Mr. HUMPHREY did not think it fair to be charged by a member of the government with taking an unfair advantage. If he had had a large majority with him, and the noble lord had been opposed to the Bill, would not the noble lord have taken the same advantage? The Bill ought to be circulated, free of cost, like a newspaper (laughter), and fully discussed. Why had not the noble lord all the government down to support him? If the noble lord's supporters were present, and hon. members on his (Mr. Humphrey's) side of the house were where they ought to be, would the noble lord charge him with taking an unfair advantage?

The Earl of LINCOLN.—No.

Mr. HUMPHREY.—Then why do you now?

The Earl of LINCOLN.—Because you stand alone.

Mr. HUMPHREY.—Am I to be blamed for that?

The CHANCELLOR of the EXCHEQUER gave the hon. member great credit for standing alone. (Laughter.)

The report was then ordered to be received on Friday, at 12 o'clock.

#### DAMAGE BY FIRE METROPOLIS (NO. 2) BILL.

The Earl of LINCOLN said, he intended to abandon this Bill for the present year in consequence of the representation of the vestries of parishes. Although they did not disapprove of the regulations in the Bill, and were prepared to admit that considerable improvements on the present system were effected by it, yet several parties had pressed on him that there might be much more economy if the whole of the regulations were placed under one superintendence and a general fire brigade like that which existed in Paris and other places were established. By this means not only would the system be more efficient, but it would also entail much lighter burdens upon the rate-payers. He was not prepared to affirm that

proposition, but thought the suggestion so valuable that he should abandon the Bill for the present year, for the purpose of obtaining information from Paris and other towns on this subject. If this suggestion proved not to be available, he should then reintroduce the Bill.

Mr. HAWES hoped the noble lord would consider not only the means of supplying fire-engines, but also water. His belief was that more destructive fires took place from the want of water than from the want of fire-engines.

The Bill was then withdrawn.

#### COMPLETION OF STONE-BUILDINGS, LINCOLN'S-INN.

These magnificent chambers, built by Sir Robert Taylor, and entirely faced with Portland stone, being at present deficient of their southern wing, are forthwith to be completed. To such persons as are not acquainted with this well-known pile, we merely intimate, that they are externally of the Corinthian order, and are (some details excepted) by all persons, except those who originate or follow the bad criticism of the day, much to be commended; as seen from the extreme length of Lincoln's-Inn-Fields (over the beautiful terrace now cut up for the erection of the new Hall and other buildings, and the wall of which is celebrated for containing some workmanship from the very hand of "Rare Ben Johnson"), the pearl-like effect of their beautiful stone throws into shade every competing object; their simple, plain continuity, surmounted by the richer, though still plain, entablature of the order, shews how superior an effect plain, bleached, enduring masonry has to frippery, falsely called architecture. A little further on may also be seen the exquisite Portland stone masonry of the upper part of the great gable of Lincoln's-Inn Chapel; which, contrasting with the wretched clay-coloured stucco, with which nearly all the remainder of that building was some years since invested, puts the right-minded in an almost fixed humour to forswear the use of all other materials.

#### DESTRUCTION OF ANTIQUITIES OF IRELAND.

It is much to be regretted that the society lately established in England, having for its object the preservation of British antiquities, did not extend its design over those of the Sister Island—which are daily becoming fewer and fewer in number. That the gold ornaments which are so frequently found in various parts of Ireland should be melted down for the sake of the very pure gold\* of which they are composed, is scarcely surprising; but that carved stones, and even immense druidical remains, should be destroyed, is indeed greatly to be lamented. At one of the late meetings of the Royal Irish Academy, a communication was made of the intention of the proprietor of the estate at New Grange, to destroy that most gigantic relic of druidical times, which has justly been termed the Irish pyramid, merely because its vast size "cumbereth the ground." At Mellifont, a modern corn-mill of large size has been built out of the stones of the beautiful monastic buildings, some of which still adorn that charming spot. At Monasterboice, the church-yard of which contains one of the finest of the round towers, are the ruins of two little ancient stone Irish churches, and three most elaborately carved stone crosses eighteen or twenty feet high. The church-yard itself is overrun with weeds; the sanctity of the place being its only safeguard. At Clonmacnoise, where some forty years ago several hundred inscriptions in the ancient Irish character were to be seen upon the grave-stones, scarcely a dozen (and they the least interesting) are now to be found; the large flat stones, on which they were carved, forming excellent slabs for doorways, the copings of walls, &c. It was the discovery of some of these carved stones in such a situation, which had the effect of directing the attention of Mr. Petre (then an artist in search of the picturesque, but now one of the most enlightened

\* One recently discovered, and now in the possession of the Rev. Dr. Todd, is equal in weight to not fewer than 200 sovereigns.

and conscientious of the Irish antiquaries) to the study of antiquities, and it is upon the careful series of drawings made by him that future antiquaries must rely for very much of ancient architectural detail now destroyed. As to Glendaloch, it is so much a holiday place for the Dubliners, that no wonder every thing portable has disappeared. Two or three of the seven churches are levelled to the ground; all the characteristic carvings described by Ledwich, and which were "quite unique in Ireland," are gone—some were removed and used as key-stones for the arches of Derry-bawn-bridge. Part of the church-yard has been cleared of its grave-stones, and forms a famous place where the villagers play at ball against the old walls of the church. The little church called St. Kevin's Kitchen is given up to the sheep, and the font lies in one corner, and is used for the vilest purposes. The abbey church is choked up with trees and brambles, and being a little out of the way, a very few carved stones still remain there, two of the most interesting of which I found used as coping-stones to the wall which surrounds it. The connection between the ancient churches of Ireland and the north of England renders the preservation of the Irish antiquities especially interesting to the English antiquarian, and it is with the hope of drawing attention to the destruction of those ancient Irish monuments that I have written these few lines. The Irish themselves are unfortunately so engrossed with political and religious controversies, that it can scarcely be hoped that single-handed they will be roused to the rescue even of these evidences of their former national greatness. Besides, a great obstacle exists against any interference with the religious antiquities of the country, from the strong feelings entertained by the people on the subject, although *practically*, as we have seen, of so little weight. Let us hope that the public attention directed to these objects will have a beneficial result, and insure a greater share of "justice to Ireland"—for will it be believed, that the only establishment in Ireland, for the propagation and diffusion of scientific and antiquarian knowledge—the Royal Irish Academy—receives annually the munificent sum of 3000*l.* from the government? And yet, notwithstanding this pittance, the members of that society have made a step in the right direction, by the purchase of the late Dean of St. Patrick's Irish Archaeological collection, of which a fine series of drawings is now being made at the expense of the Academy, and of which they would doubtless allow copies to be made, so as to obtain a return of a portion of the expense to which they are now subjected? Small, moreover, as this collection is, it forms a striking contrast with our own National Museum, which, rich in foreign antiquities, is almost without a single object of native archaeological interest, if we except the series of English and Anglo-Saxon coins, and MSS. Surely the progressive history of the arts of our own country deserves a place in the British Museum, and yet this has not hitherto been afforded to it: in this respect, even the Ashmolean Museum at Oxford must take precedence; whilst in Ethnographical collections, the little museum of the British Institution may be cited as an example fit to be followed; for strange indeed does it seem that, with the exception of the few specimens brought home by Capt. Cook from the South Sea Islands, the national museum of our country, whose intercourse with every quarter of the globe is so immense, is destitute of specimens of the manufactures, carvings, paintings, &c. of the inhabitants of almost every part of the world. The Chinese Collection, at Hyde Park Corner, and Mr. Catlin's collection, ought not to be allowed to be broken up. These would form a fitting nucleus for an Ethnographical addition to the British Museum.—*Athenæum.*

SINGULAR DISCOVERY.—A discovery of extreme interest has been made within the last ten days, in a fen about five miles from Cambridge. A man employed in digging turf, about five feet from the surface found, embedded in the soil, an ancient armet or bracelet, of the finest gold, weighing upwards of 5 oz. It consists of five spirals, 3 inches in diameter, and of beautiful workmanship, exhibiting an interesting specimen of the art of the ancient Britons, which it is presumed to be.

VIEW NEXT THE COURT OF THE ENTRANCE TO THE BRITISH MUSEUM.

## ENGLISH DOORWAYS.—No. 3.

ENTRANCE, NEXT THE COURT, TO MONTAGUE HOUSE.

Our accompanying view is taken from the court-yard of Montague House, now forming the older portion of the British Museum, and represents the inside of the southern entrance from Great Russell-street, Bloomsbury, the outside of which we gave in No. 73.

The present subject forms in truth part of the Ionic colonnade, which traverses the whole southern side of the court-yard, and is indeed detached, except by its ceiling and roof, from the outer portal itself, a porter's lodge in part intervening between the doorway and the avenue of the colonnade. The whole mass of the gateway, internal and external, is surmounted by an octagonal turret, finished upwardly by an ogive cupola; which, according to our print, though in outline, from the nearness of the view, somewhat harsh, is not, as seen more remotely, without elegance of shape: with some reforms in its transomed and mullioned windows, and other parts, it might be successfully employed again in picturesque works. The interior of the gateway itself is of masonry, while the cupola is principally of wood; and its carvings, though coarse and common-place, are not altogether destitute of merit; and we may hereafter, among our specimens of scrolls and brackets, take an example from this subject.

When we give an interior view of the whole

court and buildings of this ancient mansion, we shall go more into detail. el.

TIMBER—ITS TREATMENT AND USES.  
BY JAMES WYLLSON.

“The gloomy pine, the poplar blue,  
The yellow beech, the sable yew,  
The slender fir that taper grows,  
The sturdy oak with broad-spread boughs.”

1. As it is of the highest importance that those interested in building should be familiar with the nature and properties of the materials used therein, and with none more necessarily than those upon which the carpenter and joiner have to operate, we shall endeavour in this paper to bring together such data as shall forward that desirable object with reference to timbers, confining our attention to such as are actually comprehended under the title of building-materials.

2. The term *TIMBER* is used to imply wood prepared for the purposes of building, and comprises a considerable variety, both in genera and species; before proceeding, however, to that mature stage of the subject, it is our duty to inquire, if not into the botanical niceties, at least into the general nature, of its growth.

3. In the first place, then, with regard to structure, it has to be observed that the transverse section of a tree presents numerous concentric rings encircling the medulla or *pith*, and encompassed by the *bark*, and which rings or layers being counted from the pith outwards, give of the tree, as has been ascertained, its age in years,—one ring being formed every year. The process of formation is this:—the fluid called *sap*, which is necessary to the growth of the tree, rises in a watery but yet saccharine state from the roots, becoming

enriched as it ascends; and during which stage of its progress it bears the name of *common sap*; undergoing then a change in its nature, during the production and growth of the leaves and young shoots, it descends in a less liquid state, now *proper sap*, between the last formed ring and the bark, and there forms a new layer of wood, the bark during its descent expanding and leaving a space to receive it.

4. The ascent of the common sap is chiefly through the newest wood, which is more soft and porous than the older central part—the density in young trees existing in regular gradations, from the heart outwards, diminishing but in those which have reached maturity divided only into two, each nearly uniform throughout,—the inner being called *heart-wood* and the outer *sap-wood*. Of these, the former contains little fluid and no vegetable life; and being the least liable to decay, is therefore the most perfect wood,—the latter is soft and perishable in its nature, abounding in saccharine and fermentable principles; thus affording the very food for worms, whose destructive inroads hasten its natural tendency to decay.

5. Before leaving this part of the subject, let us direct more minute attention to the annual rings and other phenomena observable in the transverse section. The rings are very distinct in some woods, from being uniform in their texture and colour, while in others they are found to be compact in one part and porous in the rest. Of the first description mahogany is a familiar example, and one of the latter structure is ash: besides these there are the resinous woods, in which the porous part is found to be filled with resin or gum, presenting in the layers one part dark, compact and hard, while the other is lighter and softer. In addition to these characteristics in the annual rings, there may be distinguished in every wood except the palm-tree, traversing rays, the same which appear

THE BUILDER

to divide the circular section of the tree into minute sectors, having pores in them, and which in the resinous woods are filled: also, in some woods, larger rays, usually silvery and light in their colour, and which, when the wood they are in is cut and planed in an oblique direction, present those changing flowers which appear in the finer sorts of oak: these rays are generally termed the *silver grain* of the wood, but are more distinctively denominated the lesser and larger transverse septæ, or medullary rays.

6. Woods are variable in quality according to the nature of the climate and of the soil, as also in a considerable degree to the aspect in which they are situated. Trees grown slowly in open, dry, and exposed situations are more fine and close in their annual rings, and more substantial and durable, than those which are grown in close and shady forests, or rapidly reared in sappy or moist places, the latter being broad and soft in their rings, and very subject to decay; and their pith is not always quite in the centre, for the layers are variable also from the situation of the principal roots, or the circumstance of the soil on one side being more favourable to growth than that on the other; or one side of the tree may be more dense from more hardy exposure; the rings may also depend individually for their thickness on the degree of vegetation which takes place in the particular years of their formation.

7. The age and season for felling are subjects which call for the deepest consideration, but do not always receive that attention which is due to their importance. Timber-growers, in their haste to supply the market, too often fell trees that have not arrived at maturity, the heart-wood being therefore imperfect, with much sap-wood, and of course little durability, and, unfortunately, they are the more readily led to do so on account of the increase in size being very slow after a certain age. Felling should not be too early, for the reasons above contained; neither should it be in the decline of the tree, when its elasticity and vigour are lost, and the wood has become brittle, tainted, and discoloured, with the pith gone and the heart in progress of decay. Maturity is the period when the sap-wood bears a small proportion, and the heart-wood has become uniform and compact. It must be obvious, however, that it is a worse fault to fell wood before it has acquired thorough firmness, than when it is just in the wane and its heart may exhibit but the first symptoms of decay; for in the former there is no perfectly-enduring timber to be got, while in the latter the greater part is in the zenith of its strength. This is in regard to the *age of the tree*, and now with respect to the *season of the year* it should be felled, we must take into some consideration the *barking*.

8. It happens unluckily that the best times for felling are the worst for separating the bark for tanning, and the consequence is, that the value of the latter in some kinds of trees is such as to lead to the cutting down of timber at very improper seasons. The best time for felling is midsummer, when the leaves are fully expanded, and the sap has ceased to flow, and the extraneous vegetable matter intended for the leaves has been dislodged from the trunk of the tree, by the common sap leaving it in a quiescent state, and free from that germinative principle which, from being more saccharine and fermentable than the proper juices which form the wood, is readily excited by heat and moisture, and if the timber were cut while it remained, would subject it to rapid decay and to the operations of worms. The period during which the vegetation is at rest generally extends from about midsummer, or the middle of June, to the middle of August, when the autumnal vegetation, or the operation of forming the nutritious matter for the foliage, &c. of the succeeding year, begins. In the winter months there is another cessation, and mid-winter is therefore also chosen as a time for felling, and receiving, indeed, a preference: but as the only peculiar recommendation which that time possesses is the facility which it affords for gradual seasoning, by which timber is rendered less liable to split and get distorted, and slow drying being generally available at any season, under shade or shelter, midsummer appears, for many obvious reasons, the most expedient.

9. During these periods of rest, so favourable for felling, the bark adheres closely to the wood, being neither separated from it by

the descending sap nor by the vegetable deposit which forms in the sap-wood; and, as has been already mentioned, those seasons during which the bark bangs loosely on the trunk are the least advantageous for cutting it down. Under this dilemma a mode is practised of stripping the bark from the standing tree early in spring when the sap is rising, and felling after that sap and the vegetable matter which it carries off along with it are expended in foliage, and the latter has died away. This practice has been found advantageous in every respect, as it at once insures obtaining the bark in a perfect state, and renders the sap-wood by exposure almost equal to the heart-wood in hardness and durability. When this method is not adopted, it is well either to pierce the trunk some time before felling, to drain out the sap, or, immediately on its being felled, to set it on end for that purpose.

10. The next consideration is the mode of rendering the timber fit for use, and the time which can be afforded for that purpose. There are natural and artificial means of seasoning, both of which have their recommendations; but the former has certainly the right of preference, as it gives greater toughness, elasticity, and durability, and therefore should always be employed in preparing timber for carpentry.

11. When there is time for drying it gradually, all that is necessary to be done, on removing it from the damp ground of the forest, is to place it in a dry yard, sheltered from the sun and wind, and where there is no vegetation; and set it on bearers of iron or brick in such manner as to admit a circulation of air all round and under it. In this situation it should continue two years if intended for carpentry, and double that time if for joinery; the loss of weight which should take place, to render it fit for the purposes of the former, being about one-fifth, and for the latter about one-third. If it is to be used round, it is good to bore out the core; as by so doing the drying is advanced, and splitting prevented, with almost no sacrifice of strength. If it is to be squared into logs, it should be done soon after some slow drying, and whole-squared, if large enough; as that removes much of the sap-wood, and facilitates the drying, and prevents the splitting, which is apt to take place when it is in the round form, in consequence of the sap-wood drying before the heart, from being less dense; also, if it may be quartered, it is well to treat it so after some time, as the seasoning is by that means rendered more equal. It is well also to turn it now and then, as the evaporation is greatest from the upper side.

12. To prevent timber warping, it should be well seasoned before it is cut into scantlings; and the scantlings should be cut some time before they are to be used, in order that the seasoning may be as perfect as possible; and if they can be set upright, so much the better, as then they will dry more rapidly; and as the upper dries sooner than the lower side, they ought, therefore, to be reversed at intervals.

13. When there is not time for gradual drying, the best method that can be adopted, especially for sappy timber, and if strength is not principally required, is immediately on felling to immerse it in running water; and, after allowing it to remain there about a fortnight, to set it in the wind to dry. This renders timber less apt to crack and warp in drying, and less subject to be worm-eaten, especially the more tender woods; but it must be altogether under water, as partial immersion is very destructive.

14. Of steeping generally, whether in cold or warm water, it must be observed, that it dissolves the substance of the wood, and necessarily renders it lighter: therefore, the less that is necessary of it, the better; indeed, it is known that, notwithstanding wood that is completely submersed remains good for a very great period after the water has dissolved a certain soluble part, it is, when taken out and dried, brittle, and in every respect unfit for use.

15. For the purposes of joinery, steaming and boiling are very good methods; as the loss of elasticity and strength which they produce, and which are so essential in carpentry, is compensated by the tendency to shrinkage being reduced: the durability also is rather

improved than otherwise, at least from steaming. It has been ascertained that of woods seasoned by these methods, those dry soonest which have been steamed; but the drying in either case should be somewhat gradual, and four hours are sufficient for the boiling or steaming process.

(To be continued.)

REPUTED FIGURE OF THE FIRST BISHOP OF FERNS.

TO THE EDITOR OF THE BUILDER.

SIR,—On looking over No. 63, I find you placed in the hands of the engraver my sketch of the first Bishop of Ferns. It may not be out of place to remark there is nothing in the appearance of this curious piece of sculpture to indicate it ever was designed as a figure of St. Edau, who is said to have been consecrated first Bishop of Ferns so far back as 598, beyond a modern inscription cut on a plain marble slab, as follows:—

“Under this Monument are interred the remains of SAINT EDAU, commonly called Saint Monque, the Founder of this Cathedral, and first Bishop of Ferns; he discharged the pastoral office with piety and Christian zeal for the space of fifty years; and died in an advanced age, Jan. 31st, A.D. 632.”

Whether this is a figure of the founder of the cathedral or not, it is evidently a work executed with considerable ability, and must, therefore, have been chiselled centuries after the death of St. Edau. It is well known nearly all our ancient sculptural remains are rude efforts, destitute of any pretensions to symmetry or order, whilst the figure in question is chiselled from Kilkenny marble, a stone most difficult to work and manage even by a master-hand.

The appearance of the *face* of the figure referred to is that of a man not exceeding fifty years of age; contrasting this fact with the concluding part of the inscription, that he (Saint Edau) “discharged the pastoral office for the space of fifty years, and died in an advanced age,” I come to the conclusion that this figure was never intended to commemorate Saint Monque. It is now about seventy years since it was found in a vault under the cathedral, through the laudable exertions of the then rector, Dr. Lloyd, who, after it being carefully cleaned, had it placed in its present position in the parish church.

I expect shortly to send a sketch of the monument (with a bust) of the *last* Bishop of Ferns, Dr. Erlington.

I am, Sir, your obedient servant,

Ferns, 7th July, 1844. J. K. L.

## PETRALOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY O. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 339.)

In order to form a right conception of the *modus operandi* of nature in forming rocks and stones, it is also necessary to treat more particularly upon the process of lapidification, or petrification as it is commonly termed, for to this process we owe the formation of rocks which are termed *amorphous*—that is to say, *deficient of crystalline structure*. I have previously observed that every bed of earth or clay has a tendency, under favourable circumstances, to enter into the state of rock, which circumstances are produced by climate and association; thus, in one region of the earth, from the absence of heat, moisture, or other changing causes, soils continue in their disintegrated state, for ages—so long, in fact, as they continue exposed to the like influences; but in the revolutions of time and changes of the position of the earth's surface, these loose masses become exposed to new elemental influences, and it is then cohesion or crystallization takes place, whereby the bodies or portions of bodies of which such masses are composed lose their individuality, and are no longer to be distinguished in the general mass.

"Pure earth," says Aristotle, "doth not become a stone, because of its brittle, friable nature, the prevalent dryness in it not permitting it to coagulate, and so by the aqueous mixed with the terrene, stones are made." Such was the philosophy of early ages, founded upon observation of nature; it is not, however, essential that water enter into their combination to produce all the phenomena, for many varieties are produced in the total absence of water, in climates where it never rains; it is, therefore, essential that we look to other causes for lapidification and crystallization, which modern knowledge enables us to do, and by analysis to separate the elementary constituents of rocks; thus we have discovered that, while water was absolutely necessary for the generation of the bodies of which rocks are composed, the bodies thus formed, and containing the elements of water in their composition, are further perfected by the presence of heat, light, and atmospheric air, the latter being an essential component of rocks and stones. Dr. Price, in his "Mineralogia Combiensis," observes: "That there is a petrifying quality in the earth or its juices, is manifest to those who are conversant with mining, and consider the nature of the stones which are dug out of the ground; for they frequently meet with large solid rocks, composed of several small stones, united together, of different forms, colours, and properties, with respect to the same individual rock or stone;" which is a manifest indication that its different parts were originally loose and distinct from each other, until they were conjoined into an entire solid mass, by something of a petrifying principle which cemented them together. Here are, in fact, many soils, even in this country, favourable to the generation of stones, much to the annoyance of the farmer, who, not aware of this fact, expresses his wonder at the annual crop of stones, which reappear, in despite of his continued trouble to collect them; and this lapidifying process is sometimes produced by the very means which the farmer employs to fertilize the soil; the earths applied as manures uniting with the soil, natural concrete-masses are formed, which by atmospheric influences are rapidly converting into stone. Again, when lime is thrown upon sour lands, while it tends to neutralize their acids, it also forms concreted nodules, which speedily change their condition; and when bodies, or portions of organic bodies, are disposed in these soils, they speedily petrify, or uniting the sulphate of iron with their organic constituents, they become mineral petrifications. The well-known property of iron to form concrete masses has led to the theory that it is almost the sole cause of the production of concrete-masses; and it is observed that iron pipes and vessels buried for a long time in the soil gradually disappear, and become the cement of inclosed or surrounding masses; boilers also attach earthy matters held in suspension by the waters, and their whole interior becomes lined with a stony con-

crete-mass. To the presence of this metal, also, many mineral waters owe their petrifying powers, and it is also an ingredient in artificial stones; its more comprehensive character is manifest in *siderous rocks* and stones, of which I shall speak in my next article.

The experiments of Sir John Hall, quoted triumphantly by existing geologists to prove that marble is formed under an intense degree of heat and lateral pressure, were far from being a satisfactory explanation of the *modus operandi* of nature, in forming the crystalline and amorphous rocks; a much better explanation is afforded by the concretions constantly accumulating in salt-pans, boilers of steam-engines, wooden pipes through which waters charged with mineral matters and earths are conveyed, &c. The boiling springs or fountains of Iceland may also be quoted as illustrations of the lapidifying process, the vegetable bodies on which the water falls being speedily converted into stone. The crystallizing waters are here composed of a large portion of alumine as well as silica, uniting with them potash and other compounds. At Carlsbad, in Bohemia, there are similar springs.

The hot springs of the Valley de Fournos, in the Island of St Michael, rising through granitic and schistose rocks, precipitate vast quantities of silicious matter, and the herbage and leaves, encrusted with silex, exhibit all the stages of petrification, from the soft pulpy state to the complete conversion into stone. The river Chorrun may also be noticed for the lapidifying quality of its waters; for if the root or branch of a tree fall so that a portion of it lies within the waters, the portion thus immersed becomes petrified, but the other part of it remains in its natural state. When the current is most rapid, then the transformation is most readily effected; the substance transformed always retains its natural porosity and the texture of its fibres. In Africa, several parts of America, and Asia, localities exhibit the like phenomena of lapidification.

The lapidifying waters near Marsighi, close by Tabreez in Persia, are too remarkable to escape our notice. "Here," says M. Morier, "the process of petrification is to be observed from the beginning to its termination. In one part the water is clear, in a second it appears thicker and stagnant, in a third quite black; and in the last stage is white like boar-frost. Indeed a petrified pond looks like frozen water; and before the operation is quite finished, a stone slightly thrown upon it breaks the outer coating, and causes the black water underneath to exude. When the operation is complete, a stone makes no impression, and a man may walk upon it without wetting his shoes. Wherever the petrification has been seen into, the curious process of the concretion is clearly seen, and shews itself like sheets of rough paper placed one over another in accumulated layers. Such is the constant tendency of this water to become stone, that where it exudes from the ground in bubbles, the petrification assumes a globular shape, as if the bubbles of a spring by a stroke of magic had been arrested in their play and metamorphosed into marble.

The substance thus produced is brittle, transparent, and sometimes most richly streaked with green, red, and copper-coloured veins. It admits of being cut into immense slabs, and takes a good polish. Its use is restricted to royalty.

The island of Ascension also exhibits many curious specimens of recent breccia and conglomerate; the heaches being an amalgam of oceanic, animal, and vegetable exuviae, sands, and waters charged with ocean slime are rapidly hardened into these products, which contain turtles' eggs, and many other curious animal remains. The limestone of Gaudalope, containing human fossil skeletons, are also singular evidences of the recent induration of earths.

Mr. Lyall, in the last edition of his "Elements of Geology," attempts to explain the process of lapidification, by assuming that strata are very generally permeated by water charged with minute portions of calcareous, silicious, and other earths, in solution, and the above examples furnish him with arguments in favour of this opinion; but, in nature, as I have previously demonstrated, there are other and more extensive processes by which lapidification is conducted without the aid of water,

and solely by the agency of long continuous atmospheric or chemical heat.

The recent attempts of Professor Göpperts, of Breslau, to imitate the lapidifying process of nature, like the attempt of Sir John Hall to imitate the crystallizing process, was an approximation to one, or perhaps more, of the numerous means by which nature effects her purposes, but cannot be quoted as the law of nature, but rather is the power of imitation by which man, in this and many other respects, is enabled to mould the material of the earth to his wants and purposes. The professor steeped a variety of animal and vegetable substances in waters holding in solution silicious, calcareous, and metallic matters. He found that in a period of three weeks, or even days, the vegetable bodies thus immersed were mineralized to a certain extent. Thin slices of Scotch deal were immersed in a moderately strong solution of sulphate of iron. When they had been for several days thoroughly soaked in the liquid, they were dried and exposed to a red heat until the vegetable matter was burnt up and nothing remained but an oxide of iron, which was found to have taken the form of the deal so exactly, that even the dotted vessels peculiar to this family of plants were under the microscope distinctly visible.

This is art, not nature: many nodules and large aggregate bodies, it is true, silicify upon being permeated by silica, or mineral acids, or gaseous products, but then silica invariably becomes the base, the carbon of the permeated body undergoing a change, and passing, by a new combination with oxygen, into the compound form termed silica; for here, with due deference to the eminent chemists of the age, I must express my decided conviction that silica is none other than the re-combination of the elementary constituents of carbonaceous, aluminous, and gelatinous bodies, with oxygen, chlorine, or iodine, and all the phenomena of change termed petrification confirm this view; for how otherwise could the shells of fishes, nay fishes themselves, and other portions of animals, as well as of vegetable bodies, become, on mere exposure to atmospheric action, converted into silicates, unless a radical change took place in their elementary constituents, which, as is palpably manifest to observation, as it is confirmed by experiment, have combined with an extra dose of oxygen: it can be demonstrably shewn that they do not derive this material from the soil on which they are disposed, for the whole bed, so far down as the influences of light and heat extend, is composed of the like silicified substances, and at the lower depths the fossils have maintained their primary condition, and are very often wholly unimpaired.

So essential are locality and climate to the formation of rock, that many varieties may be considered as existing monuments of change in the position of the earth, equally as certain and convincing as the existence of vast quantities of animals and vegetables, both of the land and waters, which could only have existed and propagated their species in an unbroken line of generations, while disposed beneath the tropics. The very high degree of oxidation of many of the hill and mountain-chains of Europe is demonstrative proof that they at one period of time were subject to long and continuous intense heat, such as we now find in tropical regions. The iron of Finmark, says Von Buch, actually forms mountains, and it is remarkable how great the similarity is between this ore and the ores of Asia, both being highly oxidated. The ironstone here is everywhere with difficulty pressible, and yields an iron which is brittle when cold. It exceeds in richness the ironstone of Sweden, but, as is the case with oriental iron, requires to be mixed with other kinds of a more pliant quality; this ironstone is analogous in every respect to the ironstone of Hindostan, which is chiefly disposed in elevated plains or mountains. Again, the same remarks are equally applicable to rocks: farther, Van Buch observes of geiss: "Nature in the higher latitudes is so accustomed to gneiss-formations, that she always returns to it; and even when mica-slate, limestone, and clay-slate, make their appearance, they merely resemble a series of movements, which have spread towards the North Pole without having their origin here." The same remarks apply to the porphyritic and jasper rocks; the causes by which they were produced have ceased in these northern lati-

tudes, and thus those geologists who have confined their observations to the strata of Europe have been led to infer that they have ceased altogether over the face of the whole earth; but within the tropics, all surface-soils not covered in by vegetable-mould are the subject of incessant change peculiar to locality or particular regions, and those varieties of rock may be observed in all their progressive stages of development.

The range of rocks of Holmestrandt is porphyry, but passing through all the imperceptible gradations and changes of formations, in which Auvergne is so rich, into basalt, the sandstone upon clay mixed with mica: the granite mountains in the island of Arran, in the Frith of Clyde, rest upon strata of clay slate; in Norway it rests upon mica slate; in Mount St. Gothard it lies above slaty mica slate. Cronstadt tells us that northwards of Jämtland, the mica-slate changes more and more into granite, and the latter appears at last of a very coarse grain, and of a red colour. The disposition of the rocks is, therefore, as is the disposition of the beds or soils from which they were formed, owing to those accidental causes which mark the local accumulations now going on in all parts of the earth, which continue so long as the disturbing causes exist; thus the river Thames will continue to convey mud, consisting of animal and vegetable bodies, portions of the older soil, and excrementary matter, into the ocean, and deposited on its bed, it continues to form layers alternately with oceanic substances, or to blend with them, and give peculiarity to the forming beds.

#### MUTILATION OF STATUES AT WINDSOR.

All who have visited Windsor-park and the grounds adjoining Virginia-water, will remember a beautiful and retired spot, called "The Ruins." The name is derived from some very fine specimens of architectural antiquities brought from Greece by Lord Egin, and which were so disposed in this appropriate locality, under the direction of George IV., as to represent the remains of an extensive Grecian temple. The principal ruins consist of several remarkably beautiful columns, with plinth complete, and various statues are placed on either side of the approach, and in different parts around. Several of them are of great beauty and antiquity, besides being in a good state of preservation. Others date from about the middle of the 16th century; and it is one of the latter that has, within the last few days, been destroyed by the wilful conduct of some one or more of the visitors, whose sense of gratitude for the privilege of viewing such a delightful spot should have taught conduct far different from this disgraceful and malignant work. On Sunday week, according to the statement of the man whose province it is to shew the public the cascade, &c., the statue in question, a female figure, with the horn of plenty by her side, and apparently intended for a Flora, was thus mutilated. It was a work of great beauty, the head and arms particularly being remarkably fine, and sculptured with extreme delicacy; but it now lies in a state of mutilation that is alike painful to behold, and disgraceful to the hands that have thus destroyed what cannot be satisfactorily restored. The statue was thrown down from the spot where it stood with great violence, and the fall has broken the head completely off, and also broken the right arm in two places. This could not possibly have resulted from accident, as the strength of two or three persons must have been required to remove this heavy marble figure from its station. The destruction of this statue, however, though the most recent, is not by any means a solitary instance of the wilfully mischievous conduct of some of those who thus abuse the privilege awarded the public of viewing these splendid grounds and Virginia-water. Various other beautiful works of art, also adding attractions to these modern antique ruins, bear terrible proofs of the same destructive spirit. There was formerly a row of statues on each side of the approach to the principal group of columns. Now the uniformity is entirely destroyed, and the ruins spread around are far more numerous than agreeable to behold. Very few of these works of ancient art have entirely escaped.

These are most fortunate that merely have carved upon the breast, or some conspicuous portion of the body, the name of William Tomkins, or Jeremiah Noodle, or some other equally high-souled owner of a bread and cheese knife, who has been thus anxious to expose his name to the disgust and contempt of all right-minded persons. Most of the statues, however, are much more mutilated; the heads having especially formed favourite points of attack. Really some steps should, if possible, be taken to prevent the perpetration of such atrocities, worthy only of modern ignorant and malicious Goths and Vandals, who have not the intellect or taste to appreciate the beautiful works of art, or the gratitude or good feeling to estimate the privilege accorded by these grounds being thrown open for their inspection. — *Correspondent of the Times.*

#### A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARHAM, IN NORFOLK, WITH NOTICES OF THEIR ACTUAL CONDITION.

*Ringland.*—The site of this church, a barren spot, which edges the green basin of the Wensum, is peculiarly uninteresting: the pile rose on us in bleak keeping with a day of incessant snow, drifted into every nook and erevise by a merciless north-easter. And yet well were it, at such a season, standing among the graves of the departed, to bethink ourselves how

"The storm that racks the wintry sky  
No more disturbs their deep repose,  
Than summer evening's latest sigh,  
Which shuts the rose."

The edifice consists of a nave with clerestory, two aisles, a chancel, a square tower having five bells in it, and a south porch.

On opening the great south door, which is in good preservation, the first object presenting itself is a massive octagonal font, in the decorated style, and raised on three high steps. Its existing state will indicate the taste in which reparations of our village sanctuaries are too generally conducted. At the instance, it appears, of a late visitor, this elegant memorial of olden piety has been cleansed from the lime-wash that incrustated it; but instead of being allowed to remain in its natural state, our gorge rises at finding the whole besmeared with a vile daubing of flesh colour.\* It stands, where in every case the baptismal font should stand, just within the principal entrance, and its leaded bowl is provided with a drain to permit the consecrated fluid to escape.

In 1506, John Att Mere, who lies buried in the nave, desired by will that the heir or purchaser of his lordship should "fynde a light of waxe brenning before the high rode:† it has not been since his day the practice in churches, to prevent the closing of windows, to the exclusion of heaven's own sunlight from the entire body. We have something like this in the once splendid east window of the chancel, the crockets and mullions of which have been supplanted by two unsightly brick piers. The same does not apply to the fine painted glass in the aisles and clerestory, where many windows have been cleaned and reglazed in a manner that reflects credit on the artisan employed. On the other hand, we learn, from good authority, that portions of these were, not many years since, abstracted, with the connivance of the authorities, to adorn a Roman Catholic Chapel in the adjoining parish of Costessey.

A label on the east window of the north aisle—which, together with all the rest, is in the style known as the *Perpendicular*—acquaints us that the charges of its erection were defrayed by "the brethren and sisters composing the guild of the Holy Trinity." What a contrast between this elegant memorial and the thing near it, fit only to receive the team-hoy of a threshing-machine, where the parochial Dominie finds himself weekly exalted.

Many of the original massive oak benches yet remain, their ends being surmounted by large finials, called poppies, some elaborately, others more plainly sculptured. Those

\* [We think so small a matter as the unimpersonated cleansing of so small a piece of furniture as a church font, would be far better than any "gorge-rising," which is the exchanging of piety for passion. —Ed.]

† Parkin's "History of Norfolk."

once standing in the eastern part of the nave and aisles, and where rich and poor sat together in the house of God as friends, have been either entirely swept away, or mutilated past repair, to admit "mean and high pews, the unhappy legacy of our Puritan forefathers."\* We were gratified to learn that a lady of influence here has recently expressed a wish that these last could again be gotten rid of. The pulpit and reading-desk form no exceptions to the reigning ill-taste, although they possess the merit, by no means general, of not compelling the minister and clerk to avert their faces from the altar.

The master barbarism seen in this fine church lies in its reredos or altar-screen, which wainscots the entire east end of the chancel. It would be difficult, were not the existence of similar perversities elsewhere matter of too general notoriety, to conceive how things so expensive and tastelessly absurd as Grecian pilasters and alcoves could ever have gained admittance to our time-hallowed fane, utterly incongruous with them as they are in style, and destitute of all ecclesiastical propriety. Strange that with the inarched monument, or the niche with its fretted canopy, occurring at every turn, the Dealogue could only appear in this ill-assorted guise! The canonists, when enjoining that the "ten commandments should be set up at the east end of every church and chapel," would have stood aghast had their eyes been greeted by a visio of the monstrosities which their rule was destined to originate. The nave presents at its west end another disfigurement under the pseudo-name of "gallery," a place where in too many instances Brady and Tate are "villainously entreated." It should be demolished and swept away forthwith, and the village choir located in the north aisle on seats placed *longitudinally* at the east end.

The chancel-screen yet remains, although sadly shorn of its ancient honours: it is noticeable now chiefly for three paintings,—the Last Supper, and two other incidents in our Lord's life,—which stand over it, facing the communion-table. They have most likely yielded place to the vulgarity above commented upon. We are not adequate to decide, *ex cathedra*, on the merits of these portraits as works of art, but none can devoutly gaze on the solemn quietude depicted, without feeling at once that "it is good for them to be there."

We take leave—We trust in no irreverent vein—with a quotation from the autobiography of a parish clerk in days of yore, useful for the lesson it should convey to his followers generally in the same office: "Fourthly. The pews and benches, which were formerly swept but once in three years, I caused every Saturday, to be swept with a besoon and trimmed." C. T.

#### YORK MINSTER BELLS.

MANY of our numerous readers will, doubtless, be anxious to hear something of the "Beckwith bells," which were rung for the first time on the 11th inst. By a preconcerted plan, they were not even heard during the process of hanging, and about half-past one o'clock in the afternoon the citizens of York were taken by surprise, by the full peal hursting upon their ears, evidently to the astonishment of many, who ran out of their houses, and congregated in groups in the streets or hastened towards the minster. The bells were heard to great advantage, not having had the usual separate trials to tune and adjust them in their frames. The ropes being new, would of course stretch: the other fittings were also new, and require time to adapt them to their purpose; the ringers were out of practice, and unaccustomed to a peal of twelve bells. Musicians conversant with campanaloga agree that the quality of tone is fine, but it is premature to judge of them now, and until they have been severely rung, and both bells and clappers have accommodated themselves, the first to the machinery, and the latter to the sides of the bells, it is impossible to speak accurately of the good tones they have yet to hear. However it may surprise some, there is a similar adjustment to be effected by vibrations in bells as in musical instruments made of wood, although in a slower degree, and these bells will, if a fair and liberal use of

\* "Marklaud's "Remarks on English Churches."

them is allowed, become more rich and mellow every year.—It will no doubt be interesting to many to know the weights and dimensions of the new peal, which are as follows:—

	Weights.		Dimensions.	
	cwt.	qr. lb.	feet.	inch.
Treble .....	7	2 22	2	6
Second .....	7	1 14	2	7
Third .....	8	0 2	2	8
Fourth .....	8	1 12	2	10
Fifth .....	9	2 15	3	0
Sixth .....	13	0 8	3	2½
Seventh .....	14	1 2	3	6
Eighth .....	17	3 18	3	9
Ninth .....	19	3 4	4	0
Tenth .....	25	1 10	4	3
Eleventh .....	33	3 7	4	9
Twelfth .....	53	3 9	5	5

The treble and second are the additional bells to make the peal one of twelve. The other bells, from the third to the twelfth inclusive, would form a similar peal to the old one, of ten bells. The ten lowest bells in this new peal are heavier by 2 cwt. 38lb. than the old peal, and the total weight of the new peal (including the two small bells added to the ten) makes 16 cwt. 2 qrs. 18 lbs. additional to the peal.—*Local Paper.*

**RAILWAY INTELLIGENCE.**

*York and Scarborough Railway.*—On Wednesday week, the directors of the York and North Midland Railway held a meeting at the board-room, to receive tenders for the making of 44 miles of the Scarborough Railway and branch to Pickering. The work was divided into four sections, but the directors accepted the tender of Mr. Crawshaw.

*Leeds and Bradford Extension Line of Railway.*—Robert Stephenson, Esq., accompanied by the directors of the Leeds and Bradford Railway, and Mr. Young, the assistant engineer, visited Keighley, for the purpose of determining the point of terminus at that place, in the event of the contemplated extension of the line to Blackburn, by the Lancashire and Yorkshire junction, when it was arranged that Robert Stephenson, Esq., take an early opportunity of consulting with Mr. Vignols, the engineer of the latter company, and arrange such other matters as may eventually lead to both the companies working harmoniously together, to accomplish what may be considered eventually a line not only of local but of national importance, across the island.

*Leeds and Bradford Railway.*—This bill received the Royal assent on Thursday week. The engineer has already commenced staking out the ground; the previous consent of owners and occupiers not being required for merely surveying and taking levels, and the company only being liable to make compensation for any damage thereby occasioned. The Act contains a penalty for obstructing the company on setting out the line, or removing or in any way destroying the stakes or marks left in so doing.

*Grand Junction and the London and Birmingham Railway.*—The disputes between these two companies were brought to a most satisfactory conclusion on Wednesday week, at a meeting held at Birmingham. The value and importance to the proprietors of such an arrangement may be inferred from the fact, that an advance immediately took place of 8s. or 10s. a share on each line.

*Railway from Maestricht to Aix-la-Chapelle.*—*Venloo, June 30.*—The inhabitants of Maestricht have now hopes of obtaining a railway to Aix-la-Chapelle, with a branch to Kerkrade. A company is ready to undertake the work at its own expense, if the government will grant it the coal-mine of Kerkrade for a certain number of years. If it is true, as is affirmed, that these coal-mines cause more loss than gain to the state every year, why not give them up, and thus obtain an iron railway, which may be of great importance to Maestricht and the province of Limburgh?—*Herald.*

*The Lancaster and Carlisle Railway.*—This important national work is now fairly commenced. A satisfactory arrangement has been made between the company and the Earl of Lonsdale, upon the fair principle that a valuer should be appointed on either side, with power to name a third party; and the adjustment of terms will, therefore, be an easy matter. The first general meeting of the company was held on Friday week at Kendal. A very efficient body of directors has been appointed.

A petition from the Hull and Selby Railway Company, against the Government Railways Bill, was presented to the Lower House on Thursday week. The York and North Midland and the Manchester and Leeds Railway Companies have also petitioned against the Bill.

Preparations are in progress to commence the Whitehaven and Maryport Railway immediately.

**AN INDIAN METHOD OF CONSTRUCTING ARCHES.**

*SIN.*—The accompanying sketch of a semi-circular arch 22 feet in span, built at Nagpore, may prove of utility, even in this country, in the construction of bridges, domes, and other arches or vaulted buildings, being applicable in masonry or cast-iron to an arch of any dimensions. It is from a drawing and description given by Captain B. Mackintosh, of the Madras Artillery.

Fig. 1.—At the spring (A) of the arch, stones of a considerable length were used, having their inner ends cut so as to suit the curvature of the arch; six such layers were laid on each side, in the manner wherein stones are placed in the generally-termed *Egyptian arch*, the upper layer having a groove five inches wide and two inches in depth.

On arriving at this height, stones of a smaller size (B, B, B, B) are made use of,

each having a groove cut in two adjoining faces two inches in depth and four inches in breadth, with corresponding projections on their opposite side.

The stones were so placed, that when a layer was completed, there appeared a channel or groove (C, C, C.) the whole length of the building, ready to receive and bind to it by their projections the next row of stones when applied.

Eight layers on each side of the stones to an arch of the above span having been placed, each layer occupying about six inches of the curvature of the arch, it became necessary to prevent the work, if carried on, from falling inwards. A space of ten feet in length on each side of the unfinished arch was then marked off (see fig. 1 and 2), and at these points two strong horizontal beams were forced into the grooves (fig. 1, D, D.) extending across the chasm. From these, as from a new base,

the grooved stones already described were used. (Fig. 2, F, F.) The length of each succeeding layer contracting gradually until the application of the key-stones.

When the arch is of considerable span, a series of bases such as now described (fig. 2, I, H.) is placed, each base higher than the other, in order to support the work until it is secured by being keyed.

When the centre portions of the arch have been thus completed, the beams are removed by being sawed asunder in two places. (Fig. 2, F, G, H.) In a similar manner the arch is continued in different portions at either end of that part which is first finished; the introduction of a new beam constituting with it a renewed base; a slight scaffolding supports the workmen. No frame or centering is used for support while building of arches so constructed. INDIANUS.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

**Salisbury.**—At the quarterly meeting of the Committee of the Diocesan Church Building Association, held at the Board-room, in the Close, on Tuesday week, Archdeacon Lear in the chair, the following grants were voted:—60*l.* towards restoring and providing increased accommodation in the parish of Coombe Bisset; 25*l.* towards lengthening the nave and repairing the church of Sedgell; 200*l.* towards the extensive enlargement and new pewing of Melksham Church, Wilts, &c. A former grant of 200*l.* to the new church at East Crafton, in the parish of Great Bedwyn, Wilts, was ordered to be paid, the church having been consecrated.

**New Churches.**—The friends of the Establishment in St. George's parish are going to erect two new churches in Pinlisco—one in the Belgrave-road, near Warwick-square, and the other near the Orange Tavern.

**A Chapel on Wheels.**—The Wesleyan Methodists of the Bingham circuit have erected a moveable wooden meeting-house upon wheels, capable of seating about 120 persons, at a cost of about 60*l.*, for the accommodation of several villages where no site could be obtained.

The late William Stephenson, Esq., of Stamford, has secured by deed, for building a church in Deeping Fen, Lincolnshire, 4,000*l.*; for keeping it in repair, 200*l.*; for income for the minister, 5,000*l.*; total, 9,200*l.*

A new church has been erected in Birmingham, and will be consecrated on the 25th inst. by the Lord Bishop of Worcester. The church is dedicated to St. Stephen.

## Correspondence.

## SOUTHWELL CHURCH, NOTTS.

SIR,—In your number for June 22, I observed a notice *en passant* of some complaints made relative to a competition for Southwell Church, Notts; perhaps the following may furnish some comment on the same: the drawings were sent in on the 5th inst., on the 9th the committee forwarded their circular to the competitors, "that the plans of another architect had been thought more proper for the purposes of the committee." It would seem that two clear days, Saturday and Monday, were sufficient to enable the committee to examine (?), compare (?), and make their selection; perhaps a committee of professional men would feel some difficulty in coming to a conscientious decision in so short a space of time.

Your obedient servant and constant reader,  
Friday, July 12, 1844.

## SHAM COMPETITIONS.—DERBY LUNATIC ASYLUM.

SIR,—I am glad that your spirited correspondent, signed "A second Subscriber," will, I trust, do good, in helping to expose the infamous system of "Sham Competitions," and shew Mr. Dewsbury that, as the real circumstances of the case are now pretty generally known, he has no very great reason to plume himself as being the successful competitor, but ought rather to blush for the share he has had in the transaction; for, as reported, he sent in a set of drawings that had already been seen and approved by the Committee before the competition was thought of, I trust he sees that his own conduct, as a member of the profession, is not without blame; as he must have known that "the great expense," that many architects would put themselves to, would, in this instance, be wholly misapplied. The competition, I believe, was proposed merely to destroy a counter-influence that had been raised by the friends of Messrs. Scott and Moffat, who obtained the second premium. For myself, I had nothing to do with it, as I heard that Mr. Dewsbury was competing, and I was aware of his local influence; but I was foolish enough to send in a design for the church at Southwell, Notts, where a similar farce was enacted; and it is to be regretted that you did not give publicity to the "complaints" which you noticed, in No. 72, as having been received relative to the competition. I forwarded my drawings, seven in number (in the vain hope of standing on their merits), on the 6th of July, which, being Saturday, I may fairly suppose they were not laid before the committee until Monday, the 8th. In a day or two afterwards I received my drawings back again, with an intimation that, "although highly commended, they were not deemed so suitable as the plans of another competitor." This intimation was dated the 8th inst., so that these wise men (perhaps none of whom had ever seen a set of drawings before) were so inspired, that in one short sitting they were enabled (by intuition, I suppose) to jump to a conclusion, and decide upon the merits of all the designs submitted for their notice. Now, is it not pretty evident that they must have selected their *pet* before-hand, and that the whole affair was a mere juggle, got up for some hidden purpose of their own? I will only add, that I never yet sent in any competitor designs, but something or other came to light to shew the futility of doing so, without first having strong interest with the committee.—I am, Sir, yours faithfully,  
17th July, 1844.

inspecting the prison, or by application to Mr. Silvester, who superintended the warming and ventilating apparatus.

"The committee do not pledge themselves to adopt the cheapest plan."

all others. The successful candidates may, in this instance, reap all the advantage of this jobbing, but I entirely deny that any honour is attached to it.

I do not understand upon what principle the sealed letters of those competitors, whose designs were not selected, were opened. They might surely have been apprized of the decision by the medium through which they were invited, and the designs would then have been applied for, as in other cases. I received mine per railway, unpaid, addressed to me.

In number 73, your correspondent, "A subscriber," puffs off the Derby Town Hall, which he says has a very commanding elevation. I am ready to admit that it stands in a commanding situation (an open market-place), but I must confess that, on my first view of the building, I was struck with its singular inelegance and bad outline. It appears to me to betray an entire absence of all good principles of architectural design, and presents a most awkward perspective effect. On my subsequent visits to this building, it lessened in my estimation, and appeared to exhibit a miserable poverty of design; it reminded me of the new-square-style in Mr. Pugin's criticisms. When I contrasted with it the fine old tower of All Saints Church, and that of the Roman Catholic church erected a few years since in Derby, I could not avoid observing (although they are of very different styles of architecture), as features of the town decoration, how greatly this building suffered by the comparison.

What the other designs sent in competition for this building may have been I know not, but it tells little for the credit of the sapient committee who advised and carried out its erection. I am by no means singular in my opinion; on the contrary, I found the building generally disliked by those of the gentry whom I met with in the town and neighbourhood. A wealthy and influential inhabitant of Derby assured me he considered it a disgrace to the town, and (much as he deprecated the calamity of fire) he should not regret to see it again destroyed, and another more worthy building substituted.

I am, Sir, your obedient servant,

A THIRD SUBSCRIBER AND A COMPETITOR.

SIR,—Seeing in your valuable paper a letter respecting the Derby Pauper Lunatic Asylum competition, and wishing that all such rascally tricks should be made public, I inclose you the instructions received from the committee in answer to the following questions:—

What expense is to be gone to?

What size and style is the building to be?

A plan of the ground, and general information.

Now, Mr. Editor, does it not carry upon its very face that it is a job from beginning to end, for what architect in his senses would ever think of competing on such instructions? The following letter accompanied the production:—

"Derby, 26th March, 1844.

"SIR,—In reply to your letter to Mr. Barber, I am directed to send you the foregoing general answers, being all the information he is at present able to furnish.

"I am, Sir, your obedient servant,

"Mr. ——— "S. WHITAKER."

And this is a specimen of competition.

Wishing every success to THE BUILDER,

I remain yours truly,

A LOVER OF FAIR PLAY, AND SUBSCRIBER FROM THE COMMENCEMENT.

The following are the general answers alluded to by our correspondent:—

"The site is not yet chosen, therefore no information depending upon locality, the nature of soil, &c., can at present be given.

"It is wished that the front of the building shall have a south aspect.

"The arrangement of the wards and offices, the general design and construction of the building, and the style of architecture, are for the consideration of the gentlemen who send in plans, and who will, of course, avail themselves of the information to be gathered from the most approved establishments of the same kind. The committee reserve their opinion on these points until all the plans are before them.

"The principle of warming and ventilation now in use at the Derby County Prison will be most satisfactorily ascertained, either by

SIR,—The letter in the last number of THE BUILDER, from "A Second Subscriber," will, I trust, do good, in helping to expose the infamous system of "Sham Competitions," and shew Mr. Dewsbury that, as the real circumstances of the case are now pretty generally known, he has no very great reason to plume himself as being the successful competitor, but ought rather to blush for the share he has had in the transaction; for, as reported, he sent in a set of drawings that had already been seen and approved by the Committee before the competition was thought of, I trust he sees that his own conduct, as a member of the profession, is not without blame; as he must have known that "the great expense," that many architects would put themselves to, would, in this instance, be wholly misapplied. The competition, I believe, was proposed merely to destroy a counter-influence that had been raised by the friends of Messrs. Scott and Moffat, who obtained the second premium. For myself, I had nothing to do with it, as I heard that Mr. Dewsbury was competing, and I was aware of his local influence; but I was foolish enough to send in a design for the church at Southwell, Notts, where a similar farce was enacted; and it is to be regretted that you did not give publicity to the "complaints" which you noticed, in No. 72, as having been received relative to the competition. I forwarded my drawings, seven in number (in the vain hope of standing on their merits), on the 6th of July, which, being Saturday, I may fairly suppose they were not laid before the committee until Monday, the 8th. In a day or two afterwards I received my drawings back again, with an intimation that, "although highly commended, they were not deemed so suitable as the plans of another competitor." This intimation was dated the 8th inst., so that these wise men (perhaps none of whom had ever seen a set of drawings before) were so inspired, that in one short sitting they were enabled (by intuition, I suppose) to jump to a conclusion, and decide upon the merits of all the designs submitted for their notice. Now, is it not pretty evident that they must have selected their *pet* before-hand, and that the whole affair was a mere juggle, got up for some hidden purpose of their own? I will only add, that I never yet sent in any competitor designs, but something or other came to light to shew the futility of doing so, without first having strong interest with the committee.—I am, Sir, yours faithfully,  
17th July, 1844.

[We have received other letters, which, being to the same purpose, we deem it unnecessary to publish.—Ed.]

## FALL OF HALSTEAD CHURCH STEEPLE.

SIR,—On Wednesday last, at half-past two o'clock in the afternoon, the spire and tower of the beautiful new church at Halstead, intended to be dedicated to the Holy Trinity, fell to the ground with a tremendous crash. It had reached the height of 115 feet before it fell, but for a fortnight past many persons have expressed their doubts that it could not stand, owing, in a great measure, to the rapid manner in which it was being carried up, as much as 30 feet being executed during the week before it fell. On the day it fell, the mason, after being returned from dinner, could perceive that the cracks in the tower were much larger than they were before he left, which caused him to communicate with the other parties connected with the building, the result of which was, that the men were all ordered down directly from the scaffolding. They had all reached the ground in safety with the exception of two poor fellows who remained behind, at about 100 feet from the ground, to lower a ladder, and it is supposed they must have clung to the scaffolding, as one of them was very slightly bruised about the arms, but the other was more seriously hurt, having two dreadful cuts on the head and three ribs broken, but hopes are now entertained of his ultimate recovery. A third person met with a slight contusion by a brick falling upon his head, but was very little hurt. The con-

sternation into which the inhabitants of Halstead were thrown by the sudden falling of the greatest monument that was ever erected in this part of the country may be more easily imagined than described; hundreds of persons might be seen flocking to the spot, and I believe I do not exaggerate if I say there were near three thousand persons within an hour after it fell. The shrieks and screams were dreadful to hear; almost every one expecting that not less than from twelve to fifteen persons were beneath the ruins.

The church was to have been consecrated on the 31st of this month, and the tower and spire altogether would have been 150 feet high.

Yours, most respectfully,  
G. C.  
Halstead, July 15.

[As we judge our correspondents take the same interest as ourselves in all matters of the construction and failure of buildings, we should be obliged by any exact particulars as to the nature of the work and the cause of its ruin.—Ed.]

Miscellaneous.

**PICCADILLY IMPROVEMENT BILL.**—A bill is now on its way through Parliament to widen and improve Piccadilly, in the city of Westminster. It is under the care of the Earl of Lincoln, M.P., and Mr. John Young, the Secretary of the Treasury, and contains eight clauses. The first clause empowers the Commissioners of Woods and Forests to widen the carriage-road and south side foot-way of so much of the street called "Piccadilly," in the parish of St. George, Hanover-square, as lies between Bolton-street on the east, and Park-lane on the west, and to take and use for that purpose so much of Her Majesty's "Green" Park, in the parish of St. Martin-in-the-Fields, as will make Piccadilly, from Bolton-street to Park-lane aforesaid, of an uniform width of 70 feet, or thereabouts. The second clause empowers the commissioners to alter, raise, lower, and shut or stop up the carriage-way and foot-way aforesaid during the progress of the works, to put up bars and posts, and to make general orders for regulating the passage of carts, carriages, and horses. The street, as widened, is to be repaved by the Commissioners of Woods and Forests, either with stone or wood, or it may even be macadamized. The portion of the Green Park, appropriated towards the widening of Piccadilly, is to be severed from the parish of St. Martin-in-the-Fields, and annexed to that of St. George, Hanover-square. The whole of Piccadilly, between Bolton-street and Park-lane, when so widened and improved, is to be kept in repair at the expense of the last-mentioned parish. This act is to be deemed a public act.

**DESTRUCTIVE FIRE AT SLOUGH.**—On Monday afternoon, a very destructive fire broke out in the recently erected mansions at Upton-park, near Slough, the property of Mr. J. T. Bedford, the extensive builder, of New Windsor. As soon as the intelligence of the fire reached Windsor, two companies of the Scotch Fusilier Guards left Windsor, with the harrack engine, for the scene of the conflagration, followed by two engines from the Castle, the Windsor and Eton College engines, and several others from the vicinity; but such was the ascendancy that the flames had obtained before their arrival, that all attempts (although there was a plentiful supply of water) to preserve the property were totally ineffectual, and three houses were completely gutted forming the west end of Victoria-terrace. We understand the property is insured to the amount of 3,000*l.* (about one-half of its value) in the London Union Fire-office. It is supposed that the fire broke out in the basement of the house (situate at the eastern end of the Terrace, the wind at the time blowing strongly from the westward) in which a fire had been lighted by the workmen who were employed in some zinc works connected with the buildings. Such was the rapidity with which the flames extended, that several of the workmen lost their clothes, and a large portion their tools, which were consumed before they had time to secure them.

**ROYAL ACADEMY.**—In the House of Commons on the 9th instant, Mr. Hume moved "That an humble address be presented to her Majesty, praying that, as patroness and controller of the Royal Academy of Arts, she will be graciously pleased to take into consideration the laws and regulations of that institution, with a view of rendering it more conducive to the advancement of the fine arts, better suited to the spirit and circumstances of the present age, and more consonant with the original intention of its royal founder, George III." The hon. member was proceeding, in support of his motion, to arraign the conduct of the Royal Academy, as impeding rather than assisting the progress of art, and to argue the right of the people under the charter to free admission to its exhibitions, when an hon. member moved that the house be counted, and there being only thirty members present, the house adjourned.

**ST. MARYLEBONE BANK FOR SAVINGS, 76, WELBECK-STREET.**—ESTABLISHED 5th JULY, 1830. COMPARATIVE STATEMENT OF PROGRESS at specified periods during the last seven years.

	Open Deposit	Sums invested with
	Accounts.	National Debt Commissioners.
On 5th July, 1838	£. 10,703	£. 179,381
" 1839	11,620	216,017
" 1840	12,445	243,469
" 1841	12,881	260,852
" 1842	13,100	275,072
" 1843	13,820	305,383
" 1844	14,638	340,509

D. FINNEY, Assistant Secretary.

**NEW HARBOUR AT ABERDEEN.**—The works for the new harbour at Aberdeen have been contracted for by Messrs. Oldham, builders and railway contractors, of Cheltenham. The sum is 99,660*l.* When completed, the new harbour will be one of the most commodious in the kingdom.

**THE ARTESIAN WELL NEAR PARIS.**—The volume of water supplied by the Artesian Well of Grenelle was measured a few days ago, and found to have lost nothing of its force or quantity. The source furnishes 2,000,000 quarts of water per 24 hours, which is more than sufficient for the consumption of the quarter of the Pantheon, where immense reservoirs have been constructed to receive it. The water is as limpid as filtered Seine water, and has continued clear since tubes have been inserted in the aperture.—*Constitutionnel.*

**SINGULAR CIRCUMSTANCE.**—Lately, as some workmen were employed in quarrying a rock close to the Tweed, about a quarter of a mile below Rutherford-mill, a gold thread was discovered embedded in the stone at a depth of eight feet. How long this remnant of a former age has remained in the situation from which it was taken will baffle the skill of the antiquary or geologist to determine. A small hit of the thread has been sent to our office for the inspection of the curious.—*Kelso Chronicle.*

**NATIONAL PROPERTY IN FRANCE.**—A general statement of the national estates and property, with an estimate of value, has been distributed to the members of the Chamber of Deputies. The gross amount is 1,237,300,000*fr.* (51,430,000*l.*) The portion appropriated to the public service amounts to about 550,000,000*fr.* (22,000,000*l.*), and the woods and forests to 729,000,000*fr.* (29,000,000*l.*)

**LONGEVITY OF TREES.**—The following trees are calculated to live—elm about 335 years; cypress, 350; cheirostemon, 400; larch, 575; orange, 630; olive, 700; ornamental plane, 720; cedar, 800; lime, 1,147; oak, 1,500; yew, 2,820; baobah, 5,150; taxodium, 6,000.

On Wednesday week, his Royal Highness Prince Albert presided at a meeting of the commission for promoting and encouraging the fine arts in the rebuilding the Palace of Westminster.

The Health of Towns Commission had a meeting on the 9th instant at Gwydyr House, Whitehall.

A poor little sweep was suffocated in a flue at Goldings, Herts, on Friday week.

**STONELEIGH BRIDGE.**—It has been ordered that this bridge be repaired. The cost will be 600*l.*

It is in contemplation to convert the Tunbridge Wells Theatre shortly into a corn market.

Tenders.

TENDERS delivered for Messrs. R. Barratt and Sons' premises, Beech-street, Barbican. Quantities provided, and tenders opened in presence of contractors.—W. Wallen and Son, Surveyors, 1, Circus-place, Finsbury.—July 13.

Piper .....	£769
Furnival .....	748
Webb .....	735
Waterlow .....	705
Ashby .....	695
Ward .....	678
Trego .....	660
Haynes and Co. ....	650

TENDERS delivered for building two third-rate houses and offices on the east side of Holford-square, Pentonville.—Mr. James Harrison, Architect.

Thomas Lawrence .....	£2,339 0 0
C. Hellis .....	2,125 12 0
Lawrence and Sons .....	2,116 0 0
John Hall .....	2,084 0 0
C. Tibbets .....	2,050 0 0
John Jay .....	1,934 0 0
Locke and Nesham .....	1,977 0 0
W. Smith .....	1,957 0 0

G. Cooke .....	72 0 0
Chandler .....	49 0 0

The lowest tender was accepted.

TENDERS delivered for erecting a new Hospital. The Guardians of the Poor of the Union Workhouse, Aston, near Birmingham.

Davies, Birmingham .....	£1,515
Watson, Whitacre .....	1,404
Greensall, Erdington .....	1,365
Norton, Birmingham .....	1,350
Warden, do. ....	1,329
Dredge, do. ....	1,297
Johns, do. ....	1,275
Dewsbury, do. ....	1,270
Machin, Erdington .....	1,260
Hardwick, Birmingham .....	1,239
Heafild do. ....	1,911

The lowest tender was accepted.

TENDERS delivered for erecting a School at the Workhouse of the parish of St. Mary, Newington.

Hawes .. .. .	£1,205 0 0
Wood .. .. .	1,198 0 0
Colven .. .. .	1,196 0 0
Warren .. .. .	1,180 15 0
Peacock .. .. .	1,173 10 0
Plasket and Shelton ..	1,152 0 0
Bartenshaw .. .. .	1,145 0 0
Ward .. .. .	1,135 0 0
Geary .. .. .	1,132 0 0
Cooper and Davies ..	1,090 0 0
Mason .. .. .	1,010 0 0
Watson .. .. .	944 0 0
Cuttress .. .. .	935 0 0

The tenders were opened in the presence of the parties.

# The Builder.

NO. LXXVII.

SATURDAY, JULY 27, 1844.

Nothing else does the mind, whether refined or unrefined, take greater delight than in the beauties of statuary—for by nothing else is the mind more correctly informed of the history, the religion, the passions of our species: the present exhibition of statuary in Westminster Hall claims therefore, the greatest consideration from us, whether as to its own intrinsic merit or the opening of a new era in architectural art, whereby no longer is the bald white-washed wall deemed too costly, but embellishment is re-admitted, and superiority is called for. The chosen work of the chosen artist is to form the decoration of the Westminster Palace, and the three sister arts—architecture, sculpture, and painting—are to be united in one magnificent work.

The exhibition is highly creditable; it contains many respectable and many fine works, and is particularly pleasing, as containing not a few which, in the patriotic spirit of representing our own sages, our own heroes, our own monarchs, gives it a nationality, which, eventually, will be the distinguishing excellence of the British School. All appreciate such subjects, treated in such spirit. We do not deem it necessary to give any more general observations upon the matter, but proceed to some particulars relative to these objects of art themselves.

85. Lord Bacon, by John Henning, jun.—It must be recorded to our disgrace, that the name of Bacon has been more highly appreciated and more extensively diffused by the eulogium of Gassendi, the admiration of Voltaire, and the critical sagacity of D'Alembert, than by any efforts of our own. Whatever in the revolution of ages may be the fate of this empire, even to that distant, but probable period, when the present continent of Europe shall exchange its civilization for the barbarity of regions now undiscovered or unexplored, in whatever corner of the globe literature and science may hereafter seek an asylum, so long will they exalt the fame, and be guided by the genius of Bacon.

This is a fine work, in the peculiar costume of the day, which outdid nature when in any mood.

89. Captain James Cook, R.N., F.R.S., by V. G. Nicholl.—A very proper subject for the chisel.

91. Richard I., by Charles Augustus Rivers.—A work of animation.

93. St. George and the Dragon, by Hamilton and Carleton McCarthy.—The horse of St. George is a fine work.

95. John Rennie, F.R.S., by C. A. Rivers.—A fine work.

100. Geoffrey Chaucer, the Father of English Poetry, by W. Calder Marshall.—A very beautiful work.

103. The Earl of Marlborough, afterwards Duke of Marlborough, by Henry Sibson.

Quite out of the Gothic character; yet, though hugely hooted, according to the costume of the man himself—therefore proper.

106. The Archer or Eagle-Slayer, by John Bell.—Our ancestors used the bow for a double purpose; in the time of war it was a dreadful instrument of destruction, and in peace it became an object of amusement. It will be needless to insist upon the skill of the English archers, or to mention their wonderful performances in battle.—*Strutt's Sports and Pastimes of the People of England.*

The story intended to be conveyed is, that an eagle having just slain a lamb, soars high aloft; scared from his prey by the shepherd (represented in the statue), who has just launched a successful shaft at the wide-winged robber.—A very fine work, seeming to live.

108. Milton dictating his Poem of Paradise Lost to his Daughters, by W. F. Woodington.—A good work.

111. Chaucer, by John Hancock.—A very beautifully designed production, having an air totally differing from routine performances.

113. Boadicea, Queen of the Iceni, a group, by John Henning, jun.—“But she then appeared upon the same foot as one of the vulgar, and sought vengeance for the oppression of public liberty, for the stripes inflicted upon her person, for the defilement of her virgin daughters. To such a height was the wild fury and consciousness of the Romans advanced, that neither the persons of individuals, not even old age, nor even tender maidens could escape their rage and contamination. The incensed deities were, however, ready to aid the just sword of vengeance; by it a legion which dared to attempt an engagement had already fallen. . . . If the Britons would survey the number of men under arms; if they would well weigh the affecting cause of war; they would find that in that battle they must remain utterly victorious or utterly perish; such was the firm purpose of her who was a woman; the men, if they pleased, might still enjoy life and bondage.”—*Annals of Tacitus*, book 14.

A very masterly work of art.

115. Talbot Earl of Shrewsbury (time of Henry VI.), by Charles Samuel Kelsey.

A capital architectural statue in costume and treatment, suiting the building.

117. Alfred the Great with the Book of Common Law, by Frederick S. Archer.

A very good work.

118. The Death of the Duke of York at the Battle of Agincourt, by Benjamin E. Spence.

“Upon these words I came and cheer'd him up: He smil'd me in the face, raight me his hand, And with a feeble gripe says—Dear, my lord, Commend my services to my sovereign.”

—*Vide SHAKESPEARE'S HENRY V.*

An artistic specimen of exquisite feeling.

120. Alfred the Great, by James Sherwood Westmacott.

Good and suitable in design and execution.

123. Portrait Statue of Robert Burns, by David Dunbar, jun.

A worthy morsel of art.

124. Sir Isaac Newton, by William Jackson. Simply, yet finely treated.

129. The Mourners; representing a wife, who, during the civil wars of York and Lancaster, has followed her husband to the field of battle, and discovers his lifeless body among the slain, his charger standing over him. By T. G. Lough.

After passing a file of good, of fine, of even very fine productions, this wonderful piece of art breaks upon the view, and the longer the sight rests upon it, the longer view does it desire.—The heroic slain, who has not fallen till the sturdy wood of his battle-axe brake under his prowess, seems in death a conqueror: the bereaved lady pictures a fine mixture of heart-break, pride in her husband's prowess, of grief and adoring love: the noble charger, faithful to its master, remaining there in death, as in life, with the beautiful widowed face almost leaning in companionship upon it, breathes through the stolid material in audible passion. How fine, how touching does art become, when, leaving the ineffectual restraints of conventionalism, it dares to assume, that perfect art can take no flight higher than the perfect beauty which God himself has set in the feature, the limb, the muscle, the action, the breath, with which, after his own image, he has endued nature in all her works!

131. Cardinal Wolsey, by Thomas Grimsley, “Farewell, a long farewell, to all my greatness.”

A beautiful cabinet statue, with its hands silently clasped in bitterness.

132. Sir Isaac Newton, by Edwin Gahagan.—The first idea of universal gravitation was suggested to Sir Isaac Newton (in his 24th year) by the fall of an apple.—“A new idea darted across his mind. Why, he asked himself, may not this power extend to the moon, and then what more would be necessary to retain her in her orbit round the earth?”—*Library of Useful Knowledge.*

Wonderfully fine—indeed exquisite—quiet, yet evidently all soul, though evidently worked out in only rude matter.

133. Milton reciting to his Daughters, by James Legrew.

Of perfect beauty, elegant, soul-like, wanting nothing in design, or execution, or finish.

134. Jane Shore, by John Bell.

“Look on her now, behold her where she wanders, With no one hand to help; and tell me, then, If ever misery were known like her's?”

\* \* \* \* \*

Somewhere about this quarter of the town, I hear the poor abandoned creature sing; Her guard, tho' set with strictest watch to keep All food and friendship from her, yet permit her To wander in the streets, there ebose her bed, And rest her head on what cold stone she pleases.”

ROWE'S TRAGEDY OF JANE SHORE, Act 5.

A very beautiful figure, not spoiled by being over short.

135. Bede, the Saxon Ecclesiastical Writer, by Charles Samuel Kelsey.

Thoughtful, but too coarsely managed to reach ideal beauty.

137. Richard Cœur de Lion planting the Standard of England on the Walls of Acre, 12th July, 1191, by James Sherwood Westmacott.

A very beautiful work; the more meritorious from being free from the mere matter-of-fact of conventionalism.

139. Edward I. creating a Knight Banneret. The dying man still retains the banner in his grasp and is supported by a trooper, while the King, who comes up at the moment, is in the act of conferring on him the honour of knight-hood; the horse of the dying man is also mortally wounded by a spear in his throat. By T. G. Lough.

A very beautifully executed horse—the dying man of speaking effect; the figures of the prince and the trooper less striking; but the monarch's horse, stumbling over a dead mailed warrior, exhibits the highest art.

140. Richard I., King of England, surnamed Cœur de Lion, by James Wyatt.—“The Christian adventurers, under his command, determined to besiege the renowned city of Ascalon, in order to prepare the way for attacking Jerusalem with greater advantage. Saladin, the most renowned of all the Saracen monarchs, was resolved to dispute their march, and placed himself upon the road with an army of 300,000 men. This was a day equal to Richard's wishes, this an enemy worthy his highest ambition. The English Crusaders were victorious. Richard, when the wings of his army were defeated, led on the main body in person, and restored the battle.”—*Goldsmith's History of England*, vol. i., p. 283.

Of considerable beauty.

141. Margaret of Anjou and her Son meeting the Robber after the Battle of Hexham, by John A. P. Mac Bride.—“Margaret, the wife of Henry VI., after her defeat at Hexham, fled, accompanied only by her son. She was met in a forest by some robbers, who stripped her of her jewels, and treated her with great indignity. The division of this rich booty caused a quarrel amongst them, and she took the opportunity of escaping still further into the forest, when, overcome by hunger and fatigue, she met another robber, who approached her with a drawn sword in his hand; anxious only for her child, and with the courage and dignity which never forsook her, she advanced and said, ‘Hold, my friend, save the son of thy king.’”

Quiet, yet speaking more passionately than all the outward hard working of muscle, fixed eye, and stiffened features.

144. Caractacus before Claudius Cæsar, with his Wife and Child, by W. Spence.—A fine group.

147. A Portrait Statue of Lady Emily,

daughter of the Duke of Beaufort, by Wm. Behnes.

148. Cupid, with Doves, by Wm. Behnes.

Two works by this sculptor, of great beauty.

151. A Girl at Prayer, by P. MacDowell.—An extremely exquisite work.

153. The Burial of the Princes in the Tower of London, by H. C. Shenton, jun.

"The tyrannous and bloody act is done;

The most arch deed of piteous massacre,

That ever yet this land was guilty of.

\* \* \* \* \* We smothered

The most replenished sweet work of nature

That, from the prime creation, e'er she framed."

Vide SHAKESPEARE'S RICHARD III., Act 4,

[Scene 3.

A meritorious work.

154. The death of Boadicea, by Thomas Woolner.

Exhibiting death in the face of the figure in a manner wonderfully affecting.

162. An Ancient Briton, as a Scout, torch in hand, and with fire-wood resting on the ground, by Geo. G. Adams.—A good work.

163. Prince Henry, by Wm. Thomas.

"I spake unto the crown, as having sense,  
And thus upbraid it:—The care on thee depending

Hath fed upon the body of my father,

Therefore, thou best of gold art worst of gold;

Other, less fine in carat, is more precious,

Preserving life in med'cin' potable;

But thou, most fine, most honour'd, most renowned,

Hast eat thy bearer up."

SHAKESPEARE'S HENRY IV., Act 4, Part 2.

A very beautiful work.

165. Eve, by W. Calder Marshall.

"So saying, her rash hand, in evil hour,

Forth reaching to the fruit, she pluck'd, she ate!

Earth felt the wound; and nature, from her seat,

Sighing through all her works, gave signs of woe,

That all was lost. Back to the thicket slunk

The guilty serpent; \* \* \*

MILTON'S PARADISE LOST, Book ix.

The mother of mankind is beautifully shown plucking the fruit, while the serpent is coiled aloft around the trunk. The subject is well treated.

169. An Ancient Briton protecting his Family, by Thomas Earle.

170. Edward I. presenting the first Prince of Wales, by Thomas Earle.—"He began by declaring to them, that whereas they were oftentimes suitors unto him to appoint them a prince, he, now having occasion to depart out of the country, would name them a prince, if they would allow and obey him whom they should name. They cautiously answered that they would do so if he would appoint them one of their nation. The king lost no time in assuring them 'that he would name one that was born in Wales, and could speak never a word of English.' He left them to congratulate each other on his favourable intentions, and returned in a few seconds, very much to their surprise, bearing in his arms a new-born infant; but much more were they astonished when he presented him to them as their prince, satisfying them most completely that he fulfilled the stipulated conditions, that he was born in Wales, and could not speak a word of the English language."—*Lives of the Princes of Wales*, by Robert Folkestone, vol. i., p. 4.

Two very beautiful works.

171. William of Wykeham, by John Thomas.—A capital performance.

173. Alfred the Great propounding his Code of Laws, by Edward B. Stephens.—A very good work.

178. A British Warrior, by Samuel Nixon.

—An excellent work.

#### THE GOVERNMENT SCHOOL OF DESIGN.

The annual distribution of the prizes to the most meritorious of the pupils in the Government School of Design took place on Wednesday the 24th inst., in the apartment of Somerset-house set apart for the studies and business of the institution, in the presence of the great body of the pupils, and of a very numerous assembly of ladies and gentlemen. The walls of the room were covered with designs in plaster of Paris, on paper, and with other things connected with the progress of art; and numerous tables were placed, on which were displayed specimens in sculpture, in casting, in porcelain, &c., the productions of the continent, collected for the use of this establishment,

and to make the students better acquainted with the modes by which foreign works of art are distinguished, and to avail themselves of foreign discoveries and improvements in the classes for which the School of Design was established.

Amongst the company present were the following members:—The Right Hon. Lord Colborne, Mr. B. Hawes, M.P., Mr. H. Galley Knight, M.P., Mr. R. Monckton Milnes, M.P., Mr. P. Pusey, M.P., Mr. T. Wyse, M.P., Sir R. Westmacott, R.A., Mr. J. G. Shaw Lefevre, F.R.S., Mr. W. R. Hamilton, F.R.S., Mr. W. Etty, R.A., Mr. W. Dyce, Mr. J. M. Gardiner, Mr. Thomas Gibson, Mr. H. B. Ker, Mr. Apsley Pellatt, Mr. A. Poynter, besides Lord Westmorland, the Right Hon. Mr. Gladstone, Mrs. Gladstone, Colonel Wodehouse, M.P., and many other persons of distinction.

The chair was taken precisely at 4 o'clock by Lord Colborne, who expressed his high satisfaction at what he saw in the room that day. He felt so great an interest in the success of the Government School of Design, that he had left other duties which demanded his attention to take the chair. His duty on that occasion was not, however, likely to be a very long one; it was, first, to return his thanks, and that of the council, to the company assembled, for their attendance, and next, to tender to Mr. Gladstone, who appeared there to distribute prizes, the thanks of all present. He was convinced that hon. gentleman, and all who were there met, would rejoice to behold the works displayed around them—works, for the most part, of individuals who had only been pupils of the institution for two years. His Royal Highness Prince Albert had been pleased to preside on the last annual meeting, and had most kindly offered his services this year, provided the distribution of the premiums could have been arranged to take place previously to his going to Windsor. He (Lord Colborne) much regretted that Prince Albert was not present, but that regret was greatly alleviated by the presence of the Right Hon. the President of the Board of Trade. He hoped he was not too sanguine when he alluded to the attention bestowed on the institution by Mr. Wilson, the director (to whom his lordship paid an elegant compliment), in thinking that it would flourish and answer the expectations that had been formed of it. He (Lord Colborne) was most happy to hear the mark of approbation which had been given when the name of Mr. Wilson was mentioned, because it showed how highly he was esteemed. He thought that under his management the artists who attended the School of Design, and their productions, would shortly be able to compete with those of the continental countries. He would come now to the most pleasing part of his duty, which was to call upon the secretary to read over the names of those to whom the premiums had been adjudged; but first he would place the Right Hon. Mr. Gladstone in the chair, who would distribute them to the successful candidates.

His Lordship then quitted the chair, which was taken by Mr. Gladstone amidst expressions of applause from the company; and Mr. Wilson shortly explained the collection of works of art and of design which were exhibited in and hung around the walls.

Mr. Gladstone then rose, and after apologizing to the company for the few brief remarks he was about to offer, said the institution had the best wishes of the Government, as well as of the public. They were assembled there that day with one unanimous feeling of anxiety to promote the objects connected with it. Those objects were not only intimately connected with the commercial prosperity of the country, but with the progress of good taste, and that feeling for the truly beautiful in art by which the country was to be improved and exalted. Perhaps if more of difficulty was to be surmounted, a greater degree of interest might be excited for the progress of the institution; but the great difficulty had been surmounted. The greatest credit was due to that Ministry which had first established the Government School of Design, when its subsequent fate was doubtful, and when strong prejudices were to be encountered and got over—when some prejudiced people thought, and perhaps there might be some few who still thought, that the artists of England could not contend in rivalry with the artists of foreign countries, in uniting what

was useful with what was beautiful. Great honour was due to those who had recommended Parliament to attend to that school. Many thanks were next due to Lord Colborne and the gentlemen of the council of the School of Design; many great questions had made demands on their time since the School of Design had been originated, nevertheless they had not relaxed in their efforts and attention to the interests of that school. The labours of those also must be taken into view who had produced those works which the company were that day assembled to view. He would say that the present director was the soul of the school, without whose genius and application the council or any other assistance could not avail. It was impossible to overrate the public importance of the institution. The commercial power of this country excelled that of all others; but one defect—the defect in the art of design—had given other countries an advantage we did not possess. France was deserving of praise for her efforts to effect a union between the beautiful in design and the national industry. He did not, however, despair for what England would do by such a union. He no longer despaired of making the people of this country understand what beauty in art was, and by such understanding would be supplied all that was wanting. No vote in Parliament was more cheerfully made than that for the advancement of the School of Design. The vote was cheerfully supported by the Government, by the Board of Trade, and every assistance had been furnished by Sir Robert Peel and by Mr. Lefevre. Sir Robert Peel felt, what every minister should feel, a warm, a lively interest in the success of the institution. The pupils, who fully appreciated the importance of what was presented to them, might rely that the encouragement hitherto given would not be withdrawn. There would be found no indisposition or backwardness to reward those who developed ability and talent. The late changes in the law had been beneficial to the encouragement of the art of design; the designer had as much right to be protected as the author, and that principle was now recognized by the law. The law now worked beneficially for all parties: the designers were now secured the fair reward of their talent and genius, which but for this alteration of the law would have been the prey of pirates. They might now indulge a thankful satisfaction on the progress of the school; and the problem would be solved, whether or not a true estimate of the beautiful in art might be united to commercial industry and the enterprise of trade, and might not exist in its full development in England. We had no envy for the advancement of other nations, but contended that in adopting what they had adopted, this country showed that it appreciated their efforts. Mr. Gladstone concluded by congratulating the meeting on the results of what had been attempted, and then delivered the prizes, in the following order, to the persons named:—

1. Arabesque painting in fresco, Mr. Silas Rice, 5*l.* 5*s.*
  2. Arabesque painting in fresco secco, Mr. G. Stuart, 5*l.* 5*s.*
  3. Arabesque in oil, Mr. A. E. Vindon, 5*l.* 5*s.*
  4. Arabesque in oil, Mr. F. R. Fussell, 3*l.* 3*s.*
  5. Design for paperhangings, Mr. Walker, 2*l.* 2*s.*
  6. Composition of ornament from natural flowers, Mr. Brown, 3*l.* 3*s.*
  7. Design for glass chandelier, Mr. J. Stradwick, 5*l.* 5*s.*
  8. Design for porcelain dinner-service (two prizes), equal merit, Mr. G. Wallace, 5*l.* 5*s.*; Mr. W. C. Wilde, 5*l.* 5*s.*
  9. Design for side-board, Mr. J. Phillip, 2*l.* 2*s.*
  10. Design for carpet, Mr. J. R. Harvey, 3*l.* 3*s.*
  11. Design for silver candelabra, Mr. J. Stradwick, 5*l.* 5*s.*
  12. Design for silk hangings, Mr. J. Brown, 3*l.* 3*s.*
  13. For coloured designs for printed druggery.
  14. W. C. Wilde, 3*l.* 3*s.*; J. R. Harvey, 3*l.* 3*s.*
  15. Best specimen of ornamental modelling, Mr. H. Armstead, 3*l.* 3*s.*
- Class Drawings.—For outline drawing, 1st, Mr. W. Scott, 1*l.* 10*s.*; 2nd, Mr. G. George, 1*l.*

Shaded Drawings of Ornament in Chalk.—1st, Mr. J. Phillips, 2l. 2s.; 2nd prize, J. Pringle, 1l.; 3rd prize, Short, 1l.  
Shading in Chalk.—1st, W. Gledall, 2l. 10s.; 2nd, L. C. Wyon, 2l.  
Best Grisaille Drawing.—1st, E. Arnold, 2l. 2s.; 2nd, L. Walker, 1l. 10s.  
Best coloured drawing in tempera from flowers, F. Smallfield, 2l. 2s.  
Best copy of an arabesque painting, 2l. 10s.  
No name on the drawing.  
Best chalk drawing of the human figure, Mr. F. R. Fussell, 2l. 10s.  
Second Prize.—G. Stuart, 2l.  
Junior Class.—Drawing from the mask of Lucius Verus, A. G. Gandy, 1l. 10s.  
Second Prize.—J. Brown, 1l.

## FEMALE SCHOOL.

Best design for lace, Miss Dixon, 3l. 3s.  
Best design for flowers, Miss R. Densdale, 1l. 1s.  
Best chalk drawing from the round, Miss E. Angell, 2l. 2s.; 2nd prize, Miss E. Cannon, 1l. 1s.  
Best design of ornament for engraving on wood, Miss A. Colchester, 2l. 2s.; 2nd prize, Miss Bragg, 1l. 1s.  
Best drawing for lithograph, Miss Clark, 2l. 2s.; 2nd prize, Miss Bridges, 1l. 1s.  
The business of the day having thus been terminated, the thanks of the meeting were moved by one of the council to the hon. chairman, who returned thanks for the honour done him; after which the meeting broke up.

## COMPLETION OF THE NELSON MONUMENT.

HOUSE OF COMMONS, July 22.—A vote for 8,000l. being proposed to defray the cost of completing the Nelson Monument, Mr. WYSE begged to know whether the Government had not received an offer from an artist of the name of Park, who had offered to complete the monument at an expense of 5,000l., if he were suffered to undertake and finish it in conformity with his own taste and judgment.—Sir R. PEEL said, it was true that the Government had received such an offer, but had not thought proper to accept it, as a monument like that erected to Nelson ought to be the subject of competition to artists, and it would be establishing a bad principle if such a proposition as that referred to by the hon. member were to be accepted. The best way was for the Government to pay the expense attendant on completing the monument upon such a plan as might be deemed proper, and not to accept the money of private individuals in such a matter.—Mr. WYSE did not disapprove the conduct of the Government in this matter, but thought the present occasion was the fittest opportunity for bringing the offer that had been made to the notice of the House.

Mr. G. KNIGHT recommended that the shaft of the Nelson Monument should be carried to the height to which it was originally intended to carry it before the funds fell short: its height at present was 20 feet less than that originally contemplated, and now the Government had undertaken its completion, the monument ought to be finished in a style worthy of the nation and of the man to whom it was erected. As for the taste which was displayed in the statue of Nelson now placed on the column, he thought it in the lowest possible school of art. He hoped, in the completion of the monument by the Government, that care would be taken to secure good and competent artists to execute the lions which were to adorn the base of the column, and that they would be of a size proportioned to the structure.

Mr. B. COCHRANE observed that he had seen it stated in one of the papers that the Emperor of Russia had bestowed 500l. towards the completion of the Nelson Monument, and that this sum had been accepted. He considered that if this statement was true, the fact was extremely disgraceful to this country, for a national monument ought to be paid for by the people alone, and not to be the result of foreign assistance. As the Government had now taken charge of the structure, he begged to express his entire satisfaction with this proceeding; but he thought that if this had been done before the length of the shaft had been reduced 20 feet, in consequence of the falling off of the funds, it would have been much better. ("Hear," and "No.")

Would it be disputed that the monument was twenty feet shorter than it was intended to be, and that this was occasioned by the inadequacy of the sum subscribed to erect it? Why, there was still a sum of 12,000l. required to finish the pedestal, and how therefore would it be denied that the sum required for the shaft, as originally designed, had not been inadequate for that purpose? The whole progress of this and of many other public buildings proved to him the necessity that existed in this country for creating a Minister of Public Works, whose attention would be directed to objects of this nature, and which were of such vast importance.

Sir R. PEEL said the house should bear in mind that this design of a monument to Lord Nelson was originally a private affair. It was proposed to erect a monument to Lord Nelson exactly in the way in which two memorials of the Duke of Wellington were about to be erected, one in the east and the other in the west part of the town, not by Government, but by private subscription. He could not help thinking that memorials in honour of a great general must be more acceptable to his feelings when erected by the spontaneous offerings of his fellow-subjects, than if erected by a vote of Parliament. (Hear, hear.) In like manner it was determined to erect a monument to Lord Nelson, and the design of the monument originated entirely with individuals. A sum of 20,000l. had been subscribed, but the committee of management had expected that a considerably larger sum would have been raised. In the progress of the proceedings connected with this monument the committee thought it desirable to take the opinion of an architect and engineer as to its height, and the parties consulted Sir R. Smirke and Mr. Walker, who, considering the height of the fluted Corinthian column, which was also to have a bronze capital and statue on the top, declined to answer for its safety, strongly advising that the shaft should be curtailed by 20 feet. The curtailment was injurious to the effect, but it arose entirely from considerations of public safety, as it was thought that it would be extremely inconvenient should the monument fall in that crowded part of the metropolis, where it was now erected. This consideration alone, and not one of expense, led to the curtailment of the monument. When the Emperor of Russia gave 500l. towards the completion of the monument, the Government had not the charge of the monument, and the committee accepted the gift, which was not given towards the expense of a public monument erected by public money, but in aid of private subscriptions already collected; the Emperor of Russia being willing to mark his sense of Lord Nelson's merit, and slew his gratitude for the courteous reception he had experienced in this country, by this subscription of 500l. (Hear.) With the same feelings the Emperor subscribed towards the Wellington Monument. Though the Government had now the charge of the Nelson Monument, he hoped the hon. member would not advise the Government to return the subscription of the Emperor of Russia, which was presented before the monument came under the charge of the public, and when it was to have been raised by private subscriptions.

After a few words from Mr. B. COCHRANE, the vote was agreed to.

[In allusion to the proceedings in the House of Commons, reported above, the *Times* of Thursday observes, "We did yesterday a very unimportant, but very material, injustice to Mr. Patric Park. We stated erroneously that he had offered to complete the Nelson Monument for the sum of 5,000l., whereas his proposal was to do all that remains to be done gratuitously, giving, at the same time, a guarantee of 5,000l. that the work should be finished according to the terms specified in his communication to the committee. So generous an offer requires no comment."]

It appears that the sum of 12,000l. and upwards is yet required for the completion of this great national memorial, which the Lords of the Treasury have recommended Parliament to supply, a vote of 8,000l. being proposed to be taken for the expenses of the present year. The sum of 3,957l. is required for the discharge of Messrs. Grissell and Peto's contract for granite steps; 4,000l. for the cost of four

commemorative subjects, in bronze; and 3,000l. for four lions, in granite; making altogether 10,957l. Upon this there is, however, a charge of 2,000l. for the architect's commission upon the gross amount, and for incidental expenses. It was so far back as the year 1816 that the House of Commons (on the 5th of February) resolved, *nem. con.*, that an address should be presented to his Royal Highness the then Prince Regent, humbly requesting his Royal Highness to give directions that a national monument be erected in honour of the ever-memorable victory of Trafalgar; and on the 11th of February, 1816, the Prince Regent intimated to the House, through Lord George Beresford, his willingness to grant its request.

A meeting of the Nelson Pillar Committee took place on Saturday at the National Gallery, Sir George Cockburn in the chair, for the purpose of taking into consideration a communication which had been transmitted by the Government, on the subject of the application made by the committee, to the effect that the Government would either supply the means of completing the monument, or take it wholly into their own hands. There were present, besides the chairman, the Marquis of Northampton, Lord Colborne, Lord Montague, Sir P. Laurie, Mr. Sydney Herbert, one of the Lords of the Treasury, &c.

The official letter from the Treasury was read. It stated that in the year 1816, the House of Commons having voted adequate sums for commemorating the great military victories which were achieved, and might thenceforward be achieved, by the arms of this country, there could be no doubt of the existence of a similar desire to perpetuate the memory of the naval valour by which England was so eminently distinguished. It appeared, therefore, to the Government, that the most advisable course which could be pursued by the committee of the Nelson Pillar was to deposit whatever sums of money might be in the possession of the treasurer to the fund in the hands of the Commissioners of Woods and Forests, who would undertake the task of completing the monument. The letter also alluded to the large sum, 20,000l., already subscribed by the public, and desired that all the drawings, plans, and documents relative to the pillar should be sent to the office of the commissioners.

The meeting unanimously agreed to the suggestion in the official letter, which was considered by the committee as a security for the most perfect completion of the work. A general wish was expressed that upon one side (the northern) of the pedestal not only the name of Nelson, but the names of all the other eminent officers engaged in the battle of Trafalgar should be chiselled. The expense of completing the pillar will amount to 10,000l. or 12,000l.

## TRAFALGAR-SQUARE.

(From a Correspondent.)

As much public curiosity has been manifested for these last few weeks, to know when the fountains are to be brought to their place there, and as to what kind of things they are to be when duly finished—with respect to the first part of the matter we do not profess to be very intimate; but with respect to the second, it may be observed, that we have every reason to believe that they will be the two finest, largest, and boldest fountains in the country. They are to be of Aberdeen granite, of very considerable elevation, and noble proportion, consisting of *two basins*, one above the other, somewhere about in the proportion of seven feet to nine, which is the proportion considered most eligible for the situation. They will each contain a central or upper jet, which will consist of a good body of water, and be thrown to a tolerable elevation, say about ten feet; then falling into the first basin, and running over its side in a continuous stream, so as to form one solid sheet of water till it reaches the second basin, where it is again to pass through the same process of running over the sides, and from thence falling in streams to the granite blocks or steps which support the fountain, and thus form a fine, bold cascade into the large open basins now already fixed in the square; in addition to which, there will be four jets, thrown from dolphins' mouths, in the framework which supports the basins.

From this rapid description it will be seen that there will be a considerable degree of effect produced by these fountains, as they are intended to be on a large scale, with a plentiful supply of water, which is the main feature in the whole affair. The granite works of these fountains is to be executed by Macdonald and Co. (the contractors for the Wellington Statue pedestal), and will, no doubt, be done in their usual style; the mechanical part of the matter is intrusted to the firm of Easton and Amos, the engineers, of the Grove, Southwark, who have already completed the two wells for the purpose of supplying the water, one of which is behind the National Gallery, and the other immediately in front; they are connected together by a tunnel, so that there need be no apprehension of a failure in the supply of that needful element—the water. There were several designs for these fountains, of various materials, including stone, plaster, and iron; of the latter, a very bold one was furnished by Messrs. Lockwood and Folkard, consisting of two basins, and each having nine jets of considerable magnitude.

Messrs. Macdonald have just completed a granite fountain for her Majesty, at Windsor, which is a very fine addition to the beautiful improvements in the Home Park which have been so recently made by the authorities of the castle.

It is much to be regretted that there are not more ornamental fountains in the metropolis than there are, the more particularly as water can be so readily obtained in most of the localities where fountains are already placed—such as they are. There is a most unhappy dumb-water-looking thing at the end of the Serpentine, in Kensington Gardens, which ought to be immediately removed, as it is a positive disgrace to all parties connected with it, and, what is more, it is anything but an ornament to the gardens. There is also an attempt at a fountain in the inclosure in St. James's Park, which is as rich a specimen of Cockerism as ever disgraced a public garden. It is the more surprising that this fountain, a squirt, should be a failure, because it is so well commanded by two reservoirs at a good elevation above it; namely, one hid in the shrubs on the top of Constitution-hill, and the other at the top of the hill in the Green Park, both of which, if properly managed, would yield a plentiful supply of water to feed a *real fountain* on a scale of grandeur which would make it worth the trouble of looking at, and be a noble ornament to the gardens, as well as a matter of satisfaction to the public, who have to pay for all these things, whether they may happen to be good or bad.

#### VAUXHALL AND BATTERSEA EMBANKMENT.

The Commissioners of Metropolitan Improvements are endeavouring, we understand, to effect arrangements with the proprietors of the river frontage between Vauxhall and Battersea Bridges, for the construction of an embankment and roadway which shall connect the two, and afford the public an uninterrupted promenade by the river side of about two miles in extent. There are circumstances connected with the interior of the Chelsea district which obviously exclude this from the class of cases in which the public should be at the entire charge. Much of the ground is yet uncovered; and while on the one hand, therefore, there is no very crying demand for improvement, in the sense in which the term has been applied of late years in the metropolis, on the other there is a field for speculation and private enterprise which must render the opening of any great line of communication like that in question an object of great interest to the various freeholders in the line—such, we can easily apprehend, as would justify any commission in making the recommendation of such a measure to her Majesty to some extent dependent upon private contribution.

The fairness of this principle, we believe, has been at once recognized in the instance before us; and, if we are rightly informed, Lord Westminster, Lord Cardigan, the Chelsea Water Company, and others have offered to contribute very largely. We are told, indeed, of a promise of some thousands! But be this as it may, we are satisfied, after the immense pains which were taken by this

commission upon a somewhat kindred improvement on the river last year, that the subject of the proposed embankment at Chelsea has been examined in all its bearings, and amongst these, of course, would be the relative interest of the public and the freeholder in the accomplishment of such a measure. The terms proposed, we feel assured, have been liberal; and if there should be any truth in the rumours which have reached us as to the dissent of certain parties in the line, we must advert to them hereafter, and upon better information as to the grounds of such dissent, than we possess at present.

On one point, however, connected with this improvement, we must be allowed to express a very decided opinion. In the appendix to the report of the proceedings of this commission during last session is a correspondence referring to the appropriation of the grounds of Chelsea Hospital. As far as we can find, the commissioners were not the first to enter upon this question. They appear to have applied for permission to carry their roadway between the garden of the hospital and the river, and to have been not very courteously refused. But the present appropriation, or rather non-appropriation, of these grounds is an abuse that calls most loudly for a remedy; and if, as we hear rumoured, there be at length a prospect of a terrace road being constructed in the line originally proposed by the commission to the hospital authorities, we hope and trust that the gardens of Chelsea Hospital will be no longer closed against the admission of the public. The place has, at present, all the seclusion of a monastery without its sanctity.—*Observer.*

#### LONDON AS IT WAS IN 1800, AND IS IN 1844.

WHAT a wonderful place is this London of ours! Its appetite of increase is insatiable—fields, villages, towns, disappear in rapid succession, as they are absorbed in the forest of houses. And yet it is not the size of London which excites the admiration and astonishment of foreigners; it is the ten thousand indications of wealth, afforded by the endless succession of private streets and squares, the splendour of the shops, the illuminations of a city which knows not darkness, the numerous contrivances for obliterating time and space, for making money and spending it. Talk of ancient Thebes and its hundred brazen gates, this famous city would have been lost in one of our second-rate parishes; the bricks employed in building the tower of Babel would scarcely be deemed sufficient for a week's requirement of the London builders of our time; and the stones of the Great Pyramids sink into insignificance, when compared to the quantities of hewn granite employed in the paving of our streets and thoroughfares; nay, the very fragments of the ancients give way to the sober realities of modern times: and not Rome in the Augustan age, enriched by the pillage of all nations, could boast of a title of the riches, or moral wealth and spread of intelligence, so pre-eminently manifest in our own modern Babylon.

Our hairs are not yet grey, nor has age chilled the active current of our blood, and yet how old we appear, as we take a retrospective view of the past, as we look at London as it was in the beginning of the present century, and London as it is now.—A city then ill-paved, ill-lighted, ill-ventilated, and reeking with fumes of open ditches, kennels filled with filth breathing typhus, plague, and pestilence; the houses too of the old city denoted a primeval simplicity of manners, kept up to the very latest possible period; they were chiefly of wood, without party-walls, and story overhanging story, surmounted with fantastic chimneys, and having projecting spouts, by which the drainage of their roofs was carefully poured upon the heads of those unfortunate pedestrians whom business or pleasure called into locomotion. The luxury of cabs and omnibuses was then unknown, steam scarcely dreamed of—backney-coaches, chairs, oil-skins, and umbrellas looked up mightily. The shoeblack was then a mighty important personage, and was always to be found when the mud became cumbersome to the feet and unlighty to the eye. As a running accompaniment to music-grinding, such as those days could afford, we had also the creaking of innumerable sign-boards, the melodious sounds

of coach-guards and newsmen, varied by the doleful ditties of Grub-street sons of harmony, and the stentorian laments of peripatetic vendors of last dying speeches and confessions; for the offices of sheriff and sheriff's deputy, the gentle "John Ketch," were then no sinecure, Hounslow, Bagshot, and other outskirts of the town being well stocked with gentlemen of the road; the worthy citizens had always a weekly pageant at Tyburn; and fellows were as used to hanging in those days as eels are to skinning with us.

The merchant then might still be seen trudging on foot to his office, between eight and nine in the morning, and returning thence late at night; unless, and which was generally the case, he resided in his house of business: he did not think of working by deputy, or of employing numerous clerks without adequately paying for their services; nor was it usual to find him at the head of hubble companies or fraudulent foreign loans; neither was he seen a hanger on at court, or aping the manners of a west-end beau; nor was he often found playing the usurer, or anticipating the smiles of fortune by bankruptcy; his character for hospitality had passed into a proverb, realizing in this respect the manners of the fine old English gentleman.

It is amusing to read the history of London in 1803. Its length was then about seven miles, exclusive of road-side houses in the suburbs; but its breadth in the narrowest part did not exceed two miles. It was even then considered the most healthy city in Europe; the principal streets were paved and flagged, and boasted of underground sewers; but many of the courts, alleys, and private streets were close, densely populated, and abounding with filth of every description. It contained sixty squares, and 160,000 houses, warehouses, and other buildings; but its population for its extent was less than any other great cities, being estimated at not quite eight hundred and forty thousand resident inhabitants.

The number of bullocks annually consumed in London was 110,000, of sheep and lambs 776,000, calves 210,000, hogs 210,000, sucking pigs 60,000, besides other animal food. The consumption of milk was little short of 7,000,000 gallons, and 14,000 acres of land around London, now almost entirely built upon, were cultivated wholly for vegetables and fruit. 16,600,000 lbs. of butter, 21,100,000 lbs. of cheese, 700,000 quarters of wheat, 600,000 chaldron of coals, 1,113,500 barrels of porter and ale, 11,146,782 gallons of spirituous liquors and compounds, and 32,500 tons of wine were also consumed in the year. To those who are curious in such matters, it will be worth while to compare this consumption of provisions with the consumption of the present day, by which a pretty correct estimate may be formed of the comparative state of the middling and lower classes.

The progress of the fine arts was confessedly slow at that period, and, in despite of the vaunted wealth and beauty of the metropolis was wholly unworthy of these times. Thus, in "the Picture of London," we find the following remarks: "A stranger who rambles in London will be dissatisfied with the general style of public buildings, and chilled with the poverty of thought and invention, that leaves the noblest situations unadorned with monuments of the arts, or disfigured with poor and frigid examples of them. Besides the outside of the cathedral of St. Paul, the inside of St. Stephen's Church, Walbrook, the portico of St. Martin's, near the Strand, and the fragments of the Palace of Whitehall, there are few buildings of eminent grandeur or exquisite beauty in this metropolis."

The first symptoms of the improving spirit of the times was manifest in forming the London Docks. The great increase of commerce, shipping, and revenue for the port of London was found productive of numerous inconveniences; the moorings in the river were wholly inadequate to the reception of shipping, the legal quays, the same in extent as at the fire of London in 1666, and limited to between London Bridge and the Tower, could not accommodate one-fourth of the ships; the losses, damages, accidents, and plunder annually sustained, to the amount of 300,000*l.* per annum, had become intolerable. A company was formed to remedy these evils by forming docks in Wapping over a low space of ground mostly

composed of gardens, pastures, rope and waste grounds, the houses being of the most wretched description, the major part being in the last stage of repair or of habitation. This company, having a subscribed capital of 1,200,000*l.*, struggled slowly into existence against the united opposition of those whose interests were at stake. Objections were urged that ships would be removed to an inconvenient distance from the city, that the risk of fire was very great, that it was impossible to complete the plan, and that, even if completed, they could not possibly extend them. Time has shewn the folly of these arguments, but they had their weight in that day, and between seven and eight years were consumed in discussing the policy of it. Its success encouraged other speculations of the like nature, and the West, and eventually the East, India Docks were formed, the beneficial results of which were not only felt by the commercial world, but also by the community at large.

At this early period, however, architecture had been gradually improving for the previous sixty years; the heavy fabrics of brickwork, the uniform square mass of building, before so fashionable, and which had succeeded the uncouth structures that braved both time and proportion since the reign of Queen Elizabeth, then gave way to lighter Italian models. The introduction of Portland stone contributed much towards improving the beauty of English architecture, while the balcony, the Venetian gallery, by admitting a large body of air into apartments, greatly contributed to the health of the resident inhabitants; but the improved style of buildings manifest in the suburbs, formed a still more remarkable contrast with the ancient buildings of the old city; many of the houses even of the principal thoroughfares were still little better than lath and plaster edifices; the shop fronts were mean and contemptible compared to the present noble display; the streets, better paved and lighted than any metropolis in Europe, were scarcely passable for mud; and the dim obscure and effluvia of train-oil were anything but agreeable to the quiet order of night pedestrians, or to those miserable apologies for watchmen, yept Charles's robbery and violence were very frequent at night.

The extension of London was a natural and inevitable consequence of increase of population, wealth, and industry; but our acquired taste in building is attributable to several co-operating causes. The frequent and destructive spread of fires, and the stern necessity of attending to the health and comfort of a rapidly increasing population gave birth to the Building Act and its imperfect clauses. But the progress of improvement was almost imperceptible for the first ten years of this present century. Many elegant buildings, it is true, had been erected, many new and beautiful streets had been formed, but so little real progress was made, that the picture of London in 1800 is the picture of London in 1810. Fires, however much to be deplored, have had their full share in effecting local improvements, and to their destructive powers we owe many of our most beautiful public and private buildings. The theatres have arisen phoenix-like from their ashes, and the new Houses of Parliament, springing forth in like manner, will redound to the lasting fame of Mr. Barry, the architect. I remember the great fire at Wapping; what an awful, yet beautiful sight! the whole of a densely-populated neighbourhood in flames, and sheets of liquid fire floating down the river Thames; that fire was truly a blessing, it devoured dens of infamy, and swept away in a breath a huge cancer from the body corporate; it was the last essential purifying by burning which this great city was to undergo. I had been present at the burning, and three days after strolled over the still smoking ruins, and while I truly felt for the many friendless and houseless sufferers, I still thought of the noble purposes to which such a vast space could then be applied. A rather curious incident to which I was a witness may not be amiss here: while standing gazing upon the ruins before me, my attention was suddenly attracted to a true Boniface, such as only exists in the person of a Wapping landlord; his rubicund countenance exhibited a most extraordinary state of inquietude and restless anxiety; he was the landlord of a *Blue Anchor*, and upon that anchor his present hopes appeared fixed, for

he shuffled onwards through the crowd as a being wholly unconscious of its presence; he neared the spot—the house to which he directed his attention was down—but the chimney was still standing—there was magic in that sight, his countenance suddenly underwent all the varied phases of hope, fear, joy, sorrow, and doubting anxiety; he advanced with accelerated step, thrust his hand up the chimney, and from it drew forth, with a yell of success, a large bag of gold—it was his all; the fire had not penetrated his secret recess—lucky dog!

At the west end of the town, never was improvement more called for than in 1813; the court, fixed and immovable, made property too valuable to be lightly abandoned, and nobility could not retreat far from its immediate atmosphere. The Prince Regent was the first to set the example of improvement, and, however little we admire his taste or choice of architects, still to him we are really and truly indebted for every improvement that followed. His will was good to realize the proud boast of Augustus, that "he found Rome of brick and left it of marble," but reforms in building, as in every thing else, are difficult to accomplish when opposed to custom, early association, and individual interests; his views were therefore not met with that cordial acquiescence they ought to have been, but they produced all the effect truly required,—individual or corporate rivalry, and the onward march of taste. That beautiful park named in honour of him is much more honourable to this pacific and voluptuous monarch than the very equivocal tribute to the Duke of York erected on the site of Carlton House.

The improvements of the western end of the town were begun by removing Swallow-street and its neighbourhood, to make way for the present elegant street; and house after house rapidly disappeared as disposed of by auction, presenting a scene of demolition to which we were then wholly unaccustomed; and, armed with the Act of Parliament, the commissioners paid little or no attention to interests opposed to their plans, on the plea of inalienable rights, family inheritance, or dogged attachment to place—turn out you must. There is something strangely repulsive in these Acts of Parliament, by which the ancestral home is razed to the ground, the park, or family estate, is divided, and the solitude of privacy broken into and destroyed. Gold does much in the present day; but gold will not always compensate for the loss of that which we have loved for its own sake, or for associations connected with it. In the present instance, numerous complaints were made against these arbitrary ejections, but the plea of public utility is imperative and knows no compromise, beyond that of a mercantile one. Of the many houses removed, my guardian purchased the material of several, among which was an old-fashioned mansion, in a state of great dilapidation, the effects of sheer old age. It was occupied by an elderly person, most decidedly very poor, but his careful attention to the minutiae of dress, his amply-powdered wig, gold-headed cane, and silver buckles, together with his suavity of manners, proclaimed him a finished courtly gentleman of the old school. Docile as a child in all things else, he manifested a determined resistance to the sale of his property, refused his consent to any pecuniary reward, and expressed his determination to be put out only by force; his opposition was useless, the house must come down, even to prevent its falling, and our people were set to work. Seeing all further opposition useless, he begged of me, as a favour, that I would permit him to follow the steps of the workmen in their work of demolition, and to this I most cheerfully assented, for his deep and settled grief appealed most forcibly to the heart. In the midst of falling crashing timbers, and clouds of dust, might be seen this venerable old man, watching through the dim obscurity the removal of every plank and joint, the displacement of every brick, the ripping out of every skirting-board; from room to room he went, from floor to floor he descended with the men, his evident anxiety increasing almost to agony as they neared the base of the building. He seldom spoke, and seemed almost unconscious of the presence of any one; a tear might now and then be found trickling down his aged cheek, and involuntary exclamations would escape him, evidently in unison

with his thoughts: "No, no! Not here—not here!"

The whole of the upper portion of the house was removed, and the uncovered kitchens alone remained—his anxiety increased—tears of bitterness coursed his venerable cheeks, and wringing his hands in an agony of grief he exclaimed, "My noble boy, thy last hope perishes—but no—while a brick remains there is hope." Five days had elapsed and brick after brick was removed towards the foundation, and still he looked intent upon their labours; the workmen had retired—yet still he remained as though rooted to the ground on which he stood. I was a youth at that time, but my heart was sensitively open to the sorrows of others, and I would have given the world to have seen that old man smile again. With timidity I approached and seized his hand. I would have spoken words of comfort, but tears choked my utterance: he started—awakened to consciousness by my overpowering feelings—he gazed upon me in silence for a few moments, and then mingled his tears with mine. As soon as his feelings subsided, he convulsively whispered, "There are papers, my child—papers of importance to me and mine—concealed in this house—I cannot yield up my hope so long as a brick remains." I assisted his search, raised up one by one the flags, sounded every part of the remaining walls, but all to no purpose. Night advanced, we were retiring, when a thought struck me to examine the extensive range of vaults—he had often done so, he said, but perhaps my young eyes might assist him in a stricter examination. I procured flambeaux and carefully scrutinized every part of them. Upon entering one of a range of four, I observed it was much shorter than the rest, although in every other respect uniform, and on applying a strong light to the extreme end, discovered a patchwork of brick, evidently more recent than the rest, and not occasioned by dilapidation; I pointed it out to him—we assailed it with hammers—the brick-work immediately fell inwards, discovering an aperture beyond it; through this I crept, and my companion followed—it was a continuation of the vaults, but almost filled with a variety of boxes and packages—a gleam of hope, followed by a wild cry of joy, betrayed his feelings—box after box was rapidly forced open, until at length he suddenly started backward, and fell without a word at my feet, his hands firmly grasping a bundle of parchments.

