been built, as most of the public are aware, for the congregation who have been worshipping, for the last forty years, under the pastoral care of the Rev. James Lister, in the building, at the corner of Lime and Elliot-streets, which building is now about to be removed by the corporation, in order to widen the approaches from Ranelagh-place to the new Assize Courts. The new Chapel is built in the Gothic style of architecture, and is surmounted by a number

of ornamental turrets, the combination of which, at the south end, produces a striking and beautiful effect. The interior possesses an air of neatness in strict conformity with the character of the exterior. At each end is a gallery supported by projecting trusses, richly ornamented. The ceiling is divided into panels, with enriched centre pieces, and pendants at the intersection of the moulded ribs. A powerful organ, built by Bewser and Fleetwood, of this town, occupies the centre of the northern gallery. Immediately in front of the organ gallery and choir, the pulpit has been erected. The chapel is lighted with the Bude light, by means of a large chandelier suspended from the centre pendant in the ceiling. The extreme length of the building is eighty feet; and it is calculated to accommodate between 800 and 1,000 persons. Underneath the chapel is a spacious school-room, capable of containing about 600 children; also an excellent and convenient lecture-room, 47 feet by 39, which will hold 400 people, besides committee and retiring rooms. The whole has been erected under the superintendence of Mr. W. H. Gee, architect, of Castle-street; and the total cost of the work will be about 8,500*l.*—*Liverpool Journal.*

*Northfleet—Curious Discovery.*—On Thursday, 11th inst., some workmen whilst trenching at Perry-street, Northfleet, dug up a leaden seal, once attached to a Papal Bull, on the one side was the name of the Pope JOHANNES, PP. XXIII., in Roman characters, and on the reverse the heads of Paul and Peter, rudely designed and coarsely executed, above them, S.P.A.S.P.E. The two S's stood for Sanctus Paulus et Sanctus Petrus. The seal is now in the possession of that erudite member of the Numismatic Society, W. Crafter, Esq., of the Fort, Gravesend. It is about the size of a twopenny piece, is in beautiful preservation, and has a slit in the centre by which it was appended to the original instrument, now entirely lost. The term Papal Bull was taken from the seals, but was not confined to deeds of Popes, and was derived from *bulla*—a metal ornamented cross. It may be observed that to seal with metal was reckoned an illustrious privilege, consequently the Roman Pontiff's seals or bulls were commonly affixed to their more solemn public instruments impressed in lead, sometimes in gold. These seals varied in form till Urban II., about 1088, since which time they have been as we have described above. Du Cange says that the leaden seals, with the Pope's name only, are as old as Silvester; but the images of Peter and Paul not earlier than Adrian IV., who lived in 1153, some say, commenced with Paschal II. Brief was the term applied to the Papal acts sealed with wax, with the impress of a circle called the Fisherman's Ring.

*Ancient Church Roofs.*—A fine carved timber roof has been lately discovered in the Castle Cary Church, with its bosses, purlins, and principals all moulded, and spandrells filled with elegant tracery. It has been concealed by a flat lath and plaster ceiling for many years. Another roof of carved timber has been lately discovered in Kelvedon Church, Essex, also with its bosses, purlins, and principals all moulded, and spandrells filled with elegant open tracery. This was also concealed by a flat lath and plaster ceiling for, perhaps, nearly two centuries.

A very handsome altar-cloth has been presented to Morwenstow Church, by a lady of Devonshire. It was received on Christmas-day, during the offertory, by one of the churchwardens, and delivered by him in the chancel, with the alms, to the vicar, who laid it reverently on the altar.

*NEW DISTRICT-SURVEYOR.*—JAN. 18.—This day, Mr. George Legg, of Gray's-Inn-place, who for many years superintended the Clerkenwell district for the late Mr. Beazeley, was elected and sworn in district-surveyor for St. Andrew's-above-Bars, St. George the Martyr, and the Liberty of the Rolls.

The Italian architect Canina has lately published a work on the construction of the most ancient Christian churches, which is spoken of highly; it contains fifty-seven engravings on copper, and one hundred and forty-seven folio pages of letter-press.

## RAILWAY INTELLIGENCE.

**York and Scarborough Railway.**—The plans and other documents being now completed and deposited, we are enabled to describe generally the course of the line, and to mention a few particulars. The line commences by a junction with the York and North Midland Railway, near York city walls, and passing a little to the right of the workshops of the North of England Railway Company, crosses the river Ouse, and then approaches the village of Clifton, near Mr. Robert Bellerby's stack-yard, where a station will be probably made for the convenience of market passengers. From Clifton the line passes across Bootham Stray and Strensall Common, leaving the villages of Haxby and Strensall a little to the left, and crossing the Foss nearly midway between them. The line, which is nearly straight as far as Strensall, now bends towards the east, and after crossing the York and Scarborough road, between Barton-bill Inn and Spittal Inn, passes below the village of Crambe, and winds along the left bank of the Derwent, as far as Hutton Ambo, where the line crosses the river and runs along the right-hand side of the valley to Malton. In the parish of Crambe another line is laid down on the plan, for a short distance, called the tunnel line. This line would have the effect of shortening the route, but this advantage would be much more than overbalanced by a long tunnel through Whitwell-hill. At Malton the line closely skirts the river, crossing the Scarborough-road, near the end of Norton Bridge. At Norton it leaves the river to the left, and passes a little to the left of Rillington, near which a branch to join the Whitty and Pickering Railway at Pickering is intended to commence. Passing a little to the left of Scampston, the line again crosses the Scarborough-road, and passes along the flat ground within a short distance of the villages of Hesterton, Sherbourn, Ganton, and Staxton. At Staxton the line turns to the east, and leaving the village of Seamer on the left, runs along the bottom of the valley, and terminates in a field, a few hundred yards from the end of Newborough-street and the principal hotels of Scarborough. The length of the main line is about forty-one and a half miles—the Pickering branch being about six and a half miles. The estimated cost of the whole is 260,000*l.*—*Hull Packet.*

**Railway Reform.**—Influential parties in the city are forming a society to carry out the plans of the author of the pamphlet on Railway Reform. As all matters relating to railways must possess some interest for your town and neighbourhood, I am glad to be able to give you information of the plans which "The Railway Reform Association" have in view. They are as follows:—

"First.—To induce the Government to purchase for the State all the railway property in the kingdom at its fair market value, the shareholders to be paid in 3 per cent. consols.

"Second.—The consolidation of all the railways under one general management.

"Third.—The adoption of the following uniform scale of fares:—

"Mail trains, travelling at the rate of 35 miles per hour—2*d.* per mile.

"Passenger trains, first division (travelling at the rate of 25 miles per hour), first class, for every 2 miles, one penny; second class, for every 3 miles, one penny. Second division (travelling at the rate of 15 miles per hour), first class, for every 6 miles, one penny; second class, for every 8 miles, one penny.

"The charges for merchandise, cattle, carriages, horses, &c., to be reduced to a rate not exceeding one-sixth of the present average rates."

The association are taking active steps to bring their plan before Parliament in the course of the ensuing session, and they thus enumerate the advantages which they allege would be derived from the adoption of the system of railway reform they recommend. "Its adoption," they say, "would give a great stimulus to trade and commerce—reduce the price of the necessities of life—save the public five millions in direct taxation—enable the Government to carry out completely Mr. Rowland Hill's plan of Post-office reform—and, above all, confer an inestimable benefit on the people of the country, by the present system, deprived of the advantages of railway travelling by the prohibitory charges."—*London Correspondent of the Hunts Independent.*

**Improvement in the Value of Railway Property.**—The comparative want of profitable employment for capital in trade and manufactures, and the small rate of interest offered by the government securities at the present high prices, combined with other causes, have for some time had the effect of directing the public to railway property as the most eligible and favourable investment for their money; and the consequence has been a general improvement in the value of this description of property. The London and Birmingham Railway shares were in January, 1843, 20*s.* per share, and in the last week in December, they were done at 24*l.*—showing an increase in value of 38*l.* per share; the Liverpool and Manchester were in January, 1843, 19*l.* in the last week in December 22*l.*—showing an increased value of 3*l.* per share; in February, 1843, the Grand Junction shares were 19*l.* and in the last week of December 22*l.*—increased value 3*l.*; the London and South-Western were in January, 1843, 62*l.* and last week of December 75*l.*—increased value 13*l.* 10*s.*; the Manchester and Bolton were in February 50*l.* and in December 86*l.*—increased value 36*l.* 10*s.*; the Manchester and Leeds were in February 66*l.* and on the 30th of December 100*l.*—increased value 34*l.* 10*s.*; the Midland Counties in February 60*l.* in December 80*l.*—increased value 20*l.*; the North Union in October were at 70*l.* and in December 95*l.*—increased value 35*l.* 10*s.* The York and North Midland have increased in value to the amount of 39*l.* 10*s.* per share since February, having been then 93*l.* and since (in November) 132*l.* The Great Western increased 14*l.* 6*s.* per share in value between the middle of October and the end of December, the prices of the two periods being 85*l.* and 99*l.* Another cause of this improved aspect is of course the increased traffic on the different lines, and the diminished expenditure in keeping them in repair. For instance, in the year ending last July the result of the traffic on the London and Birmingham line was an increase of 16,367*l.* as compared with the previous year; on the Great Western the increase gave a result of 19,557*l.*; the Manchester and Leeds 12,565*l.*; the London and South-Western 7,768*l.*; the Grand Junction 6,899*l.*; the North Midland 6,483*l.*; the Glasgow and Greenock 2,283*l.*; the Manchester, Bolton, and Bury 4,008*l.*; and the Liverpool and Manchester, 1,113*l.*

**Atmospheric Traction on Railways.**—The principle of atmospheric traction, successfully brought into operation on the Dukeith branch of the Dublin and Kingstown Railway, is likely to be brought into extensive use upon short lines. Among others, in which it is said it might be profitably employed are the Blackwall and Greenwich Railways; and one of the projected lines to Gravessend and Rochester, under the superintendence of Mr. Brunel, is started on the understanding that the line will be worked by atmospheric traction.

**Croydon and Epsom Railway.**—It appears from a series of resolutions advertised in the daily papers, that a strong opposition has been raised by the Croydon landholders, including the most wealthy proprietors, against the proposed Croydon branch to Epsom; and from the determined course which these parties have taken, a most formidable array in Parliament may be expected when the competing lines bring forward their respective cases. The route by the Southampton line is stated to have the preference, and little or no opposition is anticipated in that quarter.

**Hastings, Rye, and Tenterden Railway.**—The Mayor of Tenterden, in compliance with a very numerous signed requisition, convened a public meeting at the Town-hall for yesterday, at 12 o'clock, and invited the provisional committee to attend.

**Railway Well-drains.**—Wells are now being sunk in various parts of the embankment at Mountnessing, on the Eastern Counties Railway, to carry off the springs, and provide against any disposition in the materials to slip.

The number of presents this Christmas passing to their various destinations has been very large. So considerable were they in amount and bulk one day last week, that a special train was sent to the London and Birmingham Railway for their conveyance into the country. On the day in question, upwards of 6,000 barrels of oysters were transmitted by the train.

Upwards of 400 horses, purchased by dealers at the Christmas shows, were forwarded by railway from York last week to London and other southern destinations.

The extension line of the Manchester and Leeds Railway, from Collyhurst to the new Victoria Station at Hunt's Bank, was opened last week.

An atmospheric railway between Margate and Ramsgate is in contemplation.

Glass windows have been introduced in the second class carriages of the Glasgow and Greenock railway.

The railroad from Naples to Caresta was opened on the 11th ult.

The following are the receipts of railways for the past week—that is to say, up to the date to which the respective returns are made:—

**SCOTCH SETTLERS IN ENGLAND AND ENGLISH IN SCOTLAND.**—The English residing in Scotland are in more striking quantity in proportion to the Scottish population, than are the Scotch residing in England. For our small population of 2,620,184 to contain 37,796 persons of English birth, is very remarkable. It could not have been believed upon any but statistical evidence, that 15 per thousand of the inhabitants of Scotland are English, while only six per thousand of the population of England are from Scotland—a difference as five in two. There is actually a sixteenth of the whole population of Scotland of English or Irish birth. This shows that Scotland, while sending off adventurers to every other part of the world, receives also a number of adventurers from the two other kingdoms. Of the English in Scotland, nearly one-fourth are in Edinburghshire, and somewhat less than another fourth are in Lenarkshire. We trust that none of these results can be the subject of invidious or jealous feeling in any quarter. The Irish are acknowledged to be a useful, though occasionally unruly, set of people amongst us. The Scotch in England are, we believe, generally appreciated for their steady conduct in affairs which require thought and powers of management. We only speak a general sentiment when we remark, that the English settlers in our northern regions are generally held in esteem. They are for the most part tradesmen engaged in lines of business hitherto little known in Scotland; a considerable class are teachers; there is also a large number of working men of superior skill. Any one who casts his eye along one of the principal streets of the New Town of Edinburgh will remark the surprising number of shops occupied by persons with English names. As far as we are aware, these intrusions amongst us are regarded with any thing but a hostile feeling.—*Chambers's Journal.*

The large work on the Etruscan Museum Gregorianum, published at the expense of the Pope, has appeared in two volumes folio, containing upwards of two hundred plates.

**GOVERNMENT FEMALE SCHOOL OF DESIGN.**—It is stated that the wood-engraving branch of this school has been discontinued. On the opening of the school after the Christmas holidays, the teacher was dismissed, and the pupils told they were to discontinue their studies.

COURT OF QUEEN'S BENCH.

(Sittings in Banco.)

THE QUEEN v. THE COMMISSIONERS FOR BUILDING NEW CHURCHES.

THURSDAY, JAN. 11.—Mr. Kelly said he was instructed to apply for a rule calling upon the commissioners to shew cause why a *mandamus* should not be directed to them, commanding them to appropriate convenient pews and sittings in the new district church of Highgate for the master and governors of Sir Roger Cholmondeley's Free Grammar School at Highgate, and for their families. This institution was created by letters patent granted by Queen Elizabeth, and consisted of a free school for forty scholars, and some fifty or sixty other boys, besides a master and six governors. Before the year 1830 the institution was possessed of a chapel, which would contain 700 persons, and there was, of course, ample accommodation for all the persons in any way connected with the school; but at that period there were some proceedings in Chancery, which ended in a scheme being agreed to and sanctioned by the Lord Chancellor, and an Act of Parliament was passed to carry that scheme into effect.

Under that Act of Parliament the chapel was pulled down, and the school had to contribute 2,000*l.* towards building a new church at Highgate, which was to be erected; but it was enacted that the master and governors and their families, and the scholars, were to have pews and sittings in the church. The commissioners had appropriated a pew containing eight sittings for the master and his family, but only twelve sittings for the governors and their families. He had to urge that this was not a compliance with the Act of Parliament, and therefore this rule was applied for.

Rule granted.

ASSESSED TAXES CASES.

Determined by the Judges on Appeal.

May 18, 1841.

Windows—Attorney's Office.

*A house with fourteen rooms, nine used by appellant (an attorney residing in a separate house connected with the other by a covered way), solely as offices in his profession, one not used at all, and the other four used and slept in by his servant and his servant's wife and family, is not exempt for its windows under the 5 Geo. 4, c. 44, s. 4, as persons inhabited therein in the night-time, and the covered way formed a communication with another house.*

At a meeting of the commissioners of assessed taxes, acting for the Holborn division, holden at their board-room in Red Lion-square on the 23rd of October, 1840, for the purpose of hearing appeals against the first assessments (48 Geo. 3, c. 55, sch. (A); 57 Geo. 3, c. 25, ss. 1, 2; 5 Geo. 4, c. 44, s. 4)—Edwin Ward Scadding, of No. 2, Gordon-street, in the parish of St. Pancras, within the said division, attorney-at-law, appealed against a charge from thirty to fifty-three windows made on Nos. 2 and 3, Gordon-street.

The appellant states that he resides at No. 2, which is charged to the window duties. That No. 2 contains fourteen rooms, nine of which are used by him as offices for the purpose of his profession only, one is not used at all, and his man-servant uses the other four—namely, the kitchen, wash-house, and two attics, for the purpose of taking care of the premises. The servant and his family, consisting of a wife and two children, sleep in the attics of No. 3; but throughout the day he is employed, and attends at the house of No. 2, and takes all his meals there, his wife and family remaining at No. 3, in the kitchen.

The servant's wife and family are not subject to the control of the appellant. For the purposes of ingress and egress, from and to the street, they use the area-gate, and not the general entrance to the premises. There is a covered way from No. 3 to No. 2, across the yard or garden of No. 3, for the appellant's own private use, with a distinct and separate door at each end, and distinct locks and keys; the business entrance is at the front door of No. 3. The two houses are separately assessed in the parish rate-books.

The appellant contended that either the twenty-three windows, or at least the windows of that part of No. 3 which is used for the purpose of his profession, should not be added in charge with those of No. 2, inasmuch as the statute 5 Geo. 4, c. 44, s. 4, intended to exempt from the duties "all and every person and persons for and in respect of any house, tenement, or building, or part of a house, tenement, or building, which should be used by such person or persons as offices or counting-houses, for the purposes of exercising or carrying on any profession, vocation, business, or calling by which such person or persons shall seek a livelihood or profit, no person inhabiting, dwelling, or abiding therein except in the day-time, only for the purpose of such profession, vocation, business, or calling,

such person residing in a distinct and separate dwelling-house charged to the said duties." The appellant contended that the word "therein" refers to the house or part of a house (as the case may be) used for the purposes specified, and that he is at least entitled to exemption in respect of the windows of the rooms used for the purposes of his business only.

The commissioners relieved the appellant in respect of the twenty-three windows so charged on No. 3.

The surveyor for the crown being dissatisfied with such determination, contending that the constant residence of the servant's wife and family precludes the exemption sought by the appellant, the words in the 4th clause of the said Act being as follows:—"No person inhabiting, dwelling, or abiding therein except in the day-time only," and further contending that the communication across the yard or garden unites the two houses, and is not such a distinct and separate house as by the provisions of the said Act is contemplated; and in support thereof refers to the case No. 1255, and also to Nos. 490 and 507, decided by her Majesty's judges, demanded a case for the opinion of her Majesty's judges, which we have accordingly stated.

J. MANSFIELD, }  
J. H. MANN, } Commissioners.

We are of opinion that the determination of the commissioners is wrong.

J. PATERSON. J. GURNEY. T. COLTMAN.

Windows—Surgery.

*The windows of a surgery wherein drugs were exposed for sale, being a distinct building, and not under the same roof as the dwelling-house, though adjoining it and internally communicating with it, and hidden from the road by a wall, and not having appellant's name on the door:—Held, liable to duty.*

At a meeting of the commissioners of assessed taxes, held at the Ship Inn, at Banwell, on the 31st day of August, 1840 (48 Geo. 3, c. 55; 4 Geo. 4, c. 11, s. 1), Mr. Samuel Parsley, of Worle, in the county of Somerset, surgeon, appealed against a charge for thirteen windows. The appellant admitted his liability to twelve windows, but contended that the other window was exempt, being the window of a surgery wherein drugs were exposed for sale, such surgery being a separate and distinct building, and not under the same roof as the dwelling-house, though adjoining thereto.

On the part of the Crown the surveyor contended that inasmuch as there was an internal communication from the appellant's dwelling-house into his surgery, and the surgery, though fronting the same way as the dwelling-house, fronted the court of the appellant, and was not visible from the public road, from which it was hid by the court wall, and inasmuch as the appellant's name was not on the door of his house or surgery, such window was liable to duty.

The appellant, in answer to the surveyor, stated that the court was the only front of his house and entrance to his premises; that his surgery window was so situated as to be necessarily seen by every person going to his house or surgery. The commissioners relieved the appellant; but the surveyor being dissatisfied therewith, demanded a case for the opinion of her Majesty's judges, which we state and sign accordingly.

J. EDGAR, }  
H. SYMONS, } Commissioners.  
HEBERDEN F. EMERY, }

We are of opinion, that the determination of the commissioners is wrong.

J. PATERSON. J. GURNEY. T. COLTMAN.

Correspondence.

POSTAGE CHARGES FOR UNSTAMPED COPIES OF "THE BUILDER."

SIR,—A friend of mine to whom I have sent THE BUILDER desires me to discontinue the same on account of what I consider an overcharge of postage. He states that during the last six months he has been charged 4*s.* for postage; the postmaster demanding 2*d.* and sometimes 6*d.* for a single paper, and stating, as a reason for so doing, that they were over weight. Now, as such an extra expense is calculated to injure the sale of your work, as well as to become an annoyance to your country readers, I have thought fit to acquaint you thereof, and if it is an imposition practised by the postmaster, it ought to be exposed.

Most of the copies have had the common post stamp appended by myself to them; for two or three 1*d.* each has been prepaid, and the others stamped with the news stamp, when I could conveniently get them from your office; but, supposing the penny-post stamp equivalent to the newspaper stamp, and that it would clear further charge for postage, I did not

hesitate in taking the unstamped edition. As such impression prevails with many other persons, it would be well if that question could be set right.

I remain, Sir, your obedient servant,  
London, January, 1841. E. W. B.

[The cheapest and safest plan to adopt would be to purchase a stamped copy, which may be procured at any news-vender's, and to be careful in folding the stamp outside; the paper will be then transmitted free of charge. If the paper does not bear a news stamp, it must be prepaid by postage stamps affixed to it, equal to the weight of the paper; according to the post-office regulations; and if the full amount of stamps are not affixed, a double charge may be made for the difference. Thus the postage of a single paper will sometimes amount to 4*d.* or 6*d.* when not prepaid to the full weight; whereas a copy of the stamped edition will cost only one penny extra, and no postmaster can make a charge for delivering it, unless any matter beyond the name and address be written on the envelope, or upon the paper.—Ed.]

THE ROYAL EXCHANGE.

SIR,—I have always held that no person has a right to take up the time of a public journalist unless the subject he writes upon be of a public nature; I therefore, as you have courted communications, beg to address you upon the subject of the New Royal Exchange, which, if you view it as I do, you will oblige by inserting at your own convenience.

Having dispassionately surveyed that building, I am sorry to find it laid out quite contrary to the rules of architecture. For who but a city committee of taste, who generally spoil every thing they undertake, would have thought of selecting a plan whose sides are at obtuse angles with the front, and thereby sacrificing the beauty of a building (erected to stand as long as the city retains its present elevated situation), for the purpose of making its sides range with two streets, the existence of whose houses cannot be much more than half a century.

And, instead of the powers that will then be in existence being able to throw it open to the public view, they will be compelled to inclose it as now, to hide, if possible, a little of its deformity.

What would have been said, aye! and what would the architect himself have said, of Sir Christopher Wren, had he erected the north and south sides of St. Paul's in a line with Cheapside and Watling-street? and the buildings both stand in a similar manner.

Would not that noble edifice, which is now the pride of the nation (like some others of our national buildings), have been its disgrace, and have been far beneath the talents of that great man?

I should not have intruded, but think it the duty of every professional man to point out the defects of those buildings which are erected as an ornament as well as for utility, that they may be a beacon for those who follow after.

I am, Sir, your obedient servant.  
J. C., Architect, &c.  
2, Albany-road, Barnsbury Park, Islington.

MEASUREMENT OF HEIGHTS.

SIR,—As you so readily inserted my last communication respecting the measuring of distances, I beg leave to trouble you with another on the measurement of heights.

I am, Sir, your most obedient servant,  
N. H.  
Kennewhere, 11th January, 1841.

Suppose the height of the tower A C is required, and you have no other instrument than a foot rule or small scale.

Measure a part of the tower accurately from A to B, which suppose 8 feet, then stand back at any convenient distance with the rule or scale in your hand in a perpendicular position, and observe how much of the scale the space A B occupies, which suppose one division, or one inch upon your scale, and suppose the whole tower occupies 7 inches of your scale, then you have the proportion of A B to the whole height, which would be 56 feet.

## ARCHITECTURAL GLOSSARY.

Sir,—Allow me to suggest to your notice, the propriety of devoting a portion of your valuable paper to the production of a glossary of terms connected with building and architecture, the compilation of which, while it would afford an opportunity to young aspirants after fame of distinguishing themselves, would be highly useful to the building-art in general, and, at the same time, supply in the form of a complete and accurate glossary of the present style of art, a want which has been long felt.

I would, with all deference, propose the following method of procedure:—Let a notice of your intentions appear in some future number of *THE BUILDER*, with a request to correspondents willing to assist you, to forward definitions of such words as begin with the letters *AB* on or before that day month, the following words in each letter respectively to be sent at least one fortnight before their probable appearance in *THE BUILDER*; these notes would come under your searching inspection, and all approved definitions, or compilations of such, inserted, with the cuts necessary for illustrating the terms.

I have to observe that no notices of competitions for designs have had place in *THE BUILDER* for some time past; even one for two cemetery chapels in London, which was advertised in your own paper, had no notice taken of it. Was it a neglect, or is that part of your proposed arrangement thrown aside? I should hope not, as such notices could scarcely fail to produce many useful and instructive, though probably humiliating lessons to Tyros in the art, while it would be an obvious ladder for the ascent of ability.

I am, Sir, your obedient servant,  
Glasgow, Jan. 14, 1844. Poz.

[We beg to inform our correspondent that the formation of an architectural glossary which he thinks so desirable, has been undertaken by the Freemasons of the Church; at the formation of the institution, the following declaration was made:—

"As a first labour of the College, it is proposed that the present unsatisfactory division and nomenclature of Pointed Architecture shall be remedied, and that all the publications of the society upon that subject shall be issued according to such classification and nomenclature. Not indeed that the perfecting of so desirable a project can be expected at once; but such a nomenclature can be laid down as shall immediately distinguish the different members of the art, which are as numerous as those of heraldry; and these can be superseded by more primitive or more simple and energetic terms, as they shall be recovered from ancient contracts and other documents, or shall be invented by more judicious and mature consideration. But, to prevent doubt or future mistake, it is proposed that a cut of each intended object shall be executed, and that a reference shall be made to where exemplars of it are to be found, and also to its chronology."

No doubt the College will add to the nomenclature of Gothic architecture, all that is previously known on building generally. The institution would, we judge, willingly profit by any suggestions which may be conveyed through our columns. The other subjects mentioned by our correspondent will receive due attention.—Ed.]

## THE LEICESTER MEMORIAL.

Sir,—In answer to your correspondent, "Another Competitor," who asks in your publication of to day, whether "my remarks apply to the design No. 40, stated to be the one selected?" I reply that in my letter of the 1st January I specifically alluded to the author of the design selected, when I wrote, "Can it be true that one of the candidates (or perhaps more) personally paraded his designs to many of his friends?"

I now ask again, did not the successful candidate exhibit four designs?

Did he not take two of these designs with him into Norfolk, some day in the week preceding that which was declared to be the last for the receiving of the designs; and then and there exhibit his drawings to many persons previously to their being sent in to the committee? In fact, did he not canvass for those two designs?

Lastly, was not one of those very designs, so exhibited, the successful one?

I assert that the facts are as here stated, and if so, any candidate so canvassing ought, in my opinion, to be disqualified from competing, if honour and straightforward dealing are to be at all considered as directing the fiat of the judges.

For myself, I do not complain of any neglect of my design, which is most probably inferior in merit

to the one selected; but this I do say, that I too had many friends amongst those interested (as subscribers), and, moreover, of much influence, but not one of these was even aware of my intention to compete. I should have scorned to use so unfair an advantage against my less fortunate brethren.

I am well aware, Mr. Editor, of the little weight attached in general (and frequently most properly) to an anonymous assertion. At the same time, I am also fully aware of the folly of running a here endeavouring to expose. I can, therefore, only retire from the presence of the committee with the feeling that I have been unfairly treated in common with many others; and whilst I utterly disclaim every feeling of personal anger, I, as one possessing a high esteem for the character of the late Lord Leicester during his lifetime, cannot but feel sincere sorrow that chicanery and want of candour should be mixed up with the very first act connected with the lasting memory of this fine old English gentleman.

"A COMPETITOR."  
And, above all, a lover of fair play.  
London, January 13, 1844.

## NORMAN COTTAGE.

Sir,—In a recent number of your very important paper, you published a design for a Norman cottage, together with some others. Novelty and singularly combined must certainly have prompted the designer in his choice of style, and it is a very good precedent of the indiscriminate use of a peculiar style or order, without any regard to the applicability of the same in execution. Where novelty is governed by a refined taste, and in the hands of a skilful artist, much that is beautiful is likely to be the result. Why should every sense of propriety be sacrificed merely for the untutored mind to revel amid whim and caprice?

Norman architecture has always possessed the admiration of antiquarians and the disciples of our mystic art, but they have never thought that it was applicable to any other than ecclesiastical buildings. The general character of its masses, the form, and, compared with more recent styles, the frequent rudeness and heaviness of its details, afford, in my opinion, a complete barrier to its use for domestic buildings.

In our modern villa residences lightness and beauty are now looked upon as decidedly requisite; but in vain do we search for them in the massy cylindrical columns, or columnar piers of the nave, or the smaller ones of the triforium, in a Norman edifice. Grandeur and solemnity are the sources of our pleasure in viewing these buildings, but turn from such substantial piles to a residence where every part must be suitable to the purpose for which it is built, namely, "to a pretty villa residence." Is it not necessary to design according to the material to be used? For capital cannot be lavished and squandered away merely to give the elevation a good look, while, as in the Norman style, the interior fittings must of necessity be poor and unmeaning. It is, I think, quite a mistaken idea for students in architecture to attempt to design buildings, which answers to the proverb of mere "castles in the air." Architects are not merely called upon to design, but to superintend the carrying out of those designs. Hoping that my attempt to shew style is of all importance in designing even the smallest building, will meet your approval,

I am, Sir, your well-wisher,  
Jan. 2, 1844. H. VERNON.

[We insert this letter in order to conclude the series upon the subject. We in general desire correspondence of a more practical nature, but may hereafter ourselves shew wherefore Norman architecture was supplanted by succeeding styles.—Ed.]

## ARCHITECTS' COMMISSION.

Sir,—In answer to your correspondent upon this matter, I beg to intimate to him that some years ago I had the unpleasant task of proceeding at law to recover compensation for designing and estimating the cost of buildings to a considerable extent, which were not carried into effect in consequence of the inability of the parties concerned to provide the funds, and to which I was an utter stranger until after the builder's tender was accepted, but then discovered the difficulty of obtaining a verdict for the amount of my bill, calculated at a per-centage on the amount of the estimate, although much under that stated by your correspondent. From the experience I have subsequently had, I can advise that if he intends proceeding at law, the charges that he will be able to substantiate will be a fair remuneration for the time engaged in the business, with incidental expenses, if any, added thereto; of course the skill of the work will be considered. I should say 40l. would be a fair charge, and there can be no doubt he will have the assistance of his brother architects whom he may subpoena to give evidence in support of his claim, provided the designs are properly executed. Proceeding for a

per-centage will be a failure, and but for occupying too great a space in your journal, I could satisfactorily explain that a per-centage, scarcely in any case, is a proper criterion for charging; hence the difficulty of proving the custom. I remember a survey on which I was engaged, where the bills were referred to a Master-in-Chancery, that the account, calculated by a commission on the amount, was returned with instructions that it might be made out according to the number of days engaged in the business, with the travelling and incidental expenses added, and when sent in that form, amounted to some 40l. more, and was allowed.

I remain, Sir, your obedient servant,  
AN ARCHITECT.

P.S.—In proceeding at law to recover for professional services, the items must be set forth in the bill that they can be substantiated by the evidence; and in the case of your correspondent, should there be special attendance, or other extra trouble in the course of the business, he may recover for them beyond the designs and estimate; in fact, the great point is to make out the bill properly.

## SCARFING OF TIMBER.

Sir,—If you or any of your readers would favour us in *THE BUILDER* with the best mode of scarfing beams, it would greatly oblige yours,  
A WELL-WISHER.

[We intend in the course of the year to give some representations of timber joints, and shall be happy to receive communications on the subject; in the meanwhile we beg to refer our correspondent to "Tredgold's Carpentry."—Ed.]

## TIMBER VALUATION.

Sir,—I shall feel obliged if you, or any of your correspondents, can inform me in your next number of *THE BUILDER*, if there is any work published on the valuation of the different kinds of standing timber, and where any such work can be obtained.  
Your well-wisher and subscriber,  
Duffield, near Derby. D. D.

## Tenders.

TENDERS for completing the works of three houses in Seeford-street, and a workshop in Sutton-street, Clerkenwell, under the superintendance of Messrs. Reed and Son:—

Hawke .....	£787
Vigers .....	760
Arding and Son .....	737

## NOTICES OF CONTRACTS.

ENLARGEMENT OF SUFFOLK LUNATIC ASYLUM.—SPECIFICATIONS, &c.—Dr. Kirkman, the Asylum; J. H. Borton, Clerk of the Peace, Bury St. Edmunds. January 22, 1844.

WORKHOUSE ALTERATIONS, ST. LUKE, MIDDLESEX.—Plans, &c., at Workhouse.—J. Parson, Vestry Clerk. Feb. 7, 1844.

Paving and keeping in repair Foot and Carriage-way Pavements, Goodman's Fields.—Mr. Simmonds, Surveyor, 7, Great Alicestreet. Jan. 26, 1844.

ALTERING EAST SUFFOLK COUNTY HALL AND COURTS OF JUSTICE, IPSWICH.—Plans, &c., for inspection.—Mr. Whiting, Surveyor, &c., County Hall, Ipswich; J. H. Borton, Clerk of the Peace, Bury St. Edmunds. January 29, and February 12, 1844.

## NOTICES.

## TO READERS AND CORRESPONDENTS.

As the contributions to the illustrations of *THE BUILDER* are daily becoming more and more frequent, it would be well if our correspondents would send new draughts of size convenient for insertion either as one, two, or three column blocks. This, at the same time that it would spare considerable trouble to the draughtsman, would tend greatly to insure the accuracy, and, consequently, the utility of such contributions.

## TO OUR CORRESPONDENTS.

"W. W.'s request cannot be attended to quite so soon as he mentions, but as soon as we can find time to make the survey, the description asked for shall be given.

We shall take an opportunity of seeing Mr. Fletcher's draughts.

TO OUR SUBSCRIBERS.

In compliance with the wishes of very many of our Subscribers, we have prepared a cover for binding the copies of THE BUILDER for those who may be desirous of preserving them in uniform Volumes. These may be had on application at the office, at the price of Two Shillings; or our Publisher will undertake to have sets bound at a charge of Three Shillings per Volume.

We also take this opportunity to inform our Subscribers that, with a view to the additional embellishment of the Volume just completed, we have had printed an ornamental Title-page, which may be had gratis, on application at the Office.

The Builder.

NO. LI.

SATURDAY, JANUARY 27, 1844.

WHILE stating to our readers that we have in hand many subjects for future appearance in our columns, few, we imagine, will think any thing more pertinent to the present juncture could be chosen (especially as we have promised it), than the consideration of Westminster Bridge.

We shall first briefly discuss the taste of altering the external features of this public work, and then proceed to examine

the scientific matters which have been brached upon the subject, the differing opinions relative to which have become matter of public notoriety.

Relative to the TASTE of making any apparent alteration in the external features of the bridge, we must declare ourselves not merely sceptical, not merely doubtful whether there be good taste in altering the outward dress of such a work, but we boldly go further, and, on the score of taste, openly declare all such alterations to be bad in principle, palpably against good taste, and altogether condemnable.\*

\* "It is to be deeply lamented, that from Blackfriars' bridge having been constructed at a time when a flat roadway over a bridge was not deemed of advantage sufficient to lead to raising the abutments much above a low shore, with the attendant expense and disadvantage of that, the unrivalled bridge seems doomed at no distant period to be either destroyed, or to be totally ruined in appearance. Within the author's short memory, the transcendently elegant approaches of this bridge have been most wretchedly mutilated in order to lessen the acidity, but this improvement is so trifling and ideal, that besides the loss of beauty, it may be doubted whether any one has yet felt any relief in the transit of the bridge: a large mound of earth has been accumulated at each end of the bridge, in the once-beautiful squares, which have also from additions and structures shared in the general wreck. In the memory of the author, Blackfriars' bridge, with its approaches, and the fine streets leading to it, had no parallel in the world; but this improvement appear will be long the case; the desire to be doing, seems rapidly fermenting the destruction of Mylne's delightful work: first its balustrades are giving place under the plain pavement; next its columns will be removed in order to widen the roadway, in passing over which many thousands times the author never once saw obstructed; and in the end, the city of London will have a costly but ugly production, which even its maker would be unable to recognize." "The citizens of London should be proud of every one of their fine public works, duly considering how scarce in architecture are both taste and structural excellence combined, and how few modern works, alleged to possess these properties, maintain their rank for even ten or twenty years." "The citizens should remember, that they owe to their posterity unpolished, the architectural beauties which they have received from their fathers. The citizens know well what enormous sums they have in modern times spent, but how few pieces of architecture they have produced. This should lead them to value those works which they have inherited freely."—Bartholomew's Essay on the Decline of Excellence in the Structure, &c., of Modern English Buildings.

We have such a rooted dislike to the mutilation of original designs, that we can very rarely forgive the making any alteration from the intentions of him who generally must know most concerning the propriety of his own work. Much as we admire the talent shewn by the artist in his original designs, we like not the alterations which were made by Inigo Jones to old St. Paul's, how great soever may be our reverence for the grandeur and gusto of the portico itself, which he added to the ancient work of Pointed Architecture. We like not the deviations from Chambers's great design made for the buildings of Somerset Place, by forming King's College, in the eastern wing of that fine collection of edifices, in a style and of a form differing from the original conception, and against conformity with the buildings of the western wing, with which they should have corresponded.

We worship not the alterations made either within or without St. Margaret's Church, Westminster; so zealous and jealous are we on this subject, that we see with pain the fine transeptal doors of New St. Paul's clouted over lately with some mean plank-work; and would not have the authorities rest till that and every other inroad, however small, shall, as profanation, be eradicated from the sacred fabric—that this fine structure may remain in its integrity, the gem of Protestant Churches,—an honour to the nation and its pure religion,—of all the cathedrals in the world by an especial divine favour permitted to be the only one, which, like the vesture of Christ, was ever wrought in one texture throughout.

The alteration of an architectural work is indeed laying the destroying axe at its root: when a fabric is made parcel-wise of different tastes, men soon grow tired of it; and if not a very great work, it is then soon succeeded by a new erection all in one style. Francis Milizia, the Italian physician, author of the "Memorials of Ancient and Modern Architects," indeed wrote well when he declared "THESE PRETENDED CORRECTIONS ARE THE WORK OF A MADMAN. EDIFICES SHOULD BE LEFT AS ORIGINALLY BUILT, WHATEVER BE THEIR TASTE, OR THEIR WANT OF TASTE: THEY SERVE AS HISTORIES, AND ENABLE US TO COMPARE AND PURIFY MORE AND MORE THE TASTES OF SUCCEEDING TIMES."\*

Making such declarations, it is scarcely necessary for us to add that so long as the present Westminster-bridge shall stand, we alike deprecate the masking of it either in the Norman style, or as though it were an edifice of Pointed Architecture. If its acclivities are to be reduced, if its burthens are to be eased, if its piers are to be lengthened, if its roadway is to be rendered more ample, we yet trust, that as far as architectural appearance is concerned, the whole will be done, preserving it as the design of Labeyle,—its piers, cornices, balustrades, alcoves, pedestals, and other visible component parts, being restored exactly as when the work was first executed, except only in the alterations necessarily resulting from the required improvement of its traffic-way.

The architect whose work, under the plea of improvement, is mutilated by a successor, is always amply revenged by that successor's works being destroyed in a similar way; and often in his lifetime, like the man of sin, displaced from his office, he ceases to be overseer, another takes his bishopric, and his children beg their bread. Through following the mutilation.

\* Tamo I. p. 146. Queste pretese correzioni fanno rabbia. Si debbono lascia gli edifici come sono stati architettati da loro Autori, di qualunque gusto sieno, o di disgusto: servono di storia, e di confronto, e per depurare sempre più il gusto de' posteri.

system, we have scarcely one-tenth part so many architectural works approaching perfection as we otherwise should have. Half the restorations now being effected, at so much cost, to our churches and other ancient buildings, consist in the removal of the interpolations which have, in a wrongful spirit, been unfeelingly made to them.

Before we go into an examination of the statements which have been put forth relative to the construction and proposed scientific improvements of Westminster-bridge, we shall enter a little into the rationale of bridge-arches, after which we shall proceed to examine the different proposals for altering the work.

Abstractly considered, the CATENARY, or natural curvature which a pendant chain assumes by its own weight, is the true form for an arch: in such an arch of suspension, it is evident that the various parts of the chain so act upon each other, that the quantum of gravity with which one part acts on the other parts, produces, when the whole chain has fallen to a state of rest, the catenarian or chain curve; and it should be equally evident that, were the catenary composed of several cords or strands in their curvature parallel to each other, the tension would be fair and just throughout;

and lines drawn in different places at right angles to the curve, would shew the joints of blocks, which, being hung upon a string, would exactly fit the curvature of the catenary.

If, then, such a model be inverted, it will form a true catenarian masonry arch, wherein the just tension of the pendant catenarian arch is changed into compression, fairly and justly extended over the surface of every joint in the work, without any tendency to split the blocks by any partial or angular meeting of the surfaces of the voussoirs or blocks. But an arch so formed, though nearly such as often has been constructed, is very far from being thoroughly scientific, for it is by no means economical.

Nature, in forming pendant things, as icicles, the tails of animals, vegetable twigs, and other like matters, graduates them in dimension and strength; thus, in the tail of an animal, the second of the vertebrae has to sustain the first, the third has to sustain the second and first, and so on till the eighth has to carry all the others. If, however, Nature had made a tail equally thick all over, it is

evident that besides the great waste of material which would be caused by making the lowest of the vertebrae of the same size and weight as the eighth, the eighth would have to carry all that additional weight, and would therefore be much weaker for the purpose. Thus, there may be cases in which materials more than threefold would be consumed; and the eighth of the vertebrae having consequently more than threefold burthen to sustain, the effective strength thus resulting from the materials would be less than a ninth part of that which it naturally should be.

Hence, in suspension-bridges, the chains ought to be thinner in their middle than at the suspension-towers, as practised in Dredge's mode. Great consumption of metal is thus saved, the chains are much more safe and much less likely to break near the suspension-towers, lighter suspension-towers are sufficient, and the foundation of the work is safer, from being much less tried by burthen.

The same rule applies to masonry bridges of the catenarian form, by merely changing the tension of the catenary into the pressure of the voussoirs upon each other; in which case the surfaces of the arch-joints should continually increase in dimension as they recede from the vertex of the arch, so that there may be the same pressure upon every inch of joint-surface throughout the work.

But now comes the burthen of the bridge; and upon that subject we boldly say that many bridges have been formed upon false, wasteful,

and ruinous theories; for, abstractly, no bridge ought to have on its piers and arches any burthen whatever other than the mere materials

requisite for catenarian construction, with the simple addition of its roadway and traffic.

It is that burthen which costs money,—it is that burthen which occasions excess of dimension in the piers,—and finally, it is that burthen which causes ruin to the work by sinking in its foundation.

The practical man may start at this decla-

ration against hurthen, but we say the catenarian vertebrae ought to be split apart or distended, so as to form the line of roadway above and the arch curvature below.

William Edwards, the Welsh country mason, a hundred years ago, made considerable approaches to this perfection of construction, in his bridge of Pont-y-Pridd, over the Taff, the arch of which, though rising only thirty-five feet, has a span of one hundred and forty feet. This bridge is only eleven feet wide; it is, indeed, a stiffened stone rope, proportioned like two animal tails, united at their inferior ends, and distended at their other ends to the forms of the arch and roadway.

As bridges have mostly parallel sides, the increase of the surfaces of the voussoirs being

restricted that way, the raising of the spandrels to the form of the roadway is the more readily managed.

But great art is requisite in forming the masonry-joints of such a work; and this, we believe, has never yet been perfectly effected: on a future occasion, however, we may go a little into the subject.

The ancient Freemasons appear to have been intimately acquainted with the catenarian principle of construction, as we shall also take occasion hereafter to shew. They found that they could nearly imitate the form of the chain-curve, by drawing, with little trouble, with the compasses, a pointed arch; but, knowing that a weight appended from the centre of the catenary [C in the annexed diagram] draws it still more nearly into the form of the pointed arch: when they reversed the curvature and put it into absolute work, they added to the vertex

of the arch a weight, which they usually carved into the form of an ornamental boss.

Want of space compels us here to break off the subject, which we shall resume in our next number.

WESTMINSTER BRIDGE.

SOME statements having lately appeared relative to the present condition of Westminster-bridge calculated to induce doubts of its safety, we have ascertained the real and actual condition of the structure in question.

It appears that after the steps which Mr. Walker had taken to improve and secure the foundations of the bridge, the sixth arch on the Surrey side was observed to settle, both in its pier and its superstructure; and this sinking continued from time to time during the space of nearly eight months, when it at last ceased, and for the last three months has remained stationary without any further alteration of its level.

Upon an investigation into the extent to which this settlement had gone, and of the causes which led to it, it was found that the pier itself had sunk bodily about nine inches, and that even the new extension of the pier, which was founded upon concrete carried down to the level of the blue clay, had participated in the settlement, without, however, affecting the solidity of the pier itself, or, as far as it can be ascertained, of the piling with which it was surrounded, which latter, it seems, still remains perfect and uninjured.

The consequences of such settlement were, that four of the larger masonry courses or arch stones fell some four inches, so that they projected slightly below the curve line described by the under surface of the arch itself.

The steps taken to remedy these evils have been to lower the roadway over the bridge generally, more especially over that part which had given way; the superincumbent load on which was further lightened to the extent of 2,000 tons, by removing the solid superstructure and substituting in its place a series of hollow brick arches.

The injury done to the arch itself was repaired by withdrawing the stones or courses which had become displaced, and replacing them with others; in fact, re-keying the arch by stones adjusted to the altered level occasioned by the settlement of the sunken piers.

That these steps have been perfectly efficacious, is proved by the fact that no further settlement has taken place within these last three months, the foundations of the piers having become completely settled and stationary. The masonry remains perfectly solid, and although the bridge has been opened now upwards of four weeks, and the traffic over it has been immense, not the slightest vibration or alteration of level can be detected; and for any thing at present apparent, the bridge is more firm and solid than ever, and will most likely (if permitted) remain in its present state for ages.

It should here also be remarked that the sinking was almost entirely confined to this one pier (the sixth from the Surrey side); and that the reason so little has been done in the repair of the bridge since Christmas is, that the Commissioners have adopted the recommendation of the engineer to suspend the works during the winter months.

When the works which are now contemplated shall be finished, it is clear that the public will derive great advantage from them,

inasmuch as the general level of the roadway will be reduced 3 feet 6 inches in the centre, and proportionally at the approaches, which will thus eventually become much easier, and the steepness which is now so much felt and complained of will then be removed, or at least be greatly modified.—*Times*, 23rd January.

TO THE EDITOR OF "THE BUILDER."

SIR,—Having carefully examined the design of "A Practical Observer" in last week's number of your useful publication, I beg to observe that great credit is due to him for the proposal which he has submitted, as well for its elegance as for its stability; and it is to be observed that its practical construction rises above that of the design by Mr. Barry, whose pointed arches, though small, justly brought forth the strictures of Messrs. Walker and Burgess, they each having a tendency by their thrust to throw weight and resistance towards the adjoining arches, and as Messrs. W. and B. have asserted, should "one give way the rest must follow;" but the form selected by your correspondent removes this objection, by partaking of the properties of the ellipsis which concentrates the weight upon the piers. As your correspondent seems to have omitted the mention of this great advantage of his design, it deserves to be noticed.

I am, Sir, your obedient servant,  
A CIVIL ENGINEER,  
of the Great Western Railway.

#### SEWERS OF WESTMINSTER AND PART OF MIDDLESEX.

(From a Correspondent.)

At a meeting of the ROYAL INSTITUTE OF BRITISH ARCHITECTS, held on Monday, the 22nd inst., Mr. Donaldson, V.P., who was in the chair, called the attention of the meeting to a recent examination, which had taken place at the Court of Sewers for Westminster, &c., of candidates for the new appointments of Assistant Surveyor and Clerk of the Works; out of above thirty candidates for the former appointment, only six were found efficient men, and not one of them was an architect or surveyor, but all were engineers. Mr. Donaldson, in alluding to the fact, impressed upon the minds of members of the rising generation the necessity of fully qualifying themselves for all the classes of appointments within the sphere of their professional practice. He inculcated the necessity of their studying mathematics, mechanics, and natural philosophy, in addition to the usual routine of the architect's office, as otherwise they would fall short of the requirements of the present age. If they wished to maintain their position they must not be merely equal to the expectations of society, but should be in advance of them.

The following are the questions which were submitted for solution to the candidates:—

For the situation of Assistant Surveyor.

1. What are the distinctive differences between Dorking Lime, Abertaw or Blue Lias lime, and Sheppy cement, and the causes of those differences?
2. For what constructive purposes is each best adapted?
3. Which is the best process for slaking respectively Dorking lime and Abertaw lime?
4. What is the best proportion of sand to these limes to make good mortar?
5. How is cement most beneficially used, whether with or without sand, or in what proportions?
6. Which are the best bricks to be used for the London sewers, in economical and practical points of view?
7. Which is the best form for the bottom of a sewer?
8. Which is the best mode of laying the bricks of the bottom of a sewer?
9. Imagine a trench which is to be cut for a sewer 25 feet deep, the upper 5 feet loose earth, the next 6 feet hard gravel, and the remaining 14 feet loose sand or silt, how should it be effected, what precautions should be taken, and how should the lower part of the sewer be laid in the running sand?
10. Imagine a sewer in an upper level, which is to be discharged laterally into one 18 feet

lower, how should it be done? Give a sketch, plan, and section. The average depth of water in the upper sewer being 2 feet, and the horizontal distance from the end of this sewer to the side of the lower one 50 feet.

11. A sewer is to be carried through two streets 15 feet wide, the one with houses on one side only, the other with houses on both sides. Make sketches of the best mode of shoring up the houses. The trench required being 6 feet wide and 15 feet deep.

12. In what part of a column of water flowing down a sewer is the velocity the greatest, and where is it the least?

13. When two forces act on the same point in different directions, how can their equivalent be represented?

14. What is the difference between the angle of incidence and the angle of reflection?

15. What is the pressure of the atmosphere on a square inch?

16. Suppose a very flat district, at a distance from an outlet, to be drained so as to reduce the water in the district to be drained as low as possible, and to take the greatest advantage when the tide is down. The water free from deposit. Should the bottom of the new drain be level, or have a fall, and to what extent? State the reasons.

Valves.

17. What is the pressure upon a valve, 3 feet high and 2 feet wide, the top of which is 3 feet under the surface of the water, and of a valve 2 feet high and 3 feet wide, under the like conditions?

18. What is the pressure of water on a circular valve 4 feet in diameter, the top being 5 feet under the surface of the water? What power would raise such a valve (sliding) supposing both the faces of iron? If of iron, what thickness would be sufficient? If of elm, what thickness?

19. Give the sketch of a valve and hinges for excluding the tidal water, the rise being 20 feet above the top of the valve.

20. What "by theory" is the velocity of water through a pipe, or other opening, 1 foot in diameter, the top of the opening being 3 feet 6 inches under the surface? What proportion of this ought to be deducted on account of friction, viscosity, &c.—1st, supposing an iron pipe—2nd, supposing a brick drain.

The Questions for solution by Candidates for the situation of Clerk of the Works, were the same as the first nine and the eleventh of the preceding series, together with the following:—

What is the strongest form for a drain, supposing it pressed equally in all directions?

12. Give the quantity and price of 20 feet run of a full-sized sewer, as per section given herewith, having a central granite keel stone to the invert, 9 inches deep, 8 inches wide at top, and 9½ inches wide at the bottom, instead of the central courses being in brickwork; the brickwork being valued, inclusive of all charges, at per rod 11s. 2s. 4d., the granite to be valued according to its cubical quantity, at per foot cube 4s. 9½d.

13. Put the quantities and money to two bills for 20 feet run of sewer each, as per drawings Nos. 1 and 2.

P.S. The Candidates were required not to have any communication with each other, nor to leave the Court-house until they had delivered up to the Surveyor this paper, with their respective answers signed by themselves, and were allowed three hours for their solutions.

In the letter on Sewers by "An Old Commissioner," inserted in your paper of January 6, it was erroneously stated that a map was being prepared by Messrs. Milner and Braithwaite, which is not the case, as the map is in preparation for private purposes by Mr. Frederick Braithwaite, engineer, 1, Bath-place, New Road, who will no doubt be happy to forward a communication on the subject, should the Editor deem it interesting, when the map is complete.

London, Jan. 25th, 1844.

SIGNS OF IMPROVEMENT.—In Lancaster, seventy-one new houses have just been completed, or are in the course of erection.

#### LIGHTNING-CONDUCTORS AT STRASBURG CATHEDRAL.—THEIR COST AND EFFECTS.

BY M. A. FARGEAUD.\*

SCARCELY was Franklin's invention known in Europe, when the idea occurred at Strasburg of protecting the cathedral with a lightning-conductor. It was not, however, until 1780 that a definite proposition was made to the magistrates of the city by Barbier de Tinan, commissary of war. His project, which had been submitted to the examination of Franklin himself, was approved of, in all its details, by the Academy of Sciences. But this proposition was not followed out; the expense was feared.

Forty-seven years afterwards Professor Meunier recalled the attention of the authorities and the learned men of Strasburg to this subject; and in his memoir he reverted to the visit which M. Gay-Lussac had just paid to the cathedral, and the wish which the illustrious academicien had expressed, eventually to see this monument protected from the effects of lightning by a properly arranged conductor. An inconceivable opposition had just prevented the erection of a lightning-conductor on the theatre; the demand of M. Meunier was therefore ineffectual.

Such was the state of things when, on the 14th of August, 1833, about 4 P.M., a most violent storm burst over the city; the tower was struck three times within a single quarter of an hour; the third stroke illuminated almost the whole of the building for a few moments: the lead, the copper, the iron, the mortar, the very pavement itself, were burned or melted in several places; the hammers were soldered to several bells, and were not detached without considerable difficulty. The repairs, which this terrible explosion had rendered necessary, cost several thousand francs. Serious accidents might have attended the fall of the fragments of stone, which were driven even into the neighbouring streets. Destruction like this, and the fear which was its natural consequence, were more than sufficient to rouse anew the solicitude of the administration. A commission was named by the mayor, Frederick of Turckheim, to settle these three leading questions:—

1st. Is it right [convenable Fr.] to place the lightning-conductor on the tower of the cathedral?

2nd. What particular arrangements should be adopted in adjusting it?

3rd. What will be the expense?

This commission, which was organized two months after the event, was composed of MM. Lacombe, Husson, Voltz, Meunier, Herrenschneider, Fargeaud, and the architects, Spindler and Fries; it was proved by documents that for thirty years the mean expense for repairing the damage by lightning was 1,000 francs (forty-two guineas) per annum. But in the period preceding this, the existence of one part of the monument had been several times threatened. In 1759, for example, on the 27th of July, a lightning-flash burned all the wood-work of the roof of the church; the same year, in the month of October, the lightning struck the upper part of the tower three times during the same storm, and almost entirely destroyed one of the pillars of the lantern, &c.

I was instructed by my colleagues to draw out a summary of our discussions; my report was signed, and was addressed to the mayor, December 11th, 1833; the administration caused it to be printed, but they did not carry into effect the propositions which were laid down in it. Probably things would have once more remained in this condition, had not an explosion, more terrible even than that which we have just described, occurred on the 19th July in the following summer, most opportunely to call us to order. One of the four turrets was cut, as it were, through the middle; enormous stones were displaced; numerous fragments were transported to considerable distances: it was very evident that we ought to set to work, and so at last we did.

Our colleagues, to whom M. Diebold was joined, were desirous that M. Fries, the architect, and myself should undertake the details of the operation. Some modifications of the original project were easily adopted, and the apparatus was ready for action by the summer

\* Translated by Charles Walker, Esq., for the *Electric Magazine*.

of 1835. The following is a brief description of it:—

The cathedral, as a whole, is protected by three vertical rods, placed on the summit of the pyramid, on the guard-house, which occupies one end of the platform, and finally, above the choir, beside the telegraph. The conductors, which proceed from the base of these apparatus, communicate with the earth by three wells, about ten metres (eleven yards) deep.

One of these wells was dug at the very foot of the nave and the tower, beside the Place du Château, at the bottom of the passage which separates the walls of the temple from the shops, that hide the lower part. The shop which is nearest to this first well is that of M. Rhein, the tinman.

The second well is placed, symmetrically, on the opposite side, towards the Place du Dôme; the third is behind the choir, also on the side of the Place du Dôme, and near the vestry, distant, therefore, from the other two by almost the whole length of the building. The three wells are also isolated from the public way; and each contains about one metre (a yard) of water in the most unfavourable weather.

The conductor that protects the telegraph is composed of a brass rope, which, after being bent in various ways, arrives near the mouth of the vestry-well. This rope is then continued by a stout copper bar, terminating, at the bottom of the well, in the shape of a goose's foot.

The conical rod which surmounts the apex of the pyramid, and which constitutes the principal conductor, is at least one metre fifty centimetres (five feet) high. It seemed to me useless to elongate this rod for no other purpose than to attain or exceed the height of the highest pyramid of Egypt, as some amateurs ardently desired. The essential point was to fix it firmly on the narrow space from the middle of which it was to be elevated: its base was five or six centimetres (two to two and a quarter inches) thick. From this point proceeded four conductors formed of rectangular bars of iron, about fifty-five millimetres (two inches) wide, and fifteen (half an inch) thick. These conductors pass between the four arms of the cross, and bend, according to circumstances, in order to follow the form of the crown of the lantern, and to arrive at the summit of the eight spiral staircases; they then descend in the intervals which correspond to the four turrets; on arriving at the upper level of the edifice, they are united by a circle which goes entirely round it, and are completely associated one with the other.

From this metallic girdle, it was thought sufficient to carry two conductors down the length of the turrets on the north and on the east, that is to say, on the right and on the left of the immense copper roof of the nave towards which the lightning is always directed. One of these conductors—that on the north turret—descends, almost in a direct line, from the summit of the pyramid to the well of the Place du Dôme, where it terminates by a bar of copper, the thickness and width of which correspond with those of the iron bars.

The second conductor descends on the side of the east turret, touches the corner of the ridge of the nave, and is bent in order to reach the well of the Place du Château, behind the tinman's shop. By an excess of caution, we thought we had better protect the guard-house on the platform by a separate lightning-rod, the conductor of which is connected, at the mouth of the well, with the conductor that descends from the east turret.

The conductor of the tower, and those of the telegraph, are united by a long bar of iron, which follows the whole length of the ridge of the nave. All the other large metallic surfaces are also connected together, and with the general system of these conductors. The expense of the erection amounted to about 15,000 francs (625*l.*), not including, I believe, the three wells, which were constructed by the workmen attached to the monument.

During the last seven years, it does not appear that any flash of lightning, properly so called, has struck either the building or the conductors. It almost seems that storms had become less frequent and less intense over Strasburg; but on Monday, July 10th, 1843, a very violent storm burst over the town, and the lightning rods struck the cathedral, or rather the conductor.

Some individuals pretend to have seen a globe of fire enveloping the upper conductors of the lightning-rod, and gliding rapidly along their surface; but the man employed at the telegraph, who was better placed than any one else at that moment, assures us that he could only distinguish a luminous train rushing along the conductors from the top of the pyramid to the platform where the conductor became invisible to him.

At the same moment some remarkable phenomena occurred in M. Rhein's, the tinman's shop, the position of which I have mentioned above. Seven or eight persons were assembled there: a considerable number of tin and zinc vessels were ranged on the sides; long bars of iron were resting, in an upright position, against the wall, in the corner which was nearest to one of the conductors. At the moment of the explosion, they thought they saw the lightning enter by the door, which opens on the Place, pass between the legs of the persons who were present, without, however, wounding any one, and burst in a great flame against the bars of iron, going thus directly towards one of the wells. This explosion was accompanied with a noise similar to that which would be produced on striking one of the bars with a great hammer. A minute after this first explosion another thunder-stroke occurred; the electric matter again entered the same shop; but this time they were not aware of the direction in which it came.

Some workmen of the cathedral were, at the same moment, very near the shed which shelters the mouth of the well. One of them, of an advanced age, accustomed, so to speak, to this kind of observation, distinctly observed on the pavement of the little yard behind M. Rhein's workshop, luminous trains similar to those which he often remembers to have seen passing along the walls of the tower. Although he was very near, he did not feel any shock; he could distinguish neither their direction nor their form.

This, then, is the phenomenon which produced so lively an emotion in the neighbourhood of the cathedral.

What could be the cause of this deviation, partial no doubt, but, however, in some degree contrary to laws?

In the evening, after the storm, and especially on the following day, workmen descended in our presence into all the wells. M. Klotz, the architect, and M. Wagner, a clever locksmith, who constructed the lightning-rod, examined all the conductors from below upward to the summit of the pyramid, even to the apex. I did not feel myself called upon to follow these gentlemen to the limits of their aerial peregrination; but I went high enough to be convinced with them that all the conductors were sound at the points of junction, as well as elsewhere. It was impossible to discover along their whole extent the least trace of the passage of the lightning. So far as the monument is concerned, it was not touched,—not a single piece of stone or mortar was detached.

However, the electric matter evidently arrived by the summit of the apparatus, and the quantity must have been very great. In fact, the platinum cone, which was eight centimetres (three inches) long, and about one (two-fifths of an inch) thick at its base, was melted towards the point, to a length of five or six millimetres (a quarter of an inch). The metal sank down on one side, and ran like wax which had been softened at the fire. The part thus rounded, presented, on the first day, the appearance of a small and very brilliant convex mirror. This point, together with the portion of the copper rod which supported it has been taken down, and it will be preserved in the archives of the cathedral.

My colleague, M. Finck, professor of mathematics, warned by the first explosion, immediately looked towards the summit of the tower. He saw the second flash of lightning arrive horizontally, in order to reach the point of the lightning-rod. The zigzags of this luminous line were not very distinct, and its length appeared to him about fifty metres (fifty-five yards). The cathedral was quite separate from the clouds; no light was observed either on the conductors, or on the body of the rod, the point of which had just received the fluid

Thus, then, the electric fluid struck the

lightning-rod at its extremity, certainly in the second explosion, very probably in the first, which was much more powerful. Having arrived there, it had two paths to pursue, in order to reach the earth; one would have conducted it, almost in a straight line, into the first well of the Place du Dôme, with or without luminous appearances; the second path, longer but quite as continuous, would have led it on the opposite side into the well of the Place du Château. In fact, on this side it is that a considerable number of persons profess to have seen brushes of light upon the conductors. There it is that the extraordinary deviation, which I have pointed out, took place.

A particular circumstance seems to us readily to explain the choice of the conductor, if indeed there was no division, and especially the deviation. Behind the workshop of the tinman, on the same side as the two conductors, which unite at the mouth of the well, was collected a large quantity of lead and iron, weighing about 2,000 kilogrammes (two tons), taken from the small roofs of the nave, which, at the present time, were being covered with copper. These pieces of metal were heaped one against the other, like a pile of wood, and presented an apparent volume of about two cubic metres, (six and a half cubic feet).

Very probably some of the sheets of lead touched the conductor; but it was impossible for us to verify this fact. On our arrival, the workmen had already removed a considerable portion in order to clear the mouth of the well. Admitting the contact, we see that this great surface of extraneous metal had the power of drawing off a portion of the current from its principal direction, and directing it towards the most vicinal exterior conductors. The masses of tin, zinc, or iron, which crowded the workshop and the loft above, certainly favoured this deviation.

If contact did not take place, we must suppose that, at the moment before the explosion, all the conductors vicinal to the lightning-rod, but not connected with it, were electrized by induction. When the explosion took place, a true return shock must have been produced in a locality prepared, so to speak, in the best possible manner for a phenomenon of this kind. Further, while attaching some degree of importance to the direction of the fluid, we need not trouble ourselves about the direction in which some persons say they saw it travel; we know how very easy it is to be deceived in this point.

If, in reference to certain electric sparks, I have been induced to enter into lengthened detail, it is, first, because it seems to me that we have yet much to learn respecting thunder; it is also to shew that the lightning-rod acted with success, and that the only members of the Commission yet alive, M. Fries and myself, have not to reproach ourselves with negligence in the arrangement of the different parts of the protecting apparatus. I am very desirous that M. Arago, who has rendered so much service to electro-meteorology, should take some interest in this long recital.

**ENLARGEMENT OF THE LONDON DOCKS.**—The extensive alterations making in this great emporium of shipping, wealth, and the produce of all parts of the globe, are proceeding rapidly. The splendid entrance will soon be finished, as the foundation is now nearly completed, and workmen are busily engaged in pulling down the building recently occupied by the government emigration agent, Lieutenant James Sedgwick Lean, of the royal navy, to make way for the improvements. The old entrance and the store shops on the southern side will be levelled to the ground as soon as the new buildings are so far advanced as to permit of their being demolished; on whose site will be erected a most commodious range of warehouses. The building for the commissioners, committee-room, and superintendent's offices are to be on a very large scale, and, when finished, the London Dock will be one of the finest commercial buildings in the world.

**PORTSEA ISLAND UNION WORKHOUSE.**—The tender accepted by the board of guardians amounting to 10,700*l.* has fallen to the hands of the spirited contractor, Mr. Nicholson, of Wandsworth.

## CITY IMPROVEMENTS.

At a meeting of the Common Council on the 18th instant,

Mr. R. L. Jones (the chairman of the London-bridge Approaches Committee) brought up a report from that committee, "On the state of the funds connected with the approaches to London-bridge, and for authorizing the raising of the sum of 50,000*l.* for completing the same; and for the completion of the improvement by the removal of the west block of Bank-buildings, in the vicinity of the Royal Exchange;" and said his object at present was to point out the necessity of immediately empowering the committee to direct the Controller to serve certain parties with notices with respect to premises which were required for the further improvement of the city of London, as the Act which gave the committee power would expire in August, and if immediate measures were not adopted, it would be necessary to apply again to Parliament. (Hear, hear.) He thought it was due to the committee to state, that, after a period of 20 years during which it had existed, and expended upwards of two millions of money in the erection of the bridge and the formation of its approaches, the present was the first time it had come to the Court to state any deficiency in its estimates. (Cheers.) He felt pride in asserting such a fact, the more so as he was able to shew, he trusted to the satisfaction of the Court, that no blame was imputable to the committee. What were the facts of the case? After the committee had finished the various streets which it had been intrusted with the power to form, and which constituted so noble a mass of improvements, it considered that a surplus would remain sufficient to carry out the great object of making a street from the Bank to the Post-office. The conduct of the Bank of England was, he regretted to say, in direct contrast to the liberality which there had been reason to expect from such a body, and which the Governor and Deputy-Governor several years ago had given the committee every ground for supposing would have been exercised. (Hear, hear.) It was natural to suppose that the promise then held out that improvements which in so many respects benefited that building would, to a certain extent, receive its patronage and assistance; but, instead of helping the corporation in promoting the grand design which the committee was labouring to carry out, every thing had been done by the establishment to which he alluded to shew their indifference to the exertions which had been made. (Hear.) The committee had been called upon from all quarters of the city to extend to them the vast advantages which had been already completed. The law expenses in investments became greater than had been calculated upon, and the interest upon the sums required to complete the purchases which were indispensable in effecting the improvements was what the committee had never been subjected to upon former occasions. (Hear, hear.) The necessity for improvement became every day more and more apparent. The largest item in the report related to the block of Bank-buildings, the freeholders of which were the Governors and Company of the Bank of England, who had repudiated by their illiberality the evidence of the former Governor and Deputy-Governor, Mr. Curtis and Sir J. Reid, before the House of Commons' Committee. That committee pressed upon these gentlemen the necessity which existed for giving up that block of buildings, as no buildings were to be erected on the site, and the Bank would be itself thrown open to public view by so splendid an improvement. Their answer was, that they could not think of recommending such a gift, as the Bank would be put to a very large expense in throwing open Bartholomew-lane and Threadneedle-street, but they would be liberal in their views with the corporation upon the subject. Now, the Bank had made no improvements in Bartholomew-lane or Threadneedle-street, and their liberal views amounted to an evasion of every thing like liberality. (Hear, hear.) He felt that the Court were determined to do justice to the labours, and instructions, and integrity of the committee. (Loud cheers from all parts of the Court.) (A general cry was then raised of "Move that the report be received.")

Sir J. Duke called the attention of the

chairman to the state of the eastern end of the Royal Exchange, and asked whether it was likely that the improvement which the public had frequently called for, in the throwing back of the houses in Freeman's-court, would be effected? (Hear.)

Mr. Jones said he regretted that the ground in the spot described was unfortunately out of the hands of the corporation. In fact, the ground was never in their hands. Morden College had a clause giving that institution a right of pre-emption, and it had been appropriated accordingly. It would be, indeed, a most important addition to the splendid improvement of the Royal Exchange; but the committee congratulated itself upon what it had already accomplished, and would not relax its exertion to gain every possible advantage. (Hear, hear.) He would venture to say that the ground at the eastern end of the building would be made a fine pathway 47 feet in width. (Hear, hear.)

Alderman Humphrey said, that every one in the city would be delighted to see the block of houses at the eastern end of the building removed, and he thought the committee might beneficially make the experiment of applying to the Commissioners for the Improvement of the Metropolis, who were about to visit upon her Majesty, and were to meet on Wednesday next to sign their report, to represent the fact alluded to in the proper quarter. (Hear.) A sum of money was about to be raised by a tax of 6*d.* per ton upon coals, and, as the city would be very large contributors, they had a right to expect a share of the advantages. (Hear.)

The report was then received and unanimously agreed to, and ordered to be printed.

## DESTRUCTION BY FIRE OF KING WILLIAM'S COLLEGE, ISLE OF MAN.

It is our painful duty, on the present occasion, to record the total destruction by fire of this beautiful, modern, and extensive edifice. The origin of the fire is as yet unknown, but it is ascertained to have broken out in the western wing, either in the class-rooms of the English department or in the boys' dining-room immediately below. Shortly after 2 o'clock the first alarm was given; but for many hours after this there was no fire-engine, ladder, or supply of water that could be used with any effect; and the flames, having thus unchecked progress, rapidly spread through the corridors and the entire of the vast building, including the class-rooms, the dwelling-house of the Rev. Mr. Dixon, the principal, the beautiful chapel, and the great tower, which, with the exception of the apartments of the Rev. Mr. Cumming, the vice-principal, situated in the eastern wing, were totally destroyed. The first alarm was given by two boys who were sick of the measles, separated from the other boys, and sleeping immediately over the English class-rooms, who, having experienced a strong smell of fire, gave the alarm to the principal and vice-principal, who, with their families, servants, and about 50 boys boarding at the College, were aroused from their slumbers, although, we understand, some of the servants and children of the Rev. Mr. Dixon escaped with difficulty.

His Excellency the Lieutenant-Governor, the Clerk of the Rolls, the High Bailiff, and nearly all the respectable inhabitants of Castletown and the neighbourhood, were shortly on the spot; also the company of the 6th Foot, presently stationed at Castletown, headed by their captain; and every thing that could be done was adopted; but in the absence of an engine for several hours—the essential requisite being wanted—the devouring element spread with uncontrolled fury, and every thing that could be done was to secure as much of the furniture, books, and other property as possible; but even here the want of ladders, whereby an entrance might have been effected into the upper stories, without traversing the corridors of the building, was severely felt, and much valuable property has consequently been lost, that otherwise might have been saved. The greater part of the private library of the principal, a portion of the wines, and some articles of furniture in the front rooms, were saved by great exertions; but the very valuable library of the College, containing many works of great value, and a curious collection of Bibles, from the time of Coverdale, in

upwards of 50 different languages, many unique MSS. relating to Manx ecclesiastical affairs, and the very valuable military models and plans, maps, mathematical and other instruments, many of which cannot be replaced without much labour and expense, belonging to Mr. Browne, the professor of English and Modern Literature, were completely destroyed.

The building, we understand, was insured in the Sun-office for 2,000*l.*, and Mr. Dixon's property for 2,200*l.*; but the loss to the building alone cannot be under 4,000*l.* Mr. Cumming, it appears, was uninsured. We have not been able to learn precisely, but have been given to understand, that the principal's policy is for his own property and "goods in trust," which, we suppose, will include the property of the servants, the boys, and that of the other masters in the class-rooms, in which case, if the sum were insufficient to cover the entire loss, some compensation would be awarded; but the servants can especially ill afford to lose their all.

We cannot conclude these remarks without adverting to the obvious fact, that had there been an efficient fire-engine on the premises, or even in Castletown, the building could easily have been saved; instead of losing 4,000*l.* the Sun-office would probably not have lost 200*l.*; and at an expense of a few hundred pounds they might, as they ought even for their own interest, furnish an efficient engine to each of the four towns. This office draws large sums annually from this island, and we must say the paltry garden engine they have stationed in Douglas, and its slovenly and inefficient management, are any thing but creditable to an office of such respectability. The inhabitants of the four towns ought to bestir themselves in the matter; they have a practical example that in cases of fire they are absolutely without protection. Probably the other offices who do business in the island would contribute, and the inhabitants themselves might do something. What is 100*l.* laid out in such an investment, to avoid being exposed to such serious calamities?

King William's College was a modern erection. The first stone was laid by the late Lieutenant-Governor Smelt, on the 23rd of April, 1830, and it was opened in the summer of 1833. The building is partly in the early English and partly in the Elizabethan style, forming a spacious and cruciform structure, 210 feet in length from east to west, and 135 feet from north to south; from the intersection rises the embattled tower, 115 feet high, strengthened with buttresses, and surmounted by an octagonal turret, intended for an observatory, having in each of its sides an elegant and lofty window, and crowned with a parapet. The edifice cost about 6,000*l.*, of which 2,000*l.* was from the accumulated fund from property granted by Bishop Barrow in 1663, for the education of young men for the ministry in the Manx Church. From subscriptions raised chiefly in the island, 2,000*l.* was obtained, and the remaining 2,000*l.* was supplied by mortgaging the funds. The original draught of the design was furnished by Messrs. Hanson and Welsh, architects; but the execution of the works, including the alterations and additions and the design for the great tower—a beautiful specimen of masonry—were under the direction of Mr. Welsh. The contractor was the late Mr. Fitzsimmons, who, it is said, lost 1,500*l.* by the contract. The property is vested in the hands of trustees, who are the Lieutenant-Governor, the Lord Bishop, the Clerk of the Rolls, the Archdeacon, Deemster Christian, one Vicar-General, and the Attorney-General. The present number of boarders, we learn, was with the principal 37, with the vice principal 11, and the entire number attending the seminary, besides day pupils, 110.—*Morning Herald.*

**NAPHTHA AND THE FIRE OFFICES.**—The Imperial and other fire offices have issued a notice to their agents that naphtha or liquid gas lamps, recently introduced into manufactories and other premises, are attended with considerable hazard, and that in effecting all future insurances on such premises, a warranty must be given that these lamps are not used therein; and the agents are required to decline all insurances of premises lighted with them.—*Carlisle Patriot.*

DESIGN FOR A MANSION.

FRONT ELEVATION.

SOUTHERN ELEVATION.

SCALE. 10 5 0 10 20 FEET.

PLAN OF THE CHAMBER-STORY.

PLAN OF THE GROUND-STORY.

SCALE. 10 5 0 10 20 30 40 50 FEET.

DESIGN FOR A MANSION IN THE PLAIN GRECIAN IONIC STYLE.

TO THE EDITOR OF THE BUILDER.

Sir,—Noticing in an early part of your valuable magazine an article headed "On Seeking Employment," and wishing myself, solely for the purpose of improvement in practical knowledge, to get employed as an architectural draughtsman under some builder extensively engaged in London, I have been much obliged to you for sending me the accompanying design for insertion in THE BUILDER, as a specimen of my work in

drawing and designing, and to obtain the benefit of your kind advice on the subject.

I have been brought up to the study of architecture, and am well experienced in measuring, framing estimates, geometry, all kinds of architectural drawing, as well as sketching from nature; but my object is to get employed in a builder's establishment, that I may improve my knowledge of the working part of the profession; and I have no doubt, with the acquirements I possess, and salary being a secondary consideration, such a situation is attainable.

The estimated cost of the above house, built

of brick and cement, would be from 1,800*l.* to 2,000*l.*

There would be a kitchen, cellars, a pantry, a scullery, and other offices in a basement story, underneath the housekeeper's apartments breakfast-room and back-stairs; and a stone staircase leading to them from the ground-floor at letter A, and also a back entrance leading to them from outside at letter B.

The principal staircase I propose shall be lighted by an ornamented cupola in the roof, with side lights adapted for showing to advantage pictures hung around the gallery on the chamber-story.

Trusting you will find room in **THE BUILDER** to insert this design, which I have drawn to small scales for the purpose, I remain, Sir, your very obedient servant,  
January 10th, 1844. ACANTHUS.

[We think this design not discredit to our correspondent. We should have, however, preferred it if it had contained on its ground story fewer and better apartments. A principal staircase, practice shews, is best removed to an external wall, leaving quite free the space up to it, as by such a disposition, entanglement with all doorways is avoided. Thus would be obtained a much handsomer ball, which could be lighted by a well-hole in its ceiling, leaving around it, on the one-pair story, a broad gallery. A butler's pantry near the dining-room is required; but a portion of the housekeeper's room (which is over large for the size of the other apartments) might be cut off for that purpose; and at the same time a passage might be obtained to the adjoining bed-room, which could then be very properly assigned for use to a man-servant; or these three apartments could be arranged so as to be opposite the three windows.

We should have avoided all irregularity in

the rooms caused by cutting off their corners; deeming one of the requisites of a perfect plan to lie in making every apartment regular, even though the general form of the whole building be not so. The elevations we should re-arrange, avoiding the receding of the entablature over the principal entrance, and the forming of central piers in the different component masses of the design, which we hold to be against one of the elementary principles of taste, a chapter upon which head we propose giving hereafter. We should have avoided the introduction of a large Venetian window to an apartment so small as the dressing-room over the entrance-hall, and also as not being an article of very good taste, though now so often used. Moreover, we should have omitted the two blanked shused-windows which flank it, perfect architectural design not allowing any parts for mere shew, but requiring the whole work to come together elegantly with every requisite, and without any such sacrifice. The chimney-shafts we should, both for effect and just operation, have liked better if they had not been paneled, but formed in some way with detached flues. We should be happy to receive another design from our obliging correspondent.—ED.]

is the key-stone of two semi-arches  $r k$  and  $r f$ , and is held in its place by the thrust in the stones in  $K r$ ; and this thrust is propagated down the semi-arches,  $r k$  and  $r f$ , and acts ultimately upon the buttresses  $k$  and  $f$ ; the masonry of the rib  $b c$  is sufficiently heavy to prevent these semi-arches from sinking by their key-stone rising. It will be clearly seen, then, how every stone in  $b c$  and  $a K d$  is supported; it will also be seen that every other stone in the roof is sustained by being a member of a semi-arch springing from one of the buttresses, and having its key-stone in  $b c$  or  $a K d$ . The pressure of the compartments  $f g h k$  upon the buttresses acts obliquely; for instance, that on  $f$  will act downwards in a line whose projection on the horizontal plane will lie towards the south-east. But the compartment east of  $f g h k$  will press upon the buttress  $f$  in a line whose horizontal projection lies towards the south-west; and, consequently the resultant of these pressures will act in a line whose horizontal projection runs due south. Let  $f F$  be this line (Fig. 3); this figure represents one of the buttresses. The dimensions of the buttress are so arranged that  $f F$  shall lie within the masonry and pass into the foundation within the foot of the buttress.

The resultant pressure of the roof on the walls at each of the four angles of the whole building acts obliquely, consequently instead of buttresses of the ordinary form at these four angles, towers crowned with lofty turrets are erected, of such a weight as to deflect the line of pressure of the roof, and cause it to pass into the ground through the masonry.\*

Mr. Bland, in his work on piers, arches, &c., speaking of this building says, "the key-stone, which is of great weight, is placed in the centre of every four buttresses, and is most essential, not only as a wedge, but from its great weight, locking up, as it were, the lighter parts of the roof in perfect safety against being displaced by the fortuitous pressure of any person's foot."

I am, Sir, your obedient servant,  
C. J. HUTT.  
Cambridge, January 16, 1844.

PUBLIC BATHS AT NEWARK.

WE are glad to announce that the little town of Newark is about to have erected in it public baths for the accommodation of all who may be desirous of availing themselves of the healthiness of bathing. The site chosen for the baths is within the walls of the ancient and venerable castle. To those who are unacquainted with Newark, it may not perhaps be uninteresting to add, that the Castle stood three sieges, and was the last of the king's fortresses in the north to surrender, and surrendered then only by the express command of his Majesty Charles the First, in 1646. It is recorded that one Lord Ballasye, the heroic governor of Newark Castle, communicating the king's orders for surrendering the Castle and town of Newark, Major Smith (a brave officer) urged the governor with tears to trust to God and SALLY (the name of a famous piece of ordnance in the Castle), rather than think of yielding the town to the Parliamentary forces; and also that the citizens, with the mayor at their head, beseeched the governor on their knees to disobey the king's orders for surrendering the Castle. The Crown having agreed to grant a lease of the Castle and Bowling Green, for the purpose before mentioned, in consideration of the lessees laying out a certain sum, the expense is proposed to be defrayed by subscriptions in shares of 5*l.* each, to be transferrable. We hope shortly to witness the commencement of the baths and their erection, considering, as we do, that such will be an improvement as well as an advantage to the town, which, in point of situation, with land and water carriage to all parts of the kingdom, excellent roads and well-supplied markets, yields to none in the realm.—(From a Correspondent to the Nottingham Journal.)

VAULTING OF KING'S COLLEGE CHAPEL, CAMBRIDGE.

TO THE EDITOR OF "THE BUILDER."  
SIR,—In the article on King's College Chapel, which appeared in **THE BUILDER** for Dec. 9, it is asserted that the great key-stones of the roof "may actually be removed without endangering the safety of the vaulting."

It is scarcely feasible that the building would have been encumbered with those immense additional weights, had there not been an absolute necessity for their insertion; that such a necessity existed, will, I trust, be sufficiently proved by the following explanation of the principles on which the roof is constructed:—

Fig. 1.

Fig. 1 represents a projection upon a horizontal plane of one compartment of the roof included between the four buttresses  $f g h k$ ; and Fig. 2 represents the projection of half this compartment upon the vertical plane of one of the windows on the south side; the same letters in the two figures refer to the same points.

The rib  $b c$  runs from the east to the west end of the chapel, the stones which form it lie in the same horizontal line, and at a greater elevation from the ground, than any other part of the roof;  $K$  is the central stone of the compartment, and is the upper part of one of the ornamented drops seen from below hanging from the roof of the interior. The stones in  $a K d$  lie in an arch of which  $K$  is the keystone; it is clear that the tendency of this arch is to sink at the crown,  $K$ , and thrust down the walls at  $a$  and  $d$ . I shall proceed, then, to explain how the stones in this arch are supported; and also the stones in the rib  $b c$ ; and in the course of the explanation it will be seen that I shew how every stone in the compartment  $f g h k$  is supported.

On examining the roof carefully, it will be found that the stones are placed in semi-arches in vertical planes through the buttresses; the spring of all the semi-arches in the space  $b a$  being at  $f$ , and their crowns or key-stones in

the courses  $b K$  or  $K a$ ; this is best seen in Fig. 2. Now, any stone  $S$  in the arch  $a K d$  is

Fig. 2.

the key-stone of the two semi-arches  $S f$  and  $S g$ ; and the thrust of the stones in  $K S$  is propagated down the semi-arches  $S f$  and  $S g$ , and ultimately acts upon the buttresses at  $f$  and  $g$ ; the same is true of every stone in  $K a$ ; likewise on the other side of  $b c$  the stones in  $K d$  are supported by the semi-arches of which they are the key-stones, and which spring from the buttresses  $h$  and  $k$ . ## Literature.

*Ecclesiastical Edifices of the Olden Time: a Series of Etchings, with Ground Plans and Fine-panels of Hollier's Views of the Cathedral and Conventual Churches, Monasteries, Abbeys, Priories, and other Ecclesiastical Edifices of England and Wales.* By JOHN CONEY, in 2 vols. folio. London: James Bohn, 12, King William-street, Strand, 1842.

This work, consisting of a profusion of beautiful and holdly-executed etchings, the work of the late Mr. Coney, is one of the finest architectural productions which ever issued from the press. It is particularly valuable to all who have the care of designing architectural works, and from the large scale of the plates, their details may be easily seen, and when the sections of Gothic mouldings in their various styles come to be properly understood, the plates of these fine volumes will afford nearly enough information upon their subjects.

The following list of the edifices delineated in this work will afford valuable knowledge to those who desire to know where information upon them is to be found:—

## VOL. I.

Dunstable Priory, Bedfordshire, 1 plate.  
Burnham Abbey, Bucks, 1 plate.  
Ely Cathedral, 4 plates.  
Thorney Abbey, Cambridge, 1 plate.  
Chester Cathedral, 2 plates.  
Carlisle Cathedral, 1 plate.  
St. Bees Priory, Cumberland, 1 plate.  
Calder Abbey, Cumberland, 1 plate.  
Holin Cultram Abbey, Cumberland, 1 plate.  
Lanercoast Priory, Cumberland, 1 plate.  
Exeter Cathedral, 3 plates.  
Tavistock Priory, Devon, 1 plate.  
Crediton Collegiate Church, Devon, 1 plate.  
Sherborne Minster, Dorset, 1 plate.  
Wimborne Minster, Dorset, 1 plate.  
Durham Cathedral, 3 plates.  
Gateshead Monastery, Durham, 1 plate.  
Finchale Priory, Durham, 1 plate.  
St. John's Abbey, Colchester, 1 plate.  
St. Botolph's Priory, Colchester, 1 plate.  
Tilney Abbey, Essex, 1 plate.  
Waltham Abbey, Essex, 2 plates.  
Chichester Abbey, Essex, 1 plate.  
Gloucester Cathedral, 4 plates.  
Tewkesbury Abbey, 3 plates.  
Lanthony Priory Gloucester, 1 plate.  
Cirencester Abbey, Gloucester, 1 plate.  
Winchester Cathedral, 4 plates.  
Hospital of St. Cross, Hants, 2 plates.  
Netley Abbey, Hants, 1 plate.  
Rumsey Nunnery, Hants, 1 plate.  
Beaulieu Abbey, Hants, 1 plate.  
Christ Church Priory, Hants, 1 plate.  
Hereford Cathedral, 4 plates.  
Blackfriars' Monastery and Cross, Hereford, 1 plate.  
Bromyard Collegiate Church, Herefordshire, 1 plate.  
Collegiate Church of Leominster, Herefordshire, 1 plate.  
St. Alban's Abbey, 3 plates.  
Canterbury Cathedral, 4 plates.  
St. Augustine's Monastery, Canterbury, 3 plates.  
Rochester Cathedral, 3 plates.  
Malling Nunnery, Kent, 1 plate.  
Furness Abbey, Lancashire, 1 plate.  
Cartmell Priory, Lancashire, 1 plate.  
Leicester Abbey, 1 plate.  
Ulverscroft Priory, Leicestershire, 1 plate.  
Lincoln Cathedral, 5 plates.  
Sempringham Priory, Lincolnshire, 1 plate.  
Barling's Abbey, Lincolnshire, 1 plate.  
Bourn Abbey, Lincolnshire, 1 plate.  
Thornham Abbey, Lincolnshire, 1 plate.  
Croyland Abbey, Lincolnshire, 1 plate.  
Westminster Abbey, 4 plates.  
Temple Church, London, 1 plate.  
Knights Hospitallers' Priory, Clerkenwell, 1 plate.  
St. Bartholomew's Priory, London, 1 plate.  
Austin Friars' Monastery, London, 1 plate.  
St. Saviour's Church, Southwark, 1 plate.  
Tintern Abbey, Monmouthshire, 1 plate.  
Lantony Priory, Monmouthshire, 1 plate.  
Collegiate Church of Higham Ferrers, 1 plate.  
Tewkesbury Abbey, 1 plate.  
Seals of Monasteries of the Benedictine Order, 27 plates.

## VOL. II.

Wymondham Abbey, Norfolk, 1 plate.

Norwich Cathedral, 2 plates.  
Binham Priory, Norfolk, 1 plate.  
Castle-Acre Priory, Norfolk, 1 plate.  
Walsingham Priory, Norfolk, 1 plate.  
Gray Friars' Monastery, Lynn Regis, Norfolk, 1 plate.  
Peterborough Cathedral, 4 plates.  
Collegiate Church of Irthingborough, Northamptonshire, 1 plate.  
Lindisfarne Monastery, Northumberland, 1 plate.  
Brinkburn Priory, Northumberland, 1 plate.  
Tynemouth Priory, 1 plate.  
Collegiate Church of Southwell, Nottinghamshire, 2 plates.  
Newstead Abbey, Nottinghamshire, 1 plate.  
Oxford Cathedral, 3 plates.  
Shrewsbury Abbey, Shropshire, 1 plate.  
Wenlock Abbey, Shropshire, 1 plate.  
Buildwas Abbey, Shropshire, 1 plate.  
Hagham Abbey, Shropshire, 1 plate.  
Hales-Owen Abbey, Shropshire, 1 plate.  
Bristol Cathedral, Somersetshire, 3 plates.  
Wells Cathedral, Somersetshire, 5 plates.  
Bath Abbey, Somersetshire, 3 plates.  
Glastonbury Monastery and Abbey, with views of Glastonbury, Somersetshire, 4 plates.  
Litchfield Cathedral, Staffordshire, 3 plates.  
Dudley Priory, Staffordshire, 1 plate.  
Abbey Tower, Bury St. Edmunds, Suffolk, 1 plate.  
Butley Priory, Suffolk, 1 plate.  
Chichester Cathedral, Sussex, 4 plates.  
Battle Abbey, Sussex, 1 plate.  
Boxgrave Priory, Sussex, 1 plate.  
Bayham Abbey, Sussex, 1 plate.  
Collegiate Church, Bosham, Sussex, 1 plate.  
Salisbury Cathedral, Wiltshire, 5 plates.  
Malmesbury Monastery, Wiltshire, 3 plates.  
Worcester Cathedral, 3 plates.  
Evesham Abbey, Worcester, 1 plate.  
Pershore Monastery, Worcestershire, 1 plate (containing some most remarkable buttresses).  
Priory of Great Malvern, Worcestershire, 1 plate.  
York Minster, 6 plates.  
Grey Friars' Tower, Richmond, Yorkshire, 1 plate.  
St. Agatha's Monastery, Yorkshire, 1 plate.  
St. Mary's Abbey, York, 1 plate.  
Whitby Abbey, Yorkshire, 2 plates.  
Selby Abbey, Yorkshire, 1 plate.  
Fountain's Abbey, Yorkshire, 1 plate.  
Byland Abbey, Yorkshire, 1 plate.  
Rivaux Abbey, Yorkshire, 1 plate.  
Kirkstall Abbey, Yorkshire, 2 plates.  
Bolton Priory, Yorkshire, 1 plate.  
Ripon Cathedral, Yorkshire, 1 plate.  
Kirkham Priory, Yorkshire, 1 plate.  
Gisburn Priory, Yorkshire, 2 plates.  
Bridlington Priory, Yorkshire, 1 plate.  
Goverham Abbey, Yorkshire, 1 plate.  
Old Malton Priory Church, Yorkshire, 1 plate.  
Eglington Abbey, Yorkshire, 1 plate.  
Beverley Minster, Yorkshire, 2 plates.  
Collegiate Church of Howden, Yorkshire, 1 plate.  
Costumes of religious bodies, 16 plates.  
Arms of religious houses, 2 plates, 126 subjects.

The seals, arms, and costumes of the religious houses which are given in this work are particularly interesting.

## e.

## THE FOREST OF DEAN.

ALTHOUGH this noble domain forms part of the southern boundary of Herefordshire, and is in fact within a few hours' ride of most parts of it, it is, we believe, in a measure an "unknown land" to many of our readers.

Nominally belonging to the Crown, it is in reality (adopting the words of one of the Forest Commissioners) "public property," and its surface is, for the most part, devoted to the rearing of oak timber for the "wooden walls of Old England."

Interested as all must be and are in it, we may well spare a little space for some scattered notices, as well of this romantic region as of its inhabitants.

From north to south it extends no less than eight miles, and about the same distance from east to west, its boundary forming a circuit upwards of thirty miles, and the heights within it vary from a hundred to nearly a thousand

feet. The noble timber on its surface is rivalled in value by its mineral wealth in coal and iron ore. One of the numerous seams of coal (the Coleford High Delf), of which only a comparatively small part has yet been worked, extends over no less than sixteen thousand acres; this forms part of the lowest series, the middle series extending over seven thousand.

The different seams of coal vary in thickness from one or two to six feet, and in some places attain, for a limited area, eight, ten, or even twelve feet, but are then subject to "faults," which either diminish or wholly destroy them.

In the solitudes of the forest the bittern and the other rarer British birds still find a secure asylum, having seldom other companions than the deer. In some parts a considerable distance might be traversed without meeting any human being or approaching any habitation, the interior being nearly uninhabited.

Nor does its assimilation to the wilds of Canada end here, for, like them, the forest has its "scatter;" and it is to its internal government with regard to this race of intruders that we mean chiefly to confine the present notice.

As early as the reign of Charles II. the attention of the legislature was attracted to the keeping the forest in all its integrity, for in the twentieth year of the reign of that monarch an Act was passed rendering invalid all future grants of land within its boundary. This Act had in later years an effect which was not contemplated at its enactment, it being held, as regarded the vast extent of encroachments which still continued to be made round the boundary of the forest, that the property being in the Crown, the ostensible owner could not recover, even from a stranger, if he once got out of possession. Thus "possession," which is popularly held as "nine points of the law," was, with regard to what was called "Forest land," the law itself—it was, in fact, "the law."

In this extraordinary state, and shut out from all legal protection, matters remained till 1838, when the Crown wholly gave up its title to about fifteen hundred acres, encroached upon in the period between the passing of the Act of Charles II. and the year 1787. It also abandoned its title to a tract of about six hundred acres, encroached upon subsequent to the last-named period, on favourable conditions, proportionate to the length of occupation of its numerous possessors, leaving about twenty-three thousand acres devoted to public uses, of which by much the larger portion is under enclosure for timber.

The anomalous state of the population cannot be said to have ended with the setting at rest the feuds regarding the right of property, nearly all the tract within the Forest boundary being extra-parochial, and county rates, therefore, never collected, no constables appointed, and the destitute poor, sick, maimed, and aged left unprovided for.

It was in July, 1842, that provision was first made in the latter respect, an Act being then passed by which the Poor Laws were for the first time extended over this vast tract of land to a most industrious and deserving population, nearly ten thousand in number.

## INCORPORATED SOCIETY FOR BUILDING, ENLARGING, &amp;c., CHURCHES AND CHAPELS.

ON Monday last, a meeting of this society was held at their chambers in St. Martin's-place, Trafalgar-square. His Grace the Archbishop of Canterbury was in the chair. There was also a very good attendance of members, amongst whom were the Lord Bishops of London and Landaff, Sir R. H. Inglis, Bart., M.P., the Very Rev. the Dean of Chichester; the Rev. Drs. Spry, J. Jennings, and Benjamin Harrison; and Messrs. James Cocks, N. Connop, J. S. Salt, W. Davis, E. Baddeley, Powell, and W. Cotton.

After some preliminary business, grants of money were voted towards building churches at Seacroft, in the parish of Whitehurst, Yorkshire; at the Link, in the parish of Leigh, Worcestershire; at Blaydon, in the parish of Ryton and Winlaton, Durham; at Thorpe Acre, Peterborough; at Great Wsley, in the parish of Cannoek, Staffordshire, and at The Groves, in the parish of Sutton, near Hull, Yorkshire; also, towards enlarging, by rebuilding, the church at Bidnath, Staffordshire; and towards enlarging and otherwise increas-

ing the accommodation in existing churches at Usk, Monmouthshire; Hunmanby, Yorkshire; Spinnall, Warwickshire; Lewes, St. Ann & Buckley, in the parish of Hawarden, and Stoke St. Gregory, Somersetshire.

The above-named 11 parishes contain a population of 34,831 souls, and possess church accommodation in 17 churches and chapels for only 7,611 persons, including 2,149 free seats, of which provision of church accommodation 3,826 sittings will be added, by the erection of the seven new churches, and the rebuilding, enlarging, and otherwise increasing the sittings in several existing churches and chapels; of this additional accommodation 2,942 will be free and unappropriated sittings.

The committee next examined the certificates relating to the completion of three new churches and chapels, and of the increase of accommodation in seven existing churches and chapels; and orders was issued for the trustees to pay over to the treasurer the sum awarded in each case.

It should be remarked here that the population of the 10 parishes just alluded to is 85,115 persons, for whom church accommodation to the extent of only 7,729 sittings was provided previously to the execution of the works now certified as completed; of that number not more than 2,580 were free; and the number of seats added to the church room before provided is 3,796, of these 2,560 are free and unappropriated.

Since the committee last met the society has lost a valuable officer in the late Rev. Mr. Rodher, M.A., who had been for many years the secretary to the institution.

The Rev. Thomas Bowdler has been appointed to succeed him.

CHURCH BUILDING INTELLIGENCE.

**Heversham Church.**—This fine old structure has been just repaired and restored by means of the liberal contributions of the principal persons connected with the parish. A dreadful conflagration in the beginning of the reign of James I. destroyed the north aisle, and did much damage to the nave and south aisle. The north aisle was consequently rebuilt in a style unsuitable to the original plan, and both this and the patchwork which they made of the rest was covered with a thick coat of whitewash. This has all been removed, the walls stone-finished, capitals added to the rude columns of the north aisle in proportion to their diameters, the square windows in the north clerestory replaced by new after the model and originals in the south. The beautiful south arcade of the nave, which is of the 12th century, has been restored, and the bold and elegant works of the chancel, which is of the 15th century, have been laid open in the original rich colour of native stone. The front of the gallery at the west-end has been brought into harmony with the rest of the building. But, above all, the large east-window, which is one of no common elegance, and a most interesting specimen of the transition from the decorated to the perpendicular style, has been filled with stained glass of wonderful richness and beauty, [so as quite to match the best ancient specimens], by Mr. Warrington, of London. The five lower bays contain the figures of our Lord and the Evangelists, under rich canopies. In the compartments above are the figures of St. Peter and St. Paul, and in the central that of the Virgin Mary, to whom the church is dedicated. The rest contain various most appropriate emblems. The effect of the whole is very striking; and the beauty and simplicity of the figures, and the harmony of the colouring, by which the richness of it is at once sobered down, and yet displayed to the utmost advantage, cannot be appreciated but by an eye witness. Mr. Warrington may well be proud of his work. The fine old chancel, with its roof, recalling forcibly to mind, on a small scale, that of the nave of Ely Cathedral, is now filled with a mellow light, which adds a deep solemnity to its architectural features. Thus, this church has become one of the most interesting objects of our neighbourhood, and doubtless will attract the notice of many of our summer visitors, and tell them that the north will not quietly yield to the south the palm of good taste and good spirit.

RAILWAY INTELLIGENCE.

**Hull and Beverley Railway.**—An application will, it is said, be made in the session of 1845, under the auspices of the Manchester, Leeds, and Hull Associated Company, for an Act to make a railway from Hull to Beverley.

Glass windows have been introduced in the second-class carriages of the North Midland, and the Glasgow and Greenock Railway, as had previously been done on the Manchester and Leeds, and on all the Belgian lines. We should like to see the same thing done on the London and Birmingham, the Midland Counties and the Hull and Selby lines.

GERMAN RAILWAYS.

The following table of the German railways now open is taken from the *Allgemeine Zeitung*. It gives the length in miles of each, with the number of passengers for the month of September, and for the first nine months of the year:—

Name.	Length.	Passen. in Sept.	Passen. in 9 months.
Linz—Budweis . . . . .	77½	2,195	13,104
Linz—Gmunden . . . . .	42½	16,994	105,720
Ferdinand's North Road . . . . .	187½	68,705	502,112
Vienna—Glognitz . . . . .	46	166,543	1,025,355
Munich—Augsburg . . . . .	37½	23,876	159,285
Nurnberg—Furth . . . . .	33	42,761	322,709
Frankfurt—Wiesbaden . . . . .	26½	100,902	614,342
Carlsruhe—Manheim . . . . .	42½	90,452	606,847
Hamburg—Bergeedorf . . . . .	10	23,438	163,109
Berlin—Anhalt . . . . .	93½	37,430	262,146
Berlin—Potsdam . . . . .	16	45,005	359,393
Berlin—Stettin . . . . .	82½	29,542	170,241
Berlin—Frankfort . . . . .	49½	23,965	159,479
Breslau—Oppeln . . . . .	49½	25,170	181,514
Leipzig—Altenburg . . . . .	24	23,003	130,372
Leipzig—Dresden . . . . .	71½	47,835	315,913
Magdeburg—Leipzig . . . . .	67½	73,391	478,904
Magdeburg—Halberstadt . . . . .	35½	19,563	59,542
Brunswick—Oschersleben . . . . .	59	37,492	253,864
Dusseldorf—Elberfeld . . . . .	16	33,415	212,403
Cologne—Aachen . . . . .	43	33,953	217,843

Total length, 1,083 miles.

The following railways are in progress:— From Carlsruhe to Kehl, to be finished in April; also one from Kehl to Basle. When this is completed, there will be a direct communication from Ostend to Switzerland.

From Stettin to Stargard.  
From Berlin to Hanburgh.  
From Frankfort on the Oder to Breslau in Silesia.

From Oppeln in Silesia to the Austrian frontier; and another in continuation to Olmutz in Moravia.

From Frankfort to Posen.  
From Posen to Konigsberg—a distance exceeding 200 miles.

The whole of these lines will extend to a length of 700 or 800 miles.

A line through Wirtemberg and Bavaria. One from Bavaria to Dresden.

Lines from the French territory to the Maine, from Cassel to Berlin, and from Berlin to Dresden.

These will extend to a further length of 800 or 1,000 miles. The surveys have been made, and it is supposed that they will all be finished in six or eight years, if not earlier.

It may not perhaps be out of place here to remark some peculiarities in the German railways:—

1st. A great number of them have been undertaken either directly at the expense of the state, or upon security being given by the state for 3 per cent. interest on the capital invested. To prevent jobbing in railway shares, in most German states a law has been enacted that 10 per cent. of the sum must be paid forth with after subscribing. Yet so great seems the spirit of speculation to be, that some months ago, when the railway from Dresden to — was resolved upon, 5,000,000 dollars (nearly 900,000£) were subscribed in two days.

2nd. German railways pay better than the English ones. It is said that two yield 15 per cent. clear profit, some others from 7 to 10 per cent., and none has begun with less than 4 per cent. This may be owing to the rates of German railways being proportionally lower than those of Britain, and the want of good means of communication otherwise.

3rd. The propensity to travel for amusement is greater among the Germans than among any other people.

ABERGAUVENNY IRON TRADE.

NOTWITHSTANDING the daily reports which appear of the progressive improvement going on in the northern manufacturing districts, we are not able to add that the cheering influence has had any effect upon the demand for iron, which branch of trade remains, we regret to understand, in an almost torpid state. A few months back, it is true, a slight improvement was perceptible, which, in accordance with former experience of recovery from a state of depression, was put down as a commencement of better times; visions of prosperity, at no very distant period, once more flitted across the minds of many individuals inhabiting the vast iron district, and dependent upon its progress for a subsistence; but visions have vanished, and despair again broods over the district. Yet, from being situated in a position which has enabled us to watch for a great number of years the progress and vicissitudes of the iron-trade, during which period two or three depressions have occurred, whilst on the other hand the most unexampled prosperity has followed, we are not amongst those who would despond and not hope to see even in this important branch of our manufactures an improvement of a permanent nature, and that too very shortly. It is an established and well-known fact that the iron-trade generally ranks amongst the last to feel the effect of depression, which was evinced prior to the stagnation at present existing, from the circumstance that during the year 1839 and part of 1840, when the cotton and woollen branches were suffering to an unknown extent, the mineral district was in its best days, and the supply of iron was nothing like equal to the demand. Again it has, in most instances, proved that the first-named branches, after recovery from inaction, have been for several months, and in one or more periods for a year or so, participating in returned prosperity, whilst the iron trade has remained depressed, and has further required longer time to enter within the pale of improvement. Our hopes are grounded on the above facts, and we firmly believe the anticipation would, in all probability, be much sooner realized, did Government, by making reasonable treaties with foreign Powers, induce them to rescind their lately made tariffs, which have, in some measure, tended to lay prostrate one of the most vital and important manufacturing commodities of this great empire.—*Hereford Times.*

SCIENCE OF ANCIENT ARCHES, AND DEFECTS OF MODERN ARCHES.

*Of the Faulty Modern English Method of covering over the External Apertures of Edifices, and of the Destruction of Property to which this Fault Leads.*

ANOTHER cause of the vast inferiority of modern English edifices, particularly of private edifices, is the modern method of covering over their external apertures; the author sometimes goes through the streets of London, and becomes worked up into a fit of melancholy nervousness, at observing such a multitude of structures, literally dropping to pieces from fractures in the arches or other coverings of their external openings; whether built by common bricklayers, or by masons, or by surveyors, by jobbing speculators, or by wealthy bankers, little difference is to be found. As a professional man, the author feels humbled and more sunk into littleness. An incredible number of our edifices are in this condition; nor indeed is the difference very great, where pier is erected over pier, and window over window, a property of construction often lost sight of.

If those who have the conducting of our buildings will not take other and more proper means, one could almost wish resort were had, to the old-fashioned unsightly method, of supporting the window-arches by wooden framework; for however settled and out of level may be the brickwork of old houses with external wooden frames, their arches are comparatively seldom fractured or dropped.

But perhaps the most scandalous instance of modern ignorance, or culpable imprudence, is the covering over of the apertures of structures, otherwise good, with an arrangement of bricks, possessing none of the properties of an arch. Some call the

brickwork so placed, a French arch; the author is unacquainted with any name for it; and were he disposed to give it one, it might be no-arch or flaw-wall.

Almost all our new buildings, which are intended to have their sins hidden by external plaster, are endowed with this kind of malformation; even over Venetian windows eight or ten feet wide, the same silly freak is repeated; sometimes these pieces of brickwork, are set in Parker's cement, but are even then little better. The truth is, they are un-geometrically absurd; they depend upon nothing but the tenacity of the cement, or the violent friction of the bricks one against another; even if they otherwise escape fracture, the slightest settlement at the foundation is sufficient to destroy the whole of them in a building.

When the author was a youth, he first observed a whole row of houses being erected, with fifty of these sham arches; he imagined at the time, that they might be some new scientific discovery in construction; but passing the same houses a year afterwards, he found that thirty of them were hideously cracked and displaced, although they had been coloured to appear like cut radiated gauged arches.

When a review is taken of the works of the Egyptians and Greeks, and of the care which they exhibit in the spanning of apertures with masses of solid material next to eternal,—when we behold the advances in science exhibited by the architecture of the Romans, and behold that after two thousand years arches of even contemptible materials are still firm and free from flaw,—and again when we lose ourselves in admiration of the still more economical, safe, and tasteful arches of the middle ages,—we find that down to our own times, anxious care if not refined science of the very first quality which the respective ages afforded, always presided in its most advanced state over the practice of building, and that it ever employed a chief part of its ability in covering over the apertures of buildings; we thence become the more surprised that at the present day, England, London its capital, and the seat of the world's wealth, should be the seat of the most reckless modes of structure, caused by the corruption and inattention which have at once taken possession of the whole building art, and particularly in the use of pseudo-arches; a fact too the more remarkable, from England at the present day possessing literary and graphic works upon architecture, an immeasurable deal more illustrious than were possessed by any former age, or are now possessed by any other nation.

In order to exhibit the more visibly ancient care and modern inferiority in this particular, the author brings together a few of the modes followed in times past, the meanest of which is as honourable as the frequent abuse whereof he complains is dishonourable,—an abuse which has rendered the church, the palace, the hospital, the public hall, and many other public buildings, crazy alike with the meanest and most obscure private dwelling.

No. 1.

B. Lower part of the Vaulting, formed of three courses of travertine stone voussoirs, joggled together.

C. View of one of the stone voussoirs, drawn to a larger scale.

D. D. Joggles in the form of wedges, rising from the upper side of one voussoir into the under side of the voussoir immediately above it, so as to prevent one archstone from sliding upon another.

The first example here given is from a Roman sepulchre upon the Appian Way, and exhibits not only archstones of a proper wedge shape, but with a curious invention, the

result of great care and skill, by which one course of the vaulting is prevented from sliding upon another: it much resembles the joggle-joints made use of in the pendent parts of a modern stone architrave.

The second example is taken from the abutments of an arch over the doorway of another Roman sepulchre, also upon the Appian Way, and exhibits even an advance in care and skill.

The third example (probably of later date), is perhaps the earliest existing instance of a curious mode of preventing the Voussoirs of level stone architraves or lintels from settling downwardly, which became prevalent in various parts of Europe during the middle ages: it is from Diocletian's palace at Spalato, in Dalmatia, which has so often been referred to as exhibiting some germs of the peculiar ornaments which afterwards became prevalent in the Romanesque, Norman, or Byzantine style of architecture; and the gradual western spread of this same method, till it at length reached England, seems almost to furnish another argument for the Oriental origin of some particular parts at least of Gothic architecture.

The fourth example is taken from the lower story of the reputed tomb of Theodoric, at Ravenna, and exhibits a semi-circular arch with its Voussoirs joggled or refracted as those of the third example.

The fifth example is taken from the upper part of the reputed tomb of Theodoric, at Ravenna, and is similar to the third example, but displays double precaution.

The sixth example is taken from the Transom of the Norman work of the Western doorway of Rochester Cathedral.

The seventh example is from the mantel of a fire-place in Edlingham Castle, Northumberland.

The eighth example is from the mantel of a fire-place in Conisborough Castle, Kent, and is exactly similar to that at Diocletian's Palace shewn in the third example.\*

The ninth example from the Gate of the Alhambra is copied from the magnificent Spanish Work published at Madrid, A.D. 1804, entitled "Antigüedades Arabes de España." There is even below this arch another of the Moresco horse-shoe shape: and Mr. Murphy gives two instances of the same kind of construction in the first plate of his superb work on the Church of Batalah.

The tenth and eleventh examples are from

the fifth chapter of the fourth book of Sebastian Serlio's "Opere d'Architettura," and are both very excellent: the following is their author's description of them (with the ancient orthography preserved):—

"Et perche la maggior parte de' supercilli, o architraui che dir vogliamo, che sono posti sopra alcune porte, onero botteghe, per la larghezza dell' apertura se la pietra non è di buonissima grossezza non puo resistere al peso, & per questo in processo di tempo si uiene a rompere, si come in moltissimi luoghi si puo uedere; si potrà per gran distanza che si sia, pur che le spalle dalle bande siano forti, far tal cosa di pezzi, nel modo qui disotto in due modi designato, che indubitateamente tal opera sarà fortissima." But experience will withhold the reader from following Serlio's further observation, " & quanto il carico disopra sarà più grande l'opera andera a maggior perpetuo."

The twelfth example is taken from Mylne's work of Blackfriars' Bridge, London, and exhibits an excellent and economical piece of construction more applicable to ordinary cases than any of the preceding examples; in this example the joggles consist each of a cubic foot of hard stone. In small works copper plugs would be more proper, from requiring the removal of less of the substance of the arch-stones in order to admit the joggles.

It is hardly necessary to observe that whatever ingenuity is displayed by each of the above examples, the Gothic architects made still greater advances in the science of constructing arches, for their pointed arches, as has been already observed, were formed without any of their parts being in jeopardy, and that they therefore needed no other means for preventing their voussoirs slipping from each other; whereas the pseudo-arches have none of their parts which are out of jeopardy. Another excellence of the pointed arches is, that they may be formed well of such small stones as to be scarcely either curved or wedged in form; and it is probable that the workman, by narrowly observing the natural inaccuracy and oblique angles of the blocks of stone as roughly quarried, was enabled to shape them to his purpose without any waste whatever; whereas whoever knows any thing of modern masonry, is well aware of the enormous consumption both of material and labour necessary for the production of the stones of a modern arch, or of even a piece of plain square masonry.

There is yet another method of forming arches which is indeed still practised in masonry: it consists in joining by an elbow each voussoir a portion of the neighbouring horizontal course of the work. At first sight this method appears to be more excellent than any other; but observation upon its practical effect will tend considerably to lower that high estimate; as the angle of the elbow will not yield, irregular settlement will cause the horizontal parts to fracture from the radial parts of the voussoirs; specimens of this mode of fracture are to be seen at the "London Institution," Moorfields, which stands on a foundation so warty, that its side colonnades and portals have settled away from the main building, although they have been once rebuilt on the same account. In the northern gate of St. Bartholomew's Hospital, London, there

the fifth chapter of the fourth book of Sebastian Serlio's

"Opere d'Architettura," and are both very excellent: the following is their author's description of them (with the ancient orthography preserved):—

"Et perche la maggior parte de' supercilli, o architraui che dir vogliamo, che sono posti sopra alcune porte, onero botteghe, per la larghezza dell' apertura se la pietra non è di buonissima grossezza non puo resistere al peso, & per questo in processo di tempo si uiene a rompere, si come in moltissimi luoghi si puo uedere; si potrà per gran distanza che si sia, pur che le spalle dalle bande siano forti, far tal cosa di pezzi, nel modo qui disotto in due modi designato, che indubitateamente tal opera sarà fortissima." But experience will withhold the reader from following Serlio's further observation, " & quanto il carico disopra sarà più grande l'opera andera a maggior perpetuo."

No. 10.

No. 11.

No. 12.

\* The immediately preceding three specimens were kindly communicated to the author by W. Twopenny, Esq., the eminent architectural antiquary.

are examples of the same kind of fracture; and even at the side of the north portal of St. Paul's Cathedral there are in the small apertures which light the crypt, some specimens of similar rupture; in the last case the arches have above them an altitude of one hundred feet of solid masonry, and a quick sand below them. It must be confessed that the rustic channels of arches wrought in this form have a beautiful effect.

When a moderate estimate is made of the number of arches and pseudo-arches in the metropolis, which are broken from carelessness and inattention in their structure, it appears that there cannot be less than 500,000 of them: many of them from immediate fracture require repair as soon as formed, many more of them lead sooner or later to very extensive general repairs of the buildings which they should have upheld; but even considering that in their broken condition they on an average go twenty years before they are repaired, so that only 25,000 of them are repaired in any one year, and that they lead to an expense of only ten shillings each for their repair, it appears that the sum of 12,500*l.* is annually spent in the mere repair of that work which without one shilling further outlay at first, but by the mere exercise of common discretion, might have been wholly saved: such an outlay, well applied, might annually enrich the metropolis with an additional church such as the beautiful little new structure at Forty Hill, near Enfield, but something larger; and a hundred years of such judicious useful and tasteful economy, might double the churches of the metropolis.\*

But without instances be given, few will believe that the mischiefs of this fault are such as the author represents, and the evil may consequently perhaps be perpetuated, the author feels himself compelled to arm his observations with real facts: with great pleasure he would have concealed these instances, but concealing them, the mischief would become greater and greater; whereas in performing the unpleasant duty of directing attention to them, he flatters himself that no repetition of such severity will require to be made: and in order to shew that the fault is rather the result of general bad system than of individual incapacity, the instances given are as much varied as possible, and are by men of all degrees of repute, and they are confined to only a few instances of Public Buildings.

First, then, the New Palace at Piccadilly contains many broken window-heads, both in the original building, and in the subsequent additions to it; secondly, St. Bartholomew's Hospital, London, possesses only about fifty of them, while a plastered metropolitan hospital, erected only a few years ago, contains more than fourscore of them; thirdly, of the twenty-four doorways and lower windows of the new church at Bryanston-square, London, eighteen of them have their stone architrave-lintels broken; fourthly, of the ten lower windows of St. Mark's Church, at Clerkenwell, not one of their heads has escaped fracture; fifthly, of sixty windows of the new buildings in the Middle Temple, London, fifteen are broken; and sixthly, of seventy-one stone window-heads

to the new Westminster Hospital, sixty-one are fractured. It is useless to pursue the inquiry any farther; of modern private building, it is sufficient to say, that in the new houses alone which have within the last four or five years sprung up in the neighbourhood of the new London Bridge, there are already one hundred and fifty fractured window-heads, some of them in desperate condition, although most of these houses are built at great expense.

The author has had the flat external arches of various brick buildings erected under his direction prevented from fracturing or dropping by means of eradle-bars of wrought-iron placed invisibly below the arch-soffits, especially where he has suspected any uncertainty of foundation; and in all the buildings in which he has made the application, not the slightest symptom of defect has occurred; emboldened by this success, he feels greatly disposed to follow the same method, in all brick buildings whatsoever. The universal fracturing of modern buildings is certainly an unadulterated disgrace to us as a profession.

Gauged arches, that is, arches of cut and rubbed bricks, are of all things used in building the least capable of duration, and of the resistance of fracture: made of the softest, and therefore of the worst possible bricks, the soffit or under-side of the arch being usually

a. Cross lines merely drawn on the surface of the arch.

only four inches thick, the bricks carelessly jarred away except in front, and the joints not half filled with mortar, and that mortar of no durable quality, they hardly bear their own weight: they should upon every possible occasion be discarded. But not so those arches which are used in the counties where the best white bricks are made: they are as excellent and commendable in every respect as those of London are bad and absurd; the arches alluded to are composed of very long, hard, and fine white bricks, burnt of a wedge-shape; these are not shattered by the process of cutting, and require little besides grinding to a perfect surface; they do not lose their hard outward crust for a porous texture, while, from their considerable length and wedge-like upward increase, they never from any ordinary circumstance slip or fracture; and in colour, and perfection of surface and joint, they almost resemble the finest marble, while they are in this climate more durable than marble. Surely, if the same method were universally adopted, less first cost would be incurred than by the use of the present pieces of mutilated brickwork misnamed gauged arches.

It would be well, if in an amended Building Act, the external apertures of buildings were required (with some exceptions) to be made of long wedges of white or yellow brick, or of the substance of clinkers, or of that of Malm paving-bricks. And external arches would be still more secure from fracture and settlement if two copper plugs were inserted in every arch-joint.—From *Essay on the Decline of Excellence, &c., of Modern English Buildings*. By Alfred Bartholomew, Esq., F.A.S., Architect, Secretary to the Free-Masons of the Church.

HOUSES ABROAD AS WELL AS AT HOME FALL.—According to a letter in the *Journal de Francfort* from Meurs, in Prussia, a short time ago, a house which was being built about a quarter of a league from the town suddenly fell down while the workmen were putting on the framework of the roof. Thirteen men were at the time employed as masons and carpenters about the building, and all of them were buried in the ruins. A thousand men came from all parts to aid in their release, but although these all laboured incessantly, it was not until twelve hours afterwards that the tenth and last dead body was recovered from the fatal pile. Five of these were fathers of families, and have left widows, with, between them, 25 children. The other three were not dead, but so dreadfully injured that little hopes are entertained of their recovery.

MONUMENT TO THE REV. DR. WATTS.

On the 13th inst. a public meeting was held at the King's Head, Poultry, for the purpose of considering and adopting measures for erecting a public monument to the memory of the late Dr. Isaac Watts, in the new cemetery at Abney Park, Newington, the suggestion having arisen from the circumstance of the house at Newington which this eminent divine occupied for some years immediately previous to his decease (Nov. 20, 1748) having lately been taken down for the purposes of the cemetery. Mr. W. Alers Hankey, the banker, presided, and in stating the object of the meeting, expressed his conviction that the design of erecting a suitable monument to the memory of the late Dr. Watts, would, even at this distant day, be hailed with sincere approbation by, and receive the cordial support of, the religious public of every denomination, the episcopalian as well as the dissenter. It were needless at this day to expatiate on the piety, the learning, the talents, and the zeal of this truly eminent man, seeing that his works were still universally read and admired, and that they were even at this time looked upon as the best and most engaging media through which religious and moral instruction of the highest order could be imparted to the mind of youth. His religious poetry, especially, from its pleasing simplicity, at once attracted the attention of the youthful mind, and, once read, became indelibly fixed in his memory and thoughts, and indeed often served as a moral guide to his actions in after-life. After some further observations, the chairman concluded by expressing his cordial concurrence in the object of the meeting, and recommending its immediate adoption. The Rev. Dr. Freeman, Rev. Messrs. Shartman and Smith, Dr. Kempis, and others then addressed the meeting. Resolutions were agreed to, and a committee was appointed to carry into effect the proposed design. A subscription in aid was commenced, and, after a vote of thanks to the chairman, the meeting separated.

BAIL COURT.

(In Banco, before Mr. Justice WILLIAMS.)

ST. MAGNUS CHURCH, LONDON-BRIDGE.

THE QUEEN v. THE CORPORATION OF LONDON.

Mr. KELLY applied to the Court for a rule, calling upon the Mayor, commonalty, and citizens of the city of London, to shew cause why a *mandamus* should not issue, commanding them to pay to the parish officers of St. Magnus, London-bridge, and St. Margaret, New Fish-street, the arrears of an annuity of 8*l.*, which are payable to those parishes, and which are charged upon what are called the Bridge-house Estates. It appeared from the statement of the learned counsel, that in the great fire of 1666 the church of St. Magnus was destroyed, and that the church of St. Margaret, which was then close to that of St. Magnus, shared the same fate. Instead of the two churches which had been destroyed one was built; the two parishes were united by Act of Parliament, and the new church became the parish church of the united parishes. This was the state of affairs until the second year of the reign of George III., when it became necessary to improve the approaches to old London-bridge as well as the bridge itself, and to make a new footway on a level with the new balustrade. The church at that time had two towers at the north and south ends, and also a piece of land, which was used for interment. For the purposes of the proposed improvements it became necessary to take the land and the two towers, as well as a passage under one of them, and for the injury done and loss sustained by the parish, the Act of Parliament provided that the corporation should pay them for an annuity of 13*l.*, to be charged upon all the manors, lands, tenements, &c., of the corporation, commonly called the Bridge-house Estates. Of the sum thus awarded by the Act, 5*l.* were to be paid to the rector, and about this there was no question at present. The remaining 8*l.* were to be paid to the churchwardens for the sustentation of the works and ornaments of the church. The first payment of the annuity was appointed by the Act for Michaelmas, 1762, and the annuity had been regularly paid from that period until 1832, when the officers of the corporation refused to pay the annuity any longer, for considerations arising out of the following circumstances:—Under the Acts of Parliament for the building of new London-bridge, it became necessary to take a part of the new churchyard for the purposes of the new approaches, and the corporation were obliged to provide the parish with other ground instead. Several "sub-arrangements" were made, with a

\* For those who are curious to know how such a calculation could be formed, the following particulars are subjoined of the fractured window-heads in some of the streets in which the author reckoned their number: these include only such as are in the principal fronts of the houses from the ground upwards; to them must therefore be added those in the basement stories, in the backs, in the interior, and in the other parts of the houses:—  
 Battle Bridge, . . . . . 22  
 Bagnidge Walk Road, . . . . . 83  
 New Road, . . . . . 171  
 Great Surrey Street, . . . . . 240  
 Westminster Road, . . . . . 108  
 Circus, St. George's Fields, . . . . . 20  
 Skinner Street, . . . . . 33  
 Holborn, . . . . . 175  
 High-street, St. Giles's, . . . . . 13  
 Broad-street, St. Giles's, . . . . . 36  
 Tottenham Court Road, . . . . . 92  
 Compton Street, Burton Crescent, containing only thirty-five houses, . . . . . 45  
 Regent-street, although coloured and repaired on an average every three years, . . . . . 250  
 Total taken on the same day in only thirteen streets, 1268.  
 From the above, it appears that in those streets which are the newest, and are covered with stucco, and have their constantly-recurring fractures stopped the ofttest, there is a far greater proportion of fracture than is to be found in older streets, however ill-built they may be; thus Tottenham-court-road, which is principally of naked brick-work, and is one of the very meanest-built in the metropolis, does not contain two-fifths of the fractures subsisting in Regent-street: between its periodical whitewashings, although in number of houses they are not greatly different; taking into account the more frequent repairs of Regent-street, the balance of superiority will be seven-fold against it, although it is all pretended to be architecture. These mischiefs are independent of those resulting from the shrinking and subsidence of breast-summers, which have in some cases eroded the whole walls.

view to carrying this arrangement into effect, but the learned counsel said that he thought it unnecessary to enter into the details of those transactions upon the present occasion. In part-performance of the liability which was imposed upon the corporation for the benefit of the parish, the corporation assigned for the use of the parish the very piece of ground which the corporation itself had upon the former occasion taken from the parish. The land was taken possession of by the parish officers, and the corporation allege as an excuse for the non-payment of the 8*l.* a year, that as the parish had now got the land in reference to which the corporation had been obliged to pay the annuity, they would no longer be compelled to pay the annuity itself.

Mr. Justice Williams inquired how it was that the parish authorities had for so long a time acquiesced in the refusal of the corporation?

Mr. Kelly said that there had not been any acquiescence in fact. It was very difficult to compel such a body as the corporation of London to comply with any request. There had, in fact, been a great number of applications to the corporation, and several attempts to induce them peaceably to pay the arrears, as the sum in question was so small and the costs of proceeding at law so great, that nothing but an imperative sense of duty could induce the parish authorities to adopt legal proceedings. The negotiations had been for a long time going on, and it was only very lately that such a refusal had been given as would support an application like the present. The claim was at last brought before the Committee of the Bridge-house Estates, and they came to a resolution not to pay the money; but even if the officers of the parish had been guilty of *laches*, he (Mr. Kelly) submitted that it was not the neglect of one or two sets of churchwardens which could have the effect of taking away the rights of the parish. The matter was due to the public of the parish, and was applicable to public parochial purposes, and a fresh instalment became due every year. There was, therefore, no *laches* in fact, and even if there had been, the *laches* could not prejudice the rights of the parish.

The application was granted.

### Miscellaneous.

**FINE ARTS.**—A paragraph found its way into circulation a few days ago, respecting some additions which have recently been made to the Print-room of the British Museum. As some inaccuracies were contained in the paragraph alluded to, it may be as well to lay before the public a more correct statement of the circumstances. Since the appointment of Mr. José to the keepership of the collection of prints and drawings in the British Museum, not only have great and very important additions been made to it, but the whole has lately been removed to a room built expressly for the purpose, and nearly all the prints and drawings have been arranged and placed in magnificent portfolios. The more recent acquisitions alluded to above, are a most perfect collection of the works of Raffaele Morghen, consisting of the various etchings, unfinished and finished proofs, which he retained for his own use, and which, after his decease, passed into the possession of Signor Bardi, of Florence. From him they were purchased by Messrs. Colnaghi and Co., of Pall Mall East (not Messrs. Colnaghi and Preckle, of Gockspur street, as erroneously stated), and sold by them to the Trustees of the British Museum for 1,575*l.* The etchings by Rembrandt, recently purchased from Messrs. Smith, of Lisle-street, consisted chiefly of prints of somewhat minor importance, but still available for all artistic purposes. These have been added to a second collection of that artist's works, which has lately been judiciously formed in order to obviate any possibility of injury happening to the magnificent collection of Rembrandt's etchings already there, which has, under Mr. José's auspices, become, instead of the third or fourth, undoubtedly the first collection in Europe. But among the prints furnished by Messrs. Smith are some of very considerable importance, of which may be mentioned unique and undescribed early states of Rembrandt's portraits of Coppola the writing-master, of Vander Linden, and some of his landscapes, together with many very important prints by early German and Dutch masters, several curious early mezzotints, and some fine engravings by Faithorn and Hollar. —*Morning Herald.*

Sir Thomas G. Cullen, Bart., purchased the estate of Hanstead Lodge, near Bury, on Saturday week, for 10,650*l.*, it being just a century that day since it passed out of the hands of his ancestors. —*Maidstone Journal.*

**IMPROVEMENTS OF THE MINT IN THE BOROUGH.**—The long contemplated improvements in that densely populated *locality*—the Mint in Southwark, are now, it would seem, at once to take place. The same plan for a new street, which was approved of at a meeting held at the Town Hall, on September 17, 1840, designed by Mr. Attisocks, the surveyor, is to undergo little or no modification or alteration.

It runs in a slightly curved line from Blackman-street, St. George the Martyr, and joins Charlotte-street, Christchurch, this cutting through the very heart of the miserable dens and those hotbeds of crime in the Borough Mint. The line will intersect Harrow-street, Red-cross-street, Duke-street, and King-street, embracing Mint-square, and widening Queen-street, Southwark Bridge-road, to upwards of three times its present width. After crossing the Southwark Bridge-road it leaves a portion on the north of Norfolk-street standing, and quitting it at Pavion's-alley, intersects Prince's-street and crosses Gravel-lane into Charlotte-street, only a corner of which will have to come down. The whole extent is a little more than 6,600 yards. A question naturally suggests itself—beneficial as the vast improvements at present proceeding must be allowed to be,—what is to become of the poor who have so long inhabited St. Giles's, the Mint, and other localities which are now daily being razed to the ground?

The results of the last journey made by the celebrated archaeologist, Karl Otfried Müller, are in course of publication at Frankfurt-on-the-Maine. The first part, which is already published, contains *The Antiquarian Collections of Athens*; the second will comprise in it the *architecture and sculpture* of that city; and the third will contain an account of the author's travels in the Morea and Rumelia.

The Lords of the Admiralty have purchased the working model from which the statue of Lord Nelson upon the column in Trafalgar-square was executed. The model is five feet ten inches high, and is to be placed in a niche in the vestibule of the Admiralty, immediately facing the principal entrance to that building.

**NEW SQUARE AT PIMLICO.**—There is a new square in course of being laid out and planned in the Belgrave-road, to be called Warwick-square, which will be the most extensive square on the Grosvenor estate. Where the Lock Hospital formerly stood there are erected several splendid mansions.

**ROAD-SURVEYORS' TITLE OF DIGNITY.**—A gay young lady from a neighbouring village, being on board of a steam-boat on the Clyde, was courted distinction among a party by a display of flippant volubility, intended to indicate to them her superior status and accomplishments. On her ever and anon remarking "My father did this," "My father did that," one of the party, a stranger, in innocent admiration, asked, "Pray, what is your father?" To which this fair pretender to excellence, after a little hesitation, replied, "He is a-a-a-highwayman." Road-surveyor is the term that would have been employed by a plain person on that occasion. —*Glasgow Paper.*

**A HINT TO GAS COMPANIES.**—At Sheffield, the charge is 4*s.* 2*d.* per 1,000 feet; Leeds, 6*s.* 8*d.*; Liverpool, 6*s.*; Cheltenham, Glasgow, and Bradford, 7*s.*; Paisley and Newcastle, 7*s.* 6*d.* The effect which lowering the price of an article like gas has upon its consumption was, perhaps, never better exemplified than in the statistics of Manchester, when, in 1833, the charge was 10*s.* 6*d.* per 1,000 feet, the profits then were 8,292*l.*; in 1834 it was 10*s.* 3*d.*, the profits 10,191*l.*; in 1835, 10*s.*, profits 13,510*l.*; in 1836, 9*s.*, profits, 16,196*l.*; in 1837, 8*s.* 6*d.*, profits 18,712*l.*; in 1838 it was again lowered to 8*s.*, and the profits realized 19,376*l.*; in 1839 the price was 7*s.* 6*d.*, the profits 24,658*l.*; the last reduction, in 1840, to 7*s.*, and the profits increased to 24,738*l.*; in 1841, to 29,694*l.*; and in 1842, to 34,232*l.* These facts speak for themselves.

**RAILWAY TRAFFIC.**—The last weekly returns of 42 railways, 1,544 miles in length, will be of interest.—Number of passengers on 29 railways, 300,153. The receipts for passengers on 42 railways, 58,660*l.*; ditto for goods on 37 railways, 21,776*l.*; total, 80,436*l.* This is an average of 65*l.* per mile per week. We have not received the traffic returns this week of the following railways:—Dundee and Arthroath and Brandling Junction. —*Railway Magazine.*

**THE ISLAND OF LEWIS.**—Mr. James Matheson, M.P., has purchased from the family of Seaforth the princely property of the Lewis, one of the largest islands in the Hebrides, with a population of about 15,000, and included in the county of Ross. The purchase-money was 100,000*l.* Mr. Matheson and his lady are at present on a tour in Italy; but improvements will soon be commenced, for the new proprietor intends, we understand, to devote a further sum of 40,000*l.* or 50,000*l.* towards establishing a regular steam communication with the island, forming roads, and otherwise improving his extensive territory. —*Inverness Courier.*

A deputation of the Metropolitan Association for Improving the Dwellings of the Industrious Classes, consisting of Mr. J. D. Powles, Dr. Southwood Smith, M.D., Mr. W. A. Wilkinson, the Rev. W. W. Champneys, Mr. F. A. M'Geachy, M.P., Mr. John Dunlop, Mr. P. F. Gibson, Mr. J. W. Tottice, and Mr. Charles Gattiff, had an interview with Sir Robert Peel on the 23rd instant, at his official residence in Downing-street.

### Tenders.

**TENDERS** delivered for the new Union House a Portsea, Hants.— Livezey, Esq., Architect.— January 11, 1844.

Hendy .....	£19,930
Hicks .....	19,780
Wells and Co. ....	19,591
Kirk (Lincoln) .....	19,300
Ploughman and Luck ..	18,994
Hill (Arundel) .....	18,500
Absalom (Portsea) .....	17,980
King and Voller (Portsea) ..	17,800
Diggle .....	16,990
Nicholson (Wandswoth) .....	16,780

Mr. Nicholson's Tender was accepted.

### NOTICES OF CONTRACTS.

KEEPING in repair for three years, at a sum to be paid annually, all Pumps, Drains, Water-closets, Troughs, Cisterns, Glass Windows, Locks, &c., of Plumageat Union Workhouse, Wickham Market. —Specification at the Clerk's Office.—J. Dallinger, Clerk to Board of Guardians. Jan. 29.

Constructing various Stations at Gateshead and other places, Newcastle and Darlington Junction Railway.—Plans, &c., after 1st of February, at Railway Office, York.—Further particulars on application to Mr. Andrews, Architect, York.—G. Hudson, Esq., Chairman. Feb. 13.

BUILDING A COUNTY LUNATIC ASYLUM AT LITTLEMORE, OXFORD.—Plans, &c., at Mr. R. Clarke's, Architect, Clinton-street, Nottingham, or at the Office of the Clerk of the Peace, Oxford.—J. M. Davenport, Clerk of the Peace. February 22, 1844.

BRIDLING PIER AND HARBOUR.—Erection of a new south pier, removal of present pier, and other works for enlargement of Harbour.—Plans and Specifications at Mr. Sidney Taylor, Solicitor, Bridlington, after Jan. 1, 1844. March 1, 1844.

ALTERING EAST SUFFOLK COUNTY HALL AND COURTS OF JUSTICE, IPSWICH.—Plans, &c., for inspection on application to Mr. Whiting, Surveyor, &c., County Hall, Ipswich, on Monday Jan. 29; J. H. Borton, Clerk of the Peace, Bury St. Edmunds. February 12, 1844.

WORKHOUSE ALTERATIONS, ST. LUKE, MIDDLESEX.—Plans, &c., at Workhouse.—J. Parson, Vestry Clerk. Feb. 7, 1844.

### NOTICES.

#### TO READERS AND CORRESPONDENTS.

As the contributions to the illustrations of THE BUILDER are daily becoming more and more frequent, it would be well if our correspondents would send new draughts of size convenient for insertion either as one, two, or three column blocks. This, at the same time that it would spare considerable trouble to the draughtsman, would tend greatly to insure the accuracy, and, consequently, the utility of such contributions.

#### TO OUR CORRESPONDENTS.

We beg to inform "C. D." that his design for a school is engraved, and will appear in our next. We think the letter of "A Third Competitor" cannot be inserted without publishing a libel.

"A Constant Reader's" request will be attended to in our next.

We beg to thank "J. H. P." for his poetical contribution, but think it not sufficiently architectural for our publication.

The Builder.

NO. LII.

SATURDAY, FEBRUARY 3, 1844.

**EEMING** that scarcely of greater importance can be any subject of architecture,

whether simply practical or simply decorative (which indeed we hold to be inseparable, and into the discussion of which we shall by-and-by enter, fearless of being triumphant), we resume our last week's paper upon

**Westminster Bridge.**

Before going further, we beg to say, fanciful theories have retarded infinitely the science of arches; most of those broached have in succession been given up, though very artificial, yet as very untenable; very few of them have effected even partially that which they purported to perform, while the greater part of them have violated that great object of science, TO DO THINGS WISELY WITH THE LEAST REQUISITE MEANS.

In the pendant catenarian construction,

every link or vertebra is strained by the weight of all the others beneath it in the series; and in the inverted masonry catenary, every voussoir is compressed by the weight of all the voussoirs

above it. Therefore, all arches whatever, whether of masonry or brickwork, have their voussoirs compressed in this manner, though from their imperfect design and formation, gravity deranges their component parts, distorts their curves, and brings them to ruin. All the theories on the equilibrium of arches, by which an attempt is made to balance the voussoirs by causing them to slide together on their arch-joints towards a centre, are erroneous; no such effect ever takes place in arches, unless they be in jeopardy, ill at ease in their parts, settling through defective foundation, or from some other cause tending to bring them to a state of ruin.

On the contrary, great address has been often used to prevent utterly such sliding, as in the case of Blackfriars' bridge, where the voussoirs are joggled by a cubicfoot of hardstone being let into each arch-joint. In all arches of brickwork set in Parker's, or any other quickly-setting cement (which mode of practice we, for various reasons, deprecate, except in arches formed in old work), no sliding to a centre can take place without such crisping cements fracturing, as, indeed, they do, simply from the curvature of an arch altering in form, through the work settling to a state of rest. If, then, pains and expense be employed in the endeavour to effect the equilibrium of an arch, by causing its voussoirs to slide upon each other, and equal pains and expense be resorted to for preventing them from so sliding, it must be evident that such pains and expense neutralize each other; and it will be fortunate if they leave the arch as well off as it would have been without their use, and with no weakness caused by casting extra burthen upon the foundation.

But what says Dr. Robison on this very subject?—

"This much will serve, we hope, to give the reader a clear notion of this celebrated theory of the equilibrium of arches, one of the most delicate and important applications of mathematical science. Volumes have been written on the subject, and it still occupies the attention of mathematicians. But we beg leave to say, with great deference to the eminent persons who have prosecuted this theory, that their speculations have been of little service, and are little attended to by the practitioner. Nay, we may add, that Sir Christopher Wren, perhaps the most accomplished architect that Europe has seen, seems to have thought it of little value: for, among the fragments which have been preserved of his studies, there are to be seen some imperfect dissertations on this very subject, in which he takes no notice of this theory, and considers the balance of arches in quite another way. These are collected by the author of the Account of Sir Christopher Wren's family. This man's great sagacity, and his great experience in building, and still more his experience in the repairs of old and crazy fabrics, had shewn him many things very inconsistent with this theory, which appears so specious and safe. The general facts which occur in the failure of old arches are highly instructive, and deserve the most careful attention of the engineer; for it is in this state that their defects, and the process of nature in their destruction, are most distinctly seen. We venture to affirm, that a very great majority of these facts are irreconcilable to the theory. The way in which circular arches commonly fail, is by the sinking of the crown and the rising of the flanks. It will be found by calculation, that in most of the cases it ought to have been just the contrary. But the clearest proof is, that arches very rarely fail where their load differs most remarkably from that which this theory allows. Semicircular arches have stood the power of ages, as may be seen in the bridges of ancient Rome, and in the numerous arcades which the ancient inhabitants have erected. Now all arches which spring perpendicularly from the horizontal line, require by this theory, a load of infinite height; and, even to a considerable distance from the springing of the arch, the load necessary for the theoretical equilibrium is many times greater than what is ever laid on those parts; yet a failure in the immediate neighbourhood of the spring of an arch is a most rare phenomenon, if it ever was observed. Here is a most remarkable deviation from the theory; for, as is already observed, the load is frequently not the fourth part of what the theory requires."

"Many other facts might be adduced which shew great deviations from the legitimate results of the theory. We hope to be excused, therefore, by the mathematicians for doubting of the justness of this theory. We do not think it erroneous, but defective, leaving out circumstances which we apprehend to be of great importance; and we imagine that the defects have arisen from the very anxiety of the mathematicians to make it perfect. The arch-stones are supposed to be perfectly smooth or polished, and not to be connected by any cement, and therefore to sustain each other merely by the equilibrium of their vertical pressure. The theory insures this

equilibrium, and this only, leaving unnoticed any other causes of mutual action."—System of Mechanical Philosophy, Brewster's Edition, Edinburgh, A.N. 1822.

After very mature consideration of the subject, we have come to the conclusion, that DRIFT is the active force in arches and vaults; the exercise of this principle lies in the avoidance of all cross strain and the pressing of every stone to its neighbours: by this free-masonry principle stand all the buildings of Pointed Architecture which approach perfection. Drift commences at the summit of every vault and pinnacle, and is carried through every stone of a fabric till it reaches the ground at the feet of the buttresses, walls, and columns.

All the address of a master is called forth to cause the drift or gravitation of materials to operate exactly at right-angles to each stone which receives pressure. Hence the bed-jointing of each course in a work should be formed exactly at right-angles to the direction of the active drift, in order that, as in the suspension-catenary, the risk lies in failure through the tension of the chains, so in the catenarian masonry arch, THE RISK MAY BE CONCENTRATED SOLELY IN THE FRANGIBILITY OF THE MATERIALS, no failure occurring till they become pulverized.

Our deductions from these theories, and their application to the subject engaging our attention, will be given in our next.

MEETING OF THE MASTER CARPENTERS' SOCIETY.

A MEETING OF THE Master Carpenters was held on Wednesday evening last, at the Freemasons' Tavern, Great Queen Street, being the first of the new year, for the purpose, among other matters, of appointing a committee to watch in its progress through Parliament the proposed New Metropolitan Building Act, and to give notice of a proposed amendment in the Rules of the Society for the election of members.

The minutes of the last meeting having been read by the secretary, and unanimously confirmed, Mr. Biers, the chairman, proposed the confirmation of the election of a member that took place at the last meeting, which was seconded by Mr. Knight, and carried without opposition.

Mr. Biers then said he thought there ought to be some alteration in the laws of the society for the election of members; for the delay he considered too great from the time they were proposed to the time they were admitted as members of the society. He had two new members to propose at the present meeting; and, according to the regulation then in existence, it would be four months before those two gentlemen could sit as members, although there could be no objection made to their joining the society. This delay was too great; and what he would suggest as an amendment was, that it should be sufficient for any eligible person wishing to become a member, to write to the secretary, signifying such his desire, and that his name being written in the circular to the members, if any one of the society knew any reason why he should not be admitted a member, he might oppose his election; and thus, by such an arrangement, two months would be saved.

After some remarks from Mr. Stephens and Mr. Harris, as to the proceedings requisite for altering their present laws, notice was given that the motion for amending the laws of the society, respecting the election of new members, would be brought on at the next meeting.

The chairman then nominated Messrs. Crow and C. Harbert as candidates for election at the next meeting, and was therein seconded by Mr. Knight.

Upon inquiry, the average price of the best Crown Memel fir was quoted at 90s. per load, and the best 12 feet 3 inch Christiana yellow deals 36l. per hundred.

The chairman proceeded to inform the meeting that the bill which was brought into Parliament last year, was entirely laid aside, and a new one was in preparation for introduction this session. He had received a letter from Lord Lincoln (who had so kindly brought their objections to the late bill under the consideration of the government), stating that the new bill was much altered in form and substance; that he would have sent a copy of it, but it was not yet out of the printer's hands. He then read the following letter:—

Whitehall Place, Dec. 25, 1843.

Sir,—The bill, which I hope to introduce very soon after the meeting of Parliament, for the regulation of buildings in the metropolis, will be a good deal altered in substance, and still more in form, from that which was printed at the end of last session, after being "amended in Committee."

I will send you a copy of the bill as soon as it is printed; and in the mean time, I beg leave to express my thanks to you, and the other members of the Master Carpenters' Society, for the assurance of your readiness to consider its provisions in a fair and candid spirit—a course which my past experience would lead me fully to anticipate from you.

I am, Sir, your obedient Servant,  
H. Biers, Esq. (Signed) LINCOLN.

Mr. Biers, in continuation, said they had only to work with a single impulse for the benefit of the community. All the suggestions which they had made to the crown surveyors had been attended to; and the crown solicitors said that the referees should be paid out of the county rate instead of by fees. Referees will be of very great assistance, that is, if care be taken to appoint proper persons. It appeared to him (Mr. B.) probable that the referees were to be selected from architects. He would suggest the propriety of their getting the word "architect" struck out, and replaced by the words, "from competent persons." Under these circumstances he begged to leave in the hands of the meeting the appointment of a committee to watch the bill through parliament.

Mr. Knight proposed the following gentlemen as the committee:—Messrs. Biers, Lever, Sparkes, C. W. Knight, Stephens, Harris, Higgs, Grissell, Peto, W. Cubitt, Burstall, sen., Allen, Lawrence, Stokes, and Lock, which was seconded by Mr. Burstall, jun., and carried unanimously.

The other business being concluded, the second meeting-day was named for two months hence.

**NEW FIELD OF COAL.**—For some time back, workmen belonging to the Duke of Hamilton have been employed boring for coal at Brixtons, in the immediate vicinity of the Brixton station, on the Edinburgh and Glasgow Railway. Their labours have been rewarded by the discovery of a seam of coal of considerable thickness, and which it is understood extends upwards of 3,000 acres. The coal has been burned in a small gas-work, and from the quality of the light it is evident it must be a first-rate household coal.—*Scotch Reformers' Gazette.*

### DR. KEENAN'S LECTURE.

THE HUMAN BODY A GALVANIC BATTERY.

GREAT excitement having been evinced in consequence of the first of a series of lectures, now delivering by Dr. Keenan at the Royal Polytechnic Institution, on the function of the lungs being considered as a galvanic battery, we cannot refrain from furnishing our scientific readers with some of the prominent ideas of the lecturer, as being new and original. That in order to prove the human body is an electro-motive machine, propelled by the lungs (like a steam-engine), it was to be remembered, 1st, That in all chemical actions electricity is evolved; 2nd, That the chemical action which takes place in the lungs by the union of the oxygen of the air with the carbon and hydrogen of the blood, is highly fitted for the extrication of electricity, which accordingly takes place in great abundance; and 3rd, That the electric fluid is an adequate cause of motion, being proved to be so by the fact that thereby respiration is re-established in a drowned person after it has wholly ceased, whilst the limbs, and even the trunk, are by it put in motion after life is gone,—phenomena which, to the same extent, cannot be produced by any other known agent. It was to be observed that all living and moving bodies agree in two essential particulars, viz., in requiring a stream of air and a supply of food; the use of food being twofold: 1st, To sustain the formation of the body, and 2nd, To supply the blood with carbon and hydrogen for the purpose of generating, with the oxygen of the air, the moving power of the lungs. Dr. Keenan then gave several instances to prove that exhaustion from want of food arises more from the deficiency of moving power than from loss of substance, and that, consequently, food is required to supply the former rather than the latter; that the constitution of our food is of two kinds—one consisting principally of the oxidisable materials, viz. carbon and hydrogen for producing with oxygen the moving power, and might hence be called the *respiratory food*, whilst the other is mainly of nitrogen and the salts, and is the *plastic material* for composing the animal body. So long as food was supposed to be for nutrition alone, it was not easy to perceive what became of it; because the body did not continue to increase although a man continued to eat. To account for this paradox, an hypothesis was adopted which has no foundation in nature, viz. that there is a constant removal of old and a constant deposition of new particles, so that the whole of the body was renewed every seven years. The reasons given to shew this idea is a fallacy would take more room than can be given to this article; and we shall, therefore, content ourselves by stating the arguments of the Doctor, who remarked, that when a fat man takes a fever, and becomes emaciated, his emaciation is no proof of the real staminal parts of his body having changed; because fat is no part of the body, as such, but is merely a depository of digested food (charcoal and hydrogen) which, in the absence of eating, the constitution gives up to the air, to combine with the oxygen for the production of force to keep the blood in circulation, and to maintain other natural actions. Neither is there any proof in the famous experiment of feeding animals on madder; for although in time the dyed textures of the animal become white, this is to be attributed to the absorption of this colouring matter as a *foreign material*, and not to the removal of the coloured textures themselves. Neither are experiments made upon starved animals of any value, because it is easy to shew that certain changes must have then taken place, which could not have occurred if the animals had been naturally fed. To us appeared to be of great importance the remarks to the following effect:—Why man breathes differently from a fish, is a question not yet answered by comparative anatomists. Why does a man in the process of breathing expend so much of the force generated in breathing? Is the maximum force produced by combining the carbon and hydrogen with oxygen in a vacuum? If so, why should not the conditions of the maximum effect be realized by practical engineers, who, in producing the greatest heat from the least inflammable matter, might, in imitation of nature, effect it in a vacuum like the thoracic, and not only so, but bring the inflammable matter and

air (as in breathing) in contact through a great number of capillary tubes.

Dr. Keenan concluded his address, which lasted for an hour and a quarter, and of which this is but an abstract report, by repeated *applaudissements* from a crowded and scientific audience; and, in conclusion, we may declare we never recollect having heard a more ingenious and extraordinary lecture. The course will be continued this evening at eight o'clock, and at the same hour on the evenings of the following four Saturdays.

### MR. GODWIN'S LECTURE ON ARCHITECTURE.

On Thursday, Jan. 25, George Godwin, Esq., F.R.S. and S.A., delivered a lecture in the theatre of the Western Literary Society, on the progress of architecture, from the earliest times that present any evidence of the efforts of man having been directed to the construction of edifices for domestic or sacred purposes. The lecturer prefaced his view of the course of architecture downwards by some observations on its paramount interest as a fine art—as affording us the landmarks of history, and incontrovertible evidence of the degree of refinement and intellectual culture existing among nations that, even thousands of years ago, have been merged in the inevitable tide of the perpetually progressive change to which the surface of the globe is subject. The historian, amid the gloom and desolation of regions that have once been famous, finds nothing now there to trim his lamp by save those monuments which their inhabitants have set up as if to compete with time; to these, therefore, must all turn who would consider the state of the earlier races of mankind, for thus have they described themselves in imperishable characters of stone. The lecturer alluded to the primitive state of man as pastoral and dwelling in tents, and as living in caves. After sustenance, the next care of every animal is shelter; and in the barbarous state, but one remove from beasts of prey, caves and tents served as shelter from the rays of the sun and the inclemency of the weather. The latter of these habits is that to which mankind has most tenaciously clung; since dwellers in tents have existed in all countries, and still inhabit large tracts of country, and are now the same as they were thousands of years ago. Those, on the contrary, who dwell in caves or "in the rock," aimed at something beyond the rude burrow, and attempted architectural embellishment: the banks of the Nile present examples of their efforts to this end in the excavations found there. Rocks were hollowed for habitations and the exercise of sacred mysteries; many such dwellings and temples yet remain, showing us that men inhabited the "living rock," and also found sepulture therein. Having touched upon many of the records in Scripture bearing upon his subject, Mr. Godwin spoke of the Druidical remains in Britain, and the various absurd theories adduced to account for such an assemblage of huge stones, which, it is not difficult to shew, attest in themselves that their arrangement is in no wise owing to chance, since those which are placed horizontally upon others, are hollowed to receive the tops of the latter in such a manner as at once to proclaim human agency. Altars were the first and simplest attempts at construction. They were formed of a few stones piled together; they were afterwards more elaborately constructed, and at length covered in by edifices upon which every magnificence was lavished, figuring in history as the great temples of the world. Besides Stonehenge, remarkable Druidical remains exist, as at Urswick and other places, which are, with much probability, supposed to have been places appointed for the periodical assemblages of the people on occasions of great religious festivals. In South America relics very similar in arrangement and construction are found. It has been a matter of question as to how such immense blocks of stone could be moved into and adjusted in the positions they occupy. This is accounted for, most probably, by supposing that a mound of earth was formed, to the top of which they were gradually moved, and thence tilted over to their intended site. Of the many extraordinary edifices mentioned in sacred history, there are but few of them of which we can have any just conception. It has been remarked by more than one writer, that the abodes of the living have been destroyed,

while the resting-places of the dead in so many cases remain perfect; of these the most remarkable are the Pyramids of Egypt, which, in size, are proportionate to the length of the reign of the king whom they were intended to entomb. Of the base of the great pyramid some idea may be formed from Lincoln's-Inn-Fields, the area of which is about equal to the site of the pyramid of Cheops. Mr. Godwin closed his lecture with a detailed description of Egyptian architectural remains, and on Thursday the 6th of February the subject will be concluded with an account of modern architecture. He has contrived to render the subject deeply interesting and popular.

## SOCIETY OF ANTIQUARIES.

JAN. 11.—HENRY HALLAM, Esq., V.P., in the chair.

Albert Way, Esq., director, exhibited a rubbing from a very fine foreign sepulchral brass, now in the hands of Mr. Pratt of Bond-street. It came from a family chapel in Germany or Flanders, and represents Ludovic Corteville and his lady.

Mr. Doubleday, of the British Museum, exhibited a small oval seal (in sulphur) inscribed S. Mag'ri Simonis Langton, and bearing a finely-executed head, which may be supposed to be the portrait of its owner, Simon Langton, Archdeacon of Canterbury, and brother to the Archbishop, Stephen Langton. He founded a hospital for poor priests at Canterbury circ. 1243.

Mr. Doubleday also exhibited plaster casts of the seal of King Charles the Second for the counties of Carmarthen, Cardigan, and Pembroke. The obverse has the King's effigy on horseback, and the legend *ANNO 11. DEI GRACIA MAG. BRITANNIE FRANCIE ET HIBERNIE REX FIDELI DEFENSOR*. The obverse has the arms of France and England quarterly, quartering Scotland and Ireland; supporters, the dragon and the spotted panther. Above the shield a crown, and below a plume of three ostrich feathers, and the motto *ICH DIEN*. Legend, *SIO. PRO CANCELLARIA POC COMITATUS CARMARTHEN CARDIGAN ET PEMBROK.*

Two coloured drawings were exhibited by Mr. W. Beak, of Roman tessellated pavements, the one preserved in the park of Earl Bathurst, the other in the garden of Mr. Brewin of Cirencester.

J. Y. Akerman, Esq., F.S.A., communicated a note in illustration of a representation of the head of St. John the Baptist on a leaden oche or ornament found at Abbeville; he noticed the analogy between the figure of the head and that on the coins of King John, and gave instances of the veneration in which the head of the saint was held in the middle ages.

Sir Henry Ellis read a very interesting report of the seizure and examination of a Jesuit under the disguise of a Puritan in the reign of Elizabeth, singularly illustrative of the Machiavellic doctrines and practices of that order, and the activity of the Jesuit missionaries in England at that time.

He then concluded the reading of the translation, by George Stephens, Esq., (author of the Translation of Frithiof's Saga from the Swedish), of "The King of Birds, or the Lay of the Phoenix; an Anglo-Saxon song of the Tenth or Eleventh century, translated into the metre and alliteration of the original;" followed by a description, by the same gentleman, of an English medical manuscript, apparently of the end of the fourteenth century, preserved at Stockholm.

JAN. 18.—Lord Viscount MAHON, M.P., in the chair.

John Brodrick Bergne, Esq., was elected a Fellow of the Society.

Albert Way, Esq., director, exhibited a combination of several prints from Mr. J. G. Nichols's "Specimens of Encaustic Tiles," shewing the effect of the wall-tiles with which the church of Great Malvern was formerly ornamented, in the manner of wainscoting, and many of which still remain in the pavement. They are rendered more interesting by bearing a date, the 26th Henry VI.

W. R. Hamilton, Esq., V.P., made a communication relative to various ancient weapons, found in the bed of the Thames, immediately above Kioleston, seven feet below a bed of

gravel. They were chiefly of brass metal and cast, and therefore supposed to be Roman.

Mr. Way contributed some further observations on the leaden ornament bearing the head of John the Baptist, exhibited at the previous meeting of the society. It appears that the head of John the Baptist was preserved among the relics at Amiens, and that it was a favourite object of pilgrimage; and Mr. Way gave strong reasons for believing that these leaden oches, which rudely represent the ferretary, or keeper of the shrine, exhibiting the head, attended by his two acolytes, were given to pilgrims, who carried them about their persons as amulets to preserve them from the disease of epilepsy, or the falling evil (*le mal de Saint Jean, or morbus Sancti Johannis*), which that saint was believed to have the power of curing.

Thomas Wright, Esq., F.S.A., communicated a mediæval list of engraved gems, with descriptions of the magical virtues they were believed to possess; and an introductory essay on the excavations and researches for antiquities by the monks in the middle ages. The Anglo-Saxons appear to have been assiduous in opening ancient tombs, and digging among ruins, and in this manner they collected together great numbers of Roman articles. The ancient Christian rituals contain forms for blessing vases and other vessels dug up from the earth, in order to render them fit for Christian use. A curious account is given in the early lives of the Abbots of St. Alban's, of the extensive excavations made by two abbots in the tenth century among the ruins of Verulamium, and of the numerous curiosities they found. Among these curiosities there were many engraved stones. There were numerous collections of engraved gems in the middle ages, and many instances were cited. The virtues attributed to these articles are strange enough. One is stated to have the quality of rendering the bearer liable to be frequently invited out to dinner, and to be much feasted; another to make the hearer invisible; and so on with the rest.

JAN. 25.—HENRY HALLAM, Esq., V.P.

Mons. Edouard Frere, of Rouen, and Mons. Léchaudé d'Anisy, of Caen (the associate of the late Marquis de St. Marie in "Recherches sur le Domesday d'Angleterre,") were elected Foreign Members of the Society.

The Directors exhibited a large plate, printed in chromo-lithography, for Mons. Dusionnerad's Histoire des Arts du Moyen Age, of the enamelled tablet of Geoffroy le Bel (Plantagenet), at Mans (which was engraved in a smaller scale by the late C. A. Stothard.)

Mr. Rogers exhibited an Etruscan instrument of bronze in the form of a small pair of fire-tongs, fitted with two little wheels.

Albert Way, Esq., Director, exhibited a deed now in the possession of Richard Almack, Esq., of Long Melford, being a lease of the Earl of Bedford, in the year 1570 to Sir William Cecil, afterwards Lord Burghley, of a pasture at the east end of Covent Garden, on the site of which Lord Burghley afterwards erected his town mansion. Mr. Way made some remarks upon the description of the boundaries of the land, in which mud walls and "stulps, or rails," are mentioned.

Sir Henry Ellis, Secretary, communicated three historical documents: 1. A note of the good uses to which the Companies of London applied their grants of Chantry Lands, which it appears they purchased of the Crown to the extent of 18,714*l*. 2. A letter written in 1588 by William Benett, priest, to the Earl of Arundel, begging his forgiveness for the "false charge" against the Earl which had been extorted from him, to the effect that the Earl had ordered a mass of the Holy Ghost for the good success of the Spanish fleet, and offering to deny the same at all hazards. 3. A statement of Affairs Ecclesiastical in Cuernsey and Jersey in the time of James the First, describing the innovation of the Book of Common Prayer which had taken place upon the influx of French Protestants who came to the chaonel islands after the massacre of St. Bartholomew, and substituted a Book of Discipline of their own. The memoir proceeded to recommend a restoration of the liturgy, and the appointment of a Dean of Jersey, both which prayers were shortly after granted.

## INSTITUTE OF BRITISH ARCHITECTS.

JAN. 24.—T. L. Donaldson, V.P., in the chair.—A communication was read from Dr. Brömet, relative to the New Bridge lately erected over the River Moine, at Clifton, near Nantes, in Brittany.—The river runs in a deep ravine, is at all times shallow and consequently un navigable, and is seldom frozen. In the design of the structure, it was necessary for the architect to consider it less as a bridge than as a viaduct for the more easy passage of the ravine. The length of the bridge between the abutments is about 350 English feet, the width of the carriage-road and two footways together, 27 feet, making the entire width, including the thickness of the parapet walls, 30 feet. The arches are fifteen in number, of 19 feet 4 inches span, and of a semicircular form (eight being land arches), the whole supported by fourteen lofty piers, and a long abutment at either end, following the slope of the banks or sides of the ravine; the springing line of the arches is about 33 feet 3 inches above the bed of the river. The total height, from the bed of the river to the top of the parapets, is about 54 feet 3 inches. The foundations of the piers of the seven principal arches are carried about 6 feet 9 inches below the bed. The piers and abutments are founded on the dark-coloured granitic rock, of which the banks are composed, which being too coarse for architectural purposes, the superstructure has been built of a white granite, found in the vicinity. The stones are all of a large size, well squared and dressed, and closely jointed with fine white mortar. The piers, at their lower extremities, present faces of 5 feet, with returns or sides of 30 feet in extent. The chief peculiarity of the construction consists in each of these piers, at the height of about 13 feet from the bed of the river, being pierced with an arched aperture, of a pointed form, 14 feet in width; these arches having the same springing line as the semicircular arches, and intersecting the cylindrical intradoses of the semicircular arches, and thereby forming a series of groined vaultings, which, when viewed longitudinally, from under either of the abutment arches, produces an effect somewhat similar to that of the nave of a Gothic church.

Mr. R. W. Billings read a paper, descriptive of some peculiarities in the arrangement of the plan and in the construction of the church of St. Peter and St. Paul at Kettering, in Northamptonshire, and exhibited numerous diagrams in illustration thereof, and of the forms of the doors and windows, and the principles on which the tracery and ornaments had been designed. He likewise noticed the unusual height of the spire as compared with the body of the church, by which the importance of the latter (really of large dimensions) is much diminished; a circumstance not uncommon in the churches of this district.