All that remains is told in a few words. His elder brother, with himself, joined the Pretender, were declared rebels, and his family estates confiscated. Being mortally wounded in the field of battle, George sent for his brother, who was in the immediate neighbourhood, and after giving some general directions, was about to inform him where his papers were concealed. "You will find them," he said, "in my house in town in the ——" Death stopped his further utterance. The survivor, then a young married man, fled the country, and returning after some years' banishment, he found the family town-house untenanted, took possession, and commenced an unavailing search for the papers. Age crept upon him—poverty oppressed him—but still he wandered through the house like some discontented spirit, in the vain hope of finding the hidden treasure. His wife died—all his children died but one, a fine young man, who, unable to purchase a commission, had volunteered previous to the close of the war, and attained the rank of a lieutenant; he was put on half-pay at the close of the war. In this young man rested all his hopes—the discovery of those papers gave him rank and wealth.

**THE COLCHESTER CORN EXCHANGE.**—The front elevation of the New Corn Exchange, which is now in course of erection by Mr. Hayward, consists of a receding centre and wings; the entrances, three in number, are in the centre compartment under an Ionic colonnade, which is surmounted by an allegorical group of sculpture, representing Ceres scattering around her the produce of an abundant harvest. The wings are formed by pilasters of the Ionic order, between which, in each wing, is a recessed panel, containing a bas-relief composed of agrarian produce and implements of husbandry. The whole of the High-street front is to be of stone of the same description as that of the Town Hall, with the exception of the plinth and steps, which are to be of granite.

Mr. CHADWICK, in his report on interments in the metropolis, proposes, as a remedy for the defects in the present system of burials, to establish four large national cemeteries, in the environs of the metropolis, each having appropriate buildings of magnitude and grandeur sufficient to produce a solemn effect.

The following sketch is submitted as a hint towards the production of designs for such buildings:—

NEWSPAPER  
 The object proposed to be obtained is a building of such size and grand proportions as to form a complete whole, and at the same time, to present to the visitors a series of various delightful and interesting scenes, to impress on their minds a pleasing and lasting remembrance of the place, and by means of the fees from the tablets and tombs, to pay a very large portion of the expense of the building.

By inspecting the accompanying plan, it will be seen that it contains two chapels at the

west end, with an archway between them, with carriage drive leading under the tower and spire to the two chapels at the east end; the lateral spaces, between the chapels, being devoted to cloisters for tombs and tablets, thus the whole building giving externally the general and grand outline of a complete cathedral.

The chapels have each two entrances under the archways, with cloisters on each side leading to the body of each, so that mourners may proceed up the western, and be seated, while a corpse is being conveyed from the hearse at the other entrance up the eastern ones, thus preventing all confusion. In all, the desks are at the ends opposite the entrances under arched recesses, with open spaces in front for the bier; on each side of the desks are robing-rooms for the clergymen and clerk, so that they may have free access to them; at the opposite ends is a gallery for the organ, also in an arched recess,

and on each side of the chapels, over the cloisters, galleries for choristers and strangers. These chapels would have grand and lofty interiors, and with the arched recesses at their ends and sides, and groined ceilings and stained-glass windows, have a solemn effect.

The carriage-drive entering from the grounds under the lofty groined archway at the west end, with the large open space beyond, bounded on the right and left by the three tiers of open cloisters and tombs, with the tower and spire at the end, would form a fine and novel feature; this open space perhaps might be arched over with the intersecting ribs only, leaving the spandrels open, having creeping plants entwining round them, and hanging down in natural festoons, which, with the addition of the various colour of the leaves and flowers, contrasted with the sky-tints (seen through the open spandrels), and the playful shadows cast on the adjoining cloisters, would add much to the beauty and interest of this scene.

Proceeding eastward under the tower, which would be of one height internally to the base of the spire, looking upward, with the arched openings all round (the light passing freely through them), a new and magnificent picture would be given; beyond which are the groined arches with open cloisters and tombs on each side, nearly similar to the west end, under which arrival to the cemetery grounds would be again effected.

In the cloisters forming the sides of the cathedral I have shewn tombs; as they would be commanding and desirable situations, a sum of money would be obtained, in addition to the ordinary fees, for the privilege of placing them there; and it might be hoped that many would be induced to erect handsome memorials to themselves or deceased friends, which would greatly add to the decoration of these cloisters; and by a little outlay in gilding, colouring, and bringing out heraldry, &c., a splendid effect would be the result, which would be much heightened by having small parterres of flowers, of rich tints, placed in the spaces between them. The flowers being behind the buttresses, some would just catch the strong lights, and some be in the deep shade, causing in this little matter an almost endless variety of tint and shadow. I would here also suggest that the building should be surrounded outside by a grass-lawn, freely sprinkled with flower-beds, as the view outward would be improved, and the scent wafted into them pleasant; besides, on a bright day, the refraction of the sun's rays would illuminate the lower cloisters with all the various and splendid tints of the grass and flowers, and thus colour them in a manner far superior to any which can be done by any artificial means. If a few trees were placed near the chapel, the shadows east into the cloisters would by their contrast make the bright parts appear still brighter. By attending to these little, and apparently insignificant matters, at times most unexpected beauties are added to buildings, and almost magical effects can be produced. On the opposite side to the tombs are blank walls, on which tablets are proposed to be placed facing the light, which, by being inserted in proper recesses and paneling, might be made to assist greatly in ornamenting these cloisters, as the decorations would not be more expensive than those used at present on such occasions. By spreading out the lower parts of the buttresses, the tombs on the ground-story may be placed outside, with canopies over them, which, with the deep shadows cast by them, would add to the pictorial effect of the exteriors, at the same time protect the open cloisters, and by a judicious arrangement of the arches, and the arches over the carriage-drive (which might be formed into bridges to communicate with the cloisters on each side, from which splendid views of that part of the building and the funeral processions below would be obtained), the lateral, the filling-in walls, and upper cloisters might be *surprisingly* thin and light, consequently be of little comparative cost. These cloisters, it may be observed, would produce distinct and separate scenes (all of

which might be differently decorated internally), some embracing views of the cemetery grounds, and some the carriage-drive, with the tower and opposite cloisters through the openings at the sides; by forming these various scenes, a greater degree of interest would be excited and kept up in the mind of the observer, and afterwards be related, and so cause hundreds to view the place who would never otherwise have thought of going, and by these means make popular the establishment.

The length of the whole of the cloisters would be upwards of 2,500 feet, and the space therein capable of being covered with tablets at 10s. per foot superficial (I believe the usual charge), would produce 12,000*l.*; the fees from tombs, at 25*l.* each, would amount to about 3,000*l.*; and, putting the fees for the burials in the family vaults on the ground-story at a similar total sum, about 18,000*l.* of the cost could be obtained from this source alone, without taking into consideration the fees to be received for interments in the catacombs to be formed under the whole building, which would be very considerable, and much above the additional cost of erecting them.

With regard to the situation of the building as to the points of the compass, I have shewn and described it as standing due east and west, as is usual; but it is evident that the north side of the building would never have the benefit of the sun's rays, and it being an important elevation, requiring strong light to bring it out effectually, would lose a great deal of its beauty in consequence; besides, the grass and shrubs on that side would never thrive so well as on the others. By placing the building diagonally to the points of the compass, one end only would be in the shade; the three principal elevations would then have all the advantages possible to be obtained, the sun's rays penetrating into the open cloisters and archways, bringing out, by deep shadows, all their parts boldly, ventilate and keep dry the whole building.

In conclusion, I will, in a few words, give a summary of what I consider to be advantages in this plan.

- 1st. That the building forms a complete and grand whole.
- 2nd. That the cloisters would be a source of considerable profit, from the fees for tablets and tombs; would be very attractive to visitors, and by these means make the last resting-place of the dead less distasteful to the living.
- 3rd. That the construction of the building is proposed to be of such a nature, that more effect and accommodation would be obtained for less money than by the ordinary means, and *every inch of space* would be devoted to some useful purpose.
- 4th. That the building would not be liable to decay or dry-rot, having but little timber in its construction.
- 5th. That the building would be *fire-proof*, consequently an annual saving of the insurance would be made, and the inconvenience and ruinous effect a fire would have on such an establishment would be prevented.

W. J. SNORT.

TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.

(Continued from p. 361.)

16. Langton's method of seasoning by extraction of the sap is another that is considered well worthy of notice: it consists in letting the timber into vertical iron cylinders standing in a cistern of water, closing the cylinders at top; and the water being heated, and steam used to produce a partial vacuum, the sap, relieved from the atmospheric pressure, oozes from the wood; and being converted into vapour, passes off through a pipe provided for the purpose. The time required is about ten weeks, and the cost is about ten shillings per load; but the sap is wholly extracted, and the timber fit and ready for any purpose; the diminution of weight is, with a little more shrinkage, similar to that in seasoning by the common natural process.

17. Smoke-drying in an open chimney, or the burning of furze, fern, shavings, or straw, under the wood, gives it hardness and durability; and by rendering it better, destroys and prevents worms: it also destroys the germ of any fungus which may have commenced.

18. Scorching and charring are good for preventing and destroying infection, but have to be done slowly, and only to timber that is already thoroughly seasoned; otherwise, by encrusting the surface, the evaporation of any internal moisture is intercepted, and decay in the heart soon ensues; if done hastily, cracks are also caused on the surface; and which, receiving from the wood a moisture, far which there is not a sufficient means of evaporation, renders it soon liable to decay.

19. We now proceed to treat of the various timbers individually, taking them in the order of their importance as materials used in building.

20. OAK.—To the oak has been justly awarded the pre-eminent title of the "King of the Forest," and when we consider its high qualities, as well as the length of its existence—in the tree and in the timber—we must approve of the distinction, and give it in our notice of timbers that first place to which it is so honourably entitled.

21. There are several species of the oak, and they differ very considerably from each other, both in appearance and quality: some individual description of them, therefore, is necessary.

22. Of the ENGLISH OAK there are two kinds, namely, the common British and the sessile-fruited, the former of which is most plentiful in the south, and the latter in the north of England: the first is the most esteemed, and that from Sussex is considered the best that England affords; it is a stiff, straight, and fine-grained wood, with very few knots; the raffling of its leaves is irregular, with very little foot-stalk; the stalks of its acorns are long; the wood is often reddish; the larger transverse septæ are plentiful, and produce large flowers: it is eminently adapted for the purposes of the carpenter; it can also be split readily, and makes laths of the best description, both for tiling and plastering. The sessile-fruited is the bandsomer tree of the two; it has likewise these marks of contradistinction: its leaves have long foot-stalks, and are less deeply and more regularly sinuated, and its acorns are almost without any stalk; the wood is darker and has fewer septæ; in gloss and smoothness of grain it somewhat resembles the chestnut, and exceeds it in hardness, weight, and elasticity; being very tough and difficult to rend, oak laths are seldom used where it prevails; in the seasoning it is very liable to warp and split. Both these oaks require long seasoning by the ordinary mode to fit them for the purposes of joinery, but steaming and boiling are adopted with advantage.

23. The *Lacomb Oak*, so called in Devonshire, where it is cultivated (as well as in Cornwall, Somersetshire, &c.), is an evergreen species, of rapid and large growth; straight and handsome, compact and hard, but not so durable as the common oak. The *Durmast Oak*, belonging to France and the south of England, keeps in foliage later than the English oaks; it is inferior to them in compactness and strength.

24. Of the American oaks there are the red, the white, the hunt-lobed, the live, and the chestnut-leaved. The *White Oak* has the preference in America, both for house-carpenter-

try and ship-building; the wood is flexible and tough, it grows quicker, and is not so durable as the English oak; it derives its name from the appearance of the bark. The *Mountain Red Oak* is light and soft in the wood, and not very durable; it grows rapidly, and not uncommonly attains a height of a hundred feet; it has its name from the circumstance of the leaves changing their colour before the fall. The *Blunt-lobed Iron Oak* frequently grows to the height of seventy feet, and is a valuable timber; it is hard, and not being subject to decay, has generally the preference for fencing and works of a similar nature. The *Live Oak* reaches a height of fifty feet, and is a wide-spreading tree; it furnishes very durable wood, and is in high estimation as a ship-timber. The *Chestnut-leaved Oak* is a tall and handsome tree, coarse in grain, but useful for inferior purposes.

25. The oak which we call *Dutch Wainscot*, from importing it from Holland, grows in the German forests, whence it is floated down the Rhine; it is fine in the grain, generally free from knots, and more easy to work and is less liable to warp than English oak; it is much used for floors and joinery in general; also for a variety of furniture. The *Riga Oak* is esteemed on account of its freeness from knots and from its straightness in the grain. The *Austrian Oak* grows quicker and to a greater height than our oaks; but it is less valuable, because softer in texture, lighter, and less durable; it is also lighter in shade than English oak.

26. The oak is to be found in almost every climate, but thrives best towards the northern parts of Europe, that being the most compact and durable which is grown in a dry and sandy soil and an exposed situation; much moisture causing expansion, and giving bulk without nourishment or firmness of texture: oak so reared also splits more easily than the former, and is more liable to shrink and swell with the changes of the weather.

27. The age at which the oak is considered to reach maturity is 100 years; that period is therefore the best for cutting it down; it certainly ought not to be felled earlier than at 60, nor allowed to exceed 200, although under favourable circumstances the tree may attain the age of 1,000 years. The average quantity of timber that is obtained from trees which have been allowed to reach maturity is a load-and-a-half, or seventy-five cubic feet; but it too often happens that they are cut down before they produce a load of timber.

The best time for felling is in summer, the timber cut down at that season being the most durable, supposing the common mode of treatment only to be adopted; but as the bark, which is very valuable for tanning, is not easily detached from the trunk when the sap is at rest, the method referred to in Art. 9 is sometimes pursued, by which it is obtained in the readiest manner and best condition, and the timber left for felling when most fitting or convenient, say after the fall of the leaf, a practice which not only improves the sapwood, rendering the timber heavier and stronger, but also makes it less liable to engender worms, and to decay. The sap-wood of oak (of which the proportion is not so great as in fir) is by steeping made less subject to worms, and is otherwise improved. Green oak is said to suffer in seasoning a reduction of from one-third to two-fifths of its weight. The shrinkage in its width has been ascertained to be about one thirty-second part.

28. The annual ring in oak presents a compact and a porous part, the former being the darkest in colour; the pores in the sap-wood are large and numerous, and distinctly apparent; the larger septæ are usually very distinct, but the smaller they are, and the more minute the pores, the greater the strength and durability of the timber; also the less that the brown colour approaches a foxy or red shade, the more superior it is. On cutting oak in an oblique direction, much beauty in flowers and veins is discovered, originating in the septæ and mixed texture of the wood.

MONUMENT TO WILSON, THE ORNITHOLOGIST.—A subscription has been commenced at Paisley for the erection of a monument to the memory of Wilson, the celebrated ornithologist, who was a native of that town, and originally a weaver there.

COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. VIII.

COLUMN—DORIC.—Of existing remains of the Grecian Doric, the earliest known specimen is the Temple at Corinth, of which the columns, whose shafts are monolithic (or consisting of a single stone), are little more than four diameters in height; in the latest recognized examples of Greek taste, the columns are found to be in height nearly six diameters and a half. Between these two extremes, in the former whereof we see the nearness, both in date and character, to the massiveness of

Egyptian architecture, and in the latter when Roman innovation had already interfered with the purity of Greek taste; between these two we find a proportion which has been always looked upon as the perfection of this order; this proportion is found in buildings which are clearly ascertained to belong to one period, viz., the age of Pericles, wherein the most consummate taste and the highest skill bad the direction of the public buildings. The following table exhibits at one view the proportions of the columns in some of the principal buildings in Greece and its colonies, concluding with the scale which the Roman and Italian schools assigned to the Doric:—

Date of Erection.	Name of Building.	Name of Architect.	Height of Column.	Diameter.	Number of Diameters high.	No. of Columns in Portico.	No. of Columns on the side.
About 800 B.C.	Temple at Corinth . . . .	—	Fl. In. 23 8	Fl. In. 3 10	4 <sup>2</sup> / <sub>3</sub>	6	—

Palladio, Vignola, De Lorme, and others of the Italian school, assigned eight diameters (including the base as well as the capital) for the height of the column, whilst Scamozzi gives 8 <sup>1</sup>/<sub>2</sub> diameters. Sir William Chambers, in his plate of a column, which he calls the Doric order "in its improved state," follows the proportions of Palladio and Vignola.

By a reference to the table, it will be seen, that in the examples of the best era, that of the Parthenon, the columns are found to exceed five, and to be less than six, diameters high; difference of situation, or other local circumstances, might affect the proportion in some slight degree, but it will be seen that Ictinus adhered very nearly to one standard.

Lord Aberdeen is inclined to test the antiquity of a building, by comparing the proportion of the capital to the shaft; but Mr. Gwilt prefers "a judgment from the height (of the column) as compared with the diameter, to any other criterion; although it must be admitted that it is not an infallible one." (Encyc. p. 63.) The same excellent critic observes, that "the origin of the Doric order is a question not easily disposed of. Many provinces of Greece bore the name of Doria; but a name is often the least satisfactory mode of accounting for the birth of the thing which bears it." Colonel Leake, and many other authorities, consider that the Doric order arose, as soon as internal tranquillity followed the return and settlement of the Heraclidae in Peloponnesus, 825 B.C.; and that it began in those cities which were the earliest seats of art in Greece, viz. Sicyon, Corinth, and Argos. Professor Muller says, that "the order is not improperly termed Doric, inasmuch as it was

brought to perfection in the Doric cities;" and that Corinth was the first place "where the front and rear parts of temples were finished with pediments, the tympanum being adorned with statues of terra-cotta."

In the opinion of the same writer, the Doric architecture was created by the Doric character, and displays therein "the peculiar bias of the Doric race to strict rule, simple proportion, and pure harmony."

Unfortunately many temples, of which we read, have entirely disappeared—as that of Juno, at Argos, said to have been the very first Doric erection, considered as a specimen of the order, and the temple of Jupiter at Olympia, by the architect Libon—still enough has been spared to later times to justify the admiration of posterity; and in the unrivalled Parthenon and the Theseum, we have two examples which have been so accurately measured and delineated, as to leave no cause for regret but the ravages of man—for time seems to have respected such admirable relics of taste. "For all the highest effects, which architecture is capable of producing, a Greek peripteral temple of the Doric order is perhaps unrivalled." (Hosking.)

To correct an optical deception, the Greeks made the columns at the angles of buildings thicker than those in the middle; at the Parthenon this increase is one-forty-fourth—at the temple of Theseus one-twenty-eight—the Vitruvian precept is that it should be one-fiftieth part of the diameter.

It may be taken as an invariable rule that the Greeks always fluted their columns, and it is remarkable that the axiom that "the exception proves the rule" has peculiar force in this respect. For, either from motives of economy or other unexplained cause, some examples are found in which the columns are fluted only a few inches at top and bottom, the rest of the shaft being left plain, doubtless to be also

\* Lord Aberdeen and other writers are inclined to place the date of the Parthenon a few years later than the above, the year in which Pericles obtained undivided power by the death of Cimón.

† According to Plutarch; but Vitruvius states that Ictinus designed it.

‡ Has no base.

fluted at some future period. Such examples are found at Eleusis, Rhamnus,\* and Thoricus in Attica, at Ægesta and Selinus in Sicily, and at the temple of Apollo at Delos; and it may be confidently asserted that no column can be mentioned, belonging to a Greek temple, which is not either fluted throughout its whole height, as usually seen, or prepared for the process, as the exceptions declare. The columns at Ægesta are the only instances which at first sight may appear not to come within the full meaning of these remarks, but the peculiar arrangement of their shafts seems to point to some future adornment.

"The refined Athenians had so exalted an idea of the beauty and grandeur of their columns, that no private citizen was allowed to decorate his abode with these distinguished members of their orders which were consecrated by them to the exclusive ornament of their grandest and most sacred edifices." (Bardwell.) Some modern writers, among them Sir William Chambers and Le Clerc, who have a decided leaning to the Roman school, lament the omission of a base to a Grecian Doric column; the latter writer believes that "the ancients had not yet thought of employing bases, or that they omitted them in order to leave the pavement clear, and that had the columns been made with bases, the passages between them would have been extremely narrow and inconvenient." Sir W. Chambers had, with all his undoubted skill and genius, but little veneration for, or even acquaintance with, Grecian art, for he says—"None of the few things now existing in Greece, though so pompously described, seem to deserve notice either for dimension, grandeur of style, rich fancy, or elegant taste of design; nor do they seem calculated to throw new light upon the art, or to contribute towards its advancement; not even those erected by Pericles or Alexander, while the Grecian arts flourished most, neither the famous lantern of Demosthenes, nor the more famous Parthenon, which, though not so considerable as the church of St. Martin, in St. Martin's-lane, had for its architects Phidias, Calliades, and Ictinus, was the boast of Athens, and excited the envy and murmurs of all Greece." Yet the Parthenon exceeds the church by 65 feet in length, 20 feet in breadth, and has 42 more columns, those of the church being 3 feet 4 inches in diameter, whilst in the Greek temple they are 6 feet 1 inch.

Mr. T. L. Donaldson claims the merit of being the first to notice that some of the columns of temples are not placed quite perpendicularly. "The axis of the columns of the Parthenon, both on the flanks and on the fronts, as well as those of the temple in Ægina, and of Concord at Agrigento, have a considerable inclination inwards (a circumstance I am not aware to have been before noticed), though not to such a degree as required by Vitruvius, and not confined, as he directs, to the columns of the peristyles only." (Vol. IV. Stuart's Athens.) Vitruvius thus directed: "The bases being thus completed, we are to raise the columns on them. Those of the pronaos and posticum are to be kept with their axes perpendicular, the angular ones excepted, which, as well as those on the flanks right and left, are to be so placed that their interior faces towards the cella be perpendicular. The exterior faces will diminish upwards as above mentioned. Thus the diminution will give a pleasing effect to the temple." (Gwil.'s Vitruvius, b. 3, c. 3.)

Mr. Jenkins (also in the fourth volume of Stuart's Athens) adds to the examples named by Mr. Donaldson, the temple of Theseus, the Erechtheum, the Choric monument of Lysicrates, &c., as instances in which the Vitruvian precept was in some measure corroborated.

In Mr. Bartholomew's "Essay on the Decline of Science in Architecture, &c.," the same point is thus scientifically explained. "The ancients, knowing how much more secure were their fabrics when made to settle together and consolidate by their own gravity, set the lateral columns of their temples with their axes falling towards the cells, so that the inner faces of the shafts of the columns should be perpendicular, and the outer faces of them receding the whole quantity of columnar diminution in order to afford to the building a more solid, pyramidal, and graceful appearance; and by this shrewd device they rendered the

avenues between the side walls and the colonnades of their temples no wider next the soffits of the architraves than down upon the pavement; and it is not improbable that the preservation of this symmetry led to the omission of the inner columns of the ancient pseudo-dipteral temples; whereas the moderns, in general, not attending to this dynamic and optical nicety in architecture, so set their columns that when we walk down a modern colonnade, we cannot divest ourselves of the idea that the axes of all the columns are falling outwards; and, indeed, accurate admeasurement would often find this to be no illusion, since the work, not erected so as to fall together, will, in general, with the slightest inevitable settlement, expand at its upper part." (Part I., c. 51, 453.)

The Greek word usually employed for column is *στυλος*, *stylos*, which is found connected with other words, as *peristyle*, from *περι*, about, used when a building is set about with columns; *epistyle*, from *επι*, upon, for the architrave, which rests upon the columns; *stylobate*, which signifies a base under columns, &c. The arrangement of porticos, as to the number of columns and distances between them, is also expressed by words compounded of *στυλος*, and others, which will be explained in due course. Mr. Hosking considers that "the word *style* would be more correct than order, as it would indicate the column as the feature referred to, without conveying the idea of fixed rules." The word used in Homer, *κίονες*, *κίονες*, *κίονες*, may be rendered as meaning lofty posts, or pillars, rather than columns of a cylindrical plan, which formed no part of the exterior of the Homeric palaces.

G. R. F.

#### THE NATURE OF DESIGN.

*A Paper read at the meetings of the Decorative Art Society, March 15th and 27th.*

BY MR. CRABB, V.P., MEMBER OF THE INSTITUTE OF FINE ARTS.

A CORRECT understanding of the nature of design being essential to the proceedings of our society, I have attempted in the paper of this evening a short notice of its origin and progress, the resulting benefits and present position, upon the continent and in England. The general tenor is a broad consideration of the subject; details and critical notices of the distinct styles of ornament, and upon outline, colour, teaching for design, and other leading points being intended to occupy separate papers. These will constitute an important portion of the advantages of this society; although I cannot disguise from myself, that the free communication of valuable practical information (extensively known but to few of us) must necessarily depend upon contingencies yet to be developed. We are proposing to collect, classify, and diffuse information, that long since ought to have been publicly given through the Government School of Design, and to what extent we can privately afford to make our experience known is uncertain.

The term *design* admits of various explanations, according to the nature of its intended purpose; the most concise and specific meaning is *delineation of objects* through the acquired medium of geometry, optics, and colour. A knowledge of these may be possessed, and the faculty of delineation exist, without any creative power of mind, and therefore the real and true meaning of the word is discovered when to these capabilities is added the genius of originating; embodying such combinations as have not been previously known, and are capable of amalgamation under the admitted governing laws of nature and of taste. This power is found to result from a careful study of nature, and an accumulation of the sound principles and excellencies of our great predecessors in art; producing in combination new arrangements and beauties, in proportion to the originality of conception and power of invention in the artist. Manufacturing design requires different modes of treatment, that it may accord with the nature of the material to receive embellishment; but the laws or great principles are known to be unchangeable; thus a silk damask or an iron railing may be designed from the same given quantities of proportion. A division under the heads of outline, light and shade, and colour, will enable us to make a classification for its distinctive application to weaving, printing, wood, metals, and other great branches of trade; each

requiring special instruction to produce successful design. Fitness of purpose is another essential, and doubles the value of the art; nowhere can we so perfectly study this portion of design as throughout the works of nature, where it is discovered in unity with embellished elegance of form and wisdom of application.

The human figure is a beautiful illustration of the possibility of combining great mechanical power with the most graceful contour and action; the general design affords extensive varied power of motion,—the detail shows the most profound skill in adapting the form of each bone to its respective office,—the provision of pro and antagonist muscles, their form, insertion, and beautiful mechanical action, discover a profound design, and the disposition of each part being considered with relation to the production of a perfect whole, we have the upright and commanding figure of mankind, capable of exhibiting the athletic muscular massiveness of a Hercules or the feminine loveliness of a Venus. The animal creation is replete with graceful beauty, subject to fitness of purpose. The horse and his numerous varieties present noble examples. What majesty is exhibited in the lion! ponderous limbs, breadth of shoulders, clothed with a magnificent mane, thin flanks, and enormous muscular strength. Opposed to this king of the forests we find the lightly moulded, elegant gazelle, whose pace is on the wind, and

"Who glads one by its fond blue eye."

In the vegetable world no grace of form, no colouring is wanting; the most studied productions of man are as nothing compared with the resulting effects of a gorgeously varied tropical vegetation: through all the striking varieties of the stately palm and small-leaved cedar, to bowers of citron and acacia, with colouring and contrasts, frequently displayed upon a gigantic leafage, instructing, but defying the humble imitative art of man; from the most delicate hue of green, warm or cool, to those of intense depth, mingled with bright scarlets, deep crimsons, and a profusion of brilliant and secondary colouring, blending into repose with the tertiaries. Imagine for one moment a woody scene under the dazzling tropical sun, with all its curious varieties of shape in tree and foliage, the jungle balf choked by tall grass and knotted reeds; then picture the gay and glittering plumage of the birds, from pale amber to deep golden yellows, rich purples, russets, the finest reds and glistening blues! what a study for the decorative colourist! 'Tis thus nature teaches the principles upon which her sister art should found the theories of her charming imitations. Unpossessed as we are of tropical advantages, let us endeavour to appreciate the value of those we enjoy. The horticulturist presents the choicest flowers of every clime, and the botanical garden will give us some idea of the palm and olive; we have the acacia, the stately chestnut, the mountain ash, with its peculiar leafage and clustered bright scarlet berries; our fields, our hedges, and the varieties of trees common amongst us, afford materials for studying portions of design in a way that may be rendered most profitable and most agreeable. Many a common plant presents a diminishing elegance, a graceful flow of line, colouring, and hints of much value; the fine-shaped leaves in this class are replete with instruction; exquisite tints are often seen on the withering moss-rose leaf; the whole science of colouring is there exemplified; yellow, a primary, continued through the russets to the primary red, often very brilliant. Who, that has viewed the rich hues of autumnal colouring, but must feel the varied tones to be a source of admiration? and how much more so when he can deduce the whole apparently endless variety from three simple original colours? But apart from other considerations, there is scarcely any ornamental production in which some object from the vegetable world is not introduced, and for correct delineation we ought therefore to be intimate with its original source and habits. The trees about bursting into bloom will afford delightful examples: render them therefore useful to yourselves by making notes of your observations; there will be the deep pink of the almond, the delicate hue of the clustered apple blossom, and the pyramidal flower of the chestnut, a fine mellow white, of peculiar crisp-like character, relieved and inspired by a dash of crimson.

(To be continued.)

\* At Rhamnus the columns of the pronaos are actually fluted throughout the length of the shaft in front.

## Law Intelligence.

VICE-CHANCELLOR'S COURT, JULY 24.  
(Before Sir L. Shadwell.)

BUNNETT AND ANOTHER v. SMITH.

This was a motion by the plaintiffs, as patentees of certain improvements in the construction of iron revolving window-shutters, for a special injunction to restrain the defendant from manufacturing and selling shutters, alleged to be an infringement of their patent. A patent was granted to the plaintiff, Bunnett, in June, 1836, and the specification described his shutters to consist of a series of partially overlapping strips or plates of iron, or other metal, so connected together by a particular description of crank, butt-hinge, that the knuckles of the hinges should be hidden by the partial overlapping of the plates, and without such plates being cut away at the upper edges to let in the knuckle of the cranked hinge, which arrangement the plaintiff claimed as the first feature of his improvements; and the specification also described a plan of applying an endless screw and toothed-wheel to the roller on which their shutters revolved, for the purpose of raising and lowering not only shutters as above described, but any shutters used before the date of his patent, and this arrangement formed the second feature of his improvement; and it was for an alleged infringement of the plaintiff's patent in these two particulars that the plaintiff sought the injunction of the court. The plaintiff in his specification disclaimed the various portions of his shutters and lifting-gearing *separately*, admitting that each was *per se* old and well-known in principle and in use, previously to his obtaining the grant of Royal Letters Patent, but rested his claims entirely on the combination of the whole. The circumstances which gave rise to this motion were as follow:—It appears that Messrs. W. Cubitt and Co., the eminent builders, of Gray's-inn-road, are engaged in making considerable additions to the banking premises of Messrs. Smith, Payne, and Co., in George-street, and Mansion-house-place, in the City, and it being determined that iron shutters should be adopted, application was first made by the surveyor of the works to the plaintiffs, who furnished drawings of their shutters and gearing, and gave information as to the smallest space within which they would revolve; but the surveyor finding that the space required was more than could be afforded in the building, applied to the defendant, Andrew Smith, of Princes-street, Leicester-square, who is the manufacturer of an improved iron revolving-shutter, and was there shewn specimens of the defendant's shutter, which it was stated would occupy less space than that of the plaintiffs, and exhibited other advantages, by reason of the outer strips or plates of the shutters being connected by a peculiarly constructed chain, consisting of alternate links of wire and flat plates, in lieu of the crank-butt-hinge of the plaintiffs; the shutters being raised and lowered by means of an endless screw and tooth-wheel, similar in principle to that used by the plaintiffs (which is old and well-known), though differently arranged by defendant, so as to further economise space; and upon looking into the relative merits of both, the surveyor determined on having Mr. Smith's shutters, as being manifestly superior in many respects to the plaintiffs; and Messrs. Cubitt and Co. accordingly gave orders for numerous shutters to be affixed to the windows of the building in

question by Mr. Smith. The work was accordingly proceeded with by the defendant; and in consequence of an intimation from the plaintiffs to Messrs. Cubitt and Co. that legal proceedings would be taken by them against the defendant for an infringement of their patent, he (the defendant), on the first day of July, wrote them a letter, denying that he was infringing their patent, and asserting his right to manufacture and affix shutters and gearing on his own principle, as being wholly distinct from theirs, and greatly superior; also challenging them to try the question of law at the next Surrey assizes, or by arbitration, and offering to afford every facility for effecting that object with as little loss of time as possible. This was, however, not accepted by the plaintiffs, who preferred to file their bill in Chancery against defendant, and in such suit to adopt the present motion. It was contended by Mr. Bethell, with whom was Mr. Bacon on the part of the plaintiffs, that the chain of the defendant was a colourable and evasive imitation of the first head of their patent, and that the lifting gearing used by the defendant was also a colourable and evasive imitation of the lifting gearing claimed under the second head of their patent; on the other hand it was contended by Mr. Stuart and Mr. Thomas Turner on behalf of the defendant, firstly, that the plaintiffs patent was altogether bad and invalid on several grounds, and that therefore the plaintiffs could not be entitled to the interference of the Court, but should be left to their remedy at law; secondly, that even if the patent was good, the defendant's chain was in nowise similar, either in appearance, principle, or effect, to the crank-butt-hinge of the plaintiffs, but infinitely superior in point of strength, security, durability, and economy of space, as was evidenced by the selection of Messrs. Cubitt, and therefore could be no infringement; thirdly, that the lifting gearing of the defendant, although similar in principle to the plaintiffs, was differently arranged, and so as to produce a much more beneficial result, and therefore was no infringement of the plaintiff's patent; and lastly, that inasmuch as the plaintiffs had specified, for a particular combination of old parts, they were not entitled, nor could they restrain the defendant from using any of the respective parts unless he also used the whole. Numerous affidavits of scientific gentlemen and others were put in by both sides and read, and various models, shewing the relative constructions and arrangements of each party were exhibited, and amongst the evidence brought forward by the defendant to shew the non-existence of novelty in the plaintiff's patent, were affidavits to the effect, that iron revolving-shutters of a similar construction to the plaintiff's fastened by hinges on the same principle, made in nearly the same particular manner, were in use long prior to the date of the plaintiff's patent. Also the particular description of machinery used for raising and lowering the plaintiff's shutter, and claimed by him, in his specification, was patented, and in use about thirty-six years ago for closing and opening window shutters. And in shewing that the plans adopted by the defendant were not the same as claimed by the plaintiff, it was demonstrated that they were essentially different in construction and effect, although producing the same result, but in a superior manner, which creates alone a difference.

His Honour the Vice-Chancellor said, that where a patent was found to have existed for a period of eight years without any dispute, it was not the habit of the Court to scan very narrowly the expressions used in the specification, and to affirm that because the language was not as clear as it might be, that therefore the patent was bad. The long acquiescence of the public rather afforded *prima facie* evidence that the patent was good. But what pressed upon his mind was, whether the plaintiff had not so described the operation by which a part of the invention was managed, as in effect to permit the defendant to do what he contended the patent left him the right to do. There appeared to his Honour to be a difference in the mode by which the operation of winding up was effected in the two inventions, and it appeared to his Honour that the whole scheme of the thing was to make a succession of hinges, which were so placed that the successive lateral bars lapped over

each other, and thus concealed what his Honour might call the cardinal virtues of the whole thing. The second part of the specification regarded the rolling up of the shutter so constructed, and this was effected by "the revolving power of one hinge being made to depend upon a piece of the next hinge." Now, in the defendant's alleged piracy his Honour saw a different piece of machinery, for instead of making the revolving power of one hinge, according to the plaintiff's specification, depend on the adjoining hinge, the defendant did not make his hinge come in contact with the next hinge. It might be for a jury to say whether this were an infringement of the patent or not, but his Honour was not called on to decide such a question on a motion of this sort. It was the custom of the Court in granting injunctions to do as little injury as possible, and therefore he thought the proper course was to make no order on the motion, but let the plaintiff proceed forthwith to establish the validity of his patent in an action at law, as proposed by the defendant previous to this application for injunction.

The case occupied the Court for five hours, and excited great interest. Amongst the auditors, many scientific and practical gentlemen engaged in the engineering and building professions were observed.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

York Minster was re-opened on Sunday, the 7th instant, having undergone a complete restoration.

The consecration of the new church at Yeodon, near Leeds, by the Bishop of Ripon, took place on the 19th inst.

The intended Roman Catholic cathedral at Bristol, which has long remained in an unfinished state, is announced for sale.

## RAILWAY INTELLIGENCE.

*Important Railway Meeting at Banbury.*—A most important meeting took place on the 11th inst. The Messrs. Stephenson (engineers of the London and Birmingham Railway), Mr. Brunel (engineer of the Great Western Railway), and most of the influential inhabitants of the town and neighbourhood, numbering about eight hundred, were present. The first speaker, Mr. Elgie, of Worcester, advocated the adoption of a line from the terminus of the Great Western Railway at Oxford, to Wolverhampton, through Worcester and Banbury; the second, Mr. Barlow, advocated the extension of the Great Western line from Oxford to Rugby, through Banbury; the third, Mr. Carter (who represented the London and Birmingham company), advocated a line from Weedon to Worcester, passing near Farnborough, through Banbury to Oxford; the fourth, Mr. Hodgson, of Stockton, spoke in favour of a line from Oxford to Banbury, through Farnborough, Southam, Leamington, and Warwick, and thence to Birmingham direct. The proposition of the second speaker was carried without one dissenting voice, which virtually included that of the first, and we may now safely augur, from what transpired at the termination of the meeting, that ere long, under the same patronage, the fourth proposition will be carried into effect.—*Warwick Advertiser.*

*Rival Railways to Ashton.*—The great contest which has been proceeding in Parliament during the whole session between the Manchester and Leeds Railway and the Manchester and Sheffield Railway, in reference to the two Ashton lines, has at length been brought to a conclusion, the House of Lords having confirmed the decision of the Commons in favour of both the Ashton-under-Lyne and Stalybridge Branch Bill, and the Ashton, Stalybridge, and Liverpool Junction line. The Sheffielders are the defeated party in the contest, they having opposed the passing of the Liverpool Junction, as vitally endangering the prosperity, not merely of their Ashton branch, but also of their main line itself. To the Manchester and Leeds Company many reasons combine to render the victory they have achieved one of paramount importance.

**Lancashire and Yorkshire Junction Railway.**

—This line is projected to connect the Blackburn and Preston Railway with the Leeds and Bradford Railway, passing through or near the several towns of Blackburn, Church, Accrington, Whalley, Clitheroe, Padiham, Burnley, Colne, Skipton, Keighley, Bingley, Shipley, and Bradford, forming a continuous line from the port of Hull on the east coast, to the ports of Liverpool and Fleetwood on the west coast, with a branch at Accrington, through the town of Haslingden, to the Manchester, Bury, and Rossendale Railway—forming a direct communication with the town of Manchester. The length of railway to be made, including the branch at Accrington, will be about forty-five miles. A branch to Skipton is also suggested. Sir George Strickland, Bart., M.P., Sir C. R. Tempest, Bart., R. Townley Parker, Esq., C. Roys, Esq., M. Wilson, jun., Esq., and other gentlemen interested in the district through which the line will pass, are members of the Provisional Committee. — *Railway Record.*

**York and Scarborough Railway.**—On Wednesday week the directors of the York and North Midland Railway held a meeting at the board-room, to receive tenders for the making of 44 miles of the Scarborough Railway and branch to Pickering. The work was divided into four sections, but the directors accepted the tender of Mr. Crawshaw, who tendered for the execution of the whole distance. The contractor's tender is under the engineer's estimate, and fully justifies Mr. Hudson's statement as to the cost of the line.

A petition from the Hull and Selby Railway Company against the Government Railways Bill was presented to the lower House on Thursday week. The York and North Midland and the Manchester and Leeds Railway Companies have also petitioned against the Bill.

The Leeds and Bradford (valley line) Railway received the royal assent on Thursday week. The line will, it is expected, be completed within two years.

**THE NEW ROYAL EXCHANGE.**

This edifice is rapidly approaching completion, and at present no obstacle is apprehended that will delay its being opened beyond the early part of September. The Gresham committee have not as yet appointed the day, although preparations are going on to celebrate the event, so as to render the ceremony of an imposing and interesting character, it being clearly understood that her Majesty, accompanied by her august consort, will honour the city of London by opening it in person. The exact arrangements have not been as yet determined; it is, however, known that a grand banquet will be served in a spacious pavilion erected in the area, and that the whole proceedings will be conducted in an unusual degree of splendour, well becoming the opening of the most important commercial building in the country. At the recent meetings of the committee some alterations have been arranged, the original intention being that it should be free from all decorative and sculptural embellishments. In the centre of the quadrangle will be raised a marble statue of the Queen. For this work her Majesty has been pleased to name Mr. Lough, the sculptor. The committee have allowed 1,100*l.* for the execution of statues. A new statue of Sir Thomas Gresham has also been decided on. It will be 15 feet in height, chiseled out of Portland stone by Mr. Behnes, at a cost of 550*l.*, and when completed will be placed in the niche at the eastern end of the Exchange, immediately under the tower. The old statue of the wealthy founder, that withstood the ravages of the fire at the burning of the former Exchange, has been preserved, and will be erected in another part of the building. New statues of Sir Thomas Whittington and Sir Hugh Myddelton will also decorate the area—the artist selected for the former being Mr. Joseph, at a cost of 450*l.*; and the latter, Mr. Crewe, at a cost of 430*l.*, who has also been appointed to execute the Royal arms for the western entrance.

The ground between the eastern front of the new Royal Exchange, at the rear of the houses in Finch-lane, is being now built upon by direction of the trustees of Magdalen College, to whom the property belongs. There will be a line of houses from Cornhill to Threadneedle-street, for which purpose the church of St. Benet Fink, it is stated, will be pulled down, the living of which, it is said, will be transferred to a church which will be erected on the site of what was formerly Cripplegate Workhouse, Moor-lane. In excavating for the foundation of the new houses, at a depth of about 12 feet, a large quantity of common Roman and of Roman tessellated pavement was found.

**Correspondence.**

**SHAM COMPETITION.—DERBY PAUPER LUNATIC ASYLUM.**

SIR,—I was much amused at the letter contained in No. 73 of THE BUILDER, on the subject of the Lunatic Asylum competition at Derby; it (the letter) reminding me so very strongly of the old fable of "The Ass in the Lion's skin." We are told by Æsop that the long-eared simpleton, having disguised himself in the skin of one of the kings of the forest, carried all before him, until, wishing to boast of his success, and almost forgetting, in his new-born grandeur, the manner in which he had, as yet unchallenged, borne the palm, opened his unlucky jaws to roar, when "lo!" a violent braying was all that escaped his lips, and thus he betrayed himself a beast.

I have until now remained quiet, in order that I might the better observe the proceedings of those most interested in the matter; but as I do not see in any of the letters on the subject points or facts as strong as I myself am in possession of for believing the competition to have been a mist thrown over the deeds of those who, from the position they occupy in the land, should be —; but of what use will it be for me to say what they should be?—suffice it for me to say that what they should be they are not.

The list of the magistrates of Derby contains names of some of our high nobility, numbers of wealthy men, men known for their honest works—they number in all about 113; of these, about half-a-dozen attended at the meeting of

the committee on the occasion of selecting the plans.

Some friends of mine who competed among the rest, I know produced a plan not without merit—indeed, so good, that a learned physician, the first authority on such a subject, having inspected it, pronounced his decided opinion of its perfection in every respect for the purposes of an asylum for the reception of the insane.

Immediately after the plans were delivered, a pamphlet on the subject of lunatic asylums appeared from the pen of Dr. Brigstock, a gentleman residing at Derby, and who keeps a private mad-house in Green-lane; the idea suggested in this pamphlet was, that all the chambers should be upon the ground-floor, and the disposition of the buildings resembled that of a barrack, a number of detached wards connected to each other, to the chapel, to the kitchen, and to the superintendent's house, by long covered passages, but altogether extending over so much ground, that the idea became preposterous.

A competitor, who was exhibiting a radiating plan for the proposed asylum, called on the author of this pamphlet, and having presented him with a sketch of his design, he was much astonished at the instant remark of the doctor, "Oh, the committee has decided to reject at once all radiating plans; at least, so I am informed by the mayor." The truth of this observation was afterwards proved by the result of the committee's award of the premiums.

At this time the plans had not been seen.

I had an opportunity of inspecting with my friend the whole of the plans, and he remarked to me that two sets of drawings were distinguished by the same mark, viz., a seal bearing a coat of arms; to make sure of this, he examined and compared minutely the two seals, when he found that while the crest on the one (on the drawings also bearing the motto "Curator") was a bull's head rising from out a ducal coronet, the other was the head of an unicorn or horse, although at first sight very similar to the other.

The committee met twice, perhaps thrice, for a few minutes at each time. My friend called on Mr. Barber, the mayor, to know whether it was probable that the matter would soon be settled, but having been informed by that gentleman that it was likely that a fortnight might elapse before the decision was come to, he departed.

At this very moment the decision was already made; no more meetings of the committee took place, the committee having previously selected the design of Mr. Duesbury. A few days after this, my unlucky friend received a letter from the mayor to say that his drawing, not being successful, would be sent to him by rail, &c. &c. Yes, the letter was addressed to him by name, his sealed letter having been actually broken open, by what authority I know not.

The letter is sealed, and at first my friend thinks it a letter from "Curator," for it is sealed with the impression of the bull's head, with arms, as before seen on "Curator's" drawings; but no, it is from the mayor of Derby.

How easy is it to select from a multitude of designs.

The watchword is—The bull's head; the answer—"Curator."

When unanimously adopted by the committee (of half-a-dozen), without even a division on the subject—so great was the superiority of the Bull's-head plan—on examination it was found that the drawings were distinguished by the motto "Curator," and upon opening the sealed letter bearing the like distinguishing motto, to the astonishment of all present, they find it to contain the name of their old friend "Henry Duesbury," of Town Hall notoriety.

There were eighty sets of drawings exhibited, and I am told that on the average, each set must have cost 50*l.*; at that rate 4,000*l.* must have been expended in their preparation.

Trusting that you will not deny insertion to these remarks, and apologizing for thus long intruding upon your valuable time,

I have the honour to remain, Sir,

Your most obedient servant,

Derby, July 20. A TOWNSMAN.

**ARCHITECTURAL GEOMETRY, No. VII.—TUDOR ARCHES.**

SIR,—Having seen in THE BUILDER several articles upon Architectural Geometry, I myself send to you some sketches for three-centred arches. First example, of which the span

only is given. The line *ad* is divided into four parts; from the centre *o*, describe the arc *bc*; from *a* set off the distance *ae*, equal to *ab*; draw *eo* to *h*; then *hgo* will be the three centres for describing the required arch.

Second example, when the height and span of the arc are both given. Divide *a b* as

before; with *a* as a centre, and one-fourth of *ab* as a radius, mark off *e*; draw a line from *e* through *h* to *d*; produce a line from *fh* to *e*; let the given height be *g*; bisect *gf*; let the bisecting line cut *fh* at *c*. Then, with *c* as a centre, describe *fg*; with *h* as a centre, describe *bf* and *ae*, &c. A. K.

Spalding, June 5, 1844.

## Miscellaneous.

**RADCLIFFE OLD HALL.**—This interesting relic of old English domestic architecture was taken down a number of years ago, to make room for a row of cottages for the workpeople of Mrs. Bealey and Sons, bleachers. It is understood that the Earl of Wilton, to whom the place belonged, sold the materials to the above parties, and re-erected the land to them, and so, in the spirit of modern improvement, the order was given, "Take it down, why cumbereth it the ground?" This venerable pile was highly interesting to all who loved to gaze on the relics of other days; and it was probably calculated to convey a more correct idea of the rude but strongly built habitations and festive halls of our forefathers than any other object to which the curious of this neighbourhood had access; and by them, no doubt, its destruction has been much regretted. Sir Walter Scott directed public attention to Haddon Hall, as a representative of the halls of the early Norman or latter Saxon chiefs; but the hall at Radcliffe must have been much older than Haddon Hall, as Sir Walter describes it. The materials at Radcliffe were chiefly beams and planks of solid black oak, which, together with the simplicity of the construction, and the rudeness of the workmanship, testified to the great age of the edifice. What a pity that it could not have been left alone, or rather that it was not deemed worth a little expense and trouble in covering it in once more; that it was not given as a shelter to some half-dozen poor families, on condition of their keeping it in perfect order; it would thus have endured for ages. The square tower, or fortified part of the ancient residence, still remains, but tottering with decay. The vaulted roof of the lower room almost hangs by a single stone; and unless it be protected from further wanton outrage, it must soon share the fate of the hall, and leave only its name in the remembrance of things that have been.—*Samuel Bamford's Walks in South Lancashire.*

**SCOTT MONUMENT.**—Sir Thomas Dick Lauder has received a subscription of twenty guineas from the Marquis of Bute. The Earl of Zetland has contributed twenty pounds to this truly national testimonial. The heads sculptured on the main capitals under the groined arch, now thrown open by the removal of the scaffolding, are likenesses of the principal Scotch poets. The following are finished:—On the north front—Queen Mary, James, I., James, V., and Drummond of Hawthornden. On the west front—Hogg, Burns, Ferguson and Ramsay. On the south front—Buchanan, Sir David Lindsay of the Mount, Tannahill, and Byron. On the east front—Smollett only is yet completed; but the other three—viz., Hume, Thomson, and Beattie—are in progress.

**THE LATE DR. ARNOLD.**—The *Literary Gazette* says, "Having been invited to see the monument about to be erected to the late Dr. Arnold, designed by Mr. J. Thomas, we have to notice a very pleasing return to mediæval forms, executed with great taste. Under a Gothic canopy, it represents the late eminent scholar, in academic costume, lying on his back, with his hands uplifted and folded together on his breast. The head rests on a massive volume. The likeness is grave and expressive; the drapery simple and well composed; the pinnacles, traceries, and other ornaments subordinate, and good in style. The whole effect does credit to the artist."

**FINE ARTS.**—The following extract from the report of her Majesty's Building Commissioners, which is so complimentary to our townsman, Mr. Rogers, will be read with interest in this locality:—"It is the opinion of the committee that among the carvers whose works have been exhibited, Mr. W. G. Rogers holds the first place; and they consider him as the person best qualified to be entrusted with those parts of the wood-work of the House of Lords in which great richness of effect and delicacy of execution are required. (Signed) Mahon, Colbourne, J. B. Macaulay, B. Harris, jun., George Vivian, Thomas Wyse.—*Dover Chronicle.*

The Pulteneytown Harbour Improvement Bill has passed the House of Commons. The estimated expense for completing the works amounts to 26,900*l.* 5*s.* 3*d.*

**THE IRON TRADE.**—The quarterly meetings of ironmasters were held during the past week, as usual. During the last quarter the trade has been in a healthy state, the demand steady, and the prices for all descriptions of iron fair and remunerating. It was, however, expected that there might have been a downward tendency, the masters being less flush of orders than at the beginning of the quarter, and some forced sales having been made in Liverpool and London, at rates rather below the market price. Notwithstanding these circumstances, and although some slight indications of a fall were given at Wolverhampton on Wednesday, at the meeting in this town on Thursday, which is justly considered the most important, former quotations were fully maintained, and several considerable contracts for Staffordshire bars were entered into at 7*l.* per ton prompt, and other descriptions in proportion; for forged pigs some efforts were made for an advance. The number of railway hills passed during the present sessions, the steady demand for manufacturing purposes arising from the improved state of trade in general, together with the increasing application of iron as a material to purposes for which it had not previously been used, all concur to strengthen the conviction that the present fair price will remain steady during the current quarter. It mainly depends upon the ironmasters themselves to preserve the trade in its present satisfactory state; but if, on the one hand, by a hasty attempt to force up prices, the demand is suddenly checked; or on the other, by a rapid increase of works, or the bringing into operation too many of those which have been suspended, the market be overstocked, and a ruinous competition created, the present prospects of the trade may be effectually marred. Of the latter of these evils there are at present too many indications; and it is to be hoped that by timely caution the consequences may be averted.—*Birmingham Gazette.*

**MAGDALEN COLLEGE, OXFORD.**—The splendid tower of Magdalen College, that soars to the height of 150 feet, was last week struck by lightning, and one of the pinnacles much shattered, several large stones being hurled into the street. One of the servants of the college, who was passing at the time, had a miraculous escape, being struck down by one of the fragments, which fell on his umbrella and hat, but we are happy to state he was not materially injured. The staircase of the tower, also, is much injured by some of the stones that were forced into it. The same turret, we believe, was struck in a similar way eight years ago, on St. Switin's day.

**KING WILLIAM'S COLLEGE, ISLE OF MAN.**—The restoration of King William's College is progressing rapidly. The workmen are now engaged upon the roof, and the chapel is also in a state of forwardness. The patrons and friends of the institution are sanguine that the annual meeting for the distribution of prizes, on the 4th of June, will be held within the walls of the renovated building. The edifice was insured for 2,000*l.*, but the estimate of the necessary repairs was 3,100*l.*; the trustees, however, calculate on a gross expenditure of 4,000*l.*, thus leaving a deficiency of 2,000*l.* to be provided for.

Mr. Baily, the Royal Academician, has just completed his model of the statue of his Royal Highness the late Duke of Sussex, which, when completed in marble, is to be placed in the large room at Freemasons' Hall. The statue is of colossal dimensions, being about double the size of life, and his Royal Highness is represented standing upright, in the action of addressing an assembly. He is habited in the robes of a knight of the Garter, and, in addition, wears the insignia of the Guelphic order. At the side is placed a small altar, on which the masonic emblems are figured.

**A WINDMILL FOR SAWING.**—The gable ends of cottages often exhibit a very primitive windmill for sawing wood within doors. It is a large wheel, the spokes of which flappers are adjusted, made of coarse matting, and so placed as to profit by the ordinary sea breeze; and, while the *wind* is thus *sawing* his planks for him, the carpenter, at his door, carries on his craft.—*Blackwood.*

**HUNGERFORD SUSPENSION BRIDGE.**—One of the principal rivet chains has been completely swung across the river and secured to its arches.

## MARKET WESTON, NEAR EAST HARLING.

—It has long been a well-known fact, that metals will expand by heating, and contract in cooling; and this principle was most successfully applied on Monday week, and two previous days, in bringing upright the north side wall of Market Weston Church, which had declined full 18 inches from the perpendicular. The length of this wall was 54 feet, the height 24 feet, and 2 feet 9 inches in thickness. To accomplish this object, three iron bars, 36 feet long and 2 inches square, having powerful screws, of the workmanship of Mr. George Blomfield, Thelthetam, were passed from one side of the church to the other: enclosing these were sheet-iron troughs, containing ignited charcoal; which, after the bars were sufficiently heated, were removed, and the bars allowed to cool gradually. By this process, on their first contraction, the walls were brought in 5½ inches; on the second, 4½ inches, and on the third and fourth heatings, full 8 inches. The coming to of the inclined wall was very slow, but the result satisfactory, not even the surface being in the slightest degree defaced. The restoring of the church, which was in a very dilapidated state, was from plans and designs of L. N. Cottingham, Esq., London, under the immediate personal superintendance of Mr. John Reid, builder, Ixworth. This novel experiment is said to have been the first successful one made in England, although Mr. Cottingham adopted this method in restoring the walls of Armagh Cathedral, Ireland, which were two feet out of the perpendicular. So much interest had been excited on the occasion, that during these days many of the neighbouring clergy and gentry with their families were present.

**DISCOVERY OF AN ANCIENT ALTAR STONE AT BRANTINGHAM.**—The old Roman Catholic altar stone has lately been found in the pavement of the parish church of Brantingham, in this tiding. It is now removed (with the permission of R. F. Shawe, Esq., and Mr. J. Beaumont, under whose seats it partly was), and placed for the present within the communion rails. It is broken into two parts, but is very nearly perfect, and has on it the five crosses with which the altar stones were formerly marked. This stone is curious, as there are very few of them now left in our churches. They were forbidden by an express injunction of Edward VI.; and their removal was made an article of inquiry in the visitation of several bishops in the reigns of both Edward and Elizabeth.

A silver coin of the reign of the Emperor Trajan, in excellent preservation, was lately dug up at the Cherry Garden Farm, the residence of Mr. Ford, at Kilmersdon, near Bath.

The Royal Naval School at Deptford is nearly built, at a stated cost of 16,000*l.*

## Tenders.

**TENDERS** for building Wesleyan Chapel, &c., Landport, Portsea.—A. Frimem, Esq., Architect, Adam-street.

Absolon, Portsea .....	£2,453	0	0
Genett, Portsea .....	2,390	0	0
King, &c., Portsea.....	2,245	0	0
Hendey and Son, Portsea	2,264	0	0
Low, Guildford .....	2,165	0	0
Wells, &c., Portsea .....	2,150	12	0
Nicholson, Wandsworth..	2,115	0	0

**TENDERS** for Works for Stabling and Residence adjoining the Plough Tavern, Shorehitch, for Mr. Thomas Harford Cox.—Mr. Thomas Ward, Surveyor, 95, Kingsland-road.

W. H. Little .....	£767	14	0
Little and Oakshott .....	700	0	0
T. Wythe .....	650	0	0
Hervey and Son.....	560	0	0
R. Briant .....	481	10	0
B. Chesterman .....	426	0	0

Opened in the presence of the several parties, and the lowest tender accepted.

The Builder.

NO. LXXVIII.

SATURDAY, AUGUST 3, 1844.

THE session drawing to a close, we can have little expectation of much more being done in Parliament with regard to architecture and building. The new Metropolitan Building-Act, which passed its second reading in the House of Lords on Monday last, went into committee on Tuesday, and was brought up again on Thursday, we doubt not is being finally passed while we are in the act of publishing.

On the whole, while some may find particular parts of this Act to cavil at, it may be taken as an excellent measure. We may ourselves wish some few things in it had been otherwise; but considering in how many cases we have been listened to attentively, and have had our suggestions adopted to the very letter, we do not mean to shew ourselves dissatisfied; and we may congratulate the public on the consummation of a piece of architectural legislation, which, from its difficulty, has occupied many years in its incubation; so easy has been suggestion, but so difficult satisfactory amelioration and general agreement of differing interests upon so technical a subject.

On the whole, we think great credit is due to the department from which the measure has emanated—the harsher parts of the first proposal of the present Bill being mostly softened down, and in fact almost every person whose opinion upon the subject is of any value, and who has taken the trouble to speak out upon it, has been listened to, and the measure may be taken as a congress-opinion of the metropolitan building-world; and if, upon a practical trial of the Act, any alteration be found necessary, we little doubt the sterling desire to produce an useful, beneficial, unoppressive, and permanent code of building-law will immediately operate to the effecting all, by way of amendment, which may be desired.

The Government seems determined to carry on metropolitan improvement and the announcement with regard to the proposed Thames embankment may be taken as an earnest of the activity which the Government feels to be requisite for upholding and increasing the splendour of the metropolis of the first and richest empire in the world.

The Metropolitan Bill relative to danger by fire, we have already noticed, has been for the present withdrawn.

Our attention being now relieved from the exhibitions and legislation of the year, we shall have time and space for the resumption of our reviews of architectural works; this, with our attention to the subject of parsonage houses, we think will be acceptable to many of our readers. Some of our correspondents have desired us to fill our pages with designs and technical matters, good or bad, so that they may be accommodated with that which

is to be found in many ordinary books; but such is not our desire: without we can furnish good and practicable designs, we rather take the advice of those of our friends, who say, "give none, unless they be really good, and abstain from all common-place information, which most men previously know." We have for a long while past been collecting examples of Gothic architecture, and these, as the opportunity serves, we shall insert; and we have also in preparation a treatise on mechanics and hydraulics, preliminary to their application to engineering and building generally. We have moreover another subject in hand, viz., the consideration of the propriety or impropriety, profitableness or improvidence, of Building-societies. These in due time will make their appearance; we might introduce them more rapidly if we excluded other matters, but we trust our readers would rather bear with us while doing things soundly and deliberately, than be furnished suddenly with worthless or imperfect papers.

W. G. GOVER'S PATENT REMOVABLE WINDOW-SASHES.

We have lately seen a model of the above, which is a simple but ingenious method of constructing new sashes, or altering old ones, so that they may be taken out at pleasure, without removing the beads. By means of Mr. Gover's patent metal stops, windows are made perfectly firm when closed, and the sashes move easily and silently when opened and shut.

In our next number we shall give a detailed description of the patent, which we have no doubt will ere long be very generally adopted as an efficient means of preventing the many fatal accidents which are so constantly occurring amongst servants and others who are obliged to clean the outsides of windows.

METROPOLITAN BUILDINGS BILL. HOUSE OF LORDS, MONDAY, JULY 29.

THE Duke of Buccleuch moved the second reading of the Bill, briefly explaining its object and provisions.

Lord CAMPBELL thought that this Bill was founded on very good intentions, but that its promoters had entirely failed in carrying them out. The Bill came up on the 22nd of this month; it contained 118 clauses and 27 schedules, comprising 107 folios, rather more than the *Code Napoleon*. (A laugh.) The Bill affected property all over the circuit within the bills of mortality. He did not mean to say that legislation regarding ventilation and drainage was not wanted, but this was not the way to go about it. It would take weeks to go through this Bill properly. As far as he could judge, the measure had no judicial determination, and its principle as regarded its interference with private property, where the public interest was not concerned, was, to say the least, extremely doubtful. He therefore moved that the Bill be read a second time that day three months.

The Earl of Cadogan opposed the Bill. The Earl of BESBOROUGH thought, as the measure had been prepared with much care, it ought to be read a second time, in order that its defects might be corrected in committee.

Lord KINNAIRD wished to know how the Government intended to provide for the great number of poor who would be turned out of their dwellings by this Bill after January. It ought not to be forgotten, that a measure for the improvement of Liverpool was some time since found impracticable, in consequence of the Government being unable to provide accommodation for 40,000 persons, who were inhabitants of cellars in that town, and who were proposed to be removed.

The Marquis of SALISBURY suggested, that the amendment should be withdrawn, on the

understanding that the Government would not pass the Bill this session.

The Earl of Wicklow was of opinion that the measure ought to be persevered with.

Lord COTTENHAM said, as this was one of the most important Bills that could be brought before the consideration of Parliament—affecting, as it did, an enormous amount of property in this metropolis, and as none of their lordships had had an opportunity of becoming sufficiently acquainted with it, he should vote for the amendment. It was obvious, if their lordships passed the measure this session, they would merely take it on credit from the Commons and the Commissioners of Woods and Forests. The noble lord on the woolsack, who had often alluded to the inconvenience of bringing forward Bills at a late period of the session, would certainly concur with him in thinking, that a Bill of this magnitude and importance ought not to be passed by their lordships at so advanced a period of the present session.

The Duke of Buccleuch, in reply, said, he had not heard any objection to the principle of the Bill, and noble lords had not made themselves acquainted with its details. The noble duke said he considered it to be his duty to press this Bill to the second reading, and in the committee all the difficulties would vanish away.

Their lordships then divided, when the numbers were—

For the second reading.....	31
Against it .....	8
Majority for the second reading ..	—23

TUESDAY, JULY 30.  
The Bill passed through committee, several verbal amendments being adopted, and the report was ordered to be brought up on Thursday.

EMBANKMENT OF THE THAMES. HOUSE OF COMMONS, JULY 30.

THE Earl of LINCOLN rose to move for leave to introduce a Bill to empower her Majesty's Commissioners of Woods to form a terrace and embankment, with convenient landing-places for the public, on the Middlesex shore of the river Thames, between Westminster and Blackfriars' bridges. It was not his intention to press this Bill during the present session of Parliament. He merely moved for leave to bring in the Bill, in order that parties whose interests it affected, and hon. members of that house, especially the metropolitan members, might have ample time to consider its details, and to form an opinion as to its merits, before the commencement of another session of Parliament. It was, therefore, unnecessary for him to waste the time of the House by urging the necessity of such a measure, to meet the evils complained of in connection with the navigation of that important river on which the metropolis was situated. He would only remind the House, that the year before last a commission was appointed by Her Majesty to take into consideration any improvements that might be suggested; and the members of that commission were deeply impressed with the importance of effecting an improvement in the navigation of the river Thames. That commission drew up a report, which he (Lord Lincoln) laid on the table some three or four months ago; but, as that report was exceedingly voluminous, and accompanied by numerous plans, he thought it would not be right to call upon the House to consider this subject during the present session of Parliament. He conceived that better course would be to consider that report in connection with the present Bill. It had been suggested that the expense of the proposed improvements should be defrayed by a tax upon coals imported into the city of London; but he had not introduced any clause into the present Bill to enable the imposition of such a tax, though he thought, if an impost of this nature could be justified, it would be with the view of effecting the improvements contemplated by this measure. He would not now, however, enter into any discussion as to the propriety or impropriety of such a tax; but he hoped, under the circumstances, the House would permit the introduction of the Bill.

Mr. HURT thought it right to say that if any tax upon coals were proposed, he, and those hon. members whose duty it was to protect the

interests of the inhabitants of the northern districts of this kingdom, would feel it their duty to give their strenuous opposition to the Bill; and he hoped they would be supported by all those who believed there was either wisdom or common sense in the principles of political economy.

Mr. HUME.—If the noble lord had 3,000,000, or 4,000,000, to spare, he (Mr. Hume) would oppose his plan. The increase of the tax upon coals would be attended by most mischievous consequences. The embankment, instead of being an improvement, would be the greatest possible impediment to the navigation, but he would say no more on the subject, as the Bill was to be postponed until next session—"sufficient unto the day is the evil thereof."

Sir F. TRENCH advocated the erection of a new bridge on the other side of the House of Parliament, and proposed that old Westminster-bridge should be continued until the New Houses of Parliament were completed. Instead of putting a tax on coals, he would suggest, that the Government should erect a railroad on the site of the embankment. This railroad would not only pay its own expense, but the expense of the embankment, and would at the same time greatly add to the embellishment of the river.

Leave was then given to bring in the Bill.

#### PROPOSED MONUMENT TO THE MEMORY OF SOUTHEY.

A MEETING took place on Saturday week last, at the Institution, Park-street, to take into consideration the erection of a monument to the memory of Dr. Southey, in Bristol Cathedral. The Mayor, W. L. Clarke, Esq., took the chair, and introduced the subject, commenting upon the claims which Dr. Southey had upon the recognition of the people of Bristol, as a native of their city, who had conferred honour upon the place of his birth, by the manner in which he had distinguished himself in several branches of literature.

J. S. Harford, Esq., after adverting to the high moral tone of Southey's writings, and to the sincere reverence for Christian revelation displayed in them, and observing that the proposed erection of a monument to his memory in Westminster Abbey by no means rendered it a work of supererogation to offer a similar tribute to his genius in the cathedral of his native town, moved, as the first resolution, "That it is incumbent on the citizens of Bristol to give public testimony of the sense they entertain of the worth and genius of Dr. Southey; and that, therefore, a subscription be now opened for the purpose of erecting to his memory, in the cathedral of this, his native city, a monument, ornamental to that edifice, and worthy of the poet's fame"—which was carried unanimously.

The next resolution was in reference to the appointment of a committee, and the following gentlemen were named:—the Right Worshipful the Mayor of Bristol; the Very Rev. the Dean of Bristol; the Canon in Residence for the time being; Sir Charles Elton; Walter Savage Landor, Esq.; J. S. Harford, Esq.; the Rev. John Eagles; Dr. Pritchard; C. L. Walker, Esq.; J. Cottle, Esq.; Rev. T. Grinfield; Dr. Symonds; P. F. Aiken, Esq.; S. S. Wayte, Esq.; J. C. Swayne, Esq.; Jere Hill, Esq.; and C. B. Fripp, Esq. J. S. Harford, Esq., was chosen as treasurer, and the Rev. George Swayne, secretary.

A design, by Baily, for the monument, was then brought forward. It consisted of allegorical figures of Poetry and History, and a large medallion, on which was a profile of the poet in bas-relief. The architectural members were simple, but belonging to the forms of classic art. This design was sent by Mr. Cottle to C. B. Fripp, Esq.

Dr. Budd stated that a resolution had been placed in his hands, to the effect that the thanks of the meeting be voted to Mr. Baily, and that his design be adopted; but he could not help observing that this design, however beautiful, did not appear to be in harmony with the character of the structure for which it was intended, and that on that account he should hesitate to offer the resolution without some amendment.

Mr. Harford remarked, that the confidence which Mr. Baily's name would inspire as to the satisfactory execution of the monument, and the feeling in his favour as a native of

Bristol, would induce many gentlemen to subscribe, if it were understood that the design would be by him, who might not otherwise do so.

Mr. Sidney called the attention of the meeting to recommendations of the Royal Commission on Fine Arts, that, in future, monuments erected in Westminster Abbey should be more in accordance with the character of the building than had hitherto been the case. He thought that, after such a recommendation from such high authority, after a proposition had been seriously considered in high quarters for removing the monuments in Westminster Abbey, and St. Paul's, to a suitable edifice, it would be well to pause ere they decided on adopting a design so entirely unsuitable to the character of the edifice in which it was to be erected. He begged to remind them that there was a numerous society, distinguished not less for their attainments than for the enthusiasm with which they pursued their objects, who were earnestly engaged in renovating the churches of this kingdom, and reducing their ornaments to an ecclesiastical character; and he feared that if a purely classic design, however beautiful, were adopted, the committee would be deprived of an important amount of subscriptions. He did not for one moment venture to criticise the works of Baily, which could not but afford to all who examined them feelings of pleasure and admiration; but he could not consider that this particular design was in the true character for the position designed. It was his anxiety to see erected, not a mere mural tablet, but a monument suitable in character to the ancient cathedral, and yet worthy of the great man whom it would commemorate, and of the great city by which it was to be raised.

The Mayor observed that the design offered had struck him as rather too closely resembling a very beautiful one already in the cathedral, by the same accomplished artist. He referred to that to the late bishop—a medallion and allegorical figures. He suggested that Mr. Baily might be nominated as the artist, although the present design should not be adopted.

F. Ward, Esq., suggested that the nature of the monument should be left open to future consideration, and that the attention of the meeting should at present be confined to determining the means by which it might be carried into effect.

The Mayor then altered the wording of the resolution; when it was put and carried unanimously.

The subject of the subscription-book being broached, J. S. Harford, Esq., suggested, as the most satisfactory plan, that the subscriptions should be small, in order that they might be numerous; as it would be much more desirable that a monument to so eminent a citizen of Bristol should be raised by small subscriptions from a large number of his townsmen, than by large sums only from a few.

A vote of thanks to the Dean and Chapter of Bristol, for permission to erect the monument in the cathedral, and for their liberality in remitting the customary fees, was moved by Sir C. Elton, seconded by the Rev. J. Eagles, and passed.

The subscriptions amounted, including those that had been previously entered, to 150*l.*; 500*l.* is the sum named as required for the purpose in view; but, of course, the nature of the design must depend greatly on the pecuniary means at command.—*Great Western Advertiser.*

#### THE NEW ROYAL NAVAL SCHOOL AT NEW CROSS.

THIS edifice, situate as above-mentioned, and intended, in accordance with the rules of the corporation, as the future scene for the education of the sons of the less affluent naval and marine officers, is almost completed, and the pupils now on vacation will be enabled to enter it on their return, on the 8th of August next; so that Alfred House, Camberwell, formerly known as the Royal Naval School, will no longer be occupied as such. It will be recollected that when the new building was first contemplated, many urgent appeals were made to the public on behalf of the fund required for the erection, and the claims of the British navy to gratitude were earnestly set forth, as were also the objects of the institution, which are not entirely

confined to the education of those intended for the navy, the pupils receiving instruction as the sons of naval officers, that will qualify them for all professions, and the general pursuits of life. Some very liberal subscriptions were subsequently made to the building-fund. His Royal Highness Prince Albert subscribed 100 guineas, and the corporation of London 200*l.* Amongst other subscriptions were those of the Archbishop of Canterbury, 50*l.*; the East India Company, 100*l.*; the Lord Bishop of Elphin, 20*l.*; Mr. Alderman Lucas, 100*l.*; the Earl of Yarborough, 100*l.*; Sir Isaac Coffin, Bart., 200*l.*; Messrs. Drummond and Co., 50*l.*; Messrs. Coutts and Co., 20*l.*, &c.

Her Majesty the Queen Dowager and several members of the nobility are also amongst the subscribers; and his late Majesty William IV. was an annual donor of 100*l.*

The site for this national institution was purchased from the governors of Christ's Hospital and the Clothworkers' Company. The land consists of seven acres, most favourably situated at New-cross, four miles from London, and commands a view of that proud monument of British glory, Greenwich Hospital. The edifice is from the design of John Shaw, Esq., surveyor of Christ's Hospital, and Messrs. Locke and Neesham, of Theobald's-road, are the builders. When completed, the length, according to the plan, will be 280 feet by 170 feet; and when the entire plan shall be carried out, there will be accommodation for 400 pupils. It is at present calculated for 260. The ground-floor contains 17 apartments. In the upper story there are the dormitories, ushers' rooms, wardrobes, library, museum, &c. It appears that about one-fourth of the edifice remains unfinished, and the only impediment to the completion is want of funds, which, it is to be hoped, will not be long withheld.

#### THE NEW COLLEGE OF CHEMISTRY.

IT has long been remarked as a very serious defect in the scientific establishments of this country, that there is in existence no institution especially devoted to the study and practice of chemical science, similar to that of Giessen, presided over by the celebrated Professor Liebig; and that if the student desire to perfect himself in analysis and research, he must resort to the schools of the Continent. With the increasing appreciation of the powers and importance of chemistry, as a science, and the daily extension of its practical application to all the useful arts, especially to agriculture, the deficiency has become more and more manifest; and we are happy to perceive that the first step has been taken towards supplying it by the establishment of a college or school where analysis and research are to be taught practically and systematically, and where the education of the scientific chemist can be completed at a moderate expense. A prospectus or proposal for founding such a college, has been sent to us, from which we extract the following summary of the objects it is intended to embrace.

First, a laboratory, as designed by Sir Humphrey Davy, and on the model of Giessen. Secondly, a college for the instruction of students, and for qualifying public lecturers and teachers. Thirdly, departments for the application of chemistry to especial purposes (as agriculture, geology, and mineralogy, by the analysis of soils, rocks, &c.), to manufactures, medicine, physiology, and the arts. Fourthly, the employment of such means as may appear expedient for facilitating the pursuit of scientific chemistry throughout the country.

These are national objects, and we shall rejoice to see them carried out to the fullest extent. The advantages to be derived from such an institution are so apparent, that we need not enlarge upon them, and we cannot entertain a doubt of the public support being awarded to the undertaking. We may remark, that the list of the provisional council contains some of the first names in the country.

To the above we may add, in no department of art or science would such an institution be more beneficial, if rightly conducted, than in building and architecture, it being at present a singular fact, that in proportion as chemical knowledge has extended under the present means, so have the right choice, and consequently the duration, of building materials retrograded.

## PETRALOLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 363.)

Following up the chain of reasoning I held last, I will first, previous to entering further into the siliceous rocks, define to the reader the nature and origin of clay, or aluminous earth; so termed, because its base is almost invariably composed of the earth alumina, or otherwise it is the preponderating ingredient. In tracing the origin of clay, and the various modifications of mixture that it undergoes, we cannot sufficiently admire the wonderful provision of nature by which she accomplishes results perfectly analogous to each other, not only from varied materials, but also by varied action. It is by attentive observation of nature alone, and not by means of the crucible or the alembic, that we are enabled to arrive at a knowledge of first causes, which, from their obscurity and perplexity, are the forbidden fruit of modern men of science. For although the analysis of organic and inorganic bodies ever exhibits certain unvarying results, which enable us to classify and arrange elementary principles and compounds; although it is affirmed that all things known to us may be resolved into oxygen, hydrogen, nitrogen, and carbon, which affirmation has not yet, nor, in all human probability, ever will be verified; yet, in nature, the aluminous results seldom exist presented by the chemist, although the result satisfactorily proves that the elements of these bodies exist in the body analyzed.

CLAY is the resolution of putrescent animals and vegetables, produced upon the surface of the earth and in the waters. In its primary state, it is a carbonaceous product, consisting chiefly of, and known as, vegetable mould or soil; and in this state it is the *humus*, so much talked of by modern chemists. To this humus is added acids, alkalis, and alkaline earths, in varying proportions, which are abstracted from, and finally returned to, the soil, on which the vegetable bodies exist; or it is deposited over tracks of the earth, in the ocean-bed, by rivers and running streams, which abstract it from the lands through which they flow. Its nature is, therefore, under all circumstances, very variable, and its combinations almost indefinite; consequently, the rocks formed by the consolidation of its beds partake of the like character of irregularity and disposition of parts, quantities, and qualities.

An island, or a large continent, no sooner becomes elevated above the waters, and becomes exposed to a warm, humid climate, than the process of vegetation commences, species springing spontaneously from the soil, or being wafted thither by the winds, the waves, and birds; and with the development, growth, decay, and dust of these species, vegetable mould is generated, and where the position is favourable, gradually increased. While in the friable or unwashed state, this material is termed mould; but when digested in marine or saline waters, and amalgamated with animal matters, it rapidly passes into the state of clay; the nature of the clay, as previously observed, depending on the nature of the material from which and by which it is produced. Its character is now changed from a carbonaceous or an aluminous product, and mineralogy then describes it as sordid, viscid, slippery to the touch, impalpable, without regular shape, tough, opaque, and becoming plastic by the addition of moisture; in its primary state and place moist, becoming friable when dry, hardening by ignition, not fusible by the greatest degree of heat; but when mixed with other heterogeneous substances, becoming variously shaped by fire, hardens into slate of varieties, rocks and stones, sometimes talcose, which, by resolution, is reproduced in mica, a scaly, opaque, flexible, and shining substance.

Clay, generally speaking, consists of alumina and silicea—that is, the common, viscid matter united in variable proportions with sands, as every one may observe in the beds and on the banks of rivers; and with these are blended various substances, as the accidents of position may determine, being generally sulphates of iron, lime, magnesia, and other earths and inflammable products; it imbibes and retains water and oil, by each of which it is softened, being rendered plastic by the former; it does not effervesce with nitric acid, contracts and becomes harder in the fire. There are nume-

rous varieties known, as porcelain clay, pipe clay, potters' clay, fullers' earth, Lemnia earth, soap clay, common brick clay, Stourbridge clay, indurated clay, schistose clay, bole, earth of stragorium, cimolite, Chinese clay, red ochre, yellow ochre, green bole, tripoli, kollyrite.

Native alumine is the constituent of a salt called alum; it is also the chief constituent of clays or argillaceous compounds, eight parts of oxygen combined with nine parts of the earth aluminum, to form seventeen parts of oxide of aluminum or alumina. All bodies have this distinguishing basis, and the chief constituents are termed aluminaries. Argillaceous earths are the parents of aluminous, crystalline, and concrete aggregates: considered in their relative position to calcareous earths, they are secondary results, but generating perpetually with calx and silica, they are also secondary, recent, and still producing.

Having thus far given the origin of a material so universally diffused in and upon the superficial crust of the earth, and performing a most important part in the economy of nature, manifest in the fossil and mineral kingdom, I will not proceed in my description of those rocks, of which I have previously spoken.

The phenomena of intersecting other beds and running in veins and fissures, is not confined to granite, being common to those varieties of rock known as porphyry, trap, and basalt, and which geologists describe as volcanic. In the coal-districts of this country, we find a vast number of faults, as they are termed, filled in with an exceedingly hard, dark-coloured mass, porphyritic or basaltic, which the miners call clunch, and from the circumstance of its affecting the beds against which it rests, penetrating their material, and, in some cases, rendering them more highly crystalline, geologists have supposed the material to have been at one time in the heated liquid state of melted lavar. In order to account in a rational manner for the circumstance of one bed intersecting another, we have only to look at the operation of natural causes in the present day. The continued action of streams opens a channel through a thousand beds, varying from each other, sometimes in a direct line, sometimes tortuous, sometimes diverging right or left. Rivers in tropical climates throw out numerous branches; in one place we find them scooping out channels; in another place, filling up with the materials held in suspension by the waters channel veins, and extensive fissures formed by various causes. Again, when sedimentary deposits are carried into the ocean, and are deposited over an extensive surface of its bed, it often happens that so long as those deposits are forming, so long the bottom of the ocean is here and there disturbed by tidal lines or ocean currents, varying in their breadth; and when this is the case, the sedimentary matter is carried away in the line of action and deposited elsewhere. Thus, for instance, if pure vegetable earths and other carbonaceous matters are periodically deposited, preparatory to their transition into the state of coal, the whole accumulating bed will be cut right across by the tidal line, and a fault is naturally formed, the beds on each side of this fault preserving the same thickness. Again, other faults are the results of rents and fissures, which very often fill in fragments of the separated beds, and such matters as may happen to form the surface soil which are carried in by the rains, or by streams. Thus the fissures in the Devonshire strata are filled in with a material termed toad-stone, which is a species of Siderite. The basaltic dykes, which pass through chalk, in the island of Rathlin and other places, convert it into granular crystallized limestone, the rock in contact with the muddy deposit absorbing the hydrogen whereby its atomic particles were enabled to expand in the crystalline form. Heat would not produce this effect; the presence of water is a condition of crystallization.

The porphyry peculiar to the country around Christiana, says Van Buch, traverses clay in innumerable veins: the multitude of them is incredible; on every hill new ones break out and create confusion, when we wish to follow the same vein throughout its course to its termination. They frequently traverse the clay-slate at right angles, often almost perpendicularly; and in the direction and inclination there is also an infinite diversity, and

many of these veins must necessarily traverse each other. Their thickness is from ten to fifteen fathoms and upwards, and veins of less than a fathom I never remember to have seen. All these spaces are, however, filled with a sort of porphyry, which is completely similar to that which, as a widely extended formation, and in high mountains, we find at only a mile distance: a remarkable example of the filling-up of the veins with the formation which covers these repositories, and an important fact with respect to the theory of veins in general. Porphyry veins are also found in these mountains, traversing clay-slate and limestone: the porphyry of the mountains presents a vast perpendicular front resting upon sandstone, and this again resting upon limestone. Professor Jamieson also tells us that in the island of Arran porphyry occurs in veins and mountain masses, over red sandstone, containing coal and limestone full of petrifications.

Von Buch truly remarks, that "the great course of nature is one and the same, from the coagulation of granite to the career of man." The concretion of a small mass of earths, variously blended together, and uniting solid bodies within its matrix simply by the force of cohesion, is but the type of action and result by which nature forms the most stupendous rocks: the common phenomena of cracks and rents of a small piece of clay occasioned by summer heat, and the filling-in of these rents with a liquified mass of earth is typical of the filling-in of rents and fissures, such as are common to hot climates, extending many fathoms wide, of vast depth and length. In all these phenomena there is no necessity for the violence of volcanic action; beds upon beds are rent asunder, but without violence, and nature repairs the evil without violence, and the intruding matter is generally such as we recognize as forming one or the other of the overlying beds, differing from it only when subject to different conditions, such as amalgamating with other matters, or by the mineralizing process becoming more compact, silicified, or crystalline.

(To be continued.)

## TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.

(Continued from p. 374.)

29. OAK when thoroughly seasoned is so very durable that its application is advisable in almost all cases where there is great exposure to the weather, it seems calculated to endure for ever, either in the earth or in dry carpentry above ground; in water it is almost equally so, but in moisture it is more perishable, and when taken from bogs is found to be brittle and in progress of decay; when exposed to the action of sea-water it is, like other woods, subject to the operations of pipe-worms; but they seem but small and poorly-nourished, and to make much slower progress than in such woods as the bir and alder. For all purposes where strength is required, and the degree of flexibility it possesses, and its tendency to warp in drying, are not materially objectionable, oak is suited in the highest degree. It makes the best king-posts, because it is least compressible by the ends of the principal rafters: for ceiling-joists it is not calculated, because subject to warp. In wainscot joinery the presence of nails about the surface should be avoided, on account of a discolouration which takes place around them, if driven in before the wood is quite dry; this circumstance has more than once determined the question of identity, where it was doubted whether the material in some old work was oak or chestnut, the absence or presence of the stain about the bolts denoting which it was, since it is peculiar only to the former: the powder to which oak crumbles in its rotten state is of a fine snuff-brown colour.

30. FIR.—Of this useful description of timber there are various species; the most important, which is the red or yellow, being from what is called the Scotch fir, a tree which is a native of the Scottish Highlands, and almost all other parts of northern Europe; it is common, and thrives in the highest degree, in

\* [We believe in most cases fir is better than oak for king-posts; the latter, by its ordinary immature seasoning, warping and shrinking, after use, so much, as to derange the work greatly.—Ed.]

Russia, Prussia, Lapland, Denmark, Norway, and Sweden—the extensive forests of the two latter consisting chiefly of it and the spruce fir—that from Riga, Memel, and Dantzic, being the most distinguished and esteemed. It is imported in great quantities from Christians, Stockholm, Frederickshall, and several other parts of the above countries, in logs, deals, &c., and is called Red-wood.

31. The logs, or barks, are, by workmen, denominated *timber*, in contradistinction to the wood that comes in the form of boards, which is termed *deal*. The boards consist of three sorts, designated according to their scantlings, viz.: *planks*, which are 11 inches wide by 3 or 3½ inches in thickness; *deals*, 9 inches by 3 inches; and *battens*, 7 inches by 2½ inches.

32. The timber sent from Norway does not exceed 18 inches in diameter, and the sapwood of it being considerable, leaves rather a small proportion for the heartwood; but the quality of the latter, in regard to strength and durability, is superior to that in the larger timber from other countries. The timbers exported by Riga, under the names of *masts* and *spars*, are, the former, from 18 to 25 inches diameter, and, usually, 70 or 80 feet long; and the latter, such as are under 18 inches in diameter. The Riga timber is not so hard as that of Norway. Swedish timber is often of that woolly nature mentioned in article 35.

33. Fir grown in cold countries is harder, in a considerable degree, than that which is produced in milder climates: the Scotch fir is propagated, to some extent, by the English in their plantations; but the wood which it there affords is, in quality, inferior to the Scotch-grown timber. It would appear, therefore, that the soil is not of the hardy description which is most congenial: indeed the natural-grown wood from different mountainous districts of Scotland, although confessedly inferior to the best fir that is imported, is still superior, in most respects, to that which is planted and cultivated in England—many of the trees attaining above 90 feet in height and 3 feet in diameter. A striking proof of the difference which exists in fir timbers that are raised in mild and cold climates, is afforded in the *Aior* of the Laplanders; this wood is from the under or shaded side of crooked pine trees, and is equal in hardness to box-wood; the natives make use of it for the bottom of their sledges, or that part which is most subject to wear and tear.

34. Fir is little, if in any degree, inferior to oak in point of durability, whatever situation it be employed in. When taken from bogs it is generally much sounder than oak found under similar circumstances; and therefore, as it is also stiff, light, easy to work (if not too full of resin), and stands well, it is preferable to every other wood for carpentry in general; if straight in the grain, the foreign timber makes the best common rafters and purlins, being not so subject to warp with the heat of summer as roof timbers of oak. Besides its almost universal adoption for carpentry, it is also extensively used for joinery, as well as for masts and other parts in ship-building.

35. The wood is of a varied yellow colour, having no larger transverse septa, and the annual rings are very distinct; these, in the best descriptions of timber, are not more than  $\frac{1}{4}$ th of an inch thick; in the inferior sorts they are considerably thicker: one portion of each ring is soft and light-coloured, the other is hard, red, and heavy—the pores being filled with resin, which imparts its flavour to both the taste and smell of the wood. In some of the inferior kinds the resinous matter is soft and viscous, rendering the wood troublesome to work; in others, where the resin is not so plentiful, the wood assumes in the sawing a nappy surface, which is also obstructive to the workmen; in both cases, the wood is deficient in stiffness, strength, and durability, and therefore unfit for principal timbers. It may, however, be here observed, that woods abounding in resin have been ascertained to be not more durable than others; as volatile and fixed oils, wax, and resins are equally as susceptible of decay as woody fibre; this accounts in a measure for coatings of paint requiring renewal.

36. In a resinous wood the fir is very subject to the pipe-worm, which operates upon it with great and destructive facility, and fattens in it to its largest growth. It has more sapwood

than oak has, but does not lose so much weight by steeping in cold water as some of the harder woods do. The shrinkage in seasoning fir timber from the balk is about one-thirtieth in the width. It is the Scotch fir from which pitch and turpentine are obtained.

37. WHITE FIR is imported in deals and planks from the north of Europe and North America—the wood from the former being the produce of the Norway spruce fir, and that from the latter country from the black and white spruces, both of which receive their names from the colour of their respective barks. The Norway spruce, commonly so called, is a native of the mountainous districts of Europe and the northern parts of Asia, abounding in the Norwegian forests, and also cultivated in Britain, where it produces timber very little behind the foreign in quality, being only a little softer in the grain and harder in the knot, which contending properties offer some extra difficulty to the artificer. It is very resinous, and furnishes the well-known Burgundy pitch; it is generally cut at the ages of from seventy to a hundred years. The black and white spruce firs of America are natives of the mountainous and cold northern tracts; the former is said to be the higher-growing tree of the two, and the one furnishing the best wood. The latter, called in Canada *epinette*, or *sapinette blanche*, excels the Norway spruce in toughness, is lighter and less resinous, and more liable to warp in the seasoning. American timber, generally, being brought over in the holds of ships, has the seeds of decay already sown in it when it reaches this country—fungus having almost invariably made its appearance. Of the white deals and planks imported from the Norway and Baltic ports, those from Christiania are the most highly approved; the trees are generally cut into three equal lengths, and each length into three boards, which are generally about 12 feet long; a tree, therefore, which takes seventy or eighty years' growth ere it arrives at perfection furnishes nine twelve-foot deals or planks. In this country they, as well as the yellow deal, are sold by the hundred, of six score.

38. The colour of the wood is a sort of creamy white; the annual rings are very distinct, and are of a darker shade in the hard portion; the knots are in general very hard and tough. When properly seasoned and kept dry, it is very durable; and, therefore, suitable for internal joinery, furniture, and cabinet-work; but it does not stand the weather. The straight-grained, tough sorts, however, generally stand very well if properly treated, and are frequently used by the ship-builders for the top-masts: it takes glue better than the yellow wood. The shrinkage in white deal, from its state when stacked in the timber yard to that of perfect seasoning, is said to be  $\frac{1}{4}$ th, and that in such as is kept in a dry state, about  $\frac{1}{8}$ th.

39. The SILVER FIR is a large tree of quick growth, which abounds in the plantations of Great Britain, but is a native of the mountainous tracts of Germany, Switzerland, and Siberia; the wood which it yields is of a good description, light and stiff, and fitted for both house and ship carpentry: in flooring it will bear a considerable load without bending under it. It is durable, but liable to the destructive inroads of worms; and being subject to decay when employed under water, may be considered as suited only for dry situations or the open air. The compact and resinous part of the annual rings is of a sort of yellowish colour, the softer part whitish. Some one has said that the goldfinch will build in no tree but this.

(To be continued.)

FINE ARTS.—The celebrated painting by the late Mr. Heaphy of the Duke of Wellington in Consultation with his Officers previously to a general engagement, was on the 24th instant sold by Forster and Sons to a dealer of the name of Keen, of Green-street, Leicester-square, at a sacrifice of 85 guineas. This picture is known, not only by the fine engraving by Anker Smith, but by Mr. Heaphy having had the express commands of his late Majesty George the Fourth to complete this great national undertaking, and on which he was employed in Spain nearly three years.

#### THE NATURE OF DESIGN.

A Paper read at the meetings of the Decorative Art Society, March 13th and 27th.

BY MR. CRABB, V.P., MEMBER OF THE INSTITUTE OF FINE ARTS.

(Continued from p. 375.)

FLOWERS offer to us a much more extensive field for observation; from the humble primrose, with its straw-tinted bloom and warmed leaf, to the magnificent japonica, whose elegant heart-shaped glossy leaves—stiff, dark-blue green—display its superb flower to the utmost advantage. So true is nature to her principles, that you will not observe any flowering plant, shrub, or fruit-bearing tree, whose bloom does not only harmonize in colour but finely contrast with its own foliage; it is equally remarkable that the shape of the flower or arrangement of petals is such as to improve by contrast the form of leaf. The tribe of fuchsias is a remarkable exemplification; of several distinct sorts, the bloom bears the exact relative proportion of colour and contrast to its leafage, that a skillful colourist might use in matching his tints to execute a work in stained glass. This observation brings home to immediate application for manufacturing purposes the principle advocated; and I am firmly of opinion that persons desirous of acquiring the power of understanding grace in form and beautiful tone of colour will derive the utmost advantage by following out an intimate acquaintance with the productions of nature. I would consequently present the vegetable world as a truly instructive source from whence to derive beneficial studies; outline and colouring from flower and leafage, and gracefulness from the whole.

An enthusiastic admirer of nature, I take pleasure in tracing the varied excellencies of art to their original source. The most perfect productions of the sculptor are but copies of nature, placed in attitude and moulded into perfect form by the resulting skill of long study and experience; and assisted by the highest attributes of genius, we find it eventually creating the matchless frieze of a Parthenon. Architectural proportions are deducible from the same source, and in those magnificent paintings bequeathed to our admiration by the most profound colourists, we discover their principles to have been those of nature, and their compositions are more delightful the nearer they approach to simple natural dispositions.—Raffaello was the painter of nature.

I am offering these desultory remarks to induce you to examine the very source and origin of all design; not to remain satisfied with results drawn from other men's labours, but to go to the fountain-head itself. Take but a common serrated leaf, and see with what mathematic precision it radiates from one centre, and how perfectly each point is shaped. The elegant, but casual disposition of the acanthus over a basket originated the Corinthian capital. The beautiful ornaments of foliage in Gothic architecture may be directly traced to nature; they are faithful copies, gracefully and skillfully arranged. Examples from various styles might be usefully adduced, and each would be found to contain some peculiarity and marked principle, deserving the designer's careful attention. The most celebrated and successful artists in the highest walks of art have recommended the study of nature, as originating their chief beauties. To the manufacturing designer, who has less opportunity for deep study, a contemplation of the beautiful productions of the meadow and the woodland will at once afford elegant recreation and valuable improvement.

I know not a word so completely misappropriated and misunderstood in England as *design*; it being generally used to express drawing, or a pattern, which is not its signification in art. The linen-draper aims to catch a stray buyer of a *mousseline de laine* by pinning to it "new design;" various trades are bitten by the same mania, and we may anticipate the butcher frizzing a sheep's head, and ticketing it "new design." It is of the utmost consequence that design should be popularly known as an important art including much beyond mere drawing. Design cannot receive its true appreciation until this takes place; therefore every opportunity should be taken to remove an error by no means confined to the lower classes. It is a word of but recent use, forced into notice by our accidental neighbours' successful application of educated art to their manufactures;—occasioning a world of grumbling among our old-fashioned trades-

men, who were well disposed to adhere to their fathers' notion of all foreigners being humbugs, and, as a consequence, stuck to the perfection of their own taste; but some younger men, adopting those foreign notions, sadly confused their trade. The ladies naturally possess a more lively perception of the beautiful than man, and will always be found the first to appreciate the elegancies of refinement. It was thus that, guided by their natural taste, they chose dresses whose improved colouring had come from France, bought French ribbons for similar reasons, and eagerly sought the nicely-fitting French slipper and French glove; all this was declared prejudice, protective duties were tried without success, for he will be a clever statesman to defeat woman when dress is concerned. Customers of a quarter of a century's standing looked at their neighbours, admired the taste or novelty, and bought elsewhere; it became high time for both tradesman and manufacturer to accommodate themselves to the growing change: deficiency of intelligence upon the origin of true taste prevented inquiry into the causes which produced these improved articles in France, and they sought, and still seek, to meet the difficulty by importing and copying patterns. Then came a parliamentary inquiry, and a great mass of evidence was collected; among many others I contributed to state our deficiencies. Subsequently a School of Design was instituted, which has continued putting forward excellent theories, but unsuited for practical purposes, and a continued series of failures has resulted from an unbusiness-like management.

There are very many persons, who, without much thought, and with a deficient capability of comprehension, consider the art of *Devising or Design* to be nothing more than mere drawing, and as easily learned as any mechanical craft. By taking this deteriorating view of the art, it immediately ceases to be held in the estimation to which, from the importance of its varied and extensive application, it is justly entitled.

A creditable designer requires to have naturally a fine perception of the beautiful, a feeling for the charming versatility of form and colouring, a lively imagination, facility in associating ideas and applying the materials collected by study to produce invention, and an extensive acquaintance with the sources of ornament and principles in which the Arts of Design originated among the nations of antiquity, and ultimately arrived at very great perfection. A peculiar knowledge separate from artistic skill is also requisite for the application of design to manufactures. Judicious culture, aided by experience, will produce a purity of taste, a power of adjusting and adapting the separate principles with sound judgment, so as to create the highest excellencies.

A man thus endowed claims respect and attention; and we find in all countries, and in all times where the elegant arts have been appreciated, the artist, in his several gradations, placed in a conspicuous position, and supported in honour and opulence. The nation that would live in after ages, by acquiring distinction in the refinements of art, must elevate the artist, and however indisposed we may be to admit the fact, it is unquestionable that in England this has not been done. A want of appreciation of the artist's labours for the application of fine art has caused secondary design to be neglected, and the inordinate desire to accumulate wealth has caused the softening, elegant refinements of universal art to be subverted by the British standard of man's worth—money.

But brighter prospects are dawning; the successful cultivation of design by our continental neighbours will tend to place us in our proper position. The most powerful and wealthy kingdom must not continue to do less for the encouragement of art than such a state as Bavaria. Although a nation of shopkeepers, we may hope to see a taste spring up among our merchant princes that shall demand a revival of the sumptuous decorations of the old Italian trader. What a cheering hope to think of our City companies and corporate bodies all over the country sparing a little wealth from gross feasting, to decorate their halls, encourage art, and do honour to themselves! The Egyptian Hall may yet present other than its newly poverty-stricken attempt at decoration: some Medici in embryo may spread ooe dinner less, and cover its naked surface with

decorations suitable for the chief apartment of the first (i.e. the richest) of corporations.

Once enable the public mind to understand the real beneficial purposes of art, and it would be fostered: fewer discredit public edifices erected, and a desire for the universal embellishment of interiors arise, with the capability of appreciating the ennobling and humanizing qualities associated with a love of the fine arts. Architecture, painting and sculpture are all equally incomplete without each other; and design for the manufacturer becomes indispensable. It is in the powers of each one of us to contribute toward the better understanding and consequent appreciation of these social benefits, which are obtained by cultivating the refinements of understanding; and it will be found a means of accelerating the advancement to superior feeling for both art and artists, especially for its appreciation when applied to manufactures.

It is necessary we should constantly keep before us the fact, that our own more humble branches of art are inseparably associated with the success of the higher branches. They cannot be cultivated apart, and when speaking of one I include both. A noble architectural mansion requires the rich embellishments of historic painting, decoration and gilding, sculpture in its halls, elegant furniture and costly plate, more or less in good taste, as the owner is influenced by liberality and fine feeling toward arts. Dress and ornaments partake of the splendour, and thus we have a universal benefit, creating and extending itself to a variety of minor employments.

Design, or creation of form and enrichment, being as essential to manufacturers among the ancient nations as at present, we may consider the arts to have then originated, and to have been systematically encouraged; and, although the existing sources for obtaining certain information are limited, we can arrive at highly interesting general conclusions respecting the actual formation of art, and the embellishment of their manufactures.

Scripture informs us, that before the Deluge, when the habitations were in tents, God had discovered to his people the arts of spinning wool and flax, and the weaving it into stuffs and linen,—and also of forging and polishing brass, iron, &c. The metals being thus rendered subservient to the uses of man, of course received shape for their several purposes. Soon after the Deluge, human industry made several discoveries conducive to the improved beauty of their fabrics: among others, the art of spinning gold thread and interweaving it, if not the actual embroidery of a pattern upon stuffs. The extreme ductility of gold was also known, as we find it beaten into thin leaves, and applied to the surface of wood and metals,—and the secret of casting metals, brass, silver, and gold. They were used to produce figures in imitation of nature, and even statues, vessels for use and ornament, and warlike weapons. Carving upon wood, stone, and marble, was in use,—and the imitation of natural objects by colour (i.e. painting). They became exceedingly celebrated for dyeing their stuffs and silks, giving to them the most exquisite variety of beautiful colours. To all these several discoveries, the art and practice of design must have been an essential addition in their progress to perfection. The East was the cradle of the arts and sciences, and it is sufficient for our present purpose to mention the Eastern empires which, through their long duration and immense extent of power, became associated with other nations of note, as the Egyptians and the Greeks.

(To be continued.)

#### THE STREET ARCHITECTURE OF PARIS AND LONDON.

TO THE EDITOR OF THE BUILDER.

SIR,—Having just returned from a tour by way of Paris and Brussels, I intend, should it prove acceptable to you, to send you, as I can find leisure during the next two or three weeks, a few rambling notes of my tour.

My visit had more immediately in view an examination of the works lately done in the sister arts of painting and sculpture, in which commissions have of late been so very liberally dispensed in France; and, as must be confessed, most ably responded to—paintings and statues fresh from the studio so meeting the eye at every turn, as to make even a most cursory

examination of them a work of considerable time. My intention, however, in the meanwhile, is, as being more immediately within the scope of your journal, to confine myself to the architecture of Paris, in contrast with that which has of late years been performed and is now doing in London in that important branch of art.

That much has been done in Paris of late years in art, and with great care and study, every one, who has lately crossed the Channel I think will allow, and although more latitude of opinion may exist as to how it has been done, I have no hesitation in my own opinion that, on the whole, and by comparison, in every branch, it has been done well; and especially so, as I have just witnessed in architecture the execution of designs within the last fifteen years, since when I was last there, which give a lasting proof of the high character of the profession in France. The French feel what we have yet to learn, that taste is not expended in vain on the front of a stable or on a village pump. Professional men will have no difficulty, I think, in understanding me when I say that in every work I met, however small and unimportant, I felt that an architect had been employed, and I felt, too, that it was not done by adding expense, but that the judicious arrangement and combination of the same materials alone make the difference between the work whereon a man of taste and education has been employed, while the mere builder kept in his proper place, and one where, to save the architect's fee, the builder is himself the designer, leading almost invariably to a vulgar excess of ill-placed enrichment, the additional expense of which costs far more than an architect's commission. It is in this apparently unimportant branch of the architect's labours (but of much importance in leading and preparing the minds of the people to a correct appreciation of the noble works of architecture), that the French, in my opinion, shew their superiority over us, while, at the same time, in the magnificent works of the metropolis and the leading provincial towns, a strong effort is making to revive for their appropriate purposes, the two great recognized styles which have shed so much lustre upon the ages in which they respectively flourished, when, by universal consent, they are allowed to have attained that point of excellence which it is enough for an architect of the present day to attempt to imitate. The "Madelain," the "Palais D'Orsay," and the "Notre Dame de Lorette," are great strides towards the one, and the vast sums spending in the completion and restoration of the gorgeous specimens of Gothic in the cathedrals and town-halls throughout the country, give no small proof of enthusiasm in the latter.

In London, on the contrary, nothing has been done on a systematic plan for improving the general character of its architecture, and of late years, in every district, what opportunities have been lost and thrown away. What a noble opportunity, for instance, was lost in the opening of Moorgate and King William-street, for an attempt (and, as I said with reference to what is doing in France, without adding a shilling to the expense) to rival some of the streets of palatial edifices in (not to be too ambitious) some of even the second-rate towns of Italy. It must be annoying, beyond expression, for a man of taste to walk along Moorgate-street, after returning from Paris, to think how little was required to have made it what it ought to have been, and what I cannot but confess I feel that in Paris it would have been made. Ornament is too cheap in London, and too easily had readily-made; and, in this case, there is no want of it; but the directing mind, although having the intention, wanted the knowledge from personal observation of what constitute the features which give so much charm and magnificence to the architecture of the "Grand Canal," "Toledo," and the "Corsos."

I have already spent too much of your time and space with preliminaries to enter upon my task in this number, but I cannot omit to remark, that although my observations have suggested themselves to me from comparison, such, as I shall, I hope, shew, has been done in London, which cannot but draw forth admiration from any one who has a feeling for beauty and originality in architecture.

Glasgow, July 2.

"OMEGA."

THE HUNTSBANK STATION  
ON THE LIVERPOOL, MANCHESTER, AND LEEDS RAILWAYS.

PERSPECTIVE VIEW.

GROUND PLAN.

In a former number of our journal (see No. 35), we gave our readers a description of the Huntsbank Station of the Liverpool and Manchester and Manchester and Leeds Railways; and being one of the most extensive in the kingdom, we are induced to furnish a perspective view and a ground-plan of this work, emanating from the good taste of Mr. Stevenson, the celebrated engineer. In the original design, the covered ways to the booking-offices were intended to be supported by Roman-Doric columns, but for the convenience of passengers and the removal of luggage, cantilever brackets were substituted,

which alteration in some measure destroys its architectural pretensions, conventionally considered; but so satisfactorily has this been effected, that the present design is far from inelegant or void in its general features; and when its intended purposes are considered, it claims praise, on account of the deviation from routine architecture, for the space afforded by the alteration is decidedly advantageous. The building, which is 256 feet long and 36 feet wide, is in immediate connexion with the covered roof, and, as we before stated, is of the largest area yet executed. It is uniformly divided at the centre, the right half containing booking-

offices for the Leeds and Manchester Railway, with refreshment and waiting-rooms, superintendents' apartments, and other conveniences, upon an extensive scale, and of good proportions and arrangement, as shown by the accompanying plan. The left half contains similar accommodation for the Liverpool and Manchester Railway. The basement-story, which is approached by area-steps at the back of the edifice, contains luggage-rooms, and accommodation for the third-class passengers, with suitable accommodation for the porters and other attendants of the station, and easy communication with the railway and approaches.

COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. IX.

FLUTINGS.—IN THE GRECIAN DORIC.

"FLUTING.—A concave channel. Columns whose shafts are channelled are said to be fluted, and the flutes are collectively called flutings." (Hosking.) Mr. Gwilt observes, "In the investigation of the Doric order, among its more remarkable features are to be noted the longitudinal striæ called *flutes*, into which the column is cut, every two whereof unite, in almost every case, in an edge. Their horizontal section varies in different examples. In some, the flutes are formed by segments of circles; in others, the form approaches that of an ellipse. The number all round is usually twenty, such being the case at Athens; but at Pæstum, the ex-

terior order of the great temple has twenty-four, the lower interior order twenty, and the upper interior sixteen only. It has been strangely imagined by some that these flutings, which, be it remembered, are applied to the other orders as well as to the Doric, were provided for the reception of the spears of persons visiting the temples. The conjecture is scarcely worth the refutation; first, because no situation for the *δωροδοκία* (place for spears) would have led to their more continual displacement from accident; and secondly, because of the sloping or hemispherical form in the other orders, the foot of the spear must have immediately slid off. Their origin may probably be found in the polygonal column, whose sides received a greater play of light by being hollowed out, a refinement which would not be long unperceived by the Greeks." (Encyc. p. 64.) Mr. Knight was one of the first to form the conjecture that the *dourodoké*, or spear-holder, men-

tioned by Homer in the *Odyssey*, alluded to the flutings of columns; and Lord Aberdeen has been at considerable pains to refute his friend's reasoning. (See Inquiry, p. 113.)

In Mr. Gwilt's edition of Sir William Chambers's treatise on Civil Architecture, is a note contributed by Mr. Charles Barry, with illustrations from buildings in Egypt, whose antiquity is considered earlier than any known existing specimen of Grecian Doric. In one of these is a sketch of a portico of two fluted columns *in antis*, about 5½ diameters high. "The flutes are shallow, and twenty in number, and the capital consists of an abacus only." Another illustration of Mr. Barry's is also very striking; it is an example of a column at Kalaptchic, on the Nile: "The abacus is square, and 11 inches thick; the shaft, which has a trifling diminution, is 7 feet 8 inches high, and 3 feet 2 inches diameter. The circumference is in twenty-four divisions,

NEWS  
LONDON  
1853

whereof four, which are at right angles with each other, are flat faces, covered with hieroglyphics, and the other intervening ones are sunk into flat elliptical flutes  $\frac{1}{4}$  inch deep.\*

The same writer also tells us that "there are several instances of polygonal shafts in the Egyptian temples. A remarkable one is in a temple at Eluthias, on the right bank of the Nile, a few miles south of Esneh, where, in the interior of a large vestibule, the whole of the roof is supported upon polygonal columns of sixteen sides." Mr. Barry concludes his interesting communication by observing that "the general resemblance of the fluted columns to those of the Grecian Doric order is manifest, and, in addition to many other remarkable indications in the Egyptian temple, clearly points to Egypt as the source of both Greek and Roman architecture." These flutings alluded to above are the reverse of the readings frequently met with in the shafts of Egyptian as well as of Indian columns, and even in Persepolis—seldom, it is true, continued uninterruptedly throughout, being stopped at intervals by rings or annulets. Still the character of these readings is not very dissimilar from flutings, and their origin would appear to be derived from the bundle-pillar, i. e. composed of a number of reeds set round a common centre.

The Italian word for a fluting is *scanalature*, and to flute is *scanalare*, answering to the French *canelure* and *caneler*, and best rendered in English by *channel*. Now there is no doubt that this and other words implying hollowness, as canal, kennel, can (a vessel), are derived from the Greek word *kanna*, which is exactly the same in Latin (*canna*), the meaning of which is a reed, or, as we more closely translate it, cane (as sugar-cane). The meaning of a fluting, therefore, is a hollow; and if we cut through a reed or cane (which

chant, &c. I can only, therefore, trace the use of the word *flute*, as applied to the channels of columns, in a similar way, viz. that it is a hollow instrument, like the reed or pipe of the ancients, with whom the flute was a familiar and favourite instrument. In the famous "Athenian Marble" in the British Museum, which describes the state of the Erechtheum, the same word is used, *απαβρωτος* (*arabrotous*), to signify *unfluted*, as respecting the unfinished columns and the bases; the word is compounded of *a*, negative, and *παβρος* (*rabdos*), which signifies *bacellus*, a stick, *virga*, a twig or *rod*, and *fascis*, whence the well-known *fascies*, carried before the Roman authorities of justice, so called because they were bundles of *rods* tied round an axe. The words *rudis* and *radius*, both signifying a staff, or measuring-rod, as well as the English word *rod* itself, are derived from the Greek word *παβρος*, which springs from a Hebrew word, used sometimes to denote a sceptre, and sometimes a *rod*. (Exod. xxi. 20, and 2 Sam. vii. 14.) The words chiefly used in Latin authors to denote a fluting, are *stria*, *striatura*, *strix* (*striges* plu.), all derived from the same verbs, *strigo* or *stringo*, and *strio*, which mean to make channels in timber or stone, to groove. *Striga* signifies a *furrow*, as in ploughing.

Another word also found in Latin writers for flutings is *canaliculi*, or little channels, the diminutive of *canalis*, *quod cavus sit in modum canne* (because it is hollow after the fashion of a reed); this meaning carries us back to the cane, as before alluded to. (*Canalis anima* is often put for a *wind-pipe*.)

Vitruvius lays it down as a rule, that the flutings should be twenty in number, which agrees with the general practice in Grecian examples; as at Athens, in the Parthenon, Propylæa, and Thesum; at Corinth and Delos; at Eleusis; at Rhamnus, and Thoricus; at Bassæ, at Cadachio, and Agrigentum (in the great temple of Jupiter a man can stand in the fluting), and at Pæstum, in the temple of Ceres, and in the Basilica; whereas, in the bulky columns of the temple of Neptune, the number of flutings is twenty-four, and the only other known\* departures from the usual rule are to be found in two instances,—one, in the delicate columns of the temple of Minerva, at Sunium, wherein are only sixteen channels (whilst there are twenty to the columns of the Propyleum, at the same place), and the other in the upper range of the interior columns in the great temple at Pæstum.

The examples wherein the flutings are only shewn at the upper and lower diameters, leaving the shafts to be completed at some future time, are at Eleusis; at Thoricus, at Delos, at Selinus, and at Rhamnus, in the external columns, those of the pronaos being fluted on the front with eleven channels, having on the back nine planes, a remarkable instance of economy. Two gigantic columns still remain near the river Papyrus, in Sicily, fluted to within a few feet of the ground; and in some of the Selinuntine temples, many of the columns exhibit preparations more or less advanced, for flutings, the process being probably interrupted by war.

In Doric columns "the flutes are sometimes segments of circles, sometimes semi-ellipses, and sometimes eccentric curves. They always meet in an arsis or edge," and follow the entasis and diminution of the column up through the hypotrachelium to the annulets, under which they finish, sometimes with a straight, and sometimes with a curved bead. At the base they detail on the pavement or floor of the stylobate." (Hosking.)