NEW STREET TO THE LINKS.—On Friday week a meeting of the committee appointed to consider this subject was held in the Town-hall, when a lithographic sketch of the proposed street, from the design of Mr. Abernethy, civil engineer, was submitted to the meeting, and warmly approved of by all the gentlemen present. It is proposed by Mr. Abernethy that the approach to the Links shall commence at the south-east corner of Castle-street, from whence, by a circular sweep under the terrace in front of the Barracks, the new road shall cross Commerce-street and the Canal, and run in a direct line to the Links. We were happy to see so numerous an attendance of gentlemen anxious to promote this very desirable improvement. It is admitted that our Links form a place of public resort and recreation the most extensive and agreeable, perhaps, to be found in the neighbourhood of any large town in the kingdom; and nothing is wanting but a good road to render it available to all classes of the citizens. We would, therefore, urge upon the committee the importance of immediate exertion to procure the necessary funds. If each member of the committee (as suggested by Mr. James Hadden, Jun.) were to obtain subscriptions, from amongst his own circle of friends, to the extent of 10*l*., the plan would speedily be carried into execution; and we would hope that, if the gentlemen who have undertaken this duty would make an effort, the requisite sum might be raised in a few weeks. The citizens, we trust, will come forward generally and generously.—*Aberdeen Herald.*

## ETHNOLOGICAL SOCIETY.

THE PERMANENT HOUSES AND HUTS OF THE  
ESQUIMAUX.\*

By Richard King, M.D. Read before the Society.

Of the arts and manufactures of the Esquimaux, the houses, from their construction, and the variety of the material of which they are composed, display, perhaps, the greatest ingenuity. This race of fishermen inhabit the northern coast of America, from Prince William's Sound on the Pacific, to Labrador on the Atlantic; and although their hunting-grounds extend about a degree of latitude inland, their dwellings are almost invariably raised near the sea-shore, and are either permanent or temporary, the character of them depending upon the locality and the material at the workman's disposal. But even those who have fixed dwellings leave them in the summer for tents suited to their migratory habits. The Esquimaux of Greenland inhabit a low hut, built with stones two or three yards high, with a flat roof of wood covered with turf, and the same plentiful material is crammed between the stones forming the walls. It has neither door nor chimney, the use of both being supplied by a vaulted passage, made of stone and earth, two or three fathoms long, entering through the middle of the house. The floor is divided into several departments, resembling horses' stalls, by skins reaching from the posts that support the roof to the wall. Each family has its separate room, and each room in front a window formed of seal-skin parchment, which is white and transparent. The ceiling and walls are lined with seal skins, which once formed the covering of their boats, but rendered by age useless for that purpose. In the room beneath the window, attached to the whole length of the wall, is a deal bench raised half a yard from the ground, and reserved, as we do best rooms, for visitors. A similar bench is attached to the back wall of the room as sleeping places for the family, the bedding consisting of rein-deer skins. These benches are also used as sofas by day, the women sitting in the rear cross-legged like tailors, and the men in the ordinary sitting position.

In Gilbert's Sound, instead of the walls being formed of stone, John Davis informs us that they are made of wood; while at Regen's Bay, according to Sir John Ross, who obtained his information from hearsay, stone-built houses are again used, and the roof, instead of being flat, is arched, and the floor sunk three feet in the earth, a description which exactly answers for the habitations of the Esquimaux of Labrador.

From the Coppermine river along the coast westward, and thence to Prince William's Sound, the winter houses are built of drift wood, which is found along the whole route in more or less abundance. At Norton Sound, a sloping roof without any side walls is the fashion, and instead of raised benches, the floor is formed of logs, the entrance being at one end, with a fireplace just within it, and a small hole to let the smoke out. From Norton Sound to Point Barrow, the houses vary in their construction according to the nature of the ground and the taste of the inhabitants. Some are wholly above ground, some have the roof scarcely raised above it, and others resemble those of the natives of Norton and Prince William's Sounds; but they all agree in being constructed with drift wood covered with peat, and in having the light admitted through a hole in the roof, covered with the intestines of sea animals, for a window. They are said by those who have seen them, to be very comfortable abodes, and now and then of considerable size. One, situated between the Mackenzie and Coppermine rivers, was in the interior found to be a square of 27 feet, having the log roof supported on two strong ridge poles, two feet apart, and resting on four upright posts. The floor in the centre, formed of split logs, dressed and laid with great care, was surrounded by a raised border about three feet wide, intended for seats. The walls, three feet high, were inclined outwards for the convenience of leaning the back against them, and the ascent to the door, which was on the south side, was formed of logs. The outside, covered with earth, had

nearly a hemispherical form, and around its base were arranged the skulls of twenty-one whales. There was a square hole in the roof, and the centre log of the floor had a basin-shaped cavity, one foot in diameter, probably intended for a lamp.

The most extraordinary permanent edifices of the Esquimaux are those constructed of the bones of whales, walrus, and other animals. Sir Martin Frobisher first makes mention of this kind of dwelling as existing at Labrador, and Sir Edward Parry and Captain Lyon afterwards found the same style of house adopted by the natives of Melville Peninsula and of Igloodik. They are built circular, and of a dome-like form; the lower part or foundation being of stones, and the rest of bones gradually inclining inwards and meeting at the top. The crevices as well as the whole of the outside are then covered with turf, which with the additional coating of snow in the winter serves most effectually to exclude the cold air. It is about 17 or 18 feet at its base, and about 9 feet in height. The entrance is towards the south, and consists of a passage ten feet long, and not more than two feet in height and breadth; it is built of flat slabs of stone, and has the same external covering as that of the hut. The beds are raised by stones two feet from the ground, and occupy about one-third of the apartment at the inner end. Near the huts when they were discovered were large tumuli, which had been formerly dwellings, but which were then solid moss-covered mounds.

Although during winter the Esquimaux generally occupy permanent dwellings, it not unfrequently happens, from scarcity of provision, or some other calamity, that it is necessary for them before spring arrives to seek a new home. When we consider the low temperature of the country which many of the communities inhabit; that in many parts it is destitute of wood even for fuel; that the fixed habitations being cemented together by frost cannot be removed, and that the summer tents from their construction are not calculated to withstand the cold, we are at first led to suppose that, if driven at the inclement season from his accustomed haunts, death must soon close the sufferings of the poor inhabitants of the Pole. But this is far from being the case, for these ingenious people have learnt to convert snow into building materials, by which means they can raise an establishment for their families in a few hours; an establishment which, from the purity of the material of which it is composed, the elegance of its construction, and the translucency of its walls, gives it an appearance far superior to a marble building. "One may survey it," says Sir J. Franklin, "with feelings somewhat akin to those produced by the contemplation of a Grecian temple reared by Phidias; both are triumphs of art, inimitable of their kind."

Having selected a spot where the snow is sufficiently compact, they commence by tracing out a circle of from eight to fifteen feet in diameter, proportioned to the number of occupants the hut is to contain. They then prepare a number of oblong slabs of snow of six or seven inches thick and about two feet in length, which are tenacious enough to admit of being moved without breaking or even losing the sharpness of their angles. These slabs, which have a slight degree of curvature corresponding with the circular foundation, are piled upon each other exactly like courses of hewn stone, and care is taken to make them fit closely to each other by running a knife adroitly along the under part and sides, and to cut them so as to give the wall a slight inclination inwards. Tier after tier is thus laid on by one man standing within the wall, who is supplied with material by one or more assistants from without. But for the better convenience of transmitting this supply to the workman, when the wall has attained a height of five or six feet, a hole is cut on the south side close to the ground. Thus they continue labouring till they have brought the sides nearly to meet in a perfect and well-constructed dome, sometimes nine or ten feet high in the centre; and this they take particular care in finishing, by fitting the last block or key-stone very nicely in the centre, dropping it into its place from the outside, though it is still done by the man within. The people outside are in the meantime occupied in throwing up snow with the snow-shovel, and in stuffing in little wedges of snow where holes have been accidentally left.

The builder next proceeds to let himself out by enlarging the hole on the south side into the form of a Gothic arch, intended as a doorway, three feet high and two feet and a half wide at the bottom; communicating with which he constructs two passages, each from ten to twelve feet long and from four to five feet in height, the lowest being that next the hut. The roofs of these passages are sometimes arched, but more generally made flat by slabs laid on horizontally. In first digging the snow for building the hut, the workmen take it principally from the part where the passages are to be made, which purposely brings the floor of the latter considerably lower than that of the hut, but in no part do they dig till the bare ground appears.

The work just described completes the walls of a hut, if a single apartment only be required; but if, on account of relationship, or from any other cause, several families are to reside under one roof, the passages are made common to all, and the first apartment, in that case made smaller, forms a kind of ante-chamber, from which the entrance is through an arched doorway, five feet high, into the inhabited apartments. When there are three of these, which is generally the case, the whole building, with its adjacent passages, forms a tolerably regular court.

For the admission of light into the huts, a round hole is cut on one side of the roof of each apartment, and a circular plate of fresh-water ice, three or four inches thick and two feet in diameter, let into it. The light is soft and pleasant, like that transmitted through ground glass, and is quite sufficient for every purpose. If fresh-water ice is not within reach, melted snow is poured into a vessel and thus frozen into a transparent plate.

When after some time these edifices become surrounded by drift, it is only by the windows that they can be recognized as human habitations, and but for them one might walk completely over them without suspecting the little hive of human beings that is comfortably established below. This, however, is not always done with impunity when the thawing within has too much weakened the roofs, in which case a leg sometimes makes its way through, to the no small terror of the inmates.

The next thing to be done is to raise a bank of snow two feet six inches high, all round the interior of each apartment, except on the side next the door. This bank, which is neatly squared off, forms their beds and fire-place, the former occupying the sides, and the latter the end opposite the door. The passage left open up to the fire-place is between three and four feet wide. The beds are arranged by first covering the snow with a quantity of small stones, over which are laid their paddles, tent-poles, and some blades of whalebone. Above these they place a number of pieces of network, made of thin slips of whalebone, and lastly a quantity of twigs of birch. Their deer skins, which are very numerous, can now be spread without risk of their touching the snow; and such a bed is capable of affording not merely comfort but luxurious repose, in spite of the rigour of the climate.

With the lamps lighted and the hut full of people and dogs, a thermometer placed on the net over the fire indicates a temperature of 33°, when removed two or three feet from this situation it falls to 32°, and placed close to the wall stands at 23°, the temperature of the open air at the time being 25° below zero. A greater degree of warmth than this produces extreme inconvenience by the dropping from the roofs. This they endeavour to obviate by applying a little piece of snow to the place from which the drop proceeds, and this adhering is for a short time an effectual remedy; but for several weeks in the spring, when the weather is too warm for these edifices, and still too cold for tents, they suffer much on this account.

The interior appearance of these habitations is rendered more beautiful when they are situated on the ice, which, being cleared of the snow, presents a flooring of that splendid blue, which is perhaps one of the richest colours in nature.

If it should happen that the family is increased by births or by the system of adoption in use amongst them, they have to enlarge their buildings, which they effect by adding another apartment, or by building a more roomy house over the old one, and as it were

\* The author of the above interesting communication was one of the party who went out in the Arctic Land Expedition, under direction of the British Government, in search of Captain Sir John Ross. The information it contains therefore is valuable, as being the result of personal observation and inquiry.

concentric with it; and when completed the old one is removed from within.

As the spring advances the snow walls melt and freeze alternately, forming innumerable icicles, which reflect the light like radiant diamonds. Although this is very beautiful, it is a source of great trouble to the poor inhabitants, whose lungs become affected from repeated colds and coughs. For this reason, although the houses are formed of snow, coolness is the object always kept in view; and from the inexhaustible building materials always at hand, but little time and labour are required to effect any alterations or additions that may be requisite to effect the purpose. Sir John Ross relates a case of a native of Boothia who had closed in his roof within 45 minutes.

Equal in beauty to the snow-houses are those constructed of fresh-water ice. When this is the material employed, it is collected in large transparent slabs, which are arranged in somewhat an octagonal form, and plastered together with snow. The roofs of some are formed of walrus skins, and others have the regular dome-tops of snow. These dwellings are so transparent that even at some paces distance it is possible to distinguish those who stand within them, yet they are so completely air-tight as to be perfectly warm. A passage of the same pure material forms the entry to the hut.

#### PROJECTED JUNCTION OF THE RED SEA AND THE MEDITERRANEAN BY A SHIP-CANAL THROUGH THE ISTHMUS OF SUZ.

This important project is attracting considerable attention in the commercial, political, and scientific circles. Several pamphlets have been recently put forth to show its practicability; but that which affords the most detailed and comprehensive view of the subject in all its bearings, is one from the pen of Mr. Arthur Anderson, of the Peninsular and Oriental Steam Company, of the contents of which may be reduced the following analysis:—Mr. Anderson, it appears, visited Egypt about two years since, when he effected some important arrangements with the Pacha, relative to the transit of the communications with India; and, as would appear from one part of his pamphlet, he must have acquired some share of Mehemet Ali's confidence, having been recently intrusted with a communication on behalf of the Pacha to Sir Robert Peel, the nature of which, however, does not transpire.

During his stay in Egypt, Mr. Anderson devoted much attention to investigate the feasibility of improving the communications with India, *via* the Red Sea, by re-opening the ancient canal, said to have once joined the Red Sea and the Mediterranean.

He obtained much valuable information on the subject from M. Linant, of Cairo, a French civil engineer, holding the important office of chief surveyor of roads and bridges in the Pacha, who had shortly previous made an elaborate survey of the isthmus with a view to ascertain the practicability of making a canal through it; and of which, from the extract of his report, given in the pamphlet, there would appear to be little doubt.

Mr. Anderson is not, however, satisfied with this part of the subject merely, but examines the whole question under the following heads:—

1. Its physical practicability.
2. Political arrangements necessary to its accomplishment.
3. Financial considerations.
4. Advantages or disadvantages of navigating by the canal route, as compared with that *via* the Cape of Good Hope.
5. General observations on its political, commercial, and moral utility.

Under the first head it is shown by M. Linant's report, that in consequence of the Red Sea being 32 feet higher than the level of the Mediterranean, the nature of the soil—a considerable part of the bed of the ancient canal remaining—together with a chain of lakes lying in the proposed track, the excavation of a canal of sufficient depth and width to admit vessels of large burden to pass from one sea to the other may easily be effected; and that, once opened, a salt-water river would be formed, flowing continually from the Red Sea to the Mediterranean, at a velocity of from three to four miles an hour. M. Linant estimates the whole expense of making this canal,

including a pier or breakwater at its embouchure in the Mediterranean, at only 175,000*l.*, which Mr. Anderson considers much below the outlay that would be required. This is a point, however, of no great importance, as it is subsequently shown that the canal, if opened so as to admit a general intercourse through it, would, at a moderate toll, yield a revenue sufficient to repay the outlay of several millions.

Under the second head, Mr. Anderson considers it doubtful whether Mehemet Ali would be induced to enter upon such undertaking, except through the intervention of some of the leading European powers, and under such guarantees from them as would secure to his descendants a permanent benefit from the tolls of the canal. He then shows the interest which each of the European powers would have in promoting the object.

Under the head of "Financial considerations," he shows, from the value of the trade with the East, and the tonnage of shipping required to carry it on, together with the advantage to be gained by the shorter route, that, estimating only one-fourth of the trade to pass through the canal, and at a very moderate toll, it would yield a revenue of 200,000*l.* per annum—equal to five per cent. on a capital of four millions, whereas M. Linant's estimate of the required outlay is only 175,000*l.*

Mr. Anderson, under the fourth head, enters into a detailed comparison of the advantages or difficulties of navigating by the proposed canal and the Red Sea, as contrasted with the present route *via* the Cape of Good Hope, and also points out some obvious and most important advantages which the canal would afford to steam navigation with India, &c.; and he concludes with some general observations as to its utility in a political point of view, as well as in promoting the interests of commerce and civilization throughout the East, which every one must concur in.

The object of his publication Mr. Anderson states to be to draw the attention of the public and the government to the expediency of having the surveys already made verified by British engineers of such eminence as to settle the question of the physical practicability of making a harbour at its entrance in the Mediterranean; and also to ascertain by what means and to what extent the Pacha of Egypt would be induced to undertake or co-operate in it: two points which Mr. Anderson considers must precede any other proceedings, and ought to be taken up by, or under the auspices of, government, under whose notice, it appears, he some time since brought the matter.

The time chosen for calling public attention to it is opportune. The new relations established with China—the increasing development of the resources of our vast Indian empire, and the growing importance of our Australasian colonies, all tend to enhance the importance of so improved a route for oriental commerce; and when the immense influence which it would exercise in civilizing the East is also considered, its accomplishment would, no doubt, be one of the most splendid as well as most useful achievements of modern enterprise.

—*Morning Herald.*

#### PRESTON INSTITUTION FOR THE DIFFUSION OF KNOWLEDGE.

##### PROPOSED NEW BUILDING.

The present establishment, in Cannon-street, comprising the usual objects of a Mechanics' Institution, was founded in the year 1828. It now possesses a valuable library of more than 3,300 volumes, in different branches of literature and science, besides philosophical instruments, works of art, a numerous collection of natural curiosities, and other articles, forming a museum well worthy of inspection; but the entire property of the institution being crowded together in one room, of very inadequate size, which is also at the same time necessarily used by the members for reading, the utility and interest of the whole are consequently much diminished. The only other room in the present building is fitted up as a lecture-room, being also used by different classes of the members in their meetings for mutual instruction, and it is much too small for either of those purposes. This want of accommodation, in every department, not only forms a bar to

the increase of the library and museum, but many of the working-classes, for whom the institution was principally intended, are thereby prevented from availing themselves of the benefits which it might otherwise afford, and for which there is now an increasing desire.

A proposal was very recently made to the committee by several musical amateurs, members of this institution, and others, for the formation of a choral class, in connection with the institution; they undertaking to provide music and instruments at their own expense, upon condition that any additions made by them to the property of the institution, should only circulate amongst those who are or who should become members of such choral class, as well as members of the institution. The committee having deemed it expedient to accept this offer, the choral class has been formed upon those terms, and upwards of fifty names are already entered as having joined it, being also members of the institution.

It is proposed that the intended new building shall comprise suitable apartments for a library, a museum, a reading-room, a lecture-hall, and class-rooms, in accordance with the original objects of the institution; and also a music-hall, wherein sacred music and miscellaneous concerts may be performed every week, as for some time past has been the case at similar institutions in Liverpool, Manchester, and other large towns; and which is found to engage the attention of great numbers of both sexes in innocent recreation, who might otherwise have been induced to spend their evenings at public-houses, or in still worse places.

The funds at present applicable to the purchase of land, and the erection of a new building, have arisen from the surplus receipts at an exhibition in the Corn-Exchange four years ago; and a legacy of 100*l.* (minus duty) from the late Mr. Hamer Hargraves, amounting, together with the interest allowed by the bankers, to nearly 400*l.*; exclusive of the profits of the late hall, not yet ascertained; and about 45*l.* collected within the few last weeks amongst the working-classes, of which a separate account is kept under the designation of "The Operative Building Fund," and which is expected to be considerably increased within a short time. These resources are, however, very insufficient for the providing and fitting up of a suitable building to comprise all the above-mentioned desirable objects, upon an adequate scale, with a view to the numerous and increasing population of Preston. Contributions are, therefore, respectfully solicited from the public at large, and especially from the wealthier and middle classes of inhabitants and others, who are interested in the town and neighbourhood of Preston.

The present funds are placed in the bank of Messrs. Lawe, Hudson, and Lawe, in the names of the following trustees, *viz.*:—R. W. Hopkins, Esq., John Addison, Esq., Thomas German, Esq., John Pacey, Esq., George Jackson, Esq., Charles Buck, Esq., and B. F. Allen, Esq.; and all future subscriptions will be placed to the same account.

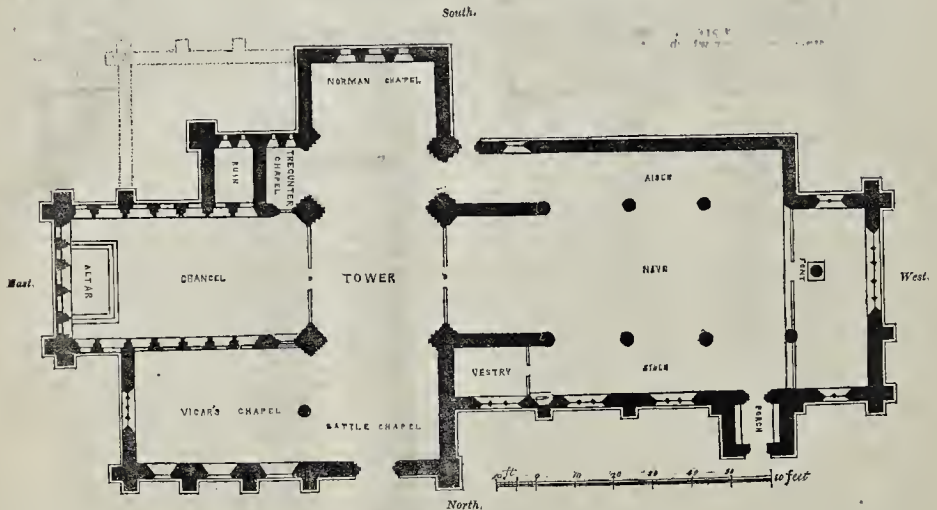

Contributions may be paid or remitted to Robert Lawe, Esq., Treasurer of the Institution, at the above bank; Mr. J. R. Allen, Secretary; or any of the members of the committee.

**MOLIERE'S MONUMENT—AN AWKWARD BLUNDER.**—The *National* notices a fault of orthography on the monument of Molière, which was only perceived after its inauguration. The figure placed to the left of the fountain, and representing a muse, holds in its hands a list of Molière's comedies, on which the *Avare* is written with two r's. "What," asks the *National*, "can the Committee of Surveillance say for itself? It cannot plead want of time nor want of spectacles. The word is written in black capital letters on a white marble, as clearly and visibly as possible. The committee consisted of 20 members, some filling the highest offices in the Administration, and the others occupying seats in the Academy or belonging to the French Theatre. One would naturally suppose those gentlemen to be competent judges. If they did not sin through ignorance of grammar, how have they accomplished their mission? What did they oversee? A fault of orthography on a literary monument, between the bands of a muse and by the side of Molière! A fault of orthography saluted by all the learned bodies in Paris! Such a mistake is certainly calculated to rejoice critics; and the epigrams to which it gives rise are assuredly well-merited.

## PRIORIAL CHURCH OF THE HOLY CROSS, BRECON.

NORTH-EASTERN VIEW.

GROUND-PLAN.

TO THE EDITOR OF THE BUILDER.

SIR,—Having a short time ago sent you for insertion in *THE BUILDER*, a sketch of a Saxon font, I beg now to forward you a perspective view and a ground-plan of the church in which it is placed, from my own sketch and actual measurement; and if you can find room in an early Number for them, and the interesting particulars I have gathered respecting the first erection of the church, you would greatly oblige me, your most obedient servant,

J. L. T.  
Berkeley-place, Brecon, December, 1843.

St. John the Evangelist's, formerly from its cross aisles and chapels called *Ecclesia Sancta Crucis*, and sometimes the Church of the Holy Rood, stands upon a hill above the river Howden. It is certainly most romantically situated on the verge of a thick wood intersected with delightful walks, below which the murmuring stream, bursting over many natural and artificial falls, hides itself in the thick and ample foliage, and here and there reveals itself again with increased force and beauty; and being surrounded by a chain of stupendous mountains, amongst which are prominently

seen the celebrated Brecknock Beacons, it forms upon the whole a picture on which the eye would dwell long with interest and admiration. The church formerly, like the precinct of the priory, was surrounded by a lofty and strong embattled wall, still remaining on the western side. Some suppose it was built, and others think it was only repaired, by Bernard Newmarch, the Norman conqueror of Brecknockshire, who entered the county in the year of our Lord 1092, and, by the superior discipline of his Norman soldiers, prevailed against the sturdy bravery of the Welsh; and their king, the courageous but unfortunate Bleddin ap Meenarch, who opposing him,

was slain gallantly defending his life, his liberty, and his country against a horde of robbers, who had no pretence for hostilities except a savage and unjustifiable love of plunder, and no argument but the sword to support them. However, as regards the church, it is probable there was one here before the conqueror's time, from the above-mentioned Saxon font, and some slight remains in the present building of the architecture of that age; but it is certain he so far improved and enlarged it, and caused it to be dedicated to the honour of St. John the Evangelist, that he may very properly be called its founder. Since his days it has undergone so many changes, in consequence of the injuries of time and unavoidable dilapidations during the lapse of nearly eight hundred years, and the "beautifications" (to use a Gothic term to describe a Gothic act) the interior has lately received, that little of its original form remains; and at present it has a venerable, though rather a motley, appearance to the eye of the man of taste.

The outward walls of the nave beneath the tiles are what is termed embattled, and within runs a gutter to carry off the water. The windows are the "pointed" of the 15th century, and divided at their tops by ramifications; the western one only excepted, which has a circle near the top, within which are quatrefoils conjoined at the centre. The aisles, which appear to have been added subsequently to the erection of the most ancient part of the fabric, have windows of a later date. The arch of the north eastern door is of the same date as the windows in the nave. Proceeding eastward a different style prevails; so that it appears from the long lancet windows divided on the inside by slender clustered columns, and externally by narrow compartments, that the chancel and cross aisles, on the junction of which is placed the tower or steeple—a building of the same age—are of much higher antiquity.

At first the structure was perfectly cruciform, as there formerly stood a chapel on the site, marked on the plan by dotted lines, out of the ruins of which the two small chapels were built some three centuries ago. To describe the interior of the church in its present state, I begin at the western end, near which is the beautiful circular stone font before-mentioned. The nave of the church, which is very lofty, is in length from the western end to the entrance into the chancel, one hundred and thirty-seven feet. On each side are the aisles divided from the nave by lofty pointed arches on round piers. It is intersected by two cross aisles, or transepts, forming the Chapel of the Men of Battle and the chapel of the Norman or Red-haired Race, in the vernacular, Capel Cochaid; they are each about 40 feet in length by 30 feet.

The chancel is 64 feet in length by 30 feet in breadth; and here time and his apparent adversary (though frequently too powerful coadjutor), *innovation*, have failed in their attempts to efface more than a portion of the ancient magnificence of the Brecknock Priory Church. On each side are rows of light and beautiful clustered columns, broken off just above the corbels, though they shew parts of the ribs springing to support the roof; these were, doubtless, continued originally throughout the nave; for though the ceiling which preceded the present one was of early date, I should not suppose it was coeval with the foundation of the fabric.

Those who have seen structures of the same description as Westminster Abbey, know how to appreciate the grandeur and sublimity of this style of architecture; and admitting the varied excellences of the different classic styles—the elegance of the Grecian, and the boldness of the Roman—yet what is so strangely called the Gothic arch, has something peculiarly attracting in its sweeping curve and finely-pointed termination. The long rows of slender columns, shooting loftily up and at once bursting in the richest and most fanciful foliage, or mingling in the labyrinth of the intersecting groin, and all the varied details appertaining to this most interesting style, naturally and forcibly elevate the human mind, tend to impress the soul with devotion, and powerfully assist and promote religious awe and holy rapture, when—  
"Through the long-drawn aisle and fretted vault  
The pealing anthem swells the note of praise."

J. L. T.

DESIGN FOR AN INFANTS' SCHOOL.

ELEVATION OF THE SCHOOL ENTRANCE FRONT.

Porch. School-Room. Dwelling.

LONGITUDINAL ELEVATION.

GROUND-PLAN.

TO THE EDITOR OF THE BUILDER.

In the ground-plan, A, is the school-room; B, a lobby open at the sides and front; E, parlour; D, bed-room; F, kitchen; and G, a wash-house, communicating with a small yard at the back; H H, are passages; C is a committee-room, which might also be used in the day time as a repository for books, &c. The school-room would accommodate 330 children, and be kept at a proper temperature by two stoves in the centre; the ventilation would be ensured by the top sashes being made to swing on pivots; no ceiling would be necessary. If intended to be used also as a Sunday school, a moveable partition may be constructed so as effectually to divide it when requisite into two separate rooms.

In the elevations I have endeavoured to unite economy with propriety. The dwelling-house ought in the design to form a feature distinct from the school. The pilasters, plinth, entablature, chimney-shafts, and the dressings to the doors and windows should be of cement jointed, the other parts might be of brick. A wall may surround the play-grounds; their size depending on the plot of ground intended for the site. The building ought to be at some distance from the footpath, and should be surrounded by an iron railing, with piers and gates. C. D.

London, January 2, 1844.

[We do not approve of the mass of building containing the porch being set before the end of the school-room, finished with a pediment, which latter it would partly conceal in every view; the flank of the school-room containing six bays and six windows, we hold would be improved by continuing the roof of the school-room quite over the porch, so as that an unobscured pediment might then be formed over the end elevation of the whole building; and also that the flank elevation might contain seven bays and seven windows, and two closets might then be formed at the sides of the porch. We do not particularly like the dwelling-house as attached to the main building, making the latter merely as an irregular wing, without being picturesque, although uniformity has been sacrificed. We do not approve of a public building being unsubstantially decorated with cement; but prefer the adoption of a style of architecture which can be executed with a moderate proportion of dressed stone, or with moulded brick. We do not think strict economy has been followed in making the dwelling, which consists of small apartments, one of them only 14 feet by 9 feet, in a building, of the same altitude as the school-room, which is 66 feet long and 33 feet wide. By the adoption of domestic Gothic architecture in school-buildings, all these sacrifices and anomalies may be effectually evaded, and the feelings of most people be better consulted. Nor is there any reason why school-buildings should be of the very latest kind of the Gothic, or of the latest Tudor style, from whence "the vital spark" of architecture "had fled," but the more ancient and more scientific style, of assimilation with the parish churches, may be successfully adopted.—Ed.]

## Literature.

*New Experiments on Building Materials, in Reference to their Conducting Power, Dryness, and Resistance to the Progress of Fire; as read before the Chemical Society of London.* By JOHN HUTCHINSON, M.R.C.S. F.S.S. London: Taylor and Walton, Upper Gower-street, 1843. 8vo. p.p. 48. 1 lithograph.

THE author of this tract sets out with declaring that "having been, for some time past, engaged in the study of Medical Police, or Public Hygiene, I found upon following out one of the branches of that science (the section of warming) a great want of information respecting the relative conducting power of the various materials used in building. I therefore conceived it absolutely necessary to examine this subject, as it appeared to me impossible, or at least unwise, to put forth rules to the public for the best mode of warming buildings, with a view both to economy and safety, until I ascertained the natural relative power of the different substances used in their construction for confining heat or permitting its escape. Hence I instituted an extensive series of experiments for that object, which I now venture to lay before this society, with a few remarks relating thereto.

"To be brief, I may therefore say that the present memoir is an inquiry into the relative power of conducting caloric, of all or most of those materials used in the construction of our habitations, whether private or public, together with their relative specific heat.

"The substances which I have examined are the following, viz:—

"Of Woods.—Oak, beech, and fir.

"Of BRICKS.—Common or Cowley stock brick, facing or malm brick, and fire brick.

"Of COMPOSITIONS.—Asphalt, hair and lime, lath and plaster, Roman cement, plaster and sand, plaster of Paris, and Keene's cement.

"Of ROCKS.—Slate, Yorkshire flag stone, Leunelle marble, Napoleon marble, Portland stone, Bath stone, chalk, and three specimens of the stones used in building the new Houses of Parliament, namely, Norfolk, Bolsover, and Painswick.

"Of METALS.—Lead.

"The annexed table No. II.\* will shew the times of the passage of caloric as to velocity through the various substances. It is here designated the 'resistance to the passage of heat inwards,' in contradistinction to another class of experiments, of heat passing outwards, established by the laws of cooling. In the last column of Table II., the mean time of every 10 degrees rise, is calculated. It will be here observed, that the resistance afforded to the passage of heat for the first degree, *i. e.*, from 55° to 56°, is 71"·5, and the first ten degrees only 82"·58, and the two following ten degrees progressively less; it is not until the 100° that the time materially increases, and from thence it continues to increase up to 200°.

"ON THE RELATIVE DRYNESS OF BUILDING MATERIALS.

"This portion of the present memoir has been added after the foregoing experiments were read before the Chemical Society. Finding the subject of the natural absorbing power of these substances for water easily obtained, and believing also the inquiry to be of no less importance as regards Hygiene than that of their conducting power for heat, is the reason I assign for subjoining this matter, as it may there by enable builders to correct, in a great measure, the evil attending that dampness natural to certain localities, which affects the foundations of buildings, to the great inconvenience of their proprietors.

"Eight other substances have also been added to twenty-two of the materials before examined. I am indebted to the kindness of my friend, Mr. Robert Robinson, of Newcastle-upon-Tyne, for forwarding to me some different specimens of flag stone now much used in that town, which has been so remarkably altered of late years; some of them will be seen by the table to resist the passing of moisture most completely; also a specimen of Maulmieu teak, a wood which is now rapidly coming into use from the many advantages it possesses over oak, especially that of its not destroying iron. A specimen has also been for-

\* We have not space for the insertion of these valuable tables.

warded to me of Messrs. Mann & Co.'s 'Patent stucco paint cement,' which, I understand, is extensively employed by engineers and conductors of public works, from its property of resisting the transmission of moisture in exposed and damp situations. It also adheres with great firmness to any smooth surface, and hence is well adapted to encase brick houses. I am told the principal ingredients used in its composition are linseed oil, resin, and a sand stone, of the oolite kind, from Rouen.

"Five hundred grains of each of these materials were reduced to coarse fragments of uniform size, and laid between thick cloths, perfectly saturated with water, for a given number of hours, and afterwards weighed; the increase of their weight signifying the quantity of water absorbed by each substance. In the following table the substances are ranged in gradation; the driest, or that which absorbs least water, placed first, and that which absorbs most water at the bottom of the list, with the others arranged between in their respective order. The first column gives the absorption by equal weights, and the second column the absorption by equal bulks; and the third column the specific gravity, or their relative weight as compared with water.

TABLE X.  
Absorption of Moisture, by Weight.

Name of Substance.	Absorption of moisture by weight.	Absorption of moisture by bulk.	Specific gravity.
Aberdeen Granite ..	2·00	5·416	2·708
Napoleon Marble ..	3·00	9·85	3·284
Carrara White do. . .	3·10	8·42	2·717
Shetland Flag Stone	3·25	8·74	2·691
Caitness ditto . . .	3·27	8·62	2·638
Slate . . . . .	3·50	97·58	2·788
Leunelle Marble . .	4·00	10·71	2·678
Asphalt . . . . .	5·00	12·86	2·572
Carrara hard Marble	8·50	23·09	2·717
Mann & Co.'s Stucco	16·00	35·56	2·223
Arbroth Flag Stone	20·50	50·77	2·477
Hewthorn ditto . .	23·00	56·85	2·422
Fire Brick . . . . .	32·00	70·43	2·201
Norfolk . . . . .	33·50	74·33	2·219
Portland . . . . .	34·25	73·87	2·157
Yorkshire Flag . . .	40·00	94·40	2·360
Bolsover . . . . .	40·10	86·77	2·164
Painswick . . . . .	58·00	129·80	2·238
Bath Stone . . . . .	78·00	144·12	1·858
Maulmieu Teak . . .	82·50	61·85	·7498
Stock Brick . . . . .	109·00	199·57	1·831
Hair and Lime . . .	109·12	184·52	1·691
Malm Brick . . . . .	116·50	186·63	1·602
Keene's Cement . . .	126·50	155·59	1·230
Chalk . . . . .	133·50	206·79	1·549
Roman Cement . . .	133·56	208·35	1·560
Plaster and Sand . .	147·00	192·27	1·308

Plaster of Paris . . .	187·50	220·50	1·176
Oak . . . . .	224·75	128·04	·5697
Fir Wood . . . . .	622·75	265·41	·4262

## " PRACTICAL DEDUCTIONS.

"Asphalt stands as the best composition for resisting moisture; it is a slow conductor of heat, and hence is well adapted for flooring, as in cells of prisons, where economy of heat and dryness, the most important advantages, are obtained. Slate will be seen to stand as a very dry substance, but from its quick conducting power (Table IX.) it is very unfavourable to flooring where warmth is required; but when the one property is sought for and not the other, as preventing the ascent of moisture up the walls of houses, it is well calculated to be useful, by forming a layer in the wall a few inches above the ground. The absorbing power of common brick appears very great, being more than 1 of its own weight, whereas Mann & Co.'s cement is not greater than 1/4 of its own weight, and hence more than six times better adapted to resist moisture than brick; therefore the advantage to be derived by covering brick houses in exposed situations with this substance is considerable, while Roman cement resists moisture even worse than brick. I wish it to be borne in mind that I only speak of this stucco as regards its power of resisting the transmission of water, being the only property of it which I have examined.

"Keene's cement and plaster of Paris stand as the warmest substances, therefore are well adapted to line rooms with; while hair and lime is a remarkably quick conductor, and therefore a cold substance for that purpose. I

would also draw attention to the fact that plaster and sand and plaster of Paris (particularly the latter) are admirably calculated to resist the action of fire; while we know, on the other hand, that lath and plaster is about the most combustible material in a house. I can most confidently recommend plaster of Paris and plaster and sand to be employed in surrounding iron chests, or other places which contain valuable property, intended to be protected from fire. If an iron chest be surrounded with six or eight inches in thickness of this substance, I believe it will perfectly preserve papers, &c., from any destroying heat in the midst of the burning of our ordinary dwelling-houses. I may also point out that Yorkshire flag stone is a very quick conductor, and therefore ill adapted for warm flooring; also that lead which forms the covering of roofs is a remarkably quick conductor, and therefore a great waste of heat is experienced where such covering exists; hence the third back rooms on ground floors in our London houses are found to be so cold; a vast quantity of heat escapes through the leaden roof and through three of the surrounding walls, which are generally external, and so thin as to allow of a free escape of heat. Such places should be lined with slow conductors if warmth is sought for. Touching the practical utility of the specific heat experiments, I may point out that fire-brick absorbs a great quantity of heat, and therefore is well adapted to form the backs of our fire-grates; whereas, with iron backs, there is an enormous waste of fuel and heat, at the same time the fire requires constant stirring, and a quick supply of coal to keep it in; yet, curious to remark, we never enter a house, even of the highest order, where iron backs to fire-grates are not universally to be seen; while a back formed of a composition, as that of fire-brick, which can be as easily moulded into any desirable shape, would save fuel, thoroughly warm any apartment, require less stirring, and not go out so soon.

"There certainly exists in the present day a most extraordinary inattention to the economizing of artificial heat generated in the fire-grates of our dwellings in this country; the whole of this error proceeds from the total inattention of architects and builders to the subject of the difference of conduction of heat by different materials, which, I consider, is one of the most important points to study before an architect attempts to construct a dwelling. According to Deprez, iron is more than twice as quick a conductor as lead, and, according to these experiments, lead is more than eight times as quick a conductor as fire-brick, bearing the relation of 1888 to 233; and the difference of the relative absorbing power for heat, viz., that heat which is required to bring them to the same temperature, is in the relation of ·0392 to ·017, the fire-brick retaining nearly seven times more heat than the lead. If to this we add the great escape of heat by the chimney, well might it be said that 'not more than a fiftieth portion of the heat generated was rendered available for warming apartments at the period Franklin visited England.' Rumford estimated the loss of heat and fuel to be more than 1/3, and the lowest estimate is that of 1/2. A due consideration of conduction, in relation to this most necessary part of our habitations, would, in a great measure, contribute to produce that which is sought for by every Englishman, 'a cheerful fire.'

"With regard to the specimens of wood I have examined, it is worth observing that Maulmieu teak absorbs much less water than oak wood, in the proportion of 82 to 224, being nearly one-third less; and as the density of woods in their ordinary state bears a strict relation to their porosity or proportion of air within their pores, connecting with this, the fact that iron, protected from contact with the atmosphere and water (being compounds of oxygen), the better it is preserved, may very possibly be the reason assignable for the truth why iron is preserved considerably longer in Maulmieu teak than in oak; the relation of absorption of water with the teak and oak (omitting the decimals) is as 82 of the former to 224 of the latter. The density of all these specimens of wood is here calculated from the state in which they naturally exist, that is, as dry as could be obtained, yet containing an unknown quantity of air and moisture. Mr. Parnell observes, 'when wood, rendered perfectly dry by the aid of heat, is exposed at

common temperatures to the atmosphere in its ordinary state of humidity, it re-absorbs a certain proportion of water, varying according to the compactness of the wood, and to the quantity of deliquescent saline matters present. In reference to these two assigned reasons that govern the absorption of water by woods, I would draw attention again to the Maulmten teak in comparison with the beech wood; the relative specific gravity or density of the former to the latter is as 7442 to 7498, being very nearly equal, yet the absorbing power of the two is very different, being in the proportion of 82 to 185. These facts render it incumbent on me to recommend it to the attention of ship-builders.

"By Table X. it will be observed that the two kinds of flag stone, termed Sheldand and Caithness, absorb very little moisture. Having been previously informed of this property, I was desirous of examining them, and certainly they maintain the character determined from the observation of practical men. Their conducting power for heat, I had not an opportunity of calculating, but if I might venture an opinion, I suspect they would range like Yorkshire flag stone; if so, they are quick conductors, or cold materials for flagging rooms where warmth is required; nevertheless, they will be found as valuable materials for arresting the ascent of moisture in the walls of houses; and speaking from memory, I believe the Caithness flag has thus been employed in the North of England with great success.

"The Carrara marbles mentioned are those generally employed in constructing mantel-pieces; it is curious to observe, though their density is the same, yet the harder specimen absorbed more than twice as much water as the softer marble.

"Portland stone, Bath stone, and the stones employed in erecting the new Houses of Parliament, may be considered as spongy materials for absorbing water; their relative conducting power may be referred to in the first column in Table IX. It will also be seen that Napoleon marble is a warmer material than common brick. I mention this to correct the general opinion that brick is a slow conductor, and therefore a greater thickness of that material should be used in forming the walls of our houses; hence it is that the brick walls so often neither afford protection from the cold of winter nor the heat of summer.

"It will be observed that the specific heats have been compared with water as 1; therefore, if we reflect upon the capacity of water for absorbing heat, it very much exceeds all the substances with which it is compared. Water, therefore, becomes a reservoir for heat upon the surface of the globe; islands being surrounded by this reservoir, are preserved of a more equable temperature than main lands. It was the knowledge of this which led Cook to the conclusion that there must be a vast continent at the South Pole. That great current, universally bearing in one direction from south to north, the 'Gulf Stream,' transports an enormous quantity of heat from the Equator towards the North Pole, running at the rate of four miles per hour, and retaining for a thousand miles, from the Straits of Bahama, a temperature of ten degrees warmer than the air, and maintains an open sea, in the meridian of East Greenland and Spitzbergen, moderating the cold of all the lands in that inhospitable region. What has thus been going on for ages in the great scale of nature, is now made applicable in miniature, where water is used to warm the different apartments in our habitations, receiving a great amount of heat at a given point, and circulating through our chambers in pipes, yielding back that heat to the surrounding medium.

"In reference to the conducting power of malm and stock brick, it will be seen that stock brick is placed twelfth in the scale, and malm brick the sixteenth; it is, therefore, so much colder as a shield from the weather. From this circumstance I would remark, that when this brick (malm) is used to case a building (as is now commonly done), the walls should be constructed proportionally thicker, or we render the house so much colder. The absorbing power also of this brick for heat is very low, being placed third in the scale in Table IX. (third column); therefore we may conclude that malm brick is more a substance to please the eye for building than useful as a protection against the escape of heat; and

what applies to the escape of heat will bear a similar relation to the protection against the cold of our climate.

"It is curious to observe how low in the scale hair and lime is placed, both as to the conduction and capacity for heat. If lead were omitted from the tablet would stand nearly as the quickest conductor and the lowest specific heat, proving that the compound is ill adapted to line our rooms, as far as concerns the preservation of heat. The best property of Roman cement, from these tables, certainly appears to be that of its slow conducting power, and therefore it is much better adapted to encase brick houses than malm brick; and as far as regards their relative absorbing power for moisture, the difference is not very great, being in the relation of (omitting the decimals) 133 of the former to 116 of the latter. But in this humid climate, the absorption of moisture is a most important consideration for all who erect habitations with a view of combining comfort with the order of architecture. Too often is it to be seen that the former, not to say yields to, but is totally neglected for the sake of the latter. One of the great exciting causes of rheumatism, that most common disease, is, I believe, most generally produced by the ill-constructed order of our habitations. Were air visible, we should wonder at witnessing the cascade (if I may be allowed to use this term) that is maintained between the windows and doors towards the fire-place, in the midst of which we are compelled to exist, and when experiencing this we draw towards the very part of the room where the current is strongest—to that imaginary circle which encompasses the fire,—here the evil is increased."

The above copious extracts from this small tract will give some idea of the valuable practical philosophy relating to architecture contained in its few pages; but much greater promise is held out by the author in his concluding observations, which are as follow:—

"With these remarks I leave the subject for the present, intending to enter more into it in a work which will shortly appear on the 'Construction, Warming, and Ventilating of Public and Private Buildings,' a topic which has lately engaged much of the public attention, and on which many revived theories have been brought to the test of experiment as newly discovered; but which, it will be obvious from a perusal of the work in question, are, in point of fact, some of very ancient date, and not one of recent invention, more especially those now in use in the ventilation of public buildings."

We doubt not the author's numerous, extensive, and toilsome experiments will prove a successful addition to the knowledge of practical architecture. We therefore recommend an attentive perusal of this work, which, though small, is a condensation of a great deal of scientific work; and no doubt he who does peruse it will desire anxiously to see forthcoming Mr. Hutchinson's other works.

## F.

## HOSPITAL OF ST. CROSS, WINCHESTER.

In the Hospital of St. Cross is reformed at all, it must be by the pressure from without. Public opinion must be brought to bear upon it, and public spirit and public honesty be set in array against the present monstrous mode of applying its revenues. We have fortunately a parallel case in our own city; and the success which attended the exertions of those public-spirited individuals who rescued the management of St. John's Hospital and other charities from the old corrupt Corporation of Winchester, should stimulate others to do likewise. St. John's Hospital, like the Hospital of St. Cross, once maintained but six old women, with but an indifferent allowance; while its revenues were expended for the benefit of its managers—the mayor and aldermen of Winchester. Suits in Chancery were commenced against the corporation, notwithstanding that they were appointed, by the testaments of the endowers, the managers and controllers of the charities through all time, just as is the present Bishop of Winchester the controller, the responsible controller, of St. Cross. Those suits were, after much vexatious opposition and delay, successful against the corrupt trustees, and the control they had abused was taken from them and given to others nominated by the Lord Chancellor. And what is the result?

Twenty-six persons are now comfortably lodged and fed; a new alms-house is built; the revenues are rapidly increasing; the charity is now a far more valuable one than is St. Cross under its present mismanagement; and all this good has been effected by the disinterested and philanthropic exertions of a few men who sought no other reward than the approval of their own consciences, and the approbation of all honest men. A similar course would be, we think, successful in the case of St. Cross; and in these times of reform and improvement, when associations are formed for the carrying out of almost every conceivable mode for benefiting the poor, and removing the plague-spots of ignorance and pauperism from the land, surely there are those who will lend a hand to such a noble and desirable object. The preachers of that faith of which the noble master of St. Cross is also a teacher, tell us from their pulpits that "he who giveth to the poor lendeth to the Lord." What he does and deserves who taketh from the poor we may imagine. But surely a gift to the poor which promises a more abundant return can hardly be found, than would a mite contributed to a fund for instituting suits in Chancery for the restoration of the funds of St. Cross Hospital to their original uses and intentions. We have merely thrown this out as a hint which we hope will be acted on. We can see no reason why the Hospital of St. Cross should be exempted from the power which has searched and reformed other public charities. We know that no charitable institution ever needed it more, and we hope yet to see it what it ought to be—an extensive asylum for the poor and destitute; a means of assistance to the hungry and thirsty wayfarer and wanderer.—*Hants Independent.*

## STATUE OF THE QUEEN AT EDINBURGH.

THE magnificent statue of Queen Victoria, executed by our celebrated sculptor, Mr. Steele, and which workmen have been employed for some time past in erecting on the top of the grand portico of the Royal Institution Buildings immediately behind the apex, was opened to public view on the evening of Tuesday, and in the course of Wednesday was eagerly gazed upon by numerous groups passing along the fine promenade of Prince's-street. It called forth general admiration, although there were not wanting individuals to make objections in reference to various supposed faults in the design, which, however, none of these hypercritics could very satisfactorily explain. As we have said, the statue was the subject of general admiration. Our Most Gracious Sovereign is here represented wearing a simple coronet, but in her robes of state, which are draped in such a way as to give a general idea of Britannia, as seen on the coins of the realm, while the bust and features most strikingly resemble those of the Queen. The neck and head are truly graceful, and the *tout ensemble* is classical and commanding. The height of the statue and base is 18 feet, while the length of the base (the doving robes reposing upon it) is about 20 feet. Her Majesty is here represented in a sitting posture, her left hand leaning on the orb, while from her right hand, covered by the drapery, appears the point of the sceptre, resting on the arm. The Queen is looking up Hanover-street, towards the statue of George IV., her royal uncle, in the centre of George-street. The statue adds greatly to the architectural magnificence of the Royal Institution Buildings; and, when viewed from the west, forms a fine leading point for the Scott Monument, and other interesting objects in the vista. It is creditable to the institution, and will no doubt serve to extend the fame of the clever sculptor.—*Caledonian Mercury.*

## MONUMENT TO DR. HARVEY, FOLKESTONE.—

It is in contemplation to erect a monument by subscription to the memory of the celebrated Doctor Harvey, the discoverer of the circulation of the blood, &c.; and several respectable inhabitants are actively engaged in collecting funds in order to raise a memento to their illustrious townsman. Dr. Harvey was born in Folkestone, and it is intended to erect the monument on the spot of his birth-place.

A ROYAL COMPOSER.—A portion of the musical service at St. George's Chapel, Windsor, on Sunday last, was the composition of Prince Albert.

## RAILWAY INTELLIGENCE.

*Extension of the Eastern-Counties' Railway to Ipswich.*—There now appears every probability of the Eastern-Counties' Railway being extended to Ipswich, every preparation having been made for the introduction of the bill for that purpose into the House of Commons. The opposition of the Eastern-Counties' Company has so far subsided that, we understand, they are very desirous to promote the extension, and the bill is now intrusted to the care of the Parliamentary agent they had retained for the Hadleigh line. The applications for shares have been very numerous, considerably exceeding the number at the disposal of the committee, so that the apprehensions of the *Railway Times* and *Bury Post* upon this subject may be allayed. As a portion of the extension from Colchester, we shall be happy to see the work commenced, and we confidently expect that it will ultimately become the main line to Norwich. Considering that the Northern and Eastern Extension, by which it is now proposed to connect Norwich with the metropolis, will be at least 15 miles longer than the route by way of Ipswich, we think we may entertain an expectation that the citizens of Norwich will regard with favour an extension of the Norwich and Brandon Railway from East Harling to Stowmarket. Indeed, as the principal railway traffic from Norwich must be towards London, the saving of 15 miles in distance must be of some moment. We observe that a meeting is to be held at Bury next Wednesday, to consider the course to be pursued in consequence of the abandonment of the Hadleigh line by the railway company. Mr. Eagle has addressed a letter to the local papers, in which he suggests that exertions be made to induce the Parliament to institute a deliberate inquiry into the merits of the variety of different plans proposed, before they allow any bill whatever to pass upon the subject. Mr. Eagle here refers to the Northern and Eastern extension, and the Hadleigh and Bury branch; but we must remind him that Parliament has already pronounced upon the expediency of a railway via Ipswich to Norwich; which resolution, we suppose, will have some weight with the committee on the Ipswich bill. It may therefore be assumed that the main line to Norwich will in no case be made by way of Bury. We hope, therefore, the meeting on Wednesday will see that their interest lies in supporting the Ipswich line, as well as in proposing a branch to Cambridge. Under such circumstances, we see no reason why the town should lose the benefits of its market, for it will still remain the centre of a large district. With regard to the Harwich extension, we understand no arrangement has been come to between the competing interests of Mr. Locke's line, supported by Mr. Attwood, and Mr. Braithwaite's line. The plans and sections of the former prove that the ground has been most judiciously chosen, as for ten miles there is no cutting or embanking to the amount of four feet. There is a plan for a floating harbour with extensive quays and jetty. The execution of such a work would be of the highest importance to that town.—*Ipswich Journal*.

*South-Eastern Railway.*—The Dover terminus buildings of this railway are progressing rapidly, and when finished (which will be right early), they will present a magnificent appearance, and afford the most ample accommodation for its traffic. Abbott's Cliff Tunnel is now completed, and the permanent rails are now laid throughout. The line will be opened for general traffic in a few weeks. These prospects are highly gratifying to the good people of this town and neighbourhood. The importance of the London and Dover Railway to this locality in particular, and to the nation generally, we have constantly maintained; and we trust the auspicious day of its completion will be celebrated in a manner befitting the occasion. Let there be then a concentration of those who represent the interests of Dover and the out-ports, to meet the chairman, the directors, the engineers, and the other gentlemen who have brought this benevolent undertaking to a close. Let there be a gathering together of the leading men of Dover, Deal, Folkestone, Canterbury, Sandwich, and the other neighbouring places, as

well as those of Boulogne, Calais, and Ostend; so that a general expression of respect and gratitude may be unanimously given by England and France to these indefatigable and enterprising spirits, who have so ably conquered those formidable obstacles which have been strewed in their path while constructing this noble highway to the Continent, which will be the means of uniting the metropolis of England and France in a closer bond of union and intercourse than has hitherto existed.—*Dover Chronicle*.

On Saturday week, the proposed branch line to Maidstone, from the South-Eastern Railway, was commenced.

*West-London Railway.*—At a special general meeting of this railway company, held on Tuesday week, at their offices, Abchurch-lane, Mr. Robert Gunton in the chair, to consider the expediency of extending the railway to the river Thames, and of applying to Parliament for an act or acts to enable them to proceed with the necessary works, the report of Mr. Robert Stephenson was read, and a series of resolutions moved by Mr. Whitechurch, authorizing the directors to proceed as above, were carried, only two hands being held up for an amendment to adjourn for a fortnight, moved by Mr. White.

*Manchester and Bolton Railway.*—On Friday week a special general meeting of the Manchester, Bolton, and Bury Canal Navigation and Railway Company was held at the Clarendon-rooms, South John-street, Liverpool. It was numerously attended. James Brancker, Esq., presided. The 11th half-yearly report was read, and also the receipts and disbursements on the railway and the canal, for the half-year ending the 31st of December, from which it appeared that the railway receipts had amounted to 21,042l. 11s., and the disbursements to 8,084l. 10s. 1d., leaving the railway surplus 12,957l. 11d. The canal receipts had been 6,987l. 6s. 4d., and the disbursements 2,957l. 8s. 10d., leaving the canal surplus 4,029l. 11s. 8d., which, added to the railway surplus, and deducting 554l. 4s. 3d. for interest, rents, and commission, left a net profit for the half-year of 11,432l. 8s. 4d. To this was added 1,736l. 6s. 4d. for half-year's dividend, and the balance from 30th June, making the disposable net proceeds 13,168l. 14s. 8d. A dividend of 2l. per share would amount to 12,402l., leaving on hand, including the dividend on the 120 shares held by the company, a surplus of 1,066l. 14s. 8d.; and the committee had accordingly directed a dividend of 2l. per share to be paid to the proprietors on the 1st of February. In the course of the proceedings, the chairman stated incidentally that the committee had that morning borrowed 20,000l. at 3 per cent. The agreement of the company with the Liverpool and Manchester Railway Company, giving the latter an interest in the line of the former, was approved and confirmed; as was the agreement with the Manchester, Bury, and Rosendale Railway Company; and the committee of management were authorized to carry it into effect, and for that purpose to obtain parliamentary powers to raise any sum not exceeding 100,000l. Thanks were then voted to the directors and the chairman, and the meeting separated.

*Taff Vale Railway.*—The adjourned meeting was held at the Cardiff Arms, Newport, on Tuesday week, Sir John Guest, Bart., in the chair. The committee of investigation appointed at a previous meeting, having gone into a detailed examination of the proposed agreement to lease the docks to the Marquis of Bute, stated that they were of opinion that a permanent arrangement with the Marquis of Bute for the docks would be an object of the greatest importance to the railway; and strongly recommended to the shareholders, as the most effectual means of carrying out that object, that an Act of Parliament be obtained to enable the railway company to take a lease of the Bute Docks and the adjacent conveniences from the Marquis of Bute; and the committee also recommended that in case such an arrangement be made between the Marquis of Bute and the railway company, that the terms and period upon which such lease should be held, be printed and circulated among the shareholders, to be read and brought to a meeting of the proprietors, to be called for the purpose of ratifying or rejecting such arrangements. The report having been received,

thanks were voted to the committee for their services; and it being resolved that the former agreement made with the Marquis of Bute was in its present form ineligible, it was determined that the directors should be empowered to take measures under the notice already given for applying to Parliament for a bill, in conformity with the recommendation of the committee.—*Bath Herald*.

*Whitby and Pickering Railway.*—A special general meeting of this company was held at Whitby, on Wednesday week, for the purpose of authorizing the committee to give their formal assent to the notice served upon their treasurer by the York and North-Midland Railway Company, with reference to the terminus of their line at Pickering. The opportunity of the meeting was taken by the directors to obtain from the shareholders authority to negotiate with the York and North-Midland Railway Company for the sale to them of the Whitby and Pickering Railway, as to which some preliminary steps had been taken by the directors, a deputation from whom had an interview with Mr. Hudson on the subject.

*The Cornwall Railway.*—Pursuant to advertisement, a public meeting of the shareholders and others interested in the construction of a railway through Cornwall, was held on Friday week, in the Town-hall, Truro, for the purpose of receiving a report from the provisional committee, and devising such plans as may be needful for the carrying out this important measure.

*Railway Law.*—It is, we are informed, the intention of her Majesty's Government, immediately after the meeting of Parliament, to propose that a select committee be appointed to consider the standing orders relating to railways, and whether any and what changes ought to be made in those standing orders; and likewise to consider whether any and what new provisions for the advantage of the public, and the improvement of the railway system, ought to be introduced into such railway bills as may come before the House during the present or future sessions, and to report their opinion thereon to the House.—*Times*.

*English Workmen on French Railways.*—A correspondent, who states that a great number of workmen have been induced to come over to France from England in the expectation of obtaining employment on the Rouen and Havre Railroad, requests us to announce, in the hope of preventing a further influx, that "in consequence of some difficulty in procuring land, &c., the works on the said line cannot be proceeded with to any great extent for some weeks to come; and, further, that although there are many men fully employed, yet hundreds are actually starving from want of work." He adds, "During the last fortnight the Rev. Mr. Tucker, with means benevolently furnished by Messrs. Mackenzie and Brassey, the contractors of the railroad, has supplied with food and other means of support upwards of 120 men, who have been wandering about the streets of Rouen without bread or any prospect of employment for some time to come."—*Galignani*.

At a meeting of the Oxford Parish Burial-ground Committee, held on Friday week last at the Archdeacon's rooms, Christ Church, the report of the sub-committee was delivered in and adopted, recommending—

1. The purchase of three burial-grounds on different sides of Oxford, for the use respectively of the parishes nearest them; considering the many evils which might result from funeral trains being made to pass out by one road, the injury to property lying on the sides of that road, the great inconvenience likely to arise on occasional days of busy traffic, the interruption to vehicles passing, and the unseemliness of all that would take place amid such scenes, not to mention the great advantage and comfort to the attendants on the funeral processions—the aged and infirm, for example—of not being compelled to extend their walk through the length of the city under such circumstances.

2. That such burial-grounds should be purchased by subscription.

3. That these burial-grounds should be a provision for all persons, being placed precisely on the same footing as the existing churchyards.

CHURCH BUILDING INTELLIGENCE.

**Restoration of Redcliffe Church, Bristol.**—A meeting of the subscribers to the fund for the restoration of this noble fabric was held on Thursday week, when the right worshipful the Mayor of Bristol presided. The report of the committee was read by Mr. Procter, churchwarden, from which it appeared that although in consequence of the general pressure of the times, and more particularly the prevalence of local distress, the committee did not think it prudent to make a very urgent appeal to the liberality of the public, yet the sum obtained, almost voluntarily, was 4,700*l*. This is far short of the amount required, but the gentlemen present expressed themselves so anxious for the preservation of the church, that they resolved to recommend to the subscribers generally, to allow the money to be expended in putting the church into substantial repair, if sufficient should not be raised to carry out the magnificent plans contemplated last year. We understand that the project of erecting a spire on the present tower is abandoned.—*Bath Herald*.

**Alnwick.**—It is contemplated to erect a new church at Alnwick, Northumberland. A memorial to his Grace the Duke of Northumberland, patron of the living, is now in course of signature, stating that the parish of Alnwick, with a population of nearly 7,000, contains only one church, which is insufficient for the wants of the parish, and requesting his grace's consideration and assistance with the view to the erection of a new church.

**New Church, Lynn.**—At a meeting of the committee, held at the Town-hall on Saturday last, it was resolved that the new church should be erected on a part of Allen's Close, being the ground offered for that purpose by the corporation.

**Llandisilio.**—The Marquis of Anglesey has granted two acres of land in a romantic and beautiful situation, as a site for a new church at Llandisilio, towards the funds for meeting which 360*l*. have been subscribed.

PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c.

Granted between 23th December, 1843, and the 25th of January, 1844.

[SIX MONTHS FOR ENROLMENT.]

Thomas Murray Gladstone, of the Swan Garden iron works, Wolverhampton, ironmaster, for certain improvements in machines for cutting or shearing iron or other metals, which improvements are applicable to other like purposes.—Sealed Dec. 28, 1843.

George Benjamin Thorneycroft, of Wolverhampton, ironmaster, for a machine for rolling, squeezing, or compressing puddled balls of iron, and also for crushing or grinding other substances.—Sealed Dec. 28, 1843.

Edward Budd, of Haford Copper Works, Swansea, Glamorgan, copper-merchant, and William Morgan, of the same place, refiner of copper, for improvements in treating or reducing copper ores, and in the construction of furnaces for treating such ores, part of which improvements are applicable to other ores.—Sealed Dec. 28, 1843.

William Longmaid, of the borough of Plymouth, accountant, for an improvement in the manufacture of copper, tin, zinc, and peroxide of iron.—Sealed Jan. 1, 1844.

Robert Foulerton, of the Jamaica Coffee-house, Cornhill, master mariner, for certain improved apparatus for moving vessels and other floating apparatus.—Sealed Jan. 13, 1844.

Anthony Moviton of Glimes, of Panton-street, Haymarket, gentleman, for certain improvements in apparatus for propelling vessels on water, and also in machinery capable of communicating manual power to work the same, which machinery is also applicable to raising heavy bodies and exerting power for various other purposes.—Sealed Jan. 13, 1844.

Henry Bessemer, of Baxter-house, St. Pancras, engineer, for a new pigment or paint, and of which method of preparing the same; part of which method is also applicable to the preparing and creating of oils, turpentine, varnishes, and gold-size, when employed to fix metallic powders, and metal leaf, or as a means of protecting the same.—Sealed Jan. 13, 1844.

Charles Cameron, of Liverpool, chemist, for improvements in extinguishing fires in buildings.—Sealed Jan. 16, 1844.

Benjamin Cheverton, of Pratt-street, Camden Town, sculptor in ivory, for improvements in ma-

chinery for cutting wood and other materials.—Sealed Jan. 16, 1844.

William Edward Newton, of Chancery-lane, civil-engineer, for improvements in machinery or apparatus for facilitating the tracing and copying of designs, drawings, and etchings of all kinds, either of the original size or upon an enlarged or reduced scale.—Sealed Jan. 16, 1844.

William Basford, of Burslem, Staffordshire, brick and tile manufacturer, for certain improvements in the mode of manufacturing bricks, tiles, quarries, and certain other articles made or composed of brick-earth, and of burning and firing the same, and certain articles of pottery and earthenware.—Sealed Jan. 20, 1844.

Samuel Wright, of Shelton, Staffordshire, for a manufacture of ornamental tiles, bricks, and quarries for floors, pavements, and other purposes, being an extension of former letters patent for the term of seven years, from the 26th instant.—Sealed Jan. 23, 1844.

Henry Davies, of Norbury, Staffordshire, engineer, for certain improvements in the construction of vessels for conveying goods or passengers on water; also certain improved arrangements of machinery for communicating motion to such vessels.—Sealed Jan. 25, 1844.

SCOTCH PATENTS.

Granted between the 28th November and the 12th of January, 1844.

Arthur Wall, of Bisterne-place, Poplar in the county of Middlesex, surgeon, for certain improvements in the manufacture of iron.—Sealed Nov. 28, 1843.

John George Bodmer, of Manchester, in the county of Lancaster, engineer, for certain improvements in grates, furnaces, and boilers, and also in the manufacturing of iron or other metals.—Sealed Nov. 29, 1843.

Thomas Drayton, of Brighton, in the county of Sussex, gentleman, for improvements in coating glass with silver for looking-glasses, and other uses.—Sealed Dec. 4, 1843.

Francis Higginson, of the city of Rochester, in the county of Kent, lieutenant in her Majesty's royal navy, for certain improvements in fastenings for parts of ships and other vessels, which improvements are also applicable to other building purposes.—Sealed Dec. 14, 1843.

John Hick, of Bolton-le-Moors, in the county of Lancaster, engineer, for certain improvements in steam-engines, and in apparatus to be connected therewith for driving machinery, part of which improvements are applicable to forcing, lifting, and measuring water.—Sealed Dec. 15, 1843.

Henry Austin, of 87, Hatton-garden, in the county of Middlesex, civil-engineer, for a new method of gluing or cementing certain materials for building and other purposes.—Sealed Dec. 26, 1843.

Charlton James Wollaston, of Welling, in the county of Kent, gentleman, for improvements in machinery for cutting marble and stone.—Sealed Dec. 26, 1843. (Communication.)

Margaret Henrietta Marshall, of Manchester, in the county of Lancaster, for a certain improved plastic composition, applicable to the fine arts and to useful and ornamental purposes.—Sealed Jan. 5, 1844.

Charles Townsend Christian, of St. Martin's-place, St. Martin's-lane, in the county of Middlesex, East-India army agent, for improvements in the construction of steam-engines.—Sealed Jan. 12, 1844. (Communication.)

IRISH PATENTS.

Granted between the 25th October and the 27th December, 1843.

John Wood, of Parkfield, Birkenhead, in the county of Chester, merchant, for certain improvements in machinery or apparatus for affording additional or artificial buoyancy to sea-going or other vessels, or for lessening their draught of water, and which said improvements are also applicable to raising vessels, or other heavy bodies, and for securing and supporting the same.—Sealed Oct. 25, 1843.

Ernst Lentz, of Eastcheap, in the city of London, gentleman, for improvements in machinery for raising and forcing water and other fluids, which machinery, when worked by steam or water, may be employed for driving machinery.—Sealed Oct. 25, 1843.

Alfred Jeffery, of Lloyd-street, Pentonville, in the county of Middlesex, gentleman, for a new method of preparing masts, spars, and other wood, for ship-building and other purposes, and also a new method of defending the sheathing of ships, and protecting their sides and bottoms.—Sealed Nov. 7, 1843.

Charlton James Wollaston, of Welling, in the county of Kent, gentleman, for improvements in machinery for cutting marble and stone.—Sealed Nov. 7, 1843.

Nicholas Troughton, of Swansea, in the county of Glamorgan, South Wales, gentleman, for improvements in dressing ores requiring washing.—Sealed Nov. 29, 1843.

William Wylam, of the borough and county of Newcastle-upon-Tyne, for an artificial composition, which, if variously modified, may be applied in preparing fuel from coal and other substances, or as a cement, or as a substitute for stone, or as a coating for metals and other substances.—Sealed Dec. 27, 1843.

Correspondence.

WESTMINSTER BRIDGE.

SIR,—The writer of the letter in your last Number, signed "A Civil Engineer of the Great Western Railway" (although he leaves us in ignorance of his status, whether engineer-in-chief, or a resident engineer's assistant's assistant), appears to me to have failed in his attempt to give support to the design which accompanied the letter of "A Practical Observer" in THE BUILDER of the previous week. The artificial effect of the design is a mere matter of taste, and may please some persons; but the point to which I would draw your attention, is the fallacy of the supposition, that a pier, incapable of supporting an arch of 70 feet span with its superincumbent weight, would be equal to the support of one of 140 feet span as proposed.

In a case like the present, when the state of the work is such that Messrs. Walker and Burgess say, "To support the piers has been a constant expense, and is at this moment a source of considerable anxiety;" and Mr. Barry—"It is now, in my opinion, no longer a question as to the propriety of rebuilding the superstructure alone, but the entire bridge," every other consideration must give way to the all-important one, the foundations. Let the bridge be reconstructed as it may, whether in the Tudor, Norman, or any other style, it must be supported by one of two methods: the first, by massive piers, each of sufficient strength and bearing to support half of the weight and thrust of the two adjoining arches. If this principle be adopted, which "A Civil Engineer of the Great Western Railway" (following in Messrs. Burgess and Walker's wake) recommends, then it is manifest that, instead of throwing two arches into one, and thus doubling the pressure upon piers acknowledged to be incompetent to bear their present load, the correct system of procedure would be to increase their number, and reduce the span of arches, inconveniently narrow as they are.

The second method above referred to, is to construct the arches of such a form as to enable them to transmit their thrusts from one to another until they terminate in the abutments, which might be made sufficiently massive, without any interference with the waterway. Thus, the piers being relieved, might be "few and far between;" while, as relates to the lowering of the roadway, the height of headway for vessels, and the amount of clear waterway, the public convenience could be consulted to a far greater extent than by the former system.

The particular form of the arches I speak of, I must decline entering upon at present; but, Sir, one thing I trust, when Westminster-bridge becomes in such a state that all doubt of the advisability of removing it is cleared away, and that such ere long will prove the case (especially if the proposed Thames embankment is carried into execution), notwithstanding the paragraph in the *Times* of the 23rd instant, I for one feel confident; then, Sir, I do trust, that the commissioners (acting upon the system pursued in the case of the Houses of Parliament) will at once call forth the energies of the engineering profession, by throwing the matter open to competition, without even a restriction as to style. Should this be done, I feel assured, so great has been the advance within a few years in the principles of bridge-architecture, that a design may be selected, to which, in point of beauty in outline, stability, united with economy of construction, and public convenience, even the Waterloo and new London bridges, fine structures as they are, must yield precedence.

I am, Sir, your obedient servant,  
London, January 30, 1844. B.

SIR,—Two letters have been lately published in the *Times* journal, the one from Messrs. Walker and Burgess, and the other from Mr. Barry, on the subject of Westminster-bridge. The former gentlemen insist in their letter that "in a bridge constructed with semicircular arches, any one of the arches may fall without endangering the others, because a semicircular arch has no lateral thrust;" and the latter gentleman declares that a pointed Gothic arch requires "less weight on its crown to keep its haunches in their places than any other form of arch in use."

Most men acknowledge that our progress in engineering and architecture has of late been very rapid, but I think few were aware that the disco-

veries above named had been made; and I am sure it would be highly instructive to the profession generally to know from such high authorities as the gentlemen referred to, upon what principles the truth of either of the propositions can be made to appear. Surely it has been well said that "when a man has got the name of being an early riser he may lie in his bed all day."

I am, Sir, your obedient servant,  
A BUILDER.

January 26, 1844.

DEAR SIR,—It affords me much pleasure to see the steady improvement that is taking place in your journal, the last numbers of which are filled with most interesting matter. My object in writing is to forward to you, with the hope that it may in some measure meet the wishes of your correspondent "A WELL-WISHER," a paper which I put together some years ago connected with the subject of scaring. I have not now leisure to revise or rewrite, and must therefore give it you "with all its imperfections," leaving you at liberty to hew or prune as you may find expedient. I need hardly say that the examples are not original, but selected.

I am glad to find that your views coincide with my own respecting the absence of any provision for the wants of decayed members of the architectural profession—that is, as a distinct body. I have long regretted the non-existence of such an institution; and it was in a great measure for the purpose of setting on foot a fund of the nature referred to (Leader No. 50) for one of the classes you mention, namely "Architectural Draughtsmen," that the society with which I am connected was first instituted; although, what with the "higher grounds" talked of by some, and the jeocosities of others, and my failing to impress the majority with an equal conviction of the importance of the subject, that department has been materially modified, and become a subordinate feature. I hope, however, that the good intentions of the "College of the Freemasons of the Church" may be realized, and that the architectural profession will eventually no longer stand alone unprovided, but possess a haven of refuge for those of its members who, though well doing, may, notwithstanding, be unfortunate.

I remain, obediently yours,  
JAMES WYLSON,  
Hon. Sec., B. A. A. D.  
33, Southampton-street, Strand,  
January 27, 1844.

[We have placed in the hands of our engraver the twenty-seven diagrams kindly transmitted to us by our correspondent, and his article will appear as soon as his illustrations are ready.—Ed.]

#### MEASURING ROUND TIMBER.

SIR,—I beg to call the attention of your readers to a blunder of my townsman in No. 49, which is the finding of the cube contents of a piece of round timber, being 6 inches diameter at one end and 6 feet diameter at the other, and 80 feet long.

I must call his attention back to the first part of mathematics, and remind him that although triangulation cannot be applied to cube measure, its principles are the same. Lay down a triangle of the dimensions given, agreeably to the rules of geometry, and be can with precision find the mean diameter therefrom, at 40 feet length, being equidistant, viz., 3 feet 3 inches; the area of this being 8 29578750  $\times$  80 = 663.663 cube feet, being less by 159 feet. If he takes them separately, the mean diameter of the thicker part being 4.33 = 18.7489, and its area 14.7253  $\times$  40 = 589.010, contents; the mean diameter of the thinner part being 1.552 = 2.40, and its area 1.8849  $\times$  40 = 75.390 solid contents.

589.010

Total contents 664.400 taken together.

The difference of both ways being one half foot, is accounted for by not extending the decimals.

I trust the above demonstration will prevent many (there are too many) from committing such gross mistakes; as also that of dividing by 4 for the square. I am, Sir, yours very truly,  
Liverpool, 17th January, 1844. J. M.

#### COPYRIGHT OF DESIGNS.

SIR,—If an architect design a building for a certain purpose on a plan not usual, can he prevent any person from erecting a similar building, and adopting the same principle of construction without his permission? The building in question is composed of a series of arches to make it fire-proof, and to be applied to a purpose of which I believe there is no existing example. By publishing the design in the shape of a hook, and entering it at Stationers' Hall, would that give him any protection?

Any remarks you may be pleased to make will be thankfully received by one of your subscribers.  
January 20, 1844. B.

#### Miscellaneous.

ISLINGTON LITERARY AND SCIENTIFIC SOCIETY.—The annual meeting of the proprietors was held in the theatre of the institution on Thursday week, Charles Woodward, Esq., F.R.S., in the chair. The annual report announced, as in past years, an increase of members and attractions; 630 members were enrolled on its books at Christmas; and the library now contains 5,600 volumes.

EARTHQUAKE.—At Corrie, on the 14th inst., at half-past twelve, noon, a smart shock of perpendicular earthquake was felt. At five minutes past one a second shock occurred, which, although rather less, continued longer. There were three slight sounds heard preceding the first-mentioned shock, two betwixt the shocks, and one about a quarter of an hour after the last, and two during the following night. The momentum of the shocks was nothing to the momentum of the great shocks of 1839 and 1841. Still they were severer than any shock since that time. The accompanying sound was very loud on the present occasion.—*Westmoreland Gazette.*

IMPROVEMENT OF THE METROPOLIS.—The commission for improving the Metropolis, and providing increased facilities of communication within it, had a meeting on Wednesday week at the office in Whitehall-place. The commissioners present were the Earl of Lincoln, the Right Hon. J. C. Herries, the Lord Mayor, Sir R. H. Inglis, Mr. Alderman Humphrey, Mr. H. T. Hope, Mr. A. Milne, the Hon. Charles Gore, Sir Robert Smirke, and Mr. Charles Barry.

LEEDS.—A project exists for the erection of a public building in Leeds on a scale much more capacious than any that at present exists. The principal room is to seat three thousand persons, and the edifice is to consist of an hotel of a very superior kind (resembling some of the hotels in Manchester and Liverpool), a mesonic lodge, and a picture-gallery, with other accommodations applicable to public purposes.

Mr. James Matheson, M.P. for Ashburton, has just purchased the noble mansion in Cleveland-row, adjoining Sutherland House, so long the town residence of the Earl of Durham. The house will be thoroughly repaired and embellished previous to the return of the honourable member from the Continent.

THE OLD BRIDGE, BATH.—We understand the committee are about to recommend the adoption of an entirely new bridge, which will afford the passengers a roadway of 40 feet, and a clear water-course of 110 feet. The bridge will, it is proposed, be of one arch, and made of cast iron.

#### MEETINGS OF SCIENTIFIC BODIES, To-day and during the ensuing week.

SATURDAY, FEB. 3.—*Asiatic*, 14, Grafton-place, 2 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.

MONDAY, 5.—*Entomological*, 17, Old Bond-street, 8 P.M.; *British Architects*, 16, Lower Grosvenor-street, 8 P.M.; *Chemical Society of Arts*, Adelphi, 8 P.M.; *Medical*, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 6.—*Linnean*, Soho-square, 8 P.M.; *Antiquaries*, Somerset House, 8 P.M.; *Royal Society of Literature*, 4, St. Martin's-place, 4 P.M.; *Medico-Botanical*, 32, Sackville-street, 8 P.M.

WEDNESDAY, 7.—*Society of Arts*, Adelphi, 8 P.M.

THURSDAY, 8.—*Royal*, Somerset House, 8 P.M.; *Antiquaries*, Somerset House, 8 P.M.; *Royal Society of Literature*, 4, St. Martin's-place, 4 P.M.; *Medico-Botanical*, 32, Sackville-street, 8 P.M.

FRIDAY, 9.—*Astronomical*, Somerset House, 8 P.M. (anniversary); *Royal Institution*, Abchurch-lane, 8 P.M.; *Philological*, 49, Pall Mall, 8 P.M.

SATURDAY, 10.—*Royal Botanic*, Regent's-park, 4 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.

The *Oxford Society*, for the study of Gothic Architecture commenced their meetings for the present term on Wednesday last, and will continue them on Wednesday, Feb. 14 and 28, and March 13, 8 P.M.

LINNEAN SOCIETY.—Library open on Monday, Tuesday, and Thursday, and the Museum on Wednesday and Friday, from 12 o'clock to 4 in the afternoon.

GEOLOGICAL SOCIETY.—Library and Museum are open every day from 11 till 5.

ROYAL ASIATIC SOCIETY.—Museum is open every Tuesday, Wednesday, and Thursday, from 11 till 4.

CIVIL ENGINEERS.—Library open from 9 A.M. to 9 P.M.

LONDON INSTITUTION.—Lectures will be delivered every Monday and Thursday evening, at 7 o'clock, until May 6.

#### Tenders.

TENDERS for the Monumental Chambers at the Cemetery, Kensal-green.—Mr. Griffith, Architect.

Messrs. Piper (Bishopsgate-street) £6,841  
Mr. Stephens (Charlotte-street,  
Portland-place) . . . . . 6,814  
Mr. Lander (Kensal-green) . . . . . 5,671

#### NOTICES OF CONTRACTS.

BUILDING SEWERS in Cree-Church-lane, King-street, Duke-street, and Great Duke's-place, City.—Plan and Specification at Sewers' Office, Guildhall, daily from ten till four o'clock.—Joseph Daw, Principal Clerk. Feb. 13, 1844.

BUILDING THREE ROOMS OF LARGE DIMENSIONS, LAMBETH.—Plans and Specifications at 96, Westminster Bridge-road.

FORMATION OF RESERVOIRS and laying down Iron Conduit, with other masonry work connected therewith, Bradford Waterworks.—Plans, &c., to be seen, and further information had, at the Office of Messrs. Leather and Son, Civil Engineers, Leeds; John Thompson, Law Clerk to the Company. Feb. 13, 1844.

WORKS REQUIRED FOR THE NEW FISH MARKET, GREAT YARMOUTH.—Plans, &c., to be seen on application to Mr. A. T. Tillett, Architect, King-street, Great Yarmouth; Town Clerk. Feb. 21, 1844.

CONSTRUCTING VARIOUS STATIONS AT GATESHEAD and other places, Newcastle and Darlington Junction Railway.—Plans, &c., at Railway Office, York.—Further particulars on application to Mr. Andrews, Architect, York.—G. Hudson, Esq., Chairman. Feb. 13.

BUILDING A COUNTY LUNATIC ASYLUM AT LITTLEMORE, OXFORD.—Plans, &c., at Mr. R. Clarke's, Architect, Clifton-street, Nottingham, or at the Office of the Clerk of the Peace, Oxford.—J. M. Davenport, Clerk of the Peace. February 22, 1844.

BRIDLINGTON PIERS AND HARBOUR.—Erection of a new south pier, removal of present pier, and other works for enlargement of Harbour.—Plans and Specifications at the Office of Mr. Sidney Taylor, Solicitor, Bridlington. March 1, 1844.

ALTERING EAST SUFFOLK COUNTY HALL AND COURTS OF JUSTICE, IPSWICH.—Plans, &c., for inspection on application to Mr. Whiting, Surveyor, &c., County Hall, Ipswich, on Monday Jan. 29; J. H. Borton, Clerk of the Peace, Bury St. Edmunds. February 12, 1844.

WORKHOUSE ALTERATIONS, ST. LUKE, MIDDLESEX.—Plans, &c., at Workhouse.—J. Parson, Vestry Clerk. Feb. 7, 1844.

#### COMPETITION.

PREMIUM OF 20 guineas for the best plans and estimates for erection of a new gaol, Banbury.—All information may be obtained on application to the Town Clerk. March 1, 1844.

#### TO OUR CORRESPONDENTS.

PERIODICAL LITERATURE.—A BIRD-OF-PASSAGE.—The letter of our droll and industrious correspondent, "J. R. W.," dated from Norton-street, the 1st of January last, and which appeared in our No. XLVIII., has, it seems, migrated wonderfully. Going northwards (diverging a little to the west), it stopped at Manchester, as a half-way house; from thence, having shaken off all that related not to Manchester, it took its course still further northwards, and in a week or two arrived opposite the Orkneys. Having then, some how or other, flown into Cornwall (land of granite, blue and saucy pichards), it on Thursday morning last alighted from the Cornwall Gazette, and that morning reappeared with the "Times" in London.

The appearance of several articles of correspondence, which we had intended to insert in our present Number, we have been reluctantly compelled to postpone from want of space.

We have several fine specimens of the details of Gothic architecture ready for early insertion, and have others progressing for our intended extensive treatment of the subject.

SIR,—I wish you could inform me, through your paper, of the best book on agriculture, and the best book of designs for farms, &c., fitted for New Zealand, and where I could obtain them.

I am, Sir, yours, &c.,

A SUBSCRIBER.

[Few architectural books of the kind mentioned by our correspondent have been published. Perhaps through many of the designs contained in it are very exceptional, London's Cyclopaedia of Cottage and Villa Architecture contains most information upon the subject.—Ed.]

The Builder.

NO. LIII.

SATURDAY, FEBRUARY 10, 1844.

**P**URSUING the subject of Bridge-arches, and recurring to that which

terminated our last week's disquisition, it will be remembered we stated Drift to be THE ACTIVE FORCE IN ARCHES AND VAULTS.—This drift, commencing at the crown of an arch, gradually reaches the base of the work supporting the superstructure.

But at first sight, a portion of this drift may seem to have an opposite course when an arch has been carried up so far as that its component voussoirs have a tendency to fall over from their beds.

But this is fallacious; for if a voussoir V have a tendency to leave its arch-bed B, and

have a drift away from its supporting pier equal to a ton weight, the voussoir v on the opposite side of the vertex of the arch will have a counter-tendency to leave its bed b, and will so neutralize the contending forces, and in effect restore to the arch-bed B its ton of drift; and gravitation will go on (while the foundation of the work remains secure and unflinching, and while the crown of the arch is prevented from either rising or falling) precisely as though no counter-drift existed.

We now proceed to our DEDUCTIONS FROM THESE THEORIES.

- 1st. Drift is the active force in arches.
- 2ndly. The action of the drift commences from the vertex of an arch, and continues from thence to the foundation of the work.
- 3rdly. Provision should be made for preventing fracture by reason of drift, through the increase of pressure as the work recedes from the vertex downwardly.
- 4thly. The provision for preventing fracture from the increase of drift must be made by the arch-joints of the voussoirs increasing in superficial extent as they recede from the vertex of the work; or if such an increase of the surfaces of their arch-joints be not adopted, the voussoirs should be made of materials increasing in firmness and ability to resist compression continually more and more as they diverge from the vertex of the work.
- 5thly. If any circumstances prevent the pure adoption of one or the other of the above-mentioned provisions against failure from drift, they may be combined; as, for instance, if ne-

cessity exist for restricting the bulk of any part of the work, harder materials may be used, or if it be necessary to amplify the bulk of the work, softer and lighter material may be used.

6thly. The whole structure of a bridge should be catenarian.

7thly. The catenary must, at its crown or key, commence with strength sufficient to resist the pressure and concussion of the traffic, and of the roadway and parapets.

8thly. The depth of the key-stone must depend upon the nature of such traffic, &c.

9thly. A key-stone being the part of an arch most in jeopardy, requires on that account the greater care to prevent it from falling through; but pure natural catenarian construction requires that a key-stone should have less depth than any other part of the arch, and therefore such key-stone having little wedge-like upward increase, thence two antagonistic principles clash with each other.

10thly. In order to obtain an upward increase, or enlarged extrados to the key-stone and neighbouring parts of an arch, without violating the natural graduated catenarian principle by unduly burthening the voussoirs in the neighbourhood of the key-stone, such key-stone and neighbouring voussoirs may be made of lighter materials, so as to present, by an extended surface, as much resistance against crushing, though of a softer nature.

11thly. Again, if the foundation of an arch be uncertain, and therefore likely to settle from the weight of the work or any other cause, the catenary should commence at its crown or key with an increase of depth, in order that the upward or extrados *al* increase of the voussoirs may make up for the increase of jeopardy and liability to derangement on account of such uncertainty of the foundation: here again antagonistic principles exist, since the weakness of the foundation requires a diminution of weight, rather than an increase of weight; therefore, in such case, if a masonry bridge be adopted, the lightest kind of stone should be selected, so that provision against the derangement of the voussoirs may be made by increase of their depth, without increasing, but if possible rather diminishing, their weight.

12thly. The depth or strength of the key-stone being settled, the strength of all the other parts of the catenary from thence take an increasing sequence, as stated 4thly and 5thly.

(To be resumed in our next.)

**THE NEW ROYAL EXCHANGE.**—Instructions have been given by the Committee superintending the erection of the New Royal Exchange, to sell the triangular block of buildings facing Cornhill and Threadneedle-street, known as Bank-buildings, and which is to be taken down for the purpose of forming the western approach to the New Royal Exchange and the site for the Wellington Statue. The buildings to be sold comprise the premises occupied for many years by the Sun Fire Office, the house where Messrs. Ladbroke & Co., the bankers, carried on the business of the establishment, and several residences adjoining. The sale is announced to take place by auction, by Messrs. Pullen & Son, on the 19th instant, and appears to include a vast quantity of useful materials for building purposes. It is fully expected that the New Exchange will be opened in June.

EMIGRATION.

There can never be a happy industry at home, nor a just empire abroad, when, to relieve the country from its burthens or its troubles, expatriation is brought forward and supported as a forced necessity—it only leaves evils as they are; takes the sluggish ease of an assumption that they are incurable; and establishes thereupon that feeling of neglecting troubles which will assuredly cause them to grow to evils of greater magnitude.

The proprietor is led to this remark and the following observations, by a letter from Mr. Smith, of Greenwich, on the subject of Emigration.

When expatriation is suggested and becomes almost universally adopted as the last hope of the country for relief from the distresses and troubles of its inhabitants, then is it indeed a sad state of things. It is a sad reflection upon a nation where the inhabitants of such nation are many, and a bodily-active and mind-energetic race, and where the chief features of the moving activity of its influential mind are prudence and wisdom to provide for the improvements of the enjoyments of this life, and every contributive for the indulgence and information of the intellectual faculties; it is indeed a sad reflection that such prudence and wisdom should overlook the simple care and knowledge of providing all things, those which are most essential for the real comfort and happiness of the most needy, and for their means of existence in their own land.

The prudence and wisdom of goodness of intention could never thus perplex the nation, could never thus invert the true welfare of the community,—it must have been produced by the unseen or unimpeded agency of cunning prudence and wisdom of evil design. But the evil-designing cannot perplex affairs beyond the skill of infinite wisdom and goodness to unravel,—Almighty God rules, and will guide the simple-minded, acting in subordination to his will, to arrest the last effects of the malice of the evil-minded in the midst of their career for expected triumph. In all cases where and if evil is the design, or is the unseen tendency arising from thoughtless design, this will be accomplished. For the last pass is come—(to adopt the truthful perception of *The League* paper), "the last act of the drama" is truly arrived when, without providing honest remedial measures, we are losing all confidence in the will and ability of the many to incline to and to provide what is just and good at home—we become placed in the position of being forced to expatriate our fellow-countrymen from their homes—to the, perhaps, greater miseries of distant shores.

Every one who is industrious may or ought to gain subsistence in his own country—where agriculture, the arts, manufactures, and commerce are encouraged. And what is to prevent their proper and fruitful encouragement in England, or in Great Britain and Ireland? whereby the strength and prosperity of our nation would depend upon the number of its inhabitants, instead of depopulating and loosing the sinews of the glory of our country by forced expatriation.

Emigration is good when adopted as of free choice, and not as of forced necessity. When in such necessity our fellow-countrymen have to run from one distress to another, perhaps greater, as being in a distant land, not cared for, and not able to help themselves, we only by placing them in this position establish at the moment a separation in heart from us for ever, as sending them an encumbrance to other lands, to relieve our own; or we introduce into a colony the seed of dissatisfactions, dissensions, and division—and thus generate, with its first establishment as a colonial British possession, the germ of its dissolution or separation in disgust from the parent nation whose population it comprises.

Emigration is good when we extend the influence of Britain's disposition of peace and good-will to all mankind by her well-affected and enterprising sons in distant colonies. But above all, it is essential with the distressed

and needy, before we encourage the emigration of our fellow-countrymen, that they should not have to run from one distress to another, but that they should be cared for when they arrive in distant colonies, and find ample compensation for leaving a distant home, by the pre-induced and prepared happy employment and reward of toil which they seek, and thereby have occasion to feel ample cause ever to have and grow upon an affectionate and grateful remembrance of those of the nation they have left.

Plans for emigration promoted and instigated and provided for as described, would be indeed a blessing to our country; it would afford a means of permanent employment and improved condition; but until we shall have commenced with and established the right concern and care for our poor, the working classes at home, emigration will only be an unmanageable trouble to us, increasing our distresses for the time present, and a curse to us as a nation, increasing our perplexities with the time to come.

Agriculture, arts, manufactures, and trade at home are the first essentials and the only sources of legitimate wealth, of employment and consequent relief to the distresses of the poor, the working classes. Commerce with other nations is only an adjunctive means which gives the value of steady increase to this employment, when and as the honest and solid worth of the home industry shall have been duly cared for. If it be so cared for,—flourishing as a populous kingdom, we can then afford to buy freely of the industrial products of other nations, and extend our own happy but not avaricious wealth, by interchange of products of our industry, creating with other nations the due appreciation and fruitful and sterling value of our own.

The community may obscure or veil their power to do the good that is needful by the mere will to do it, and thus tolerate and perpetuate evil, enjoying their will to do good, alike in its perception and deception.

There is a power for the community lodged in the government and the governing institutions of our country, to foster, to create anew when decayed, and to cherish the vigorous energies of our home trade and manufactures.

A parent of a family would check all injurious or licentious freedom in one child, which was either hurtful to such child or tending to injure or destroy the welfare of any of his other children. So will the parental power of the state guard and protect the proper and wholesome freedom of all individuals and classes for whose welfare and guardianship it is appointed to protect, so that the freedom given to one individual or class of individuals should not be exercised to the injury of any one member or body of members of the community.

Arts and manufactures, trade and commerce, are inseparably connected with freedom; but it is only a just and wholesome freedom based upon just laws of mutual benevolence, based upon those "eternal principles of justice which unite the wise, the learned, and the good of every name and denomination, and insure the final triumph of whatever is consistent in goodness with these principles." It is only with this wholesome freedom that a country flourishes in blessings to itself and the means of blessing other nations; but with unrestrained hurtful liberty, it soon falls to decay. The very rivalry of injurious competition engenders animosities and injuries from one portion of a trading interest against the other of its own class—but to such a pitch has it now run, that the manufacturing interest is not content with rivaling prejudicially the manufacturing interest, but sets itself against whatever interest shall interfere with its money-gains, even against its best friends, the agriculturists, setting with this interest, one against the other, with a reckless spirit of general ruin.

Artists, manufacturers, and merchants duly encouraged are the life and soul of a commercial and enterprising—of a happily civilized country. It is on these the agriculture of our nation, and especially the agriculture of our own nation, depends. In vain will the farmer raise his corn, or fatten his cattle, if there be not manufacturers willing to buy, and the many

sufficient to consume the product of their industry and labour.

But if our merchants be encouraged by the government of the country, merely to suit the supposed money advantages of the manufacturers, to procure, as in substitution for that which the agriculturists of our country have produced, the corn and cattle from abroad, then is the freedom given to arts, manufactures, trade, and commerce made tyranny—then assuredly will our country sink to decay.

Under the mutually advantageous desires of a people, and the genial desires and encouragement of a duly bounded free country—agriculture is carried to the highest pitch, farmers are wealthy, peasants abound and have abundant work; all are employed, and all are happy. The farmer finds a ready market for all his cattle, corn, and wool, and the peasant goes cheerfully to his labours in the field, while his wife and children sing (perhaps it may be again as it was in former days) over the spinning-wheel. "The pastures are clothed with flocks, the valleys also are covered with corn, and the little hills rejoice on every side."

In this state of things, the wealthy and happy mind of manufacturing towns and districts of this should be happy island would be amongst the first, with merry bells of joyous hearts (thus set at ease and made content), to rejoice at the welfare of others; but, most assuredly, by their striving to effect the realization of this attainable welfare of the agriculturists, will they accomplish their own happy and life-stirring employment, and their own enduring and lasting substantial welfare, with happy hours of rest for enjoying the fruits of their labour, either in the town or the suburban country, when their daily labour is done.

As the farmer depends upon the manufacturer for consuming the product of his labour and risk, so does the manufacturer depend upon the agriculturist to consume or purchase for fancy or for use whatever may be produced by the industrious enterprise of manufacture.—All beyond the support at home (such as the home consumption) should only be looked upon as secondary in and for certainty of dependence; it should be regarded as an adventurous speculation, subject to all the chances of adventitious causes, which produce a casual demand that can never be reckoned upon as certain, or of sure continuance; whereas, to a certain extent, if agriculture at home be duly encouraged and flourishing, the manufacturer always reckons upon a certain amount of demand for his product, probably increasing annually, as confidence and mutual prosperity shall exist and increase amongst mankind.—*Provident Philanthropist.*

#### DESCRIPTION OF MR. CROGGON'S PATENT ASPHALTE ROOFING.

This material for roofing is a composition of hair and hemp, felted together and thoroughly saturated with pure mineral asphalt; it is a perfect non-conductor of heat and cold, and consequently keeps a building both warm and cool. It is portable, for being flexible, it is easily packed, and it is not liable to damage. It is so light, that timbers little stronger than sufficient to carry themselves will support it; nor is it applicable only to the roofs, but also to the sides of buildings. The following is the mode of application:—Cover the roof or building with thin (say  $\frac{1}{4}$  inch) close boarding, *where practicable*, not running horizontally, but the reverse way; securely nail the "material" each sheet lapping about  $1\frac{1}{2}$  inch, with copper nails; then pay it over, while hot, with a mixture of coal-tar and lime (about 6 lbs. of the latter to 2 gallons of the former). When this has become hard, it is advisable to give it a second coat, and the roof is complete. The price of the material is one penny per foot superficial; it is in all cases 32 inches wide, but can be furnished of any length. As a protective material to plants Dr. Lindley has pronounced it most efficient.

The "Dry Hair Felt" is a very desirable material to prevent the escape of heat from boilers and steam pipes, where heat has to be conveyed from one part of premises to another. As a preventive to sound it is a most effectual barrier, by lining the partitions of rooms with it.—*From a Correspondent.*

#### MICROSCOPICAL SOCIETY.

JAN. 17.—J. S. Bowerbank, Esq., F.R.S., in the chair.—The secretary, Mr. John Quekett, made some observations upon the structure of some human bones which had been discovered in a bog about ten feet below the surface. When first taken up they were as black as ebony, but on drying, the colour had changed to a dark brown; the specific gravity was exactly twice that of water. The most remarkable circumstance connected with these bones, was the fact of the earthy matter not only having penetrated into the Haversian canals, but had made its way from them through the canaliculi into the osseous corpuscles. The specimens exhibited had been boiled in Canada balsam, to render them very transparent, and to show the great contrast between the corpuscles which had been filled with earthy matter and those which were still empty. The same fact had been noticed by Mr. Luce in the bones of a mummy. The author stated that he had not been able to succeed in filling the corpuscles with injection.

Mr. Dalrymple alluded to a portion of a skull of a Peruvian, in the Haversian canals of which he had seen not only a single vessel running in the canal, but a number of capillaries on the walls of the canals. Dr. Goodfellow mentioned that he had seen the osseous corpuscles artificially filled by Mr. Tomes.

Mr. Quekett then made another communication on the arrangement of the blood-vessels in the lower part of the lung of the camelion, which were so precisely like those in the air-bladder of the eel, that it left no doubt on his mind of the respiratory function of that organ.

#### ROYAL INSTITUTION.

JAN. 19.—On Friday evening, Mr. Brande gave a very instructive lecture "On Fermentation." The lecturer, after some successful experiments, showing the changes produced by chemical action, directed particular attention to the fact, that the presence of a body which could have of itself no apparent action, is yet found to exercise a most decided influence. A portion of chlorate of potash was heated by an argon lamp in a glass retort, and by the side of it was placed, in a retort of exactly the same size, exposed to exactly the same heat, some chlorate of potash mixed with a small portion of oxide of manganese; after a few minutes, the chloride of potash mixed with the oxide of manganese was observed to be suffering decomposition, evolving large quantities of oxygen gas, while the other suffered no change. The oxide of manganese was entirely unchanged, and even oxide of copper, or any metallic oxide, could be substituted for it. Again, platinum resisted nitric acid; it could be boiled in it without change. Silver was, on the contrary, dissolved. Yet, on submitting an alloy of these two metals to the action of the acid, the platinum might be supposed still to escape action, but it was not so. The chemical action commenced in the silver extended to the platinum; both were dissolved. These results were precisely identical with fermentation, the action of neither was at the present moment known, and the application of alstruse chemical terms did not advance the knowledge. Experiments had, however, proved that no body, unless it contained nitrogen in its composition, could produce this result. On mixing a small quantity of halm or yeast with a solution of sugar and water, the following changes could be traced:—sugar consisted of three atoms of carbon, three of hydrogen, three of oxygen; a proportion of carbon would, under the influence of the yeast, unite with oxygen, forming carbonic acid, and the remaining proportions would be so arranged as to form alcohol. In the manufacture of wine, yeast was not required, as the sugar of the grape contained this principle, yet the grapes could be dried into raisins without change; but that arose from the total imperviousness of the skin of the grape to air. Drying could be effected, for water could pass, but no air; allow even for a moment the entrance of air, and the change into vinous fermentation would inevitably result. There was a peculiarly instructive experiment of Liebig upon this point: he introduced into a vessel holding a solution of sugar and water, a smaller one with a false bottom (covered with muslin), and he placed in the smaller one some yeast;

and it was shewn that the fermenting action had commenced in the smaller vessel, while in the larger, or outer one, although there was a free communication through the gauze, the action had not commenced, nor would it till the particles became sufficiently reduced to pass through the gauze. The presence of kreosote turpentine would stop the action of yeast; boiling might be regarded in the light of delaying it, for after some time the action could not be perceived. It might to many appear strange to hear that sugar consisted but of charcoal and water, yet he could shew it by experiment. The lecturer poured some oil of vitrol into syrup; steam was evolved, and a large pasty mass of charcoal formed. The lecturer, in conclusion called attention to a very ingenious plan for brewing, suggested by Sir Thomas Murrable, by which the elaborate apparatus now employed was completely dispensed with. The malt and hops were boiled together, as at present; when it had cooled to about 90°, it was mixed with the yeast, and poured at once into the cask. The cask was fitted with a bent tube, connected with a basin of water, to prevent the access of air, while it allowed a free exit to the carbonic acid so formed. The cask required to be kept at a temperature of 60° or 70° for five weeks, and a very excellent beer was produced; the uppermost and the lowest strata were to be rejected as containing impurities.

ON "SCARFING" OR LENGTHENING OF TIMBERS.

BY MR. JAMES WYLLSON.

WHEN beams or other timbers employed in carpentry are required to be of length greater than can be obtained in the *balk*, it is necessary to adopt artificial means of lengthening them, or so connecting together as many pieces of timber lengthwise as will make out the extent required, and which result is obtained by means of the method called *scarfing*. "SCARFING" may, therefore, be termed the art of uniting two or more pieces of timber endwise, so as to make them like one piece, nearly so in appearance, and, if possible, perfectly so with respect to strength.

Of the various methods in use, there are some in which there is no expenditure of the length of the timbers that are to be united, the pieces being joined end to end; in others some sacrifice takes place in this particular from the pieces lapped together. They might also be classified as those which with regard to strain longitudinally and transversely depend for strength of connection, entirely on bolts; and those which in reference to the strain lengthwise have, from being so formed as to clasp together, some independent security in themselves. The clasping, or as it is technically termed, *indenting*, necessarily reduces the depths of the timbers more than a single lap-joint does; and consequently weakens them in a proportionate degree; the practice, therefore, in regard to beams, is less available where there is a weight to be sustained, and less necessary where a tendency to extension is least required to be guarded against, than when the chief or entire purpose is to furnish a tie between two given points—in which case it is recommendable.

Before entering into a detailed description of the variety of scarfs herein exhibited, we must make mention of another and simple method of lengthening timbers, called *fishing*, and which, though inferior in appearance, is perhaps the most efficient in point of strength; and is very convenient for temporary purposes. It consists in abutting against each other the ends of two pieces of timber, and applying to the joint, instead of the plates of iron employed in superior scarfing, two pieces of timber, one on the top and the other below, and bolting the whole together (see fig. 1.) This

Fig. 1.

joint, like most simple modes of scarfing,

depending altogether for strength as a tie upon bolts, may be improved by indenting the pieces

Fig. 2.

together, as shewn by fig. 2, or by introducing

Fig. 3.

keys, as in fig. 3: either of these methods gives resistance to the strain which affects the beam lengthwise, in addition to that of the bolts; but at the same time it must be observed, that as the two main timbers are weakened in the same ratio that they have in the indentations been decreased in their depth; therefore consideration has to be made when adopting this mode of connecting timbers lengthwise, whether opposition to the strain above noticed, or to the cross ones of compression and extension which simultaneously proceed from loading, is most to be provided: in other words, whether the compound beam is to be a tie or a support; and as the strain in the former is trifling in comparison with that in the latter, there will be no doubt as to the method which should be adopted; the use of one indented piece only (the under one) is a good compromise where objection to the reduction of strength is not great; since it assists the bolts in holding together the lower half of the main abutting joint. These remarks are equally applicable to scarf-joints.

Fig. 4.

Fig. 5.

Fig. 6.

Figs. 4, 5, and 6 are modes of scarfing which may be adopted when none of the length of either of the pieces can be spared. The first may be used as a tie, without plates or bolts, where little strength is required:—*a* is a key tightened by wedges at *b c d* and *e*, which cause the ends of the timbers to abut closely together. It may be here stated as applying to this and all other cases of wedging in scarf-joints, that the wedges ought to be driven in only just sufficient to bring the abutting surfaces to bear properly on each other. It is a very good practice to place a piece of thin sheet-lead, or, what is better, plate-iron, between the surfaces, in a joint where two timbers, meeting together, the grain of the wood in one is made to abut against that of the other, to prevent them from penetrating each other; this of course only applies to abutting joints; under this denomination those at *a* in Figs. 4, 5, 6, 22, 23, and 24 would come were

Fig. 22.

Fig. 23.

Fig. 24.

the beams loaded above. The second of the examples in question (fig. 5) shews a method of

lengthening with an intermediate strengthening piece indented flush into the others by steps, and all three secured together by means of an iron plate and bolts; this is a very good scarf for a bearing-beam, but lengthwise its strength entirely depends on the bolts; in this respect, however, it may be considerably amended by turning in the ends of the plates (supposing it to have two, one at top and another at bottom), as in Fig. 7, &c., and which may be regarded as a good practice generally. The third example being indented, is a fair tie-joint, and if the ends of the connecting piece be splayed inwardly, as shewn at *b*, it will be also effective under a weight.

Fig. 7 A.

Fig. 7 B.

Fig. 7 shews A, the side, and B, the top, of a joint which is very good for purposes where bolts are not intended to be used, and where much strength is not needed; the joint *a* (fig. A) is made just sufficiently easy to allow the wedges fair scope for bringing the parts at *b* (fig. B) close together.

Fig. 8.

Fig. 9.

Fig. 10.

Figs. 8, 9, and 10 are the most simple of those methods, in which sacrifice is made of length of timber equal to that of the scarf; and they may be considered very good joints where the resistance offered by the bolts to the strain which tends to separate the timbers, aided by the degree of connection afforded by turning in the ends of the plates, is deemed equal to the requirements of the case.

Fig. 11.

Fig. 11 may be considered as an improvement on fig. 8, if the strain is lengthwise; but not so under a cross strain, the depths of the timbers being reduced by the indents.

Fig. 12.

Fig. 12. The same remarks apply to this (with reference to fig. 10) as to the preceding, the only difference being that the tie is formed by means of keys instead of tabs.

(To be continued.)

COLOURING.—Nature employs but two metals, iron and copper, for colouring the whole creation. All her variety results from the varied combination of three colours—red, yellow, and azure. What a harmony there is in the rainbow! Take away but one of its principal colours—the red, for instance, and the harmony is gone. The ancient painters, for a long time, employed only these primitive colours; the moderns make use of a considerable number. But with these three, and the addition of black and white, eight hundred and nineteen different combinations may be produced. Hence Apelles and Protogenes might have been as good colourists as Titian and Correggio.—*Magazine of Science.*

## LIVERPOOL DOCKS.

CONSIDERABLE discussion occupied the Council for a long time on Monday and Tuesday, last week, as to the propriety of affording increased dock accommodation. The debate was opened on Monday by Mr. Moore, the chairman of the Dock Committee, who moved a resolution to the effect that "the proceedings and resolutions of the Dock Committee, from the 28th of September to the 24th inst., so far as the same related to extending dock accommodation, be confirmed; that the Dock Committee be authorized to prepare and present a bill for carrying the same resolutions into effect, laying before the trustees the plans as soon as they shall have been printed and prepared, the Dock Committee having full authority to proceed with the bill, the Dock Solicitor conferring with the Town Clerk on the same subject, and settling the same with him, subject to the approbation of the trustees; and that the Dock Committee be authorized to affix the seal of the trustees, preparatory to the bill being brought in."—Mr. Nicol, the deputy chairman of the Dock Committee, seconded the motion.—Mr. Alderman Evans opposed it, in a speech of about an hour and a half's duration, and the debate was then adjourned.—Mr. Aspinall re-opened it on Tuesday morning, after which Messrs. Hodgson, Parker, Isaac Holmes, Busbell, and Aikin addressed the Council. All parties seemed to unite in thinking that this was the most important and momentous question which had ever been agitated in Liverpool, involving, as it does, the outlay of upwards of a million of money. Two amendments were moved, one by Mr. Aikin and the other by Mr. Turner. The first was to the effect that it was inadvisable to proceed further with the dock bills, until the plans of the proposed new docks be prepared and approved of. The second was to the effect that negotiations be entered into with the Harrington Dock Committee for the purchase of land for a sea-moak to the extent of 40,000 yards. The first amendment was lost by a majority of 33 to 14; and the second by a majority of 34 to 13. The original motion was carried by a large majority.

## URNS LATELY FOUND IN LANCASHIRE.

Mr. Studley Martin states that, being on a visit to the Rev. William Thursby, at Ormerod House, I went to see the spot on the moors dividing Lancashire from Yorkshire, about four miles east of Burnley, where Mr. Spenser discovered some time ago four urns, and on my way over Worsthorn Moor, I noticed a collection of stones, scarcely raised above the turf, which struck me as worth investigation—evidently not got together for lime burning, clearing the land, or any building purpose. On the 17th of April, 1843, I therefore, assisted by a man with a spade and pick, and accompanied by Mr. John Hardy Thursby, examined the centre of the heap. The stones were rough, irregular, and moss-grown. Upon clearing them away, some rather fine sand appeared, and about a yard below the original surface, covered by a stone, was an urn containing ashes and fragments of partially burnt bones, pronounced, from roughness, where the muscles had been inserted, to be those of a muscular man. The upper part of the urn, which was five inches in diameter at the bottom, eight and a half at the widest part of the top, and eleven and three-quarters high, contained either charred substance or peat, and sand or earth, with which the ashes were mixed, probably filled in upon them, and was moist, I fancy, more so than if it had been dry when originally deposited. The stone was not wrought, and without any inscription or mark. The urn was exactly in the centre of the heap, which formed a circle, extending east and west about eight yards in diameter, and six north and south. On the turf is discernible a circle about eighty yards in diameter east and west, and sixty north and south—the centre of which the urn also formed. Round the urn was a sort of wall of stone, filled up with peat or clay. The cardinal points were marked by larger stones. The whole of the stone-enclosed space has been examined, but without further results. The spot, on Worsthorn Moor, about three miles

east of Burnley, is on the north side, and about two hundred yards from the summit of a hill, called Smallshaw, and is at the junction of two scarcely defined paths, one leading from Worsthorn Quarry, over the moors, in the direction of Mr. Spenser's urns, which were found on the further side of a hill, to the east, and separated by a ravine from Smallshaw; the other from a hill to the north, between which and the stones is a gully called Thornden, with a stream flowing into one of the Caldera. Dr. Whitaker, in his "History of Whalley," mentions, under "Clogiers," Roman coins having been discovered in this district in 1695, and given by a Townley, of Townley, to Thoresby—a tumulus, at Lawhouse, destroyed in 1763—another opened in 1766 containing a rude urn—appearances of entrenchments at Redlee—all immediately in the neighbourhood of my discovery. He also mentions Briercliffe as remarkable for some Roman remains, and thought a chain of small Roman posts, subordinate to the station of Casterfeld (the castro restio of Colonic), extended on the elevated grounds of Briercliffe, Worsthorn, and Extwistle, commanding the great inclined planes intersected by the deep ravines of Thornden, Swinden, and Thurston, one of which was in the middle of Worsthorn Moor. This is also near the stones. The other barrows he mentions are not now easily to be found. The urn is without inscription; but on the upper part had rude marks. It was entire when discovered; but several portions crumbled off the top in my hands. I left it at Ormerod. Conjecturing it not to be Roman, I was on the lookout on the moors for any traces of serpent circles Dracontia, &c., but in vain. The Ormerods, whose heiress is Mrs. Thursby (with her sister, the Hon. Mrs. Yorke Scarlett), intermarried with the family of Edmund Spenser, which the *Gentleman's Magazine* shews to have sprung from Hurstwood, now belonging to the Ormerod estate, and between it and Worsthorn. The writer of the communication respecting Espenser, is Mr. Spenser, of Halifax, who discovered the first-named urns.

## RAILWAY INTELLIGENCE.

**Railway Docks at Hull.**—At the meeting of the Hull Dock Company last week, the chairman stated that a representation had been made by gentlemen connected with the Leeds and Manchester and Hull and Selby Railway Companies of the inadequacy of the dock accommodation in the vicinity of the railway terminus for large quantities of salt and coal that were expected to be shipped from the port for exportation, and that the same parties had made the suggestion that a small dock might be formed upon the ground of H. Broadley, Esq., of about 720 feet by 120, capable of accommodating some 14 or 15 vessels, which would have the effect of materially relieving the Humber Dock from the pressure of shipping, and where the articles referred to could be delivered from the railway waggons at once into the ships' holds. It was necessary, however, that power should be delegated to a committee to entertain the proposal, and consider of the necessary steps to be taken, in the event of a successful negotiation with the associated railway companies. A resolution was passed accordingly, empowering the committee to take the proposition of the railway companies into their immediate consideration. We understand that the railway companies have contracted with one house for carrying and delivering at Hull, in the course of the present year, upwards of 20,000 tons of salt. This is quite a new article of traffic on the Manchester and Hull Railways, and will add to their revenues some 12,000, or 15,000, per annum.

**Blackburn and Preston Railway.**—We are enabled to state, that there is no longer any obstacle to the carrying out the project of a railway from this town to join the North Union line at Farrington, near Preston, and we are also glad to be informed that the line, as originally struck out and surveyed by Mr. Collier, the engineer, has been altered for a better one, Mr. Fielden having, with his usual liberality, granted leave for the line to take a more convenient course through his estate at Witton. This amended line has, we understand, been recommended by the eminent railway engineer, Mr. Locke, after a careful personal examination.

**London and Chatham and Chatham and Portsmouth Junction Railway.**—The directors of the Croydon and South-Eastern Railways have united to form this line, which, by arrangements with the Brighton and South-Western Railways, is to connect Chatham, Rochester, Strood, Gravesend, &c., with the metropolis, as well as with Brighton and the coast of Sussex, and with Southampton and the west of England; uniting, at the same time, the two naval arsenals of Chatham and Portsmouth. This line will also be guaranteed four per cent. on the capital by the South-Eastern and Croydon Companies.

**Brighton and Chichester Railway.**—A company has been formed, under the auspices of the London and Brighton Company, for connecting Brighton and Chichester by means of a railway, to commence by a junction with the Brighton Branch at Shoreham. Arundel, Bognor, Littlehampton, and Worthing will thus have the advantage of railway communication with London. The Brighton Company offer to lease the line for ten years from its completion, at a rent of 12,000, per annum, being four per cent. on the estimated cost, dividing the net profits equally between themselves and the proprietors of the projected railway. The line will be twenty-three miles long, over a country described as remarkably level.

**Brighton, Lewes, and Hastings Railway.**—This company is brought forward with a guarantee by the Brighton Company similar to that offered to the Brighton and Chichester line. Hastings, St. Leonard's, Eastbourne, Hailsham, and Lewes are the principal places to be connected with each other, as well as with London and Brighton. The length of the line is about thirty-one miles, making the total distance of Hastings from London eighty-one miles; the capital required is 475,000.

**Hastings, Rye, and Tenterden Railway.**—This railway will be twenty-five miles in length, and is intended to connect Hastings, St. Leonard's, Rye, and Tenterden, with the South-Eastern line at Headcorn. A single line of rails will be sufficient, and the cost, it is stated, will not exceed 400,000. The South-Eastern Railway Company guarantee a return on the capital similar to that offered by the Brighton Railway to their Hastings branch.

**Harrogate and Knaresborough Railway to the York and North-Midland Line.**—We understand that such is the favourable opinion entertained by the public of this proposed railway, and the anxiety evinced to obtain shares therein, that the provisional committee have received applications for upwards of 24,000 shares; and, having only 6,000 shares at their disposal, they have been under the necessity of refusing *in toto* a great number, and in many instances have been compelled to cut down the amount of shares allotted to highly respectable parties, in order to meet the wishes of such an unprecedented number of applications.—*Leeds Mercury.*

**North British Railway.**—Mr. Hudson, the indefatigable chairman of the York and North-Midland Railway, accompanied by Mr. Stephenson, the engineer, are engaged in a careful personal examination of the line of the North British Railway, between Edinburgh and Berwick. So far as their tour along the line has proceeded, both gentlemen have expressed their satisfaction with the route chosen by the Edinburgh engineers, as well as with the estimated cost of construction.

**Stansted Mountfichet.**—The works of the Northern and Eastern Railway Extension are proceeding with great rapidity in this parish, and the adjoining ones of Elsenham and Birch-anger; but as yet nothing is doing upon the property of Mr. Maitland, here, through whose land it will pass to the extent of a mile. The operations have caused a considerable influx of railway labourers into the parish, all of whom, at present, have conducted themselves with great propriety.

**French Railways.**—An attempt was made by M. Muret de Boret and M. De la Roche Jaquelin to extract from the Minister of Public Works an idea of his intentions relative to the great new lines of railroad which have been some time projected, and on which speculators are in doubt whether the Government means to execute them itself, or deliver them over to joint-stock companies.

**Dreadful Accident on the Sheffield and Manchester Railway.**—On Friday, the 26th ult., a frightful accident occurred at Dinting viaduct, now in course of erection across Dinting Vale, a short distance from the present Glossop station on the Sheffield and Manchester line. The viaduct is of great height, vying with that at Broadbottom, and comprises three stone arches, raised from massive abutments or pillars. Our informant happened to be proceeding from the Glossop railway station, outside the coach, when the appalling event took place. He states that one of the three arches, partly formed with stone, and resting on the centres and other supports, suddenly moved and oscillated, when, in a moment afterwards, the ponderous erection fell to the earth, carrying with it the immensely large stones already laid towards forming the arch, and producing a fearful sound, resembling the discharge of artillery guns. On the highest part of the centres, when they fell, stood two workmen, who were precipitated among the heavy stones, timber, and mortar. One of them was found to have sustained a compound fracture of the elbow joint, with internal injuries, which brought on collapse, and in a few minutes the poor fellow ceased to exist. His fellow-sufferer was not so severely injured; fracture of the ribs had occurred, but with care and attention he is likely to recover. When our informant left, the cause of the accident had not been clearly ascertained. It was said that the centres, or timber supports of the arch, were not new and sound, but had been used on another part of the line, and had been here most improperly introduced. On this very important point no doubt an investigation will be immediately entered upon, and the truth elicited.—*Manchester Times.*

**Advantages of Low Fares on Railways.**—The report of the North Shields Railway presents some curious particulars in respect of third-class passengers. The directors, with a view of restoring the former position of the railway, which had been greatly depressed, resolved on re-establishing third-class carriages at lower fares, and with more frequent trains. The result has been that in the half-year ending the 31st of December last, the number of passengers was 487,064 as compared with 381,522 passengers in the corresponding six months of the previous year, being an increase of 105,542, the increase in money being 347l. 3s. 6d. A very gratifying fact is also mentioned in the report—namely, that “the passengers carried since the opening of the railway amount, on the 31st of December, to the very great number of 3,369,491, and no accident to the life or limb of any passenger has ever occurred.”

**Statistics of Railway Traffic in 1843.**—An interesting table, prepared from the returns of the past year, appears in the *Railway Magazine*. We have not room for the table, but quote the following results:—“The number of passengers was 17,255,985 during the past year, upon thirty railways; the total traffic receipts upon forty-four railways for the year, being 4,327,655l.; making an average earning of 3,076l. per mile per annum, which is at the rate of 59l. per mile per week. If we deduct 40 per cent. 1,931,062l., from the total receipts, as working expenses, we shall have, less the passenger duty to Government, (5 per cent. on passenger receipts.) 179,662l., and income-tax, 81,509l., leaving the clear sum of 2,635,462l., to pay an average dividend per cent. of 4l. 18s. 10d. upon the actual amount of capital already expended as per last reports, namely, 56,135,134l.; which, of course, entirely excludes nominal capital and preference advantages. The traffic receipts for 1843 exceed those of 1842 by at least 470,000l., shewing an increased average traffic of more than 9,000l. per week in favour of 1843, which is, perhaps, a promising argument of railway prosperity, and may in some measure account for the great desire the public have shewn lately for railway investments, in consequence of which, and the state of the money-market, railway shares have risen to an astonishing price.”

A deputation, consisting of Mr. Glyn, Chairman of the London and Birmingham Railway Company; Mr. Baxendale, and several other gentlemen connected with railways, had an interview with the Right Hon. W. E. Gladstone on Monday last, at the office of the Board of Trade.

RAILWAY ACTS.

Mr. GLADSTONE, as President of the Board of Trade, proposed to the House of Commons on Monday last the appointment of a select committee to consider the standing orders relating to railways, and the course which it might be expedient for Parliament to take with respect to applications for new lines or for new powers in relation to old lines. He intimated that it might be fitting to reduce the amount of deposit now required by the standing orders; and, having regard to the growing importance of the subject, he suggested that future railway bills should be referred to the Board of Trade before the introduction of them into the House of Commons. His present motion would not include any inquiry into the checks which it might be desirable to provide against the alleged abuses of existing railways. There were indications of a disposition to apply for competing lines; but such lines would not produce all those advantages to the public which are considered as attaching to competition in other matters; and he was not without hope that such advantages might be obtained from the good sense of the existing companies, without any unlimited encouragement to competing lines. The object he chiefly desired was, a reasonable arrangement for passengers of the third class, which he thought there was a disposition to concede, and which he believed would be attainable without breaking down the fair principle of the general charges.

Mr. Labouchere wished to make the terms of the reference to the committee a little more extensive, lest the committee should find itself wholly precluded from entering upon an inquiry into the arrangements of railway companies not seeking any further aid from Parliament. He could not think that competition was useless to the public in railway undertakings, and illustrated his opinion by the fact that parcels from Bath, of which it might be supposed that the Great Western Railway would have the entire monopoly, are frequently carried by the Southampton line.

Mr. Gladstone said, that when a certain progress had been made by the committee, such additional references as should then appear expedient might be added by new instructions from the House.

Mr. Roebuck was solicitous that nothing should be done that could fetter the House in examining and dealing with a subject so material to the public welfare. He insisted on the usefulness of rivalry by competing lines; and on the principle that Parliament, after passing an act of monopoly, had a right to interfere if that monopoly were not used as Parliament had expected it should be. The hardships now imposed upon third-class passengers on the Great Western line were an exemplification of this grievance. Having these views of the subject, he wished that there should be nothing to narrow the scope of the committee.

Mr. C. Russell (chairman of the Great Western Railway Company) gave some explanations respecting the accommodation of third-class passengers on that line, and stated that most of the companies were at this moment carrying this class at a positive loss.

Mr. Wallace contended for good accommodation to third-class passengers, and against the discretionary power of directors to raise fares.

Sir R. Peel enforced the principle, that there was a great distinction between parties coming for new enactments, and parties having invested their capital on the faith of enactments already existing. There might, indeed, be cases where Parliament would have a right to control even companies long since founded and seeking no new powers; but he would caution the House to pause in such interference. They ought not to interpose merely because some railways produced profits larger than had been expected; the Legislature which should do that would be equally bound to compensate those lines which had been productive of a loss. But, undoubtedly, the Legislature would do quite fairly in checking abuse by authorizing lines that would have a competing effect; and that power of Parliament, and that probability of competition, constituted the true control on the existing bodies, who, he trusted, would see, in particular, that it was their interest to make fit provision for the third-class passengers.

Mr. S. Wortley was desirous of giving the widest possible scope to the inquiries of the committee.

Mr. P. Stewart trusted that, even if these inquiries should be limited in the beginning for the sake of convenience and despatch, the subject would afterwards receive a wider consideration.

Colonel Sibthorp enlarged upon the evil which railroads had produced in displacing the employments of those who were connected with the old roads and modes of travelling. He did not care how soon he saw all these railway schemes hankrupt.

After a few words from Mr. Plumptre and Mr. F. French, the motion was agreed to.

THE CANAL OF ALEXANDRIA.

THE Canopic mouth (of the Nile) is long since closed up by the mud of Æthiopia, and the Arab conquerors of Egypt were obliged to form a canal to connect this seaport with the river. Under the Mamelukes this canal had also become choked up, and her communication with the great vivifying stream thus ceasing, Alexandria languished—while Rosetta, like a vampire, fed on her decay, and, notwithstanding her shallow waters, swelled suddenly to importance. When Mehemet Ali rose to power, his clear intellect at once comprehended the importance of the ancient emporium. Alexandria was then become a mere harbour for pirates—the desert and the sea were gradually encroaching on its boundaries—but the Pasha ordered the desert to bring forth corn, and the sea to retire, and the mandate of this Albanian Canute was no idle word—it acted like an incantation to the old Egyptian spirit of great works. Up rose a stately city, containing 60,000 inhabitants, and so suddenly yawned the canal, which was to connect the new city with the Nile, and enable it to fulfil its destinies, of becoming the emporium of three quarters of the globe. In the greatness and the cruelty of its accomplishment, this canal may vie with the gigantic labours of the Pharaohs. Three hundred thousand people were swept from the villages of the Delta, and heaped like a ridge along the destined banks of that fatal canal. They had only provisions for one month, and implements they had few or none; but the Pasha's command was urgent—the men worked with all the energy of despair, and stabbed into the ground as if it were their enemy; children carried away the soil in little handfuls; nursing mothers laid their infants on the shelterless banks; the scourge kept them to the work, and mingled blood with their milk, if they attempted to nourish their offspring. Famine soon made its appearance, and they say it was a fearful sight, to see that great multitude convulsively working against time. As a dying horse lites the ground in his agony, they tore up that great grave—30,000 people perished, but the grim contract was completed, and in six weeks the waters of the Nile were led to Alexandria. The canal is forty-eight miles in length, ninety feet in breadth, and eighteen in depth; it was finished altogether in ten months, with the exception of the lock which should have connected it with the river; the Bey who had charge of this department lost his contract and his head.—From “*Episodes of Eastern Travel*,” in the *Dublin University Magazine*.

**GOOD AND BAD ROADS.**—The following table will shew the occupiers of land, who by their teams and in their gigs are the most frequent travellers along the cross roads, how very expensive bad roads are to them, and how much it is their interest to endeavour to improve them, to which frequent gates are the greatest obstacles. Force required to draw a loaded cart, weighing 1,000 lbs. :—

Turnpike road hard and dry	20½ lbs
Ditto dirty	39
Hard compact loam	53
Ordinary bye-road	105
Turnpike road newly gravelled	143
Loose sandy road	204

From this it appears that there is more than three times as much force required in draught on a middling bye-road as on a hard turnpike road. No farmer makes money now-a-days by cart horses; he ought not, therefore, to wish to keep more than necessary; and good roads enable him to turn the keep of a cart-horse into the more profitable animal, a cow or some sheep.—*Berks Chronicle.*

KING'S LANGLEY PRIORY, HERTS.

This priory was founded by King Edward the Second, who, by letters patent, dated at his palace at Langley, granted to the fraternity of Friars Preachers, a garden and other lands lying contiguous to the parish church; and by other letters patent dated at York, granted to them seventy marks, wherewith they might build themselves a house in his park of Langley, for the daily celebration of mass for the soul of himself and his ancestors.

King Edward the Third, also in further testimony of his affection to the foundation of his royal father, gave them a mazer cup called Edward, and thirty-nine other mazer cups, with a particular injunction that they should

never be alienated from this religious house. Upon the dissolution, the revenues of this priory, then valued at the sum of 122*l.* 4*s.*, were surrendered to the Crown.

King Philip and Queen Mary, in 1557, gave and restored to this priory all the houses and grounds, &c., but in the first of Elizabeth, A.D. 1559, this priory, with the appurtenances, reverted again to the Crown, and in the 42nd year of her reign, 1600, gave to Martin, Bishop of Ely, the rectory of King's Langley, with the rights, &c., &c., late parcel of the possessions of the dissolved priory.

Edmund de Langley, the fifth son of King Edward the Third, who married Isabel, second daughter of Don Pedro, King of Castile and

Leon, was buried, according to his own desire, in this priory of the Preaching Friars, in the third year of Henry the Fourth, from whence his tomb was removed into the parish church at the time of the dissolution, and now stands at the N.E. corner of the chancel within the communion-rails, covered with a slab of Purbeck marble.

Notwithstanding the present insignificance of the village where the remains of this priory are situate, it could at one time boast of a palace erected by Henry the Third. Of this once magnificent structure (covering three acres of land), however, but very few vestiges can now be traced.—(*From a Correspondent at King's Langley.*)

#### WOODS, FORESTS, AND METROPOLITAN IMPROVEMENTS REPORT.

The following is an abstract of the twentieth Report of the Commissioners of her Majesty's Woods, Forests, Land Revenues, Works, and Buildings. By the fourteenth annual Report of the said Commissioners, it appears that the leases of Crown property in England and Wales granted in the year ending the 5th of January, 1843, amounted in annual value to 3,692*l.* 7*s.* 4*d.*; the yearly rents reserved to 3,712*l.* 7*s.* 3*d.* The proceeds of the sales by public auction of the land revenues of the Crown in England, between the 5th of January, 1842, and the 5th of January, 1843, produced 2,085*l.* Sixty-six sales of lands and premises by private contract yielded 15,183*l.* 13*s.* 5*d.* The appendix contains an account of land-tax redeemed by the Crown up to the 5th January, 1843, which amounted to 6,441*l.* 0*s.* 6*d.*; reduced Bank Annuities, 30,430*l.* 3*s.* 10*d.*; total, 225,280*l.* 9*s.* 10*d.* The amount paid for the purchase of property on behalf of the Crown was 30,760*l.* 1,080*l.* was paid for the purchase of property for the purpose of forming a new opening from Knightsbridge-road into Hyde-park, and a new opening from High-street, Kensington, into an intended new

road across the Palace-green. The reports contain an account of the particulars of some purchases which have been made for the improvement of the Crown property in the Phoenix-park, near Dublin. The Commissioners have also purchased some property lying to the south of Holyrood Palace, Edinburgh. The purchases alluded to were completed for the sum of 580*l.* The sum of 711*l.* has been paid for the purchase of some premises adjoining the ancient ruins of the Abbey of Arbroath. The tenement in question is built against the walls of the abbey, and it is said, would have interfered with the preservation of the ruins. For Holyhead-road 12,697*l.* 12*s.* 10*d.* has been received, and 11,235*l.* 9*s.* 7*d.* expended. For the metropolitan improvements, purchases to the amount of 300,755*l.* 5*s.* 8*d.* have been made; and contracts for further purchases have been made to the amount of 194,641*l.* 13*s.* 6*d.*, viz. —in the line of Oxford-street to Holborn purchases have been completed to the amount of 166,851*l.* 12*s.* 10*d.*, and contracts to the amount of 15,906*l.* 15*s.* In the line from Bow-street to Charlotte-street, Bloomsbury, the purchases amount to 35,464*l.* 11*s.*; contracts, 26,485*l.* In a line from the London Docks to Spital-fields Church purchases, 44,157*l.* 10*s.*; contracts, 71,102*l.* 18*s.* 6*d.* From Coventry-street to Long-acre, purchases 54,281*l.* 5*s.* 10*d.*; contracts, 78,477*l.* From East Smithfield to Rosemary-lane no purchases have been com-

pleted, but contracts have been made to the amount of 2,670*l.* For the purpose of these improvements the sum of 500,000*l.* has been borrowed from the Equitable Assurance Company. Three houses have been purchased in High-street, Kensington, which were required for opening the intended new communication between Kensington and Bayswater, which not only forms an essential part of the plan for letting for villas the site of the Royal kitchen-garden at Kensington, but will be a great accommodation to the rapidly increased and increasing population of that district. In order to form a new park in the eastern part of the metropolis, the freehold interest in 101 out of 290 acres has been purchased. The following items of expenditure are to be found in the reports:—Amounts paid for purchases at Charing-cross and in the Strand, 874,010*l.* 2*s.*; in Downing-street, 67,293*l.* 6*s.* 5*d.*; King-street, 17,028*l.* 10*s.*; Bedford-street, 7,325*l.*; York-street, Tavistock-street, Long-acre, 29,403*l.* 10*s.*; Piccadilly, 2,130*l.* 17*s.* 6. Payments made for the exhumation of bodies from St. Martin's churchyard, 2,523*l.* 3*s.* 1*d.* The receipts arising from the woods, forests, and land revenues of the Crown in the year ended 5th of January, 1843, including "produce of the land revenue," the "Royal gardens, parks, forests, and woodlands," "extraordinary receipts," "public works and buildings," and "Holyhead Harbour and Roads," were 754,213*l.* 16*s.* 6*d.*

**INFERIORITY OF MODERN ENGLISH BRICKWORK.**

It is a remarkable fact, that in proportion as the manufacture and burning of bricks have improved, and while the use of stone-lime has become more general, the workmanship of much of our modern English brickwork has debased in quality more than the materials of the work have improved. The author is obliged to confess, that although he has taken very great pains to procure complete soundness in the execution of brickwork, he has almost wholly failed: his idea of soundness is nothing more than that the work should be composed of good materials correctly bonded in every part, should be thoroughly cemented together, and that as few broken bricks as possible should be used in the work.

An idea is prevalent that great care and exactness in the choice of the materials of brickwork, and in the workmanship of it, are too burthensomely expensive to be borne in ordinary buildings. No idea could be more erroneous, for had materials will not support much more than their own weight; and though bad brickwork may even cost only 10*l.* per rod, a much larger bulk of it is required for supporting the same weight, and for keeping out the weather equally well, than for the same purpose would be required of brickwork of a better quality; while the carriage and the excise duty are as costly, and the mortar and workmanship of it are as expensive and sometimes more so.

It will be found that for the performance of a certain quantity of duty, malm paving-bricks set in the best stone-lime mortar, will (besides their superior duration) be cheaper than the worst descriptions of place-bricks. It is useless to plead that of itself, circumstances apart, such a wall is too thick or too thin; for sufficiency of substance depends entirely upon the

purpose for which work is required. If he who built Salisbury spire found out the art of so disposing the materials of it as to make a thickness of 7 inches of stone last 500 years and still to remain, it is in vain to say that a wall 9 inches thick will not serve for such or such a purpose: the masonry of Gothic edifices is but rarely in its particles so sound as excellent brickwork; and yet frequently, though you cannot get a builder to double the strength of his walls by careful workmanship, he very often advises you to double the thickness of them in situations where weight and bulk are positive evils.

When you deduct from brickwork in ordinary buildings the loss of strength occasioned by badness of material, by disconnection of the bond, by small pieces being inserted where whole bricks should have been used, and by the weakness which is the result of the work not being duly cemented, you will find that the useful part of common work (if indeed it possess any such) executed at 10*l.* per rod, really costs 50*l.* or more per rod: and then when it is considered in a vast number of our erections, that from one pier not being set over another, a large portion of such piers, instead of supporting the superincumbent weight, acts as ruinous burthens upon the remaining parts of the pier, it will be found that the quantity of effective brickwork is often so reduced, as to cost more than 100*l.* per rod; and indeed it is almost a mistake to say that any of it is effective while in jeopardy from defective nature and mal-construction. In this view of the subject, brickwork is somewhat different from timber-work; for the nice calculator of interest is frequently satisfied, provided he can save by the use of low-priced and bad timber present outlay more than enough to counterbalance the expense of subsequent repairs, and perhaps he may on some special occasions be right, though, nationally considered, the use of had timber is a disgrace.

$\frac{1}{4}$ th part of the superficial extent of the work is bonded,—and in common bad ordinary work, the tie may be reduced to  $\frac{1}{10}$ th; and the author has seen work in which it was reduced to less than  $\frac{1}{20}$ th of the superficial extent, and acted rather as a burthen than a support to the brickwork. But if a wall be built wholly of malm paving-bricks, the facing, if the work be in Flemish-bond, will have  $\frac{1}{3}$ d of its superficial extent bonded in, and if of English-bond,  $\frac{1}{2}$  of its superficial extent will be bonded.

By the ordinary mode of bonding in only the "headers" of each alternate course, two-thirds of the extent of facing throughout the work are separated from the back-work by a series of perpendicular joints extending from the base to the summit of the work. See section from c to d.

The author believes that if the favour in which Flemish-bond facings are held be not altogether a prejudice, the superior soundness of facings of English-bond ought to prevent the use of Flemish-bond in most cases where it is now adopted.

It is of the greatest importance to reduce brickwork to the smallest possible dimensions; for besides the saving of the carriage and duty of the materials, the foundation is thereby disburthened of a crushing heap. In many parts of structures their grace and convenience depend solely upon the ability to reduce the bulk of their substantial component parts; and, moreover, every proprietor has a natural inherent feeling against the occupation of the site of his habitation, by an useless bulk of materials; and the disparity in favour of the quantity of permanent strength to be produced out of a given sum of money, by the use of good materials and good workmanship, should for ever, with the wise and truly economical, banish inferiority. The wonder with which mankind in general view a small quantity of materials reared by delicate art, should be sufficient inducement for the architectural practitioner to take some pains in this respect.

The author has sometimes, under peculiar circumstances, run up to a considerable height walls in their principal parts no thicker than nine inches, and has been cautioned against this; but he has found, although he could not get the brickwork executed to his satisfaction, these walls, from even the moderate care which has been used in their formation, have remained without flaw, while walls much thicker, raised by those who gave him their advice, have in a few months cracked and fallen to ruin, because they were worse constructed, and were reared contrary to all static principle.

Of how much importance it is to reduce the bulk of the component materials of an edifice to the smallest bulk which safety will allow, is the circumstance of the fondness with which so many persons view the adoption of small coarse and proportionless pillars of iron, in preference to the most beautiful piers and columns of either Grecian or even Pointed Architecture.

Only practically convince the public that economical soundness, internal capacity, and duration, may be obtained by the proper use of proper materials, and the coarse and slovenly workman will in vain attempt to defraud his employer by the sale of large quantities of worthless materials,—the brickmaker will find a mode of protecting his goods, while crude, from the injuries of inclement weather, and he will so well burn his bricks, that no more soft ones will be in the market than can be used for mere purposes of bulk and weight, or for the repairs of old and inferior buildings, the great duration of which is of little consequence.

The author is the more earnest in these remarks, since he finds it difficult to disabuse one class of employers from the ill advice which they receive from inferior tradesmen, who, unable to perform any thing well, find more pecuniary profit result from the sale of a large quantity of bad materials and bad workmanship, than from the performance of a moderate quantity of excellent work.

*English Bond of Brickwork.*

It is universally admitted that English-bond is the mode in which brickwork can be put together with the greatest strength,—for in no part of such work, when properly done, does joint come over joint, and it does not require small pieces of brick to fill up the work; moreover it may and ought to be done entirely with whole bricks, except the "closers" near its angles, requisite in order to adjust properly the bond. Whereas Flemish-bond requires of necessity, through its whole structure, a multitude of small pieces, and possesses the additional inconvenience of having throughout its structure a series of coffers (filled with unbonded work) which extend perpendicularly from the base to the summit of the work.

*Flemish-Bond of Brickwork.*

It is customary to consider Flemish-bond as indispensable for the external facing of even the commonest descriptions of buildings; hence there is license given for the most defective workmanship; for as in general bricklayers use for all work out of sight the English-bond,

they make the insides of external walls of English-bond, and the outsides of them of Flemish-bond, and thus much irregularity and breach in the bonding of the work ensue. In order to avoid this evil, the author, for some considerable time past, has had all his external walls, except those of principal fronts, executed entirely within and without in English-bond; and he would have adopted the same mode of structure even in principal fronts, had he not been restrained by the fear of increasing the proportion in the quantity of facing-bricks, which are in general much softer and inferior in goodness to the description of grey-stock bricks which he in general uses: and this imperfection of the ordinary facing-bricks has almost induced him to lay aside altogether the ordinary facing-bricks, and to make his walls only of moderate thickness, but within and without entirely of the very best malm paving-bricks, a description of material which he believes to be the most excellent for walls; and this would remove altogether the imperfection of softness and the want of tie, in the ordinary facings of brickwork; for by the ordinary mode of carrying into the body of the work the "headers" of but every alternate course, only  $\frac{1}{4}$ th part of the superficial extent of

*Brickwork Faced with Malm Stock.*

the facings can be tied into the work; and when it is considered how many of the "headers" break off while the workman is

laying them, how many he omits from carelessness or fraud, and how many of them are short when used, it will be found that only about

Perhaps no other description of work executed at the present day in England, calls for such asperity of condemnation as much of our London brickwork: where it is to be exposed to view, it is too often bad enough; but where it is to be concealed, as is so often the case, by vicious plaster finery, one-half the expense of which might have made it work indeed, no pen can describe adequately its abominations, its pseudo-arches, its want of bond, its shattered condition, its internal uncemented state, and its general badness of materials.—From *Bartholomew's "Essay on the Decline of Science, &c. in Modern English Buildings."*

### Literature.

*Fisher's Colonial Magazine.*—No. I.—New Series.

A NEW issue of this valuable periodical has been commenced, with a reduction of price from half-a-crown to a shilling per monthly number, so as to suit the purses of every grade, whether colonists, emigrants, or home readers. Among the many articles of interest contained in this periodical which we recommend to our subscribers, the article entitled "On the Use and the Practicability of the Construction of a Canal or other Communication from the Atlantic to the Pacific," will be of very great interest. The following are remarks contained in the paper in question:—

"Were we about to offer our sentiments on the formation of a canal of even larger extent than any now existing, either for internal communication, or between rivers, lakes, channels, or even seas, we might call to our aid a tolerable quantum of resolution; but, when on the brink of considering the feasibility of uniting two vast oceans, and that by crossing through a portion of the most stupendous range of mountains on our earth, we become sensible of our relative pigny weakness in attempting, perhaps rashly attempting, to modify, by human art, the vast works of an all-intelligent, all-powerful, and beneficent Creator.

"The idea of a communication between the Atlantic and Pacific Oceans is not a new or recent one. It did not escape the keen imagination of Columbus, the last days of whose eventful, ever-active, and vastly-useful life, were devoted to the deep contemplation of the work. His great mind did not rest satisfied, as well it might have been, with discovering for his fellow-men a new and mighty continent; but, like all master-minds born to improve their species, an achievement gained, was to him the foundation upon which he lifted himself towards the accomplishment of others. But he had already done more than is commonly allotted to man, and, unfortunately for mankind, the great design was left by him for the precarious accomplishment of subsequent ages. After his death, the scheme had attractions for the bold and daring aspirations of the early Spaniards, to whose habits of enterprising adventure, the vastness and sublimity of the project were congenial; but nothing was effected. We are not surprised at little having been done in later times, during the dominion in South America of the Spanish government; for what could be expected from the dullest political and scientific apathy, but a stagnation of all that is good and profitable to man in his social condition? Beyond a solitary survey, made by order of the government, it would seem, solely and only for the embellishment of the archives of the city of Guatemala, and which was, in truth, most religiously confined to its musty dormitory until the South Americans cast off their galling yoke, the matter was hardly thought of. Since the achievement of their freedom, however, the republics of Venezuela and New Granada, and of Central America, have not been idle; amid their young flutterings for stability of government, they have found time to do much, by investigation, towards removing the imagined obstacles in the way of the accomplishment of the undertaking, having bestowed much pains in procuring those exact surveys, and other data, which are essential to a careful and accurate consideration of its accomplishment.

"We have thus seen that the New World is in itself naturally of a form eminently favourable to commercial enterprise; but, it is clearly also susceptible of great artificial improvement, and particularly and prominently so as respects the subject of our present article; a

subject affecting not only that vast hemisphere itself, but of immeasurable account to the other quarters of the globe. Were a water-communication, by means of a canal for ships, effected across the Isthmus of Darien, through Central America, or even Mexico, it is obvious that the harshest features of our present navigation would be softened down, and that also vast countries abounding in natural resources and wealth would be soon quickened into active commercial life. Instead of the now precarious and perilous voyage by the Cape of Good Hope to the East Indies and China, and their neighbouring islands, and also Australia, a safe one, occupying much less time, could be effected; not, however, because of there being any great difference of direct distance, but on account of extremely advantageous winds, tides, and weather. In place of the still more hazardous and trying route round Cape Horn, through icy seas, and along inhospitable coasts, to the western shores of America—every day rising in commercial and political consequence—and the islands of the Pacific, now assuming a prominent importance, and also to the whale fisheries in that ocean, an opening through the continent of America, would furnish both a fearless and an infinitely shorter voyage than that so frequently ruinously disastrous one. In short, a glance over the map of the world will make it evident, better than any description that can be given, that the execution of this great work would send over our globe a flood of commercial light, the effects of which would benefit not only Europe, but every part of the habitable earth. It would most emphatically and decidedly advantage those magnificent countries through which it would pass; Europe and North America, unquestionably so, in an eminent degree; Asia would be vastly benefited by it, and even dormant Africa would feel its awakening, enlivening influence.

"The much agitated question of the practicability of a communication between the Atlantic and Pacific Oceans, is now no longer a matter of speculation; if any seeming ground for doubt was ever involved in it, such has been now quite dissipated, for competent men, from actual survey, have confirmed what has been always our opinion, the admissibility of its accomplishment, and not only at one, but at several places—although the work has certainly appeared to us to be one of great difficulty, and also of distant and very uncertain fulfilment; necessarily difficult, from the very great magnitude of the work, and remote and precarious from paucity of inhabitants, and want of sufficient capital and enterprise in the states immediately concerned in bringing about its execution: but now that other governments seem to be taking up the matter, we may look for the early fruition of this unspeakable benefit to commerce and civilization.

"As many as four places have been supposed eligible for effecting this junction. It has been proposed that the Gulf of Mexico should be united to the Gulf of Tehuantepec, in the Pacific, by means of a canal, which should join the sources of the river Chilimalpa to those of the Rio del Passo. The distance, however, being as great as thirty-eight leagues, added to other unfavourable local circumstances, renders this plan by no means an advisable one; and then, its being so much to the north, would also detract from its merit; besides, its realization is of more moment to the state of Mexico than to the general interests of the whole commercial world. The second plan proposes a line of communication across Central America by passing from the Atlantic up the river San Juan, into the lake of Nicaragua, and thence by a canal to the Pacific. This project has great recommendations, and, we think, is even preferable to any other, which we shall endeavour to make apparent, after having stated the merits of the two most popular ones; the third and fourth plans, which contemplate a passage through the Isthmus of Panama, and have occupied more attention than any of the others: an account of the features, both topographical and statistical of the locality, is essential to an explanation of the subject.

"The Isthmus of Panama, a name which must not be confounded with a province having the same designation in New Granada, is that remarkable ligature, neck, or link of land, ~~more properly speaking, which connects~~ the continents of North and South America. It is sometimes also called the Isthmus of Darien,

a name which is, however, now much out of use, and ought to be expunged on that account from geographical works. It extends from about the meridian of 77° to that of 81° west of Greenwich. Its breadth at the narrowest part, which is opposite the city of Panama, which is situated on the Pacific Ocean, is not less than thirty miles; and it swells out more or less at either extremity, where it blends with the parent continental portions of the New World. The continuity of the great Andean chain of mountains, which, for the most part, traverses the whole continent of America, is twice interrupted, if not entirely broken, within the limits above defined. The northern Cordillera exhibits the first indication of depression in the province of Nicaragua; but it again rears itself in the province of Veragua, where it expands and forms into a very fine table-land. In the eastern part of the last-named province it breaks into detached mountains of considerable elevation, and of a most abrupt and rugged formation, until, still further to the east, numerous conical hills make their appearance, raised not more than three or four hundred feet high, and having their bases skirted by extensive plains and savannas. These finally disappear, and the country becomes almost uninterceptedly level, until the conical mountains again thicken, and, becoming connected, form a small Cordillera, which runs from about opposite Porto-Bello on the Atlantic side to the Bay of Mandingo on the Pacific, and in the country of that name to the north-east, where the second break occurs. The land there continues low for a considerable distance, and abounds in rivers—those on the north side flowing to the Gulf of Uraba, or Darien, and those on the south to that of San Miguel, beyond which point the Cordillera again rises itself on an extended scale, and criers South America. The general bearing of the mountains in the vicinity of Panama is north-east and south-west. They vary elsewhere, and appear to have a relation to the line of coast, although their course is not always parallel to it. Their height is not considerable; near Panama, their elevation is not more than 1,000 to 1,100 feet; east of Porto-Bello, however, they are considerably higher, and are generally covered with that dense and almost impenetrable forest and vegetation, which can only grow on a soil of great depth and amazing fertility, under the prolific action of great heat and moisture.

"The present very limited communication across the isthmus is maintained chiefly by two lines of road, one from Panama to Porto-Bello, and another equally from Panama by way of the town of Cruces to Gorgona, down the river Chagres to the seaport of the same name, at its mouth. There are some others in use, but little known, and, under the Spaniards, their improvement and multiplication were much discouraged. The present roads are exceedingly bad, and they traverse a mountainous part of the country. That between Panama and Porto-Bello is infinitely the worst of the two principal ones, being in many places almost impassable in the rainy season, from the steepness of the ascents and descents. But the roads to Cruces and Gorgona also lead across a mountainous country, and are extremely difficult in bad weather—a considerable part of the latter, indeed, being merely the bed of what is in winter a large stream.

"The Isthmus of Panama is divided into two provinces, namely, Panama, which includes Darien and Veragua; these again are divided into cautions, each having a certain number of parishes. By a census taken in 1822, the following was the state of the population in the two provinces:—that of Panama contained 65,188, and that of Veragua 35,367 inhabitants—making the population of the whole isthmus, for that year, 101,550, an amount which has not since materially altered. The people are composed of white and coloured, as in the other parts of South and Central America, and are given up to indolence and want of industry, although strong and enduring under occasional fatigue; they are, in point of civilization, less advanced than their neighbours of the same continent. The extreme fertility of the soil, together with their great destitution of moral enlightenment, are the chief causes of their general indolence, as, in the absence of the good influences of civilization, a man can there, notwithstanding, for a small expenditure of desultory labour, procure a

sufficient subsistence for himself and family. They are, however, like other persons, quite susceptible of steadily practising habits of industry, when proper incentives and sufficient stimulants are powerful enough to call forth their energies. There are within the province several regiments of militia, formed of the lower classes of people and Indians, and there are also excellent workmen in felling timber and clearing ground, and not inapt in acquiring any mechanical trade or art. They are, moreover, exceedingly simple in their habits, and are easily maintained, so that, in the projected work of a communication between the Pacific and Atlantic Oceans, some workmen may be obtained at a tolerably moderate rate of wages—a circumstance of much importance in assisting the success of the undertaking, which we will here state must be principally the work of foreign labourers, as we shall explain in its proper place.

"The site of Panama, the capital of the Isthmus, has been once changed. The old city stood about three miles east from the present situation. The name is supposed to be derived from the Indian word *panama*, signifying "much fish," from its great abundance along the coast. The first city was originally a village inhabited by Indians, at the invasion by the Spaniards in 1515. The present city of Panama is situated in latitude  $8^{\circ} 57'$  north, and longitude  $79^{\circ} 30'$  west from Greenwich, on a rocky tongue of land, shaped nearly like a spear-head, and extending a considerable way into the sea. Its harbour is protected by a number of islands lying at a distance from the main-land, and some of which are of considerable size, and highly cultivated. Its anchorage is good, and it has a plentiful supply of water and provisions. Its great advantages in regard to situation will, no doubt, be one day turned to great commercial profit. The population amounts, according to some, to not more than 12,000, but others make it to contain nearer 25,000 inhabitants, which seems the more probable estimate. It is tolerably healthy, notwithstanding its high temperature, if we except during the months of August and September, when its increased warmth engenders frightful epidemics.

"Panama is protected by some fortifications, and is divided into the high and low towns, the last, called *Varal*, being the most densely peopled. Its streets are narrow, dark, and filthy. The houses, for the most part, are built of wood, and covered with a thatch; they are of three stories high in general, and are much neglected in their interior arrangements. It has a large open square, but, through the inattention of the authorities, this is overgrown with weeds, and encumbered with the fallen ruins of a great many buildings, and particularly of the college of Jesuits. Here is a college, in which are professorships for Spanish and Latin grammar, philosophy, theology, and public and canon law. The churches and convents, which are still numerous, are built of stone; the cathedral and the hospital are very fine buildings. The roadstead of Panama is extensive, but rendered dangerous by the prevailing north winds, which are violent. There is so little depth of water along the shore, that goods can only be landed at one place, and that by using flat-bottomed boats and piraguas. Hence large vessels are obliged to come to the islands *Perico* and *Flamenco*, two miles out; but nevertheless there is a good deal of traffic carried on, principally with the English at *Jamaica* and the United States of America. The annual exportation of pearls alone amounts to 40,000 dollars. A good deal of commercial spirit is manifest; the stores for ships' goods are spacious, and well filled with merchandise. Every year there is a well-frequented fair. English fashions and customs have the ascendancy; and even the *cuisine* of Old England is allowed supremacy. The women wear no beading, and parade stately with their long black tresses flowing down their shoulders. The environs of the city are planted with bananas, oranges, figs, and limes; and the tamarind and cocoa-nut trees are beautifully conspicuous in their majestic height. Our readers will remember that Panama was a most flourishing port when the commerce of South America with Spain was carried on by means of the *galleons*; it was then the *entrepôt* of the commerce of America, Asia, and Europe. Its importance since then has greatly decreased.

"Porto-Bello is situated in latitude  $9^{\circ} 35'$  north, and longitude  $77^{\circ} 45'$  west, close to the sea, at the foot of immense mountains which surround the whole of the port. It is, from its situation, most unhealthy, for the heat is exceedingly oppressive; and the town being encompassed by mountains, the freshness of the sea-breezes cannot gain admittance as a relief; while the country being uncleared of wood, and there being a great deal of, nay, almost constant rain and damp, the uninviting features of the place are rendered most repulsive, although some 2,000 mortals contrive to exist in it. Chagres and Porto-Bello are the only towns or villages on the Atlantic shore of the isthmus. About nine miles east from Chagres is the Bay of Simon, also called Navy Bay, which is large and spacious, being as much as three miles wide at the entrance. The other towns of Panama are of trifling importance. Gatun is a small hamlet; Gorgona is somewhat larger, and is a point at which passengers going to Panama frequently land. Cruces, however, is of more consequence—it is the place to which goods are always conveyed. It is agreeably situated on a fine open plain, upon the left or southern bank of the river Chagres, about thirty-four miles from its mouth, and eight hours' journey on mule-back from Panama. The inhabitants of these places are, for the most part, owners of canoes or mules for the purposes of transport, or are store-keepers for taking charge of the custody of goods and merchandise; or *logos*, that is, persons employed in working canoes. Cruces and Gorgona are also places of resort in the dry season, or summer, as watering-places for the inhabitants of Panama; for they are considered extremely salubrious, a reputation likewise enjoyed by the town of Chorrera, situated upon the river of that name.

"The, at present, very limited trade on the Atlantic shore of the isthmus is maintained with *Jamaica* by a British man-of-war, which sails monthly for the purpose of conveying letters and specie; with *Carthage*, by government vessels, twice a month, and also with the same place and a few other points by private trading-vessels, which bring freight to Chagres, and there exchange or sell it. Its commerce on the Pacific is, however, more extensive, embracing all parts of the coast, both north and south, which find it their interest to communicate with Europe by this way. Specie is conveyed across the isthmus to be embarked at Chagres at an expense of ten dollars and two rials for every 5,000 dollars; besides which, there is a transit duty of three per cent. on silver and one per cent. on gold. In return, goods are brought to Panama, where they are lodged in the custom-house immediately on their arrival. When for exportation, they pay a duty of two per cent., but if for home consumption, one is imposed according to the nature of each particular article. Limited as the trade of the isthmus is, it is yet somewhat improving. The receipts of the treasury of the government of Panama in the year 1827, we are assured by good authority, amounted in round numbers to 250,000 dollars, of which was left a balance in the public chest of nearly 3,000 dollars, after providing for all the exigencies of the state; and there is reason to suppose that since that period the finances of the territory have improved. The receipts are not one-third, it is true, of what they were in the year 1812, when Panama was a colony of Spain; but this we are not surprised at when we consider the grinding, exclusive system of dealing which was universally adopted by that unfortunate government. It is important to mention, that by the last arrangement affecting the territorial distribution of this country, it became the north-western boundary of New Granada, one of the three republics into which Colombia was divided in the year 1832.

"Now, in considering the merits of the Isthmus of Panama as a point at which to attempt the junction of the two oceans, we must not allow our judgment to be led aside by a circumstance which is no doubt calculated to render us liable to be warped from an impartial view of the matter; we mean this: the isthmus presents the narrowest barrier to the meeting of the two mighty waters, whose conjunctive commercial assistance we are so anxious for. That is not all,—not only its form, but its peculiarly convenient position with respect to the civilized world, seems to draw us, as it were, instinctively towards it, as to a place which nature

has formed and destined expressly for the great purpose of aiding man in beneficial intercourse with his fellow-man, and has therefore, it would appear, legibly written in its lineaments a powerful appeal to him to model it to his necessities. The land retiring on either side seems only the more to woo on the embrace, while even its stern hills stoop in encouraging aid of the longed-for union. Nature, however, does not send things out of her laboratory so nicely adjusted to our hand, but has wisely left much to give play to our mental exercise and industrial perseverance; and has taught us, and that too frequently by dear-bought experience, that the most encouraging appearances are but the meretricious lures of empty insubstantiality. But, reader, a canal across the Isthmus of Panama could be effected—we mean a ship canal—yet in the present social condition of that country such an undertaking is altogether impracticable, as we shall endeavour to explain in a future number of this magazine."

The above extracts, upon so important a subject, are of the more interest from the proposed Central American communication, being only part of a general system of continental isolation which is proposed to take place simultaneously by separating the Americas, uniting the Mediterranean with the great Indian Ocean, and the dismemberment of Spain from the rest of Europe; to the end that as an ordonnance seems to have gone out to Anglize the greater part of the world, in order that one religion, one tongue, one body of literature, one civilization may pervade the whole, so one bond of union may girdle the entire body and all its members, by means of easy and rapid communications, where formerly months, and at one time even years, were expended in once effecting intercourse.

Ae.

## INSTITUTION OF CIVIL ENGINEERS.

FEB. 6. — The President in the Chair. — The first paper read was by Mr. S. B. Moody. It described a water-wheel, constructed by Mr. W. Fairbairn, from the designs of Mr. B. Albano, and erected at the Flax-mills in Lombardy. The chief peculiarities of this wheel consisted in the introduction of the tension principle for the arms, and the ventilation principle for the buckets.

The use of wrought-iron bars as arms and braces on the tendon principle diminished the weight, as fewer centres and arms were required, and consequently a lighter shaft could also be employed; repairs were less frequent, and also were not so expensive as with cast-iron arms.

In the old form of the buckets, the air entering with the water, prevented them from filling; but by this introduction of an inner sheathing, forming a space between it and the sole plate, the air was permitted to pass off freely, and the buckets, being thus ventilated, were enabled to be more completely filled, and the effective power of the wheel was increased.

Mr. Albano explained its construction, and stated that its speed was about six feet per second, and that the useful effect obtained was equal to 6-10ths of the power expended, which was higher than many of the best wheels had attained. He then described a very ingenious adaptation of the balance weight governor for the penstock, for regulating the flow of the water to the wheel.

A description of a water meter, by Mr. P. Curnichael, was then read. The mode of operation of this meter, which was attached to the feed pumps of three steam boilers supplying an eighty-horse engine, was thus described: As the water proceeds through the discharge valve the float sinks until it comes in contact with a detent, or catch, attached to a rod which is suspended from a lever. This moves round a spanner and pendulum until it passes the centre of gravity, when the pendulum falls and strikes a spanner, which shuts the discharge valve and opens the inlet valve from the reservoir to the closed box which supplies the boiler. A dial, the hand of which was acted upon by the spanner, indicates the number of times of the emptying of the reservoir, and it was stated that the action of the machine was very correct.

Dr. Roth's automaton calculator was exhibited, and its action explained by Mr.

Wertheimer. He gave a short review of the various attempts at constructing calculating machines, noticing the Roman Abacus, the calculating boxes of the Chinese and Russians; the several classes of instruments invented by Napier in 1617, by Perrault and others in 1720, and subsequently, the slide rule, invented by Michael Scheffelt of Ulm, in 1699; the more important machines attempted by Pascal, in 1640, by Moreland, in 1673, by Gersten and by Leibnitz, which were submitted to the Royal Society of London and the Académie de Science in Paris. He then mentioned the machine of Mr. Babbage, upon which upwards of 20,000*l.* had been expended before the project was abandoned, and the finished part, which formed tables of progression up to five figures, was consigned to the Museum of King's College, London.

Dr. Roth's machine appeared very simple, and its results, which were severely tested, were very accurate; it performed all the operations in arithmetic from simple addition, subtraction, multiplication, and division of numbers, or of pounds, shillings, and pence, to vulgar and decimal fractions, involution and evolution, and arithmetical and geometrical progression, with surprising rapidity; it appeared particularly adapted for checking long calculations of quantities, for contractors, for the merchant's counting-house, or for government offices.

The same principle had been adopted as counters for rotary or reciprocating machines, and they appeared, from the compactness of their form and their regularity of action, to be well adapted for the purpose.

A collection of specimens were exhibited of a new material for architectural decoration. It was termed the "Cannabic composition," and was stated to be composed of hemp, with a resinous mixture, which, after a careful preparation in sheets, was forced by powerful presses into metal moulds, producing very sharp ornaments, in high relief. The detail of this mechanical arrangement was promised by Mr. B. Albano, C. E., on a future occasion. The ornaments were stated to be so hard, as to bear a blow of a hammer; they were very light and elastic, resisting the action of heat or cold, and of water, without change of form. Mr. Ponsonby, agent, of the Regent Circus, Piccadilly, explained that the specimens were capable of being bronzed, gilt, or painted, so as to produce an excellent effect for ceilings, and other internal decorations; and it was stated that the price was from ten to twenty per cent. below that of any other material in use for a similar purpose.

The monthly ballot for members took place, and the following gentlemen were elected.—Messrs. S. Robinson and J. Fowler as members; Messrs. R. Cowen, B. H. Blyth, J. Wilson, J. Holdsworth, A. J. Robertson, J. T. Blackburn, A. S. Coffey, J. G. C. Curtis, and G. Nasmyth, as associates.