The ante of the Doric were never fluted by the Greeks;† and Mr. Hosking judiciously observes; "Fluting on a straight surface must be productive of monotony, as the flutes can only project a series of equal and parallel shadows.

\* Mr. Hosking says, that "there are several examples with sixteen" flutes (Treatise on Architecture, p. 32), but I have not discovered more than those at Sunium and Pæstum.

† In the examples of the Propyleum at Sunium, at Rhamnus, at Eleusis, and Thoricus, there is a slight fillet, about 1-12th of an inch, between the flutes.

‡ Our Builders, who seldom have the opportunity to acquire a knowledge of the nice distinctions and just perceptions of the best Greek architects, reverse in almost every instance their practice respecting columns and pilasters; they flute the latter and leave the former naked; but this is of a piece with the omission of triglyphs, and addition of superfluous members, and other solecisms against good taste, and which must happen as long as builders usurp the legitimate functions of architects.

Not so, however, with columns, on whose rotund surface fluting produces a beautiful variety of light and shade in all their gradations, which it could not possess without that enrichment; for on a plain column neither are the lights so bright, nor the shadows so dark as in the former case, nor are they so finely diffused over the whole surface in the one as in the other." Another writer remarks on the advantage of fluting: "It prevents the monotony and heaviness of appearance that would else take place, and without disturbing the proportions of the columns themselves, it imparts to them a certain degree of lightness, and of variety also, since it produces a multiplicity of lines and of distinct lights and shadows, but without the least confusion. These upright lines tend also to produce an agreeable contrast between the narrow channels thus produced, and the massive proportions of the shaft itself."‡ G. R. F.

LONDON AS IT WAS IN 1800, AS IT IS IN 1841.

(Continued from p. 370.)

"THE town of London" says a clever, witty writer, in 1735, "is a kind of large forest of wild beasts, where most of us range about at a venture, and are equally savage, and mutually destructive one of another: the strange hurries and impertinences; the busy scaramblings and underminings; and, what is worse, the monstrous villanies, cheats, and impostures in it." Well, the forest has wonderfully enlarged, the wild beasts, the villanies, and cheats have perhaps proportionably increased; but, for all that, London is a very pleasant place, containing both the bane and the antidote: it is the tree of evil, laden with good fruits; the philosopher's stone to some, the Scylla and Charibdis to others; the pride of every Englishman; and the envy of the world!

One man plans, another man executes. Eighty years ago, R. Dingley, an active, spirited, well-informed citizen, the founder of the Magdalen, proposed and carried to a forward state of maturity a plan of a new street, from the front of the Mansion-house to Moorgate. Citizens have of late grown wiser than they were in the days of Queen Elizabeth; as we read that in 1685, in consequence of the great increase of buildings, the citizens of London became alarmed, lest so many new houses should lessen the rent and trade of the old ones, fancying that the inhabitants would remove on a sudden to avoid the danger of having them fall upon their heads; the country gentlemen were also alarmed lest they should draw away the inhabitants, and thereby depopulate the country; and both agreed that the increase of building was prejudicial to the Government. At their earnest supplications, a law was made to prohibit buildings in the city; and such was its effect, that for thirty years afterwards no buildings were erected, but under licence; and the people, for want of accommodation, shipped themselves to Virginia, Maryland, and other newly-settled parts of America. The cottage-law prevented their building in the country. Again, in Oliver Cromwell's time, the citizens took fright, and raised a clamour against the Builders: and the Protector, thinking to raise a revenue by this means, laid a tax upon the foundations. Consequences similar to the above followed—a total cessation of buildings took place, and things continued pretty nearly in this state until the great fire of London.

The nineteenth century ushered in the fruits of the tree of knowledge, and the talisman, by which the minds of men were wedded to such ancient usages and customs, shorn of much of its power by the continuous civil wars of this country, was finally broken to pieces by the French Revolution. Men then began to appreciate rightly the powers of mind, and the galaxy of talent, wit, and eloquence existing at that period fairly laughed old fashions and old prejudices out of countenance; a social revolution took place of the political one; and the pride of accumulating wealth and power, adorned with heroic deeds and brilliant victories, laid the foundations of a taste for substantial display, and social and intellectual refinement. The eloquence of Pitt, Fox,

§ From observations on "Outlines and Characteristics of Styles," published in *Weale's Quarterly Papers on Architecture*, a periodical which cannot fail of gratifying those who indulge in the luxuries of literature, and which is got up in a style worthy of that excellent and spirited publisher, to whom the architectural world is so greatly indebted.

is hollow), we have at once a flute. At all events, there is a greater likeness between the flutings of columns and the readings of Egyptian shafts than there is between the former and the marks on the trunks of trees, or the folds of female garments, both of which have been adduced as the probable prototypes. The Latin word *cana*, I sing, is also derived from the same Hebrew word קנה, signifying a cane or reed, whence the Greek *kanna*, and קנמן, *cinnamon*, (which again reduced to קנה, signifies *fragrant*), and its meaning is obvious, because instruments formed of a reed were the first musical accompaniments to singing;\* and hence our words *canon*, *canon*,

\* Thus *tibia canere* signifies to play upon a flute; and thus Cicero says, *Tibicen sine tibiis canere non potest*.

Sheridan, and others too numerous to mention, the rapid advances of chemistry, mechanics, and the arts, an extending system of instruction, and the encouragement given to learning and learned men, rendered London in 1800 one of the most desirable places in the world.

At the west end of the town a great extension of building took place between Bond-street and Park-street. In 1716, Lord Burlington having built considerably in the neighbourhood of Conduit Mead, situate in the parish of St. George's, Hanover square, the lessees of this open field, which extended over 27 acres of the parish, raised New Bond-street, Conduit-street, Brook-street, Woodstock-street, Silver-street, Great George-street, Pedley-street, South Molton-row, &c.; consisting of 429 houses, 21 stable-yards, and 15 vacant spaces of ground, bringing in a rental of 14,240*l.* 15*s.* It was previously held on lease by the Earl of Clarendon at 2,000*l.* per annum, but at no very distant period before his days, the rental was no more than 8*l.* per annum. These vacant spaces became gradually built over, and the whole space was completely occupied soon after the commencement of the present century.

Marylebone parish was then slowly increasing, field after field disappearing to make way for the multitude of private streets now covering the space within Oxford-street, the New-road, Tottenham Court-road, and the Edgware-road. East of Tottenham Court-road, stood Lamb's-conduit-fields, extending to Great Russell-street, including the two noble houses of Bedford and Montague. Tottenham Court-road had at that time the appearance of being out of town, being partly in the fields, Gooseberry Fair being held near Tottenham Court. The village of St. Mary-borne (vulgarly St. Mary-le-bonne), says Maitland, which is situate in the liberty of Finsbury, manor of Tyburne, and hundred of Ossulston, owes its rise to the fall of Tyburne, which stood at the east end of the Banqueting-house-bridge, almost contiguous to which, where the court-house and pond are situate, stood the church and cemetery. The village of Tyburne going to decay, and its church, denominated St. John the Evangelist, left alone by the side of the highway; it was robbed of its books, vestments, bells, images, and other decorations; on which occasion the parishioners petitioned the then Bishop of London for leave to build a new church elsewhere, which being granted, they built a new church, in the year 1400, in a place where they had some time before built a chapel; and the same being dedicated to the Virgin Mary, it received the additional epithet of *Borne*, from its vicinity to the neighbouring brook or bourne. The village of Tyburne was of great antiquity, for in the Conqueror's survey it appears to have given denomination to the manor of that name, at which time it belonged to the abbess and nuns of Berching or Barking, in the county of Essex. The village of Tyburne was situate on the eastern bank of Tyburne-brook, at the east end of the Lord Mayor's Banqueting-house-bridge, in the neighbourhood of which the citizens of London had nine fountains or conduits of water for supplying the city with salubrious water; but on the formation of the New River, by Sir Hugh Myddelton, these fountains were disposed of on lease for forty-three years, and finally became the property of the nation.

Tyburne Road disappeared, and in lieu of it we have Oxford-street, the noblest avenue in Europe, being much longer than Regent-street, and promising, in a very few years, to rival the latter in the magnificence of its houses and display of goods. The last benefit conferred upon its residents, and the population at large, was the wooden pavement, not obtained without great difficulty, for parish Solons are the most difficult of all to contend against. Thank heaven, the taste for MacAdam and mud is rapidly fading away, and we may soon hope to be able to perambulate all the leading streets of London without endangering our hearing from the violent concussion of the ear produced by the incessant rumbling of wheels of vehicles of every description, or our necks, from the slippery state of the pavements. The Pantheon was a beautiful theatre internally, but an unfortunate speculation—three or four claimants to the property died in the workhouse; as it is now, it is one of the lions of London. A little more uniformity in the buildings of this street is very desirable, but

little to be hoped for, at least for another half-century. Tottenham Court-road is much behind the spirit of the times; it is a great and important thoroughfare, and might command a business rivaling, if not exceeding, Oxford-street; but, with the exception of a few gin-shops, and three or four linendrapers, the houses are better suited to the meridian of Shoreditch.

The wealthy classes of this great metropolis are always in locomotion; the streets and squares now covering Lamb's-Conduit-fields, which have almost all been built since 1800, are undergoing the changes common to all cities increasing in wealth and population. At the time they were built they were eagerly sought after by the gentry, and Russell-square had its ducal resident: retreating before the tide of population, their place was supplied by dignitaries of the law, medical men, and merchants, for convenience-sake; but time is bringing further changes—the houses are now being rapidly deserted—are converted or converting into shops, lodging-houses, and chambers, and in a few years, when age begins to stamp its mark upon them, the last traces of aristocratic, commercial, or professional opulence will vanish from among them.

It is really singular to remark how often a single line of road or houses serves to form a distinct line of demarcation between the extreme conditions of society: a few steps beyond this assemblage of streets and squares, and we enter Somers Town, a vast assemblage of "put up houses," already falling to decay, and inhabited by poverty in its hydra-headed form on the one hand, and by greedy shopkeepers on the other, who, in the provision way in particular, are well-stocked with all the refuse trash of the market; but poverty is a crime, and ought to be cheated, mulcted in weight, mulcted in quality, and caged in eight-foot rooms. Somers Town was a very small hamlet in 1800, and its numerous tea-gardens were then favourite places of recreation for the citizens, and from here they had an uninterrupted view of Hampstead, Highgate, and the whole of a beautiful country north-west.

Our ancestors made many and grievous complaints of sea-coal nuisance, and Sir John Evelyn, in his "Fumifugium," says, that to its abundance may be fairly ascribed diseases of the lungs and numerous other diseases: that it is a reproach to the city, and sullies all her glory, super-inducing a sooty crust or fur upon all that it lights, spoiling the movables, tarnishing the plate, gildings, and furniture, and corroding the very iron bars with those piercing and acrimonious spirit which accompany its sulphur, obscuring our churches, and making our palaces look old, fouling our clothes, and corrupting the waters, insinuating itself into our very secret cabinets and most precious repositories, and destroying, in fact, all things.

If this complaint were considered reasonable and just in his days, what are we to say to it now, when we find our beautiful cathedral, our churches, our palaces and public buildings in mourning, dark as Erebus—when, even at this season of the year, we no sooner enter the forest of houses, than we enter a dense fog, composed chiefly of mephitic vapours, produced almost exclusively from the combustion of sea-coal? The whole lower atmosphere is heavily charged with sulphur and carbonic acid gas, besides other and vast exhalations produced by chemical and mechanical processes. Is it then to be wondered at that so many perish annually from phthisical and pulmonary distempers—that the inhabitants are never free from coughs, rheumatisms, and bilious complaints, which, although not directly fatal, have the effect of poisoning every enjoyment of life? It is true that this state of affairs benefits some 6 or 7,000 members of the faculty; but, as a wise people, we ought to turn our attention more immediately to an evil, which is infinitely greater than in the days of Evelyn, and which is constantly increasing. The benefits of good sewerage are now duly appreciated, why, then, do we neglect the still greater benefit produced by inspiring a pure and wholesome air? Many men of talent have employed their ingenuity in devising means of abating this dreadful nuisance, and their discoveries have been highly satisfactory, so far as applies to large manufactories; but still powers are wanting to enforce their use, and until these powers are obtained, there is little to

be hoped for in this respect. Three years ago, the Mansion House had its face washed for the first time—it is now as black as ever; the soot embracing the front entrance to St. Paul's is sufficient to manure an acre of ground; and during the completion of the exterior of the Royal Exchange, one portion becomes black while another is in the act of purifying.

(To be continued.)

#### CARISBROOK CASTLE.

Among the numerous attractions to the Isle of Wight, Carisbrook Castle and its interesting locality, rich in varied beauty, are not among the least. The former is associated with important facts in our national history; the latter has derived considerable advantages from the care with which taste has improved its natural beauties. The announcement that has been publicly made of the sale by public auction, on building leases, of the beautiful plantations partly surrounding the castle, has caused no little excitement among the residents, and of regret to all who visit the island for health or recreation. It is thought, with some appearance of reason, that the Commissioners of Woods and Forests might have stepped in between the threatened desecration of this lovely spot and the public convenience, and for a small outlay have prevented an act of destruction which will be matter of general regret. When Lord Bolton was governor of the island, his lordship, at his own cost, purchased the land in question, which is about eleven acres, and added it to the very small portion of ground which pertains to the castle. He planted most of it with trees and ornamental shrubs; and it now forms a most beautiful plantation, intersected with walks, and greatly adds to the other beauties of the spot. The Hon. T. Powlett, for reasons sufficiently forcible with him, but manifestly at variance with the feelings which actuated his ancestor, recently offered to dispose of these eleven acres of his patrimony to the Crown. A few hundreds would have preserved this lovely spot to the public, and perpetuated its existence, free from invasion, to future generations. The offer was, however, declined. In a few weeks the work of destruction will commence, and the prison of Charles I. will be envied by buildings, some of them on a small scale. Beer-houses and small shops will cover the plantations and fields which have been the resort of visitors; and this beautiful locality will be deserted by those on whom the inhabitants of the island greatly depend for their prosperity as a community. It is not yet too late to avert a proceeding which the public contemplate with regret, and the inhabitants with indignation. We strongly urge upon the Commissioners of Woods and Forests a compliance with the general wish that these eleven acres may be preserved from the threatened alienation, and that they be purchased by the Crown, and appropriated to the public use. The act would be a cheap purchase of popularity. It would reflect as much credit on the Government as it would be fraught with satisfaction and advantage to a numerous class of her Majesty's subjects.—*Globe*.

#### INCORPORATED SOCIETY FOR BUILDING, ENLARGING, AND REPAIRING CHURCHES AND CHAPELS.

PREVIOUS to the long vacation, so necessary to those who labour so constantly during every other season in this great and essential work, the society held two special meetings (on the 1st and on the 15th inst.), in consequence of the numerous and pressing applications for aid which have been made from various rural, manufacturing, and other districts, many of the cases being of great importance.

At these meetings the Lord Bishop of London presided.

The committee having, among other business transacted, ordered the payment of ten grants to places where the works undertaken with their aid have been completed (eight of those grants being for the erection of additional churches), then proceeded to consider the applications for assistance recently received, and eventually decided upon voting new grants of money towards building twelve additional churches or chapels, and towards

rebuilding, enlarging and otherwise increasing the accommodation in ten existing churches, making in all, at this time, twenty-two grants.

The new buildings are to be erected for two districts in the parish of Gainsborough, and for districts in the parishes of Middleton, in Teesdale, Durham; Ashbourne, Derby; Sandback, Cheshire; Woolwich, Kent; Colverly, Yorkshire; Barnstaple, Devon; Bushbury, Staffordshire; Lynn, Norfolk; Gosport, Hampshire; and Didsbury, a chapelry in the parish of Manchester.

The churches to be enlarged or repaired are at Istrad-y-fodwg, Glamorganshire; St. Teock, Cornwall; Great Bootham, Surrey; Lower Guiling, Gloucestershire; Yordley Hertfordshire; Ninebanks, Northumberland; Attleborough, Norfolk; Shanlon, Durham; Kirkdale, near Liverpool; and Tarrant Grenville, Dorsetshire.

Five of the districts in which new churches are to be built are situated from one to seven miles from the nearest church or chapel. This is a fact worthy of very serious attention; and although the other districts are nearer to places of worship, they are, in truth, equally destitute of church accommodation, as those churches are fully occupied by the inhabitants of the districts to which they properly belong.

The population of twenty-two parishes now assisted amounts to 462,000 souls; the number of existing churches, seventy-two, containing accommodation for 69,034 persons, and including 18,994 free seats. The free accommodation, therefore, at present is only one seat for twenty-four inhabitants. The additional accommodation to be obtained by the execution of the works just referred to in the application now considered, is 6,139 sittings; 4,940 of these are to be free and unappropriated.

It will be observed that five-sixths of the new seats are to be free; in fact, two of the new churches—namely, those to be built at Middleton and Gosport—will be entirely free; a further evidence that it is of the greatest importance to provide the labouring classes with the means of attending public worship.

Thus the aggregate amount of the population in twenty-five places above referred to, when compared with the present provision of the church-room therein, does not convey a direct idea of the wants of the particular parishes; and without calling attention again to the parish of Manchester, it should be noticed that Middleton, in Teesdale, contains a population of 3,000 persons, and one church with 284 sittings. Woolwich contains nearly 28,000 inhabitants, with one church accommodating 1,500 persons, and a proprietary chapel. Kirkdale, a suburb of Liverpool, has a population of 5,000 persons, rapidly increasing, and 960 sittings in the chapels, 100 only of which are free. Lynn, with more than 1,200 inhabitants, has two churches, accommodating one-sixth of that number, but not affording accommodation for more than 450 persons. Gosport, containing a population of about 8,000 persons, has only a proprietary chapel, containing 1,000 sittings; of these scarcely 300 are free. Sandback, with 6,600 inhabitants, has 1,247 sittings in its two churches; of these sittings only 224 are free; therefore, in these six parishes there is a population of 63,000 persons, 55,901 of whom have no seats provided for them in the existing churches, in which the free accommodation, in fact, amounts to 1,822 seats, or at the rate of one sitting for thirty-five persons.

The board of directors have recently determined that in future they will hold a meeting on the third Monday in July in each year, instead of that hitherto held in October. They have, therefore, adjourned their sittings to the 18th of next November, after one of the most active and efficient sessions known to this society.

**THE NEW DOCKS AT BRICKENHEAD.**—The works for carrying out this great undertaking are to be commenced in the beginning of the month of September next, and they are expected to be completed in three years from that time, so that a dock of one hundred and fifty acres will then be ready to receive vessels of the largest class, and quay walls and fire-proof warehouses will be constructed on its sides.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

**Danbury Church struck by Lightning.**—A scaffolding has been erected upon the tower and spire of the above church by sappers and miners, for the purposes of a trigonometrical survey, which, in consequence of the inaccuracy of the former one, is now being made throughout the country. Within the outer scaffold by which the ascent is made, is a framework for the steady support of the instruments, and upon the summit of the spire is placed a platform, about nine feet square, upon which an elegantly-constructed octagon tent, to shelter the persons engaged in making the observations, is erected. The sides of the tent are of wood, with the exception of three, which are open, and the roof is formed of cloth. On Thursday week last, about mid-day, during a thunder storm, two of the men who were upon the spire took shelter in the tent, and whilst they were there, the electric fluid entered in the shape of a "fire-ball," as they describe it, exploding, with a loud report, between them, about two feet from the floor, and filling the place with sparks; it then appears to have descended by the conductor, the point of which passed through the floor of the platform. The men, who were for some time rendered insensible by the shock, on partially recovering from their alarm, immediately descended, and providentially reached *terra firma* uninjured. On subsequent examination it was found that a copper nail upon the outside of the tent had been fused by the electric matter—a hole was made through the pole supporting the tarpauling, and even the iron braces used in the construction of the platform were perforated from the same all-powerful cause. The cloth of the tent presented the appearance of a charge of shot having passed through it. This church, standing as it does on the summit of a hill, is necessarily much exposed to tempestuous weather, and in former times suffered severely from its effects, particularly in 1402, when, in the superstition of that period, the mischief was ascribed to the agency of a diabolical spirit.

**Stunnington Church.**—On Monday week this church was struck by lightning, and seriously damaged. It has a slated roof, capped at the ridge and edges with sheet lead. There is also a metal pipe descending to an under-ground sough, through which the water from the roof passes. The electric fluid appears to have been collected by the latter, and conveyed by the metal pipe to the spouting, and up to the edging, where, not finding a direct conducting surface to the highest point of the steeple, it discharged itself through the latter in several places, displacing several large stones, and injuring the windows. From this it passed to the bell, without injuring it, thence through the opposite side, displacing much of the ornamental stone-work, and injuring it so much, that it is feared the whole will have to be rebuilt. The fluid appears to have spread out over the surface of the wet roof, and to have discharged itself from several places, perforating the leaden edgings, and furling up the edges from below in such a manner as to leave no doubt as to the direction the fluid has taken. The metal pipe has undoubtedly been the main cause of this unfortunate disaster. Had it ascended to the highest point of the steeple, the fluid would have discharged itself from thence without producing any injury; but conducting, as it did, only part of the way, viz., to the base of the steeple, through the medium of the lead, its destructive and powerful effects were immediately brought into action.—*Sheffield Independent.*

**New Church at Morpeth.**—The foundation of an intended new church has been laid by Lord Morpeth. The site of the church, which is dedicated in memory of St. James the Great, is situate in the centre of the town, and the church is to be built in consequence of the distance of the old parish church, which is about a mile from the town.

**New Church at Clifton.**—This church has been erected by Mr. Dyce, of Bristol, and is built of Bath Stone, cut by machinery, the courses ranging from 5 inches to 7 inches. The expense of the work, it is stated, is less by 20 per cent. than Ashlar facing, and the strength of the building much greater.

**Closing of St. Paul's Cathedral.**—On Sunday last, after the performance of Divine service in the morning, the following notice was affixed to the doors of St. Paul's Cathedral:—"Notice.—There will be no service in this cathedral during the repairs and cleaning. Due notice will be given of the recommencement.—St. Paul's Cathedral, July 28, 1844."

**Lay Munificence.**—Mr. James Fussell, of Chantrey-house, in the county of Somerset, is building a beautiful church near his house, in the parish of Whatley, after the designs of Messrs. Scott and Moffatt, architects, which he intends furnishing and endowing at his own expense. He is also building a parsonage-house, stable, &c., for the future incumbents. This magnificent donation to the establishment will, it is believed, amount to nearly 8,000*l.*

A stained-glass window, designed and executed by Mr. Willement, of London, has been introduced in the chancel over the altar-piece, in Faversham Church, at the cost of more than three hundred pounds. A figure in the centre of the window represents the Virgin Mary with the infant Jesus in her arms; on her right is a figure of the Apostle Saint Peter, and on her left that of Saint Paul; the arms of the town and of the Cinque Ports being introduced below.

The King of Prussia has accorded a renewed grant of fifty thousand thalers (7,500*l.*) for the completion of the cathedral of Cologne. His Majesty has, moreover, dedicated a sum of ten thousand thalers (1,500*l.*) to the works of the north tower.

Earl Jermyn, M. P., has sent a second donation of 25*l.* towards the restoration of the Norman Tower, at Bury; and several smaller subscriptions have been likewise received.

Extensive repairs are about to take place in the church at Leverington, near Wisbech. Messrs. Royce and Rickmans, of Peterborough, are the architects engaged to do the works.

On Friday week the Lord Bishop of Worcester laid the foundation-stone of a new church in Garrison-lane, Birmingham.

## RAILWAY INTELLIGENCE.

**Railway from Southampton to Dorchester and Weymouth.**—A meeting was held in the Town Hall, Dorchester, on Friday, of those persons who were favourable to what has been termed the coast line. It was very numerously attended. The Mayor of Dorchester was in the chair. The report of the committee, containing the reports of Captain Moorsom and Mr. Pare, was read. Captain Moorsom stated much in favour of that line to pass by Redbrook, Lyndhurst, Ringwood, Wimborne, Poole, and Wareham, and so to Dorchester, and from Dorchester, by atmospheric traction, over the hills to Weymouth. The expenses of the line between Southampton and Dorchester would be 450,000*l.*, and Dorchester to Weymouth 104,000*l.* more. Mr. Pare's report stated that the traffic would amount to 48,752*l.*, and that the profit would be 61 per cent. The committee strongly recommended the adoption of this line, and stated that they believed they should meet with the co-operation of the South Western Company. Lord Worsley moved the adoption of the report. Captain Garland seconded the resolution. A long discussion then took place as to whether it could not go from Wareham to Weymouth, and so on to Bridport and Exeter, avoiding Dorchester; and as to whether it could not be called the Southampton, Dorchester, and Weymouth Railway. Mr. Hodding drew attention to the line from Salisbury, through Shaftesbury to Dorchester. Ultimately, the name of the line was settled to be Southampton and Dorchester, and the resolution was carried unanimously. A vote of thanks was passed to the committee and the mayor.

**The Atmospheric Railway.**—Mr. Cubitt, the engineer of the Croydon line, with his son, Mr. Joseph Cubitt, and several of the directors, have gone to Dublin for the special purpose of observing the working of the Dalkey line, preparatory to their own arrangements to commence the work on the Croydon line. The directors of the Dublin and Kingstown Railway have placed at their disposal the Dalkey line for such experiments as they may deem it necessary to make.

**South Devon Railway.**—The works will soon be in full action; Mr. Brunel has been daily employed with a great number of men in obtaining the necessary information preparatory to the contracts being advertised. The specifications, we understand, are nearly ready, and we have every reason to believe that the public notices will soon be issued. At Dawlish Beach the soundings for the foundation have been ascertained by Mr. Brunel, and have been in some instances about 17 feet, and at other places a much less depth than was at first imagined. The station will be on the site of Mr. Kennaway's house; the cuttings through the cliff will soon be worked out, on to the rocks to the Parson and Clerk. The sand rocks, being easily cut, will soon be gone through, and the outward sea-wall facing, built of the Babbicombe lime-stone rock, will form its outward exterior of the finest workmanship. At Marley, the works will be prosecuted with the utmost despatch, and it is reported that the engineer has some improved system under consideration, which will greatly tend to expedite the work. It is considered certain that the line to Newton will be completed within twelve months, and to Plymouth within two years. The latter is not, however, so certain, as unforeseen contingencies may arise as the works are being prosecuted. At all events we may, we believe, state with safety that the line will be completed to Plymouth as soon as the tunnels can be finished. Every thing appertaining to the line is progressing most favourably, and it is arranged that a public meeting of the shareholders shall take place in Plymouth about the end of August, when a full statement of the proceedings will be laid before them.—*Western Luminary.*

**The Railway via Kendal.**—Preparations are being made, prior to the commencement of cutting the intended line of railway between Lancaster and Carlisle. A number of excavators are now at work in the neighbourhood of Shap, removing walls and fences, making roads, and clearing away all obstructions which stand in the direction of the line. Cart-loads of wheelbarrows and implements to effect this were removed from Kendal some days ago; and the men have entered upon their employment.

**The Railway.**—Mr. Locke, the engineer of the London and York line, has been at Huntingdon during the week, and the survey of the whole line is now nearly completed. A public meeting in support of it will shortly be held, with a view to get the rail as near the town as conveniently can be. The avidity with which the shares have been purchased is evidence of the opinion entertained of its being a lucrative investment, more than the 70,000 having been subscribed for within the month.

**South-Eastern Railway.**—We perceive that the South-Eastern Railway Company, or rather the executive of that company, on Thursday week last, at their special general meeting, have resolved to raise another 199,000*l.*, to construct a branch to Canterbury, to effect alterations, &c., on the Maidstone branch, and to complete and maintain a branch railway, approach, &c., to Folkestone harbour.

**North-Western Railway.**—A scheme has been broached for the purpose of making a railway from Southampton *via* Salisbury, to Bideford Bay, in Devonshire. The plan has been started by some unknown individual, whose prospectus appears in the *Taunton Courier*, and who states that a public meeting on the subject will be shortly called in Taunton.

**Irish Railways.**—The preparatory prospectus of the Irish Great Western Railway has been issued. It is proposed that the line shall run from Dublin to Mullingar and Athlone, a distance of sixty-six statute miles. The expenditure has been estimated by Sir John McNeill at 11,000*l.* per mile. The proposed capital is 730,000*l.*

**Dublin and Cashel Railway.**—On Thursday and Friday week the Dublin and Cashel Railway Bill passed the committee of the House of Lords. The Bill will receive the Royal assent in the course of a few days, and within the next three months from 15,000 to 18,000 Irish labourers will be set to work on the line.

Proceedings have commenced, near Roney, in the construction of the Salisbury and Bishopstoke Railway.

**West Indian Railway.**—The first railway ever formed in the British colonies is about to be constructed in the island of Jamaica, between Kingston and Spanish Town. The length is twelve miles, though powers have been obtained from the House of Assembly to carry the line some miles further, if the projectors should think it desirable, and from the extraordinary facilities presented by the form of the land on the rich plain which extends from the sea eight or ten miles into the interior, round the greater part of the island, it is not unlikely that it will ultimately be carried much further. Although the engineer and superintendents of the works have not yet left England, yet it is expected, from the easy gradients on the line, the abundant offers of labour already received, and the forward state of the iron-work, sleepers, and so forth, all of which are in course of preparation in this country, that the line will be open in October twelve months. This will be the first line of railway ever constructed by the labour of free negroes, and also the first investment of British capital ever made in the colonies for such a purpose. Nearly the whole of the shares are held in Liverpool, Manchester, and London, and from the great amount of traffic already existing, between Kingston and Spanish Town, as well as the cheapness with which the line will be formed and the business-like hands into which the work has fallen, we have no doubt that the result will be very favourable, and will encourage the formation of railways in other parts of the British colonies.

**Government Railways Bill.**—On Thursday week, Mr. Gladstone informed the House of Commons, that in consequence of communications which he had recently had with several gentlemen who were opponents of this bill, he had agreed to make certain alterations in it, chiefly of omission, which would not at all impair the value of the measure. By doing this, he believed he had entirely removed the objections which had been entertained against it.

**The Landowners and Railways.**—It was given in evidence before the select committee, that no less a sum than 8,500,000*l.* has been expended by railway companies, in England and Scotland, on land and "compensation." This is about an average of 5,000*l.* a mile. On the Paris and Rouen railway, the item was 2,300*l.* a mile. The average in Belgium is 2,750*l.* a mile.—*Railway Record.*

**Proposed Railway.**—At a meeting of the citizens of Hereford, held in the Council Room on Saturday last, William Webb, Esq., Mayor, in the chair, a provisional committee was appointed, with power to investigate and arrange all matters necessary for effecting a railway communication between that city and Gloucester.

**Oxford and Cheltenham Railway.**—It is said that a Bill for a railway from Oxford to Cheltenham direct, will be applied for in the next session of Parliament. Surveys are in the course of being made. The broad gauge will be adopted.

The railway between Turin and Genoa, with two branches between Venice and Milan, has received royal sanction. It is to be executed at the expense of Government, and the Council of State have given directions that it shall be immediately marked out.

**METROPOLITAN IMPROVEMENT SOCIETY.**—The annual meeting of this society took place at the society's rooms, 20, Bedford-street, Covent-garden, on the 25th ult., Charles Fowler, Esq., in the chair. The report of the committee, detailing their proceedings for the past year, chiefly with regard to their efforts to obtain some modification of the window duties, so as to effect sanitary relief in the ventilation of the habitations of the poor, the suppression of the nuisance arising from the smoke of large manufactories, the embankment of the Thames, and other street improvements, various suggestions for the improvement of the Building Act now before Parliament, &c., was read, approved, and unanimously adopted. Thanks were then given to the committee for their past services, and they were requested to continue the same for the ensuing year; and Mr. G. E. Dennes and Mr. G. A. Walker were added to the said committee.

## THE NEW HOUSES OF PARLIAMENT.

The following is an extract from the report of the committee appointed to inspect the works of decorative art exhibiting in King-street, St. James's, in April and May, 1844:—

"Your committee have examined the specimens of carved wood, and the designs relating to such specimens, which have been sent in by artists desirous of being employed in the decoration of the Houses of Parliament.

"Your committee have recorded their judgment respecting the comparative merit of many of the works in question, and respecting the nature of the employment for which the various artists whose works they have so noticed appear to be fitted. But not being at present in possession of sufficient information as to the extent to which wood-carving may be considered desirable in the Palace at Westminster, or as to the precise character of the works which may be required, they have thought it expedient in general to enumerate the names only without further distinction of the artists whose works have received the commendation of the committee.

"In the department of wood-carving the artists so noticed in the detailed report of the committee are Mr. Cummings, Mr. Ollett, Mr. Ringham, Mr. Freeman, Mr. Browne, and Mr. John Thomas.

"Among the artists in wood, Mr. Rogers did not comply with the terms announced in the notice put forth by the commission, and his name has, therefore, not been inserted in the foregoing list. It is, however, the opinion of the committee, that among the carvers whose works have been exhibited he holds the first place; and they consider him as the person best qualified to be intrusted with those parts of the woodwork of the House of Lords, in which great richness of effect and delicacy of execution are required.

"MAHON. "COLBOURNE.  
"T. B. MACAULAY. "B. HAWES, JUN.,  
"GEORGE VIVIAN. "THOMAS WYSE."

"The commissioners having had reason to suppose that some of the persons who have exhibited works of decorative art may have employed other bands, or even the assistance of foreigners, in the execution of such works, have resolved that those persons who may be selected for employment in those branches of decoration shall, if the commissioners think fit, be required to produce specimens of their art, to be completed under such conditions as the commissioners may think necessary."

## Correspondence.

BUNNETT AND ANOTHER v. SMITH.

SIR,—The above case is reported in your last Number so as to give a colour to the transaction altogether at variance with the facts, and your report might, if left uncontradicted, do us much injury; the representation of "the circumstances which gave rise to the motion," in particular, being altogether untrue, we beg that in your forthcoming Number you will do us the justice to insert the following correction.

The description of the specification of our patent is much garbled and misrepresented; we claim no particular form of hinge, only in combination with a particular form of shutter, and no mention is anywhere made of a "crank-but hinge." We claim a particular modification of machinery (the endless screw and worm-wheel) for the purpose of raising and lowering our patent shutters, and also revolving iron shutters as heretofore made; such apparatus being admirably adapted to, but never before used for, such a purpose. We can, however, very well afford to let the specification speak for itself, merely stating, that it is absolutely false that a similar contrivance for raising and lowering such shutters "was patented and used thirty-six years ago."

The building in George-street, Mansion-house Place, is *not* an addition to, or part of, the banking-house of Messrs. Smith, Payne, and Co., as was artfully represented on the hearing of this cause, and which, no doubt, had its effect upon the Vice-Chancellor; for, to use his own words, "to do as little injury as possible," he withheld the full injunction which, at the outset of his address, he appeared inclined to grant. The premises in question belong, it is true, to Messrs. Smith, Payne, and Smiths, and have been superintended during their erection by Mr. Beadnell, their principal clerk; Mr. Flower, the architect of the Gresham Club-house adjoining, giving his friendly aid, in the absence of a professional engagement. One of the partners in the house of Messrs. Smith, Payne, and Co., had satisfactorily used our patent revolving iron shutters in his private residence (of which Messrs. Cubitt and Co. were the builders), and had, in conjunction with Mr. Beadnell, decided on their being also used in this building; Mr. Flower also strongly recommended their adoption. The intentions of these gentlemen were, however, frustrated by a clerk in the employ of Messrs. Cubitt and Co., the builders; who, without their knowledge, or that of any of the parties concerned, applied to the defendant, and agreed to introduce eight shutters of his make; an infringement of our patent, which has led to these proceedings.

Messrs. Cubitt and Co.'s clerk stated, in explanation of his conduct, that he had not space enough for our (Bunnett and Corpe's patent) shutters, and had, therefore, adopted those of Mr. Smith (not one of a similar make having been previously put up by him), which were represented as taking up less room. It was proved, however, by the affidavits, and is well known to most builders and architects, that our patent shutters for windows 6 feet 6 inches high (the dimensions of those in question) occupy a space, when wound upon the roller, of  $7\frac{1}{4}$  inches only. The space available in the building referred to is nearly 10 inches! and the shutters put up by Mr. Smith actually occupy a space, when wound upon the roller, of  $2\frac{1}{2}$  inches. *One inch and a quarter more than our patent shutters, for which (according to Messrs. Cubitt and Co.'s clerk) there was not room!!*

Much pains were taken to impress upon the Court, and it was repeatedly stated in the defendant's affidavits, that a great saving of room would be effected by the defendant's form of shutter, whereas in the case at issue they really do, and must inevitably under any circumstances, occupy at least *one eighth more space* than our patent shutters. As to the attempted evasion of our patent by substituting one sort of hinge for another, and by turning our raising gear upside down, we leave that question to be decided by the pending proceedings. We not only deny that any advantage can result from such mis-called *improvements*, either in strength, durability, or economy of space; but we pledge ourselves, backed by the practical experience of eight years of the most extensive employment in the manufacture of revolving iron shutters, that our patent shutters are in every respect superior to those put up by Mr. Smith, and that far from any economy of space resulting from his arrangement, it is the reverse; in the majority of windows his plan would be altogether inadmissible, and is at best a most unmechanical arrangement.

That Messrs. Cubitt and Co. gave orders for the eight shutters in question, from a conviction of their superiority over our own patent shutter, is wholly false, as both Mr. Cubitt and this partner Mr. Alchin assured Mr. Bunnett that they knew not of Smith's shutters being used at the building until apprized of that fact by Messrs. Bunnett and Corpe. So much for the superiority of the defendant Smith's shutters being "evidenced by the selection of Messrs. Cubitt and Co.!"

We are, Sir, your obedient servants,  
Lombard-street, BUNNETT and CORPE.  
July 29th.

[The account given in our last number was brought to the printing-office at a very late hour on the night previous to publication, and we were not aware of its containing any thing beyond a mere report.—Ed.]

## SHAM COMPETITION.—DERBY PAUPER

LUNATIC ASYLUM.

SIR,—I trust you will not withhold from your columns the other communications which you mention having received on the subject of the Derby Asylum and the Southwell Church competitions; as, provided they be concise and to the purpose, the stronger the case of direct favoritism is made out, the better it will be as a lesson for our guidance in like matters for the future.

The very reason which deterred your correspondent "T." from entering on the first-named competition, actuated myself, and I believe the facts to be as stated in his letter. At any rate, the influence possessed by the parties who obtained both the first and the second premium was such as to deter any one cognizant of it from bestowing any time or attention on the subject.

As regards the second competition (for the church at Southwell), many of your readers can vouch for the time which such men as Sir R. Smirke, Mr. Hardwick, and Mr. Tite, have devoted to the examination of designs referred in recent instances to the professional judgment of these gentlemen, by committees who had some *decent* sense of their own incompetency to enter fairly into the question of deciding.

These three professional gentlemen certainly devoted more than *one, two, or three* sittings to the numerous drawings submitted to them before they made their awards.

We know by a letter from the party to whom application for particulars was addressed, that more than one hundred such applications were made (for the terms of the advertisement were calculated to mislead the unwary). Now, supposing that only fifty designs were actually sent in, and valuing them at the moderate average worth of only ten guineas each for *time and actual outlay* bestowed on them, here are 500 guineas thrown away, to please whom? A set of somebodies writing themselves a committee. Of a truth, their haste in deciding and returning the rejected drawings clears them of any possible suspicion of having paid *particular* attention to any of them for the purpose of culling something new for the fortunate *pre-selected* one; and of this negative praise, at any rate, we may let them take their full benefit. But, Sir, who constitute this committee?—and who is the party whose name appeared in the advertisement? His letters were written in a very *epicene* hand, and he did not so much as claim to himself the distinction of Hon. Sec., as usual in similar cases.

Are there any such people in Southwell as speculative dabblers in bricks and mortar, to whom designs, "*furnished gratuitously*," might be ready-money hints for their own interested purposes?

Is it not "too bad," that artifices should be resorted to in building an edifice for *religious* purposes, which an individual would neither imagine nor venture to employ in erecting one destined for his *own secular employments*?

Can any of your readers favour me with the information, whose design was selected for the "Hardy Testimonial" near Dorchester? I believe that due time was allowed in that instance for all interested to inspect the designs which were exhibited to the public in Dorchester. It is somewhat remarkable that information, such as that asked above, is almost always omitted when the competition drawings are returned to their respective authors.

Your constant Reader, Φ.

July 22, 1844.

[We think it unnecessary to insert the additional letters alluded to.—Ed.]

## PREMIUM FOR THE PREVENTION OF SMOKY CHIMNEYS.

SIR,—It is generally known by the readers of your journal that you are at all times desirous of doing a duty to the multitude, by informing them of new discoveries, inventions, and improvements, thus benefiting the millions in all countries on the globe. I am pleased to find nearly every day some paragraphs announcing new discoveries, improvements, or experiments for improvements.

The improvements in arts and science, machinery, &c. in modern times are astonishing; and going along the streets of London, beautiful designs of ornaments are met with;

\* See the original advertisement in the *Times* newspaper. This part of it did not appear in *THE BUILDER*.

and the pleasing façades of some of the buildings erected a few years since seem to prophecy that we are very near to a second golden age.

A few days ago I came along the new town of London called Hyde Park Gardens, and I was much pleased to see that the architects in general are anxious not only to imitate, but to outdo, the ancient Grecians, Romans, &c., in the decoration of buildings. I could not help thinking that the inmates must perceive the pleasure the passers-by feel, in looking at the nice façades of their dwellings; but, by looking above the parapets, I found that the inmates of the well-formed and ornamental buildings are not so comfortable as I imagined, because some of the lofty rooms contain bad atmosphere.

The question of your readers may be, "how can a person, in passing a house, know if there is inside a good or bad atmosphere?" In answering this question, I say that every person can see this, by looking over the parapets, at the wonders of the invented ornaments upon the chimney-pots! If the atmosphere in the rooms were pure, as it ought to be, no such nuisances would be seen. When I saw the hundreds of newly-invented apparatus—cows, pipes, caps, and the strange bent figures of pipes in a row, like soldiers, when sitting on a pole in the field behind a tent, I felt very much annoyed, and was certain that the rooms contained an impure atmosphere. Of what use is the well-designed and ornamented façade to the inmates, if their health be undermined by noxious atmosphere?

From thence, I went down Hyde Park and the Green Park to St. James's Palace, and I saw the same nuisances upon St. James's Palace, as well as upon Buckingham Palace, and other buildings in their immediate neighbourhood. At Charing-cross and Trafalgar-square the same mischief is disgracing the place.

When I arrived in the City and close to the Bank, the New Exchange, with its majestic portico, made me forget the nuisance at Hyde Park Gardens, and other places mentioned, because the chimneys were free from disfigurement. In going along the Bank towards the Sun Fire Office, a most splendid façade met my eyes; but lo! what a disagreeable impression did a glance over its parapet produce!—A most ridiculous invention presented itself upon the chimney-pot. The said inventors were not satisfied with a simple or single ventilator (like a certain doctor, an experimentalist, with one large cow), no; they put one disgraceful disfigurement upon another.

I hope the architect of the New Exchange will take care to introduce only such fire-grates into the building as will require no such disgusting disfigurement for the draught of smoke. It is indeed an annoyance to look at such crooked figures as are fixed upon the chimney-pots of the new Bank Buildings, and many other edifices.

That the science requisite for avoiding with certainty such disfigurements is at present unknown to the human race, is proved by the facts mentioned; and particularly through the fact lately produced by some men of science, who have introduced stoves with which the pure atmosphere is changed into noxious vapour, whereby the health of the people is undermined and destroyed, and to which chimney-pots are required to create a draught for the smoke; and by experimentalists, who, feigning to know the science of ventilation, nevertheless set the lives of useful beings in danger through could draughts or noxious atmosphere. And such experimentalists attempt to teach the people the science of warming and ventilation!

Architects would never permit any person to disfigure their masterly works if there were a book in existence in which could be found the knowledge how to construct fire-places and chimneys so perfectly that the smoke would escape through ornamented chimneys as well as through the disfigurements already mentioned.

I do not think it impossible that the science, of avoiding and removing the nuisance in question, exists in nature, and that an offer of a high premium might lead to the discovery.

I therefore pray, in the name of the millions, and particularly in the name of those ladies who are confined to their rooms, and are obliged to inhale the poisonous effluvia from their fire-places, and suffer from illness

on account thereof, that the editor of this valuable journal will assist, by informing the honourable members of Parliament that the millions of sufferers, and architects in general, will thank them if they will take this matter into consideration, and grant a liberal premium to the individual who discovers the laws or rules, by which fire-places may be constructed without mistakes, and the chimneys remain without disfigurement.

If the honourable M.Ps. consider the dangerous action of the smoky atmosphere in apartments, and the indisputable fact, that thousands of females of delicate health suffer and die on account of the bad atmosphere in their apartments, while the individuals themselves and their medical advisers do not perceive the least sign of the dangerous effluvia, they will be satisfied that the matter deserves consideration.

A society of physicians has discovered the above-mentioned dangerous secret action of impure air in apartments, and has reported the facts to their Government.

A nobleman, or gentleman, of large fortune, desirous of benefiting the millions, might meet with success in offering a trifle for the discovery of the above-mentioned science, and would erect for himself a monument in every country in the known world, because the evil is to be found in all civilized countries, and in all situations on the globe.

I am a friend of improvements, through which the health and comfort of the millions may be heightened, and

I am, Sir, your humble servant,  
A LOVER OF SWEET AIR.

Miscellanea.

STATUE OF THE DUKE OF SUSSEX.—The model from which the marble statue of the late Duke of Sussex, which will be erected in the Great Hall of the Freemasons, attached to the Freemasons' Tavern, Great Queen-street, Long-acre, has been completed by Mr. Baily, R.A., and is now in his studio, in Percy-street. It represents the late Grand Master of the brethren with the decorations of the Garter and the Bath, and in the robes of a knight,—this gives a dignity to the figure, which modern costume alone could not have conferred, and is better than the adoption of Roman or Greek draperies, which would have been inconsistent and incongruous. The figure is of the heroic size, standing about seven feet and a half in height. The great merit is the felicitous representation of character. The features, the figure, the attitude, are all expressive of the character of the original, and, as far as portraiture is concerned, the likeness is perfect. There is also an appearance of life. Stiffness has been avoided without detracting from dignity, and there is an ease and freedom in the outline, which gives as much grace to the figure as is compatible with the fact. Perhaps this is one of Mr. Baily's best statues; it is worth a hundred of the absurdities which have of late been put forth, and will make English art somewhat more respected than most of the strange productions, which have created more amazement at their absurdity, than admiration at their merits.—*Times*.

MONUMENT TO THE EARL OF LEICESTER.—A monument to the memory of the Earl of Leicester has just been completed at Mr. Hall's marble works, Derby. It consists of a mass of sculptured Gothic tracery, forming a cinque-foil arch, resting on buttresses and columns, and open foliage capitals, and surmounted by a pediment and pinnacles, ornamented with panels, crockets, &c. Within the niche formed by the columns and arch, stands a massive tablet containing an inscription, with the capital letters illuminated alluding to his public conduct as a representative for fifty-seven years of the county of Norfolk, his generosity as a landlord, and skill and enterprise as an agriculturist.

NEW HOUSES OF PARLIAMENT.—The committee appointed to inspect and report on works of decorative art have recommended the specimens of ornamental metal work sent in by Messrs. Messenger and Sons (Birmingham), Messrs. Bramah and Co., and Mr. Abbott, as the best exhibited by the persons who are desirous of being employed in the embellishment of the Houses of Parliament.

CURIOUS OLD HOUSE.—Among the various buildings in West-street, formerly called Chick-lane, now about to be pulled down for the Clerkewell improvements, is a house, supposed to have been built at least 300 years ago, once known as the Red Lion Tavern, but for the past century used as a lodging-house, and the known resort of thieves and the lowest grade of the frail sisterhood. It is situate on the west side of the Fleet River, now called the Fleet Ditch, and used as a common sewer; and from its remarkable adaptation as a hiding-place, with its various means of escape, it is well deserving a visit of the curious. Its dark closets, trap-doors, sliding panels, secret recesses, and hiding places, no doubt rendered it one of the most secure places for robbery and murder. It was here that a chimney-sweep, named Jones, who escaped out of Newgate about three years since, was so securely hidden, that although the house was repeatedly searched by the police, he was never discovered, till it was divulged by one of its inmates, who incautiously observing that he knew whereabouts Jones was concealed, was taken up and remanded from time to time as an accessory to his escape; but when at last tired of prison fare and prison discipline, pointed out the place to obtain his own liberty. He was concealed by parting off a portion of a cellar with brickwork well be-moored with soot and dirt, to prevent detection. This cell, or more properly den, is about 4 feet wide by 9 in depth; and during Jones's incarceration therein he had food conveyed to him through a small aperture, by a brick or two being left out next the rafters. It was here, about seven years since, that a sailor was robbed, and afterwards flung naked through one of the convenient apertures in the wall, into the sewer, for which two men and a woman were transported for fourteen years. A skull and numerous human bones have been found in the cellars, some of which have been taken away by Mr. Taylor, the police medical officer. On one occasion, though the premises were surrounded by seven police officers, a thief made his escape by its communications with the adjoining houses, which were all let out to the lowest characters. Numerous parties daily visit the premises, among whom have been many of the police and county magistrates.

WESTMINSTER-BRIDGE.—The following is the report of the select committee appointed to inquire into the present state of Westminster-bridge, and into the expediency of continuing the present expenditure thereon, or of erecting a new bridge on or near the site thereof, and also into the amount of the bridge estates, and the liabilities thereon; with power to report their opinion, together with the minutes of evidence taken before them, to the House:—"That on a review of the whole of the evidence, no case has been made out to justify the committee in recommending to the House the pulling down the present bridge and the constructing a new one. That it is desirable that the inclination of the roadway over the bridge be improved by lowering its summit and raising its extremities. That the parapets of the bridge be lowered as much as is practicable and consistent with safety.

METROPOLITAN IMPROVEMENTS.—On Monday, by direction of the Commissioners of Woods and Forests, workmen were employed in making the excavations for the new street which is to pass down the centre of the sewer that is to connect Holborn with Oxford-street, and which will be about 2,000 feet in length, the new street being about 1,800 feet long. It is expected that this will take about six weeks to complete, and when finished the new roadway will be carried out as fast as possible. In a few days, on the houses in Holborn being removed, there will be a clear view of Oxford-street from Holborn.

DUNROBIN CASTLE.—Large additions are to be made to this ancient and weather-beaten pile, whose proud battlements have for ages bid defiance to the storm, and repelled the ruthless invaders of the olden times. Much as we venerate the gray towers of this feudal keep, we readily admit that modern elegance and splendour will form an agreeable contrast to the rough old grandeur of the castle. Quarrying stones for the buildings is already in progress, and a number of unemployed hands will be benefited by the work necessary to complete the buildings.

NATIONAL GALLERY OF ART IN SCOTLAND.—A meeting of citizens was held on Thursday night in the Café Royal, to consider a proposal which embraced the double idea of completing the structure of the National Monument on the Calton Hill, and of rendering it a receptacle for works of high art; of making it, in fact, a gallery of the fine arts in Scotland. The Lord Provost was called to the chair. Mr. D. R. Hay explained the scheme, which was in substance that an association should be formed similar to those already known in the country as art-unions; but that the funds so raised should be devoted, the one half to the completion of the monument, the other half to the purchase of works of high art; which, instead of being balloted for by the subscribers, should be deposited in the gallery to be established in the National Monument. Resolutions carrying out this view were moved and seconded; and a committee was suggested to carry the resolutions into effect.—*Edinburgh Observer*.

TO CORRESPONDENTS.

If the correspondent who favoured us with the sketches of Arbroath Infirmary, will favour us with his address, we shall transmit to him proofs of the cuts, which we have had executed.

# The Builder.

NO. LXXXIX.

SATURDAY, AUGUST 10, 1844.

NOTWITHSTANDING

fools make a mock at sin; notwithstanding the fool bath said in his heart, there is no God; though the unwise deface the holy temple by putting forth his hand presumptuously to uphold or to work that which requires knowledge, with which he has not been inspired:—still the canon of scripture remains unchanged; still the temple stands, though profaned; still is there existing a deep and secret knowledge of architecture, however the foolish discover it not.

We have hitherto but slightly touched upon the doings at Cambridge in relation to architecture, partly because we have confidently believed the hot rancorous evil would burn itself out,—in the fulness of time cause its own parturition; and partly because we have hitherto had our hands completely full. It is now, however, our intention shortly to go through the whole catalogue of trumpery put forth by the so called Cambridge Camden Society, and to examine it page by page; to separate the small quantity of good from the bad; to expose the weakness and disgusting effrontery of the remainder, and to bring it down to its true level. This we esteem a duty to our church, to our profession, and to society: if architecture were not at present in a most peculiar situation, we should take no such trouble; for the miserable issues of the *Cam. Cam.* Society could not hold a single day, were our art not in that peculiar situation.

It is a strange affront to the London, or *proper* Camden Society, that it should have had its name parodied by a juvenile set at Cambridge; whose weak and frantic proceedings are in complete antipodean opposition to the cool judgment—the deep, patient, learned, and meritorious antiquarian pursuits of the great man whose name is insulted by their assumption of it: indeed, seeing the ignorance, coarseness, and buffoonery, which are so plentifully sprinkled through the works of this society, we never behold or hear the three repeated letters *CAM. CAM.* without feeling the same sensation as we should were we to see the announcement of the theatrical pantomime of “*Harlequin Camden* :” so singular is the difference between the gravity, the depth of judgment, and the propriety of language of our venerable English antiquarian father—and the meanness and levity of deportment, the weakness of judgment, and the coarseness and scandal of discourse suited only to the level of the gladiator and prize-fighter, which the *Cam. Cam.* denizens have assumed; deficient of that calm, sacred, gentlemanly, and modest demeanour,

which is the humble pride of the true English churchman, and without the possession and practice of which, the foot is not even placed on the first step of religion or of science.

We intended to say no more at present upon the subject of the publications of this society, or of its members, except, that after two of them have had the audacity to blenish their characters as English priests by publishing the translation of Durandus, we have lost all previous remaining confidences in their judgment and usefulness; nor would we take the Eucharist from one, nor have our children baptized by the other: and were such a misfortune to happen to the church, that either of them, after having earned the highest ecclesiastical censure which bishop can bestow, were to arrive at episcopal dignity, and the times were strait, we should feel disposed to move into another diocese.

We propose next week to say a few words relative to the Round Church at Cambridge; in the meanwhile we caution all Englishmen, who love their church and its architecture, to be on their guard against the insidious, false science of this society, which does almost every thing—speaking, writing, construction, choice of materials, as it ought not to be done—and if they have sons to educate, to pause before they suffer them to come within the verge of their spider-web toils; and instead of returning to their families as learned Christian gentlemen, have the mortification of receiving them back as priggish, ribald scribblers, pretending to be ecclesiologists, while performing no one act of modest, deferential piety; that quality which has placed the Church of England in its present high position, and borne it illustriously through good report and through evil report, and given it a worth and power, which the foolish cast-aways of the present day can little injure, however disgusting and indecent their proceedings.

## THE LATE W. H. STUCKEY, C. E.

W. H. Stuckey, C. E., the author of the system of filtering large bodies of water, that goes by his name, died on Thursday, the 4th instant. He was also the inventor of many important discoveries, especially one for a new motive power by a pneumatic process, which has obtained patents in England, France, Holland, Belgium, and Austria; and another for a process of tanning, which, like his filtration, economized space, time, and money. The deceased's system of filtering water was recommended in both Houses of Parliament, and Lords Brougham and Radnor especially called the attention of Government and the Commissioners on the Health of Large Towns to its great utility. In France it is about being applied to all the fountains of Paris, and here to the intended fountains in Trafalgar-square. Mr. Stuckey was born at Cherson, on the banks of the Dnieper, where Howard, the philanthropist, died. He was afterwards a civil engineer and merchant at St. Petersburg, where, having obtained the Governor's (Count Essen's) approbation for his plan for supplying that city with pure water, he was doomed to endure the consequences of arbitrary power. The son of a member of the Government, finding the intended plan to be a profitable one, solicited the contract, and obtained it. Stuckey was ordered to take down his works, and sacrifice his capital. He asked the reason. The reply was characteristic:—“It is your duty to obey, and not put impertinent questions.” Descended from English parents, and with English feelings, he refused. The works were pulled down in the dead of night by 200 men of the fire-brigade. He petitioned seventeen times, without obtaining a single answer. His anxiety at seeing himself so treated, where his brother had been ennobled for his public services by the late Emperor Alexander, and his father acknowledged to be the best builder of the Russian navy, laid the foundation of the disease of

which he died. He refused to state his wrong, during the recent visit of the Emperor Nicholas, as he considered that the Emperor knew nothing personally about the conduct of his Ministry, though the letter of the Marquis of Northampton, as the President of the Royal Society, stating that the Emperor ought to be well received in this country, from the patronage afforded to Englishmen of science by the Russian Government, could in his own case, and a hundred others, be flatly denied. He died a martyr to science—a victim to arbitrary power.—*Sun.*

## MR. GEORGE STEVENSON.

This eminent engineer, at a recent entertainment at Newcastle, gave the following account of himself:—“The first locomotive that I made was at Killingworth colliery, and with Lord Ravensworth's money. Yes: Lord Ravensworth and Co. were the first parties that would intrust me with money to make a locomotive engine. That engine was made 32 years ago, and we called it, ‘My Lord.’ I said to my friends that there was no limit to the speed of such an engine, provided the works could be made to stand. In this respect great perfection has been reached, and in consequence a very high velocity has been attained. In what has been done under my management, the merit is only in part my own: I have been most ably seconded and assisted by my son. In the earlier period of my career, and when he was a little boy, I saw how deficient I was in education, and made up my mind that he should not labour under the same defect, but that I would put him to a good school, and give him a liberal training. I was, however, a poor man, and how do you think I managed? I betook myself to mending my neighbour's clocks and watches at night, after my daily labour was done; and thus I procured the means of educating my son. He became my assistant and my companion. He got an appointment as under-reviewer, and at nights we worked together at our engineering. I got leave to go from Killingworth to lay down a railway at Hetton, and next to Darlington; and after that I went to Liverpool, to plan a line to Manchester. I there pledged myself to attain a speed of ten miles an hour. I said I had no doubt the locomotive might be made to go much faster, but we had better be moderate at the beginning. The directors said I was quite right; for if, when they went to Parliament, I talked of going at a greater rate than ten miles an hour, I should put a cross on the concern. It was not an easy task for me to keep the engine down to ten miles an hour, but it must be done, and I did my best. I had to place myself in that most unpleasant of all positions—the witness-box of a parliamentary committee. I was not long in it, I assure you, before I began to wish for a hole to creep out at. I could not find words to satisfy either the committee or myself. Some one inquired if I were a foreigner, and another hinted that I was mad. But I put up with every rebuff, and went on with my plans, determined not to be put down. Assistance gradually increased—improvements were made every day—and to-day a train, which started from London in the morning, has brought me in the afternoon to my native soil, and enabled me to take my place in this room, and see around me many faces which I have great pleasure in looking upon.”

THE XANTHIAN MARBLES.—The first portion of the Xanthian marbles, which were selected by Mr. Fellowes and his party, at their survey of the extensive ruins on the banks of the Xanthus, in Asia Minor, have arrived in the British Museum. This part of the collection was placed on board her Majesty's ship the *Media*, on the twelfth of March last. There were altogether twenty large cases of marbles and casts. The principal of these remains, the Horse and the Chimæra tomb, were left on the ground, in consequence of their great weight; but it is supposed that they, with some other monuments of ancient art, are now on their way to England. The first portion was brought several days ago in waggons from Portsmouth. The cases, each of which weighed some hundred weight, were deposited in the room where cases are placed on their first arrival, and they are being opened under the superintendence of Mr. Hawkins (the keeper), with great care and attention.

## DESTRUCTIVE FIRE AT MANCHESTER.

On Monday evening, another destructive fire broke out in this town; and in the course of about an hour and a half property to the amount of 25,000*l.* was destroyed. The premises in question formed a pile of buildings, called Irwell-buildings, situate in Blackfriars'-street, the Parsonage, and Water-street, and belonged to Messrs. Robert Charlton, Brothers, calendarers, &c. Messrs. Charlton occupied the lowest story of the building, and several rooms in different parts of the premises, and their fire-proof engine-house was at the extreme angle of the building. The next portion of the premises, in Blackfriars'-street, was occupied by six firms, viz., Garner and Co., Henry Jacquet, Henry Fischer and Co., M. Ralli, Richard Rostron and T. Halstead, export merchants, and Mr. Mendel, also a foreign merchant, had the rooms fronting into Water-street. The building, we understand, with the exception of a small portion which is fire-proof, was lined with wood, and had not a party-wall in it; and, therefore, fell an easy prey to the flames. About a quarter past ten the attention of the police was attracted by seeing several persons standing in Blackfriars'-street, watching the progress made by a light in the third story of the premises next to those used by Messrs. Charlton, who were then at work. The constables perceiving that the light increased, concluded that the premises had caught fire, and at once proceeded to the police-yard, and alarmed Mr. Rose, the superintendent of the fire-brigade, who went to the spot with the Niagara engine, followed by six other engines and a large body of firemen. Upon their arrival at the place, they found that the fire had made an exceedingly rapid progress. It had already reached the fourth story, and was spreading rapidly in all directions. Messrs. Charlton immediately set to work to save such of the goods upon their premises as could be easily removed; but little progress could be made on account of the intense heat. The firemen got into the building occupied by the six foreign houses; but, after a short time, were compelled by the flames to retreat. The Salford engine, and one belonging to Messrs. Wilson, Brothers, were also brought to the spot, whilst Mr. Gould, who occupies a mill in Bateman's-buildings, caused a water-pipe to be attached to his steam-engine, which rendered considerable service. In less than 20 minutes, the whole of the building which is fifteen windows long by five deep, and six stories high, was one mass of flame, with the exception of the engine-house. Such was the intense heat, that the Blackfriars' Hotel and the houses adjoining were several times on fire, and it was only by a continual stream of water from two engines being poured upon them that they were saved. The wind fortunately was not high, or no exertions of the firemen to save the adjoining buildings would have been of any avail.

## LONDON AS IT WAS IN 1800, AS IT IS IN 1844.

(Continued from p. 387.)

MR. WILLIAM PETTY, in 1683, demonstrated that the growth of London must stop of itself before the year 1800, at which time he calculated that the population must be 5,359,000 persons: as time, however, has shewn the fallacy of these as well as many other prophecies. The beginning of the nineteenth century was the signal for increase of population, improvement, and extension; and although the war still continued a check to the enterprising spirit of Builders, yet the germs of improvement were gradually unfolding in the north of London, chiefly under the superintendence of that eminent builder, Mr. Burton. The ground belonging to the Foundling Hospital and the Duke of Bedford was the first to go off. Guilford-street was formerly a path, which led from the Earl of Roslyn's house at the back of Queen-square, and the gardens of Ormond-street, round the front wall of the Foundling Hospital, to Gray's Inn-lane, and was generally bounded by stagnant water, at least 12 feet lower than the square. This place was now raised to a level with the adjoining streets, and a considerable addition made to the garden of the square; and the beautiful view of Hampstead and Highgate was now hidden in by majestic houses with Tuscan pillars. This pleasant prospect

being reserved for a short time to the inhabitants west and north of Brunswick-square.

Bedford House, in Bloomsbury-square, designed by Inigo Jones for the Earl of Southampton, being sold for 5,000*l.*, was pulled down to make room for the elegant houses now standing on the site of this house and garden, embracing Montague-street, the north side of Bloomsbury-square, &c.; and Montague House was soon surrounded with houses. Roslyn House (formerly Lord Baltimore's, and afterwards the Duke of Bolton's), which forms the south-east corner of Russell-square, becoming built in, lost, with its beautiful view, all value in the eyes of its noble proprietor, was seldom occupied, and finally abandoned; this noble roomy house, after being untenanted for many years past, has been sold within these few weeks, and will soon be lost sight of by additional buildings.

In order to expedite the building of Russell and Tavistock-squares, and the various lines of streets, the proprietors offered leases for 99 years; and the houses being valued from 500*l.* to 4,000*l.*, they lent sums of 150*l.* to 600*l.* for three years to such persons as chose to accept them. Several acres of ground, where now stands Euston-square and other houses, and bounding the New-road on either side, were about this time converted into gardens for culinary and other plants. The only house in Somers Town of any age was the Brill Tavern, which in 1792 was approached by a pleasant path, through a white turnstile where Judd's-place now stands. The principal public structure was a chapel, first called Bethel, afterwards St. Paul's, and in 1803 Bethel Meeting for Anabaptists. The Methodists also had a chapel, and several private places of worship. In the Polygon lived and died the celebrated Mrs. Walsonecraft Godwin, and many years afterwards her equally celebrated husband. Somers Town was then a great place for French refugees, who were noted for their civil, but at the same time unsocial behaviour. The fields between Somers and Camden Town were at this time let out for grazing; and were for several years afterwards let to Mr. Rhodes, the celebrated cow-keeper. Camden Town was a country village of small size, consisting of two road-side public-houses, and a few straggling tenements, commanding an uninterrupted view of Highgate, Hampstead, and Islington; Kentish Town was also a small romantic village, celebrated for the purity of its air, and the simple manners of its inhabitants; its houses were chiefly built of wood surmounted with red tiles.

In the neighbourhood of Kentish Town lived the noted miser John Little. A few days prior to his demise, the physician who attended him observed how highly necessary it was that he should occasionally drink a glass of wine; after much persuasion, he was induced to comply, yet by no means would entrust even his housekeeper with the keys of his cellar, but insisted on being carried down to the door, which, on being opened, he in person delivered out one bottle of wine; when, it is supposed, by the removal from a warm bed into a dark humid vault, he was seized with a shivering fit, which terminated in an apoplectic stroke, and occasioned his death. So great was his antipathy to the marriage state, that he discarded his brother, the only relative he had, for not continuing, like himself, in a state of celibacy. He left 38,000*l.* in vested and landed property. One hundred and seventy-three pairs of breeches, and a numerous collection of other articles of wearing apparel were found in a room which had not been opened for fourteen years. One hundred and eighty wigs were found in the coach-house, which, with other things, had been bequeathed to him by different relations. He died April, 1798.

The vast parish of St. Marylebone was little known or noticed before Pennant's time. Captain Rathbone commenced, in 1721, the erection of Rathbone-place, in which year he died; part of Charlotte-street was built in 1791, and two sides of Fitzroy-square were completed a few years after. The ground on which Cavendish-square, originally called Oxford-square, and its neighbourhood, is built, was sold at first for 2*s.* 6*d.* per foot, afterwards for 1*s.* The following is quoted by Pennant from the "Weekly Medley, Sept., 1719:—"Not far from Tavistock-street lives a man, by profession a measurer and surveyor; this fellow is for everlastingly boasting of himself,

and vapouring of his performances, and has the boldness to style himself the prince of that calling. If towards being a prince of a trade, it is necessary to make himself wealthy and great by undoing all that are subject to his management, he richly deserves the name; for you must understand that as among authors, there is *cacoethes scribendi*, so there is *edificandi cacoethes*, or an itch of building, that prevails much among our tribe, that dabble in mortar. All the raw and inexperienced workmen that lie under this evil, have been drawn by this booster to build in and about Hanover-square, till they have built themselves quite out of doors in this part of the world, and so are about to cross the water to another climate, and take up their lodgings within the street adjacent to Mint-square (within the rules), where they still rear palaces in imagination, and metamorphose themselves into that species of men called castle-builders."

Newman-street and Berners-street were built between the years 1750 and 1770, and were remarkable for the residence of artists; of whom West and Russell in oil and crayon-paintings, and Bacon, sen. and jun., will long be held in remembrance. The centre house, on the west side of Cavendish-square, was built by Lord Bingley, its first stone being laid in 1722. This house is 153 feet in length and 70 in breadth. Two of the four houses on the north side, which are of stone, were intended as wings to a magnificent palace, projected by the Duke of Chandos, contemporary with Pope. The house running into Harley-street was formerly occupied by Mr. Hope, the celebrated banker, who possessed one of the finest collections of valuable paintings then existing. The sale of his effects after death occupied fourteen days, and laid the fortunes of many brokers and other purchasers. This house was afterwards occupied by another millionaire, Mr. Watson Taylor; it is now divided into several tenements. Welbeck-street is celebrated as formerly the residence of that crack-brain enthusiast, Lord George Gordon; and also of the ever-to-be-remembered Edmund Hoyle, Esquire, who died at the advanced age of 97.

Stratford-place was erected about 1775, on the Banqueting-house ground, which was built under a lease renewable for ever, granted by the Corporation of London to Edward Stratford and others, the proprietors and executors of the present magnificent houses. Here was the celebrated Banqueting-house, used by the Lord Mayor and Aldermen, for taking refreshments, when they visited the city conduits.

For the first 12 years of the present century a very steady annual increase of buildings was perceptible north-west of London; the formation of the Regent's Park gave a remarkable fillip to the speculative spirit of the day, and field after field was rapidly swallowed up by the moving torrent of brick and mortar. A new style of building was introduced, by which, however, sterling comfort was sacrificed at the shrine of ornament. The houses, surrounding the Regent's Park, present the maximum of ornament, indicating wealth, but the minimum of convenience. They are, in general, small, violent digressions from true taste; and from their style of building, have the tendency to exclude both light and air so really desirable in this vicinity. Again, a taste was introduced about this time for a kind of nondescript building, termed country box or cottage, and the roads of our suburbs were soon lined with these things of Lilliputian dimensions, divided into four, six, or eight cells, in which people eat, drank, and slept, and performed the ordinary routine of idle life, protecting themselves from the balmy breath of heaven by bulwarks of rheumatic-looking trees and sickly shrubs, and enjoying their *otium cum dignitate* in the midst of brick-fields and stagnant pools. There is something strangely repugnant to the nature of most of us in being compelled to vegetate in these abominable eight-foot rooms, breaking one's shins, or the crockery at every move, sweeping off the china, treading on cats, lap-dogs, and gouty toes, and drinking bad port in a pent up atmosphere replete with carbonic acid gas. The decrease of rent is but a poor consolation for the loss of every comfort.

On the other hand we cannot but confess that many of the buildings more immediately

in the neighbourhood of the Regent's-park, while they do ample credit to the architect and builder, are all that is desirable for family residence, and are suitable for the aristocracy of wealth. Of the mansions within the area of the park, some of them have been remodelled so as to preserve no resemblance to their original form and architectural character, and many of the buildings now in hand are classically beautiful; still there is an evident deficiency of tact in jumbling the poor and rich together, for the latter soon take fright as they find themselves envied by the former.

Entering the city northward from Camden Town, we enter the parish of Clerkenwell, so named from a spring at the lower end of Clerkenwell-green, where the parish clerks of the city used annually to exhibit dramatic representations of historical events recorded in the sacred writings; which representations were well attended by the Lord Mayor and citizens, and occasionally by the nobility. Here was formerly a nunnery founded by Jordan Bristet, a wealthy baron, about the year 1100, in a field adjoining to Clerks or Clerken Well, and dedicated to the honour of God, and the Assumption of the Blessed Virgin. This priory was suppressed by Henry VIII. in 1539. Soon after the dissolution of the convent the ground came to the inheritance of Sir William Cavendish, who, being created Duke of Newcastle, built a large brick mansion on the north side of the church, on the east side of the close, which now bears the name of Newcastle-place.

Where St. John's-square now stands was formerly the Hospital of St. John of Jerusalem, which stately edifice was consumed by fire by the rebels under Wat Tyler and Jack Straw: it was rebuilt with greater magnificence, and eventually suppressed by Henry VIII. It then became a Government store-house, and was finally demolished by order of Somerset, the Protector, who employed its materials in building Somerset House. Near this spot is Cold Bath-fields, and the prison of Bridewell, of which we have a particular and curious account by Waddington; he says:—"The dissolution of monasteries and the suppression of religious houses in 1536, having driven great numbers of priests and others from their asylums, destitute of all provision or means of support, they were reduced to the miserable expedient of begging alms for a precarious existence. In a short time this became so burdensome and expensive to the nation, that a severe statute was made in 1 Edward VI., for the regulation of paupers and the punishment of vagrants. In consequence of this and other ordinary causes, multitudes of necessitous persons resorted to the metropolis for protection and relief; and it appears that some respectable citizens, either voluntarily, or more probably, as a committee instituted for that purpose, contributed liberally towards their necessities. At length, however, their wants became so pressing, and they were reduced to such misery, that in 1552, upon the recommendation of those governors, as they were called, it was thought advisable that a petition, in the name, and on behalf of those unhappy sufferers, should be addressed to the king, "beseeching him, in Christ's name," to grant the old palace of Bridewell to the city of London for their harbour and lodging. This was granted at the earnest representation of Bishop Ridley and Sir Martin Bonner, the then Lord Mayor of London, and when the indenture was presented to this pious monarch, with a blank space left for the value of lands that might be taken in mortmain, he called for pen and ink, and with his own hand wrote, "4,000 marks by the year;" exclaiming, in the hearing of his council, "Lord, I yield thee most hearty thanks that thou hast given me life thus long, to finish this work, to the glory of thy name." The preamble declares that the house of Bridewell was established, and should have continuance "for the suppression of idleness, the enemy of all virtue; and for the nourishment of good exercise, which is the conqueror of all vice. The idle strumpet and vagabond were to be forced and compelled to honest and virtuous exercise, so long as they were whole; but being sick, they were to be taken to St. Thomas's, and when cured, returned to Bridewell, and not set at liberty into the highways, as heretofore, by means whereof was made a sick beggar or whole thief." As an evidence that this establish-

ment and these regulations "had taken effect, and had good success," it is observed, "that no poor citizen at that day begged his bread; but that by some means his poverty was provided for."

(To be continued.)

#### TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.

(Continued from p. 382.)

40. PINE.—Of the pine there are several species, the wood from which being well-adapted for joiners' work, is used in Great Britain; although, from the heavy import duties which are levied on North European timber, there is much temptation to devote Canadian wood to purposes for which its properties every way disqualify it.

41. The Weymouth or white, the yellow, and the pitch pine, are natives of North America; the cluster pine, or *pinaster*, which is to be found in British plantations, belongs to the rocky and more mountainous regions of Europe; extensive woods of it also cover a great portion of the sandy downs on the southern French coast; the influence of sea-breezes seeming to be congenial with its nature. The Siberian stone, or *Cembra* pine, is a beautiful species, which, on account of its ornamental character, is now cultivated to a considerable extent.

42. The timber of the white pine is said to make excellent masts, and to stand the weather moderately well; but being very subject to dry-rot, and otherwise unendurable, it is unsuitable for principal timbers in house carpentry; on the whole, however, it is one of the most serviceable of the American pines, being light, soft, straight-grained, and uniform in tinge and texture; it is very good for many descriptions of moveable articles. It is one of the largest of the species, and is imported to this country in balks, sometimes 30 feet long and 2 feet square. The wood is of rather a rich and dark yellow, and has a particular odour; from the evenness of the texture, and the comparative absence of resinous matter, the annual rings are not very distinct. The yellow pine is also used in Britain for house and ship-carpentry.\* The pitch pine abounds in a soft and fragrant resin, which renders the wood, which is of a deeper colour than that of the Scotch fir, heavy and difficult to work: this timber affords conclusive evidence that the presence of resin is not a guarantee of strength, for it is not very durable at its best, and is brittle when dry. The cluster pine is not so deep in the colour of the wood as the Scotch fir; it reaches to a size greater than that tree, being of a rapid and luxuriant growth, and that, too, in sandy tracts wherein any other tree could scarcely live, attaining in fifty or sixty years a height of as many feet, with girth proportionate: it yields both resin and turpentine.

43. LARCH.—This is another of the pine tribe; and, in the live tree, perhaps the most beautiful of them. It is of rapid growth, tall, straight, tapering, and furnished with pendulous branches, bearing a delicately-drooping and feathery spray. It is, moreover, a very valuable timber, the only drawback to its extensive application in house-carpentry being its want of stiffness, as it is exceedingly durable in whatever situation it is employed; and for ship-building deemed excellent. For joiners' work, and even cabinet-making, it is very available; and, indeed, is in many parts superseding the common fir-wood, being susceptible of receiving a superior surface; and, from the beauty of the wood, when deepened by oil or varnish, the cost of painting is rendered unnecessary. For stairs and floor-boards, besides the above valuable properties, it has to recommend it that of standing more wear and tear than deal will undergo, a circumstance of paramount consideration.

44. Besides the European species, which is indigenous to Siberia, the Alps, Germany, and Italy, and of which the timber of the latter is held in the highest estimation, there are two from America, namely, the black or Tamarack, and the red species; and which are considered somewhat inferior to the former. The European varieties all thrive well in this country; and

\* [But should be almost wholly excluded from work intended to be durable.—Ed.]

the Italian larch, which is a straight tree of quick growth, is being propagated to a considerable extent. Of the American species, the timber of the first-named is said to be in quality almost equal to that of the European—the second is next in quality, and not much behind the other. The European larch yields the Venice turpentine, which the American does not. Unfortunately of the kinds grown in this country, the worst is the most abundant.

45. The sapwood of larch loses two-fifths of its weight in drying; and the timber throughout, a great deal in seasoning; but it stands well afterwards, and is not subject to worms. It is not so easy as fir to work, but the superior finish of its surface compensates for that inconvenience; and it bears well the driving of nails and bolts. In the European kinds the wood is of a yellow colour; but there are two descriptions—one tending more to the red and the other to the white kind: the former is the closer, straighter, and harder of the two, and necessarily the better wood: it has no larger transverse septæ; the annual rings are distinct, their harder part being more of a dark-reddish tinge than the general colour of the wood. The age for felling is from fifty years upwards; but it has been found that by dis-barking a year or two before felling, timber of thirty years' growth is rendered as durable as if cut down at fifty and treated in the ordinary way; the hardness of the wood being thereby considerably increased while dryness is insured; besides its tending to remedy the deficiency in stiffness which disqualifies this timber for some uses; the practice must therefore be a profitable one; and even stripping in spring and felling late in the autumn of the same year, is one which would make amends for the extra trouble.

46. The larch was employed to some extent in ancient Rome, where, however, it does not appear to have been cultivated—Vitruvius having had occasion to lament the obstacles which existed to its more general introduction.†

47. CEDAR.—This also is one of the pines, and a handsome and valuable tree; producing, in several of its species, very beautiful and useful wood; although its scarcity in this country precludes its application to building purposes. The following are some of the best known, namely, the cedar of Lebanon, a native of Mount Libanus; the *Bernudian*, a native of Bermuda and the Bahama Islands; the *Virginian*, a native of the West Indies, North America, and Japan; and the *Brown-berried*, a native of Spain, the South of France, and the Levant.

48. The cedar of Libanus or Lebanon (also called the cedar; being the *cedrus magna* of the ancients), is a tree of considerable size; an evergreen, and coniferous: it is considered, on account of its large dimensions, to be the species from which those immense pillars and beams were formed, that are recorded as having been employed in the construction of ancient temples—its use in that of Apollo at Utica, is mentioned by Pliny. The cones are almost round, are smooth in their scales, and stand erect; the leaves are small, narrow, and thick-set. The Virginian or pencil cedar, is the species used by makers of black-lead pencils in Britain, and which artists who have used those of Continental manufacture will attest to be admirably adapted for the purpose; it is very durable and not subject to worms or insects. The species last enumerated above is supposed to be the famous cedar of the ancients, which they employed for their statuary before the use of marble was known for that branch of art; it is celebrated for its durability, being almost incorruptible. There are some fine cedars grown in this country.‡

49. The colour of cedar-wood generally is a light pinkish brown in the heart wood, and a creamy white in the sapwood; the annual rings are distinct, and consist of two parts—one being light and soft, and the other,

† The stag feeds readily on its young branches; and a girl died at Lanark, in Scotland, 3rd May, 1840, in consequence of having masticated and swallowed some larch bark the day previous.

‡ [The best use for this kind of wood is for the interior of wardrobes, and the shelves and other fittings of libraries; its strong fragrance preventing the destructive operations of moths and other insects. It is also used in superior work, for the seats of water-closets, being more comfortable than mahogany.—Ed.]

which contains resin, harder and darker; it has no larger transverse septa; but the lesser exhibit, when the wood is smoothed across the growth, a small and beautiful mottling. The grain is straight, and in texture nearly uniform; it is light and easily worked, splits readily, and is rather brittle; it is somewhat bitter to taste, and has a strong and peculiar odour; qualities which effectually fortify it against worms and insects: this exemption, together with its toughness and durability, are the chief properties it possesses—both the latter existing in it to a very high degree: those of strength and stiffness, especially the latter, it is materially deficient in; which renders it therefore unfit for carpentry; it is very useful, however, in cabinet-making, whether for interior fittings, or the outside shell; the figured portions, in particular, being very beautiful when brought to the smooth surface, and high polish of which the wood is susceptible.

(To be continued.)

#### RETROSPECTIVE ARCHITECTURAL LITERATURE.

COLLECTED BY SIR HENRY WOTTON, KNIGHT.

From the best Authors and Examples.

#### THE ELEMENTS OF ARCHITECTURE.

I SHALL not need (like the most part of Writers) to celebrate the Subject which I deliver; in that Point I am at Ease: For Architecture can want no Commendation, where there are noble Men, or noble Minds: I will therefore spend this Preface rather about those from whom I have gathered my Knowledge: For I am but a Gatherer and Disposer of other Men's Stuff at my best Value.

Our principal Master is Vitruvius, and so I shall often call him, who had this Felicity, that he wrote when the Roman Empire was near the Pitch; or at least, when Augustus (who favoured his Endeavours) had some Meaning (if he were not mistaken) to bound the \* Monarchy: This, I say, was his good hap, for in growing and enlarging Times, Arts are commonly drowned in Action: But on the other side, it was in truth an Unhappiness to express himself so ill, especially writing (as he did) in a Season of the ablest Pens; and his Obscurity had this strange Fortune, that though he were best practised and best followed by his own Countrymen, yet after the reviving and republishing of good Literature (which the Compositions and Tumults of the middle Age had uncivilized) he was best, or at least, first understood by Strangers: For of the Italians that took him in hand, those that were Grammaticians seem to have wanted Mathematical Knowledge, and the Mathematicians perhaps wanted Grammar, till both were sufficiently conjoined in Leon Baptista Alberti the Florentine, whom I repute the first learned Architect beyond the Alps; but he studied more indeed to make himself an Author, than to illustrate his Master: Therefore among his Commenters, I must (for my private Conceit) yield the chief Praise unto the French, in Philander; and to the High-Germans, in Gualterus Rivius, who, besides his Notes, hath likewise published the most elaborate Translation that I think is extant in any vulgar Speech of the World, though not without bewailing now and then, some Defect of artificial Terms in his own, as I must likewise: for if the Saxon (our Mother Tongue) did complain; as justly (I doubt) in this Point may the Daughter: Languages for the most part, in Terms of Art and Erudition, retaining their original Poverty, and rather growing rich and abundant in complementary Phrases, and such Froth. Touching diverse modern Men, that have written out of meer Practice, I shall give them their Due upon Occasion.

And now, after this short Censure of others, I would fain satisfy an Objection or two, which seem to lie somewhat heavily upon my self: It will be said that I handle an Art no way suitable either to my Employments, or to my Fortune; and so I shall stand charged both with Intrusion and with Impertinency.

To the First I answer, That though by the ever-acknowledged Goodness of my most dear and gracious Sovereign, and by his long indulgent Toleration of my Defects, I have born Abroad some part of his Civil Service; yet when I came Home, and was again resolved into my own Simplicity, I found it fitter for my Pen (at least in this first publick Adventure) to deal with these plain Complements,

\* Tacit. Lib. 1, Annal.

and tractable Materials, than with the Labyrinths and Mysteries of Courts and States; and less Presumption for me, who have long contemplated a famous Republick, to write now of Architecture, than it was anciently for \* Hippodamus the Milesian to write of Republicks, who was himself but an Arhitect.

To the Second, I must shrink up my shoulders, as I have learned Abroad, and confess indeed, that my Fortune is very unable to exemplify and actuate my Speculations in this Art, which yet, in truth, made he rather, even from my very Disability, take Encouragement to hope that my present Labour would find the more Favour with others, since it was undertaken for no Man's sake less than mine own: And with that Confidence I fell into these Thoughts, of which there were two Ways to be delivered: The one Historical, by Description of the principal Works performed already in good part by Giorgio Vasari, in the Lives of Architects: The other Logical, by casting the Rules and Cautions of this Art into some comfortable Method, whereof I have made choice, not only as the shortest and most elemental, but indeed as the soundest: For though in practical Knowledges every compleat Example may bear the Credit of a Rule, yet, peradventure, Rules should precede, that we may by them be made fit to judge of Examples. Therefore to the Purpose, for I will Preface no longer.

PART I.—In Architecture, as in all other Operative Arts, the End must direct the Operation.

#### THE END IS TO BUILD WELL.

Well Building hath three Conditions; *Commodity, Firmness, and Delight.*

A common Division among the Deliverers of this Art, though I know not how somewhat misplaced by Vitruvius himself, (Lib. 1, Cap. 3) whom I shall be willing to follow, as a Master of Proportion than of Method.

Now, for the attaining of these Intentions, we may consider the whole Subject under two General Heads:

#### THE SEAT, AND THE WORK.

Therefore, first touching Situation, The Precepts thereunto belonging, do either concern the Total Posture, (as I may term it) or the placing of the Parts: Whereof the first Sort, howsoever usually set down by Architects as a Piece of their Profession, yet are in truth borrowed from other Learnings; there being between Arts and Sciences, as well as between Men, a kind of good Fellowship, and Communication of their Principles.

For you shall find some of them to be merely Physical, touching the Quality and Temper of the Air; which being a perpetual Ambient and Ingredient, and the Defects thereof incorrigible in single Habitations (which I most intend) doth in those Respects require the more exquisite Caution: That it be not too gross, nor too penetrations, not subject to any foggy Noisomeness from Fens or Marshes near adjoining, nor to mineral Exhalations from the Soil itself: not undigested for want of Sun; not unexercised for want of Wind; which were to live (as it were) in a Lake, or standing Pool of Air, as Alberti, the Florentine Architect, doth ingeniously compare it.

Some do rather seem a little Astrological, as when they warn us from Places of malign Influence, where Earthquakes, Contagions, Prodigious Births, or the like, are frequent, without any evident Cause; whereof the Consideration is, peradventure, not altogether vain: Some are plainly Oeconomical; as that the Seat be well watered and well fuelled; that it be not of too steepy and inconvenient Access, to the Trouble both of Friends and Family; that it lie not too far from some Navigable River, or Arm of the Sea, for more Ease of Provision, and such other Domesticke Notes.

Some again may be said to be Optical; such I mean, as concern the Properties of a well-chosen Prospect, which I will call the Royalty of Sight: For as there is a Lordship (as it were) of the Feet, wherein the Master doth much joy when he walketh about the Line of his own Possessions; so there is a Lordship likewise of the Eye, which being a ranging, and imperious, and (I might say) an usurping Sense, can endure no narrow Circumscription, but must be fed both with Extent and Variety: Yet on the other side, I find vast and inde-

finite Views, which drown all Apprehensions of the uttermost Objects, condemned by good Authors, as if thereby, some part of the Pleasure (whereof we speak) did perish. Lastly, I remember a private Caution, which I know not well how to sort, unless I should call it Political, by no means to build too near a great Neighbour; which were, in truth, to be as unfortunately seated on the Earth, as Mercury is in the Heavens, for the most part ever in Combustion or Obscurity, under brighter Beams than his own.

From these several Knowledges, as I have said,\* and perhaps from some other, Architects do derive their Doctrine about Election of Seats, wherein I have not been so severe as a great Scholar of our Time, who precisely restrained a perfect Scituation, at least for the main Point of Health, *Ad locum contra quem Sol radios suos fundit cum sub Ariete oritur*; that is, in a word, He would have the first Salutation of the Spring. But such Notes as these, wheresoever we find them in grave or slight Authors, are, to my Conceit, rather Wishes than Precepts; and in that Quality I will pass them over. Yet I must withal say, that in the Seating our selves (which is a kind of Marriage to a Place) Builders should be as circumspect as Woovers, lest, when all is done, that Doom befall us, † which our Master doth lay upon Mytelene: A Town, in truth, (saith he) finely built, but foolishly planted. And so much touching that which I termed the Total Posture.

The next in Order, is the placing of the Parts; about which (to leave as little as I may in my present Labour, unto Fancy, which is wild and irregular) I will propound a Rule of mine own Collection, upon which I fell in this manner: I had noted, that all Art was then in truest Perfection, when it might be reduced to some natural Principle: For what are the most judicious Artizans, but the Mimicks of Nature? This led me to contemplate the Fabrick of our own Bodies, wherein the High Architect of the World hath displayed such Skill, as did stupify all humane Reason: There I found the Heart, as the Fountain of Life placed about the Middle, for the more equal Communication of the vital Spirits; the Eyes seated aloft, that they might describe the greater Circle within their View; the Arms projected on each Side, for ease of Reaching: Briefly (not to lose ourselves in this sweet Speculation) it plainly appareth as a Maxim drawn from the divine Light, that the Place of every Part is to be determined by the Use.

So then from natural Structure to proceed to artificial, and in the rudest Things, to preserve some Image of the excellentest, let all the principal Chambers of Delight, all Studies and Libraries be towards the East; for the Morning is a Friend to the Muses. All Offices that require Heat, as Kitchens, Stillatories, Stoves, Rooms for Baking, Brewing, Washing or the like, would be Meridional. All that need a cool and fresh Temper, as Cellars, Pantries, Butteries, Granaries, to the North: To the same side likewise, all that are appointed for gentle Motion, as Galleries, especially in warm Climes, or that otherwise require a steady and unvariable Light, as Pinacotheca (saith Vitruvius) by which he intendeth (if I may guess at his Greek, as we must do often even at his Latin) certain Repositories for Works of Rarity, in Picture or other Arts, by the Italians called Studioli, which at any other Quarter, where the Course of the Sun doth diversify, the Shadows would lose much of their Grace: And by this Rule, having always regard to the Use, any other Part may be fitly accommodated.

I must here not omit to note, that the ancient Grecians and the Romans, by their Example in their Buildings abroad, where the Seat was free, did almost religiously seatuate the Front of their Houses towards the South, perhaps that the Master's Eye, when he came home, might not be dazzled, or that being illustrated by the Sun, it might yield the more graceful Aspect, or some such Reason. But from this the modern Italians do vary, whereof I shall speak more in another Place. Let thus much suffice at the present, for the Position of the several Members, wherein must be had, as our Author doth often insinuate, and especially, (Lib. 6, Cap. 10.) a singular regard to

\* Joannes Heurnius Instit. Medicin. Lib. 7, Cap. 2.  
† Oppidum quidem edificatum eleganter sed imprudenter positum.

\* Aristot. 2. Lib. Polit. Cap. 6.

the Nature of the Region: Every Nation being tied above all Rules whatsoever, to a Discretion of providing against their own Inconveniences; and therefore a good Parlour in Egypt, would perchance make a good Cellar in England.

There now followeth the second Branch of the general Section touching the Work.

In the Work I will first consider the principal Parts, and afterwards the Accessory, or Ornaments; And in the Principal, first the Preparation of the Materials, and then the Disposition, which is the Form.

Now concerning the Material Part, although, surely, it cannot disgrace an Architect, which doth so well become a Philosopher, to look into the Properties of Stone and Wood; as that Fir-Trees, Cyresses, Cedars, and such other aëreal aspiring Plants, being by a kind of natural Rigour (which in a Man I would call Pride) inflexible downwards, are thereby fittest for Posts or Pillars, or such upright Use; that on the other Side, Oak and the like true hearty Timber, being strong in all Positions, may be better trusted in cross and traverse Work, for Summers, or girding and binding Beams, as they term them. And so likewise to observe of Stone, that some are better within, and other to bear Weather: Nay, to descend lower, even to Examine Sand and Lime, and Clay, (of all which Things Vitruvius hath discoursed, without any Dainties, and the most of new Writers) I say, though the Speculative Part of such Knowledge be liberal, yet to redeem this Profession, and my present Pains from Indignity, I must here remember, that to chuse and sort the Materials for every part of the Fabrick, is a Duty more proper to a second Superintendent over all the under Artizans, called (as I take it) by our Author, Officiario, (Lib 6, Cap. 11.) and in that Place expressly distinguished from the Architect, whose Glory doth more consist in the Designing and Idea of the whole Work; and his truest Ambition should be to make the Form, which is the nobler Part (as it were) triumph over the Matter; whereof I cannot but mention, by the way, a foreign Pattern, namely, the Church of Santa Giustina in Padua. In truth, a sound Piece of good Art, where the Materials being but ordinary Stone, without any Garnishment of Sculpture, do yet ravish the Beholder (and he knows not how) by a secret Harmony in the Proportions. And this, indeed, is that End, which, in some degree, we should aim even in the privatest Works; whereunto, though I make haste, yet let me first collect a few of the least trivial Cautions belonging to the Material Provision.

Leon Baptista Alberti is so curious, as to wish all the Timber cut out of the same Forest, and all the Stone out of the same Quarry.

Philibert de l'Orme, the French Architect, goes yet somewhat farther, and would have the Lime made of the very same Stone which we intend to employ in the Work, as, belike, imagining that they will sympathize and join the better by a kind of original Kindred. But such Conceits as these seem somewhat too fine among this Rubbish, though I do not produce them in Sport; for surely the like Agreements of Nature may have oftentimes a discreet Application to Art: Always it must be confessed, that to make Lime without any great Choice of Refuse-Stuff, as we commonly do, is an English Error of no small Moment in our Buildings: Whereas the Italians at this Day, and much more the Ancients, did burn their firmest Stone, and even Fragments of Marble, where it was copious, which in Time became almost Marble again, or at least of indissoluble Durity, as appeareth in the standing Theatres. I must not here omit, while I am speaking of this Part, a certain Form of Brick, described by Daniel Barbaro, Patriarch of Aquileia, in the largest Edition of his Commentary upon Vitruvius: The Figure triangular, every Side a foot long, and some Inch and a half thick, which he doth commend unto us for many good Conditions; as that they are more commodious in the Management, of less Expence, of fairer Show, adding much Beauty and Strength to the mural Angles, where they fall gracefully into an indented Work; so as I should wonder that we have not taken them into Use, being propounded by a Man of good Authority in this Knowledge, but that all Nations do start at Novelty, and are indeed married to their own Molds. Into this Place might aptly fall a Doubt, which some have

well moved, whether the ancient Italians did burn their Brick or no; which a Passage or two in Vitruvius hath left ambiguous. Surely, where the natural Heat is strong enough to supply the artificial, it were but a curious Folly to multiply both Labour and Expence. And it is besides very probable that those Materials, with a kindly and temperate Heat, would prove fairer, smoother, and less distorted than with a violent: Only they suffer two Exceptions, First, that they are likely by such a gentle drying to be the more ponderous, an important Circumstance to the main of the Work in the Complement. The next is of no less moment, That they will want a certain sucking and soaking Thirstiness, or a fiery Appetite to drink in the Lime which must knit the Fabrick. But this Question is to be confined to the South, where there is more Sun and Patience: I will therefore not hinder my Course with this incident Scruple, but close that Part which I have now in hand about the Materials, with this principal Caution, that sufficient Stuff and Money be ready before we begin; for when we build now a Piece, and then another, by Fits, the Work dries and sinks unequally, whereby the Walls grow full of Chinks and Crevices; wherefore such a pausing Humour is well reproved by Palladio, (Lib. 1, Cap. 1), and by all other. And so having gleaned these few Remembrances touching the Preparation of the Matter, I may now proceed to the Disposition thereof, which must form the Work. In the Form, as I did it in the Seat, I will first consider the general Figure, and then the several Members.

(To be continued.)

#### A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARKHAM, IN NORFOLK—NO. II.

WITH NOTICES OF THEIR ACTUAL CONDITION.

*Morton-on-the-Hill, antique Helmingham.*—The little church of Morton, with its slender round tower, occupies a position of scenic beauty not frequently occurring in this county. Looking down from among the tall fir-trees, which embower the summit capped by it, over the long valley of the Wensum,

“Exulting and abounding river

Making its waves a blessing as they flow,”

the edifice forms, in its rude antiquity, picturesque background to the fine mansion that rises immediately beneath. Pass within the sanctuary and learn how frail and liable to decay even the strongest work of man; come forth again to confess how lovely, as well as enduring, are the features of nature.

But decay is not the only enemy with which our sacred piles have had to contend; covetousness, and a taste which it were complimentary to call “debased,” have wrought in aid here. The neglect of a wordly age has, moreover, joined to impair what had escaped the ravages of fanaticism. A change has happily come over the views of many in this respect, but zeal—patient and temperate zeal to restore the diminished honours of his worship—has yet a wide range of usefulness. To return, however, to the subject more immediately in hand.

The form, or rather the ground-plan, of this church, is somewhat peculiar, a north aisle or chapel ranging with the east end of the nave, while it falls short of the other's length by about one-third. A screen probably crossed this aisle, separating the eastern portion of it from the rest to form a chantry: that an altar stood within it we gather from the piscina in the south wall yet visible, and John de Weston, by his will, dated June 4, 1375, bequeathing his body to be buried in the chapel next the chancel of the church of St. Margaret the Virgin in Helmingham.\* Inarched in the north wall of the chapel is an antique monument without inscription, but bearing a cross cut in wood: two grave-stones on the pavement, charged with brasses exhibiting portraits in armour, were to be found here about the middle of the last century. An altar-tomb, also inarched, bears a memorial to one of the Southwell family, former lords of the soil here, albeit “the place thereof knoweth them no more.”

We were pained to detect in every portion of this interesting relic, manifest tokens of neglect, and consequent dissolution. “If a

man's stable for his horse,” says the Homily, “yea, the sty for his swine, be not able to hold out water and wind, how careful is he to do cost thereon; yet the world thinketh it but a trifle to see their church in ruin and decay.” A niche in the north wall of the chancel, and opposite to it a small window at less than man's height from the sward, may recall the watchings of the sepulchral light, anciently observed on Easter eve. We have cast aside such mummeries, some one will say; true, but in parting with them, we have grown careless also of God's house, and the inestimable privileges there vouchsafed to us. Modern affluence can be liberal enough in its expenditure on secularities, but ask a pittance for the wants of the sanctuary, and *deficit crumena*, the purse labours under a consumption. Far better were it, however, that we should insist, like David, on laying our *shekels*, as well as our prayers, on the altar of peace-offering.

Seem we over earnest? At a time when the average repair of our churches is so depressed, it reflects small credit on any parish to find the condition of theirs infinitely below that average. We should feel ourselves not unjustified in passing severe comment, but would avoid at some sacrifice the risk of individual application; mindful of a certain Sir Roger de Coverley and his advice, “to take care how we meddle with country squires, the ornaments of the English nation, men of good heads and sound bodies.”

But in serious earnestness be it asked, why should not a Diocesan Architectural Society, be established among us? If such an association had been in existence during the last twenty years only, it could hardly have proved altogether inoperative against the vandalizing, which has been even in that space perpetrated. This by way of appeal; we would raise a spirit like Nehemiah's, that should go forth, and restore all the desolations of our Zion: “Why should not my countenance be sad, when the place of my fathers' sepulchres lieth waste?” Neh. ii. 3.

We next propose to treat of the neighbouring church of Weston Longueville and its condition. C. T.

#### THE LATE DR. DALTON.

THIS celebrated chemist and philosopher died on the 19th ult., at Manchester, in his 73rd year. He was a native of Kendal, but has for a long series of years been connected with Manchester, where for more than half a century he has been an active and invaluable member of the Literary and Philosophical Society in that town, having, together with his friend Dr. Edward Holme, M.D., F.L.S., been elected on the 25th April, 1794. Indeed, they were the oldest surviving members of the society, with the sole exception of Sir George Philips, Bart., who became a member of it in 1785. Dr. Dalton had been president of this society since 1817. In 1768, he commenced his “Meteorological Observations,” which have been continued to the present time. In 1793, he published a volume of “Meteorological Observations and Essays,” a work which displays much original thinking, and the germs of some of Dalton's after discoveries. Some time afterwards he was appointed to the situation of Professor of Mathematics and Natural Philosophy in the New College, Mosley-street, Manchester. He resided for about six years within the institution, with which Dr. Barnes was contemporaneously connected as Theological Professor, and continued to hold his office until the college was finally removed to York. On withdrawing from the college, in the year 1799, Dalton began to teach mathematics and natural philosophy at his own residence. The deceased was a member of the Society of Friends.

BEACON ON THE GOODWIN SANDS.—The beacon recently erected on the eastern edge of the Goodwin Sands remains firm, and bids fair to be as effectual and substantial as that of Captain Bullock's on another part of the sands, and which has withstood the tempests of three winters. The new beacon is 45 feet high. It has been placed as a guide to ships passing on the outside of that dangerous bank:

TO THE EDITOR OF THE BUILDER.  
 SIR,—The above is a small church of the 14th century, situated in a secluded spot about two miles from the market-town of Thornbury; but is seldom visited by persons having a taste for antiquarian pursuits, being at some distance from the main road. It harmonizes well with the surrounding scenery; (and where is there an ancient church that does not?)  
 This rural temple is of small dimensions, and consists of a chancel, nave, tower, and south porch. The tower is of three stages, and a handsome little tower it is. The buttresses at its angles are finished a few feet below the parapet, which is pierced with cinque-foiled panels, and gives a pleasing effect to the whole. At the north-east angle is a belfry turret, finished at its summit with a pyramidal

capping: the pinnacles have five foil-headed panels sunk in them. Ivy is growing very luxuriantly on the western side, and adds to the rural appearance of the building.  
 At the south-east angle of the nave is a small square turret, doubtless erected to receive the water from the piscina in the interior wall. I could not perceive any aperture but the one shewn in the view above. In the porch there is a very good oak door of perpendicular date, such as is not often found in small churches; a sketch of it is here inserted.  
 The windows are simply square-headed, two-light five-foiled ones, with a hood-moulding and a wide splay on the interior, excepting those of the tower, the nave and porch, which are pointed two-light trefoiled windows with tracery, and one in the nave of debased character.

On the south side of chancel are four sedilia of equal height, with seven-foiled heads, and a shield in the centre of each compartment; the seat is formed on the window-sill, and projects 8½ inches beyond the face of wall; near it, on the eastern side, is another piscina, with a cinque foiled headed arch; a doorway on the north side has been blocked up many years. The roof is semi-circular, and of little or no interest. The chancel arch is plain. In its right position, at the west end of the nave, stands the font, which is of rather poor design; it is 2 feet 10 inches in height, depth of bowl 9¼ inches, ditto of interior 6¼ inches, diameter across top 1 foot 10¼ inches.

On the summit of the porch-gable is placed a dial, which by no means improves the effect of the church.

Of the history of this little edifice I at present know nothing, but may at some future time; if so, I will send it. J. N. H.

LECTURES ON ARCHITECTURE AND ANTIQUITIES.

Lecture IV.

ROMAN ARCHITECTURE.

“Roma, Roma, Roma, non e più come era prima.”\*

ROME, regal, republican, imperial, papal Rome, has for ages excited the wonder of the world, from the time that Romulus planned his humble capital,† over whose walls his brother Remus leaped in contempt, until the death of the emperors, whose world was a law to the whole world, and under whom the seven-hilled city arose into a magnificence and splendour worthy of the mightiest nation that ever lived. There is a fascinating influence shed over the history of this wonderful people from which the mind is perhaps never wholly freed. From our childhood we are led to look upon the ordinary standard of mortality. Brutus and Caesar, and Pompey and Cato, and the Scipios, and the Decii, and Fabricii, and a long train of illustrious characters, “men more than kings,” appear as beings of a superior mould; whilst the names of Virgil, Horace, and Ovid, are synonymous with all that is most exquisite in the regions of poetry; and the orators, philosophers, and historians of Rome occupy the chiefest niches in the Temple of Fame. It is from the recollection of her immortal names that the traveller derives so much of his pleasurable emotions when he visits the eternal city, where

“The very dust we tread stirs as with life,  
 And not a breath hut from the ground sends up  
 Something of human grandeur.” ROGERS.  
 It is true that Rome has become  
 “The Niche of nations;” BYRON.  
 that she has fallen from her proud pre-eminence,  
 “But falling (she has) kept the biggest seat,  
 And in her loneliness, her pomp of woe  
 Where now she dwells, withdrawn into the wild,  
 Still o'er the mind maintains from age to age  
 Her empire undiminished.” ROGERS.

\* See page 100, where the author says that Rome has been.  
 —Mrs. Hemans  
 † According to Cato Rome was built 752 B.C. According to Varro 754 B.C.

NEWSPAPER  
 1841

In addition to the magnificent buildings erected by the Cæsars,

"When Rome in noon-tide empire grasp'd the world,"  
Thomson.

modern Rome attracts the observation of the visitor by the scarcely less splendid structures which arose under the auspices of the popes, who, calling themselves, in the pride of humility, "the servants of servants," assumed a power little inferior to that of the former imperial masters of Rome, trampled upon prostrate kings, compelled haughty emperors to perform the offices of menials, issued their imperious mandates to the ends of the globe, and thundered forth their dreaded anathemas against kings, or a whole people, who presumed to question their infallibility.

"Those ancient men, what were they, who achieved A sway beyond the greatest conquerors; Setting their feet upon the necks of kings, And thro' the world subduing, chaining down The free immortal spirit? Were they not Mighty magicians?"  
Rogers.

Their power, like that of their predecessors, is gone, it is to be loped, for ever; but, whilst we condemn their presumption in arrogating to themselves an authority to which they had no just pretension, we must do them the justice to admit that they patronized the fine arts, encouraged learning, and promoted taste. The religious structures erected by them were adorned with the productions of men whose "pencil had a voice;"\* and the matchless paintings of Michael Angelo, of Raffiello, and Corregio, in particular, with a host of others who trod in the footsteps of those "divine masters," divide the attention of the tourist with the buildings; and above all these attractions are perhaps to be named those statues in the Vatican and Capitol, of which we can hardly speak in measured terms. The Apollo Belvidere, that unrivalled model of manly beauty, has been well described by the noble author of "Childe Harold" (Canto iv. St. 161); an earlier description may therefore be welcome, it is that of Thomson:—

"All conquest-flush'd from prostrate Python came The Quiver'd God. In graceful act he stands, His arm extended with the slackened bow, Light flows his easy robe, and fair displays A manly-softened form. The bloom of gods Seems youthful o'er the beardless cheek to wave; And sweet subsiding to a native smile, Mixt with the joy elating conquest gives, A scatter'd frown exalts his matchless air."

This statue was found (as was also the Fighting Gladiator) in the ruins of the ancient city of Antium; in Flaxman's opinion it is only a copy! What must the original have been? The famous group of Laocoon and his sons has been also nobly described by Lord Byron, but the following apposite lines by Mrs. Hemans are less familiar:—

"And mark yon group, transfixed with many a throe,  
Sealed with the image of eternal woe:  
With fearful truth, terrific power, express,  
Thy pangs, Laocoon, agonize the breast,  
And the stern combat picture to mankind,  
Of suffering nature and enduring mind.  
Oh, mighty conflict! tho' his pains intense  
Distend each nerve, and dart thro' every sense;  
Tho' fixed on him, his children's suppliant eyes  
Emplore the aid avenging fate denies;  
Tho' with the giant-snake in fruitless strife,  
Heaves every muscle with convulsive life,  
And in each limb Existence writhes, enrol'd  
'Midst the dread circles of the venom'd fold;  
Yet the strong spirit lives,—and not a cry,  
Shall own the might of Nature's agony!  
That furrow'd brow unconquered soul reveals,  
That patient age to angry heav'n appeals,  
That struggling hosom concentrates its breath  
Nor yields one moan to torture or to death!"

This sublime group was the joint production of Greek sculptors, Agesander, Apollodorus, and Athenodorus of Rhodes. The statue called the Dying Gladiator, supposed to be only a copy of the famous work of Cteslaus,† and likewise well-known in Lord Byron's graphic description, I prefer therefore to quote again from the author of "the Seasons," who thus alludes to the "Dying Other:"—

"Supported on his shorten'd arm he leans,  
Prone agonizing, with incumbent fate  
Heavy declines his head, yet dark beneath  
The suffering feature sullen Vengeance lours,  
Shame, indignation, unaccomplish'd rage,  
And still the cheated eye expects his fall."

This statue was found in the gardens of Sallust, the right arm was entirely restored by Michael-Angelo. Countless as the stars are the unrivalled works, the productions of Greek artists, which adorn the different galleries at Rome. Well therefore might the author of "Italy" exclaim,

"Who would not say the forms  
Most perfect, most divine, had by consent  
Flock'd thither to abide eternally,  
Within those silent chambers where they dwell  
In happy intercourse?"  
Rogers.

It is not wonderful, therefore, that such a combination of the beautiful and sublime in architecture, painting, and sculpture, should have made Rome what it is, the metropolis of the fine arts, and a point of attraction to all who have opportunity, leisure, or wealth, wherewith to gratify their taste or curiosity by a sight of the treasures it contains. And what has Greece to offer to the general traveller to compare with this? After having viewed all the magnificence of the eternal city, he sees in Athens and other parts of Greece, with slight exceptions, nothing but broken columns, fragments of marble, ruins on every side, the mere wrecks of once-mighty fabrics;—here are no paintings,—the works of Zeuxis and Apelles are lost for ever;—here are no statues,—the performances of Phidias, of Praxiteles, of Lysippus (who, himself, alone produced 600 works), have either disappeared, or have been removed to distant countries. Unless a person, therefore, have a strong relish for art, and a previous acquaintance with the outlines of Grecian architecture, he will, no doubt, be disappointed in the remains of that style.

Before we proceed to notice the structures of Rome, we shall pause to consider the five orders of architecture which form the standard of the Roman and Italian schools. We have seen in the last lecture that the Greeks had but three orders, the Doric, the Ionic, and the Corinthian; to these the Romans added two more, the Tuscan and the Composite. The Roman Doric, Ionic, and Corinthian orders are derived from those of the Greeks; it was a restless spirit of innovation, and a desire for novelty, which prompted the addition of the two other orders. The Roman Doric differs from its Grecian proto-type in many respects. The first step taken to infringe upon the solid simplicity of the Greek model, was to lengthen the shaft of the column in proportion to its diameter, so that when the two orders are drawn to one height, the difference of proportion is so great, that the lower diameter of the Roman column will be only equal to the upper diameter of the Grecian column. Instead, too, of the shaft of the column resting securely at once upon its platform, as in the early and best examples of Greece, the Romans placed theirs upon a base (and sometimes upon lofty pedestals); they likewise frequently left the shafts unfinished, which omission gives them an unfinished appearance when compared with the Greek models. A still greater deviation took place in the capital; the members of the Greek capital are actually retained, but mouldings are added above, and a necking is placed below. The Greek proto-type has always been admired for its simplicity; and the excellent effect produced arises from the very few lines of which it is composed. As this order was the favourite of the Greeks, and as the capital is one of its great beauties, we will search a little into its origin, for which purpose we must retrace our steps to Egypt. In the front of a cavern-tomb at Beni-hassan are two fluted columns, which are simply covered with the flat square member called the abacus. "In this representation," observes Mr. Gwilt, who gave the sketch from Mr. Charles Barry, "the reader will in it be struck by the appearance of the Doric column almost in its purity. Wilkinson is of opinion that the date of these tombs is 1740 B.C., an antiquity that can be assigned to no example in Greece." In the interior of another excavated temple at Kalapothie, 25 league above the first cataracts, are fluted columns, which are also crowned with the abacus (as in the sketch which has appeared in THE BUILDER under

the glossarial article "Column," which is also taken from Mr. Gwilt's edition of Sir W. Chambers' "Civil Architecture"). Denon has given some similar columns, which he says decorated the galleries of the temple at Karnac. All these seem to afford strong proofs of the origin of the Doric; but the echinus is absent: and the more tasteful eye of the Greek led him to discover that something was wanting to ameliorate the unsatisfactory appearance occasioned by the shaft running up at once to a member which overhung it so much; he added, therefore, the moulding called the echinus, which connects the two in the most harmonious manner. This simple arrangement is quite destroyed by the Roman plan of placing superfluous mouldings above the deep abacus, which had been always hitherto the crowning member. The entablature loses much of its imposing and simple effect from the needless repetition of mouldings; and the architrave is made considerably less than the frieze, a practice not in accordance with common sense, as well as an offence against good taste; for, as the lowest member, it has to support the weight of the frieze and cornice, and therefore should at least be equal in height to the frieze.