The following papers were announced to be read at the meeting of February 13th:—

No. 659. "Results of experiments on a vessel called the 'Liverpool Screw,' fitted with Grantham's patent engine and screw propeller." By J. Grantham, Assoc. Inst. C. E.

No. 598. "Description of a Bridge across the river Shannon at Portunna." By T. Rhodes, M. Inst. C. E.

No. 602. "Description of an hydraulic traversing frame at the Bristol terminus of the Great Western Railway." By A. J. Dodson, Assoc. Inst. C. E.

BRITISH MUSEUM.—By a Parliamentary return, the annual estimated charge for the British Museum to Lady-day next, is stated to be 34,975*l.* The return embraces nine divisions, including the number of persons who have visited the institution for the last six years. From Christmas, 1836, to Christmas, 1837, the number was 321,131; from Christmas, 1837, to Christmas, 1838, the number was 266,008; to 1839, 280,859; to 1840, 247,929; to 1841, 19,374(2); and to Christmas, 1842, 547,718. No fewer than 5,827 visits by artists were made in the year 1842 to the galleries of sculpture, and 8,781 to the print-room. It is stated in respect to the reading-room, that "the number of books returned to the shelves of the general library from the reading-room is 142,178; to the Royal library, 22,408; to the closets where they are kept for the use of readers from day to day, 78,470; to the shelves of the reading-rooms, about 116,400; altogether, 359,457 volumes—on an average, 1,230 a day. The number of readers is 71,494."

#### PROJECTIONS IN BUILDING.

QUEEN-SQUARE.—On Saturday, Jan. 20, several gentlemen, residents in the neighbourhood of Eaton-square, attended at this court, anxious to hear the proceedings in a complaint laid by Mr. Foxall, the district surveyor of St. George's, Hanover-square, against Charles James Freaque, an extensive builder, for having added to the side front of Lord Denbigh's house, in Elizabeth-street, Eaton-square, a projection of thirty-three feet in length, and seven feet in breadth, the same not being an open portico.

An application having been made to defer the proceedings until the arrival of Mr. Bodkin, the barrister,

Mr. Foxall said it would be unnecessary, as in consequence of a recent decision at quarter sessions, he felt it would be useless to go on with the case. The magistrate would remember having, about a month since, convicted a medical gentleman of the name of Griffiths, on his (Mr. Foxall's) complaint of a similar offence to the present. Mr. Griffiths gave notice of appeal, and the case came on by special appointment on last Monday at sessions, when the chairman got up and quashed the conviction. He did this in so sudden, so positive, and so determined a way, that he (Mr. Foxall) felt that it would be an absolute waste of time to proceed upon this, which precisely resembled the former complaint, and he was more particularly brought to this conclusion by the conviction in the former case having been quashed, although the court had said the magistrate was right in the view he had taken of the matter.

The complaint was then withdrawn.

#### Correspondence.

##### MANUFACTURING ENCAUSTIC AND ORNAMENTAL TILES BY MEANS OF MACHINERY.

Sir,—Some little time since being engaged in arranging machinery for a particular purpose, it occurred to me that I might with some alterations apply its principles for the purpose of making ornamental tiles and slabs of various kinds.

With this view, I devoted what little time I could to the consideration of the subject, and have every reason to believe that ornamental tiles may be much reduced in price, as well as improved in appearance, by the use of such a machine; which will be the means of extending the practical application and of more frequently introducing this species of architectural embellishment.

The patterns for the most simple of these kinds of tiles are first of all to be drawn on wood, of the size required, and are then to be cut out in the usual way, from which wood-patterns casts are to be taken either in good plaster of Paris or by means of the electrotype, which is perhaps the best method; by this operation a matrix will be obtained from which to take the working casts, in some hard, close-grained metal—as iron, which should be afterwards case-hardened.

These moulds are then to be fixed in the frame of the machine, and made to operate on the various earths and clays prepared for that purpose, and so imprint upon them the different devices required, which of course may be varied according to the order or wish of the architect.

A machine of the kind now under notice will also make tiles with alto or basso relievo, and consequently the manufacture may be extended to the production of slabs and plates with ornaments in full relief, for the purpose of filling up the faces of sunk panels or other plain surfaces which occur in every kind of architecture. For this purpose casts may be taken from Gothic tracery, monumental brasses, and the ornaments both of the Greek and Roman styles of architecture.

Among coloured things, for instance, a vast variety of very elegant embellishments may be obtained by imitating the scrolls and figures on the beautiful Etruscan vases and other ornaments so common now in every museum in the ancient Egyptians.

Gothic ornaments and tracery of the most elaborate styles, if not too deeply cut, may be introduced, which if made of well prepared earthen, and carefully baked, will be as hard and durable as stone-work itself, and as they may be made much cheaper than stone can be chiselled, ample means will be afforded for architects to decorate their designs for the interior of buildings, in the most minute and elaborate manner.

As the potters' art is now well understood, the variety of different coloured earths, &c., in use is very great, so that almost any wished-for effect may be

ultimately produced, by judiciously blending and working party-coloured patterns.

I was much struck a little time since with the beauty of some Oriental perforated tiles, said to have been brought from the neighbourhood of Cabul, which if imitated and improved upon, will, I have no doubt, become in a little time a valuable acquisition to our architectural decorators' stock of standard ornaments.

As the operations of the machine now under notice are quick and precise, the first cost of all kinds of ornaments produced by it will be much reduced in price, compared with similar things now known to the profession.

I am, Sir, yours very truly,  
JOSEPH LOCKWOOD, Engineer, &c.  
52, Lime-street, City.

##### LONDON, ITS SIZE, AND POPULATION.

Sir,—Your remarks in the last number relative to my letter on this subject, which appeared in No. 48, have surprised me much, and no doubt others have been astonished by these comparisons, or they would not have been copied so frequently and in such distant places.

I take the liberty of writing to you to say that I was much hurt to see "London" so mutilated by the *Times* on Thursday last, in their extract of this subject from a Cornwall newspaper. They have only made the slight mistake of more than 352,000 souls, which, of course, makes their notice of "London" untrue and ridiculous.

I beg to say that the remarks upon "London" that you thought worthy of a place in your interesting work, were true to the letter, and I can prove them by the last published government census.

With a hearty wish for your success in your arduous undertaking, I remain, Sir, your most obedient servant,

J. RAWSON WALKER.

P.S.—Would there be any harm in mentioning this great mistake of the *Times* in your next number, because any one taking up that article, and comparing it with the last census, would, of course, say the whole was false together?

16, Norton-street, Portland-place.

##### MONUMENT AT ST. REMI.

Sir,—In your Number dated Jan. 13 appears a representation of a monument at St. Remi: I am not presuming to give any information upon the matter. It is stated by "Amateur" that the architect has very little projection compared with the advanced position of the columns. I agree with "Amateur" in not charging the architect with ignorance, for ignorance could not have produced such a work; but I cannot conceive how the effect can be as stated, when such a visible distortion must be manifest. As to preserving the pyramidal form, the principle is certainly one to be attended to; but bringing the entablature a few more inches in advance could not have seriously injured the pyramidal figure, particularly when such a sacrifice is made. I trust "Amateur" will not consider me severe in my observations. I make them merely because it is an error that many country builders practise, and one that cannot but be censured—that is, projecting pilasters five or six inches, and the architrave, in many instances, not more than two inches. If you deem these few remarks worth the attention of your readers of a certain class, I should esteem their insertion a favour.

I am, Sir, yours respectfully,  
Newport, Jan. 22, 1844. JAMES PICKARD.

##### PUBLIC WALKS.

Sir,—In *THE BUILDER* of the 16th December, 1843, you state that there is still in the hands of the Exchequer 9,500*l.* out of the 10,000*l.* voted by Parliament for "Public Walks." I find from the *Hull Packet* that the walk along the Humber bank is in a very dilapidated state; could any part of that sum be obtained towards repairing it, if an application were made by the inhabitants of Hull? Any information you, or any correspondent, could give on this subject would, I have no doubt, be laid hold of by the inhabitants of Hull, and would greatly oblige,

A Struggler for Distinction,  
Liverpool, Jan. 29, 1844. E. J. L.

##### "NATIONAL MONUMENTS."

Sir,—In the year 1816 the House of Commons voted two national monuments to commemorate the services rendered by the army and navy. I find by the public records, the committee of taste, appointed by Parliament to decide upon the designs for the grand national monuments, held their final meeting in March, 1817, at the house of the Earl of Aberdeen. Mr. Wilkins's estimate for the Waterloo Monument was 200,000*l.*, and that for Mr. Smirke's Naval Trophy was 100,000*l.* They were then intended to be immediately begun. The situations for placing these national monuments was Greenwich for the navy, and Portland-place, in the circle next

the New Road, facing the Regent's Park, for the army. Why there should be so great a difference in the estimates appears somewhat strange when the "services of one have been equal to those of the other." Perhaps Mr. W.\* and Mr. S. (now Sir Robert S.) can enlighten those heroes who fought the battles of their country upon the subject, and why they have never been commenced.

INQUIRENDO.

ASSISTANT SURVEYORS AND CLERKS OF WORKS.

SIR,—Allow me to suggest to your well informed readers, how valuable it would be to many who are but just commencing the profession, if they would give the result of their experience in answer to the questions contained in your last number, which were put to the candidates for the office of Assistant Surveyor and Clerk-of-the-Works to the Westminster Sewerage. The want of good sound information on these subjects is sufficiently evinced from the fact of only six out of about thirty candidates being thought competent to be allowed to stand.

I am, Sir, your obedient servant,  
A CONSTANT READER.

REBUILDING PARTY-WALLS.

SIR,—Our Metropolitan Building Act requiring three months' notice to be given before you can interfere with a party-wall which it may be necessary to rebuild, I will thank you or some of your country correspondents to explain how the law is out of the metropolis. Should a party-wall between A and B become so bad that, in consequence of A pulling his house down, the wall must be rebuilt, I want to know what sort of notice, and what time should be specified as sufficient notice, and what power have you to compel him to admit of the said wall being so pulled down to allow of the building of a new wall? This is a very important question. Though not brought before the trade that I know of, it is important to builders and surveyors too, who may have work a very few miles from town, and not know how to proceed.

Yours, much obliged,  
Shadwell, Feb. 7, 1844. L.

[We are not acquainted with any general statute or practice ruling matters connected with party-walls out of the range of the Metropolitan Building Act. We apprehend all such questions, in default of any local statute, must be governed by common law, professional opinion, agreement of the parties interested, and, if necessary, by arbitration. No doubt a general statute conferring directory power in all such cases will ere long pass the legislature.—Ed.]

SIR,—Can you, or one of your correspondents, oblige me with an economical plan of improving the appearance of my little house, merely a workman's house, with one room in front, up and down stairs? This room I wish to make comfortable (the door now opening immediately to the street in this country village.) I inclose a drawing of my house.

I wish to have some kind of double door or portico, so as to make the front down-stairs room comfortable as a parlour or sitting-room; and my object is also to improve the appearance of the door and bottom window, both being now very poor and common.

Hoping to be favoured with a hint to assist me, I am, Sir, with sincere wishes for the continued success of your publication, yours respectfully,  
A WORKING MAN.

January 20, 1844.

If a portico be recommended for the door, I should like it to be wrought-iron, as, in this case, I could make it myself; but should require assistance as regards the best material for the roof of it.

[Our correspondent, desiring to make his house comfortable, should send a ground-plan of it, showing the situations of the chimney and staircase; and should also state the aspect of the front, and if the house be detached;]

\* The late Professor of Architecture in the Royal Academy, since deceased.—Ed.

by which might be seen whether it would be advisable to design for the side of the building a porch with an entrance on the side least pervious to inclement weather. The material of the walls should be stated, and whether the apertures are arched.—Ed.]

CABINET WORK.

SIR,—Having a chair to make out of old oak for a curious advocate of the early styles, it would greatly oblige me if you or some of your talented correspondents could favour me with a design for an arm-chair—an elaborate one in the Tudor or Elizabethan style would be preferred. I regret that your valuable publication does not often contain designs for cabinet-work; the want of funds to purchase works on early furniture induces me to make this application; and the seeing you were kind enough to obtain a beautiful design for a "Young Mason," has induced me to apply to you in the same manner, hoping you will confer the same favour on a constant subscriber to your journal. Yours respectfully,  
A YOUNG CABINET-MAKER.

[Those who cannot afford to purchase Shaw's, and other entire works upon the subject, may obtain separate plates of them for sixpence or a shilling each, of Evans, the printseller, Great Queen-street, Lincoln's-Inn-Fields, and of other dealers, who break up the works for the convenience of such purchases.—Ed.]

THE LONDON GAZETTES.

SIR,—Being a subscriber and admirer of THE BUILDER, I beg leave to suggest that I think it very desirable, and would be very useful to the trade, if you were to insert the Gazette, especially (I am sorry to say it) as the builders have frequently appeared of late so prominently in it.

I am, Sir, yours, &c.  
OLO CARPENTER.  
[We should willingly comply with "Old Carpenter's" suggestion, if on compliance with it would not follow the necessity of stamping, as a newspaper, every copy of our publication.]

THE ATMOSPHERIC RAILWAY.

SIR,—I shall feel obliged if you, or any of your correspondents, can inform me in your next number of THE BUILDER the principle of the atmospheric railway. Also, at the same time, if you know if there is any person in London engaged in the direction or construction of such works.

Your well-wisher and subscriber, F. R.

SIR,—Being anxious to become acquainted with land-surveying as well as ordinary surveying, I should feel obliged by your mentioning in your notices to correspondents the best work now published on the above subjects.

Your constant subscriber, F. M.

Miscellaneous.

WASTE LANDS.—INCLOSURE ACT.—On the motion of Lord Worsley, a very long return was made in June last "of the true or estimated quantity in statute measure of all common or waste lands not being held in severalty, in every parish or tithable commutation district, so far as the same can be ascertained from the schedules to the agreements or awards, or from the apportionments received by the Tith Commissioners;" and also "a return of all Acts passed since the year 1800 for the inclosure of common or waste lands in England and Wales not being held in severalty, distinguishing the parishes and counties in which the same were situated, together with the estimated number of Acts passed from 1800 to 1810, from 1810 to 1820, from 1820 to 1830, and from 1830 to 1840." The summary of England shews that in the forty counties the total quantity of land amounts to 6,718,523 acres, of which the quantity of common or waste land is stated to be 1,358,419 acres. In Middlesex alone there are 1,321 acres of waste land. The largest quantity of waste land is in the North Riding of Yorkshire, there being no less than 132,815 acres of common or waste land out of a total of 1,897,592 acres; making a total of waste land in England and Wales of 1,860,232, out of the total of 8,616,115. By the second return it appears that from 1800 to 1810 the number of Inclosure Acts passed was 995; from 1810 to 1820 the number was 741; from 1820 to 1830 the number was 192; and from 1830 to 1840 the number of Inclosure Acts was 125.

THE TAX UPON COALS.—The merchants of the Coal Exchange are getting up a petition to Parliament against the projected duty of 5 per cent., which Government intends imposing upon all sea-borne coal that enters the port of London, for the purpose of enabling them to carry out the proposed metropolitan improvements, and for which a bill is to be presented to the House this session.

THE COAL TRADE, Jan. 27.—Copies of a memorial to Sir Robert Peel agreed upon at a numerous meeting of coal-owners of Northumberland and Durham, held this week, have been circulated in the North. The document (which is of great importance) is signed by Mr. Robert W. Brandling, on behalf of the representatives of 103 collieries present at the meeting. The following is a copy of it:—

"That your memorialists believe that an effort will be made to induce her Majesty's Government during the next session of Parliament to propose an additional tax on coals imported into the port of London, in order to defray the expense of certain projected works on the banks of the Thames. That your memorialists contend that such a tax would be partial, unjust, and highly prejudicial. That the mining and shipping interests of the coal districts of the north of England, so far from being in a state to bear the smallest impost without being greatly affected by it, are so depressed that the most serious evils may be apprehended, unless the extension of the coal trade is encouraged by the removal of some oppressive charges with which it is at present clogged, especially the recently imposed export duty. That this depression has already most seriously diminished the fair returns upon the capital embarked by the coal and ship owner, and must, at no distant period, if a remedy is not applied, gradually increase the hardships which it has already inflicted upon the miners and sailors, in depriving them of that fair remuneration which they have a right to expect as a compensation for the labour they undergo, and the contingencies to which they are exposed. Your memorialists, therefore, most earnestly request the immediate and serious attention of her Majesty's Government to this important subject; and that they may be allowed an opportunity of proving that the fears which actuated your memorialists when the export duties were re-imposed have been fully realized, and that a longer continuance in this line of policy affecting the coal trade, must operate destructively to the interests of your memorialists, and the future prosperity of the general export and import trade of this district." The question of the proposed new tax excites great interest and general condemnation in this locality. It is probable the proposal will be withdrawn; but it is certain that the export duty on coals will be brought before the attention of Parliament almost immediately after its assembling.

PRUSSIAN FORTS.—It is stated in a letter from Berlin, that the Prussian Government intends to enlarge several of the commercial towns of the kingdom, and to substitute for the fortifications which now surround them, detached forts and towers, similar to those of Posen and Cologne. The first towns in which this course is to be adopted are Magdeburgh and Stettin.

FORTS OF ROUEN.—The Commerce says:—"Rouen, as well as Paris, is to have its detached forts. The preparatory plans are already far advanced. They comprise three citadels; one on the plateau of Bon Secours, another on Mont Riboudet, and the third on the Havre road, 600 metres from the Rouen gate of oetroi."

THE EFFECT OF RAILWAYS.—On Monday last, the Saracen's Head, Friday-street, Cheap, adjoining the church of St. Peter's, West Cheap, which is one of the oldest inns in the city of London, having been built in the style of architecture of the 15th century, with balconies in front, was disposed of by auction, for its building materials, when it will be pulled down, and on its site which extends nearly to the Old Change, large Manchester warehouses will be erected. This inn was extensively connected with coach proprietors and waggon carriers down the Great Western road, the traffic of which has been broken up by the establishment of the railways. The house adjoining, No. 5, Friday-street, which is part of the above property, is said to have been in the occupation of Sir Christopher Wren at the time of the erection of St. Paul's. The estate belongs to the Merchant Tailors' Company.

AN OLD PRINTING OFFICE.—The printing office established by Christopher Platin, about the year 1530, at Antwerp, then a great commercial emporium, has survived to our time in active operation, through the descendants of his daughter, the wife of John Moret, whose name the press has continued to bear. The Polyglot Bible of 1569-1578 is an enduring monument of Platin's press, of which some of the productions attest the existence in 1555.

**SUBSTITUTE FOR WHITE LEAD.**—The great amount of mortality among painters and manufacturers of paint, arising from the deleterious effluvia of white-lead, is well known, and has frequently directed the attention of chemists to the discovery of an innocuous substitute. Hitherto the attempt has been fruitless; at least as far as we are aware, no other substance has taken the place of the common pigment. It would appear, however, from the report of the Paris Academy of Sciences, that M. de Ruolz has at length succeeded in producing a preparation possessing all the economical properties of white-lead, without partaking of its offensive character. This substance is the oxide of antimony, which is distinguished by the following qualities—Its colour is very pure white, rivaling the finest white silver; it is easily ground, and forms with oil an unctuous and cohesive mixture; compared with the white-lead of Holland, its property of concealing is as 46 to 22, and, when mixed with other paints, it gives a much clearer and softer tone than white-lead. It may be obtained, according to M. de Ruolz, from the natural sulphuret of antimony, and at a third of the cost of ordinary white paint.

**HADDON HALL** is a relique in the county of Derby most interesting in point of antiquity. It was formerly the seat of the Vernon family, and now belongs to the Duke of Rutland, whose ancestor, Sir John Manners, acquired it in the reign of Queen Elizabeth by a marriage with one of the co-heiresses of Sir George Vernon. It is situated on an eminence above the river Wye, and consists of two courts in an irregular form, approaching to squares, and surrounded by suites of apartments. This fine ancient English seat is now comparatively deserted: its halls are silent, giving but a mournful idea of its past scenes of revelry and antique pageantry. Prince Arthur, son of Henry VII., is said to have repeatedly visited Haddon Hall, when Sir Harry Vernon, who was his preceptor or governor, resided there. The chapel and the great hall—considered to be the most ancient parts of the edifice, having been built prior to 1452, the former with its despoiled sacred ornaments and curious old font, the latter with the deep-toned oak panelling and its elevated seats at the end, that distinctive spot where the owners of old used to entertain in rude hospitality at the door the more distinguished of their guests, for in those times the hawk and hound afforded amusements for the day, and the riotous fascinations of the baronial board and wine-cup closed the day after the fatigues of the chase—the dining-room, long gallery, state bed-room, and ancient state-room, were among the interesting parts visited by her Majesty and party. The Rutland family have not resided at Haddon since the reign of Queen Anne, when the first Duke of Rutland lived there occasionally in great state, and is said to have kept Christmas with open house, in the true style of old English hospitality.

**THE HIERARCHY.**—The bishoprics of England and Wales are considered to have been instituted according to the following order of time, viz.:—London, an Archbishopric and Metropolitan of England, founded by Lucius, the first Christian King of Britain, A. D. 185; Landaff, 185; Bangor, 316; St. David's, 519. The Archbishopric of Wales from 30 to 1100, when the Bishop submitted to the Archbishop of Canterbury as his Metropolitan; St. Asaph, 547; St. Augustine (or St. Austin) made Canterbury the Metropolitan Archbishopric by order of Pope Gregory, A. D. 596; Wells, 604; Rochester, 634; Winchester, 650; Lichfield and Coventry, 656; Worcester, 679; Hereford, 680; Durham, 681; Sodor and Man, 898; Exeter, 1050; Sherborne (changed to Salisbury), 1056; York (Archbishopric), 1067; Dorchester (changed to Lincoln), 1070; Chichester, 1071; Thetford (changed to Norwich), 1088; Bath and Wells, 1088; Ely, 1100; Carlisle, 1123. The following six were founded upon the suppression of monasteries by Henry VIII.:—Chester, Peterborough, Gloucester, Oxford, Bristol, and Westminster, 1535. Westminster was united to London in 1550. Ripon, 1836.

**MEDAL, COMMEMORATIVE OF THE QUEEN'S VISIT TO ANTWERP.**—Mr. Frederick Veracker has caused to be struck a beautiful medal of our beloved Queen, having her profile on the obverse, and the arms of Antwerp on the reverse. The medal is about the size of a crown piece. It is executed by the unrivalled medallist, Hart, from whom we have a bronze medal of Rubens' head, beyond all competition and praise. Mr. Veracker has been archivist of the city of Antwerp for the last 22 years, and has, in this instance, given undoubted proofs of his gallantry of spirit and accuracy of taste. Three casts of this medal, one in gold, another in silver, and one in bronze, are consigned to the Rev. Dr. Dibdin (the particular friend of Mr. Veracker), to be presented by him personally to her Majesty.

**MICA, A SUBSTITUTE FOR GLASS.**—In the workshops of the Buttery Iron Works, so much glass was broken by the chippings of iron, that a substitute was sought which would resist a moderate blow, and yet be translucent. A quantity of the sheets of mica were procured from Calcutta, which, when fixed into cast-iron window frames, were found to resist the blow of a chipping of iron driven off by the chisel with such force as would have shivered a pane of glass. Mica possesses both toughness and elasticity, and when a piece of iron penetrates it, merely a hole is made large enough to allow the piece to pass, while the other parts remain uninjured. It is not quite so transparent as glass, but it is not so much less so as to be objectionable; but this circumstance is not important at Buttery's, as, in consequence of the quality of fluoric acid gas evolved from the fluete of lime used as a flux in the blast furnaces, the glass in the windows is speedily acted upon, and assumes the appearance of being ground. Mica is a little more expensive than common glass; but, as its duration promises to be much longer, it must be more economical. It can be procured of almost any dimensions necessary for ordinary purposes, as it has been found in Russia in masses of nearly three feet diameter. It is susceptible of very minute subdivision, as, according to Haily, it may be divided into plates no thicker than one three-hundred-thousandth part of an inch.

### TENDERS.

**TENDERS** delivered for building a house for C. Parker, Esq., at Eton. Jno. Shaw, Esq., Architect.—

Opened in the presence of the parties.

Burton	£3,540
Bridger and Ashby	3,750
Locke and Nesham	3,835
Winsland	3,987
Hicks	4,070
Grimsdale	4,150
Lee	4,283
Piper	4,300
Bedborough and Jenner	4,350
Hayward and Nixon	4,363
Grissell and Peto	4,375
Baker and Son	4,590

The quantities were supplied.

**TENDERS** for new shops in Hungerford Market, December 6th.—

Hayward and Nixon	£4,563
Grissell and Peto	4,473
W. Rogers	3,688
Clemence	3,593

The tenders not opened in the presence of the holders.

**TENDERS** for the erection of a mansion at Portsea, from the designs and under the direction of A. Trimer, Esq., of Adam-street, Adelphi.—

Clements	£6,279
Nicholson (Wandsworth)	5,878
Sugden	5,777
Stevenson & Co.	5,675
Absalom (Portsea)	5,646

**TENDERS** for building three rooms, of large dimensions, Lambeth, February 7th, were opened in the presence of the competitors:—

Mays	£647
Herbert	553
Mitchell	520
Cooper and Davis	520
Wadey	488
Mason	480
Want	477
Pelbam	463

### NOTICES OF CONTRACTS.

**TENDERS** for TWO GAS TANKS.—Directors of the New Gas Company, Aberdeen. Feb. 12.

**TENDERS** for a HYDRAULIC PUMP and APPARATUS for PROVING PIPES.—Directors of the New Gas Company, Aberdeen. Feb. 19.

**TENDERS** for TWO GAS HOLDERS.—Directors of the New Gas Company, Aberdeen. Feb. 19.

Offers are wanted by the Aberdeen New Gas Company for the furnishing and erection of a Steam-engine, of a six-horse power, with Pumps and Pipes, and connection for pumping.—Adam and Anderson, Advocates, Aberdeen.

**CONTRACT** for a large quantity of Cast-Iron Pipes, of various Sizes.—Directors of the Aberdeen New Gas Company. Feb. 12.

**YORK AND SCARBOROUGH RAILWAY.**—Tenders for 50,000 Larch and Mixed Sleepers.—Secretary of the York and North Midland Railway Company. Feb. 21.

**PARISH OF ST. GEORGE, HANOVER-SQUARE.**—Contract for Workmen's Tools and Hammers, Iron Lamp Posts and Gas Fittings, and for keeping in order the garden in Hanover-square, for one year from the 25th March. R. Lees, Clerk, Board Room, Mount-street. March 6.

**PARISH OF ST. GEORGE, HANOVER-SQUARE.**—Contract for Masons' and Paviers' Work, and supply of Guernsey Granite Chippings, and Yorkshire Paving, for one year from the 25th March.—Mr. R. Lees, Clerk, Board Room, Mount-street. March 6.

**CONTRACT** for Paving and Cleansing the Streets for one year from the 25th March, the United Parishes of St. Andrew, Holborn, and St. George-the-Martyr, Middlesex also for Watering the Streets for six months, from the 25th March.—Commissioners of Paving, Board Room of the Workhouse, Gray's-Inn-Lane. Feb. 12.

**BUILDING SEWERS** in Cree-Curch-lane, King-street, Duke-street, and Great Duke's-place, City.—Plan and Specification at Sewers' Office, Guildhall, daily from ten till four o'clock.—Joseph Daw, Principal Clerk. Feb. 13, 1844.

**FORMATION** of RESERVOIRS and laying down Iron Conduit, with other masonry work connected therewith, Bradford Waterworks.—Plans, &c. to be seen, and further information had, at the Office of Messrs. Leather and Son, Civil Engineers, Leeds; John Thompson, Law Clerk to the Company. Feb. 13, 1844.

**WORKS REQUIRED** for the NEW FISH MARKET, GREAT YARMOUTH.—Plans, &c., to be seen on application to Mr. A. T. Thillett, Architect, King-street, Great Yarmouth; Town Clerk. Feb. 21, 1844.

**CONSTRUCTING** various STATIONS at GATESHEAD and other places, Newcastle and Darlington Junction Railway.—Plans, &c., at Railway Office, York.—Further particulars on application to Mr. Andrews, Architect, York.—G. Hudson, Esq., Chairman. Feb. 13.

**BUILDING** a COUNTY LUNATIC ASYLUM at LITTLEMORE, OXFORD.—Plans, &c., at Mr. R. Clarke's, Architect, Clinton-street, Nottingham, or at the Office of the Clerk of the Peace, Oxford.—J. M. Davenport, Clerk of the Peace. February 22, 1844.

**BRIDLINGTON PIERS AND HARBOUR.**—Erection of a new south pier, removal of present pier, and other works for enlargement of Harbour.—Plans and Specifications at the Office of Mr. Sidney Taylor, Solicitor, Bridlington. March 1, 1844.

**ALTERING** EAST SUFFOLK COUNTY HALL and COURTS of JUSTICE, IPSWICH.—Plans, &c., for inspection on application to Mr. Whiting, Surveyor, &c., County Hall, Ipswich, on Monday Jan. 29; J. H. Burton, Clerk of the Peace, Bury St. Edmunds. February 12, 1844.

### COMPETITION.

**PREMIUM** of 20 guineas for the best plans and estimates for erection of a new gal, Banbury.—All information may be obtained on application to the Town Clerk. March 1, 1844.

### TO OUR CORRESPONDENTS.

We are sorry that we have not in our power compliance with the request of "C. D. S."

The cuts for the article of "A Constant Reader" having been spoiled, we must postpone its appearance till next week, as we do not desire so important a question to be unduly answered.

"J. B." London.—We refer to our last year's volume.

Mr. Kelly's contribution is being engraved. We shall be happy to receive his details of Irish and other kinds of Gothic architecture.

The MS. of "G. R. E." is being set up, and his illustrations are being executed.

The designs by "Σ" for a School and an Effluvia-tray we have ordered to be engraved.

We have taken some pains to afford the information required by "A Working-man," Leamington, but have not yet fully satisfied ourselves; we hope, however, that we shall be able to give a proper answer in our next number.

We have received copies of—

"Payne's Universum," 2 Nos.  
Knight's "Old England," 3 Parts.  
Skyring's Price Book.

**ERRATUM.**—In the article last week upon Bressay Priory, the river "Honddd," pronounced Honethes, was misprinted Howden.

# The Builder.

NO. LIV.

SATURDAY, FEBRUARY 17, 1844.

OUR essay or disquisition upon arches, prompted by the state of Westminster Bridge, and the reports and other matters

relative to it, which are before the public, having, as we proceeded, grown under our hands to an extent far beyond the limits of our first contemplation, we are compelled to take a little breathing-time, during which some fresh and wholly original illustrations of the subject will be in a state of preparation, the production of which will confirm our theories, and we trust, by clear and visible demonstrations, certify the merest reader of those truths over which so much obscurity has been thrown.

In the meanwhile, as an arrear of important subjects has accumulated with us, we shall take the opportunity of touching slightly upon such matters as are most pressing.

We have been besought to take an early opportunity of going into the causes of the failure of the construction of buildings.

We trust that we have never lost sight of this important matter, and that while proposing excellence of structure, we have constantly given conversely a series of essays thereon, by endeavouring to teach the mode of avoiding failure: indeed, we have received from different correspondents some waggeries prompting us to be up and doing, as though we had verily fallen asleep.

One desires us to bring a certain building for its sins into the *Court of Arches*. Another, assuming something of vulgar familiarity, and putting our oral gravity a little to the blush (though not causing our ears quite to redden into scarlet), craves our surveillance of some specimens of *crack* architecture. A third has sent us a very learned essay, in which he draws our attention to an instance wherein the fall of a building occurred through its being *shored down*.

To these pleasantries we beg to reply that, some little while hence, we may find time, even though it be only during the hours of broken rest, to enter into some *critiques upon cracks*; we may give our *sentiments upon settlements*; perhaps descend into *disquisitions upon the dangers of downfalls*; offer a *few facetiae on the faults, failures, and falls of fabrics*, and conclude with some acute cautions against *crevices*.

Thus disposing for the present of our wags, further we should recommend those of them who may feel indisposed to wait till we put forth essays meeting their desires, to employ themselves in ascertaining the length of a pendulum to beat seconds in the latitude of the land of Gothem.

We return now to graver subjects. During the sittings of the Parliament which is now assembled, a general opinion seems to be enter-

tained, that many most important Acts relative to buildings will be passed. We shall almost immediately enter into the subject of the Metropolitan Building Act, making such suggestions as we think will have a tendency to produce the greatest public benefit and safety with the least possible private restriction; upon the general Act for the regulation of provincial buildings we shall give our own opinions, and as there seems one united admission that the time has come for the adoption of such a prudential and sanitary measure, we trust that the wisest Act which could be framed will pass the legislature.

In furtherance of an improved architectural police, the following forty-four Requisitions have been made by the Secretary to the Commission for Inquiring into the State of Health, Drainage, &c. in the Metropolis,

#### TO PAROCHIAL COMMISSIONERS FOR PAVING, LIGHTING, AND CLEANSING.

1. Is the paving, lighting, and cleansing, executed under authority of the 57 Geo. 3, cap. 29, or is it under a local Act? If so, give the date of it, and state if it supersedes any of the powers contained in the general Act.

2. If there is a local Act, does it contain any powers for the prevention of nuisances from noxious trades, offensive dung-heaps, slaughter-houses, or privies, and does it prohibit the keeping of pigs?

3. Have proceedings been taken in any instance under 57 Geo. 3, cap. 29, sects. 67 and 68?

4. Does the local Act contain any power over private drains or cesspools, or over the public sewers?

5. Do occasions frequently arise for the exercise of them?

6. Is there any power in the local Act for pulling down ruinous houses?

7. Is a power requisite for such a purpose?

8. Do you know of any proceedings having been taken under 57 Geo. 3, sect. 79, for that purpose?

9. Is there any Court Leet regularly held, which exercises jurisdiction for any of the above purposes? If so, are its powers effectual?

10. What number of Commissioners are appointed, and what is the usual number who attend, and how frequent are the meetings?

11. What officers are in the employ of the Board, and at what salaries?

12. What is the mode of making the rate, on whom is it made, and how frequently?

13. Is there any power of appeal from it?

14. Are there many instances of an appeal being made and contested?

15. State the amount of assessable property within the district managed by your Board.

16. What is the average annual amount of rate in the pound, and the gross amount collected?

17. State the amount of loss on collection.

18. What are the most frequent causes of loss?

19. State the expense of management for the last ten years.

20. State the amount of expenditure, for the last ten years, under the following heads:—

21. Paving, lighting, cleansing, watering the streets.

22. Other expenses under their several heads.

23. Has any money been borrowed under the powers of 57 Geo. 3, or under any power contained in any local Act? If so, state the amount, and on what terms, and for what purpose the money was borrowed.

24. Has any land been purchased under sect. 80 of that Act, for widening or altering streets? If so, state if the whole of it was thrown into the streets, or if any portion remains in the possession of the Commissioners of Paving.

25. Have any contributions been made to the Commissioners of Sewers in aid of the formation of new sewers?

26. Under what Commission of Sewers is your parish?

27. Are there any complaints of the defective state of the sewers, or that they emit offensive smells?

28. In what manner are the streets, courts, and alleys drained? Have they drains communicating with the sewers?

29. Is any control exercised over these drains? If so, state the annual expense for the last ten years for cleansing and repairing them.

30. Has any wood pavement been laid down in your parish? If so, have you sufficient experience to be able to state the difference in expense of cleansing it, compared with granite pavement and macadamized road?

31. State the difference in expense of laying down the above description of pavement.

32. What are the regulations for scavenging and cleansing the streets, and how often are they cleansed?

33. Are the courts which are inaccessible to carts properly cleansed, in what manner, and how often?

34. Are the houses generally provided with dust-hins, or are any provided at the public expense?

35. What other means are adopted to prevent filth and refuse being thrown into the streets?

36. Are the poorer classes generally supplied with water, laid on to their own houses, or by a common stand-cock?

37. Are there any public pumps erected and repaired at the expense of the Board?

38. Is the water for them well adapted for culinary and domestic purposes?

39. Are there any instances of pumps becoming useless from the foul state of the water? If so, state the cause known or suspected, and how long they have been in that state.

40. In case of fire, what time usually elapses before a good supply of water can be brought to bear upon the premises?

41. What is the annual amount of rewards, for the last ten years, paid to turncocks and firemen?

42. The same as to rewards for alarms of fire, and what proportion has been recovered from the occupiers of the premises?

43. Have you any remarks to offer upon the operation of this system of rewards?

44. What number of engines are kept in your parish?

Upon the necessarily absorbing subject of railroads, though much has been done, and much still is doing, much yet remains to be done; the Legislature is alive, and desirous of effecting general and particular improvements, and is, indeed, as quick to the subject as contending interests will suffer; the notices which have been given, and the conversations which have already occurred in Parliament, afford a perspective of the year's railroad programme.

When we have disposed of the subjects of the general and metropolitan bills relating to buildings, drainage, and health, we shall enter into that of fire-insurance, and the vicious and impolitic scale of its duties, after which we shall proceed to others of importance, wherein we hope for improvement.

ed.

THE NEW ROYAL EXCHANGE.—Preparatory to the demolition of the houses forming Bank-buildings, adjoining the New Royal Exchange, a very extensive hoarding has been erected, and several of the inmates have removed their furniture, the sale by auction of a portion of them having been announced for Monday next. That part disposed of will then be cleared away, and within a fortnight the remaining portion will be also sold, and in a few days afterwards the whole will be removed. Subsequently it is intended as quickly as possible to erect on a part of the site the statue of the Duke of Wellington.

## ON IMPROVEMENTS CONNECTED WITH GILDING.

BY HENRY DIRCKS, ESQ.

It is rather remarkable, considering our national wealth, that, except in the embellishment of the interiors of our public buildings and mansions, there is a comparative dearth of that richness and beauty of ornament which would be afforded by the appropriate introducing of plate-glass and decorative gilding. We may probably trace the paucity of these luxuries, in even the residences of wealthy private individuals, to the little excitement to emulation that must naturally exist so long as the expense of such ornamental work is so considerable as to limit its universal adoption. It can, however, be no matter of doubt that the more general this art does become, the more will the aristocracy vie with each other to obtain, even in the less pretentious country villa, or the now plain town mansion, the same splendour of decoration that at present forms a principal feature in the lordly ball.

But certainly, for gorgeous, tasteful, and expensive decorations, most excellent specimens are to be found in the ordinary business establishments of many tradesmen, as well in the metropolis as in most of the principal towns in the country; the plate-glass and gilt embellishments in the fitting-up of many of the metropolitan shops form, indeed, matter of daily comment and surprise.

Gilding, to which department of the decorative art we shall confine our present remarks, affords employment to a large body of artisans. Various and curious as are the different operations involved in applying the laminated gold to wood, plaster, &c., we shall, instead of entering here into detail on these, proceed to consider, what will at present be more instructive, the causes most affecting the limitation of this highly ornamental art; at the same time endeavouring to shew that it is within the scope and province of modern science and improvement, to enable us to obtain, at a materially lessened cost, all the richness and beauty attainable by judiciously introduced gilding.

In the application of gilding and bronzing for ornamental house-work, two very different processes are adopted. The first requires the employing of pure gold leaf, equal in fineness to the  $\frac{1}{277}$  of an inch, and gives rise to the two methods, one called *oil gilding*, comprising about a dozen operations from first to last; the other known as *burnished or distemper gilding*, which, performed in its best style, occupies about half as many more processes as the former for its completion. We may here at once perceive that the expense of both these processes is materially enhanced by the amount of time consumed in their performance.

Bronzing does not strictly belong to this division of the subject, but a bronze powder is often employed, which is rather imitative of gold than of antique bronze. Its use to imitate bronze castings is well understood, by a slight gilding of a few prominent portions, which, tastefully applied, greatly enriches ornamental cast-iron work, statuary, &c.

We come next to consider the procuring of these precious materials. It may not be generally known, that such has been the encouragement long given to the art of gilding in Germany, that we were early, and have since continued to be, extensively supplied with the bronze powders from Germany, which still find a good market in London, as also in Birmingham and other manufacturing districts engaged in fabricating ornamental metal and japan work, and similar articles of taste and *virtu*. The foreign markets reap, therefore, the benefit of both their home and foreign trade, while we have hitherto been almost wholly dependent on them, as much from prejudice as from custom. To reach has this been the case with our tradesmen and artists hitherto,

that it is a well ascertained fact, that although the English manufacture of these articles has of late been brought to a high state of perfection, and is now even approved on the continent, in preference to their own, both for excellence and cheapness; yet, to accommodate English fastidiousness, the English produce is frequently only disposable through the medium of the German dealer, to whom is often paid 50 per cent. and upwards over what it might have been purchased for in the metropolis from the manufacturer. It is almost incredible that prejudice should so strongly warp the judgment of many of our traders and artists; and it would really appear that the fact has only to be known, and exposed in all its glaring absurdity, to be exploded; and that encouragement given to British art and British skill, of which we are too apt to lament the absence, or the decline, though often on the most vague, superficial information. Improvement in art or science is effected by the united efforts of many, which can only be sustained by proper encouragement being given; but which cannot be expected to result from the folly of constantly charging on the present age the weaknesses of the past, as if science stood still, or was circumscribed by soil or climate. What it is possible to manufacture on the continent it is surely possible to manufacture on our own island; yet past experience has afforded the fullest evidence, practically, of this simple fact having long been most obstinately doubted and disputed against the strongest evidence to the contrary.

The creating of a new art, or the adding of another branch to an existing one, must always excite considerable interest. I have no hesitation in pronouncing this to have been effected in regard to painting, as a decorative art, by a remarkable and truly beautiful and ingenious application known as *Gold Paint*, of which Mr. Henry Bessemer, of St. Pancras-road, is the inventor and patentee, by the use of which all the gorgeous and rich appearance of gilding is produced with wonderful despatch, at an amazing reduction of cost. I consider that the gilding of the dome of St. Paul's would cost little less than a thousand pounds, whereas all the brilliancy and lustre of the leaf-gold may be obtained by employing the gold paint, as it is very appropriately called, for an expense short of 200*l*. Mr. Bessemer, who is deservedly distinguished as a bronzer, has by his highly improved manufacture of bronze powder, greatly reduced its price, yet at least one-half of that article continues to be purchased from the German dealers.

The introduction of the gold paint will now, however, more than enable us to compete with continental manufacturers, for we may be well assured, that by their present means, nothing to be compared with it for fineness and effect can be produced in the foreign market. The better to understand the value of the new process, which in fact will become a new and highly ornamental branch of painting, the principal objections to the use of bronze powder for such purposes may be enumerated. In the first place, we find that when an attempt is made to imitate gilding by bronzing cornices, mouldings, carvings, and similar work, it is always attended with a deadness of effect, a want of brilliancy;—secondly, some difficulty is experienced in applying powder to large fixed objects without its falling about the apartment, occasioning waste, while great care is requisite to guard against spoiling whatever of furniture is in its neighbourhood;—and lastly, not the least consideration is the cost of preparing surfaces with gold size, as for gilding, which requires the utmost management in the after-application of the powder, to avoid its becoming oxidized by being fixed on the surface of the varnish, unprotected from atmospheric influence. The gold pigment obviates every objection that has been raised to other methods of imitative gilding. Its preparation involves the employment of very curious and elaborate machinery, by which an impalpable metallic powder is produced of singular beauty. Its application to plaster, papier maché, wood, plain or painted frames, or whatever it is required to cover with the composition, is effected simply by using a camel-hair pencil, which is dipped into a little of the powder and rubbed up in a small portion of a transparent gummy varnish, prepared and supplied for the purpose, by which it is made firmly to adhere to what ever it is laid on, after the common method of

applying paint. Thus may be seen how much this process differs from that of bronzing, and how successfully is avoided all waste or risk of spoiling furniture. Ease and simplicity of operation are likewise no small recommendation of this process, which requires no previous ground-preparation; one coat will even cover black paint, or mark a sheet of writing-paper, though for finer and richer work two coats may be applied. A magnificent effect may be produced on massy ornamental iron-work by first applying the gold-paint and afterwards passing over it a thin coating of a green coloured varnish. For all out-door work this paint would require to be varnished over for its better preservation.

Mr. Bessemer undoubtedly deserves our esteem for the skill which he has displayed in perfecting this ingenious invention; for we may now emulate Paris and other continental cities in their elaborate and profuse display of internal and external gilding (with no doubt equal lustre of effect at less expense), but in an especial manner has he contributed, by this means, to benefit a large class of the community—painters, in all almost every branch of the art. At no very distant period we may, therefore, expect to see a complete change effected in ornamental gilding by this additional gift of science.

77, King William-street, City.

## SOCIETY OF ARTS, ADELPHI.

FEBRUARY 14.—George Moore, Esq., F.R.S. (V.P.), in the chair. J. F. Doyle, W. A. Goodhue, W. H. Todd, and H. Yool, Esqs., were elected members.

Mr. Heaton continued his experiments illustrative of the principal cause of the rocking motion of railway engines and carriages.

The machine by which these experiments were shewn consists of a cam ring having four sets of cams on its periphery, viz., one set of sixteen cams, one set of eight cams, one set of four cams, and one set of two cams.

When the cam ring is made to revolve, the cams raise a rod of iron 12 inches long, and supported at one end by a cross bar fixed between centres. When the rod is fixed for the sixteen cams, it is raised  $\frac{1}{2}$  inch by each cam, and strikes (after the manner of a forge-hammer) 292 blows per minute, or travels at the rate of  $7\frac{1}{2}$  inches in a second, and no faster.

When fixed for eight cams, to raise it  $1\frac{1}{2}$  ins. high, the rod strikes 234 blows per minute, or travels at the rate of  $11\frac{1}{4}$  inches per second.

When fixed for four cams, to raise it three inches high, the rod will strike 170 blows per minute, or travel at the rate of 17 inches per second. A half-pound weight being fixed close to the end of the rod which is raised by the cam, two additional blows will be struck in one minute more than when the rod is not thus loaded, and if the half-pound weight be removed, and a two-pound weight be fixed near to the centre of the rod, so as to require the same weight to raise it by each cam, it will strike 233 blows in a minute, or travel at the rate of 25 $\frac{1}{4}$  inches in one second, *clearly shewing* that the one end of the rod working on centres does not retard the falling of the rod lifted by each cam.

Numerous other experiments were made with the same machine, with modifications, from which it appears that the small iron rod travels as fast as a forge-hammer ordinarily used.

That the velocity of a body falling short distances is doubled when passing through double the distance.

That due allowance should be made for the momentum of the piston, piston-rod, and slide gearing of a locomotive engine; and shewing particularly that a great loss of power is sustained by the wheels being heavy-sided.

Mr. Martin explained his Chirogymnast, which is intended to prepare the hand for playing on all sorts of musical instruments, but in particular the piano-forte.

It consists of a board 19 inches long, 12 $\frac{1}{2}$  inches wide, and 1 inch thick, with brass slides, pivots, buttons, straps, ladders, &c., &c., and 18 *different* parts containing also other eleven exercises.

INSTITUTION OF CIVIL ENGINEERS.

FEBRUARY 13.—George Rennie, Esq., in the chair.

A paper by Mr. J. Grantham described a series of experiments on an iron vessel called the "Liverpool Screw." This boat was 65 feet long, 12 feet 6 inches beam, and had 3 feet 9 inches draught of water; she was propelled by two high-pressure oscillating engines, with cylinders 13 inches diameter and 18 inches stroke; the pressure of the steam in the boiler varied from 50 lbs. to 60 lbs. per square inch, and it was cut off at one-fourth of the length of the stroke, working the remainder by expansion. The nominal power was 20 horses, but it did not really exceed 18½ horses. The cylinders were placed diagonally, with both the piston-rods working upon the same crank, the driving-shaft being beneath the cylinders and running direct to the propeller, without the intervention of either gearing or hands.

The screw-propeller was enlarged three times, and at last was left at 5 feet 4 inches diameter, by 20 inches in length; it was set out with a pitch expanding from 10 to 11 feet, on Wooderoff's plan; it was made of wrought iron, with four short arms with broad shovel ends, whose united area was 16 square feet, 13 feet only of it being immersed, as some portion of the arms was constantly above the water; the angle of the centre of the float was 45°. The speed of the propeller was generally 95 revolutions per minute.

With these dimensions, the speed attained was described as 10½ statute miles per hour. The amount of "slip" of the screw in the water, as ascertained by Massey's log, was stated not to exceed 5 per cent. Several experiments were detailed, which shewed that there was not more tendency to "list" or to turn round by the action of the screw than with paddle-wheels, and the vessel was said to have excelled all the other steamers of the port of Liverpool in towing out vessels in a rough sea.

Designs were submitted on this principle for a steam frigate, and for large steamers working with oscillating cylinders direct upon the main shaft.

In the discussion which ensued, the various forms and modifications of screw-propellers and their relative merits were very ably treated by a number of speakers.

Mr. Rennie gave a sketch of the introduction of a kind of screw used by Mr. S. Brown with his gas-engine, which was tried on the Thames; the more successful attempt of Mr. Smith, and the building of the Archimedes and other vessels; he mentioned also the claim of M. Sauvage, of Boulogne, to the invention, and his being recently rewarded by the King of the French. Mr. Rennie entered largely into the theory of the forms of the propellers, and in this he was followed by Mr. Farey, Mr. Galloway, Mr. Samuda, and others; and M. Normand, of Havre, who is celebrated for giving such superior forms to the vessels built by him, gave a slight sketch of the *Napoléon* French frigate, in which he eulogized the engines constructed by Mr. Barnes, and the general result obtained with the vessel, but it appeared that the speed was not superior to what had been obtained with paddle-wheels.

A model was exhibited by permission of Sir H. T. de la Bèche from the Museum of Economic Geology, shewing all the kinds of valves used in the pumps for draining the Cornish mines, and the merits and defects of the various kinds were very ably explained and commented upon by Mr. Jordan, under whose directions the model was constructed. Mr. John Taylor gave an historical sketch of the introduction of the various improvements, the causes which led to them, and the effects they had produced: the length of the discussion upon the screw-propeller left so little time for the subject of the valves, that it was announced to be renewed at the next meeting, Tuesday, Feb. 20th, when the following papers will be read:—

No. 598. "Description of a bridge across the river Shannon at Portumna," by T. Rhodes, M. Inst. C. E.

No. 658. "Description of a bridge over the river Whitadder at Allanton," by J. T. Syme.

No. 625. "Description of a cast and wrought-iron trussed girder for bridges, with a series of experiments on their strength," by F. Nash.

ON "SCARFING" OR LENGTHENING OF TIMBERS.

BY MR. JAMES WYLSON.

(Continued from page 63.)

Fig. 13 is another form of a scarf with tablings, and is tightened by means of a pair of

Fig. 13 A.

wedges; a (fig. B) shews a tongue which may be formed on the extreme end of each of the

Fig. 13 B.

timbers, to resist the tendency which any force might have to bend the parts laterally out of their ranging position, and would be found convenient, from keeping the timbers in right position when in the first instance fitted together; another method is shewn in B, fig. 21.

Figs. 14 and 15 are for scarfs in tie-beams,

Fig. 14.

Fig. 15.

wherein bolts may be dispensed with unless great strength be required; but the keys must be such as can be fully depended upon, and should therefore be of a hard, tough, and incompressible wood, so as to keep the tongue which is on each end of the timber, securely in its proper place; the addition of bolts renders such scarfings of the first order; the former of the two examples is the easier to execute, and may perhaps be considered preferable on account of its thimble parts being less in extent than those of the latter.

Fig. 16 is the same scarf as fig. 14, but with

Fig. 16.

the wood well tabled together instead of being keyed.

Figs. 17, 18, and 19 are various modifications of one description of scarf; the first,

Fig. 17.

Fig. 18.

Fig. 19.

which is very common, is not very recom-

mendable, since, if used as a tie, the oblique pressure has a tendency to make the two ends incline towards each other; and, if under compression, to have a contrary effect; the two latter, which only differ in the modes of affording them a means within themselves for resisting the strains lengthwise, are very much superior to the first, and are indeed very good and strong scarfs.

Figs. 20 and 21 are good ordinary scarfs, in

Fig. 20.

Fig. 21 A.

principle similar to fig. 15, but inferior to the same on account of the oblique joints; the clasp of the first may be improved by the insertion of a key; the second may be tightened up by wedges; the form shewn by B for cutting the

Fig. 21 B.

ends of the scarf is very convenient for fitting and keeping the pieces immovably in their places.

Figs. 22, 23, and 24, are combinations peculiarly calculated for timbers sustaining a super-

Fig. 22.

Fig. 23.

Fig. 24.

imposed weight. In bearing-timbers the upper half is in a state of tension; and the lower half in that of compression, and in these examples the plain square form which in these examples has been adopted for the abutting-joint *a*, must be the best that can be employed under such circumstances. In the first of these scarfs the bolts and the turned ends of the plate afford the only check to the extending strain in the lower half, but the deficiency is made good in both the others by their being indented and wedged up.

The examples for scarfing which I have herein given (those of them having in their formation oblique parts excepted) are generally applicable also to the lengthening of vertical and diagonal supporting-timbers, such as posts and struts, it being only advisable to tongue the ends of the wood as shewn by figs. 13 *a*, or 21 B, though the better to ensure their remaining in their intended positions, and which tonguing might be introduced in the internal tablings as well as to the outside ends, wrought-iron collars being substituted for the upper and lower bolts. The *fished* timber, fig. 1, would require pieces on all the four sides.

According to Tredgold, the length of scarfs should be about—

For Oak, Ash, or Elm, without bolts	..	..	..	6 times the depth of the beam.
— Fir	..	..	..	12 ditto.
— Oak, Ash, or Elm, depending on bolts only	..	..	..	3 times the breadth.
— Fir	..	..	..	6 ditto.
— Oak and hard woods, bolts and indents combined	..	..	..	Twice the depth.
— Fir and soft woods	..	..	..	4 times ditto

## METROPOLIS IMPROVEMENTS BILL.

HOUSE OF COMMONS.

FEB. 12.—The Earl of Lincoln moved the third reading of this bill.—Mr. Hume objected to that part of the bill by which the Bank of England were authorized to advance money on the security of the new houses to be built as part of the projected improvements in the metropolis. The practice of such advances by the Bank of England was contrary to every sound principle of banking; and, if carried out to a great extent, might not leave a single sovereign in the bank, as was the case once. He would ask the right hon. gentleman the Chancellor of the Exchequer whether his attention had been called to this clause?—The Chancellor of the Exchequer said, that there was nothing in the present bill which had not been contained in a bill brought in two years ago. Since that bill had been passed into a law, a doubt arose as to the legal construction of one clause, viz., whether the bank would be bound to take, in repayment of the money advanced, instalments, as the money should be raised from the rents of the houses to be built. Legal opinions were taken on the point, and they were considered satisfactory; but he thought, under all the circumstances, that it would be the better course to come to Parliament, and thus at once to remove every doubt or difficulty in the matter. The whole of the money which the Commissioners of Woods and Forests were authorized to borrow from the bank would be repaid in five years. He did not see that the bank ran any risk whatever in the transaction.—After a few words from the Earl of Lincoln, which did not reach the gallery, Mr. Hume said, that very great complaints had been made of the delays which took place between the removal of houses and the erection of others in their place. In some cases two years were allowed to elapse from the removal of one set of houses to the erection of others. Would the noble lord the chief commissioner say to what cause those delays were to be attributed?—The Earl of Lincoln assured the hon. member and the House that every reasonable diligence was used in carrying out the contemplated improvements. It was necessary that houses should be removed gradually, for if all the houses which were intended to be removed were to be taken down and sold at once, their materials would scarcely fetch any thing.—The bill was then read a third time; and, after a short discussion relative to the advance of money by the Bank of England for the erection of public buildings, the bill was passed.

THE GRESHAM CLUB HOUSE.—The foundation-stone of the new building for the Gresham Club was laid on Thursday, the 8th inst., by the Lord Mayor. His lordship was attended by the sheriffs, a committee of the members of the club, and a number of influential citizens. The Lord Mayor, having been received by the committee, Mr. Flower, the architect, submitted to his lordship the plans of the building. The vice-chairman of the club (Mr. R. P. Davis) presented to the Lord Mayor the various coins to be deposited, and the secretary (Mr. Best) read the scroll on which the objects of the club were inscribed. The coins and scroll were then placed in a leaden box, and deposited in the aperture prepared for them in the foundation-stone. The silver trowel was now handed to the Lord Mayor, by the chairman of the committee of the club (Mr. Lamie Murray), and the stone having been properly placed by the builder, Mr. Cubitt, his lordship spread the mortar upon it, and declared the foundation-stone to have been laid. Mr. L. Murray said he had now to thank his lordship on the part of the members of the club for his condescension in having on the present occasion laid the foundation of an institution which, he trusted, would be found to take its rank amongst the many which ornamented their noble city, founded, as they had all been, by the perseverance and enterprise of the citizens, amongst the foremost of whom stood Sir Thomas Gresham, whose name the club had honoured itself by taking. The ground on which the building (in the Italian style) is about to be erected adjoins the banking house of Messrs. Smith, Payne, and Smiths.

## DESCRIPTION OF A NORMAN CASTLE OR FORTRESS.

It consisted, with very few exceptions, of an inclosure of from five to ten acres of land; and was encircled by a river or artificial canal, called a moat, on the scarp or edge of which was a strong wall, succeeded by another, and between these was the first ballium, or outer court of the castle. Within the second wall, or that which immediately surrounded the keep or great tower, were storehouses for the garrison, and other offices suitable to the extent and distinction of the fortress. In the centre of this interior space or inclosure, was the citadel, or master-tower, as it is more properly called, in which resided the suzerain, or feudal chief, but occasionally it was occupied by the deputy, or castellan, who, for the time being, was the representative of the baron, and had the full exercise of his delegated authority. This master-tower was generally built upon an artificial mound. It contained the state apartments, which were in proportion to the style and retinue of the founder, with all the other domestic offices belonging to the strongholds of that period. In the centre of the tower, and descending to the lowest part of the foundation, were the dungeons, in which were confined the prisoners of war, the felons or malefactors of his jurisdiction. In several instances, access to the various compartments of the castle was provided by secret inlets through the centre of the walls, and by subterraneous passages made under the fosse.

In advance of the ditch or moat was the barbican, or outer defence, with a watch-tower that communicated with the interior by means of a drawbridge across the moat, which opened inwards, so as to be under the control of the sentinel on guard. The entrance to the ballium, or outer court, was secured by gates, with a ponderous grating or portcullis, which was raised or lowered by means of those iron chains and pulleys which are still used in some of our military fortresses, and are always met with in the fortified cities of the Netherlands. The walls were further protected by towers and battlements, from which, as well as through the numerous loopholes by which they were perforated, arrows and other missiles could be discharged with deadly effect; while through the apertures of the machicolation above—

"Sudden on the assailants' head,  
Blocks of stone and molten lead,  
O'er the foe descending, gushing,  
Scorching as they fell, or crushing,  
Helm'd warriors in their fall,  
Guarded each embattled wall."

The outer walls were generally from six to ten feet thick; those of Rochester Castle are seven; while the walls of the keep to which all look for retreat under desperate circumstances, were often fifteen feet in thickness, and contained in their centre many secret closets, passages, and recesses, to which none but the castellan and his family had access. In the castle of Glamis there is a secret chamber, the key of which is transmitted from father to son, and never known to more than the "seigneur actuel," and some trustworthy official. Before the invention of artillery, one of these strongholds, such as we have described, might have been considered impregnable; and when taken, the surrender was generally in consequence of famine, revolt, or cowardice on the part of the garrison, or of stratagem on that of the besiegers.

Nearly all the fortresses of this class were erected during that period that elapsed between the reign of the Conqueror and that of Edward the Third. The Castle of Rochester appears to have been erected soon after the decisive battle of Hastings; and in tracing its history and that of its founder, we shall adhere to the general opinion, so far as that may be found to harmonize with historical documents. Castles built on the Norman model varied according to the natural shape of the ground selected for their erection. The military baron, following the example of the Roman general, selected that position to which nature had given the best means of security, which provided against sudden approach or surprise, and in cases of extremity offered some facility for escape, of which various instances are recorded in history. The sites chosen were generally on capes or promontories overlooking the sea; on high banks protected by a

river, or on isolated hills, where connecting valleys, by forming a natural fosse, would interpose a chasm between the besiegers and the besieged. These natural positions were readily taken advantage of by the warlike baron; while the difficulty of access could be increased by artificial means, such as damming up a stream which flows through the ravine, and thus forming a temporary lake. The situation of Rochester Castle is partly an example of this kind; the high ground on which it stands, and its immediate access to the river, were natural recommendations not to be lost sight of, and which the founder took every opportunity of turning to the best account. In castle-building, the general maxim was—

"Where the land o'erlooks the flood,  
Steep with rocks and fringed with wood;  
Where, throughout the circling year,  
Wells the fountain fresh and clear;  
Scoop the dungeon, rear the wall,  
Pile on high the feudal hall."

—The Castles and Abbeys of England.

## THE "NELSON MONUMENTS" OF ENGLAND.

AMONG the innumerable Nelson statues to be found in English towns, Birmingham possesses on its Bull-ring the smallest. This is a statue of the great man, representing him only the size of life. It is a perfectly faithful copy of nature, expressing thoroughly the simple, unassuming appearance of this citizen hero. His lean cheeks are represented just as they were in the man; his lank hair falls over his forehead, and he wears the empty sleeve of his shot-off arm. To my mind, the whole was too faithful to nature, although it comes from the hand of Westmacott, one of England's most distinguished living sculptors. Much, too, might be said against the empty sleeve. On right and true principles of art, ought not the arm to have been restored? Were a great man, an admiral or a general, to have both legs shot off in battle, should we put up the mutilated trunk—a statue without legs—in the market-place? Can we not imagine ourselves as meeting great men in a future state, whole and perfect? And is not this art of sculpture in white marble a sort of transfiguration of the human form, as it has preceded us to Paradise? Should we not represent our great men, in order to make this transfiguration more noble, hovering as it were over us, transfigured to the highest ideal glory, rather than cling to the historical, and therefore earthly truth of their sorrowful every-day history, and to their bodies battered by the storms of life? For the rest, this little, sorrowful-looking statue of Nelson, literally the only statue which Birmingham possesses, stands almost lost in the midst of 200,000 inhabitants. Only imagine, one single sculpture to 200,000 living men! In Rome, or Athens, there would have been one to every 100, or even 50 men. Even in Berlin, Petersburg, and other comparatively modern towns, we might reckon a statue to every 4,000 or 5,000 inhabitants; but in Birmingham, as I have said, there is one to 200,000! It is a question whether, in the whole world, there could be found another town of the same population so monumentless; at any rate, thus much is certain, that even among the manufacturing towns of England it has in this respect no equal. Not only Liverpool, Manchester, and Glasgow, but Newcastle, Bristol, and Hull have more, not to speak of such fine cities as Dublin and Edinburgh. Birmingham and Leeds are, I verily believe, the most pleasureless, tasteless, and ornamentless towns in England. On the whole, if Birmingham, in reference to the useful arts, may be called a Paradise, it is, in reference to the fine arts, a complete wilderness. In the theatre here I learnt that I could get tired even of a play of Shakspeare.—*Khol's Travels through England and Wales.*

REMARKABLE CHANGE IN PROPERTY.—When Lawrence Sheriff, grocer and citizen of London, left the third part of a field of 21 acres, in the parish of Holborn, for the endowment of a grammar-school at Rugby, it produced no more than 8*l.* a year. This field was called Conduit-close, and was nearly half a mile from any house. It is now covered with buildings, and the rental exceeds 10,000*l.* a year. The field has risen in value from 8*l.* to 10,000*l.* and upwards.

## RAILWAY INTELLIGENCE.

*London and Birmingham Railway.*—Feb. 9th, at noon, the half-yearly general meeting of the proprietors took place in the board-room at the London terminus, Euston-grove. Mr. G. C. Glyn, the chairman of the company, presided, and in opening the meeting, alluded to the proceedings in Parliament with respect to railways, and congratulated the shareholders on the prospect that was opened for their connecting the London and Birmingham line with Lancaster and Carlisle, and in another direction with Holyhead, where a spacious harbour was about to be formed by Government. He said that the Birmingham line paid 71,700*l.* per year to Government for duties, including 16,300*l.* for income-tax, and complained of the manner in which the line was rated to local taxes and parish rates, which had been increased in the present year to the extent of 3,000*l.* Mr. Creed, the secretary, read the report. The revenue account for the last half-year, as compared with the corresponding half-year of 1842, shewed an increase in the traffic of 11,393*l.*, and a decrease of 6,221*l.* in the working charges. The directors had to report that the net profits of the year 1843 being 502,484*l.* 0*s.* 5*d.*, and the dividend declared at the last half-yearly meeting 243,732*l.* 14*s.*, there remained a disposable balance of 259,751*l.* 6*s.* 5*d.*, from which they recommended that a dividend of 5 per cent. be deducted, leaving 17,006*l.* 18*s.* 5*d.* to the credit of the current half-year. The Warwick and Leamington, and Northampton and Peterborough lines were progressing satisfactorily, and the latter was rapidly advancing towards completion. The directors had to apply to the proprietors for powers to carry out the line from Chester to Holyhead, where the Government was about to erect a new harbour, and thus make it the great medium of intercourse with Ireland. Every endeavour had been made to accommodate the public, and, in order to do so, they had given to all passengers going and returning by the railway on the same day, the benefit of a reduction of one-third in their fares, and they allowed them to compound for two months' fares at half-price. They had also modified their rates to first-class passengers riding in the company's carriages, but travelling with their own carriages on the train, by charging them second-class fares. The report was adopted, a dividend of 5 per cent. declared, and 17*s.* on each of the 32*l.* shares of the company. A resolution was adopted, giving powers to the directors to provide capital for making the proposed railway between Chester and Holyhead, not exceeding in the whole 1,000,000*l.* sterling, and to take any other measures for the interest of the company.

*The Northern and Eastern Railway* continues to improve, and the dividend, the net profits return, is 5 per cent., which was the amount declared, although the directors in their report only recommended 4½ per cent. When the line is fully developed, the directors say that there can be no doubt of the shareholders receiving a dividend considerably in excess of the 5 per cent. guaranteed by the Eastern Counties Company, according to the agreement made between the two companies.

*North Midland Railway.*—The report declares a dividend of 2*l.* on every whole share, of 12 on every half-share, and 13*s.* 4*d.* on every third-share, clear of income-tax, and then 4,956*l.* 3*s.* 4*d.* is left to be carried to the next half-year's account. The net profits of the past six months were 64,722*l.*, shewing an increase in revenue of 6,463*l.*, and a decrease in expenditure of 6,230*l.*

*The York and North Midland Railway* pays a dividend of 2*l.* 10*s.* on each whole share, and 1*l.* 3*s.* on each half-share, clear of income-tax. The total receipts of the half-year have been 47,594*l.*, and the expenditure 23,218*l.*, leaving about 24,400*l.* for division among the shareholders.

*The Chester and Birkenhead Railway* pays a dividend of 8*s.* 6*d.* per share on the 50*l.* share, and 4*s.* 3*d.* on the 25*l.* share; and this concern is now to be amalgamated with the new project of the Holyhead Railway. The terms on which the amalgamation takes place are purchasing the stock of the Chester and Birkenhead Company at par, and allowing the shareholders either to take new shares in exchange, or receive immediate payment.

*South Devon Railway.*—At the last meeting held at Teignmouth, to take into consideration the advantages of this railway, Mr. Brunel remarked that it appeared to the Great Western, Bristol and Exeter, and Bristol and Gloucester companies, that the South Devon line should go coastways, and he thought that any other would be injurious to Teignmouth. The South Devon line was as little complained of as any line he knew, and he had selected that line which would do the least possible injury, and which would connect the large populous towns with the metropolis, and which had secured the approbation of the landowners generally. G. S. Curtis, Esq., entirely approved of the projected line, and would support the plan. He moved a resolution, approving of the west line, which was seconded by — Watts, Esq. Mr. Curtis's resolution was put and carried.

*Committee on Railways.*—On Saturday last, in the House of Commons, Mr. W. E. Gladstone inquired of Mr. Wallace whether he purposed persevering with his motion with respect to the striking off the committee directors of railways and leading shareholders?—Mr. Wallace said that the course he intended to pursue was to move an instruction to the committee, which instruction he should put on the paper for to-night, declaring the principle which, in his judgment, ought to govern the House in this matter.—Mr. Gladstone said, under these circumstances, he should move the appointment of the committee.—The Speaker having read the names of the gentlemen to serve on the committee, Captain Pechell said, that he had received instructions from his constituents to oppose the appointment of directors on railways to serve on this committee.—After a short discussion, the motion was put, and the committee was appointed.

*Frauds.*—The railroad question absorbs the whole attention of the Cabinet, as the Chamber of Deputies has so many interests at stake, that no opinion can be formed as to the plan which can combine the greatest number of affirmative votes. A large portion of independent deputies, scandalized at the jobs which the proposed companies sought to fix the country with, recommended the State to construct the roads, while the Minister of Finance, who sees that in order to do so he must come forward with two instalments of the loan, is anxious to decline the responsibility. Other deputies, who have a direct interest in companies desirous of making the roads, urge on the Cabinet the danger and impolicy of its attempting such an undertaking, while the personal friends of the ministers entreat that they will not let slip through their hands so fertile a source of patronage.

## BIOGRAPHICAL MEMOIRS.

WILLIAM WALLACE, LL.D., HON. M. Inst. C.E., late Professor of Mathematics in the University of Edinburgh, was born at Dysart, in the county of Fife, in 1768. From birth, fortune, or education, he derived no advantages whatever, and the eminent station he eventually occupied as a mathematician was achieved solely by his own industry and love of scientific knowledge, aided by natural talents of a high order. He was appointed, at the age of twenty-six, assistant teacher of mathematics in the academy of Perth. In 1803 he obtained a professorship in the Royal Military College at Great Marlow (afterwards removed to Sandhurst); and in 1819, upon the death of Mr. Playfair, and the removal of Mr. Leslie to the chair of Natural Philosophy, he was elected professor of mathematics in the University of Edinburgh.

Professor Wallace's pursuits and studies were chiefly connected with abstract mathematics, but some of the subjects to which he directed his attention may be here noticed, as having more immediate reference to the objects of this institution.

The Eidograph, an instrument for making reduced copies of drawings, which he invented about the year 1821, and exhibited at a meeting of the institution in 1839, is considered superior in many respects to the Pentagraph. It possesses greater smoothness and flexibility of motion, and while the copies may be reduced (or enlarged) in any proportion, their similarity to the original is preserved with

geometrical precision. By a particular modification, the instrument is made not only to reduce, but to reverse the copies, whereby it is rendered peculiarly applicable to the purposes of the engraver.

Among the papers which he contributed to the "Transactions of the Royal Society of Edinburgh," there is one on the subject of curves of equilibration, which is interesting to us on account of its connection with the theory of suspension-bridges. From the development of a certain functional equation, he deduces series for computing the co-ordinates of the catenary, and gives tables of the corresponding values of the co-ordinates so computed; thus furnishing engineers with a ready means of constructing arches having the forms of equilibrated curves.

Professor Wallace obtained a high reputation as a mathematician, at an early age, and during his whole life he laboured assiduously to extend and facilitate the study of his favourite science. Besides his contributions to the memoirs of scientific societies (chiefly the Royal Society of Edinburgh), he was the author of nearly the whole of the articles on pure mathematics in the fourth and subsequent editions of the "Encyclopædia Britannica," and likewise of the greater part of those in Brewster's "Edinburgh Encyclopædia."

His health having given way so far as to render him unable to discharge his duties in the University, he resigned his chair in 1838. During the remainder of his life, although an invalid, his scientific ardour suffered no abatement, for while confined to his chamber, he composed the memoir on equilibrated curves, as well as a work intitled "Geometrical Theorems and Analytical Formulæ," which was published in 1839. His disposition was amiable and benevolent; he was beloved by his friends, and respected by his fellow-citizens; and he died, universally regretted, at Edinburgh, on the 28th of April, 1843, in his seventy-fifth year.

MR. JOHN BIDDLE, M. Inst. C. E., was born at Kyo, near Lancaster, in the county of Durham, in 1773, and resided there nearly twenty years, when he removed to Wallsend with his father, who had then attained considerable eminence as a colliery viewer.

The elder Mr. Biddle was a man of considerable attainments in mathematics; he was a correspondent of Hutton, Emerson, and other eminent men, and contributed many papers to the scientific publications of that period. He was remarkable for the systematic manner in which he conducted his professional avocations; and to him we are indebted for the introduction of iron tubing for sinking shafts, which, it is believed, was first used at the Wallsend colliery.

At an early age Mr. John Biddle evinced an attachment for active occupation, and an eager pursuit of experimental knowledge. These studies and pursuits were encouraged by his father, from whom he derived nearly the whole of his education, having only been at school during one year, when very young. He became very early the assistant of his father as a colliery viewer; and on one occasion, when, as usual in cases of emergency, the viewers of different collieries were called together, to consult on the means of stopping an extensive fire of gas in the Washington pits, he suggested the trial of a jet of water moved rapidly, alternately, across the flame, in the same manner as in his boyish experiments he had cut off the flame of gas with a knife: the plan was adopted, and being carried into effect by himself, was perfectly successful.

After the death of the elder Mr. Biddle, his son succeeded him in the management of the Wallsend colliery, and there, in 1810, he introduced those extensive improvements in ventilation which have been so much imitated.

He was engaged as a viewer and consulting engineer of a number of the principal collieries in the North of England. His experience in all the details of the coal trade led to his being frequently examined as a witness in Parliamentary committees; and he was also employed as consulting engineer on railways and general engineering questions. In 1838 he was appointed one of the Dean Forest Mining Commissioners, and his tact and experience materially aided in the successful completion

of their labours. As he advanced in life, he became the proprietor of coal-mines, as well as of landed, shipping, and other property, which, under prudent management, produced a considerable income; indeed, when it is remembered that he was a bachelor, and that his habits were very simple, it is surprising that he did not accumulate greater wealth.

He was very liberal, and his charities were extensive. He took great interest in the local scientific societies, and, even amidst his numerous engagements, found time to communicate to them some valuable papers.

To all who have visited the coal-mines of the North of England, or have taken any interest in the history of coal-mining, the name of Mr. John Buddle is familiar.

He was active, steady, and unremitting in the discharge of duties which were attended at all times with much personal fatigue, and frequently with imminent danger. He was extremely exact in his extensive correspondence, and kept a diary, which may probably furnish materials for a detailed and useful memoir.

In private life he was distinguished by many excellent qualities and social virtues. Among other accomplishments he was a superior musician; and his retentive memory, and happy mode of explaining and illustrating his subject, rendered him as agreeable a companion as he was a valuable friend.

His habits were extremely simple, but his house for nearly half a century was the resort of most of the scientific strangers who visited the North of England, and his hospitality was unbounded. Whether viewed in his professional or private character, he has left solid claims to admiration and esteem, and his death may justly be regarded as a public loss. He died on the 10th of October, 1843, at the age of seventy years, and was interred in the ground which he had given for a cemetery, and where a church had been erected, on his estate at Benwell, near Newcastle.—From the Report of the Institution of Civil Engineers.

#### CLENDINNING TESTIMONIAL.

TO THE EDITOR OF THE BUILDER.

SIR,—I send you a design for a public monument to the memory of G. Clendinning, Esq. It is of the Gothic or Pointed Architecture of the late period, which an antiquary with whom I have some acquaintance informs me is now generally denominated "*the Perpendicular style*," having been first so called by the late Mr. Rickman, the Quaker architect of Birmingham. Those who have not previously applied themselves to the subject will readily perceive that a succession of perpendicular lines reach from the base to the summit of the work, shewing that the appellation has not been without reason. The steps and basement of the structure I propose to be of granite, all the remainder of the work to form an open lantern of Caen stone. Within the first stage (A), in which a statue of the deceased is designed to stand, surrounded by an octastyle peristylum, attached to the eight piers of the arcade, and canopied over by a groined and ribbed stone ceiling, of the fashion shewn by the plan of that stage, but with the central compartments of the groining forming a star, left open, and without panel-work between the stone ribs, so that light from the lantern above may be shed over the statue.

The letters B C and D attached to the elevations and plans exhibit the forms and dimensions of the succeeding stages of the work, as they proceed to its summit. The general form of the monument is exactly pyramidal, as may be seen by drawing lines from its lower steps to the summit of the crowing finial, the corbel of canopy-heads and small pinnacles at the base of the spire, ~~stage~~, D, alone playing lightly without the circular ribbing lines, thereby giving, as in the case of many ancient works, more vivacity to the composition, without offending against unalterable rule.

I am, Sir, your humble servant,

W. R.

January 10, 1844.

#### DESIGN FOR THE CLENDINNING TESTIMONIAL.

ELEVATION.

PLANS OF THE DIFFERENT STAGES.

## MONUMENT TO THE LATE DR. MALKIN

A HANDSOME monument has just been erected in St. James's Church, Bury St. Edmunds, in honour of the late Dr. Malkin. Soon after his decease, a number of his former scholars at Bury, who judged that his memory deserved well of themselves—of the school over which he so successfully and so splendidly presided, and of the town which was so largely benefited by his presidency, entered into a subscription for the purpose of extending, by enduring marble, the knowledge of him, and of their feelings towards him, to generations beyond that in which he and they should "live, and move, and have their being." It was at first intended that the subscription should be small, and the object simple; namely, to express on a plain tablet, and in few words, the sentiments which were entertained towards him: in short, to do him honour, not by an overdisplay of the sculptor's and the penman's arts, but by the fact of the erection of the memorial. When, however, this intention became known, a sum exceeding thrice the amount at first contemplated was brought together. This result is highly creditable to the Bury scholars of by-gone days, inasmuch as the individual whom they sought to honour had passed the last fourteen years of his life, not only divested of scholastic office, but also, in distant retirement. Some of his learners "had paid the debt of nature," all were more or less widely dispersed: yet "the love of many was not cold;" manhood had not effaced the recollections of youth; the world had not extinguished the sympathies of school.

The committee, finding so large a sum at their disposal, resolved upon improving their object, and intrusted the fulfilment of it to Mr. Lough, of London, a statuary of fast-increasing reputation. There existed a bust of Dr. Malkin, executed during his life by Chantry, and worthy the chisel of that highly-gifted artist; this was shewn to Mr. Lough, and upon viewing the well-favoured, dignity-hespeaking, and statuesque style of features there represented, he determined to introduce a medallion likeness into the monument. This, accordingly, forms a prominent portion of the work; and it is both beautiful as a production of art, and faithful as a resemblance to the original.

The compartment containing the inscription is separated from that bearing the medallion profile by torches just extinguished—a classical emblem of the expiration of life, and appropriate in a memorial of the departed. The inscription is as follows—

"In remembrance of  
BENJAMIN HEATH MALKIN, LL.D., M.A.,  
Head Master of the Royal School in this town  
from 1809 to 1828,  
Who died at Cowbridge, May 26, 1842, aged 72.

Erected by his pupils as a tribute of  
gratitude, respect, and affection."

This is a simple but effective record: for what sentiments more honourable and more pleasing than these can an instructor of youth hope, or desire, to actuate the hearts of his former scholars, and to embalm his memory?

MONUMENT TO BISHOP LATIMER.—A monument has just been raised in the chancel of the parish church of Thurcaston, Leicestershire, to the memory of the celebrated Hugh Latimer, Bishop of Worcester. In the centre is a concave marble slab, bearing the following inscription:—

"H. S. E.  
The grateful memory of  
HUGH LATIMER,  
Lord Bishop of Worcester.  
The great champion of the Protestant Faith  
Was born in the parish of Thurcaston,  
In the year 1470.  
He faithfully followed in the glorious train  
Of his Lord and Master,  
And having joined the Noble Army of Martyrs,  
Sealed the truth with his blood.  
He was burnt at the stake in Oxford,  
In the year 1555,  
And then 'lighted a candle,' which  
Shall 'never be put out.'  
Hoc marmor ponendum curavit,  
Ricardus Waterfield,  
Rector de Thurcaston.  
1843."

## ON VENTILATING AND WARMING SCHOOL-ROOMS.

TO THE EDITOR OF "THE BUILDER."

THE proper ventilation and warmth of school-rooms ranks next in importance to the sufficient admission of light, both as regards the health of the children, as well as in an economical point of view. The ventilation of school-rooms is a subject of the utmost moment, but which, in very many instances, is grossly and often totally neglected; the only apertures by which a current of air can enter, or the vitiated part escape, being by the windows and door, a mode which, under the best circumstances, only very partially performs the object, and in cold or rainy weather becomes totally useless; thereby producing injurious and unpleasant effects on the teacher and children.

It is a well-known fact that, in a school-room occupied by a number of children, the atmosphere becomes specifically lighter than the surrounding parts, in consequence of the warmth of their bodies and by the heat of the fire, and which, therefore, has a tendency to rise and escape through the roof, while the cold air outside presses in to supply the deficiency. All that is necessary, therefore, to be done to insure perfect ventilation in a school-room, is to provide apertures in the gables of the roof, with valves for the outlet of vitiated air, and to cause a current of fresh air to enter in the most agreeable way, so as to prevent draught. This mode of ventilation is further explained in the accompanying diagram,

which is a section of a school-room, where A is the opening in the gable, furnished with a valve, having a cord for the purpose of opening or closing it, and B the opening in the wall, so as to admit air under the room, the floor of which is provided with openings and valves to supply the school-room with air to any required amount. If the floor be of asphalt, &c., a brick flue must pass under it to the air-valves. For warming school-rooms, common fire-places may possess some advantages, but these are more than counterbalanced by the disadvantages which must always attend them; two-thirds of the heat generated is carried up the chimney and wasted, and the remainder being confined to a short distance from the fire, leaves the remote parts of the room quite cold; added to this, a common fire consumes a great quantity of air, thereby occasioning draughts to enter by all the crevices, the effect of which being injurious to health, the trouble and annoyance arising from continually stirring and supplying the fire with fuel, the risk of smoky chimneys, and the almost insurmountable difficulty of avoiding them in the sudden changes of wind and temperature, render their use, when practicable, to be avoided, especially as a stove answers the purpose much more effectually. To warm a school-room with a stove, if placed near a wall the flue may be carried up in the brickwork about 3 inches square, but if in the middle of the room, an iron pipe must be fixed so as to communicate with the exterior. The advantages arising from the use of a stove are, that it requires fuel but once a day, the fire being kept always alight; the small quantity of air required precludes the possibility of draught; the temperature, by means of a thermometer placed against the wall of the room, may be kept at any requisite degree; the prime cost is less; it consumes much less fuel than a common fire, and all risk of accident to the children is avoided. A small vase of water with a perforated cover should be placed on the stove, and one of the

air-valves in the floor should be quite close to it, the others may be equidistant between the stove and end walls.

This is the best and most simple mode of ventilating and warming schools, and it behooves all who have the duty of forming new schools devolving on them, to give the proper ventilation of the rooms their most serious attention, as it produces not only corresponding good effects on the children's health, but also in many other important branches.

C. D.

[Supposing our correspondent means by "a stove" some kind of inclosed fire-place, as Arnott's, or an offset of the old German stove, we beg to remind him of the frequent banishment of all manner of iron stoves from buildings, from the head-ache and other inconvenience produced by the foul air reigning wherever such stoves are used, often compelling a recurrence to the old-fashioned, wholesome common open grates, with all their waste and weakness of operation. A century and a half ago, John Evelyn recommended, even in the heating of a green-house, the avoidance of iron, and the use of baked earth. Perhaps the French apparatus denominated the "Calorifere" (whereby a current of external air is introduced through heated pipes of terra cotta), makes the nearest approach to the wholesomeness of the hot-water warming-apparatus in its best form. We very seldom suffer naturally from head-ache, yet cannot stand against the noxious fumes generated by any of the race of iron pipe-stoves, Arnott's included.—En.]

## FIRES IN LONDON.

## IMPORTANT EXPERIMENTS.

A GREAT many proposals having lately been urged upon government with the view of establishing in London, and all the large towns throughout the provinces, a system for the more speedy extinction of fires, viz., by attaching hose or leathern pipes, with branches, to the plugs and mains laid down in the streets, so that the water might be thrown to a sufficient altitude by its own pressure, without the aid of fire-engines, an experiment a few days since was made by Mr. Quick, the engineer of the Southwark Water Company, in order to ascertain how far it could be made applicable. The company not having the necessary apparatus to make the trial, the assistance of the Fire Brigade was granted to carry out the experiment, Mr. Braidwood, the superintendent of the force, being present on the occasion, the particulars of which will be found to be highly important. The report, which is extremely voluminous, states that it took place on the morning of Thursday last, between the hours of 4 and 9 o'clock, Mr. Quick selecting Old Gravel-lane, Union-street, and Tooley-street, as the most favourable spots to carry on the operations. During the whole period the pressure of water at the company's works at Battersea was kept at 130 feet, and every service-pipe or outlet was kept shut, so that the trial should be fairly made. The first experiment took place in Union-street, by having lengths of riveted leathern hose (two inches and a half in diameter and 40 feet long) attached to six standcocks, placed into plugs, all situate within the space of about 700 yards. The water was conveyed from the head at Battersea, through 5,300 yards of iron piping, consisting of 4,250 yards of 20-inch main, 550 yards of 15-inch main, and 500 yards of 9-inch main. On one standcock being opened, the jet of water thrown from the copper branch (with  $\frac{3}{4}$ -inch hose pipe on) reached an elevation of 50 feet, and the delivery was at the rate of 100 gallons per minute. The next object sought was to ascertain the quantity of water that could be obtained from the plug. The branch-pipe for this purpose was taken off, but the length of hose remained on. The delivery was then found to be 260 gallons per minute, shewing that nearly two-thirds of the water was lost by confining it to a small jet. Had the standcock and hose been taken away, there would have been quite sufficient water to supply three fire-engines, each delivery being equal to the discharge from the first standcock. Another was then opened, and the jet from the former was reduced to 45 feet elevation. Other two were added, and the jet of the first was then 40 feet; and on three being opened, the jet from the first rose to 35 feet.

The fourth was opened, and the jet of the first decreased to 30 feet. The fifth was then brought into play (viz. six in all), and the jet from the first only measured 27 feet, fully shewing that there was a regular gradation in the height of the jets, according to the number opened. The next trial was made in Tooley-street, the standcocks being used as in the former case. Some slight difference was observed in the elevation to which the jets were thrown, the first gaining 60 feet; and when the whole were opened, the height was reduced to 40 feet, the delivery of the water being at the rate of 70 gallons per minute. Another trial was then made in a street leading into Tooley-street, where there was only a service-pipe laid down, called a 5-inch main. The first standcock threw a jet of 40 feet, and on the others being opened, the one furthest from the first started only emitted a jet of 24 feet, and a delivery of 58 gallons.

NORWICH.—The erection of the observatory on the Cathedral for the purpose of connecting this portion of the kingdom with the great system of triangles, which has now been carried over nearly the entire surface of England and Wales, afforded an opportunity for meteorological observations not to be neglected, and accordingly a series of experiments were commenced by the permission of Lieut. Da Costa, of the Royal Engineers, under the direction and management of the Rev. A. Bath Power. The bearings were taken of no fewer than 194 towers, but only 58 of them were identified.

IESWICH.—The usual monthly meeting of the Dock Commissioners was held last week at the Town-hall. The chairman read the minutes of the committee of management, and from them it appeared that the Charity Trustees had been authorized to build a quay in front of the charity land, abutting on the new channel, under the direction of the engineer; and that the engineer had been directed to procure three drags and six life-lines, for the assistance of persons who may have the misfortune to get into the dock.

COURT OF QUEEN'S BENCH.

CARPUE V. THE BRIGHTON RAILWAY COMPANY.

FRIDAY, Feb. 9.—Lord Denman this morning delivered the judgment of the court in this case. The only question remaining for decision was whether the defendants were entitled to notice of action under the 252nd section of the Act. For the necessity of such notice it was argued, that the declaration charged the injury to have been done to the plaintiff by the defendants' omission to do some of the works required by the Act, and the *dictum* of Baron Parke in the case of "Palmer against the Grand Junction Railway" was cited, where the notice was not thought necessary; but that *dictum* was this, that if the action was founded upon neglect in not fencing the railway, whereby the travelling became dangerous to those passing on it, assuming that obligation to be the result of the provisions of the Act, the case would have fallen within the section requiring notice; but when the matter was looked at and explained, he said it appeared the action was not of that nature, but the defendants were sued as common carriers, and the learned judge commented on the fact proved in that case, and considered it did not come within the Act. In defence to that *dictum*, leave was given to move to enter a nonsuit, and a rule was granted and largely discussed, but the Court was not now called upon to consider how far that *dictum* was correct law, because the Court was clearly of opinion that this injury had arisen from the defendants' misconduct as carriers, and not as proprietors; but in considering the evidence it was impossible to exclude some reference to the state of the railway; hence the Court thought there was no foundation for an argument in favour of the necessity of notice, and the plaintiff was, therefore, entitled to retain his verdict.

Rule discharged.

LORD MINING UNDER HIS TENANT'S PREMISES.

HILTON V. LORD GRANVILLE.

FEB. 10.—In this case, which was argued on Monday last, Lord Denman delivered the judgment of the Court. This was an action on the case for an injury done to two ancient houses, one occupied by the plaintiff, and the other held under him by a tenant. The declaration stated, that the plaintiff was lawfully possessed of certain houses, with the appurtenances, situate at Newcastle-under-Line, supporting which houses were certain foundations, which the plaintiff of right had enjoyed, and was enjoying, for the support of his house, and that on divers days and times, without the leave and license of the plaintiff, the defendant, intending to destroy the foundations, negligently and improperly worked certain mines underground, and dug for ores and minerals, and that by reason thereof the foundations of the house became and were greatly weakened, injured, and damaged, and rendered unsafe and incapable of supporting the house; in consequence whereof the house cracked, sank in, and was in great danger of falling down and being destroyed, and the value of it was reduced. The third plea to this declaration was as to the working of the mines underground; that, before the making of the lease to the plaintiff, the defendant had a grant of the right of mining from the present Queen; and it then proceeded to state, that from the time whereof the memory of man was not to the contrary, he had a right to get minerals and dig and work such mines under the dwelling-houses in such manner as might be expedient for the purpose of getting the ore, paying to the respective occupiers of the surface reasonable compensation for or in respect of the use of the surface, and without making any compensation for any damage occasioned to any messuages, &c., by any acts done for the purpose of working the mines underground; and the defendant justified that this injury arose from the working the mines underground. These acts were justified by prescription in the third plea, and by custom on the fourth plea, by which the defendant claimed a right to do what was complained of. These pleas were demurred to as setting forth a prescription and

custom which could not be sustained, they being uncertain and unreasonable. The Court made no distinction between the two pleas, for if either the prescription or custom were bad, the other must be so likewise; if one was valid, the other must be valid. The Court also thought the question as to the premises being freehold or copyhold did not affect the principle; if the custom prevailed to freehold property, it must also prevail as to copyhold. The principle on which the custom was said to be founded was laid down in a case where it was said that the objection to this custom, that it was only beneficial to the lord and prejudicial to the tenant, was of no weight, for it might have had reasonable commencement notwithstanding, for the lord might take less for the land; but the true objection was, that it was uncertain and unreasonable, as it might deprive the tenant of the full benefit of the land; and it was not to be supposed that any of the tenants would have taken the land subject to such a custom. The custom held invalid was, that so often as the lord of the manor sank pits on the freehold land for working the collieries, he had been accustomed to cut the earth, &c. coming therefrom on the land, there to remain so long as he thought fit. Chief Justice Willes, after pointing out the unreasonableness of the custom, said no custom was more unreasonable than the present—it might deprive the tenant of the whole benefit from the land, because the lord might dig as often as he pleased, and at what time of the year he pleased; so that the lord might stay upon the tenant's land for ever. The case had been removed by error into this court; and after having been argued three times, the judgment against the custom was affirmed. Justice Lee said the question was whether this was a reasonable *lex loci*, and the Court held it not to be so, as it laid a great burden on the land; it savoured much of arbitrary power, and might have put it in the power of the lord utterly to deprive the tenant of the benefit of the land, there being no restriction as to time; and in the report it was remarked that the custom was very unreasonable, for it laid such a great burden on the land, without any advantage to the tenant, as tended to destroy his estate, and savoured much of arbitrary power; and what was said at the bar touching the public utility of coal-pits could not be considered, because the pits might have been worked without it, and to support the custom would be to take away the whole benefit of the custom. The words "at the will of the lord" did not appear, but such might be understood, because the lord sought to have the power of going upon the land at any time. Several cases have been cited to shew that such custom might be valid, but they had no bearing on the point. In one case the plaintiff had sued in trespass for digging and taking away his land, and the defendant justified in one plea under a custom. The general custom was traversed under the special custom. The defendant pleaded that he had made sufficient compensation. Upon the trial at bar the jury found that the compensation was insufficient. The injury to the foundation was in no way connected with the question. On that trial the greatest reliance was placed on some decisions in which, the custom being derogatory to the rights of the tenant, the original grant could not be maintained. Lord Kenyon had said, if it must be taken to import that a lord after granting rights of common might help himself to any portion, to the exclusion of the grantee, it was incompatible with other cases, and could not be supported. The defendant justified under the usage, and assuredly whatever the lord could reasonably be supposed to have reserved out of his grant consistent with the grant, that usage might be set up; but a claim destructive of the grant could not be set up, it was repugnant and absurd. The custom here pleaded had that destructive effect, and it was too clear to admit of any doubt. The judgment would therefore be for the plaintiff.

The capital of Berlin is about to be enriched with a new cathedral. The designs have been executed by M. Stieler, after the suggestions of the king himself. It will be in the Italian style, and embellished with sculpture and painting. The vaults will be appropriated as a burial-place of the reigning family of Prussia. The estimate of the expense amounts to 33,000,000f.

ASSESSED TAXES CASES.

Determined by the Judges on Appeal.

May 18, 1841.

Windows—Shop.

*A soda-water manufacturer held liable for the window of a shop where ginger-beer, soda-water, corks, &c., were exposed to sale, such shop being partly above and partly below the street, and part of the dwelling-house.*

At a meeting of the commissioners of land and assessed taxes, acting for the division of the town of Cambridge, on the 9th day of November, 1840, the following case was heard and determined (48 Geo. 3, c. 55).

Mr. Thomas Birch, of this town, soda-water manufacturer, appealed against the assessor's charge of eight windows, and contended "that under the Act of 4 Geo. 4, c. 11, s. 1, he was entitled to one as a shop window where goods are exposed to sale, namely, ginger-beer, soda-water, corks, &c.; the room is partly above the street and partly below." He claims the exemption as being the basement story.

The facts of the case are these:—The party manufactures soda-water and ginger-beer in an underground room of his dwelling-house, which in all similar houses is used as a kitchen or wash-house; he is a wholesale vender of the above articles, and not a general retailer, but may occasionally dispose of a bottle of either of the above waters if any person happened to go to his house and requested to be served with a draught of either soda-water or ginger-beer; the selling of the corks spoken of relates to those which are necessarily put into the bottles. The above facts being detailed to the commissioners, they were of opinion that the room used as herein described did not come within the meaning of the Act of Parliament; they therefore confirmed the assessment. The appellant being dissatisfied, demanded a case for the opinion of her Majesty's judges, which we sign accordingly.

SAMUEL EVANS, } Commissioners.  
S. ADCOCK, }

We are of opinion that the determination of the commissioners is right.

J. PATTERSON. J. GURNEY. T. COLTMAN.

Windows—Shop.

*Two windows of a shop of appellant who had retired from business, but in which a small stock remained, and which she continued to sell; such shop being used for no other purpose, no goods being exposed for sale, and the shutters of one of such windows being almost always kept closed:—Held, liable to duty.*

At a meeting of the commissioners of land and assessed taxes, acting in and for the hundred of Arduwyis, held at Llanddwywe, the 21st and 22nd days of August, 1840, for the purpose of hearing appeals against the first assessments (48 Geo. 3, c. 55, sch. A.):—Mrs. Margaret Griffiths, of Barmouth, appealed against a charge for twelve windows. The appellant stated that two out of that number are shop windows, for which she claimed exemption; that she had retired from business, and discontinued shop-keeping for some time, but there being a few trifling things of her stock remaining, such as books, &c. she continued to sell the same; the room is used for no other purpose whatever; that there are now no goods exposed for sale in the said windows, one of which is scarcely ever opened, the shutters thereof remaining almost always closed. The commissioners, conceiving the appellant clearly entitled to an exemption for such windows, by virtue of the 1st section of 4 Geo. 4, c. 11, allowed the appeal, and reduced her assessment to ten windows; but the surveyor having expressed himself dissatisfied with such decision, inasmuch that the appellant had entirely ceased to be a shopkeeper, that there is no external appearance of a shop in passing the house, there being no goods exposed for sale in the said windows, one of which is invariably closed, demanded a case for the opinion of one or more of her Majesty's judges, which is here stated and signed accordingly.

RICHARD DAVIES, } Commissioners.  
DAVID EVANS, }

We are of opinion, that the determination of the commissioners is wrong.

J. PATTERSON. J. GURNEY. T. COLTMAN.

Windows—Shop.

*Appellant was not brought into charge for two windows in a shop, and claimed exemption for one window in a room of his dwelling-house on the first floor and immediately over the shop, in which room drapery goods were kept and exposed for sale, as the 4 Geo. 4, c. 11, grants exemption for three:—Held, chargeable for such one window.*

At a meeting of the commissioners of land and assessed taxes, acting in and for the division of Estmanor, county of Merioneth, held at the White

Hall, Town, the 31st day of August, 1840, for the purpose of hearing appeals against the first assessments (48 Geo. 3, c. 55, sch. A.)—Mr. Robert Edwards, of Aberdeen, draper and grocer, appealed and claimed exemption for one window in a room in his dwelling-house in which drapery goods are kept and exposed for sale. The appellant stated that the shop forms a part of his dwelling-house in front, and on the ground floor thereof; that there are two windows in the same, which were allowed and not brought into charge; that the first section of 4 Geo. 4, c. 11, grants exemption for three windows in any shop or warehouse, being parts of a dwelling-house; he therefore claimed exemption for one other window which is in a room on the first floor immediately over the shop, wherein drapery goods are exposed to sale. The commissioners present demanding the exemption provided by the said Act to extend to and embrace this case, allowed the appeals; but the surveyor submitted that in order to entitle the party to exemption for the said window, it is necessary that the room should be on the ground or basement story, which it appears is not the case in this instance, therefore not exempt from duty, and demanded that the case be stated for the opinion of her Majesty's judges.

Griffith Evans, } Commissioners.  
Edward C. Owen, }  
We are of opinion that the determination of the commissioners is wrong.  
J. PATESON, J. GURNEY, T. COLTMAN.  
—Justice of the Peace.

### Correspondence.

#### MEASURING ROUND TIMBER.

SIR,—I was somewhat surprised to perceive in your last number a correspondent, signing himself "J. M.," calling the attention of your readers to a "blunder of his townsman," in reference to a letter of mine some weeks ago, descriptive of the true method of measuring round timber, and which was written in answer to an inquiry in your last volume into the cause of a discrepancy between two methods of doing it. He calls my attention back to the first part of mathematics, presents us with a very popular but very erroneous method of solution, with his bare assertion that the result is the content, calls it a demonstration, and trusts it will prevent many "committing such gross mistakes."

Permit me respectfully to assure him that I have made no blunder whatever. The blundering (I regret to say) is entirely with himself! and one of the gross mistakes of which he warns others, he has most egregiously committed himself. He has, in fact, fallen into the chief of those errors out of which I endeavoured to rescue your former correspondent, and which endeavour he might have rendered instrumental to his own enlightenment, had he given it the requisite consideration, and a moderate portion of his attention to that part of mathematics to which he calls mine.

He has escaped the error of dividing by 4 for the girth, which brings him something nearer to the truth than your correspondent "L," but the error of measuring in the centre (which in a piece so conical is a monstrous one) has been retained; which keeps him wide of the mark in his result nearly 159 feet.

He directs us to lay down a triangle (he means a *trapezoid*) according to the rules of geometry, and says we can, with precision, find the mean diameter by measuring at 40 feet from the end, that is to say, in the centre. I admit that we can do so, but it is evident, and well known to all mathematicians, that the area of the circle to which that diameter refers is not the mean area, simply because "triangulation," or the methods of superficial mensuration, "will not apply to cube measure." The mean diameter is an *arithmetical* mean between the diameters of the extremes, whereas the thing wanted is a *geometrical* mean between the area of the extremes. It is this I have sought, and by it obtained the true mean or average area, in the method I laid down, and which is applied below, viz.:

$6 \times 47^2 + (72 \times 6) \times 2618 = 1479\text{-}6936$ , mean area in inches; or  $10\text{-}27565$  feet  $\times 80 = 822\text{-}527$  feet, contents of the piece,

Or  
 $(6^2 \times 7854) + (72^2 \times 7854) + \sqrt{(6^2 \times 7854) \times (72^2 \times 7854)} = 1479\text{-}6936$ , Then,  $1479\text{-}6936 \div 3 = 1479\text{-}6936$ , mean area in inches, agreeing exactly with the result of the former methods.

There is another way which might be advantageously pursued in the mensuration of such solids, and by which a proof more obvious to many of the truth of the former ones, will be obtained. It is to compute the contents of the cone of which the given solid is a frustum, and deduct the contents of the smaller cone by which that cone exceeds the frustum. The length of the smaller cone, and consequently of the larger one, may be found in the manner following, viz.:—Let *ab, dc* be the section through the axis or cen-

tre of the frustum; extend the sides *ac* and *bd* until they intersect at *e*, draw the axis *fe*, and also the line *gc*, parallel to *fb*; then are the triangles *agc, che* equiangular, and therefore the side *ag* is to the side *gc* as the side *ch* to the side *he* (Euclid, prop. 4, book VI.); but the length of the three former are known; *ag* is 33 inches, *gc* 80 feet, *ch* 3 inches; therefore as 33 : 80 :: 3 : 7-2727 feet, length of *he*, the axis of the smaller cone.

We have thus the dimensions of both cones, the larger one being 6 feet diameter at the base, and 87-2727 long, the smaller one 6 inches diameter at the base, and 7-2727 long; and to obtain the contents of each, we have only to multiply the area of the base by the height, and divide the product by 3; every cone being the third part of a cylinder of the same base and altitude. (Euclid, prop. 10, book XII.)

Thus for the first cone—  
 $6 \times 6 \times 7854 = 28\text{-}2744$  feet, area of the base; and  $(28\text{-}2744 \times 80) \div 3 = 822\text{-}527\text{-}4296$  feet, contents.

For the second cone—  
 $6 \times 6 \times 7854 = 28\text{-}2744$  inches, or 19635 feet, area of the base; and  $(19635 \times 7\text{-}2727) \div 3 = 475998215$ , contents; leaving  $822\text{-}527\text{-}44745$  feet for the contents of the frustum.

This is a method distinct from the others, and yet it agrees with them in its result, within 0-000256, or about  $\frac{1}{3907}$  of a foot; and it would agree *exactly*, but for the necessary limiting of the places of decimals.

If I am correct, Sir, in these statements (and that I am, no mathematician will deny), you will admit that the error I have endeavoured to refute is a most egregious one, and to the interest of the merchant charging his timber under its influence, a most fatal one. Supposing the price is, per foot, he would, in the piece in question, lose 71. 19s.; and, of course, double and quadruple that sum in the same quantity of the more costly kinds. I should be obliged by the insertion of this communication in your next excellent paper, and remain, Sir, yours very respectfully,

S. HUGGINS.

Liverpool, February 6th, 1844.

SIR,—As a reader of THE BUILDER, your correspondent "J. M." has called my attention to a blunder committed by his townsman in finding the contents of round timber, and has not answered the question proposed, *i. e.* why the three parts measured separately amount to more, by the same method of measurement, than the tree when measured in one; but has merely cautioned me and many others not to commit such gross mistakes, by committing a greater one himself. Had "J. M." worked his proposition rightly, he would have found the method used by him produce the same results; for I find the contents of his two parts taken separately to be 672-007 feet and 110-446 feet, which exceeds the whole, viz. 663-663 feet by 119-791 feet. The discrepancy arises from the area of the section in the middle not representing the mean area throughout the whole length. Your correspondent "L" has measured the tree by the customary quarter-girth method, *i. e.* as a square prism, whose side is the quarter-girth in the middle of the length; by comparing the two following formulae, he will see the section in the centre does not represent the mean area to be multiplied by the length. Let *l* be the

length, *C* the greater quarter circumference, and *c* the less, then  $\frac{C+c}{2}$  will be the centre quarter circumference, and  $\frac{C^2 + Cc + c^2}{3} \times l$ , the solidity of the frustum of a square pyramid, and  $\frac{C^2 + 2Cc + c^2}{4} \times l$ , the solidity, by

customary method; by using the first of these, the tree might have been cut into any number of lengths, and their solidities added together would have been the exact contents of the whole. Your correspondent "J. M." takes the tree as a cylinder whose diameter is the diameter of the section in the middle of the length of the tree, which section does not represent the mean area throughout. Let *l* be the length as before, *C* and *c* the circumference of the two ends, then  $\frac{C^2 + Cc + c^2}{37\text{-}6992} \times l$ , the solidity of the tree as a frustum of a cone, and  $\frac{C^2 + 2Cc + c^2}{50\text{-}2625} \times l$ , the solidity of the tree as a cylinder.

I am, Sir, yours, &c.,

Newman-street, Feb. 9, 1844. R. F. P.

N.B. If you think the above remarks worthy a place in your journal, you will oblige by inserting them, and, perhaps, some of your correspondents will oblige by letting me know where I may cut a tapered plank (whose length is *l*, and breadth of the two ends *B* and *C*) parallel to its ends, so that the two parts may contain each the same area.

#### STUDY OF EUCLID.

SIR,—Having often heard the advantages of a knowledge of Euclid insisted upon, I have for some weeks past given a part of my time to the study of it. I have thus advanced some short way without, I fear, reaping all the advantages which I might had I studied with any definite object in view besides the mere mastering of the propositions, that is, had I known what were the *practical* advantages of the study, and something of its *application* to the profession which I am learning. If, then, Sir, either you or any of your correspondents will be kind enough to give me a little enlightenment upon these heads, they will confer a favour on

Your obedient servant,

F. L. P.

P.S.—I am well aware of its use in expanding the reasoning and calculating powers of the mind; I merely wish to know how the problems are applied in practice in architecture and engineering.

[Proceed, and the knowledge thence resulting will bring the right answer.—Ed.]

#### WESTMINSTER-BRIDGE.

SIR,—In reply to a letter signed "B." in your useful periodical No. 52, with all due respect to the great or *bouncing* B, under which initial I am convinced I do not address the great Barry, the scientific Burgess, the elaborate Basivi, the mechanical Brunel, or the indefatigable *practical* preceptor Bartholomew, the skilful Braithwaite, or, in fact, any of the eminent B.'s of the profession, —I beg merely to state, that I am only "an assistant's assistant" to those who require aid; with this view, I beg to refer that gentleman to the original article which drew forth my remark, in your 50th number, signed "A Practical Observer." By offering this assistance to "B.'s" memory, he will perceive no alteration or embellishment is proposed, until the piers were effectively constructed, or, to use his own words, "been underpinned (despite of the caisson), progressively, to the whole depth required, so as to obtain a sound and substantial foundation on such a stratum as might be relied upon for carrying the most massive erection." By this reference, the great "B." will perceive that it was not by the "Practical Observer" intended as "B." states, "that a pier incapable of supporting an arch of 70 feet span, with its superincumbent weight, would be equal to the support of one of 140 feet span, as proposed;" nor can I believe it to be "in Messrs. Walker and Burgess's wake," that it would be necessary to suggest, as "B." states, "it is manifest that instead of throwing two arches into one," &c., and of course doubling the pressure (if not of higher construction), that "the correct system of procedure would be to increase their number, and reduce the span of the arches, inconveniently narrow as they are." The

advantage of rebuilding this long patched-up bridge, and, I may add, *abruptly so*, is admitted; but the economy of doing so, by reserving the present line of approaches, and the ingenuity displayed by the "Practical Observer," is not the less deserving of emulation; the merit of *finding fault*, or submitting other modes of remedying the present evil, is still open, it is hoped, not only to the great "B.," but the whole alphabet of scientific men, their assistants, and their assistants' assistants' best energies, so as to produce in the reconstruction a work of art and science worthy of this great city. With the fullest assurance of respect to your correspondent "B.," I beg to state in reply to his inquiries, that I am really

A CIVIL ENGINEER of the G. W. R.

## ARCHITECTURAL VOLUTES.

SIR,—Having lately been excessively bothered with Ionic volutes, I think it would greatly benefit not only myself, but a large class of architectural pupils, if you would request some of your correspondents to furnish you with the best methods known to them, and in what works they may be found; or perhaps, if not asking too much, you might find room to assert at least one or two of the best, and I am quite sure it would be conferring a great benefit on the architectural world in general, among pupils in particular. I have tried Nicholson, but find it utterly impossible to attend to the decimals and logarithms in scales so small as these to which most of our drawings are made. I have also tried the volute inserted in the *Civil Engineer and Architects' Journal* for this month, but it is so complex, and so intolerably carelessly described, that it is impossible to make any thing out of it. Wishing long life and success to THE BUILDER,

I am, yours obediently,

AN ARCHITECTURAL PUPIL.

SIR,—I should be greatly obliged if informed through the medium of your valuable journal, which is the best method of hanging sympathetic folding-doors; and whether the proper apparatus is sold by any one.

I am, Sir,

Your well-wisher and constant reader,

J. W. P.

## Miscellaneous.

CURIOUS PHENOMENON.—A good many years since a breast-wall or quay was built at Ardentalan, in Argyleshire, for shipping stones from a quarry at which much work has been done. When Mr. David Smith, builder, at Oban, was erecting the beacon of Skeruvuil, in Jura Sound, for the Northern Lights' Board, he fitted the courses of blocks for that work to their places on the quay, and has occasionally had upwards of 200 tons of stone upon it at a time, without accident. The quarry has lately been worked for the repairs of the Caledonian Canal, and on the 23rd ult. there were between 170 and 180 tons of dressed stones lying upon the quay ready for shipment, when, to the astonishment of the quarriers, the crane upon the quay was observed to move and shake without any visible cause, and some openings appeared at the surface of the quay, which were rapidly widening; the men on the instant cried out for the foreman, who rushed to the spot, and saw the quay, with its crane and the cairn of blocks upon it, moving outwards from the shore, and sinking in the deep water; and in less than two hours the whole had proceeded seaward about 50 yards, and settled with a depth of 11 feet water over them. This quay was 48 yards in length, and had a large space behind for arranging materials for shipment. The face wall was founded one foot under the lowest tide-mark, upon a bed of strong blue clay, covered with a thin stratum of gravel; and at 100 yards from the site of the quay the water deepens to 4 fathoms. It is remarkable, that with much heavier loads, this breast-work should have stood so long without any apparent failure, and after the foundation was so much consolidated, that it should have completely left its site and settled in deep water. The whole mass is now so completely absorbed in mud and clay, that although the height of the quarry and materials could not be less than 20 feet, it has not lessened the depth of water at the entrance of the place.—*Scotsman*.

DESTRUCTION OF HILLINGDON-HOUSE.—Hillingdon-house, the seat of Mr. R. H. Cox, has been destroyed by fire; the bare walls alone are standing. We are happy to learn that nearly the whole of the costly furniture has been preserved, the principal portion uninjured. The whole is deposited in an extensive green-house in the park, in the stables, and at the houses of Mr. Mills and Mr. Greville. The valuable pictures are also safe, as is also the extensive library, the whole of which (seven wagon-loads) were removed to the premises of Mr. Lake, bookseller, at Uxbridge, for the purpose of being cleaned and arranged. The engines continued to work upon the ruins during the night, under the directions of Gerard and Bailey, two of the London Brigade, who were despatched to Hillingdon on Sunday evening, on the intelligence of the fire reaching Mr. Braidwood. From an early hour of the morning until nightfall yesterday, hundreds of persons of all classes visited the ruins, which still emitted volumes of smoke. No portion of the mansion remains but the bare walls, and some portions of the inner ones have fallen during the night, and have forced in the roof of the ale-cellar, which contained nearly 3000 worth of fine ales. Some portion was destroyed by the barrels bursting, but sixteen large double butts were observed amongst the ruins, which appeared to be uninjured. Beyond the ale-cellar is the wine-cellar, which contained a splendid stock of old wines, the whole of which is believed to be comparatively uninjured. All classes of persons unite in expressing a strong and warm feeling of sympathy with Mr. Cox and his family in consequence of the calamity, that gentleman and his lady being highly respected and esteemed throughout the district for their kindness and amiable qualities. The whole of the servants have been great sufferers, having lost all their clothes, money, &c., it having been impossible to save any of the property in the upper rooms. Mrs. Mills has given each of the female servants 2*l.* to enable them to obtain change of linen, &c. Mr. Cox, with the Earl of March, Mr. Mills, and other members of the family, were about the ruins immediately after the fire, engaged in giving directions, &c.

THE NEW PEAL OF TWELVE BELLS FOR YORK MINSTER.—A suggestion from Hull.—In accordance with the munificent bequest of the late Dr. Beckwith, of York, the Minster Restoration Committee have directed an eminent bell-founder (Mears, of London) to complete a peal of twelve musica bells; the tenor bell to be 53 cwt., in the grand key of C. Mr. Thomas Dykes, jun., of Hull, has thrown out a suggestion on the subject, which has been published in some of the York papers. He says—"It has long been my opinion that the bells of York Minster were not in accordance with the dignity of the capital of the largest county in the kingdom, and of the most magnificent cathedral, perhaps, in Europe. The tenor bell of York Minster is C. Let us keep up the honour of the place. C is very well for the parish church of Leeds, but not for the cathedral of York. A peal of twelve bells in A, and the clock bell, or 'Great Tom,' in F, would be an harmonious treat to the inhabitants of York and the circumjacent country. The musical effect of a deep-toned bell cannot be surpassed. Let an inhabitant of York, whose ears have been well saturated with the C of its minster, go to Lincoln and catch the A as it undulates from her Lady Tower. No words can describe the witchery of that tone, or rather combination of tones. Here is a fine specimen of a chord formed by the harmonics; and if so in A, what would be the effect in F? for the deeper the tone, the more perfect the harmonics. I should then recommend a peal of twelve bells in A, with a 'Great Tom' F, or rather, I would say, a peal of thirteen bells in A, one of which should be a half-note, as in the parish church of Leeds, by which arrangement another key-note is gained, and if four of the ringers should be absent, eight might ring in the key of E."

SIR WALTER SCOTT'S MONUMENT AT EDINBURGH.—On Monday last a meeting of the contributors to the intended monument to Sir W. Scott was held in the New Music-hall, Edinburgh, the Lord Provost in the chair. The chairman stated that the object of the meeting was to increase the fund, which had fallen short, chiefly on account of the expense attendant upon a proper preparation of the site, which required to be raised to a level with Princes-street. The height of the monument was designed to be 182 feet—the money in hand would only raise it to the summit of the pinnacles of the abutment towers, 102 feet; thus leaving 80 feet of the upper part unbuilt, to complete which would require 3,000*l.* in addition to the funds already subscribed. Sir T. Dick Lauder then read letters of apology, and remittances towards the object of the meeting, from his Grace the Duke of Buccleuch, 50*l.*; Viscount Melville, 20*l.*; the Lord Advocate, 10*l.*; Mr. M. Innes, 20*l.*; the Earl of Stair, 10*l.* 10*s.*; Mr. Campbell, of Blythswood, 10*l.* 10*s.*; and from Lord J. Stewart, Mr. G. Trail, M.P., Mr. Ramsay, of Barnton, M.P., &c. Professor Wilson, in a most eloquent speech, moved the first resolution. An enthusiastic spirit pervaded the meeting, and there is little doubt of the necessary funds being raised almost immediately. Upwards of 500*l.* was subscribed before the meeting broke up.

CANAL BETWEEN THE MEDITERRANEAN AND THE ATLANTIC.—A project has been brought forward for cutting a "canal of the Pyrenees," to connect the Mediterranean with the Atlantic, and avoid the circuitous route by the coast of Spain. The plan, as it at present stands, was first matured by M. Calabert, member of the French Chamber of Deputies. The French legislature granted to a company that was to carry it into execution the property in perpetuity in the canal, with several other advantages, but required a deposit of 3,000,000*fr.* until the act was passed. The subscriptions were completed, and the company was in active operation. In consequence of this deposit not having been made, the grant has remained subject to forfeiture; but, nevertheless, the scheme has not been abandoned, and the notion exists of raising capital in England. There is no occasion to enter at present into a subject which is so far from mature, but it is as well to remark, that the particulars up to the present time are contained in a pamphlet written by Mr. Bush.

RAPID INCREASE OF POPULATION IN MANCHESTER.—It would scarcely be credited, at the first avowal, that the population of this town has increased more than eleven-fold within living memory, were not the fact easy of proof. The Rev. William Turner, formerly of Newcastle, but now a resident of Manchester, in speaking on a recent occasion of the interest he took in the welfare of this town, said that when he first knew it, it had a population of not more than about 27,000 individuals! In the year 1778, there was a sort of census, not an estimate, but an actual enumeration of the inhabitants of Manchester and Salford, in short of all that is classed under the general name of Manchester, and the numbers were stated to be 27,246. By the official census, in June, 1841, the numbers of the same aggregation of buildings were upwards of 308,000, an increase of more than eleven times that of the year 1778.—*Manchester Guardian*.

BATH.—The consecration of the cemetery at Lyncombe was solemnized last week by the Right Rev. the Lord Bishop of Salisbury. Nature seems to have marked this secluded site for the very purpose to which it is now happily dedicated. The carriage-road, diverging from the public thoroughfare to Prior Park, by a gradual and easy ascent, sheltered by majestic elms, terminates in an edifice of the purely Anglo-Norman style of architecture, in front of which there is a spacious area, commanding one of the finest views of the city of Bath, embracing a *coup-d'œil* of the public buildings, squares, parades, crescents, and masses of building, more perfect than can be obtained from any other point. The soil is rich, but not deep, resting on a substratum of crumbling oolite, in every respect suitable for a cemetery.—*Bath Gazette*.

**ATHENS AS IT IS.**—We see Athens in ruins. On the central rock of the Acropolis exist the remains, in a mutilated state, of three temples—the Temple of Victory, the Parthenon, and the Erechtheum; of the Propylea in the same place; at its western entrance, some walls and a few columns are still standing; of the theatre on the south side of the Acropolis, in which the dramas of Æschylus, Sophocles, and Euripides were represented, some stone steps remain. Not a vestige survives of the courts in which Demosthenes pleaded. There is no trace of the academic porches of Plato, or of the Lyceum of Aristotle. The pæcile of the Stoics has vanished; only a few stones of the long walls which run along the plain and united Athens with its harbours are yet visible. Even nature herself appears to have undergone a change. The source of the fountain Callirhoe has almost failed; and the bed of the Illissus is nearly dry; the harbour of the Piræus is narrowed and made shallow by mud. But while this is so, while we are forcibly and mournfully reminded by this spectacle of the perishable nature of the most beautiful objects which the world has seen, while we read in the ruins of those temples of Athens, and in the total extinction of the religion to which they were dedicated, an apology on behalf of Christianity, and a refutation of paganism, more forcible and eloquent than any of those which were composed and presented to the Roman emperor by Aristides and Quadratus in this place; we are naturally led by it to contrast the permanence and vitality of the spirit and intelligence which produced these works, of which the vestiges either exist in a condition of ruinous decay, or have entirely disappeared, with the fragility of the material elements of which they are composed. Not at Athens alone are we to look for Athens. The epitaph—"Here is the heart; the spirit is everywhere"—may be applied to it. From the gates of the Acropolis, as from a mother-city, issued intellectual colonies into every region of the world. These buildings now before us, ruined as they are at present, have served for two thousand years as models of the most admired fabrics in every civilized world. Having perished here, they survive there. They live in them as in their legitimate offspring. Thus the genius which conceived and executed these magnificent works, while the materials on which it laboured are dissolved, has itself proved immortal. We, therefore, at the present time, baving witnessed the fact, have more cogent reasons for admiring the consummate skill which created them, than were possessed by those who saw these structures in their originality, glory, and beauty.—*Wordsworth's Greece.*

**ANCIENT RUINS.**—We have been informed by a gentleman who has traversed a large portion of the Indian country of Northern Texas and the country lying between Santa Fe and the Pacific, that there are vestiges of ancient cities and ruined castles or temples on the Rio Puerco and on the Colorado of the West. He says, that on one of the branches of the Rio Puerco, a few days' travel from Santa Fe, there is an immense pile of ruins that appear to belong to an ancient temple. Portions of the wall are still standing, consisting of huge blocks of limestone, regularly hewn, and laid in cement. The building occupies an extent of more than an acre. It is two or three stories high, has no roof, but contains many rooms, generally of a square form, without windows, and the lower rooms are so dark and gloomy that they resemble caverns rather than the apartments of an edifice built for a human habitation. Our informant was unable to describe the style of architecture; but he believes it could not have been erected by Spaniards or Europeans, as the stones are much worn by the rains, and indicate that the building has stood several hundred years. From his description we are induced to believe that it resembles the ruins of Palenque or Otulun. He says there are many similar ruins on the Colorado of the West, which empties into the Californian Sea. In one of the valleys of the Cordilleras traversed by this river, and about 490 miles from its mouth, there is a large temple still standing, its walls and spires presenting scarcely any trace of dilapidation, and were it not for the want of a roof, it might still be rendered habitable. Near it, scattered along the declivity of a mountain, are the ruins of what must have been once a large

city. The traces of a large aqueduct, part of which is, however, in the solid rock, are still visible. Neither the Indians residing in the vicinity, nor the oldest Spanish settlers of the nearest settlements, can give any account of the origin of these buildings. They merely know that they have stood there from the earliest periods to which these traditions extend.—*Texas Telegraph.*

**IN THE REIGN OF EDWARD III., THE WAGES** paid to a master carpenter were at the rate of 3d. a day, other carpenters 2d. A master mason 4d. per day, other masons, 3d.; and their servants, 1½d. a day. Tilers, 3d., and their *knaves*, 1½d. Plasterers and other workers of mud walls, in like manner, without meat or drink, and this only from Easter to Michaelmas; during the remainder of the year a reduction was made, according to the direction of the justices. These wages were increased in the year 1445, reign of Henry IV., to a master mason or carpenter, 4d. a day, or without meat or drink, 5½d. Master tiler or slater, mason, or mean carpenter, and other artificers concerned in building, 3d. a day, or without meat or drink, 4½d. During the reign of Henry VII., there was a like rate of wages, but with a slight advance; for instance, a master carpenter, mason, hricklayer, master tiler, plumber, glazier, carver, and joiner, were each allowed from Easter to Michaelmas to receive 4d. a day, or without meat or drink, 6d.; but from Michaelmas to Easter they were to abate one penny. A master having six men under him was allowed one penny a day extra.

### Tenders.

**TENDERS** delivered for erecting two houses at Stockwell Common, for F. Dansey, Esq.—William Rogers, Esq., Architect:—

Hayward and Nixon .....	£2,754
Notley .....	2,496
Taylor .....	2,489
Gerry .....	2,439
Wilson .....	2,394

**TENDERS** for erecting Coal Stores at Ben Jonson's Fields, Stepney, for the Commercial Gas Company:—

J. and J. Ward .....	£419
Gerry .....	450
Cooper and Davis .....	459
Ibbett .....	473
Kempster .....	480
Blackburn .....	499
Burtenshaw .....	535

### NOTICES OF CONTRACTS.

**TENDERS** for a HYDRAULIC PUMP and APPARATUS for PROVING PIPES.—Directors of the New Gas Company, Aberdeen. Feb. 19.

**TENDERS** for TWO GAS HOLDERS.—Directors of the New Gas Company, Aberdeen. Feb. 19.

**WEST LONDON RAILWAY.**—Contract for Four fixed five-ton Cranes, and three portable three or four-ton Cranes.—Mr. John Thompson, Secretary. Feb. 20.

**WORKS REQUIRED FOR THE NEW FISH MARKET, GREAT YARMOUTH.**—Plans, &c. to be seen on application to Mr. A. T. Tillett, Architect, King-street, Great Yarmouth; Town Clerk. Feb. 21, 1844.

**YORK AND SCARBORO' RAILWAY.**—Tenders for 60,000 Larch and Memel Sleepers.—Secretary of the York and North Midland Railway Company. Feb. 21.

**BUILDING A COUNTY LUNATIC ASYLUM AT LITTLEMORE, OXFORD.**—Plans, &c., at Mr. R. Clarke's, Architect, Clinton-street, Nottingham, or at the Office of the Clerk of the Peace, Oxford.—J. M. Davenport, Clerk of the Peace. February 22, 1844.

**CONTRACT** for Building an Infants' School-Room, near St. John's Church, Bury St. Edmunds.—Rev. Robert Rashdell. March 1.

**BRIDLINGTON PIERS AND HARBOUR.**—Erection of a new south pier, removal of present pier, and other works for enlargement of Harbour.—Plans and Specifications at the Office of Mr. Sidney Taylor, Solicitor, Bridlington. March 1, 1844.

**PARISH OF ST. GEORGE, HANOVER-SQUARE.**—Contract for Workmen's Tools and Hammers, Iron Lamp Posts and Gas Fittings, and for keeping in order the garden in Hanover-square, for one year from the 25th March. R. Lees, Clerk, Board Room, Mount-street. March 6.

**PARISH OF ST. GEORGE, HANOVER-SQUARE.**—Contract for Masons' and Pavions' Work, and supply of Guernsey Granite Chippings, and Yorkshire Paving, for one year from the 25th March.—Mr. R. Lees, Clerk, Board Room, Mount-street. March 6.

**CONTRACT** for Removing present Wooden Turret, and erecting a Stone Turret in lieu thereof, with other works, at Preston Hospital, near Wellington, Slop.—Plans, &c., E. Haycock, Esq., Architect, Shrewsbury, or at Mr. Potter's, Bridgman-place, Walsall. March 9, 1844.

### COMPETITION.

**PREMIUM** of 20 guineas for the best plans and estimates for erection of a new gaol, Banbury.—All information may be obtained on application to the Town Clerk. March 1, 1844.

### TO OUR CORRESPONDENTS.

"C. H. S."—*The drawing of the mantel piece has been received, but we request the favour of being furnished with correct details of the carvings, &c. on a larger scale, before our engraver can commence.*

"I. K. L."—*The sketch of the window has been received, and will appear in an early number.*  
*The interesting communication of "M. R. I. B. A." has been received, and the diagrams have been placed in the hands of our engraver.*

"A. B."—*We are unable, at present, to answer the inquiries of our correspondent, relative to the Cleudinian Testimonial, to be erected at Westport. Perhaps some of our friends in Ireland can inform us whether the design has been selected and arrangements have been made for its completion, or if the time for sending in designs has been extended. In an announcement which appeared at page 465 of our first volume, the 1st of January, 1844, was the day named for the purpose.*  
*The letter of "O. P. Q." came too late for answer this week.*

### MEETINGS OF SCIENTIFIC BODIES,

To-day and during the ensuing week.

**SATURDAY, FEB. 17.**—*Asiatic*, 14 Grafton-street, 2 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.

**MONDAY, 19.**—*British Architects*, 16, Lower Grosvenor-street, 8 P.M.; *Chemical Society of Arts*, Adelphi, 8 P.M.; *Medical*, Bolt-court, Fleet-street, 8 P.M.; *Statistical*, 11, Regent-street, 8 P.M.

**TUESDAY, 20.**—*Linnean*, Soho-square, 8 P.M.; *Horticultural*, 21, Regent-street, 2 P.M.; *Civil Engineers*, 25, Great George-street, 8 P.M.; **WEDNESDAY, 21.**—*Society of Arts*, Adelphi, 8 P.M.; *Geological*, Somerset House, 8½ P.M.; *London Institution*, Finsbury-circus, 7 P.M.

**THURSDAY, 22.**—*Royal*, Somerset House, 8½ P.M.; *Antiquaries*, Somerset House, 8 P.M.; *Royal Society of Literature*, 4, St. Martin's-place, 4 P.M.; *Medico-Botanical*, 32, Sackville-street, 8 P.M.; *Naturalist*, 41, Tavistock-street, Covent Garden, 7 P.M.

**FRIDAY, 23.**—*Royal Institution*, Alhambra-street, 8½ P.M.; *Philological*, 49, Pall Mall, 8 P.M.

**SATURDAY, 24.**—*Royal Botanic*, Regent's-park, 4 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.

**BRITISH MUSEUM.**—Open to the public every Monday, Wednesday, and Friday, from 10 till 7 during May, June, July, and August, and from 10 till 4 the rest of the year; except the first week in January, May, and September, Ash-Wednesday, Good Friday, and Christmas Day, and Fast or Thanksgiving Days. *The Natural History Collections* are open for study and comparison of specimens, to persons having permission, on Tuesday and Thursday from 10 till 4. *The Reading Room* is open to persons having tickets of admission every day (except Sundays, and when the Museum is closed, as above mentioned), from 9 till 7 in May, June, July, and August, and from 9 till 4 during the rest of the year. *The Gallery of Antiquities* is open to students having tickets every day in the week, except Saturdays and Sundays (and those times when the Museum is closed), at the same hours as the Reading Room.

**ROYAL COLLEGE OF SURGEONS.**—The Museum is open to visitors on Monday, Tuesday, Wednesday, and Thursday, from 12 till 4, except during the month of September; on Friday to gentlemen for studying in it; and on Saturday from 10 till 1 to gentlemen desirous of comparing specimens with those in the Museum. The Library is open to members and students of the college, and visitors having tickets of admission, daily (Sundays excepted), from the 1st of October to the 1st of April, from 10 till 4; and from the 1st of April to the 1st of September, from 10 till half-past 5.

**LINNEAN SOCIETY.**—Library open on Monday, Tuesday, and Thursday, and the Museum on Wednesday and Friday, from 12 o'clock to 4 in the afternoon.

# The Builder.

NO. LV.

SATURDAY, FEBRUARY 24, 1844.

RARELY is any work perfected at first: few that are not endued with an extraordinary quantity of that kind of mental, nervous, and muscular ballast, in the short-hand of common parlance termed simply *gravity*, could, on perusing another iteration of such a truism, remain without a smile at receiving such a lesson, or perhaps the ironical ejaculation of a "thank-ye for the information;" and yet no truism is more frequently forgotten in the affairs of life. In almost every business and transaction, some one forgetting such an old saw and its right use, and remembering not his own trespasses, for the forgiveness of which he daily prays, begins cutting away at his neighbour or friend, because some trivial error may have been fallen into, some change of plot may have become necessary. In violation of the retention of judgment which a good and talented man should ever hold in all his transactions, we have had this week sent to us drawings of a fabric, the iron-work of which during its construction was somewhat altered from the original design for it, so as to run into the mould, and be delivered perfect and without fracture, from the volume of metal in different parts of the work being adjusted to cool about the same time, and so prevent that rigidity in the thinner parts of the work which must give way by snapping at the parts of the work which obtain mastery over them by their condensation as they solidify and lose their heat. We have no objection to insert in this periodical all obtainable information relative to the arts connected with architecture and building; and if our correspondent will send us a drawing, shewing to a larger scale sections of this work as at first designed, and as eventually executed, with mere plain statements of the facts, without any observations, which we think if published would not only be subversive of that good and gentlemanly Freemasonry which should subsist among all members of the building, architectural, and engineering community, but a positive actionable libel—we should take pleasure in inserting such a contribution. Every one must admit the propriety of our correspondent's observations, that "It is of the utmost importance that engineers should well consider and digest their plans before they place them in the hands of the operative department; as any error or failure is generally attended with delay to the works, additional expense to the contractor, and reflects any thing but credit on their skill and professional reputation."

But, because a professional man in making a new design may not exactly see the end in every minute matter; may have made a slight oversight (as a general sometimes does at the cost of the lives of a hundred thousand men, and, perhaps, the glory—perhaps, the political existence—of his nation), it does not

follow that some person connected with the work, who possibly might have himself committed greater errors, should volunteer anonymously to be the accuser; albeit he may declare, "although the publication of such palpable error must be very galling to the feelings of those connected with the works, still, for the benefit of the professional community, it is necessary it should be made known; so that they may avoid the rocks their more careless coadjutors have foundered on."

Now there are many modes of imparting precept for the benefit of others without galling any one: if contractors are to suffer through misdirection, that error will soon be cured; if they can obtain no other redress, the courts of law are open to them, and we opine few directors of works who are in fault, would allow any ease to go there, but would tender such amends as an affair required.

We beg to draw our correspondent's notice to the following good and wholesome law of the *Free-Masons of the Church*, in which we heartily concur:—

"That all members of the college shall abstain from personal altercation with each other, and from all public depreciating strictures, either by speech or writing, upon each other's works, knowledge, and talents; but shall endeavour, in all possible ways, to impart kindly and fraternally each to other whatever knowledge they may possess, (except in every such secret matter as could not be divulged without breach of trust,) so as to produce a kindly community of the most advanced science, knowledge, and experience, and in order that the college and each professional member may alike gain honour, strength, and revenue, by the efforts of all unitedly tending to that end, each member of the college always bearing in mind that he is 'a brother of the Free-masons of the Church,' and therefore of the high calling of a Christian gentleman, which title he would forfeit if acting otherwise."

Such a law we are convinced will have a great effect upon the science and conduct of architecture and its practitioners. We believe science works silently as galvanism, little seen, little understood, by the multitude, yet powerfully. Weak minds alone are afraid of its thunders; but much personal unhappiness may be caused by the snappishness and unguarded remarks of the sour-tempered and virulent, who are ever descending from the grand and patriotic design of general reformation and general good to petty waspish stinging.

We now turn to another subject, emanating from the same cause as that to which we primarily alluded, viz., the imperfection of first workmanship.

We mean the new Bill relative to metropolitan improvements, lately brought by the Earl of Lincoln and Sir Thomas Fremantle into the House of Commons and on the second day of this month, ordered to be printed. We shall close this article by presenting to our readers a copy of the Bill in question; but before doing so, we beg to say, after making all due allowance for the frequently inevitable imperfections and incompleteness of acts and measures, resulting from official persons having often over-much to do, and for the delays arising from the jarring of contending interests, that a necessity for a species of compensation has thence arisen. We have watched attentively for years the injury to particular property accruing from the long precursive rumours of intended improvements, their partial performance, their hanging half done, the waiting for additional powers, the stagnation arising from obtaining new Acts of Par-

liament to amend explain and enlarge former Acts; new applications for monetary clauses, for the amendment of pure oversights contradictions and ambiguities; the tenants in the mean time leaving, leases running out, and no one willing to tenant afresh the estate. We have observed in one district alone dozens of houses fall to ruin during a twelve-years' abeyance of this kind. We know one long court, crossing a proposed new public avenue, where the tenants first went; then the materials of the houses went; and, were it possible, the very soil of the estate would go too—sportive boys plucking away every brickbat found imbedded in it.

Surely wherever any corporate or other body, by mooted any project of the kind, and then leaving it, occasions, or has occasioned, any such evil, there should be some power for the redress of the pecuniary damages thence resulting.

elp.

*A Bill to enlarge the Powers of an Act of the Fourth and Fifth Years of her present Majesty, empowering the Commissioners of Her Majesty's Woods to raise Money for certain Improvements in the Metropolis, on the Security of the Land Revenues of the Crown, within the County of Middlesex and City of London. 7 VICTORIA.*

WHEREAS, by an Act passed in the Session of Parliament holden in the fourth and fifth years of the reign of her present Majesty, intitled, "An Act to empower the Commissioners of her Majesty's Woods to raise Money for certain Improvements in the Metropolis, on the Security of the Land Revenues of the Crown, within the County of Middlesex and City of London," it was enacted, that it should be lawful for the Commissioners of her Majesty's Woods, Forests, Land Revenues, Works, and Buildings for the time being, and they were thereby authorized and empowered, by and with the consent and approbation in writing of the Lord High Treasurer, or of the Commissioners for executing the office of Lord High Treasurer of the United Kingdom, or any three or more of them, notwithstanding any provisions, restrictions or clauses contained in any Act or Acts of Parliament relating to her Majesty's Land Revenue, from time to time to borrow and take up at any rate of interest not exceeding Five Pounds per centum per annum, and on such terms and conditions as they should think proper, such sum or sums of money as the said Commissioners, with such consent and approbation as aforesaid, should judge necessary for the purpose of carrying into effect and completing the several improvements and new streets authorized and directed to be made by them by the several Acts therein recited or referred to, on mortgage of all or any part or parts of the houses, buildings, lands, tenements and hereditaments of or belonging to her Majesty, her heirs and successors within the county of Middlesex and city of London, or either of them (other than Royal Palaces and Parks), and for securing the repayment of the sum or sums so to be borrowed, or any part or parts thereof, with interest for the same, with such consent and approbation as aforesaid, to grant, demise or mortgage all or any part or parts of the same houses, buildings, lands, tenements and hereditaments respectively unto any person or persons, body or bodies corporate, who should lend and advance such sum or sums of money respectively, his, her or their heirs, executors or administrators, successors or assigns, or to whom he or they or any such body should appoint for any term of years, so that every such grant, mortgage or security were made with a proviso or condition to cease and be void when such sum or sums of money thereby to be secured, and the interest thereof, should be fully paid and satisfied:

And whereas doubts are entertained whether the said recited Act extends to empower the Governor and Company of the Bank of England and certain other Public Companies and Corporations to advance and lend moneys to the said Commissioners on the security of the said Land Revenues of the Crown, the said Governor and Company of the Bank of Eng-

land and other Public Companies and Corporations not being expressly named and empowered in and by the said recited Act; and it would facilitate the raising of such monies if such doubt were removed;

1. *Bank of England and other Corporations empowered to lend on Mortgage of the Land Revenues.*—BE IT THEREFORE ENACTED, by THE QUEEN'S most Excellent MAJESTY, by and with the Advice and Consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the Authority of the same, THAT it shall be lawful for the Governor and Company of the Bank of England, and for any person whomsoever, and any bodies politic or corporate or companies whatsoever, to advance and lend from time to time to the Commissioners for the time being of her Majesty's Woods, Forests, Land Revenues, Works and Buildings, any sum or sums of money, or any part or parts of the capital, or other monies or funds of or belonging to such Governor or Company, person or persons, bodies politic or corporate or companies respectively, which the said Commissioners, by and with the consent and approbation in writing of the Lord High Treasurer or the Commissioners for executing the office of Lord High Treasurer of the United Kingdom, or any Three or more of them, shall from time to time judge necessary for the purpose of carrying into effect and completing the several improvements and new streets authorized and directed to be made by them by the said several Acts in the said recited Act of the fourth and fifth years of her Majesty's reign recited or referred to, on mortgage of all or any part or parts of the houses, buildings, land, tenements and hereditaments of or belonging to her Majesty, her heirs and successors, within the county of Middlesex and city of London, or either of them (other than Royal Palaces and Parks), so as that all such loans be made with the approbation of the said Lord High Treasurer, or Commissioners for executing the office of Lord High Treasurer, or any Three or more of them, to be signified by his or their warrant or warrants for that purpose, notwithstanding any thing contained to the contrary in an Act passed in the fifth and sixth years of the reign of their late Majesties King WILLIAM and Queen MARY, intituled, "An Act for granting to their Majesties several Rates and Duties upon Tonnage of Ships and Vessels, and upon Beer, Ale and other Liquors, for securing certain Recompenses and Advantages in the said Act mentioned to such persons as shall voluntarily advance the sum of One million Five hundred thousand Pounds towards carrying on the War against France," or in any other Act or Acts.

2. *Commissioners of Woods Incorporated, and Powers of Recited Act Extended to this Act.*—And be it Enacted, That the Commissioners for the time being of her Majesty's Woods, Forests, Land Revenues, Works and Buildings shall be and they are hereby constituted a corporation for the purposes of this Act, as well as for the purposes of the said recited Act of the fourth and fifth years of her Majesty's reign, and may have such seal as in the said recited Act is mentioned; and that all and singular the powers, provisions, exemptions from stamp duties and enactments in the said recited Act contained, with respect to moneys borrowed and mortgages made under the authority of the said recited Act, and the application of such moneys, shall, so far as the same are applicable, extend to all moneys to be borrowed and mortgages to be made under the authority of this Act; and that all sum and sums of money which by the said recited Act are made applicable to the repayment of moneys borrowed on the credit of the Land Revenues of the Crown, under the powers and provisions of the said recited Act, and the interest thereof, shall equally be applicable and be applied in repayment of any sum or sums of money which may be borrowed on the credit of the Land Revenues of the Crown, under the powers and provisions of this Act, and the interest thereof.

3. *Commissioners of Woods Empowered to Lease, notwithstanding Mortgages.*—Provided always, and be it Enacted, That it shall and may be lawful for the Commissioners for the time being of her Majesty's Woods, Forests, Land Revenues, Works and Buildings, in all respects to make and grant such leases, and

agreements for leases, and to accept a surrender of any lease or leases granted, or to be granted, of any hereditaments comprised in any mortgage made, or to be made, in pursuance of the said recited Act passed in the fourth and fifth years of the reign of her present Majesty, or of this Act, and on any such surrender to grant any other lease, or separate leases, of the hereditaments so to be surrendered, for any term which they are or may be authorized to grant, in all respects whatsoever as they could have done if such mortgage or mortgages had not been made, and the said last-mentioned Act and this Act had not passed, so as the rent to be reserved in respect of any hereditaments to be comprised in any new lease to be made in pursuance of any surrendered lease be not less in amount than the rent which was reserved by the surrendered lease, or when more than one lease shall be granted of any hereditaments comprised in a lease which shall have been surrendered, so as the aggregate amount of rents to be reserved by the separate leases shall not be less in amount than the rent reserved by the lease so surrendered.

4. *Saving Rights of Distress, and Entry of Mortgagees.*—And be it Enacted, That the person or persons, bodies or body to whom any such mortgage as aforesaid has been or shall be granted, shall (in respect of such leases so to be granted, and during the continuance of such mortgage securities) have such and the same powers of distress, entry or otherwise, for the recovery of the rents, by any such leases so to be granted, reserved, and shall have the full benefit of the covenants in such leases to be contained, and on the part of the lessees to be performed, as they would have had if they had been parties to such leases, and the rents and rights of distress and entry had been reserved to them, and the covenants entered into with them in all respects whatsoever, but not so as to give any subsequent mortgagee any right or priority over the prior mortgagee.

5. *Act may be Amended or Repealed this Session.*—And be it Enacted, That this Act, or any part thereof, may be amended or repealed by any Act to be passed in the present Session of Parliament.

#### THE "TIMES," MR. BOWEN, AND JOINT-STOCK BUILDING-SOCIETIES.

AN anonymous pamphlet, entitled, "Building-Societies and their Traducers," has been published by Messrs. Whitaker & Co., of Chancery-lane, containing a copy of the article which appeared in the *Times* paper, and inserted in our 50th No., with a reply thereto, sent to the *Times* for insertion, but which has not appeared in that journal. As the subject is so important, and should be fairly stated to the public in all its bearings, we here copy the whole of the reply, which is as follows:—

"**STR.**—The article which appeared in your paper of Friday last, on the subject of these societies, seems open to very considerable objection. If they are contrivances of 'ravenous capitalists for transferring into their own pockets the little savings of the frugal poor,' so base and heartless a combination should be opposed by every honest man, and searchingly and truthfully investigated by every able one. In this case, however, your notice, instead of assisting, would prejudice the desired object, inasmuch as the nature of a Building-Society is so unfairly and insufficiently stated, that any man of ordinary understanding and knowledge of the subject would justly consider that the conclusions arrived at from such statements are very different from what they would, or could have been, had the facts been more fully and impartially disclosed. No such man, therefore, would be deterred from becoming a victim to the 'ravenous capitalists.' If, on the other hand, these societies may be beneficial to a number of prudent people amongst the middle classes (and to such *only* do they peculiarly address themselves), your notice will do harm, for it will very likely prevent many timid and uninformed persons from joining the societies. I do not pretend to determine under which of those descriptions the Building-Societies ought to be ranked. I have an interest, however, in common with many hundreds of others in London alone, that the question should be rightly determined without loss of time. Being merely a member, a shareholder

in one such society, and holding no office of any kind therein, being, in fact, one of the plundered, if your statements be correct, I have no interest or inclination whatever to attempt bolstering up the designs of sharpers, upon the hard-earned savings of the honest and industrious.

"Having, however, taken considerable trouble to inform myself of the nature and objects of the society, both before and since becoming a member, I must say that nothing can be further removed from even the appearance of collusion, partiality, or injustice, than all the proceedings have uniformly been. Of course, notwithstanding this, I may be deceived, and the society may be a mere job after all; and, if so, it would be an act of real benevolence on the part of any one of the many able actuaries or accountants in this metropolis to step forward and demonstrate in the columns of your extensively circulated paper, that the objects contemplated, and the prospects held out by these societies, are not within the compass of reasonable probability. Such a proceeding would have a very different effect upon the minds of thinking men, from what your notice on Friday can be expected to produce. As I have often observed much space devoted, and great talent well applied, in your influential paper, to the exposure of public abuses, and to the correction of public error and prejudice, I would earnestly solicit a thorough investigation of this subject, so important to many of the industrious and frugal in all parts of the kingdom. This investigation, however, can only proceed, or be brought to a satisfactory termination, by the whole nature and objects of the societies being impartially stated, and then shewing, by suitable calculations, that they (the societies) are, as asserted or insinuated by you, mere jobs for defrauding the credulous and ignorant. *This has not yet been PROVEN*, until it be, there should not be any unnecessary calling of hard names. If it be not proved, I am afraid your notice on Friday can only be considered as a very garbled statement, mixed with a pretty free sprinkling of gratuitous abuse. I have no small share of respect for many of your sentiments and decisions, but the mere circumstance of even your stigmatising the societies as 'swindling bubbles,' 'self-evident marcs' nests,' conducted by 'sleight-of-hand and legerdemain,' would not deter me, or any reasonable man, from exercising our own judgment on the matter, as far as you have furnished us with the means in the article which has occasioned this communication.

"In inference to that article, and to my assertion, that the nature of a Building-Society is unfairly and insufficiently stated therein, I beg to offer the following remarks, solely with a view to elicit from some competent person such a fair and candid statement and calculation as will finally settle the question:—

"1st. It appears incorrect to assert that the society 'does not profess to trade with its money, so that all the advantage it gives is simply derived from the money, as it passes within itself from one side of the society to the other,' and that 'if the borrower is benefited, it must be at the expense of the lender.' As I understand the societies, however they may differ in some respects, they all agree in this, that the *only* condition upon which they will advance money to any member is, that he *does immediately* trade with it, that is, that he does immediately purchase some freehold, copyhold, or long leasehold property with the money so advanced, and deposit the title-deeds with the society, as a security for the regular monthly payment, for ten years, of certain sums of money, previously agreed upon at an open meeting of the members. Of course, if so disposed, he may go on further to trade, by selling his property at a profit (if shrewd or lucky enough to have made a good purchase), or he may retain it for his own occupation, or otherwise remain satisfied with the success of his first trading. Now this seems to me to be so important a feature of the societies, that it cannot be brought too strongly into light, in comparison with the statement that all the advantage they give 'is simply derived from the money passing within itself.' Why, the fact is just the contrary! The advantage is derived from the money passing out of 'itself' into the hands, probably, of builders, and others who, from whatever causes, may have cheap houses to sell, and who have a hundred ways of trading with, and turning such

ready money to account, so as to make, no doubt, very sufficient profits, and suit their own purposes better than keeping the houses. The persons *taken advantage of in some such transactions* may possibly be those whose misfortunes compel them to dispose of their property greatly below its value; but with this the society has nothing to do; the same thing would occur whether the purchase fall in the way of a member of the society or any other person; although it is undoubtedly by means of such trading, and such advantageous purchases, that the society expects, in an indirect way, to realize in some degree the promised benefit to the whole of its members.

"Well, then as to the arranged payments, these begin to come in to the society from the borrower, by *monthly* payments, and the society is very soon again in a condition to supply ready money to the members, whose observation may have been stimulated, so as to be on the alert for a purchase, sufficiently advantageous to warrant them in taking up money on the terms offered by the society.

"So that, in fact, the main principle of the society, during the principal part of its existence, is not to have the money '*within itself*,' or to allow it to be foolishly 'passing from one side of the society to the other,' but to circulate it amongst the trading and enterprising, *not being members of the society at all*, and who, but for such means, might never have had the opportunity of trading with and turning it to advantage.

"2ndly. It seems very unfair to place in juxtaposition the two classes of 'rich capitalists' and 'poor borrowers,' as the description of persons respectively lending and borrowing money in these societies. It is extremely questionable whether a single member, in several such societies I could name, can be correctly described as belonging, in fact, to either class. They are generally speaking all of one, the middle class, voluntarily combined for the purposes of profit, by means of a purely trading principle, and apparently to the advantage of all, at least very much to the general satisfaction, for they pay their hundreds of pounds per month, with the cheerfulness of men who knew what they were about, and whose minds were made up as to the result.

"As to the assertion that the society is a '*swindling felo de se*, contradicting itself, and cutting its own throat,' those terms are simply surplussage, of a rather coarse kind; at best they only apply to what is an entirely incorrect description of the societies in a very important particular.

"3rdly. With regard to the deduction from the ultimate value of each share, to which parties are willing to submit, in consideration of an immediate advance,—it should, in the first place, be considered that persons do not, *cannot*, take up money from these societies, for any 'pressing necessities'; and that it must indeed be a very singular 'recklessness,' a very indescribable kind of 'despair,' that induces a man to submit to a 'ruinous loss' in order to buy a house that he need not buy unless he chooses. It should also be considered that men are generally (when not pressed by any urgent necessity) pretty good judges of their own concerns, and know very well whether or not it will suit them to submit to a reduction of 65*l.* or 50*l.* for any specific purchase they wish to make,—for the difference between those two sums is not, as stated by you, 'all the difference as to the advantageousness of the terms to the borrower.' The real question with him is, whether or not the *object* for which he takes up the money is worth his submitting to the highest deduction. If it be, he will take up the money; if not, he will leave it alone. Of course a man may make a bad purchase, or an imprudent or injudicious investment; but he would not be more likely to do so in trading with money borrowed from the society than in trading or purchasing under any other circumstances. He would be rather less likely, on account of the absolute necessity of making the profits of such purchase or investment materially assist his payments to the society. It may be very fairly doubted whether any of the members of these societies are so very 'inexperienced, sanguine, or needy,' as to be induced to 'bid one against another,' for the purpose of obtaining and laying out a sum of money upon an investment, the probable returns of which they have not tolerably well calculated. It is altogether

a matter of business amongst them; there is very little 'recklessness,' 'despair,' 'ignorance,' or 'misfortune' in the matter.

"Lastly, the statements and calculations published by you, by which you state Mr. Bowen 'makes the hedgehog unroll itself,' are objectionable on two grounds. The statements are not all true, and the calculations are far from clear. The statement you make that 'so far from Mr. Bowen's scale of deduction being too high a one, he declares it is frequently a full 10*l.* higher in such societies';—this is not true. It is so palpably untrue, that it may be doubted if any society, acting regularly or frequently upon such a scale of deductions, could ever have had an existence of such duration as to be worth naming. There may certainly have been instances of speculating borrowers consenting to submit to exorbitant deductions, but in the general sense asserted in the last lines quoted it is untrue.

"The greatest deduction made in the society to which I belong never amounted to 58*l.*, and the deduction has been very regular at from 50*l.* to 55*l.* This may be proved by a person taking the trouble to inquire of any one or more of the three or four hundred respectable men of the middle class (I am almost certain they are not 'ravenous capitalists') who belong to the Metropolitan Society, held at the Loudon Tavern. The last shares sold were at a deduction of 51*l.* odd shillings. This is of itself sufficient to disprove Mr. Bowen's last-quoted declaration. Information obtained from other London societies would further prove that such declaration is not worthy of credit. 2ndly, with regard to the calculations, it is not proved (and until it be proved, it must be doubted) whether the table of any existing society shews 'that a man can borrow 350*l.* of them, and repay the same at an interest of only 7*l.*' This must be doubted, because any man knows he cannot borrow 350*l.* for ten years without paying for it in the course of that time 175*l.* at a simple interest of 5*l.* per cent., and without being any nearer the repayment of the principal than when he started.

"Whether or not the 350*l.* would cost him, as you state Mr. Bowen shews, 300*l.*, or what sum it would in fact cost him, would manifestly depend upon circumstances connected with time and mode of payment, which you do not touch upon. Even admitting the correctness of such statement, whether or not such payment would be a hardship upon him, would seem also to depend entirely upon the use he had for the money. Neither do you attempt to shew (what it would have been very important to have done) that, whether at an interest of 300*l.* or any other sum, the 350*l.* and *all interest*, would not be repaid to the society in about ten years. If it were so, and the man then had his house, even though he paid 10*l.* a year more to the society, than he had been previously paying for rent, he would probably be well enough satisfied with his bargain, be the gain to the society what it might.

"Mr. Bowen is of course here treated as a secondary person. His pamphlet may or may not be capable of entire refutation; but so far as can be judged of it from your extracts, it is not of that temperate and impartial character likely to be very useful, and it would probably without your notice have done little good or harm: but you are responsible for the use or abuse of very different kind of power; and it certainly does appear to me, that in the prominent notice you have taken of Bowen's '*Bubble*,' you have not exercised your usual discrimination and good judgment. You have, in a leading article, advanced the weight of your powerful influence in support of statements, which, to say the least, are, as you have printed them, extremely vague and unsatisfactory, and, thereupon, passed a sweeping sentence of condemnation on these societies. The injustice is evident. The sentence will go forth to thousands, who, resting satisfied with the authority, will probably never trouble themselves about its justice.

"In concluding, allow me, Sir, to ask you one question. What on earth do you suppose Mr. Bowen could have been thinking of when he penned the grandiloquent flourish with which you conclude your notice? As well as having, as you state, 'an indubitable nose for a job,' he must also be endowed with a vigorousness and play of fancy and imagination, the flights of which, to mere ordinary

men of business, like the hulk of those who compose these societies, will, I should think, be totally incomprehensible. It seems to me to be perfectly bewildering to conceive what in the world there can be 'so detestable in principle,' 'so degrading to our common nature,' in men adopting, for an absolutely necessary purpose, the same means as are daily used at every sale by auction to ascertain who is disposed to give the most for something that is to be sold! What other means could, in fact, he had recourse to, where there are several men equally desirous of purchasing, and differently circumstanced with regard to what sum it will suit their purpose to bid. There is no 'encouraging the needy to bid one against another.' They are not needy at all! They have a reversionary interest in 120*l.*, due ten years hence, and they want its present value, because they have an opportunity of using it to immediate advantage. I suppose it is not contended that they ought to have it for nothing! If not, I should really like to know, when the matter is stripped of all this nonsense about 'pressing necessities inducing men to submit to ruinous loss from the recklessness of despair,' where exists the detestable principle, in half a dozen men voluntarily bidding for a sum of ready money, which they can only obtain on condition of having very sufficient security to invest it upon. As they must have this security they cannot be so very needy, and they mostly belong to a frugal class, opposed to recklessness of any kind.

The legislature of this country have, at one time or other, unfortunately, enacted laws, the advantage of which to the mass of the people is extremely questionable. When not actuated, however, by the selfish influence of powerful classes, the legislature cannot be fairly accused of deliberately making bad and corrupt laws. At all events I have still too much respect for the 'collective wisdom,' to give ready credence to the assertion, that under the specious guise of 'affording encouragement and protection to certain societies, called Building-Societies, established in different parts of the kingdom, principally amongst the industrious classes' (see 6 & 7 Will. 4, c. 32), our government has been coolly preparing a trap 'for transferring the little savings of the frugal poor into the pockets of ravenous capitalists.'

"I am, Sir, very respectfully,

"Your most obedient servant,

"A MEMBER OF THE METROPOLITAN BUILDING-SOCIETY."

In addition to the preceding letter the pamphlet contains some additional remarks, of which the following are a portion:—

"Not more than three or four months ago, a letter, purporting to be from Messrs. Wilkinson and Cobbold, was addressed to the *Times*, stating, amongst other facts, that 'it had been found by experience that the interest of the borrower (for whom the benefit of the act was chiefly designed) was more consulted by reducing the value of the share to 120*l.*, and his monthly payments to 10*s.*, and it had been also found and proved by experience that taking 50*l.* per share as the average premium paid for an immediate advance, ten years and a half would suffice to raise the full sum of 120*l.* per share,' and moreover offering 'to shew any person making the inquiry from fair motives, a series of calculations working out a society upon this hypothesis for ten years and a half, and demonstrating that at the expiration of that period the capitalist will receive 120*l.* for each share, and the borrower have his deeds returned without further payment;' and further offering to 'shew balance sheets of various societies demonstrating the statement in actual practice, and proving that where (as is the case in most of the London societies) the premiums paid average about 60*l.* per share, a shorter period than ten years will suffice.' Now, for any thing that appears to the contrary, Messrs. Wilkinson and Cobbold, members of the Incorporated Law Institution, London, are as good authority as John Bowen. They do not, it is true, draw any delusive comparisons, having more sound than sense, between Building-Societies and the National Debt, and, being practical men, their letter is very meagre of passages about 'necessitous men submitting to ruinous loss from the recklessness of despair;' but, such their letter appears to address itself very much to the *real, the actual* state of the case for all that."

## INSTITUTION OF CIVIL ENGINEERS.

ADDRESS OF THE PRESIDENT TO THE ANNUAL GENERAL MEETING—JANUARY, 1844.

THE time has again arrived when I, with the other members of Council, have to surrender my trust into your hands, and to thank you for the manner in which you have, by your attendances and otherwise, supported me during the year.

I have to congratulate you on the accession to our ranks of several members, at the head of whom stands the name of the most exalted subject in these realms, the only honorary member elected during the last session; one who is not more distinguished by his rank than he is by his virtues, and by the manner in which he discharges the various duties which his high station has assigned to him. Our honorary member, Prince Albert, appears to possess extraordinary moral power, to have been enabled to steer a straight course without attaching himself to any political party, and yet attaching all parties to him. Not a whisper has, I believe, been uttered to his prejudice; and the way in which he is respected and beloved by all ranks proves that the love and attachment of the inhabitants of this country may be easily gained by those in exalted stations, when they really deserve it. That the Prince should encourage and countenance the sciences and arts, which have been mainly instrumental in raising this country to its present position, was to be expected from his taste and judgment; and, as it is probable this was his motive for acceding to our wishes and becoming a member, he has conferred a high compliment upon the Institution, which was enhanced by his honouring us with his company at the conversazione last year at my house.

The election of the Duke of Buccleuch, Hon. M. Inst. C.E., took place during the session of 1842. His Grace's splendid present, named in the Report of the Council, has been made during the last session. It is valuable, as proving the estimation in which his Grace holds this Institution, with the character of which he is so well acquainted. The same inference may be drawn from the present made by Mons. Legrand, our honorary member, as announced in the Report.

All those who knew the Institution in 1834-5 must remember the efficient and zealous offices of Captain Stoddart, who discharged, gratuitously, the duties of secretary for one session, and are probably aware that the same individual is the Colonel Stoddart whose sufferings at Bokhara have excited the sympathies of Europe, and to which we, who are his friends, and have profited by his exertions, cannot be indifferent. Dr. Woolf has been sent out by the united exertions of a few noblemen and gentlemen to ascertain whether Colonel Stoddart be yet living; and if so, to endeavour to rescue him. I felt it my duty to attend the public meeting, and to add my name to the list of subscribers. Captain Grover, the zealous chairman of the committee, has been in communication with the secretary of this Institution, and by applying to him, gentlemen desirous of subscribing to the expense of the mission have the opportunity of doing so. The last news respecting Colonel Stoddart strengthen the hope of his being still alive; and should he return to England, we may easily imagine his pleasure at finding that the members of a society for which he laboured actively, though but for a short period, had taken such an interest in his fate. The last letter I received from him was dated from Teheran, in 1837; the following extract from it may be found interesting:—

“The Schah takes a great interest in the Artesian wells; I brought out drawings of the tools, which I handed over to an engineer officer from Bengal serving here; the tools have been made very well, and the pipes are about to be made. Private individuals are also extremely anxious for the result of the first experiment, as, wherever water can be obtained, the soil becomes fertile, and the revenue accruing to its proprietor is proportionally increased.

“Ten miners, to work the iron-mines of Karadagh, are also come from England, but they are not yet paid their expenses out; and I fear, though iron is plentiful, and the price of it in the Tabreez market would be clearly reduced to one-third of its present rate, that the non-payment system of the government will

oblige the miners to retire, at a loss to themselves, from the undertaking. This is the only engineering news in the country.”

The original communications that have been received are fewer than might have been expected, considering how many are due, the number of individuals who are unemployed, and the frequent applications and earnest representations that have been made.

Want of energy to make the trial, joined to the fear that it would be unsuccessful, is perhaps the principal operating cause of this, particularly with the graduates and young engineers, who thus allow their faculties to rust. If desirous of being employed upon a public work, or in an office, the applicant states that he can draw, measure, plan, and in fact do almost anything; he has been probably articulated to an engineer, and although two years may have elapsed since his pupilage expired, and he may not have had any employment, and although he has been some years a graduate, it too frequently happens that he has not sent in a paper, nor a description of any work; his excuse is, “that he was not sure what would be acceptable,” or he had “thought of and commenced several subjects, none of which pleased him;” and it appears at last that he has not only never sent any paper to the Institution, but he has nothing of his own drawing or writing to shew. Such want of energy is more apt to cause sorrow than anger, but frequently gives rise to both. Let such individuals learn the effect of a contrary conduct from the experience of those who have usefully employed their minds, redeemed their engagement, and brought themselves into notice by drawings and papers presented to the Institution.