The Tuscan order so much resembles the Roman-Doric, that it is difficult to conceive why it was introduced. The chief distinction is that the triglyphs are omitted, and that there are fewer mouldings; it is, in fact, a sturdy copy of the Doric. An example of this order was executed by Inigo Jones in the church of St. Paul, Covent Garden. This was done under peculiar circumstances; the then Earl of Bedford sent for him, as he wished to build a church for the parishioners, but told him that he would not go to any great expense, "in short," he said, "I would not have it much better than a barn." "Then," said Inigo Jones, "you shall have the handsomest barn in England." It appears, therefore, that economy determined the architect in his choice of the plainest of the orders, in which he has even dispensed with the frieze, a practice allowed by Vitruvius. On the whole, Inigo Jones has made the most of his meagre materials in this, which is one of the very few applications of the Tuscan order; it is, however, to be regretted that he finished his portico by pilasters instead of columns, and that he has carried out the entasis to such an excess, as to be a caricature of the Greek models; in which the swelling outline was hardly perceptible, and its existence only of late years actually determined.

In the Ionic order, likewise, the Romans deviated greatly from the original models; they made its capital much more shallow than in Greek examples; and the shaft is generally plain and more drawn out, whilst the architrave is not so bold, and much of its effect is lost by the introduction of numerous mouldings. But if the Romans were not happy in their imitation of two of the orders, it must be confessed that in the third they have been extremely fortunate; and their Corinthian may vie with the richest specimens of art in any country. It became their favourite order, as the Doric had been of the Greeks; and the luxurious masters of the world, calling in the aid of Greek artists, carried out this style to its utmost height of perfection; and if Rome could not boast of a Parthenon or Erechtheum, it could point with pride to its temples of Jupiter (*Sutor* and *Tonans*), of Mars, of Venus, (*Genetrix*, built by Julius Cæsar,) and to its unrivalled Pantheon.

The fifth order of the Romans, the Composite, is a compound (whence its name) of the Ionic and Corinthian; and may be considered to bear to the latter order the same relation that the Tuscan does to the Doric; and with it, may be looked upon as unnecessary. The unpractised eye would not readily discern the difference between the Corinthian and the Composite, the chief distinction being in the capital of the column, which is a hybrid mixture, having the Ionic volutes, with their accompaniment of enriched ovolo, placed above the acanthus leaves of the Corinthian. We may be quite satisfied that no Greek artist contributed to this debased style, which arose during the declining periods of architectural purity, and which possesses no charm either of richness or novelty, which should supersede the use of the two orders, upon which it is founded. Whilst the admirer of Greek simplicity must deprecate the alterations which

\* All the 364 churches of Rome contain monuments of art or antiquity.

† The original work was executed in bronze.

the Romans introduced into the orders, he cannot withhold from them the meed of praise at the manner in which the practice of the art was applied, and the wonderful combinations they produced. The works of the Greeks were chiefly temples, their religious feelings confining architectural grandeur almost entirely to sacred buildings;\* but the Romans employed their architecture not upon temples only, but upon amphitheatres, palaces, triumphal-arches, baths, aqueducts, and bridges; in short, upon every object on which they could exercise their love of splendour. In most of these the arch was a conspicuous feature; and whoever made that important discovery, the credit is due to the Romans of being the first who appreciated and applied its mighty powers.

Rome, under Romulus, who died 714 B.C., occupied only the Palatine hill, as we learn from Livy, and from Ovid:—

"Inde petens dextram, porta est ait ista Palati,  
Hic Stator, hoc primum condita Roma loco est."  
TRIST. iii. El. 1.

Servius Tullius inclosed the seven hills of Rome by a wall; and from his time to that of Aurelian the walled limits were nearly the same: their extent was about 7½ miles. Aurelian took in the Field of Mars (*Campus Martius*), and the Pretorian camp.

Of the buildings erected by the early kings of Rome, we have few traces: constructed either of brick or stone, they made way for the more sumptuous edifices of marble, which were introduced after the conquest of Greece, 146 B.C., when, on the fall of Corinth, (taken by the Consul Mummius), Macedonia and Greece being reduced to the condition of provinces, Rome became, in truth, the Mistress of the World.

"She who was nam'd Eternal, and array'd  
Her warriors but to conquer; she who veil'd  
Earth with her haughty shadow, and display'd  
Until the e'er-ascending horizon fail'd  
Her rushing wings."

CHILDE HAROLD, Canto iv. s. 84.

With the riches thus acquired, and with the spoils of the inestimable treasures of art, collected from every conquered country, Rome gradually became the centre, not merely of political importance, but of the cultivation of the arts; and the new capital of the world became the resort of Grecian, and other distinguished artists, secure of patronage from the wealthy citizens of a place, "whose private individuals, going out as governors of provinces, which had once been empires, after boding in their governments the state of kings, returned home in numbers, with all the wealth of which they stripped its tributaries, and lived as individuals with the income of monarchs." (*Hope on Architecture*, p. 55.)

An honourable exception to those in power, who made enormous fortunes during their governments, is the Consul L. Mummius, named above, who returned home from the fall of Corinth, without any increase of fortune; and was so unacquainted with the value of the paintings and works of arts, which formed the rich plunder of that city, that he said to those who conveyed them to Rome, "that if they lost or injured them, they should make others in their place."

The names of several Greek artists are reeferred, who resided at Rome during the time of Caesar and Pompey—namely, Arcesilaus, Pseustes, Zephyrus, and Criton; and in later times, Hermodorus, architect of the temple of Jupiter Stator, Cyrus, celebrated in the time of Cicero, Posphorus, one of the architects of Augustus, Saurus and Batrachus, (whose works were marked with a lizard and a frog, the meaning of their names,) and Apollodorus, the architect of the emperors Trajan and Hadrian, were Greeks by birth.

The wonders of Rome are so many that it is difficult to know where to commence our inquiry; but having, in the last lecture, noticed the orders in their chronological arrangement, it is not so necessary to do so in the present instance. The information respecting the temples and public buildings of ancient Rome will be chiefly derived from the publication by Messrs. Taylor and Cressy, architects, whose work is the best in our language, many of its

illustrations being on a large scale, and the admeasurements carefully given. The magnificent work of Piranesi, which is so costly that it cannot be purchased entire at much less than 500*l.*, is not of essential service to the architectural student, as it consists chiefly of perspective views without measurements.

The immediate neighbourhood of the Sacred Way was a congeries of architectural wonders. Standing on the steps which lead to the Capitol, the spectator sees on the right hand, and on the left, and before him, "a marble wilderness;" the ruins of temples and arches which once crowded with their magnificence that narrow spot—

"Once,  
And long, the centre of their universe,  
The Forum, whence a mandate, eagle-winged,  
Went to the ends of the earth."—ROGERS.

The vista is finished by the mighty Colosseum, alas! too, a wreck. At the foot of the Capitoline-hill, and looking towards the Sacred Way, which wound its passage in front, stood the temple dedicated to JUPITER TONANS, erected in honour of the *Thunderer*, by Augustus, as a mark of his gratitude for his escape from lightning, which killed his armour-bearer at the side of his litter, on his return from his expedition against the Cantabrians in Spain.† Three noble fluted Corinthian columns alone remain to denote the former splendour of this temple; they were buried nearly up to their capitals when Camporesi reduced the hill, and laid them open. The columns are of white marble, nearly ten diameters high, their whole height being 46 feet 5 inches, whereof the base is 2 feet 6 inches, and the capital 5 feet 6 inches; the lower diameter of the shaft is 4 feet 8 inches; the height of the architrave is 3 feet 1 inch; of the frieze 3 feet 3 inches; and of the cornice 3 feet 8 inches. In its original arrangement, as gathered from coins, it is presumed that it had a portico of six columns, (though Palladio conjectured that it was octostyle,) with returns of seven columns, the nature of the ground behind not admitting a portico in the rear. The columns are very well proportioned, and the example is frequently employed by modern architects.

Opposite to this temple, and separated from it only by the narrow road of the Sacred Way, stood (as it is called) the temple of CONCORD, of the Ionic order, having a portico of six columns of granite 42 feet high, and two more on each flank, forming the projection of the portico, the remainder of the temple having, it is supposed, only a pseudo-dipteral arrangement; the details of this building (said to have been erected by Tiberius, nephew of Augustus) are in a very debased style of art. Beyond the temple of Concord, on the same side of the Sacred Way, was the edifice known as the temple of JUPITER STATOR (the Immovable), beyond all dispute the noblest and richest specimen of Corinthian architecture in Rome, or in the world. Of this temple, originally founded by Romulus, but rebuilt in the age of Augustus, only three columns remain with their entablature of the finest white marble, so beautifully wrought, and so delicate in design, that it must be a matter of the deepest regret that no more of the once magnificent structure should be in existence. From excavations made in the Roman Forum, over the whole surface of which the earth had accumulated to a depth of twenty feet, it is ascertained that these three columns belonged to one flank of the temple, and that from them again were two more columns to the front portico, which was octostyle, and the flanks were supposed to have had twelve columns (counting both angles) terminating in a portico in the rear. The effect of this fabric must have been very imposing, as we may judge from the dimensions; the front of the temple, when entire, must have extended nearly 100 feet. The columns are 48 feet 4 inches high, and the entablature 12 feet 10 inches; and the diameter of the columns is 4 feet 10½ inches, and the distance between them is 7 feet 6 inches. The capitals are the most enriched that were ever executed, and are easily recognized from

\* "Dost thou flow,  
Old Tiber, through a marble wilderness?"  
—CHILDE HAROLD, C. 4, 72.

† Tonanti Jovi sedem consecravit liberatus periculo, cum expeditione Cantabrica per nocturnum iter, leucæam ejus fulgur perstrinxisset, seruicume præluocumtem exanimasset.  
—SERTORIUS, lib. 6.

all other Corinthian examples by the central volutes intertwining, instead of only touching each other. This example has been imitated both on a large and on a small scale very extensively in London. This example served as a model for the once noble portico of Carlton House (the columns only of which were applied to the National Gallery), and Sir John Soane copied this example in the new Privy Council Office and Board of Trade in Whitehall. Of these remains Valadier justly remarks that "they are a monument of the best age of Roman architecture, in which we see united magnificence with beauty, sublimity of idea with perfection of execution,—the acme of architecture with that of sculpture." Authors differ widely as to the real destination of this building. Albertino considered that it was a temple of Vulcan; in this opinion Labacco, Palladio, and Pomponio Leto concur; Ligorio and Marliani call it the temple of Jupiter Stator, which, according to the accounts of Cicero and Livy, was at the foot of the Palatine Hill; in this notion also agree Ganucci, Fauno, and Ficoroni; whilst Nardini, Venuti, the great critic Nibby and others, contend that the columns belonged to the Comitium. Valadier inclines to the opinion of Piranesi, that the columns in question formed part of a temple erected by Posthumus in honour of Castor and Pollux. From all that we can gather, amidst these conflicting statements, we may reasonably look upon this building as of the age of Augustus and the work of Greek artists. Hermodorus, a native of Salamis (and therefore a Greek), is said to have been the architect of this splendid temple.\*

(To be continued.)

#### CHURCH-BUILDING INTELLIGENCE, &c.

*New Church at Westwood Heath.*—This church, which is in the parish of Stoneleigh, was consecrated on Thursday, the 25th ult. The first stone of this building was laid in the summer of 1842, by Lady Leigh; and Lord Leigh not only gave the site of ground upon which the edifice stands, but has amply endowed it. The subscriptions among the parishioners of Stoneleigh, for the erection of the building, amounted to nearly 1,600*l.* The church is a neat edifice, and of that style of ecclesiastical architecture so much in vogue in the days of the Third Edward. The architects are Messrs. Scott and Moffatt, of London. It is sufficiently spacious to afford ample accommodation for about four hundred persons.

*All Saints' Church, Hunmanby.*—This ancient church was lately re-opened for divine service, having been completely restored in a becoming manner. The interior is now being embellished with fresco painting and scripture sentences, by Mr. Weld Taylor, of London, artist,—a species of decoration well worthy the attention of all who are interested in the revival of church architecture and adornment. The chancel of the church has also been repaired, and is to be beautified by a painted east window, the gift of Captain Mitford, R.N., of Hunmanby Hall.—*Hull Packet.*

The old church of St. Peter's in the East, Oxford, founded by St. Grimbald in the 9th century, and recently much restored and beautified by the zeal and care of the late vicar, the Rev. W. K. Hamilton, is now undergoing further repairs. Holywell church, having been disencumbered of its old and inconvenient pewing, besides being enlarged by a new aisle, presents an almost perfect specimen of an Anglo-Catholic church—thanks to the munificent gift of 1,000*l.*, and the presiding taste of the late curate, the Rev. E. S. Baburst, Fellow of Merton College.

Lord Morpeth laid the foundation-stone, on Thursday week, of a new church in the borough of Morpeth, in the presence of his brother-in-law and sister (the rector and the hon. Elizabeth Grey), the Rev. Dr. Hook, and a large concourse of spectators.

A monument has recently been erected in Haworth Church, in remembrance of the late Rev. William Weightman, M.A., a native of Westmorland, and a graduate of University College, Durham, who was three years curate of Haworth, and who died on the 6th of September, 1842, aged 26 years.

\* The cut of this remain will be given when the subject is resumed in our magazine.

## PETRALOLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 351.)

SIDEROUS rocks include all those rocks which contain a portion of iron, which is sufficient to give them peculiar character, with or without reference to the earths with which the iron is united. This, therefore, necessarily includes a vast variety of rocks and stones, such as traps, basalts, iron-stone, jasper, &c.

Jasper, in mineralogy, is a genus of siliceous earth, consisting of a base of silic, iron, magnesia, potash, and other ingredients which distinguish varieties: it is hardish, opaque, breaking into indeterminate fragments, of a conchoidal texture, lightish, somewhat detached, and of every size, from the smallest pebble to that of an entire mountain.

The various acts of formation of jasper furnish an instructive commentary on those teachers of the people who think by one poor solitary term, or by one act of analysis, to lay down the laws of formation and to account for all the varied phenomena of rocks and stones. It is laid down as a rule by philosophers, that it is unwise to multiply causes, and this plea even Sir Isaac Newton puts prominently forth in excuse for many dogmas which time and discovery prove to be erroneous. The love of generalizing appears to be almost inherent in humanity, proceeding from a sometimes laudable anxiety to lay down unalterable laws for the guidance and government of others. Educated in this way, the truth is taken for granted, and few men think of seeking further, or to raise a doubt where firm belief is impressed upon the mind. Thus one man's discovery becomes the light of others, until doubts arise from the accidents of observation, and then men find that the light by which they have been hitherto guided is not clear or strong enough to reflect on the new objects contemplated.

Jasper is a siliceous body, and as such presents almost innumerable varieties, passing into or altered to agate, cornelian, opal, greenstone, porphyry, and other definable bodies. It presents itself under several varieties as an organic product in its mineralized state. In the Nubian and Egyptian desert it is exceedingly abundant, enormous fossilized beds of shell-fish and of vertebrated fishes and the relics of oceanic animals being wholly composed of this mineral. Its mode of formation is variable; on the surface of extensive valleys, it would appear, that on the rapid evaporation of the waters, shoals of fish had been left behind, and preserved from entire decomposition by the salt and marine acid in which they were disposed, they gradually silicified as the liquid matters evaporated. They are sometimes found in the shrivelled state, such as must take place by long incineration in saline waters; at other times their outer configuration is so beautifully preserved, that we are enabled to identify the species to which they belong, and of these I observed between thirty and forty species now common to the Red Sea. The shell-fish are still more true to nature; they retain not only the exactitude of form as when in the living state, but they also present the whole internal configuration of the stomach, the shield appearance of the shell, the stomach, and other appendages, and the cryptogamia which were attached to them in the living state. This is the direct state of change, embracing not only vast quantities of mollusca and swimming fishes, but also branches of coral, of such extent as often to be mistaken for fossilized wood.

In the indirect state of change, they first decompose into the state of carbonate of lime, or chalk, and this, on exposure, gradually hardens, silicifies, and passes into the same material. On the other hand, towards the eastern portions of the Red Sea, balani build vast edifices in groups and families, almost wholly independent of the myriads of living creatures surrounding them; and being of a hardy nature, they are found in the living state at high-water mark. Here the building ceases, and when (as near the coast was formerly the case), they are wholly abstracted from the waters, they pass through the like changes and present the same appearance as Egyptian jasper, the small pebble being a true sample of the jasper rock. The hills bordering Upper Egypt are sometimes wholly com-

posed of these families, some of them having passed into the state of chalk, others partly or wholly silicified, presenting on the surface the honey-combed appearance produced by the sudden cessation of vital action and consequent disappearance of that animal matter which was exposed to the influence of the atmosphere. These are true animalized rocks, seen in every stage of change, from the living concrete mass to the perfect jasper rock, presenting its smooth brown surface to the sun, and sometimes rising full 150 feet above the level of the plain.

Other phenomena illustrate the ways of nature still more admirably. While travelling in Upper India, I found groups of the very same formation rising above the level of the surrounding plain, their honey-combed shape being similar to the formations on the banks of the Nile; but here they had passed into a species of siderate or iron-stone. Again, I have observed this peculiar rock in other climes, presenting a glossy surface, beautiful colour, and gem-like appearance.

Egyptian jasper contains at most but very minute portions of alumina, and these are the results of accidental intrusion where they are found. Its formation takes place precisely like that of nephrite or jade, but the latter is very often the silicified remains of large ocean fish, which being thrown into lagoons, where living creatures, from the nature of the saline waters, cannot live, they either enter into the bituminous state, or otherwise they silicify and are converted into nephrite, so valued by the Chinese, and so common to some of the islands of the South Sea and Pacific. I recollect, previous to travelling, having read in Captain Cook's voyages of a similar account of the origin of jade being given, the natives informing him that if fish were placed in the neighboring lake they would soon be converted into it.

Why should it be doubted that the living that the great fountain of life, as it continually flows over, adds to the strength and permanent increase of the fossil and mineral kingdoms? Look at your own country: the flints within the chalk, the wood among the coal; the very stones on which you daily tread, the very cup you drink from—do they not all of them tell this same true but curious tale of other times? The fish, once basking in the sunshine of life, is chalk, is a siliceous pebble, is bitumen, is iron-stone, is a component part of rock. Whatever may be its state, its usefulness is preserved, and it may be made to administer to the happiness of man, as it sometimes administers to his vanity in the form of a siliceous gem, decking the bosom of some fair one, emblem of her purity of heart, and reflecting the shadows of her smiles.

Striped or ribbon jasper is distinguished by having differently coloured alternate parallel layers, without lustre, internally of an imperfect conchoidal texture. It is found in Siberia, in Saxony, near Gnarstein, and Woltitz, and particularly fine at Ural, in large amorphous masses, forming long layers; its colour is yellowish, greenish grey, ochraceous, isabella yellow, brownish red, pale or dark flesh red, or dark green. It takes a high polish. The finest Siberian ribbon jasper is found, together with other varieties, in the hills that border on the southern part of the Uralian mountains, about 100 or 150 leagues northward of the Caspian Sea, in the neighbourhood of the fortress of Orskaia. It is found in large masses, and wrought into canoes, and other ornaments. In the Bombay Presidency, at a short distance from Poona, there are several large beds of green earth, which is the mother earth to the ribbon jasper and blood-stone; it is of the consistence and character of the clay, and, like clay, hardens on exposure to the atmosphere; and small pieces, exposed to long continuous atmospheric action, are seen in every stage of silicification, until, in its ripened beauties, it appears as blood-stone. The formations in those Ghats have some analogy to the jasper mountains of Siberia; and when we consider the fossil phenomena of Siberia, demonstrative evidence is abundantly manifest, that the jasper of the latter place was formed under an analogous latitude. This green earth, in its soft and silicified state, is very abundantly diffused throughout Africa; and the Orientals, and even people of this country, have always held the stone in great estimation, ascribing certain

sovereign virtues to it, such as stopping hemorrhage, &c. It possesses a dull surface an earthy fracture, previous to its silicifying but is then susceptible of a very high polish.

The origin of jasper is more obscured in the writings of the day than any other siliceous compound. In its natural state, and preserving the rounded form of the body to which it owes its origin, geologists, imbued with the notions passing current, suppose that it must be classed with rolled pebbles, and that its local accumulations have been occasioned by the action of sea beaches: thus one error begets another, for one-half of the so termed rolled beaches of this country have originated in a similar manner, of which many of the hornstones and all the flints are demonstrable evidence. Some suppose that the petrified echini, which appear like small stone cannon-balls, having a nucleus separated from the surrounding coatings by a coating of crystallized quartz, are precisely the same as the balls in hornstone, which is the case, and both have an origin similar to the agate nodules found in amygdaloidal rock. These stones are termed geodes by the modern geologists, who assume that they have been formed by the gradual accretion of matter around a nucleus or kernel. Corder observed brecciated rock containing vast quantities of these Egyptian pebbles. Breccia of this formation is, in fact, very common in the Nubian desert.

Nephrite is found in many parts of America, particularly near the great river Amazon, and was formerly held in high esteem by the natives for some supposed medical virtues; it abounds in some parts of Upper India, and in many other countries.

## THE NATURE OF DESIGN.

A Paper read at the meetings of the Decorative Art Society, March 13th and 27th.

BY MR. CRABB, V.P., MEMBER OF THE INSTITUTE OF FINE ARTS.

(Continued from p. 382.)

EGYPT was contemporaneous with the Assyrian empire, which made way for the Babylonian, Median, Persian, Macedonian and Roman. In discovering and tracing the invention, cultivation, and improvement of the arts and sciences, their origin and progress, we perceive the nearer we approach those countries once inhabited by the sons of Noah, the more perfect is the knowledge of those arts; so that in after times, when men desired to revive the forgotten arts, they found advantage in going back to their original source. The people of Asia were of a warlike cast, varying according to the nature of the country they inhabited; thus the arts of manufacture would be early applied to offensive weapons and armour. Their steel was of excellent temper and variety of form. They had helmets and cuirasses of brass, which, it is recorded, fitted so well the body as not to intercept motion and agility of limb. Greaves covered the thighs and legs of the horsemen; their brazen shields, of great length, were very celebrated, and their horses were usually armed, the faces, chests, and flanks being covered in brass. Now we read that this armour was distinguished for its elaborate workmanship, its richness and costliness; design must therefore have largely entered into its original construction and subsequent embellishment. Their chariots, body and wheels, were elegant, and of great strength; the pole, axletrees, &c., armed with scythes. In later ages, luxury and extravagance rose to excess: it became the custom for the court and wealthy men to make the most profuse display of magnificence and pompous splendour, calculated to dazzle the eyes of a people. In war they went to the field accompanied by their wives and concubines, each in proportion to his ability. The equipage of such a troop must have been immense, and the most exquisite dainties were to be procured wherever this host might be encamped. They had their jewels, and vessels of gold or silver; their garments were richly shining with gold,—the dresses of the women, of the nobles, and of the king, were equally numerous and magnificent. A people thus disposed to luxurious enjoyment would naturally seek to enrich and embellish with the refinement of art every manufacture that could promise the creation of new ideas or new pleasures. Design would be lavished upon

their robes, their armour, weapons, and plate, and upon all the artificial wants of a vast voluptuous nation.

Their cities in time became of wonderful magnificence. Nineveh was one of the most extensive and celebrated. A description of Babylon may probably give us the most perfect idea of the gigantic grandeur of their undertakings. Babylon was situated upon the banks of the river Euphrates, in an immense plain of fat rich soil, intersected by long, straight canals, bordered by lofty poplar or lime trees. Its area was about 60 miles, and an exact square, enclosed by walls every way prodigious, 350 feet in height, and 87 feet in thickness, built of brick, cemented by bitumen, a glutinous slime arising out of the earth, binding far stronger than lime, and even growing harder than the bricks or stone. Exterior, and lined, was a vast ditch, and the earth dug in forming it composed the bricks. On every side of this square were 25 gates, 100 in all, of solid brass; with towers 10 feet above the wall. From each gate in this great square went 25 streets in straight lines, being 50 streets, each 15 miles long and 150 feet broad, crossing from gate to gate at right angles, cutting the city into 676 squares; around these squares were built the houses, detached, and three or four stories high—their fronts richly decorated. The hollow of the square was as gardens, or open space, not building; thus, half the area of the city formed pleasure grounds; the river ran through the city bordered by quays and a wall, having brazen gates to each street, and steps to the water; and a kind of tunnelling covered the river for three miles: the plan of erecting this singular structure is on record, and deserves our attention. The snow melting on the mountains of Armenia caused, in summer, the Euphrates to overflow the country, much as the Nile does Egypt; to preserve the city, an immense lake was dug, and canals connecting it with the Tigris; when this was ready the course of the river was turned into it, and subsequently the lake remained as a reservoir to supply the canals, which, intersecting the immense plains, fertilized the country all the year. The bottom of the river was sandy, and to secure for the arches a firm foundation, large stones were bound together by chains and melted lead; the immense structure was then erected, and the channel throughout the city lined with brick. At either end of this bridge was a palace, connected by a tunnel, built under the bed of the river. Near the old palace stood the Temple of Belus, and to the new one was attached the hanging gardens. The latter surrounded by three concentric walls, seven miles in circumference; considerable space existed between each wall, and they were adorned by an infinite variety of sculpture and ornament,—one represented Semiramis on horseback, throwing her javelin at a leopard, and her husband, Ninus, piercing a lion. These works of art must have been in relief, and a knowledge of their existence is highly interesting. The hanging gardens of all these mighty structures became the most celebrated; they contained a square of 400 feet each way, and were carried up in a succession of decreasing arched terraces to a level with the city walls; stairs ten feet wide led from terrace to terrace, flat stones were laid upon the arches, then rushes, floated in bitumen, and two rows of brick covered by thick sheets of lead, upon which lay the mould of the garden, so deep that the greatest trees might take root; groves, plants, and flowers adorned the gardens, and an engine was contrived to raise water for their use; in the spaces between the supporting arches were spacious apartments commanding magnificent prospects. The Temple of Belus was a prodigious tower, used for worship and for astronomical purposes, for which the people were famed. The riches of the temple are described as immense, consisting of statues, tables, censers, cups, and various sacred vessels, mostly of pure gold, and richly wrought. Of the extent and magnificence of these cities there can be no doubt, and it is equally certain that a people so powerful and luxurious would as far as possible embellish their manufactures with elaborate workmanship; slight traces remain to guide our inquiries, but from the unvarying habits of the Eastern nations we may presume the many beautiful fabrics of India to have descended from them; rich carpets and woven shawls of elaborate design remain a staple commodity of Persia. Their silver and arms are

skillfully worked and elaborately inlaid in intricate and often exceedingly elegant patterns. The existing architectural edifices and interior decorations of India are full of peculiar beauty, and deserve our attentive consideration: the design is made to produce effects not known elsewhere, and we must regret the deficiency of popular acquaintance with their detail and ornamental disposition.

With Egypt and Egyptian art we are better acquainted; its prodigious edifices stand at this day attesting the truth of what might otherwise be considered fabulous: the pyramids, labyrinth, and mighty temples. Egypt was an extraordinary country; two narrow straight lines of vivid green bordered the river; mountains on one side, desert on the other, with a cloudless canopy of deep blue sky. The popular habits and architecture partook of the stern unchangeable colossal character of the country; all art was imbued with the feeling; their statues received an ideal god-like expression; every head alike and the same in sentiment, whatever the action of the body. This remarkable trait was adopted and carefully preserved by the Greeks: the trunk was moulded perfect, yet but one unvarying expression of feature marked the embodying of poetical symbols in stone. The head of the Memnon in the British Museum is full of beauty, and is one of the finest known. Their Temple of Karnac covered forty acres; ten acres occupied by buildings, and its approaching avenue of colossal sphinxes one mile in length. It is considered that these vast spaces were not solely devoted to the priesthood: the Pharaoh himself probably residing there, upon the broad terraces which such vast buildings afforded, raised in the air, removed from vermin, inundations and annoyances, to which the inhabitants were peculiarly subject; the Arab villages are placed upon them at the present day. This Temple Palace was approached by an avenue of sphinxes, and the Pylar were seen from afar raising a vast front of uniform surface; upon one was engraved, in square sunk lines, the Pharaoh's warlike attributes, battles and sieges; upon the other his peaceful attributes and sacred duties. The first court was of immense extent; there, under a colonnade, the king sat in judgment; the sculpture and paintings of the ceiling being appropriately designed to symbolize the passage of the soul through human vicissitudes to final judgments. The columnar grove came next, 325 by 266 feet, being a luxurious cool waiting-hall for the whole court: above was a paved surface, upon which buildings of wood were erected, and concealed by the external face of the temple walls. They were very extensive, and called the ivory palaces, habitations of cedar and sandal wood, where the Pharaoh might be glad, and live exempt from inconveniences of the nether world. Design must have entered largely into the construction, embellishments, and ordinary service of the Egyptians; we know the son was bound to follow the trade of his father, that manufacturing arts were fostered, and the higher arts diligently though peculiarly cultivated. The design and execution of single colossal figures, also, the sphinxes, are full of fine artistical feeling; usually, they emblematically represented kings. The two lions in red granite, given by Lord Prudhoe to our Museum, were sculptured 3,000 years ago, and are remarkable for their treatment being in many points equal to the best efforts of Grecian art. The working of so hard and unkind a material displays a knowledge of anatomy and other great principles of sculpture truly surprising: they must also have required excellent tools. Bas-reliefs were frequent, and art appears to have been in its highest excellence about 800 B.C.; after which, the great principles of design were lost amid exuberance of ornament; which, as in Greece and Italy, at all subsequent times, accompanied a decline of the arts.

In the description of their festivals, with the vessels and ornaments used, we arrive at some little notion of the ordinary applications of art to manufacture. Take the inauguration of Ptolemy, 300 B.C., when Egypt was at an extraordinary height of grandeur and power; it is one of the most celebrated solemnities of ancient history, and is fully described in Rollin's "Alexander's Successors;" we find separate processions and decorations, emblematical of each god; priests, troops, and multitudes of persons, clothed in robes of varied colours of

purple, deep red, and saffron, brocaded habits and rich embroideries of gold thread; elaborately wrought and sculptured plate, to an immense extent; cups set with jewels, and profusion of rich manufactures. The ambition of the king upon such occasions was to display the greatest possible amount of treasure; during the games which succeeded, forty-three crowns of gold were given to the victors.

Just glancing at Tyre, the abode of those haughty and voluptuous merchants, kings of the sea, whose riches accumulated by dealing in all the fabrics of the East, and whose bales would discover the embroidered Tyrian wool, we pass to the most celebrated and illustrious nation of the world—Greece; the favoured of climate and geographical position. Wars and admixture with the great contemporaneous nations, especially the Persians and Egyptians, may in a great measure be considered to have introduced the Arts to her in considerable advance. Her laws, institutions, chariot-races, games of the gymnasium, and all others, of which they were passionately fond, were directed to exalt the mind and refine the understanding, rendering it capable of appreciating and desirous of obtaining the highest perfection in fine art; civilization had just arrived at that state when the manners of men become polished, without ceasing to be natural, and consequently their attitudes and gestures expressive and emphatical, without degenerating into coarseness or violence. The Greeks were idolaters, and their love of beauty was a principle of their religion; the more beautiful a face or form could be rendered, the greater chance of the artist receiving the present blessing and immortal honours of the gods; beauty was so much prized among this acute and highly gifted people, that all those possessing it were ambitious of making it known through great artists to the world; statues were erected to the most beautiful children, and the Lacedæmonian women kept in their bed-rooms models of the finest forms. The philosophers recommended to all classes the study of art, and the government seconded those recommendations; the priests found the religions feeling rendered more acute by painting and sculpture; and the authorities discovered that, by commemorating great national events in temples and public halls, they gave an additional impulse to the ardent emotions of patriotism; add to these, the natural inherent genius of the people, and we find in result those miracles of perfection of Art upon which the world continues to gaze with almost incredulous wonder.

In Pericles, unbounded magnificence, and a spirit of sublimity was united with equal taste and judgment; he determined that a temple should be erected to Minerva, excelling in every refinement, beauty and costliness, which the advanced state of the arts could supply. In this spirit the Parthenon was built, and enriched with the most perfect specimens of sculpture that art ever produced; exhibiting a display of constructive knowledge of the human figure, skill in execution, and effect of design, unparalleled. (The drawings upon the walls are after the equestrian frieze.) The Greeks did not alone confine themselves to stone or bronze for sculpture; the Olympian Jupiter, at Elis, was of gold and ivory, 60 feet high, the eyes of precious stones; and the Minerva of the Parthenon, 40 feet high, made of ivory, and the ornaments of gold, both of exquisite workmanship. When this temple was built 500 B.C. art was at its zenith, and the most celebrated sculptors contended for the honour of its embellishment. The Greeks were consummate masters of effect, and by a wall, prevented a clear view of their temples being obtained until the spectator came within a certain range, and then the temple was approached upon its angle, displaying the architecture and embellishments in the finest point of view.

The Greek mind became enlarged and enriched by science and literature, and versed in all the arts of civilized life and elegant accomplishments. The greatest men of mighty nations listened to Athenian philosophers, and long after her subjugation to Rome did she support this superiority. Her coins, intaglios, and medals, for ages, were remarkable for their beauty and intelligence; and her bronzes are the finest in existence. A constant demand existed for sculpture, by rulers and warriors desirous of propitiating their gods,

by erecting temples, or bestowing statues: this occasioned art to be equally profitable and ennobling.

This refined people paid great attention to ornamental design for domestic use; the exquisite variety and beauty of their drawing would appear to be inimitable, for after all our attempts, we return and acknowledge their supremacy. These fine designs were used upon their architecture, their gold and silver vessels, and embroidered on their dresses, and gave form to the ordinary familiar household vessels. Grecian history shews the greatest solicitude to have existed upon the important connection between arts and manufactures: they had laws for protection, and for restraining the emigration of artists. A stranger exhibiting a new manufacture in Athens, obtained the rights of a citizen, and some of the most illustrious men were sons of manufacturers. Athens and Ægina were the great manufactories of Greece in all works connected with the fine arts, and had more commissions than any other nation; their bronzes, vases, and candelabras being especially celebrated. This progress to a perfect state of art was gradual, but always well directed; their admirable works of a minute or minor kind upon armour, vases, medals, and general bronzes, were unquestionably executed by men of high talent, who might have failed, or quitted the higher branches of art, for the service of the manufacturer.

(To be continued.)

#### RAILWAY INTELLIGENCE.

**Railway Changes.**—Amongst the recent alterations in the railway arrangements, the South-Western Railway Company's trains to Hampton Court now stop at Kingston, instead of Esher. The extraordinary extension of building in this neighbourhood would scarcely be credited by those who have not visited it of late—indeed it has become by far the most important station on the line; the number of passengers during the past year being upwards of 150,000. The new town, commenced but a few years since, has risen into actual existence, and in addition to residences of great variety and extent, which seem to be occupied as soon as built, a very beautiful church is in the course of erection, and if it may be judged from what has already been accomplished, it adds another creditable evidence to the good taste which has been brought forth by the interest recently taken amongst the aristocracy, the clergy especially, and indeed by all classes, in the revival of the church architecture of our ancestors.—*Evening Paper.*

**The Cheltenham and Great Western Railway Station.**—We learn that the branch line of railway leading to the new station is finally marked out, and that active operations will be commenced forthwith. Jessop's Nursery-garden, so long the theme of admiration to our numerous visitors, will be the site of the station. A continuation of Clarence-street to a point in St. James's-square, in proximity with the station, is contemplated, and would, we think, prove a great public convenience.—*Cheltenham Chronicle.*

**Bristol and Exeter Railway.**—It is understood that the directors of this railway, in consequence of the amount of business transacted at the Tiverton Road Station, are willing to cut a branch to the town of Tiverton, provided they can obtain the voluntary cession of the land from the owners. This is necessary, in consequence of the expiration of the period fixed by the Act of Parliament for taking it compulsorily.

**The new Tunnel in Liverpool.**—It is intended that the terminus of the new tunnel, which the Liverpool and Manchester Railway Company propose to form under the town of Liverpool, shall be at the north end of the town. The company will thus be able to receive and discharge goods and merchandise with ease at both ends of the docks, and merchants and shippers will be able to effect great savings in cartage.

**Sherborne.**—An engineer was busily engaged on Saturday last in taking the levels in several meadows and fields in and adjoining the town, for the intended line of railway from Salisbury to Taunton. The same gentleman will extend his survey—westward, to Exeter; south, to Dorchester and Weymouth; and also to Bath.

#### PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c.

Granted between 25th of June and 25th of July, 1844.

[SIX MONTHS FOR ENROLMENT.]

Guy Carlton Coffin, of Lunaford, Wilts, Esq., for certain improvements applicable to locomotive, marine, and stationary engines. July 3.

Anthony Lorimier, of Clerkenwell Close, Middlesex, bookbinder, for certain improvements in the apparatus and means of facilitating drawing from nature or models. July 3.

Henry Smith, of Stamford, Lincolnshire, agricultural implement maker, for certain improvements in the construction and arrangement of hand-rakes and horse-rakes, and in machinery for cutting vegetable substances. July 3.

John George Bodmer, of Manchester, engineer, for certain improvements in locomotive steam-engines, and in carriages to be used upon railways, in marine engines and vessels, and in the apparatus for propping the same, and also in stationary engines, and in apparatus to be connected therewith. July 3.

Octavius Henry Smith, of Wimbledon, Surrey, Esq., for certain improvements in steam-engines, boilers, and condensers. July 3.

Thomas Syson Cundy, of Cutler-street, builder, for certain improvements in the construction and arrangement of stoves and fire-places. July 3.

Daniel Stafford, of Grantham, gentleman, for improvements in apparatus for preventing what is termed smoky chimneys or flues, and for the extinction of fire in chimneys or flues. July 3.

Timothy Fisher, of Liverpool, mechanic, for improvements in locomotive engines. July 10.

William Bedington, jun., of Birmingham, manufacturer, for improvements in the construction of furnaces. July 10.

William Newton, of Chancery-lane, Middlesex, civil engineer, for certain improvements in the manufacture of wire from zinc, and the application of the same to various useful purposes. July 10.

Henry Highton, of Rugby, Warwick, master of arts, clerk, for certain improvements in electric telegraphs. July 10.

Robert Beart, of Godmanchester, Huntingdon, gentleman, for improvements in apparatus for boring in the earth and in stone. July 10.

John McBride, manager of the Nursery spinning and weaving mills, Hutchesontown, Glasgow, for certain improvements in the machinery and apparatus for weaving by hand, steam, or other power. July 15.

James Harrison, of Irwell House, Bury, Lancaster, manufacturer, for certain improvements in machinery or apparatus for spinning cotton and other fibrous substances. July 15.

Henry Davies, of Norbury, Stafford, engineer, for improvements in the construction of certain steam-engines, also in the application of steam to such engines. July 15.

Jacques Bidault, of Paris, merchant, for improvements in applying heat for generating steam, and for other purposes, which improvements may be employed to obtain power. (Being a communication.) July 17.

Charles Armengaud, of Paris, engineer, for improvements in apparatus for heating apartments and other places, and in apparatus for cooking. (Being a communication.) July 18.

General George Wilson, of Cross-street, Islington, machinist, for certain improvements in the construction of chimneys and flues, and in furnaces, stoves, grates, or fire-places generally. July 24.

William Brockedon, of Devonshire-place, Queen's-square, gentleman, for improvements in covering the roofs of houses and other buildings, in covering the valves used when propelling by atmospheric pressure, in covering the sleepers of railways, and in covering parts of stranded and keyed musical instruments. July 24.

John James Russell and Thomas Henry Russell, both of Wednesbury, Stafford, tube manufacturers, for improvements in the manufacture of welded iron tubes. July 24.

James Kite, of Hoxton, coal-merchant, for certain improvements in constructing chimneys, and in the means used for sweeping the same, parts of which improvements are applicable to other like useful purposes. July 24.

Edward Pace, of the firm of Messrs. Taylor and Pace, of Hackney, in the county of Middlesex, gentleman, for improvements in the machinery for figure weaving in silk, and other fabrics. July 24.

#### SCOTCH PATENTS.

Granted between the 22nd of June, and the 22nd of July, 1844.

James Kennedy, of the firm of Bury, Curtis, and Kennedy, of Liverpool, Lancaster, engineer, and Thomas Vernon, of the same place, iron ship builder, for certain improvements in the building or construction of iron and other vessels for navigation on water. Sealed June 24.

Walter Frederick Campbell, of Islay, Argyle, Scotland, Esq., for an improved rotatory engine, to be driven by steam or other power. June 25.

Robert Foulerton, of the Jamaica Coffee House, Cornhill, in the city of London, master mariner, for improved machinery for mooring vessels and other floating apparatus. June 25.

Edmund Morewood, of Thornbridge, Derby, merchant, and George Rogers, of Stearndale, in the same county, gentleman, for improvement in coating iron with other metals. June 27.

Robert Dawson, of Brick-lane, Middlesex, civil engineer, and William Symington, of East Smithfield, Middlesex, civil engineer, for a method or methods of drying, seasoning, purifying, and hardening wood and other articles, either in a manufactured or unmanufactured state, parts of which are applicable to the preparation and desiccation of animal, vegetable, and mineral substances. July 1.

John McBride, manager of the Nursery spinning and weaving mills, Hutchesontown, Glasgow, for certain improvements in the machinery and apparatus for weaving by hand, steam, or other power. July 9.

William Henry Phillips, of Bloomsbury-square, Middlesex, engineer, for certain improvements in the means and apparatus for subduing and extinguishing fire, and saving life and property, and in obtaining and applying motive power, and improvements in propelling. July 15.

#### Correspondence.

##### COMPETITION IN BUILDING.

SIR,—Being one of the so-named second-class builders, I beg to call your attention to a most important matter as regards the competition for general affairs of public buildings, which in most cases imposes on our anxiety to do business, and at the same time occasions us to incur a very great outlay of time and expense in forming estimates for the same. In most cases a specification is drawn up, and which, from the tenor of its wording, permits great opportunities of shuffling through it, and puts the good and trustworthy tradesman from the mere chance of doing justice to his employers and himself. Now, through your intercession, a great boon might be conferred by calling a meeting of this class, to demand in such cases a blank bill of quantities, prepared by a surveyor, and which would give occupation to hundreds of men, who are now literally without employment, and who have been educated for this purpose. If such were the arrangements made, we should be enabled with pleasure to enter into competition, having better data on which to construct our estimates; whereas, we now sign a contract to fulfil all things according to the true intent and meaning of the said specification, and are bound, as men of honour, to give perfect satisfaction, having a reputation to lose. There could scarcely be a complaint made to this arrangement, for if the public are to have the advantage of our experience and method of doing business, it is only fair they should accurately state what is required, and only receive the originally intended benefit. I have observed that in some of your reports on estimates, tenders have been accepted which in

one or two instances were about one-fourth the amount of the calculations made by respectable and moderate men. The evil does not rest here, for the person offering a high price labours under the stigma of being an exorbitant and extravagant person to intrust works in his hands. I believe your journal is the only medium through which such an arrangement could be brought about. I therefore trust the matter will not rest here, but that some of your correspondents may aid me in calling the attention of the trade generally to this all-important arrangement.

Should you favour us with some remarks on the matter, you will have the thanks and good wishes of many on the success of your endeavours. This matter must be kept alive, and it remains for you, Sir, to effect very much good to the public by so doing.

A LOVER OF FAIR PLAY.  
August 6th, 1844.

THE HARDY TESTIMONIAL.

SIR.—In answer to an inquiry in THE BUILDER of August 3rd, respecting the Hardy Memorial, I beg to say that the committee have selected a design from one of those forwarded by amateurs; and have awarded the premiums of 5*l.* each to Mr. T. Glegg, architect, Clatham, and Mr. Henry Barnes, architect, Dorchester, to signify their approval of designs sent by those gentlemen.  
Z. Y.

Miscellaneous.

**DESTRUCTION OF BLAMPHAYNE-HOUSE.**—This mansion, the seat of Sir Edward Marwood Elton, situated at Colyton, being a few miles from Exeter, and one of the most antique structures in that part of the country, has been totally burnt down. Its ancient construction and picturesque situation formed a very great attraction in the county, it having been erected in the reign of Queen Elizabeth by Mr. Thomas Marwood, one of Sir Edward's ancestors. The mansion was of considerable extent. The fire broke out last Wednesday, and it was supposed that from age, the brickwork of the roof had in some way parted, and formed a cavity under the rafters, where the soot collected, and the flue of one of the chimneys taking fire, soon communicated to the mass, for the upper part of the building was in flames before the alarm was given, and the domestics encountered some difficulty in preserving themselves. Every endeavour was made to check the entire demolition of this interesting edifice, but all was of no avail, and within an hour after the discovery, the building, with all its ancient relics, was reduced to ruins.

**CALEDONIAN CANAL.**—The repairs on the canal are proceeding rapidly. The number of workmen employed is estimated at 1,200. At Bennaive several of the locks have to be wholly renewed. The pressure of the waters of Loch Lochy will also be rendered less dangerous by the construction of a new lock at Gairloch. The late drought reduced the waters of Loch Och to a lower level than was ever remembered, affording facilities for removing, in the course of the channel through the lake, some hundreds of trees, consisting chiefly of the finest black oak—some of the blocks 3*1*/<sub>2</sub> feet in diameter, and other logs 25 to 30 feet in length. They must have lain in their watery beds for centuries.—*Times*.

**THE FITZWALTER BARONY.**—Sir Brook William Bridges, of Goodnestone Park, has succeeded to the ancient and honourable titles of the house of Fitzwalter. The title was granted to the ancestors of the present noble lord by Edward I. whose reign commenced in 1272. Lord Fitzwalter has lately been making extensive alterations at his princely seat at Goodnestone, and the whole pile is undergoing reparation and improvement. His lordship has renovated the parish church, and beautified the interior with coloured and painted glass windows, new seats, &c. &c.

**OXFORD.**—Considerable restorations and repairs are going on at several of the colleges in Oxford, among which Magdalene, Brasenose, and All Souls are the most conspicuous. At Worcester College additional buildings are in course of erection for the students.

**BRITISH MUSEUM.**—The King's or Royal Library in the British Museum is undergoing a complete renovation, and not before it was wanted. It was dingy in the extreme, nothing having been done to it since it was first built, some sixteen or seventeen years. As neither this nor the general libraries are open to visitors on the public days, few are aware of the existence of this magnificent room, which is not alluded to in the catalogue. It is by far the most ornamental and most extensive of all the galleries, being 300 feet in length, 41 in breadth, and 30 feet high. The centre compartment is much wider than the other two, for there it expands to a width of 53 feet, owing to which circumstance the perspective acquires a considerable degree of variety, whereas had the room been continued from end to end, without other break or division than that perhaps of columns, although the first impression might, perhaps, have been equally striking, it would quickly have given place to a feeling of monotonousness. The Corinthian columns of highly-polished granite contribute very much to the architectural character of this noble apartment. All the fittings-up are carefully executed in the very best mode of workmanship. The lofty marble door-cases, with doors of oak and bronze, are not the least remarkable features. The library, which now contains about 80,000 volumes, was collected by George III., and presented to the nation by George IV. The gift was one worthy of a sovereign, and the room is worthy of the splendid collection it contains.—*Times*.

A highly-interesting geological discovery has been lately made at the Pentwyn Iron Works, near Pontypool. While the workmen engaged in one of the mine levels were proceeding with their operations, they encountered a fossil tree of considerable size. It was in an erect position, and perpendicular to the plane of stratification. The circumference at the base, immediately above the point of junction with the roots, is six feet, and from thence it diminishes to four feet, in a height of about five feet.

**SALE OF CWM CELYN AND BLAINA IRON WORKS.**—This fine mineral property was sold by Mr. White, of Coleford, at the Westgate Hotel, on Wednesday week, for 57,000*l.* The purchaser is Mr. Stodart, of Bath, for self and some of the leading shareholders of the recent company.

**TIMBER IN NEW BRUNSWICK.**—In one week in the early part of last month, it was estimated that upwards of 70,000 tons of squared timber passed Woodstock on the river of St. John. The lumber men had been highly favoured by three or four days successive rains.—*Halifax Morning Post*.

**BRICKS GOING TO ENGLAND.**—A Philadelphia paper says Mr. George Snyder, a well-known brickmaker, is now completing an order for 30,000 bricks for Mr. Gibbons, a gentleman in London.

The trustees of the British Museum have made great acquisitions at the recent sale of the library of his royal highness the late Duke of Sussex. The number of lots purchased for the library of the British Museum is 1,150.

Workmen are erecting a fence around the Dock Company's ground, on the west side of the Humber Dock Basin, preparatory to the construction of the intended new Western Pier.

The yew tree in Gresford church-yard, Wales, is upwards of 31 feet in circumference. This giant of nature is probably not surpassed in the principality, or indeed, in England.

Public baths, the cost of which is estimated at 1,500*l.*, are about to be erected at Bolton. The land for the purpose has been given by the Earl of Bradford.

Sir M. De la Beche arrived at Merthyr, on Tuesday, to prosecute a government inquiry into the sanitary condition of large towns.

TO CORRESPONDENTS.

The notice relative to moving "bodily" the gallery of the chapel in the Liverpool-road, Islington, did not arrive in time for us to be able to present on the occasion; but we shall insert any account of the operation which may be sent to us. The Elizabethan Gate we cannot insert without it be accompanied by sections of its component parts.

# The Builder.

NO. LXXX.

SATURDAY, AUGUST 17, 1844.

AST week we intimated our intention of saying a few words relative to the Round Church at Cambridge,—of course meaning principally with regard to the work, which for so long a time has been going on by and at the instance of the CAM. CAM. Society.

At first sight it appears very generous for a body of persons, non-parishioners principally, to come into a parochial district, and to concentre therein upon its ancient church the outlay of a large amount of both time and money, and to have involved itself to a great extent; this to some may appear even noble, and we are willing to give the Cam. Camdenites every credit which they deserve: but if these *Cam. Cam.* have fallen into error, they must not expect, or rather they ought not to expect, that mere bullying will serve their purpose, any more than it will the supporting of the errors of any other persons, or of any person whatever. They are ardent to have churches restored, so are we as ardent as they—in many things more so: but in doing this we should not commit the indecency of running counter to the proper recognized parochial pastor. Such a proceeding is of itself a most gross act of indecency; an offence against that bond of peace, which is the greatest blessing of any and every church, and is, indeed, thoroughly subversive of a Catholic church: and we believe if the Cam. Camdenists have so far forgotten as members of that Church, their duty to become pious, useful, and peaceable members of it, and for which indeed they were sent to Cambridge—and if they have set an example of insubordination between the priest and people in the parishes over which ministers more advanced in theological knowledge, of greater forbearance, and who have brought the weight of years and experience—that all this will return upon themselves. They are breeding, they are nurturing hornets' nests, from which, when they become parochial clergy, they will be stung; and when they come themselves to work in parishes, they will have the full benefit of their perverse teaching, their breeding of dissention, the building up of hay and straw, and the blowing of stubble into men's eyes; theirs will be such a case as that of the French king who, assisting the American republicans, caused to be reflected back upon France the republican principle, which in a few years afterwards swept away the French monarchy. We know so many acts of indecency committed in various places by the Cam. Camdenists, that we are bound to say that we believe no body, great or small, reverend or irreverend, ever acted with greater indiscretion; none ever with less dignity; none ever so contrary to the

recognized feelings of propriety in the conduct of ecclesiastics of whatever church, party, sect, or persuasion; and if it be asserted that among them are to be found one or two—who, having by office the ordering of churches—that only makes the case the worse; for an improper assumption of power which they do not by law possess, an interference where they have no right, a pertinacious infringement even in trifles of the recognized office of others, is, in fact, only insidiously undermining their own authority in quarters where they themselves of right bear authority. In fact, they sap the foundation of the very first principles of Christianity, which is peace; and all their preaching of "*peace! peace!*" while they will have no peace, is vain. We would that the young Cam. Camdenists remember what Judge Best said when Sergeant Wild was skirmishing with him, "*I am pained at witnessing my brother take so much trouble to assail and lower that bench which he is one day fated to adorn.*"

Those who would uphold, or at least excuse the Cam. Camdenists on the score of zeal, little honour them; for by all recognized principles and feelings, young men, who go to our Universities, are considered to be under a state of strict tutelage; are to be on their guard, lest the vagaries of their own invention, the breakings out of their own minds, not sufficiently chastened down to decency and propriety of conduct, should appear in opposition to those reasonable maxims, and to that staid dignity of deportment, which the doctors, who teach them, and who have grown hoary in a state of self-denial, the self-denial of tongue-luxury, and whom, in fact, they discredit by such license of tongue and deportment. Mere zeal goes for nothing. There is hardly any crime which stains humanity, which has not arisen from zeal. Nearly all the higher classes of crimes—the trial of which employs our judges—have arisen from zeal; zeal not under command, and like a steam-carriage with no director.

We believe the appeal which is now being made for the raising of the balance due upon account of the work done to the Round Church would not have been necessary had any proper care been taken; for we doubt not that the whole fabric might have been rebuilt for a much smaller sum.

We now proceed to make a few observations upon the so-called restoration itself.

In the first place, we beg to give our opinion, that if the church had been left alone, it would in seventy years have been in better condition of repair than it will now be seventy years hence. Those acquainted with building materials know that the Bath stone unfortunately imported into Cambridge for the work is not fit for the purpose; multitudes of the churches and other buildings which have been erected in London during the last twenty-five years of this material are, so far as their masonry goes, mere ruins; but as we are engaged in an accurate survey of the whole of them, and intend shortly to give the result, it is unnecessary for us to say any thing more thereon at present, except that the neighbourhood of Cambridge possesses better and more durable kinds of native stone, and which ought to have been used in preference. Again, we think little credit is due to the Cam. Camdenists for increasing the quantity of building attached to this edifice, in the latest and most degraded style of Gothic architecture; this, of itself, we consider to be a tasteless squandering of money.

We by no means approve of some of the other alterations, and we shall be able to shew

on the proper occasion that the roofing is formed in opposition to competent scientific authority.

The defects of the old fabric of this church have taught the Cam. Camdenists no prudent caution. The stones in places were falling from the crowns of the semi-circular Romanesque arches, and the walls are forced over by the weight of the crowns of the Romanesque vaultings; and yet with these dissipating effects, which are proper and inherent to the very nature of Romanesque architecture, and can alone be in any way avoided in that immature style by the use of a vast proportionate quantity of materials, and which are all avoided by the Pointed style, in the state in which it was at the building of Westminster Abbey. Indeed in Romanesque architecture substance will not alone prevent fracture of the work. We can bring a host of instances, besides the one at Barfeton, which we gave in No. 68 of THE BUILDER. At the Church of St. Bartholomew the Great, Smithfield, the large arches of the crossing have settled hideously in a similar way: and at Westminster-bridge, which we shall touch upon shortly, the fractures of the great semi-circular arches have occurred just where the Pointed architects left off carrying the work any further towards a crown.

On the whole we think the work of the Church of St. Sepulchre, Cambridge, has been rashly, unscientifically, and extravagantly done; for half the amount of money which has been expended, it ought to have been more soundly, more scientifically, and more tastefully performed; its material ought to have been better, and its fabric ought to have been rendered more durable.

We shall next week give a review of the translation of Durandus, by which our right-minded readers who do not know this precious work, will see what degree of reliance is to be placed in Cam. Cam. judgment. We shall not enter into the question whether there should be a "*credence-table*," or whether an altar-table should be of stone or wood, believing these things to be of themselves idle questions; but after the partial advocacy of the presiding authority at Cambridge, and the subsequent inhibition, viewed in connection with a society finetured with such trifling, and whose leading members dare to idle their time, and to squander that of others who ought to be better employed, by the issue of such rabbinical trumpery as Durandus, we can no longer look upon such behaviour and such apparent trifles as innocent.

## THE PROJECTED EMBANKMENT ON THE RIVER THAMES.

We have obtained a printed copy of the Bill recently introduced by the Government relative to the Thames embankment. It is entitled, "A Bill to empower Her Majesty's Commissioners of Woods to form a Terrace and Embankment, with convenient Landing-places for the Public on the Middlesex shore of the River Thames, between Westminster and Blackfriars' bridges." The measure, which was under the care of Lord Lincoln, M.P., and Sir G. Clerk, contains no less than 84 clauses, with a copious schedule. It is, of course, laid on the shelf until next session, being merely brought in and printed for the information of hon. members, and to afford them an opportunity of considering its provisions during the ensuing recess. Power is given to the Commissioners of Woods and Forests to carry out the purposes of the Act, the expenses to be defrayed out of the fund to be created for the execution of improvements in the metropolis. The third clause, which will be most interesting to the public at large, enacts that it shall be lawful for (that is, it empowers) the Commissioners of Woods and Works to make and

construct a raised terrace and public roadway or communication from or near Whitehall-place, in the parish of St. Martin's-in-the-fields, in the city of Westminster, on or along the bed or shore of the river Thames, on the Middlesex and city of London side thereof, to or near to Chatham-place, Blackfriars, in the city of London; also to embank certain portions of the bed or shore of the river, on the Middlesex side, from Westminster-bridge to the said intended roadway, at or near the northern pier of the intended Hungerford Suspension-bridge, and also from time to time to alter, widen, divert, and remove all causeways, piles, stairs, hard, or landing-places, on the shore of the river, or projecting from the bank thereof, on the side aforesaid between Westminster-bridge and Chatham-place; and to drive other piles, and construct other causeways, piers, stairs, &c., in such situations and in such manner as they (the commissioners) shall deem best suited to the convenience of the public; and to remove all mud-banks and obstructions on the bed or shore of the river, and to deepen, scour, and cleanse the same bed or shore on the Middlesex side, and to dredge and deepen any other parts of the river between Westminster-bridge and Chatham-place aforesaid; and also to make and maintain all necessary and convenient ways and communications from Whitehall-place, Villiers-street, the Savoy, Wellington-street, Surrey-street, Norfolk-street, and Arundel-street, to the intended terrace and roadway, and to construct and maintain all necessary viaducts, roads, bridges, embankments, quays, basins, banks, walls, locks, sewers, culverts, drains, arches, landing-places, tide-gates, piles, and other necessary works. The remaining clauses would not interest our readers, as they merely relate to the details of measures by which the purposes of the act are to be carried into effect.—*Times*.

#### THE NEW HOUSES OF PARLIAMENT.

THE following is an abstract of the second report from the Lords' select committee on the progress of the building of the Houses of Parliament.—That the Committee appointed last session recommended that the architect should so conduct his operations as to secure the occupation of the new House of Lords, with temporary fittings, at the commencement of the session of 1844; and that, if he should find that more time would be required, that he should report the same to the Commissioners of her Majesty's Woods and Forests, in order that such report might be communicated in due time to the House. That instead of the new House of Lords being covered in by Christmas last, as was stated to be practicable by Mr. Barry, in his evidence last year, it is now only in course of erection. That Mr. Barry now states, that if great exertions are made, the House of Lords, the lobbies at each end of it, the corridors connecting the same with the front building and the libraries, the committee and other rooms belonging to the House of Lords, may be covered in before winter; and the committee, having examined the building, with the clerk of the works and one of the contractors, are of opinion that the whole of these apartments may be prepared for the use of the Lords by April next. That the committee do not recommend that any temporary fittings should be prepared, but that all the works connected with the buildings above mentioned should be advanced with the greatest possible speed. And the committee have examined Mr. Barry, with respect to the style of internal fitting and decoration, and he has distinguished those parts of the building, to which he considers the more costly and elaborate style should be applied. In respect to the remaining portions of the internal arrangements, the committee entertain the strongest opinion, both in reference to economy and despatch, that the committee-rooms and secondary apartments should be completed in the most simple and solid manner, consistent with the character of the general building, but not involving any extraordinary expenditure. In respect to the deviations from the original plan, it has been satisfactory to learn that they have not been of a character to vary or affect the builder's contract; and that no future deviations are to be allowed, without the previous sanction and authority of the Commissioners of the Woods and Forests.

#### WHITECHAPEL IMPROVEMENTS.

WORKMEN have been this week employed in pulling down the mansion in Essex-street, Whitechapel, which was in the occupation of the Earl of Essex, the favourite of Queen Elizabeth, shortly before his death. In a few days nothing will remain of the building. It is situated on the east side of Essex-street, and was at the rear of the houses forming that street. It is three stories high. The attic windows are latticed, and the rooms on the first and second floors are about 14 feet square. There is a part of the spacious staircase remaining, and the joists and girders are in as good preservation as when originally placed in the brickwork. The property was sold a few days ago by order of the Commissioners of Woods and Forests, with 25 other houses, which are to be taken down for the improvements in that neighbourhood. At a short distance from this spot, between Elliston-street, Petticoat-lane, and Houndsditch, is another large mansion, which will be demolished for the purpose of having new buildings erected on its site. This was the palace where Queen Elizabeth occasionally resided. The building, the walls of which are very strongly constructed, is four stories high, and some of the windows are latticed. The ceilings of the ground and first floors are ornamented with different devices, coats of arms, figures, &c., among which may be distinguished roses, fleurs-de-lis, and the word "Britannia." There are also several Latin inscriptions, scarcely legible. There is a quantity of oak panelling in various parts. The premises were for some years latterly used as a common lodging-house, where beds were let out at 3d. a-night, and it was known as the "big-house." The rooms are now used as carpenters' workshops. This property belongs to Mr. Hutchinson, who, at the last general election, contested the borough of the Tower Hamlets.

#### ARTESIAN WELLS AT SOUTHAMPTON.

DURING the meeting of the Royal Agricultural Society, Dr. Buckland delivered a lecture on Artesian wells, and in particular on that which is now in progression at Southampton. Though uncompleted, it is a work of immense magnitude, vying with the great well at Grenelle, by which Paris has been lately supplied. The depth of the Southampton well is at present 1,300 feet. The shaft descends through 78 feet of alluvium, 300 feet of clay similar to the London clay (which is a general substratum in the Southampton basin), and through another 100 feet of plastic clay, before it reaches the chalk, through which it descends 100 feet still further. Thus from the surface a well has absolutely been built downwards nearly 570 feet, and under such difficulties from irregularities in the strata that four iron cylinders have been placed in points where no attempt at masonry could have proved successful. Not the least singular part of this work is the manner in which this underground well has been built from the summit level downwards "into the very bowels of the land." This is a matter, however, which it would be tedious to describe; suffice it, therefore, that after reaching a depth of nearly 600 feet, the operations of the masons were suspended, and the boring-rods were brought into operation, and employed until, through their instrumentality, the contractors have reached a depth of 1,300 feet. As might be expected, the supply of water is already abundant. It now rises within 40 feet of the surface, and by the aid of powerful steam-engines no less than 55,000 gallons a day are literally poured into the town of Southampton. It is expected that the water will soon rise to the surface, when the supply will be immensely larger than even this.—*Hull Packet*.

#### BRITISH ARCHEOLOGICAL ASSOCIATION.

THE first general meeting of this new association will be held at Canterbury, in the first week of next month, under the auspices of the Archbishop of Canterbury, who was one of its early members. Its plans are the study and preservation of English antiquities, and the opposing and preventing, as far as possible, all injuries with which ancient national monuments of every description may from time to

time be threatened; and it is proposed to carry these objects into execution by holding general meetings at different parts of the country, on the plan of the British Association. Its proceedings are arranged under four sections:—1. Præval Antiquities; 2. Mediæval Antiquities; 3. Architecture, and 4. History; at which papers will be read and discussions entertained. The sections will meet on the morning of each alternate day of the week; the other days to be occupied with visits to monuments, &c. The members will have free access to all the stores of the cathedral not exhibited on other occasions; and Lord Albert Conyngham, the president, has invited the members to be present at the opening of some Saxon barrows in his park, on one of the mornings. The unrolling of an Egyptian mummy will form an object for one of the evening meetings by Mr. Pettigrew. A local council, consisting of the mayor, and several leading persons at Canterbury, has been formed for making arrangements, and a full attendance of members is expected. The number of these at present exceed 1,000, including the names of 12 bishops and 12 deans, with many leading antiquarians.

#### PETRALOLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 399.)

"A general treatise on rocks," says Pinckerton in his admirable attempts at classification, "cannot be founded on any theory of their formation, however plausible; as the opinions of the author will be biased by that theory, and he will be inclined, like Buffon, to reject or pass in silence any substance which interferes with his pre-conceptions. Thus Jasper is totally omitted by Werner, though it forms a chain of mountains in Siberia of more than 1,000 miles in extent, spreading even to the islands between that region and America." Modern geologists have contributed to establish the truth of this axiom, for in diving into the mystic theories of these men, we invariably find them vainly endeavouring to model natural phenomena to their views and purposes, instead of taking nature for their guide, and endeavouring to penetrate to the primary fountain from whence the several phenomena proceed. M. de Saussure, one of the most celebrated mineralogists of his day, after forty years' close application to this science, after traversing every region of the Appennines, with the ardent desire and ambition to form a system of petralogy, gave up the idea in despair, the various rocks running so much into each other as to defy classification. But our modern men of science, who have scarcely passed the precincts of the closet, are less scrupulous in this respect, favouring the public from time to time with many illustrated fables, within which truth is hidden as in a well, from whence few people are capable of extracting it. When the unlearned reads of *lava*, he is naturally led to expect that, like chalk, it is a characteristic body consisting of certain compounds united in definite proportions of each; and, further, when he is told that *lava* is a volcanic product, he is led to suppose that the material of *lava* is generated by volcanic heat, the whole interior of the earth being filled with this material in a state of heat of fusion: he is not prepared for the fact that under this one universal and misplaced term, geologists comprise almost all the numerous varieties of rock known to us, from simple carbonate of lime to the very heterogeneous mixtures termed basalts, traps, granites, &c.; nay, some geologists contend that all crystalline rocks are *lavas*, which, on cooling down under immense pressure, assume the crystalline form: thus the reader is led astray, and the smatterer in science walks abroad upon the earth talking ridiculous nonsense of plutonic and volcanic rocks, and fancying every hollow and natural chasm of the earth is the mouth of an extinct crater. This abuse of terms, leading to a thousand other absurdities, is so common in the present day, that much of the varied, complicated, and beautiful phenomena of creation is completely veiled from vulgar observation, and the end and aim of nature is perverted to suit ridiculous and unnatural theories.

The notion of granite being the universal

hase of the superficial crust of the earth was no sooner set aside by men of sound reflection, than theorists invented another term (trachyte) to supply its place; and Humboldt, who on many occasions draws largely on the credulity of his readers, speaks of whole volcanic mountains formed of this material, which is to be considered as lava in its changed state: thus errors promulgated by learned men are received and perpetuated, standing as an almost impregnable barrier against truth, and the stumbling-blocks to discoveries of much greater importance.

Mr. Lyall, in his very interesting romance termed "Elements of Geology," gives an analysis of minerals most abundant in what he is pleased to term volcanic and hypogenic rocks; and, on reference to his analysis, the reader will readily perceive that their character is determined by mere modifications of mixture of silica, alumina, magnesia, lime, potash, soda, iron, and manganese, with the occasional omission of one or more of these ingredients. The earths, in their disintegrated or divided state, exhibit the like combinations, and the accident of flood or fire acting upon them cannot by any means obliterate or change the nature of these earths. We find them forming the lower as well as the upper beds, the ingredients of sedimentary deposits, and the ingredients of lavas, in the state of mud, of clay, of slate, of porphyry, jasper, and various other rocks. We see them continually abstracted from the inner beds of the earths, and ejected as rivers and torrents of mud from volcanoes, as well as in the melted or lava form. On the other hand we see them in the sediments of rivers and seas gradually and progressively increasing in extent, and gradually undergoing changes in their disposition and chemical and mechanical combinations, as they are influenced by local influences of temperature and association. It is therefore idle to say that such a rock is volcanic under any circumstances, unless we are to presume that the action of internal heat upon terrestrial masses is productive of these earths. No one presumes that a brick is volcanic, simply because the bed from whence it was abstracted is open to the observation of all; like glass it is admitted to be an artificial product, and so is obsidian, but lava in general is not; for although abstracted from the interior beds and united with water, or acted upon by fire, its character and composition remain unimpaired: but where the melted material assumes an artificial state of induration, the term may then be applied; but even then I think unwisely, when it gives rise to a system of generalization so utterly at variance with nature.

It is acknowledged that the upper crust of the earth consists of series of overlying beds, locally disposed and locally varying from each other, and being of homogeneous as of mixed qualities. Every one of these beds, however deeply disposed at present within the earth, was once the uppermost; and while in this position was the particular subject of moving or disturbing causes. While beneath the waters in its disintegrated state, it was subject to division by tidal currents, to local intermixture of sedimentary deposits, and to intersection by deposits of nature differing from its own taking place in those divisional parts. Again, on dry earth it was subject to the like action of streams and rivers, of grooving or channelling out in various directions, of intermixtures with other earths, or of minerals conveyed within its matrix by percolating waters. In every state it was subject to fracture, dislocation, separation of parts, and partial decay; and having undergone these changes, we can readily conceive its becoming covered in by succeeding depositions, its fractures and inequalities filling up by the overlying matter, and forming dikes and other intervening beds, now so commonly and so fondly ascribed to volcanic causes alone. Every person who has traversed regions of the tropics during the dry season of the year, or in rainless regions, cannot fail to have observed the enormous and deep-seated rents and fissures which take place in the earth's superficial crust, and many a time and oft it is that these fissures extend to and divert the course of waters from the natural beds, which rushing into the aperture thus made, carry with them material varying in its nature from the beds in which it is finally deposited. Earthquakes, whether proceeding from volcanic action, or the pent up vapours

generated within the bowels of the earth, are productive of the like effects.

It is my wish to render these matters more familiar to my readers, in order to shew them, that however tempting the science of geology may appear, and however imposing its assumptions, that there are facts in nature militating against these assumptions, and presenting in their purity and simplicity a natural solution to phenomena which men delight to rohe in the veil of mystery. Trap is said to be of volcanic origin, but the very facts brought forward in support of this supposition, prove the direct negative. In England, in the islands of Arran, Sky, and other parts of Scotland, it is the overlying bed, and is always found filling in the vertical fissures, dykes, and veins of the underlying rock, taking the form of the opening, and continuously appearing the whole extent of it. The fissures are, in general, those common to many consolidating beds, which, contracting in their parts, as acted upon by the long and intense atmospheric heat, separate, and present to the view deep vertical fissures; and these rocks afterwards in this state being covered in by the loose earth, the fissures fill up with the same substance.

Again, if the fissures thus formed, exist in disintegrated masses, then we unitedly find that the filling in material when united with water, alters by combination the character of this bed to such an extent as it is capable of permeating. This is exemplified by a striking example quoted by Mr. Lyall, in favour of his theory, of the mass being projected from beneath. The dyke is 134 feet wide, and consists of a rock, variously termed by different writers, a compound of felspar and argillite, Strata of shale and argillaceous limestone, through which it cuts perpendicularly, are altered to a distance of 30 and 35 feet from the edge of the dyke. The shale as it approaches the trap, becomes gradually more compact, and is most indurated when nearest the junction. Here it loses part of its schistose structure, but the separation into parallel layers is still perceptible. In several places the shale is converted into a hard porcellaneous jasper. In the most hardened part of the mass the fossil shells principally productae, are nearly obliterated; yet even here their impressions may frequently be traced. The argillaceous limestone undergoes analogous mutations, losing its earthy texture as it approaches the dike, and becoming granular and crystalline. But the most extraordinary phenomena is the appearance in the shale of numerous crystals of analcime and garnet, which are distinctly confined to those portions of the rock affected by the dike.

In Antrim the chalk is converted into granular marble near the basalt, and many other examples of change are adduced by geologists to shew that the intruding matter has caused a manifest change in the contiguous beds. What then, in this respect, becomes of Sir John Hall's hypothesis, that crystalline rocks are formed under exceeding high pressure, accompanied with a corresponding high degree of heat, the intruding matter could have had upon the vertical beds whose fissures it filled in, no effect other than that daily exhibited by the filling in of earths or marl; for if in the melted liquid state of lava, instead of contributing to the density of the beds in contact, it most probably, by abstracting some portion of their material contributed to their expanding power, and instead of crystallizing, would have caused them to become more pulverulent; but these beds have evidently acquired earths at the points of contact which they previously did not possess, and such as are received by loose deposits or simply cohesive rocks through the agency of water, by the introduction of carbon or of mineral gaseous or fluid bodies. The dike is in general compact and highly silicified, and the bed in contact has evidently received the excess of silica in its external parts, whereby it has become a harder and more ponderable body; nay, in many instances the intruding matter filling up these dikes or fissures, has evidently blended with the primary bed to a limited extent, proving thereby, that the one and the other were in their decomposed state; and this is particularly observable in some of the limestones, which by contact present a compound union of lime and alluminous earth.

Brochant's able summary against the Volcanic, and in favour of the Nepturian theory,

embraces the facts, that if true basalts are found among the products of burning mountains, they are extremely rare, and modern eruptions have not produced any. Their prismatic and tabular form is not peculiar to trap, but extends also to gypsum, marls, and sandstones. They often repose immediately over coal, as at Messner, near Cassel; and, we may add, many of the coal beds of this country. They embrace the remains of animals and vegetables; they often contain hydraulic agates. There is no appearance of vitrification, nor have real craters ever been discovered; all those which have been cited being natural hollows or chasms. Mandelstein has certainly some resemblance to porous lava; but it is palpably manifest that some mandelsteins are not volcanic. Rocks might re-combine, but substances would certainly be left, as at present, denoting the action of fire. In Bohemia and different countries, beds of basalt have been observed to alternate with grit or stratiform limestone. There are many basaltic regions where basalt is only found in situ. Basalt has no appearance of fusion; heated in a furnace it melts to glass. The prismatic division of basalt has been attributed to the water of the sea. The conical form of basaltic mountains is common to all submarine hills formed by contending tidal action over a wide area of the sea.

But the most unanswerable argument against the volcanic formation of rock, is the fact demonstrable to all men, and open to observation, that those particular varieties which it is insisted upon are volcanic, are even now to be observed in every stage of formation, both in Asia and Africa. Dolomieu, a very attentive and accurate observer of rock, has expressed his opinion that the basalt of the ancients is not a volcanic product. Of the vast number of Egyptian monuments examined by him in the Borgean Museum, many, he says, are formed of stones having qualities attributed to basalts, but not one is volcanic. In this I can most fully bear him out, for all the Siderous rocks, of which I am to speak, abound in Egypt, and are disposed in the pure oceanic and undisturbed strata, and could not possibly be formed by volcanic action. Again, we observe the material of which they are composed in the newest formations, disposed on either side of the Red Sea; and also the progressive stages of their formation, and of transition into other varieties of rock. These beds are most decidedly marine deposits, and abstracted from the waters by their gradual decrease; these masses of matter, after long exposure to atmospheric action, become gradually cemented together by silica, in like manner as porphyry, amygdolite, jasper, and other amorphous rocks; the difference of the one and of the other being only in the nature and qualities of the bodies, and fragments of bodies, of which they are composed; all of them boasting a common parentage, a simultaneous development, and common properties, and being subject to the like atmospheric influences in those regions where they abound.

**SIDEROUS ROCKS.**—Having in the above general remarks on the modern theories concerning the origin of all crystalline and many amorphous rocks, spoken of basalt, I shall now proceed to consider the division under which it is placed.

Siderous rocks are those rocks which are particularly characterized by the great quantity of iron they contain; it being, in general, uniformly diffused throughout the whole bed, gives this rock a marked and decided character, manifest to observation, and confirmed by fracture and analysis. The distinguishing characters of siderites are generally basaltic, sometimes only marmoric hardness; fracture commonly foliated, sometimes radiated; weight siderose, sometimes approaching to the harytose; lustre splendid, shining between vitreous and pearly, opaque, the green sometimes translucent on the edges; colour generally black, sometimes of a greenish grey. It sometimes composes entire mountains, but more commonly occurs disseminated in veins or nodules in granite, or beds of gneiss.

Siderites, says Pinkerton, may be characterized by their silky or crystalline appearance, basalts by their dull earthy aspect; the one, in fact, is the mere modification of the other, and in a different stage of change; for basalt, upon long exposure to a dry hot atmosphere, passes of necessity into the crystalline form of

siderite; this remark also applies to those rocks which geologists, after Werner, denominate trap, and embracing the recent series; the latter term being, in many cases, useless, as applied to basaltic bodies.

Siderites are extensively distributed over many regions of the earth, varying in composition, and consequently in external character, from the pure oceanic depositions, to the numerous and varied unions of these deposits with pure vegetable and aluminous earth. In their simplicity of structure they are merely coherent masses of earth, mechanically held together, but so lightly, as to be readily separable by the fingers, and from thence they gradually acquire hardness, or, strictly speaking, like the porphyries, with which they are often confounded, they gradually silicify. Mountains of black hornblende exist in Siberia, vast strata in Saxony, and basaltic formations are very extensive in many regions. Ironstone is very abundant in this country. Specimens of siderite and basalt on analysis have been found to consist of

Siderite.		Basalt.	
Silix	37	Silix	50
Argil.	22	Argil.	15
Mag.	16	Mag.	2
Lime	2	Lime	8
Ox. of iron	23	Iron	25
	100		100

Coarse basalts embrace the common whinstones of the north of England and Scotland. Slaty basalts, green stones, and slates, form mountains in Sweden, often metalliferous. Some of the interior pillars of cathedrals, whinstone from the Salisbury Crags, the Malvern Hills, and much of the pavement of London, is of compact basalt; although, latterly, this material has been superseded by granite.

#### RETROSPECTIVE ARCHITECTURAL LITERATURE.

##### THE ELEMENTS OF ARCHITECTURE.

COLLECTED BY SIR HENRY WOTTON, KNIGHT,  
From the best Authors and Examples.

(Continued from p. 395.)

FIGURES are either simple or mix'd; the simple be either circular or angular: And of circular either complete or deficient, as Ovals; with which Kinds I will be contented, tho' the Distribution might be more curious.

Now the exact Circle is in truth a Figure, which for our Purpose hath many fit and eminent Properties, as Fitness for Commodity and Receipt, being the most capable; Fitness for Strength and Duration being the most united in his Parts; Fitness for Beauty and Delight, as imitating the Celestial Orbs, and the Universal Form: And it seems, besides, to have the Approbation of Nature, when she worketh by Instinct, which is her secret School; for Birds do build their Nests spherically: But notwithstanding these Attributes, it is in truth a very unprofitable figure in private Fabricks, as being of all other the most chargeable, and much Room lost in the bending of the Walls when it comes to be divided, besides an ill Distribution of Light, except from the Centre of the Roof: So as anciently it was not usual, save in their Temples and Amphitheatres, which needed no Comparitions. The Ovals and other imperfect Circular Forms, have the same Exceptions, and less Benefit of Capacity: So as there remains to be considered in this general Survey of Figures, the angular and the mixed of both. Touching the angular, it may perchance sound somewhat strangely, but it is a true Observation, that this Art doth neither love many Angles, nor few. For, first, the triangle, which hath the fewest Sides and Corners, is of all other the most condemned, as being indeed both incapable and infirm (whereof the Reason shall be afterwards render'd) and likewise unresolvable into any other regular Form than it self in the inward Partitions.

As for Figures, of five, six, seven, or more Angles, they are surely fitter for *Military Architecture*, where the Bulworks may be laid out at the Corners, and the Sides serve for Curtains, than for Civil Use, tho' I am not ignorant of that famous piece at Caprarola, belonging to the House of Farnese, cast by Baroccio into the form of a Pentagon, with a Circle inscribed, where the Architect did ingeniously wrestle with diverse Inconveniences

in disposing of the Lights, and in saving the Vacuities. But as Designs of such nature do more aim at Rarity than Commodity; so, for my part, I had rather admire them than commend them.

These things considered, we are both by the Precepts and by the Practice of the best Builders, to resolve upon rectangular squares, as a Mean between too few, and too many Angles; and through the equal Inclination of the sides (which make the right Angle) stronger than the Rhombe, or Lozenge, or any other irregular Square. But whether the exact Quadrat, or the long Square be the better, I find not well determined, though in my own Conceit I must prefer the latter, provided that the Length do not exceed the Latitude above one-third part, which would diminish the Beauty of the Aspect, as shall appear when I come to speak of Symmetry and Proportion.

Of mixed Figures, partly circular and partly angular, I shall need to say nothing, because having handled the simple already, the mixed, according to their Composition, do participate of the same Respects: Only against these there is a proper Objection, that they offend Uniformity, whereof I am therefore opportunely induced to say somewhat, as far as shall concern the outward Aspect, which is now in Discourse.

In *Architecture* there may seem to be two opposite Affectations, Uniformity and Variety, which yet will very well suffer a good Reconciliation, as we may see in the great Pattern of Nature, to which I must often resort: For surely there can be no Structure more uniform than our Bodies in the whole Figure, each Side agreeing with the other both in the Number, in the Quality, and in the Measure of the Parts: and yet some are round, as the Arms; some flat, as the Hands; some prominent, and some more retired; so as upon the Matter we see that Diversity does not destroy Uniformity, and that the Limbs of a noble Fabrick may be correspondent enough, though they be various; provided always that we do not run into certain extravagant Inventions, whereof I shall speak more largely when I come to the parting and casting of the whole Work. We ought likewise to avoid enormous Heights of six or seven Stories, as well as irregular Forms; and the contrary Fault of low distended Fronts is as unseemly: Or again, when the Face of the Building is narrow, and the Flank deep, to all which Extremes some particular Nations or Towns are subject, whose Names may be civilly spared: And so much for the general Figure or Aspect of the Work.

Now concerning the Parts in Severalty: All the Parts of every Fabrick may be comprised under five Heads, which division I receive from Baptista Alberti, to do him right; and they be these:

##### The Foundation.

##### The Walls.

##### The Apertions, or Overtures.

##### The Compartitions.

##### And the Cover.

About all which I purpose to gather the principal Cautions; and as I pass along, I will touch also the natural Reasons of Art, that my discourse may be the less mechanical.

First, then, concerning the Foundation, which requireth the exactest Care; for if that happen to dance, it will mar all the Mirth in the House: Therefore, that we may found our Habitation firmly, we must first examine the Bed of Earth (as I may term it) upon which we will build; and then the Underfilings or Substruction, as the Ancients did call it: For the former, we have a general Precept in Vitruvius, twice precisely repeated by him, as a Point indeed of main consequence; first Lib. I. Cap. 5. And again more fully, Lib. 3. Cap. 3. in these Words, as Pbilander doth well correct the vulgar Copies.

*Substructionis Fundationes fodiantur (saith he) si queant inveniri ad solidum, & in solido.* By which Words I conceive him to commend unto us, not only a diligent, but even a jealous Examination what the Soil will bear, advising us not to rest upon any appearing Solidity, unless the whole Mold through which we cut, have likewise been solid; but how deep we should go in this Search, he has no where to my remembrance determined, as perhaps depending more upon Discretion than Regularity, according to the Weight of the Work; yet

Andrea Palladio hath fairly adventured to reduce it into Rule, allowing for that\* Cavassione (as he calleth it) a sixth part of the Height of the whole Fabrick, unless the Cellars be under Ground, in which case he would have us (as it should seem) to sound somewhat lower.

Some Italians do prescribe, that when they have chosen the Floor or Plot, and laid out the Limits of the Work, we should first of all dig Wells and Cisterns, and other Under-Conduits and Conveyances for the Suillage of the House, whence may arise a double Benefit, for both the Nature of the Moil or Soil would thereby be safely searched; and moreover, those open Venis will serve to discharge such Vapours, as having otherwise no issue, might peradventure shake the Building. This is enough for the natural Grounding, which though it be not a Part of the solid Fabrick, yet here was the fittest place to handle it.

There followeth the Substruction or Groundwork of the whole Edifice, which must sustain the Walls; and this is a kind of artificial Foundation, as the other was natural, about which these are the chief Remembrances: First, that the bottom be precisely level, where the Italians therefore commonly lay a Platform of good Board; then that the lowest Ledge or Row be merely of Stone, and the broader the better, closely laid without Mortar, which is a general Caution for all Parts in Building that are contiguous to Board or Timber, because Lime and Wood are insoceable, and if any where unfit Confiners, then most especially in the Foundation. Thirdly, that the breadth of the Substruction be at least double to the insistent Wall, and more or less, as the Weight of the Fabrick shall require; for as I must again repeat, Discretion may be freer than Art. Lastly, I find in some a curious Precept, that the Materials below be laid as they grew in the Quarry, supposing them, belike, to have most Strength in their natural and habitual Posture. For as Philippe de'Orme observeth, the breaking or yielding of a Stone in this Part but the breadth of the Back of a Knife, will make a Cleft of more than half a Foot in the Fabrick aloft, so important are fundamental Errors; among which Notes I have said nothing of Pallification, or plying of the Ground-plot, commanded by Vitruvius when we build upon a moist or marshy Soil; because that were an Error in the first Choice, and therefore all seats that must use such Provision below (as Venice, for an eminent Example) would, perhaps, upon good Enquiry, be found to be at first chosen by the Counsel of Necessity.

Now the Foundation being searched, and the Substruction laid, we must next speak of the Walls.

Walls are either entire and continual, or intermitted, and the Intermissions be either Pillars or Pilasters, for here I had rather handle them than, as some others do, among Ornaments.

The entire Muring, is by Writers diversly distinguished: By some, according to the Quality of the Materials, as either Stone or Brick, &c., where, by the way, let me note, that to build Walls and greater Works of Flint, whereof we want not Example in our Island, and particularly in the Province of Kent, was (as I conceive) merely unknown to the Ancients, who observing in that Material a kind of metallic Nature, or at least a Fusibility, seem to have resolved it into nobler Use, an Art now utterly lost, or perchance kept up by a few Chymicks. Some again do not so much consider the Quality, as the Position of the said Materials; as when Brick or squared Stones are laid in their Lengths, with Sides and Heads together, or their Points conjoined like a Network (for so Vitruvius doth call it, *Reticulatum Opus*) of familiar Use, as it should seem, in his Age, tho' afterwards grown out of request, even perhaps for that subtil Speculation which he himself toucheth; because so laid, they are more apt in swagging down, to pierce with their Points, than in the adjacent Posture, and so to crevice the Wall. But leave such Cares to the meaner Artificers; the more essential are these:

That the Walls be most exactly perpendicular to the Groundwork; for the Right Angle, thereon depending, is the true Cause of all Stability both in artificial and natural Positions, a Man likewise standing firmest when he stands uprightest. That the massiest and

\* Under-digging, or Hollowing of the Earth.

heaviest Materials be the lowest, as fitter to bear than to be born; that the Work as it riseth diminish in Thickness proportionally, for ease both of Weight and of Expend; that certain Courses or Ledges of more Strength than the rest, he interlard like Bones, to sustain the Fabrick from total Ruin, if the under Parts should decay. Lastly, that the Angles be firmly bound, which are the Nerves of the whole Edifice, and are therefore commonly fortified by the Italians, even in their Brick Buildings, on each side of the Corners, with well squared Stone, yielding both Strength and Grace: And so much touching the entire or solid Wall.

The intermissions (as hath been said) are either by Pillars or Pilasters.

Pillars, which we may likewise call Columns (for the Word among Artificers is almost naturalized), I could distinguish into simple and compounded. But (to tread the beaten and plainest way) there are five Orders of Pillars, according to their Dignity and Perfection, thus marshalled:

The *Tuscan*.  
The *Doric*.  
The *Ionic*.  
The *Corinthian*.

And the *Compounded Order*, or, as some call it, the *Roman*, others more generally, the *Italian*.

In which five Orders I will first consider their Communities, and then their Properties. Their Communities (as far as I observe) are principally Three: First, They are all round, for though some conceive *Columna Atticæ*, mentioned by Vitruvius, L. 3. Cap. 3. to have been a squared Pillar, yet we must pass it over as irregular, never received among these Orders, no more than certain other licentious Inventions of wretched, and vined, and figured Columns, which our Author himself condemneth, being in his whole Book a professed Enemy to Fancies.

Secondly, They are all diminished or contracted insensibly, more or less, according to the Proportion of their Heights, from one third Part of the whole Shaft upwards, which Piliander doth prescribe by his own precise measuring of the ancient Remainers, as the most graceful Diminution. And here I must take leave to blame a Practice grown (I know not how) in certain Places too familiar, of making Pillars swell in the middle, as if they were sick of some Tympany or Dropsy, without any authentic Pattern or Rule, to my Knowledge, and unseemly to the very Judgement of Sight. True it is, that in Vitruvius, Lib. 3. Cap. 2. we find these Words, *De adjectione, quæ adjectur in mediis Columnis; quæ apud Græcos ὑπερανε appellatur, in extremo ubi erit formatio ejus*; which Passage seemeth to have given some countenance to this Error. But of the Promise there made, as of diverse other elsewhere, our Master hath failed us, either by slip of Memory, or injury of Time, and so we are left in the Dark. Always sure I am, that besides the Authority of Example, which it wanteth, it is likewise contrary to the original and natural Type in Trees, which at first was imitated in Pillars, as Vitruvius himself observeth, Lib. 5. Cap. 1. For whoever saw any Cypress or Pine (which are there alledged) small below and above, and tumorous in the middle; unless it were some diseased Plant, as Nature (though otherwise the comeliest Mistress) hath now and then her Deformities and Irregularities.

Thirdly, They have all their Undersettings or Pedestals, in Height a third part of the whole Column, comprehending the Base and Capital, and their upper Adjuncts, as Architrave, Frize, and Cornice, a fourth part of the said Pillar; which Rule, of singular Use and Facility, I find settled by Jacobo Baroccio, and hold him a more credible Author, as a Man that most intended this Piece, than any that vary from him in those Dimensions.

These are their most considerable Communities and Agreements.

Their Properties or Distinctions will best appear by some reasonable Description of them all, together with their Architraves, Frizes, and Cornices, as they are usually handled.

First, therefore, the *Tuscan* is a plain, massy, rural Pillar, resembling some sturdy well-limbed Labourer, homely clad, in which kind of Comparisons Vitruvius himself seemeth to take Pleasure, Lib. 4. Cap. 1. The Length thereof shall be six Diameters, of the grossest of the Pillar below, of all Proportions in truth

the most natural; for our Author tells us, Lib. 3. Cap. 1. that the Foot of a Man is the sixth Part of his Body in ordinary Measure, and Man himself, according to the Saying of Protagoras (which Aristotle doth sometimes vouchsafe to celebrate) is *τὸ τῶν ἀνθρώπων χομμόρων μίτρον*, as it were the Prototype of all exact Symmetry, which we have had other Occasion to touch before: This Column I have by good warrant called Rural, Vitr. Lib. 3. Cap. 2. and therefore we need not consider his Rank among the rest. The Distance or Intercolumniation (which word Artificers do usually borrow) may be near four of his own Diameters, because the Materials commonly laid over this Pillar, were rather of Wood than Stone, through the Lightness whereof the *Architrave* could not suffer tho' thinly supported, nor the *Column* itself, being so substantial. The Contraction abovt shall be (according to the most received Practice) one fourth part of his Thickness below. To conclude (for I intend only as much as shall serve for a due Distinguishment, and not to delineate every petty Member) the *Tuscan* is of all the rudest Pillar, and his principal Character, Simplicity.

(To be continued.)

#### A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARKHAM, IN NORFOLK.—NO. III.

WITH NOTES OF THEIR ACTUAL CONDITION.

(Continued from p. 395.)

*Weston Longueville*.—“Since the stormy and eventful period of the great rebellion, the injuries which our churches have sustained are, for the most part, the results of shameful neglect and tasteless reparations.\* The interior of this spacious edifice will, we fear, render some among its former wardens liable to imputations like these; although, from the tokens of recent care for its externals—the roof, walls, &c.—we had at first hoped to find it otherwise. The building consists of a large square tower, with pointed windows on the west side ranging with those in the aisles; a nave, having its roof supported by tall octangular pillars, the intervening clerestory receiving light through quaterfoil windows, two aisles, and a roomy chancel. The roofs are covered with lead throughout, that of the porch only excepted, which is tiled. The arch here is surmounted by a horizontal range of panels, formed of dressed freestone, filled in with squared flints. In the angle above occurs

“A little Gothic niche that 'erewhile held  
The sculptured image of some patron saint.”

Its apex supports a shield charged with armorial bearings, probably those of the founder. In the steeple are five bells.

The octagonal font, a massive structure of the Norman period, has its capacious bowl leaded, and duly supplied with a drain; it rests on four small shafts, encircling a large cylindrical stem, the whole set on a square pedestal. Beneath this, two square steps admit of easy descent to the pavement level. On a projecting piece of masonry, attached to the upper one for the convenience of the officiating priest, may be traced an effigy of our Lord, coarsely sculptured in the attitude of the crucifixion; this stands centrally between the door, and much in advance of the tower arch, thus separating, as it were, an antechapel parvost from the main body of the church. A huge wood framed lock on the south door merits inspection, if only for the rudeness of its workmanship.

Advancing up the nave, where the supply of seats is partial, and these of very debased character, we happen upon one of those specimens of a higher and purer feeling for the Lord's honour which, although “few and far between,” at times cheer us amid the barren poverty round about. Offering, as it does, a fine model of what should characterize the furniture of a Gothic church, comely adorned, and befitting the Almighty Presence, we will essay to prove accurate in our description. The ends of this seat, which is low and unenclosed, are surmounted by finials or crests, having the

apex spear-shaped, and terminating at the neck in a chevron. The *quasi* elbows are sculptured, each with the figure of an eagle, having its cloven head retorted, and the wings reversed. These support the seat, adjusted so that none might by any means sit with their faces averted from the altar. The back presents a plain boarding under, but above the seat a course of perforated tracery runs along beneath the hand-rail or capping, the reverse side of which is carved with the Tudor flowers in the hollow, and the head is embattled. Below this rail we find a broad shelf, placed for accommodation of those occupying the next seat, and somewhat elevated above that on which it adresses. Such was the godly array of open pews or benches in which our ancestors were content to worship; they knew that with God there is no respect of persons, and carefully avoided the least token of it in portioning out His sanctuary. But now *inebriatur sæculum*—the age is steeped to the lees in fastidiousness.

The pavement, more especially that of the north aisle, is in a wretched state; shewing that a position ever so elevated affords no security from damp. The avenues are largely occupied by flat grave-stones, many of them charged with heraldic bearings; three are inlaid with brasses, but only one demands our notice, it lies in the north aisle. The effigy of a lady, wearing the “miniver cap” of the period, and having two children standing at her feet, has this inscription—“Of your charity, pray for the soule of Elizabeth, late wife of Firman Rookwood, Esq., daughter and heir of Sir John Timperley, Knt., who died May 13, 1533.

A feature of considerable rarity occurs in this church—a large altar stone or slab,\* marked with small crosses at each corner and in the centre, symbolical of the five wounds. It finds place as a flag-stone in the cross avenue of the nave flags, without the chancel screen; and has not, as is now generally the case, the incised face reversed. This interesting relic is well worthy of careful regard and protection, so few having escaped the profanation of the civil wars, in the reign of Charles I.

The lower section of the screen has its panels decorated with paintings of the apostles, each carrying the emblem by which he was anciently recognized. The keys, and that form of the cross known as St. Andrew's, speak for themselves; the new figure, bearing a fish, probably designates the elder James; a spear should indicate St. Thomas; the club Simon the zealot; the square St. Jude; we assign to “the loved apostle John” the feather or pen of the succeeding portraiture; to the lesser James the pilgrim's staff and scrip next given; a hatchet and a slaying knife may point out respectively Matthias and Bartholomew; while a club and a censer, each accompanied by a book, denote, we take it, the first Philip, the other Matthew the evangelist. Admonitory scrolls, lettered in small English characters, wreath about these figures; and above them might once be read at whose charges the work was executed. . . . . *Hoc opus fieri fecit.*

The perforated part, supported on light shafts in form of buttresses, has its ogive arches surmounted by a double line of perpendicular tracery, separated by embuttled transoms intersecting the apex of the lower range, the whole being elaborately foliated and otherwise enriched. We regret to add that the loss of its doors, and other mutilations, impair, though they cannot efface the beauties of this elegant relic. An open archway in the south angle shews that the roof loft was gained by an inward staircase in that direction.

The sedilia and piscina deserve more than cursory examination. They are canopied by fretted ogive arches, springing from clustered pillars, the whole inserted in a square-headed compartment, having its spandrels and cornice enriched with four-leaved flowers, grotesque figures, &c. An elegant little niche of much smaller dimensions, situate in the north wall opposite, might not improbably have been used as a table of prothesis or credence.

We pass on to the parish-church of Lyng.

MR. THOMAS'S PRIZE FRESCO OF "PHILOSOPHY."

(Drawn on the Wood by MR. THOMAS himself.)

THE above is from Mr. Thomas's design entitled the Throne of Intellect, in which the principal figure, "Philosophy," forms the subject of the fresco by the same artist.

The oil-painting (exhibited with the cartoon and fresco) is intended to present as nearly as possible the effect to be produced by the whole

design, when executed in fresco. The centre figure, Philosophy, tramples on the emblems of Force and Tyranny. The progression of mind is indicated from the simple properties of matter (Geometry), as extended to the planetary system by Astronomy; and Philosophy, supreme in perception of Divine order, points to the Author of All.

The allegorical figures in the angles repre-

sent Man escaping from the evils of the serpent Error. The other, Superstition, veiling herself.

The fresco is executed on a gold background, which must have increased the difficulties; but has been done probably to diversify the artist's contributions: the attempt has been to produce the severe architectural design on the models of the Florentine school.

LONDON AS IT WAS IN 1800, AS IT IS IN 1844.

(Continued from p. 392.)

THE onward march of intellect during the last half century is truly admirable, the manners of the present day afford a most encouraging contrast to those of our forefathers; and although it is to be lamented that old English hospitality should have been superseded by a cold calculating spirit, that the social thread which formerly bound all classes together should have been violently broken by the worship and votaries of mammon, yet the change has not been without its advantages. Hadji Mahomed, a very elegant and witty writer, informs us that drunkenness was very prevalent in his days, the common people having a proverb, "that their labour could not

be too small, nor their liquor too strong." "These," he says, "celebrate the sabbath and all their festivals with drinking and riotous living, esteeming it a very great crime (and that no blessing will attend them) should they do otherwise, and live soberly at those seasons." He relates an anecdote that a poor shoemaker being on his death bed, the parson of the parish was sent for to console and prepare him: the man declared the utmost unwillingness to die, saying "that he had been guilty of one of the most enormous sins of omission that could lie upon a man's conscience, and seemed to be in a state of deepest despair about it. The clergyman, at length, with many arguments, prevailed on him to unburthen himself, and declare what it was: the wretch, with grievous and heavy sighs, then owned, that he had not so much as wetted his whistle with a draught of strong beer, or a dram

of Geneva, during the whole course of Easter holidays." It was a melancholy sight to observe most of the villages adjacent to London crowded with drunkards, perishing with dropsies and consumptions, brought on them by their violent excesses.

Again, "in the country," he observes, "one can scarce go into a mixed company of men and women, among the middling gentry, without having barbarous indignities put upon modesty and good breeding. Their songs, their jests, and their stories have all chiefly a turn towards smutiness. At christenings and marriages their libertinism reigns without control: and one's conversation is rendered insipid and improper unless it is seasoned with lewd mirth. He is a happy companion who can make the ladies simper over plates, or screw up their mouths to suppress a laugh, and improve the hint by a circular sneer and whisper behind their fans; a reverend piece of smutiness given with all due gravity taking the lead." This writer also condemns the females for

NEW

their masculine habits of dress and tobacco-smoking.

These were the days of bull and bear baits, cocking, and boxing, of Fleet and Mint marriage by disgraced clergymen, and of imprisonment for debt without hope, and sometimes without redemption of the body after death, of robbery, and of judicial wholesale murder.

What wonderful changes have taken place within the memory of man! The middling classes are now distinguished for their sobriety, industry, and intelligence; they form a current rolling onwards and strengthening as it proceeds, checking pride, ambition, and arbitrary power on the one hand, bigotry, intolerance, and the countless vices arising from ignorance on the other. We find them intent on intellectual pleasures and intellectual acquirements; and when the present furor for the poisonous trash of literature shall have abated, when thieves and cut-throats shall no longer be exalted as demi-gods, and pointed out as objects of ambition; the fruits of their intelligence will, of necessity, follow in the blessing of universal peace and continually increasing happiness. Even the lower classes have prodigiously improved; it is true that drunkenness, and its attendant vices, is still prevalent and most particularly exemplified on those days, when the working classes are let loose from labour, but it is satisfactory to see the thousands and tens of thousands, banding themselves together to resist this insidious enemy, or seeking, through the blessings of steam, the higher intellectual pleasures, far away from the site of their daily toil, and still surrounded by their families and friends. Woe to the bigot who would stand between them and rational enjoyments! Who would coop them up by Acts of Parliament, oppress them by exaction, and with true pharisaical spirit devour their substance, and for a pretence make long prayers.

The love of the fine arts and of the more abstruse branches of science, including mechanics, chemistry, and mathematics, is continually increasing with the increase of our population; and even many of the common problems of metaphysics are shrewdly commented on with a strength of thought and richness of conception, not unworthy the learned men of olden times. The days of sterling tragedy and comedy have, it is true, gone by; for men are now more prone to look to the realities of life; and their once concentrated taste for theatricals has of necessity given way to the numerous means and opportunities of more extended intellectual and social enjoyment.

Still we cannot say that in the vast augmentation of buildings, now environing London, that a corresponding improvement has taken place in architecture. With the exception of some few streets and squares, some few churches and public edifices, to be noticed hereafter, we have most decidedly retrograded at the West end of the town since 1800. The new squares and streets will not compete with those built within the thirty years previous, either in architectural beauty or family convenience. The churches, even to the present day, are specimens of what is to be expected, and a sad exhibition of the effects of concealed competition, favouritism, and building by tender; all defects of execution being hidden for a time beneath the mask of plaster; and even where there is a display of taste, stability is wanting, in order to ensure future fame to the architect. The streets present either a dull uniformity, or, as is exhibited by Regent and Oxford-streets, a total absence of all regularity and design. The architect has, in fact, seldom power to follow out the dictates of his taste, the interest or obstinacy of individuals governing his movements. This is speaking critically; for the common observer sees much to admire, although the architect has little before him worthy imitation. The older churches of St. George's, Hanover-square, and St. Martin's, admit of no competition by any modern one in that portion of London, of which I am speaking; and yet architects of those days had no such excitement to tax their genius: for most of the beautiful works even of Sir Christopher Wren, were then hidden by huge unsightly masses of wood or brick. St. George's church was built in 1725; the ground, on which it stands, being the gift of the Rt. Hon. General W. Stuart, one of the churchwardens of the parish.

The large stone house, on the south side of Berkeley-square, was built by the Earl of Bute, circa 1765, and sold incomplete to the Earl of Shelburne, afterwards Marquis of Lansdowne, for 22,000*l.*; the square is said to contain three acres of ground. Grosvenor-square owes its origin to Sir Richard Grosvenor, Bart., who in 1695 named all the streets between New Bond-streets and Hyde Park. The centre house on the east side was raffled for in 1739, and won by two persons named Hunt and Braithwaite, who subsequently sold it to the Duke of Norfolk for 7,000*l.* The Weekly Journal of June 1, 1717, observes—"The new buildings between Bond-street and Marylebone go on with all possible diligence; and the houses even let and sell before they are built. In 1800 Bond-street, as a fashionable street, was without rivalry, and almost impassable for vehicles in fine weather. May-fair was held annually for fourteen days; in 1727 it was marked out to be built upon.

In the Evening Post, March 16, 1715-16, we read—"On Wednesday last four gentlemen were robbed and stripped in the fields between London and Mary-le-bon." In the year 1707 the maps of London represent King-street near Golden-square as perfect to Oxford-street; between which and Berwick-street were fields. In 1742, the little church of St. Mary was detached from London, with two zigzag ways leading to it; one near Vere-street, which was the then western boundary of the new buildings, and the second from Tottenham-court-road, and somewhere about Charles-street. Rows of houses, with their backs to the fields, extended from St. Giles's to Oxford-market; a small cluster on the west side, and Spring-water House, constituting the whole of Tottenham-court-road. I have already noticed the extension of this quarter of the town in 1800.

Paddington parish extended over 1,197 acres, 3 roads, and 30 perches; of which 84 were arable or garden-ground, the remainder pastures. The manor of Paddington was granted to Westminster Abbey by King Edgar; and when the see of Westminster was abolished, it was given to Ridley, Bishop of London and his successors. In 1601 it was sold by the Parliamentary commissioners to Thomas Browne, Esq.; in 1741 it was purchased by Sir John Frederick, Bart.; and in 1800 was vested in Sir John Morshead, Bart. and Robert Tibstlethwaite, Esq., in right of their wives.

The chief buildings at this period were Paddington-house, then a handsome brick edifice on the east of the green, built by Mr. Dennis Chirne, jeweller to Queen Anne, and then occupied by John Symmons, Esq.; West-bourne-place, granted by Henry VIII. in 1540 to Robert White, and some years afterwards the property of Isaac Ware, the architect (editor of Palladio's works and other professional productions), who erected the mansion with materials brought from Lord Chesterfield's house in May-fair; this was afterwards sold to Sir William York, Bart., Chief Justice of the Common Pleas in Ireland; and in 1800 was the property of Mrs. Coulson; Little Shaftesbury-house, the seat of Ambrose Godfrey, Esq.; the Queen's Lying-in Hospital, at Bayswater, where Mrs. Kennedy, the celebrated singer, closed her days in 1793, at the apartments of her husband, who was physician to the hospital; the church, rebuilt 1791 at an expense of 6,000*l.*; the stipend was formerly so small that it was difficult to find a person who would supply the cure; in 1626 it was only 10*l.*; it was afterwards 23*l.* Bishop Sheldon in granting the lease of the manor to his nephews in 1661 raised it to 80*l.*, at which rate it continued some time after the beginning of the present century. The number of houses was about 340, the greater portion of which, disposed a little to the north of Tybourn turnpike, were small wooden cottages, inhabited principally by journeymen artificers.

A celebrated eccentric statuary named John Bushnell was buried at Paddington in 1701; among other whims he undertook to demonstrate the possibility of the Trojan Horse, and began to make one upon the same principles, of wood covered with stucco; the head was capable of holding twelve men, the eyes were to serve as windows. Before it was half completed a storm of wind overset and destroyed the unwieldy machine. Bushnell was much admired as an artist.

PANCRAS.—This place took its name from

the saint, to whom the church is dedicated. It was called St. Pancras in the Doomsday book. Its extent in 1800 was 2,700 acres, being rated at 1,400*l.* per annum land tax. Keatish Town was formerly written Kentesstowne, being the property of Reginald de Kentewode; from whom also Caen-wood or Ken-wood, Earl Mansfield's seat, derives its name.

The old church is of Gothic architecture, built of stones and flints, and supposed to have been built in the 14th century. "Pancras Church," says Norden, "staadeth all alone, as utterly forsaken, old, and weather-beaten, which, for the antiquity thereof, it is thought not to yield to Paul's in London. About the church have been many buildings now decayed, leaving poor Pancras without company or comfort, yet it is now and then visited with Kentishtowne and Highgate, which are members thereof; but they seldom come there, for they have chapels of ease within themselves; but when there is a corpse to be interred they are forced to leave the same within this forsaken church or churchyard, where it resteth as secure against the day of resurrection, as if it lay in stately Paul's." It was long noted as the burial place of such Roman Catholics as die in London and its vicinity, and many are buried there at the present day. It was plastered and repaired about 25 years ago, and now bids fair to outlast many of our modern churches. The Small-pox Hospital was built in 1675; the Foundling-house was instituted 1739; the Veterinary College in 1791.

Hampstead, formerly Hamestead, the ancient way of spelling *homestead*, contained in 1500 2,169 acres of land, of which 273 were waste; the land-tax was 855*l.* 17*s.* 4*d.*, which was at the rate of 10*d.* in the pound rack-rent. Its fine, healthy, and commanding situation for a panoramic view of London and the surrounding country have always drawn together a number of occasional visitants, for whose accommodation several places of public amusement had been established. The Spaniard and the Flask taverns, and a tea-drinking house called New Georgia, where the company were diverted with various water-works, were the most remarkable places. The latter is now inclosed with Lord Mansfield's premises. The Hampstead Wells were once in great request by rank and fashion. The present church was consecrated in 1747. When Hampstead was granted to Westminster Abbey by King Ethelred in 986, it contained only five cottages.

Kensington, in Doomsday book called Chensiton, in other ancient records Kensitune and Kensintune, was a village lying on the Great Western road, about 1½ miles from Hyde Park Corner, embracing 1,910 acres of land, about 500 of which were devoted to raising garden produce, and 100 acres to horticulture.

Holland-house, one of the most ancient mansions in this parish, is the manor-house of Abbot's Kensington, and takes its name from Henry Rich, Earl of Holland. It was built by his father-in-law, Sir Walter Cope, in 1607, and affords a very good specimen of the architecture of that period. The stone piers at the entrance of the court (over which are the arms of Rich, quartering Bouldry, and impaling Cope) were designed by Inigo Jones, and executed by Nicholas Stone. The internal decorations were by Francis Cleyne. The Earl of Holland was a conspicuous character during the whole of the reign of Charles the First he was made a prisoner in his own house, and was finally beheaded by the Parliamentarians in 1649. General Lambert fixed his headquarters at Holland-house. On its restoration to the countess, and when the theatres were shut up by the Puritans, plays were very often acted there, collections being made for the actors. The celebrated Addison became possessed of it in 1716, by his intermarriage with Charlotte, Countess Dowager of Warwick and Holland.

Campden-house, in 1800, the property of Stephen Pitt, Esq., and occupied by Mrs. Denham, another celebrated house, was built by Sir Baptist Hicks in 1612, a zealous royalist and great sufferer during the civil war. Charles the Second supped with him there about a fortnight after the restoration. Montagu Bertia, the brave and loyal Earl of Lindsey, immortalized by his filial piety, died at this house. In 1691 it was hired of the Noel family by Queen Anne, then Princess of

Denmark. At Earl's-court was the villa of the celebrated surgeon, John Hunter.

Kensington Palace was the seat of Sir Heneage Finch, afterwards Earl of Nottingham and Lord Chancellor of England; his son sold it to King William soon after the accession of that monarch to the throne. Kensington Gardens were originally only 26 acres, Queen Anne added 30 acres, 300 acres were afterwards taken from Hyde Park and added thereto. It is a very irregular building.

(To be continued.)

#### TIMBER—ITS TREATMENT AND USES. BY JAMES WILSON.

(Continued from p. 394.)

50. **CHESNUT.**—The sweet Spanish chestnut is a hard and compact wood, so similar to the oak in colour and general appearance, that it is sometimes mistaken for it; it is, however, to be distinguished by the absence of the larger transverse septa; besides which, it will be observed in old wood, that the sap-wood is somewhat whiter, and the heart-wood a little browner, than in oak; also, the pores of its sap-wood are scarcely visible, while in oak they are large, thickly set, and distinctly apparent. It also differs from the oak in another respect referred to in article 29; and it is more easy to work than those of native growth. The annual rings are very distinct, one side being porous, and the other compact.

51. It is a native of many parts of Europe, and flourishes in the dry, congenial soil of the southern, and the warmer of the mountainous parts; the largest being found on Mount Etna, in Sicily: in the south it is chiefly regarded as a fruit-tree. It is of rapid growth, and long-lived, particularly if grown in a rich, dry, and sandy loam; if sprung from a moist soil, it is less firm in texture, and more liable to split, shrink, and swell with the variations of the weather; although, under no circumstances is it so subject to these disadvantages as other woods generally. When favourably situated, the tree may attain the age of 1,000 years.

52. With the oak, to which as a tree it is a formidable rival, although inferior in girth, it is pre-eminent as to hardness and durability; and, indeed, the young wood, which is tough and flexible, even excels the other in these respects, the proportion of sap-wood being also very small. It is applicable to the same uses as the oak, though in strength somewhat inferior to it. But from a brittleness which is in its nature when of mature growth, along with shakes to which it is somewhat subject, the wood of old trees is unsafe for beams and other bearing purposes as have to sustain a great or undefined load, being often decayed and rotten within when it has a very fair appearance without; it is then liable to break without affording any warning. It is also said to be very liable to decay if deprived of the salutary influence of ventilation; on which account, the ends of beams, when let into walls, should rest upon stone templates, in arched openings prepared for them, a free circulation of air being thus admitted all round.\* The above circumstances being all considered, it appears that the young is more valuable than the old wood.