I am aware that all essayists, from Johnson downwards, have experienced and complained of the difficulty of choosing a subject. The printed list of subjects for Telford and Walker premiums is intended to aid in this choice; but if it is found deficient, I am sure that any further assistance will be given on application to our secretary.

There are many works either executed or in progress, in this country, of which the detail of the success, or still more of the failures (for the history of these points out the best way to avoid them), would be very important to have recorded, and there are plenty of young men, unfortunately not much occupied, who would benefit themselves, as well as the institution, by describing them; but yet the duty is omitted. Measuring and planning executed works, is the lesson next in point of importance to actually constructing them, for acquiring correct knowledge. As drawing from the living subject is the best study for the young artist, so inspection of works in progress and the practice of drawing and describing them correctly, is one of the most useful employments for the young engineer. By describing, I mean specifying and reporting at length on the nature, component parts, and quality of the work; which most essential part of an engineer's employment is, however, too frequently overlooked and undervalued by the younger members of the profession. If they consider what is necessary to enable them to direct the construction of works, they will perceive that the most correct drawing is but one of the means employed. The facility of describing, in language, a work and its various processes, is with some persons more difficult than the drawing; but it is essential to be learned, if the student in engineering ever looks forward, as he ought, to the higher grades of employment in the profession. The number of their future employers who can understand and appreciate drawings, however explanatory and detailed, they will find to be much less than of those who can comprehend a well-written description or report.

Let it not be understood, however, that I would recommend the study of the works of others exclusively, or even principally, after a certain degree of progress and experience. This is an error to be carefully guarded against, as in most cases mental rest is more agreeable than mental exertion. The effect of beginning by consulting authorities, and seeing what others have done, when a subject is proposed, is, by falling into their track we are contented to remain in it. The question whether there is another way probably never presents itself to us. If, instead of this, the first call were made upon our own powers of invention and

construction, we should probably find our labours rewarded beyond our previous expectations, by the satisfaction of seeing that the result of our thoughts had some sanction from authorities; or even where differences existed, or errors were apparent, we should better feel our own inferiority, as well as the nature of the error, and perceive therefore how they were in future to be avoided. If we would walk alone through the world, we should begin soon to avoid dependence upon the support of others. In what I have said, however, I would by no means countenance that professional confidence which is above being controlled and corrected by experience, which none of us are too old to learn from. The designing which is the result of our own mental exertion, and to which I have referred, is not to go far beyond the study or the confidential friend until it has been matured, compared with, and corrected, by what has been recommended and done by others.

I have been led into these remarks by an anxious desire that the institution should contain good accounts of executed works, that members of all classes should profit by the production of them, and that while they discharge their obligation, they should enable the Council to withdraw their names from the list of defaulters, which it must be the duty of the Council soon to lay before the meeting; and if what I have said shall tend to reduce the list, my object will have been attained.

To this short address, I hope I may be permitted to add my congratulations on the continued and accelerated march of civil engineering in this country. The practice of using steam expansively, first, I believe, explained by Watt, but for prudential reasons not much used by him, when there was so much to introduce; and then other contrivances have tended, and are daily tending, to reduce the cost of steam power, and to increase the general utility of the steam-engine. For the two new purposes to which this wonderful machine has been applied within a quarter of a century, viz. travelling by land and by water, it has so triumphed beyond all calculation, that it is difficult to set reasonable bounds that it may not pass.

In 1825 the speed of steam-boats was estimated at from six to eight miles per hour; had an opinion then been given that within twenty years the speed would be more than doubled, notwithstanding the rapid ratio of increase of the resistance of the water, it would have been received as at least wild and improbable.

The increased velocity of the locomotive engine, not having the same law of resistance to keep it in check, has been still greater. The rate which was assumed in the reports for the Liverpool and Manchester Railway in the year 1825, was twelve miles per hour, the speed which has lately been calculated by me for the travelling of the Irish mails between London and Holyhead is thirty-six miles per hour; and, I believe, the present companies make no objection to it. It would not be just towards our former member Mr. Clegg, to omit stating that the Atmospheric Railway patents, Messrs. Clegg and Samuda, consider my calculation for the lower portion of the line (Chester to Holyhead) as too low, if their system be adopted. You are probably aware that two miles of Atmospheric Railway are laid down between Kingstown and Dalkey (Dublin), through the exertions of our zealous and enterprising associate Mr. Pin, and that carriages with loads of passengers are carried upon it daily, although it is not yet opened to the public. Having had occasion lately to visit Kingstown professionally, I witnessed with pleasure the performance of this ingenious invention; and without prognosticating as to the future, I may state that the results of the experiments are much superior to those with locomotive engines, at a corresponding early period of their introduction upon railways.

The interest of this session is likely to be increased by communications on the subject of the working of the Atmospheric Railway; which, whatever the ultimate results or extent of its application may be, cannot fail to be interesting to the philosopher and the engineer, as a new application of the wonderful laws of nature to the use of man.

The duties of the Publication-committee, and the reasons for the restriction of their labours, have been noticed in the report of the

Council. You are aware that the domestic affairs of the Institution are managed by the House and Finance Committee, who have also the task of examining and certifying all the accounts, and approving the payments that are made. The improvements in the rooms and in the general arrangements, as also in the lighting and ventilating of our theatre, will have convinced you that much time has been devoted to these labours, for which our thanks are justly due to these gentlemen, and particularly to Mr. James Simpson, whose attention continues to be conspicuously useful.

Before leaving the chair I must express my own opinion, in which I believe every member of the Institution who has had an opportunity of judging will agree, of the ability, zeal, and obliging manner, in which the important duties of secretary are discharged by Mr. Manby.

FEB. 20.—The President in the chair.

The discussion on the screw propeller, which was carried to so great a length at the last meeting, was resumed.

Mr. Grantham explained the construction of the propeller upon hoard the Liverpool Screw. It was formed of four arms, with broad shovel-ends, set at an angle of 45°; and from his account its action appeared to have been very satisfactory. He also spoke very high of Ericson's form of propeller as better adapted for large diameters than any other kind. This statement was confirmed by Mr. Braithwaite, who promised, at a future meeting, to give the results obtained on hoard the Princeton steamer, United States of America. Several other members addressed the meeting, and almost all in favour of the principle of screw-propelling, which appears now to have assumed a practically useful shape.

The discussion upon the valves of pumps was also resumed. The resemblance between the disc valve of Palmer and Perkins, and that invented by Belidor was examined, and the general feeling appeared to be that Messrs. Palmer and Perkins' valve would be very useful in large pumps for mines through which much sand or chips passed. The general question of valves with large openings, with their influence on the working of the deep mines of Cornwall and other places, was noticed.

The discussion occupied so much time that no papers could be read; those therefore which had been appointed for the 20th were announced for reading on the 27th instant, viz.

No. 698, "Description of a bridge across the river Shannon at Portumna," by T. Rhodes, M. Inst. C. E.

No. 658, "Description of the bridge over the river Whitadder at Allanton," by J. T. Syme.

No. 625, "Description of a cast and wrought iron trussed girder for bridges, with a series of experiments on their strength," by F. Nash.

#### ELECTRO-METALLURGY.

AN article appears in the *Mechanics' Magazine* of the 3rd instant, being a "Contribution towards a History of Electro-Metallurgy," by Henry Dircks, Esq., the author of the essay upon "Improvements connected with Gilding," which appeared in our last number, and who gives in succession the names of Mr. Henry Bessmer, Mr. C. J. Jordan, Mr. John Dancer, and lastly, Mr. Thomas Spencer, of Liverpool, who for about five years has enjoyed the distinguished honour of being considered the discoverer, and therefore, "the father of electro-metallurgy." The introductory portion of Mr. Dircks's very able *exposé* of this strangely successful piece of artifice, explains in a few words the circumstance which led to its composition. He observes, that in looking over the *Mechanics' Magazine* for several years past, his attention was drawn to Vol. 36, for 1842, in which appears a paper entitled "Books on Electro-Metallurgy" (a review of the works of Mr. G. Shaw and Mr. A. Smeed on that subject), and in which critique the claims of Mr. T. Spencer to priority of invention are strongly advocated. He then proceeds to remark, that the earliest published account of the manipulation requisite for obtaining casts by galvanic action is contained in the letter of a Mr. C. J. Jordan, dated May 22, 1839, and published in the *Mechanics' Magazine* for June 8, 1839. Both Mr. Jordan and

Mr. Spencer describe Dr. Golding Bird's small galvanic apparatus; and it appears, that in the processes employed by each there is such similarity, that it would not be saying too much to assert, that if Mr. Spencer's paper had never been published, Mr. Jordan's letter would have quite as fully supplied us with all the needful information. Mr. Jordan's letter is then given, and will be read with considerable interest by electricians, and all who are conversant with the increasingly useful art of electrography.

Mr. Dircks, however, has not stopped here; he has given verbatim a letter from Mr. John Dancer (formerly of Liverpool, now of Manchester), which clearly places Mr. Spencer in the light of horrowing assistance, which he has never acknowledged. The modest, unassuming manner in which Mr. Dancer makes his statements, in the letter from him to Mr. Dircks, dated June 17, 1840, is very praiseworthy. He concludes that—"The whole of the matter may be summed up thus: I never did, nor ever wished to, take credit for Mr. Spencer's experiments; but if he had, as he now states, produced compact precipitated copper at the time when I shewed him the piece in question, he was wrong in allowing me to suppose otherwise; and that, whether he had or not, the experiments that I tried originated with me in the manner described—and this is all I have ever desired to maintain."

The case of Mr. Thomas Spencer is briefly this:—He read his paper, "On Voltaic Electricity applied to the purpose of Working in Metal," before the Liverpool Polytechnic Society, on the 12th of September, 1839. In recapitulating what he has advanced, Mr. Dircks notices, that Mr. Spencer received his first promptings at the Liverpool meeting of the British Association, assisted by Dr. Bird's ingenious galvanic apparatus—that the scientific journals were discussing applications of electricity—that the appearance of Mr. Jordan's letter and intercourse with Mr. Dancer altogether afforded Mr. Spencer broad and sufficient hints. In a note appended to the article written by Mr. Dircks, the editor acknowledges the egency of the statements brought forward, and expresses his surprise that not only himself, but likewise Mr. Noad (the author of an excellent work on electricity), should have fallen into and perpetuated the same error of supporting the untenable claims of Mr. Spencer; still more, however, is it a matter of surprise to him, that neither Mr. Jordan, nor any of his friends, should have before now stepped forward "to vindicate his claims to the promulgation of an art which justly entitles him to take a high place amongst the benefactors of his age and country."

CLEANSING THE STREETS.—The powers of an engine for cleansing the streets, for which a patent has been obtained, and of which all the particulars are to be learnt at No. 3, Trafalgar-square, were tested yesterday in the streets in the neighbourhood of Guildhall, in the presence of many gentlemen who were invited to attend, and amongst whom were some of the Commissioners of Sewers. The engine could scarcely be said to have had a fair trial, for the streets were not sufficiently muddy to shew what might be done by it. As far as the experiment went, it was most satisfactory; it cleared away the dirt and mud with rapidity and certainty, and surpassed all inventions of the same sort which we have hitherto witnessed. It unites simplicity, strength, continuity of work, and cheapness of construction, and is the best thing of the sort hitherto produced. An extract from the prospectus, published by the patentee, will explain its properties and its merits:—"The engine is simply and effectively constructed; is enclosed in a case open only at the bottom part of it, to enable the brushes to come in contact with the street or road, so that neither dust nor dirt can escape from it. The mud or dirt is discharged into a receiving truck travelling in front of the engine; the truck when filled is easily detached and drawn away to the laystall or chute; another empty truck is instantly attached to the engine, which proceeds on its work without the delay of taking it from the street with the receiver when it requires to be emptied; thus the engine remains constantly at its work. This is a distinguished and most important feature of this engine."

#### Literature.

Boone, for George Andrew, Saddler-street, Durham, R. W. Billings, Manor House, Kentish Town, and George Winter, 5, Frederick-place, Gray's Inn-road. Parts 1 and 2, containing 4 plates each. Medium 4to.

#### [FIRST NOTICE.]

It is not our intention to go upon the present occasion into a review of these works further than to recommend them for their usefulness, as we intend reserving our critical remarks till we have space to enlarge in a detailed manner upon every statement and graphic representation contained in them. We shall, therefore, confine ourselves this week within very narrow limits, for the purpose rather of stating our own intentions than of developing the merits of Mr. Billings and of his engravers.

The work on Kettering church being very beautifully executed, is, on that account, and from its number of illustrations, extremely useful, though issued at a low price; but in order to obtain the extended support of the public, and by the circulation of a more numerous edition obtain remuneration for the inevitable trouble and outlay, Mr. Billings projected the publication of a lower-priced series of works, and in pursuance of that project has put forth two parts of the Durham Architectural Antiquities; but the lowness of charge for this latter work, and of those which he proposes to publish as companions to it, has, of necessity, induced and compelled the confining of the illustrations to pictorial representations of the subjects delineated; which mode of treatment, though suited to the general public taste, is, however, insufficient for the man of practical architecture. Feeling deeply the loss which would ensue from the lapse of any opportunity which the visitings of Mr. Billings (who is *l'homme de l'art* of Architecture Subjects to the Freemasons of the Church) afford for the collection of the exquisite details of Gothic architecture which lie, many of them buried as it were, in obscure country villages, we have given him unlimited orders to collect, in his professional journeyings, accurate drawings of windows, doors, capitals, bases, crockets, finials, hesses, panels, fonts, and other details, which he has undertaken himself to draw upon the wood, so as to insure authenticity in every desirable particular.

In order to shew the manner in which architectural subjects will in future be treated in THE BUILDER, Mr. Billings has delineated for us on the wood, the eastern window of the chancel of Kettering church, which, though simple in form, is of peculiarly fine and lofty proportions; qualities rendering it a subject much more proper for imitation than the later "Decorated" examples, which are so often low and crouching in general shape, and dry and mean in the profiles of their mouldings; whereas the example in question, which we here give, preserves the graceful loftiness of the "Early English" with an union of the geometrical animus, with lines flowing alike in the tracery and in every moulding of the work. The circles in the window-head are without foliation, sub-divisions, and cusps; and yet so admirably are richness and simplicity united in the design, that no want is apparent on that account. We have desired Mr. Billings, in this, and in all the other drawings of windows which he may send us, to add a plan, or horizontal section, and also a vertical section through the centre of the work, in order to shew the peculiar construction of the inner arch, which, being level at its crown, and not flung or splayed, naturally fits upon and meets the window-jamb with an inclined line, which may be seen in this section of our subject running from the inner arris-moulds up to the head-tracery; and we have further desired him to afford us an elevation of the inner

arch, wherever any peculiar development or construction of the work ought to be shewn. In the elevation are marked the centres from which the curvatures of the work are struck. Mr. Billings has also given us an enlarged section or plan of the external parts of the window-jamb; but we should have been better

External Mouldings of the Window-jamb.

pleased if the same draught had contained also the inner mouldings of the jamb, including those peculiar ones at its arris; we should have liked the whole section of the mullion and the profiles of the different parts of the tracery-moulds, and also the section of the sill within and without the building, so that a workman might execute every part of the masonry correctly, without a doubt, and without a blunder.

The label, a section of which we here give, is designed without the elegance of spirit which dictated the rest of the invention: its abundance of small mouldings renders it illegible to the eye, while its general shape does not follow the beauty usually so conspicuous in the profiles of examples of Pointed Architecture.

We give it here rather for avoidance than imitation. When the spirit of Pointed Architecture reanimates the science in modern times masonically and corporally, mere timid imitation will be exploded, the errors of former works will be corrected with the same anxiety as it is not only fair to suppose,

Label moulding.

but evident and patent, the freemasons ever strove to act in the olden times, constantly aiming (while architecture was ordained to advance towards its zenith) to improve upon former endeavours.

In future draughts from buildings we should also like represented to a scale suitable for the carver any bosses or animal springers to the labels; and when the styles of such ornaments come to be properly understood, it will be found that often such enrichments, which add great interest to a building, may be executed at little if any expense beyond that which would be requisite for forming merely mitred knees to the mouldings.

We make these observations in order as well to shew our own views, and our intentions and directions with regard to the delineations in future proposed to be inserted by us, as to afford our correspondents a just idea of how their kind contributions in furtherance of motives so good may be doubly appreciated and become ten-fold more useful to the practically architectural, and may thence work a revolution by which every person concerned in the use and patronage of pure architecture may derive benefit and pleasure.

We now proceed to say wherein our present delineations of the Kettering window fall short of our ideas of just requirement. We deem them imperfect, from not shewing exactly the jointing of the masonry of the jambs mullions and sill; we should wish the insertion of the saddle-bars and stanchions, and the pattern of the glazing; and, further, if there be any settlements or breaches in the works, we should

CHANCEL WINDOW OF KETTERING CHURCH.

B. External Elevation of the Window.

C. Vertical Section through the centre of the Window.

desire to have them distinctly shewn, in order that judgment may be formed of the causes of such failure, and thence philosophical deductions be made for their avoidance in a shrewd modern reproduction of the work. To these we desire to have added the date of the subject as far as can be authenticated, as well by documents as by the taste of its design; also the nature of the materials used in the work, how they have been affected by time, and whether they have been repaired by cements or otherwise, or if they have been renewed; whether the superincumbent weight has not been, by the great head-arch, duly discharged from the tracery and mullions. We desire to have an account of what derangement and fractures have occurred in the mullions and tracery, also what effect has been produced on the masonry by the iron work fixed therein.

The mode of inserting the dimensions upon the drawings we find imperfect, inasmuch as their values are not given by setting over them "Feet, Inches" or "ft. ins.," or the marks  $^{\circ}$  and  $'$ ; they do not, therefore, convey definitely their meaning, which has to be only implied from the supposition that they cannot mean any thing else than the true one. This is not sufficient; they should be so plainly indicated that a youth, an amateur, or any foreigner not well acquainted with the customary measures of English workmen, may acquire their meaning without any extraneous questioning. We here add a scale which we have made for the general elevation plan and section of the window, which was deficient in the drawings; and we at the same time beg to say this exhibits the mode in which we wish scales to be made, written to, and figured.

We shall take an early opportunity of shewing the Free-masonic mode in which we desire to receive from our correspondents information and delineations of any stained glass which they may meet with in ancient windows, or other distinctive marks of colour in mosaics and paintings, which in a spirit friendly to the

cause of genuine architecture they may desire to impart.

COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.

TO THE EDITOR OF THE BUILDER.

SIR,—I beg to inclose to you a few suggestions for the formation of an architectural vocabulary or glossary, a branch of architectural literature which is, perhaps, in a state more imperfect than any other.

I am, Sir, your humble servant,

G. R. F.

**ABACUS.**—This word is thus defined by Mr. Gwilt in the glossary of terms in his admirable Encyclopædia of Architecture:—“Abacus (Gr. *αβᾶξ*, a slab). The upper member of the capital of a column, and serving as a crowning both to the capital and to the whole column. It is otherwise defined by some as a square table, list, or plinth, in the upper part of the capitals of columns, especially of those of the Corinthian order, serving instead of a drip or corona to the capital, and supporting the nether face of the architrave, and the whole trabeation. In the Tuscan, Doric, and ancient Ionic orders, it is a flat square member, well-enough resembling the original title, whence it is called by the French *tailloir*, that is, a troncher, and by the Italians *credenza*. In the richer orders it parts with its original form, the four sides or faces of it being arched or cut inwards, and ornamented in the middle of each face with a rose or other flower, a fish's tail, &c.; and in the Corinthian and Composite orders it is composed of an ovolo, a fillet, and a cavetto. The word is used by Scamozzi to signify a concave moulding in the capital of the Tuscan pedestal.” (p. 885.)

We find the abacus in its simplest form in Egyptian architecture, where it is sometimes seen as a simple cube of stone intervening between the column and the architrave above, in fact, it is the capital itself. Of this, which would seem to be the earliest form of the

abacus, two specimens are given by Mr. Gwilt in his edition of Chambers's Architecture, both communicated by Mr. C. Barry: one of these is here introduced.

The next in order appears to be that form of abacus wherein the same square tablet being placed above the bundle of reeds, produces by its pressure that swelling out of the head of the shaft from which it is not impossible that the Greeks derived a hint for the moulding called the echinus; for examples of this kind the reader is referred to page 449 of THE BUILDER (No. 37). We generally find that the over-hanging abacus is used in Egyptian columns where the capital has a bulbous or cushion shape, but where the capital partakes of the vase or bell shape, and is flowered, the abacus is found to recede. (See also p. 483 of THE BUILDER.) In the Indian early architecture of the cavern temples, the abacus much resembles in its massive overhanging character that of Egyptian capitals.

In the Grecian Doric we behold the abacus in its simplest and most beautiful form, consisting of a quadrilateral figure, which, contrasting favourably with the circular shape of the column below, seems to form an admirable bed for the entablature above, whilst it is connected with the shaft by the graceful outline of the echinus. It is sometimes found with a very remarkable projection beyond the lower diameter, which is considered as an indication of the antiquity of the buildings in which it is so found, as at Corinth, Paestum, Egæstæ, &c.

Those writers who discover for every part of Greek architecture, a corresponding prototype in timber construction, derive the abacus from the intervention of a cube of wood between

the architrave and the sustaining shaft, so placed to protect by its overhanging the column, and to afford a broader bed for the entablature to rest upon. But this doctrine can hardly apply to Egyptian architecture, unless that can be proved throughout to be derived from an imitation of the construction of timber houses.

In Ionic and Corinthian capitals, the abacus, losing its plain and massive character so suitable to the simplicity of the Doric order, becomes in a degree assimilated to the greater richness of the two later orders, by being moulded and sometimes carved in imitation mostly of the mouldings which are found in members of the entablature belonging to the same example; thus in the abacus of the Ionic capitals in the Temple of Minerva-Polias, there is a repetition of the egg-and-tongue enrichment found above the corona of the cornice, whilst in

many of the Corinthian examples at Rome the abacus is either carved with the egg-and-tongue or egg-and-anchor ornament, or cut into foliage of various designs, having in the centre of each of its incurved

sides a flower or other enrichment. The reputed temples of Jupiter Stator and Jupiter Tonans afford rich examples of this kind.

In the Doric and Corinthian orders, the abacus is that member of the capital which has the greatest projection, but in the Ionic, the volutes of necessity project beyond it, consequently the abacus recedes, bearing therefore, in this respect, a resemblance to its position in those Egyptian capitals where the beads of Isis are introduced, and which have been considered by some writers to furnish the origin of the Ionic capital. In their application of the abacus we perceive the admirable knowledge of effect possessed by the Greeks; in each case usefulness is joined to beauty. In the Doric, the ponderous form of the abacus is evidently best fitted for the heavy weight above, and affords a shelter to the shaft below; in the Ionic capital the effect of the volutes, whilst in the Corinthian capital the abacus, by its concave form, harmonizes with the outline of the vase, and the horns

serve to protect the graceful and delicate volutes below. In some Corinthian examples the horns of the abacus terminate in a sharp point, as in the Temple of Vesta, at Rome; in others, and most frequently so, the horns are blunted, the angles being taken off at a right-angle with the diagonal of the square of the capital, that is at an angle of 45° from the front of the abacus. In the

Grecian examples of the Ionic, and in the Roman one of the Temple of Fortuna Virilis, where the columns at the angles of porticoes have their outer volutes turned diagonally, so as (instead of the ordinary cushion pillow or drum on one side) to present externally the same appearance on each of the two sides meeting together at the same angle of the building, the abacus is partially curved like that of the Corinthian order, but only on the outer angle, the rest being square, as in the Doric. In the Roman Doric order (as in the Theatre of Marcellus) the square abacus of the Greeks is retained, but surmounted by a cyma-reversa and fillet, and this practice, so subservive of the simplicity of the original, is followed by many of the modern school.

The Tuscan abacus consists of a fillet, cavetto, and band, according to Vignola and Chambers. Describing a Corinthian capital, Vitruvius says, “The breadth of the abacus is so regulated that its diagonal from angle to angle may be twice as much as the height of the capital, for this gives a proper dimension to each of its faces. The fronts of the abacus are bowed inwardly from its extreme angles a ninth part of its breadth; the thickness

of the abacus is the seventh part of the height of the capital.” This description is found to agree very nearly with the capital of the Pantheon at Rome. The practice of modern days, of sometimes omitting the abacus altogether, cannot be too strongly reprobated.

The abacus is found as a columnar crowning member in every period or style of Gothic architecture. Mr. Britton's definition is as follows: “In Christian architecture, the abaci form the bases of arches, and in shape and ornament are greatly diversified. Mr. Rickman thinks that the square abacus is a sure guide to distinguish the Norman from what he calls the early English (p. 55), but several examples of Norman buildings may be pointed out where the abaci are circular and octangular.” In buildings which have been considered to belong to the Anglo-Saxon period, arches frequently spring from an impost which consists of a plain abacus, sometimes with its under edge chamfered. In the Norman and later styles the abacus is the crowning portion of the capitals of columns or piers, and it is found in many varieties of shape, as square, multangular, and circular, all of which, but more usually the first, may be seen in Norman examples; the following

is a very common form. In the later styles, the abaci usually follow the plans of the columns, whether clustered, circular, or multangular. In the Norman style we see, in its square and simple character, a close resemblance to the Grecian and Roman Doric abacus; it is also found cut into fillets. In the early English, Decorated, and Perpendicular styles, the abacus consists of many mouldings, such as quarter-rounds, with deep hollows between ogees and inverted ogees, and numerous fillets; the variety, in fact, is almost infinite.

Besides the strictly architectural sense in which we have just explained, in a very imperfect manner, the meaning of this word among the ancients, it signified also a *sideboard*, in which sense it appears from Livy and Sallust to have been borrowed by the Romans from the Asiatic Greeks, and to have been used for holding vases and other vessels necessary for a banquet. From the same authors we learn that the abacus thus applied was sometimes made of the most rare and precious woods, covered with gold and inlaid with ivory. From remains found at Pompeii and Herculaneum, the abacus in houses of moderate size was no more than a marble slab or table, without feet, attached to the wall, and capable of being let down after the service, in fact, it was what we should term a hanging-flap. To such a side-board Horace alludes when he says

“Lapis albus—pocula cum ciatho duo sustinet”

(that a white stone supported two cups with a cyathus). Juvenal, in describing the abacus of the poor poet Codrus, says, that it was ornamented with six little water-ewers or pitchers, beneath it a small cantharus, and a reclining figure of Chiron. At Pompeii was found a slab (abacus), above which, as over a modern dresser, are shelves to hold plates, dishes, &c. Among mathematicians the abacus signified a little table or board, rubbed with wax and strewed over with dust or sand, on which they drew their schemes and figures; in this sense the word seems to be formed from the Phœnician *abak*, dust.\* The abacus, or counting-board of the Greeks, was an oblong frame, divided by several brass wires, stretched parallel to each other, and mounted with an equal number of little ivory balls like the beads of a necklace, by means of which all kinds of calculations were easily performed. The ancient Romans had, and the Chinese now

have, similar apparatus for reckoning with: and at the present day the abacus of the ancients is made an useful toy whereby children

are taught to reckon, and may be found in every toy-shop in London.

\* אבאק, or perhaps from אבאק, finger, אבאק, oblong; the idea may arise from an oblong finger-board, which an abacus of the kind indeed is.

## THE NEW ROYAL EXCHANGE.

THE following letter, in reference to the proposed improvements at the east end of the building, appeared in the *Times* a few days since:—

"Sir,—I rejoice to perceive, by the report of the proceedings of the Court of Common Council, that the intention of improving the site of ground abutting eastward on the New Royal Exchange has not been totally abandoned.

"It does appear somewhat marvellous that disinterested persons can be found willing to advocate the propriety of keeping up the comparatively few remaining houses between the new building and Finch-lane. By slow, but sure degrees, some of those ancient, but unsightly excrescences, the 'middle-rows' of London, have ceased to exist; but, as if their demolition had been cause of regret, certain 'men of taste' have stepped forward to renew, or rather perpetuate, the deformity.

"The plan I would suggest is, that the city should not only purchase the houses alluded to, but that they should also become proprietors of the houses on the east side of Finch-lane.

"I would then form a frontage of houses extending over a portion or the whole of Finch-lane. This latter purchase would most amply repay the outlay; for the new street would unquestionably become more valuable than any other in the city of London. An archway entrance into this new line of houses might be formed towards Merchant Tailors'-ball, and a good view of the Hall of Commerce obtained by carrying the frontage of the new street in an oblique direction.

"With respect to the value of the buildings proposed to be removed, it is notorious that no inconsiderable portion of them were purchased for 'an old song' some five or six years ago."

According to public notice, the extensive premises known as Bank-buildings, Thread-needle-street and Cornhill, lately occupied by the directors of the Sun Fire-office, Messrs. Ladbroke and Sons, the bankers, the Colonial Emigration-office, and Mr. Thomas, the bullion-dealer, were brought to the hammer by Messrs. Pullen and Son, auctioneers, of Fore-street, by direction of the City Board of Works, on Monday last, to make way for the improvements that are to be made in the vicinity of the Royal Exchange. For the previous week a palisade had been erected round the buildings, which had been marked out in lots. Long before the hour of sale hundreds of persons inspected the premises and the building-materials, which are of excellent quality, and brought good prices. The fixtures are very substantial, and will be disposed of during this week and next; after which this trapezoidal pile will be pulled down, and on its site will be erected the equestrian statue of the Duke of Wellington by the late celebrated Chantrey, which is now nearly ready to be placed before the grand western entrance to the new Royal Exchange.

## THE PRIZE CARTOONS.

SOME time since the prize cartoons were placed in the Suffolk-street Gallery for the purpose of having reduced drawings made of them, in order to their being forthwith copied in lithography. Considerable progress has been made in the reduced representations of these highly meritorious works; and if the subject of the cartoons have by this time lost some of its novelty, we fancy that its interest will be revived by the inspection of the very clever reduced drawings made by the Messrs. Linnell, which are now exhibiting at the Suffolk-street Gallery along with the original cartoons. It is pleasing to compare these reduced copies with the originals, which are now hung in a light more calculated to display their best qualities than the feeble and dungeonly-like glimmer in which they were exhibited at Westminster Hall. The copies already finished are those of

Caractacus led in Triumph, by Watts,  
The First Trial by Jury, by Cope,  
The Fight for the Beacon, by Towshend,  
St. Augustine and Ethelbert, by Horsley.  
Considerable progress has also been made in reducing the cartoon of Julius Caesar, by Armitage, Uua and the Satyrs, by Frost, and

Queen Eleanor, by Severn. It is intended, we hear, to sell the set of eleven plates for five guineas—a moderate price, considering the great care and labour which must, from first to last, necessarily be expended in their execution.

It is said that the cartoons will be removed from Suffolk-street before the end of the present month, to make room for the pictures and statuary which will form the approaching exhibition there.

## BIOGRAPHICAL MEMOIRS.

MR. JOHN PENN, M. Inst. C.E., was born near Taunton, in Somersetshire, in the year 1770, and was apprenticed to a millwright at Bridgewater, whence he travelled to Bristol, and worked there as an operative. He soon became the foreman of an important work, when only twenty-two years of age, and was celebrated for his theoretical and practical knowledge of the forms of the teeth of wheels, which branch of construction was, at that period, only imperfectly understood by mechanics. He removed to London about the year 1793, and after working at and being a foreman in several works, he commenced business on his own account in 1801.

His attention was at first chiefly directed to the construction of flour-mills, in which he made many improvements, particularly in the substitution of metal for wood framing. In consequence of the injudicious proceedings of the Millwrights' Union, he was induced to oppose a determined resistance to their demands, and by the introduction of self-acting tools, and the instructions given by him to another class of workmen, the millwrights lost many of the privileges they had previously enjoyed.

The tread-mills for prisons were first constructed at Mr. Penn's works, and latterly he (in conjunction with his son) manufactured many marine engines, particularly those with oscillating cylinders.

Mr. Penn was well versed in general science; he was an amateur astronomer, and possessed some valuable instruments; much of his leisure time was devoted to horticultural pursuits, which led to several improvements in the methods of heating conservatories and forcing houses.

He died suddenly on the 6th June, 1843, in the 73rd year of his age, having enjoyed for many years the confidence and esteem of a large circle of friends.

MR. DAVID AHER, M. Inst. C.E., was born in the year 1780; he attained very early a proficiency in physical science, and at fifteen years of age commenced his studies as a civil engineer.

In 1803, he surveyed and superintended several of the works of the Grand Canal Company (Ireland), and subsequently directed the collieries in the County Kilkenny and Queen's County; an occupation for which he was well suited, from his knowledge of geology, a science at that time but little cultivated in Ireland. By his judicious direction of borings and other trials, discoveries were made which have proved very valuable to the neighbouring coal-proprietors. His inventions and improvements in mining and boring machinery (which have been generally adopted), are remarkable for the mechanical ingenuity displayed in them, for the simplicity of their construction, and for their practical utility.

In the years 1810, 1811, and 1812, he was engaged in making experiments and reports for the commissioners appointed by government to inquire into the nature and extent of the "Bogs in Ireland, and their capability of being made available for cultivation, or other purposes."

While engaged in the direction of the collieries, he laid out nearly all the new lines of road which have been made through the county Kilkenny and neighbourhood, and also the Great Leinster and Munster Railway, from Dublin to Cork, by Kilkenny, Clonmel, Cahir, &c.

In 1810 he met with some disappointments and losses, which weighed heavily on his mind, and were the principal cause of the illness which terminated his life. He died in the 62nd year of his age, respected for his high professional attainments and strict integrity of character, and regretted by all who knew him.  
—From the Report of the Institution of Civil Engineers.

## MONUMENT TO THE LATE THOMAS RICKMAN, F.S.A.

SOME of the friends of the late Mr. Rickman having proposed to subscribe for the erection of an appropriate monument over his grave, in St. George's church-yard, in Birmingham, it has been thought that many others might be willing to contribute to such an object, either from personal regard, or as a testimony of respect to the memory of one who laboured with so much zeal, industry, and success, in the revival of the true principles of Gothic architecture. A committee, consisting of the following members, has been formed, for the purpose of carrying the object of the subscribers into effect.

It is supposed that a sum not less than 250*l.* will be necessary to erect a fit and durable monument.

Subscriptions will be received by any members of the committee.

Lord Prudhoe, F.R.S. S.A.; Venerable Archdeacon Burney, D.D., F.R.S., S.A.; Rev. J. H. Spry, D.D., Rector of St. Mary-lebone, F.S.A.; Rev. W. Whewell, B.D., Master of Trinity College, Cambridge, F.R.S., S.A.; Rev. J. W. Whittaker, D.D., Vicar of Blackburn; Rev. J. Garbett, M.A., Rector of St. George's, Birmingham; Rev. James Raine, M.A., Vicar of Meldon, Librarian of Durham Cathedral; Rev. R. Hussey, B.D., Christ Church, Oxford; E. Blore, Esq., D.C.L., F.S.A., Manchester-square, London; George Barker, Esq., F.R.S., Birmingham; H. Petrie, Esq., F.S.A., Stockwell; W. Twopeny, Esq., Temple, London; J. J. Lightfoot, Esq., Tranmere Hall, Liverpool; T. Fulljames, Esq., Gloucester; R. C. Hussey, Esq., F.S.A., Birmingham.

Subscriptions will also be received at Bristol, by S. C. Fripp, Esq., Architect, Lower College-green; Mr. Strong, Bookseller, Clare-street.

Cambridge, Mr. Elliott Smith, Trinity-street; Messrs. Deighton, Booksellers; Mr. Stevenson, Bookseller.

London, Literary Gazette Office, Waterloo-street, Strand.

Oxford, Mr. J. H. Parker, Bookseller.

## NAVY ESTIMATES FOR 1844-45.

NEW WORKS, IMPROVEMENTS, AND REPAIRS IN THE DOCKYARDS.

THE most important of the estimates are those to be voted under this head, and which is on all hands admitted to be the most judicious and reasonable. The following are the new works in contemplation, and the sums of money to the commencement of which they are intended to be applied:—

At Devonport, a new steam basin, estimated cost 400,000*l.*, amount of money required for the ensuing year 30,000*l.* For new pier and entrance to the two docks, 10,000*l.*; for repairing the north jetty and dockyard-wall, 7,000*l.*—At Woolwich, a new dock, engine, and saw mills; estimated cost 86,200*l.*, amount required for the present year, 20,000*l.*; for additional buildings to steam-factory, 13,000*l.*; for a roof over a slip, 6,000*l.*; for new boundary-wall, &c., 3,000*l.*; to be provided in future estimates, 2,000*l.*—At Chatham, for re-constructing building-slips and sea-wall, the estimates are 102,000*l.*, of which 15,000*l.* are required for the ensuing year; for building metal mills and steam-engine and machinery for it, 13,600*l.*—At Pembroke, 25,795*l.* for various improvements.—At Deptford, 7,000*l.* for a new slip.

For the works commenced and in course of completion, the following large sums are required:—At Portsmouth, for the new steam basin, 30,000*l.*; 60,000*l.* in future estimates to complete it; for repairing sea-wall and building slips, and constructing three new building slips and roofs, 25,000*l.*; and for completion, 39,600*l.* in future.

For Plymouth breakwater, 15,000*l.*; and to be provided in future estimates, 120,000*l.* For the Marine Barracks at Woolwich, 15,000*l.*; and 48,000*l.* in future estimates; 4,000*l.* for machinery for building and fixing engines of steam-vessels. At Chatham, 4,000*l.* for clearing the mud in the harbour.

For the naval establishments abroad, at Malta, 13,000*l.* is required for the new dock, and 12,900*l.* in future; and 7,000*l.* for erecting a new balance and machinery for grinding corn; and 1,694*l.* for store and wharf for coal-ging steamers.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*All Saints, Maidstone.*—The work of restoration in this fine old structure is steadily progressing. Another arch, besides the elegant screen on the north side of the altar, has been denuded of its disfiguring whitewash. On this screen, on the whitewash being removed, were found traces of its having been splendidly embellished with gilding and painting, the pattern of which is sufficiently distinct to enable it to be restored.

*Eastwell.*—The Earl of Winchilsea has restored the parish church of Eastwell. The church is a very ancient one, and possesses some interesting historical associations. Amongst others it may be mentioned that the son of Richard, the Plantagenet, who was killed at the battle of Bosworth Field, was buried there.

*Brandeston Church.*—The President and Scholars of St. Mary Magdalen College, in Oxford, at a general meeting of the society on the 3rd inst., granted a donation of 40*l.* in aid of the restorations now in progress there, from designs by Mr. Blore.

It is with the most heartfelt gratification we record the splendid donation of 2,000*l.*, by the Lord Bishop of Gloucester and Bristol, towards the erection of churches in his diocese, for the especial benefit of the poor.

Earl Powis has given notice of his intention to bring forward a motion for repealing the Act which authorizes the union of the sees of St. Asaph and Bangor. The University of Cambridge is about to petition for the same object.

*Establishment of Ecclesiastical Districts.*—There are about one hundred and fifty applications to the Ecclesiastical Commissioners for England, chiefly from the northern parishes, for the establishment and endowment of ecclesiastical districts under Sir Robert Peel's Act of last session; not one of which is to contain less, and many considerably more, than 2,000 souls. Taking the average (which may be safely done) at three thousand, here are proposals for at once providing direct, authoritative, independent, pastoral superintendence for a population of 450,000 souls.

## RAILWAY INTELLIGENCE.

*Railway at Elgin.*—There is a scheme at present in cogitation to establish a railway communication betwixt the new harbour at Stotfield Point and Elgin, and from the latter place to Rothes. In speaking of this undertaking, the *Elgin Courier* says—"When the proposal was made to form a company, with a capital of 20,000*l.*, for the purpose of building a new harbour at Stotfield Point, the idea was looked upon as monstrous and visionary, and the promoters were often told that, to raise such a capital in a poor remote district like this was impossible; and yet we have seen the harbour completed at an expense of 14,000*l.*, for which it yields a fair return, and now holds out every inducement to extend its advantages to the surrounding district. The surface of the county betwixt Elgin and Stotfield Point presents no natural obstacle to the construction of a nearly level railway; but simple as the matter looks to one who has only to examine a finished survey, with a previous intimate acquaintance with the ground, already have several important and undoubted improvements been suggested on the line as surveyed. From Elgin to Rothes the line shews itself through the remarkable glen lying midway. Nature has here provided an inlet to the rich and beautiful highland strath, along a course in which the summit level to be overcome does not exceed three hundred feet in six miles. From this short description of the course of the railway, taken in conjunction with the cheapness of labour here, the estimate of construction, at less than 3,000*l.* per mile, will, we feel assured, be admitted; and if so, will present a marked contrast to the enormous cost of railways in other places."

*The Sussex Railways.*—Bills are about to be introduced into Parliament to authorize the formation of two branches of the London and Brighton Railway, one an extension of the Shoreham line westward to Chichester, the other running from Brighton eastward to Hastings.

*Gravesend.*—A meeting of the Town Council took place on Tuesday last, the proceedings of which were one continued scene of confusion and contention. A motion for rescinding all that has been done for the purpose of uniting the interest of the rival piers was proposed, and after a warm discussion was carried; but it was then discovered to be informal, and was consequently withdrawn. The principal apple of discord now seems to be the proposed Rosherville railway, which naturally excites great alarm in the borough.

*Margate.*—The surveyor of the South-Eastern Railway Company has been sojourning in this town during the past week, and from his report it is understood that there is every probability of the railway from here to Ashford being completed in twelve months from the present time; operations will commence immediately the standing crops of the ensuing season are off the ground.

*Hawkhurst.*—On Monday last a public meeting was held at Hawkhurst, to receive the report of a committee appointed some time since to confer with the Rye and Hastings committee on the subject of a railroad to Staplehurst by Hawkhurst, instead of by Rye to Headcorn. Lord Beresford in the chair.

*Railway Signal.*—The directors of the railway from Breslau to Freyburg, in Silesia, have established in each of the carriages a signal, by which passengers, in case of necessity, may have the train stopped. This is done by hoisting a flag through an aperture in the roof, and this being perceived by a conductor, he orders the stoppage of the locomotive, and proceeds to inquire into the cause of the signal.

*French Railways.*—The second part of the works of the railroad from Rouen to Havre, between Barentin and Flamenville (about nine English miles) has been contracted for (says the *Journal de Chemins de Fer*) by Messrs. Mackenzie and Brassey, at the sum of 2,008,635*fr.*

## Law Intelligence.

## SMITH'S PATENT WIRE ROPE.

## VICE-CHANCELLOR'S COURT, FEB. 10.

(Before Sir James Wigram.)

*MATTHEWS v. SMITH.*—Mr. J. Russell and Mr. Willcock moved, on behalf of the defendant, that an injunction which had been granted in this case, restraining him from assigning, vending, or disposing of certain patents and leasehold premises of the partnership business of wire rope manufacturers (in which he, the plaintiff, had been engaged), and from removing the books of the firm from the premises, might be dissolved, or that the plaintiff might be committed for contempt. The case has been recently before the Court, when it appeared a bill had been filed by the defendant praying a dissolution of partnership. The plaintiff had also instituted a suit, the object of which was to obtain a declaration of the Court that the partnership was subsisting. An injunction was also prayed by the plaintiff, in the terms above mentioned, but requiring in addition that the defendant might be restrained from granting licenses to parties to vend the patent wire rope, and also for a receiver. With the latter part of the motion the Court had refused to interfere, and the suit as to the validity of the partnership is still pending. The ground upon which the motion was now made for dissolving the injunction, or for commitment, was, the insertion by the plaintiff of two advertisements, headed "Wire Rope Patent," and warning the public that the patent could not be parted with or disposed of, or any business thereunder granted, without Matthew's consent—and that all persons having any dealings with Mr. Smith in respect to this article, without the consent of the plaintiff, after such notification, will do so at their peril. It was contended, that the advertisements, referring as they did to the suit between the parties, were an interference with the order of the Court, and that, as their tendency was also to interfere with and ruin the business, the Court would interfere by acceding to the present motion. The advertisement was a misrepresentation of the order of the Court, and, as such, was cognizable by it.

Mr. Kenyon Parker and Mr. Grove opposed the motion, disclaiming, on the part of the plaintiff, any intention of giving offence to the Court, or any design to injure the defendant, or to ruin a business in which he had much interest, and from which he expected to realize a large sum. He had merely cautioned the public against dealing with his partner alone without his sanction.

His Honour suggested, that as the effect of another advertisement, simply recalling those complained of, might probably have an affirmative declaration that all parties might deal with Mr. Smith alone, it would perhaps be better that the counsel for the parties should agree upon the form of an advertisement, not only recalling what had been said, but also stating the nature of the suit pending, and what had been done on the motion. To this the counsel on both sides agreed; and leave was given to mention the case again, if necessary, on a future day.

[This case has been before the Court on three separate occasions, besides the one noted above.]

MONDAY, FEB. 12.

(Before Sir L. Shadwell.)

*RANGER v. THE GREAT WESTERN RAILWAY COMPANY.*—This cause was spoken to this morning as to finally settling the minutes of his Honour's decree, as delivered out by the registrar. After a lengthy and desultory discussion between the counsel,

His Honour made the following order,—viz. "Let the decree be drawn up according to the minutes issued by the registrar, except that they are to be prefaced by the following declaration:—Declare that for the general purposes of the decree the portion of the railway in the pleadings mentioned, described as No. 1 B extension, must be considered as included in the contract No. 1 B; and the line of railway substituted for the line in the contract No. 8 L, must be considered as included in the contract No. 8 L; also, that where the decree directs the plaintiff's 'bill' to stand dismissed, the word 'bills' is to be inserted; and that the costs are to be paid by the plaintiff to the defendants; and also the following direction, that the defendants (the company) upon reasonable notice, at all proper times and in a proper manner, permit the plaintiff, his solicitor or agent, to survey and inspect the line of railway, and the works thereon, included in the contracts 1 B and 2 B, and the line of railway described as 1 B extension, and the Reading line."

## DEOXIDATION OF METALS—CRAUFURD'S PATENT.

TUESDAY, FEB. 13.

(Before Sir L. Shadwell.)

*PATERSON v. HOLLAND.*—This is a dispute between rival patentees of similar inventions for protecting iron and other metals from oxidation and corrosion, by means of a coating of zinc, or zinc tin. The plaintiff's patent was originally granted in 1837, to Mr. W. H. Craufurd, and subsequently to the plaintiffs, who were formed into a company to carry it into operation. This invention appeared simply to consist in covering iron or certain other metals with a coating of zinc, by means of sal-ammoniac or muriatic acid, and sometimes superadding a covering of tin, but producing an electro-negative quality in the iron, which was said to resist the chemical action of the atmosphere. The defendant (who confessed in Court that his invention was communicated to Morewood, his original patentee, by one Peter Naylor, an American) first covered the iron with a fine coating of tin, and then added a coating of zinc, in a manner similar to the process of the plaintiffs. This invention, which was also protected by a patent, granted in 1841, was alleged by the plaintiffs to be in effect the same as theirs, with a mere colourable variation; and they now moved for an injunction to restrain the infringement. The defendant, by reference to the long known process of tinning, and the description in chemical books of the principle of resisting oxidation by a coating of metal, insisted that there was no validity in the plaintiffs' patent for a new invention, and, moreover, that there was no infringement. The only question was,

whether there was such a *prima facie* case of a valid patent in the plaintiffs, and an infringement by the defendants, as to justify the Court interfering by injunction, as it appeared to be admitted on both sides that the dispute must be ultimately settled on a trial at law.

The Vice-Chancellor said, the only question was, whether the Court ought to interfere by injunction, as it was manifest that the principle claimed by the plaintiffs' patent was known and published as long ago as 1807 (as appeared from Mr. Aikin's and Prof. Brande's works), and, therefore, that it was a very fit case for the opinion of a court of law. It was shewn that the plaintiffs' patent had not been brought into active use (or had been kept in abeyance, as it was termed) for many years; and though this was no reason why the Court should not interfere to protect the patent, yet the probable mischief that might arise from the sale of the defendants' was much diminished by this circumstance—and it might, on the other hand, be a great injury to the defendants now to interfere by injunction. He thought, therefore, the proper thing to do was, to make no order on the motion, but to direct the plaintiffs to bring an action to establish their patent, with liberty to either party to apply to the Court.

#### SHERIFF'S COURT.—FEB. 1.

##### THE VALUE OF A LODGING-HOUSE.

The claimant, named Newton, landlord under an unexpired lease of fifteen years, of three lodging-houses in Buckeridge-street, St. Giles's, sought compensation at the hands of the Crown for injury done to his leasehold property and business. The claim set up amounted to 1,187*l.* The houses were held under lease at 60*l.* a-year; and it was shewn in evidence that, some time since, they were worth to the claimant 125*l.* a-year, on an improved rent of 65*l.* annually. Valuing the lease at ten years' purchase, he claimed 650*l.* In one of the houses he carried on the business of a chandler, at a clear profit of 150*l.* a-year, and taking it at a two years' purchase, he claimed 300*l.* The houses altogether contained about fifty beds, let chiefly to night lodgers, at 3*l.* a-head, or 6*l.* for a whole bed. After deducting the outgoings, the beds produced nearly 200*l.* a-year. There was but one servant to attend to the beds, thirty-six of which she made with her own hands every day, and for doing so, and washing the bed-clothes, and keeping the bed-rooms clean, in all the three houses, she received *stipendia* a day, out of which she had to feed and clothe herself. Several surveyors and auctioneers were examined, who estimated the claimant's leasehold interest at sums varying from 500*l.* to 600*l.*; the value of fixtures at from 40*l.* to 50*l.*, and the loss of business at 300*l.* The jury awarded claimant 627*l.*—namely, for leasehold interest 352*l.*, for fixtures and other damages 275*l.*

**IMPORTANT DECISION CONCERNING SCOTCH GLEBS.**—A case of considerable importance has recently been decided in the Sheriff-court of Fort William, involving the question whether the parish minister has a right to cut down the trees on his glebe. Several of the seceding clergymen in the Highlands, answering this question in the affirmative, laid the axe to the root of many a goodly tree, about the time of the Secession; among others, we noticed, at the time, the cases of Lochbroom and Kilmalie. The facts of the Kilmalie case are simply these—Mr. Davidson, late minister of that parish, maintained, in point of law, that as a minister he was entitled to cut down every tree on the glebe without control, up to the moment of his dismission. The Sheriff-Substitute took a different view of the matter, on being appealed to by Lochiel and other heritors; and Mr. Davidson having appealed to the Sheriff-Depute of Argyll (Mr. Bruce), the decision has been affirmed against the claim of the minister.—*Inverness Courier.*

**HUNGERFORD AND LAMBETH SUSPENSION-BRIDGE.**—It was stated at the last half-yearly meeting of the company, that the bridge would be completed by Midsummer. It is contemplated to take a half-penny toll, that amount including the right to return.

The great fountain now in progress at Chatsworth is expected to play to a height of upwards of 200 feet.

#### ASSESSED TAXES CASES.

*Determined by the Judges on Appeal.*

May 18, 1841.

Windows—Dairy.

*Appellant, a farmer, who had been allowed for two glazed windows, one in a dairy and the other in a cheese-room, claimed to be entitled as for a third dairy window, partly wire and partly glass.—Held, not so entitled, such third not being made wholly of glass.*

At a meeting of commissioners, held 1st September, 1840, at Brailford, for hearing and determining appeals against the first assessments of land and assessed taxes, for the hundred of Appletree, for the year ending 5th April, 1841 (48 Geo. 3, c. 55, sch. (A), exemption case 4; 37 Geo. 3, c. 25, s. 5)—William Osborne, of Sutton-on-the-Hill farmer, appealed against the assessment made upon him in respect of eighteen windows. It appeared that the appellant had been allowed two glazed windows, the one in a dairy and the other in a cheese-room, but he claimed to be exempt for a third dairy window, part wire and part glass, to which latter exemption the commissioners considered the party entitled; but Mr. Clarke, the surveyor, submitted that by the 4th section of 6 Geo. 4, c. 7, the appellant had received all the benefit which that Act allowed him, and that Case 4 of exemptions to 48 Geo. 3, c. 55, did not apply to the third window in dispute, as it should have been made "wholly without glass." The commissioners, however, allowed the appeal, and reduced the assessment to seventeen windows; and at the surveyor's request this statement of facts is given for the opinion of her Majesty's judges.

Richard Wilcockson, of Biggin, appealed at the same time in respect of eight windows. He is by trade a miller, and in the occupation of a corn-mill. He occupies land, milks five cows, and prayed exemption for two windows, both of glass, one in a dairy and the other in a cheese-room. The commissioners relieved the appellant, subject to a case demanded by the surveyor.

Charles Hazledine, of Bradley, also appeared and claimed to be exempt for two glazed dairy and cheese-room windows, included in the number, viz. fourteen, assessed in respect of his dwelling-house. The appellant is a licensed victualler, keeps seven cows, and occupies about twenty acres of land. The commissioners considering this to be a farm-house, and that the party derived his livelihood principally by farming, considered the appellant entitled to the exemption; but the surveyor contended that the house was clearly not a farm-house (*bond fide*) used for the purposes of husbandry only, to which description of houses glazed windows could only be allowed. The surveyor being therewith dissatisfied, demanded a case for the opinion of her Majesty's judges, which is hereby stated and signed accordingly.

Elisha Browne, of Shirstone, licensed victualler, also appealed against an assessment of thirteen windows, and claimed an exemption for two of them, being glazed windows, one in a dairy, and the other in a cheese-room, both distinct; from which the appellant was relieved by the commissioners, on the same terms and conditions as are set forth in the foregoing case; with which determination the surveyor was dissatisfied, and demanded a case.

Mary Wheelton, of Mugginton, also appealed against an assessment upon her for ten windows. The appellant is a licensed victualler, keeps a dairy of cows, and occupies land accordingly; and on that ground claimed to have two windows, both of glass, allowed her for a dairy and cheese-room. The commissioners relieved the appellant, and the surveyor demanded a case.

Ann Bembridge, of Hulland Ward, also appealed against eight windows; she keeps a public-house, occupies land, milks six cows, and makes butter and cheese. The commissioners allowed the claim to exemption for two glazed windows to a dairy and cheese-room; but the surveyor submitted that this house was not a farm-house (*bond fide*) used for the purpose of husbandry only; that the appellant therefore was not entitled to the relief granted; and requested a case for the opinion of her

Majesty's judges, which is stated and signed accordingly.

Witness our hands to this and the several other preceding cases this 15th day of January, 1841.

E. S. CHANDOS POLE,  
REGD. C. POLE,  
ROGER COX, } Commissioners.

We are of opinion, that the determination of the commissioners is wrong.

J. PATTESON, J. WILLIAMS, W. H. MAULE,  
R. M. ROLFE.—*Justice of the Peace.*

#### Correspondence.

##### WARMING AND VENTILATING.

SIR,—My object in writing these remarks, is not so much to endeavour to bring you to coincide with my views, as to shew your readers that when I make assertions I am generally able to prove them, though it may be perhaps not satisfactorily.

To the promiscuous use of stoves in warming ordinary buildings and dwelling-houses I am decidedly opposed, and I am aware that in many cases common grates have been substituted for them, and often at great expense; but for the purpose of warming school-rooms they are almost invaluable. In such a case, I never knew of their being removed; on the contrary, I have heard of an instance in a school-room where the chimney-openings were bricked up, and stoves being used, have given great satisfaction. The use of the hot-water apparatus is so costly at first, and so expensive in operation, that economy precludes its use, or else their use would certainly be preferable; consequently there is no choice left to the architect but the use of stoves or of common grates. The principal objection raised by you to the use of stoves, seems to be the generation of noxious fumes; but I think you will allow that this will not hold good, by the utter impossibility of any being generated in a good stove, the flue of which passing under the floor would render leakage in that part of no consequence, and, by combining effective ventilation, and the precaution of supplying moisture to the air by means of water, that the bad effects, if any were generated by such a stove, would be entirely obviated. In some schools the only ventilation afforded is by the door and a few broken squares of glass; this, with a rusty slip-stove in the centre of the school, generally red-hot, with a long iron pipe to the ceiling, every joint of which emits a deadly stream of gas, is a mode which ought to be opposed in every possible manner, and is certainly one which I should not advocate; but I contend that the numberless disadvantages attending the use of common grates, the ineffective manner in which they perform their duty, and their much greater expense, afford an argument for the use of stoves which ought not to be slightly passed over, and I am further strengthened in my opinion by actual observation and good authority.

I remain, yours, &c.

February 19, 1841.

C. D.

[We have small faith in the economy of any of these close stoves—descending flues are to be mostly deprecated; nearly all the great conflagrations which have occurred of late years in England have emanated from them. It little matters whether smoke or noxious vapour escape in a school-room or under it, since in either case it is sure to find its way into the school; but on the score of want of cleanliness they are most to be deprecated, as the havoc they cause that way renders them the most expensive means of warming which could be adopted. Much of the smoke from all stoves and chimneys comes from them when fresh coals are put upon the fire; and in all manner of pipe-stoves there is on every such occasion a great fume puffed from the stove; and if the flue descend, we know from close watching, often all the smoke for some time refuses to be drawn into the flue, unless, indeed, the whole front of the stove be shut in closely, so as to prevent its being vomited into the room. With regard to ventilation, we advise that not only should there be louvres and valves in the roof and ceiling, wherever practicable, but that air-fuses should be carried up in the thickness of the walling with grates in the building, and external gratings to prevent their being stopped by birds building nests within them; the external gratings may be made as fixed

quatrefoils and in other forms, and we have often so made them. We have lately observed in one of the beautiful alcoves in the north aisle of the nave of St. Paul's Cathedral, a curiously-horrible nondescript apparatus, half-Brobdignagian-brazier, half-giant-German-stove, placed there as a pattern, we have been told, for twelve or more such things, to be set in the sacred edifices, under the vain idea of raising sensibly the temperature of the vast body of air within the fabric; but instead of doing which, will be sure to deface the marble statuary, to soot and grime the interior of the church, and certainly not bleach its exterior, by the vile iron-piping so tastefully thrust through the great window-glazing, to discharge the smoke all about the masonry, and rebound from every cornice and projection of the edifice. These demi-coal-cauldrons demi-fume-funks seem, indeed, prepared for the festive occasion of the recovering the Gypsies into the bosom of the Church. Maintaining these censors and their bituminous pit-coal incense and of the consequently sooty windows, will only cost about twice as much as maintaining instead pictorial and historical Scripture subjects in stained glass throughout the fabric.—Eo.]

VENTILATION.

Sir,—I know not which most superabundant, cracked arches or cracked architects and builders. Could any man in his senses build a house with fire-places of the mode and dimensions which we usually see them, and at the same time carefully endeavour to make the rooms as air-tight as possible, except at those times when the doors or windows are open?

Heating and ventilating are one question—as well might we endeavour to sustain a man by giving him all victuals and no drink, as to give him all heat and no ventilation. Well may the head-ache arise from the operation of an Arnott's stove; because, unfortunately, even that most barbarous excuse for ventilation, the chimney, is closed, that the Arnott's stove may be affixed to the flue. But had the true principles of heating an apartment been borne in mind, then, before such a stove had been put into operation, pipes for the admission, and pipes for the emission, of air would have been constructed, and those pipes would have been connected with wire-gauze valves, &c., acting through a perforated cornice, skirting, &c., according to the local circumstances of the room; and thus a regulated admission of pure air, and a regulated emission of heated and deteriorated atmosphere, would be commanded, and Dr. Arnott's stove have a fair chance of its merits being judged. Colds would be less frequent, as wholesome warm air would be had without the catarrh-birning draughts attendant upon the present unscientific chimneys.

The heating of a room is governed, in all cases, by the principle of fluids finding their level in accordance with their density or weight. As a certain portion becomes heated, it rises, and its place is supplied by that portion which is colder, and consequently heavier. This is carried on by the Arnott's stove, as we now see it employed; but, unfortunately, although the air of the room may become warmer, it also becomes impure, because the same air again and again circulates about the heated stove; in fact, we may say it becomes burnt, or arid, and unfit for human respiration. But were this mode of heating combined with a proper system of ventilation, and that ventilation capable of being regulated at pleasure, no such ill effects would arise.

The circulation of the water in the pipes, as used in the hot-water mode of heating, is exactly analogous in its operation to what we have just said of the atmosphere, and may be an useful comparison to those who may not have given this subject much consideration.

Should not the many thousands of cracked arches be so many thousand reasons why architects and builders should alter their mode of constructing such arches? And should not the many thousands of zinc pipes, iron pipes, and earthen pipes, now so awfully disfiguring the tops, alike of the mansion and the citizen's dwelling, be as so many thousand loud-sounding trumpets, calling with stentorian notes upon the learned men of the 19th century to alter their modes of heating apartments? *Fini*

*coronat opus.* Save our houses from such crowns, such finials! J. J. EDWARDS.

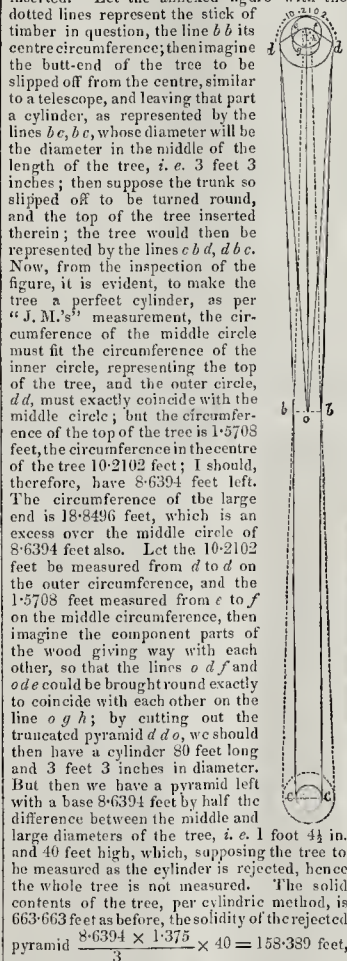

P.S.—Should you see any utility in it, I would, at an early period, send you plans for the ventilation of apartments, schools, and school dormitories.

February 19, 1844.

[We should be happy to receive from our correspondent any good suggestions for the purpose.—Ed.]

MEASURING ROUND TIMBER.

Sir,—You did me the favour of inserting my elucidation of the round timber measurement in your last number. I know several of your readers who do not now understand it, by their not being acquainted with algebraic notation. I used the following mechanical method to convince them how the discrepancy arises, which succeeded well. Judging by analogy, there are many others who read THE BUILDER for their improvement equally at a loss to understand it. I submit it to you, that if you think it worth a place in your journal, it may be inserted. Let the annexed figure with the dotted lines represent the stick of timber in question, the line *bb* its centre circumference; then imagine the butt-end of the tree to be slipped off from the centre, similar to a telescope, and leaving that part a cylinder, as represented by the lines *bc, bc*, whose diameter will be the diameter in the middle of the length of the tree, *i. e.* 3 feet 3 inches; then suppose the trunk so slipped off to be turned round, and the top of the tree inserted therein; the tree would then be represented by the lines *cbd, dbc*. Now, from the inspection of the figure, it is evident, to make the tree a perfect cylinder, as per "J.M.'s" measurement, the circumference of the middle circle must fit the circumference of the inner circle, representing the top of the tree, and the outer circle, *dd*, must exactly coincide with the middle circle; but the circumference of the top of the tree is 1-5708 feet, the circumference in the centre of the tree 10-2102 feet; I should, therefore, have 8-6394 feet left. The circumference of the large end is 18-8496 feet, which is an excess over the middle circle of 8-6394 feet also. Let the 10-2102 feet be measured from *d* to *d* on the outer circumference, and the 1-5708 feet measured from *e* to *f* on the middle circumference, then imagine the component parts of the wood giving way with each other, so that the lines *odf* and *ode* could be brought round exactly to coincide with each other on the line *ogh*; by cutting out the truncated pyramid *ddo*, we should then have a cylinder 80 feet long and 3 feet 3 inches in diameter. But then we have a pyramid left with a base 8-6394 feet by half the difference between the middle and large diameters of the tree, *i. e.* 1 foot 4 1/2 in. and 40 feet high, which, supposing the tree to be measured as the cylinder is rejected, hence the whole tree is not measured. The solid contents of the tree, per cylindrical method, is 663-663 feet as before, the solidity of the rejected pyramid  $\frac{8-6394 \times 1-375}{3} \times 40 = 158-389$  feet,

which added to 663-663 feet = 822-052 feet, the solidity of the tree measured as the frustum of a cone, which proves the cylindrical method does not measure the tree truly by nearly 1/4th part.

Now, by cutting the tree in two on the line *bb*, and measuring each part separately, and following the same steps in each, as we have done in the whole tree, we can easily see why the two parts together measure more than the tree in one; for, in this case, we shall have to reject two truncated pyramids, 20 feet high each, and whose two bases are each 4-3197 feet by 6-875 feet, and united solidities only 39-59725 feet; this, taken from the former pyramid, *viz.* 158-389 feet, leaves 118-79175 feet, the excess of the two parts, when measured

separately, more than the tree when measured in one.

Measurement in two parts {  $\begin{matrix} \text{Feet.} \\ 672-007875 \\ 110-446875 \end{matrix}$

Tree in one as before.....  $\begin{matrix} 782-45475 \\ 663-663 \end{matrix}$

Excess as before ..... 118-79175

Then the contents of the two cylinders added to the two pyramids will again equal the frustum of the cone,  $782-45475 + 39-59725 = 822-052$ , as before.

The tree, measured by the quarter-girth method, may be contrasted with the square pyramid in the same manner as I have done the cylinder with the frustum of the cone, when your correspondent "L." would instantly see the answer to his inquiries. Apologizing for occupying so much of your paper,

I remain, yours respectfully,

R. A. P. not R. F. P.

Newman-street, Feb. 19, 1844.

N.B. I beg to inform your well wisher, "J.W.P." he may obtain SYMPATHETIC HINGES for folding-doors, either with or without springs, at No. 4, Poland-street, Oxford-street. I used some from there last week, which act exceedingly well.

USELESS TROUBLE TO CONTRACTORS.

Sir,—Seeing an advertisement in five different papers, and a notice of the same in your useful publication, of works to a turret and other works to be contracted for to be done at Preston Hospital, near Wellington, I took the trouble of going to examine the drawings, &c., expecting to find something worth looking after; but imagine my disappointment when I found the turret to be about 17 feet high, 7 feet in length on the plan, and 4 feet wide, and the other works—a privy! Now, whatever might be the motive for so extensively advertising such a concern, I do think that it is "too bad," to call tradesmen from their employment, and put them to considerable expense for so paltry an affair, which I believe altogether will not exceed 50*l.*; therefore I have taken the liberty to send this account thereof to you as the advocate of the rights of the trade, leaving you to make what use you think proper of the communication. I am, Sir, yours truly, P. Wolverhampton, February 20, 1844.

DOUCEUR.

Sir,—Permit me to make an observation in your publication of this week in reference to an advertisement that appeared in your last week's number.

I find some person undertaking to offer a douceur of 4*l.* to any foreman of a good shop, if he will undertake to rob his master once per week for twelve months, *viz.*, by giving the advertiser twelve months' work, at, of course, 30*s.* per week—about 10*s.* per week more than his real worth.

If there is a class of individuals creeping into employment in any shops on such respectable terms, I hope the master-builders will have an eye to such business, and discharge any foreman who would be base enough to commit such an indirect robbery as that proposed in the advertisement of last week.

I am, Sir, your obedient servant,

A BUILDER'S FOREMAN.

NEW CHAPELS AT THE NUNHEAD CEMETERY.

Sir,—I am desired to inform you that the artists who have competed for the chapels at the Nunhead Cemetery will be admitted to an inspection of all the designs on Monday and Tuesday next, Feb. 26 and 27, between the hours of 11 and 5 o'clock, at this office.

I am, Sir, your obedient servant,

C. BURLS, Jun., Sec.

London Cemetery Company, 15, Bridge-street, Blackfriars.

Sir,—Will any one of your numerous readers inform me why it is that a plumber receives more wages, and works fewer hours, than a joiner? I have been in practice some time as a surveyor, but never could discover any reason for it other than custom. The plumber's art does not, as appears to me, require more ability than the joiner's, and the joiner's tools are certainly much more expensive than those of the plumber. I am, Sir, A CONSTANT READER AND SUBSCRIBER.

INIGO JONES.

SIR,—In page 255 of your last year's volume, there appears a view of a windmill stated to have been designed by Inigo Jones, and erected somewhere in Warwickshire, which so much resembles a building in America, imagined to be of remote and unknown antiquity, that my attention being called to the subject, I have endeavoured, but vainly, to find some account of it in such topographies and such lives of Inigo Jones, as I have by me. I therefore beg, through the medium of THE BUILDER, to ask for some further account of the locality of the object in question; the mouldings of which, notwithstanding the fine things said of them in the aforesaid page 255, are either very badly drawn, or by time have been degraded, or by injudicious renovation grossly corrupted.

I am, Sir, your humble servant,  
AN ARCHAEOLOGIST.  
London, Feb. 17, 1844.

SIR,—Will you be so kind as to inform me by means of your valuable paper, what is a good method of separating water from a clayey soil, in order to put a foundation of a building upon it; or of drying the soil in any way by means of lime, coal ashes, or some such substance? By so doing you will confer a favour on,  
Your humble servant,  
A SUBSCRIBER.

20, Berkeley-street, West, Hyde Park-square.

SIR,—Will you or any of your correspondents be kind enough to inform me where tools requisite for sinking or boring an artesian well can be procured; also in what work I can find the best description of the process now in use?

Yours obediently, S. E. A.

### Miscellaneous.

DECORATIONS AT BUCKINGHAM PALACE.—The interior of the new Chapel Royal at Buckingham Palace is being decorated. The carved stucco work, the mouldings and other ornaments of the ceiling have been gilt, and the compartments into which it is divided painted light blue. The capitals of the columns supporting the ceiling, and parts of the bases, have been gilt. The front of the royal closet has also been painted in light blue, and the frets and other ornaments of the cornice richly gilt. The Doric columns supporting the royal closet have had their capitals gilt and the shafts painted. The organ screen has also been decorated in a similar rich and tasteful style.

THE NEW ROYAL EXCHANGE.—The sale of the first portion of Bank-buildings, which was commenced on Monday by Mr. Pollen, the auctioneer, and concluded the following day, has realized a good return, amounting to about 1,300*l.*, the property disposed of including the spacious banking-house and residence of Messrs. Ladbroke and Co., and three other houses. On Monday next the sale of the second portion will be commenced among the buildings to be sold, being the Sun Fire-office. By the conditions of sale the buyer must remove the first part in 23 days; the same period being allowed for the removal of the second division. The whole will be cleared away by the end of March.

METROPOLITAN IMPROVEMENTS.—The large space of ground in Broad-street, St. Giles's, which has been obtained by the removal of the houses at the north end of Monmouth-street, is now open to the public, a granite roadway having been completed and laid down. The demolition of the houses, and the formation of the new thoroughfare, have added greatly to the improvement of this locality, as a very spacious thoroughfare has been made. At the end of Belton-street, adjoining the same spot, some houses have been cleared away, which has considerably widened that part, and, when paved with stone, will open the communication from Waterloo-bridge to St. Giles's. In Belton-street (for the line of this new street) nearly half the houses between Broad-street and Long-acre are taken down on the west side. Among the number was the Guy Earl of Warwick public-house, which was established a great many years ago. Upon a site near to this house a chapel of ease to the parish church of St. Giles-in-the-Field will be built.

SIR JOHN SOANE'S BEQUEST TO DISTRESSED ARCHITECTS.—The trustees appointed by Sir John Soane will meet at the Museum, No. 13, Lincoln's-inn-fields, on Monday, the 25th day of March, at 3 o'clock in the afternoon precisely, to distribute the dividends which shall have accrued during the preceding year from the sum of 5,000*l.* Reduced 3 per Cent. Bank Annuities, invested by the late Sir John Soane amongst distressed architects, and the widows and children of deceased architects left in destitute or distressed circumstances. Forms of application may be had at the Museum, and must be filled up and delivered there on or before Saturday, the 16th of March, after which day no application can be received.

A NEW PROPELLER.—An invention has been made by an ingenious mechanic of Edinburgh, of a new mode of creating motion to vessels, doing away with paddle-wheels and boxes, as well as the Archimedean screw. It is a simple revolving cylinder, placed amidships, which acts as a windlass, and makes a rope of the sea; in fact, the velocity acquired is in proportion to the quantity of water discharged by the agency of the cylinder, through a discharging nozzle at each side of the vessel; and what is curious, the discharging nozzles can be turned by a simple operation on deck, so as to stop the vessel, make her move backward or round as on a pivot, within her own length, without even the knowledge of the engineer, or the assistance of the rudder, as no stoppage of the engine is necessary for the purpose. The convenience is a smaller consumption of fuel, and the capability of the broadside carrying an entire armament.

ÆOLIAN SEA SIGNALS.—Another method of applying the waves of the sea has been recently contrived, which promises more practical results than the propelling scheme. The object is to make the breakers on a dangerous coast serve as their own warning signals to sailors. The inventor proposes to have hollow buoys moored near the dangerous coast or sand bank, to which buoys' pipes, somewhat like organ-pipes, are to be affixed. Metal tongues, on the principle of accordians, are to be fitted to the pipes, so that when the buoys are tossed up and down by the breakers, the air may be forced through, and cause them to utter warning sounds, which would become louder and louder as the sea raged more fiercely and the danger increased.

GOthic ARCHITECTURAL SOCIETY OF OXFORD.—The second meeting of this society was held at its rooms on Wednesday, the 14th inst., the Rev. the Rector of Exeter College in the chair. Thirteen new members were admitted, and the remainder of the evening was occupied by the reading of an interesting paper "On the Church of St. Peter-in-the-East," Oxford, by the secretary, H. Addington, Esq., who contended that the style was Transition Norman, of about the same date as the choir of Canterbury Cathedral, 1175—84, opposing the tradition of its having been built by Gimbald, in the time of Alfred the Great.

YARMOUTH.—Mr. Hutt, of Cambridge, has presented, through W. E. Randall, four beautiful models to the Gorleston Museum, viz.:—Goton Font, Cambridge; circa, 1150. Font in St. Peter's Church, as restored by the Cambridge Camden Society; style, semi-Norman; circa 1180. Font in St. Edward's Church, Cambridge, as restored by the Cambridge Camden Society; style, perpendicular; circa 1450. Font placed in the Church of the Holy Sepulchre, Cambridge, by the Camden Society, 1844.

NATIONAL THEATRE AT HANOVER.—At the ensuing session of the Hanoverian estates, the government intend asking a grant of 300,000 thalers towards building a national theatre at Hanover. An estimate for that purpose has been delivered by the Court architect, Mr. Laves, and the expenses calculated at 800,000 thalers. Should the grant of 300,000 be voted, the city of Hanover is to furnish 100,000 thalers, and 400,000 the king has munificently proffered from his private purse.

The Dockyard at Deptford is to be re-established forthwith for the building and repairing steamers. The number of workmen to be employed is 350.

Letters received from Varna mention the total destruction of that city, by which a loss of four millions of piastres has been caused.

### Tenders.

TENDERS delivered for additions and alterations to St. Luke's Workhouse.—Messrs. Penrice and Plum, Architects:—

Palmer	£3,993
Camden and Hack	3,600
Stevenson	3,575
Want and Son	3,469
Thompson	3,428
Reynolds	3,400
Burtenshaw	3,375
Mitbell	3,300
Croust	3,293
Travers and Son	3,250
Geary	3,227
Smith	3,196
Kempster	3,168
Cooper and Davis	3,163
Crook	3,159
Carter	3,115
Ward	2,972
Jay	2,889
Norris	2,577

The tenders were not opened in the presence of the parties.

### NOTICES OF CONTRACTS.

CONTRACT for the Erection of a new Union Workhouse at Birchfield Wood, Sunbridge, Kent.—Mr. Mason, Architect, 24, Lime-street, London. Feb. 29.

CONTRACT for 80 Fathoms of Yellow Deal Ends for the Kensington Workhouse.—Mr. S. Coonell, 1, Canning-place, Kensington New Town. Feb. 29.

CONTRACT for Building new Sewers in Portpool-lane, Leather-lane, Woburn-place, and Great Coram-street.—Messrs. Stable and Lush, Hattongardien. March 8.

CONTRACT for better Paving, Repairing, and keeping in order the Stone-carriage and Footway Pavements of the parish of St. Mary-le-Strand.—Mr. G. Truwhitt, Clerk. March 14.

CONTRACT for supplying her Majesty's several Dock-yards with 2,750 loads of English Elm Timber, and 119 Elm Trees for Pumps.—Secretary of the Admiralty. March 19.

CONTRACT for Building Nine fourth-rate Houses.—Mr. Single, 34, Coleman-street, City. March 11.

CONTRACT for Repairing or New Paving the Footways and Carriage-ways, as the Commissioners may appoint, of the parish of St. John the Evangelist, Westminster, for one year, from Lady-day next.—Mr. J. R. L. Walsley, Clerk. March 5.

CONTRACT for the Labour and Iron Work of Four Hundred Lineal feet of Wharfage, commencing at the North end of the present Wharf at Fleet-wood.—Mr. H. Bazett Jones, Secretary. March 1.

CONTRACT for Building an Infants' School-Room, near St. John's Church, Bury St. Edmunds.—Rev. Robert Rashdell. March 1.

BRIDLINGTON PLEES AND HARBOUR.—Erection of a new south pier, removal of present pier, and other works for enlargement of Harbour.—Plans and Specifications at the Office of Mr. Sidney Taylor, Solicitor, Bridlington. March 1, 1844.

PARISH OF ST. GEORGE, HANOVER-SQUARE.—Contract for Workmen's Tools and Hammers, Iron Lamp Posts and Gas Fittings, and for keeping in order the garden in Hanover-square, for one year from the 25th March. R. Lees, Clerk, Board Room, Mount-street. March 6.

PARISH OF ST. GEORGE, HANOVER-SQUARE.—Contract for Masons' and Paviers' Work, and supply of Guernsey Granite Chippings, and Yorkshire Paving, for one year from the 25th March.—Mr. R. Lees, Clerk, Board Room, Mount-street. March 6.

CONTRACT for Removing present Wooden Turret, and erecting a Stone Turret in lieu thereof, with other works, at Preston Hospital, near Wellington, Salop.—Plans, &c., of Mr. Haycock, Esq., Architect, Shrewsbury, or at Mr. Potter's, Bridgman-place, Walsall. March 9, 1844.

### COMPETITION.

PREMIUM of 20 guineas for the best plans and estimates for erection of a new gaol, Banbury.—All information may be obtained on application to the Town Clerk. March 1, 1844.

### TO OUR CORRESPONDENTS.

We should be happy to have any contributions from our correspondent at Gorey, whose drawings are well made out. In the present state of architectural knowledge, delineations of subjects of Pointed Architecture will be most esteemed. His drawings of the school are being engraved.

C. K. S. K.—The design for the Decaying Testimonial was made by a working-mason.

The Builder.

NO. LVI.

SATURDAY, MARCH 2, 1844.

**G**AIN resuming the subject of Bridges, we come to matters no less important than those of which we have already treated. We had arrived in our 53rd Number (p. 61) at the key-stone, and there gave some rules upon the matter: we now proceed in our theories by stating—

13thly. The bridge-builder's most scientific address is shewn by increasing the abutment, and diminishing the work

hanging in jeopardy, to the utmost limits, without burthening the foundation.

14thly. Hence those who buoy up a key-stone by an increase of extraneous abutment, though they succeed, do so at great extra expense of material; the weight of which on weak foundations would cause failure through sinking, and even, though at present successful, lead to ultimate failure through any accidental derangement of the foundation.

15thly. The relative increase of abutment, and the diminution of parts in jeopardy, should therefore be effected within the arch itself, without any increase of material.

16thly. All the parts of an arch which would not fall off their beds if the remainder of the arch were removed, form abutment.

17thly. High Gothic or Pointed arches, may be so formed as to be all abutment and to have none of their own parts in jeopardy.

18thly. Circular Segmental arches, flat Catenarian arches, and flat Two-centred Pointed arches, may be so formed as to have all their parts in jeopardy, and to have none of their parts forming abutment.

19thly. Higher Catenarian arches, Elliptical arches, and Four-centred or Tudor Pointed arches, may be so made that a portion of their work may form abutment, the remainder hanging in jeopardy; they all approach excellence, as their parts in jeopardy diminish, and those forming abutment increase.

20thly. In all bridges, consisting of a series of arches, the quantity of work in jeopardy may be greatly diminished by causing some of the voussoirs which would fall over from their beds on one side of a pier to be counter-balanced by being tied by metal (as iron or copper) to those of the arch on the other side of such pier; so that if the active force of the parts of an

amounting to only a hundred tons, the structure would be ready to fall; but if fifty tons of the work in jeopardy were added to the pier, the work to be sustained would be only fifty tons, and the sustaining abutment would become one hundred and fifty tons, without one ounce-weight being added to the work except from the gravity of the ties. But in such case a great diminution of the sustaining parts of the structure might be with safety made, thence rendering the work at once cheaper, lighter, and more secure.

ROYAL POLYTECHNIC INSTITUTION.

DR. KEENAN'S LECTURES.

ON Saturday, Feb. 17, Dr. Keenan delivered his fourth lecture at the above institution. The subject of this lecture was "the adaptation of the constitution to particular climates and occupations." The lecturer began by observing that when rain was coming on, particularly after long droughts, many persons felt a great reduction of strength and spirits, and at the same time it might be observed that the fire upon the hearth burned less briskly; the latter fact was clearly attributable to the less rapid combination of air with the fuel; and since it was previously proved that the movements of the animal machine resulted from the combination of air with respiratory food, such as butter, wine, &c., the diminished strength of body would be expected *a priori* to be contemporaneous with diminished combustion, as in this state of the weather the air had a diminished affinity with the elements of food. These, consequently, accumulated in the system, and assumed the form of fat; so that the act of growing fat is the act of storing up in the body what, in a favourable condition of the atmosphere, would be oxidized for the production of strength; and here the lecturer called the attention of the audience to the fact, that the force which actuated the electro-magnetic machine on the table before him resulted from vital air combining with zinc, that whatever increased combination increased the force of that machine, and whatever diminished the one diminished the other also; accordingly, if a person in Lincolnshire, where the situation is low, damp, swampy, and which therefore tends to induce a permanent state of the air, analogous to that which in Paris precedes rain, finds himself getting fat, and at the same time languid and spiritless, if he knew the true function of the lungs he would say to himself, "I am not to eat my food to be accumulated in my body for the sake of bulk.—I am not to carry about with me a portable pantry. I shall seek an air that by chemically combining with my butter and beer, shall result in electro-energy;" and, accordingly, he would betake himself to the Welsh mountains, or to Paris, or still better, to some of the mountains of Switzerland. Here that which in a stagnant and damp air accumulated in the form of fat, would be used as material actuating both body and mind. Effects similar to those of Paris and the Switzerland mountains may be felt at Brighton, or, in a word, any where where the air is dry and to brisk motion.

LAST Saturday Dr. Keenan resumed his course of lectures at this institution. He commenced by observing that the object of the present lecture was to trace the influence of physical causes on the moral and intellectual faculties, as well as on taste. From what had been said in the preceding lectures, he trusted he might assume as proved, that the strength or energy of the human body was to be measured by the quantity of air that the act of breathing could force into chemical combination with digested food (in the form of venous blood). To illustrate this he referred to the galvanic pile upon the table, which he said was proportionable to the metal of the battery. That that energy might be used for any given

purpose, but then it could not, at the same time, be used for any other. In like manner, the electro-energy generated in the breathing, which confers strength or vital cohesion on the textures of the body, energy on the muscles for the purpose of locomotion, and on the brain the power to sustain thought and feeling, if predominantly expended on one of these departments of the animal machine, shall necessarily be defective in others. Hence it was that an athletic youth, coming from the country, with great muscular power, to commence his collegiate studies, often exhibited, before the end of his course, as great a reduction in the firmness of his bodily textures and of his strength in enduring fatigue, as he exhibited an increase of the vigour and perfection of the cerebral actions involved in the development of thought. If by literary ambition, or the stimulus of parents or teachers, such a youth should long sustain the disturbance of his nervous energy, by keeping it constantly on the brain, the declining vigour of his other organs will warn him, though often too late, of his fatal mistake; and in this way scrofula, whether in the form of consumption, king's evil, white swelling of the knee-joint, inflamed eyes, or by other developments, is often produced. The lecturer then remarked, that among those who approached so near the truth as to know that the human body is actuated by electricity, almost all considered the brain as the organ of its production; this, however, was a grave mistake, and quite unsupported by the facts of science; for the production of electricity for the purposes of motion implied the expenditure of materials, and while these materials were to be found exactly of the kind required in food and air, they were not to be found in cerebral matter. The mistake is dangerous, if carried out, in its consequences; for if a weak boy, of a flaxy fibre, that is, of too little energy, were to be treated upon this principle, we ought to exercise the brain, and as far as possible sustain it in action, in order that it might manufacture strength for the enfeebled body; but the facts of the case would shew such procedure a good way of *weakening* further, instead of conferring strength. On the contrary, let but the exact way in which strength is generated be understood, viz., by the action of air on digested food—that the quantity of strength is proportioned to the available quantity of breathing—that the brain, instead of generating, receives its energy from the lungs, and we shall be in the sure track for finding improvement. For this purpose, by proper exercise, we should enlarge the thorax, select a food easy of digestion, that is, easily disposed to combine with air, and an air which from its dryness and brisk motion is disposed to combine with all the motor food instead of leaving a residue in the blood assuming the form of bilious accumulation.

Dr. Keenan then proceeded to shew the effects of different climates on the moral and intellectual faculties. He appealed to the audience whether they had never felt when the digestion was going on badly, when rain was coming on, &c., less intensity in their kindly affections? What was thus transiently felt under such circumstances in good air was more or less induced permanently where the air is always bad; in this case though there is experienced a reduction of sentiment, there is not a proportionate reduction of thought, on the contrary, there is a greater disposition to think in a certain manner when the emotional part of the brain is sluggish and inactive. In this case there is a tendency to a continuity of feeble, timid, and apprehensive thought, just in the same proportion that the function of the spinal marrow is reduced; so that the effect of watery, stagnant air, is to induce a balance in favour of the thinking part of the brain, while it acts against our emotional or sentimental nature. Hence the cautious thoughtfulness that characterizes the inhabitants of humid atmospheres, and the rash and precipitous character that characterizes those who live in atmospheres where, from the dryness of the air, there is more electrical excitement. The difference of the sparks drawn from the electrifying machine in France and Flanders points out the real cause of the inhabitants of the former being agile and emotional, and the latter being sedative and thoughtful. The effects of wine compared with those of tea and coffee were exactly analogous to those of a dry and

arch in jeopardy, amounting to a hundred tons, were sustained by a strength to the pier

moist climate. Wine, and a dry, brisk, sunny air, inducing a balance in favour of the back of the head—while tea and coffee, and a damp air, determined a balance in favour of the forehead. Was this the reason why so much coffee was used in France and so much spirits in the Low Countries?

Dr. Keenan here concluded his discourse, and to this evening to give his last lecture, to which we look forward with great interest, as he is to give his opinion on the causes of consumption (a malady unfortunately so prevalent in this country), and its most rational remedies and preventives.

#### ROYAL STATISTICAL SOCIETY.

ON Monday evening, 19th February, the Right Hon. Lord Ashley, the president, took the chair at the meeting of the members, supported by the Hon. P. Bouvier, Mr. Charles Hindley, M.P., Mr. R. A. Slaney, M.P., Rev. J. Milman, Professor Pryme, Dr. Guy, Dr. King, Mr. T. Tooke, F.R.S., Mr. B. B. Cabell, F.R.S., and other members of the society. Mr. Fletcher read an interesting paper, prepared at the request of the society, on the statistics of the metropolis and its suburbs, descriptive of its present boundaries, its population, its limits of local government, geographical position, and statistical peculiarities, with the view of gathering useful information, for the purpose of aiding the sanitary and other inquiries which are now being instituted into the present state of the metropolis. The paper, after stating that the City within the walls contained 70 parishes, and the City without the walls 11, occupying an area of 600 acres, proceeded to shew that, although it was the grand arena of commerce, upwards of one-twentieth of its population were resident without its walls, and that, as far as house occupation goes, it mansions at night time are half deserted. Southward, although occupying 600 acres, containing nearly 100,000 inhabitants, was without the privilege of citizenship. After describing the geographical position and statistical peculiarities of Westminster, Marylebone, and the suburban districts, the remaining portion of the paper was devoted to an analysis of the present state of the endowed, voluntary, and assessed charities of London, from which it appeared that the funds of the corporation charities alone amount annually to 220,570*l.*, the general assessed charities to 77,000*l.*, and the endowed parochial charities of the City and the rest of the metropolis to 97,000*l.* per annum, the total annual revenue of the metropolitan endowed charities being 400,000*l.* The assessed charities by poor-rates were 551,202*l.* per annum. A discussion ensued upon the facts contained in the latter portion of the paper; and it was suggested with applause that a committee of the members of the society should be formed to enter upon an investigation of this subject, with the view of furnishing authentic information as to the agency which is employed and the use which is made of these enormous revenues.

#### INSTITUTE OF THE FINE ARTS.

A general meeting of this body was held at Osborne's Hotel, Adelphi, on Saturday evening last—Thomas Wyse, Esq., M.P., in the chair. The main objects of the formation of this institute are to unite, by intellectual and social means, the interests of artists, and to attempt to establish a free and liberal intercourse between the patrons and lovers of art and its professors. The meeting on Saturday was numerously attended. The minutes of the last general meeting, held 27th January last, having been read and confrmed, Mr. Fahey, the secretary, read the draft of a petition proposed to be presented to parliament by the institute, praying for the establishment in London, at the public expense, of a "Hall of Sculpture," which should comprise the finest casts procurable of all the most beautiful pieces of sculpture in the world. It is proposed that this hall should be open during the day to the public, and in the evening to artists for the purposes of study. The meeting, having approved of and adopted this petition, was addressed by Mr. Wyse, in an eloquent speech, on the importance of the cultivation of the fine arts, and the influence they exercise on the best interests of society. Mr. Charles Mackay

then read a paper complimentary to the genius of Theodore Von Holst, an English artist of great ability, who died a few years ago. A paper, drawn up by Mr. Heaphy, on the practicability of keeping frescoes damp for several days, was also read, after which the meeting separated. The secretary announced that the next meeting would be held in March, at the rooms of the Institute, No. 7, Newman-street, for the election of a new council and other officers.

#### INSTITUTE OF BRITISH ARCHITECTS.

FEB. 19.—T. L. Donaldson, V.P., in the chair.

Drawings by F. Catherwood, Esq., of the architectural antiquities discovered in the ruined cities of Central America, were exhibited and described. The drawings exhibited tend to prove that a higher degree of civilization existed anciently on the American continent than historians have been willing to concede. One of the most singular facts necessary to be kept in mind, when considering the arts of this people, is, that they had no knowledge of the use of iron tools, but used copper instruments hardened by the admixture of tin or some other available metal, and with such tools their buildings of stone and sculptures in granite were worked. The Indians, besides a perfect knowledge of stone-cutting and laying stone, were well acquainted with various kinds of mortar, stuccoes, and cements; and large masses of excellent concrete are found in many of their buildings. They were, in fact, so far as the mechanical part went, accomplished masons. Their painting is superior both to their architecture and sculpture, and in nowise inferior to that of the Egyptians, and they went even a step beyond them in the blending of colours; approaching more nearly to the paintings found at Pompeii and Herculaneum. In one of the rooms of a large building are paintings covering the entire walls, from the floor to the ceiling. The figures are not more than from 6 to 8 inches in height, but most interesting subjects are represented, abounding with life, animation, and nature. Mr. Catherwood noticed the peculiar style of the buildings of Central America and Yucatan. The prevailing type of the architecture consists in first constructing mounds or terraces (called by the Indians *teocalli*), and on these placing the sacred edifices and palaces. These *teocalli* are found in great numbers; they are frequently of large dimensions, of a pyramidal form, but do not terminate in a point like the Egyptian structures. They have on their summits platforms of sufficient extent for the temples, which contained the statues of the deities, and in front was conspicuously seen the sacrificial stone or altar, convex on its upper surface, so as to raise the chest of the human victim. The buildings are generally long, low, arched, and of a single story, a mode of construction frequently adopted by the Spaniards, on account of the shocks of earthquake to which many parts of the country are exposed. Another, and not less distinguishing feature, is the arched rooms found in almost all these buildings. These arches invariably consist of stones overlaying each other from opposite walls, until the last meet over the centre of the room; or, what is still more commonly the case, when the last stones approach within about 12 inches of each other, a flat stone is laid on the top, covered either with solid masonry or concrete; the joints of these stones are all horizontal. The roofs have a slight inclination, to throw off the rain, and are cemented. This form of arch appears at first sight original, and is so as regards the Indians, but the same principle was adopted in the earliest times in the Old World, and would probably suggest itself to any people requiring stone roofs over spaces too wide to be covered by flat stones. As regards analogies in architectural ornaments, the same argument may apply. That most frequently met with, and perfectly alike in Greece and in Yucatan, is one likely to be found wherever rope-making is understood—and what people so barbarous as to be unacquainted with this simple and primitive process? Other ornaments, offering remarkable coincidences of form, might be adduced, but the same reasoning will apply to them all.

#### INSTITUTION OF CIVIL ENGINEERS.

FEB. 27.—The President in the Chair.

The discussion on the subject of screw propellers was continued; the main dimensions of the Princeton United States steam frigate were given: she is 164 feet long, 30 feet beam, 22 feet 6 inches deep in the hold, draws 17 feet 6 inches water, and the propeller makes 32 revolutions per minute. The engines have two semicylindrical steam cylinders or chests containing vibrating pistons or flaps, with cranks upon the ends of their suspending pivots, both these are coupled by connecting rods to a main crank on the driving-shaft: the lengths of these cranks are so proportioned, that their alternate vibrations produce a rotary motion of the main crank, and thus act directly upon the propeller without the intervention of band or gearing. This principle was some years since tried successfully by Captain Ericson in a tug-boat on the Thames, named the Robert Stocketon, after the projector, who has been the means of introducing the system into the American Navy, and now commands the Princeton. It was mentioned that recently, on being examined at Marseilles, the cast-iron propeller of the Napoleon, French steamer, was found to be much affected by the galvanic action of the copper sheathing in the salt water, and was fast turning into a substance resembling plumbago, which was so soft as to be cut easily with a knife.

Some very interesting remarks were also made on the state of the metal guns recovered from the Royal George by General Pasley; but it appeared from very careful examination of the effect of salt water alone upon cast-iron, without the contact of other metals to produce galvanic action, that good bare grey cast-iron might be used for piles or other hydraulic works with great advantage; and instances were given of cast-iron, which exhibited no appearance of change after sixteen years' immersion in salt water and silt.

A further discussion also occurred on the subject of valves for pumps; and then a paper was read giving a description by Mr. Rhodes, M. Inst. C.E., of a bridge built of cast-iron girders upon timber piles, having a swivel bridge at one extremity, with an opening of 40 feet span, through which the navigation of the river was carried on. The total length of the bridge, exclusive of the width of Hayes Island, was stated to be 558 feet 6 inches: it stretches across the river Shannon at Portumna by thirteen openings of 20 feet each, from the Tipperary shore to Hayes Island, which is in the centre of the river, and thence by twelve openings of a similar span, and a swivel bridge of 40 feet span, to the Galway shore. The construction, which was executed from the designs of Mr. Rhodes, under the direction of the Commissioners of the Public Works for Ireland, was minutely described, and was illustrated by some elaborate drawings, shewing every detail of the works, which were stated to have cost 24,131*l.*

The following papers were announced to be read at the meeting of March 5th, when the monthly ballot for members would take place:—

No. 655, "Description of the Bridge over the river Whitadder, at Allanton," by J. T. Syme.

No. 625, "Description of a cast and wrought iron trussed girder for Bridges, with a series of experiments on their strength," by F. Nash.

No. 666, "Account of the building of the Wellington Bridge over the river Ouse at Leeds," by J. Timperley.

The Bank of England has just published an engraving of peculiar interest to the city, from a picture presented to them by the late respected Jeremiah Harman. The painting is by Marlow, and represents the Bank of England, Royal Exchange, and adjacent buildings, as they existed in 1790. The proceeds from the sale of the engraving, which is by Mr. Kernot, are to be given to the Widows' Fund of the Bank of England. A value as an historical record is given to it by the circumstance that in a short time not one of the buildings represented, excepting a small portion of Cornhill, shewn in the back-ground, will be in existence.

## DESCRIPTION OF A CAST AND WROUGHT IRON TRUSSED-GIRDER BRIDGE ON THE LINE OF THE BISHOP AUCKLAND AND WEARDALE RAILWAY.

BY JOHN STOREY.

(Read before the Institution of Civil Engineers, January 9.)

The author states, that his attention has been long directed to the expensive construction of the brick and stone bridges, usually erected over and on the line of railways, and the apparent want of durability in the timber bridges, which have in some instances been substituted; as well as to the cast-iron bridges, which have generally been constructed in situations where the height between the top of the rails and the level of the roads which they span was so limited, as not to admit of a stone or a brick arch. In the latter cases, cast-iron girders have been employed, but their great weight has rendered them expensive, and has obliged the abutment piers for supporting them to be very substantial.

In order to obviate these objections, the author has introduced combinations of cast and wrought-iron in forms, which he contends may be advantageously adopted for occupation-bridges, or even for carrying the railway, and that they may be constructed at a less cost than stone, brick, or even timber bridges.

These bridges consist of longitudinal and segmental girders of cast-iron abutting against each other at the ends, secured together by bolts and nuts through the flanges, and resting on masonry-abutments: a system of wrought-iron tie-trussing is then applied, and struts are placed at certain distances where they are requisite. As many of these principal trusses are used as the strength of the bridge demands, and they are connected by transverse braces and distance pieces of cast-iron, thus preventing undue outward pressure; sockets are cast upon the girders to receive the timber-joists, and the platform is covered with Dantzig deal planking spiked to the joists. The wrought-iron struts at the top clasp the girders, to which they are also firmly bolted, and their lower extremities pass through the truss, so that on the nuts being screwed up, the truss is brought to its proper degree of tension, and being made sufficiently strong to bear the weight calculated for the bridge, independent of the segmental girders, the weight and strain are brought upon the abutments in the most favourable manner.

Bridges thus constructed do not require any centering for their erection, as each side may be put together near the spot, and by means of purchases, may be lifted entire on to the abutments, or the whole bridge may be put together before the earth is excavated from between the abutments, excepting only as much as is necessary for receiving the trussing.

The dimensions are given of occupation bridges, calculated to bear 8 tons, which is stated to be a greater weight than is required by the landowners. The total weight of cast and wrought iron in an oblique bridge of a span of 86 feet 3 inches and 11 feet wide, is 11 tons 7 cwt., and that of a square bridge of 106 feet 6 inches span and 11 feet wide, is 14½ tons: their total cost, including excavating the ground, the masonry, stone penning on the sides of the excavations beneath the bridge, the timber-work, and the painting, was, for the former 280£, and for the latter 342£. These sums are stated to be much less than the expense of similar bridges of stone or even of timber.

A design is given of a stronger kind of bridge of similar construction for carrying two lines of railway. The span is 90 feet and the width 22 feet, between the side railings: the weight is 43 tons, and the total cost, including the masonry, is estimated not to exceed 1,200£. It is calculated to bear about 50 tons, which is as much as could be brought upon it by any passing train.

The author proposes to adapt this system of construction to bridges for crossing rivers, &c., in order that by the lightness of the piers, and their having to bear only a vertical thrust, the water-way may be less impeded than it is at present by the usual heavy stone structures.

A design is also submitted for a bridge, to consist of parallel cast-iron girders, trussed with wrought-iron bars, in such a manner as to convert the depth of the girder into a strut, the weight of the passing load being entirely resisted by the tensile strain of the bars.

The author does not claim the introduction of wrought-iron trussing for cast-iron girders, as he is well aware of its being constantly practised, but he believes that it has not been commonly done to the extent which he proposes; and being satisfied of the practical utility of the system, he was desirous of bringing it more prominently under the notice of engineers through the medium of the Institution, and also of inviting discussion upon the plan, one great merit of which is, that it uses a material produced in this country, better and cheaper than elsewhere, and assists one of its staple manufactures, which is at this moment much depressed.

The communication was accompanied by five drawings of bridges, fully illustrating in detail the various modes of construction treated of.

## THE NEW METHOD OF CLOSING THE PNEUMATIC TUBE OF ATMOSPHERIC RAILWAYS.

BY M. HALLETTE.

(Communicated to the French Academy.)

In the system adopted by MM. Glegg and Samuda, this closing, as every one knows, is accomplished by means of a long band of leather, furnished with short iron tongues, which is free on one side and fixed by the other to the edge of the longitudinal opening that allows the passage of the rod by which the piston is united to the first wagon of the train. Being raised for a moment by a lever in the interior, so as to allow the passage of this rod, the hand immediately falls again; a lever, the motion of which is connected with that of the piston, immediately afterwards presses it against the opening, and an unctuous substance further contributes towards rendering the adhesion more complete. But, independently of the unctuous body's appearing readily to undergo alteration by contact with the air, the leather band must gradually lose its suppleness, and tend, in places, to rise a little, after the passage of the compressing lever; it is therefore desirable that the closing of the longitudinal fissure, instead of being due to the action of a transient effort, should result from a constant action exercised in each point of the fissure. M. Hallette appears to have accomplished this, by availing himself of the elasticity of air.

For this purpose, he has arranged on the upper surface of the pneumatic tube, and bodily connected with it, two longitudinal semi-cylinders, or rather two gutters placed lengthwise, with their concave parts facing. Each of these gutters contains a gullet of elastic material, perfectly impervious both to air and to water. When the two gutters are sufficiently inflated with air, they touch each other by one part of their surface; they act as do the lips of the human mouth, and thus entirely intercept communication between the interior of the pneumatic tube and the exterior air. When the piston moves, the rod, which connects it with the train, slides between the two tubes, which unite again immediately after its passage. This rod, the horizontal section of which is a meniscus, and which hence penetrates, like a wedge, between the two gutters, acts upon them with scarcely any friction. However, in order to ensure their durability, M. Hallette has thought it advisable to protect them with leather at the parts by which they come in contact.

M. Hallette points out all the advantages for internal navigation, which may be derived from atmospheric propulsion, as perfected by himself. While developing M. Hallette's ideas, M. Arago remarked that a system of pneumatic tubes, fixed along the walls of the quay of the Seine, would cost much less in construction than a tow-path, and that the employment of steam for moving the boats would, in many respects, possess special advantages over the employment of horses.

This communication was illustrated by a small model.

CAMBRIDGE PHILOSOPHICAL SOCIETY.—At a meeting of this society, on Monday week, the Master of Trinity, President, in the chair, a paper was read by Professor De Morgan, on diverging series, and a paper by Professor Miller, on the restoration of the standard of weight.

MR. DAWSON, Royal Engineering department, has received the appointment of clerk to the works in Van Diemen's Land.

## LIVERPOOL DOCK COMMITTEE PROCEEDINGS.

The usual weekly meeting of the Dock Committee was held at the Revenue-buildings, on Thursday, Mr. Alderman Bramley-Moore in the chair. The following members were present: Messrs. Nicol, Barclay, Holt, Holmes, Middleton, Smith, Molyneux, Trotman, Aikin, Tobin, Sandbach, Bold, Royden, Kendall, and Ripley.

A letter was read from Mr. William Brown, signed on behalf of several commercial gentlemen, in which the Dock Committee were called upon to complete the shed, covering over the whole space from Victoriato Waterloo Docks, with the view of rendering additional accommodation to the New York packet ships. Upon the motion of Mr. Nicol, it was resolved to increase the shed covering as it had been originally intended between the docks in question.

Messrs. Furnis and Hilton were declared the contractors for the completion of the shed at the King's Dock for the use of the Custom-house.

The sub-committee recommended the erection of a building for the tide-waiters at the north-western corner of the Prince's Dock, the situation of their present house, beyond the graving docks, being exceedingly inconvenient. The cost of the new building was estimated at 700£; and the tide-waiters had intimated their willingness to pay a rent which would amply cover the original outlay for the construction. The sub-committee were authorized to carry out the plan.

The sub-committee reported that, after mature consideration, they could not recommend the board to accept of the proposal of the Steam Tug Company to tow out the life-boats for the sum of 1,000£ a year, and that they would prefer the procuring of a steam-boat for the dock trust. Some discussion ensued, at the close of which the subject was referred back, with liberty to the sub-committee to negotiate with the Steam Tug Company, and to bring the result before the general meeting.

Upon the motion of Mr. Bold, seconded by Mr. Ripley, it was ordered that a new bridge, the cost of which was estimated at 2,000£, be erected at the north end of the George's Dock. Mr. Aikin wished it to be distinctly borne in mind that this bridge was about to be erected in order to afford accommodation to the public, and that its erection would not add anything to the revenues of the dock trust. A document was then read, by which it appeared that the probable net income from the warehouses round the Albert Dock would amount to 38,000£, and from the warehouses and dock 51,400£. This document was ordered to be inserted in the proceedings; and after the transaction of some financial business, the committee adjourned.

## EFFLUVIA-TRAP FOR DRAINS.

TO THE EDITOR OF "THE BUILDER."

SIR,—I forward a section or diagram of an effluvia-trap for drains and sewers, which I acknowledge I have often seen executed. If any of your numerous correspondents would have the kindness to forward a sketch of one or more through the medium of your journal, upon a better principle, effectually to prevent the escape of stench, I shall feel greatly obliged.

I am, Sir, your most obedient servant,

Brecon, 1844.

S.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*Chester Diocesan Church Building Society.*—The annual meeting of the Chester Diocesan Church-Building Society was held on Monday week at the Blue Coat Hospital, and was attended by a large number of the clergy of the Church of England. Amongst those present were the Rev. Chancellor Raikes, the Rev. Rector Brooks, the Rev. Rector Campbell, the Rev. Dr. Tattershall, the Rev. Dr. Byrth, the Hon. and Rev. Horace Powys, the Rev. Messrs. Nolan, Parry, Ewbank, May, Gunning, Bold, North, Higgins, Stewart, Jones, Hesketh, Marshall, &c. &c. About half-past ten o'clock the chair was taken by the Right Rev. the Lord Bishop of Chester. His lordship briefly opened the proceedings, and the Rev. C. Lawrence, one of the secretaries, then read the report, from which it appeared that the sum of 1,640l. had been granted to two localities during the year. The incumbent of Oldham had, a second time, brought the necessities of his cure under consideration, by stating that there existed a population of 60,000 souls, with church accommodation only for 7,500, and accordingly grants of 500l. had been made to each of the three prospective churches that were to be erected in Oldham. The committee had also acceded to an application made by the incumbent of Bleakley, to enlarge and refit an old church upon an extensive plan, and so as to render it capable of affording a large number of free sittings. These formed the grants of the year. The committee, after pressing upon all the friends of the Church the duty of co-operating in a duty so obvious and excellent, stated that they intended to hold their quarterly meetings in Liverpool in future, and that at those meetings applications for aid would be received. The appeal which the Bishop had made to the clergy during the past year, had resulted in the collection of a sum of 2,000l. and upwards, which would recruit the resources of the society. The report concluded by stating that a benevolent individual had tendered a sum of 500l. to the society, provided a further sum of 5,000l. should be raised from the public; but that as only 1,000l. of the 5,000l. had been collected, the offer could not, as yet, be accepted. The treasurer then read a statement of the accounts, from which it appeared that the receipts for the year, including a balance from the previous one, had been 8,949l.; that there was a balance of 7,741l.; that the outstanding accounts were 5,100l. and that there was an available surplus of 2,659l. for the liabilities of the society. The report was adopted upon the motion of the Rev. Rector Brooks. The officers for the ensuing year were then appointed, after which the Rev. Chancellor Raikes proposed a resolution (which was adopted *nem. con.*) to the effect, that the meeting considered that it would be a reasonable enlargement of the society's sphere of usefulness if it were permitted to make grants or the restoration of old churches, where the additional accommodation gained should be equivalent to the building of a new church, but that the sum granted should never exceed the one-fourth of the total expense. Upon the motion of the venerable Archdeacon Rushton, the meeting passed a vote of thanks to the Bishop, which his lordship acknowledged, and the meeting then formed itself into a committee for educational purposes.—*Liverpool Journal.*

*Church Extension.*—A meeting of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, was held at their chambers in St. Martin's place, on Monday week, the Lord Bishop of London in the chair. There were also present the Bishops of Bangor, Llandaff, Norwich, Hereford, and Lichfield; the Revs. the Dean of Chichester, Dr. Spry, Dr. Shepherd, J. Jennings, H. H. Norris, B. Harrison; Messrs. F. H. Dickinson, M.P., Edward Badley, William Davis, Newell, Connop, J. S. Salt, William Cotton. The reports of the sub-committee having been read by the Rev. Mr. Bowdler, the secretary, the meeting proceeded to examine the cases referred to their consideration, and finally voted various grants of money towards building additional churches or chapels. The population of the parishes now assisted is 273,994 souls, and the accommodation provided for them in 40 churches and chapels is 40,824 sittings, of which 9,334

are free; by the erection of seven additional churches, the rebuilding of one existing church, and the enlargement, &c., of seven others, it is intended to add 4,333 seats to this insufficient provision of church-room, including free-sittings for 4,195 persons. Certificates of the completion of new churches, and the enlargement, &c., of existing churches in several parishes were examined and approved, and orders were issued to the treasurer to pay the amount of the grant awarded in each case. The population of these parishes is 46,595 persons, for whom church accommodation to the extent of 4,684 sittings only were provided previously to the execution of the works towards which the society's grants were voted, and including only 1,374 free-sittings; 2,537 seats are now added to that number, 2,157 of which are free. Since the last meeting, forms of application for aid from this society have been issued to eighteen applicants, to enable them to submit their cases to the consideration of the board, and five of these applications are for assistance towards building additional churches in populous places. The treasurer reported that a legacy of 300l., free of duty, has been bequeathed to this society by the late Mr. James Hurst, of Stamford-barn, Northamptonshire.

*New Stained Glass Window, Bishopstone Church.*—A very beautiful stained glass window, by Mr. Warrington, of London, has just been erected in Bishopstone church, at the cost of the rector of the parish. The window is of the style called decorated. In the upper part, containing the tracery, are the emblems of the four Evangelists, as described in Revelations, chap. iv. v. 6, viz, the angel, lion, calf, and eagle, bearing scrolls inscribed "Holy, Holy, Holy, Lord God Almighty, which was, and is, and is to come;" and in the centre the Holy Lamb and banner, inscribed "Ecce Agnus Dei." The principal openings consist of inter-sections of colours, interlaced and intermixed with quaint foliage, after the practice and style of the fourteenth century. In the midst are medallion subjects of the principal events of the life of our Lord, formed by the various shapes caused by the general pattern and designs. The subjects in the centre opening are the Baptism, Crucifixion, and Resurrection; those of the side openings, the Agony in the Garden, the Adoration of the Magi, the Rebuke of Peter for drawing his sword, and the Last Supper. There is a calm and subdued tone of colouring through the whole of this window, assimilating it as nearly as is possible to the best specimens of the ancients, in whose finest works we shall observe that however deep and rich in hue, the ruby is the only colour allowed to show itself in unclouded brilliancy. This observation has been carefully attended to in the present instance, and the effect is chaste and solemn, gaining more and more upon the eye as we become accustomed to it, instead of being tawdry and flaunting, first dazzling, then distressing the beholder by its glitter.—*Hereford Times.*

*Chichester Cathedral.*—A new window has just been put up in the cathedral church of the diocese of Chichester, the expense of which has been defrayed by subscription. The three ancient quatrefoils in the central light are occupied by designs representing the appearance of the burning bush to Moses, the Baptism of Christ, and the Descent of the Holy Spirit on the day of Pentecost. The Resurrection occupies the northern side light, and the Ascension the southern. Emblems of the four evangelists are placed in the upper and in the lower parts of the side lights.

*Opening of Tickton Church.*—This neat structure was opened on Tuesday last, when, the day being fine, a considerable number of persons from Beverley and the neighbourhood were present. The prayers were read in a very impressive manner by the Rev. C. Gerrard, M.A., after which the Rev. J. King, M.A., of Hull, preached an appropriate sermon, which was listened to with marked attention. The choir of singers belonging to the minister were in attendance and sung with great effect.—*Hull Packet.*

*His Royal Highness Prince Albert has just* a donation of 10l., the Earl of Ripon 10l., the Earl of Eldon 20l., to the committee for the restoration of the Round Church at Cambridge.

## RAILWAY INTELLIGENCE.

*The South-Eastern Railway.*—The following is the official report from Major-General Pasley, Inspector-General of Railways, to the Board of Trade, as to the safety and stability of the South-Eastern Railway:—

Board of Trade, Whitehall, Feb. 1.

MY LORDS,—On Tuesday, the 30th, and yesterday the 31st ult., I inspected with great attention the extension of the South-Eastern Railway from Folkestone to Dover, which, combined with my previous inspections of the tunnels, viaducts, and sea-walls of this portion of railway whilst in progress, enables me to make a most favourable report of the whole of the great works comprising it, which are highly creditable to Mr. Cubitt, the engineer-in-chief, and to his assistants.

The extraordinary and novel character of this portion of railway, which has been partly conducted along the bottom of a lofty range of chalk cliffs, with the sea either near to or bordering upon part of the line, whilst the rest of it has been led through tunnels cut in the same high ground, induced many persons to believe that it would be either impossible to complete this portion of railway according to Mr. Cubitt's original plan, or that, if finished, it would be liable to be overwhelmed by the fall of the cliffs above it, or to be destroyed by the irruptions of the sea.

Having examined the whole of the ground above the railway with the greatest attention, in order to discover the unsound parts of the chalk cliffs, if any, which may be known by cracks at the surface, I am of opinion that there is not the smallest ground for apprehension in respect to the first alleged source of danger, because the two tunnels cut through the chalk have been formed in the soundest parts of it, with a considerable height or thickness of solid chalk, not only above, but between them and the sea, so that few and very small portions of unsound chalk which I observed at the extreme summit of the cliffs, 300 or 400 feet above those tunnels, can do no possible harm in falling, as the fragments will slide along the surface of the solid chalk below them, and then roll over into the sea, which has in fact occurred on two or three occasions, since these tunnels were formed, without doing the slightest injury. But opposite to the open parts of the railway all the unsound portions of the chalk have been removed with the greatest care, and the surface cut to slopes more or less regular, according to circumstances, having a base nowhere less than three-fourths of their height, and in many parts much flatter; whilst the earth, which in some few places may be as much as ten feet in thickness over the chalk, has been cut to a slope of two to one, and is every where of sound quality. In this essential process immense masses of chalk were thrown down, partly by the skillful use of gunpowder, by which the company was supposed to have saved about 7,000l., and partly by the labour of workmen continually employed; so that there is not a single crack now to be seen at or near the summit; and the stability of sound chalk, even when standing perpendicularly, or nearly so, is well known, of which a considerable part of the town of Dover itself, lying immediately under part of the same range of high chalk cliffs, from which no slips have taken place or been apprehended, is a striking example.

In respect to the second alleged cause of danger, the two short portions of railway formed along the beach, each bounded by projecting head-lands of chalk, have been protected, one by a massy concrete sea-wall, similar to that of Brighton, with foundations of brick and cement, and substantial counterforts, and the other by a solid timber viaduct on piles driven into the strong chalk below, both of which are of a sufficient height above high water to prevent them from being injured by the sea, at the same time that the tides have no tendency to wash away the beach in those small portions of the coast.

Upon the whole I have great pleasure in assuring your lordships, not only that the railway itself is in a perfectly safe and efficient state, but that no part of the works are exposed to the smallest danger, either from the irruptions of the sea or from the fall of the cliffs; though it was natural for the public to

have their doubts, in the first instance, as to the success of so very arduous an undertaking.

As every thing necessary for the public safety has already been done, for I repeatedly passed over both lines of railway at full speed on a special engine, or in the carriage attached to it, I beg leave to recommend that your lordships will be pleased to authorize the directors of the South-Eastern Railway Company to open their line to Dover as soon as they shall have erected a temporary station for the accommodation of passengers, as they propose, at that place, and which will probably be finished in a few days.

I have, &c.,

C. W. PASLEY, Major-General,  
Inspector-General of Railways.

The Lords of the Committee of Privy  
Council for Trade, &c.

**Whitehaven and Maryport Railway.**—Companies for making branch lines of communication between towns, or from populous districts in connection with some leading railways, are forming to an astonishing extent in all parts of the kingdom; and few of them but what hold out the most promising prospects to the investor, and the certainty of becoming of great public utility. Among these is a proposed line, twelve miles in length, commencing at a most eligible spot between Tangier-street and the North Pier at Whitehaven, near the harbour, proceeding through Harrington, Workington, and the much-frequented watering-place of Flimby, and terminating by joining the Maryport and Carlisle Railway at the Maryport station. The importance of Whitehaven as a seaport is generally known, and its harbour, upon which upwards of 150,000 tons have been expended within the last twenty years, is, undoubtedly, the finest on the western coast. The formation of this line will place this populous and improving town in immediate connection with all the great lines of railway in the north, and place it within a seventeen hours' journey from London, causing increased commerce to flow into it from Scotland, Liverpool, and Ireland. The line selected is highly favourable, and can be completed for 8,000l. per mile, requiring a capital of 100,000l. to be divided into shares of 20l. each; and, from a moderate calculation of the expected traffic, a clear annual revenue is expected of 11,815l., or certainly full 10 per cent. on the capital invested. An important meeting took place at the Savings' Bank, Whitehaven, on Monday last, for taking the necessary steps for the formation of this line, at which the two members for that division of the county, Lord Lowther, and most of the influential gentry of the neighbourhood attended. The proceedings were carried on in the most unanimous spirit, all present agreeing in the necessity of the proposed line, to place the town and harbour of Whitehaven in a position to compete with other large towns in the north of England.—Lord Lowther stated that their representative, Mr. Attwood, who had intended to be present, but was prevented from urgent business in London, had authorized him to state, that in case the resolutions were adopted, and the undertaking commenced, he would take shares to the amount of 5,000l. for himself, and 5,000l. for his son. The resolutions for forming the provisional committee, and giving the necessary authority to apply to Parliament, were agreed to unanimously, after which a book was opened for receiving the names of subscribers, and in a very short time shares to the amount of 45,000l. were agreed to be taken.

**Railway Passenger Duty.**—The Brandling Junction Railway has petitioned the House of Commons in substance as follows:—"That the railway of your petitioners connects the populous towns of Newcastle-upon-Tyne and Gateshead with South Shields, and the extensive port of Sunderland, and has afforded great accommodation to the inhabitants of those places, and particularly to the trading and working classes. That a large proportion of the passengers, conveyed upon the said railway, are carried for considerably less than 1d. a mile, and that the profits of the said railway yield a very inadequate return upon the capital your petitioners have invested therein. Your petitioners, therefore, pray that your honourable House will be pleased to repeal the duty upon all fares not exceeding 1d. a mile, and thereby give some encouragement to railway companies that afford accommodation to the public at so low a rate of charge."

**Rival Railways from Gravesend to Rochester and Chatham.**—In addition to the two rival railways to Rochester, the one starting from Gravesend and the other from Rosherville, a third line was introduced to public attention on Feb. 16th, at the meeting of the Thames and Medway Canal. This is proposed to consist of one line of rails, to be laid on the banks of the canal; and as the 170,000l. expenditure on the canal was for works available to a railway, only 65,000l. are estimated as necessary for the proposed line, as well as for the required carriages, engines, stock, &c. The capital is to be raised in shares, to be offered, in the first instance, to the shareholders in the canal, and if not all taken by them, the residue are to be allotted amongst the public generally. The navigation of the canal will not be affected; and it is stated that their act of incorporation will enable the company to construct the railway, but that an Act must be applied for in the session of 1845, for obtaining the necessary funds. As it is scarcely probable that Parliament will authorize the formation of more than one line of railway between Gravesend and Chatham, a warm contest between the several parties may be expected.

**Railway Property.**—The increased amount of capital invested in the railway companies, is now estimated to be nearly 80,000,000l. sterling; a return, computed by a competent authority, gives the following facts, as exhibiting the enormous increase since 1842 in the value of this species of national property. In October of that year, on the shares of seventy-three lines, the loss, by their being at a discount, was computed at 2,052,696l.; in April, 1843, the profits in premium on eighty-one lines was 3,050,770l.; but in October, 1843, the profits in premiums exceeded the discounts by 13,743,139l., and adding the recovery of the discounts of 1842 to the latter sum, an increase in the value of railway share property of not less than 15,796,183l. is shewn to have occurred, and in so short a time too. Never in the history of securities of an equal amount has such a rise as this been known, although mines, at one time, had a tolerable, but, unfortunately, a very illusive hold on the public mind.

**Scotch Mineral Railways.**—The shares of these railways are extremely dull of sale. A strong feeling prevails among many of the shareholders in favour of an amalgamation, and it was hoped that an amicable adjustment of the differences existing between the different companies would have been obtained; instead of this, however, there is a prospect of a keen Parliamentary contest, which will, of course, be attended with a large expenditure of money. The only sales have been a few Wishaw and Coltness at 25l., and Garnkirk at 28l.; the Ballochney Company have declared a half-yearly dividend of 30s.; and the Monkland and Kirkintilloch, of 15s. per share; the Wishaw and Coltness have declared 12s. 6d. for the year; the Garnkirk Railway directors propose to divide 5 per cent.

**Extraordinary Speed by Railway.**—The special train which left Southampton on Thursday week, with the mail-bags brought by the Avon, started from thence at eight minutes past two, and arrived at Nine Elms at forty-eight minutes past three. Thus, deducting eight minutes for stoppage, the distance was run in one hour and forty-eight minutes! The engine, the Lark, is a new one, constructed by Mr. J. V. Gooch, of Nine Elms, and it was driven on this occasion by Mr. W. Waylor, superintendent of the locomotive department at the Southampton station.

**Nottingham, Newark, and Lincoln Railway.**—We are given to understand, that the directors of the Midland Counties Railway have ordered a survey, under the superintendence of Mr. R. Stephenson, of a line of railway from Nottingham to Newark and Lincoln, joining the Midland Counties line at Nottingham. A prospectus, detailing the result of the survey, with the estimate and expected traffic, will shortly be published. The shares are to be 25l. each.—*Derby Mercury.*

**Salisbury Junction Railway.**—A petition is about to be presented to the House of Commons, signed by the residents in this city and its vicinity, praying that the Bill just brought in for making a railroad from Bishopstoke to Salisbury may be passed in that House.

**Lincoln and Wakefield Railway.**—The above line, fifty-four miles in length, is another of the numerous proposals for uniting important and populous districts, and placing within their power all the benefits of cheap and rapid communication; it is intended to connect the great agricultural districts of Lincolnshire and the towns of Gainsborough, Lincoln, and Doncaster, with Wakefield, the great market for the manufacturing districts of Yorkshire and Lancashire, and with all the towns bordering on the Manchester and Leeds Railway. This line of country has never possessed the advantages of railway communication, and the present undertaking is intended to remove many of the difficulties with which home-grown corn has had to contend, in maintaining its ground against the introduction of foreign grain, while the districts through which it will pass offer a cheap and rapid means of carriage for salt, stone, lime, coal, &c.—to a very large extent to the agricultural districts, hitherto only obtained by a long, circuitous, and tedious route—and, more than probable, effecting a reduction of 50 per cent. in their cost, with a corresponding increase in consumption. The passenger traffic at present existing between the towns of Lincoln and Wakefield is extensive, in proportion to the large and increasing population, and it is only likely that the same results will follow in this case as in every other where a railway has been established. From a careful survey of the line, the engineer has reported favourably of the undertaking, and which is estimated to be completed for 750,000l., or about 14,000l. per mile; and the gradients being of an easy character, offers important facilities for the economical working of the large goods' traffic, which it is confidently anticipated will flow upon the line; and for the furtherance of this object, arrangements will be entered into with the Manchester and Leeds Company for working the Lincoln line in conjunction with their own.

**Wooden Railways.**—A bill is at present before Parliament, which has for its object the laying down of a wooden railway, upon Prosser's principle, from Guildford to Woking. In the opinion of many engineers, wood, besides being very much cheaper than iron, is, in the way it is here intended to use it, more durable.

**Theftford.**—On Monday last a petition was forwarded to Parliament, signed by a great number of the inhabitants of Theftford, requesting that the intended railroad between London and Norwich may pass through that place.

**Share Jobbing in Germany.**—It is stated that a law will shortly be promulgated at Berlin, to prevent the extensive gambling transactions in railroad shares, at present carried on to an incredible extent in that city. The Exchange of Berlin is the greatest mart of all Germany for these sort of transactions, and some wealthy speculators there have formed a joint-stock company, and, by their capital and quantities of shares generally at their disposal, influence the prices just as suit their views and interests, by either buying or selling largely; these operations have ruined numbers of those who could not withstand these large fluctuations. Shopkeepers, artisans, military men, and even ladies, have imbibed the railroad shares mania speculation.

The railway between Cologne and Bonne has just been opened to the public.

**HEREFORD AND GLOUCESTER CANAL.**—We heartily congratulate the inhabitants of the city and county, on the steady and satisfactory progress which this important undertaking is making under the skilful engineering of Mr. Stephen Ballard. On Monday last the Canal was opened to Westhide, and on Monday week (the 26th inst.) it will be opened to the Wharf, at Withington, about three and a half miles from this city. On the occasion, the Canal Committee will move along the line from Ashperton to Withington, when many boats laden with coal, timber, salt, &c. &c., will arrive at Withington. On referring to our advertising columns it will be seen that the event will be celebrated by a dinner, to which the engineer, Mr. Stephen Ballard, has been specially invited. We have no doubt there will be a large party to meet the respected guest and to do honour to the event.—*Hereford Times.*

## TO THE EDITOR OF THE BUILDER.

SIR,—I herewith forward a design for schools, with a residence in the centre for the master and governess, hoping you may deem it worthy of a place in your paper. The proposed fabric is so arranged that it can be occupied by separate families if so required; it can be built with Suffolk bricks, having its exterior walls faced with Suffolk bricks, and the cornice and other mouldings run in cement; or it may be of ordinary brickwork, all stuccoed externally.

I repeat, what I stated in a former communication, that I feel deeply interested in the success of your valuable publication, and confident that if your numerous and respectable correspondents, (many of whom possess talent

and genius) unite hand and heart, their contributions will enhance its value.

I am, Sir, your most obedient servant,  
 Brecon, Jan. 21, 1844.

[We should have so placed the wings of the building containing the school-rooms as that the chimneys, if only one in each room, should fall exactly in the centres of the walls against which they would be built. The domestic arrangement we should have so contrived that the master and mistress if of different families might live separately. In each of the ends of the school-room we should have placed three windows, or one window consisting of one or three bays, lights, or days. The principal external cornice we should have made lighter.—Ed.]

## NEW METHODS OF GILDING AND SILVERING BY IMMERSION.

BY M. A. LEVOL.

At the present time, when great attention is being directed to the processes of gilding by the moist method, it seemed to me not without interest to publish an account of some new methods for gilding or silvering by immersion, more especially on account of the facility of their execution.

*Gilding on Silver.*—Silver is very easily gilt by means of the neutral protochloride of gold, to which an aqueous solution of sulphocyanide of potassium has been added until the disappearance of the precipitate which at first formed. The liquor thus obtained should possess a slightly acid reaction, and if it has lost it, by too considerable an addition of sulphocyanide, it should be again restored by a few drops of hydrochloric acid. In order to gild, the well-washed silver is immersed in this liquor nearly boiling and moderately concentrated, in which state it is kept, adding from time to time hot water to replace that which evaporates. In this manner the inconveniences which would result from too great an accumu-

lation of the hydrochloric acid, the presence of which is nevertheless useful in preventing the formation of an auriferous precipitate, which would otherwise take place at the high temperature employed, were the alkali predominant, are obviated.

*Gilding and Silvering on Copper, Brass, and Bronze.*—A solution of cyanide of gold, and that of cyanide of silver in cyanide of potassium, has been recommended for gilding and silvering under the influence of electric forces. I have found that the same solutions, when at a temperature near their boiling point, may also be employed for gilding and silvering by immersion. Their preparation would be somewhat expensive were it necessary to obtain them chemically pure; but this would not offer the least advantage, and the operation may be simplified and rendered much less expensive by treating either the chloride of gold or the nitrate of silver (both should be neutral) with an excess of cyanide of potassium so as to obtain the soluble double cyanides.

Silver cannot be gilt by this process, but it will be seen above that the sulphocyanide of gold and of potassium gilds the metal extremely well.

The solution of cyanide of copper in cyanide of potassium does not copper silver even in contact with zinc; but it coppers this last metal perfectly, and in a very solid manner.

I may observe in conclusion, that these processes, so advantageous from their always succeeding, and requiring but a few minutes for every preparation, unfortunately do not allow but of the application of a very thin layer of the precipitated metal. This inconvenience is common to all the processes by immersion.—*Polytechnic Review.*

## THE DRAINAGE OF THE LAKE OF HAARLEM.

THE determined industry, the phlegmatic perseverance, of the inhabitants of the United States of Holland have been exhibited to Europe by the laborious undertakings which, on every side of Holland, present themselves. Nearly a seventh part of this land has been rescued from the sea; and wherever the traveller is placed he recognizes the marvellous barriers that have been formed to prevent its encroachments: he sees an artificial coast, formed from the granite rocks of Norway, dykes, buttresses, constructed with a solidity which seems to promise to resist even time itself. Amongst the objects which have long occupied the attention of the Hollander has been the drainage of the lake of Haarlem, and the conversion of its bed into cultivated land; various projects have at various times been conceived, have been discussed, and, from various reasons, abandoned. A plan, which was considered feasible, was laid before the States General in April, 1838, and great hopes were entertained that the idea which was suggested was one which might easily be carried into execution. After, however, due and careful deliberation, it was abandoned, in consequence of the rejection of a bill brought before the second chamber. At length the government has undertaken the great work, and every prospect is entertained of the successful issue of the enterprise. A vote has been obtained from the chamber of 4,533,333 dollars, but this sum will be by no means adequate to the expenditure that must necessarily be made. It has been ascertained by calculations founded upon the profit obtained by other drainages in Holland, that so large an interest will be returned that a loan of much greater extent may very safely be advanced. The lake of Haarlem is calculated to be about fourteen English miles in its greatest length, and as many in breadth. About 70,000 acres are covered by it, and it has been asserted that every year nearly 250 acres are encroached upon. The depth of the water has been variously estimated, but is supposed to be upon an average twelve feet and three-quarters, and the mass about thirteen and three-quarter millions of cubic rods of water. The manner in which it has been decided to carry out the drainage is as follows:—

A channel is to be formed one hundred and forty-three feet and a half in width, supported on each side by an enormous dyke; into this is to be poured, by means of six steam-engines, each of two hundred horse power, the whole of the water contained in the Haarlem Meer, and three sluices are to conduct it into the German and the Zuyder sea. It is expected that this undertaking, commenced in May, 1840, will be completed in the course of the present year. It is understood that it will be requisite that every spring the power either of steam-engines or water-mills should be called into action, to preserve the rescued land from fresh inundation. Of what Holland is capable an idea may be formed from the recollection that large tracts of land are below the level of the sea, and that not only the safety, but absolutely the existence of the country is dependent upon the dykes, which have been at various times raised up. Near the great dyke of the Helder is the Beemster Polder, a tract of land of upwards of 8,000 acres, over which water rolled uninterceptedly, and where now there exists a healthy, industrious population of 3,000 souls.—*Polytechnic Review.*

Mr. Burgess, the partner of James Walker Esq., engineer, has been at Dover, preparing the plans and specifications for the intended improvements to the outer harbour, and it is expected that tenders for the execution of the work will be advertised for immediately.

NEW  
 BUILDER

DOVER HARBOUR.

Copy of a letter to the Editor of the Dover Chronicle.

SIR,—Although I consider it an almost hopeless task further to endeavour to convince Mr. H. Humphreys, and the disciples of the detached breakwater system, of the error of their often-refuted theories (having unanswerably proved that the only safe method of preventing the travelling shingle from obstructing the harbour's mouth, was effectually arresting its passage by an extensive pier projected from the Stone-head,—see my printed Dover Refuge Harbour Report), yet I must not permit Mr. Humphreys' letter in your journal of Saturday last to remain wholly unnoticed, lest it should be supposed that the new data of the South-Eastern Railway "dike" here, which he affects to argue from, really afforded some accidental support to his notions. Before, however, observing upon the substance of Mr. Humphreys' letter, I must remind him, and other detached breakwater speculators, of the great presumption of their theories, after a Government Commission has decided that even the eminent Mr. Cubitt's breakwater plan for our proposed Harbour of Refuge was defective, so far as it was designed to be a detached work; and it will be seen, by reference to the Commissioners' report on that plan, that Mr. Cubitt afterwards subscribed to the propriety of their view, in favour of a work united to the shore. But Mr. Humphreys, and men of his school,—men who,

"—Convinced against their will,  
Are of the same opinion still,"

are not easily satisfied of their errors; though the most eminent engineers decide against them, they will still be found dogmatically propagating their fallacies, and endeavouring to mislead superficial inquirers. As to Mr. Humphreys' letter, I find it full of absolute absurdities. First, he speaks of the South-Eastern Railway "dike" and works, as tending in their construction to aid the passage of the travelling shingle towards the harbour's mouth! and advises other alterations to a similar end!! But I believe Mr. Humphreys would find, if he were to ask Mr. Cubitt, that the very opposite effect to that supposed by Mr. Humphreys to be designed by those works, was intended by Mr. Cubitt; for assuredly that gentleman knows that the existence of his "dike," even for the few years it may be supposed, from the perishable nature of its ties and other materials of its construction, to be intended to stand, mainly depends upon its *not aiding* the passage of the travelling shingle, but *detaining it* in front to prevent the sapping by the sea of its insecure foundation; an expectation, however, doomed to be disappointed, since groins and shingle traps of any description can only be effective where shingle travels, which, it having nearly ceased to do at this port, (there being but little more shingle to come from between the Shakspeare Cliff and the South-Eastern Railway "dike," the supply being wholly cut off by the falls of the Rounddown and other cliffs,) the effect will be the continued deepening of the shore from the Shakspeare Cliff to the mouth of the harbour, and consequent incursions of the sea wherever the shore is not protected by wharfs, as at the South-Eastern Railway's eastern mouth of the Shakspeare tunnel, and along the entire line of viaduct adjoining it. I venture to predict that the consequence of the omission of a proper wharf at this part of the South-Eastern Railway works will be, that in less than twenty years, the line of old Folkstone road, immediately behind the viaduct, will not be in existence from incursions of the sea; leaving it to be conjectured what will hence be the fate of the eastern mouth of the Shakspeare tunnel and of the viaduct, the foundation of which will soon be laid bare, and its timbers be continually worn by the fretting, through the operations of the waves, of the portions of falling cliff behind it, to say nothing of the ravages of the worm. But to return to Mr. Humphreys' letter. I find next to the part I have observed upon, various prescriptions to benefit the present incurable harbour. (The great duke calls Mr. Humphreys, and men of his grade, "harbour-doctors," quacks, of course; but able, duly-qualified physicians at the same time have given it over.) On these prescriptions I shall offer no comment; the

day is past for the least attention to be paid to them, wiser heads having advised (in the Government report on Mr. Cubitt's detached breakwater plan for a harbour of refuge at Dover) a course somewhat at variance with Mr. Humphreys' assertion, "that as easily may you prevent the tide from setting up the channel, as to stay the beach from coming from the westward to the harbour's mouth." *Nous verrons.* Let Mr. Humphreys survey the shore from the harbour to the falls at the Rounddown, &c., and inquire what has been their effect in "staying the beach," before he again hazards such absurd assertions.

I am, Sir, yours, very faithfully,  
JAMES STEWARD.  
East Cliff, Feb. 14, 1844.

DOVER LANDING-JETTY.

WE are authentically informed that the Postmaster-General intends to send a mail from this port to Calais daily, and to limit the time within which it shall be transmitted, to three hours, instead of, as at present, six hours and a half; and that it is the opinion of the authorities connected with the Packets here, that the required service cannot be performed regularly and certainly, unless by means of a Jetty, from which the mails can be shipped at all times of the tide, and in any weather. We have no doubt that the Jetty Committee, with their usual vigilance and tact, have already directed application to be made to the Government for aid towards the formation of the Jetty, should it be found impracticable to raise all the required capital in shares, and at all events an additional large source of revenue (not noticed in the prospectus) is thus opened; for we have no doubt that the greater facility of shipping the mails from the Jetty, rather than from boats, independent of the practicability of the former when the latter is impossible, will induce the Government to pay a considerable annual sum for the use of it. At present, the cost of the boats performing the service is between 2000. and 3000., and when the duty by the intended new arrangement is made more frequent as well as more difficult, we may well expect the Government will adequately remunerate it. The certainty of a daily opportunity of transit to the Continent by the fast Government Packets, at a regular fixed hour, will, no doubt, make passengers give a preference to this as their port of departure; and thus again the prospect of revenue held out in the prospectus of the Jetty Committee, is improved and confirmed.—*Dover Chronicle.*

MONUMENT TO BISHOP FARRAR.

TO THE EDITOR OF THE BUILDER.

SIR,—Perhaps you may find space in THE BUILDER for a short notice of this beautiful and appropriate work of art, executed by J. E. Thomas, Esq., F.S.A., lately erected to the memory of our martyred prelate in St. Peter's Church, Carmarthen, bearing the following inscription:

SACRED  
to the memory of  
ROBERT FARRAR, D.D.  
Bishop of St. David's,  
Burnt in the market-place of Carmarthen,  
30th March, 1555,  
for adhering to the Protestant religion.  
"The righteous shall be in  
everlasting remembrance."  
This monument  
was erected A.D. 1843,  
as a tribute of pious respect to the  
memory of the martyred Bishop  
of this Diocese.

At a time like the present, when the beautiful simplicity which regulated our holy religion at the reformation is so powerfully assailed, this, and other public testimonials of similar nature, commemorating the worth of the suffering supporters of the truth, seem to be induced by a providential influence, and will doubtless be beneficial in their effects.

I am, Sir, your very humble servant,  
Brecon, 27th Feb. 1844. J. T. L.

[We should like to publish, in a two-column block, a view of this work of art, to form one of a series of Bishops' monuments.—Ed.]

FIFIELD CHURCH, WILTS.

TO THE EDITOR OF THE BUILDER.

DEAR SIR,—I beg to forward you two sketches, which perhaps you may feel disposed to give in THE BUILDER, viz., an ornamental stone cross from the east gable of Fifield Church, Wiltshire, and a small view of the whole church, copied from a sketch taken on the spot by myself. Fifield, or Fyfield, is a very small village, situated on a slight ascent about twelve miles from Salisbury, on the edge of a valley of pasture-land, which extends for two or three miles in a western direction. The village itself does not consist of more than about half-a-dozen houses, including the parsonage; the church, therefore, is the only object of any interest which it contains; and even this, without either tower or belfry to remind us of its sacred purpose, is so simply constructed, that scarcely is it distinguished from one of the neighbouring barns by any external features except a cock on the western gable, and on the eastern one the cross which I send you. The

church is, indeed, built of stone, with a pointed arch over the principal and only door-way of the fabric, in which respect it does not differ from many barns in Wiltshire. Indeed, I think I saw last month some barns more elegant in construction than this, and, from the durability of the stone which abounds there, as complete as when they were first erected, some of them probably not constructed later than the middle of the 15th century. It is, perhaps, remarkable that the cross should be so neatly and elegantly sculptured when the rest of the church is rude and bare of ornament; but we can appreciate the feeling which told them that in this case they were working on peculiarly holy ground, and that the symbol raised to assemble masters and labourers from the adjoining hills for purposes of devotion, should claim the touch of an artistic chisel, if even the roof were left without a spire, and the mouldings void of decoration.

I am, dear Sir, yours most respectfully,

Great Newport-street, Feb. 19, 1844.

\*[This idea is excellent; often may twenty shillings bestowed with taste give a small building a superior aspect; in the same way that something of no greater price may indelibly mark the gentleman amid disuse, while the utmost profusion of dizenng, whether on the person or on an edifice, violating taste, only removes either object from approving estimation. This kind of abridgement according to necessity is well expressed in the German novel of "The Family of Halden," where Hennig

(with his master) being hotly pressed by the Croats, at the moment of action, cried "Amen!" there not being time, as he relates, to repeat the whole petition. Often, from the expenditure of a million sterling in modern buildings, the artist is not furnished with one example for his pencil, while in old fabrics, though there may be nothing else, some chimney-piece, some doorway, some font, or other object of art which never cost five pounds, may furnish him with a beautiful subject. Money is powerful, but science and taste are enchanters.—Ed.]

#### THE CAMPHINE LIGHT.

AMONGST the many improved lamps, the Camphine, which has been just introduced, is beyond all comparison the principal. The Argand, by which a stream of air was directed upon the interior, as well as the exterior, of the wick, was a stride in advance of its predecessors; the recent contrivance, by which in the Solar lamp the stream of external air is poured immediately on the ignited portion of the wick, instead of being supplied from below, was an improvement of the Argand; but superior as is the Solar to the common forms of lamps, it has its defects. The capillary attraction, from the glutinousness of the oil, is comparatively feeble; and, unless the reservoir is kept well filled, the light will become dim. The combustion of the oil is imperfect, and carbonaceous matter accumulates on the wick, which renders snuffing now and then imperative. Above all, the Solar requires, as all other lamps do, a nicety of attention, that domestics can rarely be persuaded to give. There is another evil attendant on burning oil, that by no contrivance can he got rid of—the disagreeable nature of the oil itself. Let the utmost care be employed, accidents will happen in using it, and clothes and carpets, to say nothing of hands, will suffer from the contact. From all these drawbacks the Camphine lamp is free. From the manner in which the burner is contrived, and from the extreme liquidity of the fluid employed, the combustion is so perfect, that the wick, after ten or twelve hours' consecutive burning, is scarcely if at all charred. Then, by reason of the same liquidity, the capillary attraction is so active, that a flame of undiminished brightness will remain until the wick itself is actually dry! The reservoir once filled, there is no necessity in the course of sixteen hours for any additional supply. The flame of the Solar is much more intense than that of the Argand; but the flame of the Camphine is absolutely dazzling—whiter than the best gas, while it has not that disagreeable flickering that all lights are liable to; by the light of the Camphine, colours may be distinguished as readily as by daylight. English's Patent Camphine (for which her Majesty's Letters Patent have been granted) is in itself so far from being injurious, that, if accidentally spilt on the most delicate tissue, instead of soiling, should there be any spot of grease on the garment, it will effectually remove it. The trimming is a task in which the most delicate fingers may be employed; it is unaccompanied by the slightest smell in lighting, which is instantaneously effected; and as little is any smell perceptible on its being extinguished, which also is the work of a moment. The Camphine lamp requires but one act of attention—that is, to cut the edge of the wick even with the edge of the tube, and leave it so. With this one care the lamp never goes wrong, never intermits, but shines on, from sunset to morning, with an even, steady, pure, and beautiful light.—Hull Packet.

**ELECTRICITY AT BREAKFAST.**—In fact, startling as it may seem, it is beyond contradiction certain, that the largest charge of the largest Leyden battery does not equal in quantity the electricity which passes between the tongue and a silver spoon, during the simple act of eating an egg. Indeed, if the quantity developed in the latter case were free to assume the form of the electricity obtained from friction, the result would be a lightning-flash of no small power. The chemical action of a grain of water upon four grains of zinc can evolve electricity equal in quantity to that of a powerful thunder-storm.—*Electricity, by Dr. Lardner and C. V. Walker.*

#### IMPROVEMENTS IN BLOCKS, SHEAVES, &c.

THE immense destruction of hempen rope, tackle falls, &c., in the naval and mercantile marine, together with the numerous accidents, in consequence of the splitting of wooden blocks, from "choaking," and other causes, induced Mr. A. Smith (inventor of the improved revolving iron shutters, door springs, and a number of other things for builders, &c.) to turn his attention to, and thoroughly investigate, the causes, with a view to remedying the evils.

The improvements made and suggested by him to the Admiralty Board, are partly explained in the following letter, addressed to the Hon. Sidney Herbert, M.P., Secretary to the Admiralty, &c., &c. :—

"Iron-Works, Princes-street, Leicester-square.

"SIR,—I have to request that you will be pleased to lay before the Lords Commissioners of the Admiralty the accompanying improvements in the construction of sheaves for ships' blocks, and stoppings for same, as also thimbles for ropes. The sectional sketches annexed, figs. 1, 2, 3, with the accompanying specimens, from No. 1 to 6, will make the improvements apparent. The two pieces of hempen rope having been working the same length of time and with the same quantity of weight suspended, the one over the ordinary wooden flat grooved sheave, figs. 1 and 2, and the other on the improved semicircular grooved iron sheave, fig. 3, fully demonstrate that a tackle fall, rove into a set of blocks with the improved sheaves, will ensure the rope's lasting considerably longer, and retaining its natural round form, instead of being compelled to take the flat distorted form of the groove in the ordinary wooden sheave, which is the case when a rope gets wet, and is under a strain tending not only to weaken the rope, but to chock and split the block. The improved iron sheaves are not heavier than the ordinary wooden ones of equal strength, are cheaper in the first cost, will last much longer, and are not liable to warp. The improved thimbles are stamped out to the form of the rope, and allow of its retaining its natural strength. The patent wire rope stoppings for blocks are stronger, lighter, and cheaper than hempen. I shall be much gratified if their Lordships will be pleased to allow a deposit in their Lordships' model room, in Somerset House, of the accompanying specimens of my patent wire rope stoppings for blocks of from five to fifteen inches (such as I am about to supply for the use of her Majesty's ship *Penelope*, pursuant to their Lordships' demand to fit that ship), and which are numbered from 5 to 15; also a block, two sheaves, and two thimbles of my improved construction, together with fitted specimens of my patent wire-rope.

"I am, &c.,

"ANDREW SMITH.

"September 28, 1842."

Their Lordships examined, and highly approved of, the several improvements, and have most extensively adopted them.

Subsequently, Mr. Smith proposed an important improvement in blocks, substituting metal for wood, and introducing the improved semicircular grooved metal sheave, &c., models of which were laid before their Lordships, who were pleased to order the same for her Majesty's yacht, *Victoria* and *Albert*, which vessel was entirely fitted with the patent wire-rope, screw lanyards, thimbles, &c. The improved metal blocks, being formed without joining, and in one piece, will not split. The hook or eye is fastened, or made to swivel, in the shoulder of the block, requiring neither strap nor iron binding, which are so objectionable, yet absolutely necessary, in common wooden blocks; the straps are objectionable, as they become destroyed, in a short time, from exposure to the atmosphere, absorbing and retaining moisture, particularly in the splice at the lower part of the block, which becomes imperceptibly, but quickly, destroyed, while the other parts are comparatively sound and uninjured; thus it often happens, when tackle, after lying past some time unused, is again applied to raising heavy weights, though far below the weight they should bear with safety, the strap suddenly breaks (generally at or in the splice—sometimes in the throat of seizing), and the extent of accident depends upon the circumstances under which it took place. The improved metal blocks, being rounded off (having no sharp edges), do not injure the spars or gear, which is a great objection in iron-bound wood blocks, and cannot be obviated. The shell of the improved block, being hollow, as it were, with ribs, or strengthening pieces, placed vertically, and across them on each side, to support the pin upon which the sheave rotates, gives the greatest quantity of strength with the least weight—in fact, these blocks are, for the same size, not heavier than iron-bound wood blocks, while they possess about four times the strength, and will, doubtless, last more than four times as long, and, when worn out, they are worth near two-thirds of their first value. Under these circumstances, the expense, which at first is little more, will be very considerably less, than common blocks; besides the advantages, &c., already named, there are others of minor importance, too numerous to cite.

Fig. 6.

**INFIRMARY FOR CHILDREN OF FOREIGNERS.**—A committee is about to be formed, with a view to the foundation of an infirmary for the children of distressed foreigners. In aid of this laudable purpose, large sums have already been contributed both by the English and the resident foreigners. Contributions have also been received from foreigners of the highest rank residing on the Continent. A

house will be taken and fitted up, with a view to the immediate relief of some of these unfortunate children, until sufficient funds have been collected to build a hospital.

**ARTESIAN WELLS.**—A question is mooted whether the boring of Artesian wells in the neighbourhood of Charing-cross will have the effect of draining the supply of water from the upper level springs of the metropolis.

## Law Intelligence.

## HABITABLE REPAIR.

COURT OF EXCHEQUER—SATURDAY, FEB. 17.  
(Sittings in Banco.)

HART v. WINDSOR.—The question for the Court was, whether a rule for a new trial should be made absolute or discharged.

The action was brought to recover the amount of one quarter's rent for a house and premises in the Wandsworth-road. The defence was, that the house was so infested with noxious and disgusting insects, called bugs, as to render it altogether uninhabitable. The case was tried before Mr. Baron Rolfe at the Nisi Prius sittings in the last term, when the jury returned a verdict in favour of the defendant on that plea. In the course of the trial it was proved that the house in question was situated in Spring-gardens, Wandsworth-road, and had been let for the term of three years to the defendant, at an annual rent of 50*l.* A few days prior to the family entering upon its occupation, they discovered that there were bugs in two of the rooms, whereupon they caused such means to be applied as they conceived to be of a nature calculated to get rid of them. In this attempt, however, they were not successful; for on the first night of the family endeavouring to sleep in the house, not a single person was able to obtain the slightest rest, in consequence of the numberless visitations of these insects. On the following morning it was found that the sheets between which the defendant and his wife had tried to repose, presented a mass of "bug carcasses and bug's blood." In the course of the succeeding day the "army" increased, and as day followed upon day, for several days the "force of occupation" had become so alarmingly extensive as to render it a matter of absolute impossibility that human beings could continue to remain in the house. The defendant therefore sent an intimation as to the state of the dwelling. A series of communications ensued between the parties, the landlord offering to endeavour to rid the house of its "insectorial" inhabitants. To this proposition the defendant, it appeared, was willing to accede, provided he was also allowed a quarter's rent, to cover the expenses he would necessarily be put to in procuring another residence for his family, whilst the proposed "siege" was being laid and carried on. The landlord, however, declined to make the required allowance, and, upon the quarter having expired, the defendant refused to pay the rent, in consequence of having been compelled to quit, upon the ground that the house was not in an habitable condition. The matter subsequently came before the full Court, on a motion to set aside that verdict for a new trial, and on the ground that the terms of the contract set out in the lease did not necessarily imply that the house was to be put in an habitable condition by the landlord. There was another ground. The lease set forth that some garden ground was let to the defendant, as well as the house, and the question was raised whether, even though there had been an implied contract as to the reasonably habitable condition of the house, the tenant had the power or authority to abandon or give up the possession of both.

On behalf of the defendants it was contended, principally upon the authority of Smith and Marrahe, that the landlord was bound to put his house in a reasonably tenantable and habitable condition.

The Court now decided that, according to all the old authorities, a landlord was not bound to put his house in such a state of habitable repair as was contemplated in the present case. Their lordships, therefore, were of opinion that the rule should be made absolute. It would, however, be well that in all future cases this condition should be expressed.

Rule for a new trial absolute.

GOVERNMENT CONTRACT FOR NEW STEAM-VESSELS.—A circular has been issued by the Lords of the Admiralty to the chief of our engineers, to send in, on or before the 5th of this month, tenders for four new steamers, two of the first and two of the second class. The weight of the machinery, inclusive of the boilers filled with water, is to be 350 tons for the first class, and 300 tons for the second. The first class coal-chambers are to be capable of holding 400 tons, and for the second 350, taking each ton at 48 cubic feet.

## Correspondence.

## ARCHITECTURAL VOLUTES.

SIR,—In your last number, "An Architectural Pupil" desires to be informed of the best methods of striking out the Ionic volute, and in what works they are laid down, complaining of being "excessively bothered" with those he has tried. He says it would not only be a great benefit to himself, but thinks it would be conferring one on the architectural world in general, and on pupils in particular, if his request were complied with. Now, Sir, I think it would be conferring a greater benefit upon him, and upon architectural students in general, to advise him not to be bothered with any; to commit them in fact to the winds, and confine himself to those means with which nature has gifted him, I mean his eye and hand; at the same time exerting his best endeavours to educate that eye for this and other purposes of design to the perception, and his mental eye to the conception and combination of the beautiful in nature and art. The means to which I allude of course include the study of the best ancient and modern examples.

I am aware, Sir, that I shall startle many, but I speak from some years' experience of architectural designing and drawing, and am persuaded that my advice is well founded, for that which I recommend will not only be a quicker and less embarrassing way of working, but be in itself a training of the eye, both bodily and mental, to the quick discernment and appreciation of the qualities of those forms presented to it, and also of his hand to an accurate and ready delineation; and if he possess any talent (which I think he does from his expressed anxiety for information), he will be astonished at the facility of handling, and quickness of eye, which a little practice will give him.

Let us consider, for a moment, the nature of geometrical rule in relation to the design of a volute. The rules usually given render the delineation mechanical, without giving any guarantee for its pleasing the eye; but the object of the volute, and of other ornaments in architecture, is to give pleasure to the sense of sight. It is, therefore, the eye that should guide in their formation; and the eye and hand are found capable of giving to them all that beauty of effect of which they are susceptible.

The eye revels in the beauty of a volute, without inquiring if the square of one radius is equal to the product of the two adjoining ones, as one of the rules requires. The rules, as I observed before, are mechanical; whereas there can be no mechanical rule binding in the case. The rules usually laid down may be very useful to the mason or the carver when not guided by the architect, but the architect has but little to do with them; his profession is one of the arts of design, and his province is to design according to the principles of beauty recognized by his eye. He is not only a superintendent of builders, but an artist; and this constitutes the main difference between him and the practical builder.

The preceding remarks I have intended should apply to the detail or full-size working-drawings for the mason and carver; and until I read the letter of "An Architectural Pupil," I had no idea that any were so preposterous as to attempt to apply rules in the drawing of volutes of the usually small scale of elevations and sections. When I first commenced the study of architecture I followed the rules (and many of them I tried) in the study of the volute at large; but I soon discarded them all, and in the delineation of the largest Ionic capitals, modillions, or trusses, I should now use only those means which I above recommended.

It should, however, be observed, that when a volute exceeds a certain size, say, for a column beyond 18 inches diameter, the eye cannot so well operate upon it, or guide the hand in its formation. To meet this difficulty

\* [We are sorry to find our clever correspondent say any thing which might lead some to imagine an architect is not required to be thoroughly practical: no man can take a first station as an architect without possessing artistic fancy, and more science in the various arts applied to architecture than any workman.—Ed.]

I should draw one, by the eye and hand, of a convenient size, and at the same time an aliquot part of the intended one; suppose I had to draw a volute for a column of 3 feet diameter, I should design one for a shaft of 9 inches, or one-fourth part of the other. I would draw out this volute with great exactness, with very fine and distinct lines, and then by ordinates, trace it four times enlarged each way, to another sheet; but as volutes of the larger size are seldom required, the use of the best rules in their formation needs not to be much opposed.

The chief advantage of what I have proposed, consists not so much in the escape from the "excessive bother" of the rules, as in the exercise which it gives to the eye and hand, so requisite, so essential, indeed, to the draughtsman, and which will tell so advantageously in the whole of his study and practice of architectural design. The man that can only produce a beautiful curve line by means of the compass and a given rule, may be a very clever mechanic, but he is no architect. Again, when he takes up a rule laid down by another, and knows nothing of its principles (which is too often the case), what guarantee is there for the production of that which he should always seek—a curve of the greatest possible grace and beauty?

Whilst tolerably confident of the truth of what I have advanced, I should still recommend the architectural student not to be ignorant of the various methods, or at least of the best methods, laid down for striking out the volute; for, as much importance is often attached to such things by workmen, he might suffer in their estimation if found ignorant of them; and as there are many that (notwithstanding the advantages attendant on the contrary mode of procedure) will, from natural timidity and nervousness of hand, still prefer and adhere to the practice of drawing by rules, and with the compass, I trust that the remarks I have made will not prevent any of your able correspondents from complying with the wish of "An Architectural Pupil."

For myself I shall only observe, in reference to the rules, that a volute being a geometrical spiral, cannot be correctly struck with the compass from any series or arrangement of centres whatever: no portion, however small, of such a curve will coincide with the circle, it being generated by a constantly decreasing radius round a fixed centre. The Archimedean spiral is generated by a radius decreasing with an equal motion; the logarithmic spiral by a radius decreasing in geometrical ratio. It is evident, however, that there are infinite varieties of species, differing from each other according to the ratio in which the radius decreases. A spiral might be struck out with a string for a radius, and that radius made to diminish by coiling round a small cylindrical centre, or (for a decreasing diminution) round a conical one, properly proportioned to the intended volute.

Were I asked which of the methods I have seen I considered the best for practice, I should give the preference to that laid down for the logarithmic spiral in Nicholson's Dictionary, and another for the versed sine spiral (I forget where it is found). The former is the one I alluded to above, and has the radii decreasing towards the centre in geometrical proportion; and their lengths are easily found from a table of logarithms: the latter has the various points of the curve, obtained from versed sines. In most other methods we are furnished only with the centres of the different quadrants or segments of which the volute is composed; but in the two I have mentioned, we have points in the circumference or spiral itself, and can of course more speedily judge of the result.

Many volutes that I have seen, drawn from given centres, have an appearance perceptibly faulty; often I have seen the capital wear a drooping appearance, owing to the commencement of the spiral falling too suddenly from the horizontal line. To appear well, the horizontal part of the list ought to be, if I may use the expression, a tangential continuation from the curve.

I mentioned, as a means of training the eye for the delineation of volutes by hand, the study of the best ancient and modern examples. I would here take the opportunity also

of recommending to the student the keeping by him, for constant reference, a *pattern volume*, by the most approved rules accurately drawn to a large scale. With this he may constantly compare his drawings made by hand, and be enabled to judge of the improvement he is making.

I have extended this letter far beyond what I at first intended, but the interesting nature of the subject must be my apology.

I remain, Sir, yours very respectfully,  
S. HUGGINS.  
Liverpool, February 20, 1844.

Sir,—As I have no doubt you are a votary to the opinions (which, indeed, are but the record of facts) inserted in No. 51 of your publication, upon "Modern Arches," taken from the "Essay on the Decline of Excellence in the Structure and in the Science of Modern English Buildings," otherwise I doubt if you would have inserted them in THE BUILDER, I wish you would just take an *arch* look at the "flaw-walls," which in spite of prudence and decency are being formed in the new houses which are now in course of erection in the intended street between Holborn-bridge and Chick-lane. I myself have attempted to reason with the Paddies who were setting them up, but the only reply I could obtain was, "Faith, they can never go, being joined for ever, and purgatory through and through, with cement, carted from Broken Wharf be me own self."

I am, Sir, with the most profound respect, your sincere friend,  
FRANCIS FRANGIBLE.  
Farringdon-street, 26th February, 1844.

[Francis Frangible, of Farringdon-street, is a funny fellow. According to his request, we have looked at the fabrics in question; and had we not conceived from his letter too high an idea of his honesty and solidity of judgment, we might have imagined the "FLAW-WALLS" in question to be Mr. Frangible's own workmanship.—Ed.]

DELAYS IN FORMING PUBLIC IMPROVEMENTS.  
Sir,—Observing in your last Saturday's number some very proper remarks relative to the ruinous consequences of leaving in a state of abeyance public improvements when partly done, I send for insertion in your next number a copy of the petition of thirty-eight inhabitants of the parishes of St. Giles's-in-the-Fields and St. George's, Bloomsbury, lately presented to the House of Commons on the same subject, which was in the following words, viz. :—

"That your petitioners view with the greatest concern the delay made in carrying into effect the several improvements contemplated under the provisions of an Act passed in the fourth and fifth years of the reign of her present Majesty, intitled, 'An Act to empower the Commissioners of her Majesty's Woods to raise money for certain improvements in the metropolis, on the security of the land revenues of the Crown, within the county of Middlesex and city of London.'

"That a Bill is now in progress before your honourable House to enlarge the powers granted by the above-named Act of Parliament, which is to empower the governor and company of the Bank of England to advance and lend moneys to her Majesty's Commissioners of Woods, Forests, Land Revenues, Works and Buildings, on the security of the land revenues of the Crown.

"That your petitioners are tradesmen, depending upon the custom of the surrounding neighbourhood—that they have expended considerable sums in the purchase of leases, and bestowed much time and industry in promoting and improving their several establishments.

"That the Commissioners of Woods and Forests, in carrying out the provisions of the Act already named, have, as it appears to your petitioners, shewn greater alacrity in removing houses than in providing for the erection of new buildings; a vast number of houses having been pulled down without one spot being absolutely cleared for rebuilding; nor, as far as your petitioners perceive, have any preparations been made for restoring the neighbourhood; on the contrary, the commissioners continue to pull down a few houses here and there over a large district. The result is that your petitioners' sustenance are driven away, and trade nearly annihilated.

"That the number of houses that have

been settled for, and which have been vacated, is very considerable, and that the amount of rates paid by your petitioners is thereby greatly increased.

"Your petitioners therefore humbly pray that such relief may be granted as to the wisdom of your honourable House may seem meet, in order that the improvements above to be effected may be carried out with due celerity, and also that those who live in and by the locality may not incur ruin.

"And your petitioners further humbly pray that your honourable House will be pleased to direct that the said Commissioners of Woods and Forests will immediately select any part of their extensive plan for the improvement of the parishes of St. Giles's-in-the-Fields, and St. George's, Bloomsbury, and finish the portion so selected before they proceed to disturb what yet remains of the population of those districts.

"And your petitioners shall ever pray."

The following account will afford a just idea of the great delay which has occurred in carrying forward the improvements in our neighbourhood, and will shew how ruinous that delay must be to the remaining inhabitants.