53. It is much to be desired that this handsome forest-tree, so advantageous for beauty and usefulness, were even more cultivated in England than it now is; in early times it was very plentiful; and, from the evidence that is afforded by roofs and other parts of many of our old buildings, we are led to suppose that it was the principal timber adopted; although, it must be confessed that instances are not rare wherein such as have been long considered as constructed of it, have, on closer examination, proved to be really of oak. In the south of England it thrives, we may say, to perfection, attaining in fifty or sixty years as many or more feet in height. Even at this age, however, the quality of the wood is on the decline, getting ring-shaken, and otherwise less firm; at an age so early as forty years it is in perfection, notwithstanding it grows for centuries after. It is raised from the nut, which should be

\* [Care must be taken not to lay wood upon moist stone, which is sure to cause its decay; we generally take the precaution of interposing plates of lead or iron between stone and bearing-timbers, and carefully exclude timber bond from stone walling.—Ed.]

sown in February, dibbled in in-rows, and kept free from bottom shoots whilst in the nursery. Its foliage depends in splendid masses, its leaves long, lanceolate, and deeply serrated. The trunk is characterized by the deep and wide clefts with which it is marked. Its bark is sometimes used for tanning, but for that purpose it is inferior to oak bark.

54. Young coppice trees are, for straightness and durability, much esteemed for hop-poles, spars, pailings, rails, posts, and gates, and other purposes, where large wood is not; timber of a more advanced growth is advantageous. It is also well adapted for the formation of casks, water-pipes, and other receptacles of liquids; the Italians use it for wine-tuns.

55. The American is said to be in all its properties and qualities very similar to the European chestnut; the young wood being tough and flexible, much esteemed for fence-work; the old wood brittle and sbaky.

(To be continued.)

#### THE NATURE OF DESIGN.

A Paper read at the meetings of the Decorative Art Society, March 13th and 27th.

BY MR. CRABB, V.P., MEMBER OF THE INSTITUTE OF FINE ARTS.

(Continued from p. 399.)

ROME acquired her art through conquest; she imitated the buildings of countries subjected by her arms, and transported statues, pictures, and works of gold and silver, to adorn her capital. The produce of Athens, Delphi, and Elis, filled Rome with the rarest productions of the fine arts. The increasing power, when Julius Cæsar and Augustus held supreme sway, was auspicious to the general interests of the Fine Art; the emperors made great efforts to increase the splendour and magnificence of Rome, and their policy extended a similar course throughout the empire, considering that it tended to fix authority, give general security, and contribute to the happiness of the people. This example was universally followed by their subjects, who had spirit to conceive and wealth to accomplish the noblest undertakings. The opulent senators of Rome and the provinces esteemed it an honour, and almost an obligation, to adorn the splendour of their age and country; the influence of fashion very frequently supplying the want of taste or generosity. It was within a period of 300 years that the luxurious adornment of Rome took place. The sculptors were universally Greeks, and though wealth and honour drew men of talent to Rome, and somewhat revived Grecian excellence, the creative spirit, the spark of vitality, infusing life and soul, originality and thought into their productions, could not be recalled. In the best age of Roman art the demand was chiefly for statues of personal representation, in which a vitiated taste often required the embellishment of colour, by the admixture of coloured marbles or bronze. The same departure from simplicity pervaded their architecture. The most extensive and magnificent structures were erected, but in heavier proportions than the elegant Greek. Every member in the cornice of temple or public edifice became encumbered with a profusion of ornament, and an imposing heaviness of enrichment was the result. The interior of their buildings was decorated by sculpture and painting, and manufacturing design entered freely into their general domestic service. You have Sir W. Gell's fine work on Pompeii, and Sir H. Englefield's Etruscan Vases; several villa façades, the magnificent decorations of Titus' baths, and some fine specimens of colouring and modern adaptation before you.

The splendid and colossal edifices which adorned their cities; temples, palaces, and baths, were crowded with works of art. Trajan's Basilica was most magnificent; its forum, temple, and approaches, crowded 12 acres; the hall, 510 by 168 feet, would have contained our St. Paul's; and its column was enriched by sculpture descriptive of the Roman victories over the Dacians. The theatre of Marcellus was arranged in three tiers of columns, the lower of marble, the next of vitrified glass, and the upper of gilded wood; it contained 3,000 statues in bronze. The palace of Diocletian at Spato was very celebrated; his baths accommodated 18,000 persons at one time. Those of Caracalla covered 13 acres. These baths were a sort of vast club, in which every

exercise of body or mind might be taken, every delight of the senses indulged, and the whole people met there. Gardens were raised about 30 feet above the general level, adorned with pavilions, and a great central building having an immense hall, obelisks and fountains, fragrant shrubs, flowers, and the finest statues. During the first 300 years of the Christian era seven of these baths were erected, well calculated to indulge that love of luxury which rapidly corrupted the Roman manners under the emperors, gratifying the constant love of excitement in novelty and splendour, which then gave popularity to the Government. The number and beauty of their villas were amazing; built on the model of the Persian palaces, their interior decorations were full of choice design, chiefly executed in fresco, and by artists of eminence. The luxurious description given of the furnishing of these villas, their richly wrought plate, &c. &c., convey certain intimations of the encouragement given to manufacturing design. Hadrian's villa, at Tivoli, inclosed by a wall ten miles in circuit, contained the most magnificent embellishments. Pliny's villa and that of Lucullus were very celebrated; each had gardens of great splendour.

We must not overlook Palmyra built by Dionysius, whose magnificent ruins, replete with elegant design, attract the traveller's attention. Balbec, not less celebrated, boasts of the well-known Temple of the Sun—

"Whose lonely columns stand sublime,  
Flinging their shadows from on high,—  
Like dials which the wizard Time  
Had raised to count his ages by."

Every thing appertaining to this enterprising nation of conquerors was upon a mighty scale. They lived constantly in public, assuming an excess of vast magnificence in their habits, public exhibitions, and triumphal processions; and I may also add, in their arts and manufactures. They held tribute all the civilized world, and have left monuments of their greatness at the uttermost confines of their empire.

Byzantine art arose through the impatience of Constantine, and the inefficiency of his architects employed to erect the first Christian city; it presents a rich admixture of the plunder from other styles; several parts of Europe adopted it:—Moscow and the south of Russia, and also the regions along the Mediterranean coast.

The Arabian, or Moresque, took its rise among a people whose extraordinary conquests and quick perception of the beautiful enabled them to graft new combinations upon ancient Eastern architecture. At the time when other nations were again sinking into barbarism, they became a medium for preserving that knowledge which has descended to us. Their ornament was elaborate and geometrical, and distinguished by delicacy of execution; and the principle of their colouring gorgeous, as that of the eastern nations. I need only mention Mr. Owen Jones's magnificent publication upon the Alhambra Palace, in illustration.

The dismemberment of the Roman empire obscured the arts; and in the thirteenth and fourteenth centuries we find the church its only patron. During the middle ages Gothic architecture was extensively adopted; its singular and beautiful ornaments are exceedingly interesting, and frequently display very considerable talent in the principles of design. The Jesuits studied the arts, especially architecture, and have produced some of the finest perspective effects in the world; their noviciate, extending to thirty years, gave ample time and leisure for deep research, and they are considered to have produced greater benefits and greater evils than any other ecclesiastical body.

Early in the fifteenth century, immense efforts were made to restore classical architecture and ornamental embellishments, and consequently all the extensive ramifications of manufacturing design. Art quickly became the idol of the people, and there appeared some of the greatest names that ever graced the annals of art; powerful princes were patrons, and the utmost encouragement was afforded by the illustrious merchant family of Medici, the Pope's Leo X., Julius II. and Clement VII. Architecture, painting, and general decorative art, pressed forward with amazing success; all the minor discoveries had been gradually developed, and art reached its most distinguished eminence before the close of the fifteenth century. The splendid talents of Lionardo da Vinci distanced all former excellence; naturally possessing the

very highest attributes of genius, and favoured by education and circumstances, he became as great in sculpture as in painting. The musician, poet, and man of science, his genius kept unceasingly creating, but his perseverance failed before completion. The *Battle of the Standard*, a cartoon for decorating the great council chamber at Florence, is one of the noblest inventions of art, full of felicity and picturesque energy; it displays each attitude of body, and active passion of mind, with profound skill; the horses are treated with surpassing vigour; and it stood alone in art, until Rubens imagined from this text, his magnificent equestrian groups of the *Battles of the Amazons*. Contemporaneous was Michael Angelo, the prince of art; one of those mighty geniuses, who but at distant intervals are found upon the earth. He sublimely conceived, attempted, and succeeded in uniting magnificence of plan with wonderful execution and endless variety; his style was broad, his line uniformly grand; whatever he touched received the impress of his genius, and he rendered character and beauty subservient to the highest attributes of design. He shewed to what sublime purpose decorative painting could be applied, by his adornment of the Sistine Chapel; there depicting sacred history with all the wonders of art. In the "Last Judgment," every attitude, and the master trait of every passion which sways the human heart, was called to his assistance. The depth of thought and power of meditation he expressed in the prophets and sibyls of the chapel of Sixtus. His sculpture appears to have a vitality about it, and his powers as an architect were exhibited in the skilful adjustment of the vast number of jarring parts in St. Peter's, and combining them in one magnificent whole.

Raffaello was the mild and delightful painter of nature; his works in the Vatican, &c., prove him to have entertained the same thoughts as M. Angelo, upon applying the highest quality of art to decorative purposes: their ornamental portions, arabesques, borders, and numerous addenda, will be found, however beautiful in themselves, to be subservient to the great principles of design,—*harmony and repose* being essential to the ultimate effect of the whole work. To these eminent characters, who practised decorative painting in its highest walk, others, second only to such mighty names, lent their best assistance to adorn the palaces and villas of Italy, where they produced works of infinite beauty; galleries and apartments in which the richest architectural arrangements were embellished with skilful dispositions of colouring, beautiful arabesques and gilding; fine distinctive effects were produced through different combinations and proportions, harmony and rich solidity of magnificence, only to be obtained by a thorough knowledge and skilful adaptation of the sound merrings rules of art. In the magnificent folio work, just published by Mr. Gruner, upon the *Fresco Arabesques and Painted Decorations of the Churches and Palaces of Italy*, we shall have opportunities for enjoying and studying the brightest gems of decorative art. The examples of this extraordinary work of labour, forty-six in number, are coloured by hand, with a value and effect unprecedented. It expresses the mode of using the enrichments of painting and gilding, in unity with the architecture and with the sculpture; causing the entire to be viewed as one, neither perfect without the other. This work is exactly what we most required, reflecting the highest honour upon Mr. Gruner; and is likely to create a complete revolution in British decorative design.

Design, resulting from the full appreciation of fine art, was lavishly used during the fifteenth and sixteenth centuries, upon every kind of manufacture. The terra cotta of Faenza, of exquisite design and great variety. The Limoges enamels upon copper, forming cups, plates, tazzas, and various ornaments, were often painted by artists like Parmegiano. Richly coloured marbles were freely used in unity with beautiful mosaics, for interior embellishment. The dress of the period was rich in the extreme, in fashion, colours and material. The missals and psalters of the church were illuminated;—medalling carefully practised; engraving on steel, crystal, and precious stones, in intaglio and relief, and inlaying with gold and silver, upon the sumptuous designs for armour and offensive weapons, cups, vases, chalices, and sculptured plate, were

eagerly sought. The superb setting of jewels, intermixed with enamelling, became a passion; and the liberality and demand for large and small goldsmith's works, produced a great body of the finest manufacturing artists, medaliers, and engravers, celebrated in an age rich in every species of excellence depending upon the arts. Benvenuto Cellini was of most distinguished eminence, of elegant person, great vivacity; bold and full of intelligence, he lived amongst the most noble princes and dignified ecclesiastics of that turbulent age; sometimes soldier, musician, engraver, sculptor, or medallist; he produced coins for the mint, both at Rome and Florence, so fine as to be preserved as medals; he was ennobled, and dying at Florence, in 1570, was buried with great funeral pomp. He had lived in intimacy with M. Angelo, Titian, and all the great painters, sculptors, and architects of Italy; counted and esteemed by princes; these illustrious men were supported in great splendour, and held in the highest estimation.

Such being the treatment of artists by a Charles V. or Francis I., the celebrated ecclesiastics of the period, and the minor States of Italy, can we wonder at the success of art under encouragement so flattering, or be surprised that our Henry VIII. was unable to prevail upon these great artists to visit him?  
(To be continued.)

#### CHURCH-BUILDING INTELLIGENCE, &c.

*Restoration of Holy Trinity Church.*—We regret to find that a new obstacle has arisen to carrying forward the restoration of this sacred edifice, so venerable from its antiquity, and so ornamental to the town from its architectural beauty. It is certainly most desirable that a work involving so many considerations affecting the honour and credit of the town, both with the present and future generations, should be under the control of those who are not only qualified to judge of its propriety, but disposed, from their attachment to the church itself, to accomplish it in a consistent and becoming manner. The churchwardens have commenced the re-edification of the south transept and porch, without, we believe, having consulted any properly qualified architect; and incongruities are in consequence being committed, which have obliged the archdeacon to issue a citation forbidding them or any other persons from proceeding with the work. This interposition on the part of the archdeacon is only in accordance with the declaration he made upon the subject in his late charge. "The attempts at reparation," he therein observes, "which have left things worse than they found them, fully justify the law, which I hope the rural deans of this archdeaconry will invariably assist me in enforcing, that no works shall be commenced without a specific permission. I must not omit to mention that an architect at Hull, Mr. Lockwood, has consented to give gratuitous assistance by inspecting any plans for partial improvements which may be submitted to him. On this head caution is the more needed, because architecture unhappily is one of those sciences on which the popular mind still remains to be educated." What will be the result of this interference it is at present difficult to conjecture; but it is certainly to be regretted, that the more respectable portion of the town should so long have been indifferent as to the parties to whose charge was committed the preservation of a structure, which the piety of their forefathers so munificently reared, and which it is our duty to hand down, in all its primitive splendour, to the latest posterity.—*Hull Packet*.

*New Church, Halstead, Essex.*—On Wednesday week the foundation-stone of this church was laid by Mrs. Gee, at Greenstead Green, bearing an appropriate inscription. There were present nearly 1,500 persons at the ceremony, who appeared to be dissatisfied with the sight, and exclaimed against the omission of a treat being given to the workmen, as is usual upon such occasions.—*Correspondent*.

*Nottingham.*—A Romish "cathedral," on a larger and more magnificent scale than any built in England since the Reformation, has been recently erected in this town, and will be "opened" on Wednesday, the 28th instant. The architect is Mr. Pugin.

*East Ardsley Church.*—This old church is about to be taken down, and a new church, when sufficient funds can be obtained, is to be built on the same site. Lord Cardigan has contributed 100*l.* towards this object.

*New Church at Chittoe, North Wilts.*—The foundation-stone of this church was laid on Monday week by Mrs. Starkey, of Spye Park. The erection of the sacred edifice has been entrusted to Messrs. Daniel and Charles Jones, of Bradford.—*Salisbury Journal*.

*St. Mary's Church, Dover.*—The restoration of this church is now rapidly drawing towards completion.—*Dover Chronicle*.

A monument is about to be erected in Staindrop Church, Durham, to the memory of the late Duke of Cleveland.

#### W. G. GOVER'S PATENT REMOVABLE WINDOW-SASH.

Those who are aware of the many painful, and too often, fatal accidents, which are so constantly occurring for want of a safe and easy method of cleaning the outsides of windows, will look upon this invention as a great public benefit.

Most servants, particularly respectable female-servants, are unwilling to undertake the cleaning of windows, as they are at present usually constructed, because a part of this work involves the necessity of sitting or standing in situations repugnant to their feelings, and fraught with extreme danger to all; and where such unwillingness does not exist on part of the servant, humanity dictates that persons unaccustomed to such precarious situations, should not be exposed to them at the imminent peril of their lives.

The consequence is, that a periodical extra expense is usually incurred by the majority of respectable householders, who employ glaziers and others to clean their windows. But though a painter or glazier, from habit, may be less liable to accident than a domestic, when engaged in this perilous work; still the cause of humanity would be best served, if the outsides as well as the insides of windows could be cleaned without, in any degree, endangering the life of a fellow creature.

To effect so desirable an object, the inventor of the patent removable window-sash, has devoted his particular study and attention; and as it was necessary for the accomplishment of his purpose, to contrive some method easily applicable to windows now in use, as well as to those which shall in future be constructed, Mr. Gover has taken care to adopt the simplest and least expensive method he could devise, for rendering the common sash removable, in the hope that householders generally will find it to their advantage, in point of economy, as well as convenience, to submit to the alteration.

Mr. Gover's patent removable window-sash is so contrived, that in less than two minutes, the whole window may be removed and taken into the room by the most unskilful servant; so that those who possess windows on this improved principle, may have them cleaned by their domestics, &c., without endangering the life of any human-being.

Much inconvenience found to accrue from the introduction of strange workmen will thus be avoided; while additional light and comfort may be obtained through the opportunity afforded of frequent cleaning with convenience and economy.

It will be found by those who inspect Mr. Gover's models of the removable window-sash, or the windows which have been fitted up on this principle, that it possesses several advantages over the common sash, viz. :—

The firmness given to it by means of the metal stops, when the sash is closed.

The silence and ease with which the metal and wood work together when the sash is raised or lowered; and

The opportunity it affords of substituting a ventilator upon a large scale. For clubs, hotels, hospitals, and offices, a duplicate sash fitted with wire gauze (so as to yield all the luxury of ventilation) might, when the weather permits, be fixed in the frame by means of the patent stops; the same stops being in like manner applicable to the glazed-sash; and no workman being required to substitute the one for the other.

Fig. 1.

Fig. 6.

Fig. 7.

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 2.

The novelty of the design sought to be protected and represented by the drawing (which is of a scale of 3 inches to a foot,) consists in the shape or configuration of certain parts connected with the sashes of windows, whereby the sashes can be readily detached

from the window frame, without removing the beads, as hitherto commonly practised with windows of the ordinary construction; and thus the exposure of persons to the outsides of windows, for the purpose of cleaning or repairing them, becomes to a great extent unnecessary. Fig. 1. of the drawings represents an elevation of a window, the sashes having the parts above-mentioned attached thereto. Fig. 2 a vertical section through the line A B in fig. 1. Fig. 3, a horizontal section taken through the lines C D, E F, G H, in figs. 1 and 2. Figs. 4, 5, 6, 7, several perspective views of stops, hereafter mentioned; similar letters are placed upon and represent corresponding parts in all the figures. In the fig. 1, A A represents a rectangular window-frame; B, the top, and C, the lower sash; the extreme width of which is somewhat less than the width of the frame between the pulley-styles *ab*; the difference between the width of the sashes and the frame being made up by inserting pieces or stops, D, E, F, G, into grooves, formed in the top and bottom rail of each sash; and the said stops are connected to the sash-line by passing it through a hole\* formed therein, and to the sashes by passing pins or screws H through holes II, formed in the window-rails and stops, as shewn; the bottom stops of the lower sash have projections I at their under sides, which fit into holes formed in the window-sill, to prevent the sash shaking; it will appear evident that the sashes will now slide freely in the frame, and be perfectly secure therein; and may be readily removed from the frames, by withdrawing the pins or screws H, the weight attached to the sash-line being prevented from falling by passing the stop, which has a hole through it over a hook K, fixed to the bead of the window-frame, as shewn.

## RAILWAY INTELLIGENCE.

**Lincoln, Swinton, and York Railway.**—George Hudson, Esq., the chairman of the Midland, the York and North Midland, the Newcastle and Darlington, the North British, and the Leeds and Bradford Railways, accompanied by Messrs. George and Robert Stephenson, the engineers, arrived at Doncaster, on Wednesday last, from York, en route for Gainshoroug, Lincoln, Boston, March, Cambridge, and London, when they proceeded to survey the western side of the town, accompanied by Sir Isaac Morley, the town clerk, and Mr. Alexander, for the purpose of determining the approaches, and of fixing upon the site for the Doncaster station, which, it is expected, will be between Union-street and Shakespear's Head. From this station the lines will radiate west to Swinton, north to York, and south to Lincoln and London. The line to Swinton is intended to pursue the course of the Dun valley, as before proposed. The south line bears directly towards Bawtry, passing the Carr Grange, and over the low grounds to Littleworth, in Rossington, crossing the London road in the valley near King's Wood, and forward to near Bawtry, thence at the foot of Seafworth Hills, over Gringley Carr, and between Walkeringham and Beckingham to Gainshoroug, where it will cross the river Trent a little above Gainshoroug Bridge, and forward to Lincoln. The north line is to pass between the town of Doncaster and the union workhouse, across Crimpsall and the great north road, in a direct line for Askern, by Stubbs Walden and east of Womersley, crossing the river Aire between between Beal and Knottingly, and joining the York and North Midland Railway at the Burton salmon station; thus completing a continuous line of railway from London to York, considerably shorter than the existing route, and a communication between the manufacturing districts and Lincoln, Cambridge, and Norfolk. A short branch is also to be made from the main line for the accommodation of the river trade at Docks Hill; and active operations are to be commenced for preparing the necessary Parliamentary sections and surveys, in compliance with the standing orders of Parliament.

**Progress of the Atmospheric System.**—A new line from Newcastle to Berwick, a distance of 60 miles, is about to be brought forward. Mr. Brunel is the engineer, and it is to be worked entirely on the atmospheric principle. Lord Howick and other influential noblemen and gentlemen will support it.

**Railway Meeting at Workington.**—On Friday week a numerous meeting of the inhabitants of both Workington and Cockermouth and the neighbourhood was held at the Green Dragon Inn, in the former town, in order to take into consideration the report of George Stephenson, Esq., on the proposed line of railway between Workington and Cockermouth. On the motion of J. W. Fletcher, Esq., seconded by M. Falcon, Esq., Joseph Thompson, Esq., was called to the chair. The chairman having read Mr. Stephenson's report of the projected undertaking, the following committee was formed for the purpose of carrying the railway into effect—namely, the Right Hon. the Earl of Lonsdale, Gen. Wyndham, Joseph Harris, Michael Falcon, J. W. Fletcher, J. Harris (Lorton), Charles Brown, L. Bouch, T. Mawson, T. Westray, Joatham Wood, W. Fisher, G. Cape, J. Thompson, sen., J. Guy, W. Thornburn, J. Steel, Wm. Wood, Henry Grayson, Isaac Thompson, W. Cook, T. Wilson (Cockermouth). Shares to the amount of 29,500*l.*, at 20*l.* each, were subscribed for in the room during the meeting, and at present shares to the amount of 42,000*l.* have been taken up. The subscription list is now closed, until information be received from the Earl of Lonsdale, who will doubtless patronise the measure himself, as to the number of shares to be reserved, and in order to afford the noble earl time to take Mr. Stephenson's report into consideration. The projectors of this undertaking are very sanguine that the traffic in coal and lime will amply pay the interest on the full capital, which is fixed at 70,000*l.*, though Mr. Stephenson in his report only estimates the cost at 7,000*l.* per mile. The company, we understand, have decided upon reserving 500 shares, and the remaining 900 may he said to be actually taken up or he-spoken. This railroad when constructed will be of the utmost advantage to the two towns which it will connect, as well as to the district through which it passes, and will likewise form a most important branch to the Whitehaven Junction Railway.—*Carlisle Patriot.*

**West Riding Railways.**—An important meeting has been held at Leeds, at which various gentlemen from Leeds and Bradford attended, besides a portion of the Leeds and Manchester board of directors, including the chairman, to urge upon the meeting the consideration of several projected lines of railway, and eventually it was determined to perfect the surveys and plans which have been for some time under consideration, so as to supply with railways, in the best and most effective manner, the towns of Leeds, Bradford, Huddersfield, Dewsbury, Batley, Birstal, Heckmondwike, Pudsey, Cleckheaton, and the intermediates populous district, in order that the scheme might be brought under the consideration of Parliament the next year. A strong and unanimous feeling in favour of the plan was manifested by the gentlemen assembled at the meeting, and instructions were given to the official gentlemen to take the necessary preparatory steps without delay.

**York and Scarborough Railway.**—On Thursday week Mr. Alderman Hudson attended at Malton, and had an interview with several of the gentry of the town and neighbourhood, at which it was agreed that the station should be in the hone-mill and brick-yard field, in the occupation of Jonathan Booth and Co., and belonging to Robert Bower, Esq., of Welham, with a bridge over the Derwent, and a communication thence into Yorkersgate, the centre of the town of Malton. A great number of workmen are now busily engaged in the formation of the line in the neighbourhood of Scarborough.

**London and York Railway.**—The route of this elastic line is destined, says the *Leeds Mercury*, to undergo yet another alteration, so as to make its northern terminus at Leeds instead of York. A meeting was held at Peterborough, on Thursday, Earl Fitzwilliam in the chair, when resolutions in favour of the London and York scheme were advocated by the Hon. M. Fitzwilliam, M. P., Mr. C. Chaplin, Mr. R. Hodgson, M. P., Mr. E. B. Denison, M. P., &c., and unanimously carried.

The directors of the North British Railway have issued notices for contracts for executing about twenty miles of the line from Berwick towards Edinburgh.

**Edinburgh, Leith, and Granton Railway.**—This line, which was formerly called the Edinburgh, Leith, and Newhaven Railway, has changed its name since the Bills have been passed, authorizing the extension branches to Leith and Granton. The contract for the Granton branch has been contracted for at a sum far below the estimated cost, and the contract for the Leith branch is also advertised for.

#### OPENING OF A TUMULUS.

A TUMULUS or barrow called East-low, and more generally by the rustics Easly-hill, in the parish of Ringham, near Bury St. Edmund's, was excavated and explored on the 4th ult., under the direction of the Rev. Professor Henslow. The hillock at its base is about 90 or 100 feet in diameter, and its height 13 or 14 feet, covered on all sides with thorn-bushes, except its summit, which has the appearance of a spacious harbour, accessible by several winding paths through the dense thorn bushes. The tumulus is situate at the south-eastern angle of the four crossways of a road, having to the southward three other tumuli of smaller dimensions, which had been opened at a former period. The excavation was entered on the south side, the entrance being protected by two upright pieces of timber supporting a cross beam, to prevent the earth from falling; the same precaution was taken within the subterranean passage as the work of excavation proceeded. At several yards' distance from the entrance was found the tomb or chamber, built of flint and mortar, with rows of tiles at intervals, about 12 feet long and 4½ wide. Around this chamber was cut a complete passage, wider on the side entered than on the other sides; and at the north-eastern corner of the excavation was cut a passage for egress, by which means the visitors could pass round with more convenience, or make their exit. The tomb or chamber, which appeared exceedingly fresh and solid, was broken open on the west side nearest the entrance, and on the north side, and the chamber was found to contain a leaden coffin, deposited as in a brick grave at the present day. A complete arch was found a little above the coffin, formed of Roman tiles intermixed with much mortar, and then regularly covered with Roman tiles, like the roof of a house. The leaden coffin was 6 feet 9 inches long, and 1 foot 5 inches broad, and 1 foot 4 inches deep. It was formed out of a sheet of lead, by turning up the sides and ends, as in making a box or tray with a card. The edges were soldered on the inside; the lid was a loose sheet, also turned in at the edges, but without soldering. When the lid was removed, there appeared a skeleton, the skull-bone and some teeth in good preservation. In the mouth, according to ancient custom, was an obolus, or piece of money, too much corroded, properly, to ascertain its date. This was intended to pay Charon, the grim ferryman of the Styx. At the head, or north side of the grave or chamber, and adjoining it, was a small chamber, perhaps about 2 feet square, which had contained lachrymatories or small glass phials, supposed by some to be intended for bolding the tears of the mourners, but considered by Professor Henslow as vessels for balms and balsams. The glass was gone to dust, which appeared like so much salt lying at the bottom of the chamber. Altogether the discovery is one of much interest to antiquarians; and Professor Henslow appears disposed to consider that the skeleton is that of the last owner of the Roman villa discovered last year near the spot, and that the tomb was erected at a late period of the Roman occupation of Britain, when it had ceased to be the practice to burn the dead. —*Hud. Packet.*

**SALE OF ESTATES.**—During the last two or three months there has been a sale of landed property in Fife which is quite unprecedented. In that time there have been sold the lands of Pittessie, for 19,750l., to the Dowager Lady Glasgow; Newbigging, to Mr. Johnstone, for, we believe, about 19,500l.; Teuchats, to the College of St. Andrews, for 4,000l.; Myreside, 4,000l., to Mr. Currie, Leven; Pitnoddan, for about 5,000l.; Kinglassie, for nearly the same sum. Within a short period back, also, the estates of Balgarvie, Radernie, and Smyddy-green, in this county, have been purchased.

#### Miscellaneous.

**BURNS' FESTIVAL.—DIMENSIONS OF THE PAVILION.**—We took a stroll to the ground yesterday (August 2), and were much gratified by the appearance of the pavilion; it seems admirably adapted for the purpose intended, whether in point of external effect or internal accommodation. Mr. McNab and Mr. Dickie, the contractors, are doing every justice to the workmanship. As with our changeable climate, fine weather, however desirable, is not to be calculated upon, it is essential that the erection be water-tight; and this the contractors are insuring, by first roofing it with wood and afterwards overlaying it with felt that is impervious to rain. In the interior, the pavilion is 120 feet long, by 110 feet wide, yielding ample accommodation for 2,000 persons, with an architrave on each side, 6 feet indented, by 36 feet long, and elevated 11 feet—the one for reporters for the press, the other for the Glasgow quadrille band. At the one end is the chairman's seat, and fronting it the croupier's, both elevated; and at one side Mr. Blewitt, the eminent composer, who has charge of the music, will preside at the pianoforte, near which it is expected will be Mr. Templeton and Mr. Wilson, and an effective band of glee singers, trained for the occasion.—*Paisley Paper.*

**THE STATUE OF WILLIAM IV.**—A number of workmen, under the superintendance of Mr. Painter, one of the surveyors of pavements for the city of London, have commenced digging the open space between King William-street and Gracechurch-street, for the foundation of the statue of his late Majesty William IV., which will be erected in the course of the ensuing month. The statue is 18 feet high, and the design is by Mr. Richard Kelsey, the surveyor to the Commissioners of Sewers; the task of sculpturing the figure having been entrusted to Mr. S. Nixon. The statue and pedestal, which will be 40 feet high, will from its position be seen from the Surrey side of the water, and will occupy the spot where formerly stood the Old Boar's Head Tavern, immortalized by Shakespeare. The figure of his late Majesty is chiselled out of two immense blocks of granite, the largest weighing 30 tons, and the smallest 15 tons. The king is represented dressed in an admiral's uniform, over which is the robe of state.

**THE VALUE OF GROUND NEAR GLASGOW.**—On Thursday week the lands of Stobcross, to the west of Finnieston, and extending from the Clyde northward to near the Dumbarton-road, were sold by public roup at the price of 3s. per square yard, imperial measure. These lands extend to about 60 Scotch, or about 80 imperial acres, which, being about 387,000 square yards, make the price amount to somewhere about 58,000l.; but as the purchaser pays the auction-duty, which will be about 1,770l.; as well as the half of the conveyance stamp, the price will actually amount to upwards of 60,000l. These lands were purchased by the late Mr. Philips (by whose trustees they have been sold) in the year 1786, for about 3,700l., making a rise in value of upwards of 56,000l.—*Scotch Paper.*

#### Tenders.

**TENDERS** delivered for repairs and alterations at St. James's Church, Duke's-place.—Mr. Meredith, Architect.

Turner and Sons	£1,295
J. Matthews	1,219
Ketley	1,139
Little and Son	1,071
W. Trego	1,071
W. Lawrence and Sons	1,032
W. Elston	993
Brodger and Ashley	989
J. Gerry	946
— Grimsdale	945
Rd. Ashley	940
Dd. King	933

**TENDERS** delivered for General Repairs of St. Peter's, upon Cornhill.

Lock and Neshae	£1,276
Cooke and Son	1,245
Piper	1,198
Cole	1,196
Battam and Craske	833
Pritchard	829

The lowest tender accepted.

**TENDERS** delivered for alterations and improvements intended to be made to Aldridge's Repository, St. Martin's-lane, for M. C. Allen, Esq.—Charles Hatchard, Surveyor, 50, Lower Belgrave-place. August 13.

Messrs. Bennett and Hunt	£3,685
Mr. Symmons	3,644
Messrs. Parry and Son	3,638
Mr. Stearman	3,358
Mr. Todd	3,275
Mr. Mason	3,200
Mr. Cooper	2,988

**TENDERS** delivered for Additions and Alterations of Trinity (Baptist) Chapel, Trinity-street, South-wark.—R. Suter, Esq., Architect.

Wadey	£386
Crowhurst	385
Friend	358

**TENDERS** delivered for erecting a new first-rate house in Red Lion-street, Whitechapel, for Mr. White. August 7.

Woolcott and Son	£1,648
Fanson	1,595
Rivett	1,545

#### NOTICES OF CONTRACTS.

For sundry Alterations and Additions to the Bath Penitentiary.—Drawings, &c., G. P. Manners, Esq., Architect, Oxford-row, Bath. 19th August.

For the several Artificers' Works in the Erection of both or either of the New Churches—one at Merton, and the other at East Stockwith, near Gainsburgh.—Drawings, &c., Messrs. Hurst and Moffat, Architects, Doncaster. 31st August.

For the supply of 2,000 yards run of Flat Carline Hose Granite Curbing, parish of St. John, at Hackney.—C. H. Pulley, Clerk to Board for Repair of Highways. 21st August.

For the Repairs of Crypt School and House, and for Erecting a Covering to the Vegetable Market in the Southgate-street, Gloucester.—Mr. Jackman, the Chamberlain, Half-street, Gloucester. August 20.

For the Construction of a Sea Sluice, Bridges, and Tunnels, and for Excavating a Drain from a point near Gaywood-bridge to Fisher's Fleet, in King's Lynn.—Mr. E. Durrant, King's Lynn. August 20.

For 57,000 Larch or Memel Sleepers for the Leeds and Bradford Railway.—Company's Offices, Leeds. August 26.

For 3,300 Tons of Wrought Iron Rails for the Leeds and Bradford Railway, each rail to be 15 feet long, and to weigh 65 lbs. per lineal yard.—Company's Offices, Leeds. August 26.

For 1,100 of Cast Iron Chairs, for the Leeds and Bradford Railway.—Company's Offices, Leeds. August 26.

For 500 Tons of best Railway Bars of the parallel double T form, weight about 75 lbs. per yard, for the Liverpool and Manchester Railway.—To the Treasurer of the Liverpool and Manchester Railways, Liverpool. August 21.

For the Erection of a Dwelling-House for the Superintendent of the Steam Drainage Engine, and for the Walls and other necessary works to enclose a Coal-yard and Premises, and for Building a Bridge.—Mr. W. H. Young, Surveyor, Mildenhall.

For Erecting a Cast-Iron Fence, and Wrought-Iron Gates and Lamp Irons, on Yorkshire stone coping, next the high road at the Cavalry Barracks, Maidstone.—Ordnance Office, Pall Mall. August 22.

For supplying 2,250 Loads of African Timber, and delivering at H. M.'s several Dockyards during the year 1845.—Secretary of the Admiralty. 3rd September.

For supplying and delivering at H. M.'s several Dockyards during the year 1845, 1,500 loads of Honduras Mahogany.—Secretary of the Admiralty. 3rd September.

#### COMPETITIONS.

A PREMIUM of 100 guineas will be given by the commissioners appointed to erect a lunatic asylum in the vicinity of the city of Kingston, Jamaica, to the person who shall produce the best plan, accompanied by a specification, of an asylum for the reception of the insane. The institution must accommodate 200 patients of both sexes, with the requisite number of officers and servants, and due attention must be paid in the plan to the proper classification of the patients, and the climate in which the asylum is to be erected. The plan must also show how an addition may be made for the accommodation of 100 patients more, in the event of such being required. The plans must also set forth the probable cost of the building in stone, brick, and iron. The principal portion of the building is to be allotted to paupers, but the commissioners are de-

# The Builder.

NO. LXXXI.

SATURDAY, AUGUST 24, 1844.

## DESIGNING

to go through a review of the works of the Cambridge Camden Society, we this week begin, as with a text, according to our promise, with the translation by "Two of its Founders," of "*The Symbolism of Churches and Church Ornaments: from the Rationale Divinorum Officiorum, written by William Durandus, sometime Bishop of Mende. Leeds, 1843.*"

We have said we begin with this work as a text, because the bias of mind towards trifling and unsoundness, exhibited by that society, is as much to be seen from this one little work, and the reading of it will give the student as correct an idea of what reliance ought to be placed upon such authority, as if he were to waste his time by perusing a thousand folios from the same source.

For the mere information of the reader, who is unacquainted with the scanty memoirs, which are extant relative to Durandus, we copy from the preface the following particulars:—

"William Durandus was born at Puy-moisson, in Provence, about the year 1220. A legend of his native country is told in the present work. He became the pupil of Henry de Luza, afterwards Cardinal of Ostia, and taught canon law at Modena. On this subject he composed a most learned work, the *Speculum Juris*; from which he obtained the title of *Speculator*: as also another treatise called *Repertorium Juris*: and a *Breviarium Glossarum in Textum Juris Canonici*. His high attainments marked him out for the office of Chaplain to Pope Clement IV. He was afterwards Auditor of the Sacred Palace; and Legate to Pope Gregory X. at the Council of Lyons. He was then made Captain of the Papal forces; in which post he assisted at the reduction of several rebellious cities, and behaved with great courage. He finally became Bishop of Mende in 1286. While in this post and resident at Rome (for he did not personally visit his diocese till 1291, the administration of the diocese being perhaps left to a nephew of the same name who succeeded him), he finished the work, of the first book of which a translation is presented to the reader. But it probably was commenced before: for we find from a passage in its latter half, that so far had been written during the course of this same year 1286. And there is no difficulty in the title, *Episcopus Aimitensis*, which he gives himself in the proem, as this could easily have been added afterwards. But it was certainly published, as Martene observes, before 1295; because Durandus speaks of the Feasts of the Holy Apostles as *semi-doubles*, whereas in that year by a constitution of Pope Urban they were commanded to be observed as *doubles*. The time at which the treatise was written more especially demands our attention; because, did we imagine it only a few years later than it really was, we might well be astonished at finding no reference to the Symbolism of the Decorated Style. The interpositions amidst which the *Rationale* was written are feelingly alluded to by its author in the Epilogue. He also wrote a treatise *De Modo Concilii Generalis habendi*, probably either suggested by, or preparatory to, that of Lyons. He afterwards went on an embassy

from the Pope to the Sultan; and is by some said to have ended this life at Nicosia in Cyprus. But the fact is not so: for having governed his Diocese ten years, and having refused the proffered Archbishopric of Ravenna, he departed at Rome on the Feast of All Saints, 1296, being buried in the Church of Sancta Maria super Minervam, where his monument is yet to be seen."

It is not our intention to deny that there is, always was, and we believe always will be, a symbolism in certain things connected with church architecture; thus, for instance, all our own ideas about the formation and subdivision of church architecture have been trinitarian; thence we would never have two windows where there ought to be three; nor if we had our will strictly complied with, would we have any window divided into two, but rather into three compartments, such windows being undoubtedly more tasteful, and admitting of more elegant tracery: though by a very special exertion of bad taste and ignorance the Cam. Camdenists have attempted to deform the fronts of Early English churches by the placing of two windows prominently, instead of the symbolical one, or the trinitarian three, or the tri-une three united in one, or one composed of three; but as we cannot stop at present to go into the weak reasons given for such a violation of taste and propriety, we shall defer the subject till we come to that depraved part of the Cam. Camdenists' works, in which an attempt has been made to give sanctity to one of the grossest besetting sins into which those ignorant of the truth of architectural composition naturally fall, and for assisting to the promulgation of which barbarous error the Cam. Camdenists can no more be excused than Ovid can for enduring the world with his celebrated "*Art of Love*;" the error is a childish one, and in the hands of weak and tasteless men has already ruined the fronts of several churches.

It seems the Cam. Cam. members who have put forth this translation, not satisfied with their Ishmaelitic proceedings, lifting their hands against every man, and inciting every man's hand against them; not satisfied with that savage ferocity which has caused bishops, professors, and diocesan societies to eut adrift from them; because the Oxford Gothic Society has conducted itself with a persevering good temper, falling into none of the vagaries and beretical impertinences of the Cambridge Society, must needs, give it a rating for such conduct—but which society is to be preferred, the one for quiet power, or the other for indiscreet agitation, will be seen hereafter.

It seems these translators consider Mr. Lewis's droll performance upon the same matter deserved ridicule; for although on a right subject he was on a wrong scent. We quote their words:—

"Mr. Lewis, in his illustrations of Kilpeck Church (in an appendix to which he has printed a translation of some part of the *Rationale* of our Author), has given a treatise on symbolism generally, and has applied his principles to the explanation of the plan and details of that particular church. His book excited some attention at the time of publication, and was met by considerable ridicule in many quarters. To this we think it was fairly open, since the author did not seem to have grasped the true view of the subject."

Nevertheless to make up for this failure in a professed votary of symbolism, zealously and conscientiously going to work—it further seems that the inspiration of symbolism comes upon sinners who are thinking nothing of the matter; for again, observe the translators:—

"It is very remarkable, as has been already

observed, that the buildings of those who most strongly object to the Principle of Symbolism do in effect contain as striking an exemplification of it as it would be possible to find."

But to the work of Durandus itself. We shall abstain from any observation upon the peculiar tenets of the Roman Catholic Episcopal author, and only touch upon those which it is to be supposed the Anglican church translators have reproduced for the edification of their brethren of the same religion.

We are afraid that Mr. Wylson, who has just given us a treatise upon mortars and cements, has sadly failed of giving us the symbolical meaning of the articles upon which he has so industriously written; for thus says Durandus:—

"10. The cement, without which there can be no stability of the walls, is made of lime, sand, and water. The lime is fervent charity, which joineeth to itself the sand, that is, undertakings for the temporal welfare of our brethren: because true charity taketh care of the widow and the aged, and the infant and the infirm: and they who have it study to work with their hands that they may possess wherewith to benefit them. Now the lime and the sand are bound together in the wall by an admixture of water. But water is an emblem of the SPIRIT. And as without cement the stones cannot cohere, so neither can men be built up in the heavenly Jerusalem without charity, which the HOLY GHOST worketh in them."

But admitting the truth of this, what a fell swoop does it give to the Ishmaelitic handy-work of the Cam. Camdenites—who ever talk of church-union while they present the glaive to all around.

Then let the dishonest, weak, intemperate, imprudent, who dare to lay a hand to the mural work of churches, learn from the bishop that,

"17. The four side walls are the four cardinal virtues, justice, fortitude, temperance, prudence,"

and admire the deduction:—

"Hence the Apocalypse saith, THE CITY LIETH FOUR SQUARE."

And how virtuous ought glaziers to become while attending to their calling, for—

"The windows are hospitality with cheerfulness, and tenderness with charity."

Further on we have the following:—

"24. The glass windows in a church are Holy Scriptures, which expel the wind and the rain, that is, all things hurtful, but transmit the light of the True Sun, that is, God, into the hearts of the Faithful."

And then, too, how gross, it would seem, have been the vulgar ideas upon the use of window-splays, for again our old author says—

"These are wider within than without, because the mystical sense is the more ample, and precedeth the literal meaning."

And again—

"Also, by the windows the senses of the body are signified: which ought to be shut to the vanities of this world, and open to receive with all freedom spiritual gifts."

Then let us have an orthodox knowledge concerning the iron-work or the small subdivisions of windows, for—

"25. By the lattice work of the windows, we understand the prophets or other obscure teachers of the Church Militant."

But after this we have, amid the symbolical reasoning, a testimony to the subdivision of windows into three, and not into two; for thus Durandus:—

"In which windows there are often two shafts, signifying the two precepts of charity, or because the Apostles were sent out to preach two and two."

Then, concerning towers, spires, and their appendages, we have—

"21. The towers are the preachers and

Prelates of the Church, which are Her bulwark and defence. Whence the Bridegroom in the Canticles saith to the Bride, **THY NECK IS LIKE THE TOWER OF DAVID OULDOED FOR AN ARMOURY.** The pinnacles of the towers signify the life or the mind of a Prelate which aspireth heavenwards.

"22. The cock at the summit of the church is a type of preachers. For the cock, ever watchful even in the depth of night, giveth notice how the hours pass, waketh the sleepers, predicteth the approach of day, but first exciteth himself to crow by striking his sides with his wings. There is a mystery conveyed in each of these particulars. The night is this world: the sleepers are the children of this world who are asleep in their sins. The cock is the preacher, who preacheth boldly, and exciteth the sleepers to cast away the works of darkness, exclaiming, **WOE TO THEM THAT SLEEP! AWAKE THOU THAT SLEEPEST!** And these fortel the approach of day when they speak of the Day of Judgment, and the glory that shall be revealed: and like prudent messengers, before they teach others, arouse themselves from the sleep of sin by mortifying their bodies. Whence the Apostle, **I KEEP UNDER MY BODY.** And as the weathercock faceth the wind, they turn themselves boldly to meet the rebellious by threats and arguments: lest they should be guilty, **WHEN THE WOLF COMETH, OF LEAVING THE SHEEP AND FLEEING.** The iron rod, whereon the cock sitteth, representeth the discourse of the preacher, that he speaketh not of man but of God: according to that saying, **IF ANY MAN SPEAK, LET HIM SPEAK AS THE ORACLES OF GOD.** But in that the iron rod is placed above the Cross, on the summit of the church, it signifieth that Holy Scripture is now consummated and confirmed. Whence saith our LORD in His Passion, **IT IS FINISHED:** and that title is written indelibly over Him.

"23. The cone, that is the summit of the church, of great height, and of round shape, signifieth how perfectly and inviolably the Catholic Faith must be held: which Faith except a man do keep whole and undefiled without doubt he shall perish everlastingly."

Then read what Durandus says concerning bells and their gear.

"4. Again bells do signify preachers, who ought after the likeness of a bell to exhort the faithful unto faith: the which was typified in that the LORD commanded Moses to make a vestment for the High Priest, having seventy-two bells, to sound when the High Priest entered into the Holy of Holies. Also the cavity of the bell denoteth the mouth of the preacher, according to the saying of the Apostle, **I AM BECOME AS SOUNDING BRASS OR A TINKLING CYMBAL.**

"5. The hardness of the metal signifieth fortitude in the mind of the preacher: whence saith the LORD, **BEHOLD I HAVE MADE THY FACE STRONG AGAINST THEIR FACES.** The clapper, or iron which by striking on either side maketh the sound, doth denote the tongue of the teacher, the which with the adornment of learning doth cause both Testaments to resound.

"6. Wherefore a Prelate which hath not the skill of preaching will be like unto a bell without a clapper: according to that saying of Gregory, 'A Priest, if he knoweth not how to preach nor what voice of exhortation he can deliver, is a dumb preacher, and also as a dumb dog which cannot bark.' The striking the bell denoteth that a preacher ought first of all to strike at the vices in himself for correction, and then advance to blame those of others: lest indeed, contrary to the teaching of the Apostle **WHEN HE HATH PREACHED TO OTHERS, HE HIMSELF SHOULD BE A CAST-AWAY.** Which also the Psalm doth testify; **BUT UNTO THE UNCOOLY, SAITH GOD: WHY DOST THOU PREACH MY LAWS, AND TAKEST MY COVENANT IN THY MOUTH?** Because truly by the example of his own suffering he often gaineth access to those whom by the learning of his discourse he cannot move. The link by which the clapper is joined or bound unto the bell is moderation: by which, namely, by the authority of Scripture, the tongue of the preacher who wisheth to draw men's hearts is ruled.

"7. The wood of the frame upon which the bell hangeth doth signify the wood of our

LORD'S CROSS: which is on this account suspended on high, because the Cross is preached by the ancient Fathers. The pegs by which the wooden frame is joined together or fastened are the Oracles of the Prophets. The iron cramps by which the bell is joined with the frame denote charity, by which the Preacher being joined indissolubly unto the Cross, doth boast and say **GOD FORBID THAT I SHOULD GLORY SAVE IN THE CROSS OF OUR LORD JESUS CHRIST.** The hammer affixed to the frame by which the bell is struck signifieth the right mind of the Preacher, by which he himself holding fast to the Divine commands doth by frequent striking inculcate the same on the ears of the faithful.

"8. The rope hanging from this, by which the bell is struck, is humility, or the life of the Preacher: the same rope also sheweth the measure of our own life. Besides these, since the rope hath its beginning from the wood, upon which the bell hangeth, by which is understood our LORD'S CROSS, it doth thus rightly typify Holy Scripture which doth flow down from the wood of the Holy Cross. As also the rope is composed of three strands, so doth the Scripture consist of a Trinity; namely of history, allegory, and morality. Whence the rope coming down from the wooden frame into the hand of the Priest is Scripture descending from the mystery of the Cross into the mouth of the Preacher. Again, the rope reacheth unto the hands by which it is grasped, because Scripture ought to proceed unto good works. Also the raising and lowering of the rope in ringing doth denote that Holy Scripture speaketh sometimes of high matters, sometimes of low: or that the Preacher speaketh sometimes lofty things for the sake of some, and sometimes condescendeth for the sake of others: according to that saying of the Apostle: **WHETHER WE EXALT OURSELVES IT IS FOR GOD, OR WHETHER WE HUMBLE OURSELVES IT IS FOR YOU.** Again, the Priest draweth the rope downwards, when he descendeth from contemplation unto active life: but is himself drawn upwards when under the teaching of Scripture he is raised in contemplation. Also he draweth it downwards when he understandeth the Scripture according to the **LETTER WHICH KILLETH:** he is drawn upwards when he expoundeth the same according to the Spirit. Again, according to Gregory, he is drawn downwards and upwards when he measureth himself in Scripture, namely, how much he still lieth in the depths and how much he advanceth in doing good."

But how often have bell-hangers driven staples and fixed rings without knowing that—

"The ring (or pulley) in the length of the rope, through which in many places the rope is drawn, is the crown of reward, or perseverance unto the end, or else is Holy Scripture itself."

Then, concerning the piers of a church, we have—

"27. The Piers of the church are Bishops and Doctors: who specially sustain the Church of God by their doctrine. These, from the majesty and clearness of their Divine message, are called silver, according to that in the Song of Songs, **HE MADE SILVER COLUMNS.** Whence also Moses, at the entering in of the Tabernacle, placed five columns, and four before the Oracle, that is, the Holy of Holies."

And how ingeniously, where the absolute numbers run at cross-purposes, is the case disposed of, for—

"Although the Piers are more in number than seven, yet they are called seven, according to that saying, **WISDOM HATH BUILT UP HER HOUSE, SHE HATH HEWN OUT HER SEVEN PILLARS:** because Bishops ought to be filled with the sevenfold influences of the HOLY GHOST: and SS. James and John, as the Apostle testifieth, **SEEMED TO BE PILLARS.**"

What advantages ought to spring from our knowing that,

"The bases of the columns are the Apostolic Bishops, who support the frame of the whole Church. The capitals of the Piers are the opinions of the Bishops and Doctors. For as the members are directed and moved by the head, so are our words and works governed by their mind. The ornaments of the capitals are the words of Sacred Scripture, to the

meditation and observance of which we are bound."

Then, how symbolical of honour and dishonour is the same thing made to be, for it seems that—

"28. The pavement of the church is the foundation of our faith. But in the spiritual Church the pavement is the poor of CHRIST: the poor in spirit, who humble themselves in all things: wherefore on account of their humility they are likened to the pavement. Again, the pavement, which is trodden under foot, representeth the multitude, by whose labours the Church is sustained."

But, even according to Durandus, how sinful must it be to dispense with beams across churches, for—

"29. The beams which join together the church are the princes of this world, or the preachers who defend the unity of the Church, the one by deed, the other by argument."

And again—

"31. The beams in the church are preachers, who spiritually sustain it."

And—

"The vaulting also or ceiling, representeth preachers, who adorn and strengthen it, concerning whom, seeing that they are not corruptible through vice, the Bridegroom glorieth in the same Canticles, saying, **THE BEAMS OF OUR HOUSE ARE CEDAR, AND ITS CEILING, FIR.** For God hath built His Church of living stones, and imperishable wood, according to that saying, **SOLOMON MADE HIMSELF A LITTER OF CEDAR WOOD:** that is, CHRIST, of His Saints who wear the white robe of chastity."

We have then—

"The Chancel, that is, the head of the church, being lower than its body, signifieth how great humility there should be in the clergy or in Prelates, according to that saying, **AND THE MORE THOU ART EXALTED, HUMBLE THYSELF IN ALL THINGS.**"

But how does this agree with the shutting up of chancels about which the Camdenists are so anxious—after they have raised money from the people for building them.

We have, indeed, in Durandus, only

"The rail, by which the Altar is divided from the Choir, teacheth the separation of things celestial from things terrestrial."

But, following the exclusive system, we have at this time repeated twice every Sunday at the Temple Church, London, a most pitiful and disgusting scene, in which a line drawn across the entrance to the chancel, which forms the only part of the fabric in which the congregation can hear any except the musical services—excludes, while the choir is only half full, the multitude, who have to wait gazing about in the round part of the church, which seems indeed like a mere galilee—the admission to the choir going on slowly and in proportion to the outward appearance of those waiting—a woman dressed in silk at seven shillings per yard, gaining admittance in about twenty minutes, one in silk at half-a-crown, not under forty minutes; while those in stuffs and other inferior attire are wholly excluded, and, like sinful women of old, remain in the galilee; the porters of the church in the meanwhile, though the chancel is but half full, taking as much trouble to keep the congregation out, as at other churches is taken to invite them within.

After this Durandus then says—

"30. The stalls in the church signify the contemplative, in whom God dwelleth without hindrance, who, from their high dignity and the glory of eternal life, are compared to gold. Whence he saith in the Canticles, **HE MADE A GOLDEN SEAT.**"

But what do the Camdenists, who have made war upon all kinds of "convenience" or "comfort" in churches, say of the following by Durandus:—

"32. The seats in the Choir admonish us

that the body must sometimes be refreshed: because that which hath not alternate rest wanteth durability."

The following spiritualising of refectories, wine-cellars, &c., has already excited smiles in many quarters—

"43. In this cloister the diversity of office-chambers is the diversity of virtues. The chapter-house is the secret of the heart: concerning this, however, we shall speak differently hereafter. The Refectory is the love of Holy Meditation. The Cellar, Holy Scripture. The Dormitory, a clean conscience. The oratory, a spotless life. The garden of trees and herbs, the collection of virtues. The well, the dew of God's Heavenly Gifts: which in this world mitigateth our thirst, and hereafter will quench it."

In conclusion, we would ask, is our church likely to gain respect, or, rather, is occasion given to the enemies of God to blaspheme, by its ministers republishing the following passages of Durandus—

"28. The snuffers or scissors for trimming the lamps are the Divine words by which men amputate the legal titles of the Law, and reveal the shining spirit, according to that saying, YE SHALL EAT OLD STORE, AND BRING FORTH THE OLD BECAUSE OF THE NEW. The vessels in which the wicks, when snuffed, are extinguished, are the hearts of the Faithful, which admit the legal observance to the letter."

"29. Again, the tongs, by the double tooth of which the fire is arranged, are preachers; who instruct us by the accordant pages of both Testaments, and by their behaviour setting us right, inflame us to the practice of charity."

#### THE GOVERNMENT RAILWAYS BILL.

THE main features of the arrangement between the Government and the railway deputations in reference to the Railways Bills are briefly as follow:—The revision of the tolls of such railways hereafter to be constructed as may return a larger interest than ten per cent. per annum is not to take place until the lapse of twenty-one years from the passing of the bills under which the respective companies may be incorporated, and not at the end of fifteen years, as originally fixed. A further period of twenty-one years must elapse before a second revision can be effected. The Act is not to apply in any way to existing companies, except in reference to third-class passengers, for whose accommodation the companies agree to run one train daily, at fares not exceeding a penny a mile, the Government binding itself wholly to exempt from taxation the receipts accruing from such cheap trains. There are other concessions of minor importance, but for these we must refer to the annexed copy of the amended Bill.

#### AMENDED RAILWAYS BILL.

*A Bill to attach certain Conditions to the Construction of future Railways, authorized or to be authorized by any Act of the present or succeeding Sessions of Parliament, and for other purposes in relation to Railways.*

Note.—The clauses marked (A) and (B) were added by the committee.

1. Whereas it is expedient that the concession of powers for the establishment of new lines of railway should be subjected to such conditions as are hereinafter contained for the benefit of the public; be it enacted by the Queen's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, that if at any time after the end of twenty-one years from and after the 1st day of January next after the passing of any Act of the present or of any future session of Parliament, for the construction of any new line of passenger railway, whether such new line be a trunk, branch, or junction line, and whether such new line be constructed by a new company incorporated for the purpose, or by any existing company, the clear annual profits divisible upon the subscribed and paid-up capital stock of the said railway, upon the average of the three then last preceding years, shall equal or exceed the rate of 10% for every

100% of such paid-up capital stock, it shall be lawful for the Lords Commissioners of her Majesty's Treasury, upon giving to the said company three calendar months' notice in writing of their intention so to do, to revise the scale of tolls, fares, and charges limited by the Act or Acts relating to the said railway, and to fix such new scale of tolls, fares, and charges, applicable to such different classes and kinds of passengers, goods, and other traffic on such railway, as in the judgment of the said lords commissioners, assuming the same quantities and kinds of traffic to continue, shall be likely to reduce the said divisible profits to the said rate of 10% in the 100%, and so from time to time at the expiration of each succeeding period of twenty-one years; provided always, that no such revised scale shall take effect, unless accompanied by a guarantee, to subsist as long as any such revised scale of tolls, fares, and charges shall be in force, that the said divisible profits, in case of any deficiency therein, shall be made good to the said rate of 10% for every 100% of such capital stock; provided also, that such revised scale shall not be again revised or such guarantee withdrawn, otherwise than with the consent of the company, for the further period of twenty-one years.

2. That whatever may be the rate of divisible profits in any such railway, it shall be lawful for the said lords commissioners, if they shall think fit, at any time after the expiration of the said term of twenty-one years, to purchase any such railway, with all its hereditaments, stock, and appurtenances, in the name and on behalf of her Majesty, upon giving to the said company three calendar months' notice in writing of their intention, and upon payment of a sum equal to twenty-five years' purchase of the said annual divisible profits, estimated on the average of the three then next preceding years: provided always, that if the average rate of profit for the said three years shall exceed the rate of 10% in the 100%, it shall be taken at only 10% in the 100% for the purpose of calculating thereon the amount of such purchase-money: provided also, that if the average rate of profits for the said three years shall be less than the rate of 10% in the 100%, it shall be lawful for the company, if they shall be of opinion that the said rate of twenty-five years' purchase of the said average profits is an inadequate rate of purchase of such railway, reference being had to the prospects thereof, to require that the rate of purchase, instead of being calculated upon such average rate of profit, shall be taken at a valuation, to be determined, in case of difference, by arbitration.

3. (A.) That nothing herein contained shall be construed to subject to the said option of revision or purchase any railway made or authorized to be made by any act previous to the present session; and that no branch or extension of less than five miles in length of any existing line of railway shall be taken to be a new railway within the provisions of this act; and that the said option of purchase shall not be exercised as to any branch or extension of any existing railway, without including in the purchase the existing railway; also in case the company of proprietors of the same shall require that the same be so included.

4. (B.) And whereas it is expedient that the policy of calling into exercise the powers of revision or purchase hereby reserved, or either of them, should in no manner be prejudged by the provisions of this Act, and should remain for the future consideration of the legislature, upon grounds of general and national policy; and whereas it is not the intention of this Act, that under the said powers of revision or purchase, if called into use, the public resources should be employed to sustain an undue competition against any independent company or companies; be it enacted, that no such notice as hereinbefore mentioned, whether of revision or purchase, shall be given, until provision shall have been made by parliament, by an Act or Acts to be passed in that behalf, for authorizing the guarantee or the levy of the purchase-money hereinbefore mentioned, as the case may be, and for determining, subject to the conditions hereinbefore mentioned, the manner in which the said options or either of them shall be exercised: provided always, that before any application is made to parliament for the powers to exercise the said

options or either of them, three months' notice shall be given by the said lords commissioners to the company or companies to be affected thereby, of the intention so to apply.

5. That from and after the commencement of the period of three years preceding the period at which the option of ransom or purchase becomes available, full and true accounts shall be kept of all sums of money received and paid on account of any railway within the provisions hereinbefore contained (distinguishing if the said railway shall be a branch railway, or one worked in common with other railways, the receipts, and giving an estimate of the expenses, on account of the said railway from those on account of the trunk line, or other railways) by the directors of the company to whom such railway belongs or by whom the same may be worked, and of the purposes and things for which such sums of money shall have been received and paid; and every such railway company shall once in every half-year cause a half-yearly account in abstract to be prepared, shewing the total receipt and expenditure on account of the said railway, for the half year, ending the 30th day of June and the 31st day of December respectively, or such other convenient days as shall in each case be directed by the lords of the said committee, under distinct heads of receipt and expenditure, according to such form as may be required by the lords of the said committee, with a statement of the balance of such account duly audited and certified under the hands of two or more directors of the said railway company; and shall send a copy of the said account to the lords of the said committee on or before the last days of August and February respectively, or such other days as shall in each case be directed by the lords of the said committee in each year; and it shall be lawful for the lords of the said committee, if and when they shall think fit, to appoint any proper person or persons to inspect the accounts and books of the said company; and it shall be lawful for any person so authorized, at all reasonable times, upon producing his authority, to examine the books, accounts, vouchers, and other documents of the company, at the principal office, or place of business, of the company, and to take copies or extracts therefrom.

6. Companies to provide one cheap train, each way, daily. [This clause remains virtually unchanged, see clause 25 of former Bill.] And with respect to all railway companies subject to these obligations, which shall be open on or before the 1st day of November next, these obligations shall come into force on the said 1st day of November; and with respect to all other railways subject to this obligation, it shall come into force on the day of opening of the railway, or the day after the last day of the session in which the Act shall be passed, by reason of which the company will become subject thereunto, which shall first happen.

7. That if any railway company shall refuse, or wilfully neglect, to comply with the provisions of this Act as to the said cheap trains, within a reasonable time, or shall attempt to evade the operation of such order, such company shall forfeit to her Majesty a sum not exceeding 20% for every day during which such refusal, neglect, or evasion shall continue.

8. Board of Trade to have a discretionary power of allowing alternative arrangements. [This clause is the same as the former clause 27.]

9. That no tax shall be levied upon the receipts of any railway company from the conveyance of passengers at fares not exceeding 1d. for each mile, by any such cheap train, as aforesaid.

10. Certain companies to convey military and police forces at certain charges, 5 and 6 Vict. c. 55. [This is the same as the former clause 29.]

11. Railway companies to afford additional facilities for the transmission of the mails, 1 and 2 Vict., c. 98. [This is the same as former clause 30.]

12. And whereas electrical telegraphs have been established on certain railways, and may be more extensively established hereafter, and it is expedient to provide for their due regulation; be it enacted, that every railway company, on being required so to do by the lords of the said committee, shall be bound to allow any

person or persons authorized by the lords of the said committee, with servants and workmen, at all reasonable times to enter into or upon their lands, and to establish and lay down upon such lands adjoining the line of such railway, a line of electrical telegraph for her Majesty's service, and to give to him and them every reasonable facility for laying down the same, and for using the same, for the purpose of receiving and sending messages on her Majesty's service, subject to such reasonable remuneration to the company as may be agreed upon between the company and the lords of the said committee, or in case of disagreement, as may be settled by arbitration: provided always, that, subject to a prior right of use thereof for the purposes of her Majesty, such telegraph may be used by the company, for the purposes of the railway, upon such terms as may be agreed upon between the parties, or, in the event of difference, may be settled by arbitration.

13. That where a line of electrical telegraphs shall have been established upon any railway by the company to whom such railway belongs, or by any company, partnership, person or persons, otherwise than exclusively for her Majesty's service, or exclusively for the purposes of the railway, the use of such electrical telegraph, for the purpose of receiving and sending messages, shall, subject to the prior right of use thereof for the service of her Majesty and for the purposes of the company, and subject also to such equal charges, and to such reasonable regulations, as may be from time to time made by the said railway company, be open for the sending and receiving of messages by all persons alike, without favour or preference.

14. And whereas by an Act passed in the 4th year of the reign of her Majesty, intitled "An Act to regulate Railways," power is given to the lords of the said committee to appoint any proper person or persons to inspect any railway, and the stations, works, and buildings, and the engines and carriages belonging thereto; and in order to carry the provisions of this Act into execution, it is expedient that the said power be extended; be it enacted, that the said power given to the lords of the said committee of appointing proper persons to inspect railways shall extend to authorize the appointment by the lords of the said committee of any proper person or persons, for such purposes of inspection, as are by the said Act authorized, and also for the purpose of enabling the lords of the said committee to carry the provisions of this and of the said Act, and of any general Act relating to railways, into execution; and that so much of the last-mentioned Act as provides that no person shall be eligible to the appointment as inspector who shall, within one year of his appointment, have been a director, or have held any office of trust or profit under any railway company, shall be repealed: provided always, that no such person shall exercise any powers of interference in the affairs of the company.

15. Repealing provision of 3 and 4 Vict., c. 97. [Same as former clause 35.]

16. Board of Trade may direct prosecutions to prevent railway companies from contravening or exceeding the provisions of their Acts. [Same as former clause 36.]

17. Notice to be given to the company. Prosecutions to be under the sanction of the Board of Trade, and within one year after the offence. [Same as former clause 37.]

18. And whereas many railway companies have borrowed money in a manner unauthorized by their Acts of Incorporation or other Acts of Parliament relating to the said companies, upon the security of loan notes or other instruments purporting to give a security for the repayment of the principal sums borrowed at certain dates, and for the payment of interest thereon in the mean time; and whereas such loan notes or other securities issued otherwise than under the provision of some Act or Acts of Parliament have no legal validity, and it is expedient that the issue of such illegal securities should be stopped; but such loan notes or other securities having been issued and received in good faith as between the borrower and lender, and for the most part for the lawful purposes of the undertaking and in ignorance of their legal invalidity, it is expedient to confirm such as have been already issued be it enacted, that from and after the

passing of this Act, any railway company issuing any loan note or other negotiable or assignable instrument, purporting to bind the company as a legal security for money advanced to the said railway company otherwise than under the provisions of some Act or Acts of Parliament authorizing the said railway company to raise such money and to issue such security, shall for every such offence forfeit to her Majesty a sum equal to the sum for which such loan note or other instrument purports to be such security: provided always, that any company may renew any such loan note or other instrument issued by them prior to the passing to this Act, for any period or periods not exceeding five years from the passing of this Act.

19. That where any railway company, before the 12th day of July, 1844, shall have issued or contracted to issue any such loan notes, or other unauthorized instruments, the company may and shall pay off such loan notes or other instruments, as the same may fall due, subject as hereinbefore provided; and until the same shall be so paid off, the said loan notes or other instruments shall entitle the holders thereof to the payment, by the company, of the principal sum and interest thereby agreed to be paid.

20. That a register of all such loan notes or other instruments shall be kept by the secretary, and such register shall be open, without fee or reward, at all reasonable times, to the inspection of any shareholder or auditor of the undertaking, and of every person interested in any such loan note or other instrument desirous of inspecting the same.

21. Remedy for recovery of tithe-rent charged on railway land. [Same as former clause 43.]

22. Communications to and from Board of Trade, service of notices, &c. [Same as former clause 44.]

23. Penalties. [Same as former clause 45.]

24. That where the word "railway" is used in this Act it shall be construed to extend to all railways constructed under the powers of any Act of Parliament; and when the words "passenger railway" are used in this Act, they shall be construed to extend to all railways constructed under the powers of any Act of Parliament upon which one-third or more of the gross annual revenue is derived from the conveyance of passengers by steam or other mechanical power; and whenever the word "company" is used in this Act it shall be construed to extend to include the proprietors for the time being of any such railway; and that where a different sense is not expressly declared, or does not appear by the context, every word importing the singular number or the masculine gender shall be taken to include females as well as males, and several persons and things as well as one person or thing.

25. That this Act may be amended or repealed by any Act to be passed in this Session of Parliament.

#### TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.

(Continued from p. 410.)

56. ACACIA.—Of this tree the most beautiful varieties are, the weeping acacia, which is thornless, with large leaves, and the upright-growing acacia. The former, called the common, bastard, or *false acacia*, is a native of Virginia, where it is known as the *locust tree*: it is an elegant and highly ornamental tree, of rapid growth (for the first few years especially), and is of considerable size; having generally, for a few days in June a bloom of white flowers, sweetly perfumed, pendulous like the yellow ones of the laburnum, and hanging from long drooping branches. It has a luxuriant foliage of finely pointed leaves, of a brilliant green, and to grass its shade is less injurious than usual. The only drawback to its being extensively introduced in ornamental grounds in this country is the fragile nature of its lateral branches, or rather of their hold upon the stem for the first five or six years; for its shoots are large and plentiful; and, though proof against the biting severity of winter, liable to be broken off in tempestuous or blustering winds: on this account it requires much attention during the earlier growth, until it attains an altitude of ten or twelve feet; and to have the shoots nipped off short, to prevent their being strewn about;

otherwise it should be planted in a sheltered situation: indeed it has been recommended for a coppice plant on account of its quick growth and spread, as well as for the durability of the young poles for a variety of purposes—in the hop-garden for example. Once arrived at maturity, it merits regard as one of our finest ornamental trees; it seems to grow well in any kind of soil, but to greatest perfection in that which is of a light and sandy description.

57. Cobbett in later times drew the public attention to this tree, which, although it had been, on account of its beautiful appearance, cultivated in England two hundred years before, was, from his calling it by the American name, supposed to be a new tree, and as such with avidity sought after and extensively planted in England and Scotland. Its timber is highly esteemed for its durability in all situations, being almost incorruptible. In its unseasoned state it is little inferior to dry oak in the three qualities of strength, toughness, and stiffness; and when seasoned it has all of them in a very ample degree, and the first-mentioned to an undefined extent, which renders it admirably subservient to all those purposes for which oak is commonly selected. It is not yet known in England commensurately with its importance; but in America it is very much prized, and is extensively employed, as well in cabinet-making as in the more trying purposes about buildings, as fencing, &c. For the former it is valued there beyond all other woods. It is highly prized by millwrights for cogs, &c., and is generally used by shipwrights for trenails, for which it is excellently adapted; it is also reckoned well calculated for the axle-trees of wheeled vehicles. The wood makes excellent fuel, and the leaves afford wholesome fodder for cattle—horses and hogs seeming alike to relish it.

58. The wood is of a yellow colour, inclining to green, with a reddish tinge in its pores, or rather with brown veins; when green and unseasoned it is soft, but when dry it is very hard, requiring in working a degree of labour somewhat similar to ash or oak; it possesses the valuable property—rare amongst trees of quick growth—of its pith-wood turning, after the third year, into heartwood; thus enabling it to afford a body of solid timber in a much shorter period than the oak, chesnut, and many others, wherein that phenomenon does not take place before ten or fifteen years. When of an advanced age, its bark is of a thick and deeply-cleft character. The annual rings are distinct, one part being compact and the other porous; there are no larger transverse septa, and consequently no flowers; when dry it is tasteless and inodorous.

59. SYCAMORE, or great maple.—This tree is indigenous to Germany, and is a large, handsome, and hardy tree, of quick growth—more so than most other hard woods—especially in a sandy soil and exposed situation. It is also common, and thrives very well, in England, towards the north, and in Scotland; especially near the coast, where indeed it is said to flourish closer to the sea than any other tree, the salt spray appearing very slightly to injure it.

60. There are two maples, the small or common variety being a tree of but secondary pretensions, and almost confined to the underwood or thicket; but the great maple is a tree of noble appearance, second to few even of the first rank in magnitude; yet the British is said to be somewhat inferior to the German grown. The leaves are palmate, with five lobes, unequally serrated; the foliage is thick, affording a shade almost impenetrable; it blooms early in profuse bunches; its tints in spring being tender, fresh, and glowing; while in summer it has a deep-green hue, in finest harmony with the massive and majestic form of the tree. The autumnal brown and reddish tints of its fading leaves produce a beautiful effect, which is said to characterize, to fullest perfection, an American landscape in that picturesque season; and which is enhanced by the diversified appearance of the trunk and main branches, from which the ashy bark peels off, giving them a patchy but pleasing character.

61. The colour of the wood is generally a dusky white, in some specimens inclining to brown, in others to yellow, but generally very fair and silky in young wood; the texture is

uniform and compact; the annual rings just visible; the larger transverse septa fine, close, and distinct, producing minute flowers, and presenting that dapple on the finished surface so much admired, and which is sometimes enhanced by a curling in the grain. It is softer than beechwood, not liable to warp, easy to work, susceptible of a fine polish, and durable—that is, if kept dry, and by some bitter impregnation protected from worms, to which it is rather subject. It is (supposing the worms to be effectually prevented) too flexible for timbers which have to bear any cross strain; but, being in toughness superior to the oak, it might be adopted for ties and similar purposes; it might also with advantage be introduced in joinery; in floor-boarding its appearance is very pleasing. The purposes to which it is generally applied, however, and for which it is valuable, are furniture and cabinet-work; the beautiful variegation of its knots admirably adapting it for inlaying. For articles of superior description, that which is whitest and much figured is highly esteemed; for many purposes of the turner, domestic utensils indeed especially, it is preferred to beech—musical instruments are sometimes made from it. The wood of the most mature trees is not the best, as it is not so fresh or fine in colour; its strength and toughness being also impaired, brittle, and thus deceptive.

62. **POPULAR.**—There are five species of this tree common in this country, namely the *Lombardy*, the *black*, and the *common white poplar*, the *abele*, and the *aspens*. The first three are the most esteemed, but there is not very much difference in the whole. The poplar flourishes in low, fertile, and marshy grounds, the margins of streams, &c.; it is well calculated for suburban vistas, as also, from its compactness of form and foliage, for concealing unsightly offices or subordinate buildings; owing to the litter, however, which its leaves make in autumn, it is not very suitable for principal avenues, lawns, or the more ornamental grounds, where trimness is essential. The wood is well adapted for wainscoting and other joinery as well as for stairs, flooring, &c. (where there is not much wear—in bed-rooms for example), on account of its not being much liable to shrink, its very superior appearance, and small degree of inflammability; but it is not suitable for principal carpentry: it is durable when kept dry, but, with the exception of the aspen, which while soft is tough throughout, it rots when exposed to the weather: but to treat them separately:

63. The Lombardy variety is of the most rapid growth; in thirty years it attains upwards of sixty feet; but by its eightieth it is dead or in the progress of decay; to the last it has a slender and graceful cypress-like form, possessing a beauty almost peculiarly its own, that of bending to the breeze, and maintaining through its tall and spire-like figure a graceful and pleasing undulation, which has been compared to the wavings of a feather. Its precise appearance is considered to harmonize well with buildings, for which too the fact of smoke not being detrimental to its growth must subserviently be recommended to it. It has been stated that its shade, unlike that of many other trees, is very beneficial to vegetation; and the circumstance of that which is immediately under its droppings being soonest eaten by cattle gives fair evidence of the correctness of that assertion. It is recommended to use both this and the Abele for avenues or walks in low and moist situations. The trunk of this species is more furrowed than any of the others, and frequently has a spiral rope-like figure, as if it consisted of several stems twining together. The wood of the Lombardy and Abele sorts has been recommended for shelving and other fittings about cheese-rooms and farm-offices generally, for the reason that mice and mites do not attack them; but how far this is authentic is matter for inquiry.

64. The Black or Italian Poplar is common in Lancashire and Cheshire, generally possessing a fine stem and ample head; it is, when planted in an appropriate situation, often very ornamental; and it attains to a large size in a comparatively short space of time; owing to the circumstance, however, of its roots not striking very deep into the ground, it is often to be found leaning from the perpendicular; being, moreover, liable to be torn up altogether, when assailed by violent winds. It is

late in coming into foliage, its full development being rarely before the latter end of May; the leaves are of a pretty pale green, trowel-shaped, smooth, shining, and possessing fully that characteristic of fluttering with the gentle breeze, they glance and sparkle pleasantly in the sunbeams. The wood is of a pale yellowish colour, and being soft and easily worked, is fabricated into domestic utensils by the turner. The bark, being light, is employed for floats to fishermen's nets; it is also used for tanning; and, in Russia, in the manufacture of Russia leather.

65. The Common White or Grey Poplar and the Abele very much resemble each other; but may be distinguished from the circumstance of the leaves of the former being smaller, rounder, less acutely lobed, and having much less down on their under surface than those of the latter; also that its branches grow more upright and compact; it is supposed to be indigenous to Britain, which is countenanced by the fact of its being very commonly found in a wild state, whence, no doubt, arises the circumstance of its being sometimes called the *wild Abele*; but when we consider the light capillary pappas, with which its numerous seeds are furnished, serving like wings to bear them wherever they may be wafted by the wind, we have grounds for withholding our unqualified acquiescence. In a loose and moist soil, such as the bank of a river or lake, it attains a great height, even to 80 or 90 feet; and, from its narrow, spiring form, becomes a conspicuous and stately object, very ornamental to the landscape, whether placed in the hedge-row, or interspersed amongst the trees of the park or pleasure-ground; for undrainable localities, which it is desirable to decorate, it is amongst the first to be chosen; and it fortunately happens that the leaves of the poplar, generally, are eminently distinguished for their beneficial effect in compost soils, enriching the earth on which they grow. The wood is very white, tough when dry, and not liable to split; it is frequently adopted for packing-cases.

66. The Abele, or Great White Poplar (also known by the name of Dutch Beech), is of very quick growth; aspiring and light, yet fine, and of very uniform grain: its leaves are larger than those borne by the others generally, and are sinuated into from three to five lobes, dark in the upper, and clothed with a cottony down on their under side; the bark of the trunk and older branches is grey, that of the younger, purple—the down overspreading the young shoots and footstalks. Its bark is recommended for the cure of intermittent fevers. It was originally from Holland,\* where it is still a favourite;† on account of its lightness and toughness it is employed for a variety of purposes—wheeled vehicles, pumps, domestic utensils, butchers' trays, bellows, turnery, toys, carvings, Dutch shoes, packing-cases, &c.; it is also very suitable for the purposes of the cabinet-maker; and to render it an excellent imitation of mahogany, it is only necessary to use the ordinary means to which cabinet-makers resort for brightening the colour of woods; for the sapwood, where more colour is required, the stain of aquafortis will bring it up; this renders the Abele equal to the best mahogany in colour, variety, and transparency of surface, and in these respects decidedly superior to the commoner sorts of that wood; it requires very little oil and rubbing to bring upon it that admired soft, rich gloss, which it takes years to produce on mahogany furniture. For durability, it is said to be in dry and well-ventilated situations equal to the pine.

(To be continued.)

#### NEW BUILDINGS BILL.

A MEETING of the MASTER CARPENTERS' SOCIETY will take place at the Freemasons' Tavern, on Wednesday next, when a report upon the above Bill will be brought up by the committee appointed by the society to superintend the measure in its progress through Parliament. A copy of this report we shall lay before our subscribers on the first opportunity.

\* It is said that 10,000 were exported from Flanders in 1659, and transplanted in various countries.

† The Dutch regard it as a liberal provision for a daughter's marriage dowry, to present a plantation of the Abele at her birth; it is of such rapid growth and is so highly prized.

#### THE NEW ROYAL EXCHANGE.

The works of this great edifice are drawing to a rapid conclusion, and we are informed that every possible effort is being made for their early completion. On the outside the sculpture on the pediment has been finished, and is considered on the whole to be a work of considerable merit. On the stone base supporting the statue of Commerce, which forms the centre and principal figure of the group, is the very appropriate inscription from the Psalms—"The earth is the Lord's, and the fulness thereof." We understand that the suggestion of such an inscription was first given to the sculptor, Mr. Westmacott, by a very noble personage, who took much interest in the whole composition. On the frieze of the portico a Latin inscription is partly cut, recording the very curious fact of the founding of the Exchange in the reign of one queen, viz. Elizabeth, and its rebuilding in the reign of another, her present most gracious Majesty Queen Victoria. The cleaning down of the work is proceeding with great expedition, and as the architecture becomes more developed by the removal of the scaffolding and the finishing of the carvings of the various parts, the general impression, as to the elegance and characteristic design of the structure, which has been always favourable, seems to increase vastly. In the centre of the south front, over the three openings, the arms of Sir Thomas Gresham, of the Mercers' Company, and of the city of London, are introduced on the key-stones, and, with the architectural accompaniments of festoons and other decorations, give great beauty to this most important entrance. The domes at the north and south entrances are painted in fresco, and form a becoming introduction to the merchants' area within. The ceiling of the covered walk surrounding the open area is nearly finished. It is, as has been already stated, painted in encaustic on the surface of the architecture, and is considered to produce a very beautiful effect. In the centre of each panel are painted the arms of the great nations of the earth. In the four corners are the arms of Edward the confessor, Edward the Third, Queen Elizabeth, and Charles the Second, each of the two latter being so placed as to be in connection with the statues of the respective sovereigns. The statue of Charles is the old statue in marble which stood in the centre of the old Exchange, and is now being renovated by Mr. Watson, who is also carving a statue of Queen Elizabeth, to be placed in the corresponding niche. The covered walk is paved with enormous flag stones of a light colour, divided into bands by lines composed of a hard black stone, called Castle-hill stone, with squares of polished red granite at the intersections. Great pains appear to have been taken to keep the vaults dry under the open area, and to secure a beautiful, even, and dry surface for the pavement of this essential part of the Royal Exchange. To secure this object, in the first place, we are informed there is a solid layer of concrete upon the arches. Upon that concrete is a coating of the asphalt of Seyssel, laid to a proper slope, and terminating in iron gutters, which communicate with pipes, and carry the water into drains below. Over this asphalt will be laid another bed of concrete, to receive the tessellated pavement which will form the finish. The asphalt is already partly laid, and it is said that it will be completed in a week. The tessellated pavement will form a border and bands of varied patterns, and is contracted for by Messrs. Singer, of Vauxhall. This pavement is a revival of what was considered a lost art, but it is now about to be restored with exquisite beauty, and, from the perfect vitrification of the tesserae, it must be extremely durable and non-absorbent. The various offices and shops are in a remarkable state of forwardness, particularly the great rooms on the one pair floor, intended for Lloyd's establishment. In these rooms the scaffoldings have been removed, and they are to be the finest apartments in the city. One of them is 100 feet in length. Over the great western entrance is a coat of the royal arms, with supporters in alto relievo, and carved in a style of amazing boldness and effect, by Mr. Carew. The fixing of it will be completed in the course of the ensuing week. Mr. Carew is finishing a splendid statue of Whittington for one of the principal niches of the edifice.—*Observer*.

INTERIOR VIEW (TOWARDS THE ALTAR) OF ST. OLAVE'S CHURCH, SOUTHWARK.

## ST. OLAVE'S CHURCH, SOUTHWARK.

We have just visited this church, and finding that its restoration approaches completion, we this week give insertion to a print, copied from a beautiful drawing belonging to George Corner, Esq., F. S. A., vestry-clerk of the parish, which he had, with an exterior view of the same church, made by Mr. George Hawkins, jun. This print shews the interior of the church, exactly as it was before the fire, and gives an excellent idea of the finish which this work, of the kind very "decently" denominated "PAGAN" by Welby Pugin, and the Cam. Cam., who have the taste for admiring in preference mere rude barns.

The ceilings and galleries are now wholly restored, the new painted altar-window is nearly complete, the oaken pewing is more than half reinstated, and the stone upper dome of the tower has been surmounted by a small stone octagonal lantern, the crowning staff and vane of which are now depending, ready to be hoisted to their final situation.

As we intend to give some few details of the carved work of this church, we shall reserve for the present all further observation upon it,

and subjoin the following interesting article relating to the former church.

## INVENTORY OF THE CHURCH GOODS OF ST. OLAVE'S, SOUTHWARK, 1558.

(Extracted from the Gentleman's Magazine of May 1837.)

This inventory, made by John Thomas, Wyll'm Wylson, Wyll'm Jonys, Richard Westraye, and Harry Muskyne, latte beyng chyrche wardyns of the parrsche of Sentt Tollos<sup>1</sup> in Sothwarke, of all the platte, goods, and ornámets belongynge to the sayed chyrche and parrsche, and delvyard the xvj daye of Octobar, in the yere of owre Lored, 1558, unto Ollyfe Bure,<sup>2</sup> Randle Smythe, Rogare Hyppy, Charllys Pratte, and Rutte Langgar, beyng newe chyrche wardens alle thes p'sells [parcels] followyng.

## Platte.

Imp'm's a Crosse of sylvar w<sup>t</sup> Mary and John, weyging  $\frac{xx}{iiij}$  and vj oz.<sup>3</sup>

It' ij Comunyone Koppes of sylvar, gyltte bothe w<sup>t</sup> in and wythe owt, weyging  $\frac{xx}{iiij}$  and xiiij oz.

It' a Massar<sup>4</sup> garnyssecheyd w<sup>t</sup> a bande of sylvar and gyltte w<sup>ch</sup> weyed by estymacyon v oz.

It' a Challys<sup>5</sup> weyging ix ox. iij qts.

Koppes<sup>6</sup>

It' a Cope of tyssue rassed<sup>7</sup> w<sup>t</sup> blewe welfatt.

It' a Coppe of clothe of goled w<sup>t</sup> rede welfatt.

It' a Cope of blewe welfatte w<sup>t</sup> Sent Tolly<sup>8</sup>.

It' a Cope of tawny welfatt, w<sup>t</sup> flowres de luices and tonges.<sup>9</sup>

It' a Cope gyvne by Mr. John Rychards, oure p'sone, of clothe of goled wrought w<sup>t</sup> grene welfatt, with Sent George apone the bake.

Westements<sup>9</sup>

It' a Sutte of Westements of blewe tessure & golde, w<sup>t</sup> allys.<sup>10</sup>

It' a westements and a tynacolle<sup>11</sup> of blewe clothe of tyssue w<sup>t</sup> grene crossys w<sup>t</sup> alle the apparelle.

It' ij westemets of grene badekyne<sup>12</sup> w<sup>t</sup> rede crossys of satyne, w<sup>t</sup> allys.

It' a sutte of westements w<sup>ch</sup> warre Mr. Lek's, of rede welfatt wrought w<sup>t</sup> ayngylls and splede egyptys.<sup>13</sup>

It' a westement gyvne by Syr Antony Sellynger, Knyghte,<sup>14</sup> of clothe goled, wrought w<sup>t</sup> rede wellefatte w<sup>t</sup> the garttar and hys arms apone the bake, w<sup>t</sup> alle the apparelle thereunto belongynge.

It' a westement of whytte badekyne w<sup>t</sup> a rede crosse and garttars.

Altar Clothys<sup>15</sup>

It' ij altar clothys of rede clothe of goled,

the one for the ovr p'tte of the alttar, and the other for the nether p'tte.

It ij alttare clothys of blewte tyssewe.  
It ij alttare clothys of rede and grene w<sup>t</sup> ankars.

It ij alttar clothys of whytte damaske wroght w<sup>t</sup> flours.

It ij alttar clothys of grene badekyne.  
It a oled alttar clothe of blewte welfate wroght w<sup>t</sup> starys.

It vj alttar clothys peynttyed w<sup>t</sup> ymagery or pctores.

It xv alttar clothys of dyapare, goode and bade.

It iijij playne alttar clothys.  
It more vj pessys of oled peynttyed clothys.  
It a' playne awttar clothe gyvene by Mastrys Awefeled.

It ij awttar clothe of blewte and yelowe peynttyed, the owar Clemente<sup>16</sup> a crussyfyxe, and the nether w<sup>t</sup> Sent Clemente<sup>16</sup> and Ankars.

*Corttyens.*<sup>17</sup>

It ij corttyns of whytte sylke.  
It ij corttyns of tawny sylke.

It vijj peyars corttyns peynted of lynyne clothe of yellow and rede bokeram.

It ij long corttyns of yelowe.  
It iij corttyns of rede and grene saye, gyvene by Mr. Bonnyvante.

*Bokkes.*

It iijij antyfonars<sup>18</sup> pretyed.  
It a grette antyfyнар of parchement.

It iijij grravyllys<sup>19</sup> of parchementte.  
It iijij legyon<sup>20</sup> of p'chemente.

It iijij masse bok. <sup>21</sup>  
It iijij hymnalles. <sup>22</sup>

It vj pressessynars. <sup>23</sup>  
It ij manuellis. <sup>24</sup>

It ij saltars<sup>25</sup> lyytlyle.  
It a ordynary boke called a pye. <sup>26</sup>

It iijij prykesyonge bokys<sup>27</sup> covered w<sup>t</sup> parchement.

It a grette prykesong boke of parchementte.

*Dyvars othar Ornamente.*

It a canopy clothe<sup>28</sup> gyvene by Mr. John Ryehards, owre p'sone, panyed<sup>29</sup> wythe crymesyne welfate, pryched<sup>30</sup> w<sup>t</sup> golede and blaife tyssoue. <sup>31</sup>

It a polpytte clothe, gyvene by the sayed Mr. Ryehards, panyed as aforesayed w<sup>t</sup> crymesyne velfat and blaife tesseo.

It a covar<sup>32</sup> for the Sakarmentt, gyvene by the sayed Mr. Ryehards.

It a clothe for the Sakarmentte, gyvene by the sayde Mr. Ryehards, wroghte w<sup>t</sup> sylke and goled w<sup>t</sup> iijij grette tasselles of goled hangyng thereatte.

It more ij sakarmentte clothys.  
It vij dyapar twelles. <sup>33</sup>

It xvij alhys, sam paryllyed and some one paryllyed. <sup>34</sup>

It x anyssys. <sup>35</sup>  
It ix lytlyle bande twelles of dyapare.

It a twelle wroghte w<sup>t</sup> sylke, gyvene by Mrs. Maryatte.

It xvij sryplissy, goode and bade.  
It a herse clothe<sup>36</sup> of clothe of goled of sondry pessys, rased w<sup>t</sup> rede welfatte.

It ij herse clothys, one for mene, and another for cheledarne, sometyme Sente Clements's. <sup>37</sup>

It a crosse of coppar. <sup>38</sup>  
It xij lattyn kanstyks. <sup>39</sup>

It a peyar of grette standards<sup>40</sup> of lattynne.  
It v sakaryng bellys. <sup>41</sup>

It ij barrys of yarne for the sepulkar. <sup>42</sup>  
It a lytlyle crowe<sup>43</sup> of yarne.

It ij bassyns<sup>44</sup> of tyne, gyvene by Rob't Johnsone.

It ij sensars<sup>45</sup> of lattynne.  
It a schepe<sup>46</sup> of lattynne.

It a lampe of lattynne.  
It a fyar showlle. <sup>47</sup>

It a crysementary<sup>48</sup> of tyne.  
It a rowllare of wode.

It ij formyrs.  
It a laddare.

It ij corpors essayys. <sup>49</sup>  
It a rede stoll<sup>50</sup> of sylke and goled.

It a hally wattare stok<sup>51</sup> of lattynne.  
It a lantarnne.

It ij hally brede basekatts.  
It a valle for the awttare. <sup>52</sup>

It a clothe for the rode. <sup>53</sup>  
It iijij stavyss<sup>54</sup> for the canopy.

It iijij stavyss w<sup>t</sup> castelles<sup>55</sup> for to carry lyght about the sakarment.

It a cheste in the vestry w<sup>t</sup> barrys of yarne, and a bolte of yarne w<sup>t</sup> ij grette hangyng lokes.

It iijij othar chbests belonging to the chyrche.

It the lesse of Horseydowne,<sup>56</sup> w<sup>t</sup> dyvars othar wyrttyngs lyyng in the aforesayed chesta.

It a banar clothe of grene seykle for the crosse w<sup>t</sup> the troynte<sup>57</sup> upon ytte.

It ij flags of sylke w<sup>t</sup> the Queenys armys in them. <sup>58</sup>

It vj bannars of seykle.  
It a stremare of bokeraim w<sup>t</sup> Sent George apone yt. <sup>59</sup>

It ix banar polys.  
It a crussyfyxe of whyte sylke, gyvynne by Mastres Blancke,<sup>60</sup> and sette apone the best awttar clothe.

It ij grette kussebynes kov'ed and stuft w<sup>t</sup> fethars. <sup>61</sup>

NOTES.

<sup>1</sup> Saint Olave's.—In like manner St. Olave's street became corrupted to Tooley-street.

<sup>2</sup> Olfiv Burr was returned to Parliament as Member for Southwark, in the 5th, and again in the 14th of Elizabeth.

<sup>3</sup> See the 19th chapter of St. John, v. 27 and 28. This must have been a handsome and weighty cross, 86 oz.; the weight of the Communion Cups was 74 oz.

<sup>4</sup> A Mazer, a maple cup.—See Ducange.  
<sup>5</sup> Then lo, Perigot the pledge which I plight,  
A mazar wrought of the maple ware,  
Wherein is enchased many a fair sight  
Of bears and tigers, that make fierce war."  
SPENSER.

<sup>6</sup> In the Inventory for 1556, is the following:  
<sup>7</sup> It a challys gyvynne by Sente Tany's (St. Anne's) systars, thene beyng Elizabeth Eglyfered, Ione Whytte, Maryatt, Jone Vestraime, and Mg'te Rutte, w'ch challys wrythe xi onzys qtr. and d; qtr." One of the four aisles of St. Olave's Church (which fell down in 1736) was called St. Anne's aisle, and in it was a chapel and altar dedicated to St. Anne.

<sup>8</sup> The cope, cappa, called also pluviale, used for the choir service and ceremonials. It resembles in its shape a large and flowing cloak, open in the front, and fastens on the breast by clasps. The copes were of various colours and materials, and differently ornamented, as is shewn by this inventory.

<sup>9</sup> Rased, ornamented with blue velvet sewed on.

<sup>10</sup> Qu. Tongues? This was probably a cope to be worn on Whit-Sunday, when "there appeared to them cloven tongues, like as of fire, and it sat upon each of them."—Acts, ii. 3.

<sup>11</sup> The garment particularly called the vestment, is the casuble, casula, or planeta, an outer vestment pulled over the head and cut open at the sides to the shoulder, which the priest wears at mass. It derives its origin from the Roman garment, called *panpula*.

<sup>12</sup> The alb is a white linen garment worn by the priests, deacons, and sub-deacons, reaching down to the feet, and tied round the neck and at the wrists, and gathered by a girdle round the waist.

<sup>13</sup> Tymacoll, tunicailla, the sub-deacon's garment.

<sup>14</sup> Baudkin, or bodkin, a rich kind of stuff made of gold and silk.

<sup>15</sup> Angels and spread-eagles. Mr. Leke was an opulent brewer, in this parish, of German origin, who died in 1559, and by a bequest in his will, was the cause of the foundation of the excellent and now well-endowed grammar-school of St. Olave's.—See Gentleman's Magazine, N. S., vol. V., p. 15.

<sup>16</sup> Sir Anthony St. Leger, Knight of the Garter, Deputy in Ireland to King Henry VIII., and ancestor of the Viscounts Doneraile. He was actively employed in the dissolution of the monasteries, and received a grant of the inn in St. Olave's parish, belonging to the Abbot of Augustine's, at Canterbury. His arms were Azure, fretty Argent, a chief Or.

<sup>17</sup> The altar cloth is often called in English MS. "frontell" (antependium).

<sup>18</sup> St. Clement and Anchors. The anchor was the emblem of St. Clement, who is said to have been cast into the sea, with an anchor about his neck, and according to the legend, on the first anniversary of his death, the sea receded three miles, and discovered a superb marble temple, in which was a monument containing the remains of the saint.

There was in St. Olave's church, a fraternity of St. Clement, and one of the four aisles was called St. Clement's aisle, in which were his chapel and altar. He was probably a favourite saint of the mariners, to whom St. Olave's Church, being situated at the river side, was very convenient.

<sup>19</sup> Anciently, curtains were used against the altar-screen, but that custom was in disuse at the time of making this inventory. The curtains here mentioned were to cover the tabernacle.

<sup>20</sup> Antipbonar. A book for the service of the choir. It contains the responses or antipbons, hymns, verses, and singing of the canonical hours.

<sup>21</sup> Graduals. The gradual takes its name from the prayer chanted gradual, after the epistle. It is the choir-book used for singing mass.

<sup>22</sup> The legend. It contains the lessons to be read in the Mattin Office, taken from the Old or New Testament, or the Homilies, Sermons, and Saints' Lives.

<sup>23</sup> Missals, containing every thing belonging to the mass.

<sup>24</sup> Hymn books.

<sup>25</sup> Books of the order and service for the ecclesiastical processions.

<sup>26</sup> Manual, the ritual containing all things belonging to the sacraments, sacramentals, and benedictions.

<sup>27</sup> Psalters, containing the Psalms of David.

<sup>28</sup> A service-book, so called, as supposed, from the different colours of the text and rubric.—Johnson.

<sup>29</sup> Music hooks, pricked or scored.

<sup>30</sup> The canopy cloth was borne over the Eucharist on solemn processions, as on the feast of Corpus Christi, and in visitations to the sick. John Richards was instituted to this rectory on the 6th January, 1556-7, and died in 1558.

<sup>31</sup> Covered in panes or compartments.

<sup>32</sup> Ornamented.

<sup>33</sup> Tissue.

<sup>34</sup> The cover for the Sacrament was the veil used at mass over the chalice and paten containing the sacred elements, and the cloth for the sacrament of silk and gold with four tassels was probably for the same purpose, or it might have been the scarf which the priest uses when he carries the sacrament in procession, or at benedictions. It was not the cloth called the corporal on which the Eucharist is laid at the altar; that cloth was always of fine linen, and is considered so sacred that it must not be touched by lay hands, and it is never even washed, but when old or dirty is burned.

<sup>35</sup> Towels. The altar-linen for various purposes.

<sup>36</sup> Appareled and unappareled. The priests', deacons', and sub-deacons' albs were sometimes plain and sometimes ornamented on the lower part of the garment.

<sup>37</sup> The amice is an ohlong piece of fine linen, which the priest wears at mass, upon his shoulders, over the cassock and under the alb.

<sup>38</sup> It was usual, on the death of persons of any note, to erect in the church a herse or stage, decorated with palls, or herse-cloths, tapers, &c.

<sup>39</sup> Belonging to the fraternity, or priests of St. Clement.

<sup>40</sup> The copper cross was probably a processional cross.

<sup>41</sup> Candlesticks of latten, an alloy of copper and zinc.

<sup>42</sup> Standards of latten, seem to mean candelabra which stood on the floor.

<sup>43</sup> A little bell which is rung to give notice of the approach of the Host when carried in procession, and also in other offices of the Roman Catholic Church.

<sup>44</sup> Bars of iron, probably to fasten the sepulchre in which the consecrated Host was deposited on Good Friday, until Easter Day.

<sup>45</sup> A small iron crow, probably to perform the ceremony of opening the sepulchre on Easter Day.

<sup>46</sup> Basins for washing the hands of the priest at mass.

<sup>47</sup> Censers. Vessels to burn frankincense in.

<sup>48</sup> A small vessel in shape of a ship or boat to hold the frankincense.

<sup>49</sup> A fire-shovel.

<sup>50</sup> A chrismatory, or vessel for the holy oil.

<sup>51</sup> Pockets for the corporals.

<sup>52</sup> A narrow scarf or band thrown over the priest's neck, and descending to his feet.

<sup>53</sup> The holy water stock, for sprinkling holy water from the vessel called the stoup.

<sup>54</sup> Veil for the altar, used from Passion Sunday till Easter Day.

<sup>55</sup> A cloth to cover the holy rood, from Passion Sunday till Good Friday.

<sup>56</sup> Staves to support the canopy when carried over the Host in processions.

<sup>57</sup> Staves with lanterns in the form of castles, to be used in visiting the sick at night.

<sup>58</sup> Horseydown, now Horslydown, was then a large down or grazing field, containing 16 acres, belonging to the parish of St. Olave, in which the parishioners turned out their horses and cattle to graze.—See Gentleman's Magazine, N. S., vol. V., p. 15.

<sup>59</sup> Banners of green were used in procession, on vigils and fasts, and often had depicted on them, either the personified representation of the Trinity, or more frequently the heraldic emblem or diagram, drawn in a triangular form, and reading Pater est Deus, &c. &c.

<sup>60</sup> Processional banners.

<sup>61</sup> This is the second time we meet with Saint George in this inventory, but I do not find that he had any particular connection with the church.

<sup>62</sup> Thomas Blancke was sheriff of London in 1574, and Lord Mayor, as Sir Thomas, in 1582.

<sup>63</sup> Cushions for the priest to kneel upon at the altar.

## RETROSPECTIVE ARCHITECTURAL LITERATURE.

## THE ELEMENTS OF ARCHITECTURE.

COLLECTED BY SIR HENRY WOTTON, KNIGHT,  
From the best Authors and Examples.

(Continued from p. 407.)

The *Doric* Order is the gravest that hath been received into civil use, preserving, in comparison of those that follow, a more masculine Aspect, and little trimmer than the *Tuscan* that went before, save a sober Garnishment now and then of Lions Heads in the Cornice, and of Triglyphs and Metopes always in the Frize: Sometimes likewise, but rarely, channelled, and a little slight Sculpture about the Hypotrachelion, or Neck, under the Capital. The Length seven Diameters. His Rank or Decree is the lowest by all Congruity, as being more massy than the other three, and consequently slier to support. The Intercoluniation thrice as much as his Thickness below. The Contraction aloft, one fifth of the same measure. To discern him, will be a piece rather of good *Heraldry* than of *Architecture*; for he is best known by his Place, when he is in Company, and by the peculiar Ornament of his Frize, before-mentioned, when he is alone.

The *Ionic* Order doth represent a kind of feminine Slenderness, yet, saith Vitruvius, not like a light Housewife, but in a decent Dressing hath much of the Matron. The Length eight Diameters. In Decree, as in Substantialness, next above the *Doric*, sustaining the third, and adorning the second Story. The Intercoluniation, two of his own Diameters. The Contraction, one sixth part, best known by his Trimmings; for the Body of this Column is perpetually channelled, like a thick plaited Gown. The Capital dressed on each side, not much unlike Womens Wires, in a spiral Weathing, which they call the *Ionian Voluta*. The Cornice indented. The Frize swelling like a Pillow, and therefore by Vitruvius not unelegantly term'd *Pulvinata*. These are his best Characters.

The *Corinthian* is a Column laciviously deck'd like a Courtizan, and therein much participating (as all inventions do) of the Place where they were first born, Corinth having been, without controversy, one of the wantonest Towns in the World. This Order is of nine Diameters. His Decree one Stage above the *Ionic*, and always the highest of the simple Orders. The Intercoluniation, two of his Diameters, and a fourth part more, which is of all other the comliest Distance. The Contraction one seventh Part. In the Cornice, both Dentelli and Modigliani. The Frize adorned with all kinds of Figures and various Compartments at Pleasure. The Capital cut into the beautifullest Leaf that Nature doth yield, which surely next *Aconitum Pardalanches* (rejected perchance as an ominous Plant) is the *Acanthus* or *Branca Ursini*, though Vitruvius do impute the Choice thereof unto Chance, and we must be contented to believe him: In short, as Plainness did characterize the *Tuscan*, so must Delicacy and Variety the *Corinthian* Pillar, besides the Height of his Rank.

The last is the Compounded Order; his Name being a Brief of his Nature: For this Pillar is nothing in effect but a Medley, or an Amass of all the precedent Ornaments, making a new Kind by stealth; and though the most richly tricked, yet the poorest in this, that he is a Borrower of all his Beauty. His Length (that he may have somewhat of his own) shall be of ten Diameters. His Decree should, no doubt, be the highest, by Reasons before yielded: But few Palaces, ancient or modern, exceed the third of the Civil Orders. The Intercoluniation but a Diameter and an half, or always somewhat less than two. The Contraction of this Pillar must be one eighth Part less above than below. To know him, will be easy by the very mixture of his Ornaments and Cloathing.

And so much touching the five Orders of Columns, which I will conclude with two or three not impertinent Cautions.

First, That where more of these Orders than one shall be set in several Stories or Contignations, there must be an exquisite care to place the Columns precisely one over another, that so the Solid may answer to the

Solid, and the Vacuities to the Vacuities, as well for beauty as Strength of the Fabrick; and by this Caution the Consequence is plain, that when we speak of the Intercoluniation or Distance which is due to each Order, we mean in a *Doric*, *Ionic*, *Corinthium* Porch or Cloyster, or the like of one Contignation, and not in Storied Buildings.

Secondly, Let the columns above be a fourth Part less than those below, saith Vitruvius, Lib. 5, Cap. 15. A strange Precept, in my Opinion, and so strange, that peradventure it were more suitable even to his own Principles, to make them rather a fourth Part greater; for Lib. 3, Cap. 2, where our Master handleth the Contraction of Pillars, we have an Optick Rule, that the higher they are, the less should be always their Diminution aloft, because the Eye itself does naturally contract all Objects, more or less, according to the Distance; which Consideration may, at first Sight, seem to have been forgotten in the Caution we have now given; but Vitruvius (the best Interpreter of himself) hath in the same Place of his fifth Book, well acquitted his Memory by these Words; *Columnæ superiores quarta parte minores, quam inferiores, sunt constituendæ propter quod, operi, ferendo quæ sunt inferiora, firmiora esse debent*; preferring, like a wise Mechanick, the natural Reason before the Mathematical, and sensible Concepts before abstracted: And yet, Lib. 4, Cap. 4, he seemeth again to affect Sutilty, allowing Pillars the more they are channelled to be the more slender, because while our Eye (saith he) does as it were distinctly measure the eminent and the hollowed Parts, the total Object appeareth the bigger, and so as much as those Excavations do subtract, is supplied by a Fallacy of the Sight: But here, methinks, our Master should likewise have rather consider'd the natural Inconvenience; for though Pillars by channelling be seemingly ingrossed to our Sight, yet they are truly weakened in themselves, and therefore ought perchance in sound Reason not to be more slender, but the more corpulent, unless Appearances preponder Truths; but *Contra Magistrum, non est disputandum*.

A Third Caution shall be, that all the projecting or jutting Parts (as they are termed) be very moderate, especially the Cornices of the lower Orders; for whilst some think to give them a beautiful and royal Aspect, by their Largeness, they sometimes hinder both the Light within (whereof I shall speak more in due Place) and likewise detract much from the View of the Front without, as well appeareth in one of the principal Fabricks at Venice, namely the palace of Duke Grimani on the Canal Grande, which by this magnificent Error is somewhat disgraced. I need now say no more concerning Columns and their Adjuncts, about which Architects make such a Noise in their Books, as if the very Terms of Architraves, and Friezes, and Cornices, and the like were enough to graduate a Master of this Art; yet let me, before I pass to other Matter, prevent a familiar Objection. It will perchance be said, that all this Doctrine touching the five Orders were fitter for the Quarries of Asia, which yielded One hundred and twenty-seven Columns of sixty Foot high, to the Ephesian Temple; or for Numidia, where Marbles abound, than for the Spirits of England, who must be contented with more ignoble Materials. To which I answer, That this need not discourage us; for I have often at Venice viewed with much Pleasure, an *Atrium Græcum* (we may translate it an Anti-Porch, after the Greek manner) raised by Andrea Palladio, upon eight Columns of the Compounded Order; the Bases of Stone, without Pedestals; the Shafts or Bodies of mere Brick, three Foot and an half thick in the Diameter below, and consequently thirty-five Foot high, as himself hath described them in his second Book, than which mine Eye hath never yet beheld any Columns more stately of Stone or Marble; for the Bricks having first been formed in a circular Mould, and then cut before their burning into four Quarters or more, the Sides afterwards join so closely, and the Points concenter so exactly, that the Pillars appear one entire Piece; which short Description I could not omit, that thereby may appear how in truth we want rather Art than stuff to satisfy our greatest Fancies.

After Pillars, the next in my Distribution

are Pilasters, mentioned by Vitruvius, Lib. 5, Cap. 1, and scant any where else, under the Name of *Parastates*, as *Philander* conceiveth; which Grammatical Point (though perchance not very clear) I am contented to examine no farther. Always, what we mean by the thing it self, is plain enough in our own Vulgar, touching which, I will briefly collect the most considerable Notes.

Pilasters must not be too tall and slender, least they resemble Pillars; nor too dwarfish or gross, least they imitate Piles or Piers of Bridges: Smoothness doth not so naturally become them, as a rustic Superficies, for they aim more at State and Strength than Elegancy. In private Buildings they ought not to be narrower than one Third, nor broader than two Parts of the whole Vacuity between Pilaster and Pilaster; but to those that stand at the Corners, may he allowed a little more Latitude by Discretion, for Strength of the Angles. In Theatres and Amphitheatres, and such weighty Works, Palladio observeth them to have been as broad as the Half, and now and then as the whole Vacuity. He noteth likewise (and others consent with him) that their true Proportion should be an exact Square; but for lessening of Expense, and enlarging of Room, they are commonly narrower in Flank than in Front: Their principal Grace doth consist in half or whole Pillars applied unto them; in which case it is well noted by Authors, that the Columns may be allowed somewhat above their ordinary Length, because they lean unto so good Supporters. And thus much shall suffice touching Pilasters, which is a cheap and strong, and a noble Kind of Structure.

Now, because they are often, both for Beauty and Majesty, found arched than otherwise, I am here orderly led to speak of Arches, and under the same Head of Vaults, for an Arch is nothing indeed but a contracted Vault, and a Vault is but a dilated Arch; therefore to handle this Piece both compendiously and fundamentally, I will resolve the whole business into a few Theorems.

## THEOREM I.

All solid Materials free from Impediment, do descend perpendicularly downwards, because Ponderosity is a natural Inclination to the Centre of the World, and Nature performeth her Motions by the shortest Lines.

## THEOREM II.

Bricks moulded in the ordinary Rectangular Form, if they shall be laid one by another in a level Row, between any Supporters sustaining the two Ends, then all the Pieces between, will necessarily sink, even by their own natural Gravity, and much more if they suffer any depression by other Weight above them, because their Sides being parallel, they have room to descend perpendicularly, without impeachment, according to the former Theorem; therefore to make them stand, we must either change their posture or their figure, or both.

## THEOREM III.

If Bricks moulded, or Stones squared *Cuneatim* (that is, Wedge-wise, broader above than below) shall be laid in a Row level, with their Ends supported as in the precedent Theorem, pointing all to one Center; then none of the Pieces between can sink till the Supporters give way, because they want room in that Figuration to descend perpendicularly. But this is yet a weak Piece of Structure, because the Supporters are subject to much Impulsion, especially if the Line be long; for which Reason this Form is seldom used, but over Windows or narrow Doors. Therefore to fortify the Work, as in this Third Theorem, we have supposed the Figure of all the Materials different from those in the Second: So likewise we must now change the Posture, as will appear in the Theorem following.

## THEOREM IV.

If the Materials figured as before Wedge-wise, shall not be disposed levelly, but in form of some Arch or Proportion of a Circle, pointing all to the same Center: In this Case, neither the Pieces of the said Arch can sink downwards, through want of room to descend\* perpendicularly; nor the Supporters or Buttments (as they are termed) of the said Arch can suffer so much Violence, as in the precedent flat Posture, for the Roundness will always make the incumbent Weight rather to rest upon the Supporters than to shove them.

\* By the First Theorem.

\* Our Artizans call them Teeth and Cartouzes.

Whence may be drawn an evident Corollary; that the safest of all Arches is the Semicircular, and of all Vaults the Hemispheric, though not absolutely exempted from some natural Weakness,† as Barnardino Baldi, Abbot of Guastalla, in his Commentary upon *Aristotle's Mechanics*, doth very well prove; where let me note by the way, that when any thing is mathematically demonstrated weak, it is much more mechanically weak, Errors ever occurring more easily in the management of gross Materials, than lineal Designs.

## THEOREM V.

As Semicircular Arches, or Hemispherical Vaults, being raised upon the total Diameter, be of all other the roundest and, consequently, the securest by the precedent Theorem; so those are the gracefullest, which keeping precisely the same Height, shall yet be distended one fourteenth Part longer than the said entire Diameter; which Addition of Distent will confer much to their Beauty, and detract but little from their Strength.

This Observation I find in Leon Baptista Alberti; but the Practice how to preserve the same Height, and yet distend the Arms or Ends of the Arch, is in Alberti Durer's Geometry, who taught the Italians many an excellent Line, of great use in this Art.

Upon these five Theorems all the Skill of Arching and Vaulting is grounded: As for those Arches which our Artizans call of the third and fourth Point, and the Tuscan Writers *di terzo* and *di quarto acuto*; because they always concur in an acute Angle, and do spring from Division of the Diameter, into three, four, or more Parts at pleasure; I say, such as these both from the natural Imbecility of the sharp Angle itself, and likewise for their very Uncomeliness, ought to be exiled from judicious Eyes, and left to their first inventors, the Goths or Lombards, amongst other Reliques of that barbarous Age.

Thus of my first Partition of the Parts of every Fabrick into five Heads, having gone through the two former, and been incidentally carried into this last Doctrine touching Arches and Vaults. The next now in order are the Apertures, under which Term I do comprehend Doors, Windows, Stair Cases, Chimnies, or other Conducts; in short, all Inlets or Outlets, to which belong two general Cautions.

First, That they be as few in Number, and as moderate in Dimension, as may possibly consist with other due Respects; for in a word, all Openings are Weaknesses.

Secondly, That they do not approach too near the Angles of the Walls; for it were indeed a most essential Solecism to weaken that Part which must strengthen all the rest: A Precept well recorded, but ill practised by the Italians themselves, particularly at Venice, where I have observed diverse *Pergoli*, or *Meniana* (as Vitruvius seemeth to call them, which are certain ballised Outstandings to satisfy Curiosity of Sight) very dangerously set forth upon the very Point itself of the Mural Angle.

Now, albeit I make haste to the casting and comparing of the whole Work (being indeed the very definitive Sum of this Art, to distribute usefully and gracefully a well chosen Plot) yet I will first under their several Heads, collect briefly some of the choicest Notes belonging to these particular Overtures.

## OF DOORS AND WINDOWS.

These Inlets of Men and of Light I couple together, because I find their due Dimensions brought under one rule, by Leon Alberti (a learned Searcher) who from the School of Pythagoras (where it was a fundamental Maxim, That the Images of all Things are latent in Numbers) doth determine the comeliest Proportion between Breadths and Heights, reducing Symmetry to Symphony, and the Harmony of Sound, to a kind of Harmony in Sight, after this manner: The two principal Consonances that most ravish the Ear are, by consent of all nature, the *Fifth* and the *Octave*; whereof the first riseth radically, from the Proportion between two and three. The other from the double Interval, between one and two, or between two and four, &c. Now, if we shall transport these Proportions from audible to visible Objects, and apply them as they shall fall fittest (the Nature of

the Place considered), namely in some Windows and Doors, the Symmetry of two to three in their Breadth and Length, in others, the double, as aforesaid, there will indubitably result from either a graceful and harmonious Contentment to the Eye; which Speculation, though it may appear unto vulgar Artizans, perhaps, too subtle and too sublime, yet we must remember that Vitruvius himself doth determine many Things in his Profession by Musical Grounds, and much commendeth in an *Architect*, a Philosophical Spirit; that is, he would have him (as I conceive it) to be no superficial and floating Artificer, but a Diver into Causes, and into the Mysteries of Proportion. Of the Ornaments belonging both to Doors and Windows, I shall speak in another Place; but let me here add one Observation, That our Master (as appeareth by diverse Passages, and particularly, Lib. 6, Cap. 9.) seems to have been an extream Lover of luminous Rooms: And indeed, I must confess, that a frank Light can misbecome no Edifice whatsoever, Temples only excepted, which were anciently dark, as they are likewise at this Day in some Proportion; Devotion more requiring collected than diffused Spirits.\* Yet on the other side, we must take heed to make a House (though but for civil use) all Eyes, like Argus, which in Northern Climes would be too cold, in Southern too hot: and therefore the Matter indeed importeth more than a merry Comparison. Besides, there is no part of Structure either more expenceful than Windows, or more ruinous, not only for that vulgar Reason, as being exposed to all Violence of Weather, but because consisting of so different and unsociable Pieces, as Wood, Iron, Lead, and Glass, and those small and weak, they are easily shaken. I must likewise remember one Thing (though it be but a *Grammatical Note*) touching Doors; some were *Fores*, and some were *Valvæ*; those (as the very Word may seem to import) did open outwards, these inward, and were commonly of two Leaves or Panes (as we call them) thereby requiring indeed a lesser Circuit in their unfolding, and therefore much in Use among *Italians* at this Day: But I must charge them with an Imperfection; for though they let in as well as the former, yet they keep out worse.

## OF STAIR-CASES.

To make a complete Stair-Case is a curious Piece of *Architecture*: The vulgar Cautions are these:

That it have a very liberal Light, against all Casualty of Slips and Falls.

That the Space above the Head be large and airy, which the *Italians* use to call *Un bel fogolo*, as it were good Ventilation, because a Man doth spend much Breath in mounting.

That the half Paces be well distributed, at competent Distances, for reposing on the Way.

That to avoid Encounters, and besides to gratify the Beholder, the whole Stair-Case have no niggard Latitude, that is, for the principal Ascent, at least ten Foot in Royal Buildings.

That the Breadth of every single Step or Stair, be never less than one Foot, nor more than eighteen Inches.

That they exceed by no means half a Foot in their Height or Thickness, for our Legs do labour more in Elevation than in Distention: These, I say, are familiar Remembrances; to which let me add

That the Steps be laid where they join *Con un tantino di scarpia*; we may translate it somewhat sloping, that so the Foot may in a sort both ascend and descend together, which though observed by few, is a secret and delicate Deception of the Pains in mounting.

Lastly, To reduce this Doctrine to some natural, or at least mathematical Ground, our Master (as we see, Lib. 9, Cap. 2.) borroweth those Proportions that make the Sides of a rectangular Triangle, which the ancient School did express in lowest Terms, that is, Numbers of Three, Four, and Five; that is, Three for the Perpendicular, from the Stair-Head to the Ground, Four for the Ground-Line itself, or Recession from the Wall; and Five for the whole Inclination or Slopess in the Ascent; which Proportion, saith he, will make *Temperatas graduum liberationes*. Hitherto of Stair-Cases which are direct: There are likewise Spiral, or Cockle Stairs, either circular

or oval, and sometimes running about a Pillar, sometimes vacant, wherein Palladio (a Man in this Point of singular Felicity) was wont to divide the Diameter of the first Sort into three Parts, yielding one to the Pillar, and two to the Steps: Of the second into four, whereof he gave two to the Stairs, and two to the Vacuity, which had all their Light from above; and this in exact Ovals, is a Masterpiece.

(To be continued.)

## THE NATURE OF DESIGN.

A Paper read at the meetings of the Decorative Art Society, March 13th and 27th.

BY MR. CRABB, V.P., MEMBER OF THE INSTITUTE OF FINE ARTS.  
(Continued from p. 411.)

LOUIS the XIV. was a magnificent patron of the arts, and also first instituted an academy in France, for the purpose of teaching art upon systematic principles, subdividing the instruction under the heads of drawing after the antique and after the living model, anatomy, painting, perspective, the laws of taste, colouring, and composition. The plan of education previously pursued was that of apprenticeship, where the youth gradually learned the craft, assisted his master, and set up for himself; and in this manner the noblest artists had been produced. Notwithstanding the advantages which an academy presents in providing able teachers, and collecting the great examples of art, without the study of which the strongest intellect may be deviously employed, academies have never succeeded in sustaining a period of declining art: few are taught to much purpose, unless in a great measure their own teachers; and we find that art sunk rapidly after the time of Francis I.

It continued thus depreciated for nearly two centuries; and although many of the castle palaces of Germany were erected during that time, and commanded attention from their massive and often impressive grandeur, there is not that purity of style which will stand the test of time. Contemporaneous in England, the Elizabethan was paramount, and in the next age, a declassè use of the style of Louis XIV. was the favourite. Beauties may be found in both; each is extremely picturesque, and when chosen with due regard to fitness of purpose, may be tolerated by the lover of fine art, and most assuredly will please the painter. The Italians, naturally a refined people, and accustomed to fine sculpture and painting in their churches, first returned to the right path; France and Germany have followed, and England has now the opportunity.

Throughout these remarks, as previously observed, I have purposely avoided noticing any definite characteristics of particular styles of embellishment: each requires to be considered separately, with its applicable value, leading features, and distinct principles of design.

I will now take a brief view of the means by which foreigners have rendered science and fine art so popular among their own people as to cause a constantly increasing demand for the application of beautiful form and rich embellishment to their manufactures, giving them the most decided superiority over the English in taste. Speaking of the continent generally, during the last century, universal attention has been paid to the subject, and in some kingdoms, as France, Prussia, and Bavaria, most extraordinary care has been taken to teach the true principles of Design.

In each town of any importance, a hall, with a collection of casts from the antique and most beautiful specimens of modern sculpture, was opened; a museum of general and natural history,—and, wherever it was possible, a small collection of paintings. This plan was found to have the happiest effect upon the people; they came in from the market-place, or their ordinary occupations, saw the most beautiful or instructive objects of art and nature, and insensibly formed to themselves a taste for fine art.

Drawing was taught as a part of the national education, and botanical information communicated sometimes through the means of grouping and common flowers. Dr. Ure mentions this to be an usual practice among the children of the silk weavers in the South of France. With so intimate an acquaintance with nature, can we be surprised at the excellence of their after-works? Does it not pre-

† Which is the sole Prerogative of Perpendicular Lines and Right Angles.

\* Lumen est diffusivum sui et alieni.

sent an extraordinary contrast to our own silk weaving families?

In chief towns or cities, principal or central institutions, upon a larger and more comprehensive scale, were opened; instruction being there given upon the application of fine art to every description of manufacture, and by *practical men*. The leading feature was varied according to the chief production of the neighbourhood. Thus, in a mining district the museum would be rich in geological specimens, and the scholars or workmen received special instruction upon science and art, connected with the metals. Calico printing, weaving, lace work, and others, received similar attention. Libraries upon art were opened to the scholars, and often also to the public. Works, containing the finest examples of outline, form, and beautiful ornament, have been published for the use of these institutions. The people, generally, enjoy immense advantages over us by the free and constant exhibition of the finest efforts of Design, of painting and sculpture in their public places, churches, &c. The leisure of the artisan, in most cities, especially in France, is passed in the palaces and gardens of the king, where they have before their eyes beautiful applications of design in architecture, painting, sculpture, and the general interior and exterior arrangements of a refined taste. Paternal and enlightened governments, and a magnificent monarch, 300 years since, provided these elegant recreations, in which the people should pass their holidays; in England the artisan was left to seek the pouthouse. Louis XIV. after erecting the sumptuous palace of Versailles, directed his minister to burn the accounts, observing, that the enormous outlay was an investment for the refinement of his people. The truth and nobleness of that sentiment we now perceive expressed in a universal admission of the superior appreciation in France of fine art—the taste and politeness of the nation.

The wealthy man can indulge the elegancies of his taste by rendering his mansion the abode of art—but the school for the people must be the streets and squares of their cities; adorn those with statues, fountains, and opportunities for elegant recreation of mind, and the result with us will be an equal love of art with the great cities of Rome, Naples, Venice, Florence, Milan, Munich, and Paris, which are thus adorned, and thus foster art.

I will refer to the course of education as at present organized by the illustrious King of Bavaria; observing, that persons cannot be employed by the government, or in honourable works, without passing through it.

Drawing is taught in every village school, and there are in the kingdom thirty-three schools, particularly devoted to it; also, thirty secondary schools, being real schools of design for the artisan, and three chief, or polytechnic schools; design is, therefore, an integral part of national education, and is thus followed: a boy leaving his village school, and wishing to devote himself to any particular branch of art, enters one of the thirty secondary schools, where instruction is given, in applying the arts to manufactures, throughout every branch, and where he remains for three years, after which, if he determines upon any particular branch he wishes to pursue farther, he enters the Polytechnic School, where his very complete practical course of education is finished.

The scholars can mould and form designs so perfectly as not to be surpassed, except by professional sculptors, painters, &c., who have yet further opportunities for studying their profession in the academy. Scholars not only receive a scientific education, but in the secondary schools the French language, history, geography, natural philosophy, chemistry, &c., go on at the same time as the drawing. The higher classes of society, who are educated in the Gymnasiums and Universities, have an excellent knowledge of design, communicated by private lessons. Thus the entire people are prepared to appreciate beautiful art.

It is not my intention, at the present moment, to notice the numerous buildings erected to the lasting honour of this noble lover of art; but I will glance at the galleries at Munich, to shew the pervading feeling. The building is of noble architecture—the pictures and the statues are arranged in separate apartments on account of light, &c., and the histo-

rical arrangement is followed in placing the sculpture. The first hall contains the Egyptian, because Greek art came from the Egyptian; second, Greek, and early Greek; third, marbles of Egina; fourth, school and time of Phidias, and two rooms for the finest period of Greek art. Then interpose three rooms without sculpture, but richly painted in fresco, descriptive of the history of ancient gods and heroes. You observe these are skillfully introduced to refresh the eye with a sight of colours, after contemplating the statuary. Then succeed a second gallery of sculpture, and two very large halls for Roman art, and one for modern. The gallery of paintings on the ground-floor contains original drawings of the great masters, ancient terra cottas, engravings, enamels, glass paintings, and mosaics. The pictures are on the first floor; a gallery runs the whole length of the building, giving access to any room without passing through others—large pictures are in large rooms, lighted from above, and cabinet works in small rooms, side-lighted from the north. The antechamber is very large, richly ornamented in white and gold, having six great portraits of the founders of the gallery. The decorations of this palace of art present no plain white-washed ceilings, or dirty grey walls, but the staircase and the ceilings are richly wrought in beautiful design, painted, and profusely gilded; the walls of deep rich colours, giving freshness to the statues, and its floors inlaid.

In Switzerland very careful attention is paid to educating for design. In the School of Industrial Art, at Geneva, there are eight professors—the course lasting three years. They have a distinctly separate school for watch-making, and particular instruction is given in the superior manufacture of metals and jewellery. Berne, Geneva, and the Jura mountains, at this moment form the seat of a most extensive production of delicate mechanical works; their export trade supporting an immense manufacture of watches and musical boxes. Calico printing is also considerably extending.

The expense of their School of Design is trifling; one franc for the first year of the course, and two francs for each of the succeeding years: so that a most excellent training, under a sound and comprehensive system, is offered to the entire community.

In Milan exists a superior school for studying interior decoration; there carried to a great extent among the palaces and residences of the Milanese gentry. In Belgium, attention is paid to educated design; at Bruges, with a population of about 20,000, there may be about 600 scholars. In our Norwich, the seat and the centre of a great manufacture, with 80,000, there is not any institution of the kind worth naming. At Amsterdam they have a fine school, with a department for music and philosophical instruments; and similar institutions exist in all the chief towns; even Russia is making exertions promising to be worthy her resources.

As in Bavaria, so in Prussia, Design forms an integral part of the national education. In the lowest or most inferior popular schools instruction in drawing is given. Thus, by exercising and improving the eye, tending to produce taste among the people, and forming a most important assistance and advantage in propagating and generally diffusing art, its consequence is an eager desire to possess themselves of works of art, according to their circumstances. The instruction is gratuitous, and under the direction of the government—the government pay the masters and bear every sort of expense; and this extends throughout all the minor schools of the kingdom. There are five great institutions, called Polytechnic; the chief at Berlin—in which has been formed an immense collection of models of every description, embodying the newest discoveries of Europe, particularly England; a very complete collection of casts of the finest ornaments and designs of the Greeks and Romans of the middle ages, &c., in plaster of Paris, and some of the most distinguished works of naked sculpture, especially the pure Grecian.

The pupils are instructed in drawing, modelling, mathematics, and perspective; and after the general course has been attended, they each choose their own department of manufacture. Founding and casting of metals,

and every other species of manufacturing operation, is taught in its highest perfection, and chemistry, as applicable to the arts. Some instruction is given in natural history and physiology, and they have electrical and other machines for experimental purposes. Pupils are received from any of the provinces. The number in this establishment is limited—they receive instruction free, but must support themselves, and are not admitted after sixteen years of age. They remain three years, during which the business of the institution occupies the whole day, and is very laborious. All pupils must attend the drawing school, and all must learn elementary mathematics. The common courses communicated to the whole body occupies the first year; and afterwards, in the second and third year, they pursue the particular department of manufactures chosen by themselves. It is a duty of the directors of the institution to collect and preserve patterns of every various manufacture from different countries, *i. e.*, the most remarkable specimens. There is an extensive collection of models, always increasing; and attached, is a library of general literature, but particularly of all works relating to the objects of the institution. The students have access to, and may obtain specimens from, the botanical garden of the University—one of the largest in the world. There is drawing, from casts, after the most famous antiquaries, and any one so desirous may go to the academy and draw from life. They may also attend the anatomical lectures without expense.

The public lectures in this Institution, and in the Academy of Arts, are open to every person gratis.

Instruction in architecture is given, and they possess models of all the most celebrated buildings, and choice specimens of ornament. They receive peculiar instruction with a view to the designing of furniture (household) in its widest extent, and of the ornaments connected with it. They have models of the various forms of chairs, tables, tripods, and every other domestic article, collected from all countries; small models in bronze, which represent the most beautiful forms of antiquity for household furniture and ornamental service.

The pupil is not particularly recommended, upon leaving the school, but naturally going to that part of the country where the manufacture for which he has studied is carried on, meets with ready employment. The directors are, however, always in communication with the manufacturers, so that the prevailing taste suitable for trade is perpetually known to the directors.

Most careful and important instruction is given upon the theory, nature, and property, the composition, manufacture, and application of colours.

The greater and better part of patterns for their calico printing are original designs made at Berlin; and the cotton manufacture has of late considerably increased. Works of a higher and superior character are produced through the improved influence of Design, and an increasing demand exists for pupils who excel in different departments. The director Beuth has published a work at the government expense, with engravings of the most beautiful models of antiquity and the middle ages. It is intended for the scholars, and divided into three parts. The first contains thirty-nine plates, illustrative of external and internal architecture, as a guide for decorations. The second, forty-one plates of vases, tripods, pedestals, cups, &c. The third, ten plates for interior decorations of rooms, floors, walls, and ceilings.

They are the choicest examples of ancient and modern art in their respective classes, not omitting Oriental and Moresque.

A complete and perfect education is thus given in the practical application of art to trade, nothing within the reach of profound care being omitted, and expense being disregarded.

(To be continued.)

DUBUFE'S ADAM AND EVE.—The interest in these splendid paintings has increased rather than diminished, the exhibition-room being often crowded with visitors, all of whom express themselves highly delighted with these truly chaste and glowing productions of the artist's pencil.—*Hull Packet.*

## METROPOLIS IMPROVEMENTS.

The Commissioners of Her Majesty's Woods and Forests, under the powers vested in them by the Act of the 4 Victoria, c. 12, have issued their plans for the new street leading from Leicester-square to Long-acre, which will be called "Cranbourne-street," and will be of a width from house to house of between 53 and 54 feet. In a few days the commissioners will lease the ground for building the houses, which will be let out in plots, each having a frontage varying from 19 feet to 112 feet, leases for which will be granted from September 29, 1844, for a period of 80 or 42 years, "at a rent of one peppercorn for the first year, and at such rent for the remainder of the term as shall be agreed upon." The houses are to be erected according to such plans, sections, elevations, and specifications, as shall be approved by the commissioners, subject to the inspection of the architect. The whole of the buildings are to be completely finished and rendered fit for habitation before Christmas, 1845, under penalty in each case of forfeiture of the lease. The lessee is to reimburse the commissioners for the expenses incurred for building the vaults and sewers, and paving the street, at the rate of 130*l.* at once, or of 6*l.* 10*s.* rent per annum for a frontage of 45 feet 4 inches. The ground excavated for the basement stories and foundations of the several houses is to be carted away at the cost of the lessee, and, if required by the commissioners, to be deposited to fill up the low ground in the Green Park, for the intended widening of Piccadilly. The lessee is not to carry on the business of tripe-boiler, tripe-seller, slaughterman, soap-boiler, tallow-melter, blacksmith, farrier, chimney-sweeper, or other offensive trade, without consent of the commissioners.

## THE FOUNTAINS IN TRAFALGAR-SQUARE.

The operations for the fountains are in a state of forwardness, and the top of the engine-house in Hemming's-row has been surmounted by an iron tank capable of holding about 30,000 gallons of water. With this building there is connected a tower, at the top of which also another iron reservoir will be erected. The borings for water have made great progress, having been carried down to a depth of about 200 feet, and a plentiful supply of water is now obtained to about 80 feet below the surface. These have penetrated below the London clay through an interesting series of shells, down to the maiden or plastic clay. Another series of borings are made in Trafalgar-square, adjacent to the National Gallery, communicating with the former by a tunnel, which is intended to convey the water. The water obtained from these wells is intended not only for the supply of the fountains, but for the Houses of Parliament, and the various Government offices in the vicinity. This is in accordance with new arrangements which will be applicable in the case of fire occurring at these places. Iron pipes have been laid down from the engine-house to the whole of these places, and operations are expected to be completed in about six weeks. The engine-house, when completed, will have a very peculiar appearance, but is partly of the Grecian Doric order of architecture. In order that the neighbourhood shall not be affected with smoke, the three engines are to be worked with Maide's and Tarling's furnaces, two of which are erected in the building.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*Parish Church of Penrith.*—During the last fortnight the parish church of Penrith has been undergoing a thorough repair, and on Wednesday week a vestry meeting was held for the purpose of receiving tenders for renovating the paintings around the altar table in the east window. Mr. Jacob Thompson, of Lowther, was the successful candidate, whose estimate was one hundred guineas. It was decided that the amount should be raised by voluntary subscription, the Lord Bishop of the diocese heading the list with a donation of 30*l.* Amongst the individuals present at the meeting upwards of 20*l.* more was subscribed, and for the remainder it is understood the churchwardens will collect through the town.

*Kensall-green Church.*—On the 8th inst. the ceremony of consecrating the church of St. John, Kensall-green, was performed by the Lord Bishop of London, in the presence of the principal clergy and laity of the district. The church in question, which is to supply the wants of the extreme ends of five parishes, viz., St. Luke, Chelsea (in which parish it is situated); St. Mary Abbott's, Kensington; St. Mary's, Paddington; St. Paul's, Hammersmith; and St. Mary's, Willesden, is situated on the north side of the Harrow-road, almost immediately opposite the principal entrance of the General Cemetery at Kensall-green. It has been erected upon a quarter of an acre of ground, the gift of the authorities of All Souls College, Oxford, and is of the old Norman structure, after designs by Mr. H. E. Kendall, jun., architect, of Brunswick-square; the builders being Messrs. Cooper and Davies, of Castle-street, Southwark. The church is in length from 80 to 90 feet, and width from 44 to 45 feet, composed of yellow brick with flint; the windows of stained glass, with a marygold window over the altar-piece. At the west end are two towers, each about 80 feet high, each tower being surmounted by five terminals of a cross. The west entrance consists also of a porch, forming an arch in the Norman style, with dentils and dogs' toothings. The church, in which there is an organ at the west end, is capable of containing about 500 persons. It is 44 feet 2 inches wide, and 82 feet long, and has a stilted roof, with open tracing. The cost is estimated at about 3,000*l.*, of which sum 500*l.* has been furnished by the Church Building Society, and upwards of 600*l.* is still deficient.

*Restoration of Holy Trinity Church.*—We understand that a communication has been received from the archdeacon, withdrawing the citation he had felt it to be his duty to enter against the work of rebuilding the south entrance being proceeded with, upon the plan that had been adopted. The archdeacon, with the vicar, the churchwardens, and Mr. Lockwood, the architect, inspected the works on Friday last, which has led to the amicable arrangement now entered into. The principal objection taken, it appears, was to the use of stone, instead of retaining, in its original integrity, that splendid specimen of brick building which the chancel and south transept of the church present; and which is considered the most ancient existing in this country, if not the first instance in which brick-building was employed after the restoration of the art of brick-making, early in the fourteenth century. The archdeacon, unwilling to cause any delay and litigation, has waived many of his objections, and consented to the prosecution of the work in stone, of which material a considerable portion of it was already done; though he would still prefer that brick should be substituted in a buttress partly rebuilt, and the entire restoration take place in that the original material. The work will now, we believe, be immediately resumed.—*Hull Packet.*

*New Church at Whitstable.*—The foundation stone of Seasalter new church, in the town of Whitstable, will be laid by Sir Brook Bridges, Bart., on Monday next.

## RAILWAY INTELLIGENCE.

*The Keighley Railways.*—On Tuesday evening last, a meeting of the gentlemen and tradesmen favourable to the extension railway from Keighley into Lancashire, by way of Haworth, took place at the latter town, when the surveyor appointed to take the levels delivered in his report, by which it appears that the gradients would be one in eighty. The idea of proceeding with it therefore was given up at once. The meeting, however, did not separate before coming to a determination to have a branch rail up the valley for about four miles for their own accommodation, and at their own expense, the cost of which was estimated at about 10,000*l.*, and a deputation was appointed to wait upon the directors of the Leeds and Bradford Company to make arrangements respecting it.

*Proposed Railway from Selby to Goole.*—It is now announced that the York and North Midland Railway Company are about to propose the scheme for a line of railway from Selby to Goole.

*Railway to Bridlington.*—It is said that the grounds from Bridlington, northwards, have been inspected very recently by some eminently qualified gentlemen, for a branch line from the town to meet the York and Scarbro' Railway at Seamer, near Scarbro', the distance being some fifteen or sixteen miles. If such be the case it is expected to prove of great benefit to this part of the country, by giving new facilities to the imports and trade of this port; and more particularly so, as the building of the new south pier, and enlargement of the harbour to twice its present size, are now in operation.

*Rochester and Gravesend Railway.*—The railway from Rochester to Gravesend, on the line of the Thames and Medway Canal, is in a state of great forwardness, and is expected to be opened at the end of the present month. On Saturday last the safety of the tunnel was tested by firing a loaded cannon in it several times, but no fall was occasioned by the concussion.

*North British Railway.*—Tenders for the formation of twenty miles by this line of railway, commencing at Berwick, were on Wednesday last received by the directors, at their office in Edinburgh. They were very numerous, and the successful competitor is a gentleman from Yorkshire, who was the contractor of the line between Gateshead and Darlington.

*Cost of Railway Construction.*—The gradation is this—it being remembered that the amount is per mile.—Dundee and Arbroath, 8,600*l.*; Ulster, 13,800*l.*; Newcastle and Carlisle, 17,500*l.*; Grand Junction, 23,200*l.*; London and South Western, 27,800*l.*; North Midland, 45,800*l.*; Liverpool and Manchester, 51,000*l.*; London and Birmingham, 53,100*l.*; Great Western, 56,300*l.*; London and Brighton, 57,300*l.*; Manchester and Leeds, 59,800*l.*—*Railway Record.*

*Bradling Junction Railway.*—Arrangements have been entered into for the sale of this railway to the Newcastle and Darlington Company, at the rate of 55*l.* for each share of 50*l.*; the purchasers taking the concern as it is, with all its properties, engagements, and liabilities.

*Sheffield, Ashton-under-Lyne, and Manchester Railway.*—This line of railway is now open to Woodhead, two stations on the Sheffield side of Glossop. The distance from Barnsley to Manchester is thus reduced to about four hours' travelling.

## Miscellaneous.

*VICTORIA PARK.*—The adjudication in the Sheriff's Court last week, in which 3,985*l.* was awarded to the trustees of Sir George Duckett's estate for 21 acres of land, has removed the chief obstacle which has for some time impeded the commencement of operations for the formation of the new park. There is another litigant holding out for a greater sum than has been offered by the Commissioners, but it is expected this claim will be settled without going into court. The property alluded to joins what is called Sir George Duckett's Canal, a very unfortunate speculation, being a short cut connecting the Regent's Canal with the river Lea navigation. It was expected by the trustees that this would have been purchased by the commissioners as an ornamental water for the park, instead of merely constituting one of its boundaries. "Bonner's Hall," which was the subject of much litigation and delay from its proprietors, the trustees of St. Thomas's Hospital, will be vacated at Michaelmas, when it will be immediately demolished. Some interesting discoveries are expected, as it was here where the notorious bishop imprisoned and tortured the first Protestant martyrs. Although no operations have yet been commenced, all the surveys for laying out plantations have been made, and as soon as these obstacles are removed, and the purchased land is restored by the tenants, who have been allowed to resume occupation until October, active operations will at once commence.—*Times.*

*STATUE OF HIS ROYAL HIGHNESS PRINCE ALBERT.*—A marble statue of his Royal Highness Prince Albert, executed by the celebrated sculptor Wolff, was landed at the St. Katherine's Dock, from Leghorn, on the 7th instant.

**THE IRON MANUFACTURE.**—The attention of the iron-masters has been attracted to a process of considerable importance lately introduced into their manufacture. The application of electricity, to supersede several of the expensive processes, has, it is stated, been tried in the Welch and Derbyshire furnaces with satisfactory results. It appears that the costly fuel and labour required for the purification of the ore from sulphur, phosphorus, and such subtle elements, create its high market value; and these being all electronegative, have induced the new process, whereby the impure stream of metal after flowing from the blast is in its moment of consolidation subjected to a powerful voltaic battery, which so disengages the impure components that in the process of puddling they are readily extracted. The London blacksmiths, it is stated, have tested this iron after a single reheating, and pronounce it equal to the best metal in the market. By the same process an experiment was tried by Dr. Ure, by whom a soft rod of iron was held in contact with a moderate red heat, and that gentleman is understood to have stated that in a few hours the metal was converted into steel. Should these facts prove what they seem, they are calculated to affect most seriously this important branch of our trade.

**NOVEL USE OF ICE IN VENTILATION.**—A course of experiments has been going on at the Hanover-square Rooms, with a view to their more complete ventilation. The process selected as the most complete is that of Mr. Day, who calls in to his aid the Archimedean screw, by which fresh air is forced into an apartment of any size without causing the slightest perceptible draught. On the last occasion of her Majesty's visit to these rooms, during the performance of the Ancient Concerts, and when attended by the King of Saxony, the Duke of Wellington, and other distinguished persons, this scientific process was tried, and although the atmosphere, externally, was 69 to 70 degrees during the whole of the evening, that of the *salon* scarcely exceeded 70 degrees, although it was densely crowded, and highly illuminated with gas. This novelty in the history of ventilation was effected by the air being passed through trays of ice. The comfort arising from so agreeable a temperature has determined the proprietors to resort to the same means on all similar occasions in future.

The next meeting of the British Association for the Advancement of Science is to be held at York on the 26th of September, which is six weeks later than the time appointed for last year's meeting at Cork. York was the first city in which the association assembled, and the event of revisiting the scene of initiation is expected to be commemorated by a full attendance of men of science from all parts of the kingdom.

We understand that Mr. Johns, the architect of the recently published English Church on Mount Zion, and sometime pro-Consul in Palestine, is about to publish a volume from his notes of travel in Syria, &c., and many months' residence in the Holy City, with highly finished illustrations, tending to throw great light upon numerous topics connected with the past and present state of these intensely interesting relics of the most ancient nations of the world.

**MORTALITY IN THE METROPOLIS.**—The number of deaths in the metropolis during the week ending Saturday, the 10th instant, amounted to 334; the weekly average of the last five summers having been 903, and of the last five years 946. The number of males that died during the last week was 473, and of females 461. Under 15 years of age, 535 died; from 15 and under 60 years, 310; and from 60 upwards, 151.

Sir John Guest, Bart., M.P., has lately received an order from Russia, for 50,000 tons of iron, for the purpose of being employed in the construction of railways.

A bronze figure of Shakspeare has been erected in the bard's birth-place. He is represented leaning on the mulberry tree, the background being a part of Dover cliff.

Upwards of 54,000,000 francs have been expended in Paris since 1834, in establishing sewers, water-pipes, fountains, and paving the streets of that capital.

**ARCHITECTURAL SOCIETY.**—On Tuesday, a meeting of gentlemen residing in Wakefield and the neighbourhood, was held in the vestry of the parish church in that town, for the purpose of establishing an architectural society in that district, in connection with the Yorkshire Society. The Rev. J. Sharpe, of Horbury was called to the chair, and the meeting was addressed by several of the gentlemen present. A committee was formed; Mr. W. H. Dykes, jun., was chosen secretary, and E. B. Wheatley, Esq., of Hopton, near Dewsbury, treasurer. The society has a wide field for its operations, and we hope soon to have the pleasure of recording some of the benefits resulting from its establishment.

**MONUMENT TO THOMAS CAMPBELL.**—It is contemplated to erect a monument in Glasgow to Thomas Campbell, author of the "Pleasures of Hope."

The expense of paving, lighting, and cleansing London is 400,000l. annually. The supply of water costs 344,238l.

 ous work, at prices according to the quality  
 of plates coloured, being partially coloured,  
 16, 15s.; Key Plate, coloured, 5s. 6d.:  
 Plain 4 4 0
- Original Working Drawings of the late Francis Goodwin,  
 of Churches and other Buildings.

N. B. An Architect and Land Surveyor will take an Out-  
 door Pupil for an interview can be had by applying at  
 the Library of Arts.

**PORCELAIN LETTERS FOR SHOP**  
**FRONTS, &c. CAUTION.**—G. BENTLEY, of  
 234, High Holborn, begs to caution the public, as several  
 mistakes have been made as to the true Patent Letters.  
 Some persons imagine that those vulgar bright blue letters  
 they have met with, and are the Patent Letters. They  
 are merely Plaster Letters, which turn black, and are only  
 fit for Marine Store Shops.  
 The PATENT PORCELAIN LETTERS are only to be  
 had at 234, High Holborn.

**SASHES AND FRAMES,**  
**DOORS, &c.**  
 Manufactured for the Trade  
 By CHAS. W. WATERTON,  
 121, Bunhill-row, Finsbury.  
 Lowest Prices.—Terms: Cash.  
 N.B. Lists of prices had on application at the counting-  
 house; if by letter, pre-paid, inclosing postage-stamp.

By her Majesty's Royal Letters Patent.  
**W. G. GOVER'S PATENT REMOV-**  
**ABLE WINDOW SASH.**—J. PIERCE, Agent,  
 289, Strand, London.

W. G. GOVER begs to intimate to Architects and Builders,  
 also to Householders generally (and to those in particular  
 who have houses in the course of erection or alteration), that  
 he is now prepared with an ample supply of PATENT STOPS  
 for rendering new and old WINDOW SASHES REMOV-  
 ABLE.

By the scale of charges given below, it will be perceived that  
 the Patentee is determined to offer his Patent to the Public  
 at such a moderate price as he trusts will recommend it to  
 universal adoption.

The advantages derivable from the use of the Patent are  
 various; although the sole object for which the Removable  
 Window Sash was invented was to obviate the danger and  
 exposure to which those of our fellow creatures are liable, who  
 are obliged to clean the outside of windows.

In the matter of economy, the Patent Removable Window  
 Sash cannot but recommend itself to all householders who  
 are not desirous of the perpetual expense of employing glaziers  
 and others to do that, which, through its aid, may be per-  
 formed by their ordinary domestics.

In addition, however, to rendering window sashes remov-  
 able, the means, by which the Patentee has effected the formation of the  
 Stops, through which this desideratum is accomplished, has  
 enabled the inventor to give to the windows, by means of the  
 Metal Stops, a degree of firmness hitherto unattainable by the  
 common method of constructing them. The Sashes will like-  
 wise be found to move much more easily and silently when  
 they are opened and shut.

Models may be inspected at the Agent's Office, 289, Strand,  
 where they will be preserved for the Patent Stops, and printed  
 directions given to all purchasers, for the use of their own  
 joiners.  
 N.B. Sold also by several of the most respectable Iron-  
 mongers.

Prices:—Sash, 1 1/2 in. 5s.; 1 3/4 in. 5s. 6d.; 1 7/8 in. 6s.; 1 3/4 in.  
 6s. 6d.; 1 7/8 in. 7s.; 1 7/8 in. 7s. 6d.; 2 in. 8s.; 2 1/4 in. 8s. 6d.;  
 2 1/2 in. 9s. 6d.

NOTICE TO INVENTORS.

**OFFICE FOR PATENTS OF INVEN-**  
**TIONS AND REGISTRATIONS OF DESIGNS,** 14,  
 Lincoln's-inn-fields.—The printed INSTRUCTIONS gratis,  
 and every information upon the subject of PROTECTION  
 FOR INVENTIONS, either by Letters Patent or the Design  
 Acts, may be had by applying personally, or by letter, pre-  
 paid, to Mr. Alexander Prince, at the office, 14, Lincoln's-  
 inn-fields.

**POLONCEAU'S BITUMEN PAVE-**  
**MENT** for paving Foot walks, Terraces, Garden walks,  
 Stables, Coach Houses, Granaries, Corn Stores, and Salt  
 Warehouses. For the exclusion of Damp and Vermin in  
 Basements it is particularly adapted, and for Roofing Dwell-  
 ing Houses, Porticos, Balconies, and Sheds. Price 3s. 6d.  
 per square yard. BITUMEN for covering the Arches of  
 Bridges, Culverts, &c. &c. on Railways and other places  
 (with instructions for laying it down), may be had at the rate of  
 4s. per ton, by applying to JOHN PILKINGTON, 18,  
 Wharf-road, City-road.

**PAYNE'S PATENT PROCESS FOR PRESERVING**  
**AND IMPROVING WOOD.**

**RAILWAY CONTRACTORS, BUILD-**  
**ERS, and JOINERS** are requested to investigate  
 the above. A liberal Discount allowed.  
 Applications for Licences to—  
 PAYNE and LODGE, Whitehall Wharf, Canon-row,  
 Westminster;  
 Or at their other stations—  
 Fleetwood-on-Wyre, Lancashire;  
 Wisbeach, Cambridgeshire;  
 Will be immediately attended to.

TO ENGINEERS, DRAUGHTSMEN, &c.  
**STEPHEN'S RULING AND MECHA-**  
**NICAL DRAWING INK,** for Engineers, Artists,  
 and Designers. This article will be found superior to the  
 best Indian Ink for the above purposes. It does not smear  
 from the drawing-pen, and never corrodes or encrusts it.  
 It may be used on a plate or slab, with a camel's hair brush,  
 diluting it with water, or thickening it by drying, as required.  
 It has the advantage of being ready for immediate use.  
 Sold in conical-shaped Bottles, convenient for using from  
 without any stand, by the Inventor, Henry Stephens, 54,  
 Stamford-street, Blackfriar's-road, and by Booksellers and  
 Stationers, 6d. each.

**THE BUDE LIGHT COMPANY** having  
 materially reduced their Scale of Prices, Churches, Chapels,  
 Theatres, Clubs, Hotels, &c., can now be supplied with  
 the PATENT ATMOSPHERIC APPARATUS, either  
 by purchase, or at an annual rental, at a very moderate  
 charge.  
 The Patent Apparatus is adapted to be used with the ordi-  
 nary coal gas; it produces a saving averaging 50 per cent.  
 on the consumption; carries off all heat, effluvia, and smoke;  
 and produces the most perfect ventilation. The House of  
 Commons, many of the metropolitan Churches, and leading  
 Club-houses are lighted with this magnificent light. Every  
 information can be obtained by applying to  
 NEVILLE BROWNE, Secretary,  
 Office, 30, Regent-street.

The Builder.

NO. LXXXIII.

SATURDAY, AUGUST 31, 1844.

**A**LTHOUGH extending to twice our  
 usual number of  
 pages, being cir-  
 cumscribed this  
 week by the volumi-  
 nous matter of the New  
 Metropolitan Building-Act,  
 we are obliged to be brief in  
 our address; deferring for  
 the present the continuation  
 of our critical reviews. In  
 the meanwhile, such of our  
 readers as take pleasure in  
 the study of technical legisla-  
 tion, or who, from an in-  
 dustrious working out of a  
 necessary duty, apply them-  
 selves to a nouseous task, may study the details  
 of the Act; and when we give our intended  
 alphabetical digest of it, drawn up by Mr. Bar-  
 bolomew, they will find the collation of the vari-  
 ous parts of their study greatly assisted, and  
 learn, in a moment, every thing in it relating to  
 any particular matter, or to any branch of its  
 contents.

We shall speculate no further at present  
 upon the Act; but shall in our next num-  
 ber give the report of the Master Carpenters'  
 Society upon it.

TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLLSON.

(Continued from p. 419.)

67. The aspen or trembling poplar, when favour-  
 ably grown, is a tall, slender, and elegant  
 tree, pleasing in outline, and the most interesting  
 of its tribe; possessing in the highest degree  
 that sensitiveness which is peculiar to the  
 whole, making them quiver to the gentlest  
 breath of wind; the young branches are hairy;  
 the leaves are glabrous on both sides, nearly  
 orbicular, and broadly toothed.

68. MAHOGANY. Of this tree there are  
 three species known; that which is used in  
 this country is a native of the West Indies  
 and the country about the Bay of Honduras,  
 in America. The West India sort is called  
 Spanish Mahogany, being from the islands of  
 Hispaniola, Cuba, Jamaica, &c. In the low  
 lands of the latter it was formerly plentiful,  
 but now these parts appear to be exhausted,  
 and only the trees grown amongst high hills and places  
 difficult of access remain. That from Honduras  
 Bay is called indiscriminately Honduras  
 and Bay-mahogany. The tree is one of very quick  
 growth; large, straight, lofty, handsome in  
 appearance, reaching a diameter of five feet,  
 and furnishing a great quantity of very valu-  
 able timber; the flowers are of a saffron-red  
 colour, the fruit like a turkey's egg in size.  
 It thrives in moist soils; but in those of a rocky  
 and exposed description, it is of a slower  
 growth, and produces heavier and more com-  
 pact and beautiful wood than in such are  
 low and of a rich nature.

69. The wood of the Spanish mahogany is  
 the darker, harder, closer in the grain, and  
 more durable, likewise the more beautiful and  
 more costly of the two: both are porous, but  
 uniform. The Spanish-wood is to be distinguished  
 from the Bay by the chalky substance  
 that occupies (as if it had been rubbed into  
 them) its pores, which in the latter are empty,  
 and have a dark or almost black appearance: that  
 feature, however, disappears with exposure and  
 oiling, and a similar treatment of both renders  
 the distinction less observable. Mahogany  
 timber, especially the Honduras, has qualities  
 which would make it desirable for house-  
 carpentry, but its high price precludes its being  
 so employed in this country, and its ap-  
 plication is almost confined to internal joinery,  
 hand-rails, shop counter-tops, and the  
 manufacture of house furniture; for the latter  
 purpose it is very extensively used, having in  
 a great degree superseded the walnut, which,  
 before the introduction of mahogany into  
 London in 1724, was so generally used by the  
 cabinet-maker. The history given of this in-  
 troduction is, that a Mr. Wollaston made from  
 a piece of it a candle-box for Dr. Gibbons,  
 who being much pleased with its appearance,  
 afterwards caused a bureau to be made of it.  
 With respect to its applicability to the purposes  
 of the carpenter, it must be mentioned that it  
 has been frequently used in Jamaica for floors,  
 joists, rafters, shingling, &c., it has also been  
 employed for building ships, for which it is  
 rendered suitable from possessing, with its other  
 qualifications, a property similar to that which  
 has been noticed with reference to the poplar,  
 of allowing shot to bury itself in it without splin-  
 tering.

70. The colour of the wood is a deep gold,  
 or reddish brown, of various degrees of bright-  
 ness, and frequently having very fine veins and  
 figures, in different shades of the same colour;  
 the Honduras is apt to be blemished by dingy  
 grey spots, but the best is of a fine rich tint.  
 When kept dry it is exceedingly durable, and  
 free from worms; but it does not stand the  
 weather long, and is therefore not well suited  
 for sash-frames, sashes, or outer-doors. The  
 trunk furnishes wood of the largest dimensions,  
 but the wood of the branches is finer in texture  
 and more variegated in the veins, and is on  
 these accounts preferred for purposes of a  
 more delicate and ornamental nature. In  
 table-tops it is common to form the surface  
 from a piece of superior beauty, sawn up into  
 veneers (of which twenty or more can be  
 obtained from an inch in thickness), and so  
 arranged in sectors of the circle that the same  
 pattern of the variegation is repeated. In like  
 manner, the fronts of drawers are obtained all  
 alike, and are sometimes made with a joint up  
 the centre of the veneer, and the two balves of  
 the pattern reversed. Thus we perceive that  
 the mottling and featherings, which contri-

bute so much to the beauty of the wood, where they exist, do so to some depth. The Honduras mahogany holds with glue better than any other wood; the annual rings are not very distinct; there are no larger transverse septa, but the smaller are frequently rendered very visible by their compactness being set off by the porous texture of the intervening parts of the wood; the wood is tasteless and inodorous.

71. The Spanish is imported to this country in logs from 10 to 12 feet long, and sometimes 26 inches square; the Honduras 15 feet long and occasionally 5 feet square. It is seasoned by exposure to the weather during a winter, then sawn out and dried in the open air under cover; fire-drying should never be resorted to. Of all woods it warps and twists the least, and it shrinks almost as little; on this account there is a considerable consumption of it in the factories, in making machine-framing; by long steeping in cold water it loses less weight than many other woods.

72. WALNUT. This tree is a native of Persia and the north of China, and is said to have been introduced into this country by the Romans. It was formerly propagated here to a considerable extent, on account of both the timber and fruit, the former having at one time been very generally used for furniture, for which it was held in high estimation; now, however, and indeed since the introduction of mahogany, its cultivation has greatly declined, and what remains and is yet grown is so much enhanced in value by the great consumption of it in gun-stocks, handles of cutlery, &c., as to make it too costly for general purposes; it is, notwithstanding, still made available in the cabinet-maker's art, being highly prized by many, who prefer its varied and rich brown colour to that of the more uniform mahogany. Though not indigenous to this country, we may, from its growing so freely, ripening its seeds so perfectly, and being so well established, consider it as naturalized to our climate, that is to the southern part of it. A rich loamy soil is best suited for it, but it will grow well nevertheless in one of a stony description, especially if a thin limestone, or consisting partly of chalk. There are considerable plantations of it on the chalky downs of Surrey. In the midland and southern counties generally it thrives to full perfection, but so far north as Edinburgh, though it grows with vigour and to an ample size, its fruit does not reach its full degree of ripeness. It is a large and handsome-looking tree, with a lofty and generally well-balanced lead, and limbs thick and spreading, forming, when aged and well-grown, an imposing and picturesque object, having a light-coloured and deeply-furrowed bark and graceful, though light and short-lived foliage. The latter comes late, goes early (in fact, it is the soonest stripped), and is never very luxuriant; the leaves are small and oval, set on the stalks in pairs, and of a bright yellowish green, contrasting advantageously with adjacent foliage of a darker shade. It is raised readily from the nut, which is, in February, sown where it is intended to remain; it may be transplanted when considerably grown, but ought not to be so if meant for timber. It is now chiefly regarded as a fruit-tree, the nutmeats being in June, when the inner woody shell is not yet formed, converted into an excellent pickle, and those which are allowed to ripen, being probably the best fruit of the nut kind that the country produces; the inhabitants of some districts on the Continent make it fulfil an important part as an article of food; it affords an oil which, when first drawn, is little inferior to that of the olive, and the bark, leaves, and roots furnish an intense brown dye, which is permanent on woollen articles without a mordant.

73. Its wood is too limber for beams or joists; besides which, for purposes where a weight has to be sustained, it is rendered unfit by a brittleness and liability to split. It was, nevertheless, employed by the ancients for building purposes; Pliny bears evidence to its possessing the good property of giving warning by cracking before it breaks (being thus just the opposite of the lime-tree), and it cannot be denied that it has the redeeming qualities of durability, little shrinkage, and, more than all other timbers, the cedar alone accepted, non-liability to the ravages of worms or other insects, which must point it out as advantageously adapted for joinery, *parquet* floors, &c., could the supply

be sufficient, and were the cost reasonable. It is, moreover, exempt from those chemical principles which operate on the fine polish of superior steel instruments, for which reason it is peculiarly adapted for surgical cases or the repositories of other superior cutlery. The colour of the heart-wood is a greyish brown, with dark brown pores; that of the sap-wood a greyish white; the annual rings are not very distinct, and there are no larger transverse septa; it is not flowered, but often richly veined, and interspersed with shades of lighter brown and of black; being susceptible of a high degree of polish by oiling or otherwise, it is capable of receiving a fine and brilliant finish. Trees grown on dry and rather poor soils have afforded examples of the most beautifully-veined wood; and the roots, which are even more finely and variously veined than the trunk, furnish an elegant material for superior and fancy work. Its texture is not so uniform as that of mahogany, one side of the annual ring being more porous than the other; neither is it quite so easy to work as that wood; but that disadvantage is compensated for by the superior surface which it takes; it is slightly bitter when green, and emits a perceptible odour.

74. The Hickory, or White—and the Black-Virginian Walnut, are both indigenous to North America. They are both large trees and furnish respectively very useful woods, that of the latter being considered the finest, and indeed the most valuable of its species, having very fine veins and a close grain, affording facility for a high polish; it has also the other desirable qualities in common with the ordinary walnut above described. The wood of the young hickory is tough and flexible to a high degree, and is excellently adapted for lances, fishing-rods, &c. It is not imported as an article of commerce, but is used, split into billets, for the stowage of casks in ships. Some of these American species have been introduced here, but they are not yet sufficiently naturalized to warrant any decided opinion on their merits. Walnut loses by long steeping in cold water less weight than some other woods.

(To be continued.)

#### ON THE CONDUCTING AND ABSORBING POWERS OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

It is taken for granted by chemists of the day that the duration of rocks, when applied to building purposes—is demonstrated by their conducting and absorbing powers; and that therefore the Builder, in the choice of his materials, where durability is concerned, should always regulate his choice accordingly. These notions, borne out by experiment, are, in numerous instances, perfectly correct in detail; but are much too general in their nature to be received by the plain, practical, or observing man, without some further observation. The composition, and consequently the characteristic qualities, of stone, is perpetually fluctuating, presenting itself under different aspects, even in the same quarry; so that, when we speak of Portland or Bath stone, Yorkshire flag, or Aberdeen granite, we necessarily embrace numerous varieties, some of which are wholly inapplicable to building purposes.

All rock, while it remains a natural constituent of the earth, maintains to the greatest extent consonant to its nature, an equilibrium of its forces, not otherwise disturbed than by excess of heat, or local chemical action. Its absorbents, like those of the tree while living, are unceasingly occupied by the juices abstracted from the earth; and if those juices embrace the simple elements of water alone, age upon age may pass away, and the rock will undergo no perceptible change; but if those juices embrace saline solutions, or gaseous bodies, and these are conveyed into the cellular texture of the rock, or are made to embrace the several atomic parts of the concrete mass, then, a sure and certain change, no matter how slow that change may be, must take place under any condition or climate; and the nature of the agents and the aggregate masses acted upon determine the ultimate result.

There is a much greater resemblance between the concrete and crystalline mass and the organic body than physiologists are disposed to admit; for all varieties of rock

have absorbents, imbale and exbale, and go through processes analogous to those which contribute to add strength and solidity to the organic frame. All rocks are permeable and are penetrated by heat and moisture; and, according to their disposition upon, or within the surface of the earth, have a slow uniform action, the result of uniform action exercised upon them they are all compounds of compounds, sums of lesser magnitudes united to each other by some one common cementing base, and not of necessity the same substances, for many rocks present phenomena very complicated and widely differing from each other. The surface portion of crystalline rock, exposed to the atmosphere, is always the hardest, and the gradual transition from crystalline structure to even the pasty state, is far from being an uncommon occurrence. Granite invariably softens as it is removed from atmospheric influences; marbles assume a higher crystalline structure, and concrete having a siliceous base become more densely consolidated in their parts: the reasons are obviously the same in all; the absorbent pores being gradually filled up with matter analogous to the crystalline or amorphous structure. The Orientals seem to have been well aware of this; for to procure those magnificent stones so common to their temples, palaces and sculptured monuments, they quarried into the bowels of the mountains, from whence they obtained the stone in a much softer state than it existed on the surface soil, and in those truly colossal dimensions which have rendered them the admiration of after-ages.

Every variety of rock has a tendency to assume the solid state, but no one of the numerous varieties ever attains solidity; they have all absorbing powers, they have all capabilities of further increase of solidity; the nature of their earths and of their compounds determining their powers of increase, and defining the limits beyond which it does not appear they can possibly pass: thus it is we have definite compounds, as porphyry, granite and marble, each of which presents phenomena peculiar to its kind, all deviations of which constitutes variety. These well-known demonstrable facts are invaluable; first, as initiating the practical man into the *modus operandi* of nature; and secondly, as removing vulgar errors, such as that crystalline rocks are fused masses, and could only be formed under intense lateral pressure.

When the stone is quarried, it becomes immediately the passive subject of new affections, no longer deriving its invigorating juices from the earth; and, exposed to influence of the atmosphere alone, the continuance of its absorbent powers depends entirely upon its own nature and mechanism, and the atmospheric influence. Bath stone, when quarried, is a soft, cohesive, ponderous mass, intimately united, but readily separable in its parts, and to a certain extent uniform in composition though of a texture much more varied than Caen stone and many other kinds. When applied to building purposes, its excess of moisture passes off by evaporation, and its spongy cellular texture exposed to atmospheric air, gradually acquires greater rigidity of parts, but still retains its great absorbent powers, and consequently its susceptibility of accelerated chemical action, which induces decay in a much more rapid manner than can take place in stone of denser structure; and although its absorbing power may not equal that of soft malm-bricks, it is far less durable than the latter, when both are exposed to equally corroding influences, as may be seen in countless existing buildings. The stone of Malta, forming the base and almost the sole composition of that island, is of a similar nature, but even more porous after exposure to the atmosphere; it is a coral formation commingled with sand, upon which the ocean-waters, by carrying into the absorbent vessels, have no other effect than to increase its solidity, until it attains the state of limestone rock.

Portland stone is exceedingly varying in its qualities, for we find it sometimes highly consolidated with silica, at other times with silica and alumina, and very often a mere concrete, and but slightly held together by some one general base; its powers of absorption are consequently extremely fluctuating and uncertain, and the extent of durability very contradictory, for while one portion of a structure built of this material has stood the test of ages, another has scarcely seen one generation pass away ere it has decayed. Magnesian lime-

## THE NATURE OF DESIGN.

*A Paper read at the meetings of the Decorative Art Society, March 13th and 27th.*

BY MR. CRABB, V.P., MEMBER OF THE INSTITUTE OF FINE ARTS.

(Continued from p. 424.)

In France, there are about eighty recognized Schools of Design. They are varied and adapted to the nature of the productions and requirements of the districts where they may be situated.

The French Schools are all open, public, and free; they are formed upon the conviction that the application of the principles of fine art and science to manufactures is the best means of improvement among the people, and a succession of legislative measures, some general, others local, have adapted these schools to the requirements of peculiar branches of industry. As an example, I will take the school of Lyons, which originated in a decree of Napoleon, dated from Warsaw. Its special object is improvement in the silk manufacture; and having gradually extended its usefulness, is divided at present into six principal departments,—painting, architecture, sculpture, engraving, botany, ornament, and *mise-en-carte*, which is the art of transferring to a fabric in manufacture any model or drawing upon paper. These departments are again subdivided into classes for particular instruction. A botanical garden is attached to the institution, and the drawings are almost invariably made from living plants and flowers. A large library of engravings is attached; a cabinet of natural history, and a very large museum. A gallery also contains all the works for which prizes have been given in the institution. Careful instruction is given on the theory and combination of colours, and their usefulness in dyeing, printing, and application to manufactures. Attached to the school are consulting chemists, whose researches are invaluable for the invention and production of durable and fine colours. We here discover the secret which produces the extraordinary superiority and brilliancy of French colouring. The influence of this school has been incalculable, having elevated alike the character of the people and of the silk manufacture; its effects are perceived in the adaptation of classical and general embellishment upon the dwellings and familiar objects of life.

One of the most remarkable circumstances in connection with the subject is the jacquard loom, whose beautiful and simple machinery produces the most intricate and delicate patterns by the common shuttle. There are particular trades that for successful design positively require the designer to be quite familiar with the manufacture, and also to be *always upon the spot*. Weaving is one of these; and in the Lyons school, *designers* intended for the silk manufacture are carefully instructed in the transmission of patterns. A manufacturer of any eminence will employ, or rather have identified with his business, three or four artists. In England, very frequently, one ill-paid and often inefficient designer serves half-a-dozen manufacturers; but at all events they are without system.

The design having been made on paper, is then extended on another paper ruled of a larger size, which shews the pattern as magnified; each square representing a thread, perhaps twenty to an inch; this is called by the French *mise-en-carte*, i.e. *putting on ruled paper*. The ruled paper is then read in, which transfers the pattern from the ruled paper, preparing the cards for stamping; after which, the process is mechanical, punching the holes in the card, and applying the card to the machine. The result is, that boys can weave rich figures in the loom; and even youths can weave those intricate patterns, which formerly would have required careful workmen of twenty years' experience.

The patterns are not shewn to customers *upon paper*, but are woven first and then shewn. The designer and weaver being in constant communication during its production, considerable alteration and improvement may have been made, and if it does not answer the artist's expectations, it is frequently wholly rejected. As many as two hundred patterns will thus be submitted to our great London houses for selection at one time. I have been delighted, at opening a selection of French furniture damasks, to see the decided difference of cha-

racteristic design, each superior in its class, the skilful variations of weaving used to produce variety of effect, and the rich mellow colouring, whatever its tone.

Thus is an overpowering array of educated talent among the weavers and their masters, opposed to our neglected workmen of Spitalfields; and can we for a moment feel surprised at their depressed trade, when the foreigner has such advantage? Yet incredible as it may appear, I know one large master weaver in particular, who contends for our perfect equality with the foreigner, declaring it to be prejudice of west-end tradesmen against English weaving. Perhaps the best answer to this is, a reference to the comparative exports. We export but a small proportion of our manufactured silks; France by far the greatest portion of hers. All this superiority, produced by the right teaching of Design, is not confined to weaving of silks; there is a universal admission of the superiority of their shawl manufacture, which commands a great trade, and upon which they bestow the most careful study. Extensive research was even instituted to discover the origin of the real and true cachmere pattern, which proving successful, greatly elevated the character of design. I may just remark, that the jacquard loom is applicable to all the fabrics of weaving,—ribbons, table linen, damasks, &c. &c.

In the Royal School of Design in Paris, the utmost activity and liberality prevail, it having seldom less than eight hundred scholars. The term of study is three years; the expense five francs for the first, and ten francs for each of the two succeeding years. The burden is borne between the government and the municipality; at Rouen, and other localities, it is the same.

Once in five years there takes place in the palace of the Louvre a public exhibition of manufactures from the whole of France; it is under the immediate sanction and personal inspection of the king, assisted by a minister of the interior; the king distributing the prizes. There is no limitation of objects, provided they are instrumental to the advancement of arts and manufactures. It is a general display of national industry and genius, exciting a lively interest in the progress of discovery and improvement, and affording quite a national exultation; in assembling from all quarters for public display, the most successful performances of manufacturing industry, they place their skill and success under favourable comparison with imports from foreign countries, a conviction of successful rivalry stimulating to increased efforts.

The merits of the various productions are discussed, and the victors' names enumerated with pride; while all persons enjoy the advantage of freely inspecting the successful productions, gaining valuable information, and perhaps possessing themselves of hints to be improved into important discoveries.

The expositor of every class obtains advantageous promulgation of his *merits*, securing a reputation for skill and proficiency in his branch of trade, and the customer learns where he can obtain the best articles, or open superior connections of business. All is emulation and excitement for improvement.

The utmost attention was paid to Design under the empire; every trinket, jewel, or piece of furniture prepared for the court, was either approved or designed by Percier or Fontaine. A similar course is still pursued, and the elevation of public taste carefully considered. The arts owe much to the zealous and generous support of Louis Philippe, who ranks only second to Louis of Bavaria, in the extent of the works of fine art he has restored, finished, or created.

These brief imperfect notices may be sufficient to draw your careful attention to the encouraging feeling for the arts and for applied design existing upon the Continent, and cause you to rebut the senseless observation, that we equal them in knowledge of its fundamental principles. It is impossible to do so without great change. We are at present bolstering up a sort of appearance, by employing foreign artists as our designers; this is unnatural, and not likely to be permanent. A German cannot think English, nor a Prussian, a Frenchman, or a Swiss; it is true, the unchangeable principles of art are alike in all countries, yet each has its distinguishing character in the great social circle of the world, and so it has in art.

stone is equally contradictory in its results; it is at all times a very great absorbent; and when exposed to heavy rains and vapours, in a moist climate like this, is the subject of rapid decay. Such will be the fate of the beautiful architectural monument of the Houses of Lords and Commons, unless averted by saturating the whole with a composition that shall destroy its absorbent powers.

Again, the nature of earth forming the chief ingredient of the rock, and the power or force of resistance possessed by the enveloping fluid, very often determine the durability of stone; the presence of lime, in any form or combination, is always inimical; it is not only a powerful absorbent, but is always greedily attacked by the oxygen of the atmosphere, and of the waters received into its pores; thus it is, the closest, the most ponderous marble, cannot contend long against out-door exposure in this country, although in hot dry countries it may endure for many ages, as is testified by the magnificent remains of ancient Greece and Rome. Even granite desquamates rapidly in an exposed situation, and rapidly so when its crystalline particles are ill assorted to each other, or are but slightly connected together.

The most durable rock, but unfortunately the most expensive, as the most difficult to sculpture, is the silico-carbonaceous. The carboniferous limestones, containing an excess of carbon and iron, are far from being abundant in this country, as applicable to building purposes, for they generally run too much into the stratified form to be quarried in huge masses; but as the argillaceous earth replaces the lime, so we find in the siderous rocks porphyry, trap, basalt, jasper, and all the hardest concrete and crystalline masses in nature, bodies whose absorbing powers are exceedingly trifling, and whose powers of resistance enable them to brave every exposure under every climate.

It is well known that of all cements made by the art of man, those which contain carbonaceous matter are by far the most durable; and in hot climates experience proves that they sometimes attain a hardness beyond that of the hardest granite, and which, like porphyry, will resist and turn the sharpest and strongest iron implement. The natives of the East Indies have a number of receipts for making their cements, using for all better works out of door the finest shell lime, which is mixed with sugared water,—2 lbs. of sugar to every gallon of water; they afterwards add *ghee* (melted butter) or cocoa-nut oil; and if for plastering the interior, they also add the whites of eggs, &c.; so that the cement shall obtain by degrees a marble hardness, previous to which it may be burnished, so as to acquire an exceeding high polish. The Persians also have a method of making black marble by triturating very highly fine shell lime, drawn from their quarries, with the black naphtha common to the country. We also read that bitumen or pitch was generally used in olden times as a cement.

I mention these things to shew that art has here followed in the step of nature; that carbon, when it gives character to rock, and as it almost invariably is accompanied with iron, is productive of that hardness which it acquires; and that, whenever it unites with lime or magnesia in the form of rock, this stone is much more valuable for all the purposes of building than any other; and though Time is very often known to bleach this stone by abstracting its carbon, yet so long as it remains, it is a sure protection against the corroding influence of the atmosphere.

The stone changes its condition after being quarried from the bed; becoming specifically lighter and more porous; it follows, that great care should be taken in all experiments made, that the material acted upon should be in its pristine state; for if exposed in the first instance to a high temperature, in order to abstract its moisture, or to ascertain its conducting powers of heat, its organic disposition must of necessity be more or less changed, and consequently the experimental results will be fluctuating, and constantly contradicting each other.

(To be continued.)

TRINITY COLLEGE, PENTHISE.—The building is now in full operation at Cairnies, the property of George Patton, Esq. The foundation stone was laid last Monday week.

France cultivated the taste of her artisans by means of schools, as far back as the time of Louis XIV., and these institutions continued to be encouraged by succeeding governments, until Napoleon's energy gave them rank and estimation; his liberal anxiety to render fine art familiar to the people was worthy of a mighty monarch. He was, in truth,

"One of earth's great spirits."

The government of Prussia, with that attention which has always been paid to the welfare of its population, founded and liberally supported schools to promote a knowledge of industrial art among her manufacturing population; and other continental nations have not neglected this important object. We, the chief of manufacturing countries, have stood alone in a contempt for cultivating taste, we have utterly neglected every means of procuring it. Our whole system has now to be changed; a great deal of that sordid feeling which pretty generally pervades all classes, must be modified or got rid of. A little more courtesy and good feeling requires to be given in the intercourse between the rich manufacturer and his designer. Ahroad, the manufacturing artist ranks as professionally entitled to respect as a man of genius, is identified with one special business, and often, through an appreciation of services, is admitted to partnership. A very opposite state of things exists in England. Patterns of designs are considered as a cumbersome expense, and not as an integral portion of the requisite cost of production. The extent of a manufacturer's ambition is to produce quantity, but this ungenerous system is fast passing away: fine art, in the shape of design, must be properly and liberally advanced. It is as clear as noonday, that we shall have to enter into competition with countries which have systematically educated their entire people to the adroit and successful application of beautiful design upon each manufacture; and having so perfectly achieved this important step, they now require to extend their trade, and for some time past, no expense has been spared, no pains left untried to effect this purpose;—possessing themselves of every improvement in machinery, models of each change, and in many instances, of the machines and workmen themselves. The effect of great continental nations approaching us in manufacturing power, while their designs for the embellishment of those productions is far in advance, has already affected our export trade, and if we do not effectually change our system of design, will do so extensively. The superior products of the French loom are almost entirely exported. In England, the exports are common goods. In paper-hangings, they entirely shut us out. In artificial flowers, an exceedingly valuable employment for females, they are large exporters. Their china is excellent. Their metal castings immeasurably in advance of ours, and their bronzes are in extensive demand. In Switzerland, the exports of watches, watch-glasses, and musical boxes, amount to the entire production. The beautiful articles of Berlin, in iron, wire, and castings of various kinds, command a considerable trade, and their calico-printing works are so extending, and produce such beautiful colouring, as threaten serious annoyance.

Germany, in connection with France, is likely to engross our house decorative trade, by exporting to us their *educated artisans*. Similar considerations might be pursued, but we have only to compare the productions of those countries with our own, and we shall find that their staples are all connected with taste, and that our staples are those of quantity. Theirs tend to elevate the whole people in mental enjoyment, ours simply aim at an increase of wealth. Persons who are accustomed to foreign manufacturing productions of the best kind, will bear testimony to the excellence of the work, especially its correct and neat finish. They invent and spread a redundancy of elegant feeling over the most simple object.

(To be continued.)

**THE IMPROVEMENTS AT SMITHFIELD.**—Workmen are busily engaged in pulling down the old premises in West-street and the neighbourhood, which were sold on Saturday last. Some surprise was excited at the sale at the amount paid for the materials; and no less than 140*l.* was the price of the bricks of five very old and dilapidated houses in West-street.

#### CHURCH-BUILDING INTELLIGENCE, &c.

**Rebuilding of the Parish Church of St. Mary the Virgin, Dover.**—We have received a circular on this subject, of which the following is a copy:—

"The Committee, as they approach the conclusion of this work, beg leave to lay the following statement before the parishioners, and the friends of the Church in general.

"Their present assets amount to the sum of 4,850*l.*; which would have covered the cost of the works specified in the original contract. But they have been subjected to very increased liabilities, on account of the following extra works, which it was as impossible to have at first foreseen, as it was afterwards to have avoided, viz.:—The digging to an enormous depth for foundations that could be securely relied on;—the additional strength found requisite for the north wall of the Church; the taking out, and firmly reconstructing the eastern side of the tower, which had become dangerously fissured by the gradual crushing of the old tower arch;—the erection of a new organ in place of an old French one, which could not have been put together again. These chief works, together with many others, which a Church *nearly undermined*, and beset with difficulties, presented, have absolutely forced upon the Committee an additional liability of 750*l.*; to meet which they now venture upon making a second earnest appeal to the parishioners especially, and also to other friends and visitors in the town of Dover. The Committee are desirous, as far as possible, of leaving the facts of their case to speak for themselves. When it is considered *what* has been done—at what personal risk—and with what degree of success—they cannot but have every hope of meeting with such liberality and good feeling as will soon enable them to liquidate the present deficiency of 750*l.*"

Voluntary subscriptions are earnestly solicited in aid of this object; and we would recommend, when they are about it—for the public safety, as well as for the character of the place—that the inhabitants do extend these to enable the committee to complete this really handsome building by the erection of a new tower, in the room of the old one, which is now not only out of all keeping, but actually topples o'er our heads. We understand about 2,000*l.* would be amply sufficient to erect a handsome new tower; and surely the friends of the Church can have little difficulty in raising this additional sum.—*Dover Chronicle.*

**A Terra-Cotta Church.**—Near Bolton-le-Moors a church has recently been built, entirely of terra-cotta—burnt clay—inside, outside, tower, and basement, all of the same material. A correspondent of the *Herald* says, "The church is situated about a mile from Bolton, near the Haugh (called the Huff). It is built of a kind of fine clay, found near the spot, between the beds of coal, in Mrs. Fletcher's mines; it is subjected to a great pressure, and then burnt. The colour is rather good—a kind of tawny. The situation, too, is very pretty. The architecture (by Sharp, of Lancaster,) is very florid Gothic—too much so, perhaps, for the form of the arches, which cannot be of a much later date than Edward III.; but I speak doubtfully. The interior is enormously decorated—the roof of dark-stained oak; the floor is of tile, inlaid with numbers of crosses; the steps of the communion eucastic tile, and all other matters to match. The seats are open, not formed into pews. The building, which, I believe, is not yet dedicated, forms a lovely object for a landscape."

#### RAILWAY INTELLIGENCE.

**Lancaster and Carlisle Railway.**—The works at Shap and Lowther Bridge are now in rapid progress; and it is expected that in the course of another week or two, the engagements for taking possession of the land at Wray will be completed, and ground will be broken there also; all the heaviest works upon the line will then have been commenced except those at the Lancaster end.

The *Railway Record* states that the terms between the Dover and Greenwich Companies for a lease of the line were on Friday arranged to the satisfaction of all parties.

**South Devon Railway.**—The works of this Company at various places along the line between Exeter and Newton, have been actively commenced. A number of men are employed in tunnelling near the Teignmouth beach towards Dawlish; and the line is staked out from Dawlish beach to Starcross. Two shafts have been sunk on the Brent side of the Marley Tunnel, to the depth of 60 feet, which is considered the level required on this side of the hill; on the other side the shafts will be considerably deeper. The progress of the works is at times impeded by a flow of water into the shaft. The strata is of slate dunstone for about 20 feet below the surface, a mixture of clay of slight thickness, and very hard slate, with veins of white spar at the level of the line.

**Railways in Germany.**—The Thuringian Railway was finally agreed upon, and the arrangement concluded, on the 4th of this month. It required the joint consent of Prussia, Saxe-Weimar-Eisenach, and Saxe-Coburg and Gotha to open this means of communication, and it is by their co-operation that it is to be completed. How remarkable are these railways as elements in moral and political history, which at once bind together nations in perpetual relations of amicable intercourse, and emancipate them from the fetters of narrow local views and provincial prejudice! Cologne to Minden.—The section of this line between Cologne and Duisbourg is to be ready next year, and the remainder in 1847. If the Hanoverian line be then ready, there will be a continuous railway communication by this route from London, by Dover, and from Ostend, by Brussels, to Berlin. Where next?—*Railway Chronicle.*

**Eastern Union Railway.**—Preparations are making for the commencement of the works, and in the course of next week the excavators will begin their labour. The spot selected for the first operations is the hill occupied by the village of Brantham, overlooking the valley of the Stour. The greatest depth of cutting is 52 feet, and this is the only work of any magnitude upon the whole line. Immediate steps are taking for the extension of the railway to Norwich and Bury.

**Great North Road.—Burntisland Branch.**—The trustees have begun their operations for the improvement of this branch of the road, which, taken in connection with the low-water pier at Burntisland, will greatly facilitate the communication between the south and north sides of the Frith of Forth at this place. The steam-boats are to sail hourly during the day from each side of the passage.

**Newcastle and Darlington Railway.**—Since the opening of the Newcastle and Darlington Junction Railway, the revenue of the York and North Midland Railway has increased 500*l.* per week. The branch from York to Scarborough is to be opened in July next, and there is to be an extension to Bridlington.

The contractors on the York and Scarborough Railway are actively carrying on their operations in the neighbourhood of Seamer, and also at Malton.

The directors of the Midland Railway Company have determined to connect the town of Stamford with their line by a branch railway.

**BRISTOL DOCKS.**—Mr. Brunel had a lengthened interview with the dock directors, on Thursday week last, for the purpose of presenting plans and sections of the proposed repairs and enlargement of the lock at Cumberland Basin. Mr. Brunel stated to the board that, having conferred with several contractors, he was enabled to declare confidently that the lock could be extended to 54 feet in width, at a cost not exceeding his previous estimate. Mr. Brunel was requested to prepare some further estimates as to the cost of repairing the lock in its present form and dimensions; and it is understood that the dock proprietary will be called together to consider the subject within the next fortnight or three weeks.

**BIRKENHEAD DOCKS.**—The day for laying the foundation-stone is fixed for the 25th of September instead of the 11th, as originally named.

## Correspondence.

## ARCHITECTURAL COMPETITION.

SIR,—I am induced to offer a few remarks on the important but almost thread-bare subject of architectural competition, in consequence of seeing the late discussion in your pages about the Derby affair.

Competitions generally give rise to a scene of confusion, bickering, and ill will, either in consequence of the partial decision of the committee appointed to examine the designs, or it is to be attributed to the malice of those architects, who, disappointed in their hopes, strenuously endeavour to ridicule the committee, or ascribe to the successful competitor a line of conduct, which, in most cases, they know full well would have been followed by themselves, had they the opportunity. In proof of this, I would draw the attention of your readers to the letter of "F," at page 365 of THE BUILDER, where, after laudably exposing the "infamous system of sham competition" in reference to Mr. Duesbury, and lamenting that the expense to which architects are obliged to go, should be so misapplied, very unwittingly lets out the secret that he sometimes sends in designs to competitors, relying on his strong interest with the committee; very truly; "in the vain hope of standing on their merits;" certainly a most consoling reflection for those architects who may have been duped by him; and a confession which just amounts to the fact, that when he happens to have an opportunity of canvassing the committee beforehand, he is one of those who seldom neglects such an opportunity, and therefore "F" must be content to rank no higher in the matter of honour than Mr. Duesbury. I allude to this as a sample of what generally follows a competition, and to warn your readers of putting too much confidence in such angry communications.

But to return to the subject of competitions: it will be my endeavour to shew the inability of the present methods towards procuring a correct and just decision, and then to throw out a hint or two for the formation of a better system. The persons generally appointed to constitute a committee for inspecting the designs, are persons of local influence, and of a very respectable station in society, but who from their habits of life, know nothing, or at most very little, of the principles of architecture; these generally manage to get a neighbouring builder with them of some influence, who is generally connected with a local architect; the builder with the aid of a few technicalities in his conversation, and an abundant flow of high-sounding terms, makes a sensation on his fellow-committee men, who are well aware of their ignorance on the subject, and by this means finds little difficulty in persuading the committee to decide on the marked design. This is one of the present modes adopted; and though, in some cases, the detail and circumstances may differ, yet it rarely happens that there is not some hidden current at work, which by choosing the architect beforehand, becomes a source of gross injustice to the rest of the competitors. Such a method cannot be defended on any grounds; it fosters bad taste, and proves a hot-bed for the growth of angry feeling; the very idea of such a committee sitting down to give an opinion on fifty or sixty elaborate designs on a subject, with which many of them are totally unacquainted, is ludicrous, but it is a fact which stares us in the face every week in the year. It would be wasting your valuable space to dilate any further on a subject which is at once so palpably unjust and defective; I shall, therefore, proceed to notice another mode, which though far superior to the last one, fails in many instances of procuring a correct decision; it is when the committee appoint an architect to examine the designs, and give his opinion thereon. Though it is hardly possible for an architect to err so far from the mark as a committee might, yet most architects have certain prejudices in regard to styles, &c., which would operate fatally against those who happened to differ from them; at the same time a serious objection is, that it leaves room for jobbing, it being possible for an architect to have his opinion so warped, as to suit a friend's interest. Having thus expressed my hostility to the two methods most commonly adopted, I shall now describe the outline of a plan, which, I think, would effectually prevent any under-handed work,

while, at the same time, it ensures the best and most correct opinion on the designs:—it is, to make the competing architects the judges. This might easily be done by the committee appointed meeting first to examine the designs, and then by advertisement, notify to the competitors that, on a certain day, the designs would be open for their inspection; each architect would then give in his opinion in writing to the committee (of course omitting his own design); and the premium would be awarded to the design having the majority. It would rest with the committee either to approve or reject a design, with such a recommendation. This method possesses many great advantages in its favour; the numbers of the architects, and their being interested parties, would effectually preclude all attempts at making a job of it: the architects being of all persons best acquainted with the peculiarities of the proposed building, would ensure a correct decision: and the present expensive method of sending in designs with landscapes drawn by artists, and other superfluities, would be needless; as architects are not likely to give much attention to a design because the trees in the fore-ground are painted so naturally, or an Italian sky is staring them in the face. This last effect would do good, in purging competitions of the immense number of trashy designs usually sent in, whose sole merit is having a fine landscape, painted so as to bewilder the judgments of the committee; and therefore might induce architects to pay more attention to the design, and less to the picture.

There is one objection I would name, which, however, is soon answered; about the expense of travelling; if architects can afford to pay 10*l.* or 15*l.* to ornament designs, on the bare possibility of obtaining a premium under the present uncertain mode of committees, I certainly think they can afford to pay the same for travelling expenses; with the prospect of having a correct judgment passed on the designs. This plan will, no doubt, meet with opposition from those who are so fond of interest with committees, &c.; but it would tend to draw out genuine talent in young architects, and would raise the present low state of architecture in the country; and, if in some details it is defective, at all events it is worth a trial. Before I conclude, I would say a few words on the premiums generally offered: it is very usual to see an advertisement for a proposed building costing 1,500*l.*, and one magnificent premium of 10 guineas offered: this needs little comment, and it surprises me to see fifty or sixty designs sent in, when the premium, if obtained, will not pay necessary expenses. Architects who send in designs to such competitions deserve to be made the dupes of some favoured professional, who very comfortably takes a hint or two gratis from the other designs, when they happen to suit his purpose. This, perhaps, may solve the question so often asked, how it is that designs executed, resemble in many features designs rejected? Though this is bad enough, it is sometimes surpassed, when a committee inform the architects that fortunate competitor will only have the honour of superintending the building,—generous committee! This, perhaps, may be the reason why architects are so fond of dressing up their designs in splendid coats, that they may shew they have a due sense of the eye dazzling and brain-bewildering liberality of the committee; such conduct ought never to be defended. Most unreasonable is it to suppose that architects are to risk time and money for the charge of superintending a building perhaps 100 miles from home; and the most strange part of the business is, that so many architects send in designs with such an insult in their face. For any competition not less than two premiums should be awarded, and they should always bear a fair proportion to the cost of the building, so as to sufficiently recompense an architect for the necessary loss of time and money; and architects should always, when practicable, carry into execution their own designs: no other person can imbibe the spirit of the designer; and any faults could then be laid on the shoulders of the proper person. I will now conclude by observing, that it is in the power of architects, seconded by the efforts of THE BUILDER and other journals, to amend existing grievances, and that while men of talent and influence lend themselves to conduct so mean and despicable, and while the present imbecile method of judging by committee

continues, the efforts of the few must be directed to exposure and shame; then, and not till then, will architecture be calculated to raise the minds of men: at the present time the sole object seems to be, how they may soonest fill their purses. I must make the importance of the subject an apology for the length of this communication.

I remain, your obedient servant,  
SCRUTATOR.

London, August 21st, 1844.

## THE NEW ROYAL EXCHANGE.

ON Saturday last workmen commenced placing the bells in the belfry of the tower of the New Royal Exchange, of which there are to be fifteen. There are seven of them on the ground, which weigh above 38 cwt. The bell which is the lightest weighs 4 cwt, and 26 lbs. This is B flat, and the chord bell to it weighs 6 cwt, and 27 lbs. The whole of the bells will weigh above 80 cwt, and will be at the Exchange in the course of the next week. The contractor for them, Mr. Mears, will superintend the placing of them. It is expected that they will be in their several positions in the course of ten days. The mechanism of the clock will then be put up. The stone masons have begun to lay down the flag-stones outside the building, under the direction of Mr. Collingshaw, the superintendent of the works. The first stone being laid down opposite the Wellington testimonial. The operation will be finished in about three weeks, by which time the external front of this structure will have been cleaned down. It is expected that about the middle of October the merchants will be able to be admitted for the transaction of business.

## Miscellanea.

METROPOLITAN IMPROVEMENTS.—Between Holborn and Oxford-street the line of the new street is in a state of considerable forwardness. The vaults for the houses on either side of the way are completed, and the width of the thoroughfare is now marked out; through the whole distance a sewer, about 15 feet below the surface, is being formed, and is nearly half completed. When the whole length is finished (which is now expected to be in the course of three or four weeks), there will be a direct communication between Holborn and Oxford-street for foot passengers. Many now take this course, avoiding the circuitous way by St. Giles's Church. While digging the ground for the vault on the site which was formerly the area of the Rookery, the workmen met with some curious remains. Outside the walls, where stood the hospital for lepers, was found the roof of a vine, which is stated to have been celebrated for its fruit, and which was in good condition. Several pieces of marble slabs were also taken out of the ruins of the above hospital, as also a marble slab with the following inscription on it:—"Buckeridge-street, 1688." It is not generally known that this street was built shortly after the fire of London, and out of some of the materials, which were publicly sold after that disastrous calamity. A quantity of wood excavated here (some of which is oak) was discovered to be in a charred state. Several of the above articles are in the possession of the landlord of the Buckeridge Arms, which is the only house remaining of that neighbourhood.

MEDALS OF CATHEDRALS.—Mr. Joseph Davis, of Birmingham, is now issuing a series of very beautiful medals illustrative of the Cathedrals of this country. The medals are of a size sufficient to afford accurate and striking views of these glorious temples, and those which have been seen are executed with much taste and ability. The series is brought out under the patronage of Prince Albert and the chief dignitaries of the church.

A very interesting relic, a gold coin, in fine preservation, was found a short time since by a woman in a turnip field, close to the ruins of Caister, near Lakenham. The coin bears date during the reign of Nero, and contains a fine impression of the Roman monarch. It is about three times as thick, but not so large in circumference as a half-sovereign—weighs four penny-weights, and is composed of the purest gold. It was sold to Mr. Rossi, in the Market Place, and was the first gold coin remembered to have been found at Caister.

VIEW IN THE COURTYARD OF MONTAGUE-HOUSE  
(FORMING THE ORIGINAL BRITISH MUSEUM).

MUSEUM from the Greek *μῦσείον*, was a name originally given to a palace, or vast range of buildings in Alexandria, and which, history informs us, took up one-fourth of the city. This quarter was called the Museum, on account of its being set apart for the Muses, and the study of the sciences. Here were lodged and entertained the men of learning, who were divided into many companies or colleges, according to the sciences of which they were the professors; and to each of these colleges was assigned a handsome revenue. The foundation is attributed to Ptolemy Philadelphus, who here placed his library. Sir John Tradescant, in the reign of Charles I., was the first who formed a cabinet of natural and artificial curiosities in England; he possessed large botanical gardens in Lambeth: his son assisted in making a large collection, which becoming the property of Mr. Elias Ashmole, was presented by him to the University of Oxford, and a museum was then formed, called the Ashmolean Museum. Dr. Woodward is the next collector mentioned, and the fruits of his labours came to be included in the superb and splendid one of Sir Hans Sloane, which now constitutes part of the British Museum.

Sir Hans Sloane, Bart., who died January 11th, 1753, may with propriety be accounted the founder of the British Museum; for the occasion of its being established was only in consequence of his leaving by will his noble collection of natural history, his large library and his numerous curiosities, which cost him 50,000*l.*, to the use of the public, on condition that Parliament would pay 20,000*l.* to his executors. This disposition of the property was well-timed, as it necessitated Parliament to provide a place for its bestowal, and the necessary fund for the maintenance of its

officers and servants. Sir Hans appointed a number of trustees, on whose application to Parliament an Act was passed for raising 300,000*l.* by way of lottery, 200,000*l.* to be divided among the adventurers, 20,000*l.* to be paid to Sir Hans Sloane's executors, 10,000*l.* to purchase Lord Oxford's manuscripts, 30,000*l.* to be vested in the funds for supplying salaries for officers and other necessary expenses, and the residue for providing a general repository, &c. In the Act it also ordained, that Sir Hans Sloane's collections, the Cottonian Library, the Harleian Manuscripts, and Major Edwards's collection of books, should be placed together in the general repository, which was to be called the British Museum; 7,000*l.*, also left by Major Edwards, was to be appropriated for the purchase of manuscripts, books, &c.

It happened very fortunately while the trustees were at a loss where to purchase or build a proper repository, an offer was made to them of Montagu House, one of the largest and most magnificent houses at that time in London. This palace, together with its garden and appurtenances, occupying in the whole an area of 7 acres and 20 perches of land, was therefore ceded by the representatives of the Montagu family, for the moderate sum of 10,000*l.*

Montague House was built by Ralph the first Duke of Montague, who was sent ambassador extraordinary to the French King, and made his public entry into Paris on the 25th of April, 1669, in a splendid and magnificent manner, having seventy-four pages and their footmen in rich liveries; twelve led horses with their furniture; twenty-four gentlemen on horseback; with eighteen English noblemen and gentlemen of quality, in four rich

coaches, each drawn by eight horses, and two stately chariots, made as beautiful and costly as art and workmanship could contrive, each drawn by six horses. The ambassador himself was conducted to his audience in the French monarch's state coach. In France he formed his ideas of building and gardening; and his house at Boughton, in Northamptonshire, and Montague House, in some sort imitated from the royal palace at Versailles, amply indicate his taste for magnificence.

On the site of Montague House had stood a very stately mansion, and during Lord Montague's retirement in France at the latter end of the reign of Charles II., and the commencement of that of James II., for whose Bill of Exclusion his lordship had been very active, Lord Montague had left that mansion to the Earl of Devonshire, reserving some rooms for his own use; unfortunately, the whole was consumed by accidental fire, January 20th, 1685-6, by which he sustained a loss of 30,000*l.*; and to complete his misfortune, James II. bestowed his lordship's place of Master of the Great Wardrobe, on his favourite Lord Preston, though Lord Montague had purchased it of the Earl of Sandwich, and had a patent for it for life. During the remainder of that inauspicious reign, Lord Montague was indefatigable in rebuilding the mansion as it stood when purchased by the public, and it was observable that little or no alteration could be made from the original model. In Queen Anne's reign he was reinstated and raised to the highest rank of the peerage, by the titles of Marquis of Mountberrmer and Duke of Montague.

The house was designed by the architect, Peter Puget, and other French artists were sent over from Paris for the

purpose of erecting and adorning the edifice. The staircase and ceilings were painted by Rousseu and Le Fosse; the Apotheosis of Iris and the Assembly of the Gods were by the latter. His Grace's second wife was the mad Duchess of Albemarle, widow to Christopher, second Duke of that title. She married her second husband as Emperor of China, which gave occasion to a scene in Cibber's play of "The Sick Lady Cured." She was kept in the ground apartment during his Grace's life, and was served on the knee to the day of her death, which happened in 1734 at Newcastle House, Clerkenwell, at the age of 96. The second Duke and Duchess lived only in one of the wings till their house at Whitehall was completed.

The site of Montague House was a square, inclosed by a high brick wall, which excluded a view of the house in every direction. At each corner was a turret, and over the great arch of entrance a cupola (containing a clock), as shewn in the views already published in THE BUILDER. On the south side of the

court-yard is still existing, within the gate, a colonnade of the Ionic order. The Museum, as represented in the cut, consists of a building about 216 feet in length and 57 feet in height to the top of the cornice; and the ascent to the house is by three flights of stone steps, the centre of which leads to the hall. The paintings on the staircase represent Cæsar and his military retinue; in a compartment are the feasts and sacrifices of Bacchus; on the ceiling is represented the story of Phaeton. At the time the mansion was purchased it was in a very delapidated condition in consequence of having been many years untenanted. On its west side was a flower-garden and a terrace, disposed with much taste, and shaded by numbers of flowering trees and shrubs, and this communicating with a lawn on the north that was bounded by the fields and terminated by the view of Highgate, Hampstead, and the intermediate country.

On the west side of the lawn was a double avenue of lime trees, and in the front of the building a fine fountain.

George II. gave the whole of the library of printed books and manuscripts which had been gradually collected by our kings from Henry VII. to William III. George III. gave a numerous collection of pamphlets. In 1824 the valuable and extensive library formed under the direction of George III. was presented by George IV.

Vast additions have been made to the original building during the present century, and in a year or two every vestige of the old house will have disappeared, the façade of new the buildings being already in a forward state.

There is some fine carving at the principal doorway leading from the noble flight of steps to the entrance hall, and the door itself is curiously inlaid: the brackets of the principal external cornice of the house may be perhaps worth imitating on some occasion, and at any rate deserve to be admitted among a collection. The great staircase of the mansion is with its manifold curtail, its iron work, its paintings and other decoration, worthy of admiration; as are the chimney-stacks, the inlaid floors, and the other finishings of the extensive pile.

Of some of these we hope to preserve memorials. x x x x

SEAL OF THE DEAN AND CHAPTER OF ST. PAUL'S, LONDON.

SIR,—The seal, a copy of which I send to you, is attached to the surrender, by Nicholas Ridley, Bishop of London, to the Crown, of the manors of Stepney and Hackney, 4th Edward VI. (1549-50) in the Augmentation-office.

It is not engraved in "Dugdale's History of St. Paul's," nor is it noticed in the "Monas-

tion," but there is a very fair impression of it among a collection of original seals in the British Museum.

On the obverse is the representation of the front elevation of the church of St. Paul, with the following legend round it:—SIGILLUM: ECCLESIE: SANCTI: PAULI: LONDONIARUM. (The seal of the Church of St. Paul, London.)

On the reverse St. Paul is represented seated under an architectural canopy, holding in his right hand a sword, and in his left a book, with the legend following round it: MYCRO: FUROR: SAULI: LIBER: EST: CONVERSIO: PAULI (The sword is the fury of Saul; the book the conversion of Paul).

Hackney. M. A. G.

AN ACT FOR REGULATING THE CONSTRUCTION AND THE USE OF BUILDINGS IN THE METROPOLIS AND ITS NEIGHBOURHOOD.

CLAUSE 1, after reciting the defects in the existing laws for the accomplishment of the objects contemplated by the present Act, proceeds:—

GENERAL PROVISIONS.

Operation of Act—Statutes repealed.

Now for all the several purposes above mentioned, and for the purpose of consolidating the provisions of the law relating to the construction and the use of buildings in the metropolis and its neighbourhood, be it enacted by the Queen's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, that with regard to this Act generally, so far as it relates to the operation thereof in reference to time, it shall come into operation at the following times; (that is to say,) as to the districts and the officers to be appointed in pursuance hereof on the first day of September next, and as to the buildings, streets, and other matters on the first day of January one thousand eight hundred and forty-five; and that on the said first day of January all the Acts mentioned in the schedule hereto annexed, except so far as in the said schedule is provided, shall be and are hereby repealed.

Construction of Terms—Street—Alley—Square—Floor—Story—External Wall—Party-wall—Already built—Hereafter to be built—Parish—Owner—Official Referees—Surveyor—The Surveyor—Month—The Commissioners of Works and Buildings

—Justice of Peace—Local Officers—Singular and Plural—Masculine and Feminine—Corporate Body.

2. And be it declared, with regard to this Act generally, so far as relates to the construction of certain terms and expressions used therein, that the following terms and expressions are intended to have the meanings hereby assigned to them respectively, so far as such meanings are not excluded by the context, or by the nature of the subject-matter; (that is to say),

The word "street" to include every square, circus, crescent, street, road, place, row, mews, lane, or place along which carriages can pass or are intended to pass, and that whether there be or be not, in addition to the carriage-way, a footway, paved or otherwise:

The word "alley" to include any court, alley, passage, or other public place which can be used as a footway only:

The word "square," as applied to any area of building, to contain one hundred superficial feet:

The word "floor" to mean the horizontal platform forming the base of any story, and to include the timber or bricks or any other substance constituting such platform:

The word "story" to include the full thickness of such floor, as well as the space between the upper surface of one floor and the under surface of the floor next above it; or if there be no floor, then the space between the surface of the ground and the under surface of the floor next above it:

The term "external wall" to apply to every outer wall of buildings now built or hereafter to be built, which (excepting the footing thereof on one side) shall stand wholly upon ground of the owner of such buildings, and shall not be used or intended to be used as a party-wall under the definition hereinafter contained, whether the same shall adjoin or not to other outer or to party-walls:

The term "party-wall" to apply to every wall which shall be used, or be built in order to be used, as a separation of two or more buildings with a view to the occupation thereof by different families, or which shall be actually occupied by different families, and also every wall which shall stand upon ground not wholly belonging to the same owner to a greater extent than the projection of its footing on one side:

The term "already built," used in reference to buildings, to apply to buildings built before the first day of January one thousand eight hundred and forty-five, or commenced before that day, and covered in five, or commenced before that day, and covered in five, or rendered fit for use within twelve months thereafter; and, used in reference to streets and alleys, to apply to all streets or alleys made or laid out before that day, and which shall be formed and rendered fit for use within twelve months thereafter:

The term "hereafter to be built," used in reference to buildings, to apply to all buildings to be built or commenced after the first day of January one thousand eight hundred and forty-five, or which, being so commenced, shall not be covered in within twelve

months thereafter; and, used in reference to streets and alleys, to apply to all streets or alleys not laid out before the said first day of January, or which, being laid out, shall not be rendered fit for use within twelve months thereafter:

The word "parish" to include all parochial districts and extra-parochial places in which separate churchwardens, overseers, or constables are appointed; and where two parishes have been united for ecclesiastical purposes, then to include such united parishes:

The word "owner" to apply generally to every person in possession or receipt either of the whole or of any part of the rents or profits of any ground or tenement, or in the occupation of such ground or tenement, other than as a tenant from year to year, or for any less term, or a tenant at will:

The term "official referees" to mean the persons appointed in pursuance of this Act to be official referees of metropolitan buildings:

The word "surveyor" to apply to all surveyors to be appointed in pursuance of this Act, or whose appointment is confirmed by this Act, and also to all deputy or assistant surveyors to be appointed under this Act.

The words "the surveyor," used without any addition, to mean the surveyor in whose district the buildings, street, or alley, or other subject-matter shall be, or any deputy or assistant surveyor duly acting in his behalf:

The word "month" to mean a calendar month:

The expression "the Commissioners of Works and Buildings" to mean the Commissioners of her Majesty's Woods, Forests, Land Revenues, Works, and Buildings:

The expression "justice of the peace" to mean a justice of the peace for the county, division, or liberty within which the subject-matter, or other subject-matter, or any part thereof, is situate; unless it be situate within the city of London or the liberties thereof, in reference to which any matter or thing elsewhere required or authorized to be done, either by one or by two or more justices of the peace, may be done, either by the Lord Mayor of the City of London, or by any one, two, or more justices of the peace for the said city; or unless the subject-matter be situate in the district of any police court of the metropolis, in reference to which any matter or thing elsewhere required or authorized to be done by two or more justices may be done by one magistrate:

And, generally, whenever the name of an officer having local jurisdiction in respect of his office is referred to, without mention of the locality to which the jurisdiction extends, such reference is to be understood to indicate the officer having jurisdiction in that place within which is situate the building or other subject-matter, or any part thereof, to which such reference applies:

And, subject as aforesaid to the context and to the nature of the subject-matter, the words importing the singular number are to be understood to apply to a plurality of persons or things, and words importing the masculine gender are to be understood to apply to persons of the feminine gender, and words importing an individual are to be understood to apply to a corporation or company, or other body of persons.

*Extent of Operation of Act in reference to Localities.*

3. And be it enacted, with regard to this Act generally, so far as relates to the operation thereof in reference to localities, that the operation of this Act shall extend to all places within the following limits; (that is to say,)

To all such places lying on the north side or left bank of the river Thames as are within the exterior boundaries of the parishes of Fulham, Hammer-smith, Kensington, Paddington, Hanstead, Hoxsey, Tottenham, Saint Pancras, Islington, Stoke Newington, Hackney, Stratford-le-Bow, Bromley, Poplar, and Shadwell:

And to such part or parish of Chelsea as lies north of the said parish of Kensington:

And to all such parts and places lying on the south side or right bank of the said river as are within the exterior boundaries of the parishes of Woolwich, Charlton, Greenwich, Deptford, Lee, Lewisham, Camberwell, Lambeth, Streatham, Tooting, and Wandsworth:

And to all places lying within two hundred yards from the exterior boundary of the district hereby defined, except the eastern part of the said boundary which is bounded by the river Lea.

*Power to extend the Limits of Act—Publication of Notice of Intention to extend Limits of Act.*

4. And forasmuch as, partly by the rapid increase of population in the neighbourhood of the districts to which this Act is to apply, and partly by the tendency of this Act to induce building speculation in such neighbourhoods in order to evade the provisions thereof, the evils which have arisen in the districts now subject to regulation will in all probability arise in such neighbourhoods, it is expedient to make provision for the prevention of such evils, and if they should arise, for the remedy thereof; now for those purposes be it enacted, with regard to this Act generally, so far as relates to the application thereof to other parts and places in the neighbourhood of the districts appointed by this Act, whether such districts immediately adjoin such parts or places, or not, that if, from the growing increase of the population or otherwise, it shall appear to her Majesty in Council to be expedient that the provisions of this Act should be extended to any place within twelve miles from Charing Cross in the city of Westminster, then it shall be lawful for her Majesty in Council to direct, by order in Council, that at or from a time to be named in such order the provisions of this Act shall apply to such places; and at or from such time all such provisions, of whatever nature, whether penal

or otherwise, so far as they shall be capable of application to such places, shall be and are hereby declared to apply thereto as if such places were expressly named herein; and that notice of the time when it shall please her Majesty to order any such extension to be taken into consideration by her Privy Council shall be published by royal proclamation in the London Gazette, one month at the least, before such extension shall be so taken into consideration; and that three weeks at the least before such matter shall be so considered it shall be the duty of the official referees, and the overseers of the parishes within which such parts or places are situate, to cause copies of such proclamation to be fixed on the doors of the churches and chapels within such parishes; and that every order in Council made in pursuance of this enactment shall be published in the London Gazette.

#### BUILDINGS, NEW AND OLD.

*Regulation of Buildings—Rates of Buildings, and Thickness of Walls and Footings, and Rules concerning Building.*

5. And now generally, for the purpose of regulating the building and the rebuilding upon sites of former buildings, and the enlarging and altering of all buildings of what nature soever, within the limits aforesaid, be it enacted, with regard to every such building hereafter to be built (except the buildings comprised in schedule (A.), hereinafter mentioned and referred to) made by or under the direction of any Commissioners of Sewers), so far as relates to building the same, and with regard to every such building either already or hereafter built (except the said buildings comprised in the said schedule (B.), and except the said sewers), so far as relates to the rebuilding and the enlarging or altering the same, and that whether such buildings be built or rebuilt on old new foundations, wholly or partly on new foundations, that notwithstanding any thing contained to the contrary in any Act of Parliament now in force, every such building shall be built, rebuilt, enlarged, or altered in reference to the walls, whether external or party-walls, and to the number and height of the stories or rooms therein, and to the chimneys, and to the roofs, and to the eadings, and to the drains, and to the projections, and to any other parts or appendages of every such building, and in the manner of the materials, and in every other respect in conformity with the several particulars, rules, and directions which are specified and set forth in the several schedules (C.), (D.), (E.), (F.), (G.), (H.), (I.), (K.) to this Act annexed, according to the classes of buildings, and the rates of such classes to which such buildings are by the schedule (C.) declared to belong; subject nevertheless to any other rules and directions in this Act contained in the same behalf; and subject in every case of doubt, difference, or dissatisfaction in respect thereof, either between any parties concerned therein, or between any party concerned and the surveyor of the district, to the determination of the official referees, upon a reference of the matter in question, according to the provisions of this Act in that behalf.

*Buildings under Supervision of Official Referees.*

6. And be it enacted, with regard to all buildings of the first rate of the second or warehouse class, and to all buildings of the third or public building class (except the buildings hereinbefore excepted), so far as relates to the supervision thereof, that, subject to the provisions in schedule (C.) and elsewhere in this Act made in respect thereof, every such building shall be built under the special supervision of the official referees, according to the provisions of this Act in that behalf, as well as under the ordinary supervision of the surveyor; and if any difference arise as to whether any such building be liable to such special supervision, the same shall be determined by the official referees; subject nevertheless to an appeal, at the instance of any party interested, to the Commissioners of Works and Buildings, whose decision in the matter shall be final.

*Special Supervision of exempted Buildings.*

7. And whereas by several Acts now in force certain buildings and structures have been exempted from the operation of the Act mentioned in the schedule (A.) hereto annexed, for the regulation of buildings and party-walls within the cities of London and Westminster, and the liberties thereof, and other the parishes and places therein mentioned; be it enacted, with regard to the buildings heretofore exempted and comprised in schedule (B.), so far as relates to the supervision thereof, that notwithstanding any thing contained to the contrary in any Act or Acts now in force, every such building or structure mentioned in the said schedule (B.) Part I. shall be subject to special supervision by the official referees, according to the provisions of this Act in that behalf, and every such building or other structure mentioned in the said schedule (B.) Part II. shall be exempt from supervision.

*Buildings not within Rates.*

8. Provided always, and be it enacted, with regard to any building of whatever kind which is not hereby expressly assigned to any class or rate of a class, so far as relates to the application of this Act thereto, that if any party be desirous of erecting any building which does not come within any one of the said classes, or of any rate of such classes, then such building shall be built in accordance with such class and rate as shall be directed by the surveyor, subject, as in other cases of doubt, difference, or dissatisfaction, to an appeal to the official referees.

*Modification of Building Contracts—Reference to the Surveyor, or on Appeal to the Official Referees.*

9. Provided always, and be it enacted, with regard to any building of whatever class, so far as relates to

the modification of any written contract or agreement now in force for erecting or altering such building (other than a contract or agreement in the nature of a building lease), that it shall not be lawful to execute such contract otherwise than in conformity with the provisions of this Act; but it shall be lawful for either party and he is hereby entitled to deviate from such contract, so far as respects the execution thereof, as executed after this Act shall have come into operation; and the alterations rendered necessary by this Act shall be performed as if this Act had been in force when such contract was entered into; and that if the parties thereto shall disagree about the difference of the costs and expenses of the works when performed according to the provisions of this Act, and the works as stipulated for in such contract, then, upon notice being given in writing by one party to the other, it shall be lawful for either party and he is hereby entitled to refer the matter to the surveyor, who shall determine the same, subject to appeal as aforesaid to the official referees; and the award of such official referees shall be final and binding on all the parties, and in all respects as if such award had formed part of the contract; and the costs of the reference shall be borne by all or any other of the parties in such manner and proportion as the surveyor, or in case of appeal as the official referees, shall appoint.

*Modification of Building Leases—Application to Official Referees—Proceedings thereon.*

10. Provided always, and be it enacted, with regard to any building, of whatever class, so far as relates to the modification of any existing lease or agreement for a lease, being of the nature of a building lease, and whereby any person may be bound to erect buildings, that notwithstanding any thing herein contained, if it be made to appear to the official referees that any rule by this Act prescribed will prevent the due observance of or be at variance with any such lease or agreement, and that the objects of this Act may be obtained by modifying such rules, either entirely or partially, in conformity with such lease or agreement, then it shall be lawful for the said official referees by their award to authorize such modification, subject nevertheless, to the approbation of the Commissioners of Works and Buildings; and, subject to such modification, or in default thereof, it shall be the duty of such person so bound to erect buildings and he is hereby required to erect every building agreed to be built by such lease or agreement according to the conditions tendered under the Act in the same manner as if this Act had been passed and in operation at the time of making such lease or agreement; and that on the completion of such works, either according to the provisions of this Act or according to such modification aforesaid, and on giving to the lessor and other owners of such building fourteen days' notice of his intention to refer the matter to the official referees on this behalf, it shall be lawful for the lessee or tenant and he is hereby entitled to require the official referees to ascertain what loss, present and prospective, has been occasioned by the observance of the provisions of this Act, and having regard to the respective terms and interests of the lessee or tenant, the lessor and other owners of such building, and having regard to any profit, benefit, or advantage which may have accrued to such lessee or tenant since the execution of such lease or agreement, and which may appear to the said official referees not to have been in the contemplation of the parties to such lease or agreement at the time of such execution thereof as aforesaid, to determine whether he is entitled to any compensation in respect of such loss, or payment of money or reduction of rent, or both, or otherwise; and that on the receipt of such requisition, and on proof of due notice thereof having been given to the lessor and other owners of such building, it shall be the duty of such official referees and they are hereby required to proceed to ascertain if any and what loss has been so occasioned, and, having regard as aforesaid to such terms and interest as aforesaid, and to such profit, benefit, or advantage as aforesaid, to determine if any and what compensation as aforesaid is to be paid in respect thereof, and by whom the same is to be paid, and in what proportions, and their decision in the matter shall be final.

*Commissioners of Works and Buildings empowered to modify Rules generally—Report of Official Referees—Extent of Modification—Representation by Parties—Order thereupon.*

11. And for the purpose of preventing the express provisions of this Act from hindering the adoption of improvements, and of providing for the adoption of expedients either better or equally well adapted to accomplish the purposes thereof, be it enacted, with regard to every building of whatever class, so far as relates to the modification of any rules hereby prescribed, that if in the opinion of the official referees the rules by this Act imposed shall be inapplicable, or will defeat the objects of this Act, and that by the adoption of any modification of such rules such objects will be attained either better or as effectually, it shall be the duty of such official referees to report their opinion thereon, stating the grounds of such their opinion to the Commissioners of Works and Buildings; and that if on the investigation thereof it shall appear to the said commissioners that such opinion is well founded, then it shall be lawful for the said commissioners or any two of them to direct that such modification may be made in such rules as will in their opinion give effect to the purposes of this Act; and that although such official referees shall be of opinion that such modifications are not requisite or admissible, yet if any party interested present to the official referees a representation, setting forth the grounds whereon such modification is claimed, it shall be the duty of the official referees and they are hereby

required to report such representation, as well as their opinion thereon, to the said commissioners, with the grounds of such report and opinion; and that thereupon, if the said commissioners think fit, it shall be lawful for them or any two of them to direct the official referees to make such order in the matter as may appear to them to be requisite.

**Power to modify Provisions of this Act as to existing Buildings to be rebuilt.**

12. And be it enacted, with regard to buildings already built, so far as relates to the rebuilding thereof in conformity with this Act in respect of the required area, or in any other respect than the required height and thickness of walls, that if a full compliance with the provisions of this Act be attended by great loss and inconvenience, then, subject to the report of the official referees, and to the consent of the Commissioners of Works and Buildings, and to such terms as the said commissioners may impose in that behalf, it shall be lawful for the parties concerned to rebuild such buildings on the site of the old buildings as near as may be practicable, but so that nevertheless both the party-walls and the external walls be of the required height and thickness.

#### BUILDERS.

**Works to be executed.—Notice to Surveyors—20l. Penalty for Neglect to give Notice, &c.—20l. Penalty for not giving fresh Notices—Penalty for beginning without Notice, or Refusal to admit Surveyor—Emergency.**

13. And be it enacted, with regard to the works to be executed in pursuance of this Act, so far as relates to the supervision thereof by the surveyors, that two days before the following acts or events, that is to say—

Before any building shall be begun to be built; and also

Before any addition or alteration which by this Act is placed under the supervision of the surveyor, shall be made to any building; and also

Before any party-wall, external wall, chimney-stack or flue shall be begun to be built, pulled down, rebuilt, cut into, or altered; and also

Before any opening shall be made in any party-wall; and also

Before any other matter or thing shall be done which by this Act is placed under the supervision of the surveyor, except as hereinafter is provided;

It shall be the duty of the builder (by which term is to be understood, in this provision and elsewhere throughout this Act, the master builder or other person employed to execute any work, or if there be no master builder or other person so employed, then the owner of the building or other person for whom or by whose order such work is to be done), and he is hereby required to give to the surveyor, at his office, notice in the terms specified in the form (No. 1.) contained in the Schedule of Notices annexed to this Act, or to the like effect; and that if any builder neglect to give such notice, or begin to build, or do any of the things aforesaid, before such notice, or before the expiration of such period of two days, then in every such case the party offending shall for every such default forfeit and pay to such surveyor treble the amount of the fees which such surveyor would have been entitled to receive for his trouble in inspecting the same; and shall also forfeit for every such default a sum not exceeding twenty pounds; and that if for any period exceeding three months any builder, having duly begun any building requiring compliance with the provisions of this Act, suspend the progress of such building, and again go on with the same, or if during the progress thereof the builder be changed, then two days before such builder shall enter upon the performance of the work, it shall be the duty of such builder to give notice to the surveyor, and such notices must be in the terms specified in the forms (Nos. 2 and 3) contained in the Schedule of Notices annexed to this Act, or to the like effect, and must be given to the surveyor, or left at the surveyor's office, in like manner as is required upon beginning any new building, and that if any builder make default, or neglect to give or leave such notice, he shall forfeit for every such offence a sum not exceeding twenty pounds; and that if any such building, chimney, or wall be begun to be built, pulled down, rebuilt, cut into, or altered as aforesaid, or be proceeded with after any suspension of the progress thereof before such notice has been given; or if such surveyor or the official referees be refused admittance to inspect the same premises, but upon this condition, that which shall be liable to be abated as a nuisance under the provisions herein contained: provided always, that if by reason of any emergency any act, matter, or thing placed under the supervision of the surveyor be required to be done immediately, or before notice can be given to the surveyor, then it shall be lawful for the builder or any person to do such act, matter, or thing so requisite, but upon this condition, that within forty-eight hours after beginning to execute such work notice thereof be given to the surveyor.

#### BUILDINGS GENERALLY.

**Supervision of Works.—Notice of Irregularities to Builders and others.—To cut into Works.—Amendment of Works.—Proceeding thereon by Official Referees.—Costs.**

14. And be it enacted, with regard to such buildings and works, so far as relates to the supervision thereof, that if in any such building, rebuilding, cutting into, or altering any part of any building, or party-wall or external wall, or chimney-stack or flue, drains, cesspools, or any work or other thing be done contrary to or not conformably with the rules and directions of this Act, then forthwith it shall be the duty of the surveyor and he is hereby required to give forty-eight hours' notice according to the form (No. 4.) in the Schedule of Notices, or to the like effect, to the

builder, foreman, or principal workman on the premises, to amend any such irregularity which he shall deem to have been committed, and forthwith after the expiration of such notice to proceed to inspect the work; and that if he, or he so far advanced that he cannot ascertain whether the irregularity has been committed or not, or exists or not, then it shall be lawful for him and he is hereby empowered to order any work to be cut into, laid open, or pulled down, which shall in his opinion prevent his ascertaining whether any such irregularity exists or not; and that if within forty-eight hours the builder to whom any such notice shall have been given refuse or fail to amend any irregular work, or if any such builder, when ordered by the surveyor, refuse to cut into, lay open, or pull down any work which shall in his opinion prevent his ascertaining whether such irregular work exists or not, then, as soon as conveniently shall be, it shall be the duty of the surveyor to give information thereof to the official referees; and that upon the receipt of such information it shall be the duty of such official referees and they are hereby required to proceed to hear the matter, and if any breach of the rules, regulations, and directions of this Act be found to have been committed, or if there appear good reason to suppose any such breach has been committed and is concealed, then it shall be lawful for the official referees and they are hereby authorized to direct by their award that such building, party-wall, external wall, chimney-stack, flue, or other thing, or such part thereof as they shall deem necessary, shall be amended, removed, cut into, laid open, or pulled down; and that all the costs, charges, and expenses of the said work, and of the said application to the official referees, shall be borne by such party or parties as the official referees shall determine.

**Special Supervision of First-rate Buildings of Second Class and of Buildings of Third Class.—Notice to Official Referees.—Survey.—Approval.—Disapproval.—Amendment of Defects.—Notice of Completion.—New Survey.—Certificate.—Prohibition of Use.—Penalty.—Justices to consider Circumstances.**

15. And now, for the purpose of making provision for the supervision of buildings of first-rate of the second or warehouse class, and of all buildings of the third or public building class (except the buildings hereinafter excepted), be it enacted, with regard to every such building, so far as relates to the special supervision thereof, that when all the walls of any such building shall have been built to their full height, and all the timbers of the floors, roofs, and partitions shall have been set, it shall be the duty of the architect or builder and he is hereby required to give notice thereof to the official referees, according to the form (No. 6.) in the Schedule of Notices, or to the like effect; and if the official referees be of opinion that such building is subject to the special supervision herein provided, then within seven days after such notice it shall be their duty to survey the said building; and that if they approve of the same, then within seven days after such survey to certify such approval, under their hands, to the architect or builder; or that if any part of the walls, timbers, roof, or internal supports appear to such official referees defective, insufficient, or insecure, then within the said seven days after such survey they are hereby required to give to such architect or builder notice of such parts as shall so appear to them defective, insufficient, or insecure, which notice must be in writing; and that upon the receipt of such notice it shall be the duty of the said architect or builder and he is hereby required to amend and strengthen such defective, insufficient, or insecure parts; and that during or within a period of seven days after notice has been given to the official referees that such works have been amended or strengthened as aforesaid, it shall be the duty of the official referees and they are hereby required to inspect the same, or in default thereof the said parts may be covered up; and that upon completion of every such building it shall be the duty of the architect or builder to give fresh notice to the official referees, according to the form (No. 7.) in the Schedule of Notices, or to the like effect; and that thereupon, or within seven days after such notice, shall be the duty of the official referees to survey the same; and that if upon such survey it shall appear that such building has been built sufficiently strong, and is sufficiently set to be safe, then within fourteen days after such survey it shall be their duty and they are hereby required to certify accordingly, which certificate must be under their hands and the seal of office of the Registrar of Metropolitan Buildings; and that if before the certificate of satisfaction shall have been made, or if such fourteen days as aforesaid shall have elapsed without due notice being given in writing as aforesaid, any such building subject to special supervision shall be used for any purpose without such express authority in writing, then, on conviction thereof before two justices of the peace, the occupier of such building, or any person refuse or neglect to afford such surveyor or official referee every assistance which may be reasonably required in and about such inspection, then in every such case on conviction thereof the party offending shall forfeit for every such offence a sum not exceeding twenty pounds; and that if at any time during such customary working hours the surveyor or the official referees be refused admittance to make inspection of any work, then for that purpose it shall be lawful for such surveyor or for such official referees, and they are hereby empowered, accompanied by a peace officer, to enter upon the ground, building, and premises where the same shall be.

and extent of danger involved in the use of such building, and to the amount of profit which might be derived from such use thereof.