Situations.	No. of Houses.	Reel.	£.	Date when Settled.	Date when Pulled Down.
Plumtree-street (Plan 1) 1st, 2nd, 3rd, 4th, and 5th (Nos. 9)	14	45	630	August and Nov., 1842.	February and March, 1843.
Hyde-street (Plan 3)	26	35	1840	June, 1842 and June, 1843.	March and August, 1843.
High-street, south side (2)	23	50	1150	December, 1842.	March to April, 1843.
High-street, north side (2)	7	50	330	June, 1842 and June, 1843.	April and December, 1843.
Lyons-street (2)	3	30	100	September, 1842.	April, 1843.
Museum-street, part 3 and 6.	9	21	840	Dec., 1842 and April, 1843.	April and June, 1843.
Duke-street, and east side of	25	25	1430	April and June, 1843.	June, 1843 January, 1844.
Charlotte-street (Plan 2)	7	30	320	{ One June, 1842, June { One June, 1842, June { One December, 1843 { One December, 1843 { One June, 1843.	February, 1844.

West side of Charlotte-street	165	60	240	Oct., 1842 and April, 1843.	
No. Houses Settled.....	169		£8600		

The metropolitan improvements in St. Giles's and St. George's, Bloomsbury, could have been commenced and finished in six different places, each separately, and that in accordance with the plan and Act.

1. The widening of Plumtree-street.
2. Forming a street from Broad-street to Longacre, viz., the widening of Bowl-yard, Belton-street, and Hanover-street.
3. Museum-street, from the corner of Hart-street to Holborn.
4. High-street to Charlotte-street.
5. Charlotte-street to Museum-street.
6. Widening of King-street.

Feeling obliged to you for having broached the subject, I beg to subscribe myself, Sir,  
Your very devoted humble servant,  
A PLUMBER OF PLUMTREE-STREET,  
Bloomsbury, 27th February, 1844.

[We should be most particularly obliged by receiving from our correspondents accounts of cases, whether settled by private contract, arbitration, or verdict, of compensation for property taken for forming public improvements, railways, docks, &c.—Ed.]

PLUMBERS' AND JOINERS' WAGES.  
Sir,—In your last, "A Surveyor, and Constant Reader" of your useful work, wishes to know why a plumber has more wages, and

works less time than a joiner. Let him answer these questions:—Which is the more healthy? Does not a plumber lose more time than a joiner, by his repeated attacks of rheumatism and asthma, brought on by damps, and his exposure to the vapours of the metals, which his business subjects him to? How many journey-men plumbers have you seen above 50 years of age capable of work? When answering these simple questions, you will find the custom (as you term it) by no means a bad one.

Yours truly,  
A MASTER PLUMBER.

ONE-HORSE SAW-MILL.  
Sir,—Would you or any of your correspondents oblige a constant subscriber by informing me whether or not it is practicable to construct a saw-mill to work with one horse, and if it is, on what principle. The greatest power I should want to obtain would be to saw 11 inch deal planks.  
I am, Sir, your humble servant,  
H. P. W.  
London.

Miscellanea.

WELLINGTON CITY STATUE.—A meeting of the committee for the erection of this tribute from the city to the Duke of Wellington, in grateful acknowledgment of his grace's civic services, took place at the Mansion-house last week. A letter from Mr. Trevilian, of the Treasury, was read, in which their lordships sanctioned the appropriation of the surplus metal of guns placed at the disposal of Sir Francis Chantrey, to execute his statue, one moiety to the Nelson column in Trafalgar-square, and the other to the great Wellington statue now casting by Mr. Wyatt, for the west end of the metropolis. The quantity is above eight tons. It was moved by Sir Peter Laurie, and seconded by Sir James Duke, that the committee had much pleasure in complying with the Treasury minute, which, after considerable discussion, was unanimously agreed to. It was then moved by Mr. Jerdan, and seconded by Mr. Francis, that a letter should be written to the executors of Sir P. Chantrey, requesting them to have the statue ready for inauguration on the 18th of June next, the anniversary of Waterloo, which was also carried unanimously.

THE NEW ROYAL EXCHANGE.—On Monday, Mr. Pullen commenced the sale by auction of the second portion of Bank-buildings, which will comprise the Sun Fire-office, the secretary's residence, and two other houses. The disposal of the materials took place in the large room of the Sun Fire-office, and it was crowded throughout the entire proceedings. The competition was very animated, the lots put up being principally purchased by private individuals, and not by the trade, as many of the articles consisted of excellent mahogany counters, desks, &c. The day's sale produced about 300l., making 1,600l. for what has already been disposed of. The sale was concluded on Wednesday, and the attendance of buyers was as numerous as at the commencement. The bricks of the Sun Fire-office produced nearly 400l.; and the entire sale realized 2,820l.

IMPROVEMENTS IN HUNGERFORD MARKET.—Extensive alterations are now in course of execution beneath the covered portion of this market. The market-sheds which ran from north to south on each side the middle colonnade, have in part been pulled down, and in their place has been erected framework for a double row of shops with fronts east and west, and occupying the space hitherto taken up by the sheds and stalls just referred to. Some of the new shops, it is said, will vie in appearance with those of Covent-garden Market, and besides being appropriated for the sale of choice fruits and vegetables, there will be some of them fitted for what is termed the "fancy" portion of butchers' and cheesemongers' trades.

THE WILKIE STATUE.—The following inscription, proposed by Lord Mahon, is to be placed upon the statue to Sir David Wilkie, in the vestibule of the National Gallery:—"Sir David Wilkie, R.A., born 1785, died 1st June, 1841—a life too short for friendship, not for fame."

The Admiralty intend that Portsmouth dock-yard shall in future be lighted with gas, and the sum of 240l is this year inserted in the Navy Estimates to cover the expense.

**SILBURY HILL.**—Silbury Hill is the largest artificial mound in Europe. It is not so large as the mound of Alyattes in Asia Minor, which Herodotus has described, and a modern traveller has ridden round. It is of greater dimensions than the second pyramid of Egypt. Stukeley is too ardent in the contemplation of this wonder of his own land, when he says, "I have no scruple to affirm it is the most magnificent mausoleum in the world, without excepting the Egyptian pyramids." But an artificial hill which covers 5 acres and 34 perches; which at the circumference of the base measures 2,027 feet; whose diameter at top is 120 feet; its sloping height 316 feet, and its perpendicular height 107 feet, is indeed a stupendous monument of human labour, of which the world can shew very few such examples. There can be no doubt whatever that the hill is entirely artificial. The great earth-works of a modern railway are the results of labour, assisted by science and stimulated by capital, employing itself for profit; but Silbury Hill in all likelihood was a gigantic effort of what has been called hero-worship, a labour for no direct or immediate utility, but to preserve the memory of some ruler, or lawgiver, or warrior, or priest. Multitudes lent their aid in the formation, and shouted or wept around it, when it had settled down into solidity under the dews and winds, and its slopes were covered with ever-springing grass. If it were a component part of the temple at Abury, it is still to be regarded, even more than the gathering together of the stone circles and avenues of that temple, as the work of great masses of the people labouring for some elevating and heart-stirring purpose. Their worship might be blind, cruel, guided by crafty men who governed them by terror or by delusion. But these enduring monuments shew the existence of some great and powerful impulses which led the people to achieve mighty things. There was a higher principle at work amongst them, however abused and perverted, than that of individual selfishness. The social principle was built upon some sort of reverence, whether of man, or of beings held to preside over the destinies of man.—*Old England.*

**IMPORTANT MEETING AT BIRKENHEAD.**—On Saturday evening last, a meeting of the rate-payers of Birkenhead and Claughton-cum-Grange, was held, in pursuance of public notice, at the Town-hall, in the former place, for the purpose of the bill for authorizing the purchase of the Monks' Ferry, and the bill for the construction of the Birkenhead docks, being submitted for consideration. The attendance was numerous, including most of the influential gentlemen of the township and neighbourhood. On the motion of J. S. Jackson, Esq., John Deane Case, Esq., was called to the chair. The following resolutions, proposed by Mr. Wm. Jackson, were carried, without a dissentient voice:—"That this meeting fully concur in the view taken respecting the purchase of the Monks' Ferry property, and approve of the commissioners purchasing the same, and sanction their application to parliament for the necessary power, and to raise the money to pay for it; and that the act now presented be approved of."—"That this meeting approve of the steps taken by the projectors of the Birkenhead docks, and approve of the plans as prepared by Mr. Rendall; and that the commissioners be authorized to petition parliament on behalf of the township in favour of the same, and that the bill now presented be approved of." Thanks were then voted to the chairman, and the meeting separated.—*Liverpool Journal.*

**TURNPIKE TRUSTS.**—In the House of Commons, February 12th, Lord Ebrington, pursuant to notice, asked the Home Secretary, whether it was the intention of her Majesty's government to introduce any measure, or the same measure which had been already proposed.—Sir J. Graham (Dorchester) said that a commission had been appointed to inquire into and report upon the subject of the administration of turnpike trusts in England. The commissioners had fully investigated the matter, and he expected that their report would be ready in a very short time; but before introducing any measure of the kind, he wished to have the advantage of receiving their report.

**NEW MARKET.**—The subject of a New Corn Market at Colchester is to be taken into consideration at a public meeting this day.

**THE DRUID'S STONE.**—While toiling along these wild wastes (in Portugal), I observed a little way to my left a pile of stones of rather a singular appearance, and rode up to it. It was a Druidical altar, and the most perfect and beautiful one of the kind which I had ever seen. It was circular, and consisted of stones immensely large and heavy at the bottom, which towards the top became thinner and thinner, having been fashioned by the hand of art to something of the shape of scollop shells. These were surmounted by a very large flat stone, which slanted down towards the south, where was a door. Three or four individuals might have taken shelter within the interior, in which was growing a small thorn tree. I gazed with reverence and awe upon the pile where the first colonies of Europe offered their worship to the Unknown God. The temples of the mighty and skilful Roman, comparatively of modern date, have crumbled to dust in its neighbourhood. The churches of the Arian Goth, his successor in power, have sunk beneath the earth, and are not to be found; and the mosques of the Moor, the conqueror of the Goth, where and what are they? Upon the rock, masses of hoary and vanishing ruin. Not so the Druid's stone; there it stands on the hill of winds, as strong and as freshly new as the day, perhaps 30 centuries back, when it was first raised by means which are a mystery. Earthquakes have heaved it, but its copstone has not fallen; rain floods have deluged it, but failed to sweep it from its station; the burning sun has flashed upon it, but neither split nor crumbled it; and Time, stern old Time, has rubbed it with his iron tooth, and with what effect, let those who view it declare. There it stands, and he who wishes to study the literature, the learning, and the history of the ancient Celt and Cymbrian, may gaze on its broad covering, and glean from that blank stone the whole known amount. The Roman has left behind him his deathless writings, his history, and his songs; the Goth his liturgy, his traditions, and the germs of noble institutions; the Moor his chivalry, his discoveries in medicine, and the foundations of modern commerce; and where is the memorial of the Druidic races? Yonder; that pile of eternal stone!—*Borrow's Bible in Spain.*

**OPENING OF THE TAME VALLEY CANAL.**—Wednesday week being the day fixed for opening the Tame Valley Canal, the committee, accompanied by some of the proprietors, the company's engineer, their treasurer, solicitor, clerk, and other officers, proceeded from this town in two boats along the improved line of canal to the point of junction with the Tame Valley Canal at Tipton, where they found the contractors, and many boats laden with coal, iron, and ironstone. The Tame Valley Canal unites at this point with the Walsall Canal, and passes from thence through Tipton, West Bromwich, Ferry Barr, Witton, and Aston, to Salford Bridge, into another canal of the company, called the Fazeley Canal. The committee then proceeded to open the Tame Valley Canal, passing into it from the Walsall Canal, followed by the contractors and their friends, and the trading boats, with flags, banners, and a band of music, amidst the shouts and loud greetings of a large assemblage of the neighbouring population. By means of this very valuable and important communication, coal, iron, and merchandize of all kinds will be conveyed at a reduced cost both in tonnage and haulage from the South Staffordshire mineral district to the lower part of the town of Birmingham, and the large and populous agricultural district on the line and in the neighbourhood of the Tame Valley Canal; also, by the route of the Fazeley, Coventry, Oxford, and Grand Junction Canals, to Fazeley, Tamworth, Coventry, Northampton, Banbury, Oxford, and other markets in the midland counties, as likewise to the metropolis. The works of the Tame Valley Canal have been executed in the most substantial manner, under the superintendence of the company's talented engineers.—*Birmingham Gazette.*

At a meeting of a Board of Directors of the Dock Company on Monday week, it was resolved to carry into execution the wishes of the Great Britain Steam Ship Company, in the removal of obstacles preventing her floating into Cumberland Basin; the latter company giving an indemnity for loss. Repairs to be completed by the 19th of March.—*Bristol Paper.*

**WAGES IN PARIS.**—The wages of the workmen in Paris are much lower than in London. The class of labourers to whom my observations hitherto have chiefly referred, namely—stone-masons, paviours, hodmen, &c. do not earn, even in the finest weather and longest days, more than from two francs and a half to three francs and a half; or from two shillings and a penny to two shillings and elevenpence per day. The wages of mechanics and artisans are a little better, though, in different trades, the amount of earnings varies considerably. Carpenters average four francs a day; upholsterers, from three to four francs; batters, from four to five francs; tailors, from three to five francs, according to the nature of the work and the abilities of the workmen; watchmakers earn from three to four francs, or from half-a-crown to four and twopence; and jewellers do the same. Those workmen who receive the best wages are marble-cutters and stone-cutters, their daily earnings averaging from five to six francs, or from four and twopence to five shillings. Next to them are the printers, whose wages average from four to five francs. The worst-paid workmen in Paris are the shoemakers. Their wages vary from two francs to two and a half francs per day, or from ten shillings to twelve and sixpence per week. They are, in fact, no better paid for their labour than the hodmen who work at new buildings, or the paviours who toil in the streets. The exceeding lowness of the wages which the shoemakers receive in Paris, and, indeed, in all parts of France, accounts for the very great cheapness of French boots and shoes as compared with those which are made in England. Boots, as good as those which cost twenty-eight or thirty shillings here, can be procured in Paris for fourteen or fifteen shillings. And yet, low as is the rate of wages in Paris, compared with what our operatives receive in London, the working classes in that city may live more comfortably on their earnings, provided they are economical, than the same classes can on their wages in London.—*Paris and its People.*

**PHOTOGENIC LITHOGRAPHY.**—From Rome we learn that a copper-plate engraver, Signor Lanzaruolo, has discovered a method of fixing on the lithographic stone the images obtained by the daguerreotype; so that a large number of impressions can be taken on the instant. The artist has presented to the Pope proofs of several of the monuments of the eternal city, rendered by this process, which are said to be excellent. Letters from the same city mention a report, that though full of strangers, including many of our own sight-loving public, there would be no carnival this year in the papal city.—*Athenæum.*

Sir W. Ross, painter to her Majesty the Queen of England, has arrived at Brussels. The artist went, on the 17th, to the Palace of Lacken, where he obtained the honour of a first sitting of the Queen, whose portrait in miniature, and that of the young Princess Charlotte, he is to paint for the Queen of England.

The celebrated historical painter and director of the Academy of Arts at Florence, Professor Pietro Benvenuti, died in that city the week before last, after a long and painful illness, at the age of 75.

A lecture on the principles and practice of sculpture, with illustrations, was delivered by Mr. Keyworth, sculptor, before the Literary and Philosophical Society of Hull, on Tuesday night week, and was greatly applauded.

During the last few days, Mr. Francis, the sculptor, has been at Windsor, taking Prince Albert's directions for a statue of the late Duke of Saxe Gotha.

**SUNDERLAND PIERS.**—Excavating operations have commenced near to the head of the south pier at this port, which we understand are intended for the formation of a ship wash for the surge of the tide, in order to prevent the heavy swell to which the harbour is now subject.—*Sunderland Herald.*

Northumberland House is undergoing a course of re-embellishment, preparatory to the arrival of the Duke and Duchess from Alnwick Castle for the season.

The President of the Royal Society appointed the 2nd, 16th, and 30th of the present month, for his *soirées* to the Fellows of that learned body.

THE USES OF A TOWN CROSS.—TOWNS are places where travellers rest,—all men are travellers, or may be, or should be. It would add much to general accommodation, if in the centre of our provincial towns were to be a pedestal or monument, whereon should appear various local information; on each of four faces the distances to other towns, as is done at Dereham, in Norfolk; also the means of travelling, whether by coach or railway; the time of arrival and departure, and the fares.—*Bury and Suffolk Herald.*

The new Royal Academician, elected in place of Mr. Thomson, is Mr. J. P. Knight.

THE IRON TRADE.—To gratify our readers, we give them the particulars of the expenses incurred in producing one ton of No. 2 bar-iron (say merchant bars) from the ore, which, we trust, will be found to approximate as near to truth as is necessary to form an idea:—

Coal, the price of which varies according to circumstances from 3s. 6d. to 4s. per ton—Quantity required to make one ton of bar-iron through all its processes, is about six tons—at, say 3s. 9d. per ton.	£1	2	6
Quantity of ironstone required to produce one ton of bar-iron is about three and a half tons, which, ready for being put into the blast-furnace, cannot cost less than 11s. per ton		1	18
Limestone—at least		0	2
The amount paid in wages to the fireman, together with the expenses for oils, tallows, and all other necessaries, cannot be rated at less than		1	15
Expenses incurred in transit to the nearest seaport varies according to distance, but, with agents' salaries, poor-rate, rents, and other incidental expenses, cannot be rated at less, per ton, than		0	5

Making a total of £5 3 6  
Present price of bar-iron at Cardiff or Newport—say 4 0 0  
Leaving the manufacturer at a loss, on every ton made, of £1 3 6—*Swansea Journal.*

The market for metals has at length improved to some degree, but the great article of

British iron does not yet participate in the advance, although an attempt has been made to obtain 4s. per ton for bars in Wales. British copper is in greater demand; and a public sale of eighty-four slabs of Banca tin produced 66s. per cwt. The price of spelter is 21s. 10s. for delivery, and Spanish lead is in small supply, and readily saleable at 16s. 10s. per ton.—*Midland Counties Herald.*

Tenders.

TENDERS delivered for building Coach-house and Stables, for Thomas Allen, Esq., of Blackheath.—A. Trimer, Esq., of Adam-street, Architect:—

Whitewood (of Greenwich)	£454	0	0
Clemence (Villiers-street)	453	10	0
Sugden (Bermondsey)	449	12	0

Opened in the presence of the parties.

NOTICES OF CONTRACTS.

For Erecting a new Workhouse at Arctid, near Sandbach, Congleton Union.—Plans, &c., at the Offices of the Clerks of the Union at Congleton, and Mr. Henry Bowman, Architect, 47, Princess-street, Manchester; W. and J. Latham, Clerks. March 9.

For Excavating, Puddling, and Building a Gas Pit, at No. 5, Gas Station, near Gaythorne, Hulme. Plans, &c., at Mr. Shorland's Office, Town-hall, Manchester; T. Wroe, Gas Office. March 4.

For Erecting a Master's House, Boundary-walls, &c., in connection with St. Peter's National and Sunday Schools, Union-street, Oldham.—Plans, &c., at Messrs. Butterworth and Whitaker, Architects, Cross-street, Manchester. March 7.

For Sewering, Paving, &c., several streets in Chorlton-upon-Medlock.—Plans, &c., at Langtry's, Surveyor, Town-hall, Chorlton-upon-Medlock; J. Heron, Town Clerk, 21, Princess-street, Manchester. March 4.

For Erecting and completing Buildings and other Works for Station at Halifax, Manchester, Leeds, and Hull Railway.—Plans, &c., at Engineer's Offices, Palatine-buildings, Manchester. March 11.

CONTRACT for the Erection of a Town House and Outbuildings on the Charity Farm at Thrigby, near Great Yarmouth.—Mr. A. J. Tillet, Architect, King-street, Great Yarmouth. March 11.

CONTRACT for Erecting a School-house at Holway, Bath.—Mr. G. P. Manners, Bath. March 2.

CONTRACT for Building a Lock-up-house at Tonbridge, Kent.—Mr. H. A. Wildes, Maidstone. March 11.

CONTRACT for the Erection of a Chapel, and also additional Buildings for female patients, and other alterations to the Kent County Lunatic Asylum.—Mr. G. Poynder, Clerk, Asylum, Maidstone. March 13.

CONTRACT for Building Sewers in Curstow-street, Graystock-place, Dean-street, Cook-lane, Seacoal-lane, and other places contiguous.—Mr. Jos. Daw, Sewers Office, Guildhall. March 12.

CONTRACT for the Execution of the several Works necessary to be done in the Re-building of Brent Bridge, and repairing Finchley Bridge, Hendon.—Clerk of the Peace, Sessions House, Clerkenwell-green. March 26.

CONTRACT for Building new Sewers in Portpool-lane, Leather-lane, Wolmure-place, and Great Coram-street.—Messrs. Stable and Lush, Hatton-garden. March 8.

CONTRACT for better Paving, Repairing, and keeping in order the Stone-carriage and Footway Pavements of the parish of St. Mary-Je-Strand.—Mr. G. Trauhitt, Clerk. March 14.

CONTRACT for supplying her Majesty's several Dock-yards with 2,750 loads of English Elm Timber, and 119 Elm Trees for Pumps.—Secretary of the Admiralty. March 19.

CONTRACT for Building Nine fourth-rate Houses.—Mr. Single, 34, Coleman-street, City. March 11.

CONTRACT for Repairing or New Paving the Footways and Carriage-ways, as the Commissioners may appoint, of the parish of St. John the Evangelist, Westminster, for one year, from Lady-day next.—Mr. J. R. L. Walmsley, Clerk. March 5.

PARISH OF ST. GEORGE, HANOVER-SQUARE.—Contract for Workmen's Tools and Hammers, Iron Lamp Posts and Gas Fittings, and for keeping in order the garden in Hanover-square, for one year from the 25th March. R. Lees, Clerk, Board Room, Mount-street. March 6.

PARISH OF ST. GEORGE, HANOVER-SQUARE.—Contract for Masons' and Paviours' Work, and supply of Gurnsey Granite Chippings, and Yorkshire Paving, for one year from the 25th March.—Mr. R. Lees, Clerk, Board Room. Mount-street. March 6.

CONTRACT for Removing present Wooden Turret, and erecting a Stone Turret in lieu thereof, with other works, at Preston Hospital, near Wellington, Salop.—Plans, &c., E. Haycock, Esq., Architect, Shrewsbury, or at Mr. Potter's, Bridgman-place, Walsall. March 9, 1844.

TO OUR CORRESPONDENTS.

We have received the communications of "C. S.," "Alpha," "L. O. G.," "Censorius," [who assumes a Latin signature to an English letter swarming with grammatical errors, though on a good subject,] and of "One of the London Beavers."

We have received "A History of British Fossil Mammalia and Birds," by Richard Owen, F.R.S., part I.

"Geology: Introductory, Descriptive, and Practical," by David Thomas Ansted, M.A., F.R.S., part I.

"Illustrations of Baptismal Fonts," Van Voorst. Parts II., III., IV.

"ION."—The work, we are informed, is at present out of print. The price was 1s.

"T. M. C."—The present price of the work is 8s. 8s., and is to be obtained at No. 106, Great Russell-street, Bloomsbury.

The fresh communication of "G. R. F." upon "Annulets" we have received, and have put in hand its requisite illustrations.

The article "Echinus," from "G. R. F.," will appear in our next Number, if our engraver complete his work in time.

"J. L. T."—The beautiful example of a Welsh font has been received. With the other details of it, we should like to have a plan or horizontal section of its basin.

We have received "SPECIMENS . OF . DECORATIONS . IN . THE . ITALIAN . STYLE . SELECTED . FROM . THE . DESIGNS . OF . RAFFAELLO . IN . THE . VATICAN . PALACE . AT . ROME."

We have received the drawings of the ARBROATH INFIRMARY, but cannot insert them till we have a description of the building, and the names and purposes of the different wards.

We have received the drawings of the proposed *Hier, and those for Scrolls and Curtailings, on a small scale.*

ERRATA.—No. LV., page 95, first column, line 22, for "Censor" read Censer.

In page 23, first column, line 31, for *frustrum* read *frustum*.

The Builder.

NO. LVII.

SATURDAY, MARCH 9, 1844.

**B**RINGING up for the fifth time the important subject of Bridge-building, we must conclude what we have to say at present upon arches before we resort again to piers and abutments.

21stly. Every bed-joint throughout bridge-work generally should be formed at right-angles in the course of the active drift or pressure, so that no fracture or displacing of the materials may occur from irregular or askew gravitation; thence the arch-joints, instead of

being straight inclined planes, will assume a curved form, which will not only effectuate correct gravitation of the materials,

but will also prevent the slipping out of any voussoir from the work, which indeed may be utterly prevented by each stone in the work being plugged with copper, or other proper metal, to all the other stones which adjoin such stone. In the present state of architectural taste, we might not admire the appearance of arch-joints being so curved, but this may be only first prejudice, since if, by the nature of science, they should be so required for perfect operation, we should soon, becoming accustomed to such form, cease to dislike them, and even admire their prominent display, in the same manner as we do the flowing curvatures of nature. The pinning up tightly the key-stone, and plugging it to the adjoining stones, will in this, as in all other cases, be a matter of some difficulty, but may be partly effected by the key being horizontally somewhat wedge-shaped, so as to drive forward till tight, and by being then run with lead.

22ndly. The spandrils of the arch should form part of the Catenarian construction, the extrados itself being the immediate bed of the roadway.

23rdly. The mere paving or other roadway, and its traffic, should be the only burthen upon the arches and piers of a bridge, except the unavoidable weight of the parapets and their adjuncts.

24thly. In order to distend upwardly the spandrils of the arch, so that the extrados may form the bed of the roadway without any more burthen, they should be made of lighter materials, so as to afford the requisite quantity of

resistance to fracture, without any increase of weight.

25thly. Solid arch-spandrils, formed of materials graduated in lightness in proportion to the excess of length required in order to occasion the extrados of the voussoirs to reach up to the under side of the roadway without more burthen, will be more economical and more certain in operation than open spandrils formed of harder and heavier materials, on account of the difficulty and perhaps impossibility of forming tunneled or other open spandrils, without casting weight irregularly upon some parts of the work, instead of diffusing it uniformly over the whole of every skewed surface and bed-joint of the work; so that although it is necessary that all the external work of a bridge should be of such materials as will resist the effects of moisture, air, and time, there may be cases in which the arches or their spandrils, or some other parts of them, may be better formed of light topus, or even chalk, than of the hardest granite.

26thly. Having now arrived at the piers of the work, our chief theory thereon is, that they should commence in bulk of the utmost united substance of the spandrils of the two arches to be supported.

27thly. If any reduction of this bulk occur, harder materials must be chosen, as, for instance, if the inclined bed-line of each spandril be 10 feet long, the head of the pier should be 20 feet wide, if the pier be of the same kind of materials as the arches; but if it be desirable (as it may) to reduce the piers to only 10 feet wide, the material of the piers should be twice as capable of resisting fracture as that of the arches.

28thly. It may be taken as a general rule that for reducing bridge-piers to the smallest practicable bulk, and thence leave the greatest amount of water-way, they should be built of the hardest, most compact, and least bulky materials; but that from the use of light materials for arches result the advantages of greater depth of key-stone and spandril, whereby the voussoirs at the vertex of the work are less likely to slip through, and mere lumber is rendered unnecessary for filling out the haunches of the work for supporting the roadway.

29thly. The piers, instead of being perpendicular, should increase downwardly, so that there may be the same amount of pressure on every foot of the work down to near the foundation; but in order to prevent obstruction to the water-way under the arches, the piers may be made with small increase of width till near the foundation, but with greater increase of length the way of the stream, so as to make up for restriction of width.

30thly. Unless the foundation of a bridge be solid sure rock, there should be a sudden increase or spread of the work according to circumstances, so that every foot of the bed or foundation of the work (instead of being only as capable of resisting pressure as well as any course of the masonry of the pier) may be even three or four times as capable of resisting

pressure; so that notwithstanding the accident and vicissitude to which a foundation under water are liable, there may be if possible a certain assurance of the work standing.

In our next we shall go into the theory of the Land-abutments.

METROPOLITAN BUILDING-ACT.

**HOUSE OF LORDS.**—The Earl of Lincoln said he rose for the purpose of bringing in a bill for regulating the construction and the use of buildings in the metropolis and its neighbourhood. It would not be necessary for him to enter at length into the subject, as the contents of the voluminous reports which had been laid on the table of the house in reference to it must be fresh in the recollection of the House, and it would be, therefore, useless on that occasion to go into any recapitulation of them. He should merely state that the report of the committee which sat in 1840 recommended a measure for the regulation of buildings in large towns, which was not only essential, but of primary importance. The first bill on that subject was brought forward in 1841 by a noble lord a member of the other House, who was then Secretary of State for the Home Department, but it did not pass in consequence of the dissolution of Parliament that year. In 1842 it was again introduced in the House of Lords, but before the second reading in the House of Commons it was referred, by the unanimous assent of all parties, to a committee up-stairs, which sat during the session without coming to any practical result, and at the end of the session the committee reported the evidence without any decision upon it. At the desire of his right honourable friend the Secretary of State for the Home Department, he (the Earl of Lincoln) looked through that evidence, with a view to the preparation of a measure on the subject for the session of 1843. He consulted several architects and surveyors on the subject, and he found that a general measure on the subject would embrace very complicated details, from the circumstances connected with the various towns that should be included, some of them, such as Liverpool, having local acts for regulating those matters, and others, such as Manchester, having no regulation upon that subject. Seeing this, it was evident that if the difficulties were overcome, that branch of the subject would afford an ample basis for a legislative measure in itself, and consequently the bill of last session was brought forward with respect to the metropolis alone; but in consequence of the great number of other measures which were also before the house, it was found impossible to proceed with it. He did not regret that it had been so, for he had frequent opportunities during the recess of introducing alterations and improvements into that measure, and he hoped that they were such as would make the measure efficient and useful to the public. Without trespassing further on the attention of the House, he would state the leading provisions of the bill which he was going to bring in. The house was aware that the present Act for regulating buildings was introduced in the reign of George the Third, about seventy years ago, and many of its details were of course inapplicable to the present condition of the metropolis. He, therefore, proposed to repeal that Act [hear]. The existing act contained provisions for the prevention of fire, and he (Lord Lincoln) intended, in the course of the present session, to bring in a separate measure on the subject of the prevention of fire in the metropolis, rather than to mix up provisions for the prevention of fires with his present bill. It was unnecessary for him to trouble the house with technical details, which would be disagreeable and unintelligible to the House; such details, for instance, as affected party-walls, and the various classes of buildings. All he felt necessary to state was that the bill had been framed with the greatest care, and after consulting men the best qualified to give information on the subject, and he hoped it was one which would be palatable to all

conceded, as far as it was possible in a bill which, to a certain extent, placed restrictions on the free will of individuals. In the bill of last year provisions were introduced for the purpose of regulating and improving drainage. He proposed to omit those clauses from this bill, as the subject of drainage and a proper supply of water to large towns and populous places was under the consideration of a commission which, he hoped, would before long, lay a report on the table of the house that would enable him to deal with the subject separately. All he proposed, therefore, in this measure was, such a provision on the subject of drainage as was indispensable for the purposes of the bill. There were also provisions for the purpose of preventing, as far as possible, the crowded and confined character of streets and lanes, which had heretofore, in numerous instances, produced so much disease amongst the poorer classes of the community in crowded districts; in fact, to so great an extent had the evil gone, that in some crowded streets fever continued without intermission from one end of the year to the other. He proposed that in future there should be certain widths as regarded streets and alleys, and as far as was practicable he proposed to regulate the use of buildings for habitations, prohibiting the use of cellars for that purpose where it was possible. There was also a clause in the bill to prohibit the carrying on of any dangerous trade or business in crowded neighbourhoods, and another provision to prevent the practice of any business which might be noxious to the public health in close and crowded districts. The House was aware that under the present Building-Act there was a power to appoint district-surveyors, and it was not proposed to interfere with that power, or to interfere with the power of magistrates to appoint them. He should remark that in some cases great abuses had arisen from the appointment of incompetent persons to that office. He proposed to have district-surveyors appointed by the magistrates, such surveyors not to be under thirty years of age, and not to be magistrates; and he also proposed that the appointment of surveyors should be confirmed by the Secretary of State, so as to secure the services of a superior class of officers. Although he objected to making new officers, yet he felt that it was absolutely necessary, to prevent excessive litigation, that official referees should be appointed to determine disputes, and he, therefore, proposed to appoint them by this measure. There was a provision for extending the operation of the Act round the metropolis; but not further than twelve miles from Charing-cross. There was also another provision, new to this bill, and which was not in the bill of last year; it was one for vesting the power of deciding on the report of the official referee in the Commissioners of Woods and Forests, in cases where any exceptions were taken to his reports. He earnestly hoped, though the bill was of a technical nature, and therefore not of a nature to command the attention of the House, that it would receive its best consideration.

Leave was then given to bring in the bill.

#### THE NEW ROYAL EXCHANGE.

A VERY splendid entertainment was given on Wednesday week, at Mercers' Hall, by the Mercers' Company to the Gresham Committee, in congratulation of the approaching period to their labours by the completion of the civic edifice, which is to be opened in the course of the next three months.

Mr. Watney, the Master of the Mercers' Company, was in the chair. Amongst the company were Alderman Humphrey, Sir Chapman Marshall, Mr. R. L. Jones, the Chairman of the Gresham Committee; Mr. Tite, the architect of the New Royal Exchange; Mr. Palmer, Mr. Westmacott, the sculptor, &c.

In the course of the evening, Mr. Tite mentioned that he felt the highest gratification in stating that the works would be completely finished within the specified time. He expressed his gratitude for the great liberality they had exercised in giving additional beauty to the portico by employing Mr. Westmacott to make the ornamental sculpture for the pediment—a task which had been performed by that gentleman with remarkable classical taste. He trusted that the building which was so near

completion would fully answer all the purposes for which it was raised, and that the prosperity of the great city for which such exertions were made, and such an expenditure was incurred, would increase in proportion to the magnificent improvements now so rapidly advancing.

Mr. Westmacott, in returning thanks for the warm manner in which he was received by the company, said he felt much pride in informing them that the sculpture of the pediment had been seen by some of the highest personages in the realm, and that he had been honoured by their approbation of the mode in which it had been executed. Prince Albert had come upon him unawares while he was at work in his apron, and emphatically pointed out the figures and decorations which His Royal Highness considered to deserve more especial notice. The Duke of Cambridge had also honoured him with a visit, and added to the gratification which he felt by an approval expressed in terms which nobody could mistake; and the greatest man in England, the Duke of Wellington, did not withhold his tribute of unfeigned congratulation.

Mr. R. L. Jones took occasion to congratulate the city of London upon the splendid manner in which the Royal Exchange had arisen out of its ashes to claim comparison with the most famous buildings in the metropolis. In a few days the unsightly obstruction which the public had so long desired to see levelled to the ground would wholly disappear, and the figure of the hero of a hundred battles would appear before the edifice which might be considered as the type of the commercial greatness attributable in no small degree to his military skill and wisdom.

#### INSTITUTE OF BRITISH ARCHITECTS.

JAN. 8. C. Barry, Esq., R.A. V.P. in the chair.

A communication was read from W. M. Higginson, Esq., "On the recent restoration of the spire of St. Stephen, at Vienna." It proceeded to state, that the ancient church of St. Stephen is supposed to have been founded, in the year 1144, by Heinrich Jasomirgott, afterwards the first Duke of Austria, one of the twenty-three children of Agneses, to whom the Klosterneuburg owes its foundation. The church seems to have been several times injured by fire, and in 1519 by severe earthquakes, which did great injury to the buildings in Vienna and the vicinity, and on these occasions to have been partly rebuilt, and much enlarged. The tower, as built or restored in 1519, in process of time, deviated out of the perpendicular to a considerable extent. An iron bar was carried through it as an axis for the support of the spire, which, having a considerable tendency to vibrate, might be considered as an element of destruction, rather than of strength; consequently the thin wall of the lower portion of the spire was reduced almost to a ruin, and at length became in such a dangerous condition as to require rebuilding. The removal of the old spire was commenced in August, 1839, and in the following spring all the condemned part had been removed. The mode of construction adopted in the restoration was novel and ingenious; the slight masonry of the spire being supported by means of a framing of vertical iron ribs, fastened, at their lower extremities, to a cast-iron plate or base, and united to each other at intervals by horizontal rings of rolled iron. These rings are made to project from the inner surface, so as to admit of a person ascending, with the assistance of ladders, to the top of the spire. All the wrought and rolled iron employed in the construction of this iron skeleton, the weight of which was only 123 cwt., was prepared in the government works at Neuberg, in Styria. The cast-iron plates or rings were furnished from the government iron works at Maritzell. In the autumn of 1842, when the whole of the masonry of the spire had been completed, the upper portion, consisting entirely of iron-work, was fixed. This also was attached to a strong cast-iron circular plate, similar in construction to that below. This portion of the framing, with the other iron-work employed in the spire, weighed about 80 cwt., so that the entire weight of iron was about 203 cwt. The new portion of the spire was connected to the old by means of an arrangement of iron-work, very appropriately called "anchor-jasements." The portion of the spire restored (viz. from the gallery

of the tower to the top of the cross) is about 182 feet, the cost thereof being about 130,000 gulden, of which sum 15,500 gulden were expended in taking down the old spire, and in the construction of the necessary scaffolding. Objections have been raised at Vienna to the extensive use of wrought iron in the reconstruction, from an apprehension of injury arising from the dilatation of the metal under changes of temperature; it appears, however, from careful experiments made, that the expansion of a bar of wrought-iron 40 feet in length, under an alteration of 40° Reaumur, is not more than three lines, even in a horizontal position, and would be less in a vertical position, in consequence of the pressure of the upper parts on the lower; and the opposite effect would increase with the diminution of temperature, the effect being still less when a number of pieces are united, forming a system (as in the iron work of the spire), than when the same length is in a single piece. It further appears that Bolinger, the mechanical engineer, found the dilatation of one of the iron ribs, between the temperature of summer and winter, to be only one line, and that of the iron framework, when completed and exposed to the direct rays of the sun before it was covered by the masonry, to be imperceptible.

JAN. 22. T. L. Donaldson, Esq., in the chair.

Mr. Poynter made some remarks on a plan and section of the transept of Minchinhampton Church, in Gloucestershire, presented by Messrs. Foster and Son, of Bristol. The transept was, he said, a very curious one of the fourteenth century, and it was most remarkable that the roof, although supported by stone joists, was built as if it were of timber. The transept was not large, being 29 ft. long and 15 ft. wide, and the roof was carried by six stone ribs; the height to the crown of the arch being 32 ft. The appearance was very irregular, the windows also being narrow. The roof was originally covered with slabs of stone, but is now tiled.

FEB. 5. W. Tite, V.P., in the chair.

A paper was read by Mr. J. J. Scoles, on the pyramids at Abou-Koash, and those to the southward, including those in the Faiyoum, and on an arched tomb existing in the vicinity of Gizeh, shewn in the third volume of Col. Vyse's work. There appeared to be thirty-nine pyramids in Middle and Lower Egypt, all of which have been explored by Mr. Perring, at the expense of Col. Vyse. They are situated on the western side of the Nile, chiefly on the Desert Hills, occupying a space, measuring from north to south, of fifty-three English miles. The principal pyramids alluded to are distinguished by the names of Gizeh, Sacarra, Dushoor, and Meydoum, and have a remarkable correspondence in their general arrangements, their sides being placed true to the cardinal points, with one exception, the entrances being on the north side, and having inclined passages leading to various apartments; which passages, to a considerable way down, have been filled up with solid blocks of stone or granite to the exact size of the apertures. Four of these pyramids are constructed of crude or unburned bricks, formed of loam, Nile earth, and chopped straw. In making the excavations necessary to elucidate their construction, Mr. Perring discovered that the foundation of some of the pyramids was formed by levelling the stony surface of the desert with fine sand, confined by stone walls surrounding the base, and on the sand was built the pyramid. Wood, forming the ceiling of one of the sepulchral chambers, and consisting of oak, larch, and cedar, was found in a wonderful state of preservation. The walls of some of these sepulchral chambers were lined with a bluish-green porcelain; and remains of colouring, gilding, and other embellishments, shewed the magnificence of the builders of these mansions. The arched tomb near Gizeh was constructed of stone beautifully worked, and the joints were scarcely perceptible. From hieroglyphics inscribed on this monument, it appears to have been constructed in the reign of Psammeticus II. about 600 years before Christ, and is probably one of the oldest stone arches known; but Mr. Scoles seemed to have some doubt as to the high antiquity of this and other similar arches from the circumstance that the arch was not used by the Greeks, and also that it was little used by the Egyptians at a later period.

OXFORD ARCHITECTURAL SOCIETY.

FEB. 14.—The Rev. the Rector of Exeter College in the chair.

A volume entitled, "Remarks on Wayside Chapels," by J. C. Buckler and C. Buckler, Esqs., was received from the authors; and the following books were reported as added to the library: *Gotische Rosetten aus der Kirche zu Doberan, 4to. Rostock, 1838.* *L'Architecture Gothique sur les bords du Rhin, de la Lahn et du Mein, par L. Lange, folio, Francfort, 1833.* Stained Glass of the new Church of Notre Dame at Munich, large coloured plates, by F. H. Eggert, royal folio. Munich, 1843.

A paper was read by Henry Addington, Esq., of Lincoln College, on the church of St. Peter-in-the-East, Oxford. This church is well known to have been currently attributed to Grimbald, in the time of Alfred; but Mr. A. shewed, by comparison with other buildings, that the oldest parts of the present structure, comprising the crypt and the chancel, are late Norman or transition work, of about the same age as the choir of Canterbury, the crection of which, in 1175-84, is recorded by Gervase. The Lady-Chapel, on the north side, was built by St. Edmund of Abingdon, the founder of St. Edmund Hall, about A.D. 1240, and is in the early English style; the arches on the north side of the nave appear to be of the same age. The windows of the north aisle are good Decorated work, with flowing tracery approaching to Flamboyant. The tower is also of the fourteenth century, with an added parapet of the fifteenth. A fine perpendicular window at the north end of the Lady-Chapel was inserted by Vincent Wyking, Vicar, in 1433; another fine window of the same style, and the porch, are probably of the same period; the room over the porch has a stone vaulted roof of not very common construction. The present state of the church and churchyard is worthy of praise and imitation.

FEB. 28.—The Rev. the Rector of Exeter College in the chair.

G. A. K. Howman, Esq., Balliol College; the Rev. W. Fletcher, M.A., Brasenose College; W. Feetham, Esq., St. John's College; the Rev. E. R. Dukcs, M.A., Christ Church; W. H. Milman, Esq., Christ Church; W. E. Buckley, Esq., M.A., Brasenose College; the Rev. J. H. Brooks, M.A., Brasenose College; Alexander King, Esq., Oriol College, were admitted members.

Drawings of a Letter in Blythburgh Church, Norfolk; a Poors' Box in Cawston Church, Norfolk; and a singular early English Piscina across an angle in Blyford Church, Norfolk, were presented by the Rev. R. M. White, D.D., Magdalene College.

Engravings on wood of the Church and School of Garsington, Oxfordshire (the wood blocks), were presented by the Rev. the President of Trinity College.

A letter was read by the chairman from the Rev. G. Costar, Archdeacon of New Brunswick, acknowledging a present of the publications of the Society, and expressing a warm interest in its proceedings. The chairman took this opportunity again to call the attention of the society to the subject of designs for wooden churches for the colonies.

A communication from C. Winston, Esq., was read by Mr. Parker on the subject of the chapel at Rozel, in the island of Jersey, a small and interesting early structure, which had long been desecrated, and has lately been restored with much care and skill by the proprietor, Mr. Lempriere, under the direction of Mr. Winston; a number of drawings illustrating the chapel in various stages of the work were handed round the room.

Mr. Parker also read a description of Beselsleigh Church, Berks, a small oblong structure, mostly of Decorated work, with a good east window, having a cinque-foiled inner arch; and a bell-gabel for two bells at the west end. This paper was also illustrated by drawings.

A drawing of a rood-screen in Swardston Church, near Norwich, was presented by W. H. Stanton, Esq., Exeter College, and a short account of it read. This rood loft is connected with the roof by a boarded partition, which appears to be contemporary with it; other instances of the same arrangement were mentioned.

The chairman called the attention of the meeting to "The British Archaeological Association," lately established in London, and recommended it to the notice of the members as likely to be an useful central means of communication for all the local societies.

INSTITUTION OF CIVIL ENGINEERS.

INSTITUTION OF CIVIL ENGINEERS.

MARCH 5.—The President in the Chair.

The first paper read was a description by Mr. J. T. Syme, of the bridge over the river Whitadder, at Allanton. This bridge, which was executed at the expense of Miss Boswall, of Blackadder, from the designs of Messrs. Stevenson and Sons of Edinburgh, consists of two arches of 75 feet span each, with a versed sine of 11 feet 6 inches, the centre pier being 32 feet 1 inch long, and 10 feet in breadth, making the distance between the faces of the abutments 160 feet; it was constructed of soft red sandstone, and the abutments were built up solid, the greater part of the masonry being ashlar; the total cost of the bridge was stated to be 6,058*l.*

An account of the building of Wellington-bridge, over the river Aire, at Leeds, by Mr. J. Timperley, was also read. This bridge was executed from the designs of the late Mr. Rennie, about twenty years since; it crosses the river where it is 100 feet wide and 6 feet deep; it consists of a segmental arch of 100 feet span, with a versed sine of 15 feet, constructed of stone from the quarries of Bramley Fall, which are about 4 miles from the bridge; the abutments are built in radiating courses, except the external faces, which are horizontal, the whole being well bonded together; the total quantity of masonry is 80,000 cubic feet. The method of forming the foundations, as well as of the coffer-dams and centre, was given in detail, and it was stated that the total cost of the bridge was only 7,250*l.*

Mr. G. Rennie made some clear and concise remarks on the ancient arches, of which traces have been discovered by the recent researches of travellers; alluding to Perring's account of ancient arches discovered at Thebes, the bricks of which bore the name of Sesostris, which would carry back the knowledge of the arch to a period of upwards of three thousand years. He noticed also the size of the stone lintel among the Greeks; the Etruscan arches, found in Italy; and also the more modern but very bold arches still remaining in Italy, Portugal, and Spain.

A paper by Mr. F. Nash was then read, describing a new kind of girder, composed of a number of diagonal bars of wrought iron abutting against each other, with cast-iron transoms; these latter supporting the pressure, and the former the tension. This mode of construction has been recently introduced in France for bridges; and the paper, after describing a number of preliminary experiments on small girders, gave the details of the proofs to which four girders placed side by side, with a bearing of 74 feet 8 inches, had been subjected by order of Monsieur Teste, the Minister of Public Works, Paris. From this it appeared that with a load of 62 tons, the deflexion in the centre was 1 1/2 inch, and that the girders resumed their original position on the weight being removed, after bearing it for a month. In order to test the effect of a sudden shock, a cart, loaded with 43 tons of iron, was caused to break down suddenly in the centre of the bridge without producing any prejudicial effect beyond crushing the flooring planks. The weight of these four girders was stated to be 20 1/2 tons.

The following papers were announced to be read at the next meeting, when the discussion on arches will be resumed;—

No. 663. "Account of Pulteney Town and Harbour (Wick, Caithness), from their foundation in 1803 to the year 1844," by J. Bremner, M. Inst.

No. 662. "Description of casks used in floating large stones to sea," by J. Bremner, M. Inst., C.E.

No. 631. "Description of the formation of the town lands of Musselburgh," by James Hay.

The monthly ballot for members took place, when the following candidates were elected:—Messrs. J. O. Buller, C. M. Herbert, O. Dadian, J. Abernethy, A. Slate, G. K. Pollock, J. H. Pepper, J. S. Atkinson, and W. Langdon, as Associates.

LINCOLN TOPOGRAPHICAL SOCIETY.

On Tuesday evening, the monthly meeting was held in the Freemasons' Hall, Richard Mason, Esq., V.P., in the chair. Mr. W. A. Nicholson read an interesting paper, describing a subterranean passage in the bail of Lincoln, which is about fourteen feet beneath the present surface; the height is about four feet, and the walls are of rough stone, filled in around with concrete; the appearances were such as to forbid the notion that it had been built for a passage of communication, according to common tradition; nor did he think it was a sewer; the work was evidently of the Roman period, and it was probably a subterranean aqueduct, resembling that at Tusculum. An interesting discussion followed; Mr. E. J. Wilson inclined to the opinion that it was the Roman sewer. The direction of the southern branch, as far as it had been traced, leads towards the north-western tower of the cathedral, but it goes neither in the direction of the hypocaust which was found near the Chancery House, nor the tessellated pavement now in the cloisters.

WORKMAN'S HOUSE.

In the last number of the *Westminster Review* are the following remarks:—

"Self-taught architects appear to have retrograded, and lost the little taste they once possessed, for it is rare that we find one of them able to build, without instruction, a chimney in the old English style, which prevailed in country places, and especially in Kent, a century ago.

"But we despair of nothing; and we have been much gratified at observing the encouragement given to a very meritorious weekly publication addressed to this class, called *THE BUILDER*, and eminently calculated to promote the interests of working-men, as connected with the improvement of their habitations. In a late number of this publication we noticed the following communication, to which we give insertion here, from, probably, the same motives which influenced the editor."

(Here is inserted a copy of our correspondent's letter and sketch.)

"We may smile at this sketch, but a majority of the houses in the United Kingdom are fourth-rate tenements, somewhat like the above, and in Ireland often worse,—the room up-stairs, and the staircase itself, being generally wanting in an Irish cabin. It will be well for British architecture and for the British people when every working-man begins to think, like the correspondent of *THE BUILDER*, of the means of improving his little cot, and to put by something of his earnings towards the object. We earnestly hope that if the Committee of Council for Education cannot be made to perceive the importance of architectural manuals for schools, filled with suitable designs for habitations of farmers, tradesmen, and working men, the subject will be taken up by the existing Commission for promoting taste in the Fine Arts."

We have ourselves just received the subjoined sketch and remarks upon the same subject:—

Sir,—One of your correspondents applied for a design for the improvement of his little cottage. I inclose one, which I hope will meet with his approbation. C. S.

[We do not perceive that our correspondent has furnished any hints for the double door or partition requested by "A Working-man." We shall abstain from all critical remarks till we receive the plan of the house.—Ed.]

## SOCIETY OF ARTS.

MARCH 6.—Benjamin Rotch, Esq., V.P., in the chair.

The Chairman described Ellis's improved turn-table and weighing-machine.

The great objection to placing turn-tables of the ordinary construction on the main line of a railway, is that, by the nature of their construction, they are rapidly destroyed by the frequent passage of heavy trains over them, besides the injury done to the carriages, and the unpleasant motion and noise caused to the passengers.

Mr. Ellis has constructed a turn-table which, when not in use for turning engines or carriages, rests firmly on the curb, and thus allows the train to pass rapidly over them without injuring either the table itself, or engines, or carriages.

The iron pintle of the table on which it turns, being kept well oiled, works with a loose collar round it in a vertical iron case, which case is supported and kept in its central position by two cross arms of cast-iron at right-angles to each other, and attached to the curb; the lower end of the pintle passes through the bottom of the case, below which is a stirrup attached to a cross lever passing at one end through a chase in the circular masonry or brickwork supporting the table; attached to the external end of the long lever is a second lever, working in a vertical direction, and connected with a third, or handle lever, by which the table is put in motion or fixed as required. When the table is to be put in motion, the stirrup is raised by means of the system of levers, and the pintle, resting in a conical cup attached to the stirrup, causes the table to be raised from its bearing on the curb.

The table is converted into a weighing machine by attaching a steel-yard to the external end of the cross-stirrup lever.

The Secretary read an account of the result of the experiment lately made in Regent and Oxford Streets, as to daily cleansing the streets of the metropolis, from which it appears that—

The experiment was commenced on the 2nd of January, in the present year, and was continued until the 20th of the same month, inclusive, being nineteen days: 35 men, and 3-89 boys were, on an average, daily employed, at the rate of twelve hours a day.

The average area of surface, swept by Whitworth's machines, amounted to 1841 superficial yards, and the quantity of soil slop, &c. removed by the machines, averaged rather more than three loads per day, or at the rate of one load for 613 superficial yards swept by the machine.

The average cost per day was at the rate of 8*l.* 13*s.* 9*d.*

The total area kept continually clean during the 19 days of experiment amounted to 27,000 superficial yards; and, taking the boys at 2 to a man, the average area kept clean continually by each man, with the occasional aid of the machines at night, was equal to 730 superficial yards.

The expense per house for effecting this desirable object was found to be at the rate of 1*s.* 2*d.* per week; but it is evident, that if a complete system of cleansing the metropolitan streets daily were carried into effect, the cost would be materially reduced, as a large proportion of the mud collected during the experiment was transferred from the adjacent macadamized roads.

The Secretary read a short paper on Robson's patent signal lights, which are of three colours, viz., white, red, and green, the composition being contained in paper cases attached to small wooden handles.

Ignition is produced by means of a small glass globule of sulphuric acid, placed in an aperture in the handle, immediately above which is placed a small cake of oxyhydrate of potash, divided from the globule by means of a small tin slide. In the aperture, works a wooden screw; and when the slide has been withdrawn, the screw is turned against the glass globule so as to break it, and the acid and oxyhydrate of potash being brought into contact, the fire is communicated to the top of the charge by means of a quick match caused through the centre.

The practical application of these lights to an

universal system of numerical signals proposed by Mr. Whisbaw, the Secretary, was shewn at the back of the Society's repository.

To give notice, a projectile light is used, from which various balls are thrown up a considerable height above the operator; and for particular signals, cases containing the three different colours are used.

## SOCIETY OF ANTIQUARIES.

FEB. 1.—Thomas Amyot, Esq., in the chair.

Albert Way, Esq., Director, exhibited some specimens of Egyptian hieroglyphics, printed from a set of moveable types (upwards of three hundred in number) by the house of Didot of Paris.

Mr. C. J. Richardson exhibited drawings of a stone rood-screen, with an hour-glass and frame still attached to the pulpit, in Compton Bassett church, Wilts. The screen is a beautiful specimen of the late Perpendicular Gothic. They were accompanied by a drawing of the font at Yatesbury church, in the same county, a curious and rich specimen of the ornamental style of the end of the twelfth century.

Mr. Way exhibited a rubbing of a fine and instrumental monumental brass from the church of Allhallows, Barking.

Mr. C. R. Smith communicated a drawing and description of an early monumental slab of granite, found on the cliff of Carnesev, in Cornwall. It bears an inscription, slightly damaged, which is as follows, and appears to commemorate two persons:—

HIC  
GEMV  
REQUIEVIT  
CVNAIDO  
HIO  
TUMVLO  
IACIT  
VIXIT AN  
NOS  
XXXIIII.

Dr. Bromet exhibited some drawings of Newark Priory, in Surrey, and a few antiquities lately discovered there; among which were an inscribed thumb-ring, the matrix of a seal, and two enamelled armorial badges, supposed to have been worn by the retainers of the personages whose arms they bear.

Sir Henry Ellis read extracts from the minutes of the privy council, from the 32nd to the 34th Henry VIII.

FEB. 15. Lord Viscount Mahon, V.P., in the chair.

Albert Way, Esq., Director, exhibited a rubbing of a commemorative engraved slab, representing St. Louis, King of France, and two of his sergeants-at-arms, formerly placed in the monastery of Sainte Catharine du Val at Paris, founded by them at the battle of Bovines in 1214. It was removed at the revolution, and is preserved in the royal catacombs at St. Denis. It is richly gilded and painted; its date the earlier part of the 15th century. Engraved by Lenoir, in Musée des Monumens Français, vol. i., p. 29.

Two long spoon-shaped instruments, and two thin plates, all of gold, were exhibited. They were brought from South America, and used, it is believed, for ornament in the hair.

Albin Martin, Esq., of Silton, Dorsetshire, exhibited to the society, through the medium of Mr. Kempe, some articles of antiquity, and original drawings by his own hand of fresco paintings; the latter preserved in the Museo Borbonico at Naples. We describe them in the order as exhibited.

No. 1 of this collection is a head sculpture in Rosso Anticho, from the remains of the Temple of Apollo at Cuma. It represents the bearded Bacchus, the mode of displaying this divinity as conqueror of the East. The countenance is youthful, the hair disposed round the forehead in curls somewhat resembling a wreath of roses, and a straight lock of hair is dependent on each side of the head. The eyes are hollowed out, probably for the reception of jewels.

No. 2 is an elegantly-formed bronze vase, brought from Pompeii; it has evidently been cracked by the action of intense heat, and is covered with crystals of blue sulphate of copper. Mr. Kempe remarked that the sulphurous exhalations which arose from the earth and pervaded the atmosphere at the time

of the tremendous eruption of Vesuvius, which destroyed Herculaneum and Pompeii, in the 79th year of the Christian era, were so powerful that they suffocated the elder Pliny on the sea-shore at Stabia, supposed to have been at Castella Mare, about four miles from Pompeii. No. 3 is a copy of a group of divinities from a fresco painting, taken from an apartment in Herculaneum; it represents Hercules, Flora, Tellus, and other mythological characters.

No. 4 is a copy of a fresco from Pompeii, representing a satyr dancing with a goat; a very expressive and humorous composition.

No. 5. Another fresco from Pompeii, representing Atalanta, from the well-known group of Meleager, Atalanta, and attendants.

No. 6 is from a fresco painting at Pompeii, representing Justice. The figure has all the simple grandeur of attitude which the late Mrs. Siddons could so well portray.

Nos. 7 and 8 are ornamental borders from chambers in Pompeii.

No. 8 is a careful drawing of the remains of the temple of Venus at Baia. The structure is of Roman brick; this was formerly covered with white marble.

No. 9 is a view of the Street of the Tombs at Puzzuoli. They were seated on a branch of the Appian Way, and were buried at a remote period by one of those convulsions of the earth so prevalent in this volcanic district. The tombs, which are larger than those of Pompeii, were, at subsequent times, dug out and rifled of their contents. They have now the appearance of caverns on either side a hollow way. The drawings of Mr. Albin Martin display considerable power as an artist, combined with the strictest truth.

Sir Henry Ellis communicated from the Cottonian MSS. a project for amending the sewerage of the city of London, from the waters near St. Agnes le Clere, dated 20th April, 1605.

Thomas Bateman, jun., Esq., of Bakewell, communicated a description of several barrows in Derbyshire, opened by him during the summer of 1843, accompanied with numerous drawings of the relics discovered in them. It was found that most of them had been opened before.

FEB. 22.—Mr. Hamilton in the chair.

William Staunton, Esq., of Longbridgehouse, near Warwick, exhibited an original appointment by Letters Patent of the Duke of Somerset as Protector of Edward the Sixth. It is of a different date to those before known; and is signed by all the Privy Council, but appears never to have received the great seal. It is supposed to have been preserved among the muniments of the Griffin family, descended from the Attorney-general of that period.

John Gough Nichols, Esq., F.S.A., communicated a paper on the ancient Auldry subsisting between the Companies of Goldsmiths and Fishmongers of London, and their consequent participation of coat-armour. This latter circumstance, which is mentioned by Stowe in connection with the former, seems scarcely to have been understood by him, inasmuch as there is no community in the arms of the Companies, and he offers no other explanation of it. Mr. Nichols points out several private coats, principally of citizens, and some certainly Fishmongers, in which fish are found as charges in combination with the leopard's head of the Goldsmiths, and he therefore concludes that the participation took place in those private coats. The circumstance occurred at an early period, probably in the reign of Edward II., and therefore long before the incorporated College of Heralds could legislate on blazon.

## SMOKELESS STEAM COAL COMPANY.—

The prospectus of a company under this title has been issued, in which it is stated that upon estimates and calculations made, the net profits to the company will yield annually upwards of 50 per cent. on the shares. We must confess we are somewhat dubious on this point, while the prospectus appears to us to require some elucidation. It is under such circumstances that we are induced to defer any observations until our next, while we shall, in the mean time, have an opportunity of satisfying ourselves on one or two points. The collieries extend over a tract of 1,300 acres, and have, it is stated, considerable advantages and facilities of shipment.

## LECTURES ON ARCHITECTURE AND ANTIQUITIES.\*

## Lecture II.

SELEUCIA, as was observed before, was built by Seleucus, one of Alexander's great captains, forty miles above Babylon, at the confluence of the Euphrates with the Tigris, by a canal. According to Pliny (Nat. Hist. B. vi. c. 26), it once contained 600,000 inhabitants, all the commerce and wealth of Babylon had flowed into it, and the soil around it was thought the most fertile in the world. Seleucia, when an independent Greek republic, had its senate of 300 nobles. It was sacked and fired by the Romans, A.D. 165, when 300,000 inhabitants were put to the sword. Of its present appearance, Captain Mignan furnishes us with an account. He says:—"Time, violence, and repeated inundations have levelled every thing. I looked in vain for monuments, pillars, aqueducts, and buildings. Bricks of every kind, mixed up with layers of straw, varnished tiles, and pottery of every colour (but chiefly blue), stones, shells, and a variety of vitreous and nitrous substances; these, and these alone, comprise what remains of the once magnificent Seleucia. There is not a single entire building, nothing but a small remnant of a wall and a few portions of decayed brickwork left to mark the foot of the spoiler, and bid us mourn in silence and solitude over fallen and departed grandeur."

One cause of the decay of Seleucia is ascribed by Pliny to the Parthians, who, in order to destroy it, imitated the plan of the Greeks, who built Seleucia to injure Babylon; the Parthians, therefore, built the city of Ctesiphon, within a few miles of Seleucia, in order to disperse and impoverish it. Captain Mignan describes a very magnificent ruin called "Taikkessa," or the arch of Chosroes. "The full extent of the eastern face is 300 feet; it is divided by a high semi-circular arch, supported by walls 16 feet thick, the arch itself making a span of 86 feet, and rising to the height of 103 feet. The front of the building is ornamented and surmounted by four rows of small arched recesses, resembling in form the large one. The style and execution of these are most delicate, evincing a fertile invention and great experience in the architectural art." M. de Broses, a celebrated antiquary, supposes that Ctesiphon is the place where stood Calneh, mentioned in Genesis x. 10, as formerly part of Nimrod's kingdom. The natives of the country assert that the ruins are of the age of Nimrod. The riches contained in this venerable pile appear to have been immense: Gibbon, in his "Decline and Fall of the Roman Empire" (vol. ix. c. 51), describes the sack of Ctesiphon by the Saracens, A.D. 637, in the time of Caliph Omar, successor to Mahomet, in the following words:—"The capital was taken by assault, and the tumultuous resistance of the people gave a keener edge to the sabres of the Moslems, who shouted with religious transport, 'This is the white palace of Chosroes, this is the promise of the apostle of God.' The poor robbers of the desert were suddenly enriched beyond the measure of their hope or knowledge. Each chamber revealed new treasure, by art secreted or ostentatiously displayed. The gold and silver, the various wardrobes and costly furniture, surpassed the estimate of numbers and even of fancy itself. The sack of Ctesiphon was followed by its desertion and decay."

The last two places have been noticed out of chronological order, but as they arose from the ruin of Babylon, it appeared best to speak of them immediately after the account of that proud city.

NINEVEH, the celebrated capital of Assyria, was founded by Ninus (the husband of the famous Semiramis), who after his death received divine honours as the Jupiter of the Assyrians and the Hercules of the Chaldeans. Some writers suppose that Nimrod built Nineveh, as they read the 11th verse of Gen. x. thus, "Out of that land he" (i. e. Nimrod, mentioned in the three preceding verses) "went forth into Asshur" (or Assyria) "and built Nineveh." This city was built on the banks of

the Tigris\*, and, according to the relation of Diodorus, was 15 miles long, 9 miles broad, and 60 miles in circumference. It was surrounded by walls 100 feet high, broad enough for three chariots abreast, and defended by 1,500 towers, each 200 feet high. It rivalled Babylon in splendour and magnificence, as well as in extent, to which we may be easily reconciled by the knowledge that at the present day, within the inclosure of most of the great cities of the East, lie vacant spaces for gardens or for pasture, as was implied of Nineveh from the Scripture mention, that in it there was "also much cattle." (Jonah iv. 11.) The kings of Assyria or of Nineveh were noted for their luxury and extravagance, but little worth knowing is recorded of them from the time of Ninus (the son of Ninus) until the reign of Sardanapalus, the fortieth and last monarch. Before his time, Jonah the prophet was sent to warn the wicked city (whose inhabitants copied the evil habits of their kings) that it should be destroyed in forty days; but upon their repenting and humbling themselves in sackcloth and ashes, from "the greatest of them even unto the least of them," the city was spared. Jonah is believed to have lived between 810 and 785 B.C. This repentance appears not to have lasted long, for we find the prophets Zephaniah and Nahum foretelling the city's ultimate destruction. The former inspired writer, who flourished in the time of Josiah, about 630 B.C., thus predicts: "The Lord will stretch out his hand against the north, and destroy Assyria, and will make Nineveh a desolation, and dry like a wilderness; and flocks shall lie down in the midst of her, all the beasts of the nations; both the cormorant and the bittern shall lodge in the upper lintels of it, their voice shall sing in the windows, desolation shall be in the thresholds; for he shall uncover the cedar-work" (ch. ii. 13, 14). The whole book of the prophet Nahum is a "burden" against Nineveh, of which he says, "It shall come to pass that all they that look upon thee shall flee from thee, and say Nineveh is laid waste" (ch. iii. v. 7). Beleses, the Babylonian high priest, and Arbaces, the Median, conspired against Sardanapalus, and besieged him for two years in his capital, when, despairing of success, that monarch made an immense pile in his palace and set fire to it, consuming himself, his wives, and his treasures. Diodorus says, "there was a prophecy handed down by tradition from their ancestors, that no one should ever take Nineveh by force till the river had first become an enemy to the city; but it came to pass in the third year that the Tigris being increased by most violent showers of rain of long continuance, overflowed a part of the city, and threw down about twenty furlongs of the wall. Then the king thinking that the oracle was accomplished, and that the river was now evidently become an enemy to the city, gave up all hope of saving himself." Two verses in the prophecy of Nahum are very striking with reference to this fact: "But with an overwhelming flood He" (the Lord) "will make an utter end of the place thereof, and darkness shall pursue his enemies" (ch. i. v. 8); and again, "The gates of the rivers shall be opened, and the palace dissolved." (ch. ii. v. 6.) We learn also from Diodorus that "the Medians, under Arbaces, being informed by some deserters of the drunkenness and negligence which prevailed in the camp of the Assyrians, assaulted them unexpectedly in the night, and became masters of their camp." The prophet Nahum had foretold, "For while they be folded together as thorns, and while they are drunken as drunkards, they shall be devoured as stubble fully dry." (i. 10.) In the destruction of Nineveh vengeance was taken of the Assyrians for their captivity and cruel treatment of the ten tribes of Israel. Of the present state of that once unrivalled city, modern travellers of different ages inform us. Lucian, a native of Samosata, a town upon the Euphrates, who flourished in the second century, affirms that Nineveh was utterly perished, and that there was no footstep of it remaining. Benjamin of Tudela, who wrote his "Itinerary" in 1173, says that Nineveh is laid waste. Haïton, the Armenian, who wrote in the year 1300, says, "The city of Nineveh is at present totally in ruins. But by the remains which are still to be seen, one may be fully satisfied that

it was one of the greatest cities of the world." And Tavernier affirms that the ancient city Nineveh is now a heap of rubbish only, for a league along the river, full of vaults and caverns." (vol. ii. b. 2, s. 4.) The town of Mousoul, on the western bank of the Tigris, is supposed to be on the site of Nineveh, but its remains are literally no more than mounds of earth, extending over several miles; one of these is 178 feet high, 1,350 feet long, and 1,147 feet broad, as measured by Mr. Rich. G. R. F.

(To be continued.)

## RAILWAY BUSINESS IN THE HOUSE OF COMMONS.

THURSDAY, FEBRUARY 29.

*Railways.*—Two petitions were presented from merchants and others interested in the conveyance of goods by railway, for securing a free competition in the carriage of goods.—To lie on the table.

On the motion of Col. Sibthorp, a return was ordered.—"Of all moneys to be raised under the sanction of the acts whereby railroad companies had been incorporated, between the 1st day of January, 1826, and the 1st day of January, 1844; distinguishing the sums to be raised by loan or mortgage, and stating the several acts under which the said several sums are to be raised."

*South Devon Railway.*—A bill "for making a railway from Exeter to Plymouth, to be called the South Devon Railway," was presented, read a first time, and ordered to be read a second time.

*Manchester and Birmingham (Macclesfield and Poynton Branches).*—A bill "for enabling the Manchester and Birmingham Railway Company to vary the line of their branch-railway to Macclesfield, and to make another branch therefrom, and for amending the former acts relating to the said company," was presented, read a first time, and ordered to be read a second time.

*Bolton and Preston Railway.*—A bill "to effectuate the sale, by the Bolton and Preston Railway Company, of their railway, and other property and effects, to the North Union Railway Company, to incorporate with such last-mentioned company the proprietors of the Bolton and Preston Railway, and to consolidate shares and stock," was presented, read a first time, and ordered to be read a second time.

*Edinburgh and Glasgow Railway.*—A bill "to authorize an extension of the Edinburgh and Glasgow Railway, and to amend and enlarge the provisions of the acts relating to such railway," was presented, read a first time, and ordered to be read a second time.

*Leeds and Bradford Railway.*—A bill "for making a railway from Leeds to Bradford, with a branch to the North Midland Railway," was presented, read a first time, and ordered to be read a second time.

*Sheffield, Ashton-under-Lyne, and Manchester Railway.*—The standing orders committee reported a resolution, "That in the case of the Sheffield, Ashton-under-Lyne, and Manchester Railway petition, the standing orders ought to be dispensed with; that the parties be permitted to proceed with their bill on depositing in the Private Bill Office amended plans and sections, excluding from the limits of the deviation the particular portions of land not numbered, and rectifying the sectional error, so that the levels of two turnpike-roads and two public carriage-roads crossed by the railway between No. 130 on the plan and the termination of the railway at the collieries, be not affected; and that the committee on the bill do examine, in the first place, how far such order has been complied with, and do report the same to the house on the report of the bill." Resolution agreed to.

*Newbury, Basingstoke, London, and Southampton Railway.*—The standing orders committee reported "That in the case of the Newbury, Basingstoke, London, and Southampton Railway petition, the standing orders ought to be dispensed with; that the parties be permitted to proceed with their bill." Resolution agreed to.

\* Lord Byron, in his drama "Sardanapalus," has followed the mistake of some of the early historians, in placing Nineveh on the Euphrates.

GRESHAM CLUB-HOUSE.  
KING WILLIAM STREET, LONDON.  
HENRY FLOWER, ESQ., ARCHITECT.

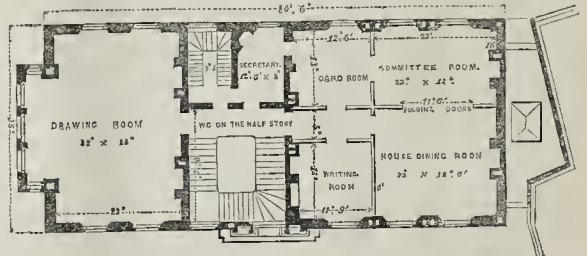

PERSPECTIVE VIEW.

THE idea for the elevation of the east end of this building was suggested by the recollection of the pontifical palace at Florence, although possibly, on comparing the two, little less than the "artistical feeling" would be recognized. The same innocent piracy may be seen on comparing the centre of the front elevation with a sketch, taken from the bridge of St. Marc at Venice, of a palazza in that city.

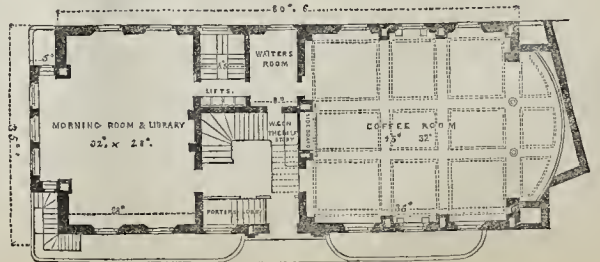

The face of the work will be composed of Roman cement.

The basement-plan shows the kitchen, which is arched over, to prevent the heat from affecting the temperature of the morning-room above, and is ventilated by means of flues peculiarly constructed for that purpose, by forming the chimney-flues of iron, 1 ft. 6 in. square, and leaving a space of about 4 inches immediately around them, so that the heat from the fire rarifies the outer space or chamber, and causes at once a rapid and perfect ventilation both of heat and smell.

The dishes are conveyed from the kitchen to the waiters' room above by means of "lifts," in which latter apartment they are examined and adjusted previous to being taken to the table. The "lift" is opposite the desk of the clerk, who is accountable for every thing that leaves the kitchen, and who is telegraphed by means of a speaking tube from the waiters' room. The soiled plates are returned down the side "lift," handed into the scullery, through the window, washed, and placed in a hot closet under the window, accessible from both sides, ready for the epicurean routine. The various receptacles for ice, vegetables, fish,

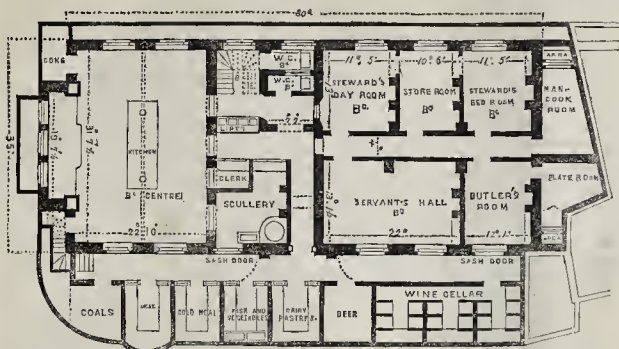

PLAN OF THE ONE-PAIR STORY.

PLAN OF THE GROUND-STORY.

PLAN OF THE BASEMENT-STORY.

cold meat, &c., are precisely on the principle rendered so perfect by the experience of Mons. Loyer, the ingenious "chef" of the kitchen of the Reform Club, and are far more admirable in their minutiae than can be described. Were it not for occupying too much space, particulars might be afforded from our estimable friend, that would be of great value to such of our subscribers as put faith in the minor comforts of domestic arrangement, a copious collection of which have been gathered by the architect, with illustrations and their "wherefores."

The ground-story consists of the coffee-room, morning-room, &c., as seen by the plans, reference to which may be made for the particulars of the rooms above, all of which are shewn, except those on the two-pair story, which comprise the smoking-room, the billiard-room, bath-rooms, and servants' dormitories. The washing-rooms or dressing-rooms, also the water-closets, are off the half-space of each landing, forming a mezzanine-story, to which

hot and cold water are laid on, as well as to the baths on the two-pair story, so that a bath may be obtained in a very few minutes.

The amount of the estimate, exclusive of the fittings, is 8,000*l.*; the works are being executed by Messrs. William Cubitt and Co., who have undertaken to have the roof on early in May, and the building completed in September; so that there is every prospect of its being occupied in October.

The architect has just received a number of Roman coins, found on the level of the basement, which, on being cleaned, have proved to be of silver, some bearing the inscription of Cæsar. They were all embedded in corrosion, as if they had been subjected to great heat; besides half-a-dozen which have been cleaned with vitriol, the architect has received some forty or fifty "en masse," resembling a lump of ore, except that on their surfaces the head and superscription are partially visible.

March 4, 1844.

X. X. X.

NEW PUBLIC BUILDINGS, PRESTON.

In consequence of the increase of the number of scholars in the grammar-school, in this town, which now exceeds a hundred, the proprietors of the building in which the school is held, at a late meeting, resolved to make an addition to it, by putting out a transept on the west side. The new room will communicate by an arch with the present school-room, and will be appropriated to the accommodation of the elder scholars, for whose use there will be a number of private studies. The building will front in Cross-street, and will be of stone, in a style of architecture harmonizing with the present school. The upper row of windows will resemble those of Heaton College, Oxford. It has been a subject of regret, that the valuable library, of upwards of 5,000 volumes, bequeathed to the Aldermen of this borough, by the late Dr. Shepherd, should remain in a room in an unsuitable part of the town. There is now a fair prospect of improvement in this respect, the proprietors of the school-buildings having agreed to erect rooms for the reception of this library; the books to remain under the control of the Aldermen, and the right of admission to be vested in them, exactly as at present. The design for the library is in a corresponding style of architecture, the principal window being of the decorated character, and resembling the beautiful example in the ancient school at Coventry. At the same meeting, the gentlemen present expressed a desire to build, along with these erections, museums, and a lecture theatre, for the Literary and Philosophical Society, and thus to fill up the whole frontage from the present grammar-school to Winckley-square. An elevation and ground plan, which were submitted to them, met with so much approbation, that no less than fifteen hundred pounds were subscribed for this purpose, at the meeting, in shares of 100*l.* each. This subscription, though begun at a meeting of the proprietors of the school only, is quite a distinct matter from the proprietorship of the school, and open to others; and since the meeting, further subscriptions have been received. From two to three thousand pounds will be required for this building,

and no doubt is entertained by the projectors that the subscription list will be filled up. The proposed lecture theatre and museums bear some resemblance to the new hall and library now building for Lincoln's-inn, but, of course, upon a smaller scale. The theatre will have two fronts, one to Winckley-square and one to Cross-street. A plan, prepared by Mr. Park, the corporation steward, for the enlargement of Avenham-walk, by the purchase of the late Mr. Starkie's field, and the formation of a street on each side, with small gardens in front, after the manner of Busbell-place, was also submitted to the meeting, and much admired. In the year 1840, parliament voted 10,000*l.* for encouraging the formation of public walks in populous towns. Only two places, Dundee and Arbroath, have, as yet, availed themselves of any part of this fund, and the remainder lies in the Exchequer, until called for. An application is intended to be made on behalf of Preston; if it should be successful, and this plan carried into execution, a great ornament will be added to the town, and one of the finest walks will have, in the new buildings, one of the finest terminations. The walk would also greatly increase the value of the adjoining lands, which belong to Goosnargh Hospital on the one side, and to Mrs. Cross on the other. Two other mansions are about to be erected on the south side of Winckley-square, which will fill the whole vacant land remaining on that side. Another projected public undertaking, worthy of support, and one which we trust soon to see accomplished, is a new building for the Institution for the Diffusion of Knowledge. Another, perhaps as much wanted, is a covered market.

ENGLISH DOORWAYS.—No. I.

We have for some time past turned our attention to collecting delineations of ancient doorways, and have in hand some very beautiful examples, especially of that class of them which, though rich in carving and free fancy, are fast disappearing for the effectuation of "Improvements." We mean the oak portals which were principally the production of the seventeenth century. We are acquainted with

two hundred, at least, of beautiful examples, all different from each other, of this class of artistic works, of which fine specimens are to be found in Leadenhall-street, Crosby-square, Abchurch-lane, Charterhouse-square, St. John's-square, St. James's-walk and Red Lion-street, Clerkenwell, Bloomsbury-square, Carey-street, St. Martin's-lane, Queen-square, Westminster; and in many other parts of the metropolis, as Bermondsey and Goodmansfields, and particularly at the Ancient Halls of the City Companies; also in the old suburban villages, as at Highgate, Hampstead, Kensington, Camberwell, Deptford, and Greenwich. The example we have here given is of masonry, and is from Stone Church, Kent, some account of which will be found in our review of Mr. Cresy's work upon that church, in No. 50, page 32, of our magazine, to which we subjoin the following particulars taken from the same excellent work:—

"The present example is almost unique in England, and it has been supposed does not occupy its original position. Between the two next buttresses eastward, the jambs of a doorway still remain worked into the wall, and which may have been the situation of an original round arch which conducted into the church mentioned in the Domesday survey.

"Some change or alteration from the original position of the stones is inferred by the imperfect mitre in the outer ring of the arch, as well as from there being eight roses on the west and only seven on the east side above the springing. The clear width is 3 feet 4 inches, and its total internal height 7 feet 3 inches, and is executed in free or Reigate stone, very much resembling the Caen. The shafts of the columns which were detached are gone. A small expenditure upon this beautiful fragment would restore it to its original perfection; and, if not taken in hand speedily, and rescued from the devouring hand of time, the amateur of all that belongs to works of the eleventh century will have to deplore the annihilation of one of the finest specimens of the Pointed arch executed in this country; an example too, which shews the application of Norman enrichments to the new style, "Novum genus edificandi," as it is called by William of Malmesbury, who lived in the reign of Henry the First."

DOORWAY OF STONE CHURCH, KENT.

Our next subject will be from Barber-Surgens' Hall, Monkwell Street, in the City of London, of which we have a beautiful cut already executed; as our subjects are fast disappearing before the pitiless hand of renovation, we shall produce those earliest which are most likely to be soonest destroyed: one of our artists is now delineating the bold portals of Montague House, which will, in a few months, be no more, in order that their sites may be occupied by the intended new facade of the British Museum.

l.p.e.

LAYING THE FOUNDATION STONE OF  
THE NEW BONDED WAREHOUSES,  
PRESTON.

In the month of November last, four plots of land, on the New Quay, and about fifty yards from the river, were sold by the corporation, for the erection of warehouses for the bonding of foreign produce imported into Preston. The purchasers of these plots were Mr. Alderman German, Mr. Alderman Haydock, Mr. Turner, coal-merchant, and Mr. Bond, contractor. These warehouses will be built of brick (with stone basements, carried to a height of seven feet above the roadway); fire-proof throughout, and finished according to the regulations, required by the customs, of full privileged ports. The buildings will be each five stories high, and occupy a surface of sixty feet by thirty-six. They are likely to be completed in the course of the autumn.

Thursday week was fixed upon to lay the foundation stone of the new buildings, and about one o'clock, a pretty numerous company had assembled to witness the ceremony. Among those present were the Worshipful the Mayor, Mr. Alderman German, Mr. Alderman Haydock, John Bairstow, Esq., Mr. Smith, Mr. Cummings, Mr. James German, Mr. Park, Mr. Leach, Mr. Turner, Mr. G. Smith, Mr. Tuach, &c. &c. A number of ladies also were in attendance. Several flags fluttered from the temporary erection on the quay, among which was a very handsome one, belonging to Mr. Bond, bearing the inscription, "Success to the Ribble." Shortly before two o'clock, the stone was hoisted in the bed, when, after three cheers had been given, the mayor addressed the ladies and gentlemen assembled. He said that, having been requested by the proprietors of the warehouses to lay the first stone, he had great pleasure in complying with that request. They learnt, from history, that Preston had been a port in ancient times; and, according to tradition, the chief magistrate of the town was, in those days, called the Portreeve. In process of time, the channel of the river became filled up; and the port business was much impeded, and the importance of the town, in a commercial sense, was much reduced. Owing to the efforts of the Ribble Navigation Company the impediments had been in a great measure removed, and the commerce of the port had been increased, and already gave promise of being large and of great usefulness to the town. Her Majesty's Government, considering these circumstances, had renewed the privileges formerly enjoyed by the town of being a port, and extended them. In return for this consideration upon the part of Government, it was intended to call the new buildings, the "Victoria Warehouses." Considering the means Preston now enjoyed of rapid communication with the south of England, and the probability there was of these advantages being extended to the north and east, and of their having a branch railway to the very spot upon which they were standing, he thought they would be able to see, in a short time, commodities from every part of the world brought into this port. He had been accustomed from his youth to look upon the verdant plain near them, as so eligible a spot for the recreation of his townsmen, that at first it was with feelings of regret that he looked upon a prospect of its being covered with buildings; but he hoped that the increased labour and energy which would be called into existence by such a change, would be attended with increased wealth and prosperity, and he would then have no reason to regret the change. They would have the means to form public walks, and to further improvements in other parts of the town. The company he was sure would join him in wishing every prosperity to the Ribble Navigation Company, to the Victoria Warehouses, and the spirited proprietors.

The mayor then called for three cheers for the new undertaking, which were most heartily given.

In a cavity in the stone was deposited a bottle, containing copies of the last week's Preston newspapers, and coins of the present year. A plate bearing the following inscription (which was read by Mr. Tuach) was then placed upon it:—

"The Foundation Stone of these Warehouses, to be built for Mr. Alderman German, Mr. Alderman Haydock, Mr. Councillor

Turner, and Mr. Bond, was laid on Thursday, the 29th February, 1844, by the worshipful the Mayor of the borough, John Addison, Esq.

"FRAS. W. TUACH, Architect.

"WILLIAM BOND,  
"THOMAS WHITTAKER, } Contractors."

His worship then spread the mortar, the stone was lowered, and having struck it three times with the mallet, he drank "Success to the Victoria Warehouses, and the healths of the proprietors," in a tankard of spiced wine, and the principal gentlemen present also partook of it, pledging the same toast. Mr. Alderman Haydock then proposed three cheers for the mayor, for his kindness in at once acceding to the wish of the proprietors to lay the first stone of the bonded warehouses. The proposition was responded to with the utmost enthusiasm, and the company then dispersed.

THE TIMBER TRADE.

THE state of the timber trade, at the present time, affords an illustration of the advantages resulting from a reduced scale of the duties upon important articles of consumption especially, and the following remarks, from the circular of Messrs. Chaloner and Fleming, of Liverpool, will forcibly illustrate this:—

"In conformity with the practice usual at this period, we proceed to take a review of the timber trade for the past year, and we do so with much pleasure, as evidencing a greatly improved state of the general state of the country, and refuting in a marked degree the anticipations of evil that prevailed with those opposed to the Government measure for the reduction of the duties. This year has, in fact, been the first of the operation of the new tariff, and has proved the principle of affording to consumers, at low prices, an article so essential as timber, it has shewn by an expanded consumption the powerful stimulus that has thus been given to the trade, when taken in connection with the improved state of the manufacturing districts. With the very untoward circumstance abroad of an unusual and excessively high price of timber, what would have been the portion of consumers had they been obliged to add thereto the late existing high duties? It is only reasonable to conclude that, with an import fully averaging that of the four years previous to that ending February, 1843 (which was the year of the change, and which was scarcely more than half an import, as explained in our last annual report), we should hardly have been in the favourable position that we now hold, with a light stock to meet an expected animated spring demand. The consumption will be found, as regards the main articles of import, to have exceeded, with one exception, any previous year since 1833, and bids fair to progress in a ratio far exceeding the most sanguine expectations of the supporters of the measure, if it be not checked by too great an advance in prices previous to the new import. These remarks apply particularly to colonial timber, which, in this locality, receives the estimation it deserves, and which is gradually superseding the use of Baltic."

Why should delays arise in the reduction of the duties upon tea, tobacco, and wool, when such favourable results are here shewn?—*London Journal of Commerce.*

NEW INVENTION.—A Mr. Pauling, of Manchester (well known as an extensive and successful contractor for railway works, and who completed the Manchester and Birmingham Station, in Manchester, and who is now engaged in completing the Junction Railway to Hunt's Bank, for the Liverpool and Manchester Station), is now engaged in erecting machinery on a very extensive scale, for the purpose of executing almost every description of joiner's work; the special objects being to effect the most difficult parts, such as mortising and the making of sash-frames, &c. Report says, that this enterprising gentleman has succeeded, and that the work thus finished is incomparable; in other terms, that it is not possible for mere handicraft labour to vie with the work finished by this new invention. The works are on a very extensive scale, and, if fully employed, will of necessity revolutionize this branch of the building business.—*Preston Chronicle.*

CHURCH-BUILDING INTELLIGENCE, &c.

*Dalton New Church.*—The new edifice intended for a place of worship for the inhabitants of the villages of Newbarns, Howcat, Barrow, and the adjoining hamlets, has, at length, been completed, and was opened for Divine service, the other week, by the Rev. John Baldwin. The congregation was so great that numbers could not find space within the building. Although some might be attracted there by the novelty of the occurrence, yet we are certain that the little temple, humble though it be, will continually be filled, at times of its sacred services, with single-hearted and devout worshippers. At the present time service is performed under a licence. It is contemplated that a school should be taught therein.

*St. Stephen's and All-Martyr's Church, Leeveridge.*—This beautiful and singular new church, built of terra cotta, in the decorated English style of architecture, was opened for divine service on Sunday last. The chancel, where the material is left in its original colour, is highly decorated, and has a very pleasing appearance. The ends and back panels of the open seats, the mouldings, and letters in the cornice, the gallery front, and parts of the pulpit and desk, &c., are made of terra cotta, and shew how extensively applicable the material is for ornamental work. The stained glass in the small windows and in the chancel is by Willement; that in the transept and west window by Wailes. Mr. Sharp, of Lancaster, is the architect.—*Bolton Chronicle.*

*Bury Parish Church.*—Richard Walker, Esq., the highly respected member for Bury, and his brother, Oliver Ormerod Walker, Esq., have, in the most liberal manner, presented two new bells to the churchwardens of the parish church, which, with the six old bells, will make a fine peal of eight. The new bells are to be cast by Messrs. Mears of Whitechapel. Thomas Norris, Esq., of Bedvale, who laid the first stone of the new steeple now in the course of erection, has presented a clock to the parishioners.—*Preston Chronicle.*

*St. Nicholas Church, Dublin.*—A copy of the correspondence which took place between the Ecclesiastical Commissioners for Ireland and the Dean and Chapter of St. Patrick's Cathedral, Dublin, in reference to pulling down the Church of St. Nicholas Within, in that city, was moved for by Mr. Grogan, and ordered by the House of Commons to be printed, 23rd February, 1844.

His Grace the Duke of Cleveland is going to erect a suitable parsonage-house in the township of Forest and Frith, near Middleton-Teesdale, where his Grace maintains a resident minister for the spiritual benefit of the people in that retired district.

The Roman Catholic chapel at Lincoln is undergoing an extensive embellishment and repair, in order to be fitted for the reception of the High Sheriff of the county, who will go in state to mass on the Assize Sunday.

COST OF DRAIN TILES.—The cost in Lincolnshire of making drain-tiles 13½ inches long, 4½ inches wide, and 4 inches high, outside dimensions when burnt is, for digging, wheeling, turning, and grinding the clay, 3s.; in all 8s. 6d., exclusive of coals and leading. In 1831 one million and a half of these tiles were supplied to one landowner, who was charged 22s. 6d. per 1,000 for them by the maker. When the expense of 1s. for grinding is added to 2s. 6d., for moulding, making in all only 3s. 6d., the slight advantage of machinery now in use to effect these processes will appear. Where its application actually does reduce the cost, it can only be by reducing the 3s. 6d. paid for moulding and grinding, for the other charges remain the same. Few use a bottom or the sole. There are tile-works now constructing where it is proposed to take the clay as soon as dug, at any season of the year, pulverize it without adding water, and mould it into tiles, all by one operation by pressure; and at one quarter of an inch thick the tiles are of a sufficient strength; they have forward projections to dispense with the use of tile soles. Pipe-tiles, and those of other shapes, as well as sewer-tiles, are to be produced of equal comparative strength.—*Anonymous.*

## RAILWAY INTELLIGENCE.

**Railway to Lincoln.**—It seems now almost certain that we shall have a railway to Lincoln; and the only thing that can prevent it is the squabble between the rival engineers, Messrs. Rendell and Walker, and surely the public will have sense and spirit enough to prevent these gentlemen from injuring them. Both gentlemen have numerous powerful friends. Mr. Walker is, we understand, supported by Earl Winchelsea, Earl Ripon, Mr. Christopher, Mr. Chaplin, and others in this neighbourhood; Mr. Rendell is said to have the support of the Duke of Rutland, Marquis of Exeter, Earls Fitzwilliam and Yarborough, Lord Worsley and others. Both gentlemen are sanguine of the success of the scheme. Mr. Rendell proposes to commence near Cambridge, where the railway is to connect itself with London, through the medium of the Northern and Eastern Railway, and passing northward in connection with the towns of Cambridge, Huntingdon, Peterborough, Stamford, Market Deeping, Spalding, Bourne, Sleaford, Lincoln, Gainsborough, Doncaster, and Thorne, terminate in Yorkshire, at the place most convenient to unite with the several railways formed there. — *Boston Herald*, Feb. 20.

**Oldham and Saddleworth Railway.**—Many of the principal inhabitants of Oldham, Lees, and Saddleworth have commenced proceedings to obtain an extension of the Oldham branch railway, to Greenacre's Moor, Lees, and Saddleworth. It is understood that the Manchester and Leeds Railway Company are giving every encouragement to the undertaking, and it is probable an Act of Parliament will be procured as early as possible to form that part of the line from Greenacre's Moor to Saddleworth. The remainder of the line, from the present Oldham station to Greenacre's Moor, is to be constructed in a few months. When the Bury and Middleton Railway is finished, there will be a direct railway communication from the westerly to the easterly parts of Lancashire, as well as to Saddleworth and Ashton-under-Lyne. — *Preston Chronicle*, March 2.

**Caledonian Railway and Lancaster Canal Company.**—We understand that one of the good effects to arise from the arrangement between the provisional directors of the intended Caledonian Railway and the Lancaster Canal Company, will be to save nearly all the expense of a new viaduct bridge over the Lune. The respective levels of the canal and railway are such, that by arching over the canal, on the present aqueduct, the two lines of rails may be laid upon those arches, leaving sufficient space for the passage of boats on the canal underneath, as usual. By adopting this plan, also, the large claim for compensation made by the owners of the Skerton fishery is completely avoided.

**The Projected Railway from Lincoln to Gainsborough.**—Every preparation is being made for commencing this important project. Mr. Stephenson, the eminent engineer, is engaged to superintend the work, if the projectors succeed (as there is no doubt they will) in obtaining an Act of Parliament. As a feeder to the Hull Railway, and eventually part of a direct line from London *via* Cambridge, Peterborough, and Lincoln to Hull and to York, such a line must be highly advantageous to this neighbourhood.

**York—Cambridge Railway.**—A great sensation is created in the railway-market on account of the almost certainty of this railway being established. It will give a much easier communication with the North, and will be of infinite service to the fine agricultural country through which it will pass. It will render the Blisworth and Peterborough line of very little service to the London and Birmingham Company, either as a protective line or as a source of profit.

**Birmingham and Derby Railway.**—At the Birmingham and Derby Railway meeting, Colonel Blane announced his intention of opposing in Parliament the Midland Railways Amalgamation Bill, unless better terms were granted to the Derby Company. The meeting was not remarkable for much else than the declaration of an increased dividend.

A line of railway is projected from Paris to Strasburg.

**The Lancaster and Carlisle Railway Bill** was read a second time in the House of Commons on Tuesday week, and ordered to be committed. The committee to whom it is referred, are Mr. Greene, Mr. Wilson Patten, Col. Lowther, and the Hon. C. W. J. Howard.

**London and Birmingham Railway.**—The present marketable value of the London and Birmingham Railway is 9,693,750*l.*

Railway reformers talk a great deal of the comparatively low rate of fares in England and in Belgium, in utter forgetfulness that the whole system of railway management in the two countries is entirely different; had we waited in England until the Belgium system was adopted by the state, we should have been as backward as France or Ireland are now in railway speculation, and there is just as much difference in the English and Belgian prices of every commodity as there is in their respective rates of railway fares.

## Law Intelligence.

REMOVAL OF PARTY-WALL.  
VICE-CHANCELLOR'S COURT, MARCH 2.  
(Before Sir L. Shadwell.)

**DISDALE v. DAWSON.**—This suit has arisen out of a dispute between the proprietors of two rival hotels (the Privateer and the Rum Puncheon) in West-street, Gravesend, with regard to the right to pull down and rebuild a certain foundation wall situate between the sites of the two houses, adjoining each other, and which has already been the subject of cross-actions at law now pending. It appeared that a foundation wall raised to a level with the ground-floor, and extending about 20 feet from the front line towards the back of the two houses, formed more or less the basis of support to each house on the side of contact. The plaintiff who was the proprietor of the Privateer, alleged that this foundation wall was formed of two parallel walls, one of fourteen and the other of nine inches thick; that a partition wall was raised between the two houses which rested partly upon each foundation wall, and that as the joists of the ground flooring of each house rested entirely on the fourteen-inch foundation wall, to the full extent of its width, the defendant had no right to remove any portion of it, and, therefore, the bill was filed originally to prevent him from doing so; but as the defendant had since pulled down the whole of the partition wall, and some portion of the fourteen-inch wall, an injunction was now asked to restrain him from building on the foundation wall of fourteen inches or on the site of it, which the plaintiff wholly claimed. The defendant insisted that the fourteen-inch wall was an ancient foundation wall common to both houses; that the Privateer rested upon it in an irregular slanting direction; and that what was termed a partition wall by the plaintiff was the west wall of the Rum Puncheon, and rested on the remaining average of seven inches, and had no other foundation than the old fourteen-inch foundation wall, the nine-inch wall being a mere buttress wall, which belonged entirely to the defendant. The question was, whether an injunction should issue to restrain the building up of the wall till the actions at law had been decided?

Mr. Bethell with Mr. Shapter moved for the injunction, and Mr. Cooper and Mr. Cooke appeared for the defendant.

The Vice-Chancellor observed upon the difficulty of forming any opinion upon the conflicting evidence before him, and, as the matter was already pending before a common law tribunal, he thought it better to grant no injunction, but let the motion stand over, with liberty to the parties to proceed with the actions at law, the defendant undertaking not to rebuild the wall otherwise than as it originally stood.

**MASTERS AND SERVANTS.**—A bill has just been introduced into the House of Commons for enlarging the powers of Justices in determining complaints between masters, servants, and artificers, and for the more effectual recovery of wages before Justices. It chiefly extends the provisions of the acts 20 George II., c. 19; 31 George II., c. 2; 6 George III., c. 25; and 4 George IV., c. 34. The bill is under the care of Mr. W. Miles, Mr. Robert Palmer, and Mr. H. Gally Knight.

PATENTS RELATING TO ARCHITECTURE,  
ENGINEERING, &c.

Granted between 27th January and 24th of February, 1844.

[SIX MONTHS FOR ENROLMENT.]

Robert Johnstone, of Baker-street, Middlesex, gent., for improvements in the construction of lamps for the combustion of naphtha, turpentine, and other resinous oils. Jan. 27.

Henry Vernon Physick, of Bath, civil engineer, for certain improvements applicable to machinery for driving piles. Jan. 30.

Ezra Washington Burrows, of Swinton-street, St. Pancras, civil engineer, for certain improvements in the construction of engines for producing and communicating motive power by the elastic force of steam, or by manual or animal labour. Jan. 30.

George Miller Clark, of Albany-street, Regent's-park, tallow-chandler, for improvements in night-lights, and in apparatus used therewith. Jan. 30.

William Lucas Sargent, of Birmingham, for improvements in the manufacture of barrels for fire-arms—being partly a communication. Jan. 30.

Baptiste Buret, of Leicester-square, merchant, and Francois Marius David, of the same place, manufacturers of gas apparatus, for improvements in the manufacture of gas. Jan. 30.

William Fletcher, of Moreton-house, Buckingham, clerk, for certain improvements in the construction of locks and latches applicable for doors and other purposes. Jan. 30.

James Silcock, of Birmingham, engineer, for certain improvements in planes. Jan. 31.

Robert Hodgson, of Princes-street, Clapham-road, Surrey, engineer, for improvements in propelling vessels, and in the machinery for working the same. Feb. 2.

Thomas Southall, of Kidderminster, druggist, and Charles Crudgington, of the same place, banker, for improvements in the manufacture of iron and steel. Feb. 8.

James Johnston, of Willow-park, Greenock, Esq., for improvements in steam-boilers. Feb. 8.

George Straker, of Newcastle-upon-Tyne, ship-owner, for a certain improvement, or certain improvements in ships' windlasses. Feb. 8.

Edwin Sheppard, of Manchester, foreman in the works of Messrs. G. C. Pauling and Co., contractors and builders, for certain improvements in machinery or apparatus for planing, sawing, and cutting wood and other substances. Feb. 8.

William Edward Newton, of Chancery-lane, civil-engineer, for a new or improved system or apparatus for obtaining and applying motive power for propelling on railways or water, and for raising heavy bodies, applicable also to various other purposes where power is required. — (Being a communication.) Feb. 8.

Joseph Gibson, jun., of Birmingham, japanner, for improvements in ornamenting glass. Feb. 10.

Henry Hawes Fox, of Northwoods, Gloucester, doctor of medicine, for an improved mode of constructing fire-proof floors, ceilings, and roofs. Feb. 10.

William Edward Newton, of Chancery-lane, civil-engineer, for an improvement or improvements in furnaces. (Being a communication.) Feb. 12.

Joh Haines, of Tipton, Stafford, coal-master, and Richard Haines, of the same place, coal-master, for an improved method or methods of making or manufacturing links for the construction of flat chains, used for mining and other purposes. Feb. 13.

Bennet Woodcroft, of Manchester, consulting-engineer, for improvements in propelling vessels. Feb. 13.

Elijah Galloway, of Union-place, City-road, civil-engineer, for certain combinations of materials to be used as a substitute for canvas, and other surfaces employed as grounds for painting, and some of which combinations are applicable to other purposes. Feb. 14.

Samuel Dobree, of Putney, Surrey, Esq., for certain improvements in the manufacture of fuel. (Being a communication.) Feb. 17.

John Lionel Hood, of Old Broad-street, gentleman, for an improved composition, or

mixture of metals, applicable to the manufacture of sheathing for ships and other vessels, bolts, nails, or other fastenings. (Being a communication.) Feb. 17.

John Kibble, of Glasgow, gentleman, for improvements in transmitting power in working machinery where endless belts, chains, or straps, are or may be used. Feb. 17.

William Losh, of Newcastle-upon-Tyne, Esq., for improvements in the manufacture of metal chains for mining and other purposes. Feb. 17.

Alfred Jeffery, of Brunton Works, Limehouse, for improvements in treating wood, and certain other substances required to be exposed to water. Feb. 19.

Alexander Parkes, of Birmingham, artist, for improvements in the manufacture of certain alloys, or combinations of metals, and in depositing certain metals. Feb. 21.

Ezra Jenks Coates, of Bread-street, Cheap-side, merchant, for improvements in the forging of bolts, spikes, and nails. Feb. 21.

Henry Charles Howells, of Hay, gentleman, for improvements in the fastenings of parts of bedsteads and other frames. (Being a communication.) Feb. 21.

Thomas Liddell, of Newcastle, engineer, for improvements in apparatus for preventing explosion in steam-boilers. Feb. 21.

William Rouse, of Great Barton, Bury St. Edmunds, wheelwright, for certain improvements in carriages, and in parts of carriages, applicable to various purposes. Feb. 21.

Gaspere Conti, of James-street, Buckingham-gate, gentleman, for improvements in hydraulic machinery, to be used as a motive power. Feb. 24.

John Aitken, of Surrey-square, for improvements in atmospheric railways. Feb. 24.

Archibald Trail, of Great Russell-street, Bloomsbury, for an improvement in the manufacture of sails for ships and other vessels. Feb. 24.

SCOTCH PATENTS.

Granted between the 22nd January and the 22nd of February, 1844.

Thomas Southall, of Kidderminster, Worcestershire, druggist, and Charles Cradginton, of the same place, banker, for improvements in the manufacture of iron and steel. Jan. 25.

William Edward Newton, of Chancery-lane, civil-engineer, for a new or improved system of machinery, or apparatus for obtaining and applying motive power for propelling on railways or water, and for raising heavy bodies, applicable also to various other purposes, where power is required. (Being a communication from abroad.) Feb. 5.

Philip Walther, of Angel-court, Throgmorton-street, London, merchant, for certain improvements in the construction of steam-engines. (Being a communication from abroad.) Feb. 5.

John Kibble, of Glasgow, gent., for improvements in transmitting power in working machinery where endless belts, chains, or straps are or may be used. Feb. 12.

Hugh Inglis, of Kilmarnock, Ayr, mechanic, for improvements upon locomotive steam-engines, whereby a saving of fuel will be effected, which improvements are applicable to steam-vessels and other purposes, and to the increasing the adhesion of the wheels of railway-engines, carriages, and tenders, upon the lines of rail when the same are in a moist state. Feb. 13.

Ezra Jenks Coates, of Bread-street, Cheap-side, London, merchant, for improvements in the forging of bolts, spikes, and nails. (Being a communication from abroad.) Feb. 15.

EXTRAORDINARY ROPE.—We are informed by Mr. J. T. Tregellas, of Tiro, the agent for Cornwall for the patent wire-rope, that Mr. Andrew Smith, the patentee at Mill-wall, near London, has just completed a galvanized wire-rope of the astonishing length of 123 miles, which is to be used for the communication on one of the railroads. We presume this may be confidently designated the longest rope in the world.—West Briton.

Correspondence.

MEASURING ROUND TIMBER.

SIR,—If the subject of measuring round timber has not already measured the extent of your patience, time, and paper, I beg to offer a few remarks thereon; and, if you think they will be useful, perhaps you will give them a place in your valuable and, I hope, widely circulated journal. Although the subject has been treated at some length by two of your correspondents, and correctly so too, as far as a frustum of a cone is considered; yet, in my opinion, they have left your correspondent "L," p. 559 in your last volume, and who first proposed the question, as much in the dark as he was before. Now, it is well known to all men in any wise acquainted with measuring round timber, that the quarter-girth does not give the true content, but that it is a country custom, and has been found quite near enough for buying and selling, as it gives a little to the purchaser for loss in bad knots, sap, and other defects, to say nothing of the loss in shrinking after being cut down and lying some time exposed to the weather; in fact, I believe measuring round timber by the quarter-girth, or what is called forest-measure, is the custom in all parts of the kingdom, London excepted. It also seems nearly the mean between the true area and the inscribed square; for instance, suppose a tree 3 feet 6 inches diameter; the side of the square equal to the full area will be about 3 feet 1 inch 3 parts, the quarter-girth 2 feet 9 inches, and the inscribed square 2 feet 5 inches 8 parts. This proves the practice to be a good one; the outside cants in many, very many, cases are not worth the sawing. But true or false is not the question, it is the content quarter-girth of a supposed conical tree 8 feet long, 6 feet diameter at one end, and 6 inches at the other.

Now, were I called on to measure such a tree, I should consider it an equilateral rectangular prismoid, and proceed as follows: first, by finding the quarter-girth of both ends and the middle; then to the area of the great and less ends add four times the area of the middle section, one-sixth of which will be the mean area, multiplied by the length will be the content quarter-girth. The same rule will also give the content of the frustum.

	Ft. Ins. Pts.
Thus, area of great end . . . . .	22 2 9
Do. less end . . . . .	0 1 10
Four times the middle section	26 1 5
	—
	½ 48 6 0
Mean area	8 1 0
	—
	10
Content quarter-girth	80 10 0
	—
	8
Content quarter-girth	646 8 0
As the frustum of a cone:—	
Area of great end . . . . .	28 3 6
Do. less end . . . . .	0 2 4
Four times the middle section	33 2 4
	—
	½ 61 8 2
Mean area	10 3 4
	—
	10
	—
	102 9 4
	—
	8
True content	822 2 8

Now, this same frustum, according to the London practice, which does not admit of either tapes or strings, but according to which round timber is measured the same as square timber, that is, by taking the diameter by the callipers in different places as may be agreed on by the buyer and seller, then by adding them up and taking the mean, which is the side of the square in all cases, conical or cylindrical; consequently the content of this supposed frustum of a cone would be 845 feet 4 in. 3 ft. 3 in. x 3 ft. 3 in. x 80 ft. = 845 ft. Now this does not seem much above the true content of the above frustum; but, suppose the

butt-end of an elm tree 3 feet 6 inches diameter at both ends, and 15 feet long,—the content, according to the London practice:—

	Ft. Ins.	Quarter-girth.
	3 6	Ft. Ins. Pts.
	3 6	2 9 0
	—	—
	1 9	2 0 9
	10 6	5 6 0
	—	—
	12 3 area.	7 6 9 area.
	5	5
	—	—
	61 3	37 9 9
	3	3
	—	—
	183 9	113 5 3
True content:—	Ft. In. Pts.	
Half circumference	5 6 0	
Do. diameter . . . . .	1 9 0	
	—	
	4 1 6	
	—	
	5 6 0	
	—	
	9 7 6 area.	
	—	
	5	
	—	
	48 1 6	
	—	
	3	
	—	
	144 4 6	

Thus you have 144 feet 4 inches 6 parts = 113 feet 5 inches 3 parts, and 183 feet 9 inches. So much for custom, which no theory is able to break down, at least in buying timber.

I am, Sir, your well-wisher,  
J. H. F.

Brook-street, West-square, Lambeth.

[We insert the above letter, in order to complete the series, although we have received a letter signed "An Old Bark," deprecating the subject as "too elementary." One thing we apprehend has been proved—there are persons who either do not know how to measure the frustum of a cone, or the foundation of the custom in buying and selling timber.—Ed.]

METROPOLITAN IMPROVEMENTS.

SIR,—In the table which you did me the honour to insert in last week's paper, an omission occurred in one of the columns, wherein it should have been mentioned that 33, of the 169 houses which have been settled for, are not yet pulled down, although, strange to say, that some of those houses were among the first settled for. I conceive that the commissioners are bound to explain how this has happened.

The Earl of Lincoln has twice offered in Parliament an explanation of the causes of delay which have been complained of. On the third reading of the Bill for enabling the Bank of England to lend money by mortgage on the houses to be built—in answer to Mr. Hume, he said, "he could assure the hon. member and the House that every reasonable diligence was used in carrying out the contemplated improvements. It was necessary that houses which were to be removed should be so gradually, for if all the houses which were intended to be removed were to be taken down and sold at once, their materials would scarcely fetch any thing; he was quite aware of the inconvenience complained of by the hon. member, but he could assure him it was not the fault of the Woods and Forests. In many parts the purchase of the land had not been completed till a short time since, and it was, therefore, impossible to take any steps. He had no doubt, however, that ultimately the constituents of the hon. member for Finsbury would be benefited; for the rating on the houses, instead of being, as it was at present £35,000, would amount to £46,000."

His Lordship surely does not mean to say that he could obtain a better price for the materials of houses pulled down in Hyde-street, Belton-street, and Leicester-square, at one and the same time, than if the houses had been pulled down all in one line.

On the first reading of the Building Bill, the subject of the delays was again mooted by Mr. Duncombe, when Lord Lincoln said that "he was quite aware of the inconvenience to which the hon. member had adverted, but it was one which it was impossible altogether to avoid, and he could assure the hon. member that it was not caused by any want of diligence in

the office over which he presided. There were many things to be done, such as the preparation of proper sewers and other improvements, before the rebuilding of the houses could be commenced, but when completed it would be found that the individual rating in the parishes alluded to would be diminished." Which, in my opinion, he failed to prove, for any one may still observe the six points where they have commenced pulling down houses, without completely clearing any one site for rebuilding. With reference to the purchase of land not being completed, &c., I beg to state that their bill enables them to take any property which may be required; and in cases of a defective title, they are empowered to have the property valued, the amount placed in the Bank of England, and then proceed to pull down the house or houses forthwith.

As to the delay arising from the making of new sewers, this delay is yet to come, for there is not an inch of ground moved for that purpose in this neighbourhood.

The Commissioners of Woods and Forests will require to make, at their own expense, a sewer from Oxford-street to Holborn, and another from Broad-street to Long-acre; but, as there exists one in Plumtree-street at present, the Commissioners of Sewers for Westminster have agreed to make a new one at their own expense, whenever they are called upon to do so.

I am, Sir, your obedient servant,

A PLUMBER OF PLUMTREE-STREET.

Bloomsbury, 6th March, 1844.

P.S.—Information regarding the amount of compensation awarded, I shall be most happy to send you when the purchases are completed.

#### ST. PAUL'S AND WESTMINSTER ABBEY.

Sir,—Parliament being now assembled, I beg to suggest, through the medium of your valuable paper, the propriety of convening a public meeting, for the purpose of considering the steps which it may be advisable to take in reference to the present disgraced condition of the Cathedral Church of St. Paul, and the Abbey Church of St. Peter, Westminster, in order to effect, if possible, the following important objects:—

1st. The abolition of fees.

2ndly. To obtain in these churches increased and better accommodation for the poor in the cities of London and Westminster. And,

3rdly. To get the *Pagan* monuments, which disgrace and profane these holy temples, removed to some other more appropriate receptacle.

I am, Sir,

Your very obedient servant,  
AN ENGLISHMAN.

[We do not undertake to be answerable for each of the opinions here expressed.—Ed.]

#### MIDDLESEX CHURCHES.

Sir,—While the Camden Society take care of the Cambridge Churches, and the Oxford Gothic Society of the Oxford Churches, can nothing be done to preserve our fine, yet unknown, Middlesex churches from churchwarden domination, and the reign of painted deal and whitewash? Few persons are acquainted with the still handsome churches within the immediate neighbourhood of London, although barbarously mutilated. Look at *Harmondsworth* Church, with its fine row of Norman arches dividing the nave from the aisles, though every moulding is stopped with whitewash. Who ever heard of such a place, and who that has seen it inside, with the whitewashed columns, and every outside piece of stonework removed or covered with beastly stucco, but must indeed grieve and lament that ignorance should have power thus to abuse man's noblest works? Look at *Harington* again; its tower still older, and which has been beautified only last year with whitewash. Look at *Hayes*, and mourn for departed greatness and its clerestory; and at *Heston*, whose beauty, indeed, still remains less injured than most. Need I mention more, to shew that while we look farther for beauty, we neglect that which lies almost at one's own door? If more names were wanted, *Hillingdon*, *Harrow*, *Northold*, *Isleworth*, &c., might be mentioned. Can nothing be done to save these churches from ruin? Will no one attempt their delineation? Will none of your Middlesex readers send you something connected with them? Our churches have indeed been neglected; and, worse still, injured

and spoiled: this must no longer be so. We must stop farther desecration, by boorish churchwardens, neglectful parsons, and niggardly vestries, of those works, which our forefathers of blessed memory raised to the glory of the South. Yours truly,

J. H.

I will just mention, that, among the things not destroyed, are the lych-gates at *Hayes* and *Heston*.

[We have had some trouble in unravelling the subtleties of our zealous correspondent, and indeed have been obliged to change the positions of some of his words in order to render the phraseology readable; still, from the nature of our correspondent's hand-writing, we cannot warrant that our printer will give every word correctly as intended. We have small love for white-wash, yet are obliged to confess our belief that had not many subjects of carving been obscured by it, long ago they would either have been hacked away or purchased.—Ed.]

#### FOREIGN MEASURES.

Sir,—I should esteem it a favour if you or one of your readers would inform me in the following matter. I find in all foreign works (*French?*) on architecture that I possess, the scales to which the drawings are made are invariably in *pieds* or *metres*. I am desirous of knowing what proportion the scales of *pieds* or *metres* bear to the scale of *English feet* which we commonly use. I am led to think more upon this point, on account of the very clever drawings exhibited lately by Professor Cockerill, in his Lectures at the Royal Academy, all drawn to the same scale, a system which I think cannot be too much admired or practised.

Your answer to the above will much oblige,

Sir, your obedient servant,

27th February, 1844.

L. O. G.

[Our correspondent will find in our 54th Number, page 80, a Comparative Table of French *Mètres* and English Feet; for feet of different nations we refer him to any ordinary Cyclopædia.—Ed.]

#### Miscellaneous.

DEATH OF A DISTINGUISHED MATHEMATICIAN.—TRINITY COLLEGE, CAMBRIDGE, FEB. 29.—The following letter has just been received:—"Duncan F. Gregory, Esq., M.A., Fellow of Trinity College, Cambridge, died here this morning at five o'clock. CANAN Lodge, Edinburgh, Feb. 23, 1844." This loss is felt by the university in general, and by the deceased gentleman's own college in particular. He died in his 31st year, of a lingering illness, which he bore to the last with manly fortitude and Christian resignation. He went off in a calm slumber, apparently, to those who watched him, without a struggle. Mr. Gregory was one of the moderators of the Mathematical Honour Examination in 1842, and one of the examiners in 1843. He was the author of a very able work on Differential Calculus, and had got half-way through another on Geometry of Three Dimensions, the sheets having been printed as he proceeded. He was the chief projector of the "Cambridge Mathematical Journal," a work which already enjoys a European reputation, and was its principal contributor till his death. His family, for scientific attainments, was one of the most illustrious in Europe; and James and David Gregory, in bygone years, shed no ordinary lustre in this respect on the land of their birth. Doctor Gregory, an eminent physician of Edinburgh, now dead some years, and father to the recently deceased Fellow of Trinity, was the author of the "Conspectus Medicinæ," and several first-rate medical works. His son inherited his amiable and estimable personal qualities, and was universally beloved and respected.—*Morning Herald*.

GEOLOGICAL.—We are informed that Mr. Hutton has completed his survey of the strata of North Derbyshire coal-field, with a coloured map, 12 by 10 feet, illustrating the various phenomena, particularly the great denudation extending from near Dronfield through Whittington Brimington, Calow, to near Chesterfield. The map is deposited in Meant St. Mary's College, near Eekington. It enumerates twenty-two oolite or gritstone rocks, and twenty-one thick and thinner coals.

THE QUEEN'S VISIT TO FRANCE.—The *Commerce* announces, that subsequently to the visit of the Queen of England to the Chateau d'En, the King commissioned several artists to decorate a gallery, to which His Majesty had given the name of "Victoria and Prince Albert Gallery." The arrival of the British fleet in the road of Trepont, the landing, entry into En, the dinners, concerts, visits to the church and forest, and the re-embarkation, form the subjects of as many pictures, which are to figure in the English gallery, with the busts, portraits, and statues of the principal personages who accompanied the young Queen. The object of the King's visit to En was to ascertain the progress made in the decoration of the new gallery.

BOTANICAL SOCIETY OF LONDON.—The ordinary meeting of this society was held on Friday evening, March 1, at the society's rooms, No. 20, Bedford-street, Covent Garden, J. E. Gray, Esq., F.R.S., president in the chair. Various donations to the library and herbarium were announced. The continuation of the paper commenced at the last meeting, being "A Synoptical View of the British Fruticose Rubi, are ranged in Groups, with explanatory Remarks." The paper was accompanied by drawings and numerous specimens.

THE SCREW PROPELLER.—A trial of speed between her Majesty's steamers *Prometheus* and *Rattler* was made in the Thames, on Saturday fortnight, over a measured distance, the former being fitted with paddles, the latter with a screw propeller, when the latter was proved to have the advantage over her opponent of nearly half a knot an hour.

THE NEW BARRACKS AT FULWOOD.—These new barracks begin to form a conspicuous feature of the locality in which they are placed, and to present an imposing appearance from various points of view. The infantry range is now nearly ready for roofing, and the cavalry range will very shortly be put in progress. There is a large accumulation of material on the ground intended for the erection of the officers' quarters, which will be begun as soon as the weather permits. The place altogether has an exceedingly stirring and cheerful appearance, being crowded with busy workshops of all sorts.—*Preston Chronicle*.

THE WOOD PAVING IN CHEAPSIDE.—The paving committee, in their report, having recommended that the paving of Cheapside should be forthwith commenced, orders have been given to Mr. L. Stevens to complete the street with wood according to Perring's safety system, of which a specimen was laid down last year westward of Bow Church Tower, in Cheapside. The work was commenced on Monday last.

DISCOVERY OF A SEAM OF COAL.—It is rumoured, that the gentlemen now surveying the new line of railway from Lancaster to Carlisle some days ago, discovered a seam of coal, four feet in thickness, three-quarters of a mile from Crooklands, in the direction of Burton-in-Kendal. It is supposed by some to be the terminus of a seam which runs through that part of the country extending from the Ingletton coal-fields.

THE CITY STATUE.—The equestrian statue in bronze of the Duke of Wellington, by Chantrey, is nearly completed; and it will be erected on the space now clearing in front of the Royal Exchange, in time for inauguration on the next anniversary of the battle of Waterloo. It is cast from the cannon taken in the Duke's campaigns; and the surplus gun-metal thus appropriated, amounting to eight tons, has been divided between the Nelson Memorial and the other equestrian statue of Wellington which Mr. M. C. Wyatt is making for the west end of London.

Lord Montagu has transmitted 20*l.*, and Messrs. Conits 20*l.*, to complete the Scott monument at Edinburgh; and Sir Thomas M. Brisbane, Lord Murray, and Sir A. Ferguson, have repeated their former subscriptions.

The Commissioners of Woods and Forests have purchased, for the sum of 580*l.*, the old buildings on the south side of Holywood House, and have appointed Mr. Donald Horne, their agent in Scotland, vice Mr. Roderick Mackenzie, deceased.

**A MEMORIAL ENDOWMENT.**—A few days since Mr. L. Moses, of the firm of Moses and Levy, in Aldgate, presented to the treasury of the Jewish Orphan School, Leman-street, Goodman's-fields, a check for 2,000*l.*, which he ordered to be appropriated to the purchasing a plot of ground for the purpose of building thereon an asylum for the above institution (it being now confined to the limits of a private house); at the same time expressing his desire that the building should be erected at his sole expense, and he would give a further sum for its completion, should it be required. This benevolent gentleman a number of almshouses in the Globe-road, Mile-end, for aged and decayed tradesmen of the Jewish persuasion, to whom he allows a certain sum of money weekly.

The opening of the Gloucester and Hereford canal to Withington took place on Monday week. A procession of boats left Ledbury at nine o'clock, and a large number of other craft followed during the day. The procession reached the present terminus at half-past two o'clock, when the spectators were estimated at 1300; in fact, the event was considered as one of the utmost importance and interest. On landing, Mr. Ballard, the engineer, the committee, and the visitors, formed a procession to Hereford, on arriving at which they alighted at the hotel, where, at five o'clock, a company amounting to about 200, and comprising many of the county gentlemen, sat down to an elegant repast provided in honour of the guest, Mr. Ballard.

Mr. Fabian's tender was accepted.

**NOTICES OF CONTRACTS.**

For the Erection of a Lock-up House, at Bridlington, in the East Riding of the county of York.—Mr. G. Leeman, Clerk of the Peace, Beverley, April 6.

For Sundry Artificers' Work, Building Additions to a Farm-house, at Farham Saint Martin, near Bury St. Edmunds.—Mr. Burrell, on the premises. March 14.

For the Erection of a Covered Market in Market-street, Blackpool.—Mr. Tauch, Preston. March 12.

For Erecting and completing Buildings and other Works for Station at Halifax, Manchester, Leeds, and Hull Railway.—Plans, &c., at Engineer's Offices, Palatine-buildings, Manchester. March 11.

CONTRACT for the Erection of a Town House and Outbuildings on the Charity Farm at Thrigby, near Great Yarmouth.—Mr. A. J. Tillet, Architect, King-street, Great Yarmouth. March 11.

CONTRACT for Building a Lock-up-House at Tonbridge, Kent.—Mr. H. A. Wildes, Maidstone. March 11.

CONTRACT for Building Nine fourth-rate Houses.—Mr. Single, 34, Coleman-street, City. March 11.

CONTRACT for Building Sewers in Cursitor-street, Graystock-place, Dean-street, Cock-lane, Scaccol-lane, and other places contiguous.—Mr. Jos. Daw, Sewers Office, Guildhall. March 12.

CONTRACT for better Paving, Repairing, and keeping in order the Stone-carriage and Footway Pavements of the parish of St. Mary-le-Strand.—Mr. G. Truwhitt, Clerk. March 14.

CONTRACT for the Erection of a Chapel, and also additional Buildings for female patients, and other alterations to the Kent County Lunatic Asylum.—Mr. G. Poynder, Clerk, Asylum, Maidstone. March 18.

CONTRACT for supplying Her Majesty's several Dock-yards with 2,750 loads of English Elm Timber, and 119 Elm Trees for Pumps.—Secretary of the Admiralty. March 19.

CONTRACT for the Execution of the several Works necessary to be done in the Re-building of Brent Bridge, and repairing Finchley Bridge, Hendon.—Clerk of the Peace, Sessions House, Clerkenwell-green. March 26.

**TO OUR CORRESPONDENTS.**

To our correspondent who asks which timbers of a roof are considered as "framed"—see answer, all trussed-work, consisting of Tie-beams, Principals, King-posts, (or Queen-posts, as the case may be) and struts, are considered as "framed-truss," and are usually paid for at a particular price agreed upon. Purlins, which ought not on any account to be framed into the Principals, may or may not, according to agreement, be included in one price with the common-rafters; if any of the common-rafters be framed to avoid chimneys or for other purposes, they may in strictness be taken as "framed," but as some small portion of timber, whether in joists, ceiling-joists, or rafters, generally must be trimmed, all such may, in strictness, be taken as framed, yet are mostly measured in with and paid for as "joists, rafters, quarters, &c.," without framing being particularized: binding-joists, framed into Tie-beams, we should take as "framed," as we also should ceiling-joists if reprehensibly framed into Tie-beams or Binding-joists, instead of being secured below them. We do not approve of the method of generalizing the price of roof-work, and taking it at so much per "square" of 100 superficial feet, but always cube the timber and charge accordingly.

We have received the letters of "Tantalus," "W. Brien," "J. S. D." and "B. C. E.," whom we refer to page 361 of Vol. I.

A view of the leavorth School, and an Elevation of the New Day of the Religious Tract Society have come to hand; and we avail the receipt of plans and descriptions of them.

"J. B. S.," Leamington.—It is certainly a remarkable fact, that so little has been written on the subject of wood-carving; with the exception of a short treatise by Robert Folkstone Williams, Esq., published in 1835, and that very imperfect as regards the practical part, and often inaccurate in its descriptions, we are not aware of the existence of any work on the subject in the English language; there is an Italian one, to which we may make some future reference. We can only refer "J. B. S." to Mr. W. G. Rogers, of 3, Great Newport-street, London, who will no doubt feel pleasure in answering his questions, and advising him how to proceed in his pursuit. In the mean time we do not believe that matured age is a barrier to the privilege of studying at Somerset House.

We have received the 4th part of Knight's "Old England." Also "Hypotrachelium," and Lecture on Grecian Architecture, by "G. R. F."

**MEETINGS OF SCIENTIFIC BODIES.**

To-day and during the ensuing week.

SATURDAY, MARCH 9.—Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

MONDAY, 11.—Geographical, 3, Waterloo-place, 8½ P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 12.—Medical and Chirurgical, 53, Berners-street, 8½ P.M.; Civil Engineers, 25, Great George-street, 8 P.M.; Zoological, 57, Pall Mall, 8½ P.M.; after Sessions of the Church, 8 P.M.

WEDNESDAY, 13.—Society of Arts, Adelphi, 8 P.M.; Graphic, Thatched House Tavern, 8 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.; Ethnological, 8 P.M.

THURSDAY, 14.—Royal, Somerset House, 8½ P.M.; Antiquaries, Somerset House, 8 P.M.; Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico-Botanical, 32, Sackville-street, 8 P.M.

FRIDAY, 15.—Royal Institution, Albemarle-street, 8½ P.M.; Statistical, 11, Regent-street, 8 P.M.; (anniversary).

SATURDAY, 16.—Asiatic, 14, Grafton-street, 2 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

CIVIL ENGINEERS.—Library open from 9 A.M. to 9 P.M.

SOCIETY OF ARTS.—Open every week-day except Wednesday, between 10 and 2. Admission by members' tickets.

**ADVERTISEMENTS.**

Hill Street, facing Richmond Bridge, and 77, Regent's Quadrant, London.

**JOHN P. HOPE, SURVEYOR, AUCTIONEER, APPRAISER, and HOUSE and ESTATE AGENT,** begs most respectfully to acquaint his friends and the public generally, that he has commenced business as above; and will be most happy to superintend the erection, alteration, or repairs of buildings for gentlemen and gentlemen; the measuring and valuing work for builders, &c.; and also to sell, by auction, landed and household property, building materials, household furniture, &c. J. P. H. confidently hopes, by blending his experience in the building department, &c. (derived from twenty years' practice therein, including his having acted as clerk of the works of the Wesleyan Theological Institution, Richmond), with prompt attention and moderate charges, he shall obtain a share of public patronage and support, which he now solicits, and which it will be his constant study to deserve.

**P.S.** AN APPRENTICE WANTED, who will be treated as one of the family. Residence, Victoria Place, Richmond Hill, Surrey, February 28th, 1844.

**LITHOGRAPHY.**—DRAWINGS of every description executed on Stone and Zinc, and printed in a superior manner, at CLEEK and Co.'s GENERAL LITHOGRAPHIC ESTABLISHMENT, 292, HIGH HOLBORN (nearly opposite Southampton-street.) Maps, Plans of Railways and Estates, Circular Letters, and Facsimiles of any original, with the greatest expedition.

**MORTGAGE AND ANNUITY OFFICE,** No. 123, CHANCERY LANE.—Persons requiring Loans on Mortgage or otherwise upon any available security, may at all times procure an advance to the extent of from 100*l.* to 200,000*l.*, or so much as the property will bear, by applying to Mr. Bray, Surveyor, Land and Estate Agent, at the Offices above, where a registry for the Sale of Estates, Houses, Land, Life Interests, and Reversions, is kept for inspection.

Particulars and Plan of Property intended for Sale are requested to be forwarded. All communications for Money are considered strictly confidential.—Letters pre-paid.

**By Her Majesty's Royal Letters Patent.**

**SECURITY AGAINST FIRE.**—TO ARCHITECTS, BUILDERS, ENGINEERS, and others.—Her Majesty's Letters Patent having been granted to **BENEDICTUS TIMMIS**, of Birmingham, for improvements in apparatus used in arresting the progress of and extinguishing fire, the attention of the public generally is respectfully invited to this important INVENTION, which is at once simple, practical, and most efficient, by the use of which fire in any situation can at once arrested in its progress, and extinguished with certainty, even by the members of a resident family, and in a space of time shorter than is usually necessary to spread an alarm. The Patentee is now in town, and will explain his plans and show a working model to any person calling upon him, from 2 till 5 each day, at 7, Farringdon-street. Licenses granted.

**ROYAL ADELAIDE GALLERY.**

**LOWTHER ARCADE, STRAND.**—Under the especial Patronage of Her Most Gracious Majesty. Open daily from 11 to 6 o'clock, and from 7 to half-past 10 every eve. Morning Attractions.—A continued series of Scientific Experiments, Musical Performances, Exhibitions, a selection from 3,000 Models of Machinery, Philosophical Apparatus, Mechanical Inventions, &c., demonstrated and explained. Glass-working, Philosophical Lectures, Hydrogen Gas, Sculptures, Paintings, &c. EVENING Recreations, in addition to Morning Attractions. PROMENADE CONCERTS, Vocal and Instrumental, Mons. L. Z. Remy, Conductor.—Admission, One Shilling.

The Builder.

NO. LVIII.

SATURDAY, MARCH 16, 1844.

HAVING received, through the favour of the Right Honourable the Earl of Lincoln, sooner than we expected, a copy of the Bill now before the House of Commons, for the proposed New Metropolitan Building-Act, we have, from the urgent importance of the subject to all builders, architects, proprietors, and inhabitants, of not only London and its vicinity, but also to very many persons throughout the empire at large, been compelled to lay aside many subjects, and to postpone the appearance of numerous valuable

articles already set up in type. We made various calculations of the extent of space which would be required for containing the whole of this most voluminous Bill, with the requisite annotations thereon. At first we endeavoured to arrange the whole within the extent of one Number of our periodical, with a Supplement, but we soon found, that even with the use of almost the smallest readable type, there was little hope of compressing the whole Bill within less than the extent of two Numbers; we have, therefore, been obliged not only to give a double Number, but also to add a Supplement, or we should otherwise not have had any space left for subjects of general interest. It has, indeed, required very great exertion to lay before our readers, upon notice so short, such an extent of technical matter; and we trust such of them as may be less interested in the measure will nevertheless bear with the suppression of other matter, which has this week of necessity resulted from our prompt attention to a subject of such great and absorbing importance to the metropolis, and which, if once brought to any near approach to perfection, will no doubt form the model for enactments as nearly as practicable similar thereto, to be extended to every principal town throughout the three kingdoms.

In the notes, parallel with the clauses of the body of the proposed Act, will be found numerous critical observations. We have set up more than three dense columns of similar notes, applicable to the voluminous schedules appended to the Bill, in which indeed lie more of the nerves and sinews of the proposed Act than in its great body of clauses; but, to our extreme regret, although we this week reach twelve columns beyond the extent of a double Number, we have been unable to find room for these exact and important observations; we shall, therefore, be compelled to give them in our next publication, with such further remarks as a week's additional deliberation will produce.

In the meanwhile, we have no hesitation in

saying that the measure as a whole is calculated to effect much good. It is true, that in some of its details it is inferior both to the present Building-Act and to the one proposed last year; but then it is in many particulars very much superior to both of them; and we hope that no unflinching obstinacy from any quarter will defeat the consummation of a measure calculated, when improved, corrected, and modified, to effect so much sterling benefit.

Building-Acts seem to have been the terror of lawyers; and, perhaps, the present existing metropolitan statute is, though of so much importance, less understood by members of the legal profession than almost any other parliamentary enactment; notwithstanding also, perhaps, this public statute is of such general concern, and is in parts difficult to expound, there are in law books fewer reports of cases decided upon points relative to it than upon any unimportant Act. Men of the law, indeed, appear always to have grown fidgety and inattentive under building technicalities. Hence has arisen that whenever any proposal for a new Metropolitan Building-Act has appeared, there has not in general been apparent that verbal nicety, that freedom from ambiguity, that terseness of expression, that absolute barrier against even torturing the language into any signification other than the one plainly and even palpably intended to be conveyed by the words which should be found in every good and carefully framed statute, and in which labour few besides lawyers are indeed commonly adept.

depplea.

A COMMITTEE OF THE SOCIETY OF MASTER CARPENTERS is summoned for Monday next, at 12 o'clock, to take into consideration the several clauses in the New Metropolitan Building-Act.

DESCRIPTION OF A CAST-IRON BRIDGE, COMPLETED IN THE YEAR 1840, FOR CARRYING THE BIRMINGHAM AND GLOUCESTER RAILWAY OVER THE RIVER AVON, NEAR TEWKESBURY.

BY CAPTAIN W. S. MOORSOM.

(Read before the Institution of Civil Engineers, January 9.)

This bridge is situated about seven miles north of Tewkesbury; the approaches to it are formed on embankments about 25 feet high, crossing the valley nearly at right angles. In the construction it was desirable to provide for the effect of considerable floods, by aiding the egress of the water, and also to avoid any interference with the navigation of the river; a greater width of water-way was therefore given, than at first view may appear necessary.

The bridge consists of three segmental arches, each of 57 feet span, with a versed sine of 5 feet 2 inches; the length between the centres of the piers being 66 feet 6 inches; the total width between the abutments 190 feet 6 inches; and the breadth of the cutwaters 8 feet 6 inches each, leaving a clear water-way of 173 feet 6 inches.

The principal novelty in the work is the method of constructing the two piers. They are formed externally of cast-iron plates or caissons, filled for the first 12 feet from the bottom with solid masonry and concrete; upon this is built hollow masonry to support the cap-plates, carrying eight pillars on each pier, with an entablature for receiving the ends of the arches, which, with the caps, pillars, and entablatures, are of cast-iron. The abutments at either end are of masonry.

The caissons are, at the bottom, 41 feet 6 inches long, and 16 feet wide, with semicircular ends, tapering upwards for 12 feet, on all sides, to 34 feet 6 inches long, by 8 feet 6 inches wide, from whence they rise perpendicularly for the remaining 8 feet 9 inches. They are constructed of cast-iron flanged plates,  $\frac{3}{4}$  inch thick, screwed together by bolts,

and the joints made with iron cement. The total weight of each caisson is about 23 tons.

The bottom of the river, at the site of each pier, having been prepared by a scoop dredger, worked from a platform erected upon piles, the lower row of plates for the caisson was put together and suspended in the water by iron rods while the other rows were added, gradually lowering the whole as the work proceeded, until the bottom rested on the bed of the river; a quantity of clay was then thrown round the outside, which formed a joint so impervious to water, that with two pumps, each of 5  $\frac{1}{2}$  inches square, the caisson was emptied in six hours, and was afterwards kept dry by one pump, which was worked occasionally during the subsequent excavations within the caisson.

The dimensions of the cast-iron work of the arches, and the masonry of the abutments, are given in detail, with an account of the methods of construction followed, and of the materials employed.

It is stated that these iron caissons, which are proposed by Mr. Ward of Falmouth, the resident engineer, were found to be cheaper than having coffer-dams and stone piers. The total cost of the bridge, including iron-work, painting, masonry, subsequent repairs to the walls, and superintendence during construction, being 10,192*l.*, and the weight of cast and wrought iron employed was about 520 tons.

The partial failure of an arch in one of the abutments is described, and the supposed reasons for the sinking are given, with the means which were adopted for replacing those stones which had been displaced, and it is stated that no sinking has since occurred.

The paper was illustrated by eighteen remarkably well-executed drawings by Mr. Butterson.

Captain Moorsom said that there were a few interesting particulars relative to the bridge, beyond those which were given in the paper. Mr. Murchison shewed, in his work on the Geology of the Silurian districts, that the deposits of gravel of the Lickey range of the hills nearer to Birmingham, and that of the Avon near Pershore, were, geologically speaking, identical; but Captain Moorsom found that, as regarded the engineer's operations, they differed in character.

The gravel in the neighbourhood of Birmingham was remarkable for the rounded character of the stones composing it, whereas that which was found in the neighbourhood of this bridge consisted almost entirely of angular stones, which were used without any admixture of sand, for making concrete, which was found to become most compact when the stones were perfectly clean; but the Birmingham gravel required a certain proportion of sand with it, to make compact concrete.

In excavating for the foundations of the abutments, several bones of deer and a human skull were found, at depths from 10 to 14 feet below the level of the bottom of the river.

The circumstances attaching to the partial failure of the small southern abutment arch were peculiar. It had been supposed to arise from expansion of the iron-work taking place all in one direction, but after watching the arch for six months, he thought such an opinion was to a great extent unfounded; and he conceived it to have arisen partly from the abutment wall having slightly sunk at the back, owing to the great quantity of rain which fell at that period affecting the spongy soil upon which it was built.

For seven months, the valley of the Avon, at the spot in question, was (with a very few days' intermission) under water, immediately after the walls had been built, and before the bridge was nearly completed. An amount of sinkage, which was scarcely perceptible in the back of the foundation of the wall, would have the effect of displacing the stones of the arch to the extent of some inches, and it was to this cause that he attributed the separation of the arch stones. As soon as the settlement appeared to have ceased, the defective stones were taken out and replaced, without interrupting the passage of the trains.

The north-eastern wing wall also failed from the same cause, viz., the spongy nature of the soil when it was thoroughly saturated with water; and if this had been foreseen, prevention would have been easy, by placing

a firmer and more extended base of concrete under the footings of the wall.

He thought that the method of forming the piers was as good and as cheap as any known mode that could have been adopted; but if he had to build another bridge of the same dimensions, and under similar circumstances, he would not use cast-iron, but would construct it of timber, not on account of any engineering difficulty, but simply because a timber structure would be very much cheaper, and equally serviceable for the purposes of the railway, taking into account comparative durability as well as present cost.

#### ON THE PROGRESS MADE IN THE APPLICATION OF ELECTRICITY AS A MOTIVE-POWER.

W. R. GROVE, Esq., submitted a communication to the Royal Institution, on the 9th ult., the subjects of which were—1, a brief summary of the laws of the electro-magnetic force; 2, a description of the chief modifications of the engines to which that force has hitherto been applied; 3, the commercial statistics of its application; 4, the purposes for which this power is available. In dealing with the first of these subjects, Mr. Grove exhibited, by many illustrative and successful experiments, the well-known re-actions of iron and other metals on each other, when exposed to the influence of an electric current. The actual application of these familiar phenomena was then shewn in the working models of several machines, which were set in action by the nitric acid (or Grove's) battery, invented by Mr. Grove, and described by him four years ago at the Royal Institution. These machines may be divided into three classes; first, those acting by the immediate deflecting force, as shewn in the galvanometer, Barlow's wheel, &c.; secondly, those on what is called the suspension principle. In these, two powerful electro-magnets are fixed contiguous to the periphery of a wheel, and in the line of its diameter, plates of soft iron being fastened on this periphery at short and equal intervals. The electro-magnets are so arranged as to lose their attractive power as soon as they have drawn through a given space each plate of iron, necessarily presented to them by the revolution of the wheel, but are immediately afterwards re-invested with this power, in order to operate on the next plate. By these means the wheel is kept in constant rotation on its axis. The remaining class of electrically-driven machines are applications of the principle of Ritchie's revolving magnet. In these, an electro-magnet, balanced on a pivot, so as to rotate in a horizontal plane, is arranged between the poles of a permanent magnet. Hence, the alternate attractions of the opposite magnetic poles, combined with its own momentum, cause the electro-magnet to continue rapidly revolving. Having noticed machines, on these various principles, by H. Fox Talbot, Esq., Mr. Hill, of Swansea, and Professor Wheatstone, Mr. Grove proceeded to his third subject—the commercial statistics of electro-magnetic power. It appears, by the experiments of Dr. Botto, that the consumption of 45 lbs. of zinc will produce an effect equivalent to a single horse power for twenty-four hours. The cost of the metal, at 3d. the pound, would amount to 11s. 3d. About 50½ lbs. of the nitric acid of commerce would be required to dissolve the metal in the most economical and effective manner. The charge of this, at 6d. the pound, would be 12. 5s. 6d. The whole expense, therefore, of obtaining the effect of a 1-horse power by an electro-motive apparatus, would be 17. 16s. 9d. In this calculation the cost of the requisite sulphuric acid is assumed to be fully covered by the value of the salts of zinc produced in the operation. The same amount of power produced by a steam-engine would not cost more than a few shillings. Mr. Grove explained that this comparative costliness of the electro-magnetic machines resulted from the sources of their force, zinc and acid being manufactured, and consequently, costly articles; whereas, coal and water, the elements of the steam-engine's force, were raw materials, supplied at once from the earth. Mr. Grove took this occasion to observe, that the experiments of Botto, just alluded to, were made with his (Grove's) battery; and that upon the cost of the constituents of this, the calculations were founded. At first sight, this battery would appear a dear form, from the

expense of the nitric acid; but a little consideration proves the contrary of this. Compare it, for example, with a battery merely charged with dilute sulphuric acid (the cheapest possible electrolyte), to perform an equivalent work (as the decomposition of a given quantity of water), a series of three cells of the ordinary battery is necessary; hence the consumption of three equivalents of zinc, and three of sulphuric acid. But the intensity of the Grove's battery is such, that the same resistance can be overcome by one cell, consuming only one equivalent of zinc, one of sulphuric acid, and one-third of nitric (there being in this acid three available equivalents of oxygen). Independently of this smaller consumption, Grove's battery has the advantage of occupying only one-sixteenth of the space of the other constructions. In concluding his communication, Mr. Grove mentioned the two well-known applications of electric power—the electric telegraph and the electric clock. To neither of these can steam, or, indeed, any known force, be so applicable as that which travels with a greater velocity than light itself.

#### ON THE LIGHT THROWN ON GEOLOGY BY SUBMARINE RESEARCHES.

THE following interesting lecture was delivered by Professor Forbes at the meeting of the Royal Institution on the 23rd February:—

Having alluded to the researches of two Italian naturalists, Donati and Soldani, who dredged the Adriatic about the middle of the last century, Prof. Forbes entered on the important inferences which he had derived from similar investigations in the Irish Channel, and in the Archipelago. His first conclusion was, that marine animals and plants are grouped, according to their species, at particular depths in the sea, each species having a range of depth appropriated to itself. Prof. Forbes illustrated this assertion by a diagram, indicating the plants and animals respectively inhabiting what he termed the *littoral zone*, which extends immediately from the coast—the *laminarian zone*, where the broad-leaved *fuci* are most abundant—the *coralline*, in which there is an assemblage of mollusca, especially bivalves and corals, and the *deep sea coral*, so called because in it only we find examples of large corals on the British shores. Prof. Forbes next alluded to the fact of the number of species diminishing according to depth, so that by gaining an accurate knowledge of the Fauna and Flora, appropriated to various sea-bottoms, the naturalist can infer their depth—no plants are found below 100 fathoms, and the probable zero of animal life is at 300 fathoms. Sedimentary deposits below this depth are consequently destitute of organic matter. This circumstance bids the geologist to be cautious in inferring that any stratum was formed before the creation of animals, on no other account than that it is devoid of organic remains: he should rather conclude from such deficiency, that the stratum was deposited in very deep water.—Prof. Forbes next remarked that British species are found throughout the zones of depth in the Mediterranean Sea; but that in that sea, the proportion of northern testacea in the lower zones greatly exceeds that in the upper, so that there is a representation of climates, or parallels of latitude, in depth. The fourth proposition advanced by the Professor, was, that all varieties of sea-bottom are not equally capable of maintaining animal life. The sandy parts are usually the desert ones. Hence the scarcity of fossils in sand-stone: though traces of worms (which inhabit the sand) are found in ancient sand-stones. As each animal is not able to live, except on its own locality, those marine animals, as the scallop, which are gregarious, deteriorating the ground when they increase beyond a certain extent, die; then the place becomes silted up, the ground changes, and another race occupies it. This fact explains the phenomena of distribution of organic remains in rocks,—i. e. their being grouped together in separate strata, fossiliferous strata alternating with those which are free from organic remains.—Prof. Forbes proceeded to observe, that such animals as are common to many zones of depth, as the *Nautilus*, are the greatest horizontal range in space, and are generally those which are present in the

tertiary deposits; and thus it is that the most generally distributed fossils are such as are found in the greatest number of formations; because these are necessarily the most independent of destroying influences. But, on the other hand, as the elevation or depression of strata to a very small extent would destroy the species peculiar to it, zone, or to the zone above or beneath it, it becomes an important inquiry how this destruction is compensated. In dealing with this question, Prof. Forbes announced a most important law in zoology, one altogether new to ourselves—viz. *That the mollusca migrate*. He discovered by his own observation, that this is the case even with the limpets, the most fixed of all species. This migration occurs in their egg-state, when the ova are strung together, and floated over the ocean, from shore to shore. In the larva state they are swimmers. In fact, they commence their life in a form closely analogous to that which is permanent among the pteropods. But, though in this state they can live in any zone, they cannot arrive at perfection except in the peculiar zone to which they are adapted. This accounts for the very imperfect shells of prematurely dying mollusca being found at a low depth. Professor Forbes concluded his communication by noticing its bearings on the views of the most eminent geologists of our time. 1st. With regard to Mr. Lyell's principle of distinguishing tertiary strata by the per-centage of recent species in each. This is confirmed by Prof. Forbes's investigations; only in using Mr. Lyell's criterion, the element of depth, which gives climatal character in living animals, must be taken into account. 2nd. Prof. Forbes next noticed that Sir H. De la Beche had hypothetically anticipated, what his researches established, the representations of climates and depth, ten years ago. 3rd. He lastly ascribed to Viscount d'Archeac and M. de Verneuil, the credit of having announced (what he had observed and mentioned in the course of his communication) that species which are found in a great number of localities, and in very distant countries, are always those which have lived during the formation of several successive systems.

#### ARTESIAN FOUNTAINS.

THE announcement of an intention to sink an artesian well in the neighbourhood of Trafalgar-square has frightened many wise heads into the supposition that such an operation would dry up the neighbouring ordinary wells. This arises from the distinction between an ordinary well and an artesian fountain (as it ought properly to be called) being apparently either unknown or not understood. Such fountains derive their name from having been first bored for in the province of Artois, in France; and the conditions essential to constitute such a fountain are, that the waters shall be forced up to the surface by the pressure from beneath, which is not the case in ordinary wells, from which the waters are pumped up, or drawn up by huckets, &c.

Tertiary basins (geologically speaking), such as London and Paris are situated in, are considered the most favourable for piercing for artesian fountains; and to reach such, it is not only necessary to go below the bed of water which supplies the ordinary wells, but also that, by means of a tube or other conveyance, the superficial beds of water should not mingle with those which are brought up from below to the surface. The means taken to effect this would require a lengthened description: the accidents to which even metal tubes are liable, from being subjected to the enormous pressure sometimes met with, were well illustrated in the case of the celebrated artesian fountain of Paris. The principle upon which artesian fountains are pierced for is the stratified deposition of the beds and the alternation of permeable and impermeable strata in any given place. The ordinary wells of London are all derived from above the London clay; the alluvium covering the surface of which is full of water, from the impermeable nature of the substratum of clay. The quantity of water is so great, that many large distilleries, sugar-houses, and some of the breweries, are supplied with this water. The water of the London clay itself is impure, and contains salts. Such are the saline springs of Bagnigge Wells, St.

George's Fields, Kilburn, and, it is believed, of Epsom.

Whenever a well is sunk above the London clay, the immediate rise of the water has some effect in depressing for a time that of the neighbouring wells; but this is only temporary, for there is no pressure from below. These are not artesian fountains. The latter fountains must be sought for (supposing, to avoid expense, that the uppermost beds were taken) in the alternating sands and clays of the plastic clay formation, or to be more certain of a plentiful supply, in the chalk itself: in either they could have no possible effect whatsoever on any neighbouring wells.

An account is given in Conybeare and Phillips's "Outlines of the Geology of England and Wales" of a well sunk at Messrs. Liptrap and Smith's distillery, one mile east of London, in which the alluvium, London clay, and plastic clay were traversed, and 160 feet of the chalk; the land-springs supplying the London wells were met with at a depth of 29 feet; two beds of the London clay yielded water; a good spring was met with in the lower sandy beds of the plastic clay, and a spring was met with in the chalk at a depth of 123 feet (in the chalk). The lower beds of the chalk formation and every fissure in them are, with very few exceptions, completely filled with water.

As the chalk and plastic clay are in the neighbourhood of Trafalgar-square at a lower level than the higher districts which supply those formations with water, so not only may a powerful fountain be anticipated in such a quarter, but also a rise which will be especially well adapted for ornamental purposes, and that without having any connection whatever with neighbouring wells.—*Literary Gazette.*

#### NEW ARCHEOLOGICAL ASSOCIATION.

THE new society, called the "British Archaeological Association for the encouragement and prosecution of researches into the arts and monuments of the early and middle ages, particularly in England," it is to be under the direction of a central committee resident in London; and among its patrons are already ranked—the Marquess of Northampton, President of the Royal Society; the Earl of Aberdeen, K.T. President of the Society of Antiquaries; the Earl of Powis; Lord Albert Conyngham; the Lord Bishops of Durham, Salisbury, Norwich, and Lichfield; Lord Stanley, of Alderley; Sir E. H. Alderson, Baron of the Exchequer; Mr. Hallam, and Mr. W. R. Hamilton, Vice-Presidents of the Society of Antiquaries. The members of the committee, as at present arranged, are T. Amyot, Esq., F.R.S., Treas. S.A.; C. F. Barnwell, M.A., F.R.S., F.S.A., late of the British Museum; Edward Blore, D.C.L., F.S.A.; W. Bromet, M.D., F.S.A.; the Rev. J. B. Deane, M.A., F.S.A.; C. L. Eastlake, R.A., F.R.S., F.S.A.; Sir H. Ellis, F.R.S., Sec. S.A.; E. Hawkins, F.R.S., F.S.A., Keeper of the Antiquities, Brit. Mus.; T. W. King, Esq., F.S.A., Rouge Dragon Pursuivant; Sir F. Madden, K.H., F.R.S., F.S.A., Keeper of the MSS., Brit. Mus.; T. J. Pettigrew, Esq., F.R.S., F.S.A., Treasurer; Amrose Poynter, Esq., Hon. Sec. R.I. Brit. Arch.; C. Roach Smith, Esq., F.S.A., Honorary Secretary; T. Stapleton, Esq., F.S.A.; Albert Way, Esq., M.A., Dir. S.A.; Sir R. Westmacott, R.A., F.S.A., Professor of Sculpture, R. Acad.; C. Winston, Esq.; and Thomas Wright, Esq., M.A., F.S.A., Corresponding Member of the Institute of France, &c.

The want of such an active institution of this kind has long been a reproach to the country, and caused the irreparable loss of many a precious relic of antiquity. Its professed objects are "to investigate, preserve, and illustrate all ancient monuments of the history, manners, customs, and arts of our forefathers, and, in furtherance of the principles with which the Society of Antiquaries of London was established, to render available the researches of a numerous class of lovers of antiquity who are unconnected with that institution." The means proposed are, "1. By holding communication with correspondents throughout the kingdom, and with provincial antiquarian societies; as well as by direct intercourse with the Comité des Arts et Monuments of the Ministry of Public Instruction in France,

and with other similar associations on the Continent instituted for the advancement of antiquarian science. 2. By holding frequent and regular meetings for the consideration and discussion of communications received from correspondents and any other persons. 3. By promoting careful observation and preservation of antiquities discovered in the progress of public works, such as railways, sewers, foundations of buildings, &c. 4. By encouraging individuals or associations in making researches and excavations, and affording them suggestions and co-operation. 5. By opposing and preventing, as far as may be practicable, all injuries with which ancient national monuments of every description may from time to time be threatened. 6. By using every endeavour to spread abroad a correct taste for archaeology, and a just appreciation of monuments of ancient art, so as ultimately to secure a general interest in their preservation. 7. By collecting accurate drawings, plans, and descriptions of ancient national monuments, and, by means of correspondents, preserving authentic memorials of all antiquities which may from time to time be brought to light. 8. By establishing a journal devoted exclusively to the objects of the association, as a means of spreading antiquarian information and maintaining a constant communication with all persons interested in such pursuits. 9. By taking every occasion which may present itself to solicit the attention of the government to the conservation of our national monuments, and to the other objects of the association."—Exertions are being made to issue the first No. of the *British Archaeological Quarterly Journal*, which will be a record of all the proceedings, towards the end of March. No fixed plan of pecuniary consideration has as yet been arranged. On the contrary, it is at present voluntary; but we understand it is proposed to hold, at appointed times, an Historical Congress, something after the manner of the British Association, on which occasion we presume there will be some call for the "sineus of war." It is proposed that the assemblage should be made at some place remarkable for its historical monuments, and other objects of antiquity; and we believe that Canterbury or Winchester will be fixed upon for the present year.

#### SOCIETY OF ANTIQUARIES OF NEWCASTLE.

THE thirty-first anniversary of this society was lately held, on which occasion the chair was taken by John Clayton, Esq., when the usual statement of accounts was read, after which the report of the council was read to the meeting. It stated that further delay had been experienced in the appearance of the Pipe Rolls, but it was expected that members who had subscribed to the work would shortly receive their copies. The memorial presented to the Town Council respecting the Braud manuscripts remained unanswered. Successful operations had been carried on in exploring Roman stations at Risingham and Walwick Chesters: Mr. Shanks had enriched the society's collection with various objects of antiquity found at the former place, and Mr. Clayton had contributed to the 'Transactions' an account of his discoveries at the latter. The council having found that there were sufficient papers, with those contributed during the past year, to form a concluding part to Vol. III. of the 'Transactions,' have determined to print them, and an interesting part will be published. Great attention has been paid to the elucidation of the discoveries mentioned above, by plates, &c. By the efforts of sundry individual members, several gentlemen have joined the society, but such exertions must still be kept up in order to secure such a fund as will enable the society to carry on the measures for which it was originally formed. The following gentlemen have become members during the year: namely, P. H. Howard, Esq., M.P., Corby Castle; Wm. Sydney Gibson, Esq., Newcastle; the Rev. W. F. Raymond, Archdeacon of Northumberland; Dr. Besley, Vicar of Long Benton; Rev. Edward Hussey Adamson, incumbent of St. Alban's; H. Ingledeu, Esq., Newcastle; J. Straker, Esq., Point Pleasant; Geo. Walker, Esq., architect, Newcastle. Whilst these acquisitions have been made, however, the society have to lament the deaths of Messrs. Biddle and Hewitson, and the resignation of Christopher Blackett, Esq.

At this meeting Charles Roach Smith, Esq., was elected an honorary, and Mr. Ions Hewitson an ordinary member. The various presents received during the year were laid upon the table for the inspection of the members, and the following gentlemen were chosen officers for the ensuing year, namely, President, Sir J. E. Swinburne, Bart., F.S.A.; Vice-Presidents, C. W. Bigge, Esq., Sir C. Monck, Bart.; and the Rev. J. Hodgson: Secretaries, John Adamson, Esq., F.S.A.; and Henry Turner, Esq.: Council, J. H. Hinde, Esq., M.P.; John Clayton, Esq.; John Fenwick, Esq.; Rev. James Raine; Dr. Headlam; R. R. Dees, Esq.; H. G. Potter, Esq.; Dr. Charlton; E. Charnley, Esq.; W. Dickson, Esq.; Thomas Bell, Esq.; and M. A. Richardson, Esq.

#### YORKSHIRE LAND DRAINAGE ASSOCIATION.

THE application of capital to the general and complete drainage of land, as a means of investment—while it would confer the greatest benefit to the farmer, as well as the landholder himself—has, among all the various speculations which have been brought before the public during the past twenty years, been completely lost sight of; to induce, however, capitalists to embark property in this useful and (certain to be) lucrative employment, the attention of the legislature was called to the subject, and, by an Act of Parliament, 3 & 4 Vict., cap. 53, power is given to the owners of settled estates to defray the expenses of draining the same by way of mortgage, and to charge all or any part of the lands so drained with payment to any persons willing to advance the capital necessary for the purpose, either as a rent charge, or by equal yearly instalments, of not less than twelve or more than eighteen years.

This Act embraces in its enactments most clearly the objects sought to be attained by an association on the principles of one which has just been formed under the above title, which, while it numbers among the names upon the provisional committee and among its patrons some of the first in the kingdom as farming landholders, enters upon the proposed undertaking with a spirit commensurate with its importance. The proposed capital is 500,000*l.*, in shares of 25*l.* each; and at the present moment, when agricultural improvement is of such urgent necessity, there is little doubt the association will be properly supported; populous as England is, and extensive as are her towns and villages, compared with other portions of the globe, there is vast room for improvement in agricultural pursuits, and the consequent investment of capital. It is calculated that by proper management the soil of this country could be made to produce four times the amount of food at present raised from it; and, though this will in a great measure depend upon chemistry, as applied to agriculture, still a thorough principle of drainage must in all cases be carried out before chemical effects can be properly developed. Under such circumstances, we hail with much gratification the establishment of such an association, the results of whose operations, we have no doubt, will tend to secure an increase of production, and, consequently, lessen much of the present misery in the agricultural districts, and counterbalance the general depression which prevails in that branch of industry. As this association will in all cases proceed on the most recent improvements, and carry on all its undertakings on the most scientific principles extant, further openings will doubtless be made for the production of many articles of manufacture for drainage, as well as other purposes of agriculture. Ainslie's patent tile machine, the Marquis of Tweeddale's, and various others, have been followed by Watson's patent draining process, which has been so successfully applied in cuttings and embankments on railroads and canals; and the operations of this association will tend to call into activity many other inventions, which, from the want of a stimulus, have hitherto lain dormant. The safety of such a speculation cannot be better shewn than by quoting the words of Lord Stanley (no mean authority on the subject) at a meeting of the Royal Agricultural Society of England, held at Liverpool, in July, 1841—he says, "There

was no bank in the country, no commercial speculation, no investment, so safe, so sure, so profitable, as that in which even borrowed capital may be engaged by investing it under the ground of your own soil." There is no doubt, under good management, the return for capital embarked will be ample, and secure the support of permanent investors—a society of a speculative character being what the promoters most strongly desire to avoid.

In two pamphlets published by J. H. Charnock, Esq., a member of the Yorksbire Agricultural Society, the subject is most ably discussed, and the objects of the association clearly pointed out; these latter are—1. To provide the requisite amount of money for either owner or occupier, or the two jointly, to thoroughly drain their land, they repaying the same with interest, by half-yearly instalments, during a certain period to be fixed, either at a rate per cent. or a charge per acre, to be determined by competent parties, in proportion to the benefit the land has obtained from the operation of the association; 2. To make tiles or other articles for the purposes of drainage, on the most approved plan, and in the cheapest and most approved localities, to enable them to be supplied at the lowest price; and 3. To take on suitable leases any land considered worth the operation, thoroughly drain it, and relet it. In the discussion of the subject, the author shews, that as the increase of produce—at the most, three crops—will pay for the cost of perfect drainage, it follows that in three years there would, by this system, be put into the occupier's pocket the total sum which, under other circumstances, he would have to disburse during, perhaps, fifteen years—thus supplying him with extra capital; and, as this must tend to give a large increase of employment in the whole of the agricultural districts, it will improve the moral and social condition of the labourer, render him contented, induce others to follow his example, feel that his condition is not uncare for by his employers—and render the advantages which we possess, beyond all other countries, in capital, and its practically scientific application, subservient to the general good of the community.