**Special Supervision of Buildings in Schedule (B.), Part I.—Survey by Official Referees.—Occasional Inspection.—Notice of Deficiencies.—Amendment of Defects.—Approval by Official Referees.—Notice of Completion.—New Survey Certificate.—Prohibition of Use.—Penalty.—Justices to consider Circumstances.**

16. And be it enacted, with regard to the buildings comprised in schedule (B.) Part I. to this Act, annexed, so far as relates to the supervision thereof, that before the builder begin to build the same it shall be the duty of the architect or the builder and he is hereby required to give notice thereof to the official referees, and also, at the same time, to transmit for their inspection the plans, elevations, and other drawings which have been made for the same; and that forthwith thereupon it shall be the duty of the official referees and they are hereby required to proceed to survey the situation of the intended building with a view to ascertain whether such building can be erected on such situation with due regard to the security of the public; and that, from time to time during the progress of such building, it shall be the duty of such official referees and they are hereby directed to inspect the same with a view to ascertain the sufficiency thereof; and that if such building or any part thereof appear to such official referees defective, insufficient, or insecure, then they are hereby required to give to such architect or builder notice of such parts as shall so appear to them defective, insufficient, or insecure, which notice must be in writing; and that upon the receipt of such notice it shall be the duty of the said architect or builder and he is hereby required to amend and strengthen such defective, insufficient, or insecure parts; and that during or within a period of seven days after notice has been given to the official referees that such works have been amended or strengthened as aforesaid, it shall be the duty of the official referees and they are hereby required to inspect the same, or in default thereof the said parts may be covered up; and that upon completion of every such building it shall be the duty of the architect or builder to give fresh notice to the official referees; and that thereupon, or within seven days after such notice, it shall be the duty of the official referees to survey the same; and that if upon such survey it shall appear that such building has been built sufficiently strong, then it shall be their duty to certify accordingly, which certificate must be under their hands and the seal of office of Registrar of Metropolitan Buildings; and that until such certificate shall have been made, or until fourteen days after such survey shall have elapsed without the official referees having given notice in writing that they are not satisfied, it shall not be lawful to use such building for any purpose whatever without the express authority in writing of the official referees under their hands and the seal of office of the Registrar of Metropolitan Buildings; and that if before the certificate of satisfaction shall have been made, or if such fourteen days as aforesaid shall have elapsed without due notice in writing being given as aforesaid, any such building subject to special supervision shall be used for any purpose without such express authority in writing, then, on conviction thereof before two justices of the peace, the occupier of such building, or other the person by whom such building shall be so used, shall forfeit for such offence a sum not exceeding one hundred pounds for every day during which such building shall be so used without having obtained such certificate of satisfaction or such express authority as aforesaid; and that, in determining the amount of any such penalty, it shall be the duty of the justices and they are hereby directed to have regard to the nature and extent of danger involved in the use of such building, and to the amount of profit which might be derived from such use thereof.

**Entry on Premises.—Refusal to permit Inspection.—Forcible Entry.**

17. And be it enacted, with regard to buildings and works, so far as relates to the entry thereon for the supervision thereof, that at all times during the progress of any operations in respect thereof within the meaning of this Act, it shall be lawful for the surveyor and the official referees, and they are hereby respectively authorized, to enter upon the premises upon which such operations have been commenced; and that if at any time whilst any building is in course of construction, demolition, alteration, or re-construction, any person refuse to admit the surveyor, or the official referees authorized under this Act, during the customary working hours, to inspect such building, or any person refuse or neglect to afford such surveyor or official referee every assistance which may be reasonably required in and about such inspection, then in every such case on conviction thereof the party offending shall forfeit for every such offence a sum not exceeding twenty pounds; and that if at any time during such customary working hours the surveyor or the official referees be refused admittance to make inspection of any work, then for that purpose it shall be lawful for such surveyor or for such official referees, and they are hereby empowered, accompanied by a peace officer, to enter upon the ground, building, and premises where the same shall be.

**All Buildings not according to this Act declared a Nuisance.—Summoned before Justices.—Compulsory Appearance.—Recognizances to pull down and amend.—Imprisonment.—Renoval of Buildings declared Nuisances.—Expenses.**

18. And for the purpose of more effectually en-

forcing the observance of the provisions of this Act, be enacted, with regard to any buildings, drains, timber buildings, chimneys and flues, party-walls, party fence-walls, external walls and projections, and every other part of every building of every class, or rate of any class, which shall be hereafter built, rebuilt, enlarged, or altered, within the limits of this Act, contrary to the provisions hereof, so far as relates to the removal thereof, that if the same be not built, rebuilt, enlarged, or altered in the manner and in the materials, and in every other respect according to and in conformity with the several rules and directions which are in this Act particularly specified, and if any person build or begin to build, or cause the building or beginning to build, or alter or cause to be altered, or use or cause to be used, any part of any ground or building, projection, drain, or other thing contrary thereto, and if in either of such cases it so appear by the certificate of the official referees, then the said building, projection, drain, or other thing, or such part thereof, shall be lawfully and begun to be built, or so irregularly altered or begun to be altered, or so used, shall be deemed a nuisance; and that thereupon it shall be the duty of the surveyor and he is hereby directed to summon the builder before any two justices of the peace; and that if at the time and place appointed on such summons such builder fail to appear, then it shall be lawful for the said justices and they are hereby authorized to issue a warrant under their hands and seals to compel such builder to appear before such justices or any other two justices; and that thereupon it shall be the duty of such builder and he is hereby required to enter into a recognizance, in such sum as the said justices shall appoint, for abating and taking down the same within such convenient time as the justices shall respectively appoint, or otherwise for amending the same according to such rules and directions as are herein contained, and also for paying the costs, charges, and expenses incurred by the surveyor in laying the information and obtaining the conviction, including such compensation for the surveyor's loss of time as the said justices shall think fit; and if the party so required fail to enter into such recognizance, then it shall be lawful for either of such justices or any justice, and they are hereby required, to commit such builder to the common goal of the city, county, or liberty where the offence shall be committed, there to remain without bail or mainprize until he shall have entered into such recognizance as aforesaid, or until such irregular building shall have been abated or demolished or otherwise amended, or such nuisance shall be abated or demolished by order of such justices respectively (which order the said justices are hereby empowered to make), and until the costs, charges, and expenses thereof, and of all operations and proceedings in relation thereto, shall have been paid; and further, that if application be made to any two or more justices, then thereupon it shall be their duty, and they are hereby empowered, to order the surveyor or any other person to abate or demolish such nuisance, and to order the persons authorized by them so to abate or demolish the same to sell and dispose of the materials thereof, and out of the moneys arising by such sale to pay themselves, and all persons by them employed for such purpose, the reasonable charges for abating or demolishing such nuisance, and also such costs and expenses as aforesaid, and to pay the surplus moneys arising by such sale (if any) to such owner of the building as the official referees shall determine to be entitled thereto; and that if the moneys arising by such sale be not sufficient to pay such charges, then it shall be the duty of the person entitled to the immediate possession of such building, or the occupier, to make good the deficiency, subject to reimbursement as hereinafter provided; and if he fail, then he shall be liable to the same remedies for the recovery thereof as are by this Act provided concerning the expense of taking down ruinous buildings, and putting up boards for the safety of passengers.

**Fifty Shillings Penalty on Workmen Offending—Imprisonment.**

19. And be it enacted, with regard to any building or work, so far as relates to the nonobservance of the provisions of this Act in that behalf by workmen and others, that if any workman, labourer, servant, or other person employed in any building, or in the alteration, fitting up, or decoration of any building, wilfully, and without the direction, privity, or consent of the person causing such work to be done, do any thing in or about such building contrary to the rules and directions of this Act, then upon conviction thereof by any two justices of the peace, upon the oath of one or more credible witnesses or witnesses (which oath the said justices are hereby empowered and required to administer), every such offender shall be liable to forfeit for every such offence a sum not exceeding fifty shillings; and that if upon or immediately after such conviction any such forfeiture be not paid, then it shall be the duty of any two justices of the peace to whom application shall be made to commit the offenders, by warrant under the hand and seal of such justices, to the common goal for any term not exceeding one month, at the discretion of such justices.

**ADJOINING PROPERTIES—PARTY WALLS—PARTY FENCES—INTERMIXED BUILDINGS.**

**Execution of Works.**

20. And forasmuch as from time to time occasion hath arisen and will hereafter arise to execute the following works in relation to adjoining buildings and premises parted by the same party-wall or party fence-wall, but belonging to different owners or occupied by different persons, or to buildings intermixed be-

longing to different owners or occupied by different persons, namely,

The reparation of the party-walls by which such premises shall be parted:

The pulling down and rebuilding of such party-walls:

The raising of such party-walls:

The reparation of party fence-walls:

The rebuilding of such party fence-walls:

The raising of such party fence-walls:

The pulling down of timber partitions which part buildings the property of different owners or occupied by different persons, and building in lieu thereof proper party-walls:

The pulling down of buildings built over public ways, or having rooms or stories the property of different persons, or occupied by different persons, lying intermixed, for the purpose of building proper party-walls or party-arches:

And generally the performance of other necessary works incident to the execution of such party-walls or party fence-walls with the premises adjoining; it is expedient to make provision, as well for facilitating the execution of such works by any such owner desirous to execute the same (who is herein denominated the "building owner"), as for protecting the interests of the owner of the adjoining premises (who is herein denominated the "adjoining owner"); now for that purpose be it enacted, with regard to all premises parted by a party-wall or party fence-wall, or parted by timber partitions, and with regard to all intermixed properties not so parted, so far as relates to the execution of any such works by any owner of any such premises, that if the adjoining owner shall have consented thereto, or if, without such consent, the required use of such works shall have been given by or on the part of the building owner, to the adjoining owner, then, subject to such modification as shall be made by virtue of the provision in that behalf, and subject to the provision for supplying the want of consent of the owners, and subject moreover to the respective conditions hereby prescribed with regard to such works respectively, as well as to the payment of the costs of such works, and to the sanction or to the award of the surveyors or of the official referees, as hereby prescribed in reference thereto, it shall be lawful for every such building owner and he is hereby authorized or required to execute such works.

**Consent of Owner to Adjoining Owner.**

21. And be it enacted, with regard to such works, so far as relates to the notice thereof, that, unless the adjoining owner consent thereto, it shall not be lawful for the "building owner" to execute such works until he have given notice thereof to such "adjoining owner;" and every such notice with regard to the pulling down, rebuilding, or repairing of party-walls or party fence-walls must be given three months at the least before the work is to be commenced; and every such notice with regard to the pulling down and rebuilding intermixed walls and timber partitions must be given three months at the least before such work is to be commenced; and every such notice must be in the form or to the effect of the notice (No. 8.) for that purpose contained in the Schedule of Notices hereunto annexed.

**Modification of Work to suit Adjoining Owner—Modification of Operations—Application to Official Referees—Authority to build.**

22. And be it enacted, with regard to every such work, so far as relates to the modification thereof, in order to render it suitable to the premises of the adjoining owner or his tenant, that if the adjoining owner, at any time within two months after the receipt of the said notice from the building owner, give notice of his desire that any modification be made in the work, so as to render it suitable to the premises, according to the form (No. 13.) in the Schedule of Notices, or to the like effect, then within seven days after the receipt of such notice it shall be the duty of the building owner, and he is hereby required, to signify his consent to or dissent from such modification or delay; and that if the building owner dissent from, or do not within such seven days signify his consent to such modification, then it shall be lawful for the adjoining owner and he is hereby entitled to require the building owner not to commence the work until the official referees shall have determined thereon; and that if within seven days thereafter application be made in writing to the official referees, according to the form (No. 19.) in the Schedule of Notices, or to the like effect, thereof be given to the building owner, according to the other form (No. 20.) then within ten days after such application it shall be the duty of the official referees to signify their decision thereon, and it shall be the duty of the building owner not to commence the work till the decision of such official referees shall have been given; and that if within the period of three months from the date of the first notice such adjoining owner do make any objection or any requisition in conformity with the enactment, then, subject to the provisions of this Act with regard to such works, it shall be lawful for the building owner and he is hereby authorized to proceed to execute the same.

**Delay of Work to suit Adjoining Owner—Delay of Operations—Application to Official Referees—Authority to build.**

23. And be it enacted, with regard to every such work, so far as relates to the modification thereof, in order to render it suitable to the premises, or to the convenience of the adjoining owner or his tenant, that if the adjoining owner, at any time within three months after the receipt of the said notice from the building owner, give notice of his desire that the work be delayed, so as to cause it to be executed at a more reasonable or a more convenient time in

reference to the business or to the family or domestic arrangements of such adjoining owner or his tenants, according to the form (No. 18.) in the Schedule of Notices, or to the like effect, then within seven days after the receipt of the notice thereof it shall be the duty of the building owner, and he is hereby required to signify his consent to or dissent from such modification or delay; and that if the building owner do not within such seven days signify his consent to such modification or delay, then it shall be lawful for the adjoining owner and he is hereby entitled to require the building owner to delay the work until the official referees shall have determined thereon; and that if within seven days thereafter application be made in writing to the official referees, according to the form (No. 19.) in the Schedule of Notices, or to the like effect, and notice thereof be given to the building owner, according to the other form (No. 20.), then within ten days after such application it shall be the duty of the official referees to signify their decision thereon, and it shall be the duty of the building owner to delay the same till the decision of such official referees shall have been given; and that if within the period of three months from the date of the first notice such adjoining owner do not make any objection or any requisition in conformity with this enactment, then, subject to the provisions of this Act with regard to such works, it shall be lawful for the building owner, and he is hereby authorized to proceed to execute the same.

**Supplying Want of Consent of Adjoining Owners—Notice of Inspection by Surveyor—Notice to Parties—Confirmation by Official Referees—Proceedings on Appeal against Certificate—Notice by Official Referees—Survey—Award—Works authorized.**

24. And be it enacted, with regard to any such work as is hereby authorized to be done in relation to party-walls, party-arches, party fence-walls, or other such structures belonging to the owners of adjoining buildings or parting adjoining premises, so far as relates to supplying the want of consent of the adjoining owners, that if the adjoining premises be unoccupied, or if the owner thereof cannot be found, or if the owner, although found, cannot, by reason of legal disability or otherwise, consent to the work, or if the owner will not consent thereto, or if differences arise amongst the parties concerned, then the notice required to be given in respect of such work must be served both on the surveyor and on the official referees, in addition to such other parties entitled to notice under this Act upon whom such notice can be served, which must be according to the form (No. 9.) in the Schedule of Notices, or to the like effect; and that forthwith on the receipt of such notice it shall be the duty of the surveyor and he is hereby required to give notice to the parties by whom such work is to be executed, and to any one or more surveyors or other agents by them appointed, as to the day and hour when he is authorized to be done in relation to the premises, according to the form (No. 10.) in the Schedule of Notices, or to the like effect; and at such time it shall be the duty of the surveyor of the district and he is hereby authorized to proceed to inspect such premises accordingly, and to certify to the official referees,

First, whether such work ought to be done or not; and

Secondly, if the same ought to be done, whether it ought to be done in the proposed manner; and

Thirdly, the site whereon the party-wall should be built; and, with regard to intermixed buildings, what party-arches may be necessary over or under any rooms of such buildings so intended to be rebuilt; and

Fourthly, the quantity of the soil or ground or other parts of the premises (if any) necessary to be laid to or taken from the house of the person desirous to rebuild to the house of the person permitting him to erect a party-wall or party-arch; and

Fifthly, the compensation (if any) which should be made and paid by either the building owner or the adjoining owner to the other in lieu of the lessening effect of the said buildings by such party-wall or party-arch, or as a satisfaction for such other injury (if any) as shall be done or occasioned thereby to any of the said parties;

And that upon the receipt of such certificate it shall be the duty of the official referees, and they are hereby required, to cause notice thereof to be given to the parties or to such of them as are known; and that if within seven days after such notice to the parties the certificate be appealed against, and if the official referees be of opinion that the work is proper to be done, and the compensation is fair, then it shall be lawful for the official referees to confirm such certificate, and to authorize the building owner to proceed with the works as if the consent of the adjoining owner had been obtained; and that if any party concerned shall appeal against the certificate of the surveyor as to the work to be done, or as to the compensation, or as to any other matter referred to in such certificate in pursuance of the above provisions, then it shall be the duty of the official referees, and they are hereby required, to appoint one of their number to survey the building in question; and for that purpose it shall be the duty of the official referee so appointed, and he is hereby required, to give notice to the parties, and to any one or more surveyors or other agents by them appointed, as to the time when he will view the premises; and that at such time it shall be the duty of such referee and he is hereby authorized to view such premises accordingly, and to inquire into the matters appealed against, and to certify to the official referees his opinion thereon, and that upon such certificate being made it shall be lawful for the official referees to make their award, thereby either confirming or reversing or modifying, as to

[For continuation see SUPPLEMENT.]

Table Spoons and Forks, full size, per doz.....	Fiddle Pattern.....	Threaded Pattern.....	Victoria Pattern.....
Dessert Ditto.....	12s.	28s.	30s.
Tea Ditto.....	10s.	21s.	26s.
Tea Ditto.....	5s.	11s.	12s.

Tea and Coffee Services, Waiters, Candlesticks, &c., at proportionable prices.

R. K. B. begs to caution the Public against a spurious low-priced imitation of his Articles, the genuine are only to be had at the Works, 174, HIGH HOLBORN.

BATHS of every description for Sale or Hire. A liberal allowance to Ironmongers and Hydro-pneumatic Establishments. Churches, Chapels, Public Buildings, and Conservatories Heated by Hot Water, Steam, &c.

Stairs, Railings, Fences, and Balconies, made from original designs. Experienced and steady Workmen sent to all parts of the kingdom.

### THE PANKLIBANON IRON WORKS,

WHOLESALE AND RETAIL, 56, BAKER STREET, PORTMAN SQUARE.

ARCHITECTS, BUILDERS, and Others, about to supply STOVES and KITCHEN APPENDAGES, will find at this Establishment the most unique and elegant assortment of STOVE-GRATES, FENDERS, and FIRE-IRONS ever offered to the Public, at prices considerably below the usual charges. The Proprietors at the same time beg to invite attention to their extensive Stock of FURNISHING IRONMONGERY, Tinned Copper, Tin and Iron Cooking Vessels, Black Tin Dish-Covers, Japanned Ware, Table Cutlery, and especially their Sheffield Plate and German Silver Wares, embracing every Article suitable for the Table, comprising Dish and Plate Covers, Liquor Frames, Epergnes, &c. &c. The plan adopted by the Proprietors of affixing the price to each article for cash, enables all purchasers to have the same advantage. The Patent Turbine Stove is in daily operation. THORPE, FALLOWS, & COMPANY, 56, Baker-street, Portman-square, London.

# THE BUILDER.

**TERRAZZO METALLIC DRAIN PIPES,**  
PAVING AND ROOFING TILES, and numerous other articles manufactured from the blue Terro Metallic Bunsell, Staffordshire. Specimens and prices may be obtained at Mr. Charles Long's, No. 1, King-street, Portman-square, and also at the Manufacturer.

**BASTENNE BITUMEN COMPANY,**  
Office, 31, Poultry. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot square:—1 inch thick, 6d.; 2 inch thick, 7d.; 3 inch thick, 8d. Works not measuring 400 feet, 1d. per foot extra. Roofing executed at 6d. and 7d. per foot square. Concrete is charged in addition according to the thickness when required. Carriage and men's time are charged extra when works are executed beyond three miles from the General Post-office. Bitumen 26 per ton, without grit. Bitumen 25 per ton, with grit. CHARLES F. HILSTONE, Secy.

**PEAKE'S TERRO METALLIC TILE**  
DEPOT, WHITEFRIARS, and 49, WATER-LANE, FLEET-STREET, LONDON; from the Tiles, Tunstall, Newcastle, Staffordshire, THOMAS PEAKE, Manufacturer, having by various means, and during a considerable time, published the names of Agents in London, &c., it is his duty to announce that he has no longer any Agent there; that, consequently, he has opened a Metropolitan Depot, situated three minutes' walk from the Temple, to supply genuine articles and at just prices as per quality. The Tiles are central, and goods are sent thence direct to any place inland, or to the Mersey, to be there transhipped for the British and Irish coasts, the Colonies, &c. The Proprietor feels most grateful to his numerous friends in London, &c., and the public also, that as probity and fair dealing have been his aim for thirty years past (although no one can control the circumstances which too often arise, affecting alike the quality of manufacturers and the time when they ought to be at their destination), so he trusts to his conduct in future to retain and increase his estimable connection. BLUE TILES for various purposes, namely, to cover roofs, both plain and of devices to suit the style of buildings; they are easily laid on, as they do not require dressing, fitting, pees, or nails; for ridges and hips of any angle, plain, capped, rolled, or with a variety of upright ornaments; for valleys; for lining chimneys and other flues; for paving—blue, red, and drab squares, hexagons and octagons for ornamental floors; for drying kilns; for skirting; for coping walls; for chimney tops; for sewers, barrel drains, soughs, surface drains, and conveying spring water without injuring it. BLUE BRICKS for paving stairs, areas, foot-paths, barns, and warehouses; also for building docks, piers, weirs, tunnel and other arches, culverts, and bridges. FIRE BRICKS for furnaces, lime kilns, steam boilers, ovens, grates, &c.; also squares to pave bread ovens. Depot at the corner of Temple-street, and Water-lane, City. Lists, in preparation, describing the articles and their uses, containing also cuttings, testimonials extracted from standard works, &c. "The bricks being made of clay peculiarly good in quality, and triturated by machinery, and being carefully dried and burnt, are, in fact, the best Newcastle blue bricks, the hardest and most durable of any made in England."—*Life of Telford*, p. 77. "The tiles being formed of terro-metallic earth, have somewhat of the colour of cast-iron; they are almost equally hard, and must, from their nature, be incomparably more durable. In short, we consider them as the best of all coverings for roofs, whether of small or large buildings." "There are available red tiles and valley tiles, all manufactured by Mr. Peake in the same superior style."—*London's Encyc. of Cottage, Farm, and Villa Architecture*, p. 648, sect. 1863; Longman and Co. 1833.

**PLUMBERS, PAINTERS, BUILDERS,**  
and OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures, Glazing, &c. &c., in any quantity, at Manufacturer's Prices.  
TURNS, per gallon . . . . . 2s. 4d.  
LINED OIL, ditto . . . . . 2s. 4d.  
SHEET LEAD, in sheets, per cwt. . . . . 18s. 6d.  
Ditto, cut to sizes and PIPE . . . . . 19s. 6d.  
WHITE LEAD (Genuine) per cwt. . . . . 18s. 6d.  
Colours, Pipe, Brushes, &c. &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to R. COGAN, 3, Princes-street, Leicester-square, London.  
PRINTERS, FIGURERS, FRAMES, RAFFLE, AND CABINET MAKERS, can be provided with flattened Crown, flattened Sheet, and the patent Sheet Plate, Lists of which, showing the price for any Square, from 14 by 12 to 40 by 30 of Best and second quality, will be sent gratis upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for, if required.  
NURSERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London.  
COMMON SHEET AND CYLINDER. The advantages of Common Sheet over Crown for Glazing Sky-lights is decidedly great, and is generally used where strength or superior appearance is required; a light 6 feet 6 in. long, with openings of any width, needs only one lap. This Glass is considerably stouter than Crown, and may be had from 1s. 3d. per foot.  
Also may be had,  
COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.  
LAMP SHADES AND GAS GLASSES,  
OF EVERY DESCRIPTION.

**GAS CONTRACTORS, FITTERS, GLASS MERCHANTS** and others supplied with Lists of near 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.  
CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS, supplied with FRENCH ORNAMENTAL SHADES, for covering Models of Public Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application.  
French Table Flowers, China Vases, Fancy Glass Ware, and Alabaster Figures in every variety.  
R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Bazaar keepers and others.

**PATENT TESSELLATED, VARI-  
GATED, ORNAMENTED MARBLE AND PLAIN  
PAVING TILES,** Manufactured by SAMUEL MAYER, Bunsell, Staffordshire. Specimens and prices may be obtained at Mr. Charles Long's, No. 1, King-street, Portman-square, and also at the Manufacturer.

**ORNAMENTAL WINDOW GLASS,**  
2s. per foot super.—CHARLES LONG having greatly improved his machinery for ornamenting glass, is enabled to offer handsome patterns at 2s. per foot super. Glass included. 100 feet can be executed and delivered in two days. Address to Charles Long, House Decorator, &c., 1, King-street, Portman-square. For Cash only.

**VICTORIA LIFE ASSURANCE COM-  
PANY.**  
Trustees.  
Sir James Duke, Alderman, M.P., Chairman.  
Benjamin Barnard, Esq.  
Benjamin Hawes, Esq., Deputy Chairman.  
Charles Baldwin, Esq.

PRECEDENTIAL ADVANTAGES ARE OFFERED BY THIS COMPANY. But Parties assuring the lives of others may take their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained. Credit of half the premiums for the first five years allowed on policies effected for the whole term of life. Assurances may be effected with or without profits—on an ascending or descending scale, or for short periods. Advances made to Assurers on real or undoubted personal security, for terms not exceeding three years, re-payable by instalments. Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the office, 18, King William-street, City, or by letter, addressed to the Secretary. WILLIAM RAYTRAY, Actuary and Secretary.

**WESTERN LIFE ASSURANCE  
SOCIETY,**  
OFFICE, 49, PARLIAMENT STREET, WESTMINSTER.  
Directors.

William James, Esq. James Les Scager, Esq.  
William Freeman, Esq. John Hazley White, Esq.  
Francis Fuller, Esq. Joseph Carter Wood, Esq.  
Joseph H. Goodhart, Esq.

Physician.  
William Richard Babban, M.D.  
Surgeon.  
Alfred Leggatt, Esq.; George D. Pollock, Esq.  
Banks.  
Messrs. Cocks, Biddulph, and Co.  
Solicitors.  
Messrs. J. L. Baskell and J. C. Lethbridge.  
The attention of the unassured portion of the community cannot be too pointedly drawn to the unusual advantages offered to the Public by this Society over those of many others, as it enables all classes to effect life assurances in the manner most convenient to themselves, and amount of its particular features that of allowing the Assured (by Table 2) to leave HALF THE ANNUAL PREMIUMS unpaid for seven years, will not be found undervaluing public attention. Immediate and deferred Assurances, and every description of Life Assurance business, undertaken by this Society. Prospectuses and all other requisite information will be furnished on application to the Secretary, or the Country Agents of the Society.  
EDWARD T. RICHARDSON, Secretary.

**BRITANNIA LIFE ASSURANCE  
COMPANY, 1, PRINCES STREET, BANK, LONDON.**

This institution is empowered by Special Act of Parliament (14, Vict. cap. 1X.), and is so constituted as to afford the best and most convenient to themselves, and amount of its particular features that of allowing the Assured (by Table 2) to leave HALF THE ANNUAL PREMIUMS unpaid for seven years, will not be found undervaluing public attention. Immediate and deferred Assurances, and every description of Life Assurance business, undertaken by this Society. Prospectuses and all other requisite information will be furnished on application to the Secretary, or the Country Agents of the Society.  
EDWARD T. RICHARDSON, Secretary.

**DECREASING RATES OF PREMIUM.**  
By this Table the Policy-holder has the option of discontinuing the payment of all further Premiums after TWENTY, FIFTEEN, TEN, and even FIVE years; and the Policy still remaining in force—in the first case, for the full amount originally assured; and in either of the three other cases, for a portion of the same according to a fixed and equitable scale endorsed upon the Policy.  
Increasing Rates of Premium on a new and remarkable plan for securing Loans or Debts; a less immediate payment being required on a Policy for the whole term of Life than in any other Office.

**CREDIT TABLE.**  
By this Table the Premiums may remain unpaid for five years, upon satisfactory security being given, and the liquidation of the same at the expiration of that period.  
Premiums payable either Annually, Half-yearly, or Quarterly, in one sum, or in a limited number of payments.  
A Board of Directors in attendance daily at Two o'clock. Age of the Assured in every case admitted in the Policy. Medical Attendants remunerated in all cases for their reports.  
Extract from Increasing Rates of Premium, for an Assurance of 1000, for Whole Term of Life.

Age.	Annual Premiums payable during					Remain-der of Life.

**BANKERS.**  
Bank of England, and Commercial Bank of London.

**PHYSICIAN.**  
Sir James Esq. Charles Hilderton Crompton, Esq.  
M.D., M.R.I.A., 22, Laurence Poultry-lane.  
11, New Burlington-street.

**CONTOURS.**  
John Hayward, Esq. 2, Adelaid-place, London-bridge, and Dartford, Kent.  
The Policies granted by this Company cover voyages of every description, and services in every part of the globe. The Premiums for Life Policies, with permission to go any and every where without forfeiture, are lower than have ever hitherto been taken for any general description of Voyages. Deferred Annuities to Mariners at very moderate premiums. The Premiums for all general assurances are based upon a new adjusted table of mortality.  
Ten per cent. of profits are applied in making provision for destitute and disabled mariners.  
JOHN DAWSON, Resident Manager.  
Arthur-street East, London-bridge.

The Company is ready to receive applications for Agencies from individuals of respectability, influence, and activity, resident in the principal seaports and market towns of the United Kingdom.

MEDICAL ADVISER—Marshall Hall, M.D., F.R.S., L. and E. SECRETARIES—John Emerson, Esq.

**SOLICITORS—Messrs. Palmer, France, and Palmer.**  
THIS IS THE ONLY COMPANY who are bound not to dispute any policy, unless they can prove that it was obtained by fraud; and for this purpose the Company have, by a clause in all their Policies, unshakably determined in favour of the power of objecting to any policy, unless they undertake to prove that it was obtained from them by fraudulent misrepresentation.  
THIS IS THE ONLY COMPANY who give to the assured on the mutual principle, the whole of the mutual accumulations, and also guarantee the sums assured.  
THIS IS THE ONLY COMPANY who themselves pay the premiums for the Policies, although the debts for which they were effected shall have been liquidated before the claims arise.  
THIS IS ALMOST THE ONLY COMPANY who grant the benefits of Europe.

**BY THE HALF-PREMIUM PLAN** only one-half of the premiums for the first seven years is required, the other half being payable at the convenience of the assured; thus allowing a Policy to be continued for seven years at one-half of the usual rate, or to be dropped at one-half of the usual rate.  
**TRINENTIAL ASCENDING SCALE TO ASSURE £100.**

ALEX. ROBERTSON, Manager.

(Continued from p. 436.)

them the case may seem to require, the certificate of the surveyor, and appointing by whom and in what proportions the expenses of the surveys and of the reports thereon are to be paid, and such award shall be final and conclusive; and with regard to any works by the award and as far as relates to the proceedings of the building owner, that if upon the making of the award the periods of the notices by this Act prescribed with regard to works of that nature have elapsed, then immediately upon the making of the award, but if such periods have not elapsed, then as soon after the making of the award as such periods shall have elapsed, it shall be lawful for the building owner, his agents, servants, and workmen, to proceed to execute the works.

**Repair and Rebuilding of joint expense.**

25. And be it enacted, with regard to any party-wall, party-arch, or external wall used wholly or in part as a party fence-wall, so far as relates to the repair and rebuilding thereof at the joint expense of the owners of the buildings parted thereby, that if such party structure be so defective or so far out of repair as to render it necessary to pull down and rebuild the same, or any part thereof, then on notice being given by the owner of one of the buildings to the adjoining owner, according to the form (No. 8.) in the Schedule of Notices, or to the like effect, it shall be lawful for the building owner to require a survey, certificate, and award, authorizing the execution of such repair or rebuilding, according to the provisions herebefore contained in that behalf.

**Rebuilding of Party-walls.**

26. And be it enacted, with regard to second party-walls, so far as relates to the rebuilding thereof at the expense of the building owner, that if the owner of one of the buildings desire to rebuild such party-wall, then, on giving to the adjoining owner the required notice of three months according to the form (No. 14.) in the Schedule of Notices, or to the like effect, it shall be lawful for such building owner and he is hereby entitled to pull down and rebuild such party-wall, but upon condition that he do reinstate and make good all the internal finishings and decorations of the adjoining premises, and pay all the costs and charges thereof, and also all the expenses incidental to the execution of the work, including therein the fees and expenses of the surveyor, and the fees of the surveyors, and any fees in respect of any services performed by the official referees, and also such reasonable compensation as to the said official referees may seem proper for any loss which the adjoining owner shall have incurred by reason of such work.

**Rebuilding a Party-wall—Building of an external Wall against a Party-wall.**

27. And be it enacted, with regard to any party-wall, so far as the rebuilding thereof, that if the owner of one of the buildings parted by such party-wall rebuild such building of a higher rate, and do not pull down such party-wall and build a proper wall in lieu thereof, then it shall be his duty and he is hereby required to build up an external wall against such party-wall.

**Damage arising from erection of external wall against a Party-wall.—Cutting into Footings and Chimneys.**

28. And be it enacted, with regard to an external wall built against a party-wall, so far as relates to the operations incident thereto, and to the making good any damage or injury which may be done to the wall of any adjoining building for the purpose of erecting a wall thereon, or for any other purpose, then it shall be lawful for the building owner and he is hereby entitled so to do, but upon condition that the said building owner do at his own costs shore up and underpin such wall, or such part thereof, to its full thickness, and to the full depth of such excavation, with good sound stock bricks and tiles or slates bedded in cement, or with other proper and sufficient materials, such underpinning to be done in a workmanlike and substantial manner; and that if for the purpose of erecting such external wall it be necessary to cut away part of the footings of such party-wall on the side next to the wall so to be built, and any part of the chimney breasts and chimney shafts belonging to the building about to be rebuilt as shall project beyond the perpendicular face of such party-wall in the lowest floor thereof, then, on giving notice of such intention in writing to the owner of the adjoining building at least one month before commencing operations, according to the form (No. 15.) in the Schedule of Notices, or to the like effect, and on the expiration of such notice, it shall be lawful for the building owner and he is hereby authorized to cut away such portions of the footings, breasts, and chimney-shafts aforesaid, but so that the same be done, and the brick-work where cut be again made good in cement, under the superintendance and to the satisfaction of the surveyor.

**Making good such Damage—Survey—Damage from Carelessness—Rebuilding.**

29. Provided always, and be it enacted, with regard to such party-wall, so far as relates to the making good of any such damage, that if it be so damaged and injured by such cutting away as in the opinion of the adjoining owner or occupier to be ruinous or dangerous, then upon application for that purpose it shall be the duty of the surveyor and he is hereby required to survey such wall; and if upon the survey thereof it be found ruinous or dangerous then to condemn it; and that thereupon it shall be the duty of the building owner to pull down and rebuild such party-wall, and also, if in the opinion of the surveyor or of the official referees such damage or injury shall have been occasioned by want of due care on the part of the build-

ing owner, then it shall be the duty of such building owner and he is hereby required to pull down and rebuild such party-wall, and that at his own costs and charges, including therein all the costs and expenses incidental to such survey, and the pulling down and rebuilding of such party-wall, and the reinstating and making good all the internal finishings and decorations damaged thereby; and that if the owner of the building to be rebuilt do not proceed with all due despatch to pull down and rebuild such party-wall, and to reinstate and make good all the internal finishings and decorations of the adjoining premises, and to pay the costs and charges and expenses of the survey, then it shall be lawful for the adjoining owner so to do, and he is hereby entitled to recover all the costs and expenses in respect thereof from such owner, his heirs, executors, administrators, or assigns.

**Rebuilding of sound Party-walls—Reference to Official Referees.**

30. And be it enacted, with regard to any sound party-wall against which an external wall shall have been built, and which shall have been suffered to remain, so far as relates to the rebuilding thereof, that if, while such party-wall continues sound, the adjoining building be pulled down and rebuilt, then the owner of such adjoining building shall not be entitled to more than his just proportion of the materials thereof, nor to more than his just proportion of the ground on which such party-wall was built, nor shall he build on more than his just proportion of the said ground, unless he shall have agreed with and satisfied the owner of the building so previously rebuilt for his half thereof; and that if the said owners cannot agree concerning the division of such materials, or of such ground, or of the building thereon, or concerning the reimbursement of the party first rebuilding as aforesaid, then the price and all matters in difference, including the sale and purchase of the ground in question, shall be settled by a reference to the official referees, whose award shall be final.

**Raising of false Buildings—Existing Buildings—Chimneys of adjoining Buildings—Use of raised Buildings.**

31. And be it enacted, with regard to every building hereafter built, so far as relates to the raising thereof, that it shall be lawful to raise any building, but so that nevertheless the party and external walls and chimneys thereof, when so raised, be of the materials and of the several heights and thicknesses hereinbefore described for party and external walls and chimneys of the rate such building shall be of when so raised; and with regard to buildings already built, so far as relates to the raising thereof, that although the walls of such buildings be not of the thicknesses prescribed by this Act, if in the opinion of the surveyor, such walls be sufficiently secure to allow of the raising thereof, then it shall be lawful to raise any such building already built to an additional height not exceeding ten feet; and with regard to any building adjoining one which shall be raised, so far as relates to the raising of the chimneys thereof, that if any building be raised it shall be the duty of the owner of such building, and he is hereby required to build up, at his own expense, the party-walls between his own and any adjoining building, and all flues and chimney-stacks belonging thereto; and with regard to any building raised, so far as relates to the walls thereof, if any such adjoining building make use of any portion of the part raised of such party-wall by building against it, or otherwise, it shall be lawful for the owner of the premises so first raised to claim, and he is hereby entitled to recover, the cost of a proportionate part of the portion which shall be so used, together with the cost of such parts of the chimney-stacks as belong thereto.

**Repairing and Rebuilding of Party Fence-walls—Deficient Party Fence-wall—Reimbursement of Expense of Operations—Limitation of Height of Screen Walls.**

32. And be it enacted, with regard to party fence-walls, by which term it is to be understood any boundary wall parting the grounds belonging to different owners or occupied by different persons, so far as relates to the repair and rebuilding and raising thereof, that if the owner of any of the premises parted thereby adjoining owner to repair, make to the use thereof the same, it shall be lawful for him so to do; and if the wall be below the height of nine feet from the ground on either side, then either to raise it to that height, or to pull it down and to rebuild it to that height, but upon condition that he do pay all the expenses thereof; and that if a building be to be erected against such party fence-wall, and such wall be not conformable to the requisites prescribed for a proper party-wall for a building of that class and rate, then it shall be lawful for the building owner and he is hereby entitled to pull down such party fence-wall, but upon condition that he do make good every damage which shall accrue to such adjoining premises by such rebuilding; provided always, with regard to the expense of so pulling down such party fence-wall and rebuilding the same, that if thereafter the adjoining owner use such party fence-wall for any purpose to which, if it had not been pulled down and rebuilt, it would not have been applied, then to such extent as such adjoining owner shall so use such wall the building owner shall be entitled to be reimbursed the expense of so pulling down and rebuilding such party fence-wall, provided also, that the limitation of the height thereof, that if any party desire to raise such wall so as to screen from view any offensive object or neighbourhood, then

on application to the official referees it shall be lawful for them to authorize such work, but not so as to obstruct the free circulation of the air, or to injure the property adjoining to or in the neighbourhood of such wall.

**Pulling down Party Timber Partitions.**

33. And be it enacted, with regard to the party timber partitions of existing buildings belonging to different owners, so far as relates to the pulling down thereof, and any wall under or over the same, that if one of the buildings be rebuilt, or if one of the fronts of any such building be taken down to the height of one story, or for a space equal to one-fourth of such front from the level of the second floor upwards, then without the consent of the adjoining owner, but upon giving the requisite notice, according to the forms (Nos. 11, 12, 13) in the Schedule of Notices, or to the like effect, it shall be the duty of the building owner and he is hereby required to pull down such timber partitions, and the walls under or over the same, and to erect thereof to build a proper party-wall, and that at the expense of the owners of all the premises parted thereby.

**Pulling down Intermixed Buildings.**

34. And be it enacted, with regard to buildings built over public ways, or having rooms or stories, the property of different persons lying intermixed (except Inns of Court hereinafter provided for), so far as relates to the pulling down and laying the parts thereof to each other, that if a party-wall or party-arch cannot be built without pulling down such buildings, and so laying parts thereof to each other, and if in default of the consent of all proper parties the official referees authorize such works, then it shall be lawful for the owner of either of the said buildings to execute the same, but so that the party-walls or party-arches be conformable to the provisions of this Act, and the directions of the said official referees in their award made in that behalf.

**Inns of Court, Chambers, &c.**

35. And be it enacted, with regard to the rooms or chambers in the Inns of Court (that is to say, in Serjeants' Inn, Chancery-lane, or in any of the four Inns of Court, or in any of the Inns of Chancery, or any other inns set apart for the study or practice of the law, and with regard to other buildings divided into rooms or chambers, offices, or counting-houses, let out or to be let in separate suites or sets, so far as relates to the pulling down of party-walls, that the walls or divisions between the several rooms and chambers in such inns, or such buildings, belonging to and communicating with each separate and distinct staircase, shall be deemed to be party-walls within the meaning of this Act, and as such must be built in conformity with the regulations and clauses herein contained relating to party-walls.

**Power of Entry on Premises to effect Works—Opening Doors and Removal of Goods, &c.—Continuance of Entry—Penalty for Hindrance.**

36. And for the purpose of facilitating and regulating the execution of any works authorized by this Act, or by any award in pursuance thereof, in respect of any party-wall or party-arch parting the buildings or grounds belonging to different owners, or in the occupation of different persons, or in respect of intermixed buildings, be it enacted, with regard to any such works, so far as relates to the power to enter the adjoining premises in order to execute the same, that if such work have been duly authorized, either by the consent of the parties competent to give such consent, or by the award or certificate of the official referees, then, at any time between the hours of six in the morning and seven in the afternoon (Sundays excepted), it shall be lawful for the building owner, or any other person acting in his behalf, accompanied by a constable or other officer of the peace, and they are hereby respectively empowered, to enter on the premises of the adjoining owner, so far as may be necessary for executing such work; and that if the outer door of such building be shut, and being thereunto required the person therein refuse to open the same, or if such building be empty and unoccupied, then it shall be lawful to break open such outer door; and if any fixtures, goods, furniture, or other thing obstruct the building of such intended party-wall or party-arch, or the pulling down any wall, partition, or other thing necessary to be pulled down and removed in order to the building such intended party-wall or party-arch, then to remove such fixtures, goods, furniture, and things to some other part of the same premises, or if there be no room on the premises sufficient for that purpose, to remove them to some other place of safe custody; and that from and after such entry, and at all usual times of working, it shall be lawful for the builder employed to erect such intended party-wall or party-arch, and for his servants and all others employed by him, to enter into and upon the premises, and abide therein the usual times of working, as well for the shoring up of the said building so broken into and entered upon, and for taking down and removing any party-wall, partition, wainscot, or other thing necessary to be taken down and removed for the purpose aforesaid, as to build such intended party-wall or party-arch; and that if in any manner any such owner or other person hinder or obstruct any workman employed for any of the purposes aforesaid, or willfully damage or injure the said workman, then every such person so offending shall forfeit for every such offence a sum not exceeding ten pounds.

**Stopping of Openings in external Walls abutting on other Premises—Stopping thereof—Costs of Stopping up—Certificate of Official Referees—Recovery of Costs.**

37. And now, for the purpose of further protecting the interests of adjoining owners, be it enacted, with regard to external walls adjoining the ground or

building of another owner, so far as relates to the making of openings therein, that if, without the consent in writing of the owner of such ground or building, any opening be made in any such wall, then it shall be lawful for such owner, and he is hereby entitled to require the owner of the premises in which such opening shall be made to stop up the same with brick or stone-work, as the case may be, according to the form (No. 5.) in the Schedule of Notices, or to the like effect; and that if within one month after such notice such stoppage be not effected, then it shall be lawful for such owner and he is hereby entitled, either by himself or his workmen, with tools, implements, and materials, to cause such openings to be stopped, and he is also hereby entitled to be repaid the costs thereof; and with regard to such costs, so far as relates to the adjustment thereof, that if such owner refuse to make payment thereof, or if there be any dispute as to the amount thereof, then, on application for the purpose to the official referees, by either of the parties concerned, it shall be lawful for the person by whom they have been incurred and he is hereby entitled to refer the matter of such dispute to the official referees, and to have their determination thereon; and that it shall be the duty of such official referees to give to the applicant a certificate in relation thereto; and that if any party liable to pay any sum of money under such certificate fail to do so, then it shall be lawful for the party entitled to such costs to recover the same in the manner herein-after provided for the recovery of the costs, charges, and expenses of executing any works in pursuance of this Act.

**Building of Party-walls next vacant Ground—Consent of adjoining Owner.**

38. And he it enacted, with regard to walls, so far as relates to the building thereof on vacant ground at the line of junction of premises belonging to different owners or in different occupations, that one month before the owner of any piece of vacant ground, or ground not hitherto built upon, shall build any building adjoining to another piece of vacant ground, or ground not hitherto built upon, or build a fence-wall for such piece of ground, it shall be his duty and he is hereby required to give to the owner or occupier of such adjoining vacant ground a notice, which may be in writing, and must set forth his desire to build a party-wall or party fence-wall, and describe the thickness and dimensions of such desired party-wall or party fence-wall, according to the form (No. 16) in the Schedule of Notices, or to the like effect; and that if within such period of one month such adjoining owner shall signify his consent in writing, then the same must be built partly on the ground of one of the said owners or occupiers, and partly on the ground of the other owner, and such last mentioned part is to be paid for as is hereinafter directed by such other owner or occupier; but if he do not signify such consent, then it shall be the duty of the building owner to build an external wall for such building, and fence-wall for such ground, entirely upon his own ground, except as to the footings of any such wall.

**Building of Chimney Breasts, &c. in new Party-wall for adjoining Owner—Instructions by adjoining Owner—Reimbursement of Expenses.**

39. And he it enacted, with regard to any new party wall built on the line of junction of premises belonging to different owners, so far as relates to the providing of chimney breasts and other accommodation for the adjoining owner, that when the owner of any piece of vacant ground shall have obtained the consent of the adjoining owner to build a party-wall on the line of junction of their respective premises, then, ten days at the least before beginning to build such party-wall, it shall be the duty of the building owner to give the adjoining owner notice thereof, according to the form (No. 16) in the Schedule of Notices, or to the like effect; and that if in due time the adjoining owner shall give instructions in writing, or by a plan and elevations or other sufficient drawings, then it shall be the duty of the building owner to construct, if practicable, such and so many chimney jams, breasts, and flues of chimneys in all such parts of such party-wall as shall be by such instructions required, and to leave such recesses in every such wall as may be so required, but so that they be conformable with the directions of this Act concerning party-walls and chimneys; and that thereupon it shall be lawful for the building owner to claim and he is hereby entitled to recover from the adjoining owner all the expenses of constructing such chimney jams, breasts, and flues of chimneys, and recesses, as provided by this Act in that behalf.

**RUINOUS BUILDINGS.**

**Repairing and Rebuilding—Application to Official Referees—Survey—Notice to Lord Mayor, &c. and to Overseers—Shoring and Erection of Hoards, and Notice to Parties—Repairs—Appeal against Survey—Demolition.**

40. And whereas buildings within the limits of this Act are often, either from litigated titles thereto, or from the obstinacy, neglect, or poverty of the owners thereof or of the parties interested therein, or from other causes, in so ruinous a condition that passengers are endangered thereby; now, for the purpose of making provision in that behalf, be it enacted, with regard to ruinous buildings or parts of buildings, so far as relates to repairing or pulling down the same, that upon receiving information of any building being in a ruinous and dangerous condition it shall be the duty of the surveyor and of the overseers for the time being of the parish or place in which the same shall be, and they are hereby respectively required, to apply forthwith to the official referees to authorize a survey to be made thereof; and that thereupon it shall be lawful for the official referees to

direct the surveyor to make such survey; and that thereupon it shall be the duty of such surveyor to act in all respects as in the case of a survey into party-walls; and that in the receipt or certificate of the surveyor it shall be lawful for the official referees and they are hereby required to cause a copy thereof to be transmitted, if the premises be within the city of London, then to the Court of Lord Mayor and Aldermen, and if they be elsewhere, then to the overseers of the poor of the parish or place in which such premises shall be; and that thereupon it shall be the duty of such Mayor and Court of Aldermen, and overseers, to cause with all convenient speed such ruinous building to be securely shored, or a proper and sufficient board to be put up for the safety of all passengers, and to cause notice in writing to be given to the owner of such building to repair or pull down the same or any part thereof, as the case may require, within fourteen days then next ensuing; and that if within the said fourteen days the repair or demolition thereof be not begun, and be not completed as soon as the nature of the case will admit, then, on a declaration being made before the said Lord Mayor or a justice of the peace of such notice having been so given (which declaration the said Lord Mayor and justice are hereby respectively empowered and required to make), it shall be lawful for the said Lord Mayor and Court of Aldermen, and they are hereby authorized and required, out of the cash in the chamber of London, and also for every such overseer of the poor by and out of the money in his hands, and they are hereby severally authorized and required, with all convenient speed, to order and cause such building, or such part thereof so certified to be in a ruinous and dangerous condition as shall be necessary for the safety of the passengers, to be repaired or pulled down, or secured in such manner as shall from time to time be requisite: provided always, that if such Lord Mayor and Aldermen, or such overseers, appeal against such certificate, it shall be the duty of the official referees to proceed to survey, to certify, and to award in all respects as in the case of an appeal from the certificate of the surveyor, with reference to party-walls or intermixed buildings; and that if such official referees certify that the said premises are ruinous and dangerous, it shall be the duty of the said Lord Mayor or the said overseers to repair or pull down such building as aforesaid.

**Disposal of Materials to pay Costs—Payment of Surplus on Demand—If no Demand—City of London or Overseers to refund within Six Years.**

41. And he it enacted, with regard to any such ruinous building so pulled down, so far as relates to the disposal of the materials thereof, and to the application of the proceeds, that it shall be lawful for the said Lord Mayor and Court of Aldermen, or the said overseers, to sell and dispose of such of the materials as they shall judge necessary, and out of the moneys arising from the sale thereof to reimburse to themselves the costs and charges which shall be expended by them respectively employed for the purposes aforesaid, all the charges of the survey and appeal, and of putting up every such hoard, and of repairing, pulling down, and securing such premises, and of making good the pavement, and of selling the said materials as aforesaid, or so much thereof as the moneys arising by such sale will extend to; and that if there be any surplus after payment of all such expenses, then, upon demand thereof made by such owner, it shall be the duty of the said Lord Mayor, or of the said overseers, to account for and pay such surplus of the moneys arising by such sale to the owner of such building; or if there be any question as to the person entitled to such surplus, or as to the priority of title to such surplus, then such person so entitled, or as to the proportions to which such persons are so entitled, then it shall be lawful, either for the Lord Mayor or the overseers, or for any person claiming to be so entitled, to refer the matter to the determination of the official referees, and their decision shall be final; and that if no such demand be made then such surplus shall, as regards places within the city of London and the liberties thereof, be paid to the chamberlain of the city, and as regards all other places such surplus shall be paid to the overseers, and added to the moneys raised as rates for the relief of the poor of the parish or place, and accounted for accordingly: provided nevertheless, that at any time within six years from the deposit of such surplus, it shall be lawful for any such owner, his executor or administrators, to claim and he is hereby entitled to recover such surplus; and the said Lord Mayor and Aldermen of the city of London, as regards the said city and liberties thereof, are hereby required to pay such surplus out of the cash in the chamber of London; and every overseer, as regards places not within the said city or the liberties thereof, is hereby required to pay such surplus out of any moneys raised or to be raised by any rate for the relief of the poor.

**If a Deficiency, to be paid by the Owner; or levied by Warrant of Distress; or levied by the Court of the Rent; or by Distress on Occupier—Payment of Money to Chamberlain or to the Overseers.**

42. And he it enacted, with regard to such ruinous buildings, so far as relates to the expenses of any such survey and appeal, putting up such hoard, repairing, pulling down, and securing such buildings, and selling the materials, beyond the amount thereof which shall have been satisfied by the application thereto of the proceeds of the materials, that if the moneys arising from such sale be insufficient to repay all such expenses, then from time to time such deficiency shall be paid by the owner of every such building, being the person entitled to the immediate possession thereof, if known; and that if, on demand thereof, such owner fail to pay such deficiency, then

it shall be lawful for the Lord Mayor for the time being, if such ruinous building in question be within the city of London or the Liberties thereof, or if elsewhere, for two or more justices of the peace, to levy the amount thereof by warrant under their hands and seals, by distress and sale of the goods and chattels of such owner, if any such can be found; and that if no such owner can be met with, or being met with, shall not demand pay the said deficiency, and no sufficient distress of the goods and chattels of such owner can be found, then it shall be lawful for the persons so named at any time thereafter to occupy any such building, or the ground where the same stood, and he is hereby authorized and required, to pay and deduct the same out of the rent thereof; and that if he neglect or refuse to pay such deficiency, then it shall be lawful for the said Lord Mayor, or two or more such justices of the peace, and they are hereby empowered and required, to cause the same to be levied by distress of the site of the goods and chattels of any occupier of the premises, together with the costs of every such distress and sale; and that if the premises be situate within the city of London and its liberties it shall be the duty of the person by whom the same shall be received, and he is hereby required, to pay the amount to the chamberlain, to be by him from time to time placed to the credit of the cash of the said city of London, and if the premises in respect of which such money shall be received or recovered be not situate within the said city of London and the liberties thereof, then to pay the amount received to the overseers of the poor for the time being of the parish or place where the premises shall be situate, to be by them placed to the account of the said parish, in aid of the poor rate of the parish or place.

**Repair of ruinous Chimneys, &c.—Notice—Repairs—Certification of Expenses—Recovery from Owner—Occupier—Penalty—Fees and Expenses—Reimbursement or Order.**

43. And he it enacted, with regard to ruinous chimneys, roofs, and projections, so far as relates to the repairing thereof, that if a chimney-shaft, chimney-pot or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or any projection from the front walls of any building, be in danger of falling, then it shall be the duty of such surveyor or Overseer, hereby required to require the occupier of such building, or if there be no occupier then the owner thereof, to take down or secure the same within thirty-six hours after notice thereof shall have been given; and that if within the time specified such occupier, or some other person interested in such building, do not begin to take down or secure the same, and as soon as the nature of the case will admit complete taking down or securing of the same, then it shall be the duty of such surveyor to give information thereof to a justice of the peace, and thereupon it shall be the duty of such justice of the peace to proceed to cause such chimney-shaft, chimney-pot or other thing thereon, or the eaves, or parapet or coping, or slates or tiles on the roof, or any projection from the front or side wall of such building as shall be considered by such surveyor in danger of falling, to be forthwith taken down or secured; and that if there be no occupier or known owner, then it shall be lawful for such justice to direct that the reasonable expenses, to be certified by the official referees, be paid by the overseers of the parish or place in which the same shall be situate; and that if thereafter the owner of such building become known, or if the building become occupied, then it shall be lawful for the overseers of the poor and they are hereby entitled to recover the amount of such expenses from such owner or from such occupier as in the case of ruinous buildings hereinbefore provided for; and that if within the time limited the occupier or some other person interested in such building, do not take down or secure the same, then for every day during which the same shall so remain unrepaired or not sufficiently secured such occupier, or the owner if there be no occupier, shall forfeit and pay a sum not exceeding five pounds; and that such occupier or owner shall also pay the surveyor's fees, and all other costs, charges, and expenses attendant upon any such taking down or securing the building; and all such surveyor's fees, and other costs, charges, and expenses, may be recovered and levied in the same manner as such penalty: provided always, that if the occupier of such building be not bound by virtue of any lease or other instrument to repair, reinstate, or secure the premises, then such occupier is hereby entitled to retain out of the premises payable in respect of such premises all such penalties, costs, charges, and expenses attendant upon or arising out of the taking down or securing, or the repairing or rebuilding the same, as in the case of any other works the costs of which he is hereby required to pay in the first instance.

**Injury by the fall of Chimneys, &c.—Compensation.**

44. And he it enacted, with regard to adjoining buildings, so far as relates to the making good any damage arising from the falling down of parts thereof (except any such part of a party-wall as shall belong to and be used conjointly by the owners or occupiers of the buildings parted thereby), that if at any time any injury or damage be caused to any part of an adjoining building, or to the internal decorations and furniture, goods, wares, and merchandize in such building, by the falling down of any other building of any chimney-shaft, chimney-pot, parapet, coping, or other thing, it shall be the duty of the owner of the building from which such part shall fall, and he is hereby bound and required, to reimburse the expense to which the owner or occupier may be put in making good such injury or damage, in like manner as herein directed concerning the reimbursement of the expenses of ruinous party-walls; and such costs shall

be recoverable in the manner hereinafter directed for the recovery of the costs and expenses of executing works in pursuance of this Act.

*Court of Mayor and Aldermen.*

45. And be it enacted, that all the powers and authorities by this Act vested in the mayor and aldermen of the city of London may be lawfully exercised by the Court of Mayor and Aldermen of the said city to be holden in the outer chamber of the Guildhall of the said city according to the custom of the said city.

**EXPENSES OF WORKS.**

*Repayment of Expenses of Works in certain Cases—Recovery of Expense from adjoining Owners—Delay of Payment.*

46. And for the purpose of reimbursing any building owner for the expense of works incurred in respect of any party structure, be it enacted, with regard to the following works, so far as relates to the reimbursement by the adjoining owner of expenses incurred by the building owner in respect of any party structure built to part the buildings or premises belonging to other owners from the buildings or premises belonging to himself, that is to say,

First, with regard to any party-wall hereafter built on the line of junction of any two buildings; and

Second, with regard to any party-wall hereafter built on the line of junction of any building and any vacant ground or of vacant premises belonging to different owners or occupiers; and

Third, with regard to a ruinous and defective party-wall pulled down and rebuilt, either with the consent of the adjoining owner, or in pursuance of the condemnation thereof according to this Act, except a party-wall condemned on account of the injury done thereto by any building owner, and the expenses of which and of other incidental works the official referees shall have awarded to be paid by such building owner by virtue of the provision in that behalf; and

Fourth, with regard to any more timber partitions between any two or more buildings, pulled down, and a party-wall built in lieu thereof; and

Fifth, with regard to a new party-wall or party-arch built in lieu of any party-wall or party-arch between intermixed properties pulled down, either with the consent of the adjoining owner, or in pursuance of the condemnation of such party-wall or party-arch; and

Sixth, with regard to any party-wall built on the site of a party-fence or party-fence-wall, and used otherwise than as a party-fence-wall by the person who shall not have built the same; and

Seventh, with regard to every other case of reimbursement in respect of any party structure,

That if the party structure be built in the manner, and of the materials, and of the thicknesses of such structure as required by this Act in reference thereto, then it shall be lawful for the building owner at whose expense such work shall have been executed to claim and he is hereby entitled to be paid, and to recover from the person who is entitled to the immediate possession of the adjoining building or ground, or who is in the immediate occupation thereof, the following compensations; that is to say,

That if a new party-wall or party-arch built on the line of junction by one owner be made use of, either wholly or partially, by the adjoining owner, then the sum of money proportionate to the value of so much of such party structure so made use of; and

If chimney-jambs, chimney-breasts and flues, have been set up in any party-wall, in pursuance of the instructions of the owner of any vacant ground adjoining to the same, then a sum equal to the value thereof; and

If an unsound party-wall or other party structure be pulled down and rebuilt, then a sum of money equal to a proper proportion of the value of the new party structure, deduction being made for adue proportion of the old materials, and also a proportionate part of all expenses which shall be necessary for pulling down the old party structure in lieu of which such new party structure shall be built; and

If a party-wall be built in lieu of a timber partition or other party structure, and be made use of by the adjoining owner, then a sum of money proportionate to the value of so much of such new party-wall as shall be so made use of, and also a proportionate part of all expenses which shall be necessary for pulling down the old timber partition or other party structure; and

If a party-wall or party-arch already built or hereafter rebuilt be used by any adjoining owner, then a sum of money proportionate to the value of so much of such party structure as the adjoining owner shall use, deduction being made, where proper, for the value of old materials;

And in every case the whole of the reasonable expenses of the shoring up the adjoining building, and of removing any goods, furniture, or other things therein, and of pulling down any waistcot or partition thereof;

And also such surveyor's fees and any other fees payable in respect of any acts performed by the official referees, and also such other costs (if any) as may have been awarded by the official referees as aforesaid in any of the cases hereby provided for: And until such expenses shall be so paid every person at whose expense such party structure shall have been built is hereby entitled to and shall be possessed of the sole property thereof, and of the ground whereon it stands, and the same shall be vested entirely in the person at whose expense such party structure shall have been built.

*Recovery of Costs of building—Account—Data of Account—Examination of Accounts by Official Referees—Disapproval—Approval and Demand of Payment—Recovery of Amount.*

47. And be it enacted, with regard to the costs of

all the works which shall be executed under this Act, incurred either by an owner or by an occupier, either on behalf of the owners of the same premises or on behalf of the owner of the adjoining premises, so far as relates to the recovery thereof, that within twenty-one days after the completion of the work it shall be the duty of the person by whom such expense shall have been incurred to deliver to the adjoining owner of the building or premises in respect of which such expense shall have been incurred an account in writing of the expenses of the work, including all preliminary and incidental operations, and also if the work shall have been executed by the authority of the official referees, by virtue of the power hereby provided for supplying the want of consent of owners, then a copy of such account shall also be delivered to the official referees at their office; and that every such account must contain a true account,—

First, of the number of rods and parts of rods of brick-work, and of all digging, and of concrete, stonework, and other requisite materials, and of the labour required in executing so much of the work as the owner of the adjoining building shall be liable to pay, and of the respective prices thereof; and

Secondly, of any deduction which such adjoining owner shall be entitled to make therefrom on account of the old materials of so much of the wall or other structure pulled down which shall have belonged to him;

And also a true account of the expenses of all other preliminary and incidental operations; and that all such works must be estimated and valued in every such account at such rates and prices as shall from time to time be fixed by the official referees; and that if within ten days from the delivery of such account any party dissatisfied with the proportion of the amount thereof charged to him appeal to the official referees, then upon the receipt thereof, or if in cases of want of due consent as aforesaid, such account be delivered to the official referees as aforesaid, it shall be the duty of the official referees to examine such account, and to certify whether they approve or disapprove of the items thereof, and whether the rates and prices are duly charged, and whether the proportion of the account charged to him appears to be duly charged, and also to appoint how and by whom the expenses of such examination are to be borne, and also to appoint the time or times at which the amount of such account and of such expenses payable by any party are to be paid; and that if they certify their disapproval, or that the charges are not duly made, or the amount fairly apportioned with regard to the party appealing, then before any demand be made or any proceedings be taken thereon, the account must be amended, and again examined by the official referees, and certified as aforesaid; and that if the official referees certify their approval, then at the time or times appointed by the said official referees it shall be lawful for the person entitled to such costs and expenses to demand the amount thereof; and that if, within ten days after the delivering of such account to the party liable to pay the same, such party do not either appeal against such account or pay the same, or if, within ten days after the demand thereof, in conformity with the certificate of the official referees, the amount thereof, together with the costs of the examination of the account as the official referees shall certify, be not paid, then it shall be lawful for the person entitled thereto to recover the same, or so much thereof as shall be then due, by the summary proceeding hereby provided.

*Reimbursements of Costs of Works to Occupiers—Discharge and Repayment.*

48. Provided always, and be it enacted, with regard to works executed under this Act, so far as relates to the reimbursement to the occupier of any costs by him paid in respect thereof, that, unless there be some covenant or agreement to the contrary between the parties, it shall be lawful for such occupier and he is hereby entitled to demand the rents due or becoming due from him to his lessor or landlord the amount of any such costs, charges, and expenses payable by his lessor or landlord, and the costs, charges, and expenses of any distress and sale made on him through the default of his lessor or landlord; and that the receipt for such payment shall be a sufficient discharge to any occupier for so much money as he shall have so paid, or which shall have been so levied on his goods and chattels in pursuance of this Act, and shall be allowed by such lessor or landlord in part or full payment (as the case may be) of the rent due to him by such occupier.

*Recovery of Expenses of Buildings—Differences—Determination by Official Referees—Charges—Receipt of Rents—Recovery of Rents—Priority of Right—Limitation of Distress—Continuance of Distress until Payment made.*

49. And be it enacted, with regard to the costs and all other expenses of pulling down, securing, repairing, and rebuilding party structures, or other parts of buildings, according to the provisions of this Act, so far as relates to the recovery thereof amongst the several owners of the premises, that when such costs and expenses shall have been ascertained and paid by the owner upon whom the payment thereof shall have first fallen, then, as to any building or tenement held under any lease or agreement for a lease, or other agreement for the occupation thereof, made before the coming into operation of this Act, it shall be lawful for such owner and he is hereby entitled to recover the same from the persons now bound or liable by law or by any existing contract to maintain and repair such buildings in respect of which such costs and expenses shall have been incurred; but if any dispute or difference arise as to the persons so bound or liable, then every such dispute or difference shall

be referred to the official referees; and that thereupon such official referees shall ascertain and determine the persons bound or liable to pay such costs and expenses, and also in what proportions such costs and expenses are to be paid by the parties liable to pay the same, and their decision shall be final; and that as to any building or tenement to be held under any lease or agreement for a lease, or other agreement for the occupation thereof, made after the coming into operation of this Act, except a lease renewable for ever on a fixed fine or other customary payment, all such costs and expenses shall be charged upon the lessor granting such lease or making such agreement, and not upon any lessee or sub-lessee holding under any such lease or agreement, subject, nevertheless, to any express covenant or agreement made between any such lessor and lessee in that behalf; and in case of such excepted lease such costs and expenses shall be charged upon the lessee instead of the lessor, subject, as aforesaid, to any express covenant or agreement in that behalf to such occupier by law or by any existing contract to maintain and repair such buildings in respect of which such costs and expenses shall have been incurred; and that if such occupier pay such rents and profits accordingly, then it shall be lawful for the person to whom such costs and expenses shall be payable to recover the same from such occupier by the summary proceeding hereby provided, in such proportions and at such times as shall be appointed by the award of the said official referees in that behalf; and that after such notice shall be given, and before such costs and expenses shall be paid, it shall not be lawful for any person otherwise entitled to receive such rents and profits and he is hereby disabled from bringing any action, and from taking any proceeding at law or in equity to recover such rents and profits: provided always, that if on the hearing of the application for the warrant to levy such costs and expenses by distress, according to the provision of this Act in that behalf, the occupier, not being an owner, shew that he is not bound to pay in respect of such building or tenement any rent or profit, or that the amount of the rent or profit payable by him is not sufficient, then it shall not be lawful to issue such warrant, if there be no rent due or accruing, or if there be rent due or accruing, then to the extent only of the amount of such rent; and that if such costs and expenses of work done thereon remain unpaid, and if the same or any future occupier be or become liable to pay rent in respect of such building or tenement, then, from time to time until the same be paid, it shall be lawful to levy the same by distress, according to the provisions of this Act in that behalf, upon the same or any such future occupier.

*Official Referees to determine Contributions—Proportional Contributions—Decision of Official Referees—Recovery of Expenses paid by any Contributor.*

50. And be it enacted, with regard to such costs and expenses of works executed under this Act, so far as relates to contribution thereto by persons bound or liable to make contribution, that in the purpose of enabling the party upon whom the payment of such costs and expenses shall fall, either in the first instance or subsequently, to obtain contribution from other persons, being owners according to the meaning of this Act, in like degree, and so bound or liable to make contribution, it shall be lawful for every such first-mentioned person, whether he be freeholder, copyholder, leaseholder, mortgagee in possession, and whatever may be his interest, or the nature and extent of such his interest, and whether he hold in his own right or in right of others, and whatever may be the kinds and degrees of their respective interests, and he is hereby entitled to a contribution from every other person having as owner an interest in the premises of whatever kind or degree, which contribution is to be computed according to the amount of his interest in proportion to that of other persons interested, so far as such persons may be known, or can be reached by process of any court of law or equity; and that it shall be lawful for any party so interested and he is hereby entitled to require the official referees to settle and determine the same by their award, and their decision shall be final; and that if the person upon whom the payment of such costs and expenses shall have fallen have paid in respect of the interest of another or others, either unknown or who could not be reached by process of any court of law or equity, more than his own just proportion, then, on the production of such award, duly made, signed, and sealed, it shall be lawful for such person to have and exercise against other parties against whom such award shall be made and he is hereby entitled to the like remedies to compel payment of money as are hereby given for compelling the first payment of such costs and charges of such expenses.

**DRAINAGE OF HOUSES.**  
*Making of Drains according to Schedule (H.)—Penalties—Communications with Sewers—Saving Powers, &c. of Commissioners of Sewers.*

51. And now, for the purpose of facilitating the improvement of the drainage of houses, be it enacted, with regard to the drains, cesspools, and privies to be made in buildings hereafter built, so far as relates to the making thereof, that from the passing of this Act all the conditions, regulations, and directions contained in the Schedule (H.) to this Act annexed shall be duly observed and performed; and that if any person offend in respect thereof he shall be liable to all the penalties and forfeitures by this Act imposed in re-

spect of any buildings either built contrary thereto, or without due notice to the surveyor appointed in pursuance of this Act to inspect such buildings; provided always, with regard to such drains, so far as relates to the communication thereof with the sewers under the jurisdiction of the Commissioners of Sewers, that unless the regulations of such commissioners now or hereafter in force be repugnant to the directions contained in such schedule, and to the extent to which such regulations are not so repugnant, it shall be the duty of every person and he is hereby required to make such drains to conform to such regulations; and that with regard to such drains, except so far as is hereby otherwise provided, all the rights, powers, jurisdiction, and authority vested in any such commissioners shall be as valid and effectual as if this Act had not been passed.

**STREETS AND ALLEYS.  
Width thereof—Penalties.**

52. And now, for the purpose of making provision concerning streets and other ways of the metropolis, be it enacted, with regard to such streets and other ways hereafter formed, so far as relates to securing a sufficient width thereof, that from the passing of this Act all the conditions, regulations, and directions contained in the Schedule (L) to this Act annexed shall be duly observed and performed; and that if any person offend in respect thereof he shall be liable to all the penalties and forfeitures by this Act imposed in respect of any buildings, either built contrary thereto, or without due notice to the surveyor appointed in pursuance of this Act to inspect such buildings.

**BUILDINGS, USE THEREOF.**

**Occupation of Cellars or Rooms unfit for Dwellings—Penalty—Report by Overseers of Poor as to Number and Situation of Dwellings—Notice thereon by Official Referees to Owners and Occupiers—District Surveyors to observe Directions of Official Referees.**

53. And now, for the purpose of discouraging and prohibiting the use of buildings unfit for dwellings, be it enacted, with regard to every building of the first or dwelling-house class, whether already or hereafter built, so far as relates to the occupation thereof, or to the occupation of any underground room or cellar thereof, that from and after the first day of July, one thousand eight hundred and forty-six it shall not be lawful to let separately to hire as a dwelling any such room or cellar not constructed according to the rules specified in the schedule (K.) to this Act annexed, nor to occupy or suffer it to be occupied as such, nor to let, hire, occupy, or suffer to be occupied any such room or cellar built underground for any purpose (except for a warehouse or storeroom); and that if any person wilfully let or suffer to be occupied in manner aforesaid any underground cellar or room, contrary to the provisions of this Act, then, on conviction thereof before two justices of the peace, such person shall be liable to forfeit for every day during which such cellar or room shall be so occupied a sum not exceeding twenty shillings; and one-half of such penalty shall go to the person who shall sue for the same, and the other half to the poor of the parish in which such unlawfully occupied cellar or room shall be situate; and that on or before the first day of January, one thousand eight hundred and forty-five, it shall be the duty of the overseers of the poor and he is hereby required to report to the official referees the number and situation of the dwellings within their respective parishes of which any underground room or cellar shall be so occupied, and that thereupon it shall be the duty of the official referees and they are hereby empowered to direct such notice to be given to the owners and occupiers of such dwellings as shall appear to such official referees to be best calculated to give to such owners or occupiers full knowledge of the existence, nature, and consequences of this enactment; and that it shall be the duty of the district surveyors and they are hereby required to give full effect to the directions of such official referees in this behalf.

**Buildings near dangerous Businesses as to Fire—Distance from Buildings—New Businesses—Prohibition after Twenty Years—Fifty Pounds Penalty, and Costs—Distress—Or Imprisonment.**

54. And now, for the purpose of making provision concerning businesses dangerous in respect of fire or explosion, be it enacted, with regard to the following businesses (that is to say), the manufacture of gunpowder or of detonating powder, or of matches ignitable by friction or otherwise, or other substances liable to sudden explosion, inflammation, or ignition, or of vitriol, or of turpentine, or of naphtha, or of varnish, or of fireworks, or painted table-covers, and any other manufacture dangerous on account of the liability of the materials or substances employed therein to cause sudden fire or explosion, so far as relates to the erection of buildings in the neighbourhood of the place where any such business is carried on, and so far as relates to the carrying on of any such business in the neighbourhood of public ways or buildings, that it shall not be lawful hereafter to erect any building of any class nearer than fifty feet from any building which shall be in use for any such dangerous business; but if a building already existing within fifty feet from any such building be hereafter pulled down, burnt, or destroyed by tempest, such building may be rebuilt; and that it shall not be lawful for any person to establish or newly carry on any such business, either in any building or vault or in the open air, at a less distance than forty feet from any public way, or than fifty feet from any other building, or any vacant ground belonging to any other person than his landlord; and that if any such business be now carried on in any situation within such distances, then from the expiration of the period of twenty years next after the

passing of this Act it shall not be lawful to continue to carry on such business in such situations; and that if any person erect any building in the neighbourhood of any such business contrary to this Act, then, on conviction thereof before two justices, he shall forfeit a sum not exceeding fifty pounds for every day during which such building shall remain near to such dangerous business; or if any person establish anew any such business, or carry on any such business contrary to this Act, then, on conviction thereof before two justices, such person shall be liable to forfeit for every day during which such business shall be so carried on a sum not exceeding fifty pounds, as the said justices shall determine, and that it shall be lawful for the justices also to award to the prosecutor such costs as shall be deemed reasonable; and that if the offender either fail or refuse to pay such penalty and costs immediately after such conviction, then they may be levied by distress of the goods and chattels of the person convicted; or if there be no such distress, then such person shall be committed to the common goal or house of correction for any time not exceeding six months, at the discretion of such justices, and that by warrant under the hands and seals of two or more justices of the peace.

**Buildings near noxious Businesses as regards Health—Distance from Buildings—New Businesses—Prohibition after Thirty Years—Fifty Pounds Penalty and Costs—Distress—Or Imprisonment.**

55. And now, for the purpose of making provision concerning businesses offensive or noxious, be it enacted, with regard to the following businesses, that is to say, blood-boiler, bone-boiler, fellmonger, slaughterer of cattle, sheep, or horses, soap-boiler, tallow-melter, tripe-boiler, and any other like business offensive or noxious, so far as relates to the erection of buildings in the neighbourhood of any such business, and so far as relates to the carrying on of any such business in the neighbourhood of any public way, or of other buildings of the first or dwelling-house class, that it shall not be lawful hereafter to erect any buildings of the first or dwelling-house class nearer to than fifty feet from any building which shall be in use for any such offensive or noxious business, but if a building already existing within fifty feet be hereafter burnt, pulled down, or destroyed by tempest, such building may be rebuilt; and that it shall not be lawful for any person to establish or newly carry on any such business, either in any building or vault or in the open air, at a less distance than forty feet from any public way, or than fifty feet from any other such buildings of the first or dwelling-house class; and that if any such business be now carried on in any situation within such distances, then, from the expiration of the period of thirty years next after the passing of this Act, it shall cease to be lawful to continue to carry on such business in such situation, save as is hereinafter provided; and that if any person erect any building in the neighbourhood of any such business contrary to this Act, then, on conviction thereof before two justices, he shall forfeit a sum not exceeding fifty pounds for every day during which such building shall remain near to such offensive or noxious business; or if any person establish anew any such business, or carry on any such business contrary to this Act, then, on conviction thereof before two justices, he shall be liable to forfeit for every day during which such business shall be carried on a sum not exceeding fifty pounds, as the said justices shall determine, and that it shall be lawful for the justices also to award to the prosecutor such costs as shall be deemed reasonable; and that if the offender either fail or refuse to pay such penalty and costs immediately after such conviction, then they may be levied by distress of the goods and chattels of the person convicted; or if there be no such distress, then such person shall be committed to the common goal or house of correction for any time not exceeding six months, at the discretion of such justices, and that by warrant under the hands and seals of two or more justices of the peace.

**The Penalty herein-before imposed to be enforceable only at a Special Sessions—Use of Means to mitigate Noxiousness of Businesses—Adoption of Means to mitigate, after Conviction—Mitigation of Penalty by Superior Courts.**

56. Provided always, and be it enacted, with regard to any such offensive or noxious business, whether such business be now carried on at a less distance than forty feet from any public way, or than fifty feet from any other building, or any vacant ground, or at a greater distance, so as to cause danger or annoyance, so far as relates to the mitigation of any penalty or punishment for unlawfully carrying on thereof, that every such penalty herein-before imposed shall be enforceable only at a special sessions of the peace summoned for that purpose, or on an appeal as herein-after provided, or at a trial as herein-after provided; and that notwithstanding the said term of thirty years shall have expired, if any party charged with carrying on such business shew that in carrying on such business all the means then known to be available for mitigating the effect of such business in any such respect have been adopted, then it shall be lawful for such justices to receive evidence, and that notwithstanding such evidence to mitigate the penalty as to them shall seem fit: provided further, with regard to such offensive or noxious business, so far as relates to the adoption of means to mitigate the injurious effects thereof, that, notwithstanding the said period of thirty years shall have expired, if it shall appear to the justices, whether at petty sessions as aforesaid, or on appeal, or on trial by jury, as herein-after provided, that the party carrying on any such business shall have made due endeavours to carry on the same

with a view to mitigate, so far as possible, the effects of such business, then, although he hath not adopted all or the best means available for the purpose, yet it shall be lawful for such justices assembled and they are hereby empowered to suspend the execution of their order or determination, upon condition that within a reasonable time, to be named, the party convicted do adopt such other or better means as to the said justices shall seem fit, or before passing final sentence, and without consulting the prosecutor, to make such order touching the carrying on of such business as shall be by the said court thought expedient for preventing the nuisance in future: provided always, that if the matter in respect of which such penalty shall be incurred come before any superior court it shall be lawful for such court to exercise such power of mitigating such penalty, or of suspending the execution of any judgment, order, or determination in the matter, or to make such order touching the carrying on of such business, as to the court shall seem fit in the case.

**Conviction and Appeal as to certain Trades not specified: Recognizances—Sessions—Proceedings.**

57. And be it enacted, with regard to any business offensive, noxious, or dangerous, and with regard to any building erected or continued within any such distance as aforesaid from any such business dangerous, noxious, or offensive, so far as relates to a conviction in respect of any such business, and to an appeal from such conviction, that if any person be dissatisfied with the decision of such justices, and if, within four days after such decision, notice be given to the party appealed against, by or on behalf of such person, of his intention to appeal, and if he enter into a recognizance, with two sufficient securities, conditioned to try such appeal, and to abide the order of the court, and to pay to the party appealed against the costs of such appeal, and if he be so conditioned, then it shall be lawful for such party so dissatisfied to appeal against such conviction to the justices of the peace at their general Quarter Sessions of the peace to be holden within four months after such conviction for the place in which such premises shall be situate; and that if the premises be situate within the City of London and liberties thereof, then the appeal must be made to the Quarter Sessions thereof, or if the premises be situate in the counties of Middlesex, Kent, or Surrey, or in the City and the liberties of Westminster, or in the liberties of her Majesty's Tower of London, then to the Quarter Sessions thereof respectively, as the case shall be; and that if within the above-mentioned period such appellant shall have entered into such recognizance as herein required, and if within one month thereafter he give notice of the grounds of such appeal, then it shall be lawful for such justices and they are hereby empowered to proceed to hear and examine on oath into the causes and matters of such appeal (which oath they are hereby empowered to administer), and to determine the same, and to award such costs to be paid by the said parties as they think proper; and the order, judgment, and determination of the said justices in their respective sessions shall be binding and conclusive upon all parties.

**Trial by Jury at Quarter Sessions—Summoning of a Jury—6 G. 4, c. 50—Witnesses—View of the Premises—Verdict of Jury—Judgment according to Verdict, and Judgment to be binding.**

58. Provided always, and be it enacted, that if before conviction by two such justices the party complained against desire to have the matter tried by a jury, and enter into a recognizance to try such matter without delay, and to pay all costs of trial if a verdict be found against him, then such matter may be tried at the next practicable Court of Quarter Sessions, or whosoever the Court shall appoint; and that if such application of such party, it shall be lawful for the said Court of Quarter Sessions and they are hereby authorized and required to issue their warrant or precept to the sheriff or other proper officer (as the case may be), requiring him to return a competent number of persons qualified to serve on juries according to the provisions of an Act made in the sixth year of the reign of his late Majesty King George the Fourth, "for consolidating and amending the laws relative to jurors and juries;" and that it shall be lawful for the said Court of Quarter Sessions and they are hereby authorized and empowered, by precept, from time to time as occasion may require, to call before them respectively every person who shall be within their power or authority to do so, and to examine them on oath concerning the premises; and that if the said court think fit it shall be lawful for them and they are hereby empowered to authorize the said jury to view the place in question in such manner as they shall direct, and to command the attendance of such jury, and of all such witnesses and parties as shall be necessary or proper, and to call such affidavits for which they are summoned, shall be concluded; and that the said jury shall inquire and try, and determine by their verdict, whether the business in question be offensive or noxious, and whether the party in question have done any act whereby the penalty hereby imposed in respect thereof has been incurred; and that, subject to the power herein-before conferred of mitigating such penalty, or of suspending their judgment, order, or determination thereon, or making such order touching the carrying on of the business aforesaid, the said Court of Quarter Sessions shall give judgment according to such verdict, and shall award the penalty (if any incurred) by the defendant, and shall and may (if they see fit) award to either of the parties such costs as they may deem reasonable, which verdict, and the judgment, award, order, or determination thereupon, shall be binding and conclusive.

*Appeals to Quarter Sessions for Surrey and Kent: to Sessions at Southwark: to Sessions at Greenwich—Further Meetings—Adjournments.*

59. And be it enacted, with regard to any appeal in respect of a conviction for carrying on any such dangerous, offensive, or noxious business, so far as relates to the place where such appeal is to be heard, that if the appeal be to the General Quarter Sessions of the peace for the county of Surrey or the county of Kent, then the jury (if any) to be impanelled in pursuance of this Act, and all parties required to attend the Quarter Sessions for the said counties pursuant to such application, shall be impanelled and required to attend at some general or special adjournment of the said Quarter Sessions to be held within six weeks next after the original sessions; and that if the matter relate to the county of Surrey, then such adjournment shall be to some convenient place in the borough of Southwark in the said county; and that if the matter relate to the county of Kent, then such adjournment shall be to some convenient place in the borough of Greenwich in the said county; and such times and places shall be appointed by the justices of the said counties respectively assembled at such original sessions; and that from time to time every further meeting of the said sessions, for any thing to be done upon such application, shall be appointed at or within the space of three weeks from the last meeting; and that from time to time it shall be lawful for the justices of the peace for the said counties of Surrey and Kent respectively, and they respectively are hereby empowered and required, to make such adjournment and hold such sessions as there shall be occasion.

*Common Law and Statutory Remedies not affected.*

60. Provided always, and be it declared, with regard to any business which is contrary to any existing Act of Parliament otherwise contrary to law, so far as relates to the operation of this Act in that behalf, that, notwithstanding any thing in this Act contained, this Act shall not be deemed to authorize any person to carry on any such business either within or without the limits of the said Act, if it is in any manner contrary to any public, local, or private Act of Parliament, or otherwise contrary to law; nor to affect, abridge, or restrain the right, the duty, or the power of any person, whether private person or public officer, to prosecute, either civilly or criminally, any person who shall carry on within the limits of this Act any offensive, noxious, or dangerous business.

*Regulation or Removal of Trades Deemed Nuisances by Purchase—Memorial to Queen in Council—Order for Removal—Compensation—8 & 5 Vict. c. 12—Unlawful to continue such Trades after Purchase.*

61. And further, for the regulation or removal of any offensive, noxious, or dangerous business now carried on, be it enacted, with regard to any such business, so far as relates to the purchase thereof, or of the premises wherein it shall be carried on, that if two-thirds in number of the inhabitant householders of any parish in which such business shall be carried on present a memorial to her Majesty in Council, stating the existence of such offensive, noxious, or dangerous business in such parish or the neighbourhood thereof, and praying the removal of such business therefrom, and thereby engaging to provide compensation to the persons carrying on the same, either at their own expense or by the means of a rate to be levied on the inhabitants of the said parish, or such part thereof as may be affected by such business, then it shall be lawful for her Majesty to refer the matter to the Lords of the Committee of Privy Council for Trade to consider the character of such business, whether it be offensive, noxious, or dangerous; and if it appear to be so, and that there are no means of remedying it, otherwise by the adoption of methods available, without unreasonable sacrifice on the part of the person by whom it is carried on, then it shall be lawful for her Majesty, by order in Council, to direct that the removal of such business may be purchased, either at the expense of the memorialists or by means of a rate as aforesaid, as to her Majesty shall seem fit, and also to direct the sheriff of the county or other proper person in the parish or liberty in which such business is carried on to summon a jury, according to the provisions of an Act made and passed in the fourth year of the reign of her present Majesty, intitled "An Act to enable her Majesty's Commissioners of Woods to make a new Street from Coventry-street to Long Acre, and for other Improvements in the Metropolis," to determine what compensation shall be paid to the party carrying on such business for the removal thereof, and to the owner and occupier of the premises for the restriction of the use of his buildings for such purpose; and that if within three months after the verdict of such jury shall be given, and judgment thereon, the inhabitants of such parish or neighbourhood pay or tender such compensation, then within three months from the payment or tender of such compensation it shall cease to be lawful for the party carrying on such business to continue the same, and for any owner or occupier thereof either to carry on or to permit to be carried on such business in the same or any part of the same premises.

*Funds for defraying Compensation—Levy of Rate.*

62. And be it enacted, with regard to the funds for defraying such compensation, so far as relates to the raising thereof, that if her Majesty shall by such order direct the compensation to be paid by means of a rate, then it shall be lawful for the overseers of the parish to raise such sum as shall be necessary, either as a separate rate in the nature of poor's rate, or as part of the poor's rate, on the inhabitants at large of such parish; or if in pursuance of the memorial of the inhabitants of such part of the said parish

as shall be affected by the said business it be appointed by such order in Council that such last-mentioned inhabitants do defray such compensation, then it shall be lawful for the said overseers to raise such sum as shall be necessary for that purpose; and that if such rate be so levied either on the inhabitants at large of such parish, or on the inhabitants of such part thereof as aforesaid, then such rate may be levied and recovered as poor's rates are leviable and recoverable.

*Exemption of public Gas Works—Extension or Substitution of Works—Distilleries.*

63. Provided always, and be it enacted, with regard to public gas works and other works heretofore established within the limits of this Act, so far as relates to the operation of the provisions of this Act in reference to businesses dangerous in respect of fire or explosion, or offensive or noxious, that such provisions shall not be deemed to apply to any such public gas-works; and that if by any Act of Parliament now in force relating to gas companies to which such works belong, any extension of such works, or any additional works, or any other works, he authorized to be erected or substituted, then such provisions shall not be deemed to apply to any such extension, addition, or substitution within the limits of the district now lighted from such first-mentioned works; and that such provisions shall not be deemed to apply to any premises entered or used for the purpose of distillation or the rectification of spirits under the survey of the Commissioners of Excise or their officers.

*SURVEYORS, THEIR DISTRICTS AND DUTIES.*

*Appointment of Districts.*

64. And now, for the purpose of dividing the district to which this Act is to apply into several smaller districts, for the convenient execution therein of this Act, and for appointing competent surveyors for superintending the same in each such district, and for regulating the duties of their office, be it enacted, with regard to such districts, so far as relates to the appointment and alteration thereof, that at any time after this Act shall come into operation, and from time to time, it shall be lawful for the Lord Mayor and Aldermen of the city of London, with reference to the city of London and the liberties thereof, and for the justices of the peace for the county of Middlesex, the county of Surrey, the county of Kent, the city and liberties of Westminster, and the liberty of her Majesty's Tower of London, in their General Quarter Sessions respectively, or any adjournment thereof, with reference to their respective counties, city, and liberties, and they respectively are hereby empowered, but subject, nevertheless, to the consent of one of her Majesty's principal Secretaries of State, to appoint the districts to which the respective places within their jurisdiction shall belong for the purposes of this Act, and to unite, enlarge, and alter such districts for the more convenient distribution of the business.

*Appointment of Surveyors.*

65. And be it enacted, with regard to the surveyors to be assigned to such districts for the purposes of this Act, so far as relates to their appointment, that at any time after this Act shall come into operation, and from time to time, it shall be lawful for the said Lord Mayor and Aldermen of the city of London, with reference to the city of London and the liberties thereof, and for the said justices of the peace in their General Quarter Sessions respectively, or any adjournment thereof, with reference to their respective counties, and they are hereby required, but subject, nevertheless, to the consent of one of her Majesty's principal Secretaries of State, to nominate and appoint as surveyors such and so many discreet persons, of the full age of thirty years, and properly educated and skilled in the art and practice of building, as they the said Lord Mayor and Aldermen and the said justices shall think fit.

*Practical Qualifications of Surveyors: Examiners—Examiners to prescribe Rules—Production of Certificates of Examination.*

66. And be it enacted, with regard to such surveyors to be hereafter appointed under this Act, except present district surveyors appointed to new districts, so far as relates to the ensuring the possession of due scientific and practical qualifications, that it shall be lawful for the Commissioners of Works and Buildings; and they are hereby empowered to appoint three or more architects, surveyors, or builders to examine, together with the said official referees, any persons who may present themselves to be examined for the purpose of obtaining a certificate of qualification, with the view of becoming candidates for the office of surveyors of metropolitan buildings of any district within the limits of this Act; and that for that purpose it shall be lawful for such examiners from time to time to appoint such times as to them may seem fit, and from time to time to prescribe such course of examination as to them may seem fit, and to make any other rules for the regulation of such examination, and the granting of certificates in respect thereof, subject, nevertheless, to the approval of the Commissioners of Works and Buildings; and that when such rules shall have been registered by the registrar of metropolitan buildings they shall continue to be in force until they shall be amended, altered, or rescinded by other rules to be made by such examiners and so registered as aforesaid; and that unless, one week before the election of a surveyor for any district created by this Act, or for any district in respect of which the office of surveyor may become vacant, or when such rules shall have been registered by the registrar of metropolitan buildings they shall continue to be in force until they shall be amended, altered, or rescinded by other rules to be made by such examiners, and that he was thereby found to be duly qualified for such office, to the town clerk of the city of London, or to the clerk of the peace for the county, city, or liberty, it shall not be lawful for any justices by this

Act empowered to appoint surveyors to appoint such person to be such surveyor, and that if such person be so appointed his election to such office shall be void.

*Tenure of Office.*

67. And be it enacted, with regard to such surveyors, so far as relates to the tenure of their office, that it shall be lawful for every such surveyor and he is hereby entitled to hold such his office of surveyor during the pleasure only of the said Lord Mayor and Aldermen and of the said justices respectively.

*Functions generally.*

68. And be it enacted, with regard to such surveyors, so far as relates to their functions generally, that it shall be the duty of every such surveyor, and he is hereby required—

To see that all the rules and directions of the Act are well and truly observed in and throughout his district; and for that purpose,

To proceed from time to time, in due course, upon the receipt of any notice, or if from ignorance or neglect, or from any other circumstance, notice of any work intended to be done have not been given, then upon such work being observed by or being made known to him, to inspect the works intended to be done, or which shall have been commenced, and to cause all the rules and directions of this Act in respect thereof to be strictly observed; and also

To attend and perform every thing required of him by this Act, whether with or without notice; and also

To inspect ruinous buildings and projections in danger, at all times when useful, and to take all necessary measures thereupon; and also

To survey all buildings built, rebuilt, enlarged, or altered by or under the superintendence of a district surveyor within any other district to which he shall be appointed by the official referees for that purpose; and also

To cause a book for registering all notices, informations, and complaints to be at all times kept at his office, and to enter in such book every notice, information, or complaint which shall be delivered or made to him, and any proceeding thereon by him taken.

*Disqualifications.*

69. And be it enacted, with regard to such surveyors, so far as relates to their disqualifications, that during the time that any such person shall act as a justice of the peace for the county in which his district shall be situated it shall not be lawful for him and he is hereby disqualified from holding the office of a surveyor or of deputy or an assistant surveyor for any district under this Act.

*Continuance of present Surveyors. 14 G. 3, c. 78—Subject to this Act.*

70. And be it enacted, with regard to the surveyors who at the time of this Act coming into operation shall have been appointed under the Act of the fourteenth year of the reign of King George the Third, mentioned in the schedule (A.) hereto annexed, so far as relates to their continuance in office, and the application of this Act to them, that until they shall be removed it shall be lawful for them and they are hereby entitled to continue to be the surveyors for the purposes of this Act, and for the districts assigned to them at the time this Act shall come into operation, but subject to such alteration of such districts as may be made by virtue of any power in that behalf, and to act in all respects as if they had been appointed under this Act; and that every provision in this Act applicable to district surveyors, so far as relates to the exercise of the office of surveyor, and to their remuneration in that behalf, shall apply to them.

*Declaration of official Fidelity—Penalty for acting before Declaration made.*

71. And be it enacted, with regard to every surveyor hereafter appointed, so far as relates to making a declaration of official fidelity, that before any such surveyor shall act in pursuance of this Act it shall be his duty and he is hereby required to make a declaration of official fidelity, which must be administered by the said Lord Mayor and Aldermen in their Court of Aldermen, or by the said justices of the peace in their respective General Quarter Sessions, and must be in the form or to the effect following; that is to say,

"I, A.B., being one of the surveyors appointed in pursuance of an Act made and passed in the eighth year of the reign of her Majesty Queen Victoria, intitled, 'An Act for regulating the Construction and the Use of Buildings in the Metropolis and its Neighbourhood,' and commonly called the Metropolitan Buildings Act, do solemnly declare, that I will diligently, faithfully, and impartially perform the duties of my office, and to the utmost of my power, skill, and ability endeavour to cause the several provisions of the said Act to be strictly observed, and that without favour, partiality, prejudice or malice, to any person whatsoever."

And that if before making such declaration any such surveyor act in pursuance of this Act, then, on conviction thereof, he shall be liable to pay, for every day during which he shall so act before making such declaration, the sum of five pounds.

*Regulation of Duties: Offices—Attendance—Return of Name and Residence.*

72. And be it enacted, with regard to the surveyors, so far as relates to the regulation of their official duties, that it shall be the duty of every surveyor for the city of London and the liberties thereof, and he is hereby required, to leave an office at his own expense, in such public situation as shall be approved by the Lord Mayor and Aldermen; and that it shall be the duty of every other surveyor and he is hereby required to have an office, at his own expense, in some central part of the district to which he shall be

appointed, as shall be approved by the justices of the peace in Quarter Sessions within whose jurisdiction he shall act; and the duty of every such surveyor and he is hereby required, by himself or by some other person in his behalf, to attend at his office every day (Sundays, Christmas Day, and Good Friday excepted) from ten of the clock in the morning till four of the clock in the afternoon; and that immediately upon his appointment, and from time to time upon every change of his residence or of his place of business, or of either if required, it shall be the duty of every surveyor and he is hereby required to make a return to the registrar of metropolitan buildings, and to the overseers of the poor of every parish or place within his district, of his name and place of abode, and the place where such office shall be.

#### DISTRICT SURVEYORS.

##### *Surveyor pro tempore—Duty of Deputy—Fees.*

73. And be it enacted, with regard to such surveyors, so far as relates to the appointment of a deputy or substitute in certain cases, that if any surveyor shall be prevented by illness or any other unavoidable circumstances from attending to the duties of his office, then forthwith it shall be his duty and he is hereby required, but subject to the previous consent and approval of the official referees, to appoint some other surveyor, duly qualified as aforesaid, as his deputy, to perform all such his duties for so long a time as he shall be so prevented from executing them; and that thereupon, during such time as aforesaid, it shall be the duty of such deputy surveyor and he is hereby required to perform all the duties of such surveyor, and that in all respects as if he were the surveyor appointed or confirmed under this Act; and that it shall be lawful for such deputy surveyor and he is hereby entitled to receive the fees payable in respect of the services so performed by him in such district.

##### *Vacancies—Occasional Services—Fees for Services.*

74. And be it enacted, with regard to such surveyors, so far as relates to the filling up of vacancies, that if any vacancy shall happen through the death or removal of any surveyor, then, within one month thereafter, it shall be the duty of the lord mayor and aldermen, or of the justices of the peace in general quarter sessions or any adjournment thereof, as aforesaid, and they are hereby respectively required, to appoint a successor as herein directed; and that in the meantime it shall be lawful for the official referees to direct the surveyor of any one or more of the other districts to perform the duties of surveyor for the vacant district, or if no district surveyor can be spared from his own district to appoint some other competent person duly qualified as aforesaid for that purpose; and that every such surveyor is hereby entitled to receive the fees payable in respect of the services so performed by him in such vacant district.

##### *Regulation of Business—Assistant Surveyors—Duties of Assistants—Fees.*

75. And be it enacted, with regard to the surveyors, so far as relates to the regulation of their business, that if it shall appear to the official referees that the district appointed for any surveyor is too extensive for the prompt discharge of his functions, then it shall be the duty of the registrar of metropolitan buildings, the Lord Mayor and aldermen of the City of London, or to the justices of the peace with whom the appointment of a surveyor for that district may rest, and for that purpose to transmit with their letter of representation a transcript of their "Register of Notices," with the results; and that if at any time it appear to such official referees that on account of the pressure of business in any district, or on any other account, the surveyor of that district cannot discharge his duties promptly as regards the builders and others engaged in building operations, and efficiently as regards the purposes of this Act, then it shall be lawful for such official referees, and they are hereby empowered to appoint any other district surveyor to assist the surveyor of such district in the performance of his duties, or if no district surveyor can be spared from his own district, then to appoint some other competent person to give such assistance; and that with regard to all buildings surveyed by such assistant surveyor, and all other acts done by him, it shall be the duty of such assistant surveyor to make returns and to act in all respects as if he had been appointed by the said Lord Mayor and aldermen, or by the said justices, to be the surveyor of such district; and that every such person shall be entitled to receive the fees payable in respect of the services so performed by him.

##### *Superintendence of Surveyors.*

76. And be it enacted, with regard to such surveyors, so far as relates to the supervision of buildings built, rebuilt, enlarged, or altered by or under their professional superintendence, that it shall not be lawful for any such surveyor to survey any such building for the purposes of this Act, but that such building must be surveyed by another district surveyor, or by another surveyor to be appointed by the official referees for that purpose.

##### *Surveyor's Fees—Refusal of Payment—To be paid only for Work done agreeably to Act—Refunding Fees.*

77. And be it enacted, with regard to such surveyors, so far as relates to their remuneration, that upon the expiration of one month after the roof of any building erected and surveyed under this Act shall have been covered in, and all the walls thereof have been built to their full heights, and the principal timbers and floors shall have been fixed in their places, and upon the expiration of fourteen days after the completion of any addition, alteration, and repair, and upon the expiration of fourteen days after each special service shall have been performed, and

upon delivering to the owner of the building an account of the fees incurred, and upon tendering a receipt, signed with his Christian name and surname, and stating the amount of such account, and the work done, it shall be lawful for the surveyor and he is hereby entitled to receive from the builder, or from the owner or from the occupier of the building, for his time and trouble and expenses in causing the rules, regulations, and directions of this Act to be observed, the several fees specified in the schedule of fees (L.) hereunto annexed; and that if on tender of such receipt any builder, owner, or occupier who shall become liable to pay any such fee shall refuse to pay the same, then, upon application to any justice of the peace, it shall be lawful for such justice and he is hereby required to summon the party complained of in the first instance, and if he do not appear, or if he fail to satisfy the said justices as to the refusal of payment as aforesaid, it shall be lawful for such justice, and he is hereby required to issue his warrant to levy the amount of such fee by distress and sale of the goods and chattels of the party so refusing, in like manner as poor's rates are by law recoverable, and if such fee be paid by the occupier, he shall be entitled to recover the amount thereof from the owner: Provided always, that if the work in respect of which such fee shall become payable is not completed in every respect agreeably to the directions of this Act, then it shall not be lawful for any surveyor to receive such fee; and that if he shall so receive it, then, upon application to the official referees by any party interested in the building in respect of which such work shall have been executed, and upon its appearing that such fee has been received wrongfully, it shall be lawful for such official referees and they are hereby empowered to order the said surveyor to refund such fees.

##### *Surveyor's Returns—Inspection of Returns—Authentication and Effect of Returns.*

78. And be it enacted, with regard to such surveyors, so far as relates to a return of the business done by them, and to the inspection thereof, that within seven days after the first day of every month, it shall be the duty of every surveyor, and he is hereby required to make a return to the registrar of metropolitan buildings, enumerating therein the number and nature of all the several works executed within the previous month under his supervision, and the fees paid to him for the same, and also a copy of the list or register of notices served upon him, with the results thereof, and to keep in his office a copy of such return; and that if any person shall apply to inspect the same, then on the payment of one shilling it shall be open for inspection at all reasonable times; and with regard to such return, so far as relates to the authentication and effect thereof, that every such return must be signed by such surveyor, and if so signed it shall be deemed to be a certificate that all the works enumerated therein have been done in all respects agreeably to this Act, according to the best of his knowledge and belief; and that they have been duly surveyed by him; but no such return shall be any protection from or hindrance to any future proceedings in respect of any work not executed according to the provisions of this Act, though the signature may have been done before the making of such return.

##### *Penalty for Extortion, Negligence, or Unfaithfulness—Complaint to Justices—Proceedings thereon—Decision—Incapacitation of Surveyor.*

79. And be it enacted, with regard to every surveyor, so far as relates to the discharge of his duties, that if any surveyor demand or wilfully receive any higher fee than he shall be entitled to under this Act, or if in his capacity of surveyor he receive a fee for any act or omission in respect of which he is not entitled to receive any remuneration, or if he refuse to refund any fee wrongfully received by him in respect whereof the official referees shall make an order to that effect, or if at any time he wilfully neglect his duty, or behave himself negligently or unfaithfully in the discharge thereof, then and in every or any such case it shall be lawful for any person to present a complaint in writing under his hand to the lord mayor and aldermen of the city of London, or the court of quarter sessions who, as the case may be, are the justices for which such surveyor shall act for the time being, at any sessions of the peace, quarter or general, either original, intermediate, or adjourned, and which complaint shall set forth the nature and particulars of the offence charged by the complainant against any such surveyor; and that the said lord mayor and aldermen or court of sessions, as the case may be, shall by order of court appoint a time for the hearing of the said complaint, and a copy of which order and of the said complaint shall be served by or for the said complainant on the said surveyor ten days at the least before the time appointed for the hearing of such complaint; and the said surveyor shall appear before the said lord mayor and aldermen or court of sessions, as the case may be, at the time and place so appointed for hearing the said complaint, to answer the same; and that if, upon the hearing of the complaint and of the surveyor, and the evidence respectively produced by or for them, it shall appear unto the said lord mayor and aldermen or court of sessions, as the case may be, that such complaint is well founded, then it shall be lawful for the said lord mayor and aldermen, or the said court of quarter sessions, as the case may be, and they are hereby respectively required, either to fine such surveyor in such sum of money not exceeding fifty pounds as they shall think fit, or to discharge him forthwith from his said office; and that if for any such cause such surveyor be discharged, he shall be incapable of being appointed a surveyor for the purposes of this Act.

##### *Appointment of Two Official Referees—Tenure of Office—Not to act as Surveyors—Temporary Official Referee.*

80. And now, for the purpose of providing for the appointment of competent official referees to superintend the execution of this Act throughout all the districts to which it is applicable, and also to determine sundry matters in question incident thereto, as well as to exercise, in certain cases, a discretion in the relaxation of the fixed rules and directions of this Act, where the strict observance thereof is impracticable, or would affect the object of this Act, or would be needlessly affect with injury the course and operation of this branch of business, be it enacted, with regard to the official referees, so far as relates to their appointment, to their qualifications, and to the tenure of their office, that it shall be lawful for one of Her Majesty's principal secretaries of state, and he is hereby empowered to appoint two persons, being of the profession of an architect or surveyor, to be official referees of metropolitan buildings, and from time to time, as he shall think proper, to remove such official referees, and in their place to appoint other persons so qualified; and that while any such person shall so hold the office of official referee it shall not be lawful for such person, and he is hereby expressly prohibited as such a surveyor, either alone or with any partner or by any agent, or to act as official referee in the case of any building or matter in which he shall act as architect; and that if an official referee be employed as architect as to any building or matter within the limits of this Act, then it shall be the duty of such official referee and he is hereby required to report thereon to the Commissioners of Works and Buildings, and thereupon it shall be the duty of such Commissioners of Works and Buildings, and they are hereby required to appoint some other competent person to act in conjunction with the other official referee as to such building or matter.

##### *Their Functions generally.*

81. And be it enacted, with regard to such official referees, so far as relates to their functions generally, that it shall be the duty of such official referees and they are hereby required to superintend the execution of this Act by the several district surveyors already existing or hereby authorized to be appointed, and to perform the several matters to them respectively assigned by the provisions of this Act, and to determine all questions referred to them, whether expressly by this Act or at the instance of any one or more of the parties concerned.

##### *Matters of Reference—One Referee may act.*

82. And be it enacted, with regard to the official referees, so far as relates to their jurisdiction, that in any suit, difference, or dissatisfaction in respect of any matter within the limits of this Act arise between any parties concerned, or between any party and any surveyor, or between any two surveyors, as to any act done or to be done in pursuance of this Act, or as to the effect of the provisions thereof in any case, or as to the mode in which the provisions of this Act are or ought to be carried into effect, and particularly as to whether the requirements implied in terms of qualification applied to sites, to soils, to materials, or to workmanship, or otherwise, and denoting good, sound, fire-proof, fit, proper, or sufficient, are fulfilled in certain cases, or as to the district in which any building, matter, or thing is to be deemed to be situate, especially in cases where such building, matter, or thing is partly in one district and partly in another, or as to the expenses to be borne by the respective owners of premises parted by the same party walls, or the proportions thereof, or as to the proportions of the expense to be borne by the occupier or by the owners of premises in respect of any work executed, or any other matter whatever, then it shall be lawful for any party concerned and he is hereby entitled to require the official referees to determine such matter, but so that such requisition be made in writing, and that it set forth, either generally or otherwise, the matters in respect of which the determination of the official referees is required; and that the determination of such referees, or of one of such referees, with the assent of the registrar of metropolitan buildings, as to all or any of the points in difference on which such referees shall make their award, and as to the costs, charges, and expenses of such reference, shall be binding on all parties to such reference.

##### *Award and Powers of Referees—Effect of Legal Awards—Effect as to Persons.*

83. And be it enacted, with regard to the official referees, so far as relates to their authority in respect of any reference to them, and to the effect of their award upon the rights and interests of the owners and occupiers of property, that it shall be lawful for such referees and they are hereby empowered to exercise all such powers of arbitrators as they would have had in case they had been appointed under an order of Her Majesty's Court of Queen's Bench at Westminster; and that if such award be given in writing, and be sealed by the official seal of the registrar of metropolitan buildings, it shall be as effectual as if made under an order of reference by such court, and shall be enforced by the said court in all respects as if made under an order of such court; and that it shall be binding and conclusive against every person, including the Queen's Majesty, her heirs and successors, claiming any estate, right, title, or any part thereof, either in possession, reversion, remainder, or expectancy, and against every other person whomsoever.

##### *Revocation of Authority of Official Referee—Not to affect their Award.*

84. And be it enacted, with regard to any reference

to the said official referees, so far as relates to the revocation of their authority, that the power and authority of the official referees shall not be revoked by any party to such reference, without the consent of all parties thereto; and that although any party shall not attend upon such reference it shall be lawful for such official referees to proceed with the reference, and to make their award.

**Taking of Evidence by the Official Referees—Appointment of Time and Place—Compensation for Attendance—Production of Documents—Administration of Oaths—Penalty for False Evidence.**

85. And be it enacted, with regard to such reference, so far as relates to the evidence of any matter thereof, that it shall be lawful for the official referees and they are hereby empowered, by their summons in writing sealed with the seal of office of the registrar of metropolitan buildings, to require the attendance of any person who may be able to give evidence in the matter of any reference to them, and to require by such summons the production of any documents to be mentioned therein; and that if in addition to the time and place of attendance in obedience thereto, signed by one at least of the official referees before whom the attendance is required, be also served either together with or after the service of such summons, then, if the party so summoned do not attend in obedience thereto, such party shall be liable to be proceeded against as for a contempt of court; and that every person whose attendance shall be required shall be entitled to the like conduct money and payment of expenses as for and upon attendance at any trial; and that no person shall be compelled to produce under any such summons any writing or other document that he would not be compelled to produce at a trial, or to attend on more than two consecutive days to be named in such summons; and that it shall be lawful for the official referees and they are hereby respectively authorized and required to administer an oath to such witnesses as may come before them, or, in cases where affirmation is allowed by law instead of an oath, to take their affirmation; and that if upon such oath or affirmation any person making the same wilfully and corruptly give false evidence, then every person so offending shall be deemed to be guilty of perjury.

**Effect of Awards as Evidence.**

86. And be it enacted, with regard to such award, so far as relates to the effect thereof as evidence of the matter thereof, that if on the trial or hearing of any cause or matter in any court of law or equity, or elsewhere, any copy of an award, signed and sealed with the seal of the said registrar, be produced, then it shall be the duty of all judges, justices, and others, and they are hereby required, to receive the same as *prima facie* evidence of the matters therein contained.

**Declaration of Official Fidelity.**

87. And be it enacted, with regard to the official referees, so far as relates to the declaration of official fidelity, that before any official referee shall act in pursuance of his appointment it shall be his duty and he is hereby required to make the following declaration, to be administered by the Chief Baron or any other of the Barons of her Majesty's Court of Exchequer; that is to say,

"I, A. B., do solemnly declare, that I will diligently, faithfully, and impartially execute the duties of an official referee in relation to matters arising under the provisions of the Act of her Majesty Queen Victoria, intituled *An Act for regulating the Construction and the Use of Buildings in the Metropolis and its Neighbourhood*, and commonly called the Metropolitan Buildings Act."

**Regulation of Business of the Official Referees—Official Referees may delegate Powers.**

88. And be it enacted, with regard to such official referees, so far as relates to the regulation of the business of their office, that when any matter is by this Act required, directed, or permitted to be done by the official referees the same may be done by either of them, with the assent of the Registrar of Metropolitan Buildings, unless express provision to the contrary be made, and if done by any one of them with such assent it shall be as valid and effectual as if done by both of them; and that, subject to such restrictions and regulations as may be made in that behalf by the Commissioners of Works and Buildings, it shall be lawful for the official referees to appoint one of their number, under their hands and the seal of the Registrar of Metropolitan Buildings, to make any inquiry or any survey which shall appear to them either necessary or expedient in order to enable them to determine any matters in reference.