**NATURE THE ARCHITECT OF SOCIETY.**—Human society is not like a piece of mechanism which may be safely taken to pieces, and put together by the hands of an ordinary artist. It is the work of nature, and not of man; and has received, from the hands of its author, an organisation that cannot be destroyed without danger to its existence, and certain properties and powers that cannot be altered or suspended by those who may have been entrusted with its management. By studying these properties, and directing these powers, it may be modified and altered to a considerable extent. But they may be allowed to develop themselves by their internal energy, and to familiarize themselves with their new channel of exertion. A child cannot be stretched out by engines to the stature of a man, nor a man compelled, in a morning, to excel in all the exercises of an athlete. Those into whose hands the destinies of a great nation are committed, should bestow on its reformation at least as much patient observance and as much tender precaution as are displayed by a skillful gardener in his treatment of a sickly plant. He props up those branches that are weak or overloaded, and gradually prunes and reduces those that are too luxuriant; he cuts away what is absolutely rotten and distempered; he stirs the earth about the root, and sprinkles it with water, and waits for the coming spring; he trains the young branches to the right hand or to the left; and leads it, by a gradual and spontaneous progress, to expand or exalt itself, season after season, in the direction which he had previously determined; and thus, in the course of a few summers, he brings it, without injury or compulsion, into that form and proportion which could not with safety have been imposed upon it in a shorter time. The reformers of France applied no such gentle solicitations, and could not wait for the effects of any such preparatory measures, or voluntary developments. They forcibly broke over its lofty boughs, and endeavoured to straighten its crooked joints by violence: they tortured it into symmetry by force, and shed its life blood on the earth, in the middle of its scattered branches.—*Lord Jeffrey.*

#### DESCRIPTION OF CHESTER.

THIS is not only the city of singular walks, but of singularities of all kinds. A German would notice one in particular in the Cathedral. Here, to his astonishment, he is led to the tomb of one of his German sovereigns, the Emperor Henry IV. The Chester people, who have invented such singular streets and walks, have firmly made up their minds, that this famous German emperor, of whose death we tell quite a different story, came over to Chester. Here the people received him and kept him till his death, then buried him in their Cathedral, and erected a monument to his memory. I told my guide that I very much doubted the truth of his tale. He replied that there were some people in Chester who doubted it: "but," said he, "I have no doubt on the subject, else why should they print it in the books?" This imperial monument is quite different from and more ornamental than the other monuments, and in order that there should be no mistake, the inscription confirms the popular legend. I can understand how a people, in its tales and legends, can fall into historical errors; but how such a mistake should have come into the daylight of one of the most famous cathedrals, and appear there cut in stone and iron, is incomprehensible. It is known that this unhappy emperor died on the 7th of August, 1106, at Liege, after he had been deprived of the crown by his son, Henry V. Obbert, the Bishop of Liege, at first permitted him to be buried in the Cathedral, but afterwards, as he was excommunicated, he had him dug up, at the command of the papal legate, and thrown, uninterred, on a little island in the Maas. On this island, so runs the tale, a pious monk night and day sang penitential psalms for the Emperor's soul. Henry V. had the body brought to Spiers, where it was buried in St. Mary's Church; but the fanatical Bishop of Spiers would not let it rest there. He removed it from the church, and had it placed in an unconsecrated chapel, where the bones of the unhappy emperor lay five years above ground. Then the bar of excommunication having been removed, he was solemnly interred in the Cathedral. There, as we know, he did not rest, for at the end of the last century but one, when the French laid waste the Palatinate, the bones of the emperor were again scattered. They have, however, been long since restored, and a monument erected over them, which is, however, scarcely so splendid as that which the English have raised to the duplicate of our emperor. There is, however, generally some truth in every legend, and the question therefore arises, what the truth is in this remarkable Chester story. It is possible, 1st, that the emperor, after his detronement and the ill-treatment he received at the hands of his son, fled from Liege, down the Mass, to England, and that the person who died at Liege was not the emperor: or, 2d, that a stranger and impostor, profiting by the stormy life and obscure death of the emperor, went over to England, and there gained compassion and support by representing himself as the unfortunate sovereign. As neither of these hypotheses can be proved, the question remains, who that Henry IV. was who was honoured in Chester with the title of emperor of Germany, and whence it came that he was confounded with this emperor. Historians have as yet been as little able to solve this question, as to say who was the man with the iron mask.—*Kohl.*

#### THE HOUSE OF SIR CHRISTOPHER WREN.

—In Friday-street, Cheapside, a short time ago, stood the house which was in the occupation of Sir Christopher Wren, the eminent architect, during the erection of St. Paul's Cathedral, and which adjoined the church of St. Mathew, Friday-street. In the course of pulling down the building, which was sold a few days ago, and which is now nearly levelled with the ground; several silver and copper coins were found in the joists of the flooring by some of the workmen. The silver coins were of the reign of Queen Elizabeth, some being in good preservation. The copper coins were of an earlier period. The foundation walls are of extraordinary thickness, a portion of which formed part of the Saracen's Head, which is also taken down.

#### CHURCH-BUILDING INTELLIGENCE, &c.

**Bury St. Edmund's.**—A meeting of some of the principal inhabitants of St. Mary's parish in this town, convened by a friendly circular from the rev. incumbent, was held at the vestry of the church on Monday. The rev. gentleman stated that the repairs of the outer roof had been now completed, and that the condition of the principals, &c., had been throughout ascertained to be fully as bad as Mr. Cottingham had represented those which had been examined. The object of the meeting now was to consider certain alterations and processes of restoration of the interior of this beautiful edifice submitted by the architect, Mr. Cottingham, which were explained by Mr. Eyre. The rev. incumbent stated that the propositions embraced, first, the restoration and cleaning of the roof; secondly, the repair, or rather restoration of the great west window, which was in an absolutely dangerous condition from injury and decay, the stone-work being broken and split in every direction; thirdly, the reparation of the roof of the south aisle, which has been discovered to be in a bad state; fourthly, the removal of the organ gallery within the west porch, the organ to be placed on the ground-floor next the tower, and the vacant space thus obtained so advantageously to the representation of the fair proportions of the building, to be filled up with seats for the poor. It was calculated that about 160 free sittings would be thus obtained. It was also proposed that the pulpit should be placed at the east end of the nave on one side, and the reading-desk on the other. Two very beautiful plans of pulpit and reading-desk drawn by Mr. Cottingham were exhibited, which received general approbation. Reference was made to some proposed and much to be desired repairs and alterations in the chancel, for which also some beautiful plans were submitted. The cost of the whole was estimated at about 1,800*l.* For the above-mentioned restoration and repairs of roof and west window, removal of organ and gallery, and substitution of free sittings, with repair of south aisle, about 1,300*l.* will be required. The rev. incumbent has already received of free-will offerings nearly 900*l.* It was thought, therefore, that these necessary repairs should be proceeded with forthwith, in the confident hope that the additional 500*l.* required will be soon obtained by an appeal to the public. The alterations and repairs of the chancel, together with new pulpit and desk, which would cost about 400*l.* additional, will be contingent upon the subscriptions. Mr. J. H. P. Oakes has undertaken, at a cost, if required, of 250*l.*, to replace the present inappropriate circular window over the east end of the nave, with a new rose window of stained glass, an admirable plan of which has also been made by Mr. Cottingham.

**Woolpit Church.**—The open roof of this fine ecclesiastical structure has recently undergone complete restoration, and is now finished, with its appropriate niches and figures, in a style which it is hoped will afford an example to be followed in the many structures of Suffolk, where restoration is so much needed. The *tout ensemble* is fine. The clerestory is divided by the roof into ten bays by eleven pairs of principal frames and trusses. These frames are formed of three stories of half arches or spandrels, supporting horizontal timbers or hammer beams. The ends of these beams are finished with the figures of angels. The bays are highly ornamented with star Tudor mouldings. The cornice is charged with figures of angels also, and bosses. The compartments are divided by Tudor mouldings. This work has been completed by Mr. H. Ringham, of Ipswich, whose talent in ecclesiastical carving, though highly appreciated in the locality, is not so extensively known as it deserves to be. In case all our readers may not fully understand the meaning of an "open roof," such roofs being mostly, though not altogether, confined to Suffolk and Norfolk, we add a slight description. An "open roof" is a timber roof, without tie beams, the outward thrust or pressure being counteracted by the skilful arrangement of the internal frame-work, such as the roofs of Westminster Hall, the Hall of Eltham,

and Crosby Hall. Many of these roofs adorn the Churches of Suffolk, as for instance St. Mary's, Bury (now in progress of restoration), St. Margaret's, St. Mary Key, and St. Mary Stoke, Ipswich; Hadleigh, Framlingham, Stonham, Ixworth, Rattlesden, Tostock, Rougham, Tuddenham near Ipswich, Wetherden, &c. Several of these roofs now mentioned have also been repaired by Mr. Ringham, to the great benefit of the structures, and to the satisfaction of those who reverence antiquity.—*Gentleman's Magazine.*

RAILWAY INTELLIGENCE.

House of Commons, Monday, March 4.—Second Report of Select Committee (1st March) considered; Resolution of Committee read, as follow:—

1. That in each case where bills are now pending to authorize the construction of new lines of railway, competing with one another, such bills be respectively referred to one committee.
2. That the committees for the consideration of such bills be specially constituted.
3. That bills now pending to authorize the construction of new lines of railway, which will compete with existing railways, be in like manner referred to committees specially constituted.
4. That such committees be composed of five members, to be nominated by the committee of selection, who shall sign a declaration that their constituents have no local interest, and that they themselves have no personal interest in the bill or bills referred to them, and that they will not vote on any question which may arise without having duly heard and attended to the evidence relating thereto; and that three shall be a quorum.
5. That a select committee be appointed, to consider which of the pending railway bills shall be deemed competing bills, according to the foregoing resolutions.
6. That such select committee be composed of five members, of whom three shall be a quorum, and that the committee have power to send for persons, papers, and records.
7. That such of the standing orders as relate to the composition of the committees on private bills, and the orders consequent thereon, be suspended, so far as regards competing railway bills pending in the course of the present session.

First resolution read a second time; motion made, and question proposed—"That this house doth agree with the committee in the said resolution;"—Debate arising; motion made, and question put, "That the debate be now adjourned." The House divided—Ayes, 3; Noes 200.

Gravesend, Tilbury, and Eastern-Counties Junction Railway Company.—This company has for its object, the most ready communication between London and Gravesend, which is proposed to be effected by a line from Romford to Tilbury Fort—the company availing themselves of the Act of Parliament already obtained for the Thames Haven line, and making a branch line from Ockendon to the Thames, crossing by way of steam ferry. The time, we are told, to accomplish this would not exceed one hour, or, as the table states, giving the widest limit, one hour and a quarter, while that required by taking the Surrey and Kent lines would require two hours, and thus a saving of three-eighths in time would be effected. There can be no question but that the traffic between Catham, Gravesend, and London is very large, and, with the facilities afforded by railway communication, this may be expected to be increased to a vast extent. It is stated, that the whole of the works are ready to be contracted for within the subscribed capital, and that the line will be completed in eighteen months. One-fourth of the shares have been taken up, and interest at the rate of 5 per cent. per annum will be allowed on deposits, or payments on shares. The prospectus states, that a dividend of 10 per cent. may be calculated upon.

Project of a Railroad from Paris to Boulogne and Calais.—I he following are the chief conditions of the Railroad Bill presented to the Chamber of Deputies by M. Dumon, the Minister for Public Works, for constructing a railroad from Paris to the Belgian frontier, with branches to Calais, Boulogne, and Dunkirk. The branches to Calais and Dunkirk are to commence between Douai and Lille, and to proceed to Calais through Hazebrouck and St. Omer, and to Dunkirk through Hazebrouck and to the west of Cassel. The line to Boulogne is to commence at Amiens, and to proceed through Abbeville and Etapes. A sum of 15,000,000*fr.* is allocated for the construction of the branches to Calais and Dunkirk, and the term of the lease to a public company, should any offer, is to be 23 years from the date of the fixing of the rails. An additional article stipulates that after the receipt of six per cent. for interest, and two per cent. for a sinking fund, the surplus of revenue shall be equally divided between the company and the government. In case that within two months from the passing of the bill no company shall have complied with the conditions proposed, the minister is authorized to complete the road at the expense of the government. Credits for that purpose are provided in the bill. There is to be a diminution of 2*c.* in the tariff of merchandise. There are to be three classes of carriages—the first at 10*c.*, the second at 7*c.* 0-005, the third at 5*c.* 0-005. The third class is to be covered and closed with curtains. The government is to become the proprietor of the railroad at the conclusion of the lease. The government is likewise to be at liberty to purchase the railroad from the company contracting at the conclusion of the 12 years from the granting of the lease. The terms of purchase are to be the same as those prescribed in the Orleans Railroad Bill, with this difference, that the premiums to be added to the dividend, of which the annuity to be paid to the company is to be composed, is to be reduced one-half.

Correspondence.

METHOD OF CUTTING A TAPERED PLANK.  
SIR,—Your correspondent "R. A. P.," in No. 54, desires to be informed where he may cut a tapered plank, the length of which is  $l$ , and the breadth of the two ends  $B$  and  $C$  parallel to the ends, so that the two parts shall be equal in area. As many cases may occur where such a division of a similar superficies is required, and in other branches of building as well as joinery, you will perhaps insert this reply in your next. It may appear strange to many that a question seemingly so simple cannot be solved but by an algebraic equation of two unknown quantities; but such I believe is the fact.

I have, however, subjoined another method, that is sufficiently correct for practical purposes, and more readily applied. But first for the equation: let the plank be represented by the annexed trapezoid or tapering superficies,

$l$  is the length,  $B$  the width of the broad end,  $C$  of the narrow end; let  $y$  represent the length of the cross-cut, and  $x$  its distance from the broad end. Let it first be granted (I need not prove it) that  $\frac{B+C}{2} \times l = \text{area of the}$

whole plank, we have then given for the  
1st equation  $\frac{B+y}{2} \times x = \frac{y+C}{2} \times (l-x)$ .  
2nd equation  $\frac{B+y}{2} \times x = \frac{B+C}{4} \times l$  by the question, to find the value of  $x$  and  $y$ .

To proceed with the first equation. Taking away the denominators on both sides, that is to say, multiplying both sides by 2, and then multiplying the two terms on each side together, we have

$$Bx + xy = ly + Cl - xy - Cx,$$

$$\text{and } Bx + 2xy + Cx = ly + Cl \text{ by transposition.}$$

And by dividing both sides by  $B + 2y + C$ , we have

$$x = \frac{ly + Cl}{B + 2y + C}.$$

For the second equation, after multiplying

the terms on each side together, and then multiplying both sides by 4, we have

$$2Bx + 2xy = Bl + Cl$$

And by dividing both sides by  $2B + 2y$ , we have

$$x = \frac{Bl + Cl}{2B + 2y}$$

Thus arises a new equation, viz.—

$$\frac{ly + Cl}{B + 2y + C} = \frac{Bl + Cl}{2B + 2y}$$

to find the value of  $y$ .

By multiplying both sides by the denominators successively, we bring both sides to whole terms; and after expanding those quantities that are common to both sides, and have like signs, we have  $2ly^2 = B^2l + C^2l$ , and therefore  $y = \sqrt{\frac{B^2l + C^2l}{2l}}$ .

We have thus  $\sqrt{\frac{B^2l + C^2l}{2l}} = \text{width of the plank at the cross-cut, and } \frac{Bl + Cl}{2B + 2y} = \text{the distance of the cross-cut from the broad end.}$

To apply this, let  $l$  be 8-4, or 100 inches,  $B$  12 inches,  $C$  8 inches, and we have

$$\sqrt{\frac{(144 \times 100) + (64 \times 100)}{200}} = \sqrt{104} = 10.198039 \text{ inches, the width of the cross-cut.}$$

And  $\frac{(12 \times 100) + (8 \times 100)}{24 + 20.396078} = \frac{2000}{44.396078} = 45.0490243 \text{ inches distance from the broad end.}$

To prove this  $(12+8) \times 2 \times 100 = 1000 \text{ in. cont. of whole plank.}$   
 $(12+10.198039) \times 2 \times 45.0490243 = 199.999999 = 500 \text{ inches, the area of one of the parts.}$

For the other method alluded to above, let  $a b d c$  in the annexed diagram be the given

plank; draw the lines  $cf$  and  $di$  at right angles with the ends; draw the line  $gh$  parallel to the ends, and midway between them; draw  $ge$  and  $li$  parallel to  $hf$  and  $mi$ ; then it is easily proved that the triangle  $ceg$  is equal to the triangle  $hlc$ , and consequently the area of the plank on the left of  $gh$  exceeds that on the right, by the two oblongs  $efhg$ ,  $ilmc$ , so that by adding one of them (which is half the length of the plank, by half the difference in the width of the ends) to  $ghdc$ , it is rendered equal to the other. Let the plank be of the dimensions supposed before, then the area of the oblong is 50 inches; to add this to  $ghdc$ , consider what number multiplied by  $gh$  will produce 50; now,  $gh$  being 10, will require 5; move the rule, therefore,  $2\frac{1}{2}$  inches nearer to the broad end, for the average width, and then find a number which, multiplied by this increased width, will produce 50, and at that distance from  $gh$ , towards  $ab$ , make the cross-cut, which will divide the plank into equal parts, very nearly. The exactness may be increased to any degree by moving the rule for the more correct average width indicated by the last number found, and then finding a new multiplier, and so on.

I remain, Sir, yours most respectfully,  
S. HUGGINS.  
Liverpool, February 29, 1844.

THE ANCIENT ROMAN WALL OF LONDON.—While making excavations for a sewer in Duke-street, Houndsditch, a few days ago, the workmen discovered the foundation of the ancient Roman wall, which it was known near this spot took its course from the Minories to the street denominated "London-wall." It was found at about 8 feet from the surface, and was between four and five feet in width. Many of the houses in Bevis-marks (which is adjoining Duke-street) are built upon this wall. It was observed that outside the wall, abutting upon Houndsditch, there was a depth of made earth of about 14 or 15 feet, shewing that the spot had been filled up at some early period, while within the wall the native earth was at a depth of between two and three feet, below which is a bed of sand. At the depth where it is necessary to build the sewer, water is abundant, and the men are now employed in pumping it up.

FONT IN ST. MARY'S CHURCH, BRECON.

ELEVATION.

TO THE EDITOR OF "THE BUILDER."

SIR,—The obliging readiness with which you have inserted many little previous contributions from me to your useful magazine, has induced me to send you sketches of a font in St. Mary's Church, Brecon. It is, doubtless, an early production, as the style of the work seems somewhat of the "Decorated period;" though I must confess myself not antiquary enough to determine precisely the date of its execution. It is elaborately ornamented, and its carving is very boldly and accurately chiselled; the effect of its design is certainly very pleasing, and well worthy of being re-produced in modern works intended for the same purpose. Indeed, if many of our little obscure country churches were resorted to, and their beautiful architectural details properly surveyed, often would as much instruction be afforded to the man of letters, to the student, and to the professor, as results from even the contemplation of the prouder conceptions of the genius of our ancestors. Perhaps, in some humble village church, unknown and unnoticed, some pure remain of Saxon or of British architecture may be concealed, by its obscurity secured from even the intrusion of the longing antiquary. In Wales there are many sequestered spots, which are little else than dilapidated ruins, and though possessing few architectural minutiae worthy of notice, are still not devoid of interest, when con-

nected with their associations of the past; and were there to arise, in some of the mountain fastnesses of the principality, another Walter Scott—that far-famed magician of the North—and to breathe the life of his genius through the ivy-clad sanctuaries of our forefathers, and the thousand legends with which they are associated, in conjunction with

PLAN OF THE SHAFT.

some stirring passages of history, to-day as freshly primitive, as in the days of "High-born Hoel's harp, And soft Llewellyn's lay;" those deserted walls would be invested

with a new and undefinable interest; and these humble relics of devotion, containing the ashes of many an illustrious personage, seated as they are amidst the sublimest display of nature, would become as deservedly celebrated, and be sought for by as many pilgrims, as Ben-Lomond.

The shaft of the font, from the lower necking-mould shewn at B to the square

plinth, is formed of wood; therefore an after-production, probably according to the taste of some country renovator. It appears to me very probable, that the font was originally fixed in the wall, as there are some fragments of a moulding in the back-ground, carved out of the same stone, which seem to have been flush with the face of a wall, forming a sort of label, hutting up against the font, leaving exposed three whole sides and two half sides of the octagonal basin. The bowl, within which a metal basin is inserted with a rim, is sunk to the depth of eight inches. I cannot discover any water-drain, therefore I should suppose it always contained a moveable basin of some kind or other. The church in which it is placed is little better than a barn, with the exception of a very fine old tower, a sketch of which I propose to send you at my first leisure. It is above a hundred feet high, and is supported at three of its angles by buttresses, and at the fourth is an octagonal turret. It is coped by very fine moulded battlements. The inhabitants desire to build a new church in the same style as the tower when they have sufficient funds; but I am fearful it will be a long time in hand, although designs have been furnished, and I think were some years ago partly approved of. There is some very good

ments are on the one-pair story (for which see section), are spacious, their floorings being carried over the arcade. The floors of the school-rooms are tiled, and have each a stove; the building is separated from the high-road by a handsome iron-railing, let into a cut-stone granite

THE CHIMNEY-CAPS (to a larger scale.)

plinth, in the centre of which is the entrance gate, with cut granite piers, inclosing an appropriate space having walks and plots studded with shrubs.

To your English readers, much of the walling will appear very thick, but it must be taken into account that the building is constructed with "rubble stone;" the reveals of windows, and doors, arches, piers of arcade, breasts of chimneys, and chimney-shafts are of brick only; the window-sills, key-stones, string-course of plinth, bases, and caps of the arcade piers, and chimney caps are of granite.

The works are substantially built, the entire cost being a trifle under 1,200*l.*—Yours, &c. Gorey, 22nd Feb., 1844. JOHN KELLY.

TO THE EDITOR OF THE BUILDER.  
SIR,—The number of designs for schools in THE BUILDER sufficiently indicates that the "schoolmaster is abroad."

Under such circumstances it may not be thought amiss to offer the annexed sketches for insertion in your really useful paper.

The drawings consist of a ground-plan, front elevation, and section of a school built about two years ago in this town, at the expense of Stephen Ram, Esq.

The central portions of the building, including the offices (facing the inner yard), are for the master's and mistress's use; the wings, which are spacious, are thus arranged: on the left side (see ground plan), are the girls' school

and infants' school: the wing on the right is chiefly occupied as the boys' school, the small room adjoining (next the front) being an office or committee-room. At the further end, from the front of each school, is constructed a deal platform, ascended by steps, which admits of the children to sit on; under each platform is space sufficiently large for hanging the cloaks and caps of the children.

The wings have no intermediate floors between the ground and the roof; the middle compartment of the windows in all the school-rooms is hung on centres adjusted by lines that regulate the admission of air, and afford ample means of ventilation.

The master's and mistress's sleeping apart-

## Miscellaneous.

**COWES, ISLE OF WIGHT.**—Osborne House, the seat of Lady Isabella Blackford, has been taken for her Majesty, with an option to purchase, if approved of. The royal household are expected down in May, but considerable additions must be made to the building before it can accommodate a very large establishment. It is beautifully situated in a fine park, with abundance of noble timber. The views are extensive and of varied beauty, though certainly not equal to Norris Castle, which commands Southampton water and the roadstead of Cowes, while Osborne takes a more easterly view, taking in Portsmouth, Spithead, &c., but is shut out by the high grounds of Norris from the views westward. The mansion has, on the ground-floor, drawing-room, dining-room, and library, with two ante-rooms and hall. First-floor.—Five bed-rooms and two dressing-rooms. Second-floor.—Nine rooms. Offices, housekeepers'-rooms, servants'-hall, laundry, kitchen, with beds for maidservants; three beds for men over the stables. There is plenty of extra accommodation to be had in the neighbourhood. When the Duchess of Kent had Norris, Osborne Villa and another house or two were taken for Sir John Conroy and other parts of the establishment. There are also ten new villas nearly finished in East Cowes-park. Osborne park and wood, with gardens, &c., contain 316 acres, the whole of which is freehold. The farm adjoining is copyhold, and contains 424 acres. The park runs down to the water. The landing and hatching is good, and strictly private. It joins the grounds of Norris, being directly to the south-east of that estate.—*Sun.*

**CHELMSFORD IMPROVEMENTS.**—The western entrance to this town, which has up to this time profited but little by the large sums expended in buildings in our vicinity, is about to share in the erection of additional houses. A large and elevated piece of ground, purchased at the sale of the Midway estate, by gentlemen connected with the railway company, is now being laid out for building purposes, and, we hear, is to be designated Primrose-hill. A bridge across the river, in connection with the road upon which the land above alluded to abuts, would open a most desirable communication with Writtle, and tend materially to enhance the value of property on both sides of the water.

**THE FORTIFICATIONS OF PARIS.**—The *Réformé* of the 8th inst. states that orders have been given to complete the works of the fortification of Paris as quickly as possible. The troops of the garrison are to be employed for that purpose, and a number of labourers have been sent from the departments to assist. Several detachments of labourers had likewise arrived at Paris from Germany and Belgium.

His Royal Highness Prince Albert presided on the 8th inst. at a meeting of the Commission for promoting and encouraging the Fine Arts in the rebuilding the Palace of Westminster.

**ST. JAMES'S PALACE.**—The noble suite of apartments forming the state-rooms of St. James's Palace have been completely and splendidly furnished and embellished. The appearance of the throne-room is truly magnificent. The hangings of the throne are composed of rich crimson silk velvet, superbly embroidered, and decorated with gold lace. The window-curtains and draperies in the Queen's closet and the throne-room are made of *tissu de verre*, a splendid damask, recently invented. The draperies are very tastefully designed, and arranged and interspersed with crimson velvet. The seats are covered with crimson velvet, and trimmed with gold lace. The throne, the throne-chair, and stool, and all the richly carved window-cornices, mouldings, picture and glass frames, the pier tables, sofas, and chairs, and the general furniture, have been newly gilt. The floors throughout the state apartments are covered with carpets of the Wilton manufacture, having the arms of England appropriately placed at their corners.

Mr. Taplin, who has recently been appointed to the chief direction of the engineers department of Portsmouth dockyard, with an increase of salary, has invented an ingenious machine for testing the strength of canvas (it is an improvement on the one for testing the strength of wire-rope), and the Admiralty have directed that all which is received into store shall be tried. The machine can produce a strain of 600 lbs. weight, and scarcely any slip of canvas can bear a strain of more than 500 lbs. The machine is something in principle resembling steel-yards. The contractor who undertook to clear the mast-pond in the dock-yard has concluded his work. Several thousand tons of soil and rubbish have been removed to the Government ground at Haslar. Mr. Rolfe, who has taken the contract for excavating at the north end of the yard, has four rails on which the carts travel to the lighters which receive the rubbish he removes, and he has a steam-tug to tow them away when full to the Ordnance ground, near Priddy's Hard.

In consequence of a recent reduction of tonnage on tiles and quarries of every description passing along the line of the Staffordshire and Worcestershire Canal, the markets for these articles at Stourport, Worcester, Gloucester, Bristol, and all intermediate places on the Severn and in South Wales, are become accessible.—*Worcester Journal.*

**DUTY ON PAPER.**—The publishers of Edinburgh have, within these few days, despatched a petition to the House of Commons, praying for the removal of the excise duties on paper; and we understand that the principal paper-makers in Mid Lothian have prepared and sent off a petition of similar import.—*Witness.*

In the United Kingdom, a sum of upwards of 20,000,000l. is annually expended in the consumption of gas; and, in London alone, the sum paid to the several gas companies has exceeded 2,000,000l. annually.

**DEVON.—FOSSIL REMAINS.**—The workmen lately employed in the brick-field, in Barbican-lane, Barnstaple, while at work, excavating the clay at a depth of fifteen or sixteen feet below the surface, struck upon a hard substance, which was at first taken for the trunk of a small tree petrified, but, on examination proved to be the tusk of a fossil elephant, or horn of some other antediluvian animal. When it was first hit upon, the workmen unfortunately split it in pieces with their pick-axes in attempting to get it up; and, on leaving the field for dinner, shortly after, some boys who were near, completed the work of destruction, and carried away a great portion of it in fragments; but, on its being made known to the proprietor of the field, Mr. E. R. Roberts, a more diligent search was made, and the remainder of the tusk traced, and taken up. It was lying on the lower gravel bed, with a superincumbent stratum of four or five feet of the blue clay, above which is about six feet of the yellow plastic clay, with several feet of coarse gravel and soil above. The tusk must have been of large dimensions, about eighteen inches in circumference, and from four to seven feet in length. It has the shape, grain, and markings of ivory, but the colour and consistence are those of horn, and it retains a considerable degree of elasticity. The fragments, which are in the possession of a gentleman in this town, weigh more than 20lb.; and it is supposed that more than that quantity besides was carried away in the first instance, which is to be regretted, as, if attention had been called to it before it was destroyed, it might have been taken up entire. This, we believe, almost the only instance of antediluvian animal remains having been found in this neighbourhood. Nothing else has been discovered in the brick-field; and from the nature of the ground, great difficulty would be experienced in continuing the search, as immediately on reaching the gravel beneath, the water comes up, and stops all progress, and the clay is consequently not worked to the bottom of the bed.—*West Briton.*

**BELLS IN FRANCE.**—The Archbishop of Bordeaux has published a long and interesting pastoral letter on church bells, from which we extract the following passage:—"There is a diocese in France, that of Belley, in which upwards of 200 steeples have been rebuilt or newly constructed, and provided with bells of all sizes; there is not a village in Lorraine that has not recovered its former peal of bells, and in the towers of the cathedrals of Paris, Lyons, Rheims, Poitiers, Strasbourg, Nancy, Rouen, Amiens, Sens, and Vendome are still to be seen the celebrated *bourdons* which added so much to their renown. The steeples of the cathedrals of Nantes, Chartres, and Rodez have been lately furnished with peals of bells far superior to those of which they had been despoiled. One of the new bells of Rodez weighs 17,000lb., and that about to be cast for Notre Dame de la Garde, of Marseilles, will weigh 22,000lb.

## A BILL FOR BETTER REGULATING THE BUILDINGS OF THE METROPOLITAN DISTRICTS, AND TO PROVIDE FOR THE DRAINAGE THEREOF.

(Prepared and brought in by the Earl of Lincoln and Sir James Graham.)

[Note.—The words printed in Italics in the body of the Clauses, are proposed to be inserted in the Committee.]

WHEREAS by the several Acts mentioned in Schedule (A.) to this Act annexed, provisions are made for regulating the construction of buildings in the metropolis, and the neighbourhood thereof, within certain limits therein set forth: but inasmuch as buildings have since been extended in nearly continuous lines or streets far beyond such limits, so that they do not now include all the places to which the provisions of such Acts, according to the purposes thereof, ought to apply; and moreover such provisions require alteration and amendment; it is expedient to extend such limits, and otherwise to amend such Acts.

And inasmuch as in many parts of the metropolis and the neighbourhood thereof the drainage of the houses is so imperfect as to endanger the health of the inhabitants, it is expedient to make provision for facilitating and promoting the improvement of such drainage.

And inasmuch as by reason of the narrowness of streets, lanes, and alleys, and the want of a thoroughfare in many places, the due ventilation of crowded neighbourhoods is often impeded, and the health of the inhabitants thereby endangered, and from the close contiguity of the opposite houses, the risk of accident by fire is extended; it is expedient to make provision with regard to the streets and other ways of the metropolis, for securing a sufficient width thereof.

And inasmuch as many buildings and parts of buildings unfit for dwellings are used for that purpose, and other buildings fit for dwellings are improperly used, whereby disease is fostered and propagated; it is expedient to discourage and prohibit such use thereof.

And inasmuch as by the carrying on in populous neighbourhoods of certain works, in which materials of an explosive or inflammable kind are used, the risk of accidents arising from such works is much increased; it is expedient to regulate, not only the construction of the buildings in which such dangerous works are carried on, but also to provide for the same being carried on in buildings at safe distances from other buildings which are used either for habitation or for trade in populous neighbourhoods.

## CRITICAL NOTES

BY

ALFRED BARTHOLOMEW, Esq.  
ARCHITECT, F.S.A.

The literal signification of the words "buildings unfit for dwellings are used for that purpose" is not very clear; the sense would be more apparent if the words ran "buildings unfit for the purposes of human habitation are used as human dwelling-houses."

The words "it is expedient to make provision for the regulation of the use of such materials" require interpretation.

And forasmuch as by the carrying on of certain works of a noisome kind, or in which deleterious materials are used, or deleterious products are created, the health and comfort of the inhabitants are extensively impaired and endangered; it is expedient to make provision for the adoption of all such expedients as either have been or shall be devised for carrying on such businesses, so as to render them as little noisome or deleterious as possible to the inhabitants of the neighbourhood; and if there be no such expedients, or if such expedients be not available in a sufficient degree, then for the carrying on of such noisome and unwholesome businesses at safer distances from other buildings used for habitation.

And forasmuch as great diversity of practice has obtained among the officers appointed in pursuance of the said Acts to superintend the execution thereof in the several districts to which such Acts apply, and the means at present provided for determining the numerous matters in question which constantly arise, tend to promote such diversity, to increase the expense, and to retard the operations of persons engaged in building; it is expedient to make further provision for regulating the office of surveyor of such several districts, and to provide for the appointment of officers to superintend the execution of this Act throughout all the districts to which it is to apply; and also to determine sundry matters in question incident thereto, as well as to exercise in certain cases, and under certain checks and control, a discretion in the relaxation of the fixed rules, where the strict observance thereof is impracticable, or would defeat the object of this Act, or would needlessly affect, with injury, the course and operation of this branch of business.

#### General Provisions—Operation of Act.

1. Now for all the several purposes above-mentioned, and for the purpose of consolidating the provisions of the law relating to the construction and the use of buildings in the metropolis and its neighbourhood; he it enacted, by the Queen's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, that with regard to this Act generally, so far as relates to the operation thereof in reference to time, it shall come into operation at the following times; (that is to say) as to the buildings, streets, and other such matters, on the first day of January, one thousand eight hundred and forty-five, and as to the districts and the officers to be appointed in pursuance hereof, on the first day of September next; and that on the said first day of January all the Acts mentioned in the Schedule (A.) herunto annexed, except so far as in the said Schedule is provided, shall be and are hereby repealed.

2. And be it declared, with regard to this Act generally, so far as relates to the construction of certain terms and expressions used therein, that the following terms and expressions are intended to have the meanings hereby assigned to them respectively, so far as such meanings are not excluded by the context, or by the nature of the subject-matter; that is to say,—the word "street" to include every square, circus, crescent, street, road, place, row, mews, lane, or place along which carriages can pass; and that, whether there be or be not, in addition to the carriage-way, a footway paved or otherwise: the word "alley" to include any court, alley, passage, or other public place, which can be used as a footway only: the word "square" as applied to any area of building, to contain one hundred superficial feet; the word "floor" to mean the horizontal platform forming the base of any story, and to include the timber or bricks, or any other substance which constitutes such platform: the word "story" to include the full thickness of such floor, as well as the space between the upper surface of one floor and the under surface of the floor next above it; or if there be no floor, then the space between the surface of the ground and the under surface of the floor next above it: the term "external wall" to comprise all outer walls of buildings now or hereafter to be built, which shall stand wholly upon ground of the owner of such buildings, and shall not be used or intended to be used as party-walls under the definition hereinafter contained, whether the same shall adjoin or not to other outer or to party-walls: the term "party walls" to comprise all walls which shall be used or built in order to be used as a partition of two or more buildings for the occupation of different families, or actually occupied by different families, and also all walls which shall stand upon ground not wholly belonging to the same ownership or occupation: the term "already built," used in reference to buildings, to apply to buildings built before the first day of January, one thousand eight hundred and forty-five, or commenced before that day, and covered in and rendered fit for use within twelve months thereafter; and used in reference to streets and alleys, to apply to all streets and alleys made or laid out before that day, and which shall be formed and rendered fit for use within twelve months thereafter: the term "hereafter to be built," used in reference to buildings, to apply to all buildings to be built or commenced after the first day of January, one thousand eight hundred and forty-five, or which, being commenced, shall not be covered in within twelve months thereafter; and used in reference to streets and alleys, to apply to all streets or alleys laid out before the said first day of January, or which being laid out shall not be rendered fit for use within twelve months thereafter: the word "owner" to apply to every person in possession or receipt, either of the whole or of any part of the rents or profits of any ground or tenement, or in the occupation of such ground or tenement, other than a tenant from year to year, or a tenant at will: the term "official referees" to mean the persons appointed in pursuance of this Act to be official referees of metropolitan buildings: the word "surveyor" to apply to all surveyors to be appointed in pursuance of this Act, or whose appointment is confirmed by this Act; and also to all deputy or assistant surveyors to be appointed under this Act: the words "the surveyor," used without any addition, to mean the surveyor in whose district the buildings, street or alley or other subject-matter shall be, or any deputy or assistant surveyor duly acting in his behalf: the word "month" to mean a calendar month: the expression "the commissioners of works and buildings" to mean the Commissioners of Her Majesty's Woods, Forests, Land Revenues, Works and Buildings: the expression "justice of the peace" to mean a justice of the peace for the county, division, or liberty within which the building or other subject-matter, or any part thereof, is situate; unless it be situate within the city of London or the Liberties thereof, in reference to which any matter or thing elsewhere required or authorized to be done either by one or by two or more justices of the peace, may be done either by the Lord Mayor of the city of London, or by any one, two or more justices of the peace for the said city; or unless the subject-matter be situate in the district of any police court of the metropolis, in reference to which any matter or thing elsewhere required or authorized to be done by two or more justices may be done by one magistrate: and, generally, whenever the name of an officer having local jurisdiction in respect of his office is referred to, without mention of the locality to which the jurisdiction extends, such reference is to be understood to indicate the officer having jurisdiction in that place, within which is situate the building or other subject-matter, or any part thereof to which such reference applies: and subject as aforesaid to the context, and to the nature of the subject-matter, words importing the singular number are to be understood to apply to a plurality of persons or things; and words importing the masculine gender are to be understood to apply to persons of the feminine gender; and words importing an individual, are to be understood to apply to a corporation or company, or other body of persons.

#### Extent of Operation of Act.

3. And be it enacted, with regard to this Act generally, so far as relates to the operation thereof in reference to localities, that the operation of this Act shall extend to all places within the following limits; (that is to say) to all such places lying on the north side or left bank of the river Thames as are within the exterior boundaries of the parishes of Fulham, Kensington, Paddington, Hampstead, Hornsey, Tottenham, Saint Pancras, Islington, Stoke Newington, Hackney, Stratford, Bromley, Poplar, and Shadwell; and to such part of the parish of Chelsea as lies north of the said parish of Kensington; and to all such parts and places lying on the south side or right bank of the said river as are within the exterior boundaries of the parishes of Woolwich, Charlton, Greenwich, Deptford, Lee, Lewisham, Camberwell, Lambeth, Streatham, Footing, and Wandsworth; and to all places lying within two hundred yards from the exterior boundaries of the district hereby defined.

#### Power to Extend the Limits of Act.

4. And forasmuch as, partly by the rapid increase of population in the neighbourhoods of the district to which this Act is to apply, and partly by the tendency of this Act to induce building speculation in such neighbourhoods in order to evade the provisions thereof, the evils which have arisen in the districts not now subject to regulation, will in all probability arise in such neighbourhoods; it is expedient to make provision for the prevention of such evils; and if they should arise, for the remedy thereof, now for those purposes, be it enacted, with regard to this Act generally, so far as relates to the application thereof to other parts and places in the neighbourhood of the districts appointed by this Act, whether such districts immediately adjoin such parts or places or not, that if, from the growing increase of the population or otherwise, it shall appear to her Majesty in Council to be expedient that the provisions of this Act should be extended to any place within two miles of Charing-cross, in the city of Westminster, then it shall be lawful for her Majesty in Council to direct, by order in Council, that at or from a time to be named in such order, the provisions of this Act shall apply to such places; and, at or from such time, all such provisions of whatever nature, whether penal or otherwise, so far as they shall be capable of application to such places, shall be and are hereby declared to apply thereto, as if such places were expressly named herein.

#### Regulation of Buildings—Rates of Buildings, and Thicknesses of Walls and Footings, and Rules concerning Buildings.

5. And now generally, for the purpose of regulating the building and the rebuilding upon sites of former buildings, and the enlarging and altering of all buildings, of what nature soever, within the limits aforesaid; be it enacted, with regard to every such building hereafter to be built (except the buildings comprised in Schedule (B.) hereto annexed), so far as relates to building the same, and with regard to every such building, either already or hereafter built (except the said buildings comprised in the said Schedule (B.)), so far as relates to the rebuilding, and the enlarging or altering the same, and that whether such buildings be built or rebuilt on old or new foundations, or partly on old and partly on new foundations, that every such building shall be built, rebuilt, enlarged or altered in reference to the walls,

The sentence "timber or bricks, or any other substance which constitutes such platform" has no just agreement of number: this ungrammatical defect may be obviated by making the words run "timber or bricks, or any other substance CONSTITUTING such platform."

The phraseology "belonging to the same ownership or occupation" requires amendment.

The sentence seems to have been intended to run thus—"Or in the occupation of such ground or tenement other than" AS "a tenant from year to year, OR" OTHER THAN AS "a tenant-at-will."

The word "district," as here used, would be well altered.

We think the Council would be so delicate in the use of this power that the provision would consequently become obsolete. We think a matter so strictly penal as a Building-Act should depend alone upon particular statutory enactment.

St. Paul's Cathedral is nearer the centre of the metropolis and the villages immediately adjacent to it. We therefore think it the vertex from which the admeasurement in question should be taken.

whether external or party-walls, and to the fences and the party fence walls, and to the number and height of the stories or rooms therein, and to the chimneys, and to the roofs, and to the timbers, and to the drains, and to the projections, and to any other parts or appendages of every such building, in the manner and of the materials, and in every other respect in conformity with the several particulars, rules and directions which are specified and set forth in the several Schedules (C.), (D.), (E.), (F.), (G.), (H.), (K.), to this Act annexed, according to the classes of buildings, and the rates of such classes to which such buildings are by the Schedule (C.) declared to belong; subject nevertheless to any other rules and directions in this Act contained in the same behalf; and subject in every case of doubt, difference or dissatisfaction in respect thereof, either between any parties concerned or between any party concerned and the surveyor of the district, to the determination of the official referees, upon a reference of the matter in question, according to the provisions of this Act in that behalf.

*Buildings under Supervision of Official Referees.*

6. And be it enacted, with regard to all buildings of the sixth rate of the first or dwelling-house class, and to all buildings of the sixth rate of the second or warehouse class, and to all buildings of the third or public buildings class (except the buildings hereinbefore excepted), so far as relates to the supervision thereof, that, subject to the provisions in the Schedule (C.) and elsewhere in this Act made in respect thereof, every such building shall be built under the special supervision of the official referees, according to the provisions of this Act in that behalf, as well as under the ordinary supervision of the surveyor; and if any difference arise as to whether any such building be liable to such special supervision, the same shall be determined by the official referees; subject nevertheless to an appeal, at the instance of any party interested, to the Commissioners of Works and Buildings, whose decision in the matter shall be final.

*Special Supervision of exempted Buildings.*

7. And whereas, by several Acts now in force, certain buildings and structures have been exempted from the operation of the Act mentioned in the Schedule (A.) hereto annexed, for the regulation of buildings and party-walls within the cities of London and Westminster, and the liberties thereof, and other the parishes and places therein mentioned; but forasmuch as the supervision of buildings of whatever kind, with a view to the public security, inasmuch as the reasons whereon such exemptions were made do not now apply; it is expedient to repeal such exemptions, and to make provision for such special supervision of such buildings as the nature thereof shall require; now for that purpose, be it enacted, with regard to the buildings hereinbefore exempted and comprised in Schedule (B.), so far as relates to the supervision thereof, that, notwithstanding anything contained to the contrary in any Act or Acts now in force, every such building or other structure shall be subject to special supervision by the official referees, according to the provisions of this Act in that behalf.

*Buildings not within Rates.*

8. Provided always, and be it enacted, with regard to any building of whatever kind, which is not hereby expressly assigned to any class or rate of a class, so far as relates to the application of this Act thereto, that if any party be desirous of erecting any building which does not come within any one of the said classes, or of any rate of such classes, then such building shall be built in accordance to such class and rate as shall be directed by the surveyor, subject, as in other cases of doubt, difference or dissatisfaction, to an appeal to the official referees.

*Modification of Building Contracts—Reference to Official Referees.*

9. Provided always, and be it enacted, with regard to any building of whatever class, so far as relates to the modification of any written contract or agreement now in force for erecting or altering such building, other than a contract or agreement in the nature of a building lease, that it shall not be lawful to execute such contract otherwise than in conformity with the provisions of this Act; but it shall be lawful for either party, and he is hereby entitled to deviate from such contract, so far as any part thereof may remain to be executed after this Act shall have come into operation; and the alterations rendered necessary by this Act shall be performed as if this Act had been in force when this contract was entered into; and that if the parties thereto shall disagree about the difference of the costs and expenses of the works when performed according to the provisions of this Act, and the works as stipulated for in such contract, then, upon notice being given in writing by one party to the other, it shall be lawful for either party, and he is hereby entitled, to refer the matter to the surveyor, who shall determine the same, subject to appeal as aforesaid to the official referees; and the award of such official referees shall be final and binding on all the parties, and in all respects as if such award had formed part of the contract; and the costs of the reference shall be borne by all, or any, or either of the parties, in such manner and proportion as the surveyor, or, in case of appeal, as the official referees, shall appoint.

*Modification of Building Leases.*

10. Provided also, and be it enacted, with regard to any building of whatever class, so far as relates to the modification of any lease, or agreement for a lease, being of the nature of a building lease, whereby any person may be bound to erect buildings, that notwithstanding anything herein contained, it shall be the duty of such person, and he is hereby required to erect every building agreed to be built by such lease or agreement, according to the conditions rendered necessary by this Act, in the same or like manner as if this Act had been passed and in operation at the time of making such lease or agreement, without the lessee or tenant being entitled to any compensation, whether by payment of money or reduction of rent or otherwise.

*Commissioners of Works and Buildings empowered to modify Rules generally—Report of Official Referees—Extent of Modification—Representation by Parties—Order thereupon—Costs of Application.*

11. And, for the purpose of preventing the express provisions of this Act from hindering the adoption of improvements, and of providing for the adoption of expedients better adapted to accomplish the purposes thereof; be it enacted, with regard to every building, of whatever class, so far as relates to the modification of any rules hereby prescribed, that if, in the opinion of the official referees, the rules by this Act imposed shall be inapplicable, or will defeat the objects of this Act, and that by the adoption of a modification of the rules hereby prescribed, its objects will be attained either better or as effectually, it shall be the duty of such official referees to report their opinion thereon, stating the grounds of such their opinion, to the Commissioners of Works and Buildings; and that, if on the investigation thereof it shall appear to the said commissioners that such opinion is well founded, then it shall be lawful for the said commissioners or any two of them to direct that such modification may be made as will, in their opinion, give effect to the purposes of this Act; and that although such official referees shall be of opinion that such modifications are not requisite or admissible, yet if any party interested present to the official referees a representation, setting forth the grounds whereon such modification is claimed, it shall be the duty of the official referees, and they are hereby required to report such representation, as well as their opinion thereon to the said commissioners, with the grounds of such their report and opinion; and that thereupon, if the said commissioners think fit, it shall be lawful for them or any two of them to direct the official referees to make such order in the matter as may appear to them to be requisite; and that, with regard to such application, so far as relates to the payment of the costs thereof, it shall be lawful for the said commissioners to direct such official referees to make such order relative to the costs of such reference to them, as to the said commissioners shall seem fit.

*Power to modify provisions of the Act as to existing Buildings, to be rebuilt.*

12. And be it enacted, with regard to buildings already built, so far as relates to the rebuilding thereof in conformity with this Act, in respect of the required area, or in any other respect than the required height and thickness of walls, that if a full compliance with the provisions of this Act be attended by extreme loss and inconvenience, then, subject to the report of the official referees, and to the consent of the commissioners of works and buildings, and such terms as the said commissioners may impose in that behalf, it shall be lawful for the parties concerned to rebuild such buildings on the site of the old buildings as near as may be practicable, but so that, nevertheless, both the party walls and the external walls be of the required height and thickness.

**BUILDERS.**

*Works to be Executed—Notice to Surveyors—20l. Penalty for Neglect to give Notice, &c.—20l. Penalty for not giving fresh Notices—Penalty for Beginning without Notice, or refusal to admit Surveyor.*

13. And be it enacted, with regard to the works to be executed in pursuance of this Act, so far as relates to the supervision thereof by the surveyors, that two days before the following acts or events, that is to say,—before any building shall be begun to be built; and also, before any addition or alteration which by this Act is placed under the supervision of the surveyor, shall be made in any building; and also, before any party-wall, external wall, chimney-stack, or flues shall be begun to be built, pulled down, rebuilt, cut into, or altered; and also before any opening shall be made in any party-wall, and also, before any other matter or thing shall be done which by this Act is placed under the supervision of the surveyor; it shall be the duty of the builder (by which term is to be understood, both in this provision and elsewhere throughout this Act, the master-builder or any other person employed to execute any work, or if there be no master-builder or other person so employed, then the owner of the building or other person for whom or by whose order such work is to be done), and he is hereby required to give to the surveyor, at his office, notice in the terms specified in the form (Number One) contained in the schedule of notices annexed to this Act, or to the like effect; and that if any builder neglect to give such notice, or begin to build, or do any of the things aforesaid, before such notice, or before the expiration of such period of two days, then, in every such case, the party offending shall forfeit for every such default, and pay to such

[For continuation see SUPPLEMENT.]

"The words, we think, should run—"When" such "contract was entered into."

We think this provision too arbitrary to become part of an English statute; it ought without doubt to be altered so as to be equitable to all parties concerned therein.

We think it possible that much good might arise from the exercise of such a provision, but fear a practical effect, more injurious and evasive than good, would be the result; we fear it would lead to the commissioners and official referees being much troubled by applications from interested parties, to render inoperative the wholesome provisions of the Act. If such powers became statutory, we think it should also be enacted that the commissioners shall publish an account of every such case of deviation, in order that well-known rules of practice may speedily grow up and be rightly ordered as directory precedents.

The last observations apply to this clause.

We apprehend the words are intended to run thus: "shall for each and every such default forfeit and pay to such surveyor."

# THE BUILDER.

## Tenders.

TENDERS delivered for twenty small Houses and large Coal Store, for Coles Child, Esq., at East Greenwich.—R. P. Brown, Esq., Architect. Feb. 28:

HOUSES.	STORE.	
Gerrard.....	£3,620	£615
Clark & Co.....	3,344	516

Each party taken their own quantities. The Tenders were opened in the presence of the parties.

## NOTICES OF CONTRACTS.

CONTRACT for the Erection of a Chapel, and also additional Buildings for female patients, and other alterations to the Kent County Lunatic Asylum.—Mr. G. Poynder, Clerk, Asylum, Maidstone. March 18.

CONTRACT for supplying her Majesty's several Dock-yards with 2,750 loads of English Elm Timber, and 119 Elm Trees for Pumps.—Secretary of the Admiralty. March 19.

CONTRACT for the Execution of the several Works necessary to be done in the Rebuilding of Brent Bridge, and repairing Finchley Bridge, Hendon.—Clerk of the Peace, Sessions House, Clerkenwell-green. March 26.

For the Erection of a Lock-up House, at Bridlington, in the East Riding of the county of York.—Mr. G. Leeman, Clerk of the Peace, Beverley. April 6.

For the Erection of a Lock-up House, at Howden, in the East Riding of the County of York.—Mr. G. Leeman, Clerk of the Peace, Beverley. April 6.

## ADVERTISEMENTS.

### TUFNELL PARK.

**BUILDING GROUND**—This Estate, consisting of about 100 acres, and situated on the east side of Maiden Lane, about one-third of a mile north of the Camden Road Villas, on the road towards Highgate, possessing fine and commanding views of the surrounding country, has been laid out with Roads, Plantations, &c., and is to be LET on LEASE (in Plots as shown on the Plans) for 99 years, for the Erection of single or double detached Villas of a superior class.

N.B.—From the Broadway Road, the Brecknock Arms, and Kenshit Town, Omnibuses are constantly running to all parts of London.

For Terms and further Particulars, apply to Messrs. Allen and Holmes, 31, Bedford-row; at the Office of John Shaw, Esq., Architect, Christ's Hospital; or Messrs. Woolcott and Son, Builders, on the Estate, and at No. 54, Doughty-st.

### MR. GRAYSON'S ARCHITECTURAL

SCHOOL OF DESIGN established about Fifty Years.—CIVIL ENGINEERS, MILLWRIGHTS, and others taught the principles of MACHINERY and PRACTICAL PERSPECTIVE. The selection of models and casts accompanying the diagrams which are introduced at this Academy will be found of great utility to the Student in elucidating the several Mechanical and Practical Sciences. Morning classes from 9 to 2; evening from 6 till 9, five nights in the week. For terms apply at 1, Banner-street, Finchbury-square; if by letter, post-paid.

### LITHOGRAPHY.

**H. T. CHURCH** is desirous of calling the attention of ARCHITECTS, SURVEYORS, BUILDERS, and the Public to his LITHOGRAPHIC AND GENERAL PRINTING OFFICE, 59, WATLING-STREET. Drawings of Machinery, Railway, Canal, and Estate Plans, executed with the greatest accuracy and elegance; a combination of qualities difficult to obtain, as many Printers are entirely ignorant of the nature of the drawings committed to their care for the purpose of being lithographed. H. T. Church having, besides a ten years' experience of the business, had the advantage of three years' observation in the office of an eminent Surveyor, is particularly fitted for the superintendance of drawings, &c., which require to be lithographed with great accuracy. Circular letters, Fac-similes, Bill-heads, Cards, Labels, Gum Tickets, and every description of Printing in demand in the commercial and manufacturing world executed with punctuality and elegance, and on the lowest remunerating terms.

H. T. Church will wait upon gentlemen in any part of London for the purpose of giving estimates or receiving orders. Country orders instantly attended to, if accompanied by a London reference.

Hill Street, facing Richmond Bridge, and 77, Regent's Quadrant, London.

**JOHN P. HOPE, SURVEYOR, AUCTIONEER, APPRAISER, and HOUSE and ESTATE AGENT,** begs most respectfully to acquaint his friends and the public generally, that he has commenced business as above; and will be most happy to superintend the erection, alteration, or repairs of buildings for gentlemen and mechanics; the measuring and valuing, for the builders, &c.; also to sell, by auction, landed and household property, building materials, household furniture, &c. J. P. H. confidently hopes, by blending his years' practical experience, and his long and successful career in the profession, including his having acted as clerk of the works of the Wesleyan Theological Institution, (Richmond), with prompt attention and moderate charges, he shall obtain a share of public patronage and support, which will now earnestly solicit, and which it will be his constant study to deserve.

P.S. An APPRENTICE WANTED, who will be treated as one of the family.

Residence, Victoria Place, Richmond Hill, Surrey, February 28th, 1844.

### ANTI-DRY-ROT COMPANY.

**KYAN'S PATENT.—EXTRACTS**

from recent TESTIMONIALS:—  
From the Engineers' Office, Great Western Railway, August 31st, 1843.

DEAR SIR,—I have sent you by the carrier a section from the centre of one of our longitudinal timbers of the permanent way; it was Kyanized and laid on the line about six years ago, and you will perceive it is as sound as the day on which it was first put down; not singular with us, but in all my examinations I have found it equally sound. I think this simple fact will be highly interesting to you.

I would remark that the pickling having been entirely under my management, I was very particular in having the strength of the solution maintained. Upon first immersion the strength was 1 in 14, at a temperature of 62 degrees, and the time of immersion for seven-inch timber was eight days; during this time the solution was kept of a uniform strength by pumping. In this way I have pickled upwards of 40,000 loads of timber, and the quantity of sublimate consumed comes out at about 14lbs. to the load.

J. HAMMOND.

T. Thompson, Esq.

From E. H. & G. ENDBERRY, Great St. Helens, London, November 10th, 1843.

SIR,—In reply to your queries respecting our ship the *Samuel Endberry*, that was built at the Isle of Wight in 1816, and wholly saturated with Kyan's preparation, we have pleasure in stating that the ship returned from her third voyage to the South Seas on the 1st of July last in a most perfect condition. We invited the officers of the naval department to inspect her, to afford them the opportunity of judging of her condition.

With respect to the crew we have only to repeat what we have before stated, that they have on each voyage enjoyed unusually good health.

We are, Sir, your obedient servants,

E. H. & G. ENDBERRY.

To the Secretary of Kyan's Anti-Dry-Rot Company.

From Earl Manvers, Thoresby Park, September 2nd, 1843.

SIR,—In reply to yours dated 21st ult., in which you state an individual has lately taken an unwarrantable liberty with my name, by asserting in several periodicals that I have impugned Kyan's process, and as the Directors of the Company you represent are pleased to attach some importance to my denial of that gratuitous statement, I derive much pleasure in acquainting them through you that after eight years' very extensive experience of its effects, my early impression in favour of that discovery has been abundantly confirmed, and desire to express my unqualified approbation of Kyan's Patent as a Preservative of Timber of every description.

MANVERS.

Taswell Thompson, Esq., Secretary to Kyan's Anti-Dry-Rot Company.

### PLUMBERS, PAINTERS, BUILDERS,

and OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures

GLAZES, per square . . . . . 2s. 3d.

LINED SHEET OIL, ditto . . . . . 2s. 9d.

SHEET LEAD, in sheets, per cwt. . . . . 18s. 6d.

Ditto, cut to sizes and PIPE . . . . . 19s. 6d.

WHITE LEAD, ditto . . . . . 28s. 0d.

Colours, Pipe, Brushes, &c. &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to B. COGAN, 5, Prince-street, Leicester-square, London.

### PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS,

can be provided with flatted Crown, fattened Sheet, and the patent Sheet Plate, Lists of which, showing the price for any Square, from 14 by 12 to 40 by 30 feet and second quality, will be sent gratis upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to B. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for if required.

NURSEYRYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London.

**COMMON SHEET AND GLASS PAPER.** The advantages of Common Sheet over Crown for Glazing Sky-lights is decidedly great, and is generally used where strength or superior appearance is required; a light 6 feet 6 in. long, with openings and which, needs only one lap. This Glass is considerably stouter than Crown, and may be had from 1s. 3d. per foot.

Also may be had, **COGAN'S PATENT CHIMNEY FOR GAS OR OIL,** which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney used.

**LAMP SHADES AND GAS GLASSES,** of EVERY DESCRIPTION.

**GAS CONTRACTORS, FITTERS, GLASS MERCHANTS** and others supplied with Lists of nearly 100 Patterns, with prices added, sent to any part of the Kingdom gratis.

**CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELERS, AND OTHERS,** supplied with FINEST ORNAMENTAL SHADES, for covering Models of Public Buildings, Geological Curiosities, &c. &c., of all sizes and shapes. List of Prices may be had on application.

French Table Flowers, China Vases, Fancy Glass Ware, and Alabaster Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the Inspection of the Public. A Liberal Discount to Bankers and others.

**ORNAMENTAL WINDOW GLASS,** 2s. per foot super.—CHARLES LONG having greatly improved his machinery for ornamenting glass, is enabled to offer handsome patterns at 2s. per foot super. glass included. 100 feet can be executed and delivered in two days. Address to Charles Long, House Decorator, No. 1, King-street, Portman-square. For Cash only.

## GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY,

14, WATERLOO PLACE, LONDON.

**DIRECTORS.**  
The Chairman, William Morley, Esq., Deputy Chairman, John Brightman, Esq., James John Kinloch, Esq., Francis Bradigan, Esq., Henry Lawson, Esq., James William Deane, Esq., Robert Power, Esq., Jonathan Duncan Dow, Esq., The Rev. F. W. Johnson, Alexander Robert Irvine, Esq., Vickers, A.M., John Inglis Jerdein, Esq.

**AUDITORS.**  
C. E. Rule, Esq., T. C. Simmons, Esq., George Thomas, Esq.

**PHYSICIAN.**  
John Clelandinng, M.D., 15, Wimpole Street.

**M.D.**  
Walter Prud'aux, Esq., Goldsmiths' Hall.

**BANKERS.**  
Union Bank of London.

**ADVANTAGES OF THIS INSTITUTION.**

The whole of the Profits divided ANNUALLY among the Holders of Policies on which five Annual Premiums shall have been paid.

Credit given for half the amount of the first five Annual Premiums, by which means Assurances may be effected and loans for short periods secured with the least possible present outlay, and after payment of the arrears, the Policy-holder will become entitled to participate in the entire Profit of this Institution, precisely in the same manner as if he had paid the whole amount of his Premiums in advance by the usual way.

Thus, for example—a person in the twenty-fifth year of his age, instead of paying 21. 6s. per annum for an Assurance of 1000, would be required to pay 14. 3s. only during the first five years, when, on payment of the amount of Premium, amounting to 54. 15s., his share of the Profits would be such as to reduce his future Annual Premiums to very little more than the half Premium of 14. 3s. originally paid by him. THE GREAT BRITAIN is the only Mutual Assurance Society in which this very great accommodation is given to the Assured.

Credit allowed for the first five Annual Premiums, on satisfactory security being given for the payment of the same at the expiration of five years.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Assured, to be specially convened on the occasion.

Holder of Policies of 21,000 entitled (after payment of five Annual Premiums) to attend and vote at all General Meetings of the Assured, who will have the superintendance and control of the funds and affairs of the Society.

Full particulars are detailed in the Prospectus, which, with every requisite information, may be obtained by application to

A. R. IRVINE, Managing Director.

## FREEMASONS' AND GENERAL LIFE ASSURANCE COMPANY.

11, WATERLOO PLACE, PALM-MALL, LONDON.

**BUSINESS** transacted in all the branches

and for all objects of Life Assurance, Endowments, and Annuities, on every description of security. Loans granted. Information and Prospectuses furnished by

JOSEPH BERRIDGE, Secretary.

## WESTERN LIFE ASSURANCE SOCIETY.

OFFICE, 49, PARLIAMENT STREET, WESTMINSTER.

**DIRECTORS.**

H. Edgeworth Bicknell, Esq., James Hunt, Esq., William Cabell, Esq., J. Arcott Lethbridge, Esq., T. Somers Cocks, Jun., Esq., Edmund Lucas, Esq., George Henry Drew, Esq., George Kemnal Pollock, Esq., William Evans, Esq., James Lys Senger, Esq., William Freeman, Esq., John Barley White, Esq., Francis Fuller, Esq., Joseph Carter Wood, Esq., Joseph H. Goodhart, Esq.

**Physician.**  
William Richard Basham, M.D.

**Surgeons.**  
Alfred Leggat, Esq.; George D. Pollock, Esq.

**Bankers.**  
Messrs. Cocks, Biddulph, and Co.

**Solicitors.**  
Messrs. J. L. Bicknell and G. Lethbridge.

The attention of the unassured portion of the community cannot be too pointedly drawn to the unusual advantages offered to the Public by this Society over those of many other Assurance Companies, inasmuch as it enables all classes to effect life assurances in the manner most convenient to themselves, and amongst other of its peculiar features that of allowing the Assured (by Table 2) to leave HALF THE ANNUAL PREMIUMS unpaid for seven years, will not be found uninteresting public attention.

Immediate and deferred ANNUITIES, and every description of Life Assurance business undertaken by this Society.

Prospectuses, and all other requisite information will be furnished on application to the Secretary, or the Country Agents of the Society.

EDWARD T. RICHARDSON, Secretary.

## ROYAL ADELAIDE GALLERY,

LOWTHER ARCADE, STRAND.—Under the special

Patronage of her Most Gracious Majesty. Open daily

from 11 to 3 o'clock, and from 7 to half-past 10 every

evening. Moving Attractions.—A continued series of

Scientific Experiments, Musical Performances, Exhibitions,

explained; Glass-working, &c. &c. demonstrated and

Oxygen Gas Microscope, Monck Mason's AERIAL MACH-

INE, worked by propulsive machinery, and explained in

a lecture on the Aerial Navigation; ELECTRICAL EELS,

a lecture on the Infant Thalia and Adelaide Wizard,

Performance of the Infant Thalia and Adelaide Wizard,

Bunsen's CARBON BATTERY, Dissolving Views, Laugh-

ing Gas, Seal-pieces, Paintings, &c. Evening Recreations,

in addition to Moving Attractions.—FROMEANE CON-

CERTS, Vocal and Instrumental, Moas, L. Z. Remy, Con-

ductor.—Admission, One Shilling.

# THE BUILDER.

**PREPARED FLOORING BOARDS.**

**SASH GLASS, &c.**

Apply at **W. CLEAVE'S** Timber Yard, Smith-street, Westminster.

Patronized by Her Majesty's Stationery Office.

**H. MORRELL'S**  
**REGISTRATION INK,**  
**MANUFACTURED FOR**

**THE USE OF REGISTRARS OF BIRTHS, DEATHS,**  
**AND MARRIAGES.**

And warranted made with Galls.  
 This Ink has received the highest reputation from the results of  
 Chemical Tests, made under Authority.

**SOLD WHOLESALE AT THE MANUFACTORY,**  
**149, FLEET STREET, LONDON;**  
 And may be had Retail of all the principal Stationers and  
 Booksellers in Town and Country.

\*\* Observe, each Bottle is sealed with the Maker's Name  
 and Address.

**HER MAJESTY'S DOCK-YARDS,**  
**SIR W. BURNETT'S PATENT** having  
 undergone nine years' trial in **ALL CLIMATES**, is  
 now in daily extensive operation in the above national estab-  
 lishments, as well as by many public companies and private  
 individuals.

This **PROCESS** preserves **TIMBER** from **DRY-ROT**,  
 and, when desired, renders it uninflam-  
 mable.

It is cheap, innocuous, and easy of application.  
 It may be used in ordinary wood tanks, and does not,  
 therefore, require hydraulic machines, except for the sake of  
 expedition.

It seasons the greenest wood in a very short time, and  
 renders the commonest domestic Timber equal to the best  
 foreign.

**CANVAS, CORDAGE, COTTON, and WOOLLEN**, are not  
 only preserved from **ROT, MILDEW, and the AT-**  
**TACKS or MOTHS**, but are unchanged in colour, and ren-  
 dered even stronger than before.

Numerous specimens and testimonials may be seen, and  
 every information upon its objects and application will be  
 given at the Company's offices, No. 53, **KING WILLIAM**  
**STREET, LONDON BRIDGE.**

**BUNNETT AND CORPE,**

**ENGINEERS,**

**26, LOMBARD STREET, LONDON,**

**AND AT THE WORKS, BEPTON.**

Patentees and Sole Manufacturers of the

**REVOLVING IRON SAFETY SHUTTERS,**

**AND OF**

**METALLIC SASH-BARS, MOULDINGS, ETC., IN**

**BRASS, ZINC, OR COPPER,**

 Fronts, Sashes, &c., Glass complete, with best Plate Glass,  
 in any part of the Kingdom.

**METALS ROLLED OR DRAWN FOR THE TRADE.**

**CAUTION.**

**PATENT REVOLVING IRON SHUTTERS.**

**BUNNETT AND CORPE,** 26, Lombard

Street, London, beg to inform the Nobility,  
 Gentry, Architects, Builders, and the Public, that there is no  
 other or other PATENT for REVOLV-

ING IRON SHUTTERS than the one granted to Mr.  
 Bunnett in 1836, and since so extensively and successfully  
 introduced by Bunnett and Corpe, in London, and in the  
 principal Towns throughout the Kingdom.

For their great superiority over every other Iron Shutter,  
 Messrs. Bunnett and Corpe can with pleasure refer to all the  
 principal Architects and Builders, as well as to many Noble-  
 men, Gentlemen, Bankers, and first-rate Trading Firms in  
 London and elsewhere. Messrs. Bunnett and Corpe con-

sider this Caution necessary, in consequence of Mr. Andrew  
 Smith's Advertisement in last week's "Builder." The only  
 revolving Iron Shutter put up by Mr. Smith, in London (an  
 attempt to evade B. & C.'s Patent), was at Mr. Garratt's  
 American Stores, Oxford Street; this Shutter proving a de-

clared failure, it was taken down and replaced by one of  
**BUNNETT AND CORPE'S PATENT**, and may now be  
 seen at their Manufactory at Deptford, with many other of  
 Mr. Smith's Patent Shutters, for which **BUNNETT**  
**CORPE'S PATENT REVOLVING IRON SHUTTERS**  
 have been substituted.

**A. SMITH, BUILDERS' MACHINIST**

**ENGINEER, &c.**, No. 69, Princess-street, Leice-

ster-square, London, PATENTEE and MANUFACTURER

of the **IMPROVED REVOLVING IRON SHUTTERS.**

The attention of Architects and Builders is particularly  
 directed to the above, they being **VASTLY SUPERIOR** (and  
 possessing **NUMEROUS and IMPORTANT** advantages  
 over) **OTHER REVOLVING IRON SHUTTERS.**  
 Any information will be given at the MANUFACTORY,  
 where Models of the above and other INVENTIONS most  
 extensively used in Buildings, may be seen, amongst which  
 are:

The Invisible Weather-tight Fastenings and Cill-bars,  
 for French Casements.

Double Action Door Springs, for Banking-house and  
 other swing doors.

Improved Cramps for laying Floors.

Copper Wire Rope Lighting Conductors for the protection  
 of Churches, Towers, Chimney-shafts, and all high  
 buildings, &c.

Metallic Wire Lines for banging Sashes, Shutters, &c.

Manufactory for Iron Suspension, Sliding, and other  
 Doors, Strong Rooms, Plain and Ornamental, Sliding  
 Gates, and Columns—Also, Metal Sashes, Shop-fronts,  
 Stall-board Plates, Brass butt, and other Hinges.

Buildings heated and ventilated on approved plans.

Estimates given for the Improved Iron Shutters, Brass  
 and other metal sashes (as required), Galvanized  
 Iron and Zinc Skylights, and every description of wrought  
 and cast-iron work.

**VALENCIA SLATE.**—THE ATTEN-  
 TION OF BUILDERS is requested to the new mode  
 in which this material is prepared for the market. Prices  
 for the various thicknesses from half-inch to six inches, with  
 each face and the edges accurately dressed by machinery,  
 will be found extremely moderate, and may be obtained by  
 application at Fremantle Wharf, Millbank-street, where a  
 large Stock may be seen.

**INCORRODIBLE IRON AND WIRE**  
**FENCES.**—J. PORTER, Grove Iron Works,  
 Southwark, and 77, Cornhill, Stationer to his Royal Highness,  
 Iron fences, is prepared to supply all kinds of IRON FENCE,  
 garden wire work, cast and wrought iron balustrade, and every  
 description of iron work connected with his business, GALV-  
 VANIZED upon Mr. Sorel's well-established mode, by which  
 means not only is their durability secured, but their dis-  
 figurement from rust prevented. Galvanized iron build-  
 ings, roofs, &c., fixed in any part of the kingdom, or prepared  
 for shipment to the East or West Indies, &c. Hurdles, six  
 feet long, five rails, 3s. 6d. each; other sizes in proportion.  
 The Trade supplied.

**ROSENHELY & Co., WHOLESALE**  
**IRONMONGERS, and MANUFACTURERS OF**  
**KITCHEN-RANGES, STOVES, &c.**, 198, Blackfriars-  
 road, and 117, Union-street, Borough.  
**Strong Self-acting Kitchen-Ranges, with back Boiler**  
**and Oven, and Wrought Bars**  
 3 ft. 3 ft. 3 in. 3 ft. 6 in. 3 ft. 9 in. 4 ft.  
 3 ft. 6 in. 3 ft. 18 in. 3 ft. 10 in. 4 ft. 10 in.  
 Henry's Patent Improved, with back Boiler and Wrought  
 Iron Oven:  
 3 ft. 3 ft. 3 in. 3 ft. 6 in. 3 ft. 9 in. 4 ft.  
 4 ft. 5 ft. 15 in. 6 ft. 5 in. 6 ft. 10 in. 7 ft.  
 Double Register Stoves, at 3d., 9d., and 10d. per inch.  
 Do. Elliptic do., at 4s., 4s. 6d., and 4s. 8d.  
 All Goods are warranted and delivered free within 6 mile  
 radius.

**COLLINGS' PATENT HINGES.**—  
 Sole Manufactory, 64, Bridge-road, Lambeth, where  
 a great variety are always on hand, for sliding, pack, or  
 house, and all other doors of large or small  
 dimensions, a gate of a ton in weight moving with these  
 hinges as easily as a wicket; they are also admirably  
 adapted for drawing-rooms, being highly ornamental, and  
 folding-doors fitted with them may be removed and replaced  
 in an instant. Rising and spring hinges, with very superior  
 fastenings, for exterior gates, at moderate prices. To be  
 seen at Messrs. Collings and Co.'s patent address, sugar mill,  
 and apical hinge manufactory, 64, Bridge-road, Lambeth.

**TO ARCHITECTS AND BUILDERS.**  
**THE FOLLOWING ARTICLES at REDUCED**  
**PRICES at CORNHILL and HALLEYS, 2, WIND-  
 LEY-STREET, OXFORD-STREET and CORNWALL-  
 ROAD, LAMBETH.**  
 Rain, Under-ground, and Hot-water Pipe, Eave Guttering,  
 Air Bricks, Sash Weights, Staircase Ropes, consisting  
 of Hangers, Ramps, Cills, Hay-racks, Capping for Wooden  
 Mangers, Stable Gates and Frames, and Pumps, &c. &c.  
 Columns, Girders, Iron Doors, Pallisading, Gates, Veran-  
 dahs, Sky-lights, Sashes, Greenhouses, Roofs, &c., &c.,  
 and every description of Wrought and Cast Iron Work (both  
 plain and ornamental) used for Buildings and other pur-  
 poses.  
 Elliptic, Register, Hot-Air, Ornamental, and Bright  
 Stoves, Kitchen Ranges, and Smoke Jacks on the best and  
 most approved principle, and an extensive assortment of  
 Furnishing Ironmongery.  
 Buildings heated either with Cottam's Patent (of which  
 above 1,500 are now in use) or Rogers' Improved Cottam  
 Boiler.  
 Estimates sent by post.  
 Show Rooms at their Manufactory, 2, Winsley Street,  
 Oxford Street.

**DAY'S PATENT WINDGUARD,** for  
 Ventilating Churches, Hospitals, Factories, Theatres,  
 Club-houses, Breweries, Mill-houses, Shops, Counting-  
 houses, School-rooms, Smoking-rooms, Bed-rooms, Nurseries,  
 Kitchens, Larders, Dairies, Stables, and Buildings  
 requiring ventilation; as also Ships, Mines, Tunnels, &c., &c.,  
 also, for Preventing Down Draft, and is guaranteed to  
 Cure all Smoky Chimneys caused by Wind; and entirely  
 supercedes the use of Revolving Chimney-covers or  
 unsightly on the tops of Chimneys or Ventilators.  
 The object of this Invention is to create a draft where  
 otherwise it would not exist, by the spontaneous action of  
 the Windguard.  
 The Windguard forms a pleasing octagonal pillar, and by  
 its peculiar construction to carry out the principle, which  
 consists of the wind giving a disposition for a vacuum within,  
 which causes a continual upward current, and can be regu-  
 lated at pleasure.  
 The Windguard applied to Ships and Steam Vessels in the  
 form of a Skylight, prevents rain or the sea entering within,  
 however hollower the weather may be, thereby affording an  
 excellent Ventilation, as well as Light.  
 The Windguard applied to the Tops of Chimneys prevents  
 all annoyance from Smoke, and securely Ventilates the  
 room when fires are not required. This is a most simple and  
 effectual way of Ventilating Bed-rooms, Nurseries, Smoking-  
 rooms, Offices, &c.; by causing the fire of the apartment to be  
 at all times as pleasant as can be desired, and may be regu-  
 lated by a valve at pleasure.  
 The Windguard is simple in its application, reasonable in  
 price, ornamental in appearance, no machinery or anything  
 movable in it, therefore, cannot get out of order; free from  
 noise or any unpleasantness whatever; not liable to choke up  
 with soot, and no obstacle to the machines used for sweeping  
 chimneys.

The Windguard having been applied, with much success,  
 to the chimneys of Windsor Castle, Buckingham Palace, and  
 Claremont, and also several of the Club-houses, as well as to  
 the mansions of many noblemen and gentlemen, it is with  
 great confidence recommended for the cure of smoky chim-  
 neys generally, and may be had of all respectable ironmongers  
 in Town and Country, and may be seen daily in operation at  
 The Patent Ventilating Works, Commercial Road, Plumtree;  
 where also may be seen Mr. G. T. Day's plans (illustrating  
 the different applications of his Patent ARCHITECTURAL  
 VENTILATOR and his PORTABLE WATER APPARATUS) for  
 effectually Ventilating, Warming, and Cooling the Air of  
 Buildings, Ships, &c. By the use of these Inven-  
 tions, the air of the room is kept pure and free from cold  
 air can be guaranteed to be continually exchanged per  
 minute, day and night, winter and summer; thereby en-  
 suring at all times the ventilation to the rooms and pas-  
 sages of buildings, &c. from the operation of the apparatus  
 size of the apparatus depends on the nature and use of the  
 buildings and its occupants.

**JOHN'S & Co.'s PATENT STUCCO**  
**PAINT CEMENT and PATENT STUCCO PAINT.**  
 —The prospectus, containing a full account of these most  
 valuable materials, and instructions to the workmen how to  
 use them, accompanied also by testimonials from Architects,  
 Builders, and others, sent only to the Agents in London, but in  
 every part of the kingdom, who have found out and know how  
 to appreciate their extraordinary qualities, may be obtained  
 free, on application to the following Architectural Book-  
 seller:

Mr. John Weale, No. 59, High Holborn.  
 Mr. J. Taylor, No. 1, Wellington-street, Waterloo-bridge.  
 Mr. H. G. Channing, No. 15, Abchurch-lane.  
 At The Builders Office, York-street, Covent Garden.  
 And of Messrs. Mann & Co., Sole Agents for the Patentees,  
 Maiden-lane, Queen-street, Cheapside.

**BASTENNE BITUMEN COMPANY,**  
**Offices, 31, Poultry.** The Directors of this Company  
 beg leave to call the attention of ARCHITECTS, BUILD-  
 ERS, and others, to the very beneficial results attendant on  
 the use of **BITUMEN** in the erection of buildings, &c. Its  
 application as a **FLOORING** will be found eminently useful.  
 It is also valuable for numerous other purposes, more parti-  
 cularly where the object is to resist the **EXCLUSION**  
**OF DAMP and VERMIN.**  
 Scale of prices per foot square—  
 1 inch thick ..... 9d.  
 1 inch thick ..... 9d.  
 1 inch thick ..... 6d.  
 Works not measuring 400 feet, 1d. per foot extra.  
 Roofing, shingling, &c., not yielding to heat, quite im-  
 permeable, and does not emit SALTS, when painted  
 Concrete is charged in addition according to the thickness  
 when required.  
 Carriage and men's time are charged extra when works  
 are situated beyond three miles from the General Post-  
 office.  
 Bitumen 20 per ton, without grit.  
 Bitumen 25 per ton, with grit.  
 CHARLES F. TILSTONE, Sec.

**MARTIN'S CEMENT.**  
**IMPORTANT TO ARCHITECTS AND BUILDERS.**  
**AMONGST** the variety of compositions  
 offered to the notice of the Profession and the Trade gen-  
 erally, for internal Works, there are none so equal as  
**MARTIN'S IMPROVED PATENT PORTLAND CEMENT.** This  
**CEMENT** is of the highest quality, and is also  
 used by eminent Builders and Architects to possess the desiderata  
 of hardness and durability, it is a preventive against fire,  
 damp, and vermin, and does not emit SALTS, when painted  
 never PEELS, but shows a plain, clear, and perfect surface,  
 not to be surpassed in beauty by any material now in use.  
 It is suitable for Stucco on Walls, or Lath, Mouldings, Ar-  
 chitects, shingling, &c., not yielding to heat, quite im-  
 permeable, worked to the same advantage as Wood, and at  
 a considerably less cost.  
 For Paving it is excellent, with an appearance of stone,  
 and much less expensive; the quality being so superior, has  
 induced the Government to adopt it in several of their Public  
 Works.

Applications to **STEVENS & SON, 185, DRURY-LANE,**  
 the sole Manufacturers, who can with confidence recommend it  
 to their extensive connection and the Public generally; their  
 long experience with the manufacture of Plaster and Cements  
 will be a guarantee to the Trade of the superiority  
 of "MARTIN'S CEMENT" possesses over all others.

**ENCAUSTIC TILES.**  
**ENCAUSTIC or OLD ENGLISH**  
**PAVING TILES, for CHURCHES, HALLS, &c.**  
 sold by **WYATT, PARKER, & Co.,** Abchurch Wharf, Holland-  
 street, S. Surrey foot of Blackfriars-bridge.  
 These Tiles are the object of the best examples which have  
 been discovered in the ancient religious edifices of this coun-  
 try, and more particularly from those of Great Malvern,  
 Romsey, Canterbury, Westminster, Winchester, Salisbury,  
 Worcester, Rochester, and York.  
 They are made from the famous red Staffordshire Clay, and  
 are less porous than those anciently used, and may be had  
 either entirely Glazed on the surface, or only partially so, or  
 wholly free from glaze.

The ardently Glazed Tiles, or those having the Ornament  
 alone Glazed, possess a sparkling brilliancy of colour equal  
 to the best encaustic Tiles, and are not so well adapted to  
 situations where they would be subject to rough usage, as  
 the unglazed Tiles, which, after many years' wear, when  
 washed with water, and a little sand and pumice, present the  
 same beautiful, elastic, and fresh appearance, as when first  
 laid down, and are also less expensive.  
 W. P. & Co., have also Tiles to work with the above,  
 which are without ornament, and are used to form Borders,  
 or to relieve elaborate masses of Encaustic Pavement.  
 These Tiles may be had of Black, Red, and Buff Colours,  
 and with those of a right-angled-triangular shape, an almost  
 innumerable variety of designs may be formed. These  
 latter Tiles are cheaper than good Portland Stone Pavement,  
 are much less porous, and will bear a pressure of Forty Tons.

**MOREWOOD'S PATENT GALVAN-**  
**IZED TINNED PLATES, HOOPING, WIRE-**  
**WORK, &c.**—This material, possessing the strength  
 and lightness of Tin or Iron Plates, combined with  
 durability, is most adapted to rust or corrode from ex-  
 posure to moisture, and is not liable to be rent by expan-  
 sion or contraction, caused by sudden changes of tem-  
 perature, which objection applies to both Zinc and Lead,  
 in consequence of their contracting and expanding in case  
 of fire; neither is it, like Zinc, liable to combustion; hence it  
 is admirably adapted for Roofing, Gutters, Spouting, Chimney  
 Pops, &c. in any climate, but more particularly where  
 the temperature varies, and the temperature, and such is  
 a matter of importance and economy to all persons in-  
 terested in our colonial possessions.

As regards the use of other Metallic Coverings,  
 it will be found that the same strength does not cost more  
 than two-thirds that of Zinc, which is the cheapest Metallic  
 Roofing, as regards first cost, at present in use; and that,  
 in consequence of the continuing repairs which are required to  
 keep Lead and Zinc Roofing in order, this would be far  
 cheaper than either, even if the first cost were much greater.  
 The material being strong, and at the same time exceed-  
 ingly light, and the sheets being fastened together, tend to  
 strengthen the building, instead of requiring any support  
 themselves. It is therefore scarcely necessary to add, that  
 the timber used in the construction of the roof is saved.  
 The Plates may be obtained of any size up to 6 feet by  
 2 feet 6 inches.  
 Specimens of the Galvanized Tinned Plates, Hooping, and  
 Wire-work, and other articles, of Messrs. Chisney Topp &  
 Co., may be seen and had of S. HOLLAND, 34, GRACE-  
 CHURCH-STREET.

[Continued from page 130.]

surveyor, treble the amount of the fees which such surveyor would have been entitled to receive for his trouble in inspecting the same, and shall also forfeit for every such default a sum not exceeding twenty pounds; and that if, for any period exceeding three months, any builder having duly begun any building, requiring compliance with the provisions of this Act, shall suspend the progress of such building, and shall again go on with the same; or if, during the progress thereof, the builder be changed; then, in any such case, two days before such builder or other such person shall enter upon the performance of the work, it shall be the duty of such builder to give notice to the surveyor; which notices must be in the terms specified in the forms (numbers two and three) contained in the Schedule of Notices annexed to this Act, or to the like effect; and must be given to the surveyor, or left at the surveyor's office, in like manner as is required upon beginning any new building; and that if any builder make default or neglect to give or leave such notice, he shall forfeit for every such offence a sum not exceeding twenty pounds; and that if any such building, chimney, or wall be begun to be built, pulled down, rebuilt, cut into, or altered as aforesaid, or be proceeded with after any suspension of the progress thereof since such building has been given; or if such surveyor or the official referees be refused admittance to inspect the same premises, then such building or work shall be liable to be abated as a nuisance under the provisions herein contained.

## BUILDINGS GENERALLY.

*Supervision of Works—Notice of Irregularities to Builders and others—To cut into Works—Amendment of Works—Proceedings thereon by Official Referees—Costs.*

14. And be it enacted, with regard to such buildings and works, so far as relates to the supervision thereof, that if in building, pulling down, rebuilding, cutting into or altering any part of any building, or party-wall or external wall, or chimney-stack or flue, any work, or any other thing be done contrary to or not conformably with the rules and directions of this Act; then forthwith it shall be the duty of the surveyor and he is hereby required to give forty-eight hours' notice to the builder to amend any such irregularity which he shall deem to have been committed; and, after the expiration of such notice, to proceed to inspect the work; and that, if the work be so far advanced that he cannot ascertain whether the irregularity has been committed or not, or exists or not, then it shall be lawful for him and he is hereby empowered to order any work to be cut into, laid open or pulled down, which shall in his opinion prevent his ascertaining whether any such irregularity exists or not; and that if, within forty-eight hours, the builder to whom any such notice shall have been given, refuse or fail to amend any irregular work, or any builder refuse, when ordered by the surveyor, to cut into, lay open or pull down any work which shall in his opinion prevent his ascertaining whether such irregular work exists or not, then, as soon as conveniently shall be, it shall be the duty of the surveyor to give information thereof to the official referees; and that upon the receipt of such information, it shall be the duty of such official referees, and they are hereby required to proceed to hear the matter, and if any breach of the rules, regulations and directions of this Act be found to have been committed, or if there appear good reason to suppose any such breach has been committed and is concealed, then it shall be lawful for the official referees, or any two of them, and they are hereby authorized to direct by their award that such building, party-wall, external wall, chimney-stack, flue or other thing, or such part thereof as they shall deem necessary, to be amended, removed, cut into, laid open, or pulled down; and that all the costs, charges and expenses of the said work, and of the said application to the official referees shall be borne by such party or parties as the official referees shall determine.

*Special Supervision of highest-rate Buildings—Penalty—Notice to Official Referees—Survey—Approval—Disapproval—Amendment of Defects—Notice of Completion—New Survey—Certificate—Prohibition of Use—Penalty.*

15. And now, for the purpose of making provision for the supervision of buildings of the sixth rate of the first or dwelling-house class, and of the sixth rate of the second or warehouse class, and of all buildings of the third or public building class (except the buildings hereinbefore excepted); be it enacted, with regard to every such building, so far as relates to the special supervision thereof, that when all the walls of any such building shall have been built to their full height, and all the timbers of the floors, roofs and partitions shall have been fixed, it shall be the duty of the architect or builder, and he is hereby required, to give notice thereof to the official referees; and if the official referees be of opinion that such building is subject to the special supervision herein provided, then within seven days after such notice it shall be their duty to survey the said building; and that, if they approve of the same, then within seven days after such survey, to certify such approval under their hands to the architect or builder; or that if any part of the walls, timbers, roof or internal supports appear to such official referees defective, insufficient or insecure, then, within the said seven days after such survey, they are hereby required to give to such architect or builder notice of such parts as shall so appear to them defective, insufficient or insecure, which notice must be in writing; and that, upon the receipt of such notice, it shall be the duty of the said architect or builder, to amend and strengthen such defective, insufficient or insecure parts; and that, until the official referees shall be satisfied, and shall have certified in writing their approval as aforesaid, it shall not be lawful to cover up any such parts; and that, upon completion of every such building, it shall be the duty of the architect or builder to give fresh notice to the official referees; and that, thereupon, or within seven days after such notice, it shall be the duty of the official referees to survey the same; and that, if upon such survey it shall appear that such building has been built sufficiently strong, then it shall be their duty to certify accordingly, which certificate must be under their hands and the seal of office of registrar of metropolitan buildings; and that until such certificate shall have been made, it shall not be lawful to use such building for any purpose whatever, without the express authority in writing of the official referees, under their hands and the seal of office of the registrar of metropolitan buildings; and that, if before the certificate of satisfaction shall have been made, any such building subject to special supervision shall be used for any purpose, without such express authority in writing, then, on conviction thereof before two justices of the peace, the owner or occupier of such building shall forfeit for such offence a sum not less than five pounds, nor exceeding five hundred pounds, for every day during which such building shall be so used without having obtained such certificate of satisfaction, or such express authority as aforesaid; and one half thereof shall go to the person giving information, and the other half to the poor of the parish in which such building shall be situate.

*Special Supervision of Buildings in Schedule (B)—Survey by Official Referees—Occasional Inspection—Notice of Deficiencies—Amendment of Defects—Approval by Official Referees—Notice of Completion—New Survey—Certificate—Prohibition of Use—Penalty.*

16. And be it enacted, with regard to the buildings comprised in Schedule (B), to this Act annexed, so far as relates to the supervision thereof, that before the builder begin to build the same, it shall be the duty of such architect or builder, and he is hereby required to give notice thereof to the official referees, and also, at the same time, to transmit the plans thereof for their inspection; and that forthwith thereupon it shall be the duty of the official referees, and they are hereby required to proceed to survey the situation of the intended building, with a view to ascertain whether such building can be erected on such situation with due regard to the security of the public; and that from time to time, during the progress of such building, it shall be the duty of such official referees, and they are hereby directed to inspect the same, with a view to ascertain the sufficiency thereof; and that if such building or any part thereof appear to such official referees defective, insufficient or insecure, then they are hereby required to give to such architect or builder notice of such parts as shall so appear to them defective, insufficient or insecure, which notice must be in writing; and that, upon the receipt of such notice, it shall be the duty of the said architect or builder, and he is hereby required to amend and strengthen such defective, insufficient or insecure parts; and that, until the official referees shall be satisfied, and shall have certified in writing their approval as aforesaid, it shall not be lawful to cover up any such parts; and that, upon completion of every such building, it shall be the duty of the architect or builder to give fresh notice to the official referees; and that thereupon, or within seven days after such notice, it shall be the duty of the official referees to survey the same; and that if upon such survey it shall appear that such building has been built sufficiently strong, then it shall be their duty to certify accordingly, which certificate must be under their hands and the seal of office of registrar of metropolitan buildings; and that, until such certificate shall have been made, it shall not be lawful to use such building for any purpose whatever, without the express authority in writing of the official referees, under their hands and the seal of office of the registrar of metropolitan buildings; and that, if before the certificate of satisfaction shall have been made, any such building subject to special supervision shall be used for any purpose, without such express authority in writing, then, on conviction thereof before two justices of the peace, the owner or occupier of such building shall forfeit for such offence a sum not less than five pounds, nor exceeding one hundred pounds, for every day during which such building shall be so used without having obtained such certificate of satisfaction, or such express authority as aforesaid; and one half thereof shall go to the person giving information, and the other half to the poor of the parish in which such building shall be situate.

*Entry on Premises—Refusal to permit Inspection—Forcible Entry.*

17. And be it enacted, with regard to buildings and works, so far as relates to the entry thereon for the supervision thereof, that, at all times during the progress of any operations in respect thereof within the meaning of this Act, it shall be lawful for the surveyor, and for the official referees, and they are hereby respectively authorized to enter upon the premises upon which such operations have been commenced; and that if any person refuse to admit the surveyor, or the official referees authorized under this Act, at any reasonable hours, from time to time to inspect any building in course of construction, demolition, alteration or re-construction, then in every such case, on conviction thereof, the party offending shall forfeit for every such offence a sum not exceeding twenty pounds; and such building or work shall be liable to be abated as a nuisance under the provisions herein contained in that behalf; and that if the surveyor or the official referees

The words "or such other person" seem to be inserted without due relation to the context.

The word "such," before the words "building, chimney or wall," does not seem to have due relation to the context.

We apprehend the word "such" should precede the words "builder refuses when ordered by the surveyor."

The words ought to be "SHALL be amended, removed, cut into, laid open, or pulled down."

The words "architect or builder" are not sufficiently definite.

This clause and the sixteenth clause, disposing of very great power, which none but great masters of architectural construction are justly entitled to exercise, would become extremely tyrannical, vexatious, and ruinous, in the custody of incompetent persons; we think the powers proposed to be delegated ought to be more clearly defined. We think society would be injured by an architect of great and original genius having the designs of his works interfered with by an official referee of less knowledge, ability, and genius: it is true, the men would find their just level in the end, but probably not before ruinous expense or mischief had been incurred.

The word "such," before the word "architect," seems to have no proper relation to the context.

The word "PLANS" is not sufficiently definite, but should be followed by the words "Elevations and other drawings which have been made for the same."

be refused admittance from time to time, at any reasonable hour, to make inspection of any work, then for that purpose it shall be lawful for such surveyor or for such official referees, and they are hereby empowered, by and with the aid of a peace officer, to enter upon the ground, building and premises where the same shall be.

*All Buildings not according to this Act declared a Nuisance—Summons before Justices—Recognizances to pull down and amend—Imprisonment—Removal of Buildings declared Nuisances—Expenses.*

18. And for the purpose of more effectually enforcing the observance of the provisions of this Act, be it enacted, with regard to any buildings, drains, timber buildings, chimneys and dues, party-walls, party fence-walls, external walls and projections, and every other part of every building of every class, or rate of any class, which shall be hereafter built, rebuilt, enlarged or altered within the limits of this Act, contrary to the provisions hereof, so far as relates to the removal thereof, that if the same be not built, rebuilt, enlarged or altered in the manner and of the materials and in every other respect according to, and in conformity with, the several rules and directions which are in this Act particularly specified; and if any person build or begin to build, or cause the building or beginning to build, or alter, or cause to be altered, or use or cause to be used any part of any ground or building, projection, drain or other thing contrary thereto; and if, in either of such cases, it so appear by the certificate of the official referees; then the said building, projection, drain or other thing, or such part thereof so irregularly built or begun to be built, or so irregularly altered or begun to be altered, or so used, shall be deemed a nuisance; and that thereupon it shall be the duty of the surveyor, and he is hereby directed to summon the builder before any two justices of the peace; and that thereupon it shall be the duty of such builder, as such justices shall require, and he is hereby required to enter into a recognizance in such sum as the said justices shall appoint, for abating and taking down the same within such convenient time as the said justices shall respectively appoint, or otherwise for amending the same according to such rules and directions as are herein contained, and also for paying the costs, charges and expenses incurred by the surveyor in laying the information and obtaining the conviction, including such compensation for the surveyor's loss of time as the said justices shall think fit; and that if the party so required fail to enter into such recognizance, then it shall be lawful for either of such justices or any justice, and they are hereby required to commit such builder to the common goal of the city, county or liberty where the offence shall be committed, there to remain without bail or mainprize until he shall have abated or demolished or otherwise amended such irregular building, or such nuisance shall be abated or demolished by order of such justices respectively (which order the said justices are hereby empowered to make), and until the costs, charges and expenses thereof, and of all operations and proceedings in relation thereto, shall have been paid: and further, that if application be made to any two or more justices, then, thereupon, it shall be their duty, and they are hereby empowered to order the surveyor or any other person to abate or demolish such nuisance, and to commit the persons authorized by them so to abate or demolish the same, to sell and dispose of the materials thereof, and, out of the moneys arising by such sale, to pay to themselves, and all persons by them employed for such purpose, the reasonable charges for abating or demolishing such nuisance, and also such costs and expenses as aforesaid, and to pay the surplus moneys arising by such sale (if any) to the owner of the building; and that if the moneys arising by such sale be not sufficient to pay such charges, then such owner, or, if there be no owner, then it shall be the duty of the occupier to make good the deficiency; and if he fail, then he shall be liable to the same remedies for the recovery thereof as are by this Act provided concerning the expense of taking down ruinous buildings, and putting up hoards for the safety of passengers.

*PARTY WALLS—PARTY FENCES—INTERMIXED BUILDINGS.*

*Fifty Shillings Penalty on Workmen offending—Imprisonment.*

19. And be it enacted, with regard to any building or work, so far as relates to the non-observance of the provisions of this Act in that behalf by workmen and others, that if any workman, laborer, servant or other person employed in any building, or in the alteration, fitting up or decoration of any building, negligently, carelessly or negligently, and without the direction, privity or consent of the person causing such work to be done, do any thing in or about such building contrary to the rules and directions of this Act, then upon conviction thereof before any two justices of the peace, upon the oath of one or more credible witness or witnesses (which oath the said justices and every such justice is hereby empowered and required to administer), every such offender shall be liable to forfeit for every such offence a sum not exceeding fifty shillings; and that if any such forfeiture be not paid upon or immediately after such conviction, then it shall be the duty of any such justice to whom application shall be made, to commit the offenders by warrant under the hand and seal of such justices to the common goal for any term not exceeding one month, at the discretion of such justices.

*Execution of Works.*

20. And forasmuch as, from time to time, occasion hath arisen and will hereafter arise, to execute the following works in relation to adjoining buildings and premises, parted by the same party-wall or party fence-wall, but belonging to different owners, or occupied by different persons, or to buildings intermixed, belonging to different owners, or occupied by different persons; namely—the reparation of the party-walls by which such premises shall be parted; the pulling down and rebuilding of such party-walls; the raising of such party-walls; the reparation of party fence-walls; the rebuilding of such party fence-walls; the raising of such party fence-walls; the pulling down timber partitions parting the buildings of different owners, or occupied by different persons, and in lieu thereof to build proper party-walls; the pulling down buildings built over public ways, or having rooms or stories, the property of different persons, or occupied by different persons, lying intermixed, for the purpose of building proper party-walls or party-arches; and generally the performance of other necessary works incident to the connection of such party-walls or party fence-walls with the premises adjoining: it is expedient to make provision, as well for facilitating the execution of such works by any such owner desirous to execute the same—who is herein denominated the "building-owner;" as for protecting the interests of the owner of the adjoining premises—who is herein denominated the "adjoining owner;" and be it enacted, with regard to all premises parted by a party-wall or party fence-wall, or parted by timber partitions, and with regard to all intermixed properties not so parted, so far as relates to the execution of any such works by any owner of any such premises, that if the adjoining owner shall have consented thereto, or if, without such consent, the required notice of such work shall have been given by or on the part of the building-owner to such adjoining owner, then, subject to such modification as shall be made by virtue of the provision in that behalf; and subject to the provision for supplying the want of consent of the owners; and subject moreover to the respective conditions hereby prescribed, with regard to such works respectively, as well as to the payment of the costs of such works, and to the sanction or to the award of the surveyors or of the official referees, as hereby prescribed in reference thereto, it shall be lawful for every such building-owner and he is hereby authorized or required to execute such works.

*Consent of, or Notice to, adjoining Owner.*

21. And be it enacted, with regard to such works, so far as relates to the notice thereof, that unless the adjoining owner consent thereto, it shall not be lawful for the "building-owner" to execute such works, until he have given notice thereof to such "adjoining owner;" and every such notice, with regard to the pulling down, rebuilding or reparing of party-walls or party fence-walls, must be given one month, at the least, before the survey of the work is to be made, and six months, at the least, before the work is to be commenced; and every such notice, with regard to the pulling down and rebuilding intermixed walls and timber partitions, must be given six months, at the least, before such work is to be commenced; and every such notice must be in the form or to the effect of the notice (number eight) for that purpose contained in the schedule of notices heretofore annexed.

*Modification of Work to suit adjoining Owner—Delay of Operations—Application to Official Referees—Authority to Build.*

22. And be it enacted, with regard to every such work, so far as regards the modification thereof, in order to render it suitable to the premises or to the convenience of the adjoining owner or his tenant, that if the adjoining owner desire that any modification be made in the work so as to render it suitable to his premises, or if he desire that it be delayed, so as to cause it to be executed at a more reasonable or a more convenient time in reference to the business or to the family or domestic arrangements of such adjoining owner or his tenants, then, within seven days after the receipt of notice thereof, it shall be the duty of the building-owner, and he is hereby required to signify his consent to or dissent from such modification or delay; and that if the building-owner do not within such seven days signify his consent to such modification or delay, then it shall be lawful for the adjoining owner, and he is hereby entitled, to require the building-owner to delay the work until the decision of the official referees shall have determined thereon; and that if within seven days thereafter application be made in writing to the official referees, and notice thereof be given to the building-owner, then it shall be the duty of the building-owner to delay the same till the decision of such official referees shall have been given thereon; and that if, within the period of six months from the date of the first notice, such adjoining owner do not make any objection or any requisition in conformity with this enactment, then, subject to the provisions of this Act with regard to such works, it shall be lawful for the building-owner and he is hereby authorized to proceed to execute the same.

*Supplying Want of Consent of adjoining Owners—Notice of Inspection by Surveyor—Notice to Parties—Confirmation by Official Referees—Proceedings on Appeal against Certificate—Notice by Official Referees—Survey—Award—Works Authorized.*

23. And be it enacted, with regard to any such works hereby authorized to be done in relation to party-walls, party-arches, party fence-walls, or other such structures, belonging to the owners of adjoining buildings

We think it would be burthensome to the surveyors and official referees, if refused admission to premises, to require the aid of a peace officer unless violence be used towards them.

The clause would run better if written—  
"The pulling down of timber-partitions which part buildings which are the property of different owners, or which are occupied by different persons, for the purpose of building in lieu thereof proper party-walls."  
The words should be—"The pulling down of buildings."

or parting adjoining premises, so far as relates to supplying the want of consent of the adjoining owners, that if the adjoining premises be occupied, or if the owner thereof cannot be found, or if the owner, although found, cannot, by reason of legal disability or otherwise, consent to the work, or if the owner will not consent thereto, or if differences arise amongst the parties concerned, then the notice required to be given in respect of such work must be served both on the surveyor and on the official referees, in addition to such other parties entitled to notice under this Act upon whom such notice can be served; and that forthwith on the receipt of such notice it shall be the duty of the surveyor and he is hereby required to give notice to the parties by whom such work is to be executed, and to any one or more surveyors or other agents by them appointed, as to the day and hour when he will view the premises; and at such time the surveyor of the district is hereby authorized to proceed to inspect such premises accordingly, and to certify to the official referees, first, whether such works ought to be done or not; and secondly, if the same ought to be done, whether it ought to be done in the proposed manner; and thirdly, the site whereon the party-wall should be built; and with regard to intermixed buildings, what party-arches may be necessary over or under any rooms of such buildings so intended to be rebuilt; and fourthly, the quantity of the soil or ground or other parts of the premises (if any) necessary to be laid to or taken from the house of the person desirous to rebuild, to the house of the person permitting him to erect a party-wall or party-arch; and fifthly, the compensation (if any) which should be made and paid by the building-owner, of either or any of the premises affected thereby, to the adjoining owner, in lieu of the lessening either of the said buildings by such party-wall or party-arch, or as a satisfaction for such other injury (if any) as shall be done or occasioned thereby to any of the said parties; and that upon the receipt of such certificate, it shall be the duty of the official referees, and they are hereby required, to cause notice thereof to be given to the parties or to such of them as are known; and that if within seven days after such notice to the parties, the certificate be not appealed against, and if the official referees be of opinion that the work is proper to be done, and the compensation is fair, then it shall be lawful for the official referees to confirm such certificate, and to authorize the building-owner to proceed with the works, as if the consent of the adjoining owner had been obtained; and that if any party concerned shall appeal against the certificate of the surveyor as to the work to be done, or as to the compensation, or as to any other matter referred to in such certificate, in pursuance of the above provisions, then it shall be the duty of the official referees, and they are hereby required to appoint one of their number to survey the building in question; and that for that purpose it shall be the duty of the official referee so appointed, and he is hereby required to give notice to the parties, and to any one or more surveyors or other agents by them appointed, as to the time when he will view the premises; and that at such time it shall be the duty of such referee, and he is hereby authorized to view such premises accordingly, and to inquire into the matters appealed against, and to certify to the official referees his opinion thereon; and that upon such certificate being made, it shall be lawful for the official referees to make their award, thereby either confirming, or reversing, or modifying, as to them the case may seem to require, the certificate of the surveyor, and appointing by whom and in what proportions the expenses of the surveys and of the reports thereon are to be paid; and such award shall be final and conclusive; and with regard to any works by such award authorized, so far as relates to the proceedings of the building-owner, that if upon the making of the award, the periods of the notices by this Act prescribed with regard to works of that nature have elapsed, then immediately upon the making of the award, but if such periods have not elapsed, then as soon after the making of the award as such periods shall have elapsed, it shall be lawful for the building-owner, his agents, servants and workmen, to proceed to execute the works.

*Reparation and Rebuilding at joint Expense.*

24. And he it enacted, with regard to any party-wall, party-arch or external wall used wholly or in part as a party fence-wall, so far as relates to the reparation and rebuilding thereof, at the joint expense of the owners of the buildings parted thereby, that if such party structure be so defective or so far out of repair as to render it necessary to pull down and rebuild the same, or any part thereof, then, on notice being given by the owner of one of the buildings to the adjoining owner, it shall be lawful for the building-owner to require a survey, certificate, and award authorizing the execution of such reparation or rebuilding, according to the provisions hereinbefore contained in that behalf.

*Rebuilding of Party-walls.*

25. And he it enacted, with regard to party-walls, so far as relates to the rebuilding thereof, at the expense of the building owner, that if the owner of one of the buildings desire to rebuild such party-wall, then, on giving to the adjoining owner the required notice of six months, it shall be lawful for such building-owner, and he is hereby entitled to pull down and rebuild such party-wall; but upon condition that he do pay all the costs and charges thereof, and also all the expenses incidental to the execution of the work, including therein the fees and expenses of the survey, and the fees of the surveyors and in respect of any services performed by the official referees.

*Rebuilding a Party-wall—Building of an external Wall against a Party-wall.*

26. And he it enacted, with regard to any party wall so far as the rebuilding thereof; that if the owner of one of the buildings parted by such party-wall rebuild such building of a higher rate, and do not pull down such party-wall and build a proper wall in lieu thereof, then it shall be his duty, and he is hereby required, to build up an external wall against such party-wall.

*Damage arising from Erection of external Wall against a Party-wall—Cutting into Footings and Chimneys.*

27. And he it enacted, with regard to an external wall built against a party-wall, so far as relates to the operations incident thereto, and to the making good any damage occasioned thereby, that if it be necessary to excavate or dig out the ground against the wall of any adjoining building, for the purpose of erecting a wall thereon, then it shall be lawful for the building-owner and he is hereby entitled so to do: but upon condition, that the said building owner do, at his own costs, shore up and underpin such wall, or such part thereof, to its full thickness, and to the full depth of such excavation, with good sound stock-bricks and such tiles or slates bedded in cement; such underpinning to be done in a workmanlike and substantial manner; and that if, for the purpose of erecting such external wall, it be necessary to cut away part of the footings of such party-wall on the side next to the wall so to be built, and any part of the breasts and chimney-shafts belonging to the building about to be rebuilt, as shall project beyond the perpendicular face of such party-wall, in the lowest floor thereof, then, on giving notice of such intention in writing to the owner of the adjoining building, at least one month before commencing operations; and on the expiration of such notice, it shall be lawful for the building-owner and he is hereby authorized to cut away such portion of the footings, breasts and chimney-shafts aforesaid; but so that the same be done, and the brick-work where cut be again made good in cement, under the superintendance and to the satisfaction of the surveyor.

*Making good such Damage—Survey—Damage from Carelessness—Rebuilding.*

28. Provided always, and he it enacted, with regard to such party-wall, so far as relates to the making good of any such damage, that if it be so damaged and injured by such cutting away, as in the opinion of the adjoining owner or occupier to be ruinous or dangerous, then, upon application for that purpose, it shall be the duty of the surveyor, and he is hereby required to survey such wall; and if upon the survey thereof it be found ruinous or dangerous, then to condemn it; and that, thereupon, it shall be the duty of the building-owner to pull down and rebuild such party-wall; and that if, in the opinion of the surveyor or of the official referees, such damage or injury shall have been occasioned by want of due care, on the part of the building-owner, then it shall be the duty of such building-owner and he is hereby required to pull down and rebuild such party-wall; and that at his own costs and charges, including therein all the costs and expenses incident to such survey, and the pulling down and rebuilding of such party-wall, and the reinstating and making good all the internal finishings and decorations damaged thereby; and that if the owner of the building to be rebuilt do not proceed with all due despatch to pull down and rebuild such party-wall, and to reinstatement and make good all the internal finishings and decorations of the adjoining premises, and to pay the costs and charges and expenses of the survey, then it shall be lawful for the adjoining owner so to do, and he is hereby entitled to recover all the costs and expenses in respect thereof from such owner, his heirs, executors, administrators, or assigns.

*Rebuilding of sound Party-walls—Reference to Official Referees.*

29. And he it enacted, with regard to any sound party-wall against which an external wall shall have been built, and which shall have been suffered to remain so far as relates to the rebuilding thereof, that if, while such party-wall continues sound, the adjoining building be pulled down or rebuilt, and such party-wall be pulled down, then the owner of such adjoining building shall not be entitled to more than his just proportion of the materials thereof, nor to more than his just proportion of the ground on which such party-wall was built, nor shall he build on more than his just proportion of the said ground, unless he shall have agreed with and satisfied the owner of the building so previously rebuilt for his half thereof; and that if the said owners cannot agree concerning the division of such materials, or of such ground, or of the building thereon, or concerning the reimbursement of the party first rebuilding as aforesaid, then the price and all matters in difference, including the sale and purchase of the ground in question, shall be settled by a reference to the official referees, whose award shall be final.

*Raising of Buildings—Future Buildings—Existing Buildings—Chimneys of adjoining Buildings—Use of raised Buildings.*

30. And he it enacted, with regard to every building hereafter built, so far as relates to the raising thereof, that it shall be lawful to raise any building, but so that, nevertheless, the party and external walls and chimneys thereof, when so raised, be of the materials and of the several heights and thicknesses hereinbefore described for party and external walls and chimneys of the rate such building shall be of when so raised; and

The words "for the building-owner to require a survey" are not sufficiently definite, notwithstanding explanation of § 2.

Stone ought to be permitted to be used as well as "stock-bricks and tiles or slates," and the word "cement" is too indefinite—any mortar is a cement. The word "CHIMNEY" ought to be placed before the word "breasts."

A party-wall may be "ruinous" or even "dangerous" without it becoming necessary to take down and rebuild such party-wall: this provision, if strictly enacted and strictly enforced, might become vexatious and burdensome in expense. A party-wall may be dangerous, and yet be so underpinned and repaired, as to be as sound and effective as a new one.

with regard to buildings already built, so far as relates to the raising thereof, that, although the walls of such buildings be not of the thicknesses prescribed by this Act, if, in the opinion of the surveyor, such walls be sufficiently secure to allow of the raising thereof, then it shall be lawful to raise any such building already built to an additional height, not exceeding ten feet; and with regard to any building adjoining one which shall be raised, so far as relates to the raising of the chimneys thereof, that if any building be raised, it shall be the duty of the owner of such building, and he is hereby required to build up, at his own expense, the party-walls between his own and any adjoining building, and all flues and chimney-stacks belonging thereto; and with regard to any building raised, so far as relates to the use thereof by the adjoining owner, that if at any time the owner of any such adjoining building make use of any portion of the part raised of such party-wall, it shall be lawful for the owner of the premises so first raised, to claim, and he is hereby entitled to recover the cost of a proportionate part of the portion which shall be so used, together with the cost of such parts of the chimney-stacks as belong thereto.

*Repairing and Rebuilding of Party Fence-walls—Deficient Party Fence-wall.*

31. And be it enacted, with regard to party fence-walls, so far as relates to the repair and rebuilding thereof, that it shall be lawful for the owner of any of the premises parted thereby to repair, pull down, and rebuild the same; and if the wall be below the height of nine feet from the ground on either side, then either to raise it to that height, or to pull it down and to rebuild it to that height; but upon condition that he do pay all the expenses thereof; and that if a building be to be erected against such party fence-wall, and such wall be not conformable to the requisites prescribed for a proper party-wall for a building of that class and rate, then it shall be lawful for the building-owner, and he is hereby entitled to pull down such party fence-wall; but upon condition that he do pay all the expenses thereof; and also that he do make good every damage which shall accrue to such adjoining premises by such rebuilding.

*Pulling down party Timber Partitions.*

32. And be it enacted, with regard to the party timber partitions of existing buildings belonging to different owners, so far as relates to the pulling down thereof, and any wall under or over the same, that if one of the buildings be rebuilt, or if one of the fronts of such buildings be taken down to the height of one story, or for a space equal to one-fourth of such front from the level of the second floor upwards, then, without the consent of the adjoining owner, but upon giving the requisite notice, it shall be the duty of the building-owner, and he is hereby required, to pull down such timber partitions, and the walls under or over the same, and in lieu thereof to build a proper party-wall; and that at the expense of the owners of all the premises parted thereby.

*Pulling down Intermixed Buildings.*

33. And be enacted, with regard to buildings built over public ways, or having rooms or stories, the property of different persons, lying intermixed (except inns of court hereinafter provided for), so far as relates to the pulling down and laying the parts thereof to each other, that if a party-wall or party-arch cannot be built without pulling down such buildings, and so laying parts thereof to each other, and if, in default of the consent of all proper parties, the official referees authorize such works, then it shall be lawful for the owner of either of the said buildings to execute the same; but so that the party-walls or party-arches be conformable to the provisions of this Act, and the directions of the said official referees in their award made in that behalf.

*Exceptions of Inns of Court, &c.*

34. And be it enacted, with regard to the rooms or chambers in the inns of court, (that is to say) in Serjeants' Inn, Chancery-lane, or in any of the four inns of court, or in any of the inns of Chancery, or any other inns set apart for the study or practice of the law, so far as relates to the building of party-walls, that the walls or division between the several rooms and chambers in such inns, belonging to and communicating with each separate and distinct staircase, shall be deemed to be party-walls within the meaning of this Act, and as such must be built in conformity with the regulations and clauses herein contained relating to party-walls.

*Power of Entry on Premises to effect Works—Opening Doors and Removal of Goods—Continuance of Entry—Penalty for Hindrance.*

35. And for the purpose of facilitating and regulating the execution of any works authorized by this Act, or by any award, in pursuance thereof, in respect of any party-wall or party-arch, parting the buildings or grounds belonging to different owners, or in the occupation of different persons, or in respect of intermixed buildings; be it enacted, with regard to any such works, so far as relates to the power to enter the adjoining premises in order to execute the same, that if such work have been duly authorized, either by the consent of the parties competent to give such consent, or by the award or certificate of the official referees, then, at any time between the hours of six in the morning and seven in the afternoon (Sundays excepted), it shall be lawful for the building-owner, or any other person acting in his behalf, accompanied by a constable or other officer of the peace, and they are hereby respectively empowered, to enter on the premises of the adjoining owner, so far as may be necessary for executing such work; and that if the outer-door of such building be shut, and being thereto required, the person therein refuse to open the same, or if such building be empty and unoccupied, then it shall be lawful to break open such outer-door; and if any goods, furniture, or other thing obstruct the building of such intended party-wall or party-arch, or the pulling down any wall, partition, or other thing necessary to be pulled down and removed in order to the building such intended party-wall or party-arch, then to remove such goods, furniture and things to some other part of the same premises, or if there be no room on the premises sufficient for that purpose, to remove them to any other place of safe custody; and that from and after such entry, and at all usual times of working, it shall be lawful for the builder employed to erect such intended party-wall or party-arch, and for his servants and all others employed by him, to enter into and upon the premises, and abide therein the usual times of working, as well for the shoring up of the said building so broke into and entered upon, and for taking down and removing any party-wall, partition, window, or other thing necessary to be pulled down and removed for the purpose aforesaid, as to build such intended party-wall or party-arch; and that if in any manner any such owner or other person hinder or obstruct any workman employed for any of the purposes aforesaid, or wilfully damage or injure the said works, then every such person so offending shall forfeit for every such offence a sum not exceeding ten pounds.

*Stopping of Openings in external Walls abutting on other Premises—Stoppage thereof—Costs of stopping up—Certificate of Official Referee—Recovery of Costs.*

36. And now, for the purpose of further protecting the interests of adjoining owners, be it enacted, with regard to external walls adjoining the ground or building of another owner, so far as relates to the making of openings therein, that if, without the consent in writing of the owner of such ground or building, any opening be made in any such wall, then it shall be lawful for such owner, and he is hereby entitled, to require the owner of the premises in which such opening shall be made to stop up the same with brick-work; and that if, within one month after such notice such stoppage be not effected, then it shall be lawful for such owner, and he is hereby entitled, either by himself or his workmen, with tools, implements and materials, to cause such openings so to be stopped, and he is also hereby entitled to be repaid the costs thereof; and with regard to such costs, so far as relates to the adjustment thereof, that if such owner refuse to make payment thereof, or if there be any dispute as to the amount thereof, then, on application for the purpose to the official referees, by either of the parties concerned, it shall be lawful for the person by whom they have been incurred, and he is hereby entitled, to refer the matter of such dispute to the official referees, and to hear their determination thereon; and that it shall be the duty of such official referees to give to the applicant a certificate in relation thereto; and that if any party liable to pay any sum of money under such certificate fail to do so, then it shall be lawful for the party entitled to such costs to recover the same, in the manner hereinafter provided for the recovery of the costs, charges and expenses of executing any works in pursuance of this Act.

*Building of Party-walls next vacant Ground—Consent of adjoining Owner.*

37. And be it enacted, with regard to walls, so far as relates to the building thereof on vacant ground at the line of junction of premises belonging to different owners or in different occupations, that one month before the owner of any piece of vacant ground, or ground not hitherto built upon, shall build any building adjoining to another piece of vacant ground, or ground not hitherto built upon, or build a fence-wall for such piece of ground, it shall be his duty, and he is hereby required to give to the owner or occupier of such adjoining vacant ground a notice, which must be in writing, and must set forth his desire to build a party-wall or party fence-wall, and describe the thicknesses and dimensions of such desired party-wall or party fence-wall; and that if such adjoining owner shall signify his consent in writing, then the same must be built partly on the ground of one of the said owners or occupiers, and partly on the ground of the other owner, which last-mentioned part is to be paid for as is hereinafter directed by such other owner or occupier; but if he do not signify such consent, then it shall be the duty of the building-owner to build an external wall for such building, and fence-wall for such ground entirely upon his own ground.

*Building of Chimney-breasts, &c. in new Party-wall for adjoining owner—Instructions by adjoining Owner—Reimbursement of Expenses.*

38. And be it enacted, with regard to any new party-wall, built on the line of junction of premises belonging to different owners, so far as relates to the providing of chimney-breasts and other accommodation for the adjoining owner, that when the owner of any piece of vacant ground shall have obtained the consent of the adjoining owner to build a party-wall on the line of junction of their respective premises, then, ten days at the least before beginning to build such party-wall, it shall be the duty of the building-owner to give the adjoining owner notice thereof; and that if in due time the adjoining owner shall give instructions in writing

It is presumed that "if one of the fronts of" ANY "such building" is the meaning intended to be conveyed.

So "broken into" is presumed to have been intended. This clause leaves undefined the ultimate fate of such "goods, furniture, or other things" as may be removed "to any other place of safe custody" for the purpose of performing the work.

If any external wall in question with any opening therein be of stone, it would be unreasonable to require brick-work alone to be used.

or by a plan, then it shall be the duty of the building-owner to construct, if practicable, such and so many chimney-jambs, breasts and flues of chimneys, in all such parts of such party-wall as shall be by such instructions required, and to leave such recesses in every such wall as may be so required; but so that they be conformable with the directions of this Act concerning party-walls and chimneys; and that thereupon it shall be lawful for the building-owner to claim, and he is hereby entitled to recover from the adjoining owner all the expenses of constructing such chimney-jambs, breasts and flues of chimneys and recesses, as provided by this Act in that behalf.

#### RUINOUS BUILDINGS.

*Repairing and Rebuilding—Application to Official Referees—Survey—Notice to Lord Mayor, &c. and to Overseers—Erection of Hoards, and Notice to Parties—Repairs—Appeal against Survey—Demolition.*

39. And whereas buildings within the limits of this Act are often, either from litigated titles thereto, or from the obstinacy, neglect or poverty of the owners thereof, or of the parties interested therein, or from other causes, in so ruinous a condition that passengers are endangered thereby; now for the purpose of making provision in that behalf, he enacted, with regard to ruinous buildings, so far as relates to repairing or pulling down the same, that, upon receiving information of any building being in a ruinous and dangerous condition, it shall be the duty of the surveyor, and of the overseers for the time being of the parish or place in which the same shall be, and they are hereby respectively required, to apply forthwith to the official referees to authorize a survey to be made thereof; and that, thereupon, it shall be lawful for the official referees to direct the surveyor to make such survey; and that thereupon it shall be the duty of such surveyor to act in all respects as in the case of a survey of party-walls; and that upon the receipt of the certificate of the surveyor, it shall be lawful for the official referees, and they are hereby required to cause a copy thereof to be transmitted, if the premises be within the city of London, then to the court of Lord Mayor and aldermen, and if they be elsewhere, then to the overseers of the poor of the parish or place in which such premises shall be; and that, thereupon, it shall be the duty of such Mayor and court of aldermen and overseers to cause, with all convenient speed, a proper and sufficient hoard to be put up for the safety of all passengers; and to cause notice in writing to be given to the owner of such building to repair or pull down the same or any part thereof as the case may require, within fourteen days then next ensuing; and that if within the said fourteen days the repair or demolition thereof be not begun and be not completed as soon as the nature of the case will admit, then on a declaration being made before the said Lord Mayor or a justice of the peace, of such notice having been so given (which declaration the said Lord Mayor and justice are hereby respectively empowered and required to receive), it shall be lawful for the said Lord Mayor and court of aldermen, and also for every such overseer of the poor by and out of the money in his hands, and they are hereby severally authorized and required, with all convenient speed, to order and cause such building or such part thereof so certified to be in a ruinous and dangerous condition, as shall be necessary for the safety of the passengers, to be repaired or pulled down, or secured in such manner as shall from time to time be requisite: provided always, that if such Lord Mayor or aldermen, or such overseers, appeal against such certificate, it shall be the duty of the official referees to proceed to survey, to certify and to award in all respects as in the case of an appeal from the certificate of the surveyor with reference to party-walls or intermixed buildings; and that if such official referees certify that the said premises are ruinous and dangerous, it shall be the duty of the said Lord Mayor or the said overseers to repair or pull down such building as aforesaid.

*Disposal of Materials to pay Costs—Payment of Surplus on Demand—If no Demand—City of London or Overseers to Refund within Six Years.*

40. And be it enacted, with regard to any such ruinous buildings so pulled down, so far as relates to the disposal of the materials thereof and to the application of the proceeds, that it shall be lawful for the said Lord Mayor and court of aldermen, or the said overseers, to sell and dispose of such of the materials as they shall judge necessary, and out of the moneys arising from the sale thereof to reimburse to themselves, the surveyors and official referees, and every person by them respectively employed for the purposes aforesaid, all the charges of the survey and appeal, and of putting up every such hoard, and of repairing, pulling down and securing such premises, and of selling the said materials as aforesaid, or so much thereof as the moneys arising by such sale will extend to; and that if there be any surplus after payment of all expenses, then, upon demand thereof made by such owner, it shall be the duty of the said Lord Mayor, or of the said overseers, to account for and pay such surplus of the moneys arising by such sale to the owner of such building; and that if no such demand be made, then such surplus shall, as regards places within the city of London, and the liberties thereof, be paid to the Chamberlain of the city; and as regards all other places, such surplus shall be added to the moneys raised as rates for the relief of the poor of the parish or place, and accounted for accordingly: provided nevertheless, that, at any time within six years from the deposit of such surplus, it shall be lawful for any such owner, his executors or administrators, to claim, and he and they are hereby entitled to recover such surplus; and the said Lord Mayor and aldermen of the city of London, as regards the said city and liberties thereof, are hereby required to pay such surplus out of the cash in the chamber of London; and every overseer, as regards places not within the said city or the liberties thereof, is hereby required to pay such surplus out of any moneys raised or to be raised by any rate for the relief of the poor.

*If a deficiency, to be paid by Owner; or levied by Warrant of Distress; or Occupier to pay and deduct from Rent; or by Distress on Occupier—Payment of Money to Chamberlain or to the Overseers.*

41. And be it enacted, with regard to such ruinous buildings, so far as relates to the expenses of putting up such hoard, repairing, pulling down and securing such buildings, and selling the materials beyond the amount thereof, which shall have been satisfied by the application thereto of the proceeds of the materials, that if the moneys arising from such sale be insufficient to repay all such expenses, then, from time to time, such owner fail to pay such deficiency, then it shall be lawful for the Lord Mayor for the time being, if such ruinous building in question be within the city of London or the liberties thereof, or if elsewhere, for two or more justices of the peace, to levy the amount thereof by warrant under their hands and seals, by distress and sale of the goods and chattels of such owner, if any such can be found; and that if no such owner can be met with, or being met with, shall not, on demand, pay the said deficiency, and no sufficient distress of the goods and chattels of such owner can be found, then it shall be lawful for the person who shall at any time thereafter occupy any such building, or the ground where the same stand, and he is hereby authorized and required to pay and deduct the same out of the rent thereof; and that if he neglect or refuse to pay such deficiency, then it shall be lawful for the said Lord Mayor, or two or more such justices of the peace, and they are hereby empowered and required to cause the same to be levied by distress and sale of the goods and chattels of any occupier of the premises, together with the costs of every such distress and sale; and that if the same shall be situate within the city of London and its liberties, it shall be the duty of the person by whom the same shall be received, and he is hereby required to pay the amount to the chamberlain, to be by him from time to time placed to the credit of the cash of the said city of London; and if the premises, in respect of which such money shall be received or recovered, be not situate within the said city of London and the liberties thereof, then to pay the amount received to the overseers of the poor for the time being of the parish or place where the premises shall be situate, to be by them placed to the account of the said parish, in aid of the poor-rate of the parish or place.

*Repair of ruinous Chimneys, &c.—Notice—Repairs—Certification of Expenses—Recovery from Owner or Occupier—Penalty—Fees and Expenses—Reimbursement of Occupier.*

42. And be it enacted, with regard to ruinous chimneys, roofs, and projections, so far as relates to the repairing thereof, that if a chimney-shaft, chimney-pot, or other thing thereon, or the eaves, or parapet, or coping, or slates, or tiles on the roof, or any projection from the front walls of any building, be deemed by the surveyor to be in danger of falling; then it shall be the duty of such surveyor and he is hereby required to require the occupier of such building, or if there be no occupier, then the owner thereof, to take down or secure the same to the satisfaction of such surveyor, within thirty-six hours after notice thereof shall have been given; and that if, within the time specified, such occupier, or some other person interested in such building, do not begin to take down or secure the same, and, as soon as the nature of the case will admit, complete such taking down or securing of the same, to the satisfaction of such surveyor, then it shall be the duty of such surveyor to give information thereof to a justice of the peace; and, thereupon, it shall be the duty of such justice of the peace to proceed to cause such chimney-shaft, chimney-pot, or other thing thereon, or the eaves, or parapet, or coping, or slates, or tiles on the roof or projection from the front or side wall of such building as shall be considered by such surveyor in danger of falling, to be forthwith taken down or secured; and that if there be no occupier or known owner, then it shall be lawful for such justice to direct that the reasonable expenses, to be certified by the official referees, be paid by the overseers of the parish or place in which such building shall be situated; and that if thereafter the owner of such building should become known, or if the building should become occupied, then it shall be lawful for the overseers of the poor, and they are hereby entitled to recover the amount of such expenses from such owner or from such occupier, as in the case of ruinous buildings hereinbefore provided for; and that if within the time limited the occupier or some other person interested in such building do not take down or secure the same, then for every day during which the same shall so remain unrepaired or not sufficiently secured, such occupier or the owner, if there be no occupier, shall forfeit and pay the sum of five pounds; and that such occupier or owner shall also pay the surveyor's fees and all other costs, charges and expenses attendant upon any such taking down or securing the building; and all such surveyor's fees, and other costs, charges and expenses may be recovered and levied

"By a plan" is not a sufficient designation; the words should be "by a plan AND ELEVATION, OR OTHER SUFFICIENT DRAWINGS."

These provisions would form a very great improvement upon those of the present Building-Act, whereby the power is left to very incompetent persons.

There is no statement who is to be paid first, or if the parties interested are to be paid equally in proportion to the proceeds of the sale.

There do not appear to be here any provisions for the expenses of surveying.

"Required to require" should be altered.

in the same manner as such penalty; provided always, that if the occupier of such building be not bound by virtue of any lease or other instrument to repair, reinstate or secure the premises, then such occupier is hereby entitled to retain out of the rent payable in respect of such premises, all such penalties, costs, charges and expenses attendant upon or arising out of the taking down or securing, or the repairing or rebuilding the same, as in the case of any other works, the costs of which he is hereby required to pay in the first instance.

*Injury by the Fall of Chimneys, &c.—Compensation.*

43. And be it enacted, with regard to adjoining buildings, so far as relates to the making good any damage arising from the falling down of parts thereof (except any such part of a party-wall as shall belong to and be used conjointly by the owners or occupiers of the buildings parted thereby), that if at any time any injury or damage be caused to any part of an adjoining building, or to the internal decorations and furniture in such building, by the falling down from any other building of any chimney-shaft, chimney pot, parapet, coping, or other thing, then it shall be the duty of the owner of the building from which such part shall fall, and he is hereby bound and required to reimburse the expense to which the owner or occupier may be put in making good such injury or damage, in like manner as herein directed concerning the reimbursement of the expenses of ruinous party-walls; and such costs shall be recoverable in the manner hereinafter directed for the recovery of the costs and expenses of executing works in pursuance of this Act.

*Court of Mayor and Aldermen.*

44. And be it enacted, that all the powers and authorities by this Act vested in the mayor and aldermen of the city of London, may be lawfully exercised by the court of mayor and aldermen of the said city, to be holden in the outer chamber of the Guildhall of the said city, according to the custom of the said city.

**EXPENSES OF WORKS.**

*Repayment of Expenses of Works in certain cases—Recovery of Expense from adjoining Owners—Delay of Payment.*

45. And, for the purpose of reimbursing any building-owner for the expense of works incurred in respect of any party-structure; he it enacted, with regard to the following works, so far as relates to the reimbursement, by the adjoining owner, of expenses incurred by the building-owner, in respect of any party-structure, built to part the buildings or premises belonging to other owners from the buildings or premises belonging to himself; that is to say—first, with regard to any party-wall hereafter built on the line of junction of any two buildings; and, second, with regard to any party-wall hereafter built on the line of junction of any building and any vacant ground, or of vacant premises, belonging to different owners or occupiers; and, third, with regard to a ruinous and defective party-wall pulled down and rebuilt, either with the consent of the adjoining owner, or in pursuance of the condemnation thereof, according to this Act, except a party-wall condemned on account of the injury done thereto by any building-owner, and the expenses of which and of other incidental works the official referees shall have awarded to be paid by such building-owner, by virtue of the provision in that behalf; and, fourth, with regard to one or more timber partitions between any two or more buildings pulled down, and a party-wall built in lieu thereof; and, fifth, with regard to a new party-wall or party-arch built in lieu of any party-wall or party-arch between intermixed properties pulled down, either with the consent of the adjoining owner, or in pursuance of the condemnation of such party-wall or party-arch; and, sixth, with regard to any party-wall built on the site of a party-fence or party-fence-wall, and used otherwise than as a party-fence-wall by the person who shall not have built the same; and, seventh, with regard to every other case of reimbursement in respect of any party-structure; that if the party-structure be built in the manner, and of the materials, and of the thicknesses of such structure as required by this Act in reference thereto, then it shall be lawful for the building-owner at whose expense such work shall have been executed, to claim, and he is hereby entitled to be paid and to recover from the owner of any adjoining building or ground, the following compensations; that is to say,—if a new party-wall or party-arch built on the line of junction by one owner, be made use of, either wholly or partially, by the adjoining owner, then a sum of money proportionate to the value of so much of such party-structure so made use of; and, if chimney-jamb, chimney-breast and flues have been set up in any party-wall in pursuance of the instructions of the owner of any vacant ground adjoining to the same, then a sum equal to the value thereof; and if an unsound party-wall or other party-structure be pulled down and rebuilt, then a sum of money equal to a proper proportion of the value of the new party-structure, deduction being made for a due proportion of the old materials, and also a proportionate part of all expenses which shall be necessary for pulling down the old party-structure, in lieu of which such new party-structure shall be built; and if a party-wall be built in lieu of a timber partition or other party-structure, and he made use of by the adjoining owner, then a sum of money proportionate to the value of so much of such new party-wall as shall be so made use of; and also a proportionate part of all expenses which shall be necessary for pulling down the old timber partition or other party-structure; and if a party-wall or party-arch already built, or hereafter rebuilt, be used by an adjoining owner, then a sum of money proportionate to the value of so much of such party-structure, as the adjoining owner shall use, deduction being made, where proper, for the value of old materials; and, in every case, the whole of the reasonable expenses of the shoring up the adjoining building, and of removing any goods, furniture or other things therein, and of pulling down any wainscot or partition thereof; and also such surveyors' fees and any other fees payable in respect of any acts performed by the official referees; and also, such other costs (if any) as may have been awarded by the official referees as aforesaid, in any of the cases hereby provided for; and until such expenses shall be so paid, every person at whose expense such party-structure shall have been built is hereby entitled to and shall be possessed of the sole property thereof, and of the ground whereon it stands, and the same shall be vested entirely in the person at whose expense such party-structure shall have been built.

*Recovery of Costs of Buildings—Account—Data of Account—Examination of Accounts by Official Referees—Disapproval—Approval and Demand of Payment—Recovery of Amount.*

46. And be it enacted, with regard to the costs of all the works which shall be executed under this Act, incurred either by an owner or by an occupier, or on behalf of the owner of adjoining premises, or on behalf of the owner of the same premises, so far as relates to the recovery thereof, that within twenty-one days after the completion of the work, it shall be the duty of the person by whom such expense shall have been incurred, to deliver to the adjoining owner of the building or premises in respect of which such expense shall have been incurred, an account in writing of the expenses of the work, including all preliminary and incidental operations; and also if the work shall have been executed by the authority of the official referees, by virtue of the power hereby provided for supplying the want of consent of owners, then a copy of such account shall also be delivered to the official referees at their office; and that every such account must contain a true account,—First, Of the number of rods and parts of rods of brick-work, and of all digging, and of concrete, stone-work and other requisite materials, and of the labour required in executing so much of the work as the owner of the adjoining building shall be liable to pay, and of the respective prices thereof; and, Secondly, Of any deduction which such adjoining owner shall be entitled to make therefrom on account of the old materials of so much of the wall or other structure pulled down, which shall have belonged to him; and also a true account of the expenses of all other preliminary and incidental operations; and that all such works must be estimated and valued, in every such account, at such rates and prices as shall from time to time be fixed by the official referees; and that if within ten days from the delivery of such account, any party dissatisfied with the proportion of the amount thereof charged to him, appeal to the official referees, then upon the receipt thereof, or if, in cases of want of due consent as aforesaid, such account be delivered to the official referees as aforesaid, it shall be the duty of the official referees to examine such account, and to certify whether they approve or disapprove of the items thereof, and whether the rates and prices are duly charged, and whether the proportion of the account charged to the party appealing be duly charged, and also to appoint how and by whom the expenses of such examination are to be borne, and also to appoint the time or times at which the amount of such account, and of such expenses payable by any party, are to be paid; and that if they certify their disapproval, or that the charges are not duly made, or the amount fairly apportioned with regard to the party appealing, then before any demand be made or any proceedings be taken thereon, the account must be amended, and again examined by the official referees, and certified as aforesaid; and that if the official referees certify their approval, then at the time or times appointed by the said official referees, it shall be lawful for the person entitled to such costs and expenses to demand the amount thereof; and that if within ten days after the delivering of such account to the party liable to pay the same, such party do not either appeal against such account or pay the same; or if, within ten days after the demand thereof, in conformity with the certificate of the official referees, the amount thereof, together with the costs of the examination of the account as the official referees shall certify, he not paid; then it shall be lawful for the person entitled thereto to recover the same, or so much thereof as shall be then due, by the summary proceeding hereby provided.

*Reimbursement of Costs of Works to Occupiers—Discharge and Repayment.*

47. Provided always, and he it enacted, with regard to works executed under this Act, so far as he relates to the reimbursement to the occupier of any costs by him paid in respect thereof, that, unless there be some express agreement to the contrary between the parties, it shall be lawful for such occupier and he is hereby entitled to demand from the owner of such building, the work him to his lessor or landlord, the amount of any such costs, charges and expenses payable by his lessor or landlord, and the costs of such costs, charges and expenses of any distress and sale made on him through the default of his lessor or landlord; and that the receipt for such payment shall be a sufficient discharge to any occupier for so much money as he shall have so paid, or which shall have been so levied on his goods and chattels in pursuance of

this Act, and shall be allowed by such lessor or landlord in part or full payment (as the case may be) of the rent due to him by such occupier.

**Recovery of Expenses of Buildings—Differences—Determination by Official Referees—Charges—Receipt of Rents—Recovery of Rents—Priority of Right—Limitation of Distress—Continuance of Distress until Payment made.**

48. And be it enacted, with regard to the costs and all other expenses of pulling down, securing, repairing and rebuilding party-structures, or other parts of buildings, according to the provisions of this Act, so far as relates to the recovery thereof, amongst the several owners of the premises, that when such costs and expenses shall have been ascertained and paid by the owner upon whom the payment thereof shall have first fallen, then as to any building or tenement held under any lease, or agreement for a lease, or other agreement for the occupation thereof, made before the coming into operation of this Act, it shall be lawful for such owner, and he is hereby entitled to recover the same from the persons now bound or liable by law, or by any existing contract, to maintain and repair such buildings, in respect of which such costs and expenses shall have been incurred; but if any dispute or difference arise as to the persons so bound or liable, then every such dispute or difference shall be referred to the official referees; and that thereupon such official referees shall ascertain and determine the persons bound or liable to pay such costs and expenses, and also in what proportions such costs and expenses are to be paid by the parties liable to pay the same, and their decision shall be final; and that as to any building or tenement held under any lease or agreement for a lease, or other agreement for the occupation thereof, made after the coming into operation of this Act, all such costs and expenses shall be charged upon the building or tenement in respect of which such costs and expenses shall have been incurred; and that in default of such costs and expenses being duly paid, it shall be lawful for the party to whom the same shall be payable, and he is hereby entitled to receive from the occupier thereof the rents and profits of such building or tenement; and for that purpose to give notice to such occupier to pay over to him such rents and profits; and that thereupon if such occupier fail to pay such rent and profits accordingly, then it shall be lawful for the person to whom such costs and expenses shall be payable to recover the same by the summary proceeding hereby provided, in such proportions and at such times as shall be appointed by the award of the said official referees in that behalf; and that after such notice shall be given, and before such costs and expenses shall be paid, it shall not be lawful for any person otherwise entitled to receive such rents and profits, and he is hereby disabled to bring any action or take any proceedings at law or in equity to recover such rents or profits; provided always, that if on the hearing of the application for the warrant to levy such costs and expenses by distress according to the provision of this Act in that behalf, the owner shew that he is not bound to pay, in respect of such building or tenement, any rent or profit, or that the amount of the rent or profit payable by him is not sufficient, then it shall not be lawful to issue such warrant, if there be no rent due or accruing; or if there be rent due or accruing, then to the extent only of the amount of such rent; and that if such costs and expenses or any part thereof remain unpaid, and if the same or any future owner be or become liable to pay rent in respect of such building or tenement, then from time to time, until the same be paid, it shall be lawful to levy the same by distress, according to the provisions in that behalf, upon the same or any such future occupier.

**Official Referees to determine Contributions—Proportional Contributions—Recovery of Excess paid by any Contributor.**

49. And be it enacted, with regard to such costs and expenses of works executed under this Act, so far as relates to contribution thereto by persons bound or liable to make contribution, that for the purpose of enabling the party upon whom the payment of such costs and expenses shall fall, either in the first instance or subsequently, to obtain contribution from others interested in like degree, it shall be lawful for every such person, whether he be freeholder, copyholder, leaseholder, mortgagee in possession, and whatever may be his interest or the degree of such his interest, and whether he hold in his own right, or in right of others, and whatever may be the kinds and degrees of their respective interests, and he is hereby entitled, to a contribution from every other person having an interest in the premises, of whatever kind or degree; which contribution is to be computed, according to the amount of his interest, in proportion to that of other persons interested, so far as such persons may be known, or can be reached by process of law or equity; that it shall be lawful for any party so interested, and he is hereby entitled, to require the official referees to settle and determine the same by their award, and their decision shall be final; and that if the person upon whom the payment of such costs and expenses shall have fallen, have paid, in respect of the same, more than his own just proportion, then, on the production of such award, duly made, signed and sealed, it shall be lawful for such person to have and exercise against other parties against whom such award shall be made, and he is hereby entitled to the like remedies, to compel payment of money, as are hereby given for compelling the first payment of such costs and charges of such expenses.

**STREETS AND ALLEYS.**

**Width thereof—Penalties.**

50. And now, for the purpose of making provision concerning streets and other ways of the metropolis; be it enacted, with regard to such streets and other ways, so far as relates to securing a sufficient width thereof, that, from the passing of this Act, all the conditions, regulations and directions contained in the Schedule (I.) to this Act annexed, shall be duly observed and performed; and that if any person offend in respect thereof, he shall be liable to all the penalties and forfeitures by this Act imposed in respect of any buildings either built contrary thereto, or without due notice to the surveyor appointed in pursuance of this Act to inspect such buildings.

**BUILDINGS—USE THEREOF.**

**Use and Occupation of Cellars or Rooms unfit for Dwellings—Noxious Uses—Penalty.**

51. And now, for the purpose of discouraging and prohibiting the use of buildings unfit for dwellings, and the improper use of other buildings; be it enacted, with regard to every building of the first or dwelling-house class, whether already or hereafter built, so far as relates to the use and occupation thereof, or of any room or cellar thereof, that it shall not be lawful to let separately, to hire any such room or cellar, nor to occupy, nor to suffer it to be occupied as such, nor to let, hire, occupy, or suffer to be occupied, any such room of less dimensions than one square, or built underground, for any purpose (except for a ware-room or store-room); and further, with regard to every building of the first or dwelling-house class, so far as relates to the use and occupation thereof, that it shall not be lawful to use or to suffer any part thereof to be used as a pig-sty, dog-kennel, or for any other noxious purpose; and that if any person wilfully let, or suffer to be occupied, or used, in manner aforesaid, any underground cellar or room contrary to the provisions of this Act, or any other part of such building, contrary to the provisions of this Act, then, on conviction thereof, before two justices of the peace, such person shall be liable to forfeit, for every day that such cellar or room shall be so occupied, a sum not exceeding twenty shillings; and the half of such penalty shall go to the person who shall sue for the same, and the other half to the poor of the parish in which such unlawfully occupied or used cellar or room shall be situate.

**Buildings near dangerous Businesses as to Fire—Distance from Buildings—New Businesses—Prohibition after Thirty Years—Fifty Pounds Penalty and Costs—Costs—Distress or Imprisonment.**

52. And now, for the purpose of making provision, concerning businesses dangerous in respect of fire or explosion; be it enacted, with regard to the following businesses, (that is to say) the manufacture of gun-powder or of detonating powder or matches ignitable by friction or otherwise, or other substances liable to sudden explosion, inflammation or ignition, or capable of causing sudden explosion, inflammation or ignition, or of vitriol, or of turpentine, or of naphtha, or of varnish, or of fireworks, or painted table-covers, and any other business dangerous, on account of the liability of the materials employed therein to cause fire or explosion on matters coming in contact therewith, so far as relates to the erection of buildings in the neighbourhood of the place where any such business is carried on, and so far as relates to the carrying on of any such business in the neighbourhood of public ways or buildings, that it shall not be lawful hereafter to erect any building, of any class, nearer than fifty feet to any building which shall be in use for any such dangerous business; and that it shall not be lawful for any person to establish or newly carry on any such business, either in any building or vault or in the open air, at a less distance than fifty feet from any public way, or than fifty feet from any other building, or any vacant ground belonging to any other person than his landlord; and that if any such business be now carried on in any situation within such distances, then, from the expiration of the period of thirty years next after the passing of this Act, it shall not be lawful to continue to carry on such business in such situations; and that if any person erect any building in the neighbourhood of any such business contrary to this Act, then, on conviction thereof before two justices, he shall forfeit the sum of fifty pounds; or if any person establish anew any such business, or carry on any such business contrary to this Act, then, on conviction thereof before two justices such person shall be liable to forfeit for every day during which such building shall remain near to such dangerous business, or during which such business shall be so carried on, a sum, not exceeding fifty pounds, as the said justices shall determine; and that it shall be lawful for the justices also to award to the prosecutor such costs as shall be deemed reasonable; and that if the offender either fail or refuse to pay such penalty and costs immediately after such conviction, then they may be levied by distress of the goods and chattels of the person convicted; or if there be no such distress, then such person shall be committed to the common gaol or house of correction for any time not exceeding six months, at the discretion of such justices; and that by warrant under the bands and seals of two or more justices of the peace.

The proposal to give power to the official referees to award, in cases of dispute, the costs of party-walls, and other matters done under the present Act, and to determine who are the parties liable for the same, is excellent; as many cases of dispute relative to bearing the expense of new party-walls erected under the present Act are still likely to arise, from the difficulty of awarding to the several parties interested their just proportions of such expenses.

We imagine "disabled FROM bringing any action AND FROM taking any proceeding" to be intended.

"Future occupier" we presume to be meant, otherwise there will be no congruity with the closing words of the clause, "any such future occupier."

The general purport of this proposed regulation is excellent; but we fear, that out of the very justice intended to be applied by it to reach all the several interests of complicated cases, great litigation and its attendant expenses will arise.

We apprehend the words "LIKE degree" are not proper for expressing the several liabilities of the parties interested; as, for instance, one man may have taken of a freeholder a piece of ground at 3l. rent, and may have underlet it to a third person at 10l. rent; he again may have underlet the same ground at 20l. rent to a fourth party, who is a builder, and who has laid out 500l. upon the ground; this party may have underlet the estate again to a fifth at 70l. rent; this fifth party, finding the estate unprofitable, may have underlet it again to a sixth at a reduced rent of 50l.; this sixth party may have so increased the buildings that the estate has become worth a 100l. per annum: in the mean while some of the parties may have become insolvent, some may have been made bankrupts, some may have died, some may have become insane, and some may have left children minors. Under such a complication, an arbitrator would have to exercise great care and ability in dividing the several interests according to term, rent, value, and legal liability, which if "LIKE" would form another miracle.

The expression should be "Nearer than fifty feet FROM any building" or "Nearer to any building than fifty feet;" the words "from such building" being then merely understood.

We cannot see any reason why FIRE-WORK MANUFACTORIES and OTHER PLACES of DANGEROUS FABRICATIONS should be legalized or in any way countenanced for thirty years in any situation-whatsoever contiguous to human habitations or to public ways.

*Buildings near dangerous and noxious Trades as regards Health—Distance from Buildings—New Businesses—Prohibition after Thirty Years—Fifty Pounds Penalty and Costs—Distress or Imprisonment.*

53. And now, for the purpose of making provision concerning businesses offensive or noxious, be it enacted, with regard to the following trades or businesses; that is to say, blacksmith, boot-maker, cooper, mangle, slaughterer of cattle, sheep or horses, soap-boiler, tallow-melter, tripe-boiler, and any other business offensive or noxious, so far as relates to the erection of buildings in the neighbourhood of any such business, and so far as relates to the carrying on of any such business in the neighbourhood of any public way, or of other buildings of the first or dwelling-house class, that it shall not be lawful hereafter to erect any buildings of two or dwelling-house class nearer than fifty feet to any building which shall be in use for any such offensive or noxious business; and that it shall not be lawful for any person to establish or newly carry on any such business, either in any building or vault or in the open air, at a less distance than forty feet from any public way, or than fifty feet from any other such buildings of the first or dwelling-house class; and that if any such business be now carried on in any situation within such distances, then, from the expiration of the period of thirty years next after the passing of this Act, it shall cease to be lawful to continue to carry on such business in such situation; and that if any person erect any building in the neighbourhood of any such business, contrary to this Act, then, on conviction thereof before two justices, he shall forfeit the sum of fifty pounds; or if any person establish anew any such business, or carry on any such business contrary to this Act, then, on conviction thereof before two justices, such person is hereby made liable to forfeit for every day during which such building shall remain near to such dangerous business, or during which such business shall be carried on, a sum not exceeding fifty pounds, as the said justices shall determine; and that it shall be lawful for the justices also to award to the prosecutor such costs as shall be deemed reasonable; and that if the offender either fail or refuse to pay such penalty and costs immediately after such conviction, then they may be levied by distress of the goods and chattels of the person convicted; or if there be no such distress, then such person shall be committed to the common gaol or house of correction for any time not exceeding six months, at the discretion of such justices, and that by warrant under the hands and seals of two or more justices of the peace.

*Use of Means to mitigate Noxiousness of Trades—Adoption of Means to mitigate after Conviction.*

54. Provided always, and be it enacted, with regard to any such offensive or noxious business, whether such trade or business be now carried on at a less distance than forty feet from any public way, or than fifty feet from any other building, or be hereafter carried on at a greater distance, yet so as to cause danger or annoyance, so far as relates to the mitigation of any penalty or punishment for unlawfully carrying on thereof, that if any party charged with carrying on such business shew that in carrying on such business all the means then known to be available for mitigating the effect of such business in any such respect have been adopted, then it shall be lawful for such justices to receive evidence thereof, and according to such evidence to mitigate the penalty as to them shall seem fit: provided further, with regard to such offensive or noxious business, so far as relates to the adoption of means to mitigate the injurious effects thereof, that if it shall appear to such justices that the party carrying on any such business shall have made due endeavours to carry on the same with a view to mitigate so far as possible the effects of such business, then although he hath not adopted all or the best means available for the purpose, yet it shall be lawful for such justices assembled, and they are hereby empowered, to suspend the execution of their order or determination, upon condition that, within a reasonable time to be named, the party convicted do adopt such other or better means as to the said court shall seem fit, or before passing final sentence and without consulting the prosecutor, to make such order touching the carrying on of such business as shall be by the said court thought expedient for preventing the nuisance in future.

*Conviction and Appeal as to certain Trades not specified—Recognizances—Sessions—Proceedings.*

55. And be it enacted, with regard to any business not hereinbefore enumerated by name as offensive, noxious or dangerous, or which shall not have been adjudged by any of her Majesty's superior courts of law at Westminster to be nuisances, and with regard to any building erected or continued within any such distance as aforesaid from any such business dangerous, noxious or offensive, so far as relates to a conviction in respect of any such business, and to an appeal from such conviction, that if any person be dissatisfied with the decision of such justices, and if, within two days after such decision, notice be given by or on behalf of such person of his intention to appeal, and if he enter into recognizance to the party appealed against, with two sufficient securities conditioned to try such appeal, and to abide the order of the court, and pay to the party appealed against, such costs (if any) as shall be awarded against him, then it shall be lawful for such party so dissatisfied to appeal against such conviction to the justices of the peace at their general quarter sessions of the peace, to be holden within four months after such conviction, for the place in which such premises shall be situate; and that if the premises be situate within the city of London, and liberties thereof, then the appeal must be to the quarter sessions thereof, or if the premises be situate in the counties of Westminster, Kent, or Surrey, or in the city and liberties of Westminster, or in the liberties of her Majesty's Tower of London, then to the quarter sessions thereof respectively, as the case shall be; and that if, within the above-mentioned period, such appellant shall have entered into such recognizance as herein required, then it shall be lawful for such justices, and they are hereby empowered, to proceed to hear and examine, on oath, into the causes and matters of such appeal (which oath they are hereby empowered to administer), and to determine the same, and to award such costs to be paid by the said parties as they think proper; and the order, judgment, and determination of the said justices in their respective sessions shall be binding and conclusive upon all parties.

*Appeals to Quarter Sessions for Surrey and Kent—To Sessions at Southwark—To Sessions at Greenwich—Further Meetings—Adjournments.*

56. And be it enacted, with regard to any appeal in respect of a conviction for carrying on any such dangerous, offensive, or noxious business, so far as relates to the place where such appeal is to be heard, that if the appeal be to the general quarter sessions of the peace for the county of Surrey or the county of Kent, then the jury (if any) to be impaneled, in pursuance of this Act, and all parties required to attend the quarter sessions, or the sessions of the county of Surrey or the county of Kent, shall be summoned and required to attend at some general or special adjournment of the said quarter sessions to be held within six weeks next after the original sessions; and that if the matter relate to the county of Surrey, then such adjournment shall be to some convenient place in the borough of Southwark in the said county; and that if the matter relate to the county of Kent, then such adjournment shall be to some convenient place in the borough of Greenwich in the said county; and such times and places shall be appointed by the justices of the said counties respectively assembled at such original sessions; and that, from time to time, every further meeting of the said sessions, for any thing to be done upon such application, shall be appointed at or within the space of three weeks from the last meeting; and that, from time to time, it shall be lawful for the justices of the peace for the said counties of Surrey and Kent respectively, and they respectively are hereby empowered and required to make such adjournment and hold such sessions as there shall be occasion.

*Common Law and Statutory Remedies not affected.*

57. Provided always, and be it declared, with regard to any business which is contrary to any existing Act of Parliament, or otherwise contrary to law, so far as relates to the operation of this Act in that behalf, that, notwithstanding anything in this Act contained, this Act shall not be deemed to authorize any person to carry on any such business either within such limits or otherwise, or any business which it is unlawful to carry on, within any limits or in any manner contrary to any public, local or private Act of Parliament, or otherwise contrary to law; nor to affect, abridge or restrain the right, the duty or the power of any person, whether private person or public officer, to prosecute, either civilly or criminally, any person who shall carry on, within the limits of this Act, any offensive, noxious or dangerous business.

*Regulation or Removal of Trades deemed Nuisances by Purchase—Memorial to Queen in Council—Order for Removal—Compensation—A Viet. c. —Unlawful to continue such Trades after Purchase.*

58. And further, for the regulation or removal of any offensive, noxious or dangerous business now carried on; be it enacted, with regard to any such business, so far as relates to the purchase thereof or of the premises wherein it shall be carried on, that if two-thirds in number of the inhabitant householders of any parish or place in which such business shall be carried on, present a memorial to her Majesty in Council, praying the removal of such business from that place or neighbourhood, and thereby engaging to provide composition to the persons carrying on the same, either at the expense of the memorialists, or by means of a rate to be levied on the inhabitants of the said parish or place, or such part thereof as may be affected by such business, then it shall be lawful for her Majesty to refer the matter to the Lords of the Committee of Privy Council for Trade, to consider the character of such business, whether it be offensive, noxious or dangerous; and if it appear to be so, and that there are no means of rendering it otherwise by the adoption of methods available, without unreasonable sacrifice on the part of the person by whom it is carried on, then it shall be lawful for her Majesty, by Order in Council, to direct that the removal of such business may be purchased by the memorialists or by means of a rate, as to her Majesty shall seem fit; and also to direct that the person in the county or liberty in which such business is carried on, shall be bound to give up the premises according to the provisions of an Act made and passed in the fourth year of the present Majesty, intituled, "An Act to enable her Majesty's Commissioners of Woods to make a New Street from Coventry-street to Long-acre, and for other Improvements in the Metropolis," to determine what compensation shall be paid to the party carrying on such business for the removal thereof, and to the owner and occupier of the premises for the restriction of the use of his buildings for such purpose; and that if, within three months after the verdict of such jury shall be given, and judgment thereon, the inhabitants of such place or

We think no person, who has recently or within twenty years set up any such noxious or dangerous establishment, should virtually be allowed to injure neighbouring property and estates, by depriving their owners of their undoubted and, as we imagine, indefensible right to build and dwell in peace and health on their own freeholds. We think no such dangerous nuisances ought to remain within the verge of habitable property, but should alone be suffered to exist on detached estates, the confines of which are sufficiently remote from the danger and nuisance to prevent the public and all neighbors and neighbouring property from being injured or annoyed.

These endeavours "to mitigate the injurious effects" will come too late after the explosion of the remaining premises where fire-works are made or sold, which have not already exploded and destroyed their inmates, and the neighbouring buildings and their inmates. If any "vested rights" prevent the instant removal of these horrible and culpable nuisances, they ought at once to be bought up at the public expense, and all such abominations be immediately banished to desert spots.

neighbourhood pay such compensation, then, within three months from the receipt or tender of such compensation, it shall cease to be lawful for the party carrying on such business to continue the same, and for any owner or occupier thereof either to carry on or to permit to be carried on such business in the same or any part of the same premises.

*Funds for defraying Compensation—By a Rate.*

59. And be it enacted, with regard to the funds for defraying such compensation, so far as relates to the raising thereof, that if her Majesty shall by such order direct the compensation to be paid by means of a rate, then it shall be lawful for the overseers of the parish or place to raise such sum as shall be necessary, as part of the poor's-rate on the inhabitants of such parish or place, or such part thereof as affected by the business, as shall be appointed by such order in Council, to defray such compensation, in pursuance of their memorial aforesaid; and that thereupon such rate may be levied and recovered accordingly.

*SURVEYORS, THEIR DISTRICTS AND DUTIES.*

*Appointment of Districts.*

60. And now, for the purpose of dividing the district to which this Act is to apply into several smaller districts, for the convenient execution thereof of this Act, and for appointing competent surveyors for superintending the same in each such district, and for regulating the duties of their office; be it enacted, with regard to such districts, so far as relates to the appointment and alteration thereof, that at any time after this Act shall come into operation, and from time to time, it shall be lawful for the Lord Mayor and Aldermen of the city of London, with reference to the city of London, and the liberties thereof, and for the justices of the peace for the county of Middlesex, the county of Surrey, the county of Kent, the city and liberties of Westminster, and the liberty of her Majesty's Tower of London, in their general quarter sessions respectively, or any adjournment thereof, with reference to their respective counties, city and liberties, and they, respectively, are hereby empowered, but subject, nevertheless, to the consent of her Majesty's Principal Secretary of State for the Home Department, to appoint the districts to which the respective places within their jurisdiction shall belong for the purposes of this Act, and to unite, enlarge and alter such districts for the more convenient distribution of the business.

*Appointment of Surveyors.*

61. And be it enacted, with regard to the surveyors to be assigned to such districts for the purposes of this Act, so far as relates to their appointment, that at any time after this Act shall come into operation, and from time to time, it shall be lawful for the said Lord Mayor and aldermen of the city of London, with reference to the city of London and the liberties thereof, and for the said justices of the peace in their general quarter sessions respectively, or any adjournment thereof, with reference to their respective counties, and they are hereby required, but subject, nevertheless, to the consent of her Majesty's Principal Secretary of State for the Home Department, to nominate and appoint, as surveyors, such and so many discreet persons, of the full age of thirty years, and properly educated and skilled in the art and practice of building, as they the said Lord Mayor and aldermen and the said justices shall think fit.

*Tenure of Office.*

62. And be it enacted, with regard to such surveyors, so far as relates to the tenure of their office, that it shall be lawful for every such surveyor and he is hereby entitled to hold such his office of surveyor during the pleasure only of the said Lord Mayor and aldermen and of the said justices respectively.

*Functions generally.*

63. And be it enacted, with regard to such surveyors, so far as relates to their functions generally, that it shall be the duty of every such surveyor, and he is hereby required, to see that all the rules and directions of this Act are well and truly observed in and throughout his district; and for that purpose to proceed from time to time in due course, upon the receipt of any notice, or if from ignorance or neglect, or from any other circumstance, notice of any work intended to be done have not been given, then, upon such work being observed by or being made known to him, to inspect the works intended to be done, or which shall have been commenced; and to cause all the rules and directions of this Act in respect thereof to be strictly observed; and also to attend and perform every thing required of him by this Act, whether with or without notice; and also to inspect ruinous buildings and projections in danger at all times when needful, and to take all necessary measures thereupon; and also to survey all buildings built, rebuilt, enlarged, or altered by or under the superintendance of a district surveyor within any other district to which he shall be appointed by the official referees for that purpose; and also to cause a book for registering all notices, informations, and complaints, to be at all times kept at his office, and to enter in such book every notice, information, or complaint which shall be delivered or made to him, and any proceeding thereon by him taken.

*Qualifications and Disqualifications.*

64. And be it enacted, with regard to such surveyors, so far as relates to their qualifications and to their disqualifications, that at the time of his appointment, every such person appointed to be a surveyor must be of the full age of thirty years; and that during the time that any such person shall act as a justice of the peace for the county in which his district shall be situated, it shall not be lawful for him, and he is hereby disqualified to hold the office of a surveyor or of deputy or an assistant surveyor for any district under this Act.

*Continuance of present Surveyors, 14 Geo. 3, c. 78. (1774.)*

65. And be it enacted, with regard to the surveyors who, at the time of this Act coming into operation, shall have been appointed under the Act of the fourteenth year of the reign of King George the Third, mentioned in the schedule (A.), hereto annexed, so far as relates to their continuance in office, and the application of this Act to them, that it shall be lawful for them, and they are hereby entitled, to continue to be the surveyors for the purposes of this Act, and for the districts assigned to them at the time this Act shall come into operation, until they shall be removed; and to act in all respects as if they had been appointed under this Act; and that every provision in this Act applicable to district surveyors, so far as relates to the exercise of the office of surveyor, and to their remuneration in that behalf, shall apply to them.

*Declaration of Official Fidelity.*

66. And be it enacted, with regard to every surveyor hereafter appointed, so far as relates to making a declaration of official fidelity, that, before any such surveyor shall act in pursuance of this Act, it shall be his duty, and he is hereby required to make a declaration of official fidelity, which must be administered by the said Lord Mayor and aldermen in their court of aldermen, or by the said justices of the peace in their respective general quarter sessions, and must be in the form or to the effect following; that is to say,—“I, A. B., being one of the surveyors appointed in pursuance of an Act made and passed in the year of the reign of her present Majesty, intitled, ‘An Act for regulating the Construction and the Use of Buildings in the Metropolis and its Neighbourhood, and commonly called the Metropolitan Buildings Act,’ do solemnly declare, that I will diligently, faithfully and impartially perform the duties of my office, and to the utmost of my power, skill, and ability, endeavour to cause the several provisions of the said Act to be strictly observed, and that without favour or affection, prejudice or malice to any person whomsoever.”

*Regulation of Duties—Offices—Attendance—Return of Name and Residence.*

67. And be it enacted, with regard to the surveyors, so far as relates to the regulation of their official duties, that it shall be the duty of every surveyor for the city of London and the liberties thereof, and he is hereby required, to have an office, at his own expense, in such public situation as shall be approved by the Lord Mayor and aldermen; and that it shall be the duty of every other surveyor, and he is hereby required to have an office, at his own expense, in some central part of the district to which he shall be appointed, as shall be approved by the justices of the peace in quarter sessions, within whose jurisdiction he shall act; and that it shall be the duty of every such surveyor, or some other person in his behalf, and he is hereby required to attend at his office every day (Sundays, Christmas-day and Good Friday excepted) from ten of the clock in the morning till four of the clock in the afternoon; and that immediately upon his appointment, and from time to time, upon every change of his residence, or of his place of business, or oftener if required, it shall be the duty of every surveyor, and he is hereby required, to make a return to the registrar of metropolitan buildings, and to the overseers of the poor of every parish or place within his district, of his name and place of abode and the place where such office shall be.

*Surveyor pro tempore—Duty of Deputy—Fees.*

68. And be it enacted, with regard to such surveyor, so far as relates to the appointment of a deputy or substitute in certain cases, that if any surveyor shall be prevented by illness, or any other unavoidable circumstances, from attending to the duties of his office, then forthwith it shall be his duty and he is hereby required, but subject to the previous consent and approval of the official referees, to appoint some other surveyor as his deputy to perform all such his duties for so long a time as he shall be so prevented from executing them; and that thereupon, during such time as aforesaid, it shall be the duty of such deputy surveyor, and he is hereby required to perform all the duties of such surveyor, and that in all respects as if he were the surveyor appointed or confined under this Act; and that it shall be lawful for such deputy surveyor, and he is hereby entitled to receive the fees payable in respect of the services so performed by him in such district.

*Vacancies—Occasional Services—Fees therefor.*

69. And be it enacted, with regard to such surveyors, so far as relates to the filling up of vacancies, that if any vacancy shall happen through the death of any surveyor, then, within one month thereafter, it shall be the duty of the Lord Mayor and aldermen or the justices of the peace, and they are hereby respectively

The words should run, “disqualified from holding.”

If the proposed Act be intended to go down to posterity, for the words “Her present Majesty” should be substituted “Her Majesty Queen Victoria.”

The words might run, “It shall be the duty of every such surveyor, and such surveyor or some other person on his behalf shall attend at his office every day,” &c.

required, to appoint a successor as herein directed; and that, in the meantime, it shall be lawful for the official referees to direct the surveyor of any one or more of the other districts to perform the duties of surveyor for the vacant district; or if no district surveyor can be spared from his own district, to appoint some other competent person for that purpose: and that every such surveyor is hereby entitled to receive the fees payable in respect of the services so performed by him in such vacant district.

*Regulation of Business—Assistant Surveyors—Duties of Assistants—Fees.*

70. And be it enacted, with regard to the surveyors, so far as relates to the regulation of their business, that if it shall appear to the official referees that the district appointed for any surveyor is too extensive for the prompt discharge of his functions, then it shall be his duty to represent such their opinion to the Lord Mayor and aldermen of the city of London, or to the justices of the peace with whom the appointment of a surveyor for that district may rest; and for that purpose to transmit with their letter of representation a transcript of their "Register of Notices," with the results; and that if at any time it appear to such official referees, that on account of the pressure of business in any district, or on any other account, the surveyor of that district cannot discharge his duties promptly, as regards the builders and others engaged in building operations, and efficiently as regards the purposes of this Act, then it shall be lawful for such official referees, and they are hereby empowered, to appoint any other district surveyor to assist the surveyor of such district in the performance of his duties; or if no district surveyor can be spared from his own district, then to appoint some other competent person to give such assistance; and that with regard to all buildings surveyed by such assistant surveyor, and all other acts done by him, it shall be the duty of such assistant surveyor to make returns, and to act in all respects as if he had been appointed by the said Lord Mayor and aldermen, or by the said justices, to be the surveyor of such district; and that every such person shall be entitled to receive the fees payable in respect of the services so performed by him.

*Superintendance of Surveyors.*

71. And be it enacted, with regard to such surveyors, so far as relates to the supervision of buildings, built, rebuilt, enlarged or altered by or under his professional superintendance, that it shall not be lawful for any such surveyor to survey any such building for the purposes of this Act; but that such building must be surveyed by another district surveyor, or by another surveyor to be appointed by the official referees for that purpose.

*Surveyor's Fees—Refusal of Payment—Fees to be paid only for Work done agreeably to Act—Refunding Fees.*

72. And be it enacted, with regard to such surveyors, so far as relates to their remuneration, that upon the expiration of one month after the roof of any building erected and surveyed under this Act, shall have been covered in, and all the walls thereof have been built to their full heights, and the principal timbers and floors shall have been fixed in their places, and upon the expiration of fourteen days after the completion of any addition, alteration and repair, and upon the expiration of fourteen days after each special service shall have been performed, and upon delivering to the owner of the building an account of the fees incurred, and upon tendering a receipt, signed with his christian and surname, and stating the amount of such account and the work done, it shall be lawful for the surveyor, and he is hereby entitled to receive for his time and trouble and expenses in causing the rules, regulations, and directions of this Act to be observed, the several fees specified in the Schedule of Fees (L.), hereunto annexed; and that if, on tender of such receipt, any owner or occupier who shall become liable to pay any such fee shall refuse to pay the same, then, upon application to any justice of the peace, it shall be lawful for such justice, and he is hereby required to issue his warrant to levy the amount of such fee by distress and sale of the goods and chattels of the party so refusing, in like manner as poor's rates are by law recoverable; provided always, that if he is required in respect of which such fee shall become payable have not been done in every respect agreeably to the directions of this Act, then it shall not be lawful for any surveyor to receive such fee; and that if he shall so receive it, then, upon application to the official referees by any party interested in the building in respect of which such work shall have been executed, and upon its appearing that such fee has been received wrongfully, it shall be the duty of such official referees, and they are hereby required to order the said surveyor to refund such fees.

*Surveyor's Returns—Inspection of Returns—Authentication and Effect of Returns.*

73. And be it enacted, with regard to such surveyors, so far as relates to a return of the business done by them, and to the inspection thereof, that, within seven days after the first day of every month, it shall be the duty of every surveyor, and he is hereby required to make a return to the registrar of metropolitan buildings, enumerating therein the number and nature of all the several works executed within the previous month under his supervision, and the fees paid to him for the same, and also a copy of the list or register of notices served upon him, with the results thereof, and to keep in his office a copy of such return; and that if any person shall apply to inspect the same, then on the payment of one shilling, it shall be open for inspection, at all reasonable times; and with regard to such return, so far as relates to the authentication and effect thereof, that every such return must be signed by such surveyor, and if so signed, it shall be deemed to be a certificate that all the works enumerated therein have been done in all respects agreeably to this Act, according to the best of his knowledge and belief, and that they have been duly surveyed by him; but no such return shall be any protection from, or hindrance to, any future proceedings in respect of works not executed according to the provisions of this Act, though the same may have been done before the making of such return.

*Penalty for Extortion, Negligence, or Unfaithfulness—Incapacitation of Surveyors.*

74. And be it enacted, with regard to every surveyor, so far as relates to the discharge of his duties, that if any surveyor receive any higher fee than he shall be entitled to under this Act, or if in his capacity of surveyor he receive a fee for any act or omission in respect of which he is not entitled to receive any remuneration, or if he refuse to refund any fee wrongfully received by him, in respect whereof the official referees shall have made an order to that effect, or if at any time he wilfully neglect his duty, or behave himself negligently or unfaithfully in the discharge thereof, and if, upon complaint thereof, such conduct be made to appear to the Lord Mayor and aldermen of the city of London, or the court of quarter sessions having jurisdiction over the district for which he shall act for the time being, then it shall be lawful for the said Lord Mayor and aldermen, or the said court of quarter sessions, as the case may be, and they are hereby respectively required, either to fine every such surveyor in such sum of money not exceeding fifty pounds as they shall think fit, or to discharge him forthwith from his said office; and that if for any such cause such surveyor be discharged, he shall be incapable of being again appointed a surveyor for the purposes of this Act.

OFFICIAL REFEREES.

*Appointment of Two Official Referees—Tenure of Office.*

75. And now, for the purpose of providing for the appointment of competent official referees to superintend the execution of this Act throughout all the districts to which it is applicable, and also to determine sundry matters in question incident thereto, as well as to exercise, in certain cases, a discretion in the relaxation of the fixed rules and directions of this Act, where the strict observance thereof is impracticable, or would defeat the object of this Act, or would needlessly affect, with injury, the course and operation of this branch of business; be it enacted, with regard to the official referees, so far as relates to their appointment, to their qualifications and to the tenure of their office, that it shall be lawful for her Majesty's Principal Secretary of State acting for the Home Department, and he is hereby empowered to appoint two persons, being architects, to be official referees of metropolitan buildings, and from time to time, as he shall think proper, to remove such official referees, and in their place to appoint other persons so qualified.

*Their Functions generally.*

76. And be it enacted, with regard to such official referees, so far as relates to their functions generally, that it shall be the duty of such official referees, and they are hereby required to superintend the execution of this Act, by the several district surveyors already existing, or hereby authorized to be appointed, and to perform the several matters to them respectively assigned by the provisions of this Act, and to determine all questions referred to them, whether expressly by this Act, or at the instance of any one or more of the parties concerned.

*Matters of Reference—One Referee may act.*

77. And be it enacted, with regard to the official referees, so far as relates to their jurisdiction, that if any doubt, difference or dissatisfaction, in respect of any matter within the limits of this Act, arise between any parties concerned, or between any party and any surveyor, or between any two surveyors, as to any act done or to be done in pursuance of this Act; or as to the effect of the provisions thereof in any case; or as to the mode in which the provisions and directions of this Act are or ought to be carried into effect; and to particularly as to whether the requirements implied in terms of qualification, applied to sites, to soils, to materials or to workmanship or otherwise, and denoting good, sound, fit, proper or sufficient, are fulfilled in certain cases; or as to the district in which any building, matter or thing is to be deemed to be situate, especially in cases where such building, matter or thing is partly in one district and partly in another; or as to the expenses to be borne by the respective owners of premises parted by the same party-walls, or the proportions thereof, or as to the proportions of the expense to be borne by the occupier, or by the owners of premises, in respect of any work executed, or any other matter whatever; then it shall be lawful for any party concerned, and he is hereby entitled, to require the official referees to determine such matter, but so that such requisition be made in writing, and that it set forth, either generally or otherwise, the matters

We think this needs some restriction, or persons may be found to evade the statute in some trifling, for the purpose of avoiding payment of the fees.

The words should run, "deemed to be a certificate of all the works enumerated therein done in all respects agreeably to this Act, and of such works as have been done contrary thereto, and of the proceedings which have been taken therein."

We do not think two Official Referees sufficient to perform the business.

in respect of which the determination of the official referees is required; and that the determination of such referees, or of one of such referees, with the assent of the registrar of metropolitan buildings, as to all or any of the points in difference on which such referees shall make their award, and as to the costs, charges and expenses of such reference, shall be binding on all parties to such reference.

*Award and Powers of Referees—Legal Effect of Awards—Effect as to Persons.*

78. And be it enacted, with regard to the official referees, so far as relates to their authority in respect of any reference to them, and to the effect of their award upon the rights and interests of the owners and occupiers of property, that it shall be lawful for such referees and they are hereby empowered to exercise all such powers as arbitrators as they would have had in case they had been appointed under an order of her Majesty's Court of Queen's Bench at Westminster; and that if such award be given in writing, and be sealed by the official seal of the registrar of metropolitan buildings, it shall be as effectual as if made under an order of reference by such court, and shall be enforced by the said court in all respects as if made under an order of such court; and that it shall be binding and conclusive against every person, body politic and corporate, including the Queen's Majesty, her heirs and successors, claiming any estate, right, title, trust, use or interest in, to or out of the said premises or any part thereof, either in possession, reversion, remainder, or expectancy, and against every other person whomsoever.

*Effect of Awards as Evidence.*

79. And be it enacted, with regard to such award, so far as relates to the effect thereof as evidence of the matter thereof, that if on the trial or hearing of any cause or matter in any court of law or equity or elsewhere, any copy of an award, signed and sealed with the seal of the said registrar, be produced, then it shall be the duty of all judges, justices, and others, and they are hereby required to receive the same as *prima facie* evidence of the matters therein contained.

*Declaration of Official Fidelity.*

80. And be it enacted, with regard to the official referees, so far as relates to the declaration of official fidelity, that before any official referee shall act in pursuance of his appointment, it shall be his duty and he is hereby required to take the following declaration, to be administered by the Chief Baron or any other of the barons of her Majesty's Court of Exchequer; that is to say:—"I, A. B., do solemnly declare, that I will diligently, faithfully, and impartially execute the duties of an official referee in relation to matters arising under the provisions of the Act made and passed in the year of the reign of her present Majesty, intituled 'An Act for regulating the Construction and the Use of Buildings in the Metropolis and its Neighbourhood, and commonly called 'The Metropolitan Buildings Act.'"

We apprehend the words should run, "MAKE the following declaration." See also *ante*, "her Majesty Queen Victoria." The same observations apply to § 83.

*Regulation of Business of the Official Referees—Official Referees may delegate Powers and revoke them.*

81. And be it enacted, with regard to such official referees, so far as relates to the regulation of the business of their office, that when any matter is by this Act required, directed or permitted to be done by the official referees, the same may be done by any one of them, with the assent of the registrar of metropolitan buildings, unless express provision to the contrary be made, and if done by any one of them with such assent, it shall be as valid and effectual as if done by all of them; and that, subject to such restrictions and regulations as may be made in that behalf by the Commissioners of Works and Buildings, it shall be lawful for the official referees to appoint any one of their number, under their hands and the seal of the registrar of metropolitan buildings, to make any inquiry or any survey which shall appear to them either necessary or expedient in order to enable them to determine any matters in reference.

REGISTRAR OF METROPOLITAN BUILDINGS.

*Appointment of Registrar—Tenure of Office—Rules of Office—Seal of Office—Use of Seal of Office—Report of Objections by Registrar—Authority of Commissioners of Works and Buildings—Interim Registrar.*

82. And, for the purpose of duly recording relaxations of the requisitions of this Act, made in pursuance of the provisions hereof in that behalf, and of providing for the revision from time to time both of such relaxations and requisitions, and of providing against the partial exercise of the powers of this Act, and for the more effectually providing for the due recording of the acts of the official referees, and for exercising a due control thereon; be it enacted that it shall be lawful for the Commissioners of Works and Buildings, and they are hereby authorized and required to appoint a registrar of metropolitan buildings; and that such registrar shall hold his office during the pleasure of the said commissioners; and that, subject to the provisions of this Act, it shall be lawful for the said Commissioners to make rules for regulating the execution of the duties of the office of the said registrar; and that it shall be the duty of such registrar to keep a seal, and to affix such seal to all documents made by the said official referees, and required to be sealed; and to keep all the documents and records relating to the business of their office, and to register the same; provided always, with regard to the acts of the said registrar, that if such registrar be ill or otherwise unable to discharge the duties of his said office, or if he be absent, then it shall be lawful for the said commissioners of works and buildings to appoint some other person to act in his behalf, and to assign to such person such part of the remuneration of the said registrar, or otherwise to remunerate him as the Lords of the Treasury shall appoint in that behalf.

*Declaration of Official Fidelity.*

83. And be it enacted, with regard to the registrar, so far as relates to the declaration of official fidelity, that before any registrar shall act in pursuance of his appointment, it shall be his duty and he is hereby required to take the following declaration, to be administered by the chief baron, or any other of the barons of her Majesty's Court of Exchequer; that is to say:—"I, A. B., do solemnly declare, that I will diligently, faithfully, and impartially execute the duties of registrar in relation to matters arising under the provisions of an Act made and passed in the year of the reign of her present Majesty, intituled, 'An Act for regulating the construction and the use of buildings in the metropolis and its neighbourhood,' and commonly called 'The Metropolitan Buildings Act.'"

*Custody and Inspection of Records of Official Referees—Copies of Awards—Authentication of Copy, and Fees Therefor.*

84. And be it enacted, with regard to such awards, certificate and other records of the said official referees, so far as relates to the custody and the inspection thereof, that all such awards, certificate, and other documents relating to the business of their office shall be kept in the office of the registrar of metropolitan buildings; and that if, for the purpose of evidence or otherwise, any party require a copy of such award, then, on payment of the expense thereof, and of such fees as may be appointed in that behalf, it shall be lawful for such party, and he is hereby entitled to demand from the registrar an inspection thereof, or a copy thereof or extract therefrom; and that, on such payment and demand, it shall be the duty of such registrar, and he is hereby required to give, under his hand and seal of office, a copy of any such award, or any other document, to the person so demanding the same.

*Office of Registrar, and Regulation of Business.*

85. And be it enacted, with regard to the registrar of metropolitan buildings, so far as relates to his office or place of business, and to the regulation of the business thereof, that it shall be lawful for the commissioners of works and buildings, and they are hereby required to appoint, in some central and convenient situation within the city of London or the city of Westminster, an office for carrying on the business of the registrar of metropolitan buildings, and registering all documents relating to such business; and in such office to keep a register of all matters referred to the official referees, and otherwise of all matters which shall come under their cognizance in pursuance of this Act; and also to keep and preserve all documents connected with the duties of official referees; and also to receive all notices requiring any act to be done by them, and to file and number them in the order in which they are received.

*Registration of Awards, &c.*

86. And be it enacted, with regard to all the awards and certificates, and all documents relating to the business of the official referees, so far as relates to the registration thereof, that the same shall be registered not only chronologically in the order in which they are received, but according to the subject-matters thereof, and also according to the order of and in relation to the provisions of this Act.

*Remuneration of Official Referees and Registrar—Quarterly Payments.*

87. And be it enacted, with regard to such official referees and registrar, so far as relates to their remuneration, that it shall be lawful for her Majesty to grant to each of such official referees and the said registrar a salary not exceeding one thousand pounds by the year, in four equal quarterly payments; and that if any such official referee or such registrar shall be appointed, or shall die, resign, or be removed from office, in the interval between two quarterly days of payment, then he shall be entitled to a proportionate part of the salary for the period of such interval during which he shall hold such appointment.

This and the following provision are most excellent.

We think as the "Registrar" is to be a kind of judge, and would to some knowledge of building require to have added the legal knowledge of a barrister, that for proper remuneration, and for insuring the employment of a respectable and impartial person, his salary should be 1,500l. per annum.

## OFFICIAL REFEREES—REGISTRAR.

*Funds for defraying Expenses of the Official Referees and Registrar—Nature of Levy.*

88. And forasmuch as the services of such official referees and of such registrar will be employed chiefly on behalf of the localities comprised within the limits of this Act, it is expedient to provide for the payment of a portion of their salaries by means of a county rate, or by a rate in the nature of a county rate on such localities, in proportion to the assessed value of inhabited houses and buildings therein, or as near thereto as may be; now, for that purpose, be it enacted, with regard to such official referees and registrar, so far as relates to the payment of a portion of their salaries out of local funds, that it shall be lawful for the Lord Mayor and aldermen of the city of London, and they are hereby required, to direct the chamberlain of the said city, and for the justices of the peace for the several counties of Middlesex, Surrey, and Kent, and they are hereby respectively required to direct the treasurer of such respective counties to pay half-yearly to or into the hands of the cashier of the commissioners of works and buildings, on account of the said official referees and of the said registrar, the several sums of money hereafter mentioned, as and by way of contribution to such salaries: that is to say,—the city of London, and the liberties and the suburbs thereof, the sum of 100l.; the county of Middlesex, 1,000l.; the county of Surrey, 320l.; the county of Kent, 80l.; and to cause the same to be levied by a rate upon the several parishes and places within the limits of this Act, in such amounts as to such justices may seem proper, having regard to the assessed value of the inhabited houses and the buildings in such places respectively, in addition to the county rate in respect thereof; and that for the purpose of levying such sums, they shall be deemed to be part of the county rate, and leviable by all the ways and means by which a county rate is leviable, and subject in all respects to the legal incidents of a county rate.

*Payments of Official Referees and Registrar out of the Consolidated Fund.*

89. And be it enacted further, with regard to the official referees and registrar, so far as relates to the payment of the balance of their salaries, that such balance shall be payable and paid out of the Consolidated Fund of the United Kingdom.

## LEGAL PROCEEDINGS.

*Fees of Office, and Application thereof—Balance to Consolidated Fund—Regulations as to Receipt, Custody, and Accounts.*

90. And be it enacted, with regard to the fees payable to the registrar, so far as relates to the appointment thereof, and to the application thereof, that from time to time it shall be lawful for the Commissioners of the Treasury to appoint such fees to be paid in respect of the services to be performed by the said official referees or by the said registrar, as shall be deemed requisite to defray the expenses of the said office or incident to such services, and the salaries or other remuneration of any persons employed under the registrar in the execution of this Act, with the sanction of the Commissioners of the Treasury, and which are not otherwise provided for by this Act; and that the balance, if any, shall be carried to the Consolidated Fund of the United Kingdom, and be paid accordingly into the receipt of her Majesty's Exchequer at Westminster; and that it shall be lawful for the Commissioners of the Treasury to regulate the manner in which such fees are to be received, and in which they are to be kept, and in which they are to be accounted for.

*Informalities in Distress—Action for Damages.*

91. And now, for the purpose of regulating sundry legal proceedings, be it enacted, with regard to any distress for any sum of money to be recovered by virtue of this Act, so far as relates to the remedying of any damage occasioned by any irregularity therein or in reference thereto, that notwithstanding there be any defect of form in the proceedings relative to any such distress, neither the distress itself shall be deemed unlawful, nor shall the party making use thereof be deemed a trespasser ab initio; but that if any irregularity be committed by any party, then, subject to the conditions in this Act prescribed with regard to actions brought for any thing done in pursuance thereof, it shall be lawful for the person aggrieved by such irregularity and be is hereby entitled to recover full satisfaction for the special damage only; and that by action on the case, and not by any other action whatsoever.

*Tender of Amends—Payment of Compensation into Court.*

92. And be it enacted, with regard to any action for any irregularity or other proceeding, so far as relates to the tender of amends or payment of money into court in respect thereof, that if, before such action be brought, the party who committed or caused to be committed any such irregularity or wrongful proceeding, make or cause to be made tender of sufficient amends, then the plaintiff shall not be entitled to recover in such action; and that although such tender shall not have been made, yet if at any time before issue joined the party who committed such action shall be depending, or a judge of any of the superior courts grant leave, then it shall be lawful for the defendant to pay into court any sum of money, by way of compensation or amends, in such manner and under such regulations, as to the payment of costs and the form of pleading, as is and are customary and in force in the said superior courts.

*Recovery of Money under Awards—Distress—Imprisonment.*

93. And be it enacted, with regard to every sum of money by this Act, or by any award or certificate or other proceeding in pursuance of this Act, charged upon any person in respect of any work done in pursuance or in accordance with this Act, so far as relates to the recovery of such sum of money, that it shall be lawful for the party claiming the same to proceed in a summary way before any two justices of the peace, or if the matter arise within the district of the metropolitan police, then before any police magistrate having jurisdiction within that district; and that, on proof of such sum of money being still due, it shall be lawful for such justices or such police magistrate, and they respectively are hereby required to issue a warrant to levy the amount thereof, and also the costs of the proceeding to be levied by distress of the goods and chattels of the person in default; and if such person have no goods and chattels whereon to distrain, or if such goods and chattels be insufficient for that purpose, then it shall be lawful for such justices or police magistrate, or for any other justice or police magistrate, to commit the person in default until the amount of such sum so due, and of such costs, shall have been fully paid.

*Prosecution of Offences—Complaint—Summons—Distress—Imprisonment.*

94. And be it enacted, with regard to all offences against the provisions of this Act for which no other proceeding is provided, so far as relates to the prosecution thereof, that it shall be lawful to proceed by complaint before any two justices of the peace; and that it shall be lawful for such justice to summon the party against whom such complaint shall be made; and that on conviction of the offender before two justices, or before any police magistrate, it shall be the duty of such justices or magistrate, and they are hereby required, to cause the amount of the penalty hereby imposed in respect of such offence, and of the costs of any such proceeding in respect of such offence, to be levied by distress of the goods and chattels of the offender; or if he have no goods and chattels whereon to distrain, or if they be insufficient for that purpose, then it shall be lawful for such justices or magistrate, or for any other justice or magistrate, and they are hereby empowered, either on failure of such distress or in the first instance, to commit the offender till he shall have paid the full amount of such penalty and such costs.

*Removal of Orders, &c. into Superior Courts—Certiorari.*

95. And be it enacted, with regard to every order which shall be made by virtue of or under this Act, and to any other proceeding to be had touching the conviction of any offender against this Act (except proceedings touching the conviction of any offender for carrying on a trade or business offensive, noxious or dangerous contrary to this Act, otherwise than those herebefore specified), that it shall not be lawful for any person to remove such order or other proceeding by certiorari, or any other writ or process whatsoever, into any of her Majesty's courts of record at Westminster; and every such order and other proceeding is hereby declared not to be so removable.

*Limitation of Actions for Penalties.*

96. And be it enacted, with regard to every penalty or forfeiture incurred under this Act, so far as relates to the limitation of the proceedings for the recovery thereof, that if, within six calendar months next after such penalty or forfeiture shall have been incurred, an action or prosecution be not brought or commenced against the person liable in respect thereof, then thereafter it shall not be lawful for any person to bring such action or commence such proceeding in respect of such penalty or forfeiture.

*Recovery of Penalties—Appropriation.*

97. And be it enacted, with regard to every such penalty or forfeiture, so far as relates to the recovery and the appropriation thereof, that it shall be lawful for any party to sue or proceed for the same; and that if such penalty be not otherwise specifically appropriated, then the person so suing or proceeding shall be entitled to receive the amount thereof for his own benefit.

*Regulation of Actions against Persons acting under this Act—Limitation of Action—Notice of Action—Venue in London—Venue in Middlesex—Plea and Evidence—Verdict—Costs.*

98. And, for regulating proceedings against persons acting in pursuance of this Act; he it enacted, with regard to any action or suit against any person in respect of any act or thing done or intended to be done in pursuance of this Act, so far as relates to the limitation thereof, and to the notification thereof to the offending party, and to the venue thereof, and to the pleadings therein, and to the evidence of the matters therein, and to the verdict therein, and to the judgment of the court thereon, and to the costs of such action, and to the recovery of such costs, that, where the notification or suit, summons, writ, or other process, is first committed, it shall not be lawful to bring any such action or suit against any person in respect of any such act; and that if twenty-one days at the least before the commencement of the action or suit, notice in writing of an intention to bring such action or suit be not given to every person against whom

We do not think the partition of expenses as here contemplated would be equitable.

The words should run, "in pursuance of or in accordance with this Act."

## SCHEDULES TO WHICH THE FOREGOING ACT REFERS.

SCHEDULE (A).—This schedule contains merely a description of the Acts and parts of Acts repealed by this Act.

SCHEDULE (B).—(See § 3 & 7.)—Containing List of Buildings of whatever Class, exempted from Ordinary Supervision, and placed under Special Supervision.

All bridges or structures wholly underground, and embankment walls, and retaining walls, and wharf or quay walls, and sea defences, and any other works, and any building in the possession of her Majesty, her heirs and successors, or employed for her Majesty's use or service: and the offices and buildings of the Governor and Com-

such action or suit shall be brought, then it shall not be lawful for any person to bring any such action or suit against any person in respect of the said Act; and that if the cause or matter of any such action or suit arise within the said city of London or the liberties thereof, then such action or suit must be laid in the city of London, and not elsewhere; and that if the cause of any action or suit arise in any part of the limits aforesaid, out of the said city of London and liberties thereof, then it must be laid and tried in the county of Middlesex, and not elsewhere; and that in every such action or suit it shall be lawful for the defendant, and he is hereby entitled, to plead the general issue; and at the trial to be had thereof, to give this Act and the special matter in evidence, and to prove that the matter or thing for which such action or suit is brought was done in pursuance and by the authority of this Act; and that if, upon the trial of such action, it appear that the said matter or thing has been done in pursuance of this Act, or if it appear that such action or suit was brought before the expiration of twenty-one days after such notice given as aforesaid, or if it appear that sufficient satisfaction was made or tendered before such action was brought, or if upon plea of payment of money into court, it shall appear that the plaintiff has not sustained damages to a greater amount than the sum paid into court, or if any such action or suit be not commenced within the time herein for that purpose limited, or if it be laid in any other county or place than as aforesaid, then and in every such case it shall be the duty of the jury, and they are hereby required to find for the defendant; and that if a verdict be found for the defendant, or if the plaintiff in any such action or suit become non-suited, or discontinue or suffer a discontinuance of any such action or suit, or if judgment be given for the defendant therein, on demurrer or by default, or otherwise, then the defendant shall be entitled to have judgment to recover full costs of suit, and to such remedy for recovering the same as any defendant shall have by law.

#### Costs of Actions.

99. And further, for the prevention of vexatious litigation, be it enacted, with regard to every action in respect of any matter or thing done or intended to be done in pursuance of this Act, so far as relates to the costs of such action, that if the defendant apply to the superior court in which such action is pending, or to any judge of any of the said courts, then it shall be lawful for such court or any such judge to require the plaintiff to give such security as such court or judge shall think fit, for the payment of all costs, charges and expenses incurred or to be incurred in and about the said action, and which shall be or become payable by him on the taxation thereof by the proper officer.

#### Prosecutions for preventing Neglect or Evasion of this Act—Notice of Action.

100. And be it enacted, with regard to any penalty or forfeiture incurred by any default in complying with the provisions of this Act, so far as relates to proceedings for the recovery thereof, that at any time within three months after such penalty or forfeiture shall have been incurred, it shall be lawful for any surveyor appointed or confirmed by virtue of this Act, and all other persons, and they are hereby entitled to commence and prosecute proceedings for the recovery thereof, or for the recovery of the expenses of pulling down or altering of any building against any owner, occupier, builder, workmen, or other person, or for any default made in complying with the provisions of this Act; provided always, that if such proceedings be taken by any person, except one of the surveyors, or except the official referees, then notice of the intention to commence such proceedings must be given at the office of the surveyor of the district, and at the office of the registrar of metropolitan buildings.

#### MISCELLANEOUS.

**Notifications—Married Female—Infant, Idiot or Lunatic—Owner unknown—Building unoccupied—Immediate Landlord—Part Ownership—Service of Notices—Damages arising from defective Service.**

101. And be it enacted, with regard to notices by this Act required, so far as relates to the service thereof upon the owner or occupier of any building or ground, that every such notice must be given as follows, that is to say—If such owner be a married female, other than a cestuquie trust in regard to such property, then such notice must be given to the husband of such married female; or if such owner be an infant, idiot or lunatic, or cestuquie trust, then such notice must be given to the guardian, trustee or committee of such infant, idiot or lunatic, or cestuquie trust; or if such owner, husband, trustee, guardian or committee is not known or cannot be found, then such notice must be given to the occupier of such building, fence or ground to which it shall relate; or if such building or ground be unoccupied, then such notice must be affixed to some conspicuous part of such building, fence or ground, at a height of not more than nine feet from the ground: and if the person in the occupation of any building or premises, ground or tenement, in respect of which notice is to be given, allege that he is not the owner thereof, then such notice must be given to the immediate landlord of such occupier, and it shall be the duty of such occupier, and he is hereby required to inform any person by whom such notice shall be required to be given, or any other person applying on his behalf of the name, place of residence, or place of business of such owner or landlord, or of his agent or other person by whom the rent of such building, premises, ground or tenement shall be received; and if each owner or landlord be not in receipt of the whole of the rents or profits of such building, premises, ground or tenement; and if any notice shall be served upon such owner or landlord, then, immediately upon the receipt thereof, it shall be his duty and he is hereby required to transmit to his immediate landlord or his agent, and also to any other person having an interest in such building or premises, ground or tenement, or in receipt of the rents or profits thereof under the same immediate landlord, or to the agent of such person, a copy of such notice: provided always, with regard to every such notice, so far as relates to the service thereof upon any such owner, that if it be served upon the immediate landlord of the occupier or upon his agent, by or on behalf of the person by whom it is hereby required to be served in the first instance, then, although it may not be served by such immediate landlord upon any other landlord or owner, such service is to be deemed to be sufficient service; but nevertheless, if any owner suffer damage by the failure of any other person, being either the occupier or any person holding under such owner, to serve such notice, then such owner shall be entitled to recover the amount thereof against such person by whom such damage shall have been occasioned; and that every notice served under this clause, on any person, must contain a copy of the provisions, so far as they require him to transmit the same to his immediate landlord, or the agent of such landlord.

#### Mode of Service upon Occupier.

102. And be it enacted, with regard to notices by this Act required, so far as relates to the mode of service thereof upon the occupier of any building or ground, that if such notice be intended for the occupier of any building or ground, then it must be given either personally or by leaving the same with some inmate at the premises, or it must be affixed as aforesaid.

#### Mode of Service upon Owners, by delivery—Effect of Notice.

103. And be it enacted further, with regard to all such notices, so far as relates to the mode of service thereof upon owners by delivery, that every such notice (except such notice as may, according to the provision in that behalf, be sent by post), must be given either personally or by leaving the same with some inmate at the usual place of abode of such party, or if that be not known, then at his last known place of abode; and that every such notice, when so given to such persons respectively as aforesaid, or left at the last known place of their respective abodes, or when so affixed as aforesaid, according to the cases hereinbefore mentioned, is hereby declared to have the same effects and consequences as if given to the actual owner.

#### Mode of Service upon Owners, by transmission.

104. And be it enacted further, with regard to notices by this Act required to the mode of service thereof by transmission, that if any owner, upon whom the same is required to be served, be not within the limits of this Act, or have not, within the limits of this Act, any agent acting in his behalf in the matter of the premises to which the notice refers, then it shall be lawful to give notice by post-letter, duly registered according to the practice for the time being, adopted with regard to letters transmitted by post; but so that, nevertheless, such letter be posted in such time as will afford to the person addressed, after the receipt of such letter, the full period of notice required in the case.

#### Notices for Surveyors and Official Referees.

105. And be it enacted, with regard to notices, so far as relates to the service thereof upon the surveyors and upon the official referees, that if the notice relate to the surveyor, then such notice must be served at the office of the surveyor; and that if the notice relate to the official referees or any of them, then such notice must be left at the office of the registrar of metropolitan buildings.

#### Consents by Incapacitated Persons.

106. And be it enacted, with regard to consents by this Act required to be given by the owner or occupier of any building or ground, so far as relates to the making thereof on behalf of incapacitated persons, that if such owner or occupier be a married female, not being a cestuquie trust in regard to the property to which such consent relates, then such consent must be given by the husband of such married female; or that if such owner or occupier be an infant, idiot or lunatic, or cestuquie trust, then such consent must be given by the guardian, trustee or committee of such infant, idiot or lunatic, or cestuquie trust; or that if such owner or occupier, husband, trustee, guardian or committee be not known or cannot be found, then such consent must be given by the official referees.

#### Exemption from Stamp Duty.

107. And be it enacted, with regard to the following documents, so far as relates to the payment of stamp-duty in respect thereof, that every certificate and every award required to be made or signed by the surveyor or the official referee, shall be and is hereby exempted from stamp-duty.

108. And be it enacted, that this Act shall be deemed to be a public Act, and shall be judicially taken notice of as such by all judges, justices and other persons whomsoever, without specially pleading the same.

109. And be it enacted, that this Act may be amended or repealed by any Act to be passed in this present session of Parliament.

pany of the Bank of England already erected, and which now form the edifice called "The Bank of England," and any offices and buildings hereafter to be erected for the use of the said governor and company, either on the site of, or in addition to, and in connection with, the said edifice; and the warehouses of or belonging to the said Saint Katharine Dock Company, and situated in the parish of Saint Botolph-without-Aldgate, and in the precinct of Saint Katharine, near the Tower of London, in the county of Middlesex; and the warehouses and buildings of or belonging to the London Dock Company, comprehended within the wall of the said company, as set forth in an Act passed in the ninth year of the reign of his late Majesty King George the Fourth: and the several warehouses and buildings of or belonging to the East and West India Dock Company, established by an Act made in the first year of the reign of her present Majesty: and the buildings erected, or to be erected, by the London and Birmingham Railway Company, established and incorporated by an Act passed in the third year of the reign of his late Majesty King William the Fourth, within and in connection with the works of that railway, by virtue of the several Acts relating thereto; and the erections and buildings authorized by an Act passed in the ninth year of the reign of his late Majesty King George the Fourth, for the purposes of a market in Covent Garden; and any other buildings exempted by any Act of Parliament from the operation of the Act passed in the reign of his late Majesty King George the Third, and hereby repealed.

**SCHEDULE (C)—PART I.—(See § 5.)—Rules for determining the Classes and Rates to which Buildings are to be deemed to belong for the purposes of this Act, and the Thickensses of the Walls of Buildings of such Rates.**

**CLASSES OF BUILDINGS.—**For the purposes of this Act, all buildings of whatever kind, subject to the provisions thereof, are to be deemed to belong to one or other of the following three classes; that is to say,—

**First Class.**—If a building be built originally as a dwelling-house, to be occupied, or intended to be occupied, as such,—then it is to be deemed to belong to the first, or dwelling-house class.

**Second Class.**—If a building be built originally as a warehouse, storehouse, granary, brewery, distillery, manufactory, or workshop, or be occupied or intended to be occupied as such, or for a similar purpose,—then it is to be deemed to belong to the second or warehouse class.

**Third Class.**—If a building be built originally as a church, chapel, or other place of public worship, college, hall, hospital, theatre, public concert-room, public hall-room, public lecture-room, public exhibition-room, or occupied or intended to be occupied as such, or for a similar purpose, or otherwise used or intended to be used, either occasionally or constantly, for the assembly of persons in large numbers, whether for public worship, business, instruction, debate, diversion, or resort,—then it is to be deemed to belong to the third or public building class.

**Alteration of Class.**—And if any room, whether constructed within any other building or not, and whether included in the aforesaid classes or not, be used at any time for the public or general congregation of persons,—then the building containing such room is to be deemed a building of the third or public building class. Or if a building originally built, or subsequently altered, so as to be included within any one class, be subsequently converted into or used as a building of another class,—then it is to be deemed to belong to such other class; and, as to it, all the conditions prescribed with regard to buildings of the same rate of such other class must be fulfilled, as if it had been originally built of such class; subject, nevertheless, to such modifications as shall be sanctioned by the official referees on a special supervision thereof.

**RATES OF BUILDINGS.**—And the buildings included in the said classes are to be deemed to belong to the rates of those classes, according to the conditions of height, area, and number of stories set forth in the following tables; which conditions are to be determined according to the following rules:

**Rule for ascertaining Height.**—The height of every building is to be ascertained by measuring from the surface of the first or lowest floor of the building, up to the underside of the ceiling of the topmost story, at the highest part thereof, whether such story be within the roof or not. And if there be no ceiling made, or intended to be made to the topmost story,—then by measuring from the surface of such first or lowest floor of the building up to the underside of any tie-beam, collar-beam, or other substitute for a tie-beam of the highest roof.

**Rule for ascertaining Area.**—And the area of every building is to be determined by the number of squares contained in the surface of any floor which shall contain the greatest number of squares at or above the principal entrance to such building; including in such surface the area of all the external walls and such portions of the party-walls as belong to such building, but excluding from such surface the area of any attached office, area, balcony, or open portico.

**Rule for ascertaining Stories.**—And the stories of every building are to be counted from the foundation upwards. And if the space between the top of the footings and the level of the first floor do not exceed five feet, then the story nearest the foundation is to be considered the lowest or first story; but if such space exceed five feet, then such space is to be considered to contain the lowest or first story; and in that case the top of the footing is to be considered the level of the first floor.

**Rule for ascertaining Thickness of Walls.**—And the thickness of every wall, and of the footing thereof, is to be ascertained by measuring only the thickness of which such walls or footings shall have been originally built.

SCHEDULE (C).—PART II.—(See § 5.)

Conditions for determining the Rates to which Buildings of the First or Dwelling-House Class are to be deemed to belong, and the Thickness of the External and of the Party Walls thereof.

In reference to Height.	In reference to Area.	In reference to Stories.	Rate of Building.	Requisite Thickness of External Walls of each Rate of the First Class.	Requisite Thickness of Party Walls of each Rate of the First Class.
1. If the building be in height not more than 22 feet,	- If the building do not cover more than 4 squares,	- If the building do not contain in height more than 2 stories,	- It is to be of the First or Lowest Rate.	- And the thickness of the external walls must be, at the least, 8½ inches from the top of the footing to the top of the wall.	- And the thickness of the party-walls must be, at the least, 13½ inches from the top of the footing to the top of the wall.
2. If more than 22, and not more than 27 feet,	- or if it cover more than 4, and less than 6 squares,	- or if it contain more than 2, and less than 3 stories,	- It is to be of the Second Rate.	- And the thickness of the external walls must be, at the least, 10½ inches from the top of the footing to the under-side of the gutter-plate; and at the least 8½ inches from the under-side of the plate to the top of the wall.	- And the thickness of the party-walls must be, at the least, 17½ inches from the top of the footing to the under-side of the second floor; and at the least 13½ inches from the under-side of the second floor to the top of the wall.
3. If more than 27, and not more than 33 feet,	- or if it cover more than 6, and less than 8 squares,	- or if it contain more than 3, and less than 4 stories,	- It is to be of the Third Rate.	- And the thickness of the external walls must be, at the least, 12½ inches from the top of the footing to the under-side of the second floor; and, at the least, 12½ inches from the under-side of the gutter-plate, and, at the least, 8½ inches from the under-side of the gutter-plate to the top of the wall.	- And the thickness of the party-walls must be, at the least, 17½ inches from the top of the footing to the under-side of the second floor; and, at the least, 13½ inches from the under-side of the third floor to the top of the wall.
4. If more than 33, and not more than 39 feet,	- or if it cover more than 8, and less than 10 squares,	- or if it contain more than 4, and less than 5 stories,	- It is to be of the Fourth Rate.	- And the thickness of the external walls must be, at the least, 14½ inches from the top of the footing to the under-side of the third floor; and, at the least, 13½ inches from the under-side of the gutter-plate, and, at the least, 8½ inches from the under-side of the gutter-plate to the top of the wall.	- And the thickness of the party-walls must be, at the least, 17½ inches from the top of the footing to the under-side of the second floor; and, at the least, 13½ inches from the under-side of the second floor to the under-side of the fifth floor; and at the least 13½ inches from the under-side of the fifth floor to the top of the wall.
5. If more than 39, and not more than 45 feet,	- or if it cover more than 10, and less than 12 squares,	- or if it contain more than 5, and less than 6 stories,	- It is to be of the Fifth Rate.	- And the thickness of the external walls must be, at the least, 16½ inches from the top of the footing to the under-side of the second floor; and, at the least, 14½ inches from the under-side of the second floor to the under-side of the fourth floor; and, at the least, 13½ inches from the under-side of the fourth floor to the under-side of the gutter-plate; and, at the least, 8½ inches from the under-side of the gutter-plate to the top of the wall.	- And the thickness of the party-walls must be, at the least, 22 inches from the top of the footing to the under-side of the third floor; and, at the least, 17½ inches from the under-side of the third floor to the top of the wall.
6. If more than 45 feet,	- or if it cover more than 12 squares,	- or if it contain more than 6 stories,	- It is to be of the Sixth Rate, and of the Third Class.	- And the thickness of the external walls must be, at the least, 18½ inches greater than is hereby required for walls of the fifth rate.	- And the thickness of the party-walls must be, at the least, four inches greater than is hereby required for walls of the fifth rate.

FIRST, OR DWELLING-HOUSE CLASS.

Party Walls.

External Walls.

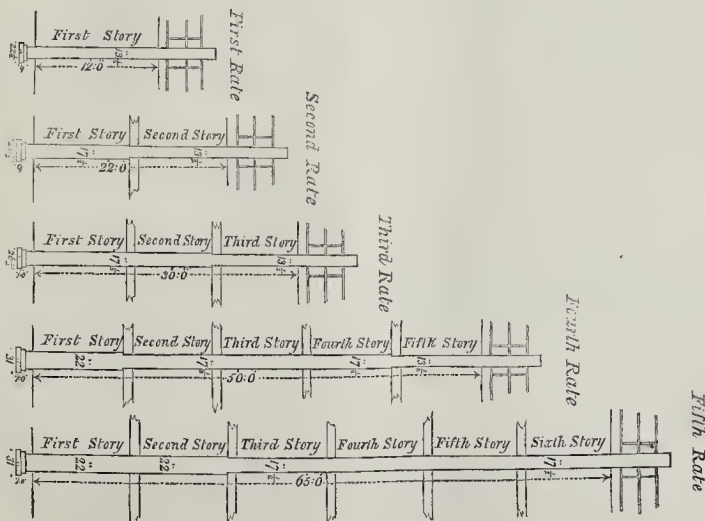

SCHEDULE (C).—PART III.—(See § 5.)

CONDITIONS for determining the Rates to which Buildings of the Second or Warehouse Class are to be deemed to belong, and the Thickness of the External and of the Party Walls thereof.

In reference to Height.	In reference to Area.	In reference to Stories.	Rate of Building.	Requisite Thickness of the External Walls of each Rate of the Second Class.	Requisite Thickness of the Party-Walls of each Rate of the Second Class.
1. If the building be in height not more than 12 feet,	- - If the building do not cover more than 6 squares,	- - If the building do not contain in height more than one story,	- - It is to be of the First or Lowest Rate of this Class.	- - And the thickness of the external walls must be, at the least, 8 $\frac{1}{2}$ inches from the top of the footing to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 13 $\frac{1}{2}$ inches from the top of the footing to the top of the wall.
2. If more than 12, and not more than 22 feet,	- - or if it cover more than 6, and less than 10 squares,	- - or if it contain more than one, and less than two stories,	- - It is to be of the Second Rate.	- - And the thickness of the external walls must be, at the least, 13 $\frac{1}{2}$ inches from the top of the footing to the under-side of the gutter-plate; and, at the least, 8 $\frac{1}{2}$ inches from the under-side of the gutter-plate to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 17 $\frac{1}{2}$ inches from the top of the footing to the under-side of the second floor, and 13 $\frac{1}{2}$ inches from the under-side of the second floor to the top of the wall.
3. If more than 22, and not more than 30 feet,	- - or if it cover more than 10, and less than 16 squares,	- - or if it contain more than two, and less than three stories,	- - It is to be of the Third Rate.	- - And the thickness of the external walls must be, at the least, 17 $\frac{1}{2}$ inches from the top of the footing to the under-side of the second floor; and, at the least, 13 $\frac{1}{2}$ inches from the under-side of the second floor to the under-side of the gutter-plate; and, at the least, 8 $\frac{1}{2}$ inches from the under-side of the gutter-plate to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 17 $\frac{1}{2}$ inches from the top of the footing to the under-side of the third floor, and, at the least, 13 $\frac{1}{2}$ inches from the under-side of the third floor to the top of the wall.
4. If more than 30, and not more than 50 feet,	- - or if it cover more than 16, and less than 26 squares,	- - or if it contain more than three, and less than five stories,	- - It is to be of the Fourth Rate.	- - And the thickness of the external walls must be, at the least, 17 $\frac{1}{2}$ inches from the top of the footing to the under-side of the third floor; and, at the least, 13 $\frac{1}{2}$ inches from the under-side of the third floor to the under-side of the gutter-plate; and, at the least, 8 $\frac{1}{2}$ inches from the under-side of the gutter-plate to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 22 inches from the top of the footing to the under-side of the second floor, and, at the least, 17 $\frac{1}{2}$ inches from the under-side of the second floor to the under-side of the fifth floor, and at the least, 13 $\frac{1}{2}$ inches from the under-side of the fifth floor to the top of the wall.
5. If more than 50, and not more than 65 feet,	- - or if it cover more than 26, and less than 35 squares,	- - or if it contain more than five, and less than six stories,	- - It is to be of the Fifth Rate.	- - And the thickness of the external walls must be, at the least, 22 inches from the top of the footing to the under-side of the second floor; and, at the least, 17 $\frac{1}{2}$ inches from the under-side of the second floor to the under-side of the fourth floor; and, at the least, 13 $\frac{1}{2}$ inches from the under-side of the fourth floor to the under-side of the gutter-plate; and, at the least, 8 $\frac{1}{2}$ inches from the under-side of the gutter-plate to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 22 inches from the top of the footings to the under-side of the third floor; and, at the least, 17 $\frac{1}{2}$ inches from the under-side of the third floor to the top of the wall.
6. If more than 65 feet	- - or if it cover more than 35 squares,	- - or if it contain more than six stories,	- - It is to be of the Sixth Rate, and of the Third Class.	- - And the thickness of the walls must be, at the least, 4 inches thicker than is hereby required for walls of the fifth rate.	- - And the thickness of the party-walls must be, at the least, 4 inches thicker than is hereby required for walls of the fifth rate.

SECOND OR WAREHOUSE CLASS.

Party Walls.

The measurements of stories given in the accompanying illustrations are intended merely to show what heights of stories may be introduced into the height to which each rate of building is limited.

SECOND, OR WAREHOUSE CLASS—Continued.

External Walls.

**SCHEDULE (C).—PART IV.—Rules concerning Buildings of the Second or Warehouse Class.**  
**Warehouses, &c.**—With regard to any building of the second class (except stables, coach-houses, and harness-rooms) hereafter built or re-built, in reference to the area thereof within the said party-walls: If such building exceed 35 squares, then it must have for every 35 squares thereof party-walls; unless such portions of such building as shall be thought necessary by the official referees be built fire-proof.

**Openings in Party-walls.**—And with regard to buildings of the second class, in reference to the openings in such party-walls—such openings must not be wider than six feet, and not higher than eight feet; and the floor thereof must be composed of brick or stone, and the piers thereof must be composed of brick, and must be at least 14 inches wide, and must project at least one foot six inches from the face of such party-wall; and the brick arches or stone landings thereof must extend the entire width and depth of such opening, above and below the same; and every such opening must have two strong wrought-iron sills or folding doors, which must be fixed in wrought-iron frames, and be not less than one-fourth of an inch thick in the panels thereof; and such doors must be distant from the other not less than four feet.

**Fire-proof Part of Buildings.**—And with regard to such second class buildings so built in part fire-proof, in reference to the construction and materials of such fire-proof part,—it must be built of such materials and in such manner as shall be approved by the official referees. And such buildings must be so built as that every single part not built fire-proof must not exceed 35 squares.

**Stables.**—And with regard to any buildings intended for stables, including coach-houses and harness-rooms, which shall be hereafter built, in reference to the area thereof, within the same walls,—no portion thereof must contain within its walls, whether party-walls or external walls, more than 25 squares, nor must any enlargement be made at any time hereafter to any building for stables already built, or which shall be hereafter built, so that any portion of the same when enlarged, including coach-houses and harness-rooms, shall contain more than 25 squares as aforesaid.

**SCHEDULE (C).—PART V.—Requisites for determining the Rate to which any Building of the Third Class is to be deemed to belong.**

If any building of the third or public building class correspond in form or structure or disposition with a dwelling-house,—then the rate thereof is to be determined by the same rules as the rates of the first or dwelling-house class. But if it correspond in form or structure or disposition with a warehouse, or any building of the second class,—then the rate thereof is to be determined by the same rules as the rates of the second or warehouse class. And further, with regard to the walls of such public buildings of whatever rate,—the width of the footings thereof and the thickness thereof are to be at the least four feet and six inches, and the same for party or external walls of the same rate, unless the official referees, on special supervision thereof, shall otherwise appoint.

**SCHEDULE (C).—PART VI.—Rules concerning attached and detached and insulated Buildings, as to the Rates and Walls thereof.**

**Buildings and Offices.**—With regard to buildings or offices now built or hereafter to be built (except greenhouses, vinerias, aviaries, or such like buildings,—and that, whether the same be attached to or detached from the buildings to which they belong),—every such building is to be deemed, in respect of the external walls thereof, and all other requisites, as a building of the rate to which it would belong if it had been built separately; but the party-walls, if any, must be of the rate of the house to which the building or office is attached, or of the rate of the building of the highest rate attached to such party-wall on either side.

**Greenhouses, &c.**—And with regard to greenhouses for plants, vinerias, aviaries, or such like buildings,—subject to any law in force applicable to such buildings, and subject to the rights of the owner or occupier of the adjoining property,—any such building may be built, as to the party-walls, if any, according to the rules of this Act prescribed regarding party-walls; but in other respects, whether the same be attached or detached from any building of whatever class, such building must be built in such manner only, and of such materials only, as shall be approved by the official referees.

**Insulated Buildings.**—And with regard to buildings of the first or dwelling-house class, and of the second or warehouse class, which shall be insulated,—every such building must be distant from any public street or alley one-third of its height at the least; and if the building do not exceed 24 feet in height,—then it must be so distant at the least eight feet; and it must be distant from any other building, or from ground not in the same possession or occupation therewith, or connected therewith only by a fence or fence-wall, not less than its full height; or if the building do not exceed 30 feet in height,—then it must be so distant at the least 30 feet; and if such building be so distant from a public street or alley, and from any other building or ground not in the same possession or occupation therewith,—then such building is not to be liable in respect of the dimensions and materials thereof to the rules and directions of this Act.

**Insulated Buildings afterwards divided.**—Provided always, that if any such building be hereafter divided into two or more distinct buildings, and the several parts of such buildings so divided be not at the aforesaid distance from each other, and from other buildings and ground, then such several parts must have such external walls, and be separated from each other by such party-walls, as are herein prescribed for the rates to which such several parts, if adjoining, would belong; and must be built in every other respect as is herein required for buildings of the rates to which such several parts when so divided shall belong. And the external walls of the several parts of such building must be built in the manner, and of the materials, and at the least of the several heights and thicknesses herein prescribed for external walls of the rates to which such several parts when so divided, and if such requisites be not observed, then such several parts of such buildings in respect of which they are not so observed, shall be deemed a public nu-

isance, and as such be taken down, according to the provisions of this Act in that behalf.

**Toll-houses, &c.**—And with regard to certain buildings which shall be built for the purposes of toll, or the collection of toll, if such buildings be situate fifteen feet at the least from any other building, and do not cover an area of more than one and a half squares, and the height thereof do not exceed twelve feet from the ground to the highest point of the roof, then every such building may be enclosed with any materials whatsoever; but the roof thereof must be covered as herein directed with regard to roofs, and the chimneys and flues (if any) must be built as herein directed with regard to chimneys and flues.

**SCHEDULE (D).—PART I.—Rules concerning Walls, of whatever kind.**

**Foundations.**—With regard to the foundations of walls, in reference to the construction and materials thereof,—every such foundation must consist either of a natural solid stratum, or be formed of a bed of concrete; which concrete must be composed of stone-lime, mixed with Thames ballast, or broken stone or flint, or sharp clear gravel, or burnt clay, in the proportion of at least one bushel of stone-lime to eight bushels of such other materials; and must be at least 18 inches thick, and 12 inches wide at the bottom of the footing; or must be composed of such other materials and be formed in such other manner as the official referees shall license or appoint.

**Footings.**—With regard to footings of walls, in reference to the materials thereof, to the construction thereof, to the width thereof, to the height thereof above the foundation, and to the bottom of the footing, as follows:

**Materials.**—1. In reference to the materials thereof:—Every footing must be built, either of stone, of good sound stock-bricks, or of good sound stock-bricks and stone, and laid in good mortar or cement.

**Construction.**—2. In reference to the construction thereof:—The footing of every wall, whether external or party (except the footings of the external walls of the second rate), and that whether the footing be built of brick-work, or of brick and stone work, must be built in two double courses at the least. The footing of every party-wall for a building of the first rate, or of external or party-walls for buildings of the second rate, whether such footing be built of brick-work, or of brick and stone work, must be built in one single course at the least. The footings of external walls for a building of the first rate, whether such footings be built of brick-work, or of brick and stone work, must be built in two single courses at the least.

**Width.**—3. In reference to the width thereof at the foundation:—The bottom of the footing of every wall must be at the least nine inches wider than the wall standing or intended to which such footing is to be built of brick-work, or of brick and stone work, it must diminish equally on each side by two inches at the least in each successive single or double course from the bottom.

**Height.**—4. In reference to the height above the foundation:—The footing of every wall, whether party or external (except the footings of the external walls and party-walls of the first and second rates), must be at the least twelve inches high above the foundation. The footing of the party-walls of the first rate, and of external and party-walls of the second rates, must be at the least nine inches high above the foundation. The footing of external walls of the first rate must be at the least six inches high above the foundation.

**Depth below Ground.**—5. In reference to the depth thereof below the surface of the lowest ground or area adjoining:—The top of the footing of every external wall and party-wall must be at the least three inches below such surface.

**Depth below lowest Floor.**—6. In reference to the depth thereof below the surface of the lowest floor adjoining or intended to which such footing is to be built of every external wall and party-wall must be at the least nine inches below such surface.

**Walls generally.**—With regard to every party-wall, external wall, or internal wall of every building of the first or dwelling-house class hereafter built, and of every addition to such building, whether already built or hereafter built,—the two courses of brick-work immediately below the level of the bottom of the paving, or of the timbers of the lowest or first floor, must be of good sound bricks, laid in good cement.

**SCHEDULE (D).—PART II.—EXTERNAL WALLS.**

**Materials.**—And with regard to external walls of buildings (except those parts thereof in which it may be required to fix plates, brackets, corbels, and wood-bricks, and to joint, girders, heads and sills of partitions, breastsummers, and story-posts, and except openings for doors and windows, shop-fronts and door-cases to warehouses),—every such wall must be built solid, and of good sound bricks or good sound stone, or of good sound bricks and stone, properly bonded, and set in good and true cemented mortar or cement. Nevertheless, in such walls, in every story above the level of the floor of the third floor, recesses may be formed; so that such recesses be arched over the full thickness of the wall; and so that the back thereof be of the thickness of at least eight inches and a half; and so that the stability of the wall be not endangered thereby.

**Height.**—And with regard to external walls, in reference to the height thereof, in every story above the gutter,—then such external wall must be carried up and remain one foot at the least above the highest part of such gutter. And if the roof overhang the wall,—then such wall must be carried up its full thickness to the underside of the plate of the roof.

**Wood and Iron.**—And with regard to such excepted parts of external walls,—they may be of such wood and iron as shall be necessary. And every plate, lintel, iron, corbel, and wood-work, and all ends of joists, girders, and heads and sills of partitions, must be fixed at a distance from the external face of the wall of four inches at the least. And the frames of doors and win-

downs must be fixed in reveals at a distance from the external face of the wall of four inches at the least. And such wood and iron work as shall be required for breastsummers, girders, and story-posts (which must be only in the lowest and second stories), must be fixed at a distance from the external face of the wall of two inches at the least; and must not exceed a height of 15 feet from the public foot pavement or footway in front of the building to the underside of the breastsummer or girder. And shop-fronts must be fixed in such manner as is herein specially directed. And the tiers of door-cases to window-heads must be fixed in the openings left in such walls, at a distance from the external face of the wall of two inches at the least.

**Breastsummers.**—With regard to every breastsummer fixed to carry any front wall of a building,—if such breastsummer have a bearing at one end upon a party-wall,—then it must be laid upon a template or corbel of stone or iron, which template or corbel must be tailed through such wall at least two-thirds of the thickness thereof; and the end of such breastsummer must not be fixed into, and must not have its bearing solely on such party-wall, but must be supported by a sufficient pier built of brick or stone, or an iron column, or iron or timber story-post fixed on a solid foundation. And if any such breastsummer have its bearing at each end upon a party-wall,—then it must be supported by at least two sufficient piers built of brick or stone, or by iron columns or iron or timber story-posts fixed on solid foundations. And every such breastsummer must be of such scantlings, and fixed and supported in such manner as shall be satisfactory to the surveyor.

**Materials to be used in Repairs.**—And with regard to old external walls or other external inclosures of any building already built, in reference to materials to be used in the repair thereof: If any such wall or inclosure be not built of the materials required by this Act for external walls or other external inclosures, hereafter to be built,—then every part of such wall or other external inclosure (except the inclosure of roofs, and the flats, gutters, dormers, turrets, lantern-lights, and other erections thereon), may be at all times thereafter repaired with materials of the same sort as those of which such external wall or inclosure has been already built.

**Materials to be used in Rebuilding.**—But if any such external wall or inclosure be at any time hereafter taken down, or otherwise demolished for the height of one story, or for a space equal to one-fourth of the surface thereof,—then every part thereof, not built in the manner and of the several materials by this Act directed for external walls, must be taken down; and the same must be rebuilt in such manner, and of such materials, and in all respects as by this Act directed for external walls hereafter to be built, according to the class and rate of the building to which such external wall or inclosure shall belong.

**External Wall used as a Party-wall.**—And with regard to external walls to be used as party-walls of any building adjoining thereto (except an attached building or office as is hereinbefore described): If the external wall of any building have not such footings, or be not of such heights and thicknesses, or be not built in such manner and of such materials as are herein directed for party-walls of buildings of the highest rate to which such wall shall adjoin,—then such external wall must not be used as a party-wall for any such building; but there must be a distinct external wall, built as herein described for external walls, of the rate to which it shall belong.

**SCHEDULE (D).—PART III.—PARTY-WALLS.**

**Division of Buildings.**—And with regard to walls used to divide single buildings into two or more: If it be intended to divide any building into two or more distinct parts, then every wall for that purpose must be built as a party-wall, in the manner and of the materials, and of the several heights and thicknesses for party-walls of the highest rate of building to which such party-wall shall belong or adjoin, as prescribed in reference to the thicknesses of party-walls in Schedule (D). And if any such building be already built, which shall be hereafter built, be converted, used, or occupied as two or more separate buildings, each having a separate entrance and staircase, and each being separately rated to the poor,—then every such building shall be deemed to be two or more separate houses, and must be divided from each other by a party-wall or party-arch or arches, built in the manner and of the materials required for party-walls or for party-arches for the class and rate to which the largest of the buildings so divided shall belong.

**Site of Walls.**—With regard to party-walls, in reference to the site thereof: If the buildings be of equal rate, then such party-wall must be built on the line of junction of such buildings, one-half on the ground of one owner belonging to one of such buildings, and one-half on the ground of the other owner belonging to the other of such buildings. If such buildings be of different rates, then such wall must be built on the line of junction thereof, as follows: That is to say, so much thereof as shall be required for the building of the higher rate, or on the ground of the owner of such building, and so much thereof as shall be required for the building of the lower rate, or on the ground of the owner of such building of the lower rate. And if such building of the lower rate be thereafter enlarged or altered, so as to become a building of a higher rate, then the owner of such first-mentioned building and the owner of such latter building shall be entitled to receive from the owner of such building of the lower rate such sum of money as shall be a sufficient compensation for the ground occupied by that portion of the party-wall which, according to the rate of the building enlarged, ought to have been built by his owner on his own ground.

**Construction and Materials.**—And with regard to party-walls, in reference to the materials thereof (except the flats and the parts thereof in which it may be required to be iron-work, and the following iron or timber, viz., the sides of story-posts, the ends of girders, and breastsummers and trimming joists, and principal timbers of roofs,

and heads and sills of partitions and wood-bricks): Every part of such party-wall must be built solid, and of good small bricks, or good sound stone, or good sound bricks or stone, properly horded and set in good and well-compounded mortar or cement. And as to solid timber or iron, in reference to the position thereof, the sides of story-posts, not exceeding fifteen feet in height above the pavement of the street in front thereof, the ends of girders, breastsummers, trimming joists, principal timbers of roofs, and heads and sills of partitions, the ends of such timbers and wood-bricks must be fixed at a distance of four inches at the least from the centre of such party-wall. But if the ends of timbers or of iron shoes or stone corbels, then such iron shoes or stone corbels may be built into the wall at least two-thirds of the thickness of such wall. And the top of every such party-wall must be finished with one course of sound stock-bricks, set on edge with good cement, or a coping of any other waterproof and fireproof covering.

**Height.**—And with regard to party-walls, in reference to the height thereof: If a party-wall adjoin to any roof,—then such party-wall must be carried up and remain one foot six inches at the least above the part where the party-wall and roof adjoin, measured at a right angle with the back of the rafters of such roof. And if any party-wall adjoin a gutter, then such party-wall must be carried up, and remain two feet at the least above the highest part of any such gutter. If there be fixed within five feet of a party-wall, upon the flat or roof of the building, any turret, dormer, lantern-light, or other erection,—then every such party-wall must be carried up next to every such turret, dormer, lantern-light, or other erection, and must extend one foot six inches higher, and one foot six inches wider than any such erection on each side thereof.

**Openings in Party-walls.**—And for the purpose of regulating the making of openings through any party-wall between one dwelling-house and another, whereby two or more dwelling-houses shall be united. With regard to any dwelling-houses which when so united will contain more than twelve square feet, and the external party-walls of which are such as are herein prescribed for buildings of the fifth rate of the first class, if such dwelling-houses shall be and continue to be in the same occupation, and if the poor-rates in respect thereof shall be paid by the same person,—then upon its being declared by the official referees that in their opinion the stability of any or either of such dwelling-houses will not be endangered by making such openings, they may be made accordingly.

**Recesses and Chases.**—And further, with regard to any party-wall, so to recesses, and to chases in such wall. In every story above the level of the floor of the third story, recesses may be formed, so that such recesses be arched over, and so that the back thereof be not nearer than seven inches to the centre of the party wall, and so that the stability of such party-wall be not endangered thereby. If any chases be required for the insertion of pipes of water, of pipes, or of chimney-jambs, or of vitæ of flues, of metal pipes, or of iron story-posts,—then every chase for any such purpose must not be left or cut nearer than four inches at the least to the centre of a party-wall, and at the distance of nine inches at the least from any front or back wall, and at the distance of seven feet six inches at the least from each other on the same side of the wall, and must not be formed wider than nine inches. And if any hole or cavity be left or made for the insertion of templates, or of landings, or of stone steps, or of corbels, or of iron shoes, or of ends of girders, or of ends of breastsummers, or of ends of trimming joists, or of heads and sills of partitions, or of ends of principal timbers of roofs,—then such hole or cavity must not be left or cut deeper than two-thirds of the thickness of such wall; and on such insertion being made, such hole or cavity must again be made good.

**SCHEDULE (D).—PART IV.—PARTY-WALLS AND PARTY-ARCHES BETWEEN INTERMEDIATE PROPERTY.**

And with regard to any building already built, having roofs or floors, the property of different owners, which lie intermixed, without being separated by any party-wall or party-arch or stone floor. If either of such houses shall be together or in part rebuilt, to the extent of one-fourth of the cubical contents thereof,—then such intermixed properties must be separated from each other as follows:—If they adjoin vertically,—then so far as they adjoin vertically, they must be separated by a party wall. If they adjoin horizontally,—then so far as they adjoin horizontally, they must be separated either by a floor formed of brick, tile, stone, or other proper and sufficient incombustible materials, subject to the consent of the official referees, or by a floor formed of iron girders and brick arches or stone landings, or tiles, or by a party-arch or party-arches of brick or stone, of the thickness of nine inches at the least, if the span do not exceed nine feet; and such floor or party-arch or party-arches must be built with sufficient abutments and in a sufficient manner.

**SCHEDULE (D).—PART V.—BUILDINGS OVER PUBLIC WAYS.**

And with regard to buildings extending over any public way, so far as relates to the separation of such part from such public way. If it be desired to be rebuilt,—then it must be separated from such public way, either by a floor or arch formed of brick or stone, or of other incombustible materials, subject to the consent of the official referees, or by a floor formed of iron girders and brick arches or stone landings, or by an arch formed of brick and stone; which arch, if the span thereof do not exceed nine feet, must be of the thickness of nine inches at the least, and if the span exceed nine feet, must be of the thickness of thirteen inches at the least. And such floor or arch, with its abutments, must be built in such manner as shall be approved of by the surveyor; so far as must be formed over such public way any ceiling of lath and plaster, or of lath and cement.

**SCHEDULE (D).—PART VI.—PARTY FENCE-WALLS.**

And with regard to party fence-walls, in reference to the thickness thereof, and to the height thereof: The footing of every party fence-wall must be six inches high at the least, and nine inches wider at the least than the wall immediately above it; and the top thereof must be in depth three inches at the least below the surface of the ground adjoining; and every such footing must be built in two courses at the least. And the thickness of every such party fence-wall must be in every part thereof one-twelfth at the least of the whole height of the wall, measured from the top of the footing to the top of the wall, and including any coping upon the wall; or if the wall be less than 8½ feet high, then such thickness thereof must be 8½ inches at the least. And every party fence-wall, less than nine feet above the ground on either side thereof, may be raised to that height by the owner of the ground, on the side on which it is less than that height; but upon condition that he do pay all the costs and charges of so raising it.

**SCHEDULE (E).—(See § 5.)—Rules concerning External Projections.**

**Projections from Walls of Buildings.**—And with regard to all buildings, in reference to projections therefrom (except the porticoes of churches, chapels, theatres, or other public buildings, but including steps, cellar-doors, and area inclosures): The walls of all such buildings must be set back, so that all projections therefrom, and also all steps, cellar-doors, and area inclosures, shall only overhang or occupy the ground of the owner of such building, without overhanging or encroaching upon any public way.

**Porticoes projected over Public Ways.**—And with regard to the porticoes of any church, chapel, theatre, or other public building of the third class: If the building of the same shall have been previously sanctioned by the official referees, by writing under their hands, and if objection be not made by any party interested within one month thereafter, and if upon such objection or appeal, Her Majesty's principal Secretary of State acting for the Home department do not decide in favour thereof, then such projections may be built over the foot pavement of any street or alley which shall be fifty feet wide at the least (notwithstanding any Act heretofore passed to the contrary).

**Projections from Face-walls, &c.**—And further, with regard to buildings, in reference to projections therefrom: As to copings, parapets, cornices to overhanging roofs, crocking-courses, cornices, piers, columns, pilasters and entablatures, facias, door and window dressings, or other architectural decorations, forming part of an external wall, all such projections may project beyond the general line of fronts in any street or alley, but must be built of the same materials as are by this Act directed to be used for building the external walls to which such projections belong. And as to all balconies, verandahs of light open iron-work, porches, porticoes, shop-fronts, open inclosures of open areas, and steps and water-pipes, and to all other projections from external walls, not forming part thereof, every such projection (except such part of shop-fronts, and the frames and sashes of the windows and doors, in reference to the necessary wood-work thereof), may project beyond the general line of fronts in any street or alley, but must be built of brick, tile, stone, artificial stone, slate, cement, or metal, or other proper and sufficient fire-proof materials.

**Projections from Insulated Buildings.**—Provided always, with regard to any insulated buildings, that if the projections be at the least 10 feet from any public way, and if they be at least 20 feet from any other building not in the same occupation, then such projections are excepted from the rules and directions of this Act.

**Wooden Shop-Fronts and Shutters.**—And with regard to shop-fronts and their entablatures, their shutters and pilasters and stall-boards, made of wood: If the street or alley in which such front is situate be of less width than 30 feet,—then no part of such shop-front must be higher, in any part thereof, than 7½ feet; nor must any part, except the cornice, project more than five inches; nor must the cornice project more than 18 inches. If the street or alley be of a greater width than 30 feet,—then no part of such shop-front must be higher in any part thereof than 15 feet; nor must any part except the cornice project more than 10 inches; nor must the cornice project more than 18 inches. And the width of such street or alley must be ascertained by measuring the same, as hereinafter directed with regard to the streets and alleys. And the wood-work of such shop-front must not be fixed nearer wall than 4½ inches to the centre line of a party-wall. And with regard to such wood-work: If it be put up at such distance of 4½ inches, then a pier or corbel built of stone or of brick or other incombustible material, and of the width of 4½ inches at the least, must be fixed against such wood-work, so as to be as high as such wood-work, and so as to project one inch at the least in front of the face thereof. And the height of every shop-front must be ascertained by measuring from the level of the public foot pavement in front of the building. And public foot pavement in front of a party-wall, and upon any part of any house must be so fixed that the top shall be within 18 feet at the most above the level of the street or alley.

**Projections beyond the general Line of Buildings and from External Walls.**—And with regard to buildings already built or hereafter to be rebuilt, as to how windows or other projections of any kind: Such projections must neither be built with nor added to any building on any face of an external wall thereof, so as to extend beyond the general line of the fronts of the houses (which general line may be determined by the surveyor), except so far as is hereinbefore provided with regard to porticoes projected over public ways, and with regard to projections from face-walls and shop-fronts;

**Fees for Additions, or Alterations, or Repairs.**—For every addition, alteration, or repair made to any building, which shall involve the execution of works subject to the regulations of this Act, the following fees; that is to say,—

	£ s. d.
If the building be of the 1st or lowest rate	0 10 0
Ditto 2nd rate	. . . 0 15 0
Ditto 3rd ditto	. . . 1 5 0
Ditto 4th ditto	. . . 1 10 0
Ditto 5th ditto	. . . 1 15 0
Ditto 6th ditto	. . . 2 10 0

**Fees for Special Duties.**—For the following special duties performed by any surveyor, according to the enactments of this Act; that is to say,—

For attending to the cutting away of chimney-breasts for external walls,—	£ s. d.
If the building be of the 1st or lowest rate	1 1 0
Ditto 2nd rate	. . . 2 2 0
Ditto 3rd ditto	. . . 2 2 0
Ditto 4th ditto	. . . 2 2 0
Ditto 5th ditto	. . . 2 2 0
Ditto 6th ditto	. . . 3 3 0
For condemning party fence-walls	. . . 1 1 0
For the inspection and removal of projections, &c. in imminent danger, and ruinous buildings	. . . 0 10 0
For surveying party-walls not kept in repair, and consenting to notice of repair being served	. . . 0 10 0

For inspecting arches or stone floors over public ways	£ s. d.
For measuring widths of streets, &c.	. . . 0 10 0
For inspecting formation of openings in party-walls	. . . 0 10 0
For inspecting drains and cesspools	. . . 0 10 0
For inspecting chimney-shafts, pots, funnels, &c. above certain heights	. . . 0 10 0

**Fees for Special Services not expressly provided for.**—For any service performed by any surveyor which is required by this Act, but not comprehended under any of the foregoing heads,—

Such fee as the official referees shall, by writing under their hands, order and appoint, with the consent of the commissioners of works and buildings,

## SCHEDULE (M).—METROPOLITAN BUILDINGS ACT.

SUMMARY OF PROCEEDINGS to be taken or observed before and after Notices in relation to Buildings.

Section of the Act.	Stages of Proceeding.	Steps to be taken.	By whom taken.	With reference to whom taken.	Form of Notice to be given.	Place of Notice.	Subsequent Proceedings.
<b>WORKS GENERALLY.</b>							
13	Before commencing the operations specified in this section.	Two days' notice to be given.	By the Builder. See Definition, § 13.	To the District Surveyor.	See Form No. 1.	At the District Surveyor's office.	£20 penalty for neglect. Existing buildings altered, &c. without notice, to be abated as a nuisance.
"	Before resuming operations, after being suspended for a period exceeding three months.	Two days' notice to be given.	By the Builder. See Definition, § 13.	To the District Surveyor.	See Form No. 2.	At the District Surveyor's office.	£20 penalty for neglect.
"	On change of Architect, Master Builder, or other Superintendent.	Two days' notice to be given.	By the Builder. See Definition, § 13.	To the District Surveyor.	See Form No. 3.	At the District Surveyor's office.	£20 penalty for neglect.
14	On the occurrence of any irregularity in building operations.	48 hours' notice to be given.	By the District Surveyor.	To the Builder.	See Form No. 4.	At the Builder's office.	Proceedings by Surveyor or Official Referees.
36	As to openings hereafter made in external walls abutting on adjoining ground or buildings.	Notice to stop up within one month.	By adjoining Owner.	To Owner of external wall.	See Form No. 5.	According to § 101, &c.	To be stopped up.
<b>SPECIAL SUPERVISION.</b>							
15	On completion of the carcass of a building subject to special supervision.	Notice for inspection thereof.	By the Architect or Builder.	To the Official Referees.	See Form No. 6.	At the Official Referees' office.	Survey and approval, or disapproval by Official Referees. Prohibition of use of irregular buildings of this class, and penalty of £5 to £200 per day.
"	On completion of amendments, or the entire completion of a building, subject to special supervision.	Notice relative thereto.	By the Architect or Builder.	To the Official Referees.	See Form No. 7.	At the Official Referees' office.	Survey and certificate.
<b>PARTY-WALLS, &amp;c.</b>							
20, 21, 23, 24, 25	Before survey, repair or pulling down of a party-wall, party-arch, or party fence-wall.	One month before survey, and six months' notice before operations.	By the Building Owner. See Definition, § 13.	To the adjoining Owner.	See Form No. 8.	According to § 101, &c.	Inspection by Surveyor. § 23.
30	In the same case	Notice for survey	By the Building Owner. See Definition, § 13.	To the District Surveyor and Official Referees.	See Form No. 9.	At the District Surveyor's and Official Referees' offices.	Inspection by Surveyor, and report to Official Referees.
"	In the same case	Appointment of surveyor.	By the District Surveyor.	To the Owners and Agents, &c.	See Form No. 10.	To Building and adjoining Owners and Agents.	Inspection by Surveyor, and report to Official Referees.
32, 33	As to pulling down rooms in inter-joined property, and repairing or rebuilding party fence-walls.	Notices of intention to build a party wall, or as directed by Official Referees.	By the Building Owner.	To the adjoining Owner and District Surveyor, § 20.	See Form No. 11.	According to § 101, &c.	Erection of wall.
"	In the same case	Notice for inspection thereof.	By the Building Owner.	To the District Surveyor and Official Referees.	See Form No. 12.	At the District Surveyor's and Official Referees' offices.	Inspection by Surveyor, and report to Official Referees.
"	In the same case	Appointment of surveyor.	By the District Surveyor.	To the Owners and Agents, &c.	See Form No. 13.	To Building and adjoining Owners and Agents.	Inspection by Surveyor, and report to Official Referees.
"	As to pulling down a timber partition, and erecting or raising a party-wall.	Six months' notice of intention to build or raise a party-wall.	By the Building Owner.	To the adjoining Owner.	See Form No. 14.	According to § 101, &c.	Erection of wall, or raising of wall.
27	Excavation against existing party-wall for a deeper story, and for the erection of an external wall.	One month's notice of intention to cut away footings or breast or shaft of a party-wall.	By the Building Owner.	To the adjoining Owner.	See Form No. 15.	According to § 101, &c.	Execution of operations.
37	Building a party-wall on line of junction of two pieces of vacant ground.	One month's notice for consent of adjoining Owner.	By the Building Owner.	To the adjoining Owner.	See Form No. 16.	According to § 101, &c.	Execution of operations.
"	In the same case	Notice of consent	By the adjoining Owner.	To the Building Owner.	See Form No. 17.	According to § 101, &c.	Erection of wall.
<b>MODIFICATIONS.</b>							
22	Modification of intended work to suit adjoining owner.	Seven days' notice for consent.	By the adjoining Owner.	To the Building Owner.	See Form No. 18.	According to § 101, &c.	If consent not given, commencement of works must be delayed for decision of Official Referees.
"	In the same case	Application for decision.	By the adjoining Owner.	To the Official Referees.	See Form No. 19.	At the Official Referees' office.	Delay in commencing operations.
"	In the same case	Notice of application	By the adjoining Owner.	To the Building Owner.	See Form No. 20.	According to § 101, &c.	Ditto ditto

### SCHEDULE (M).

#### FORMS OF NOTICES AS TO WORKS.

**METROPOLITAN BUILDINGS ACT, VICT., c. 3, § 13, 1844.**

1.—Notice by the Builder to the District Surveyor, two days before commencing operations.

I do hereby give you notice, that I intend to (1) \_\_\_\_\_ and that C. D., of \_\_\_\_\_ is to be the (2) \_\_\_\_\_ of the works to be executed; and that the said works will be begun on the \_\_\_\_\_ day of \_\_\_\_\_ (Signature.)

Dated this \_\_\_\_\_ day of \_\_\_\_\_

[\*.\* Certain penalties are attached to neglect in giving this notice.]

(1) Describing the erection or intended operation in general terms, and whether it relate to any of the following matters:—

"The erection of any building;"

"The making of any addition to or alteration in any building;"

"The building, pulling down, rebuilding, cutting into, or altering any party-wall, external wall, chimney-stack, or flue;"

"The making of any opening in any party-wall;"

"The doing of any other matter or thing by this Act placed under the supervision of the surveyor."

(2) Insert "architect," or "builder," or other superintendent to have charge of the works.

**METROPOLITAN BUILDINGS ACT, VICT., c. 3, § 13, 1844.**

2.—Notice by the Builder to the District Surveyor, two days before resuming operations.

I do hereby give you notice, that I intend to re-commence the (1) \_\_\_\_\_ and that C. D., of \_\_\_\_\_ of the works to be resumed; and that the said works will be continued on the \_\_\_\_\_ day of \_\_\_\_\_ (Signature.)

Dated this \_\_\_\_\_ day of \_\_\_\_\_

[\*.\* Certain penalties are attached to neglect in giving this notice.]

**METROPOLITAN BUILDINGS ACT, VICT., c. 3, § 13, 1844.**

3.—Notice by the Builder to the District Surveyor, as to Change of Builder.

I do hereby give you notice, that, with reference to the works specified in my notice of \_\_\_\_\_ last \_\_\_\_\_ E. F. (2) \_\_\_\_\_ is to be placed in charge of the said works, instead of C. D., \_\_\_\_\_ mentioned in the said notice.

Dated this \_\_\_\_\_ day of \_\_\_\_\_ (Signature.)

(1) Describing in general terms the works referred to in notice No. 1, and which works may have been suspended three months.

(2) Insert "architect," or "builder," or other superintendent to have charge of the works.

**METROPOLITAN BUILDINGS ACT, VICT., c. 3, § 14, 1844.**

4.—Notice by the District Surveyor to the Builder, as to any thing done in the Erection of any Building not conformably to the Act.

I do hereby give you notice, that the (1) \_\_\_\_\_ now in progress (2) \_\_\_\_\_ situate in (3) \_\_\_\_\_ is not conformable to the statute in the portions thereof under mentioned; and I require you, within forty-eight hours from the date hereof, to amend the same.

Dated this \_\_\_\_\_ day of \_\_\_\_\_ at the hour of \_\_\_\_\_ by the clock.

Not.—Irregularities referred to. (Signature.)

**METROPOLITAN BUILDINGS ACT, VICT., c. 3, § 26, 1844.**

5.—Notice by an Owner or Occupier to an adjoining Owner or Occupier, to stop up an Opening in an External Wall abutting on his Premises.

I do hereby give you notice, that if within one month from the date hereof you do not stop up the opening

(1) Insert "building," or "alterations," or "building operations," as the case may be.

(2) Insert "under your superintendence," or "in the building belonging to you," as the case may be.

(3) Insert the situation, as the case may be.

made in the external wall of your premises situate in (1) and which abuts on my (2) I shall, at your expense, cause the same to be stopped up, conformably to the statute.

Dated this day of (Signature.)

FORMS OF NOTICES AS TO SPECIAL SUPERVISION.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 15, 1844.

6.—Notice by an Architect or Builder to the Official Referees, as to Completion of the Carcase of a Building subject to special Supervision.

I do hereby give you notice, that the building now erecting under my superintendance in (1) being a building of the (3) and having been completed to the full height of the walls thereof, and the chimneys, floors, roofs, and partitions being fixed, I require you, in accordance with the statute, should you be of opinion that the building is subject to special supervision, to survey the same, and to certify accordingly.

Dated this day of (Signature.)

[\*.\* Penalties, varying from £5 to £500 per day, attach to the use of any such building without its being certified subsequent to notice as above and following.]

METROPOLITAN BUILDINGS ACT, VICT. c. s. 15, 1844.

7.—Notice by an Architect or Builder to the Official Referees, as to Completion of Amendments, and of Buildings subject to special Supervision.

I do hereby give you notice, that the building now erecting under my superintendance in (1) being a building of the (3) and having been completed in pursuance of your survey and notice subsequent, I require you, in accordance with the statute, to survey the same, and to certify accordingly.

Dated this day of (Signature.)

[\*.\* This notice will be used both with reference to the completion of amendments and to the entire completion of a building.]

FORMS OF NOTICES AS TO PARTY-WALLS, &c.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 20, 21, 23, 24, 25, 1844.

8.—Notice to be given (one month before survey, and six months before commencing operations) by an Owner or Occupier, to an adjoining Owner or Occupier, that the Party-wall, or Parly-arch, or Parly-fence-wall is out of Repair.

I do hereby give you notice, that I apprehend that the (4), or some part thereof, on the line of junction between my (5) situate, &c., and the (3) side thereto adjoining, situate on the side thereof, is so far out of repair (6) as to render it necessary to (7) such wall or some part thereof; and that I intend to have such wall surveyed, pursuant to the statute; and also, that I have given notice to the surveyor of the district, and to the official referees, to survey the premises, for the purpose of certifying the condition of such wall, and whether the whole or any part thereof ought to be repaired or pulled down and rebuilt, and to certify accordingly.

Dated this day of (Signature.)

METROPOLITAN BUILDINGS ACT, VICT. c. s. 20, 1844.

9.—Notice in the same case, to the Surveyor and Official Referees.

I do hereby give you notice, that I apprehend that the (4) or some part thereof, on the line of junction between my (5) situate in and the (3) side thereto adjoining, situate on the side thereof, is so far out of repair (6) as to render it necessary to repair or pull down and rebuild such wall, or some part thereof; and that I require a survey thereof to be made, pursuant to the statute, and that in presence of such one or more surveyors or agents appointed by me, as undermentioned, or by C.D., the owner of the adjoining premises, for the purpose of certifying the condition of such wall, and whether the whole or any part thereof ought to be repaired, or pulled down and rebuilt; and I do hereby also intimate that I have served a notice on C.D. to the like effect.

Dated this day of (Signature.)

Names and Addresses of one or more Surveyors or Agents of a Building Owner.

- (1) Specify the situation.
(2) Insert "ground" or "building adjoining."
(3) Insert "sixth rate of first class," or "sixth rate of second class," or "of the third class," as the case may be.
(4) Insert "party-wall," or "party-arch," or "party-fence-wall," as the case may be.
(5) Insert "house," or "building," or "ground," as the case may be.
(6) Insert when required "or has been rendered dangerous and ruinous by cutting away footings," or "breasts," or "chimney-shafts."
(7) Insert "repair," or "pull down and rebuild," as the case may be.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 20 and 23, 1844.

10.—Notice, in the same case, by the District Surveyor to the Building Owner and adjoining Owner, and such one or more Surveyors and Agents by them appointed.

I, surveyor of the district, do hereby give you notice, that, in pursuance of an application made to the official referees and to me in that behalf, it is my intention to proceed to view the premises (1) situate in for the purpose of certifying the condition of the (2) and whether any part thereof is so far out of repair as to require to be either wholly or in part repaired, or pulled down and rebuilt; and such survey I do intend to make on the day of next, at by the clock in the noon, in the presence of any one or more surveyors or agents, on behalf of the building owner and the adjoining owner.

Dated this day of (Signature.)

METROPOLITAN BUILDINGS ACT, VICT. c. s. 32, 33, 1844.

11.—Notice to be given, one month before survey, and six months before commencing operations, by an Owner to an adjoining Owner.

I do hereby give you notice, that I intend to (3) and that I intend to have such (4) surveyed conformably to the statute; and that I have given notice to the district surveyor, and to the official referees, to survey the premises, and to certify accordingly.

Dated this day of (Signature.)

METROPOLITAN BUILDINGS ACT, VICT. c. s. 32, 33, 1844.

12.—Notice in the same case to the Surveyor and Official Referees.

I do hereby give you notice, that I intend to (3) and that I require a survey thereof to be made, pursuant to the statute, and that in presence of such one or more surveyors or agents appointed by me as undermentioned, or by C.D., the owner of the adjoining property, for the purpose of certifying whether the whole or any part (5) ought to be pulled down and rebuilt; and I do hereby also intimate that I have served a notice on C.D. to the like effect.

Dated this day of (Signature.)

Names and Addresses of one or more Surveyors or Agents for Building-Owner.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 32, 33, 1844.

13.—Notice in the same case by the District Surveyor to the Building Owner and adjoining Owner, and such one or more Surveyors and Agents by them appointed.

I, surveyor of the district, do hereby give you notice, that, in pursuance of an application made to the official referees and to me in that behalf, it is my intention to proceed to view the premises (1) situate in for the purpose of certifying whether any part of such (5) require to be (6) and such survey I do intend to make on the day of next, at by the clock in the noon, in the presence of any one or more surveyors or agents whom the parties concerned shall appoint for that purpose.

Dated this day of (Signature.)

METROPOLITAN BUILDINGS ACT, VICT. c. s. 32, 1844.

14.—Notice to be given six months before commencing operations by an Owner to an adjoining Owner.

I do hereby give you notice, that I intend to (7) pursuant to the statute. day of (Signature.)

METROPOLITAN BUILDINGS ACT, VICT. c. s. 27, 1844.

15.—Notice of Intention to build an external Wall against an existing Party-wall, and for that purpose to cut away Footings, Breasts, and Shaft of an existing Party-wall.

I do hereby give you notice, that it is my intention, one month after the date hereof, to build an external wall

- (1) Designated by number or other name.
(2) Insert "party-wall," or "party-arch," or "party fence-wall," as the case may be.
(3) Specify the kind of operation, as to whether it be intended, "To raise a party fence-wall," or "To repair or rebuild a party fence-wall," or "To pull down and rebuild rooms in intermixed property, &c.," and specifying the situation, &c.
(4) Insert "party fence-wall," or "rooms in intermixed property."
(5) Specify the kind of operation intended.
(6) Insert "raised," or "repaired," or "pulled down and rebuilt," as the case may be.
(7) Specify the kind of operation, as to whether it be intended, "To pull down a timber partition, and instead thereof to build a party-wall," where no survey is required, or "To raise a party-wall."

against the existing party-wall by which our premises are parted, situate in, and to cut away such portion of the footings, or chimney-breast, or shaft, in such party-wall as will be necessary for that purpose.

Dated this day of (Signature.)

METROPOLITAN BUILDINGS ACT, VICT. c. s. 37, 1844.

16.—Notice of Desire to build a Party-wall on the Line of Junction of Two Pieces of vacant Ground.

I do hereby give you notice, that I desire to build a party on my land or ground, adjoining your vacant ground, and partly on your vacant ground, on the line of junction of the said premises (1) which will be of the under-noted thickness and dimensions; and should you consent thereto, I require you to signify such consent in writing on or before the day of next.

Dated this day of (Signature.)

Note of the Thickness and Dimensions.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 37, 1844.

17.—Notice of Consent to the building of a Party wall on the Line of Junction of Two Pieces of vacant Ground.

I do hereby give you notice, that I consent to the building of a (1) party on my land or ground, adjoining your vacant ground, on the line of junction of the said premises, which I require to be of the undermentioned thickness and dimensions, and other particulars.

Dated this day of (Signature.)

Note of the Thickness and Dimensions, and other Particulars.

FORMS OF NOTICES AS TO MODIFICATION OF INTENDED BUILDING OPERATIONS.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 22, 1844.

18.—Requisition to a Building Owner by an adjoining Owner, as to Modification of intended Work on his behalf.

I do hereby give you notice, that I require you to (2) the works specified in your notice of the day of in consequence of the inconvenience and loss that would arise to me if the same were executed at the time proposed by you; and if you do not consent hereto, or dissent therefrom, within days, then, in pursuance of the statute, you are hereby required to delay your intended operations until the official referees shall have determined thereon.

Dated this day of (Signature.)

Note of Modifications.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 22, 1844.

19.—Notice by an adjoining Owner to the Official Referees as to Modification of intended Works of a Building Owner.

I do hereby give you notice, that C. D., of having specified in his notice of the day of certain works to be executed subsequent to the day of next; and I having served upon him a requisition in reference to the (3) of the works so intended by him, in consequence of the inconvenience and loss that would arise to me if the same were executed at the time proposed by him, and he not having attended thereto; it is my desire that a survey be made in pursuance of the statute, with reference to such works, and the notices referred to.

Dated this day of (Signature.)

Note of Modifications.

METROPOLITAN BUILDINGS ACT, VICT. c. s. 22, 1844.

20.—Notice by an adjoining Owner to the Official Referees for Survey of intended Works with reference to the Modification or Delay thereof.

I do hereby give you notice, that, in consequence of your not consenting to the (5) of the works intended by you, as specified in my requisition of the day of last, I have applied to the official referees for a survey of the premises, pursuant to the statute.

Dated this day of (6) (Signature.)

- (1) Insert "party-wall," or "party-fence-wall," or "external wall," as the case may be.
(2) Insert "modify as under-noted," or "delay until the day of," as the case may be.
(3) Insert "modification as under-noted," or "delay until the day of," as the case may be.
(4) Within seven days after the previous requisition.
(5) Insert "modification" or "delay," as the case may be.
(6) Within seven days after the previous requisition.

LONDON: Printed by CHARLES WYMAN, of 49, Cannon-street, Pentonville, in the County of Middlesex, Printer, at the Printing-Office of J. & H. Cox, Druggists, 71 & 75, Great Queen-street, Lincoln's-Inn Fields, in the Parish of St. Giles-in-the-Fields, in the same County, and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," 2, York-street, Covent-Garden, in the Parish of St. Paul, Covent-garden, in the said County.—Saturday, March 10th, 1844.

The Builder.

NO. LIX.

SATURDAY, MARCH 23, 1844.

VERY exertion was made by us last week to circulate among our subscribers, not only a copy entire of the proposed new Building-Act, but also to append thereto such critical remarks as we could obtain upon notice so short; but notwithstanding our utmost endeavours we found that we should be compelled either to reset a considerable part of the work (including the schedules of the Bill), already in type, which would have occasioned a whole day's delay, or otherwise that we should publish with the omission of the notes prepared for us relative to the schedules. We in this number give all those notes, with some additions which the increased time has enabled us to procure; and we trust that, although they are not set against the text of the Bill, such precise explanations have been added to them, that no person will find any difficulty in understanding clearly how they relate to the parts of the Bill of which they treat. We have ourselves had opportunity in the interval from our last publication of reviewing the measure generally: we therefore ask the attention of our readers while we make a few observations upon the chief differences which are contemplated between the proposed Building-Act and the present statute.

1st. Power to be given to the COUNCIL to extend the operation of the proposed Act "TO ANY PLACE WITHIN TWELVE MILES OF CHARING-CROSS."

Some clear definition ought to be given how ad-measurement would be made, whether by the roads or by the compasses upon a map; also, if this be carried, whether a town or other place, partly within the twelve miles, is to be wholly included or wholly excluded.

No provision whatever is made for the counties of Essex and Hereford to bear any portion of the expense of the Official Referees and Registrar of metropolitan buildings, nor for increasing, according to extent of land, the number of Official Referees, nor for altering the scale of contribution according to the increase in some counties.

2nd. The extending of the powers of the Act "TO ALL PLACES LYING WITHIN TWO HUNDRED YARDS FROM THE DISTRICT HEREBY DEFINED."

In this case the district-surveyors should be sworn in accordingly, otherwise they might be required to perform duty in parishes for which they have not been sworn in to act.

3rd. The dividing public places into the two ranks of streets and alleys.

Commissioners for Paving having the power of making public places either foot-ways or carriage-ways, the restriction in this case would rest with them.

4th. The appointment of a REGISTRAR - OF METROPOLITAN - BUILDINGS, besides Official Referees.

We do not think the Bill contains sufficient definition as to what kind of person the Registrar should be; and we have heard some fears expressed that if an architect be appointed, he will often be wrong in legal points; and if a barrister be selected for the office, he will improperly have the power of defeating the wisest decisions of the Referees.

We doubt whether less than seven Referees could by any possibility execute the multitudinous duties which are projected for them; and we think unless something could be done to lessen the frequency of appeal to them, grievous delays must arise from the impossibility of two persons exercising such onerous duties, and having to attend to such a multitude of applications. We should envy not the District-surveyors under such appeals, nor the Referees in being so often applied to. The giving these latter officers fixed salaries would be most dignified, but would open them to a frightfully voluminous correspondence and official labour through which few men could go.

5th. The giving powers to dispense on certain occasions with the strict letter of the proposed Act.

This might effect much good, but would raise with some persons an infinity of expectations that the wholesome provisions of the Act may be evaded by petition, favouritism, or adroit shewing; and to the present vulgar idea, that a guinea may go a great way in rendering an irregular building strictly conformable to statute, would be added less favourable opinions.

6th. Final appeal to the Commissioners of Works and Buildings.

We think such a provision would burthen that body with duties which it would not be able to perform.

7th. Giving power to the Official Referees to assess the liabilities of all persons interested in party-walls.

We think that rules might be drawn up under the sanction of the Official Referees and registrar, by which the district-surveyors might settle the liabilities of all persons concerned in the expense of party-walls, they being allowed certain fees for that purpose.

8th. Dividing buildings into three classes, viz:—Dwelling-houses, Warehouses, and Public buildings—the subdivision of each class into six rates.

We refer in these matters to Mr. Bartholomew's Notes.

9th. The forbidding of projections of any kind over public ways.

We think this would be extremely vexatious, and would have the effect, it is true, of preserving many antiquities, but would also prevent improvements being made, by proprietors giving to their buildings a doom-time duration in order to preserve their rights acquired often before a place became public.

10th. Some restrictions as to drainage.

These are generally wholesome. We refer to Mr. Bartholomew's notes on the subject. We

11th. The forbidding District-Surveyors to survey officially any buildings erected by themselves.

think in certain cases drains larger than mentioned in the Bill should be required.

This would tend to make the District-Surveyors in some sort the creatures of the Referees, by their being induced to court employment in other districts.

12th. The requiring of open areas behind buildings.

We think more exact definitions ought to be made as to the liability of tenants, whether they are to escape repairing dilapidations upon party walls; and whether a ground-landlord, who is to receive benefit from the building of a new party-wall near the end of a lease, should not contribute the greater portion of the expense. We lately had a case wherein the ground-landlord, three years before the end of a lease, rebuilt the next house, which caused the condemnation of the party-wall; and although the house had been well and constantly kept repaired, all the remaining improved rent of 34l. per annum was absorbed by the expense of the new party-wall, which was required for the landlord's benefit when he rebuilt the adjoining house.

13th. Altering the mode of procedure in matters relating to party-walls.

14th. Altering the fees of the District-Surveyors to a scale rather lower than the present fees settled seventy years ago, but the granting of some extra fees.

We have some doubts as to the efficient operation of the proposed office of Registrar of Metropolitan-Buildings; and this brings us to put forth some ideas which we have long cherished, viz. the urgent necessity for the relief of the other courts by the establishment of

A Court of Architecture.

Whoever has had any thing to do as a witness, a plaintiff, a defendant, an attorney, or in any other capacity, with any case at law connected with building, knows how grievous is such an affair in an ordinary court. It is true some of the judges and some barristers have turned their attention to, and have studied a little of, the subject; but the proceedings are usually such as to disgust nearly all parties concerned, while the virtual denial of justice, through the enormity of expenses, causes the bitterest regret, however grievous may have been a case, that it was not abandoned rather than have followed proceedings, which soon caused the amount of the original matter of dispute to become a mere "Vanishing-point," compared to the expense which the costs subtend in the "Line-of-heights."

Most of such cases, after witnesses and all other parties have waited several days in court, are after all put off to arbitration, because their technicalities are so indistinctly understood that judges, jury, barristers, and all, desire to have them REFERRED. Now, this reference is usually to a barrister, who is attended by two other barristers, all of whom are nearly equally uninformed on the technicalities of the question in dispute, and who, after hammering away for many days or nights at an enormous expense, for witnesses and attorneys summoned to teach

and give them a slight elementary glimmering of the case, in due time an award is made which we have continually observed is pretty nearly as though the vulgar method of "toss-up" were resorted to, unless, indeed, the more equitable mode of halving the difference have been chosen. In the meanwhile each respectable witness of nice conscience has been proved by the hazy perverter of truth, bired to make wrong prevail, to be a very questionable person, a mere hiring who will say any thing. Hence it is commonly said that a surveyor, to be a good witness, must be a hard swearer, and if he be also a hard drinker, whose courage can be alcoholized above proof so as to resist attack, he is the man to employ.

At first, for judges, should be chosen those who, however ill-educated to the subject they may be, are still the best acquainted with it that could be selected from the bar, and who have a good knowledge of general law; in a few years a set of barristers would arise who would have become intimately acquainted with architectural jurisprudence, and then judges of the requisite information could be chosen.

Disputes relative to dilapidations, questions of price, whether upon contracts, or with master and man, or in whatever other way, could be discussed; all matters under the Building-Act could be justly, and with due solemnity, adjudicated at a moderate expense. At present many of the most respectable and conscientious professional men have great unwillingness to appear as witnesses in court, and if they be consulted upon valuations or other matters, make a stipulation that they shall not be called to give evidence in court; hence, with some exceptions, the court-business is done by the dregs of the profession; and it is not always without truth that the pure barrister, who has been hired for five guineas to make falsehood prevail in court (as in the case of the Swiss ruffian who murdered Lord William Russell, when knowing who was the guilty party, a fee caused the advocate to endeavour to fix the guilt upon a person whom he knew to be innocent), charges six surveyors with being easily procured to outswear six others, the very six having been, by his own advice, sought out for that purpose, twelve others not being produced because of their own conscience they would have sworn the reverse.

In disputes between master-builders, the jury should be composed wholly of master-builders; if between master-builders and ordinary persons, the jury might be composed of half builders and half respectable housekeepers of another class. In disputes between workman and master, the jury should be one-third masters and one-third workmen of the same trade, and the remainder of another class. In disputes between workman and workman, the jury should be half men of the same trade, the remainder indifferent persons not of the same trade. In all instances a majority of two-thirds might decide the case.

A certain number of experienced surveyors should also be attached as officers to the court, who simply by a judge's order should tax and allow definitively the amount of any bill for Builder's-work performed in any part of the empire.

deplea.

#### PROPOSED NEW BUILDING-ACT.

THE COMMITTEE OF THE MASTER CARPENTERS will again meet upon the above at the Freemasons' Tavern, on Monday next, at 4 o'clock.

#### CRITICAL NOTES UPON THE SCHEDULES OF THE PROPOSED NEW BUILDING-ACT.

BY ALFRED BARTHOLOMEW, ESQ.

SCHEDULE (C) p. 143.—There does not appear to be any provision for measuring the heights of buildings, in case they have no ceiling, or no tie-beam or collar-beam or other substitute for a tie-beam.

Any additional depth to which it may be necessary to carry down the walls of a building in order to arrive at a secure foundation, ought to be clearly excluded from the admeasurement of stories, and if the party-walls and other walls be carried down to different levels, as is sometimes necessary, clear definition ought to be provided for such cases.

We think the official referees ought to have a discretionary power relative to permitting addition to the thickness of walls, otherwise cases of excessive hardship and vexation will arise.

We think the Bill is by no means clear as to the mode of determining the rates of buildings. The present Act is much more definite. The Bill does not appear to state if a particular rate is to be restricted by height, area, and number of stories, or by only one or two of such conditions; in stating the number of stories, the words "and no more" seem to be omitted.

We think all party-walls would be more efficient against fire, more durable, and far superior in every way, if allowed to be built half a brick thinner than set down in the Bill, but rigidly exacted to be of hard stock brick-work, and with no bond and plates of wood on any account allowed thereon. A wall so built has a far greater provision of incombustible material; chains of vat-hooping are necessary, and may be carried close to flues without danger; the work is thus at first tied together better than if by timber, the ruin of walls by rot is avoided, and walls so constructed remain little injured, though the rest of a fabric be consumed; whereas, party-walls as at present formed often have to be rebuilt, in consequence of their bond-timber and wooden plates being consumed, and with all possible care on the part of the district-surveyor, still there may often be casts in which a party-wall a brick and a half thick will only have four inches of brick-work between timber and timber, which, in case of rot or fire, would leave a party-wall standing in part or wholly upon only one-third of its thickness.

The term gutter-plate as applied to buildings is very indefinite, such an article being rarely found in a good building; the wretched modern mode of forming valley-roofs set upon internal gutter-plates ought to be discouraged in all possible ways.

We think the requiring parapets 12½ inches thick to buildings of the sixth rate, would be vexatious. The true art of rendering buildings secure does not lie in thickening their upper work, but in increasing the strength of the lower work in proportion to altitude; hence, in ancient buildings, as the spire of Salisbury Cathedral, the thickness of the work for many feet down is not equal to one brick. All buildings should, have their gutters not lying within the compass of lites walls, but if possible without them, so that defective gutters may not rot any timber; the thicker the parapet, the more difficulty exists in effecting this wholesome caution.

We do not approve of the new method of denominated the *smallest* buildings of the *first* rate, but in this we would desire the old method of calling the *largest* buildings the *first* rate, and so prevent the confusion of ideas which must for a long time otherwise result.

PAGES 144, 145, 146.—The sections of the walls we consider are drawn to too small a scale; the dimensions upon them have, in no case, the clear and necessary expression of "feet" and "inches," the marks ' and ', in some cases placed over the dimensions, we hold to be indefinite, and in the manner here used ought to be entirely abolished, for which there are certain mathematical reasons.

We think the height of openings in party-walls ought not to be confined to 8 feet, and that sills or paving of iron and some other substances ought to be allowed.

Whether piers must be on one or both faces of a party-wall does not appear. Piers ought not to be required to be wider than 15 ins. or 12½ ins., on account of making sound work with ordinary stock bricks; in every case throughout the Bill where brickwork is required to be 14 inches wide or thick, the same amendment ought to be made.

In all cases where stone lintels are used, the weight above ought to be discharged from the lintel, to prevent inevitable fracture, as is to be seen to a horrible extent in modern buildings. The falling into this debased practice is one reason why expensive modern buildings are in so fractured a state, while from the pursuit of an opposite course, cheap ancient buildings of Pointed Architecture are often so sound, however light they may be.

We think the use of limestone-masonry in connection with iron doors should be forbidden except in fire-proof buildings, since such masonry is far less secure than common brickwork.

We think the relaxation in favour of fire-proof second-class buildings ought to be extended to all fire-proof buildings whatever.

We think it would be grossly vexatious to prevent a gentleman from building a stable-building containing more than twenty-five squares.

*Buildings and Offices.*—We think the words "or such like buildings" too indefinite. It is not clear whether the party-walls are to be suitable for the rate inclusive or exclusive of such additions, thus

leaving the old ambiguity or loophole of the present Act.

The words "one-third of its height" are not so clearly expressed with regard to the context, as to prevent doubt.

*Toll-houses, &c.*—We do not think the terms "one and a half squares" particularly elegant; we never heard of a man being "one and a half rogues."

SCHEDULE (D).—We think that provided there be below ground and below floors, the same quantity of footing, an architect or builder ought to be allowed to form the remainder of the footings as plinths, or in any manner which he may desire, otherwise useless oppression may arise.

We object to the requirement to lay the two courses of brickwork in cement as here stated; if a quickly drying cement be intended, the motives which we suppose have led to this proposal, requirement, we believe to be fallacies. Parker's cement, which we suppose to be intended, does not prevent the rise of damp, while it is frequently not half so good as stone lime-mortar, being dead before it is used, and rotten when used; and, if quick and good, fractures from its undulating nature, and immediately with the slightest settlement. We therefore deem its use in foundations an error for setting arches to be altogether erroneous and against cautious and truthful practice; ancient buildings of very inferior materials, by their science, hold statically together unfractured, while modern edifices are very frequently fractured in spite of such practice and the use of superior materials. Very many of the fractured modern arches are set in Parker's cement; no sound ancient arch is set in any such material.

We think as in doubtful foundations the base of a wall cannot be spread too much, that footings should be allowed to spread in any way the architect or builder may choose, provided such be not less than prescribed by statute; this wholesome discretion would in many cases be interfered with if the footings "must" be "double;" and it would be ridiculous to prevent an architect from making a footing in one course of masonry a foot thick if he so desire.

*Wood and Iron.*—We think that no plate or bond of wood ought to be allowed to extend into a wall so much as half the thickness of such wall, and that in walls not exceeding 12 inches in thickness, the wooden plates and bond inserted therein ought to be restricted to 4 ins.

We think that more exact definitions are required respecting the ranges of windows of printing-offices and workshops.

PAGE 147.—*Breast-summers.*—The compound term Breast-summer is here restored to its correct orthography, but ought to be separated into its elements and to be re-cited only by a hyphen.

After the words "solely on such party-wall," and also after the words "story-posts fixed on solid foundations," should follow the words, "UNLESS THE PORTIONS OF SUCH PARTY-WALL, WHICH SHALL BEAR THE SAID BREAST-SUMMER BE OF STONE-MASONRY SATISFACTORY TO THE SURVEYOR."

We should like to see timber breast-summers superseded by arches and work of wrought-iron, which would render buildings handsomer and more secure. The two huge ruinous arches which are found over most shop-fronts, like the deep lines in an aged man's

face, and the opening and dropping of the parapet, which are like the wrinkles in a man's forehead, result from the shrinkage and giving way of timber breast-summers. There is no security against damage by fire from the use of cast-iron breast-summers, since by fire and water cast-iron almost invariably breaks and ruins all above, while walls built upon timber breast-summers remain little damaged by fire. We think, for uniformity of practice, some scale of scantlings ought to be fixed in proportion to length of hearing and weight to be supported.

*Materials to be used in Rebuilding.*—We think pitch and other inflammable materials ought to be forbidden. *Materials to be used in Rebuilding.*—The words "one fourth of the surface THEREOF" do not clearly express whether of one story or if the whole inclosure be intended.

*External Walls used as Party-walls.*—We think that permission ought to be allowed for

footings of the proper kind to be under-pinned to a wall, otherwise fit to remain.

**Division of Buildings.**—The words "every such BUILDING shall be deemed to be two or more separate houses, and must be divided from EACH OTHER" require to be altered grammatically.

**Site of Walls.**—Where the buildings are of different rates the wording should run "as much of THE FRONT OR REAR AS ACCESS THEREOF" otherwise, as one building being higher than the other, and requiring the whole thickness of the wall above the roof of the other, such wording could not possibly be complied with.

**Construction and Materials.**—We think no bricks of quality inferior to properly burnt stock-bricks ought to be suffered to be used, but that allowance should be given for the erection of walls to the smallest rate of buildings only one brick thick, provided no bond and plates of timber be allowed therein.

We think it would be absurd to prevent iron-work from going all through a party-wall, unless in case the owner of an adjoining house already built will not allow such iron to be so carried through or beyond the centre of the wall: this restriction would be altogether against strength and soundness.

**Height.**—We think that for two or three feet back from a public way, a party-wall should be allowed to be only twelve inches high above a gutter.

We also think if a turret or other erection upon the roof of a building be of incombustible materials, that such erection, which may often be for useful or for ornamental purposes, as for instance a chimney-shaft, a bell cover, or a Gothic spire or pinnacle or flying-buttress, then should there be no requirement of the extension of a party-wall opposite the same.

**Recesses and Chases.**—We presume the words should run "not more than 12 inches, &c., FROM THE CENTRE OF THE PARTY-WALL," and the words "seven feet or inches at the least FROM EACH OTHER," do not agree with the preceding words, "EVERY CHASE." We think that for the words "wider than nine inches," should be substituted the words "WIDER THAN FOURTEEN INCHES."

We think that no timber ought to go beyond the centre of any party-wall.

**PART IV. p. 147.**—The words "Either of such houses" do not relate properly to the foregoing words, "any building."

**PART V.**—We think grievous trouble would arise to all parties from recurrence to the Official Referees in all such cases.

**PART VI.—Party fence-walls.**—We think it would be absurd to require that in case neighbours, in order to avoid mutual annoyance from each other's workmen or otherwise, agree to build a fence-wall of great height, as, for instance, 24 feet, that they should be compelled to make the top of the wall 2 feet thick; this would be against discreet building, in which by gradual diminution each particle of the lower material, should if possible, be no more crushed than those at the upper part of a wall.

**SCHEDULE (E.) p. 147.**—The utterly forbidding of cornices and other decorations to private buildings to project over public ways, would be fatal to architecture, and would have the effect of deterring, on that account, many persons from altering or rebuilding the fronts of their houses; it would be quite sufficient to forbid the dripping of water or other liquids from such projections upon any public way.

**Wooden Shop-fronts and Shutters.**—The expression should run "4 1/2 inches FROM THE CENTRE." Whether the highest or lowest part of the foot-pavement should be expressed. We think if the clause with regard to notice-boards be allowed at all, the restriction with regard to altitude would be uselessly vexatious.

**Projections beyond the general line, &c.**—We think verandahs, balconies, cornices, and decorations ought to be allowed to project, provided they cause no public or private injury, and are made of incombustible materials, and to the satisfaction of the Surveyor or Official Referees.

**SCHEDULE (F.) p. 148.—Chimneys.**—The plural word chimneys is (like that of moneys) misspelled throughout the Bill, in defiance of that rule of English orthography which requires if a word end with y, preceded by a vowel, they shall be retained. We are particular in this, because we think architectural nomenclature and orthography ought to be as soon as possible corrected.

The provisions restricting and forbidding the projection of flues would be so vexatious and useless, would so deform principal rooms by irregular and needless projections as to become virtually impracticable, and lead to the immediate repeal of the Bill, if passed into a law; the party-walls being stronger as they advance towards the ground, and the chimneys growing lighter as they proceed upwards, by the increase in the number of flues and chimney-openings, the fears of want of sufficient support below are altogether unfounded; the constant finding of the finest buildings several centuries old unfractured and unflashing, although from their first erection they have had chimneys corbelled out, even externally from the face of the walling, shews how needless would such prevention be.

We are not sure that the orthography of "withr" is correct. The dimension 4 1/2 inches should be 4 inches, in order to suit the size of which bricks frequently are.

We think the words "where required" ought to be omitted as evasive from before the words "to lie in the abatments" "four inches FROM."

**Slabs.**—We should like all slabs to be at least 2 feet wide; the word "wide" seems to be omitted in the description.

**Backs.**—The word "story" ought to be substituted

for the word "floor." There does not appear to be any restriction in the proposed Act to prevent chimney-openings from being carried to or beyond the centres of party-walls.

**Angles of Flues.**—We little approve of the relaxation in the matter of flues, by which soot may be collected in horizontal and flat flues, and an addition to the execrable nuisance of soot-floors be induced.

**Close Fires.**—The words should run "two feet FROM." We do not perceive any restriction to prevent ovens from being built upon wooden supports, while iron is expressly forbidden for their supporting and surrounding floors.

**Chimney-shafts.**—The restrictions relative to chimney-shafts ought to be expunged, as tending to injure the operation and beauty of chimneys, and to interfere with the right method of carrying them up in the ancient style as lofty detached shafts; but the Surveyor ought to be allowed to require, if he deem necessary for safety, that such detached shafts should have the body of their component work set in some cement, approved of by him.

**Chimney-Pots.**—We lately had a case in which a zinc smoke-funnel so fixed was blown down in a storm, carrying with it, attached thereto, a lump of 4 cwt. of brickwork, and piercing through a ceiling-boring roof, broke a strong carpenter's bench quite across, excepting, by only a few inches, the man who was there at work.

**Smoke Pipes.**—"Fourteen inches" FROM "any timbers."

**SCHEDULE (G.) p. 148.—Rain Water Pipes.**—The use of baked earthen pipes which do not corrode (as those made at Vauxhall) ought to be allowed.

**SCHEDULE (H.) p. 148.—Drains.**—The word "must" ought not to apply in any case to the use of cesspools; but nothing should restrict the formation of drains, though the common sewer be more than 30 feet distant.

The terms "Equal to an area of at least 9 inches diameter," are not sufficiently definite, the quadrature of the circle being a matter of difficulty; but some definite quantity as, for instance, 72 superficial inches, ought to be substituted.

The words should run—"And two-thirds at least of the lower half of every such drain," &c.

**Cesspools.**—We do not know why the steining of cesspools should be more than of half-brick work, unless their internal diameter exceed 3 feet 6 inches.

**SCHEDULE (K) p. 148.—Back yards.**—After the word "street," should follow the word "ALLEY."

The words "shall be entitled to open windows" are not sufficiently clear and cautious.

We do not know how it will be possible to carry forward the provisions of this schedule relative to the dimensions of back-yards, and think they must be confined to building-sites not already covered. In all other cases we think open space must be purchased at the public expense. The parable of Nathan and the ewe lamb should be remembered.

IONIC VOLUTES.

To describe an Ionic Volute.—Divide the height O P into seven equal parts, and upon the third division take C as a centre, and describe a circle whose diameter shall equal one of the parts, draw the square A B E D, and in that square draw another, whose angle shall touch the sides of the former square in the centre. Divide C in D and E each into three equal parts at 1, 5, 10, and 6; divide C 10 into

two equal parts at x, if the volute is to be on the right hand side (but if on the left, divide C 9), from x, draw the perpendicular line, cutting the side of the inner square at F; from F make F G and F H each equal to I 7, or I 2; join G K and H K, draw 5, 4, 9, 8, 10, 11, and 6, 7, parallel to the perpendicular side of the square, cutting G K and H K at 4, 8, 3, 7, 11; then 1, 2, 3, 4, &c., and on to

12, are the centres. Begin at 1, with the radius 1 N describe the quadrant N M of the volute; on 2, with the radius 2 M, describe the quadrant M L, and so on in this manner with all the quadrants until you touch the eye at B, and it will be one side of the fillet. Divide the thickness of the list N n at the top into twelve equal parts by means of the scale Q R S; begin at S, and with any opening of the compass run it twelve times from S to R, make R Q equal to the thickness of the list at N n, join Q S, draw a 11, 6 10, &c. &c. parallel to Q R, make the thickness of the list at M m, equal to a 11, and L l, equal to b 10, &c.; at the beginning of every quadrant join n m, and bisect it by a perpendicular meeting the eye at u, a little within the first centre; set the same small distance within all the other centres and describe the inside of the list, it will end in a point with the outside at B. From "ANOTHER ARCHITECTURAL PUPIL."

## RAILWAY BUSINESS IN THE HOUSE OF COMMONS.

THURSDAY, MARCH 14.

**Leeds and Bradford Railway Bill.**—Petitions against, from John Gott, Esq., George Hirst, George Baron, Esq.; Sir Sandford Graham, Bart., inhabitants of Adwalton, Armsley, Thornton, Pudsey, Gildersome, Southwarra, Leicester Dyke, Low Moor, Bramley, Bowling, Shebden, Leeds, Queen's Head, Drighlington, Bradford, Holbeck, Booth Town, East Burley, Ovendon, Great Horton, Northowram, Benjamin Gaskell, Esq.; Thomas Haigh, Rev. Godfrey Wright, trustees of the Brandling estates, Clayton, Wortley, Farnley, Robert Pemberton Milnes, Esq., and Leeds Waterworks Company; referred to the committee on the bill; counsel ordered.

**York and Scarborough Railway Bill.**—Petitions in favour, from Scarborough and Filey; to lie on the table.

**South-Eastern Railway Bill.**—"To enable the South-Eastern Railway Company to complete and maintain a branch railway and approach to the harbour of Folkestone, and to construct other works in connection with the said harbour; and also to effect certain alterations and extensions of the works of the Maidstone Branch of the said South-Eastern Railway, and to amend the acts relating to the said company;" presented and read the first time; to be read a second time.

**Leeds and Selby Railway Purchase (No. 2) Bill.**—"For vesting the Leeds and Selby Railway in the York and North Midland Railway Company, and for enabling that company to raise a further sum of money to complete the purchase of such railway;" presented and read a first time; to be read a second time.

**Edinburgh and Glasgow Railway Bill.**—Petitions against, from Edinburgh, Leith, and Newhaven Railway Company; Edinburgh and Glasgow Union Canal Company; provost, magistrates, and town council of Linlithgow; and Thomas Sprot; referred to the committee on the bill; counsel ordered.

**Lancaster and Carlisle Railway Bill.**—Reported; report to lie on the table, and to be printed.

**Slamannan Junction Railway Bill.**—Petition of the Edinburgh and Glasgow Union Canal Company, against; referred to the committee on the bill; counsel ordered.

**Maryport and Carlisle Railway Bill.**—"To amend the acts relating to the Maryport and Carlisle Railway, and for making certain extensions and branches connected therewith." Presented and read a first time; to be read a second time.

**Salisbury Branch Railway Bill.**—Petition from Blandford, in favour; to lie on the table.

**Chester and Holyhead Railway Bill.**—"For making a railway from Chester to Holyhead," presented and read a first time; to be read a second time.

**Manchester and Leeds (Bury Branch) Railway Bill.**—Petition of the Earl of Derby, the Earl of Wilton, and others, against; referred to the committee on the bill; counsel ordered.

**Railways.**—Petition of Pickford and Co., and others interested in the conveyance of goods by railway, for securing a free competition in the carriage of goods; referred to the select committee on railways.

**London Bridge Railways.**—Petition of the London and Greenwich Railway Company, complaining of the arrangements and charges of the South-Eastern and the Croydon Railway Companies; referred to the select committee on railways.

**Blackburn and Preston Railway.**—Report (13th March) from select committee on standing orders, read; bill ordered to be brought in by Mr. Wilson Patten, Mr. William Feilden, and Sir Hesketh Fleetwood.

**North British Railway Bill.**—Petitions against, from the Edinburgh and Dalkeith Railway Company, and William Henry Miller, Esq.; referred to the committee on the bill; counsel ordered.

**Eastern Union Railway Bill.**—"For making a railway from Colchester to Ipswich;" pre-

sented and read a first time; to be read a second time.

**Garnkirk, Glasgow, and Coatbridge Railway Bill.**—Petitions complaining of non-compliance with the standing orders, from Rosina Smith and George Smith, and John Leadbetter; referred to the select committee on petitions for private bills.

FRIDAY, MARCH 15.

**South-Eastern and Hastings Railway Bill.**—Motion made and question proposed, "That the bill be now read a second time." Amendment proposed to leave out the word "now," and at the end of the question to add the words "upon this day six months." Question proposed, "that the word 'now' stand part of the question." Amendment, by leave, withdrawn; main question put, and agreed to. Bill read a second time and committed, and referred to the committee of selection.

**Leeds and Bradford Railway Bill.**—Petitions against—Of the Bradford Gas Light Company; owners, lessees, or occupiers of property on the line; Bradford Waterworks Company; Leeds Gas Light Company; company of proprietors of the canal navigation from Leeds to Liverpool; Mary Ann Duffield; Ellis Cunliffe Lister Kaye, Esq.; Thomas Wilcock and others, owners, lessees, or occupiers of lands, tenements, and property on the line; inhabitants of Sowerby; Skircoat; Stanningley; Warley; Birkenshaw; Oakenshaw; Tong; Cleckheaton; Batley; Holf; Wibsey; Clayton-heights; Liversedge; Gomersal; Birstal; Heckmondwike; Calverley and Farsley; Burley; Yeadon; Armsley; Rawdon; Eccleshill; Horsforth; Guiseley; Bramley; Edward Lambert; Joshua Bower and others, owners, lessees, or occupiers of lands, tenements, and property on the line; occupiers of mills, manufactories, and other works; George Heaps, sen., and others, owners, lessees, or occupiers of lands, tenements, and property on the line; subscribers to a company for forming a direct line of railway communication between Leeds and Bradford; and company of proprietors of the Bradford Canal Navigation; referred to the committee on the bill; counsel ordered.

**York and Scarborough Railway Bill.**—Petitions against—Of Earl Fitzwilliam; and William St. Quintin; referred to the committee on the bill; counsel ordered.

**Manchester, Bury, and Rossendale Railway Bill.**—Petition against—Of William Cooper; trustees of Radcliffe turnpike-roads; inhabitants of Bolton; and company of proprietors of the Manchester, Bolton, and Bury Canal Navigation and Railway; referred to the committee on the bill; counsel ordered.

**Blackburn and Preston Railway Bill.**—"For making a railway from the town of Blackburn to the North Union Railway, in the township of Farrington, all in the county of Lancaster," presented, and read first time; to be read a second time.

**Midland Railways Consolidation Bill.**—Petitions against—Of Charles Collins Blane, Esq.; John Edward Phillips, and Francis Sherriff; owners of coal mines in the valley of the Erewash; William Jessop, Esq.; Charles Frederick Younge, and John Newton Mappin; and shareholders in the Midland Counties Railway Company; referred to the committee on the bill; counsel ordered.

**Manchester and Leeds Railway (Bury Branch) Bill.**—Petitions against—Of the company of proprietors of the Rochdale Canal; trustees of the road from Castleton to Great Heaton; and company of proprietors of the Manchester, Bolton, and Bury Canal Navigation and Railway; referred to the committee on the bill; counsel ordered.

**Ashton, Staleybridge, and Liverpool Junction Railway Bill.**—Read second time, and committed, and referred to the committee of selection.

Standing Orders Committee—Resolutions reported:—

"1. That, in the case of the Delabole and Rock Railway petition, the standing orders ought to be dispensed with; that the parties be permitted to proceed with their bill, and that they produce and prove the original contract before the committee on the bill, and that the said committee do report to the House

how far such order has been complied with, on the report of the bill.

"2. That, in the cases of the Barnsley Junction Railway, the standing orders ought to be dispensed with.

"3. That in the case of the Gravesend, Rochester, and Chatham Railway petition, the standing orders ought not to be dispensed with.

"4. That, in the case of the Gravesend Railway petition, the standing orders ought not to be dispensed with.

First resolution agreed to. Report to lie on the table.

**Delabole and Rock Railway.**—Report from select committee on standing orders (this day) read; bill ordered to be brought in by Sir John Yarde Buller, Mr. Pendarves, and Mr. Trevelyan.

**London and South-Western Railway (No. 1).**—Report from select committee on standing orders (13th March) read; bill ordered to be brought in by Mr. Kemble and Sir John Easthope.

**Great Western Railway Bill.**—Reported; report to lie on the table, and to be printed.

**Defeat of the Barnsley Junction Railway.**—In the House of Commons' committee, on Thursday, the Barnsley Junction Railway Bill was thrown out on the standing orders. This will be severe blow to the Manchester and Sheffield Railway Company, the chairman of which had boasted that the Barnsley Junction would enable the Manchester and Sheffield Company to divert the traffic from Manchester and Leeds Railway, and to make the Sheffield line the true Manchester and Leeds. Of course, in proportion to the defeat of the part of the Manchester and Sheffield is the triumph of the Manchester and Leeds. It is said that the Sheffield Company are not likely to be more successful with their Chesterfield branch, in opposition to the North Midland.—*Herald*, March 18.

**Whitehaven and Maryport Railway Bill.**—"for making a railway from the town and port of Whitehaven to the town and port of Maryport, in the county of Cumberland," presented and read a first time.

**Northern and Eastern Railway (Newport Deviations) Bill.**—"to enable the Northern and Eastern Railway Company to make certain deviations in the line of their railway, between Bishops Stortford and Newport, and to alter and amend the Acts relating to the said railway," presented, and read a first time.

**Brighton and Chichester Railway.**—Petition for Bill reported, and Bill ordered to be brought in by Mr. John Abel Smith and Captain Pecheil.

**Colchester and Harwich Railway (No. 2).**—Petition for Bill reported, and Bill ordered to be brought in by Sir Henry Smyth and Major Beresford.

**Harrigate and Knaresborough Railway.**—Petition for bill reported, and bill ordered to be brought in by Mr. Lawson and Mr. Ferrand.

**Newbury, Basingstoke, London and Southampton Railway Bill.**—Read a second time, and committed, and referred to the committee of selection.

**Sheffield, Ashton-under-Lyne, and Manchester Railway Bill.**—Read a second time, and committed, and referred to the committee of selection.

**Eastern Counties Railway (Brandon and Peterborough Extension) Bill.**—"To enable the Eastern Counties Railway Company to make a railway from the Northern and Eastern Railway at Newport, by Cambridge to Ely, and from thence eastward to Brandon and westward to Peterborough," presented and read a first time.

**Newbury and Great Western Railway Bill.**—Read a second time and committed, and referred to the committee of selection.

**Slamannan Junction Railway Bill.**—Read a second time and committed, and referred to the committee of selection.

**North British Railway Bill.**—Read a second time and committed, and referred to the committee of selection.

**Brighton, Leves, and Hastings Railway.**—Petition for bill reported, and bill ordered to be brought in by Mr. Darby and Lord Alfred Hervey.

## LECTURE ON ARTIFICIAL LIGHT.

A VERY interesting and instructive lecture upon artificial light was delivered, on the 11th inst., by Dr. Ryan, at the Polytechnic Institution, to a numerous and highly respectable auditory. The lecturer introduced the subject by pointing out the importance of artificial light, and endeavouring to trace its probable origin to the observation of the inflammable nature of the fatty portions of animals sacrificed on the altars of the ancients. The attention of the audience was next directed to the nature of common coal-gas, burnt under ordinary circumstances, as well as to the sources from which the gas is obtained. The mode of obtaining and purifying it was simply yet comprehensively explained by Dr. Ryan, and very clearly illustrated by some cleverly-executed models. He next adverted to the theory of combustion, as exemplified in the common candle, and thence glanced at the recent introduction into more general use of turpentine-naphtha, or what is becoming known to the public under the name of "camphine." Turpentine-naphtha and coal-tar naphtha have not hitherto been brought into general use from the great difficulty of producing a perfect combustion of these highly inflammable hydrocarbons, and the danger to be apprehended from the employment of them as a means of artificial light. Various means have been devised and patented for their perfect combustion. A few years since a mode of burning them, by a strong pressure of atmospheric air through the centre of the flame, as well as by throwing atmospheric air, previously heated in its passage, near the flame of the lamp, upon the material used, and which air became mixed with and supported the combustion of the vapour by which the flame of the lamp was fed. This invention was rather cumbersome, as it required apparatus for supplying the air. It was, however, deemed a very valuable one, and was sold for 20,000*l.* Since such sale the public have not heard any thing of the invention. Another mode recently patented of burning these oils is, by allowing them to flow from a small perpendicular tube and fall upon a cone which is made red-hot by the flame which proceeds from the orifices at its mouth. The practicability of this lamp does not appear to have been made apparent to the public. The two lamps alluded to were of course wickless. The one alluded to by Dr. Ryan, and burning a camphorated turpentine-naphtha under the name of "camphine," is a wick lamp, in which proper combustion is obtained by preventing, as far as possible, the production of vapour, both from the wick and the turpentine, and by placing immediately over the flame what is called a "breaker." This is a circular piece of copper or brass, and causes the air drawn up the centre to impinge upon the latter, and gives it the form of a cup or daisy. This "breaker" is an old invention, and was, we believe, applied to gas and oil some years ago; nor is its application to the turpentine lamp altogether novel. It has been for a considerable time past, it is stated, in use in the United States. The production of vapour is prevented in the "camphine" lamp by the use of wood or cork as a non-conductor of heat, and the cutting off the communication between the wick and air-tube and the reservoir of turpentine. But with this "button" or "breaker," the camphine lamp gives a flame of only an inch and a half, or at the utmost two inches in height; and it is doubted whether coal-tar naphtha, a much more inflammable material, could be continuously burned for several hours without smoke by any of the lamps known under the name of camphine lamps. The use of these hydro-carbons is yet in its infancy, but we have seen both of them burned in a common portable lamp, with an Argand flame of eight and ten inches in height, and with perfect combustion. Another lamp noticed by Dr. Ryan was a French one, called, as we understood, the hydrogen water lamp, which burns the vapour of water and naphtha. This is a small portable lamp, and when once lighted the heat of the burner raises sufficient vapour to sustain the flame. A mode of artificial illumination on a larger scale, after the mode of the little lamp just noticed, was next explained to the auditory; it was that patented by M. Pelletan. This gentleman employs turpentine-naphtha and water as his agents for the pro-

duction of carburetted hydrogen, and by a simple and extremely ingenious apparatus conveys the vapour to any part of a building exactly in the same manner as gas is distributed. A number of large Argand burners and two Bude or Boccins' burners (we did not notice which), for the purpose of shewing the Pelletan light, were fitted up in the theatre in which the lecture was delivered; the light produced from this peculiar mode of combining turpentine and water is very cheap, but on the other hand it is extremely low in illuminating power. The second portion of the lecture was devoted to the various conditions which are necessary to the complete combustion of carburetted hydrogen. The necessity of having solid matter in contact with the flame was explained—first, by the experiment of burning hydrogen in its pure state, when we have flame merely without light; secondly, by introducing a piece of lime into the flame of hydrogen in combination with oxygen, and producing the beautiful light known as the Drummond or lime light; and, thirdly, by burning phosphorus in a confined vessel filled with oxygen gas, and the consequent incandescence of a portion of phosphoric acid. The precipitation of carbon in light giving flames was also pointed out. It was observed by the lecturer that the carbon being immediately burned to whiteness by the heat of the flame, produces the same conditions as those resulting from the incandescence of lime or phosphoric acid, as shewn in the preceding experiments. The lecturer touched upon the difference between the lamps of the ancients and moderns, and pointed out the improvements resulting from the experiments of Gurney—first, in the production of the "Bude" light, properly so called; and secondly, in that of the atmospheric Bude light. He also explained the nature of the Boccins light, and observed that the arrangement both of the atmospheric "Bude" and of the "Boccins" lights are in some degree similar, the burners being simply rings of metal perforated, and these become so heated as to produce exactly the proper amount of temperature necessary for the complete combustion of the gas. The absence of light when the charcoal is not precipitated was shewn by burning common coal gas, first in an ordinary Argand burner, and next by mixing it in a copper chimney with a quantity of atmospheric air, owing to which admixture the charcoal was burned without being precipitated. The lecture, of which the preceding is a mere outline, was extremely and deservedly well received.

## SOCIETY OF ARTS.

MARCH 20.—Benjamin Bond Cabbell, Esq., V.P., in the chair.

The Secretary read a paper on "Messrs. Forrester's improved double cylinder direct action marine engine," as fitted in the Helen MacGregor Hull and Hamburg steamers. The subject was illustrated by models and diagrams.

The collective power of the engines is of 220 horses, and her tonnage 573. The cylinders are each of 42 inches diameter; length of stroke 54 inches; diameter of air-pump 33½ inches; length of stroke 28½ inches; capacity of condenser, including passage to air-pump, 44 cubic feet; ditto of hot-well, 36 cubic feet; paddle-wheel 23½ feet diameter to outside of floats; number of revolutions 234 per minute; average pressure of steam in cylinder 3½ lb.

The engine consists of two inverted cylinders placed "athwart ships," with their stuffing boxes below them; the whole being supported upon wrought-iron columns resting on the foundation-plate, and passing through suitable hoses on the sides of the cylinders to the entablature plate and crank pedestals.

The advantages of this arrangement are, that all the working parts are within the reach of the engineer from the lower floor of the engine, whereby the expense of attendance is materially reduced.

The elevated position of the cylinders obviates the danger sometimes arising from water running over into the cylinders as ordinarily placed.

All the moving parts are below the water-line, so that they are out of the reach of shot. And lastly, the reduction of weight and space is very considerable, a saving in length of 25

feet for the engine and boiler-room (the tubular boiler) having been effected.

The Secretary next read a paper on "Wright's Improved Barometer," which consists of a straight inverted tube with the cistern at the bottom, and the scale and vernier at top, so far similar to the ordinary pediment barometer. The area of the cistern is 50 times that of the tube, so that a fall of one inch in the tube will give a rise of  $\frac{1}{50}$ th inch in the cistern; the divisions on the scale are, accordingly, made  $\frac{1}{50}$ th less than an inch, and the 10th each  $\frac{1}{50}$ th less than a tenth. Thus a large tube may be used, and the sliding scale dispensed with, and a more accurate result obtained by one observation only.

As mercury is found to expand for every degree of Fahrenheit the  $\frac{1}{1000}$ th part of its volume at 32°, the expansion of a column 30 inches long from 32° to 100° will at this rate amount to .205 inch. If the horizontal line opposite 30 inches in the scale of the ordinary barometer be raised .205 inch at one end, it will form an inclined line, representing the expansion of a column of mercury 30 inches long from 32° to 100°, the lower point being that at 32° and the upper that at 100°, this line being divided in 68 parts, or intersecting lines (being the number between 32° and 100°), which lines will indicate the expansion of a 30-inch column for all the degrees between 32° and 100°. This inclined line is transferred to the scale, and all the other inches and tenths are calculated in the same manner.

Models and drawings of Edge's Water Meter were next introduced to the notice of the society, and an account of one of these machines was read by the secretary.

The meter consists of a rectangular box 14 inches long, 13 inches wide, and 12 inches high, divided into two chambers by a partition, in the top of which is an aperture, which forms a communication between the two chambers. A four-way cock is fixed in the partition, the larger end of which opens into one chamber and the smaller end into the other; the water is conducted to and from this cock by means of tubes passing through one of the chambers. Parallel with the centre of the cock is a spindle working in upright standards. The spindle carries a driver which acts upon projections on the plug of the cock; and also carries a metal cylinder hermetically sealed, in which is a heavy ball, less in diameter than the cylinder itself, so that it may freely roll within it.

In the upper part of one of the chambers there is a float working upon an axis, which carries a pendent arm, having upon its end a friction-pulley.

As the float rises and falls by the action of the water, the arm vibrates, and, acting alternately on the inner sides of two teeth of the spindle, causes the lower end of the cylinder to be raised, and thus the bar rolls to the opposite end of the cylinder, which by its weight moves the spindle suddenly round, and causes a change of inlet and outlet by the motion communicated to the plug of the cock. Upon the axis are two teeth working into a crown wheel, so that the vibration of the axis gives rotary motion to the upright spindle, which is connected with a counting apparatus also of an improved description.

The secretary read a short paper on his proposition for rendering paper-hangings intellectually useful, by introducing historical, biographical, chronological and other information, in such way as to form part of the pattern, or where required especially for use, without regard to ornament, the writing to be inserted in panelled patterns. Several designs were hung up in the society's meeting-room to illustrate the subject.

Mr. Wishaw proposes three different ways of effecting this desirable object: first, by cutting the inscriptions (likely to be extensively used) on wooden blocks, as the ordinary patterns; secondly, by introducing movable types introduced into a frame so arranged to form a substitute for one of the numerous blocks usually required; thirdly, to print all the pattern in the ordinary way, excepting such spaces as are required for the inscriptions, which may be inserted by hand, to suit the particular taste of individuals.

This latter method is much less troublesome than persons unacquainted with the process might be led to suppose.

FLAUDEN OLD CHURCH, HERTS.

TO THE EDITOR OF THE BUILDER.

SIR,—Your kindness in giving place to my former communication (the Priory) in your most valuable paper (THE BUILDER), has induced me to send you the inclosed sketch and description of an old church, which, until within a few months back, was standing near the little village of Flauden in this county; should you deem them worthy to be recorded in your paper, I beg your acceptance of them, and with hearty wishes for the welfare of THE BUILDER, Believe me, &c. A SUBSCRIBER.  
King's Langley, Herts, March 9th, 1844.

The village (to which the old church above delineated belonged, and of which but a very small portion now remains to mark its spot, the greater portion of it having been taken down shortly after the erection of the present new church, a neat early Gothic building, situated at an easy distance from the village), lies at the south-west extremity of the parish of Hemel Hempsted, in this county, of which it is a hamlet. The church stood at about a mile from the village, in a beautiful valley, watered by a fine trout-stream, called the Chesham River. The interior of the church contained no monuments of the dead, consequently afforded but little or nothing to gratify the curiosity of the antiquary; yet, when considered as a feature of a landscape, in combination with the beautifully wooded country by which it was surrounded, it had a most picturesque effect. For many years it was inhabited by three or four poor families. It was dedicated to St. Mary Magdalen, and was an appendant to the church of Hemel Hempsted, by the vicar of which the cure was con-

stantly supplied. In the year 1477, the inhabitants of this ville were empowered by bull of Pope Sixtus the Fourth to bury their dead within the precincts of this church, by reason of its distance from the mother-church of Hempsted.

KING'S COLLEGE VAULTING.

TO THE EDITOR OF THE BUILDER.

SIR,—I must respectfully beg to dissent from the statement urged by your correspondent, Mr. Hutt, relative to the vaulting of King's College Chapel, although a much clearer and mathematically deduced supposition is to be found in "Pratt's Mechanical Philosophy."

The annexed perspective sketch of one "severey" will shew that the rib *dKa* is not a row of key-stones, but rather an abutment similar to *f*; that the key-stones (?), if any, would be in the placed marked by the middle

or lower cross-band. We are also well aware how stonework can be coved, or made to overhang, as in the early cyclopæan arches, and the internal crowning members of a few of the Greek hypethral temples; probably a better known illustration would be a geometrical staircase, the under side of the winders of which may not infrequently be found of the same contour as the roof of King's Chapel, which tends to the conjecture that this fan-vaulting is constructed on the same principle, the thickness of wall and weight of parapet and pinnacles preventing the fall.

If we take a "retrospective review" of the introduction of stone-vaulting, we find that it was formed by arches, springing from corbels in the side walls between the windows, and composed of plain ribs called "cross-springers," with a key-stone in the centre; the interstices were filled up with some lighter materials.

That the principle of their construction became better known and practised about the reign of Edward III. is apparent, by their being formed of pendant semi-cones, covered with foliated panel work, called *fan-tracery*, from the design resembling a fan spread open.

What architect ever considered that an arch or vault consisted of a series of key-stones? Many voussours, but one key-stone, as its name seems to im-

ply, which having been inserted in a circular aperture, could be removed as stated in your number of December 9. For instance, we see shafts and holes for various purposes left in parts of

vaults in nearly every street in our crowded towns, still the pavement is not rendered insecure; and as frequently does an aperture (to use a bull) form the apex of a dome.

Yours respectfully, W. W.

[We do not believe that the vaulting of King's College Chapel is formed in any such manner as our correspondent imagines; if it had been so formed, it would long since have fallen, from the pressure in every joint of the work being false. Admirable as is the work of King's College vaulting, with the pressure operating at right-angles to each of its component stones, still the soffit of the vaulting has in places opened at its keel-rib or summit by the dropping of the work, so as to hold at the upper angles of the voussoirs. A work so thin as the King's College Chapel vaulting, if it had been only corbelled over throughout the work, would on the removal of the scaffolding immediately after its erection, have pulverized itself in every part: the pressure being askew in every joint, all the angles of the stones would have "spalled" off, and their total ruin would have ensued. Our correspondent is entirely mistaken on the subject of the corbels, for these were formed in early times in order to increase the weight of the abutment, and preserve it from being cut into (and weakened) for receiving the vaulting,—to diminish the span,—and to lighten the work in jeopardy. Many architects and mathematicians consider an arch to consist of a series of key-stones, and the term so applied is not worth questioning; an arch is finally locked by what is vulgarly termed "the key-stone," yet removal of any one voussoir would sufficiently unlock an arch to cause its ruin. We are certain (although now the work is old perhaps the great bosses of King's College Chapel vaulting might be removed without the vaulting falling into immediate ruin), that ultimately such would be the case, and that if the vaulting had been originally built without them, the work would have become crippled instantly on the removal of the centering. Holes left in ordinary coal-vaults in no way apply to the case, for these have usually circular rims worked round them; and leaving out the crown of a dome, which is the mischievous part of the work, is the mode which has been practised by the most skilful artists. Study, observation, mathematics, and practical experience will cause our correspondent to reverse most of his present opinions. THE MATERIALS OF NO VAULTED EDIFICE WILL STAND AS THE ARCHITECT DESIRES THEY SHOULD, UNLESS, IF THEY WERE ALL SUSPENDED IN AN INVERTED POSITION, THEY WOULD RETAIN EVERY CURVATURE, FORM, AND POSITION UNALTERED (MERE INVERSION EXCEPTED). Of this, however, more hereafter.—Ed.]

DESCRIPTION OF A WROUGHT-IRON LATTICE BRIDGE, LATELY ERRECTED ON THE LINE OF THE DUBLIN AND DROGHEDA RAILWAY.

BY G. W. HEMANS.  
(Read before the Institution of Civil Engineers, January 9.)

This kind of bridge is stated to have been first used in America, where timber being so abundant, the lattice sides are formed of that material, and consist simply of planks three inches thick, crossed so as to form deep beams, and secured with oak trenails at all the intersections.

The bridge described in this communication, is situated about three miles from Dublin, over an excavation of 36 feet in depth; its span is 84 feet in the clear, and the two lattice beams are set on edge parallel to each other, resting at either end on plain stone abutments built in the slope. These beams are 10 feet in depth, and are formed by a series of flat bars of wrought-iron, 2½ inches wide and ¾ inch thick, crossing each other at an angle of 45°. At a height of 5 feet 6 inches above the bottom edge, transverse bearers are placed, formed of 4 inch angle-iron, 6 inches deep, and set 2 feet apart, similar to the cross-ties now used for the decks of iron steam-vessels, and upon these the planking for the roadway is fastened.

The account of the mode of construction, and of the raising and fixing the lattice-beams, by Messrs. Perry, of Dublin, the contractors, is given in detail.

The author states that some deflection or sagging of the lattices was expected, and was provided for by constructing each of

them with a camber or gradual curve from the ends, amounting to 12 inches in the centre; but that far from such being the case, they did not sink even when heavy weights passed over them.

The total cost of the bridge, including the masonry of the abutments, was 510*l*.

The paper is illustrated by a drawing (No. 3408), shewing the elevation and the details of the construction of the bridge.

Major-General Pasley had seen and approved of the bridge; it appeared to be on a good principle, and was well constructed. He understood that it had been Mr. Macneill's intention to have a model made of a viaduct of 230 feet in length, with a central span of 140 feet, which he had designed for carrying the Dublin and Drogheda Railway across the Royal Canal in an oblique direction, but he now considered that the bridge which had been described was better than a model; and as it had borne, with only a slight deflection, a loaded wagon weighing 22 tons, and all other tests to which it had been submitted, he had decided upon building the larger bridge upon the same principle.

Captain Moorsom thought that the bridge was too expensive, and that if the lattice sides had been 8 feet 6 inches in depth, they would have been quite strong enough. In the timber bridges of the same construction in America, any tendency to either flexibility or buckling was obviated by placing several ranges of lattices side by side, and the custom of roofing the timber bridges of that country also gave additional strength laterally. The timber bridges on this principle which he had constructed on the Birmingham and Gloucester Railway (one of which was 160 feet span, and the others between 90 and 120 feet span), varied in cost from 4*l*. to nearly 6*l*. per running foot, according to the span, the larger spans being proportionally less expensive than the smaller. Materials and labour were dear at the time of constructing the bridges alluded to.

It was stated that the original inventor of the lattice bridge was the late Mr. Smart, by whom it was patented. It is mentioned in Dr. Gregory's "Mathematics for Practical Men," p. 231.

NARROW WINDOWS.

TO THE EDITOR OF THE BUILDER.  
SIR,—I send you the annexed sketch of a window designed for a small church, the form of the upper light, and the way the stone sill terminates, being, I believe, without a precedent.

The part *b, b, b, b*, is one solid stone checked, so as to be on a line with the face of the wall; the cross is formed in a panel, the centre narrow space being cut through and communicating with a flue ending at the window-board or flag in the interior, for the purpose of ventilation. The admission of air is regulated by means of a lid fixed in the window-flag inside.)

The hood-moulding projects before the face of the octagonal chamfered head (same as jambs), see *x x*, about 5 inches.

Your obedient, J. K. L. Gorey, 3rd February, 1844.

[We think this window would better suit a lodge than a church.—Ed.]

DESIGN FOR A NARROW WINDOW.

ELEVATION.

PLAN.

12 INCHES. 0 1 2 3 4 5 6 7 FEET.

## INSTITUTION OF CIVIL ENGINEERS.

MARCH 12.—The President in the chair.

The discussion upon the knowledge of the properties of the arch possessed by the ancients was renewed on the presentation by Mr. Page of drawings of two arches standing near some cyclopean remains at Cape Crio (Caidus). There was no positive evidence of the date of these arches; but from their being built without mortar, and the massiveness of their construction, it was agreed that they were probably of the same period as the cyclopean works among which they were situated.

The failure of the Pont de Boverie at Liège, which sunk so much and cracked on the piers to such an extent as to oblige it to be taken down, was fully explained by Mr. Rennie, who presented a drawing of it.

Mr. B. Green also exhibited a design for the proposed stone bridge of eight circular arches for connecting Gateshead with Newcastle-upon-Tyne at a high level. He also exhibited some beautiful specimens of ornamental bricks made by Mr. Burnes, of Newcastle.

The first paper read was an "Account of the harbour of Pulteney Town" (Wick, Caithness, N. B.)

This harbour was designed by Mr. Telford for the British Fisheries Society in 1803, and the first part of the works executed between 1805 and 1811 by Mr. Burn, at the expense of 16,000*l*. The success of the herring-fishery, and the consequent increase of the shipping frequenting the port, rendered a more extensive harbour essential, and in 1823 other plans, which received the approval of Mr. Telford, were carried into effect by Mr. Bremner.

The various extensions of the works were given in great detail, with the ingenious methods employed in their execution; as also the account of the devastation caused by the sudden inroad of the sea upon the unfinished work of the pier, when 100 feet in length of the pier-head was swept away in one tide, besides the occurrence of much damage to the other parts of the works. The ruined works were secured for the remainder of that year by boding them together with chain-cables, and in the succeeding summer the works were completed and have stood securely ever since. Some interesting observations were made as to the relative action of the waves upon long and short slopes of the sea faces of piers, and the author's experience evidently leads him to prefer a slope of about one to one for works which are exposed to a heavy sea.

The various ingenious methods adopted by the author for conquering the difficulties before him excited great interest, which was kept up by the next paper, also by Mr. Bremner. It was a description of casks used in floating large stones for building sea-walls in deep water.

These casks, which were strongly built of fir staves hooped externally with iron and supported inside by radiating bars like the spokes of a wheel, were used instead of cranes for conveying stones of from 30 to 40 tons weight for securing the foot of the sea-walls of Banff harbour, which had failed.

Two of these casks, of 445 feet cube each, were used to convey stones of 30 tons weight, by passing the two chain-cables which were wound round them through the eyes of the lewis, which were fixed in the stone at low water; at which time the chains being hauled down tight, when the tide flowed, the buoyancy of the casks floated the stones, and they were towed by a boat over the place where the stone was intended to be deposited; the lashing being cut away the casks were let go, and the stone fell into its seat. This method was found to succeed perfectly in weather that would have destroyed any crane barges, and the works of Banff harbour were thus secured from further degradation, and were subsequently entirely restored at a comparatively small cost.

A model of Farum's railway switch was exhibited, and its self-acting motion in guiding the carriages into the sidings or on the main lines, as required, was shown by the inventor. These switches were stated to have been used on the Grand Junction Railway for some considerable time. The drawings and enlarged diagrams gave fully the details of the method of working.

MARCH 19.—The President in the chair.

In the recapitulation of the conversation of the meeting of March 12, there were read some interesting remarks by Colonel Leafe on the knowledge possessed by the Greeks of the properties of the arch. He contended that numerous examples still existed of their having used it; but from the solidity of their construction, the nature of the materials they employed, and the architectural character of the edifices, which were chiefly temples, the arch was evidently less employed than among the Romans, who used different and less solid materials.

A description was then read of "The Formation of the Town-lands of Mussellburgh, on the Frith of Forth," by Mr. James Hay. This was a curious instance of an extensive tract, of nearly four hundred acres of land, being formed by an alluvial deposit in about three hundred years. The river Esk, when swollen by rain, is stated to bring down quantities of the detritus from the hills, which with the soil washed from the banks of the low lands is arrested when it meets the tide, and is thrown upon the beach: this being mingled with large boulder-stones, becomes fixed, and the sand is blown over it by the heavy north winds to which the shore is exposed, and thus this large tract has been formed. The diagrams showed the several lines of high water at various dates, and that nearly the entire town is built upon land thus recovered from the sea without the aid of art.

The next paper read was a description of an hydraulic traversing-frame at the Bristol terminus of the Great Western Railway, by Mr. A. J. Dodson, Assoc. Inst. C.E. The action of this machine, the object of which is to transport the railway carriages from the arrival side of the terminus to the departure side, or to any one of several intermediate lines, was thus described:—An opening being made in the train, the apparatus is pushed on to the line of rails, and the carriage required to be moved is run over it, when the frame is quite down, it being then sufficiently low to allow the carriages to pass freely over. As soon as the carriage is brought directly over the apparatus, a man works a pump acting upon four hydraulic presses, which raise the frame until both sides are in contact with the axles of the carriage-wheels, and raise the flanges of the wheels clear of the rails: the whole apparatus, with the carriage suspended upon it, is then easily transported to any of the lines of rails, when by unscrewing a stopper which allows the water to flow back from the presses into its cistern, the carriage is lowered on to the rails, and the apparatus is rolled over ready for recommencing the operation, the whole transit not having occupied more than one minute and a half. The action of the apparatus, which was made by Mr. Napier, York-road, was stated to be very satisfactory, and its cost to have been about 220*l*.

An account was then read of the land-slip in the Ashley cutting on the Great Western Railway, by Mr. J. G. Thomson, Grad. Inst. C.E.

The cutting, which was described, is situated about five miles on the London side of Bath; it was made through a mass of detritus from the neighbouring high lands, consisting of sand, oolitic gravel, vegetable matter, and stones of the great oolite, lying upon the blue clay and marl. The whole district was extraordinarily full of water, and appeared to have defied all attempts to drain it. This accumulation of water softened the clay, turning portions into soft silt, and when, by cutting away a portion of the foot, which was situated on a slope, the support was taken away, the whole mass was set in motion, and every attempt to arrest it was fruitless. The details of the attempts at driving water-headings, sinking pits, which collapsed, and were obliged to be filled up with stones and faggots, and all the other engineering devices which were adopted, were given with great minuteness, and being aided by some well-executed drawings, gave an interesting account of a good specimen of one of the difficulties to be encountered by the railway engineer in the ordinary course of his labours. The paper was an example of that which has been so frequently insisted upon at the meetings of the Institution, viz. the advantage to the civil engineer of a knowledge of geology, by which his progress would be safely made under such circumstances.

The following papers were announced to be read at the meeting of March 26:—

No. 668. "On Railway Cuttings and Embankments, with an account of some slips in the London clay," by C. H. Gregory, Grad. Inst. C.E.

No. 661. "Account of the Railway from Amsterdam to Rotterdam, and of the principal works upon it," by Le Chevalier F. W. Coorad, M. Inst. C.E., translated from the French by the Secretary.

## LECTURES ON ARCHITECTURE AND ANTIQUITIES.\*

## Lecture II.

TYRE.—There are few cities more celebrated in history than Tyre, and seldom has any one place excited so much controversy concerning its situation. Of its antiquity and greatness there is, however, no doubt. Bishop Newton says—"It was, as is well known, the most celebrated place in the world for its trade and navigation, the seat of commerce, and the centre of riches." The prophet Isaiah says—"Is this your joyous city, whose antiquity is of ancient days?" (xxvii. 7.) And in the Book of Joshua we find it spoken of as "the strong city Tyre." (ch. xix. v. 29.) Tyre was a colony or off-shoot of Sidon, the ancient capital of the Canaanites, which probably owed its origin as well as its name to Sidon, the eldest son of Canaan. (Gen. x. 15.) By its position on the sea-coast, its capability of becoming a leading maritime nation was evident. The soil around it was not inviting for the purposes of agriculture, but near at hand were the inexhaustible forests of Lebanon, from which the Tyrians built their vessels; and the daring and hardy sailors soon pushed their discoveries beyond the pillars of Hercules, founding colonies as they traversed the seas—in particular, Carthage and Cadiz may be mentioned. Quotus Curtius says of Tyre—"Colonia certe ejus pene orbe toto diffuse suot." By this adventurous spirit, the Tyrians became the carriers of the world; they made Tyre the depot for the merchandize of every quarter of the globe; her ships increased in number; her harbour was excellent, formed by an island in front; and wealth continued to pour in upon her.

The description in Ezekiel conveys a high notion of the prosperity of this great commercial people:—"O thou that art situate at the entry of the sea, which art a merchant of the people for many isles, Thus saith the Lord God: O Tyras, thou hast said, I am of perfect beauty. Thy borders are in the midst of the seas, thy builders have perfected thy beauty. They have made all thy ship-boards of fir-trees of Senir; they have taken cedars from Lebanon to make masts for thee. Of the oaks of Bashan have they made thine oars, the company of the Ashurites have made thy benches of ivory, brought out of the isles of Chittim. Fine linen with brodered work from Egypt was that which thou spreadest forth to be thy sail." (ch. xxvii. v. 3 to 7.) The prophet next describes the mercenary troops which they employed to protect their city, because the natives were all engaged in maritime pursuits, and then he continues—"Tarshish was thy merchant by reason of the multitude of all kind of riches; with silver, iron, tin, and lead, they traded in thy fairs." (v. 12.)

If we admit Cadiz to be the Scripture Tarshish, the Tartessus and Gades of the ancients, we shall perceive how well situated it was for the purpose of facilitating the trade of Tyre with the countries of the north, abounding with the articles enumerated in the verse just quoted. "There is every reason to believe that the tin was supplied from our Cornwall.

The prophet then proceeds to mention places which trafficked with Tyre in their respective products, as in slaves, ("persons of men,") brass, ivory and ebony, horses and mules; Syria supplied fine linen, emeralds, coral, and agate; the land of Judah contributed wheat, honey, oil, and balm; Damascus sent wine and wool; Arabia traded in sheep and goats, spices, gold, and precious stones. The prophet Zechariah, speaking of this city, says—"And Tyrus did build herself a strong hold, and heaped up silver as the dust, and fine gold

as the mire of the streets." (ch. ix. v. 3.) But her riches only served to make her proud and to exult in the misfortunes of her neighbours; accordingly we find the prophet Ezekiel thus instructed:—"Son of man, because that Tyrus hath said against Jerusalem, A ha, she is broken that was the gates of the people; she is turned unto me: I shall be replenished, now she is laid waste: Therefore thus saith the Lord God, Behold, I am against thee, O Tyrus, and will cause many nations to come up against thee, as the sea causeth his waves to come up." ("This," says Archbishop Newcome, "is one of the most beautiful and expressive images which occur in the magnificent prophecy here recorded.") "And they shall destroy the walls of Tyrus, and break down her towers, I will also scrape her dust from her, and make her like the top of a rock." (ch. xxvi. v. 2, 3, 4.) And again, "I will make thee like the top of a rock, thou shalt be a place to spread nets upon, thou shalt be built no more." (v. 14.) It is then expressly foretold that Nebuchadrezzar, King of Babylon, should come up against it with a large army. This prediction was fulfilled; but the place was so strong, and the besieged defended their city with such skill, that the Babylonian army lay encamped before it for thirteen years. St. Jerome states that when the Tyrians saw that the city was about to be taken, they conveyed away all their valuable property on board their ships and sailed away, so that Nebuchadrezzar found nothing in the deserted city to reward him for his long siege. This disappointment is expressly alluded to in Ezekiel:—"Son of man, Nebuchadrezzar, King of Babylon, caused his army to serve a great service against Tyrus; every head was made bald and every shoulder was peeled; yet had he no wages, nor his army for Tyrus, for the service that he had served against it." (ch. xxix. v. 18.) His recompense was Egypt. Tyre was taken 573 B.C.; and some writers, and among them St. Jerome, imagine that the inhabitants fled to Carthage, which they had founded, while Dean Prideaux supposes that they took refuge on the island close at hand, and built the new city which was afterwards destroyed by Alexander the Great. It must soon have exhibited signs of activity, as it appears to have risen rapidly into a flourishing city. Its situation was more favourable than the ancient city, from its insular position, and from its being also well fortified. The sea between the island and the continent formed two capacious harbours. When the Macedonian hero came before the city, he found that it was likely to withstand all his efforts to take it so long as it maintained its insular form, and was supported by a numerous fleet. He, therefore, formed and carried into effect the vast idea of uniting the island to the mainland by means of a mole. Quintus Curtius calls the sea a very deep one, but Arrian says its depth was only three fathoms. Alexander formed his mole with incredible labour and diligence, notwithstanding the desperate opposition of the Tyrians, and for the materials he employed the stones of old Tyre ("magna vis saxorum ad manum erat, Tyro vetere præstante." Qu. Cur.), and with these he built a causeway 200 feet wide, extending from the continent to the city. A passage in Ezekiel appears to foretell this remarkable fact. "And they shall break down thy walls and destroy thy pleasant houses, and they shall lay thy stones and thy timber and thy dust in the midst of the water." (ch. xxvi. v. 12.) Alexander captured the city, employing fire, after seven months' resistance. (332 B.C.) Zechariah, at chapter ix. v. 4, had predicted, "Behold the Lord will cast her out, and he will smite her power in the sea, and she shall be devoured with fire." The prophet Amos also thus foretells, "I will send a fire on the wall of Tyrus, which shall devour the palaces thereof." (ch. i. v. 10.) The conqueror behaved with great cruelty to the inhabitants, slew 8,000 in the storming, crucified 2,000 of them, and sold 30,000 into slavery; which was a retribution; since the Tyrians had sold some of the captive Israelites; and the prophet Joel had foretold that their recompense should return upon their own head. (ch. iii. v. 7.) "Because ye have taken my silver and my gold, and have carried into your temples my goodly pleasant things. The children also of Judah and the children of Jerusalem have ye sold unto the Grecians, that ye might remove them far from their border." The 28th chapter of

Ezekiel gives a glowing description of the magnificence of Tyre, and Strabo and Arrian speak of the beauty and prodigious height of the houses; the walls were 150 cubits high; here were two famous temples to Jupiter and Hercules.

Its present forlorn appearance is a sad contrast to its ancient splendour. Bruce says, "Passing by Tyre, from curiosity only, I came to be a sorrowful witness of the truth of that prophecy, that Tyre, the queen of nations, should be a rock for fisher-men to dry their nets on,—two wretched fishermen with miserable nets had just given over their occupation." All modern travellers agree in their account of its desolate state.

G. R. F.

(To be concluded in our next.)

#### THE NEW ROYAL EXCHANGE.

At the meeting of the Corporation of London for improving the approaches to London-bridge, held on the 12th instant, the deputation appointed to confer with the Commissioners of Metropolitan Improvements, on the question of obtaining further space at the east end of the New Royal Exchange, made their report.

The deputation consisted of Mr. R. L. Jones, the chairman of the Royal Exchange Committee; Mr. W. Lawrence, and Mr. R. Taylor, attended by Mr. Tyrell, the Remembrancer; and Mr. Tite, the architect of the new building.

It appeared that the deputation had had several interviews with the Commissioners, and that they submitted their plans or suggestions for these improvements.

The first suggestion was to make an opening into Finch-lane, the same in character as that which was made in Fleet-street, called St. Bride's passage, but wider, the width of the Finch-lane opening being proposed at 60 feet from house to house, and 30 feet between the shops.

The second suggestion proposed the same opening, but included the widening of the main street at the east end of the Exchange to 60 feet, instead of 46 feet 6 inches as at present.

The third plan proposed the taking down of Finch-lane altogether, and the construction of a new street 70 feet wide at the east end of the Exchange in its place. All the plans contained a suggestion for widening Threadneedle-street from the Royal Exchange up to Merchant Tailors' Hall.

The application on the part of the Corporation was supported by a memorial from the merchants, bankers, brokers, and traders of the city. This memorial was signed by all the first names in the city.

In opposition to further improvements in this quarter, Magdalen College appeared by their steward, Mr. Blagrove, and Mr. Sheriff Moon, their tenant.

The Commissioners, it appeared, determined that a more extended space at the east end of the New Royal Exchange would greatly conduce to the effect of the building, and the convenience of those who are to frequent it; but that, looking to the numerous and important claims upon any funds which might be provided by the Legislature for improvements in the metropolis, they could not feel justified in recommending to her Majesty or to Parliament any advance of money from public resources, or from local taxation, should be made for this purpose.

**SINGULAR DISCOVERY OF COPPER ORE.**—It is a well-known fact that copper mining in Cornwall is of comparatively recent origin, and that the mines in this county were, at no very remote period, worked only for tin, the copper ore being considered as useless, and, consequently, thrown aside. A singular confirmation of this lately occurred in widening the road in the neighbourhood of Chacewater. Captain Davies, the contractor, in removing the old hedges, perceived among the stones of which they were composed a considerable number that contained copper, and has actually selected from them several tons of copper ore. These stones had, no doubt, been raised by miners in search of tin, at a period when their value was not known, and used as materials for constructing the hedges in which they were found. Capt. Davies, in contracting for the job, had been so fortunate as to secure the stones of the old hedges, and is, consequently, a considerable gainer by the discovery.—*West Briton*,

#### ANDREW CROSSE, THE ELECTRICIAN.

IF, when you come to the village of Kingston, about three miles and a half from Taunton, you turn upon your right into a dark and narrow lane, you will soon find yourself climbing with toil a difficult and very steep hill; the road is rough, and the edges meeting overhead give it an aspect of profound gloom. But by day, in the summer time, it is deliciously cool and shady, and a very wildness of wild-flowers—the foxglove, the woodbine, the dog-rose, the ragged-robin, decorate the banks and make the hedges fragrant. By night—for many times have we dared the descent when the outline of the hand could not be traced if held before the eyes—this lane is enlivened by the songs of many nightingales, and the glow-worms light up their love-torches on every green slope. Having conquered this hill, a turn off the road on your left conducts you to a park adorned with fine beeches, on one side of which you behold a sheet of water, with a shrubbery in the back ground, whose very aspect invites you to trespass in it. All this you see as you walk under houghs that overshadow the road; and if you are a stranger to the place and its owner, you will wonder what can be the meaning of the mast-like poles fixed at the top of the very loftiest of the trees, by which a line (so it appears) is carried round the park till it is lost in the shrubbery. A little further onward and you see a small village green, with a very old tree in the centre, surrounded by a few cottages; before you the road winds about the shoulder of a steep, amid a bit of gorse brake; the breeze blows upon you from a distant channel, which you smell, though you cannot see it from the spot, and you have the light buoyant feeling of being upon a high hill. Step lightly over the mossy lawn, you will scarcely disturb the rabbits that are feeding and sporting there in conscious security. Knock fearlessly at the door; the votaries of science are always welcome there. Your name? your station? your calling? your property? Trouble not yourself about any of these things, nor hope thus to commend yourselves to the inmates. You are a man, you have a mind, you venerate science, even if you know little of it; these are your passports into that mansion. Are you a stranger? You will not long be so:

"One touch of nature makes the whole world kin."

In ten minutes you feel as if you had been acquainted with your kind and generous host for twenty years. Have you walked thither? he sets before you a profuse luncheon and his choicest cider. Such cider! bright, sparkling, luscious! The gods would have preferred it to their nectar, especially if they had toiled up that steep hill on a hot summer day.

Your generous entertainer attracts you to gaze as much as you politely may. Probably you have seen his portrait in the Polytechnic Institution, and you recognize the likeness.

He is now in his velvet jacket, his laboratory costume; his frame is made for activity; light, but muscular, having not an ounce of superfluous fat, with a trifling stoop at the shoulders; his face, too, is thin and long, with a fine forehead, grey eyes, bushy brows, a well-shaped nose, and a pointed chin. Its expression is highly intellectual, with an air of seeming melancholy, which is in fact one of thought; but a lengthened gaze discovers in it a lurking propensity for fun, which continually peeps out at the corners of his eyes and in the curls of his lips. His hair is brown, partially silvered by age, which is betrayed only there, for his gait and countenance have all the liveliness and energy of youth; his step is springy, his voice cheerful, his aspect that of one who enjoys good health and its attendant good spirits. Such, dimly outlined we must confess, is the personal appearance of Andrew Crosse.

Had you never before heard that name, or if you had not known that you were about to visit one who had distinguished himself in the pursuits of science, you would then discover, if you had the eye of an observer, that you are in the company of a man of genius; that you are conversing with one who has thought for himself, and refused to subject his mind to the chains of authority, and to bow before the dicta of schools.

The presence of genius you discover in Andrew Crosse, before you have conversed with him a quarter of an hour. The talk of most men, even of those who are reputed wise

or witty, is merely a repetition of that which you have heard in substance, if not in form, from other men fifty times before, and read as often. But Mr. Crosse's talk is his own.

You may differ from his opinions, you may question his accuracy, you may contest his arguments, you may smile sometimes at views that may seem to you visionary and wild, because they are different from your habitual trains of thinking, and therefore startle you; but you cannot complain that they are common-place; they are not echoes of the voices of others, not gems in a new setting, stolen from books old or new. Fools may deride them as being strange; wise men know their worth; fools have laughed before, when the better taught have struck the hill-side, asserting that rich ore was hidden in the stones the fools had called rubbish, and scarcely have they ceased their gibes when they have beheld the metal elaborated and glittering in their hands.

Every man has his hobby; the saying is an old one, but it means nothing more than this, that every man has some preponderating taste which governs its pursuits, and the gratification of which engrosses the largest share of its attention. Happy it is when that hobby is not only a harmless one, but ennobles the rider, and brings with it blessings to mankind. Mr. Crosse's hobby is the science of electricity; to that he has directed the studious reflection and the industrious labours of a life. No branch of science is unknown to him, but electricity has been his especial pursuit; and if he has not spun so many pretty theories about it as other philosophers, he has advanced the practical, experimental investigation of it much further than ever it was carried before. As this is the theme on which his thoughts most dwell, it is that of which his mind is the most full. Touch that chord and see how he will discourse! As he describes to you all those wonders, not imaginations of a dreamer, but realities, which he has himself seen, and proved by producing, his face is lighted up; his eyes are fixed upon the ceiling; present things seem to have disappeared from him, lost in the greater vividness of the ideas which his full mind throngs before him; he pours out his words in an unfeeling stream; but, though he has a command of epithets, he finds language inadequate to express his conceptions of the might of that mysterious element which, though so very mighty that it could annihilate a world as easily as it lifts a feather, he has summoned from its throne, compelled into his presence, guided with his hand, and made to do his bidding!—thus surpassing the fabled feats of the enchanters of old.

Before you visit the hall where this mighty power is at work night and day, obedient to his command, and daily shewing itself in some new shape (a very Frotens), yet unable to escape from the potent spell of the magician by whom it is compelled, you would like to stroll with your distinguished host into the plantations and gardens. Step through the window into the lawn, and follow him.

But, beware!—you are no longer in the company of a sage philosopher, but of a man (we might almost say of a boy) full of fun and frolic, and laugh and joke! That roguish twinkle of the eye, and half-suppressed curl of the lip, betoken mischief. Look at him!—there is not a trace of the student in his manner or in his talk. Can this be he whom we heard but two minutes since discoursing, with the rapture almost of inspiration, of the mysteries of science? He is as merry now as a child at play. What a glorious laugh—a real, honest, hearty laugh—not a stifled titter, as if he were ashamed to be natural. What a step and jump, as though age had been worsted in wrestling with him, and had succeeded only in frosting his hair with its breath in the struggle! It is an almost universal notion that wise men must be grave, and a philosopher is always associated in our thoughts with a solemn pliz, a staid demeanour, eyes that cannot twinkle, a mouth never wreathed with smiles, a chest never convulsed with laughter,—as a jestless, dull, phlegmatic mortal, who deems fun a sin, and votes frolic a degradation. But this is a very great mistake indeed, as all who have read the biographies of dead philosophers, and all who have had the pleasure of knowing any living ones, will testify. It is your false philosopher, you would-be sage, your fellow of "shame," as

Carlyle terms them, who cannot afford to be unwise.

Not such is Andrew Crosse, as you will find ere you have walked with him in his grounds for five minutes. What buoyancy of spirits! what light, cheerful, pleasant talk about field sports, country rambles, rifle-shots, planting, pruning, farming, trees, flowers! He will lead you a pretty dance when once he has got you fairly under his guidance, his bright eye all the while twinkling merry malice. He will shew you banks were wild strawberries ripen, in such multitudes, and so large and richly flavoured, that you may feast as in a garden, and you are startled by the whirr of a pheasant rising from between your very feet, and almost making you roll down the slope in your sudden fright; you will visit his well-stocked and well-trained gardens, and, if you please, pass an hour at the fish-ponds, with certainty of something better than a nibble, for the perch there are abundant and greedy, and you are sure of sport; or taking your gun, or his, for you are heartily welcome to any thing he can supply, you may walk round the park and shoot the rabbits as they run from their feeding places to their holes, and soon bag as many as you can conveniently carry. And if you are a good shot, you may venture a small wager with your host which shall bag the most from an equal number of shots; but be warned by us, and let the bet be a small one, for he is a capital shot and the chances are against you.

Nor will this walk be without profit to your mind as well as to your body. You will not only have breathed fresh pure air, and healthily used your limbs, though at the expense of a hole or two in your fine town-made coat, but you will have gathered a vast deal of information from your companion, who is intimately versed in all rural subjects. It is the prerogative of intellect to find in every thing, however humble or common, food for meditation, and a theme for intelligent discourse. Whatever attracts your attention is sure to elicit from Mr. Crosse some instructive remark; and it is worthy of note that his remarks are almost entirely the result, not of his reading, but of his observation. He is not a bookworm; he is essentially an observer; he is not stored with the ideas of other men, but he is rich in ideas of his own. Like all who have looked closely into nature, he is an humble-minded man; you discover it in every thing he says and does. He has learned by years of study the last, most difficult of all lessons, *not to know*. He rates himself much lower than any other person rates him—a rare phenomenon! nor is this humility of mind assumed; he has not a spark of affectation; the conviction is in him, and it shews itself.—*The Critic*.

#### BUILDINGS' REGULATIONS BILL.

HOUSE OF LORDS, March 12.—The Marquis of Normandy said, he observed that a Bill had been introduced into the other House for the better regulation of new buildings. It was, however, entirely confined to the metropolitan districts. He could not see any good reason for thus circumscribing its operation. He thought that it ought to be extended to other places; and he would put it to his noble friend opposite whether it was not desirable that its provisions should be so extended? There was one part of the Bill which would be of very great use to the metropolis. He alluded to the formation of cellars, except under certain regulations. But, looking to different parts of the country, that provision might be introduced with even greater advantage in a variety of places. He could name towns where actually one-half of the inhabitants lived in these miserable cellars. He wished to know whether his noble friend was prepared to extend the provisions of the Bill to other localities, or would merely confine it to the metropolis? There was another point connected with this subject on which he wished for information. Many propositions had been made for the construction of parks for the health and recreation of the working classes. For the benefit of the great mass of the people in the east end of the metropolis a tract of land, denominated Victoria Park, had been selected. He understood that the works there were suspended. Perhaps his noble friend was not able at that moment to state the cause of the suspension, but would be prepared to do so at a future day. All he should now ask was, what

progress had been made in the formation of that park?

The Duke of Buccleuch said, that he was not at present prepared to answer the last question of the noble marquis. Respecting his first question he wished to observe, that in many of the large towns throughout the country there were local acts for regulating buildings which it might not be judicious to interfere with by any general measure, without at least very great consideration. It was proposed that the present measure should be passed this session, after having been well considered in both Houses, and the true meaning of the several clauses made plain. The small towns would then have an opportunity of considering it, and of seeing what portions of it could be made applicable to them, with a view to further legislation on the subject next session. For these reasons the government were not prepared to recommend that the present Bill should be extended.

The Marquis of Normandy put it to the government whether it would not be desirable to extend the provisions of that part of the Bill which referred to cellars now actually occupied to the suburbs of the metropolis, and other parts of the country. The parties occupying them were charged enormous rents, which they were obliged to pay, in order that they might reside in the district where their occupation called them.

The Marquis of Salisbury admitted the evil of having persons huddled together, but did not think the suggestion of the noble marquis would diminish the expense to those parties, as they would have to pay still higher rents perhaps for new abodes.

#### RAILWAY INTELLIGENCE.

*Manchester and Sheffield Railway.*—Parties have been employed during the past week for the purpose of ascertaining the number of population in the townships through which the above line of railway passes from Manchester to Staleybridge; the following is the result:—From Manchester to Staleybridge, exclusive of both towns, 65,361; inclusive of both, 384,692; population of the township through which the branch line will pass from the railway to Staleybridge, including Ashton-town, and exclusive of Staleybridge, 58,205. The town of Staleybridge contains a population of 21,000, and the town of Ashton-under-Lyne 22,656.

*Warwick and Leamington Railway.*—The branch railway between Warwick and Coventry, it is now stated, will certainly not be opened before the end of the year; but we are assured, upon good authority, that the division contracted for nearest Leamington, extending to Kenilworth-common, will be completed in May next, and that the portion of the line nearest Coventry will also be perfected by the same early period.

*Ayrshire, Dumfries, and Carlisle Railway.*—We are rejoiced to find that at length a promising movement is being made to have a communication from the south with the western metropolis of Scotland, by a railway *via* Carlisle, Dumfries, and Ayr, which cannot fail to secure very great advantage, provided that connection takes place upon the coast, thus taking advantage of the rich mineral resources of the interior, and also of traffic on the entire line from Ayr to Glasgow.—*Ayr Advertiser*.

*The Cornwall Railway.*—Our readers will have observed last week, with much satisfaction, that the question of a railway through Cornwall is so seriously entertained by the Great Western Railway Company, that it was mentioned by the chairman, in very encouraging terms, at the general half-yearly meeting of the proprietors. Such a notice is practically an announcement of the undertaking to capitalists, and a recommendation of it to their consideration and support. With such a sanction, the Cornwall Railway is no longer a project, but a fact; and as such it will be contemplated by those on whose assistance we must in a great measure depend. At the same time, our friends in Cornwall must remember that it is their own concern; and though it is true that they will require help from beyond the Tamar, yet the more they do for themselves, the more independent will be the position they will be able to assume in meeting of the great companies. The railway will come through Cornwall; of that we have no doubt; but if we do what we can and ought, we shall be able

to make terms—if we go to sleep, we shall have to submit to terms dictated by others. Therefore, instead of regarding the declaration of the chairman of the Great Western as a motive for relaxing our exertions, it ought rather to be received as a stimulus to renewed efforts, that in the zeal we display, and the capital we raise, we may give to the companies and capitalists to the eastward a just sense of the importance of the county, and entitle ourselves to that due share of influence which it is desirable that the Cornish directors and shareholders should possess.—*Cornwall Gazette.*

**Bristol and Exeter Railway.**—At the general meeting of the proprietors of the Bristol and Exeter Railway Company, held at the White Hart, Bristol—Mr. Ricketts, the Chairman of the Directors, presiding, supported by Mr. Divett, M.P., Mr. Brunel, C.E., and a large number of proprietors from the West of England,—Mr. Badham, the secretary, read the Directors' Report, which announced that the amount of fixed rent and share of toll which the Great Western Railway Company had stated to be due to the Bristol and Exeter Railway Company for the past half-year was 25,555*l.*; the share of toll on 197,030 passengers, conveyed 5,023,370 miles being 5,232*l.*; and 462*l.* on 14,000 tons of goods, conveyed 443,714 miles; making a total of 31,249*l.* The gross earnings on the line for the half-year, as far as Beambridge, had been 56,543*l.* The further claims of the Company on the Great Western Company had been referred to arbitrator. The state of the works was exceedingly satisfactory, and the whole line to Exeter might be confidently expected to be ready for public traffic in the month of May next.

**Newcastle-upon-Tyne and Carlisle Railway.**—We understand that the directors of the Newcastle-upon-Tyne and Carlisle Railway Company have contracted for 1,000 tons of malleable iron rails at the low rate of 5*l.* 7*s.* per ton, to enable them to double the remainder of their line. This great improvement is to be completed before the 1st of July next, at which time it is intended the railway from Darlington to Gateshead will be opened, and which will join the Newcastle and Carlisle Railway at Redheugh, a little to the west of Gateshead. An uninterrupted railway communication will thus be formed from London to the city of Carlisle, a distance of about 350 miles, which, it is expected, will be performed in sixteen hours. To meet the additional traffic which this communication will bring upon the Newcastle and Carlisle Railway, and to prevent the least interruption in the regular running of the trains, renders it absolutely necessary to make the line double throughout. We also learn that the spirited coach proprietors, Messrs. Dunn, Croll, and Co., have advertised to start on the 5th of July two additional coaches between Carlisle and Glasgow for the accommodation of the increased number of passengers, and which coaches will arrive and depart so as to suit the trains of the Newcastle and Carlisle Railway Company.—*Newcastle Advertiser.*

**Wakefield and Lincoln Railway.**—We understand that the share list of this line is fast approaching its completion, 13,000 shares having been already applied for, the total number being only 15,000, and the project has not yet been twenty-one days before the public. The people of Lincolnshire are eager in their support of this line, both the corn-merchant and wool-dealer perceiving the importance of connecting themselves with their best markets—viz., Wakefield, Bradford, Halifax, Huddersfield, and Rochdale. We observe our contemporary of the *Leeds Mercury* is taking infinite pains to bolster up the project of a branch from Gainsborough to Swinton. This scheme, if ever carried out (of which by the way there are very great doubts), can have no possible chance of competing with the Wakefield line, even for the Manchester traffic from Lincolnshire; for, although in actual distance a few miles nearer, from the miserable gradients on the Sheffield line, it has been declared by the engineer appointed to report upon the subject, to be seven miles further from Manchester, on account of those gradients, than by the Wakefield line.—*Wakefield Journal.*

**The Sussex Railways.**—The Hastings Railway Bill has passed the standing orders; and as there is no opposition to the Chichester Bill,

it will pass on Friday, to which day it has been adjourned, in consequence of the unavoidable absence of one of the witnesses, all the others having been examined. We shall, when these railways are made, have a continuous line of railway extending upwards of 60 miles along the coast. Chichester, Worthing, and all the towns along the coast of western Sussex, have sent petitions to the House of Commons, very numerous and respectfully signed, in favour of the Chichester Railway; and we suppose that Brighton, Lewes, and the towns in East Sussex, will follow the laudable example which has been set them. The government must, we presume, be desirous of seeing these railways made; but we have not heard whether any application has been made to the Board of Trade upon the subject.—*Brighton Gazette.*

**Merchant Company.**—A special meeting, at the request of the Edinburgh and Glasgow Railway Company, was held to consider the propriety of petitioning Parliament in favour of the extension of the railway from the present terminus to the North Bridge. A petition, which had been prepared by the master and assistants, was laid on the table, and its adoption moved by Mr. Robert Cadell, who, at the same time, urged the propriety of the company, at an early day, also petitioning in favour of the proposed railway to Berwick. Mr. Philip moved as an amendment, that unless the running of Sabbath trains were prohibited, the company should not petition in favour of the bill. The amendment was negatived, and the original motion carried.—*Edinburgh Witness.*

**French Railways.**—The following are the principal conditions of the bills for establishing railroads from Paris to the Belgian frontier, with a branch line to the coast opposite England; and for executing another from Orleans to Vierzon, both of which were presented on Thursday week by the Minister of Public Works in the Chamber of Deputies. The English lines are to run by Calais, Dunkirk, and Boulogne. Those to Calais and Dunkirk are to join the Belgian line between Douai and Lille, passing in the former case by Hazebrouk and St. Omer; and, in the other, by Hazebrouk and the west of Cassel. The branch line to Boulogne will quit the main line at Amiens, and run by Abbeville and Etaples. A sum of 15,000,000*fr.* is granted for the Calais and Dunkirk lines, 2,000,000*fr.* of which is to be paid from the estimates of 1844; and 6,000,000*fr.* from those of 1845. The Minister of Public Works is to grant a lease not exceeding twenty-eight years for the Belgian line; and the branch lines by Calais and Dunkirk; and a lease not exceeding thirty-five years for the Orleans and Vierzon line. Should the companies, accepted by the Minister, fail to comply with the conditions and clauses of the bill within the space of two months, he is authorized to get the lines executed himself at the cost of the state, 44,000,000*fr.* being allowed for such works, of which 10,000,000*fr.* are to be paid out of the estimates of 1844, and 20,000,000*fr.* out of those of 1845. In case the lines are made by companies, the Minister is authorized to lease out the working of the lines, for a period not exceeding twelve years, the lines falling gratuitously into the possession of the state at the end of that period. An article stipulates, that after taking off 6 per cent. interest, and 2 per cent. for the sinking fund, the profits are to be divided equally between the companies and the state. There are to be three classes of carriages on the Belgian line; the first at 10*c.*, the second at 7*c.* 0. 005, and the third, which are to be covered and curtained, 5*c.* 0. 005, per kilometre, or quarter of a league. The state is to have the faculty of redeeming the lease of twelve years; the purchase to be made according to the conditions established for the Orleans railroad, with this difference, that the premiums which are to be added to the net dividend declared to compose the annuity, which in such cases are to be paid to the company, are to be reduced to half.

**ROYAL SOCIETY.**—The lucrative and honourable appointment of Assistant Secretary, vacant by the death of the late Mr. Robertson, has been filled up by Mr. Weld, the late Secretary of the Statistical Society. This latter situation has been filled by the appointment of Dr. Richard King, the celebrated Polar traveller.

## Correspondence.

## PROPOSED NEW BUILDING-ACT.

SIR,—As you are reviewing the new Building-Act, I send you the following hints for your consideration.

That the gully-holes and sink-stones to drains in houses and also in yards should be properly trapped to prevent the stench rising out of them, as it will be useless to make drains perfect if stench be allowed to escape from these places. With regard to houses already erected, I think the district-surveyor should have power also to order all existing sink-stones to be trapped, on receiving a written complaint from the tenant that they are an annoyance.

That privies should not be allowed in any dwelling at all, nor in any yards within, say at least, 10 feet from the external wall of a house.

Yours obediently, B.

P.S.—Sign-boards are only limited as to height, so that they may be continued the whole length of a street, from house to house, without any space between them.

## FONT IN ST. MARY'S CHURCH, BRECON.

SIR,—The exquisitely beautiful font in St. Mary's Church, Brecon, the drawings of which you published last week, I think must certainly have been "*a Piscina*," which opinion, I think, is confirmed by the minute particulars of your correspondent "J. L. T.," who describes the want of an original shaft of stone, the appearance of the bowl, only wrought half round, having been originally fixed in a wall, the wall itself having appearances of "a moulding in the background," which I should think is the arch usually above "a Piscina." I have little doubt that a water-drain is covered over by the metal lining of the bowl, which being only 8 inches deep, is too shallow for immersion. I should like very much to see a drawing of one of the crockets, and also sections of the arch-moulds and of the tablings of the small pinnacles; I think then workmen might reproduce this beautiful example. I should indeed like to possess a cast of one side of the bowl, as I think the half-figures, arches, and other decorations exceedingly fine.

I am, Sir, your very humble servant,  
Capequary, March 18, 1844. a F.A.S.

## SMALL HOUSE PORTICO.

SIR,—Will any of your numerous correspondents favour me with a plan for a portico? Something neat is required, with square columns, to rise about five steps; the width of the hall about five feet.

Your obedient servant,

A WORKING MAN.

## MEETINGS OF SCIENTIFIC BODIES,

To-day and during the ensuing week.

SATURDAY, MARCH 23. — *Royal Botanic*, Regent's-park, 4 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.

MONDAY, 25. — *Geographical*, 3, Waterloo-place, 8½ P.M.; *Medical*, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 26. — *Medical and Chirurgical*, 53, Berbers-street, 8½ P.M.; *Zoological*, 57, Pall Mall, P.M.; *Civil Engineers*, 25, Great George-street, 8 P.M.

WEDNESDAY, 27. — *Society of Arts*, Adelphi, 8 P.M.; *Pharmaceutical*, 17, Bloomsbury-square, 9 P.M.

THURSDAY, 28. — *Royal*, Somerset House, 8½ P.M.; *Antiquaries*, Somerset House, 8 P.M.; *Royal Society of Literature*, 4, St. Martin's-place, 4 P.M.; *Medico-Botanical*, 32, Sackville-street, 8 P.M.; *Nunsmatic*, 41, Tavistock-street, Covent Garden, 7 P.M.

FRIDAY, 29. — *Royal Institution*, Albemarle-street, 8½ P.M.

SATURDAY, 30. — *Free-asons of the Church*, Adjournment of Our Lady's Chapter for delivery of the inaugural address upon the foundation, 8 P.M.; *Westminster Medical*, 32, Sackville-street, 8 P.M.; *Chemical Society of Arts*, Adelphi, 8 P.M. (anniversary).

**SOCIETY OF ARTS.**—Open every week-day except Wednesday, between 10 and 2. Admission by members' tickets.

The meetings of the following Societies are continued throughout the year, on the regular days:—**HORTICULTURAL, ZOOLOGICAL, ENTOMOLOGICAL, BOTANICAL, ROYAL BOTANIC, and PHARMACEUTICAL.**

The Builder.

NO. LX.

SATURDAY, MARCH 30, 1844.

In pursuance of our intention to follow the consideration of the

Metropolitan Building-Act by that of the proposed general Act relative to the Health of Towns throughout the three kingdoms, or England and Wales at least, we this week enter a little into that subject.

In the propounding of any such extensive measure, fears are apt to be generated in the minds of many persons, of the enactment of unnecessary interferences leading to great vexation, trouble, delay, expense, and private inconvenience: and certainly statutes purporting to be merely sanitary are too apt to be afflicted by some one at least of such drawbacks upon their usefulness. Very great caution, therefore, ought to be used in the framing of any legislative measure of the kind, that when enacted, a fair chance may be provided of the long existence of such measure; and so do away with one of the curses of modern legislation, constant wavering—hasty and perpetual alteration—uncertainty, by the leaving of cramp-corners—and which faults are sure to produce a violent desire for change before better schemes are provided; the end of which is, that English law, which each English subject is supposed, and that penalty, to understand, vexes the most astute juriconsults; and after a man of incessant industry and shrewdness has passed the greater part of his life in becoming learned upon one branch of English law, he finds suddenly all his lore, all his industry, all the cramping down of his mind to the contracted subtleties of technical language, profit nothing, and that his occupation has gone; the traps which he had mastered are withdrawn; and the legal pit-falls he had learned to avoid no longer require the pilotage of the black-letter-mind of the wrinkle-browed civilian.

Many persons will think no measure of the kind is indeed necessary; perhaps with most small English towns which are clean and healthy, no such statutory interference would be of any value, were not some other measures of good account to be united with such general enactment.

But turning to the statistics of any great town, such for instance as Liverpool, few persons would for a moment hesitate in admitting such a measure to be most imperatively called for by the exigencies of the case.

The following quotations are from a pamphlet "On the Physical Causes of the high rate of Mortality in Liverpool, read before the Literary and Philosophical Society of Liverpool, by

W. H. Duncan, M.D.," and some time since published by that society.

"Table of the relative Mortality of Seven of the principal Towns, calculated on the average of 1838-39-40.

Towns.	Population in 1841.	Deaths.
Metropolis.....	1,870,727	1 in 37-38
Birmingham.....	138,187	" 30-79
Leeds.....	168,697	" 30-72
Sheffield.....	85,293	" 32-92
Bristol.....	64,298	" 32-38
Manchester (Union).....	193,408	" 29-64
Liverpool (Parish).....	223,054	" 28-75

"This table makes Liverpool the most unhealthy town of the series.

"Table shewing the average Age of Deaths.

Towns.	Average Age at Death.
Metropolis, i. e., Kensington, Strand, Whitechapel, and Bethnal Unions.....	26½ years.
Leeds.....	21 "
Manchester.....	20 "
Bolton.....	19 "
Liverpool.....	17 "

"The average duration of life in London, as taken from these examples, is therefore 56 per cent. more than in Liverpool.

"Table of average Age of Death in Professions and Trades.

Towns.	Average Age at Death.				General average.
	Gentry and professional men.	Tradesmen.	Labourers, &c.		
Kendal ..	45 years.	39 years.	34 years.	36 years.	
Bath.....	55 "	37 "	25 "	31 "	
Four Metropolitan Unions.....	44 "	28 "	22 "	26 "	
Leeds.....	44 "	27 "	19 "	21 "	
Bolton.....	34 "	23 "	18 "	19 "	
Manchester ..	38 "	20 "	17 "	18½ "	
Liverpool ..	35 "	22 "	15 "	17 "	

"The population of the parish of Liverpool, by the census of 1841, amounted to 223,054; of whom about 160,000 may be estimated to belong to the working classes; and of these, it is well known that a large proportion inhabit courts and cellars, and the remainder live in houses or rooms to the front of the street. As some members present may not be acquainted with the character and construction of the courts in which so many of their townsmen reside, I may state shortly that they consist usually of two rows of houses placed opposite to each other, with an intervening space of from 9 to 15 feet, and having two to six or eight houses in each row. The court communicates with the street by a passage or archway about 3 feet wide—in the older courts built up overhead; and the further end being also in many instances closed by a high wall, or by the back or side of an adjoining building; the court forms, in fact, a *cul de sac* with a narrow opening. Such an arrangement almost bids defiance to the entrance of air, and renders its free circulation through a court a matter of impossibility. \* \* The houses themselves are three stories high, contain three rooms of about 10 or 11 feet square, and being built back to back with the houses of adjoining courts, there is of course no thorough draught. An enumeration of the court and cellar population of the borough was made two years ago, under the authority of the Town Council, when it appeared that there were in the parish of Liverpool, 1,982 courts containing 10,692 houses, and 55,234 inhabitants. That is to say, more than one-fourth of the whole parochial population, or more than one-third of the working classes, were resident in courts. With regard to the character of these courts, it appears from the report of the Corporation surveyors, that 629, or nearly one-third, were closed at both ends; 875, or less than one-half, were open at one end; and only 478, or less than one-fourth, open at both ends.

"The cellars are 10 or 12 feet square; generally flagged, but frequently having only the bare earth for a floor, and sometimes less than 6 feet high. There is frequently no window, so that the light and air can gain access to the cellar only by the door, the top of which is often not higher than the level of the street. In such cellars ventilation is out of the question. They are of course dark; and from the defective drainage they are also very generally damp. There is sometimes a back cellar used as a sleeping apartment—having no

\* Mr. Chadwick gives 20 as the average for Manchester, as in the preceding Table, but the data only give 18.

direct communication with the external atmosphere, and deriving its scanty supply of light and air solely from the front apartment.

"The enumeration already alluded to shewed that there were in the twelve wards forming the parish of Liverpool, 6,294 inhabited cellars, containing 20,168 inhabitants, exclusive of the inhabited cellars in courts (of which there were 621, containing probably 2,000 inhabitants) \* \* Of the entire number of cellars, 1,617 have the back apartment I have mentioned, while of 5,297, whose measurements are given, 1,771, or one-third, are 5 to 6 feet deep; 2,324 are from 4 to 5 feet, and 1,202, from 3 to 4 feet below the level of the street; 5,273, or more than five-sixths, have no windows to the front; and 2,429, or about 44 per cent., are reported as being either damp or wet.

"The streets inhabited chiefly by the working classes are on an average perhaps about 8 yards in width; they seldom exceed 10, and sometimes are not more 5 yards across. Each house is usually occupied by two or more families, exclusive of the cellar, and most of the densely peopled lodging-houses are situated in the streets. As a general rule, the houses have no thorough draught, from being frequently built up against the houses in the courts behind.

Upon this subject a writer in the *Polytechnic Magazine* of January last declares—

"These disclosures have astounded us. If they had been brought from amongst the savage tribes of America, we should not have given them credit, because we have the evidence of witnesses to prove that the uncivilized man has often a very quick perception of what is unhealthy, and avoids it; but to think that the surveyors of the Corporation of Liverpool, the second town in the empire, should in the 19th century have had it in their power to lay before the public a catalogue of such hideous elements of misery, is indeed startling;—there must be an end put to the "*laissez faire*" system, and that right soon.

"The average density of the population of England and Wales is 275 inhabitants to the square mile, while that of the twenty-one principal towns is 5,045 inhabitants to the square mile. The following table exhibits the comparative density both over the whole area, and the area actually built upon of our five most populous towns.

Towns.	Inhabitants to the square mile.	
	Of the total area.	Of the built area.
Leeds.....	20,892	87,256
Metropolis.....	27,423	50,000
Birmingham.....	33,559	40,000
Manchester (township).....	83,224	100,000
Liverpool (parish).....	100,899	138,224

"We learn from this table that when compared with London, the population of Liverpool is nearly four times denser, if we take the whole area built and unbuilt into account, and that the actual built area of Liverpool has a population two and a half times more crowded than the corresponding area of the metropolis. This is no doubt a strange fact, but when we come to examine the comparative density of the population in different districts of Liverpool, we shall find cause for more surprise.

"Dr. Duncan states that there is a district containing about 12,000 inhabitants crowded together upon a surface of 105,000 square yards, which gives a ratio of 460,000 inhabitants to the square mile. This occurs in Exchange Ward, in the immediate vicinity of the Town Hall, the Exchange, and the splendid offices of the Liverpool merchants; and he further states that that portion of the district bounded by Addison-street and Great Crosshall-street contained, in 1841, 811 houses, and 7,938 inhabitants on an area of about 49,000 square yards, giving a ratio of 637,963 inhabitants to the square mile!—a proportion, perhaps, unparalleled in the world for its density. In order to enable our readers to form an estimate of what the condition of the poor in this district must be, we shall compare it with London. The present population of the metropolis is about 1,900,000, and every square mile of building contains 50,000 people. Those who are accustomed to walk our streets see no evidence of under-population, but the contrary. Now, by the census of 1841, the population of Great Britain and Ireland amounted to above 26 millions and a half, and if we could suppose 25 millions of these crowded into the present houses of London, we should

have our whole population reduced to a similar condition to that of the inhabitants of the district in Liverpool alluded to.

"In certain localities the crowding of the population is even greater than this. One instance out of a number of others is given of a court in Crosbie-street, containing 118 inhabitants on an area of 150 square yards, or about one square yard and a quarter to each. The average of inhabitants is nearly seven to each house, while in the court alluded to it is fifteen to each, and Dr. Duncan states that there are entire streets where the average is nearly as high. If we descend into these abodes of all wretchedness, the cellars, we find that when the families are shut up for the night, thirty individuals are furnished with a supply of air sufficient only for the wants of seven. This part of the subject might be illustrated to a greater extent had we space for the purpose.

"The whole of the cellar population of the parish (upwards of 20,000) are absolutely without any place of deposit for their refuse matter. Of the front houses inhabited by the working classes, a large proportion are in a similar predicament. 'In 26 streets, containing 1,200 houses, not less than 804 or two-thirds, were without either yard, privy, or ash-pit.' Even where such conveniences exist, they are said to be 'in an abominably filthy and ruinous condition.' They are generally so full before they are emptied, that the filth 'is deposited in the corners of the court, in the entries or back passages adjoining it, or in the street itself.' Dr. Duncan further states: 'I do not know of a single court in Liverpool, which communicates with the street or sewer by a covered drain,' the consequence of which is, that the fluid contents of the overflowing ash-pits and privies, 'spread a layer of abomination over the entire surface of the court.' In some instances the same filthy fluid 'oozes through into the neighbouring cellars (inhabited remember), filling them with its pestilential vapours, and rendering it necessary to dig wells to receive it.' One of these wells four feet deep, filled with this stinking fluid, was found in one cellar under the bed where the family slept."

Out of 57½ miles of streets, Dr. Duncan calculates that not more than 25½ miles are sewered wholly or partially, there being still 32 miles without drainage of any kind. Let us see how these 25½ miles of sewers are divided. There are 20 miles of streets inhabited by the working classes, and of these only 4 miles are drained by sewers; while of the 37½ miles of streets inhabited by other classes, 21½ miles are so drained. The element of deficient drainage also bears most heavily on the poorer classes. Such details as these show the value of statistical inquiries, and that sanitary legislation is imperiously called for. We shall recur again to this important subject.

type.

#### NEW BUILDINGS BILL.

A COMMITTEE of the MASTER CARPENTERS will meet at the Freemasons' Tavern, on Wednesday next, to take into further consideration the several enactments in the above-mentioned Bill.

#### INSTITUTE OF BRITISH ARCHITECTS.

MARCH 18.—E. B. Lamb in the chair. A communication was read from C. Parker, containing some observations connected with Hampton Court Bridge, and the adjacent parts of the river Thames. It appears, that as late as the year 1750 there was no communication between Hampton Court and the opposite bank except by a ferry; for we learn, by an Act of Parliament about that date, that J. Clark, who possessed the manor of East Moulsey (from the reign of Charles the Second), was empowered to erect a bridge across the river, from East Moulsey to Hampton Court. The bridge was erected from the designs of S. Stephens, by B. Ludgator, and was opened in December, 1753. That bridge, however; did not remain up long, for having been built too slight to stand, or to resist the concussion of the passing craft, it was subsequently taken down. On its removal the present bridge was erected, and although it has been repaired several times, the original

form of its construction is still preserved. It is built of oak, supported by ten piers of the same material; the length is about 350 feet, and the breadth 18 feet. In 1841, it appeared that material alterations had been made in the current of the river, by the construction of Moulsey Lock, about the year 1817, and subsequently (about 1833) the construction of two wooden embankments, projecting from the north bank of the river, by which the width of the stream was reduced one-half. These obstructions had caused such an alteration in the direction of the current and the rapidity of the stream, as to occasion not only a disruption of the banks and the bed of the river, but likewise much injury to the bridge itself, from the craft being frequently driven with violence against the piers. Extensive repairs were in consequence found necessary. The main piles were strengthened with additional ones, the decayed portions being removed, and the whole bound together with wrought-iron chains. Proper precautions were taken to render the chalk in the piers, and the gravel of the platform was reduced in thickness 18 inches, in order to lighten the superincumbent weight; and the structure, though still presenting a somewhat disjointed and sunken appearance, is now firm and compact.

A paper was likewise read by Mr. F. J. Francis, "On the Chancel of Ringwood Church, Hants."—This chancel, fifty feet long and twenty-two feet broad, is (as appeared from the drawings exhibited) a fine specimen of the early Pointed style; and although, like the rest of the church, it has suffered from continued neglect, spoliation, and had taste, enough remains to prove that the ancient builders had bestowed on it no ordinary portion of ingenuity and skill. The peculiar feature is the number of windows which it contains, there being a series of eight lofty, narrow lancet windows on each side, with deep splays, some of which bear traces of painted decorations, with a fine triple lancet at the east end, making a total of nineteen. The peculiar features of the style are well carried out in all the details. The capitals and bases of the slender Purbeck pillars, which separate the splays of the window at the east end are in the purest taste; indications of similar pillars are to be found between the windows on the north and south sides.

#### INSTITUTE OF CIVIL ENGINEERS.

MARCH 26.—The President in the chair. The paper read was by Mr. C. H. Gregory, engineer of the London and Croydon Railway; it treated of "Railway cuttings and embankments, with an account of some 'slips' in the London clay." An outline was given of the general principles which regulate the formation of railway cuttings and embankments, illustrating the manner in which these works are affected by the geological character of the earths employed, or that were cut through. The paper then gave a detailed history of some heavy slips in the London clay, which had occurred, under the observation of the author, on the London and Croydon Railway, and described the means adopted for clearing the railway from the immense masses of clay with which it was covered, to a depth of from ten to twelve feet, and for enabling the passenger-trains to run without hindrance, during the time of repairing the damage.

The cause of these slips was then fully considered, and it appeared evident that in nearly every case they proceeded from the combined action of air and water; the latter entering, in the rainy seasons, by the cracks formed by the drying action of the former, until the mass of upper yellow clay being detached, moved by its own weight, and sliding upon the blue clay, the surface of which was rendered semi-fluid by the percolated water, was precipitated into the cutting.

The means adopted for preventing the recurrence of such events were fully considered, particularly the introduction of gravel buttresses and revetments through and at the foot of the slips, a system which had been perfectly successful.

In the discussion which ensued, the means adopted were generally approved of; many improvements were given, of the use of gravel buttresses on other railways; the importance of extensive surface-drainage, and of freeing

from water the slopes and embankments, was insisted on; the interesting question of the "creep," or presumed rising of the floor of old mines, was examined, and it was contended that, in almost all cases, it was the roof, or upper rocks, that sunk down. The case of the village of Wallsend was instanced, which place had sunk vertically between sixteen and twenty-four inches, in consequence of the excavation of the coal from beneath it, by the mines under the direction of the late Mr. Buddle.

The further discussion of the question was adjourned until the next meeting, April 2nd, when the monthly ballot for members was announced to take place, and the following papers will be read:—

No. 661. "Account of the Railway from Amsterdam to Rotterdam, and of the principal works upon it," by Le Chevalier F. W. Conrad, M. Inst. C. E., translated from the French by C. Manby, secretary.

No. 660. "Description of the Piling Machine, used at Moutrose Harbour Works," by G. T. Page, Assoc. Inst. C. E.

No. 673. "Account of a series of experiments on the comparative strength of solid and hollow axles," by C. Geach.

#### THE ROYAL INSTITUTION.

MARCH 15.—Lord Prudhoe, president, in the chair.

Mr. Cowper "On Signals and Telegraphs." The object of his communication was to exhibit the method of holding intercourse at a distance, by means of conventional symbols, whether on land or at sea. The lecturer distinguished telegraphs (consisting of machinery, more or less complicated) from signals, which are simple constructions, as beacons, flags, &c. Having noticed the allusions to beacons by the sacred writers, many centuries before the Christian era, Mr. Cowper proceeded to describe the present improved state of the methods of distant communication. Signals—These comprise, 1st. The method, now brought to great perfection, of signalling letters, words, or sentences, &c., by means of a series of flags of different patterns, as used by the Royal Navy or by merchant vessels; 2nd. Homographs, or manual telegraphs, consisting of discs of basket-work, held in different positions, or, as is practised on railroads, the human arm extended in various attitudes; 3rd. A plan invented by Mr. Cowper's son to give notice to the driver of a locomotive engine of his approach to a station, or an accident in foggy weather; this consists of a small ease of gunpowder in which is inserted a kind of lucifer match; this is fastened to the rail at the spot where the alarm is to be given, and as the wheel of the engine goes over it, it explodes, and the driver instantly shuts off the steam. The lecturer noticed that the explosion, though not loud when compared with the noise of the train, attracted attention by the difference of the sound. Mechanical Telegraphs—Mr. Cowper gave a history of these curious arrangements, beginning with the telegraph invented by Hook in the seventeenth century, and then proceeded to exhibit models of the construction of Mr. R. L. Edgeworth—of the shuttle telegraph, used by the government for many years, till superseded by the invention of Sir H. Popham, the present Semaphore. This instrument was compared with the T telegraph, long used by the French. Electrical Telegraphs—Mr. Cowper concluded by exhibiting working models of the forms of these instruments, now used on the different railways—and a magnetic electric machine, superseding the necessity of a galvanic battery; and lastly, a machine by Professor Wheatstone, for making the telegraph print on paper the message which it delivers.

ABERDEEN HARBOUR.—We understand that the working plans of the Harbour improvements, with the relative specifications and other documents, are now in a state of great forwardness. From the extent and variety of the contemplated works, much time and labour have been expended in making out the necessary details; and we are happy to learn that matters are now so far advanced, that there is every prospect of contracts being advertised for in the course of the ensuing month.—Aberdeen Herald.

## STATISTICAL SOCIETY.

MARCH 18.—Thomas Toole, Esq., V.P., in the chair.

The subject of the evening was "The Metropolis, its Boundaries, Extent, and Divisions for Social Government, with especial reference to its means of Sewerage;" being a continuation of the paper read at the ordinary meeting of the 19th of February, by J. Fletcher, Esq., Hon. Sec. &c.—According to Mr. Fletcher, the objects of municipal government in London, as elsewhere in England, are, 1. Police and justice; 2. Public works and buildings; and 3. Public instruction and charity.

1. The criminal justice and police of the metropolis are virtually in the hands of the central government, which issues the commission for holding the Central Criminal Court, and the commissions of the peace for Westminster, the Tower, Middlesex, Surrey, and Kent, appoints the police magistrates, and has the direct management of the police force, through the agency of the commissioners in Whitehall-place. The only exception is the City, which has the management of its own police, and an elective magistracy, who take an inferior part in the business of the Central Criminal Court. The jurisdiction of the Central Criminal Court comprises the whole of the metropolis, as now defined, together with the remainder of Middlesex, the parishes of Richmond and Mortlake, in Surrey, and a considerable tract in Essex; that of the several courts of general or quarter sessions is continuous with the counties or liberties for which they are held; and that of the several police courts extends through the districts hereafter described, which have been severally assigned to them; in the City by the Court of Aldermen, and without its limit by the Queen in Council. For administrative purposes of police, the metropolis is subdivided into districts, indicated by the letters of the alphabet; in the City by the commissioners under the Court of Aldermen, and elsewhere by the commissioners under the Secretary of State for the Home Department. The courts at Westminster are the courts of civil jurisdiction most resorted to; those of the City have no authority beyond its limits; the several small debt courts are likewise confined, by their several Acts of Parliament, within specific bounds; but the county courts have a more general application, and those of Middlesex are now held in several places, with an enlarged jurisdiction, and improved process.

2. Nearly the whole of the public works are in the hands of local, if not of representative, authorities. The drainage is divided among commissions of sewers, issued by the Crown, like commissions of the peace; the streets and roads are in the charge of the parish vestries, local boards and trusts, and the commissioners of the metropolitan roads; the supply of water and of gas by the several companies is also a matter of territorial division under monopoly conventions; districts for the inspection of buildings in course of erection are appointed by the magistrates; but such works as markets, exchanges, approaches, bridges, cemeteries, the river navigation, &c., in the hands of the corporation, of companies, and of large proprietors, have, of course, no reference to municipal divisions.

3. Public instruction, except of paupers, is not a matter of municipal provision; but the division of the metropolis for poor-law administration, with which that for the registration of births, deaths, and marriages coincides, is one of paramount importance. Its largest charitable endowments are irrespective of locality; but a great amount of gifts is devoted to the relief of the poor in particular parishes and places. Owing to the number of parishes having local Acts for the management of their poor, and other causes, however, the metropolitan system of parochial relief is on no general and well-organized plan, and the districts in use are irregular in the extreme.

For the purposes of drainage, the metropolis is placed under the jurisdiction of seven different Sewer Commissions. The sums expended give the nearest approximation to the yearly income of these commissions, which generally make their levies at intervals of several years, so that the returns of any one year afford but very imperfect data for estimating their average income. The direct

taxation for sewers thus appears to be little if anything short of 100,000*l.* per annum.

Every portion of the metropolis is necessarily included under some trust for the purposes of paving, lighting, and cleansing; but of the limits assigned to such trusts are not parochial, we are without any information whatever. Their income and expenditure are equally unknown. Some idea of the vast sums which annually pass through their hands may be formed from the cost of paving, cleansing, and lighting in the city alone, for which the sum raised by rates in the year ended September, 1842, was 35,098*l.* 2*s.* 6*d.*; and the sum expended 41,945*l.* 6*s.* 7*d.* Supposing that the average expenditure on these objects in the rest of the metropolis were only one-half what it is in the city, in proportion to the population, it would amount to no less than 329,500*l.*, making a total in the metropolis of about 371,500*l.*; and it may safely be estimated at 400,000*l.*

The subject of drainage occupied a large portion of the paper, but we can only record the following—"The whole of the ancient statutes of sewers provide merely an open surface drainage, and until lately there were still some doubts whether these statutes give to the Commissioners power to make even a new open drain. But with regard to the covered sewers which are now a necessary part of the economy of all large towns, as they were in the civilized ages of antiquity, they give no express powers whatever; and local acts having but partially supplied the deficiency, the Commissioners of Sewers in the greater part of the metropolis have to the present day no power whatever to make a new covered sewer. Incredible as it may appear, it is not to the present day a recognized purpose of several of the principal Boards of Commissioners to protect the public health by the covering of the sewers, from the noisome effluvia of a city's drainage, but only to effect the mechanical transmission of the surplus fluids to the Thames."

The metropolis is supplied with water by nine principal and two smaller companies. By supposing the water rental in 1843 to bear the same proportion to the population of the metropolis in 1841, that the water rental of 1833 did to its population in 1831, Mr. Fletcher finds the probable amount of last year's water rental to have been 344,238*l.*

## THE IRON AND METAL TRADES' PENSION SOCIETY.

THE celebration of the first festival in commemoration of this useful and benevolent institution took place on the 19th instant at the London Tavern, Bishopsgate-street. The chair was taken by Mr. R. W. Kennard, one of the Vice-Presidents, who was supported by nearly a hundred of the most opulent and influential members of the trades. Every thing was in the best style. The entertainment supplied was more than ordinarily liberal, and the amount of subscriptions and donations more than usually large for a society in a state of creation, and certainly not yet matured. The chairman was a contributor of 100*l.* to the funds, and by his impressive and business-like address to the company on proposing the toast, "Success to the Institution," caused many of his auditors to subscribe largely. One feature of independence distinguishes this society: it can support itself, and it intends to support itself, solely by the contributions of members of the trades for the benefit of the aged and decayed of which it is instituted, and will not accept contributions from strangers. Last evening several checks from benevolent persons not connected with the trades of iron, hardware, and metal, were returned. This is, perhaps, as it should be, and it calls imperatively on all members of these trades to become subscribers, and shews their sense of independence, benevolence, and honour. The usual loyal and appropriate toasts were drunk with cheers, and the health of the chairman with more than usual demonstrations of good feeling. Mr. Toole assisted as toast-master, Messrs. Hobbs, Chapman, and Hawkins, added their vocal talents to the festivity, which was kept up till a late hour.

## WELBY PUGIN AND THE "BRISTOL AND WEST OF ENGLAND ARCHÆOLOGICAL MAGAZINE."

"Mr. Welby Pugin has made his name pretty generally known, by becoming a convert to the Romish church, and thereby obtaining the lucrative position of architect in ordinary to the Romish superstition in these islands. Possessed of much cleverness, and assisted into notice by the reputation of his father, he has contrived to escape the evil consequences that, in worldly matters, so often attend those who make change in their religious creed; and cannot, however sincere he may be in his new religious professions, adduce in proof of his sincerity the worldly sacrifices to which, for conscience' sake, he has submitted.

"But with his religious opinions we have nothing to do, and shall content ourselves by supposing him sincere, and leaving his adopted mother to rejoice over the son she has acquired. What we have to consider, is, the amount of value to be attached to his writings; and here we must observe, that he possesses the reputation, among Protestants as well as Romanists, of having originated a new and consistent theory respecting "The true principles of Pointed or Christian architecture;" he thus entitles it, though the theory is equally applicable to every congruous and fully developed style.

"The two great rules for design," he says, "are these: 1st. That there should be no features about a building which are not necessary for convenience, construction, or propriety; 2nd. That all ornament should consist of enrichment of the essential construction of the building." This we quote from the opening paragraph of the first lecture; the following is from the concluding paragraph of the last. "Truth is only gradually developed in the mind, and is the result of long experience and deep investigation. Having, as I conceive, discovered the true principles of Pointed architecture, I am anxious to explain to others the errors and misconceptions into which I have fallen,"—he admits having, in the early period of his professional career, fallen into most of the faults he reprobates,—that they, profiting by my experience, may henceforward strive to revive the glorious works of Christian art in all the ancient and consistent principles."

"In the first of the passages quoted he explains the discovery of the true principles of architectural design, and in the last he claims the discovery as *his own*. The correctness of the principles he lays down we do not wish to dispute; but to the honour of having been the first to promulgate them, we shall soon shew that he has no claim. The perception of the truth, as is the case with many discoveries, may have occurred to more persons than one, without one borrowing from the other; the time was ripe for such a discovery; many had been travelling on the road that led to it: but in such case we usually accord the honours to the first that makes the announcement to the world. In the present instance such an announcement was made so long before the appearance of Pugin's book, and in works so familiar to architectural readers, that it is impossible to suppose that his mother-wit alone brought him to the conclusions he sets forth in his treatises. Pugin's lectures were published in 1841. In a volume entitled "Specifications for Practical Architecture," by Alfred Bartholomew, architect, published in the previous year, the author sets down the principle contained in Pugin's 'two great rules' constantly and clearly. Take for example the following, from the Preface:—

"Pure taste in architecture has, in all past ages, been purely structural; and a departure from this wisdom is the true cause of the taste (or, to speak more properly, the want of taste) in modern architecture being so variable, so capricious, so much quarreled about, and so short-lived.

"In Pointed Architecture, all is structural, from the boss which confirms the arch-ribs (radiating from it, as the spokes radiate from the nave of a wheel), to the wall-buttress, which receives the energy of the vaulting, most artfully conducted down the vaulting-ribs, through the flying-buttress, and innocuously dissipated on the ground itself; all is structural, from the rudder-like pinnacle,

which suddenly diverges into the substance of the wall-buttress the drift of the vaulting, to the triforium-arcade, which bestows economical use and elegance to the interior of the fabric, while it relieves from unnecessary weight the great columns supporting the clerestory, the energy of the vaulting having passed over its head to without the building.

"The modern man of taste would imitate the groined vaults of Pointed Architecture, merely because they are groined, but the Freemason groined them because he would so relieve from thrust the window-heads, voids, and other weak parts of a fabric."

"But Mr. Bartholomew neither is, nor assumes to be, the discoverer of this truth. It has by many of late years been laid down with more or less distinctness: but we believe that the person who may most fairly claim the merit of having first pointed out the true principles of architecture, by attaching all importance to constructive arrangement and limiting the application of ornament to the 'decoration of construction,' is the French architect, Durand. So long ago as 1819, he published his 'Précis des Leçons d'Architecture,' which are founded altogether on this theory: we shall translate from his works a few passages, which will make this sufficiently plain.—

"Whether," he says, "we ask the decision of reason, or examine the great monuments of the art, it is evident that to please is not the end of architecture; architectural decoration has never been its object."

"Again: 'We are far from thinking that architecture is not capable of exciting pleasurable emotion; we say, on the contrary, that it is impossible it should not please, whilst treated in accordance with the true principles. Does not nature connect a gratification with the fulfilment of our wants; and are not our most lively pleasures the satisfaction of our most imperious necessities? How then can architecture which satisfies so great a number of our wants, an art to which all other arts owe their existence, fail to be a source of pleasure?'"

"No doubt the grandeur, the magnificence, the variety, the picturesque, and the character which we observe in buildings, are so many beauties, so many causes of pleasurable emotion. But is there any necessity for running after these? If an edifice is arranged in a manner suitable to the purpose to which it is destined, will it not be sensibly different from a building destined to a different use? Will it not have a marked character, and what is more, the proper character? If the different parts of this fabric, intended for different uses, are arranged in the manner proper to each, will they not necessarily differ from each other? Will not variety constitute one of the characteristics of the whole? If the disposition of all parts be made in the most economical, that is to say, in the simplest form, will not its grandeur, its magnificence be enhanced, because then the eye will embrace at once the greatest number of its parts? Where then is the necessity of running after these partial beauties?'"

"It is then with the arrangement only that the architect should concern himself,—even if his sole study to please the eye; because that decoration cannot be called beautiful, cannot give rise to any real pleasure, which does not result from an arrangement the least wasteful and the most convenient."

"It is plain then that Welby Pugin is not the Columbus, nor even the Vespucci, who has led us to the comprehension of the true principles of Gothic architecture."

"In his condemnation of the pseudo-Gothic of the day, he writes sensibly and well; and we can almost sympathise with his enthusiasm in behalf of the old English styles, when practised upon sound principles. It would be well if he confined himself to this, and did not break out of his province to take part in church controversy, to lament over the 'lamentable schism' from which he has so lately been himself delivered, and to trace the decline of Christian art to the dark times of Pagan and Protestant ascendancy." He has grown tender, indeed, in his comments on the schism, being filled with a most Catholic hope that all the

Pope's stray sheep will shortly come bleating back to that pasture which he himself has found so fat; in the meanwhile it is gratifying to him to observe that even Protestants are beginning to build good churches; and without any Catholic qualms of conscience, he is ready to lend his professional advice and assistance towards the erection of such edifices, from the full conviction, no doubt, that though the costs may be defrayed by heretics, the buildings themselves will ere long be made available to the purposes of the true faith.

"The attempt to connect the decline of Gothic art with the introduction of Protestantism is absurd, and leads the writer into many inconsistent statements. If the one were a consequence of the other,—if the want of consistent principles, justly complained of in the architecture of the last three centuries, resulted from the want of consistent principles in the Protestant religion,—how is it that the art declined at once in countries that threw off, and in those that retained, the papal yoke? How is it that England, the stronghold of the new heresy, according to Mr. Pugin's own confession, was the last in which the 'true principles' were entirely lost sight of? If it be answered that the virus of the Reformation had affected all the states of Europe, though it became established as a chronic disease only in a few; let us ask, then, how it was that Christian architecture was never fully developed in Italy, the head-quarters of Romanism, and, least of all, within the papal territories? The holy fathers themselves were the great patrons of those to whom we owe the revival of Pagan art."

Has not the desecration of churches been carried forward almost as much by Roman Catholics as even by the Puritans? We have the testimony of Pugin himself to the well-known fact, that the sacred structures of this country retain more of their ancient character, have suffered less from the introduction of Pagan art, than those of any other. We seldom find, in England, that injury has been carried on in our ancient churches to such a reckless extent, as is admitted in the following, which we quote from the 'Apology': 'Modern Catholic ecclesiastics, in France and Belgium, have not only taken out the stained glass, but the mullions and tracery also, by way of lighting the church? Where can we meet with a Gothic church upon the Continent, undeformed by the introduction of Pagan art, in the forms of altars, screens, baldachini, coffered ceilings, and other incongruities?'"

"Finally, let us ask, if Protestantism and true principles of art be inconsistent with each other, how is it that Protestant England, and the Protestants of England, have led the way in the revival of Gothic art?"

#### THE NEW PNEUMATIC ENGINE.

At the *soirée* of the Marquis of Northampton on Saturday week, Mr. Reinagle reproduced, in a more complete form, his metallic model for the air power, as intended to be applied to locomotive carriages, whether for railway uses or for common roads. It appeared from that gentleman's statement that the scale and proportions of his model would not allow, without a monstrous appearance, the air-balls, and especially the three-trigger valves, such as used for air-guns, to be shewn in conjunction with the other parts. In the course of the numerous anxious investigations, it was understood that the carriage engine, with all its adjuncts completely fitted, would be ready for the next *soirée*, when another form for locomotion, using the Archimedean screw to work against the atmosphere, was promised for exhibition, and, if we mistake not, means are to be employed to prove by demonstration the combined power and economy of the moving agent (compressed air) which many persons could not sufficiently comprehend by the explanations offered. The model of this pneumatic engine certainly has taken its full share of attention, and has provoked learned mathematical and pneumatic discussions, in which, on Saturday, some warmth was displayed both *pro* and *con*. Mr. Oliver Byrne was most active in defending Mr. Reinagle's principles against what he termed the old-fashioned doctrine "that it costs as much to produce power as the power incurs." Mr. F. de la... his endeavours to convince his dubious audience—for several attacked his assertions—that

his discoveries "had completely overturned that doctrine, the very extinguisher of genius, and the bar to all attempts to overrule long-established error." He demonstrated by example the immense difference there was by his invention between all beam-action steam power, and his faculty to fit several beams, carrying the moving power at the extremity of each beam, working upon the principle of a high pressure engine; that is to say, by injections of compressed air, by trigger movement, to raise one series of lifting air-vessels arranged along a cross bar uniting the four, five, or six beams, and at the same moment discharging similar air in similar quantities, to depress the lower valves of the opposite lower range of air-vessels. This action, he contended, brought the beam movement to a mere see-saw, without the smallest strain. Thus, if four beams be twenty feet in length, and the communication of power is placed on each side of the axis, at four equal distances, driving down wheels to move machinery or work water-pumps for mines, he converts this power at the end of each beam into eight times the first power, because it works agreeably with the known laws of leverage. At the next *conversazione* when the complete model is submitted, we will further enter on the assertion of the inventor, that he can make engines of any amount of horse-power; for he, no doubt, will be again called upon to further explain by model the assertion he has confidently put forward in an assembly of scientific individuals, connected with the first learned bodies in the world, that he can produce the enormous leviathan moving power equal to 320,000 horses. It is but due to the inventor to say he had many attentive listeners, and that, from his explanations, they were, with one or two exceptions, favourable to his views, and thought it probable and possible to bring his engine to operate with success.

#### GRAMMAR-SCHOOLS.

THERE are few counties in Great Britain which have so many endowed grammar-schools as Westmorland to boast of; and taking a radius of twenty miles round Kendal there is no district of equal circumference, and where there is only an agricultural population, which contains so many free schools where youth may receive the best instruction at so cheap a rate, in many cases at no expense to their parents, when residing within a short distance therefrom. We may enumerate Kendal, Sedburgh, Grayrigg, Hawkshead, Heversham, Burton, Carlisle, Lancaster, Giggleswick, and in some measure Kirkby Lonsdale. And how are many of these schools conducted? At Burton the endowment is entirely lost for want of a master, because one set of householders, in whom the right of appointment is vested, wish there should be (the visitor at their head) one description of master put into the school contrary to the provisions in the will by which it is endowed, and the other set wish to adhere to the letter of the endowment: but it would be invidious and censorious to specify and enumerate the different cases of mismanagement or bad government of these schools, many of which have rich exhibitions for supporting youths at the English Universities who have been educated at these schools, either from the negligence, immoral conduct, inebriety, incapacity, or age of the persons holding the situation of master, or from any other infirmity or cause. The object of the present paragraph is to bring under public notice the powers of trustees and visitors, contained in the Act 3 & 4 Victoria, cap. 77, intitled "An Act for improving the condition and extending the benefits of grammar-schools." By section first, Courts of Equity are empowered, whenever a question comes before them, to make decrees or orders extending the system of education and the right of admission into any school, and to establish schemes for the application of its revenues, having due regard to the intentions of the founder. By section 17, stating it is expedient to provide for the more easy removal of unfit and improper masters, "it is declared and enacted that it shall be lawful for the Court of Chancery to empower the person or persons having powers of visitation in respect of the discipline of any school, or who shall be specially appointed to exercise the same under that Act, and the governors, or either of them, after such inquiries, and by such mode of proceeding as the Court shall direct, to remove any master of any grammar-school who

\* Précis des Leçons d'Architecture, Données à l'École Royale Polytechnique. Par J. N. L. Durand Architecte. Fondateur d'Architecture, et Membre correspondant de l'Académie des Beaux-Arts d'Anvers. Paris, vol. I. pp. 18, 19, 21.

has been negligent in the discharge of his duties, or who is unfit or incompetent to discharge them properly and efficiently, either from *immoral conduct, incapacity, age, or from any other infirmity or cause whatsoever.*" Section 18th gives power to assign retiring pension, when incompetency of the master shall be from age or other infirmity, but not from *immoral conduct or incapacity.* The 3rd section of the above Act relates to the qualification of master required by the words of endowment. The 4th section—the Court not to lower the standard of admission when Greek and Latin are to be taught. The 5th section empowers the Court to dispense with the qualification required by any provision or statute for the master, in order to carry into effect more efficiently the intention of endowment deed. By the 6th section, the qualification of new schoolmaster, and right of appointment, is regulated. There is no doubt it would be salutary to put the enactments of this statute in force as regards some schools in Westmorland; but the above extracts will suffice for the present to draw the attention of the public to the powers therein contained. In a short time it may be necessary to advert again to this Act more specially and directly.—*Westmorland Gazette.*

## RAILWAY INTELLIGENCE.

*Wakefield and Lincoln Railway.*—The Wakefield and Lincoln line has been taken up with great spirit at Lincoln and its neighbourhood, and of the capital of 750,000*l.* shares to the amount of 350,000*l.* have been applied for by the gentlemen of the county, the provisional committee having determined to give the preference to applicants locally interested, provided that they are responsible parties. The Lancashire and London capitalists have sent claims for more shares than will remain after the Lincolnshire demand is satisfied. Every thing would thus seem to look well for the success of the project; which, when carried into execution, must prove by far the most important line for the agricultural districts of England of which the country can boast; carrying, as it must, the produce of Lincolnshire, North Norfolk, Cambridgeshire, and Huntingdonshire, to the great markets of consumption lying between Wakefield and Manchester, embracing the entire cotton and woollen manufacturing towns, with a population of near 2,800,000, all of whom have to be fed from other parts. So cheap is the transit of corn from Hamburg (notwithstanding the assertions of the bon. member for Stockport and his broad-brimmed brother Bright to the contrary), that a contract might be made, not, as they say, for 8*s.* per quarter charged as freight from Hamburg to Hull, but for half that rate per quarter, from Hamburg to any town between Wakefield and Manchester, including Leeds, Wakefield, Bradford, Dewsbury, Huddersfield, Brighouse, Elland, Halifax, Hebden Bridge, Todmorden, Barnsley, Rochdale, Bury, Oldham, Manchester, Ashton, Stalybridge, Stockport, and their very populous parishes and townships. In fact, without the Lincoln and Wakefield Railway, the cost and time of transit from Lynn, Yarmouth, and the other shipping places in Norfolk, as well as Boston, Wisbech, Spalding, and the other great shipping places in Lincolnshire, from which their supplies are now drawn, are actually more than from Hamburg or Dantzic, by an average of 30 per cent., which would have been proved before the House of Commons, had Mr. Cobden's committee been granted.

*Wisbech.*—The directors of the London and Birmingham and the Eastern Counties Companies had a meeting on Thursday last, for the purpose of carrying out a railway from the line at Ely to Lincoln, *via* Wisbech and Boston; it is said Mr. Stephenson is to be the engineer. This line, of course, will be opposed to Mr. Walker's line from Cambridge to Lincoln and York.—*Boston Herald.*

*Manchester, Leeds, and Hull Railway.*—On and after the 11th of April there will be two mails per day between Manchester and Leeds, and two between Manchester and Hull. As has always been the case with this company, the terms were settled between the Postmaster-General and the railway without having recourse to arbitration.

*South Devon Railway.*—We understand that Mr. Walker, the eminent engineer, who is specially appointed by the Lords of the Admiralty to report on the proposed coast line of the South Devon Railway, has arrived in this city (Exeter). He commences this morning an examination of the Exeter Canal, and will proceed with all possible despatch minutely to survey the banks of the Exe, the sea-shore to Teignmouth, and the banks of the Teign. His report, it is understood, will be of the most accurate description, so as finally to settle the question whether or not Mr. Brunel's line is one which ought to be adopted, either as regards the public safety or causing any impediments to navigation. We hear Mr. Brunel has been at Dawlish and Teignmouth during the last week, making the most rigid scrutiny into the feasibility of his proposed line of railway, so as to be prepared to rebut any arguments which may be advanced against it.—*Trevelman's Flying Post.*

*Bristol and Exeter Railway.*—A large and influential meeting of the city and county gentlemen was held at the Guildhall, Exeter, on Saturday week, to consider the propriety of adopting some course to celebrate the completion and opening of the Bristol and Exeter Railway. The High Sheriff of Devon was in the chair, and it was unanimously resolved that a public banquet should be given to the directors of the Bristol and Exeter and the Great Western Railways, the members and Recorder of Exeter, the Lord Lieutenant, the High Sheriff and members of the county of Devon, &c., on that occasion. A considerable amount was raised at the meeting for carrying the same into effect, and subscription lists are opened at the different banks in Exeter.—*Western Luminary.*

*New Railway.*—A railway is about to be proposed from Southampton, through the New Forest, between Ringwood and Christchurch to Lytchett, which is immediately at the back of Poole Harbour; from this point it will be continued to Dorchester, thence to the River Yeo, and extending to Bridgewater. This will be effectually opening up the benefits of railway communication to the counties of Dorset and Somerset. The saving to persons residing inland upon coal, and other articles of consumption which are sea-borne, will be very considerable. We are happy to hear that the landowners on the line are generally favourable, and as both the South-Western and Bristol and Exeter lines will be fed by the proposed junction, we should not anticipate any opposition in these quarters.—*Somerset Gazette, March 23.*

*Competing Lines of Railway.*—In the Lords on Friday week, the Earl Fitzwilliam recommended to government to issue a commission to take surveys of railways generally throughout the country, and fix the points from which it was for the interest of the whole community that railways should run, leaving to private enterprise the execution of the lines thus declared by government to be of the greatest public utility. The Duke of Wellington promised to mention the recommendation in the proper quarter.

*Manchester and Leeds and Hull and Selby Amalgamation Bill.*—This bill was thrown out in the standing orders committee of the House of Commons, in consequence of the required preliminary notices not having been given. As each company, however, has the power of leasing to the other, the arrangement will be carried out, notwithstanding the rejection of the bill, the terms of the lease of the Hull and Selby being 16½ per cent. of net profits, exclusive of any additional capital for branches, which is to be shared as original stock.

*Lancaster and Carlisle Railway.*—This bill has passed through committee of the House of Commons without opposition, and there is now no impediment to its being the law of the land soon after Easter. The contracts for the whole of the works, including all extras, and also for the iron, have been concluded with eminent contractors, within Mr. Locke's estimates; the whole to be completed in two years.—*Lancaster Guardian.*

*Dulkin and Drogheda Railway.*—The first experimental trip, which took place upon this line on the 20th instant was successful. No accident occurred.

*Ashton Branch Railway.*—The branch line now making from the Sheffield Railway to Ashton progresses rapidly under the able superintendence of the Messrs. Fowler, the contractors. Of the 12 arches which are to be built near and across the Dukinfield road, the walls of 11 are partially erected. Yesterday the first stone was laid of the 20 arches intended to be erected over the canal and the river Tame. Upwards of 300 men are employed on the works.

*Railway to Newcastle-upon-Tyne and Carlisle.*—The railway from Darlington to Gateshead will be opened by the 1st of July, and which will join the Newcastle and Carlisle Railway at Redheugh, a little to the west of Gateshead. An uninterrupted railway communication will thus be formed from London to the city of Carlisle, a distance of about 350 miles, which it is expected will be performed in 16 hours.—*Hull Packet.*

*Salisbury Railway.*—The threatened opposition to the details of the bill for this undertaking, in committee, has been abandoned, and the measure is proceeding through the necessary stages with the utmost expedition. It is in contemplation to have a station at Dean, and another at Romsey. The terminus will, it is thought, be advanced quite into the city.—*Bath Herald.*

*Railways to Scotland.*—The Directors of the Liverpool and Manchester, Grand Junction, and Newcastle and Carlisle Railways either have memorialized, or are about to memorialize, the Board of Trade for the purpose of having an inspection of the different projected lines of railway into Scotland. The object is to fix on that line likely to be most conducive to the general interests of the public.—*Preston Chronicle.*

*The Bill for a Railway from Blackwall to Stratford.*—Petitions in favour of the above undertaking have been signed within the last few days by most of the respectable inhabitants of Stratford and its vicinity. It is generally anticipated that the proposed bill will be passed the present session of Parliament.

On Tuesday the directors were engaged in measuring the ground at Poulton, preparatory to the projected railway from Marlborough to Southampton.

*Railways in India.*—A recent number of the *Calcutta Englishman*, in an interesting article, inviting the attention of its readers to the consideration of the progress of public works in India, places before them as the first and most important subject that of "railway communication considered in a military as well as a commercial point of view;" and refers to a carefully compiled railway map published as a supplement sheet of the *Englishman*. The writer proposes, in a series of successive papers, to give the grounds for the adoption of the lines of railway laid down in the map, and invites information from all parts respecting local circumstances which may be supposed to affect particular districts. We believe that this important subject has been already examined and reported upon by one of the first engineers in this country; and we rejoice to see it again brought under public attention, convinced, as we are, that no measure can ever be proposed so eminently calculated to promote the permanent interests of India as the establishment of railways.

**THE IRON TRADE.**—We are gratified to find that the iron trade is participating in the general improvement which has visited our manufacturing interests. The consumption, we understand, was never greater than at the present moment, the majority of our iron-founders being very fully employed, and although the present make of pig-iron in Scotland cannot be estimated at less than 6,000 tons per week, there is no accumulation of stock in the hands of either makers or consumers. Very extensive purchases have, we know, been made during the last few days, and the price of iron has advanced to 50*s.* per ton at the Broomielaw. The manufacturers, however, are not disposed to contract extensively at this price, anticipating a further rise before long, in which they are borne out by the opinion of parties who are conversant with the state and prospects of this most important branch of manufacture.—*Glasgow Chronicle.*

strange compound of the two races. The contour of his frame and features is Scotch; his manners and intelllections strongly tinged with the Indian. He has been in the service of the fur companies all his life, save some six or seven years past; and by his daring enterprise, and courage in battle, has rendered himself the terror of the Oregon Indians."

#### BIOGRAPHY OF FOUNDERS, ARCHITECTS, AND BUILDERS.

##### No. I.—EDWARD COLSTON.

At the age of 40 years he became a very eminent East-India merchant, prior to the incorporation of the East-India Company, and had 40 sail of ships of his own, with immense riches flowing upon him. He still remained uniform in his charitable disposition, distributing many thousand pounds to various charities in and about London, besides private gifts in many parts of the kingdom. In the year 1708 he instituted a very magnificent school in St. Augustine's-back, in Bristol, which cost him 11,000*l.* in the building, and endowed the same with between 1,700*l.* and 1,800*l.* per annum for ever. He likewise gave 10*l.* for apprenticing every boy, and for 12 years after his death 10*l.* to put them into business. It has been frequently reported that his private charities far exceeded those in public. I have heard that one of his ships trading to the East Indies had been missing upwards of three years, and was supposed to be destroyed at sea, but at length arrived, richly laden. When his principal clerk brought him the report of her arrival, and of the riches on board, he said as she was totally given up for lost, he would by no means claim any right to her; therefore he ordered the ship and merchandise to be sold, and the produce thereof to be applied towards the relief of the needy, which directions were immediately carried into execution. Another singular instance of his tender consciousness for charity was at the age of 40, when he entertained some thoughts of changing his condition. He paid his addresses to a lady; but being very timorous lest he should be hindered in his pious and charitable designs, he was determined to make a Christian trial of her temper and disposition, and therefore one morning filled his pockets full of gold and silver, in order that if any object presented itself in the course of their tour over London-bridge, he might satisfy his intentions. While they were walking near St. Magnus' Church, a woman in extreme misery, with twins in her lap, sat heaving, and as he and his intended lady were arm-in-arm, he beheld the wretched object, put his hand in his pocket, and took out a handful of gold and silver, casting it into the poor woman's lap. The lady being greatly alarmed at such profuse generosity, coloured prodigiously; so that when they were gone a little further towards the bridge foot, she turned to him and said, "Sir, do you know what you did a few minutes ago?" "Madam," replied Mr. Colston, "I never let my right hand know what my left hand doeth." He then took his leave of her, and for this reason never married to the day of his death, although he lived to the age of 85.—*Bristol Journal.*

**EMBANKMENT OF THE RIVER THAMES.**—Her Majesty's Commissioners of Sewers for the limits extending from East Moulsey, in Surrey, to Ravenshoe, in Kent, have issued their warrant to these several occupiers of wharves and premises on the southern shore of the river Thames, to the following effect:—"That, whereas the wall or bank of the river Thames within the parish of St. Saviour, in the borough of Southwark, in the county of Surrey, is by reason of the high tides become defective, and of insufficient height to resist the waters from overflowing the dwellings of the inhabitants, and the low grounds and places thereto adjoining within the said parish, to the great detriment and loss of the owners and occupiers thereof, &c." It is then ordered that the several resident tenants on Bankside shall raise the embankment 18 inches eastward and westward. It is much to be regretted that the embankment as proposed long since was so precipitately abandoned, particularly as the expense will fall very heavily on those wharfingers who hold their premises on lease only. A public meeting on the subject will shortly be advertised.

#### CHURCH-BUILDING INTELLIGENCE, &c.

**St. Andrew's Church, Plymouth.**—On Tuesday last, between 12 and 1 o'clock, a mural monument fell from its position near the south-eastern angle of the church, strewn the pews and floor in its vicinity with its fragments, the noble piece of sculpture being broken into "a thousand" pieces. No indication of its insecurity had been perceptible. The tablet set forth that "Near this place is interred the body of Edmund Lechinere, formerly commander of H.M.S. Lynn, and late of the Lynn frigate, of 32 guns, on board of which he departed this life, 16th of January, 1703, from wounds which he received on the 15th in an engagement with a French privateer, of 46 guns, from whom he protected a large fleet of merchant ships all into safety, and by bravery gave the enemy battle, and forced him to bear away with very much damage. He was, in the beginning of the action, wounded in both knees, and afterwards received a musket-shot through his body, yet neither discouraged him from prosecuting the enemy with the utmost vigour."

**Stained Glass.**—The painted window of the eastern aisle of the Church of St. Magdalene, was on Sunday submitted to the view of the congregation. The whole area of the window is occupied by appropriate configurations, executed by Mr. Wallis, of Newcastle, worked in stained glass of every variety of brilliant and subdued tone of colour. The subjects represented are those of our Saviour, Mary Magdalene, the Four Evangelists, and the Seraphim. The effect is exceedingly impressive. Every subordinate portion of the window is tastefully decorated with consistent embellishments, and the whole confers a strikingly pleasing effect on this beautiful fabric.—*Taunton Courier.*

**Thame, Oxfordshire.**—The parish church is about to be re-peved, the necessary funds to defray the expense having been raised by voluntary subscriptions amongst the inhabitants. On either side of the pews, which will be placed in the centre, there will be free sittings for between 300 and 400 persons more than at present.

**Briercliffe, near Burnley.**—R. Townley Parker, Esq., of Cuerden Hall, has, with his wonted liberality, given a very eligible plot of land for the site of a parsonage-house in connection with St. James's Church, Briercliffe, near Burnley. He has also given stone from one of his quarries for the building of the house.—*Preston Chronicle.*

We have pleasure in stating that her Majesty the Queen Dowager has recently forwarded to the incumbent of Stoke Saint Gregory the sum of 20*l.* towards the handsome church of that parish.—*Taunton Courier.*

**St. John's Church, Bridgwater.**—This edifice will be completed in a few weeks.

**TRAFALGAR-SQUARE.**—The works within the inclosure of Trafalgar-square are proceeding rapidly towards completion, Mr. Barry, the architect, having devoted much of his time of late for the purpose of causing the whole to be thrown open to the public during the summer months. The Artesian well is likewise fast advancing, the bore having been already sunk a considerable depth. The basins of the fountains will be 83 feet in diameter, and are to be covered with Maude's patent Portland stone cement, which has been found to resist the action of the atmosphere and of water as long as most descriptions of stone, while it possesses and retains the colour of that material. The pavement of the inner court of the quadrangle is to be laid out in somewhat of a tessellated style, the darker parts being composed of asphalt, and relieved by the introduction of ornamental work in the Portland stone cement. The whole space to be covered is about 18,000 feet.—*Globe.*

**STATUE OF THE DUKE OF GORDON.**—Preparations were commenced on Wednesday last for erecting in Castle-street the statue of the Duke of Gordon. An immense block of Peterhead granite, from the Stirlinghill quarries, weighing 10 tons, was brought to the intended site on the above day, and workmen are now busily employed upon it. This block forms the pedestal upon which the figure will stand. We understand it will take a month to complete the preliminaries for the erection of the statue on the pedestal, when it will be inaugurated with all due honours.—*Aberdeen Herald.*

#### Correspondence.

##### NEW BUILDING-ACT.

SIR,—May I draw your attention to the "Bill for better regulating the Buildings of the Metropolitan Districts, and to provide for the better drainage thereof" (dated 1st March, 1844), in which some of the proposed enactments are rather droll; some are exceedingly unjust (in proposing to deprive persons of their property without compensation); some are exceedingly arbitrary (in proposing to drive the poor from their houses); and as the Bill generally (if carried into law) will arm the district-surveys with an almost unlimited power of annoyance to the public?

The first clause I allude to is No. 5, which refers to Schedule (C) part 1, in which it treats of the "Rule for ascertaining Stories;" but before giving it, I may perhaps be allowed to digress a little to explain that the customary mode of describing the stories of buildings for nearly the last two centuries has been as follows (which you are well aware of):

Cellar-story, or basement.

Ground-story.

One-pair-story,

Two-pair-story.

Three-pair, and so on, the top story being called the attic. The one-pair, or first floor, having been so denominated from being the first floor above the general or ground level.

But in the "Rule for ascertaining Stories" it is proposed, that "if the space between the top of the footings and the level of the first floor do not exceed 5 feet, then, the story nearest the foundation is to be considered the lowest or first story; but if such space exceed 5 feet, then such space is to be considered to contain the lowest or first story; and in that case the top of the footings is to be considered the level of the first floor!"

So that instead of going up to the one-pair floor as heretofore, it will be going down to the first floor! This will be rather amusing, if carried into law.

But in some cases, the lowest story is not to be called the first story! as in the event of the foundation being bad, or if from any other cause the space between "the top of the footings and the level of the first floor exceeds 5 feet, then such space is to be considered to contain the lowest or first story!" So that the first floor will be no floor at all, and will commence two stories below the ground level; the ground floor will be the three-pair; and persons living on the present one-pair, or drawing-room floor, will be up four-pair of stairs!

In clauses 15 and 16, are penalties proposed to be inflicted on parties using buildings before they have been certified; in some cases ranging from 5*l.* to 100*l.* per day, and in others from 100*l.* to 500*l.* per day!

In clause 50, it is proposed to secure a sufficient width of streets and other ways, according to the "conditions, regulations, and directions, in Schedule (L), which is proposed to be enacted that every street must be of the width of 30 feet at the least; the effect of which will be, in a street 20 feet wide, that when a house is burnt or pulled down, it cannot be rebuilt without setting it back 10 feet, to give the enacted width of 30 feet. The property thus cut off, is to be given up to the public without compensation or remuneration! and where property is shallow, it cannot be rebuilt as a dwelling-house, if the rooms are less than 100 feet superficial; so that in such cases the property will be completely destroyed, and persons depending entirely on the rental of such premises (which is not an unusual case), will be left destitute.

The effect of such an enactment, after a time, would also be curious, as it would make straight streets under 30 feet wide completely zigzag; as on rebuilding premises after fire or otherwise, which generally occurs first on one side of the street and then on the other, the houses so rebuilt, would be set back 30 feet from the house opposite, thus sacrificing property without benefiting the public, and making a series of nuisance-corners down every street.

The provision in this clause, that all courts, alleys, passages, or other such public places, on rebuilding, must be at least 20 feet in width, with an entrance at each end of the same width, open from the ground upwards, or one entrance 30 feet wide open from the ground

upwards, will, in the case of fire, destroy a vast amount of property, and render it impracticable to rebuild in most of the courts and alleys of London.

Clause 51 proposes to enact that for discouraging, and prohibiting, the use of buildings unfit for dwellings, &c. &c.; it shall not be lawful to occupy buildings, or let or suffer them to be occupied, as dwellings, if the rooms are of less dimensions than one square, or 100 superficial feet!

The effect of this clause would be to deprive the chief part of the poor of London of their habitations, and to send them from the vicinity of their employment, to the distant suburbs, to seek the shelter that is denied them in the town; i. e. if there be sufficient houses of the qualified description to receive them, which I question.

And to give an instance of the destructive effect of the Act in the ward of Tower alone, which may be taken as a fair sample of the other parts of the city, I have ascertained that there would be upwards of 170 houses in alleys, courts, &c., chiefly of the poor, which could not be rebuilt. And under the restrictive clause of occupancy, I am of opinion that the poor tenants of one-half of the above number of houses would be turned into the street! Such would be the mild effect of the proposed measure.

And if I might venture to suggest such a thing on behalf of the poor working man, I would say a house with small rooms, was better than no house at all—than one three or four miles from his work—over even than one of the modern palaces, called union houses.

I have thus, Sir, endeavoured to draw your attention to some few of the severe enactments proposed by this Bill, which will destroy a vast amount of property, be a dreadful annoyance to the public, and crush the poor mechanic or labourer, by turning him out of his house. And as this will be the case with thousands in this great metropolis and its suburbs, the following question will necessarily arise,—where are they to go? and what is to become of them? It is not likely that they will be allowed to occupy a superior class of houses, and as persons cannot be compelled to erect houses for them, what is to become of them?

There are many other parts of the Bill which are exceedingly objectionable, but which are of minor importance to those referred to; but I trust that the public journals will join in endeavouring to draw the attention of the public to this measure, so that it may not pass into law, without due consideration and revision.

I am, Sir, faithfully yours,  
GEORGE AITCHISON.

Muscovy-court, Trinity-square.

#### NEW BUILDING-ACT.

Sir,—I cannot conceive why, in the proposed new Buildings' Bill, the district-surveyors' fees for most buildings, and particularly for small houses, should be considerably less than the fees are under the present Act, although great additional duties and responsibilities are proposed to be cast upon the surveyors, and notwithstanding the legislature, seventy years ago, at the then scale of money and price of living, deemed the fees then granted not too much. It would seem to me as though the framers of the Bill desire either to court the favour of that class of small speculative builders who, by their numerous evasions, cause district-surveyors the most trouble, or else to induce, by incompetent remuneration, neglect on the part of the officers under the new Act.

I am, Sir, your humble servant,  
ONE WHO DESIRES EVERY MAN TO BE FAIRLY PAID.

#### DISGRACEFUL PRACTICES OF SHAM SURVEYORS.

Sir,—I wish proceedings could be taken by respectable surveyors to put a stop to the nefarious practices of certain unauthorized surveyors. I am now somewhat reluctantly compelled to allude to an advertisement lately exhibited in your respectable and valuable periodical, with reference to these self-styled surveyors undertaking the usual business of surveyors "for nothing,"—at least for "no charge if not approved of."

Of course you are well aware that the members of our body have, by their friends, to be educated at a vast outlay of capital; notwith-

standing all this, there are some individuals who perhaps have only been at surveyors as office fags, or perhaps in the offices of builders in the same capacity, and who may learn just sufficient, when combined with their natural impudence, to make themselves very mischievous and annoying to the regular professor, and possessing this quack knowledge, or rather ignorance, fancy themselves adept in the business; although, not always appearing openly, yet sufficiently so to cause some poor creatures to be gulled and caught in the net spread for them; and in some shape or other, for a time, carry on their assumed calling, notwithstanding all the efforts of the regular professional to discover and expose them; such persons in the end bring disgrace on the very name of the profession, and much prejudice to the business of the honest surveyor.

I have heard of two instances lately, when two public edifices were advertised, and that the builders were to meet to appoint their surveyor, or to take out quantities; and as this branch of the profession needs a man of the greatest practical knowledge, and well-known standing, it of course requires the builders to pause ere they risk perhaps fortune itself in the hands of one of these quacks, nevertheless I have heard that in the first case, when the regular body of respectable builders met, that seven voted for one respectable surveyor, and eight voted for another, when about fourteen builders (at least so they called themselves) started up and voted for a man whom none of the respectable builders knew, or indeed ever heard of, yet of course the majority out-voted the others. What was the consequence? The quantities were supplied, and pretty quantities they were; for almost all the respectable builders declined tendering, and the one who succeeded threw up his contract, being frightened and rendered timid by the unknown and unusual way in which these quantities were got up. These two instances only occurred last week, when the same party came again with his friendly army; but I am thankful to hear he was smelt out, and deservedly rejected, and, I trust, will be marked for the future. How a man, lodging in an upper-story, and that in a questionable neighbourhood over the water, can be supposed to be responsible to the builders for his errors (if he make any), I know not. I would suggest that when this or any other touter comes in, to the prejudice of the regular man of business, that all builders wishing to tender should make a deposit of five guineas, and I am sure this would soon scatter entirely this mischievous class.

I deem it essential to the benefit of the profession, whether of builder or surveyor, to put a stop to the fraudulent practice of sham surveyors, of which I am assured you will see the propriety, and instead of your affording aid and assistance, will persist in not encouraging any such nefarious advertisements, unless with proper name and address, as your journal exists for the good of the professional and artisan. I think you will see the justice of my remarks, for I am well assured a paltry love of gain will never meet with your approval, or of that of the public; and if you would only refuse to take in any of their disgraceful and prejudicial advertisements, that this "Broker-alley" system would soon be at an end.

You will say, perhaps, that the public benefits by competition among all trades: this may be, but it cannot be so by a profession, where time alone is the only article that can be brought to market. Nevertheless, if competition must be resorted to, let it be done in an open and straightforward way, with real name and address, quite undisguised, and not based on deceit and perhaps fraud. Let any man who chooses to do work for nothing, if not approved, do it openly, so that he may be known by the regular man of business, who may by chance be pitted against him.

From a subscriber since you first began,  
Z.

#### EXPRESSION OF CHARACTER IN BUILDINGS.

Sir,—Will you permit me to add the following remarks upon a late original design in THE BUILDER, viz. a "Design for Schools," p. 102, to the judicious, but necessarily limited observations of your own which accompanied it? They are dictated I trust solely by a desire to expose error in principle, and not

from any pleasure in discovering it in the works of an individual.

If an architectural façade is to express the purpose or destination of the building, or (in other words) to possess a character in harmony with its intended uses, then is there an error of some magnitude in the design to which I have called attention,—I mean in its general arrangement; for by this arrangement such an expression could not be given to the exterior, or at least could not be given to the parts so as truly to characterize the whole. It is called a "Design for Schools," but is in reality, a design for a dwelling-house, with school-rooms attached. The principal feature in the design, and the part in which architectural embellishment (which is the language of the art) is chiefly employed, is a dwelling-house. What character is the designer to give it? Is it that of a domestic building? If he does he is not in that particular incorrect; and if he does he falsely characterizes the general design. I call the dwelling-house the principal feature in the design, for it is not only the centre, but it is of superior elevation, being two stories in height, while the school-rooms are but wings, and of one story, occupying, in fact, the relative position of the offices in a domestic establishment. No appropriateness, therefore, of style, or exterior embellishment applied to the school-rooms, could produce an effect that would characterize the whole composition, or repair the fault of the general arrangement.

The error, therefore, consists in giving that part of the building which is unessential, or at least of a subordinate purpose, the place of principal in the composition, and the essential or principal parts in regard to the destination of the edifice the place subordinate; but in the design in question the dwelling-house is not only made to occupy a position too prominent, but it is of dimensions disproportionate to the other and more important parts of the building:—supposing the scale 30 feet to the inch (for that given with the drawings is evidently an error of the printer), the domestic part of the building contains 5,600 superficial feet of flooring, while the two school-rooms together contain but 4,080 feet, or thereabouts!

I wish it to be understood that I am not charging these errors upon this design, as presenting a solitary instance of their commission, or as the only one in my mind's eye in which they exist; I merely point to it as an illustration of my remarks; but which, however, its appearance in THE BUILDER suggested. There are other designs, and executed ones too, in which such mistakes may be seen, and their name is legion!

Whilst upon the subject of expression of character in buildings, I would just remark upon the too frequent absence of it, even where the error I pointed out in the general arrangement does not exist to militate against its introduction.

Most of the other qualities requisite in a building, all understand, and intuitively perceive the importance of, and when not biased by opposing circumstances, endeavour to the best of their ability to obtain. All builders know, for instance, that a structure should be solid, that is to say, have a certain quantity of material, arranged on such principles as will insure the needful degree of strength. That it should also be commodious, conforming in its plan (if a public building) to the operations of the institution, or, if a domestic one, to the wants and habits of its inmates. Most builders are aware that it should have all its parts arranged with regularity and proportion to each other; that the height should be proportioned to the horizontal dimensions; that length should be extended with due reference to the piers, and the apertures be proportioned to the piers. These qualities are exceedingly important, but they are at the same time comparatively mechanical. An edifice may possess all the requisites of solidity, convenience, order, and adaptation to its uses, and yet, without expression of character, be no effort of artistic design, properly so called. It is but a dull and lifeless mass until the Genius of Architecture breathe into it this soul of the art—until it receives in the style and decoration of the parts, both interior and exterior, a character analogous to its uses and destination, and express such uses and destination as distinctly as the language possessed by the art can utter it. It should in fact so

unfold itself to the sense of sight, that a stranger on beholding it would have excited in his breast emotions similar to, or at least in harmony with those which would arise from a contemplation of the object or end of its erection. "To the informed spectator," to borrow the language of an eloquent work of recent publication, "a piece of genuine architecture is a *creature*, imbued with a species of life; breathing, as it were, the sentiment of its original and peculiar purpose, and promulgating, in the symbolic eloquence of its particular form and style, the idea of its designer."

But to what extent do these principles govern at present, in the practice of design? Do not a majority of the buildings around us testify to the most striking indifference, not to say ignorance, of them, on the part of their designers? Whilst some present a monotonous mass of brick or stone, without grace or beauty, others disgust us with a random variety of unmeaning or conflicting ornaments, and it is difficult to say which offend most. How few of our various public buildings, from the prison to the palace, from the church to the theatre, possess those qualities with respect to style and decoration befitting their respective characters! The primary source of architectural utterance is found in analogy and association. But in reference to many of the edifices in question, I may ask, have the dictates of analogy and association been at all consulted? Are the sculptured emblems which, when properly used, constitute the figurative language of architecture, so selected and arranged as truly to characterize the buildings they are meant to embellish? Have we not in some instances theatres that might be mistaken for churches, chapels for ball-rooms? Or, reversing Shakspeare, *gorgeous* temples and *solemn* palaces? gaiety for solemnity, severity for richness? and other expressions of sentiment equally incongruous, equally ill-adapted to the conveyance of a true impression of the building. But I have gone as far as my time, and I fear your space, will allow me, and shall therefore conclude by expressing a hope that to the removal of these, as well as the grosser errors in architectural practice, *THE BUILDER* may be enabled to exert an influence.

I remain, Sir, yours very truly,  
S. HUGGINS.

Liverpool, 22nd March, 1844.

#### FONT IN ST. MARY'S CHURCH, BRECON.

SIR,—I think your correspondent "a F. A. S." is mistaken in his observations on the Font in Brecon Church. All the communications of "J. L. T." are detailed in that spirit which, if followed up by your numerous friends in the country, must gradually bring to light many interesting particulars of bygone architectural days.

That the font "must certainly have been a piscina" can be easily ascertained by a line from "J. L. T." If a piscina, it must have been placed in the south wall of the chancel, convenient to the altar.

Even if the metal lining were removed, and a water-drain found, it would not indicate a piscina, as the drain is common to the piscina and font, though always found in the former. In Ireland I have met with several examples of ancient piscinas; one very fine one at the old ruined abbey of Mucross, near Killarney, the bottom or bowl part of which bears a close resemblance to the one furnished by your correspondent "W. H. J." in Number 40.

Two things in these matters may be taken as granted: one is, the piscina being placed in the chancel; the other, the font being always found in all ancient churches near the western doorway.

Therefore, a word or two from your obliging correspondent "J. L. T." as to the "whereabouts" of the "moulding in the background," which "a F. A. S." takes to be "the arch usually above a piscina," would throw much light on the subject. I am further inclined to agree with "J. L. T." by the position of the figures sculptured at the base of the bowl, by the outstretched hand and finger, as if pointing to the first ceremony or religious rite adopted by all Christians.

I am, Sir, your obedient servant,

Gorey, March 25, 1844.

J. K. L.

#### CLENDINNING TESTIMONIAL.

SIR,—I should be obliged by any of your correspondents informing me of the result of the competition in the matter of the Clendinning Testimonial, or if a decision has been come to. An unusually long period having elapsed since the day named as the last for receiving designs, and hearing no intelligence of them, I begin to fear that I have not only lost my time and trouble, but my drawings also.

I am, Sir, your constant reader,

AN ARCHITECT AND COMPETITOR.

March 23, 1844.

SIR,—Having some months ago seen in your valuable paper an advertisement for designs for a testimonial to G. Clendinning, Esq., all designs to be sent by January 1, and 20/ for the one selected, I submitted a design myself, since which time I have never heard any thing further about it, although I requested if my design was not approved of to have it back. Now, Mr. Editor, I do think, after parties have devoted their talents and time, these drawings ought in common honesty to be returned; indeed, there is a suspicion attached to the affair, and the sooner it is removed the better.

By inserting the above, you will greatly oblige a constant subscriber,

JOSEPH HOLMES.

3, West-place, Dulwich.

[We have not received any information upon the subject of our correspondents' inquiries.—Ed.]

#### Miscellaneous.

A NEW CONSTANT BATTERY.—M. le Prince Pierre Bagration has invented a new and simple constant galvanic battery, the particulars of which have been communicated by M. Jacobi to the Academy of Sciences at St. Petersburg. Its elements are zinc, copper, and sal ammoniac common earth saturated with the latter acting as a porous diaphragm. A plate of copper and a plate of zinc, placed at a distance the one from the other in a flower-pot, or any other water-tight vessel, filled with earth saturated with a concentrated solution of sal ammoniac, form a voltaic pair, whose action will, after a short time, continue constant, and be maintained for whole months, and, to every appearance, for years; the only care necessary being from time to time to re-moisten the earth and renew the zinc. Before putting the copper plate into the earth, it should be plunged for some minutes into a solution of sal ammoniac, and then left to dry, until it receive a greenish coating. This operation renders the effect of the battery much more prompt; and in regard to it, brass may be preferable to copper. The plates should not be too near to each other, nor too small, because the earth opposes great resistance to the current. This form of battery is susceptible of many applications, but it will chiefly be useful where a constant and prolonged action, rather than energetic effect, is required—as, for example, in the reduction of metals, chemical decomposition, &c. It may be extended, however, to any quantity or intensity. Whenever a series of numerous elements be used, the vessels should be well insulated. M. Jacobi has had one of these sal ammoniac batteries of twenty-four elements in action for six weeks, without the necessity of making the least change in it.

CURIOUS MANORIAL RIGHTS.—At Rapley Castle, in Yorkshire, the seat of Sir William Ingley, there is in the great staircase in elegant Venetian window, in the divisions of which, on stained glass, are a series of escutcheons, displaying the principal quarterings and intermarriages of the Ingley family since their setting at Ripley, during a course of 430 years. In one of the chambers of the tower is the following sentence, carved on the frieze of the wainscot:—"In the yere of owre Ld. MDLV. was this howse bulded by Sir Wyllyam Ingily, Knight; Philip and Marie reigning at the time." John Pallisser of Brithwaite, formerly held his lands of the manor of Ripley by the payment of a fee of two shillings, and by carrying the boar's head to the lord's table all the twelve days of Christmas.

MOST IMPORTANT DISCOVERY.—We rejoice to announce the most important discovery which has probably ever yet been made in the records and literature of ancient Egypt. Every reader is acquainted with the history of the celebrated Rosetta Stone, and the happy surmise of Dr. Young, that the trilingual inscriptions on that interesting monument were three versions of the same subject. Following out this idea, mutilated as all the Egyptian part of the stone is, he found that what remained and could be deciphered was identical with the Greek text. Hence our grand key to the translation of the hieroglyphic characters and hieratic writings found among the relics of Egypt, on rocks, on the walls of buildings of every kind, on mummy-cases, and on papyrus; and it is evident that whatever could extend or add to this key must be of the utmost value. It was interpreted that the Rosetta inscription had also been set up in other temples; and the learned expressed a hope that in the course of time one or more of them might reward the research of zealous antiquaries. That hope has been fulfilled. Dr. Lepsius has discovered another copy of the Rosetta inscription at Meroe! The hieroglyphic portion is unusually perfect, and so we are informed is the other Egyptian writing. Now, then, the three legends may be considered throughout; and we hesitate not to say that this is likely to create a great revolution, by the vast accession to our means of knowledge, in the literature and history of the country so truly called the cradle of mankind. It is a gratifying circumstance that the noble expedition of the King of Prussia should have met with this return. Copies of the inscriptions have, we understand, been made for Berlin; but the main fact was communicated by letter to his Excellency the Chevalier Bunsen, the Prussian minister in London. We believe that Dr. Lepsius is directed completely to explore all this upper division of the country, and will not revisit Cairo till that is accomplished, probably about April. After some repose the expedition will proceed to Syria to examine the Egyptian inscriptions there; and from what has already transpired, there can be no doubt but that an extraordinary new light will be thrown over the old world by this royally liberal, auspicious, and fortunate effort.—*Literary Gazette*.

NAPOLEON'S TOMB.—The model of Napoleon's tomb is completed. It is formed of 12 pilasters, with an open work between each, edged with a circular gallery. This gallery communicates with two staircases to the vault below, giving a passage from the church near the choir to the crypt. Twelve figures of Victory, each with a crown in the hand, decorate the "pourtour" of the crypt. These statues, of gigantic proportions, are placed in front of the pilasters. Above reigns a wide frieze, ornamented with allegories and bassi reliefs. The sarcophagus which is to inclose the imperial coffin does not rise above the level of the ground. This measure was adopted, in order not to take away anything from the general harmony of the architecture of the dome, and to preserve all the historical appearance of the time of Louis XIV. A railing is placed round the monument, to enable the public to look at it without going too close. The Commission has decided that no other inscription is to be placed on the monument than the name of "Napoleon." The emperor's sword, hat, imperial crown, iron crown, and the decoration of the Legion of Honour which he wore at St. Helena are to be placed on the tomb.—*Galignani's Messenger*.

ICE-HOUSES.—The following is said to be the course of the Eastern ice-merchants in building ice-houses:—"They are built above ground in any location. A rough structure, twenty feet square and fifteen feet high, double throughout, and filled in to the thickness of nine inches with broken charcoal, chaff, or saw-dust, built in the open air, will keep ice securely. The ice should be separated from the building on the inside, by a layer of chaff, saw-dust, or hay, and the place of entrance should be at the top. With this trifling trouble, families everywhere may have the luxury of ice in hot weather—a luxury for which the rich are willing to pay great sums in cities, but which the poor in the country might have, but will not take the trouble."

**CITY ANTIQUITIES.**—In Cateaton-street, on the east side of Milk-street, Cheapside, where the ground has been excavated a considerable depth for the purpose of making a foundation for some warehouses which are now in course of erection, the workmen have discovered a large quantity of Roman earthenware, consisting of jugs, &c., and many ancient coins. On Wednesday week, on coming to a cesspool, which was under the surface about fifteen feet, a hen's egg was found quite perfect, which must have been there 200 or 300 years. A few days ago much curiosity was excited, in consequence of the workmen meeting with several piles of wood, which are fixed in the earth at a depth of about ten feet from the surface. There were two sets of piles, at about six feet from each other. In each set there are nine piles (forming a square) each pile being about five feet high. Upon these piles were several trunks of trees, which have been removed. They are supposed to have been placed there at a period long before the fire of London, as the transverse pieces of wood have no appearance of the action of fire upon them. Many antiquarians have been to view the spot, and have had a draught and plan of this mode of building of former times. It was thought by Mr. Hawke, the builder, that a cesspool might have been under, and that the piles were to support some large structure; but which was not the case. There formerly stood here an ancient public-house, called the Paul's Head. Some months ago the remains of a garden were found close by, while excavating for a sewer. Very extensive remains of foundation walls have been dug up, which were composed and cemented together in the most solid manner. The material consisted of cliff, flint and chalk, and sandstone, and so firmly united, that the pickaxe could not penetrate, and, in order to break the walls into pieces, the wedge was applied. Upon these walls the houses, which have been recently pulled down, were built. They have been entirely removed, in order to make a foundation sufficiently firm for the houses now being erected.

**KING WILLIAM'S COLLEGE.**—We have much pleasure in stating that active measures are now taking for the restoration of this building. The necessary timber has been purchased, a cargo forwarded to Derby Haven, and workmen are employed in clearing the ruins. Advantage will be taken of this opportunity to introduce numerous improvements in the structure, more especially in the chapel, the great resonance in which, in its former state, was a subject of general complaint. We understand that the sum insured has been received, which, together with the amount of nearly 700*l.* already subscribed in the island (to which the munificent donation of 300*l.* was contributed by our excellent bishop), will, we hope, go far in enabling the trustees to replace the college on a much superior footing to its former condition. One suggestion has, we hear, been thrown out, which will, we hope, be acted upon—namely, that the building be divided into three or more separate parts, having only one communication on each floor, to be closed by an iron door. This would on any similar occasion effectually cut off the progress of the flames, and thus guard, as far as human means can, against a similar calamity. Had such been the case at the late fire, the destruction would have been confined to the wing where it originated. It is fully expected that every thing will be ready for the reception of the students after the midsummer vacation. —*Mona Herold.*

**THE QUEEN'S NEW SUMMER-HOUSE.**—Six of the frescoes, which have been some time in progress, to decorate the new summer temple in Buckingham Palace gardens, are completed. The poem illustrated is the Masque of Comus. The eight artists charged with their execution are Messrs. Eastlake, Leslie, Stanfield, MacIse, Ety, Uwins, and Sir William Ross. The building is a rustic octagon, standing on the top of an artificial hill.

Mr. James Fillans, the sculptor, has just completed his bust of Professor Wilson. It is an admirable likeness. It is to be cut in marble for the friends and admirers of the professor in his native town of Paisley.

**CITY OF LONDON SCHOOL.**—The corporation having devoted the fine of 400*l.* paid some years ago by Mr. Thomas Tegg, the bookseller and publisher, to be excused from serving the office of sheriff, towards the establishment of an exhibition to one of the universities for the benefit of pupils of the above school, Mr. Tegg has manifested his approval of such an appropriation by recently making the important addition to this fund of 100*l.*; and in return for so distinguished an act of liberality, the committee of the school have agreed that the exhibition shall in future be designated "The Tegg Scholarship or Exhibition." Mr. Tegg has also accompanied his gift with a number of valuable books for the library of the school. The corporation has lately caused one of the principal windows in the building to be enriched by the insertion in stained glass of the armorial bearings of the following benefactors of the school—viz., The corporation of London, Dr. Conquest, the late Sir James Shaw, Bart., Mr. Tegg, and Mr. W. S. Hale, the chairman of the select committee. In addition to which a statue will shortly be put up, which is in preparation by Mr. S. Nixon, of the original founder of the establishment, John Carpenter, town-clerk of London in the reign of Henry VI., and one of the executors of the famous Sir Richard Whittington.

**PROJECTED IMPROVEMENTS AT DOVER.**—We understand that the Earl of Guilford, the noble proprietor of Frith Farm, near the Castle, is about to apply to Parliament for a private Act to enable him to let a portion of the valley on lease for building purposes; and that plans for the erection of splendid terraces, said to be equal in design and magnitude to any in the kingdom, have been prepared, as also for detached villas; altogether, nearly 1,500 residences are contemplated to be formed on this delightful spot. It is also, we believe, part of the plan to make another outlet from the town, into the Deal-road, past the Castle Jetty, by which the Castle-hill may be avoided, and the distance to Deal considerably lessened. We hope to see the plans of the noble Earl carried out, as we feel convinced it will prove a good speculation. —*Dover Telegraph.*

**GIGANTIC SHED.**—Messrs. Ainsworth and Co. are now erecting a new power-loom shed, and, as we are informed, it is the largest in the world; it will not be uninteresting to give a few of the particulars respecting it. The shed is 350 feet in length, by 157 in breadth, divided into 36 bays. The roof is supported by 352 columns. It is calculated to contain 1,650 looms, and when complete the number of hands actually employed in the room will be 855. The production of the looms will average per week 13,200 pieces, 20 yards each, or 3 1-5 pieces per minute. This applies to the weaving shed alone, independent of the spinning and other departments. —*Preston Guardian.*

**COPPER BALLOON.**—A curious experiment is about to be made on air-balloons, which is likely to excite the curiosity of the public. A balloon, composed of copper, is so far completed, that it is now exhibited to the public. This immense globe is formed of sheets of copper, united and soldered. The object proposed by this experiment is to resolve the problem of the employment of metals in the construction of balloons; it is expected by this experiment to advance the question of aerial navigation. When it shall have been ascertained that solid metallic envelopes may be substituted for light silk, it is considered it will be a step towards the application of locomotives in the shape of balloons.

**THE ULVERSTONE COPPER ORE MINING COMPANY.**—This company, whose works are now in full operation at Cockley Beck, in Leathwaite, for the purpose of obtaining this valuable mineral, have now, we learn, every chance of ultimate success, several large pieces having been already taken out. The works lie directly on the opposite side of the "Old Man" to those of the Coniston Company, and it is supposed by eminent geologists that the interior of this large mountain abounds with inexhaustible veins of this material. —*Preston Chronicle.*

Mr. Baily has received a commission for a statue in marble of his late Royal Highness the Duke of Sussex, for the Masonic Hall, at the Freemasons' Tavern.

**STEAM-BOAT VENTILATION.**—One of the Addiscombe Professors, Lieut. Cook, R.N., F.R.S., has invented a method of ventilating steam-boats, which promises fair to add materially to the comfort of passengers by these vessels. Those who have merely crossed the Channel, especially by night in boisterous weather, are well aware of the impurity of the air which passengers, however delicate, are under the disagreeable necessity of inhaling, and which of itself is quite enough to produce sickness; but in a hot climate, the evil is of still greater magnitude. Even in large steam-boats, invalid passengers have been fairly driven upon deck in the night from the lower cabins, finding it impossible to remain in such an atmosphere. The evil being universally admitted, it remains to be seen how far the remedy will be applied, should it in practice prove as efficient as in principle it appears to be sound. A cylinder—in which a solid piston moves air-tight—has two valves at each end; through one, opening inwards, fresh air is admitted into a vacuum; which is, by the next action of the piston, forced through the other valve at the same end, opening outwards into tubes, and by these conveyed to every cabin upon each deck; while the hot, or foul air, is at the same time drawn off from these cabins into a vacuum above the piston, through a valve opening inwards, from whence it is finally ejected through the fourth valve, opening outwards into the open air. The effect produced will, of course, depend upon the size of the cylinder, and this upon the size of the vessel. One 2 feet in diameter—the piston having a two-foot stroke—with tubes and valves sufficiently large, would force in about 100 cubic feet, or above 600 gallons, of fresh air (drawing off the same quantity of impure air) every minute! Large steam-boats might have two cylinders. The machinery may, in an instant, be disconnected, so as to cease from acting. The fresh air would be conveyed in a regular stream, and not be intermitting in its effect.

**WESTMINSTER BRIDGE.**—A beautiful design by Mr. Barry, for an iron bridge on the site of the present bridge, has been published. It consists of five elliptical arches, is of a light and graceful structure, and is at least 14 feet lower than that now in use. The plan for this new structure is proposed in consequence of the unsafe and unsatisfactory state of the foundation of the existing bridge, as well as to improve the navigation of the river, and facilitate traffic by lowering the carriage-way. It is said that an iron bridge of this description could be constructed for less than double the amount that would be required to repair and render secure the present unseemly structure. The cost has been estimated at 185,000*l.*, including the expenses for erecting a temporary wooden bridge; and it is understood that this sum might be raised, for the most part, if not wholly, upon the security of the income from the property belonging to the Bridge Commission. —*Globe.*

Active preparations are going forward at Waltham, for the erection of a more commodious national school and house for the master. The first stone will be laid in a few days. This is a praiseworthy undertaking, and will be a credit to the parish, an honour to its founder, and an example worthy of imitation to all the villages around. —*Nottingham Journal, March 15th.*

There was found lately on clearing the canal at Rheims, a medal of Julia, the mother of Alexander Severus. She was assassinated at the same time as her son, A.D. 235. The head is well preserved.

The longest canal communication in the world extends from St. Petersburg to the frontiers of China, over a space of 4,472 miles. It was commenced by Peter the Great.

**PRINTING IN MANCHESTER.**—In 1598 the first printing press was erected in Manchester; in 1844 there are, it is estimated, upwards of 500.

Of the total number of dwelling-houses in Ireland, namely, 1,328,839, 1,024,575 are mud cabins.

A marble statue of Sir Astley Cooper, of colossal dimensions, is nearly ready for St. Paul's Cathedral.

Tenders.

Table with 3 columns: Item, Price, and Unit. Includes tenders for Brest Bridge and various materials like Gery, Milnes, Casling, Ledger, Hardy, Pratt, Johnson, G. Smith, Plews, and Martindale.

TENDERS delivered for a small house, with smith's shop adjoining, for Mr. Violet, in Paradise-street, Stockwell.—Mr. Rogers, Architect.

Table with 2 columns: Item and Price. Includes tenders for Freemantle, Hill, and Eskins.

Current Prices of Metals.

March 22, 1844.

Table with 4 columns: Metal, Unit, Price, and another Price. Lists metals like Spelter, Zinc, Iron, Copper, Tin, and Lead with their current market prices.

The market for metals improves, and iron is now firm at 4l. 15s. per ton in Wales, with the probability of higher rates, the stocks being rapidly reduced. Spelter, copper, and tin fully maintain the preceding rates.—Midland Counties Herald.

TO OUR CORRESPONDENTS.

"CETERA DESIDERANTUR."—We have seen the joocse subject before in print. We should prefer his monument.

We cannot answer our correspondent who desires to know the name of the person who drew up the proposed new Building Act.

"We have received the letter of "C. F." "

"Ein Zimmermann" is not correct. The word "Summer" is an English word of very great antiquity.

ERRATA.

Page 125, column 2, correct the diagram as here shewn. For the following

Also in the third line of the second column, for B I + C i read B I + C l.

Page 151, 3rd col. 14th line from bottom, for expense read expanse.

MEETINGS OF SCIENTIFIC BODIES.

To-day and during the ensuing week.

SATURDAY, MARCH 30.—Free-Houses of the Church. Adjournment of Our Lady's Chapter for delivery of the inaugural address upon the foundation, 8 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.; Chemical, Society of Arts, Adelphi, 8 P.M. (anniversary).

MONDAY, APRIL 1.—Entomological, 17, Old Bond-street, 8 P.M.; United Service Institution, Middle Scotland-yard, 9 P.M.; Chemical, Society of Arts, Adelphi, 8 P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 2.—Linnaean, Soho-square, 8 P.M.; Horticultural, 21, Regent-street, 8 P.M.; Civil Engineers, 25, Great George-street, 8 P.M.

WEDNESDAY, 3.—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset House, 8 1/2 P.M.

THURSDAY, 4.—Zoological, 57, Pall Mall, 3 P.M.

SATURDAY, 6.—Westminster Medical, 32, Sackville-street, 8 P.M.

The meetings of the following Societies are continued throughout the year, on the regular days:—Horticultural, Zoological, Entomological, Botanical, Royal Botanic, and Pharmaceutical.

Meetings of the Freemasons of the Church.

A.D. 1844.

Table with 3 columns: Meeting Number, Name of Chapter, and Date. Lists meetings for Epiphany, Candlemas, Our Lady's, St. Mark's, St. Philip's, St. John's, St. James's, St. Bartholomew's, St. Michael's, St. Luke's, All Saints', and Advent chapters.

ADVERTISEMENTS.

A COPY of each PROVINCIAL PAPER throughout England, and a variety of Irish, Scotch, German, West-India, and other papers, are regularly filed with the agent, Mr. Deacon, 3, Walbrook (opposite the church door), for the inspection of those who favour him with their advertisements, and which may also be perused in the Coffee and Dining-room on the ground-floor, by taking refreshments. The literary, scientific, and amusing periodicals of the day may also be seen. Cup of Coffee 3d., Mutton Chop 6d., Rump Steak 6d., Burton and Pale Ale 1d., Stout, &c.

HYDROPATHIC ESTABLISHMENT, MALVERN WELLS, WORCESTERSHIRE. Dr. KING, author of "Observations on Hydropathy," a 2nd Edition of which, much enlarged and improved, is preparing for the press, having recently returned from Grauberg, has selected this beautiful and salutiferous spot as peculiarly eligible for carrying out, with the grandest results, the operations of the Water Cure. The accommodations are of the most cheerful and best description.

OFFICE for PATENTS of INVENTION and REGISTRATION of DESIGNS, No. 14, Lincoln's-inn-fields.

INVENTORS and CAPITALISTS are informed that all business relating to the securing and disposing of BRITISH and FOREIGN PATENTS, Preparation of Specifications, and Drawings of Inventions, is transacted with care, economy, and dispatch.

REGISTRATION of DESIGNS. Under the new Act, 6 & 7 Vic., c. 63, ARTICLES of UTILITY, whether in METAL or other Substances, may be PROTECTED for the THREE YEARS, at a small expense.

Ornamental Designs may also be registered under the Act 6 and 7 Vic., c. 100.

A Prospectus, with full particulars as to the course to be pursued, and the expense, &c. of being protected, either by Letters Patent or the Designs Act, may be had gratis, upon application, personally, or by letter, to Mr. Alexander Prince, at the office, 14, Lincoln's-inn-fields.

Hill Street, facing Richmond Bridge, and 77, Regent's Quadrant, London.

JOHN P. HOPE, SURVEYOR, AUCTIONEER, APPRAISER, and HOUSE and ESTATE AGENT, begs most respectfully to acquaint his friends and the public generally, that he has commenced business as above; and will be most happy to superintend the erection, alteration, or repairs of buildings for noblemen and gentlemen; the measures and valuing work for builders, &c.; also to act by auction, landed and household property, building materials, household furniture, &c. J. P. H. confidently hopes, by blending his experience in the building department, &c. (derived from twenty years' practice therein), including his having acted as clerk of the works of the Wesleyan Theological Institution, Richmond, with prompt attention and moderate charges, he shall obtain a share of public patronage and support, which he now earnestly solicits, and which will be his constant study to deserve.

P.S. AN APPRENTICE WANTED, who will be treated as one of the family. Residence, Victoria Place, Richmond Hill, Surrey, February 28th, 1844.

PUBLICATIONS.

TO RAILWAY ENGINEERS.—The First Number of THE RAILWAY CHROMICLE will appear on the 20th of April. A detailed Prospectus will be sent from No. 11, St. Paul's Church-yard, to all those who send their address to the Office, 14, Wellington-street North, Strand, London.

Now publishing in Monthly Parts, Sixpence each,

THE ADVOCATE

OF THE INDUSTRIOUS CLASSES; OR, EVERY MAN

OWN LANDLORD.

Containing 40 pages of closely printed Letter-press, and a beautiful Steel Engraving.

London: J. and F. TALLIS, 3, Jewin-street, City; 287, Bradford-street, Birmingham; and 65, Christian-street, Liverpool.

On March 30th, price 3s. 6d., No. 1. of a Series of ORIGINAL GEOMETRIC DIAPER DESIGNS.

For the use of DECORATORS, CARPETS, DAMASK, AND SHAWL WEAVERS, CALICO PRINTERS, STAINED GLASS MANUFACTURERS, &c., accompanied by AN ESSAY ON ORNAMENTAL DESIGN. By O. B. HAY.

Decorative Painter to the Queen.

Author of "Proportion, or the Geometric Principle of Beauty Analyzed;" "The Natural Principles and Analogy of the Harmony of Form;" "The Laws of Harmonious Colouring, adapted to Decoration," &c. &c.

London: O. BOGUE, 86, Fleet street, and J. MENZIES, Edinburgh.

CHEAP PAPER-HANGINGS.—

BOYLE & Co., PAPEL-STAINERS and HOUSE PAINTERS, 41, LUDGATE-HILL, respectfully invite the attention of hotel proprietors, builders, and the public, to their large stock of Paper-hangings, Bed-room, and parlour-papers, 14 to 3d. octavo, grained, and marbled, 1 1/2 to 3d. and 2d. and 3d. 4d. 6d., books, 9d. per yard. Ladies and gentlemen visiting London will find this establishment unequalled in cleanliness and manufacture. Estimates given on the most liberal terms. Patterns sent to all parts of the country.

ORNAMENTAL WINDOW GLASS,

2s. per foot super.—CHARLES LONG having greatly improved his machinery for ornamenting glass, is enabled to offer handsome patterns at 2s. per foot super-glass including. 100 feet can be executed and delivered in two days. Address to Charles Long, House Decorator, &c., 1, King-street, Portman-square. For Cash only.

PAINTERS, BUILDERS, and OTHERS

SUPPLIED with every article in the COLOUR TRADE at WHOLESALE PRICES. LINED OIL, per gallon . . . 2s. 6d. BOILED ditto, ditto . . . 3s. 0d. TURPS, ditto . . . 2s. 6d. Best PUTTY, per cwt. . . 8s. 0d. Genuine WHITE LEAD, warranted, per cwt. 25s. 0d. SHEET ditto . . . 24s. 0d. THIRD ditto . . . 22s. 0d. At J. H. SIMPSON'S COLOUR WAREHOUSE, 54, London-road, Southwark.

PLUMBERS, PAINTERS, BUILDERS,

and OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures Glazing, &c. &c., in any quantity, at Manufactory Prices.

TURPS, per gallon . . . 2s. 3d. LINED OIL, ditto . . . 2s. 6d. SHEET LEAD, in sheet, per cwt. . . 18s. 6d. SHEET, cut to sizes and PIPE . . . 19s. 6d. WHITE LEAD, ditto . . . 26s. 0d.

Colours, Pipe, Brushes, &c. &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to R. COGAN, 5, Princes-street, London. PATENT FRAME AND CABINET MAKERS, can be provided with flatted Crown, Hatched Sheet, and the patent Sheet Plate. Lists of which, shewing the price for any Square, from 14 by 12 to 40 by 30 of Best and Seconds quality, will be sent (gratis) upon receiving the address. Builders, Glaziers, and others having to contract, sending a copy of their specifications, with a post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for if required.

NURSERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than any other House in London.

COMMON SHEET AND CYLINDER. The advantages of Common Sheet over Crown for Glazing Sky-lights is decidedly great, and is generally neglected, where superior appearance is required; a light 6 feet 6 in. long, with openings of any width, needs only one lap. This Glass is considerably stouter than Crown, and may be had from 18. 3d. per foot.

Also may be had, COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES, OF EVERY DESCRIPTION.

GAS CONTRACTORS, FITTERS, GLASS MERCHANTS and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

GLASS MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS, supplied with FRENCH ORNAMENTAL SLIDERS, for covering Models of Public Buildings, Geological Curiosities, &c. &c., of all sizes and shapes. List of Prices may be had on application.

French Table Flowers, China Vases, Fancy Glass Ware, and other Ornamental Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A Liberal Discount to Bazaar Keepers and others.

# The Builder.

NO. LXXI.

SATURDAY, APRIL 6, 1844.

## QUESTIONING

not that our readers, both in town and country, will consider a general Parliamentary enactment for promoting the health of towns in the same important light in which we ourselves do, we this week continue the subject by giving the Parliamentary

*Report of the Select Committee appointed to consider the expediency of framing some Legislative Enactments (due respect being paid to the Rights of the Clergy) to remedy the Evils arising from the Interment of Bodies within the precincts of large Towns, or of places densely peopled.*

Your committee have deemed it expedient, in the inquiries which they have made regarding the important question, how far the health of the population might be effected by interment taking place within towns or densely-peopled places, to consider the subject under the following heads:—

1. Whether the custom of interments within the precincts of large towns or populous places be injurious to the health of the community.

2. In the event of the injury being proved, what remedies could be suggested.

3. In what manner the remedies ought to be applied, so as not to interfere with vested rights.

1. In reference to the first subject of inquiry, how far the present custom of interment in populous places be injurious to the health of the people, your committee have received evidence from persons in every class of life. That of some of the sextons and grave-diggers in this metropolis exhibits a loathsome picture of the unseemly and demoralizing practices which result from the crowded condition of the existing grave-yards—practices which could scarcely have been thought possible in the present state of society. Your committee have also obtained the evidence of men of a superior education and acknowledged ability; of gentlemen at the head of the medical and surgical professions; of clergymen and high dignitaries of the church; and, after a long and patient investigation, your committee cannot arrive at any other conclusion, than that the nuisance of interments in large towns, and the injury arising to the health of the community from the practice, are fully proved.

Your committee refer to the following extracts, among many other portions of the evidence taken in support of their conclusion, as to the evils of the practice:—

The Rev. J. Russell, D.D., "It is sickening; it is horrible." Sir James Fellowes, M.D., "It becomes a serious question, with an increased and increasing population, upon what rational grounds such an objectionable feature can be longer continued without danger to the public health."—James Copland, Esq., M.D., F.R.S., Censor of the Royal College of Physicians, "I believe that the health of large towns is influenced by four or five particular circumstances; the first, and probably the most important, is the burial of the dead in large towns. In considering the burials in large towns, we

have to consider not only the exhalation of the gases and the emanations of the dead into the air, but the effect that it has on the sub-soil or the water drunk by the inhabitants."

Sir Benjamin C. Brodie, when asked whether he considered the crowded state of the churchyards as one cause of fever or disease in the metropolis, answers, "I have always considered that as one cause." "My opinion is, that the interments in the interior of this town must be injurious to the health of the town." And W. F. Chambers, Esq., M.D., in his letter to the chairman, which will be found in the Appendix, states, "I have no doubt that the fevers which are called typhus, even in this cleanly quarter of London (Brook-street), owe their origin to the escape of putrid miasma. I should presume that over-crowded burying-grounds would supply such effluvia most abundantly."

George Alfred Walker, Esq., surgeon, of Drury-lane, who has considered the subject with great attention and ability, gives the same testimony, and the whole mass of evidence taken before the committee leads to the same result; it has, therefore, not been deemed requisite to give in detail further extracts on this part of the subject.

The chief part of the evidence given before your committee has been in reference to the metropolis; but the evidence received from some intelligent persons, in regard to other large towns, and the mass of correspondence from the mayors, and other official gentlemen, communicated from nearly every large and populous place in the United Kingdom, some portions of which correspondence are inserted in the Appendix, sufficiently prove, to the satisfaction of your committee, that the evils of interment in towns and populous places have grown to such a height, that no time ought to be lost by the Legislature in applying a remedy. That this custom has desecrated the repose of the dead and injured the health and feelings of the living cannot be denied; it has also exhibited the singular instance of the most wealthy, moral, and civilized community in the world tolerating a practice and an abuse which has been corrected for years by nearly all other civilized nations in every part of the globe.

II. The next question, how to remedy the nuisance proved to exist, would resolve itself into a recommendation that such legislative enactments should be framed as would prevent the interment of the dead in or near the habitations of the living. Your committee, however, cannot but foresee that some obstacles must be overcome in effecting this change; besides which an increase of expenditure must be incurred. These difficulties, which your committee trust will be overcome, appear to arise from the following causes:—

The rapid and extraordinary extension of buildings in various parts of the kingdom, which might approximate them to places of interment when a certain distance was fixed, and might render the necessity of their removal more frequent than at first sight would appear probable.

The outlay requisite to purchase sites for the purposes of interment near large towns must in all cases be considerable, the circumjacent land bearing an increased value in proportion to the extent and population of a town.

The additional charge for removing the remains of the poor to some distance from their dwellings, and the necessity of having an officiating minister at the place of interment, and the consequent increase of expense or inconvenience to the parish or the incumbent, are not to be overlooked.

Although at the first glance these difficulties appear of moment, on consideration they lose much of their importance. The boundaries or limits of towns may be determined, and the flow of human dwellings is more likely to run in any other course than that which leads to the vicinity of a grave-yard or cemetery. Some additional expenses also must necessarily be incurred, but these will be in an insignificant proportion when compared to the great benefit that will arise to the health and enjoyment of the community by a change in the present system of interment. The Bishop of London says, "I am sure that the clergy, generally speaking, would be willing to make some sacrifice for the sake of effecting so great an improvement as is contemplated." His lord-

ship says, "With respect to interments under churches, I consider it altogether an objectionable plan."

The difficulty that was suggested in the committee, arising from the occasional necessity of burying persons of all religious persuasions in the same inclosed ground, if a removal of interments from towns took place, seems obviated by the Bishop of London in the following questions and answers:—

Assuming that a piece of land for a cemetery was purchased by a parish, or by a parochial union of parishes, for the purpose of interment, and assuming that this piece of ground was purchased by a penny rate, or a rate to a certain amount raised upon the parish at large, would there be any objection to a portion of this ground being set apart for dissenters, or for people of any other religious denomination, with this money so raised?—I do not see any objection to having a part unconsecrated, if any person should prefer being buried in such ground; of course it would not be for members of our church; the clergy would be desirous that such persons should be buried in a different part. It should be impossible, unless you set apart one for one, and another for another; you must have a part consecrated and a part unconsecrated in the cemetery for the interment of those not in the communion of the Church of England.

Your lordship sees no objection to the principle, supposing the money to be obtained by a rate levied upon the parish, to its being applied in that manner?—I should say not; I see no objection in principle. I do not suffer my objections to interfere with public measures.

Although the evidence, and especially that of a documentary kind, before your committee, tends to shew that the grievance in question is felt even in many of the smaller towns; yet in a question of so great importance, and involving so many feelings and interests, it appears desirable to proceed cautiously and by degrees. With this view your committee recommend that legislation be, in the first instance, confined to towns of the largest size, and that legislation with respect to the others, if felt needful or desirable, be postponed until a subsequent session.

III. In directing their attention to the third and last subject of their inquiry (the manner in which the removal of places of interment from populous towns may be effected without interfering with vested rights), particular attention ought to be paid to the peculiar situation of the parochial clergy, whose chief source of income, in some cases, is derived from fees received from interments. Of these fees it would be great injustice to deprive the parties. The effects of the contemplated change on the emoluments of the parish clerks is also, in the opinion of your committee, a matter to be taken into consideration. The only means, therefore, of removing the evils arising from the present mode of interment in towns, seems to be to grant a power in parishes, where an additional fund is required, to raise a rate sufficient to cover all the increased expenses which may be incurred under the proposed system.

It appears difficult to carry into execution any of the provisions recommended here without the assistance of some central and superintending authority to be established for that purpose.

In conclusion, your committee cannot but be of opinion that a legislative enactment, prohibiting interments in towns and their vicinity, is required for the welfare of the community, and that it is desirable such enactment should emanate from the government.

Your committee will conclude their report with the following resolutions to which they have agreed.

Resolved, that it is the opinion of this committee:—

1. That the practice of interment within the precincts of large towns is injurious to the health of the inhabitants thereof, and frequently offensive to public decency.
2. That in order to prevent or to diminish the evil of this practice, it is expedient to pass an Act of Parliament.
3. That legislation upon the subject be, in the first instance, confined to the metropolis and to certain other towns or places the popula-

tion of which respectively at the last census exceeded 50,000.

4. That burials be absolutely prohibited, after a certain date, within the limits of such towns or places, except in the case of family vaults already existing, the same partaking of the nature of private property, and being of limited extent.

5. That certain exceptions, as applying to eminent public characters, be likewise admitted with regard to Westminster Abbey and to St. Paul's.

6. That certain exceptions be likewise admitted with regard to some cemeteries of recent construction, according to special local circumstances, to be hereafter determined.

7. That within the dates which may be specified, the parochial authorities in such towns or places be empowered and required to impose a rate for the purpose of forming cemeteries at a certain distance from the same.

8. That a power be given to the parochial authorities of two or more parishes or townships of the same town to combine, if they think proper, for the same cemetery.

9. That a *minimum* of distance be fixed for such cemeteries, from the same motive that leads to their establishment—the public health; and that a *maximum* of distance be likewise fixed, so as to secure the lower classes, as far as possible, from the hardship of loss of time, or weariness in proceeding to a great distance to attend the funerals of their relatives.

10. That the parochial authorities be responsible for the due and decent administration of each burial within the new cemeteries, in the same manner as they are now within present churchyards; and that, on the other hand, they be entitled to the same amount of fees on each burial as they at present receive.

11. That due provision be made for the perpetual possession by the parishes or townships of the ground on which the cemeteries shall be made.

12. That due space be reserved, without consecration, and within the limits of the intended cemeteries, for the separate burials of such persons or classes of persons as may be desirous of such separation.

13. That no fees from any such burials in unconsecrated ground be payable to any ministers of the Church of England.

14. That, subject to the conditions expressed in the 10th and 13th resolutions, arrangements be made to equalize as far as possible the total amount of fees payable on burials within the same cemetery, whether in the consecrated or the unconsecrated ground.

15. That considering the difficulty of fixing the same date for the prohibition of burials within the limits of different towns, or the same distance, for the construction of the new cemeteries, and the importance of having reference to various local circumstances, it does not appear desirable to observe in all cases a uniform rule in these respects; but that the time and manner of applying the principles set forth in the foregoing resolutions should be entrusted either to some department of the government, or to a board of superintendence, to be constituted by the Act of Parliament.

16. That the duty of framing and introducing a Bill on the principles set forth in the foregoing resolutions, would be most efficiently discharged by her Majesty's government, and that it is earnestly recommended to them by the committee.

We shall next week continue the same subject.

#### F.

**IMPROVEMENTS AT WINDSOR.**—The Crown has lately determined to sell the whole of the ground lately occupied by the Lower Royal Mews, for the site of 12 or 14 large mansions which are to be erected in conformity with plans approved by the Commissioners of Woods and Forests. The Commissioners have also recently purchased several houses in Thames-street, preparatory to their being taken down for the purpose of widening the carriage-way, and thus effecting a very great improvement in this portion of the town.

**THE CARTOONS OF RAPHAEL.**—There is at present an artist busily occupied, by order of the King of Prussia, at Hampton-court, copying upon the most elaborate scale these wonders of art.

#### NEW BUILDINGS' BILL.

A MEETING of the Master Carpenters was held on Wednesday week, at which was a very full attendance, for the purpose, among other matters, of receiving the report of the committee upon the above-mentioned Bill. The chair being taken by Mr. H. Biers, the president, and the ordinary business of the society being disposed of, five new members were proposed and elected, viz. Mr. Crowe, of Mount-street, Grosvenor-square; Mr. Charles Harbert, of Clipstone-street; Mr. E. W. Burgess, of Wardour-street; Mr. E. W. Gooch, of Norfolk-crescent; and Mr. Thos. Rider, Jun., of Union-street, Borough.

Mr. Higgs gave notice that at the next meeting he should propose Mr. Timson, of the Hampstead-road, for election.

The Chairman then stated that the committee upon the New Buildings' Bill had met several times, but had not yet been able fully to complete the report they were so anxious to present to the meeting.

The Chairman here entered into a statement of the leading features of the proposed Bill, which, however, it is not necessary for us to give, as we have since been favoured (exclusively) with a copy of the report itself.

*The Report of the Committee appointed by the Society of Master Carpenters, to investigate and superintend the Progress of the proposed New Building-Act through Parliament.*

Your committee beg to report that according to your directions they have fully considered the several clauses, schedules, and other matters contained in the proposed "New Buildings' Bill," and they have much pleasure in stating that the present proposed Bill is a great improvement in many of its provisions upon the several Bills that have been brought under public notice for the three years past.

But although very considerably improved, and especially upon the Bill proposed in the last session of Parliament, yet much still remains to be done to it in alteration, addition, and abstraction. And here your committee would urge, that although the public generally consider a "Buildings' Bill" as merely interfering with the rights and costs of the builder only, that this is a most erroneous opinion, as it is the public generally, and individually, at whose expense and inconvenience any unnecessary provisions must be borne; and when it is considered that under the extended limits of the "New Buildings' Bill" the dwellings of between two and three millions of inhabitants will be regulated, it must be obvious to all that the residents within the control of its proposed power have much more to do with its provisions than they may imagine.

The Bill now comprises within its limits all such places lying on the north side or left bank of the river Thames as are within the exterior boundaries of the parishes of Fulham, Kensington, Paddington, Hampstead, Hornsey, Tottenham, Saint Pancras, Islington, Stoke Newington, Hackney, Stratford, Bromley, Poplar, and Shadwell; and to such part of the parish of Chelsea as lies north of the said parish of Kensington.

And to all such parts and places lying on the south side or right bank of the said river as are within the exterior boundaries of the parishes of Woolwich, Charlton, Greenwich, Deptford, Lee, Lewisham, Canberwell, Lambeth, Streatham, Tooting, and Wandsworth.

And to all places lying within two hundred yards from the exterior boundaries of the district hereby defined, with power to be given to her Majesty in Council for further extending its provisions to twelve miles from Claring-cross.

The Bill is drawn up in two parts; the first part detailing generally its several provisions, and the second part containing schedules of the matters referred to in the first part of the Bill. Your committee, in accordance with this arrangement, report, firstly, upon the general part of the Bill, and, secondly, upon its sche-

dules, and will then attach an appendix showing such parts of the Bill as, in their opinion required to be altered, added to, or amended.

Your committee would call your attention to the alteration in the names of the rates of the buildings; the Bill calling a fourth-rate house of the present Act a first-rate house, and a first-rate house, under the old Act, is therein called of the fifth-rate. The reason for this alteration is supposed to be that houses above 82 feet high, and covering a superficies of more than twelve squares, and warehouses above 65 feet in height, and extending more than thirty-five squares, will be (and perhaps properly so) under special supervision. Your committee think that this alteration in the names of the rates ought not to be carried out, but that the rates ought to be left as in the old Act, both as regards correct definition, and as preventing the innumerable mistakes which would inevitably occur, if the new designations were to pass into law. The new rates requiring special supervision, might be called "AN EXTRA RATE," and "A SPECIAL RATE."

Your committee represent that the Act is proposed to be superintended and carried out by district surveyors as at present, but of course with an addition to their number, and also by "REFEREES," and a "REGISTRAR," and "DEPUTY REGISTRAR," with power of appeal to the Commissioners of Works and Buildings to modify where necessary the strict letter of the Act. Upon these appointments your committee give hereafter in this report further observations.

Your committee are of opinion that where a party-wall is required to be rebuilt, and the consent of an adjoining owner cannot be obtained, that permission to a certain extent ought to be given to build a portion of the party-wall upon the soil of the owner withholding his consent, but under the direction therein of the referees.

Your committee are desirous that a better definition of the general line of buildings be given, than that at present set forth, for the prevention of projections and encroachments, and which, although not positively over the public way, yet when carried out as they are in many places by building over or upon the front gardens of houses, as in the line of the *New-road*, the *City-road*, and many other places, are very objectionable, preventing that free current of light and air intended by the first builders; and, further, if these encroachments are to be permitted, or any other additions or projections suffered to be erected, they ought only to be done by the written permission of every person interested in the line of houses which may be affected by such erection.

Your committee further notice that a *minimum* width is proposed for all new streets, whatever may be the respective rates of houses, viz. 30 feet; but your committee think that this provision might be greatly improved by regulating the widths of streets by the number of stories above the footways.

Your committee are of opinion that the time to be given in the notices of works about to be done under this Act is much too long, and would be of great inconvenience to parties about to build, rebuild, or alter edifices; they therefore recommend an alteration there in.

Your committee particularly call your attention to the 51st sec. of the Bill, as from its ambiguity it is likely to affect to a very serious extent the owners of all or nearly all third and fourth rate houses **ALREADY BUILT**.

Your committee agree upon the principle of every dwelling-room having a **WINDOW** and a **FIRE-PLACE**; but so many thousand houses having been built under the existing Act, by the provisions of which it was impracticable to make the **BACK ROOMS** of many **THIRD** and **ALL FOURTH** rate houses of a superficies of **ONE SQUARE**, it would be exceedingly unjust so to restrict parties who have built according to Act of Parliament for three-quarters of a century, from either letting or occupying such parts of such houses **ALREADY BUILT**; they therefore recommend this clause to be most materially revised, in order to prevent so much injustice as would be caused by its enactment.

And here your committee beg further to observe that in the smaller description of residences, even under the **PROPOSED BILL**, it

would be difficult to make the BACK rooms of such houses with a "square" of flooring.

Your committee beg to call your attention to the fees about to be established, and although your committee do not find fault with the scale of fees as regards the different rates of buildings, your committee must call to your serious consideration that there are many additional fees inserted in this Act which are not to be found in the old Act.

Your committee would next bring under your consideration the office and appointment of "OFFICIAL REFEREES;" and, with regard to their appointment, your committee consider that if "competent persons" were appointed, much good would arise, as a court of appeal would then be open to the public, and the judges would be much better able to deal with the matters brought under their consideration than any court as at present constituted, and which officers could, if so thinking fit, attend to view the subject matter of dispute; at the same time your committee think that not less than THREE referees ought to be appointed.

Your committee observe that the referees would not be bound to certify a building under their supervision within a given time, although a large penalty would prevent such building from being used previous to granting such certificate.

Your committee also call your attention to section 82, which section relates to the appointment of an officer termed a "REGISTRAR." Your committee having very fully considered the nature of the duties of the office, concur in the utility of the appointment.

Your committee have to suggest that additional provision be made that, upon further extension of the limits of the proposed Act, equable contribution be made by all districts within such limits towards the expenses of the referees and other new officers proposed to be created.

Your committee would also advise an alteration in the 97th section, for as it at present stands, an information may be laid by a common informer. This appears to be highly objectionable; and they submit that any information laid under this Act ought to be by the district surveyor, and that a moiety of every penalty which might be inflicted, should be paid over to the poor of the parish.

Your committee also suggest that power ought to be given to the referees to take evidence upon oath.

Your committee having brought the first part of the Bill generally under your notice, now particularly request your attention to the part of it which is set out in the several schedules.

Schedule A. repeals the 14th Geo. 3, cap. 78, commonly called the "Building Act," with the exception of such clauses thereof as relate to dangers by fire.

It wholly repeals the 50th Geo. 3, cap. 75, being an Act passed to permit roofs to be covered by patent tessera.

It partially repeals the 4 & 5 of Will. 4, cap. 35, and the 3 & 4 of Vict. cap. 85, which Acts are better known as the *Chimney Sweepers' Acts*.

And here your committee would express their opinion that numerous fires, and also the wearing away of flues, would be very greatly diminished, if the legislature would permit climbing boys, say of not less than fourteen years of age, and duly licensed, to sweep chimneys as formerly, instead of the very imperfect method of cleansing them by machinery.

Your committee call your attention particularly to schedule C. parts 2 and 3. These set out the class and also the rates of buildings, the names of which have been most inconveniently reversed; that which is called a FIFTH rate in the schedule is in the old Act called a FIRST rate, and the smallest or lowest rate is designated by this Bill a FIRST rate. This ought, for the purpose of preventing confusion of ideas, and also that the several rates may be called by their proper names, to be reversed, and with the addition of the extra rate before referred to.

This schedule gives greater extent of superficial measure to the several rates, as compared with the existing Building-Act, and is so far an improvement; but your committee consider it desirable to recommend a still further extension in the superficial measure. This schedule also regulates the rate by the height, and also by the number of

stories. Your committee observe that the party-walls in all the rates have been increased in thickness, as compared with the old Act; and although in some instances they concur in such additional thickness, yet in several instances they consider it desirable that the thickness set out should be altered from the present proposal, as involving unnecessary expense without corresponding advantage.

Your committee would particularly impress that schedule C. part 2, might be very greatly improved by two *intermediate RATES* being introduced to follow the *second* and *third* rates (in this schedule); for although in the suburban districts the increased superficies is, and no doubt will be, considered a desirable improvement; yet in the metropolis and other crowded neighbourhoods, a smaller space must be made to suffice, so that an additional story will be a very necessary accommodation.

Your committee think that this ought to be permitted, provided the superficial measure of the building does not exceed four squares and a half; and that the walls of this description of buildings might be permitted half a brick less, than if the whole extent of the superficies were taken, as set out in the schedule to houses, with the number of stories.

Your committee request your particular attention to this suggestion, as they consider the subject of much importance where space may be valuable, or not easily or cheaply to be obtained.

Schedule C. part 4, your committee consider may be improved by making the openings in party-walls a foot wider and a foot higher, and taking out entirely the provision as to the piers proposed to be built at the sides of openings.

Your committee call your particular attention to the alteration in the regulations of ADDITIONAL buildings; under the present Act the whole of the walls must be of the thickness of the rate of the principal building to which any such ADDITIONAL building may happen to be attached. Under the regulations in the proposed Bill, an ADDITIONAL building (when considered for the purpose of ascertaining the thickness of the EXTERNAL walls) would be rated as a separate building, and whatever might be the rate of the principal building, the external walls of the ADDITION would only have to be built of such thickness as such addition might rate in itself. This is a great improvement upon the old Act, but the provision ought to extend to the PARTY-WALLS of such ADDITIONS.

Your committee also call your attention to the regulations as to greenhouses, aviaries, and other such buildings. Your committee think that these trifling additions do not require the superintendence of the official "referees."

In schedule D. part 1, your committee recommend that the regulations relating to "foundations," being the first paragraph; and also the last one, relating to "walls generally," be entirely taken out as quite unnecessary; and at part 2, the regulation as to breast-summers ought also to be omitted, as this may lead to much litigation between builders and surveyors, and unnecessary interference.

In part 3 of this schedule, provision is made, in case of alteration of an adjoining building from a smaller rate to a larger rate, that the value of the extra SITE is to be paid for by the owner increasing the rate; a provision ought also to be made for the payment of any *additional thickness* that may be occupied in the party-wall.

In this part (3) of schedule (D.), provision is made, subject to the decision of the "referees," to permit two houses of the highest rate to have an opening or communication between such two houses. This is a very beneficial arrangement, but it ought in justice to be permitted to every rate from the highest to the lowest.

Schedule E. relates to regulations regarding projections; but your committee must confess that they really cannot understand how this schedule can be carried out, for while permission is given at one part of the schedule to form any projection, if made of combustible materials, another part of this schedule prohibits any projection beyond the "general line of fronts." The heights of shop-fronts and sign-boards are also regulated by this schedule, which, in the opinion of your committee, might be improved by allowing addition to the heights respectively.

Schedule F. regulates the construction of chimney-breasts in party-walls, and prohibits their *OVERSAILING*, except under certain regulations as regards the projections of chimney-breasts in the upper stories, or dressing-rooms, of the better description of houses, and in all other, and even in these, prohibits an *OVERSAILING* of chimney-breasts *sidewise*; permission for *oversailing* ought to be inserted in this schedule (the salient angles being regulated at 135 degrees, as in the former part of the Bill), as such permission would be a great saving both in space and cost, and could not be of any possible detriment either to strength or construction.

Upon the regulations in sewers, as in schedule H, your committee think that wherever a sewer is built in the public way in FRONT of any house, that it ought to be made imperative for the owner to lay into or communicate the drains and cesspools of the house with such sewer, whatever may be the distance from such house to such sewer. This regulation would prevent many of the surreptitious and imperfect drainages which at present exist, and would greatly promote the health of the tenants and locality, by an additional quantity of water being forced through such sewers.

Schedule I. would be greatly improved by regulating the width of streets by the number of the stories of the houses to be built in such street.

Your committee having given the regulation regarding the *area* of rooms their very serious and deliberate consideration, and although they very fully concur in the advantages of a large room over a small one, yet they feel that in preventing the occupation of a room otherwise fitted for a dwelling, solely because it does not contain (perhaps within a small quantity) a superficies of 100 feet, that in thousands of instances great injustice will be done to persons who have built under the restrictions of the existing Act, they recommend that the superficial quantity be not the test, but that if otherwise fitted that such rooms shall be permitted for occupation.

And here your committee cannot but suggest that, in carrying out this Act and its sanitary regulations, a great boon would be granted to the poor especially, if permission were given for a better ventilation by apertures and lights, free of window-duty, and which, in the opinion of your committee, ought to be allowed when light and ventilation are required; the parts so lighted and ventilated not being used for dwelling or sleeping therein.

Your committee must now call your attention to schedule L, which contains the list of fees proposed in future to be paid for the several duties to be performed under this Act. Your committee do not object to the fees charged in the first six rates of buildings, but to the fee for inspecting and reporting to the official referees upon party-walls, they cannot so readily assent, and your committee do not clearly understand the duties for which this fee is to be demanded. Additions to principal buildings will under the proposed Bill be exempted from fees, if covered in within a certain period after the principal building. Your committee consider the word "repairs" ought to be taken out of this schedule as too indefinite, and leading to an interference by the district surveyor, and a consequent fee, where the legislature did not intend any superintendence by that officer.

In the scale of fees for special duties, many of them being provided for in the fees in alterations and in rebuilding, your committee recommend that some be expunged and others abated. And in this recommendation your committee feel satisfied that the present district surveyors, a highly respectable body of public officers, have no desire whatever for either duplicate fees for the same service, or an additional fee for any trifling service that may be incidentally performed.

Your committee have thus generally reported upon the several parts of this very important proposed Act of Parliament, and having given the same their most deliberate and serious attention, hope that the SOCIETY OF MASTER CARPENTERS will feel satisfied that although perhaps inadequately, yet they have, to the best of their judgment, brought forward the most material parts of the proposed Bill for the better consideration of the society; and they beg further to state that in the various recommendations, either in abate-

ment or addition, their sole objects, and has been, for the public benefit, and that alone; and they cannot close this report without congratulating the society that although their opposition to the various Bills introduced into Parliament since 1840, and up to the introduction of this Bill, has been most constant and determined, and which opposition at one time was considered as emanating from private or interested motives, yet this society have been able at all times to give such reasons for all the alterations that they have from time to time recommended, as to make it clear to the promoters of the several Bills, and especially to the noble lord under whose superintendence through Parliament the one before us now is, that this society have been actuated by but one motive, which was, to obtain a really useful, good, and practicable Buildings' Bill, and which your committee think they may now say is likely to be passed.

The Bill being drawn in two parts, one part necessarily referring to the other, has occasioned your committee repetition in several of the observations they have had to make. Your committee, although unwilling to trouble you, did not think that without thus fully setting forth, and repeating in some instances that which they otherwise would have avoided, that they could make themselves clearly understood.

In conclusion, your committee have appended to this report extracts from the proposed Bill, with such emendations therein as have occurred to them in going through the several provisions and enactments; and which emendations your committee hope will be satisfactory to the society, and which they also hope may be made in the Bill previously to the same being passed into law.

(Signed) H. BERS, President.

We shall in our next number give the appendix to this report.

#### INSTITUTION OF CIVIL ENGINEERS.

APRIL 2.—The President in the chair.

THE discussion on the subject of slips in cuttings and embankments of railways was renewed, and was extended to such a length as to prevent any papers from being read.

Some interesting observations were made by Sir H. T. Delabèche, the Rev. Mr. Clutterbuck, and several members, on the geological features of the slips, whether occurring naturally in cliffs, as at the back of the Isle of Wight, or in the artificial cuttings of railways. It was contended that in both cases the reduction of the lower and softer beds to the state of mud by percolated water, rendered them incapable of bearing the weight of the superincumbent strata, and that the mass when saturated slid down by its own gravity; but that slips in railway work were accelerated by the vibration caused by the passage of the trains. The vibration of the air from the discharge of a gun had been known to cause an avalanche; and the cases were almost analogous. More attention, both to surface and bottom drainage of the slopes, was much insisted upon, and it was urged that the back drains so close to the top of the cuttings were prejudicial; that in dry seasons the bottoms cracked, the rain found its way through, and it had been frequently noticed that the slips commenced at a few feet below the level of these drains.

The dry shafts, which had been sunk in the slopes of the Eastern Counties Railway by Mr. John Braithwaite, with the concurrence of Sir T. Delabèche, were instanced as very successful in rendering wet and treacherous strata comparatively dry and secure.

An interesting section was exhibited of the embankment at Hanwell, on the Great Western Railway; this embankment, which was of gravel, was 54 feet high; it was laid in a marshy valley traversed by the river Brent; the London clay, upon which it was laid, inclined towards the river; and at one of the numerous fissures, with which that stratum abounds, a subsidence occurred, squeezing up at the same time on the lower side to as great an extent as the embankment sunk, which was stated to be nearly as much in one year as the entire mass of the embankment. This subsidence was stopped by loading the foot of the slope, and thus restoring equilibrium, and it was stated to be at present quite secure.

It was urged that in the earthwork of canals,

where there was no vibration, the slips generally occurred in the first few months after the formation of the embankments; but that on railways they occurred quite as frequently after the lapse of several years. It appeared therefrom that much was due to vibration.

The monthly ballot took place, when the following candidates were elected:—Messrs. A. S. Jee, as member; Adolphe du Bois de Ferrieres, J. H. Tasker, B. Snow, A. Coldinge, and T. Hughes, as associates.

The following papers were announced to be read at the meeting of April 16th, there not being any meeting on Easter Tuesday, the 9th instant:—

No. 661. "Account of the Railway from Amsterdam to Rotterdam, and of the principal Works upon it," by Le Chevalier F. W. Conrad, M. Inst. C.E., translated from the French, by C. Manby, secretary.

No. 662. "Description of the Piling Machine, used at Montrrose Harbour Works," by J. Milne, communicated by G. T. Page, Assoc. Inst. C.E.

No. 673. "Account of a series of Experiments on Solid and Hollow Axles," by C. Geach.

#### DANLEY'S PATENT CHIMNEY-BAR.

TO THE EDITOR OF THE BUILDER.

SIR,—I beg leave to send you a rough sketch of my newly-patented Chimney-bar, which if you think worthy of notice, the insertion of it will oblige me. I have also other inventions that may be considered applicable to your columns.

This bar forms no impediment to the smoke passing up the flue; for, instead of there being  $\frac{1}{4}$  inches, it will be seen there is but  $\frac{1}{8}$  of an inch of work. The bar is fed with pure atmosphere, so that it may be introduced into apartments in cold weather for respiration. As soon as I have specified, I will forward you a treatise of my invention for the better formation and safe construction of flues and chimneys. I have had thirty-six years' practical experience in their construction; and have long considered an alteration requisite; as it has ever been my opinion that chimney-building is the most defective part of house architecture. Your obedient servant,

WILLIAM DANLEY.

Frederick-street, St. John's Wood-road.

#### EXPLANATION.

No. 1. Front elevation of the bar as fixed in brickwork.

No. 2. Plan of ditto, as laid on the chimney-jambs.

No. 3. Internal elevation next the fire; the aperture is a thin plate perforated with holes; the bar is hollow and forms a hot-air chamber, which passes through the aperture and feeds the flue with an ascending current of warm air, which will always prevent apartments from being fouled by smoke.

No. 4. Section in the centre of the bar.

No. 5. Section of the bar at its ends.

#### SOCIETY OF ANTIQUARIES.

FEB. 29.—T. Amyot, Esq., treasurer, in the chair.

A paper was read by T. J. Pettigrew, Esq., F.R.S., and F.S.A., containing remarks on the extracts from the old English medical manuscript at Stockholm, communicated by George Stephens, Esq., and which Mr. Pettigrew illustrated by extracts from several similar manuscripts preserved in the British Museum. He stated that English treatises on medicine, or rather collections of medical receipts, are common in manuscripts of the fourteenth and fifteenth century. They were chiefly founded upon the popular Latin poem of the "School of Salerno," the *Regimen Sanitatis*, composed in the eleventh century. The Stockholm poem relates chiefly to the virtues of herbs, which had so large a share in the common medicine of the day, and which, in order to be effective, were to be gathered under certain influences of the planets. Belief in the particular effects of certain positions of the celestial bodies, not only in the cure, but also in the production of diseases was very prevalent, and so continues in many parts of the world, particularly in the East. A certain knowledge of astronomy, or rather of astrology, was necessary to the physician, because he was guided by it in the time and manner of letting blood, and other operations. Evil spirits were believed also to exercise an extensive agency in producing diseases, and various methods were employed to drive them away from the patient. Betony, goldflower, pimpernelle, motherwort, vervain, henbane, and other plants, were very efficient for this purpose. Some of the remedies are of a singular nature. For dropsy, three-three earth-worms with their heads cut off, immersed in holy water in which sugar or liquorice is to be dissolved, are recommended to be taken daily for nine days. Numerical and other charms are very common in these treatises. Charms were particularly employed against venom, tooth-ache, jaundice, hemorrhage, fevers, epilepsy, &c.; and Mr. Pettigrew accounts for their being in many cases efficacious through the influence exerted by the mind over the functions of the body, and this efficacy was of course in proportion to the ignorance of the age in which they were used.

MARCH 14.—Lord Viscount Mahon, V.P.

The following gentlemen were elected fellows of the society: Dr. Barnett, M.D., of Chesham-place; James Dearden, of the Orchard, Rochdale, Esq., formerly of St. John's College, Cambridge, and barrister-at-law; the Rev. Abraham Hume, of Liverpool; and James Nicholson, Esq., of Thelwall Hall, near Warrington.

It was announced that the second volume of the "Great Rolls of the Exchequer of Normandy," edited for the society by Thomas Stapleton, Esq., F.S.A., and which completes the work, is now ready for delivery.

Mr. E. B. Price exhibited rubbings of two remarkable sepulchral brasses.

Albin Martin, Esq., exhibited a collection of glass vessels popularly called lachrymatories, discovered in the Elysian fields near Naples, and several ancient lamps of terra cotta from a burial-place in the neighbourhood of Cumæ. Also sketches in oil of the following classic localities: the plain in which Pompeii and Stabia were situated; Puzzuoli, the ancient Puteoli, where St. Paul landed on his way to Rome, after his shipwreck at Melita; the site of the villa of Lucullus; view of the Lago d'Agnano, near the Lucrine Lake, still remarkable for its warm sulphureous baths. The exhibition was accompanied by a paper by A. J. Kenpe, Esq., F.S.A., shewing that the vessels in form of a tear were, probably, genuine tear bottles, and that the practice of depositing lamps in tombs were continued by the Romans after Christianity had been embraced, and burning of the dead disused.

MARCH 21.—Mr. Amyot in the chair.

Among the presents received was a handsome work on the ancient architecture and monuments of Saxony, entitled, "Denkmale der Baukunst des Mittelalters in Sachsen." It was accompanied with a letter from the author, Dr. L. Pütterich, stating that, having studied what has been published with regard to similar remains in England, he had observed a great correspondence with those of Germany. His

volumes consist of numerous plates in lithography.

Edward Blore, Esq., F.S.A., presented exterior and interior views of the ancient refectory at Great Malvern, which appears to have been wholly constructed of wood, including the windows, which were square-headed, but had very elegant tracery. The roof was high pitched, and handsomely ornamented. This very curious structure was wantonly demolished in 1841 by a speculative tradesman, and it is believed no other representations of it than Mr. Blore's have been preserved.

J. A. Cahusac, Esq., exhibited some antiquities found at Stony Stratford, consisting of three spears, an arrow-head, and two Roman coins, one of them of the Emperor Constantine.

H. C. Harford, Esq., communicated an account of some ruins, supposed to be Roman, excavated at Preston, near Weymouth; and exhibited several of the remains found there, consisting of great iron bars, swords, &c.

John Gough Nichols, Esq., F.S.A., communicated some remarks on a patent appointing Edward Duke of Somerset, Governor of King Edward the Sixth, Protector of the Realm, and Lieutenant and Captain-general of the Wars. This important document, which is now in the possession of William Staunton, Esq., of Long-bridge House, near Warwick, bears the signature of the king and of sixty-two other persons; and Mr. Nichols shewed that it received the signatures of the peers in the House of Lords on the last day of the first session of King Edward's Parliament. It appears never to have passed the great seal, its progress having been stayed after the breaking up of the Parliament. Its most remarkable feature is a clause declaring the tenure of the duke's high office to be terminable at the king's pleasure, expressed in writing under the great seal; whilst in the patent under which the office was actually held, and which is printed in Burnet's "History of the Reformation," the term of the duke's regency was to be commensurate with the king's minority, which the late king's will bad fixed at the age of eighteen.

IMPROVEMENTS IN THE CITY.

THOSE who have been absent from the "City end" of this great metropolis for a series of years will be somewhat startled if they have occasion to pay a visit to that part of London. "Stands the City where it did?" may perhaps be their exclamation of astonishment on contemplating the march of improvement which is now so rapidly approaching its climacteric point. To say nothing of the immense advantages obtained some years back by the removal of old London-bridge and its contiguous abominations, the abolition of Crooked-lane and the purlieus of the once famous "Boar's Head Tavern," and the opening of a new bridge across "Old Father Thames," with handsome and spacious approaches, it is only necessary to make a circuit of half a mile round the Royal Exchange, in order to be made in some degree acquainted with the reforms effected from time to time in that important commercial locality. Some of our more elderly readers may perhaps have a faint recollection of old Princes-street, on the west side of the Bank of England, which some fifteen years ago was not wider, if we rightly remember, than Finch-lane is at present. Now, on the other hand, we have a fine wide street, which, continued by Moorgate-street, forms one grand and direct line of communication from the Mansion-house to Islington. On the eastern side of the Bank, Bartholomew-lane has been latterly most conveniently widened, and the old ruined tower which formerly reared its head at the north-western corner, flanked by a boot-maker's stall (for it could hardly be dignified by the term "shop"), has given place to a handsome *façade* of buildings, which very worthily hold up their heads by the side of the New Royal Exchange. Going still further it will be found that the old and ugly little church of St. Benet Fink is now on its last legs, and on the eve of final extinction. The unsightly heap of bricks and mortar yecept "Bank-buildings" is already levelled with the ground, and the elegant portico of the new Exchange may now be viewed to some advantage. By the encroachment of this edifice, two very ancient city thoroughfares, "Castle-alley" and "Bank-street," have been utterly annihilated, but, of course, without any disadvantage