**REGISTRAR OF METROPOLITAN BUILDINGS. Appointment of Registrar—Tenure of Office—Rules of Office—Seal of Office—Use of Seal of Office—Report of Objections by Registrars—Authority of Commissioners of Works—Interim Registrars.**

89. And for the purpose of duly recording relaxations of the requisitions of this Act, made in pursuance of the provisions hereof in that behalf, and of providing for the revision from time to time both of such relaxations and requisitions, and of providing against the partial exercise of the powers of this Act, and for the more effectually providing for the due recording of the Acts of the official referees, and for extending a more general control thereof, be it enacted, that it shall be lawful for the Commissioners of Works and Buildings, and they are hereby authorized and required, to appoint a Registrar of Metropolitan Buildings; and that such registrar shall hold his office during the pleasure of the said commissioners; and that, subject to the provisions of this Act, it shall be lawful for the said commissioners to make rules for

regulating the execution of the duties of the office of the said registrar; and that it shall be the duty of such registrar to keep a seal, and to affix such seal to all documents made by the said official referees, and required to be sealed, and to keep all the documents and records relating to the business of their office, and to register the same: Provided always, with regard to such registrar, so far as relates to the affixing the seal of office to any document, that if it shall appear to the said registrar that any such documents are contrary to law, or not complete in any of the requisite forms, or beyond the competence of the said official referees, either with regard to the provisions of this Act, or any rules or regulations prescribed for their guidance by the said Commissioners of Works and Buildings, then it shall be the duty of the said registrar to refuse to affix the seal, and that thereafter, if the said official referees shall so require, it shall be his duty and he is hereby required to report the matter, and the particular grounds and reasons for his refusal, to the said commissioners; and that upon the receipt of such report it shall be lawful for the said commissioners to authorize the said registrar to affix the seal, or to confirm his refusal: Provided always, with regard to such office of registrar, so far as relates to the execution of his duties in certain events, that if such registrar be ill, or otherwise unable to discharge the duties of his said office, or if he be absent, then it shall be lawful for the said Commissioners of Works and Buildings to appoint some other person to act temporarily in his behalf, and to assign to such person such part of the remuneration of the said registrar, or otherwise to remunerate him, as the Lords of the Treasury shall appoint in that behalf.

**Declaration of official Fidelity.**

90. And be it enacted, with regard to the registrar, so far as relates to the declaration of official fidelity, that before any registrar shall act in pursuance of his appointment it shall be his duty and he is hereby required to make the following declaration, to be administered by the Chief Baron or any other of the barons of her Majesty's Court of Exchequer; that is to say,

"I, A. B., do solemnly declare, that I will diligently, faithfully, and impartially execute the duties of registrar in relation to matters arising under the provisions of an Act made and passed in the eighth year of the reign of her Majesty Queen Victoria, intituled *An Act for regulating the Construction and the Use of Buildings in the Metropolis and its Neighbourhood*, and commonly called the Metropolitan Buildings Act."

**Custody and Inspection of Records of Official Referees—Copies of Awards, Certificates, &c.—Authentication of Copy, and Fees therefor.**

91. And be it enacted, with regard to such awards, certificate, and other records of the said official referees, so far as relates to the custody and the inspection thereof, that all such awards, certificates, and other documents relating to the business of their office shall be kept in the office of the registrar of metropolitan buildings; and that if, for the purpose of evidence or otherwise, any party require a copy of such award, or certificate, or other document, or to inspect the same, then on payment of the expense thereof, and of such fees as may be appointed in that behalf, it shall be lawful for such party and he is hereby entitled to demand from the registrar an inspection thereof, or a copy thereof or extract therefrom; and that on such payment and demand required to give, under his hand and seal of office, a copy of any such award or any other document to the person so demanding the same.

**Office of Registrar, and Regulation of Business.**

92. And be it enacted, with regard to the registrar of metropolitan buildings, so far as relates to his office or place of business, and to the regulation of the business thereof, that it shall be lawful for the Commissioners of Works and Buildings and they are hereby required to appoint, in some central and convenient situation within the city of London or the city of Westminster, an office for carrying on the business of the registrar of metropolitan buildings, and registering all documents relating to such business; and in such office it shall be the duty of such registrar, and he is hereby required,—

To keep a register of all matters referred to the official referees, and otherwise of all matters which shall come under their cognizance in pursuance of this Act; and also

To keep and preserve all documents connected with the said duties of his office, and also

To receive all notices requiring any act to be done by them, and to file and number them in the order in which they are received.

**Registration of Awards, &c.**

93. And be it enacted, with regard to all the awards and certificates, and all documents relating to the business of the official referees, so far as relates to the registration thereof, that the same shall be registered, not only chronologically in the order in which they are received, but according to the subject matters thereof, and also according to the order of said in relation to the provisions of this Act.

**Remuneration of Official Referees and Registrar.**

94. And be it enacted, with regard to such official referees and registrar, so far as relates to their remuneration, that it shall be lawful for her Majesty to grant to each of such official referees and the said registrar a salary not exceeding one thousand pounds by the year, in four equal quarterly payments; and that if any such official referee or such registrar shall be appointed, or shall die, resign, or be removed from office, in the interval between two quarterly days of payment, then he shall be entitled to a proportionate part of the salary for the period of such interval during which he shall hold such appointment.

**Disqualification of Official Referees and Registrar—Officers vacant.**

95. Provided always, and be it enacted, with regard to the said official referees and registrar, so far as relates to their qualifications, that if any person be or become commissioner, receiver, steward, or agent for or on behalf of any owner of houses within the limits of this Act, then such person shall not be eligible to the office either of official referee or of registrar under this Act; and that if after having been appointed thereto he shall become such commissioner, receiver, steward, or agent, then he shall cease to be qualified to hold such office of official referee or registrar, and thereupon such office shall be vacant, without prejudice, nevertheless, to any acts done by any such person in his capacity of official referee or registrar, so far as other persons are affected thereby.

**Funds for defraying Expenses of the Official Referees and Registrar—Nature of Levy.**

96. And forasmuch as the services of such official referees and of such registrar will be employed chiefly on behalf of the localities comprised within the limits of this Act, it is expedient to provide for the payment of a portion of their salaries by means of a county rate, or by a rate in the nature of a county rate, on such localities, in proportion to the assessed value of inhabited houses and buildings therein, or as near thereto as may be; so far that purpose, be it enacted, with regard to such official referees and registrar, so far as relates to the payment of a portion of their salaries out of local funds, that it shall be lawful for the Lord Mayor and Aldermen of the city of London and they are hereby required to direct the chamberlain of the said city, and for the justices of the peace for the several counties of Middlesex, Surrey, and Kent, and they are hereby respectively required, to direct the treasurer of such respective counties to pay, by two half-yearly payments in the months of June and December in every year, to or into the hands of the cashier of the Commissioners of Works and Buildings, on account of the said official referees and of the said registrar, the several sums of money herein-after mentioned, as and by way of contribution to such salaries, that is to say,

The city of London and the liberties thereof	£100
The county of Middlesex	1,000
The county of Surrey	320
The county of Kent	50
	1,500

And it shall be lawful for the said justices and they are hereby empowered and required to cause the same to be levied by a rate upon the several parishes and places within the limits of this Act, in such amounts as to such justices may seem proper, having regard to the assessed value of the inhabited houses and the buildings in such places respectively, in addition to the county rate in respect thereof; and that for the purpose of levying such sums they shall be deemed to be part of the county rate, and leviable by all the ways and means by which a county rate is leviable, and subject in all respects to the legal incidents of a county rate.

**Payments of Official Referees and Registrar out of Consolidated Fund.**

97. And be it enacted, further, with regard to the official referees and registrar, so far as relates to the payment of the balance of their salaries, that such balance shall be payable and paid out of the consolidated fund of the United Kingdom of Great Britain and Ireland.

**Fees of Office, and Application thereof—Balance to Consolidated Fund—Regulations as to Receipt, Custody, and Accounts—List of Fees to be hung up.**

98. And be it enacted, with regard to the fees payable to the registrar, so far as relates to the appointment thereof, and to the application thereof, that from time to time it shall be lawful for the Commissioners of the Treasury to appoint such fees to be paid in respect of the services to be performed by the said official referees or by the said registrar as shall be deemed requisite to defray the expenses of the said office, or incident to such services, and the salaries or other remuneration of any persons employed under the registrar in the execution of this Act, with the sanction of the commissioners of the treasury, and which are not otherwise provided for by this Act, and that the balance, if any, shall be carried to the consolidated fund of the United Kingdom, and be paid accordingly into the Receipt of her Majesty's Exchequer at Westminster; and that it shall be lawful for the Commissioners of the Treasury to regulate the manner in which such fees are to be received, and in which they are to be kept, and in which they are to be accounted for; and that it shall be the duty of the registrar and he is hereby required to cause a list of the fees so appointed by virtue of this Act to be fixed up in some conspicuous part of his office.

**OFFICERS GENERALLY.**

**Appointments of Officers subject to Regulation by any future Act.**

99. Provided always, and be it enacted, with regard to the officers appointed by or by virtue of this Act, so far as relates to the functions, appointment, and tenure of office of such officers, that any appointments to such offices which shall be made by virtue of this Act shall be made subject to any provision that may be made by any Act of Parliament hereafter to be passed for assigning other duties than those to be imposed by virtue of this Act; and such offices shall be held not only subject to the pleasure of the officers and justices in whom such appointments shall be made, but also subject to the provisions of any future Act of Parliament in relation thereto.

**LEGAL PROCEEDINGS.**

**Informalities in Distress—Action for Damages.**  
100. And now, for the purpose of regulating sundry legal proceedings, be it enacted, with regard to any distress for any sum of money to be recovered by virtue of this Act, so far as relates to the remedying of any damage

occasioned by any irregularity therein or in reference thereto, that, notwithstanding there be any defect of form in the proceedings relative to any such distress, neither the distress itself shall be deemed unlawful, nor shall the party making the same be deemed a trespasser *ab initio*, but that if any irregularity be committed by any party, then, subject to the conditions in this Act prescribed with regard to actions brought for any thing done in pursuance thereof, it shall be lawful for the person aggrieved by such irregularity, and he is hereby entitled to recover full satisfaction for the special damage only, and that by action on the case, and not by any other action whatsoever.

**Tender of Amends—Payment of Compensation into Court.**

101. And be it enacted, with regard to any action for any irregularity or other proceeding, so far as relates to the tender of amends, or payment of money into court in respect thereof, that if before such action be brought, the party who committed or caused to be committed any such irregularity or wrongful proceeding make or cause to be made tender of sufficient amends, then the plaintiff shall not be entitled to recover in such action; and that although such tender shall not have been made, yet if at any time before issue joined the court in which such action shall be depending, or a judge of any of the superior courts, grant leave, then it shall be lawful for the defendant to pay into court any sum of money by way of compensation or amends, in such manner, and under such regulations as to the payment of costs and the form of pleading, as is and are customary and in force in the said superior courts.

**Recovery of Money under Awards—Distress—Imprisonment.**

102. And be it enacted, with regard to every sum of money by this Act, or by any award or certificate or other proceeding in pursuance of or in accordance with this Act, charged upon any person in respect of any work done in pursuance of or in accordance with this Act, so far as relates to the recovery of such sum of money, that if any party claim any such sum of money, then it shall be lawful for any one justice of the peace to summon the person on whom such sum is alleged to be charged before any two justices, or, if the matter arise within the district of the metropolitan police, then before any police magistrate having jurisdiction within that district; and if such award or certificate be produced, or if such other proceeding be proved by the oath of the party claiming or of any other credible witness, and if it be proved by the oath of such party or other witness that such sum of money is still due, then it shall be lawful for such justices or police magistrate, and they respectively are hereby required, to issue a warrant to levy the amount thereof, and also the costs of the proceeding, to be levied by distress of the goods and chattels of the person in default; and if such person have no goods and chattels whereon to distress, or such goods and chattels to be sufficient for that purpose, then it shall be lawful for such justices or police magistrate, or for any other justice or police magistrate, to commit the person in default, until the amount of such sum so due, and of such costs, shall have been fully paid, or until the party shall be discharged by or in accordance with the provisions of any Act for the relief and discharge of insolvent debtors.

**Prosecution of Offences—Complaint—Summons—Compulsory Appearance—Distress—Imprisonment.**

103. And be it enacted, with regard to all offences against the provisions of this Act for which no other proceeding is provided, so far as relates to the prosecution thereof, that it shall be lawful to proceed by complaint before any one justice of the peace or before a police magistrate as aforesaid; and that it shall be lawful for such justice to summon the party against whom such complaint shall be made; and that if such party fail to appear in pursuance of such summons, then it shall be lawful for such justice, or magistrate, or any other justice or magistrate, to issue a warrant under his hand and seal to compel the appearance of such party; and that on conviction of the offender before two justices or before any police magistrate and they are hereby required to cause the amount of the penalty hereby imposed in respect of such offence, and of the costs of any such proceeding in respect of such offence, and that if such offender have no goods and chattels whereon to distress, or if they be insufficient for that purpose, then it shall be lawful for such justices or magistrate, or for any other justice or magistrate, and they are hereby empowered, either on failure of such distress, or in the first instance, to commit the offender, for any period not exceeding three months, or till he shall have paid the full amount of such penalty and such costs.

**Removal of Orders, &c. into Superior Courts—Certiorari.**

104. And be it enacted, with regard to every order which shall be made by virtue of or under this Act, and to any other proceeding to be had touching the conviction of any offender against this Act (except proceedings touching the conviction of any person offending for carrying on a trade or business offensive, noxious, or dangerous, contrary to this Act, otherwise than those herein-before specified), that it shall not be lawful for any person to remove such order or other proceeding by certiorari, or any other writ or process whatsoever, into any of Her Majesty's Courts of Record at Westminster; and every such order and other proceeding is hereby declared not to be so removable.

**Appeal from Justices as to Penalties—Proceedings thereon.**

105. And be it enacted, with regard to any conviction or other proceeding in respect of which a penalty is by this Act imposed, so far as relates to the appeal from any such conviction in respect thereof, that if any party be dissatisfied with the decision of the justices in any case

in which such penalty may be proceeded for, and if within four days after such decision notice be given by or on behalf of such party to the party appealed against of his intention to appeal against such decision, and of the grounds of such appeal, and if the appellant enter into a recognizance, with two sufficient sureties, conditioned to prosecute such appeal, and to abide the order of the court, and to pay to the party appealed against such costs (if any) as shall be awarded against him, then it shall be lawful for such party so dissatisfied to appeal against such conviction to the justices of the peace at their general Quarter Sessions of the peace to be holden within four months after such conviction; and that if within such period of four days such appellant have entered into such recognizance as is herein required, then it shall be lawful for such justices and they are hereby empowered to proceed to hear and examine on oath into the cause and matters of such appeal (which oath they are hereby empowered to administer), and to determine the same, and to award such costs to be paid by either of the said parties as they think proper; and the order, judgment, and determination of the said justices shall be binding and conclusive.

**Limitation of Actions for Penalties.**

106. And be it enacted, with regard to every penalty or forfeiture incurred under this Act, so far as relates to the limitation of proceedings for the recovery thereof, that if within six calendar months next after such penalty or forfeiture shall have been incurred an action or prosecution be not brought, commenced, or prosecuted, or liable in respect thereof, then thereafter it shall not be lawful for any person to bring such action or commence such proceeding in respect of such penalty or forfeiture.

**Recovery of Penalties—Appropriation—3 G. 4, c. 46.**

107. And be it enacted, with regard to every such penalty or forfeiture, so far as relates to the recovery and the appropriation thereof, that it shall be lawful for any party to sue or proceed for the same; and that if such penalty be not otherwise specifically appropriated, then the person so suing or proceeding shall be entitled to receive one-half thereof for his own benefit, and the other half shall be applied to her Majesty's use, and shall be paid to the sheriff of the county, city, or town where the same shall have been incurred; and that all convictions before justices shall be returned to the Court of Quarter Sessions, under the provisions of an Act passed in the third year of the reign of his late Majesty King George the Fourth, intitled *An Act for the more speedy Return and levying of Fines, Penalties, and Forfeitures, and Recognizances estreated*, and shall be paid to the sheriff of the county, city, or town, and shall be duly accounted for by him.

**Regulation of Actions against Persons acting under this Act—Limitation of Action—Notice of Action—Venue in London—Venue in Middlesex—Plea and Evidence—Verdict—Costs.**

108. And for regulating proceedings against persons acting in pursuance of this Act, be it enacted, with regard to any action or suit against any person in respect of any act or thing done or intended to be done in pursuance of this Act, so far as relates to the limitation thereof, and to the notification thereof to the offending party, and to the venue thereof, and to the pleadings therein, and to the evidence of the matters thereof, and to the verdict therein, and to the judgment of the Court thereon, and to the costs of such action, and to the recovery of such costs, that after the expiration of six months next after the fact committed it shall not be lawful to bring any such action or suit against any person in respect of any such act; and that if, twenty-one days at the least before the commencement of the action or suit, notice in writing of an intention to bring such action or suit, and of the grounds of action, be not given to every person against whom such action or suit shall be brought, then it shall not be lawful for any person to bring any such action or suit against any person in respect of any such act; and that if the cause or matter of any such action or suit arise within the said city of London or the liberties thereof then such action or suit must be laid in the city of London, and not elsewhere; and that if the cause of any action or suit arise in any part of the limits aforesaid out of the said city of London and the liberties thereof then it must be laid and tried in the county of Middlesex, and not elsewhere; and that in every such action or suit it shall be lawful for the defendant and he is hereby entitled to plead the general issue, and at the trial to be had thereof to give the Act and the special matter in evidence, and to prove that the matter or thing for which such action or suit is brought was done in pursuance and by the authority of this Act; and that if upon the trial of such action it appear that the said matter or thing has been done by the authority or in pursuance of this Act, or if it appear that such action or suit was brought before the expiration of twenty-one days after such notice given as aforesaid, or if it appear that sufficient satisfaction was ordered before such action was brought, or if upon plea of payment of money into court it shall appear that the plaintiff has not sustained damages to a greater amount than the sum paid into court, or if any such action or suit be not commenced within the time herein for that purpose limited, or if it be laid in any other county or place than as aforesaid, then and in every such case it shall be the duty of the jury and they are hereby required to find for the defendant; and that if a verdict be found for the defendant, or if the plaintiff in any such action or suit become nonsuited, or discontinue or suffer a discontinuance of any such action or suit, or if judgment be given for the defendant thereon, on demurrer, or by default or otherwise, then the defendant shall be entitled to have judgment to recover full costs of suit, and to such remedy for recovering the same as any defendant shall have by law.

**Security for Costs.**

109. And further, for the prevention of vexatious

litigation, be it enacted, with regard to every action in respect of any matter or thing done or intended to be done in pursuance of this Act, so far as relates to the costs of such action, that if the defendant apply to the superior court at Westminster in which such action is pending, or to any judge of any of the said courts, then it shall be lawful for such court or any such judge to require the plaintiff to give such security as such court or judge shall think fit for the payment of all costs, charges, and expenses incurred or to be incurred in and about the said action, and which shall or become payable by him on the taxation thereof by the proper officer.

**Prosecutions for preventing Neglect or Evasion of this Act—Notice of Action.**

110. And be it enacted, with regard to any penalty or forfeiture incurred by any default in complying with the provisions of this Act, so far as relates to proceedings for the recovery thereof, that at any time within three months after such penalty or forfeiture shall have been incurred it shall be lawful for any surveyor appointed or confirmed by virtue of this Act, and all other persons, and they are hereby entitled, to commence and prosecute proceedings for the recovery thereof, or for the recovery of the expenses of pulling down or altering of any building, against any owner, occupier, builder, workman, or other person, or for any default made in complying with the provisions of this Act: provided always, that if such proceedings be taken by any person except one of the surveyors, or except the official referees, then seven days' notice of the intention to commence such proceedings must be given at the office of the surveyor of the district, and at the office of the registrar of metropolitan buildings.

**MISCELLANEOUS.**

**Liability of Owners and Occupiers for Expenses, &c., under this Act.**

111. Provided always, and be it enacted, with regard to the owners of any building, fence, ground, land, or tenement, so far as relates to their liabilities in respect of expenses incurred in respect of such premises or of any part thereof, that in all cases, whatever may be the nature of the interest in any such premises of the person entitled to the immediate possession thereof, or of the occupier thereof, such person entitled to the immediate possession of such premises, or such occupier, shall in the first instance bear all costs and expenses by this Act imposed on the other thereof, and shall perform all duties by this Act imposed on such owner, subject, nevertheless, to any right or claim which such person or such occupier may have to be repaid such costs and expenses, and to be indemnified in respect of such duties, according to the provisions of this Act, according to the nature and extent of the covenants or agreements under which such person or occupier may hold such premises, as fully and effectually as if such covenants or agreements were herein recited.

**Notifications: Married Females—Infants, Idiots, or Lunatics—Owners unknown—Buildings unoccupied—Immediate Landlord—Part Ownership—Notice—Requisites of Notice.**

112. And be it enacted, with regard to notices by this Act required, so far as relates to the service thereof upon the owner or occupier of any building, fence, land, ground, or tenement, that every such notice must be given as follows; that is to say,

If such owner be a married female, other than a co-tenant in respect of such property, then such notice must be given to the husband of such married female; or,

If such owner be an infant, idiot, or lunatic, or cestuique trust, then such notice must be given to the guardian, trustee, or committee of such infant, idiot, or lunatic, or cestuique trust; or,

If such owner, husband, trustee, guardian, or committee is not known, or cannot be found, then such notice must be given to the occupier of such building, fence, land, ground, or tenement to which it shall relate; or,

If such building, fence, land, ground, or tenement be unoccupied, then such notice must be affixed to some conspicuous part of such building, fence, land, ground, or tenement, at a height of not more than nine feet from the ground;

And if the person in the occupation of any building, fence, land, ground, or tenement, in respect of which notice is to be given, allege that he is a tenant from year to year, or for any less term, or a tenant at will, and not the owner thereof, within the intent and meaning of this Act, then such notice must be given to the immediate landlord of such occupier; and it shall be the duty of such occupier and he is hereby required to inform any person by whom such notice shall be required to be given, or any other person applying on his behalf, of the name, place of residence, or place of business of such owner or landlord, or of his agent or other person by whom the rent of such building, fence, land, ground, or tenement shall be received, or in receipt of the rents or profits of such building, fence, land, ground, or tenement, and if any notice shall be served upon such owner or landlord, then, immediately upon the receipt thereof, it shall be his duty and he is hereby required to transmit it to his immediate landlord or his agent, and also to any other person by whom such notice shall be received, or in receipt of the rents or profits thereof under the same immediate landlord, or to the agent of such person, a copy of such notice; and so on in turn it shall be the duty of every landlord, agent, or other person by whom such notice shall be received to transmit it to any such landlord, agent, or other person, being part owner of any such building, fence, land,

ground, or tenement, to the intent that every person affected by the work or proceeding to which such notice relates may have due notice thereof: provided always, with regard to every such notice, so far as relates to the service thereof upon any such owner, that if it be served upon the immediate landlord of the occupier or upon his agent, by or on behalf of the person by whom it is hereby required to be served in the first instance, then, although it may not be served by such immediate landlord upon any other landlord or owner, such service is to be deemed to be sufficient service; but that nevertheless, if any suffer loss or damage by the failure of any other person, being either the occupier or any person holding under such owner, to serve such notice, then such owner shall be entitled to recover the amount thereof against the person by whom such damage shall have been occasioned; and that every notice served under this clause on any person must contain a copy of the provisions thereof, so far as they require him to transmit the same to his immediate landlord, or the agent of such landlord.

**Mode of Service upon Occupier.**  
113. And he it enacted, with regard to notices by this Act required, so far as relates to the mode of service thereof upon the occupier of any building or ground, that if such notice be intended for the occupier of any building or ground then it must be given either personally or by leaving the same with some inmate at the premises, or it must be affixed as aforesaid.

**Mode of Service upon Owners by Delivery—Effect of Notice.**

114. And he it enacted, further, with regard to all such notices, so far as relates to the mode of service thereof upon owners by delivery, that every such notice (except such notice as may according to the provision in that behalf be sent by post) must be given either personally or by leaving the same with some inmate at the usual place of abode of such party, or if that be not known then at his last known place of abode; and that such notice, when so given to such persons respectively as aforesaid, or left at the last known place of their respective abodes, or when so affixed as aforesaid, according to the cases herein-before mentioned, shall have the same effects and consequences as if given to the actual owner.

**Mode of Service upon Owners by Transmission.**  
115. And he it enacted, further, with regard to notices, so far as relates to the mode of service thereof by transmission, that if any owner upon whom the same is required to be served be not within the limits of this Act, or have not within the limits of this Act any agent acting in his behalf in the matter of the premises to which the notice refers, then it shall be lawful to give notice by post letter, duly registered according to the practice for the time being adopted with regard to letters transmitted by post, but so that nevertheless such letter be posted in such time as will afford to the person addressed, after the receipt of such letter, the full period of notice required in the case.

**Notices for Surveyors and Official Referees.**  
116. And he it enacted, with regard to notices, so far as relates to the service thereof upon the surveyors and upon the official referees, that if the notice relate to the

surveyor then such notice must be served at the office of the surveyor; and that if the notice relate to the official referees or any of them, then such notice must be left at the office of the registrar of metropolitan buildings.

**Consents by incapacitated Persons.**

117. And he it enacted, with regard to consents by this Act required to be given by the owner or occupier of any building or ground, so far as relates to the making thereof on behalf of incapacitated persons, that if such owner or occupier be a married female, not being a cestuique trust in regard to the property to which such consent relates, then such consent must be given by the husband of such married female; or that if such owner or occupier be an infant, idiot, or lunatic, or cestuique trust, then such consent must be given by the guardian, trustee, or committee of such infant, idiot, or lunatic, or cestuique trust; or that if such owner or occupier, husband, trustee, guardian, or committee, be not known or cannot be found, then with a view to protect the interests of such parties, as well as to facilitate the purposes of this Act, it shall be lawful for the official referees and they are hereby authorized, by writing duly sealed by the registrar of metropolitan buildings, to give such consent as may be requisite, upon such terms and subject to such conditions as may seem fit to them, having regard alike to the nature and purpose of the subject matter in respect of which such consent is to be given, and to the fair claims of the parties on whose behalf such consent is to be given.

**Exemption from Stamp Duty.**

118. And he it enacted, with regard to the following documents, so far as relates to the payment of stamp duty in respect thereof, that every certificate and every award required to be made or signed by the surveyor or the official referees shall be and is hereby exempted from stamp duty.

119. And he it enacted, that this Act shall be deemed to be a public Act, and shall be judicially taken notice of as such by all judges, justices, and other persons whomsoever, without specially pleading the same.

120. And he it enacted, that this Act may be amended or repealed by any Act to be passed in this present session of Parliament.

**SCHEDULES TO WHICH THE FOREGOING ACT REFERS.**

**SCHEDULE (A).—**This schedule contains merely a description of the Acts and parts of Acts repealed by this Act.

**SCHEDULE (B).—(See § 5 & 7.)—PART I.—List of Buildings, of whatever Class, placed under Special Supervision.**  
Bridges, embankment walls, retaining walls, and wharf or quay walls; and her Majesty's royal palaces, and any building being in the possession of her Majesty, her heirs and successors, or employed for her Majesty's use or service; and any common gaols, prisons, houses of correction, and places of confinement under the inspection of the Inspectors of Prisons, and Brompton Hospital and the houses of occupations adjoining; and the Mansion House, Guildhall, and Royal Exchange of the city of London; and the offices and buildings of the Governor

and Company of the Bank of England already erected and which now form the edifice called "The Bank of England," and any offices and buildings hereafter to be erected for the use of the said governor and company, either on the site of, or in addition to, and in connection with, the said edifice; and the buildings of the British Museum already erected or to be erected for the like purposes; and the erections and buildings authorized by an Act passed in the ninth year of the reign of his late Majesty King George the Fourth, for the purposes of a market in Covent Garden; and the warehouses of or belonging to the Saint Katharine Dock Company, commonly called the New-street and Cutler-street Warehouses, and the Haydon-square Warehouses, purchased by the said company from the East India Company; and all other buildings exempted by any Act of Parliament from the operation of the Act passed in the fourteenth year of his late Majesty King George the Third, and by this Act repealed, except buildings included in the second part of this schedule.

**SCHEDULE (B).—PART II.—List of Buildings, of whatever class, exempted from supervision.**

And the warehouses of or belonging to the Saint Katharine Dock Company, and situate in the parish of Saint Botolph-without-Aldgate, and in the precinct of Saint Katharine, near the Tower of London, in the county of Middlesex; and the warehouses and buildings of or belonging to the London Dock Company, comprehended within the wall of the said company, as set forth in an Act passed in the ninth year of the reign of his late Majesty King George the Fourth; and the several warehouses and buildings of or belonging to the East and West India Dock Company, established by an Act made in the first year of the reign of her present Majesty; and the buildings erected, or to be erected, by the London and Birmingham Railway Company, established and incorporated by an Act passed in the third year of the reign of his late Majesty King William the Fourth, within and in connection with the works of their railway, by virtue of the several Acts relating thereto; and the buildings and structures belonging to any other dock or railway authorized to be executed by any Act of Parliament.

**SCHEDULE (C).—PART I.—(See § 5.)—Rules for determining the Classes and Rates to which Buildings are to be deemed to belong for the purposes of this Act, and the Thicknesses of the Walls of Buildings of such Rates.**

**CLASSES OF BUILDINGS.—**For the purposes of this Act, all buildings of whatever kind, subject to the provisions thereof, are to be deemed to belong to one or other of the following three classes; that is to say,—

**First Class.**—If a building be built originally as a dwelling-house, or be occupied, or intended to be occupied, as such, then it is to be deemed to belong to the first, or dwelling-house class.

**Second Class.**—If a building be built originally as a warehouse, storehouse, granary, brevery, distillery, manufactory, workshop, or stable, or be occupied or intended to be occupied as such, or for a similar purpose, then it is to be deemed to belong to the second or warehouse class.

**CONDITIONS for determining the Rates to which Buildings of the First or Dwelling-House Class are to be deemed to belong, and the Thickness of the External Walls and of the Party-Walls thereof.**

In reference to Height.	In reference to Area.	In reference to Stories.	Rate of Building.	Requisite Thickness of External Walls of each Rate of the First Class.	Requisite Thickness of Party Walls of each Rate of the First Class.
If the Building be in height more than 85 feet, and not more than 14 squares,	If the building cover more than 10 squares, and not more than 14 squares,	If the building contain more than 7 stories,	It is to be of the First Rate of this class.	And the thickness of the external walls must be at the least 2 1/4 inches from the top of the footing up to the under side of the floor next but three below the topmost floor; and at the least 1 3/4 inches from the under side of the floor next but three below the topmost floor up to the underside of the floor next below the topmost floor; and at the least 1 1/2 inches from the under side of the floor next below the topmost floor up to the top of the wall.	And the thickness of the party-walls must be at the least 2 1/4 inches from the top of the footing up to the underside of the floor next but three below the topmost floor; and at the least 1 3/4 inches from the under side of the floor next but three below the topmost floor up to the under side of the floor next below the topmost floor; and at the least 1 1/2 inches from the under side of the floor next below the topmost floor up to the top of the wall.
But if it be in height more than 85 feet,	Or if it cover more than 14 squares,	Or if it contain more than 7 stories,	It is to be an extra First Rate of this class.	And the thickness of the external walls must be at the least 2 1/4 inches from the top of the footing up to the under side of the floor next but two below the topmost floor, and at the least 1 3/4 inches from the under side of the floor next but two below the topmost floor up to the top of the wall.	And the thickness of the party-walls must be at the least 2 1/4 inches from the top of the footing up to the under side of the floor next but three below the topmost floor; and at the least 1 3/4 inches from the under side of the floor next but three below the topmost floor up to the under side of the floor next below the topmost floor; and at the least 1 1/2 inches from the under side of the topmost floor up to the top of the wall.
2. If more than 52 feet, and not more than 70 feet,	Or if it cover more than 6 squares, and not more than 10 squares,	Or if it contain more than 5 stories,	It is to be of the Second Rate of this class.	And the thickness of the external walls must be at the least 1 3/4 inches from the top of the footing up to the under side of the floor next but one below the topmost floor; and at the least 1 1/2 inches from the under side of the floor next but one below the topmost floor up to the top of the wall.	And the thickness of the party-walls must be at the least 1 3/4 inches from the top of the footing up to the under side of the floor next but one below the topmost floor; and at the least 1 1/2 inches from the under side of the floor next but one below the topmost floor up to the top of the wall.
3. If more than 38 feet, and not more than 52 feet,	Or if it cover more than 4 squares, and not more than 6 squares,	Or if it contain more than 3 stories,	It is to be of the Third Rate of this class.	And the thickness of the external walls must be at the least 1 1/2 inches from the top of the footing up to the under side of the floor next but two below the topmost floor; and at the least 1 1/4 inches from the under side of the floor next but two below the topmost floor up to the top of the wall.	And the thickness of the party-walls must be at the least 1 1/2 inches from the top of the footing up to the under side of the floor next but two below the topmost floor; and at the least 1 1/4 inches from the under side of the floor next but two below the topmost floor up to the under side of the floor next below the topmost floor; and at the least 1 1/4 inches from the under side of the topmost floor up to the top of the wall.
4. If not more than 38 feet,	Or if it do not cover more than 4 squares,	Or if it do not contain more than 3 stories,	It is to be of the Fourth Rate of this class.	And the thickness of the external walls must be at the least 1 1/4 inches from the top of the footing up to the under side of the floor next but one below the topmost floor; and at the least 1 1/4 inches from the under side of the floor next but one below the topmost floor up to the top of the wall.	And the thickness of the party-walls must be at the least 1 1/4 inches from the top of the footing up to the under side of the floor next but one below the topmost floor; and at the least 1 1/4 inches from the under side of the floor next but one below the topmost floor up to the top of the wall.

**Third Class.**—If a building be built originally as a church, chapel, or other place of public worship, college, hall, hospital, theatre, public concert-room, public ball-room, public lecture-room, public exhibition-room, or occupied or intended to be occupied as such, or for a similar purpose, or otherwise used or intended to be used, either temporarily or permanently, for the assemblage of persons in large numbers, whether for public worship, business, instruction, debate, diversion, or resort, then it is to be deemed to belong to the third or public building class.

**Alteration of Class.**—And if any room, whether constructed within any other building or not, and whether included in the aforesaid classes or not, be used at any time for the public or general congregation of persons, then the building containing such room is to be deemed a building of the third or public building class. Or if a building originally built, or subsequently altered, so as to bring it within any one class, be subsequently converted into or used as a building of another class, then it is to be deemed to belong to such other class; and, as to it, all the conditions prescribed with regard to buildings of the same rate of such other class must be fulfilled, as if it had been originally built of such class; subject, nevertheless, to such modifications as shall be sanctioned by the official referees on a special supervision thereof. Or if a building be used partly as a dwelling house and partly for any purpose which would bring it within the second or warehouse class, then it is to be deemed to belong to the said second or warehouse class; and as to it all the conditions prescribed with regard to buildings

of the same rate of such class must be fulfilled as if it had been originally built of such class, subject nevertheless to such modifications as shall be sanctioned by the official referees on a special supervision thereof.

**RATES OF BUILDINGS.**—And the buildings included in the said classes are to be deemed to belong to the rates of those classes, according to the conditions of height, area, and number of stories set forth in the following tables; which conditions are to be determined according to the following rules:

**Rule for ascertaining Height.**—The height of every building is to be ascertained by measuring from the surface of the lowest floor of the building, up to the underside of the ceiling of the topmost story, at the highest part thereof, whether such story be within the roof or not. And if there be no ceiling made, or intended to be made to the topmost story, then by measuring from the surface of such lowest floor of the building up to the under side of any tie-beam, collar-beam, or other substitute for a tie-beam, to or within the roof of the building, and to the highest part of such roof; and the level of the under side of such tie-beam, or such substitute for a tie-beam, is in such case to be taken to mean the ceiling of the topmost story. And if there be no tie-beam, collar-beam, or other substitute for a tie-beam to or within the roof of any building, then up to a level three feet below the level of the under side of the ridge-piece, or substitute for a ridge-piece, to the roof of such building.

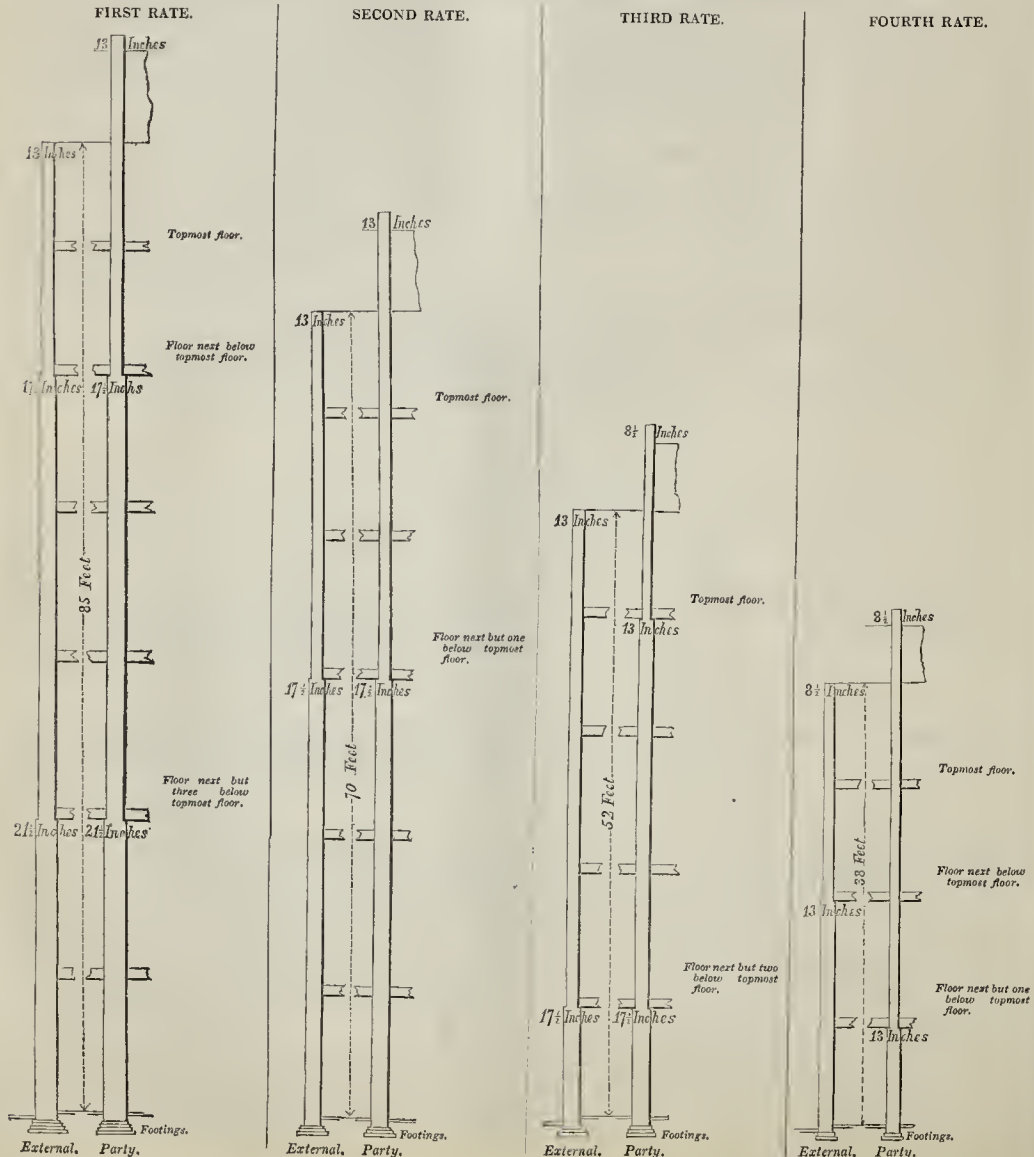

**Rule for ascertaining Area.**—And the area of every building is to be determined by the number of squares contained in the surface of any floor which shall contain the greatest number of squares at or above the principal entrance to such building; including in such surface the area of all as belong to such building, but excluding from such surface the area of any attached building, or office, area, balcony, or open portico.

**Rule for ascertaining the Capacity of any Building of the Second Class.**—And the capacity or cubical contents of any such building is to be ascertained by measuring according to the rule for ascertaining area, and from the surface of the lowest floor up to the under surface of the roof covering of such building.

**Rule for ascertaining Number of Stories.**—And the stories of every building are to be counted from the foundation upwards. And if the space in height between the top of the footings and the level of the lowest floor do not exceed five feet, then the story nearest the foundations is to be considered the lowest or first story; but if such space exceed five feet, then such space is to be considered to contain the lowest or first story; and in that case nine inches above the top of the footing is to be considered the level of the lowest floor.

**Rule for ascertaining Thickness of Walls.**—And the thickness or width of every wall, and of the footing thereof, is to be ascertained by measuring only the thickness or width of which such walls or footings shall have been originally built.

TRANSVERSE SECTIONS OF WALLS OF THE FIRST OR DWELLING-HOUSE CLASS, ACCORDING TO THE DESCRIPTIONS OF THEIR THICKNESSES IN SCHEDULE (C.) PART II.

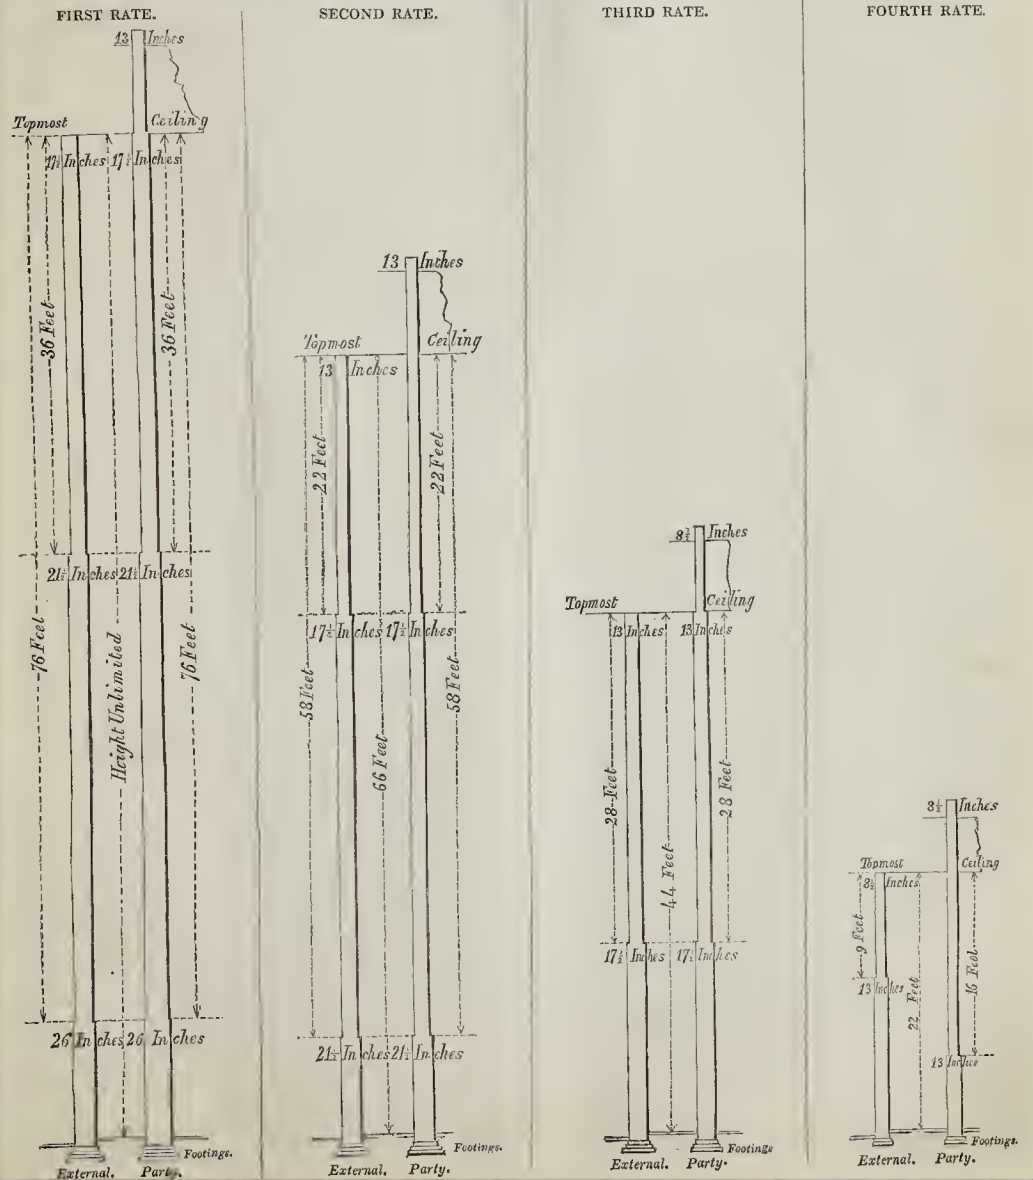

SCHEDULE (C.)—PART III.—(See § 5).

CONDITIONS for determining the Rates to which Buildings of the Second or Warehouse Class are to be deemed to belong, and the Thickness of the External Walls and of the Party-Walls thereof.

In reference to Height.	Rate of Building.	Requisite Thickness of the External Walls of each Rate of the Second Class.	Requisite Thickness of the Party-wall of each Rate of the Second Class.
1. If the building be in height more than 66 feet,	- It is to be of the First Rate of this Class.	- And the thickness of the external walls must be at the least 26 inches from the top of the footing up to the level of 76 feet below the topmost ceiling; and at the least 21½ inches from the level of 76 feet below the topmost ceiling up to the level of 36 feet below the topmost ceiling; and at the least 17½ inches from the level of 36 feet below the topmost ceiling up to the top of the wall.	- And the thickness of the party-walls must be at the least 26 inches from the top of the footing to the level of 76 feet below the topmost ceiling; and at the least 21½ inches from the level of 76 feet below the topmost ceiling up to the level of 36 feet below the topmost ceiling; and at the least 17½ inches from the level of 36 feet below the topmost ceiling up to the top of the wall.
2. If more than 44 feet and not more than 66 feet,	- It is to be of the Second Rate of this Class.	- And the thickness of the external walls must be at the least 21½ inches from the top of the footing up to the level of 58 feet below the topmost ceiling; and at the least 17½ inches from the level of 58 feet below the topmost ceiling up to the level of 22 feet below the topmost ceiling; and at the least 13 inches from the level of 22 feet below the topmost ceiling up to the top of the wall.	- And the thickness of the party-walls must be at the least 21½ inches from the top of the footing up to the level of 58 feet below the topmost ceiling; and at the least 17½ inches from the level of 58 feet below the topmost ceiling up to the level of 22 feet below the topmost ceiling; and at the least 13 inches from the level of 22 feet below the topmost ceiling up to the top of the wall.
3. If more than 22 feet and not more than 44 feet,	- It is to be of the Third Rate of this Class.	- And the thickness of the external walls must be at the least 17½ inches from the top of the footing up to the level of 38 feet below the topmost ceiling; and at the least 13 inches from the level of 38 feet below the topmost ceiling up to the top of the wall.	- And the thickness of the party-walls must be at the least 17½ inches from the top of the footing up to the level of 38 feet below the topmost ceiling; and at the least 13 inches from the level of 38 feet below the topmost ceiling up to the level of the topmost ceiling; and at the least 8½ inches from the level of the topmost ceiling up to the top of the wall.
4. If not more than 22 feet,	- It is to be of the Fourth Rate of this Class.	- And the thickness of the external walls must be at the least 13 inches from the top of the footing up to the level of 9 feet below the topmost ceiling; and at the least 8½ inches from the level of 9 feet below the topmost ceiling up to the top of the wall.	- And the thickness of the party-walls must be at the least 13 inches from the top of the footing up to the level of 16 feet below the topmost ceiling; and at the least 8½ inches from the level of 16 feet below the topmost ceiling up to the top of the wall.

TRANSVERSE SECTIONS OF WALLS OF THE SECOND OR WAREHOUSE CLASS, ACCORDING TO THE DESCRIPTIONS OF THEIR THICKNESSES IN SCHEDULE (C.)—PART III.

**SCHEDULE (C).—PART IV.—Rules concerning**

**Buildings of the Second or Warehouse Class.**  
**Warehouses, &c.**—With regard to any building of the second class hereafter built or re-built, in reference to the capacity or contents thereof within the same inclosing walls: If such building contain more than 200,000 cubic feet, then such building must be divided by party-walls, so that there be not in any one part of such building more than 200,000 cubic feet without party-walls.

**Openings in Party-walls.**—And with regard to buildings of the second class, in reference to openings through party-walls, such openings must not be made wider than six feet, nor higher than eight feet, unless in each case, and upon special evidence of necessity for convenience or otherwise, the official referee shall previously authorize larger openings. And the floor, and the jambs, and the head of every such opening must be composed of brick or stone, or iron-work throughout the whole thickness of the wall; and every such opening must have a strong wrought-iron door on each side of the party-wall, fitted and hung to such opening without wood-work of any kind; and such doors must not be less than one-fourth of an inch thick in the panels thereof; and each of such doors must be distant from the other not less than the full thickness of the party-wall.

**Roofs.**—And with regard to the roofs of buildings of the second class, in order to prevent the formation of curved roofs to such buildings, the plane of the surface of the roof of every such building must not incline from the external or party-walls upwards at a greater angle than 10 degrees with the horizon.

**SCHEDULE (C).—PART V.—Requisites for determining the Rate to which any Building of the Third or Public Building Class is to be deemed to belong.**

If any building of the third or public building class correspond in form or structure or disposition with a dwelling-house, then the rate thereof is to be determined by the same rules as the rates of the first or dwelling-house class; and the thicknesses of the external and party-walls, and the width of the footings thereof, are to be at the least four inches more than is hereby required for the external and party-walls, and the footings thereof, of buildings of the same rate of the first or dwelling-house class, unless the official referee, on special supervision in each case, shall otherwise appoint. But if it correspond in form or structure or disposition with a warehouse, or any building of the second class, then the rate thereof is to be determined by the same rules as the rates of the second or warehouse class; and the thickness of the external and party-walls, and the width of the footings thereof, are to be at the least four inches more than is hereby required for the external and party-walls, and the footings thereof, of buildings of the same rate of the second or warehouse class, unless the official referee, on special supervision in each case, shall otherwise appoint. But if it do not correspond in form or structure, or in either, with buildings of the first or second classes, or any of them, then such building is to be subject, as to its walls or other construction, to the special approval of the official referee.

**SCHEDULE (C).—PART VI.—Rule concerning Fire-proof Accesses and Stairs to Buildings of the First and Third Classes.**

With regard to buildings of the first class, whereof the internal stairs are of stone or other incombustible substance, such stairs must be set in, or be fixed to, and be wholly unburne by, fire-proof constructions, and must be connected internally by landings, the floors of which are fire-proof, and wholly unburne and supported by fire-proof constructions, and must be connected with the exterior entrance by passages, the floors of which are fire-proof, and wholly unburne and supported by fire-proof constructions. And with regard to buildings of the third class, the floors of the halls, vestibules, lobbies, corridors, passages, and the stairs and landings, and all other ways of ingress and egress within the building to and from all rooms or apartments used for public congregation, and to and from all galleries being part of, or being connected with, any such room or apartment, must be wholly supported, constructed, formed, made, and finished fire-proof.

**SCHEDULE (C).—PART VII.—Rules concerning attached and detached and insulated Buildings, as to the Rates and Walls thereof.**

**Attached Buildings and Offices.**—With regard to buildings or offices now built or hereafter to be built (except greenhouses, vineeries, aviaries, or such like buildings), and that whether such buildings or offices be attached to or detached from the buildings to which they belong. Every such building is to be deemed, in respect of the walls thereof, and all other requisites, as a building of the rate to which it would belong if it had been built separately.

**Insulated Buildings.**—And with regard to buildings of the first or dwelling-house class, and of the second or warehouse class, which shall be insulated, so far as relates to the distance thereof from a public street or way,—every such building must be distant from any public street or alley one-third of the height thereof at the least; and if the building do not exceed twenty-four feet in height,—then it must be so distant at the least eight feet; and with regard to such building, so far as relates to the distance thereof from any other building, or from ground not of the same possession or occupation therewith, or connected therewith only by a fence or fence-wall, it must be distant from such other building or such other ground at the least 30 feet; and if such building be so distant from a public street or alley, and from any other building, or from ground not in the same possession or occupation therewith,—then such building is not to be liable in respect of the dimensions and materials thereof to the rules and directions of this Act.

**Insulated Buildings afterwards divided.**—Provided always, that if any such building be hereafter divided into two or more distinct buildings, and the several parts

of such buildings so divided be not at the aforesaid distance from each other, and from other buildings and ground, then such several parts must be separated from each other by such party-walls as are herein prescribed for the rates to which such several parts, if adjoining, would belong. And if such requisites be not observed, then such several parts of such buildings in respect of which they are not so observed, shall be deemed a public nuisance, and as such to be taken down, according to the provisions of this Act in that behalf.

**Toll-houses, &c.**—And with regard to certain buildings which shall be built for the purposes of trade or the collection of toll, if such buildings be situate fifteen feet at the least from any other building, and do not cover an area of more than one square and one-half, and the height thereof do not exceed five feet from the ground to the highest point of the roof, then every such building may be inclosed with any materials whatsoever; but the roof thereof must be covered as herein directed with regard to roofs, and the chimney and flue (if any) must be built as herein directed with regard to chimneys and flues.

**SCHEDULE (D).—PART I.—Rules concerning Walls, of**

**Foundations.**—With regard to the foundations of walls,—every external wall, and every party-wall, and every party fence-wall, must be built upon a constructed footing, based upon solid ground, or upon other sufficient foundation.

**Footings.**—With regard to footings of walls, in reference to the materials thereof, to the width thereof, to the height thereof above the foundation, and to the depth below the surface:—

**Materials.**—1. In reference to the materials thereof:—Every footing must be built, either of sound bricks or of stone, or of such bricks and stone together, laid in and with mortar or cement in such manner as to produce solid work.

**Width.**—In reference to the width thereof:—The bottom of the footing of every external wall and party-wall of the first rate must be at the least seventeen and a half inches wider than the wall standing thereon; and the bottom of every footing of every external wall and party-wall of the second and third rates must be at the least thirteen inches wider than the wall standing thereon; and the bottom of the footing of every external wall and party-wall of the fourth rate, and of every party fence-wall, must be at the least eight and a half inches wider than the wall standing thereon. The top of the footing of every party fence-wall, and of every external wall and party-wall, must be at the least four inches wider than the wall standing thereon.

**Height.**—4. In reference to the height above the foundation:—The footing of every external wall and party-wall of the first rate must be at the least eleven inches high above the foundation. The footing of every external wall and party-wall of the second and third rates, must be at the least eight inches high above the foundation. The footing of every party fence-wall and of every external wall and party-wall of the fourth rate must be at the least five inches high above the foundation.

**Depth below Ground.**—5. In reference to the depth thereof below the surface of the lowest ground or adjoining:—The top of the footing of every party fence-wall and of every external wall and party-wall must be at the least three inches below such surface.

**Depth below lowest Floor.**—6. In reference to the depth thereof below the surface of the lowest floor adjoining or intended to adjoin thereto:—The top of the footing of every external wall and party-wall must be at the least nine inches below such surface; and in any building of the first class the surface of the earth or of any paving on the outside (except the pavement of any public way) must not at any time be raised to within six inches of the surface of the lowest or first floor of such building.

**Thicknesses of inclosing Walls to Stories of Buildings of whatever Rate.**—With regard to the inclosing walls to stories of buildings of the first and second classes, each of the inclosing walls of any such story throughout the whole height thereof, from the top of the footing up to the top of such story, and with all the sets off in addition required for such wall, to whatever rate or whichever class it may belong, and throughout at the least one-third of the whole length of such wall, in piers properly distributed, must be of the following dimensions (unless cross or return walls, coursed and bonded with the inclosing walls, shall in the opinion of the official referee, upon special application to them in each particular case, give sufficient strength with less thickness in such inclosing walls); that is to say,—as to first-class buildings:—If the story be in height more than 11 feet, then the thickness of its inclosing walls must be at the least 13 inches. Or if the story be in height more than 15 feet, then the thickness of its inclosing walls must be at the least 17 inches. As to second-class buildings:—If the story be in height more than 9 feet, then the thickness of its inclosing walls must be at the least 13 inches. Or if the story be in height more than 12 feet, then the thickness of its inclosing walls must be at the least 17 inches. Or if the story be in height more than 15 feet, then the thickness of its inclosing walls must be at the least 21 inches. Or if the story be in height more than 18 feet, then the thickness of its inclosing walls must be at the least 26 inches. Nevertheless as to any external wall of any building of the first class in which there are no apertures or recesses,—if there be another external wall or other external wall of not less than 84 inches thick coursed and bonded with such external wall, or if two such cross walls occur within a length of 24 feet of such wall, then such external wall may be built of the thickness of 13 inches, of any height not exceeding 18 feet, within any story, although the rate of the wall may require a greater thickness, but always upon condition that the substructure of such wall is 4 inches thicker at the least than such external wall, and vertically under it. And also if any such wall be abutted by cross or return walls within a length of 12 feet, and if

not more than one aperture or recess occur within such length of 12 feet, and not more than one-half the quantity in length be taken out of such compartment of a wall by any such aperture or recess, then such external wall may be built of any thickness not less than 13 inches, notwithstanding the rate of such wall may require a greater thickness.

**SCHEDULE (D).—PART II.—EXTERNAL WALLS.**

**Construction and Materials.**—And with regard to the component materials of external walls to buildings of whatever class,—every such wall must be built of sound bricks or of stone, or of such bricks and stone together, laid in and with mortar or cement in such manner as to produce solid work; and every such wall must be carried up to its full thickness to the under side of the plate under the roof. Nevertheless, in such walls, besides all requisite openings for doors and windows, recesses may be formed, so that the back thereof be of the thickness of eight inches and a half at the least, and so that the stability and sufficiency of the wall be not injuriously affected by making such recesses. And with regard to other substances than the component materials of external walls,—There may be such wood and iron as shall be necessary. And every plate, lintel, bond, corbel, being wood, and every wood-brick laid into any external wall, and all joints of girders, and of the heads and sills of partitions running into any external wall, must be fixed at a distance from the external face of the wall of four inches at the least. And the frames of doors and windows must be fixed in reveals at a distance from the external face of the wall of four inches at the least. And sloop fronts must be fixed in such manner as is herein specially directed. And the tiers of door cases to warehouses must be fixed in the opening left in such walls at a distance from the external face of the wall of two inches at the least. But no timber must be laid into any external wall in such manner or of such length as to render the part of the wall above it wholly or in great part dependent upon the wood for support, or so that any such wood might not be withdrawn without endangering the safety of the superincumbent structure, except in the case of breastsummers.

**Height and Thickness of Parapets.**—And with regard to external walls, in reference to the thickness of any parapet thereon,—if an external wall adjoin a gutter, then such external wall must be carried up, and remain one foot at the least above the highest part of such gutter. And the thickness of an external wall so carried up above the level of the under side of the gutter plate, and forming a parapet, must be at the least,—In every such wall of the extra first rate of the first class, 13 inches thick; and in every such wall of the first rate of the second class, 13 inches thick; and in every other external wall, of whatever rate or whichever class, 84 inches thick.

**Breastsummers.**—With regard to every breastsummer fixed to carry any front wall of a building,—if such breastsummer have a bearing at one end upon a party-wall,—then it must be laid upon a template or corbel of stone or iron, which template or corbel must be tailed through such wall at least two-thirds of its thickness above the level of the top of the breastsummer; and must be fixed into, and end not have its bearing solely upon such party-wall, but must be supported by a sufficient pier built of brick or stone, or by an iron column, or iron or timber story-post fixed on a solid foundation. And if any such breastsummer have its bearing at each end upon a party-wall, then it must be supported by at least two such piers built of brick or stone, or by iron columns, or by iron or timber story-posts fixed on solid foundations, and standing within and clear of the party-walls. Or any such breastsummer may bear upon constructed returns in the direction of the length of the breastsummer of four inches at the least, coursed and bonded with the substance of the party-wall or party-walls; and such constructed returns must be increased one inch at the least for every six feet in length that the breastsummer may be otherwise unsupported. And if the height of the under side of any breastsummer laid from party-wall to party-wall to carry any external wall exceed 15 feet from the surface of the public foot pavement in front of the building, then there must be constructed returns in the direction of the length of the breastsummer from the inside of each party-wall of 84 inches at the least, and at the least of the full thickness of such breastsummer; and every such return must be increased one inch at the least for every foot or part of a foot the breastsummer may be in height from the surface of the public foot pavement more than 16 feet, whether the breastsummer be otherwise supported or not.

**Materials to be used in Repairs.**—And with regard to old external walls or other external inclosures of any building already built, in reference to materials to be used in the repair thereof; if any such wall or inclosure be not built of the materials required by this Act for external walls or other external inclosures hereafter to be built, then every part of such wall or other external inclosure (except the inclosure of roofs, and the flats, gutters, dormers, turrets, lanterns, and other erections thereon) may be at all times thereafter repaired with materials of the same sort as those of which such external wall or inclosure has been already built.

**Materials to be used in Rebuilding.**—But if any such external wall or inclosure be at any time hereafter taken down or otherwise demolished for the height of one story, or for a space equal to one-fourth of the whole surface of such external wall, then every part thereof, not built in the manner and of the several materials by this Act directed for such external walls, must be taken down, and the same must be rebuilt in such manner, and of such materials, and in all respects as by this Act directed for external walls hereafter to be built, according to the class and rate of the building to which such external wall or inclosure shall belong.

**External Wall used as a Party-wall.**—And with regard to external walls to be used as party-walls to any building adjoining thereto (except an attached building

or office as is hereinbefore described.) If the external wall of any building have not such footings, or be not of such heights and thicknesses, or be not built in such manner and of such materials as are herein directed for party-walls of buildings of the highest rate to which such wall shall adjoin, then such external wall must not be used as a party-wall for any such building; but there must be a distinct external wall, built as is herein described for such wall, at the rate to which it shall belong. But if such external wall to any building already built be at the least thirteen inches in thickness in every part, and be of sound and proper materials, and in good condition, then such wall may be used as a party-wall; but if the house of which such wall forms a part be rebuilt within five years from the time at which the wall shall have been so first used as a party-wall, then such wall must become subject to the provisions of this Act in respect of party-walls, according to the class and rate to which the said wall did first belong.

#### SCHEDULE (D).—PART III.—PARTY-WALLS.

**Division of Buildings.**—And with regard to walls used to divide single buildings into two or more: If it be intended to divide any building into two or more distinct parts, then every wall for that purpose must be built as a party-wall, in the manner and of the materials, and of the several heights and thicknesses for party-walls of the highest rate of building to which such party-wall shall belong or adjoin, as prescribed in reference to the thicknesses of party-walls in Schedule (C). And if any building already built, or which shall be hereafter built, be converted, used, or occupied as two or more separate buildings, each having a separate entrance and staircase, then every such building shall be deemed to be two or more separate houses, and such separate houses must be divided from each other by a party-wall or party-arch or arches, built in the manner and of the materials required for party-walls or for party-arches for the class and rate to which the largest of the buildings so divided shall belong.

**Site of Walls.**—With regard to party-walls, in reference to the site thereof. If the buildings be of the same rate then such party-wall must be built on the line of junction of such buildings, one-half on the ground of the owner of one of such buildings, and one-half on the ground of the owner of the other of such buildings. If such buildings be of different rates, then such wall must be built on the line of junction thereof, as follows: that is to say, one-half of the thickness of the wall required for the building of the lower rate on the ground of each of the adjoining owners; and the whole of the additional thickness of the wall required for the building of the higher rate on the ground of the owner of such building of the higher rate. And if such building of the lower rate be thereafter enlarged or altered so as to become a building of a higher rate, then the owner of such first-mentioned building of the higher rate for the time being shall be entitled to receive from the owner of such building of the lower rate such sum of money as shall be a sufficient compensation for the ground occupied by that portion of the party-wall, which according to the rate of the building enlarged ought to have been built by its owner on his own ground, as well as the value of so much of the wall itself as may be more than the owner of such building of the lower rate had already paid for.

**Construction and Materials.**—And with regard to party-walls in reference to the component materials thereof. Every part of such party-wall must be built of sound bricks, or of stone, or of such bricks and stone together, laid in and with mortar or cement in such manner as to produce solid work. And as to the wood-work which it may be desired to connect with the party-walls of any building, the bearing ends of wooden beams, breast-summer, girders, trussing joists, and the ends of partition studs and rails, and the bearing ends of the main timbers of a roof, and wood-bricks may be laid into the substance of a party-wall; but no such beam, breast-summer, girder, joist, partition head, or sill, nor any part of a roof being wood, nor any wood-bricks, must be laid or placed within four inches of the centre of any party-wall; and no other wood-work of any kind must be laid into, placed upon, or be carried over or driven into any part of the substance of any party-wall. But if the ends of timbers be carried on iron shoes or stone corbels, then such iron shoes or stone corbels must be built into the wall at the least one-half of the thickness of such wall. And the top of every such party-wall must be finished with one course of sound stock-bricks, set on edge with good cement, or by a coping of any other properly secured and sufficient waterproof and fireproof covering.

**Height of Party-walls above Roof.**—And with regard to party-walls, in reference to the height thereof: If a party-wall adjoin to any roof, then such party-wall must be carried up and remain one foot six inches at the least above the part where the party-wall and roof adjoin, measured at a right angle with the back of the rafters of such roof. And if any party-wall in any building of the first class adjoin a gutter, then such party-wall may be carried up, and remain two feet at the least above the highest part of any such gutter. And if any party-wall in any building of the second class adjoin a gutter, then such party-wall must be carried up, and remain three feet at the least above the highest part of any such gutter. If there be fixed within five feet of a party-wall, upon the flat or roof of the building, any turret, dormer, or lantern-light, or other erection of combustible materials, then every such party-wall must be carried up next to every such turret, dormer, lantern-light, or other erection, and must extend one foot six inches higher, and one foot six inches wider than any such erection on each side thereof.

**Openings in Party-walls.**—And for the purpose of regulating the making of openings through any party-wall between the dwelling-houses and other buildings, whether two or more dwellings-houses shall be united. With regard to any dwelling-houses of any rate, such dwelling-houses may be united by means of openings in the party-walls. But with regard to any dwelling-houses which when so united will contain more than fourteen squares, if such

dwellings-houses shall be and continue to be in the same occupation, then upon its being declared by the official referees that in their opinion the stability and security from fire of any or either of such dwelling-houses will not be endangered by making such openings, they may be made accordingly.

**Recesses and Chases.**—And further, with regard to any party-wall, as to recesses, and as to chases in such wall: In every wall, recesses may be formed, but only with the consent and authority of the official referees first had and obtained, and so that such recesses be arched over, and so that the back of any such recess be not nearer than seven inches to the centre of the party-wall in the first or lowest story, nor nearer than four inches to the centre of the party-wall in any other story, and so that the stability and sufficiency of such party-wall be not injuriously affected thereby. If any chases be required for the insertion of ends of walls, of piers, of chimney-jambs, of wiles of flues, of metal pipes, or of iron story-posts, then every chase for any such purpose must not be left or be cut nearer than four inches at the least to the centre of a party-wall, nor within a distance of nine inches at the least from any front or back wall, and no two such chases must be made within a distance of seven feet six inches at the least from each other on the same side of a wall, and no such chase must be formed wider than nine inches.

#### SCHEDULE (D).—PART IV.—PARTY-WALLS AND PARTY-ARCHES BETWEEN INTERMIXED PROPERTIES.

And with regard to any building already built, having rooms or floors, the property of different owners, which lie intermixed, without being separated by any party-wall or party-arch or stone floor: If any such building be altogether rebuilt, or to the extent of one-fourth of the cubical contents thereof, then such intermixed properties must be separated from each other as follows:—If they adjoin vertically, then so far as they adjoin vertically, they must be separated by a party-wall. If they adjoin horizontally, they must be separated either by a floor formed of brick, tile, stone, or other proper and sufficient incombustible materials, subject to the consent of the official referees, or by a floor formed of iron girders and brick arches or stone landings, or tiles, or by a party-arch or party-arches of brick or stone, of the thickness of nine inches at the least, if the span do not exceed nine feet, and twelve inches at the least, if the span exceed nine feet; and such floor or party-arch or party-arches must be built with sufficient abutments and in a sufficient manner.

#### SCHEDULE (D).—PART V.—BUILDINGS OVER PUBLIC WAYS.

And with regard to buildings extending over any public way, as to the part thereof which extends over such way, so far as relates to the construction of such part from such public way: If such part be rebuilt, then it must be separated from such public way, either by a floor or arch formed of brick or stone, or of other incombustible materials, subject to the consent of the official referees, or by a floor formed of iron girders and brick arches or stone landings, or by an arch formed of brick or of stone, which arch, if the span thereof do not exceed nine feet, and which, if the span exceed nine feet, must be of the thickness of thirteen inches at the least. And such floor or arch, with its abutments, must be built in such manner as shall be approved of by the surveyor; but there must not be formed over any public way a ceiling of lath and plaster, or of lath and cement.

#### SCHEDULE (E).—(See § 5.)—Rules concerning External Projections.

**Porticoes projected over Public Ways.**—And with regard to the portico or porticoes of any church, chapel, theatre, or other public building of the third class: If the building of the same shall have been previously sanctioned by the official referees, by writing under their hands, and if objection be not made by any party interested within one month thereafter, and if upon such objection or appeal, Her Majesty's principal Secretary of State acting for the Home department do not decide in favour thereof, then such projections may be built over the foot pavement of any street or alley which shall be fifty feet wide at the least (notwithstanding any Act heretofore passed to the contrary).

**Projections from Face Walls, &c.**—And further, with regard to buildings hereafter to be built or rebuilt, or in reference to projections therefrom, as to copings, parapets, cornices to overhanging roofs, blocking courses, cornices, piers, columns, pilasters, entablatures, facias, door and window dressings, or other architectural decorations, forming part of an external wall, all such may project beyond the general line of fronts in any street or alley, but they must be built in the same materials as are used for the walls to which such projections belong, or of such other proper and sufficient materials as the official referees may approve and permit. And as to all balconies, verandahs, porches, porticoes, shop fronts, open inclosures of open areas, and steps, and water pipes, and to all other projections from external walls not forming part thereof, every such projection (except such part of shop fronts and the frames and sashes of the windows and doors, and in reference to the necessary wood-work thereof, may stand beyond the general line of fronts in any street or alley, but they must be built of brick, tile, stone, artificial stone, slate, cement, or metal, or other proper and sufficient fire-proof materials; and they must be so built as not to overhang the ground, belching to any street or alley, or so as to obstruct the light and air or be otherwise injurious to the owners or occupiers of the buildings adjoining thereto on any side thereof.

**Projections from Walls of Buildings over public Ways.**—And with regard to all buildings hereafter to be built or rebuilt, in reference to projections from the walls of such buildings, including steps, cellar doors, and area inclosures, the walls of all such buildings must be set back so that all projections therefrom, and also all steps,

cellar doors, and area inclosures, shall only overhang or occupy the ground of the owner of such building, without overhanging or encroaching upon any public way.

**Projected Buildings beyond the general Line of Buildings and from other external Walls.**—And with regard to buildings already built or hereafter to be rebuilt, as to bow windows or other projections of any kind.—Such projections must neither be built with nor be added to any building on any face of an external wall thereof, so as to extend beyond the general line of the fronts of the houses (which general line may be determined by the surveyor), except so far as is herein-before provided, and with regard to porticoes projected over public ways, and with regard to projections from face walls and shop fronts, nor so as to overhang the ground belonging to any other owner, nor so as to obstruct the light and air or be otherwise injurious to the owners or occupiers of the buildings adjoining thereto on any side thereof.

**Projections from insulated Buildings.**—Provided always, with regard to any insulated buildings, that if the projections be at the least eight feet from any public way, and if they be at the least twenty feet from any other building not in the same occupation, then such projections are excepted from the rules and directions of this Act.

**Wooden shop fronts and Shutters.**—And with regard to shop fronts and their entablatures, their shutters, and pilasters and stall boards made of wood.—If the street or alley in which such front is situated be of less width than thirty feet, then no part of such shop front must be higher in any part thereof than fifteen feet: nor must any part, except the cornice, project from the face of a wall, whether there be an area or not, more than five inches; nor must the cornice project therefrom more than thirteen inches. If the street or alley be of a greater width than thirty feet, then no part of such shop front, except the cornice, must project from the face of a wall, whether there be an area or not, more than ten inches; nor must the cornice project therefrom more than eighteen inches. And the width of such street or alley must be ascertained by measuring the same, as hereinafter directed with regard to the widths of streets and alleys. And the wood-work of any shop-front must not be fixed nearer than four feet and a half inches to the centre line of a party-wall, and with regard to such wood-work, if it be put up at such distance of four and a half inches, then a pier or corbel built of stone or brick or other incombustible material, and of the width of four and a half inches at the least, must be fixed in the line of the party-wall, so as to be as high as such wood-work, and so as to project one inch at the least in front of the face thereof. And the height of every shop front must be ascertained by measuring from the level of the public foot pavement in surging from the level of the building. And every sign or notice-board fixed against or upon any part of any house or other building standing close to any public way must be so fixed that the top shall be within eighteen feet at the most above the level of such public way.

#### SCHEDULE (F).—(See § 5.)—Rules concerning Chimneys hereafter built or rebuilt.

**Construction.**—With regard to chimneys and chimney stacks, except angle chimneys, in reference to the construction thereof: The foundations and footings of every such chimney and chimney-stack must be built similar to those of the wall in or adjoining to which it shall be. And every such chimney and chimney-stack must be built on a foundation to the top thereof without any corbel-lug over, whereby any upper part of the brick-work of such chimney or chimney stack shall overhang any lower part of the brick-work on the front thereof. Nevertheless, with regard to buildings of the first rate and extra first rate, the jambs, breast, and flue of any single chimney may be built upon brick, stone, or iron corbels, above the ceiling of the third story of every such building. And with regard to buildings of the second and third rates, the jambs, breast, and flue in any single chimney may be built upon brick, stone, or iron corbels above the ceiling of the second story of every such building. But the projection both of such jambs and breasts must not in any case exceed nine inches before the face of the wall or stack to which the same shall adjoin. And with regard to angle chimneys, such chimneys may be built in the internal angle of any building, so that the width of the breast thereof do not exceed five feet; and so that it be properly supported on iron girders, with brick arches, or on strong stone landings, not less than four inches thick, and tailed at least nine inches into each of the two walls forming such angle.

**Dimensions and Materials.**—And with regard to chimneys, in reference to the dimensions of the jambs thereof.—The jambs of every chimney must not be less than eight and a half inches wide on each side of such opening. And with regard to chimneys and flues, in reference to the thickness of the brick-work thereof.—The breast of every chimney, and the front, back, wile, or partition of every flue, must be at the least four inches in thickness of sound bricks, properly bonded, and a good mortar or joints of the work must be filled in with good mortar or cement, and all the inside thereof, and also the outside rendered or pargeoted. And with regard to flues, in reference to the dimensions thereof, no flue may be used for a smoke-flue which is of less internal diameter in any section than eight and a half inches.

**Timber or Wood-work.**—And with regard to chimneys, in reference to timber.—No timber must be placed upon any opening for supporting the breast of any chimney, but there must be an arch of brick or stone over the opening of every such chimney, to support the breast thereof, and an iron bar or bars must be built into the jambs, at the least nine inches on each side, to tie in the buildings adjoining thereto on any side thereof. And in the buildings adjoining thereto on any side thereof, an iron bar or bars must be placed over the opening of every chimney-opening within eighteen inches at the least of the surface of the hearth to the fireplace of such chimney-opening. And as to

any timber or wood-work, in reference to the fixing thereof in or against any wall containing flues or against any chimney breast or chimney jamb.—If timber or wood-work be affixed to the front of any jamb or mantle, or to the front or back of any chimney or flue, then it must be fixed by iron nails or holdfasts, or other iron fastenings, which must not be or be driven nearer than four inches to the inside of any flue or to the opening of any chimney, and such timber or wood-work must not be nearer than nine inches to the opening of any chimney. And no timber must be laid or placed within three inches of the face, or breast, back, side, or jamb of any flue, or of any chimney-opening, where the substance of brick-work or stone-work shall be less than eight and a half inches thick, nor must any flooring-board, batton, ground-skiirting, or other lining or fitting of wood, nor any wood staircase, nor any thing else of wood, be fixed or placed against or near to the face, or breast, back, side, or jamb of any flue, fireplace, or chimney-opening, unless and until the brick or stone work constituting the same shall have been thoroughly and efficiently rendered or parge-tted with proper mortar or stucco, and such rendering must be in every case in addition to four inches at least of solid fire-proof structure.

**Slabs and Hearths.**—And a slab or slabs of brick, tile, stone, slate, marble, or other proper and sufficient substance, at the least twelve inches longer than the opening of every chimney when finished, and at the least eighteen inches in front of the arch over the same, must be laid before the opening of every chimney. And in every case, except the lowest floor, such slab or slabs must be laid wholly upon stone or iron bearers, or upon brick trimmers; but in the lowest floor they may be laid on a brick fender, or bedded on the solid ground. And the hearth of every chimney must be laid and bedded wholly on brick or stone, or other incombustible substance, which must be solid for a thickness of nine inches, at the least, beneath the surface of any such hearth.

**Backs.**—And as to the back of every chimney-opening of every building (except backs of chimneys in the lowest story of buildings of the fourth rate), every such back, in the lowest story, must be at the least thirteen inches thick from the hearth to the height of twelve inches above the mantle, and in every other story at the least eight and a half inches thick up to the same relative height. And as to the backs of chimney openings in the lowest story of buildings of the fourth rate, such backs must be at the least eight and a half inches thick to the height of twelve inches at the least above the level of the mantle; provided always, that if the chimney be built in any wall, not being a party-wall, then the back of every such chimney-opening may be four and a half inches less than the several thicknesses above described.

**Chimney Openings, Back to Back.**—And as to backs of all such chimney-openings, if two chimneys be built back to back, then the thickness between the same must be at the least of the thickness hereinbefore described for the back of one chimney-opening.

**Angles of Flues.**—And as to all flues, in reference to the angles thereof.—If any flue be built with sufficient openings in it of not less size than nine inches square, and proper close iron doors and frames inserted in such openings, so that every part of such flue may be swept by machinery, then every angle in such flue may be of any degree. But if it be not so built then every such angle must be one hundred and thirty-five degrees at the least. And every salient or projecting angle within a flue must be rounded off four inches at the least, and protected by a rounded stone or iron bar.

**Close Fires.**—And as to every oven, furnace, coker, or clofise used for the purpose of trade or manufacture, it must be six inches at the least distant from any party-wall, and must not be upon nor within a distance of eighteen inches of any timber or wood-work. And the floor on or above which such oven, furnace, coker, or clofise fire shall be built or fixed must be formed and paved under, and for a distance of two feet all round the same, with stone, brick, tile, or slate, at the least two inches thick, or other proper incombustible and non-conducting materials.

**Chimney-shafts.**—And as to chimney-shafts or flues.—Every chimney-shaft or flue hereafter built, raised, or repaired must be carried up in brick or stone-work all round, at least four inches thick, to a height of not less than three feet above the highest part of such portion of the roof, flat, or gutter adjoining thereto, measured at the point of junction. And as to any chimney-shaft (except that of a steam-engine, brewery, distillery, or manufactory), the brick or stone-work of such shaft or flue must not be built higher than eight feet above the slope, flat, or gutter of the roof which it adjoins, measured from the highest point of junction, unless such chimney-shaft be built of increased thickness, or be built with and bonded to another chimney-shaft, or be otherwise rendered secure. And as to the chimney-shaft for the boiler furnaces of any steam-engine, or for any brewery, distillery, or manufactory, such shaft may be erected of any height, so that it be built in such manner and of such strength and dimensions as shall be satisfactory to the official referees, upon special application in each case.

**Chimney-pots, Tubes, &c.**—And as to earthen or metal chimney-pots, tubes, funnels, or cowls of any description whatsoever, if such pot, tube, funnel, or cowl be higher than four feet above the brick or stone work of the flue on which the same shall be placed, then it must be fixed two feet at the least into the brick or stone-work of the flue on which it shall be placed.

**Smoke Pipes.**—And as to any metal or other pipe or funnel for conveying smoke, heated air, or steam, in reference to the position thereof, such pipe or funnel must not be fixed against or in front of any face of any building in any street or alley, nor on the inside of any building nearer than four inches to any timber or other combustible material.

**Cuttings into Chimneys.**—And as to every chimney-shaft, jamb, breast, or flue already built, or which shall

be hereafter built, in reference to cutting the same, no such erection shall be cut into for any other purpose than the repair thereof, or for the formation of roof-floors, or for letting in, removing, or altering stove-pipes or snook-jacks, except as directed for building an external wall against an old solid party-wall.

**SCHEDULE (G).—(See § 5.)—Rules concerning Roof Coverings.**

**Materials.**—With regard to roof coverings, in reference to the materials thereof, if the external parts of any roof, flat or gutter, of any building, or of any projection therefrom, and of any turret, dormer, lantern-light, and other erection on the roof or flat of any building, be hereafter built or rebuilt, stripped, ripped, or aneovered, then every such part (except the door-frames and doors, window-frames and sashes of such turrets, dormers, lantern-lights, or other erections), must be covered with slates, tiles, metal, glass, artificial stone, or cement, and such excepted parts may be made of such wood as shall be necessary.

**Rain Water Pipes.**—And with regard to the roof, flat and gutter, of any building, and of any projection therefrom, and also balconies, verandahs, and shop fronts, they must be so arranged and constructed, and so supplied with gutters and pipes, as to prevent the water therefrom dropping on to or running over any public way.

**SCHEDULE (H).—(See § 5.)—Rules concerning Drains into Sewers.**

**Drains into Sewers.**—With regard to the drains of buildings of any class, and of every addition thereto, before the several walls of any such building shall have been built to the height of ten feet in either case, such drains thereof must have been properly built and made good (that is to say), if there be within one hundred feet from any front of the building, or from the inclosure about the building, a common sewer into which it is lawful and practicable to drain, then into such common sewer; and if there be not in such situation and within such distance any such common sewer, then to the best outlet that can be obtained, so as to render in either case such drains available for the drainage of the lowest floor of such building, or addition thereto, and also of its areas, water-closets, privies, and offices (if any). And the inside of the main drains under and from every building for carrying off soil must be in transverse section at the least equal to a circular area of at least nine inches in diameter. And every such drain must be laid to a fall or current of at the least half an inch to ten feet, and so as that the whole of every such drain within the walls of such building shall be wholly covered over under the lowest floor, and independently thereof. And every such drain within the walls of such building must be built and covered over with brick, stone, or slate, and so as to render the drain air-tight. And every part of such drain inside and outside the walls of every building must be built of brick, tile, stone, or slate, set in mortar or cement.

**Cesspools and Privies.**—And with regard to cesspools and privies: If there be a common sewer within fifty feet from any front of or from the inclosure about any house or other building, then a cesspool must not be made for the reception of drainage from such house or other building, unless there be, or shall be built, a good and sufficient drain from such cesspool to such common sewer. And if any cesspool be built under a house or other building, then such cesspool must be built air-tight. And every privy built in the yard or area of any building, or under any street or alley, must have a door, and be otherwise properly inclosed, screened, and fenced from public view.

**SCHEDULE (I).—(See § 5 & 52.)—Rules concerning Streets and Alleys hereafter formed.**

**Width.**—With regard to every such street or alley hereafter to be formed, in reference to the width thereof: Every street or alley must be of at the least the following width from front to front, in every part thereof, respectively: that is to say, every street (excepting any mews) must be of the width of forty feet at the least; but if the buildings fronting any street be more than forty feet high from the level of the street, then such street must be of a width equal at the least to the height of the buildings above such level; every alley and every mews must be of the width of

twenty feet at the least, but if the buildings fronting any alley, or to any mews, be more than twenty feet high from the level of the alley or mews, then such alley or mews must be of a width equal at the least to the height of the buildings above such level.

**Entrances to Alleys.**—And with regard to every such alley in reference to the entrance thereof: Every alley must have two entrances thereto, each being at the least of the full width of the alley, and one of the two at the least open from the ground upwards.

**Measurement of Width.**—And with regard both to back-yards and areas, the aforesaid width is to be ascertained by measuring (at right angles to the course thereof) from front to front of the buildings on each side of such street or alley.

**SCHEDULE (K).—(See § 5 & 53.)—Rules concerning Dwelling-houses hereafter built or rebuilt, with regard to back-yards and areas, and to basements, underground, and in the roof.**

**Back-yards.**—With regard to back-yards or open spaces attached to dwelling houses: Every house hereafter built or rebuilt must have an inclosed backyard or open space of at the least one square, exclusive of any building thereon, unless all the rooms of such house can be lighted and ventilated from the street, or from an area of the level of the second story, into which the owner of the house to be rebuilt is entitled to open windows for every room adjoining thereto. And if any house already built be hereafter rebuilt, then, unless all the rooms of such house can be lighted and ventilated from the street, or from an area of the extent of at the least three-quarters of a square, into which the owner of the house to be rebuilt is entitled to open windows for every room adjoining thereto, there must be above the level of the floor of the third story an open space of at least three-quarters of a square. And with regard to every building of the first class, every such building must be built with some roadway, either to, or to the inclosure about it, of such width as will admit to one of its fronts the access of a scavenger's cart of the ordinary size of such roadway.

**Lowest Rooms.**—And with regard to the lowest rooms of houses, being rooms of which the surface of the floor is more than three feet below the surface of the footway of the nearest street or alley, and to cellars of buildings hereafter to be built or rebuilt: If any such room or cellar be used or intended to be used as a separate dwelling, then the floor thereof must not be below the surface or level of the ground immediately adjoining thereto, unless it have an area, fire-place, and window as required for rooms and cellars of existing buildings let separately and used as a separate dwelling, and unless it be properly drained. And with regard to every such lowest room or cellar in any existing building used or intended to be used as a separate dwelling; there must be an area not less than three feet wide in every part, from six inches below the floor of such room or cellar to the surface or level of the ground adjoining to the front, back, or external side thereof, and extending the full length of such side. And such area, to the extent of at least five feet long and two feet six inches wide, must be in front of the window of such room or cellar, and must be open, or covered over with open iron gratings. And there must be made for every such room or cellar an open fire-place, with proper flue therefrom. And there must be a window-opening of at least nine superficial feet in area, which window-opening must be fitted with a frame filled with glazed sashes, of which at the least four and a half superficial feet must be made to open for ventilation.

**Attic Rooms.**—And with regard to rooms in the roof of any building hereafter built or rebuilt, in reference to the number of floors of rooms in the roof, and to the height of such rooms;—there must not be more than one floor of such rooms, and such rooms must not be of a less height than seven feet, except the sloping part, if any, of such roof, which sloping part must not begin at less than three feet six inches above the floor, nor extend more than three feet six inches on to the ceiling of such room.

**Rooms in other Parts.**—And with regard to rooms in other parts of the building, in reference to the height thereof,—every room used or intended to be used as a separate dwelling must be of at the least the height of seven feet from the floor to the ceiling.

**SCHEDULE L.—List of Fees payable to the Surveyors under this Act.**

**Fees for New Buildings.**—For any building erected on old or new foundations, as follows:—

	Dwelling-House Class.	Warehouse Class.	Public Buildings Class.
If the building be of the 1st rate.....	£ 3 0 0	£ 3 0 0	£ 3 0 0
Ditto extra 1st ditto .....	5 5 0	5 5 0	5 5 0
Ditto 2nd ditto .....	3 3 0	3 3 0	3 3 0
Ditto 3rd ditto .....	2 1 0	2 1 0	2 1 0
If the building be of the 4th rate, and contain more than two stories .....	2 2 0	2 2 0	2 2 0
And with regard to buildings of the warehouse class, a further fee to be paid in respect of any additional 200,000 cubic feet, or portion of 200,000 cubic feet, in any such building, beyond the first 200,000 cubic feet .....	1 10 0	2 2 0	1 10 0
And for inspecting and reporting to the official referees (s. 24) on party-walls and internal buildings:—			
If the building be of the 1st rate.....	3 10 0	3 10 0	3 10 0
Ditto extra 1st ditto .....	5 5 0	5 5 0	5 5 0
Ditto 2nd ditto .....	3 3 0	3 3 0	3 3 0
Ditto 3rd ditto .....	2 1 0	2 1 0	2 1 0
If the building be of the 4th rate, and contain more than two stories .....	2 2 0	2 2 0	2 2 0
If the building be of the 4th rate, and do not contain more than two stories .....	1 10 0	1 2 0	1 10 0
For every detached building built for the purposes of trade or collection of toll .....	1 1 0	1 1 0	1 1 0
			0 10 6

Equal to one-half of the above fees respectively.

For every attached or detached building, distinctly rated (except any such attached or detached building built at the same time as the building to which it belongs, and carried up and covered in within twenty-one days after

such building shall have been covered in within the meaning of this Act, such fee as is hereby imposed in respect of additions to or alterations of buildings of the rate to which such attached or detached buildings shall belong.

**Fees for Additions, or Alterations.**—For every addition or alteration made to any building (after the roof thereof shall have been covered in) which shall involve the execution of works subject to the regulations of this Act, the following fees; that is to say,—

£ s. d.  
 If the building be of the 1st rate . . . 1 15 0  
 Ditto extra 1st ditto . . . 2 10 0  
 Ditto 2nd ditto . . . 1 10 0  
 Ditto 3rd ditto . . . 1 5 0

If the building be of the 4th rate, and contain more than two stories . . . 0 15 0

If the building be of the fourth rate, and do not contain more than two stories . . . 0 10 0

And with regard to buildings of the warehouse class, a further fee, equal to one-half of the above fees respectively, to be paid in respect of every additional 200,000 cubic feet, or any portion of 200,000 cubic feet, in any such building, beyond the first 200,000 cubic feet.

**Fees for Special Duties.**—For the following special duties performed by any surveyor, according to the enactments of this Act, where such duties shall not be performed incidentally to the building or rebuilding of or adding to or altering any building in respect of which any other fees may be payable; that is to say,—

For attending to the cutting away of chimneys,—  
 breasts for external walls,—

£ s. d.  
 If the building be of the 1st rate . . . 3 3 0  
 Ditto extra 1st ditto . . . 3 3 0  
 Ditto 2nd ditto . . . 2 2 0  
 Ditto 3rd ditto . . . 2 2 0

If the building be of the 4th rate, and contain more than two stories . . . 1 1 0

If the building be of the 4th rate, and do not contain more than two stories . . . 0 10 6

For condemning party fence-walls . . . 0 10 6

For the inspection and removal of projections and raimous buildings . . . 0 10 0

For surveying party-walls not kept in repair, and consenting to notice of repair being served . . . 0 10 0

For inspecting arches or stone floors over public ways . . . 0 10 0

For inspecting formation of openings in party-walls . . . 0 10 0

**Fees for Special Services not expressly provided for.**—For any service performed by any surveyor which is required by this Act, but not comprehended under any of the foregoing heads,—

Such fee, not exceeding £2, as the official referees shall, by writing under their hands, order and appoint, with the consent of the commissioners of works and buildings.

SCHEDULE (M).—METROPOLITAN BUILDINGS ACT.

SUMMARY OF PROCEEDINGS to be taken or observed before and after Notices in relation to Buildings.

Section of the Act.	Stages of Proceeding.	Steps to be taken.	By whom taken.	With reference to whom taken.	Form of Notice to be given.	Place of Notice.	Subsequent Proceedings.
<b>WORKS GENERALLY.</b>							
13	Before commencing the operations specified in this section.	Two days' notice to be given.	By the Builder. See Definition, §13.	To the District Surveyor.	See Form No. 1	At the District Surveyor's office.	£20 penalty for neglect. Existing buildings altered, &c. without notice, to be abated as a nuisance. £20 penalty for neglect.
13	Before resuming operations, after being suspended for a period exceeding three months.	Two days' notice to be given.	By the Builder. See Definition, §13.	To the District Surveyor.	See Form No. 2	At the District Surveyor's office.	£20 penalty for neglect.
13	On change of architect, master builder, or other superintendent.	Two days' notice to be given.	By the Builder. See Definition, §13.	To the District Surveyor.	See Form No. 3	At the District Surveyor's office.	Proceedings by Surveyor or Official Referees.
14	On the occurrence of any irregularity in building operations.	48 hours' notice to be given.	By the District Surveyor.	To the Builder.	See Form No. 4	At the Builder's office or place of Building or of alteration.	Proceedings by Surveyor or Official Referees.
37	As to openings hereafter made in external walls abutting on adjoining ground or buildings.	Notice to stop up within one month.	By adjoining Owner.	To Owner of external wall.	See Form No. 5	According to Sections as to Notifications.	To be stopped up.
<b>SPECIAL SUPERVISION.</b>							
15	On completion of the carcass of a building subject to special supervision.	Notice for inspection thereof.	By the Architect or Builder.	To the Official Referees.	See Form No. 6	At the Official Referees' office.	Survey and approval, or disapproval by Official Referees. Prohibition of use of irregular buildings of this class, and penalty of £200 per day.
15	On completion of amendments, or the entire completion of a building, subject to special supervision.	Notice relative thereto.	By the Architect or Builder.	To the Official Referees.	See Form No. 7	At the Official Referees' office.	Survey and certificate.
<b>PARTY WALLS, &amp;c.</b>							
20, 21, 24, 25	Before survey, repair, or pulling down of a party-wall, party-arch, or party fence-wall.	Three months' notice before operations.	By the Building Owner. See Definition, §13.	To the adjoining Owner.	See Form No. 8	According to Sections as to Notifications.	Inspection by Surveyor. § 24.
24	In the same case . . . . .	Notice for survey.	By the Building Owner. See Definition, §13.	To the District Surveyor and Official Referees.	See Form No. 9	At the District Surveyor's and Official Referees' offices.	Inspection by Surveyor, and report to Official Referees.
—	In the same case . . . . .	Appointment of survey.	By the District Surveyor.	To the Owners and Agents, &c.	See Form No. 10	To Building and adjoining Owners and Agents.	Inspection by Surveyor, and report to Official Referees.
33, 34	As to pulling down rooms in inter-mixed property, and repairing or rebuilding party fence-walls.	Notice of intention to build a party-wall, or as directed by official referees.	By the Building Owner.	To the adjoining Owner and District Surveyor, § 30.	See Form No. 11	According to Sections as to Notifications.	Erection of wall.
—	In the same case . . . . .	Notice for inspection thereof.	By the Building Owner.	To the District Surveyor and the Official Referees.	See Form No. 12	At the District Surveyor's and Official Referees' office.	Inspection by Surveyor, and report to Official Referees.
—	In the same case . . . . .	Appointment of survey.	By the District Surveyor.	To the Owners and Agents, &c.	See Form No. 13	To Building and adjoining Owners and Agents.	Inspection by Surveyor, and report to Official Referees.
26	As to pulling down a timber partition and erecting or raising a party-wall.	Three months' notice of intention to build or raise a party-wall.	By the Building Owner.	To the adjoining Owner.	See Form No. 14	According to Sections as to Notifications.	Erection of wall, or raising of wall.
28	Excavation against existing party-wall for a deeper story, and for the erection of an external wall.	One month's notice of intention to cut away footings or breast or shaft of a party-wall.	By the Building Owner.	To the adjoining Owner.	See Form No. 15	According to Sections as to Notifications.	Execution of operations.
32	Building a party-wall on line of junction of two pieces of vacant ground.	One month's notice for consent of adjoining owner.	By the Building Owner.	To the adjoining Owner.	See Form No. 16	According to Sections as to Notifications.	Execution of operations.
38	In the same case . . . . .	Notice of consent . . . . .	By the adjoining Owner.	To the Building Owner.	See Form No. 17	According to Sections as to Notifications.	Erection of wall.
<b>MODIFICATIONS.</b>							
22, 23	Modification or delay of intended work to suit adjoining owner.	Seven days' notice for consent.	By the adjoining Owner.	To the Building Owner.	See Form No. 18	According to Sections as to Notifications.	If consent not given, commencement of works must be delayed for decision of Official Referees.
—	In the same case . . . . .	Application for declaration.	By the adjoining Owner.	To the Official Referees.	See Form No. 19	At the Official Referees' office.	Delay in commencing of operations.
—	In the same case . . . . .	Notice of application.	By the adjoining Owner.	To the Building Owner.	See Form No. 20	According to Sections as to Notifications.	

SCHEDULE (M).  
 FORMS OF NOTICES AS TO WORKS.

**METROPOLITAN BUILDINGS ACT, VICT., c. s. 13, 1844.**

1.—Notice by the Builder to the District Surveyor, two days before commencing operations.

I do hereby give you notice, that I intend to (1) and that C. D., of is to be the (2) of the works to be executed; and that the said works will be begun on the day of

Dated this day of (Signature and address.)

[\*.\* Certain penalties are attached to neglect in giving this notice.]

(1) Describing the erection or intended operation in general terms, and whether it relate to any of the following matters:—  
 "The erection of any building;" or, "The making of any addition to or alteration in any building;"  
 or, "The building, pulling down, rebuilding, cutting into, or altering any party-wall, external wall, chimney stack, or flue;"  
 or, "The making of "any opening in any party-wall" or, "The doing of "any other matter or thing by this Act placed under the supervision of the surveyor."  
 (2) Insert "architect," or "builder," or other superintendent to have charge of the works.

**METROPOLITAN BUILDINGS ACT, VICT., c. s. 13, 1844.**

2.—Notice by the Builder to the District Surveyor, two days before resuming operations.

I do hereby give you notice, that I intend to re-commence the (1) and that C. D., of is to be the (2) of the works to be resumed; and that the said works will be continued on the day of

Dated this day of (Signature and address.)

[\*.\* Certain penalties are attached to neglect in giving this notice.]

**METROPOLITAN BUILDINGS ACT, VICT., c. s. 13, 1844.**

3.—Notice by the Builder to the District Surveyor, as to Change of Builder.

I do hereby give you notice, that, with reference to the works specified in my notice of last E. F. (2) is to be placed in charge of the said works, instead of C. D., the (2) mentioned in the said notice.

Dated this day of (Signature and address.)

(1) Describing in general terms the works referred to in notice No. 1, and which works may have been suspended three months.  
 (2) Insert "architect," or "builder," or other superintendent to have charge of the works.

**METROPOLITAN BUILDINGS ACT, VICT., c. s. 13, 1844.**

4.—Notice by the District Surveyor to the Builder, as to any thing done in the Erection of any Building not conformably to the Act.

I do hereby give you notice, that the (1) now in progress (2) situate in (3) is not conformable to the statute in the portions thereof under mentioned; and I require you, within forty-eight hours from the date hereof, to amend the same.

Dated this day of at the hour of by the clock.

Note.—Irregularities referred to. (Signature)

**METROPOLITAN BUILDINGS ACT, VICT., c. s. 37, 1844.**

5.—Notice by an Owner or Occupier to an Adjoining Owner or Occupier, to stop up an Opening in an External Wall abutting on his Premises.

I do hereby give you notice, that if within one month from the date hereof you do not stop up the opening

(1) Insert "building," or "alterations," or "building operations," as the case may be.  
 (2) Insert "under your superintendence," or in the building belonging to you," as the case may be.  
 (3) Insert the situation, as the case may be.

made in the external wall of your premises situate in (1) and which abuts on my (2) I shall, at your expense, cause the same to be stopped up, conformably to the statute.

Dated this day of (Signature and address.)

FORMS OF NOTICES AS TO SPECIAL SUPERVISION.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 15, 1844.

6.—Notice by an Architect or Builder to the Official Referees, as to Completion of the Carcase of a Building subject to special Supervision.

I do hereby give you notice, that the building now erecting under my superintendance in (1) and having been completed to the full height of the walls thereof, and the timbers, floors, roofs, and partitions being fixed, I require you, in accordance with the statute, should you be of opinion that the building is subject to special supervision, to survey the same, and to certify accordingly.

Dated this day of (Signature and address.)

\*.\* A penalty of £200 per day for using any such building without its being certified subsequent to notice as above and following.]

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 15, 1844.

7.—Notice by an Architect or Builder to the Official Referees, as to Completion of Amendments, and of Buildings subject to special Supervision.

I do hereby give you notice, that the building now erecting under my superintendance in (1) and having been completed in pursuance of your survey and notice subsequent, I require you, in accordance with the statute, to survey the same, and to certify accordingly.

Dated this day of (Signature and address.)

\*.\* This notice will be used both with reference to the completion of amendments and to the entire completion of a building.]

FORMS OF NOTICES AS TO PARTY-WALLS, &c.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 20, 21, 24, 25, 1844.

8.—Notice to be given (three months before commencing operations) by an Owner or Occupier, to an adjoining Owner or Occupier, that the Party-wall, or Party-arch, or Party-fence-wall is out of Repair.

I do hereby give you notice, that I apprehend that the (4) or some part thereof on the line of junction between my (5) situate &c., and the (5) side thereto adjoining, situate on the side thereof, is so far out of repair (6) as to render it necessary to (7) such wall or some part thereof; and that I intend to have such wall surveyed, pursuant to the statute; and also, that I have given notice to the surveyor of the district, and to the official referees, to survey the premises, for the purpose of certifying the condition of such wall, and whether the whole or any part thereof ought to be repaired or pulled down and rebuilt, and to certify accordingly.

Dated this day of (Signature and address.)

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 20, 1844.

9.—Notice in the same case, to the Surveyor and Official Referees.

I do hereby give you notice, that I apprehend that the (4) or some part thereof, on the line of junction between my (5) situate in and the (5) side thereto adjoining, situate on the side thereof, is so far out of repair (6) as to render it necessary to repair or pull down and rebuild such wall or some part thereof; and that I require a survey thereof to be made, pursuant to the statute, and that in presence of such one or more surveyors or agents appointed by me, as undermentioned, or by C.D., the owner of the adjoining property, for the purpose of certifying the condition of such wall, and whether the whole or any part thereof ought to be repaired, or pulled down and rebuilt; and I do hereby also intimate that I have served a notice on C.D. to the like effect.

Dated this day of (Signature and address.)

Names and Addresses of one or more Surveyors or Agents for Building Owner.

- (1) Specify the situation.
(2) Insert "ground" or "building adjoining."
(3) Insert "first rate of second class," or "of the third class," as the case may be.
(4) Insert "party-wall," or "party-arch," or "party-fence-wall," as the case may be.
(5) Insert "house," or "building," or "ground," as the case may be.
(6) Insert when required "or has been rendered dangerous and ruinous by cutting away footings," or "breasts," or "chimney-shafts."
(7) Insert "repair," or "pull down and rebuild," as the case may be.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 20 and 24, 1844.

10.—Notice, in the same case, by the District Surveyor to the Building Owner and adjoining Owner, and such one or more Surveyors and Agents by them appointed.

I, surveyor of the district, do hereby give you notice, that in pursuance of an application made to the official referees and to me in that behalf, it is my intention to proceed to view the premises (1) situate in for the purpose of certifying the condition of the (2) and whether any part thereof is so far out of repair as to require to be either wholly or in part repaired, or pulled down and rebuilt; and such survey I do intend to make on the day of next, at by the clock in the noon, in the presence of any one or more surveyors or agents, on behalf of the building owner and the adjoining owner.

Dated this day of (Signature and address.)

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 33, 34, 1844.

11.—Notice to be given, three months before commencing operations, by an Owner to an adjoining Owner.

I do hereby give you notice, that I intend to (3) and that I intend to have such (4) surveyed conformably to the statute; and that I have given notice to the district surveyor, and to the official referees, to survey the premises, and to certify accordingly.

Dated this day of (Signature and address.)

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 33, 34, 1844.

12.—Notice in the same case to the Surveyor and Official Referees.

I do hereby give you notice, that I intend to (3) and that I require a survey thereof to be made, pursuant to the statute, and that in presence of such one or more surveyors or agents appointed by me as undermentioned, or by C.D., the owner of the adjoining property, for the purpose of certifying whether the whole or any part (5) ought to be pulled down and rebuilt; and I do hereby also intimate that I have served a notice on C.D. to the like effect.

Dated this day of (Signature and address.)

Names and Addresses of one or more Surveyors or Agents for Building Owner.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 33, 34, 1844.

13.—Notice in the same case by the District Surveyor to the Building Owner and adjoining Owner, and such one or more Surveyors and Agents by them appointed.

I, surveyor of the district, do hereby give you notice, that in pursuance of an application made to the official referees and to me in that behalf, it is my intention to proceed to view the premises (1) situate in for the purpose of certifying whether any part of such (5) require to be (6) and such survey I do intend to make on the day of next, at by the clock in the noon, in the presence of any one or more surveyors or agents whom the parties concerned shall appoint for that purpose.

Dated this day of (Signature.)

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 26, 1844.

14.—Notice to be given three months before commencing operations by an Owner to an adjoining Owner, where no survey is required.

I do hereby give you notice, that I intend to (7) pursuant to the statute.

Dated this day of (Signature and address.)

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 28, 1844.

15.—Notice of Intention to build an external Wall against existing Party-wall, and for that purpose to cut away Footings, Breast, and Shaft of an existing Party-wall.

I do hereby give you notice, that it is my intention, one month after the date hereof, to build an external wall

- (1) Designated by number or other name.
(2) Insert "party-wall," or "party-arch," or "party fence-wall" as the case may be.
(3) Specify the kind of operation, as to whether it be intended, "To raise a party fence-wall," or, "To repair or rebuild a party fence-wall," or, "To pull down and rebuild rooms in intermixed property, and specifying the situation, &c.
(4) Insert "party fence-wall," or, "rooms in intermixed property."
(5) Specify the kind of operation intended.
(6) Insert "raised," or "repaired," or "pulled down and rebuilt," as the case may be.
(7) Specify the kind of operation, as to whether it be intended, "To pull down a timber partition, and instead thereof to build a party-wall," or, to rebuild a sound party-wall, or, "To raise a party-wall."

against the existing party-wall by which our premises are parted, situate and to cut away such portion of the footings, or chimney-breast, or shaft, in such party-wall as will be necessary for that purpose.

Dated this day of (Signature and address.)

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 38, 39, 1844.

16.—Notice of Desire to build a Party-wall on the Line of Junction of Two Pieces of vacant Ground.

I do hereby give you notice, that I desire to build partly on my land or ground, adjoining your vacant ground, and partly on your vacant ground, on the line of junction of the said premises (1) which will be of the under-noted thicknesses and dimensions; and should you consent thereto, I require you to signify such consent in writing on or before the day of next,

Dated this day of (Signature and address.)

Note of the Thickness and Dimensions.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 38, 39, 1844.

17.—Notice of Consent to the building of a Party wall on the Line of Junction of Two Pieces of vacant Ground.

I do hereby give you notice, that I consent to the building of a (1) partly on my land or ground, adjoining your vacant ground, on the line of junction of the said premises, which I require to be of the undermentioned thicknesses and dimensions, and other particulars,

Dated this day of (Signature and address.)

Note of the Thickness and Dimensions, and other Particulars.

FORMS OF NOTICES AS TO MODIFICATION OR DELAY OF INTENDED BUILDING OPERATIONS.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 22, 23, 1844.

18.—Requisition to a Building Owner by an adjoining Owner as to Modification or Delay of intended Work on his behalf.

I do hereby give you notice, that I require you to (2) the works specified in your notice of the day of in consequence of the inconvenience and loss that would arise to me if the same were executed at the time proposed by you; and if you do not consent hereto, or dissent therefrom within days, then, in pursuance of the statute, you are hereby required to delay your intended operations until the official referees shall have determined thereon.

Dated this day of (Signature and address.)

Note of Modifications.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 22, 23, 1844.

19.—Notice by an adjoining Owner to the Official Referees as to the Modification or Delay of intended Works of a Building Owner.

I do hereby give you notice, that C. D., of day of certain works to be executed subsequent to the day of next; and I having served upon him a requisition in reference to the (3) of the works so intended by him, in consequence of the inconvenience and loss that would arise to me if the same were executed at the time proposed by him, and he not having attended thereto; it is my desire that a survey be made in pursuance of the statute, with reference to such works, and the notices referred to.

Dated this day of (Signature and address.)

Note of Modifications.

METROPOLITAN BUILDINGS ACT, VICT. c. , s. 22, 23, 1844.

20.—Notice by an adjoining Owner to a Building Owner as to Application to the Official Referees for Survey of intended Works with reference to the Modification or Delay thereof.

I do hereby give you notice, that, in consequence of your not consenting to the (3) of the works intended by you, as specified in my requisition of the day of last, I have applied to the official referees for a survey of the premises, pursuant to the statute.

Dated this day of (6) (Signature and address.)

- (1) Insert "party-wall," or "party-fence-wall," or "external wall," as the case may be.
(2) Insert "modify as under-noted," or "delay until the day of " as the case may be.
(3) Insert "modification as under-noted," or "delay until the day of " as the case may be.
(4) Within seven days after the previous requisition.
(5) Insert "modification" or "delay," as the case may be.
(6) Within seven days after the previous requisition.

LONDON: Printed by CHARLES WYMAN, of 40, Cuming-street, Pentonville, in the County of Middlesex, Printer, at the Printing-Office of J. & H. Cox, Brothers, 74 & 75, Great Queen-street, Lincoln's-Inn Fields, in the Parish of St. Giles-in-the-Fields, in the County of Middlesex; and published by the said CHARLES WYMAN, at the Office of THE BUILDER, 2, YORK-STREET, COVENT-GARDEN, in the Parish of Saint Paul, Covent-garden, in the said County.—Saturday, August 31st, 1844.

# The Builder.

NO. LXXXIII.

SATURDAY, SEPTEMBER 7, 1844.

OHNS' work upon "The Anglican Cathedral Church of Saint James, Mount Zion, Jerusalem," which has been for some time lying by us, we this week open and peruse. We believe most Englishmen rejoice at the erection of a cathedral in the Holy City; and very many that it is an English one.

We quote the following from Mr. Johns' work:—

"Jerusalem, or El Koods (the holy), naturally calls for some slight notice in a work like the present. The Psalmist David describes it thus—'beautiful for situation, the joy of the whole earth is Mount Zion, on the sides of the north the city of the great King.' Viewed from some points, on three sides (it approaching a quadrangular form), few cities present such a naturally picturesque appearance. The most remarkable points of view are from the east, the north, and the south; that affording the least interest is the one which the stranger first sees on his approach from Jaffa, from which place by far the larger number of pilgrims and others arrive, but the traveller who is fortunate enough to have his first glimpse of the Holy City from the north, on the Damascus or Nablous road, the quotation already made from the Psalmist and King of Israel must be brought most vividly to his recollection; his attention is at first attracted by the higher parts of Mount Zion, the Castle of David, the small dome of the Church of St. James in the Armenian Convent, then the domes of the Churches of the Crucifixion and the Holy Sepulchre, and at last the Mosque of Omar pre-eminence on his view, standing in a remarkably solitary position, with its *distant* minarets, unlike other mosques, in which the minarets aid in forming most picturesque groups. As this building is remarkable for its usurpation of such holy ground, I shall stop a few moments to describe it.—The building, in general form, differs much from other Moslem mosques, it is polygonal in its plan, is lighted principally by a clear-story of the same form as the mosque, and surmounted by a copped dome, which has never appeared to me in graceful and beautiful contour of outline, the very perfection of the 'swelling dome,' and surmounted by the sign of the Saracenic creed, the crescent. The whole building is coated externally with Arabesque tiles from Constantinople (in which green, purple, and white harmoniously blend), and has on the entablature numerous quotations from the Koran, in Turkish characters, which are continued entirely round the building; this mosque stands on the centre, or nearly so, of a large quadrangle, called the Haram Sherief, occupying, it is supposed, as near as possible, the court of the temple built by Solomon, and the mosque itself, the site of the Holy of Holies; within this quadrangle are numerous praying places and gateways, of beautifully proportioned Saracenic architecture.

"The view from the opposite direction, the south, must not pass unnoticed. On approaching from Hebron, Bethlehem, or the south, the great fall of the city eastward is very perceptible, as also the joining of the valleys of Innom and Jehoshaphat, and the bed of the brook Kidron: here you have a view of the city, apparently surrounded by a natural fosse,

and fully perceive the bold position of Mount Zion, and can easily imagine how splendid must have been the appearance of ancient Jerusalem, with the temple and its courts, the Tower of Antonia, the bridge (a portion of which still remains), which connected the upper and lower cities with the Castle of David, and Herod's gorgeous palace and towers crowning the heights of Zion.

"To the 'LONDON SOCIETY for promoting Christianity amongst the Jews,' is the effort due, which has already made a considerable progress, towards erecting on Mount Zion a Church, in which may be carried out in the sight of the heathen—the Eastern, but sadly corrupt Christian Churches, and the avowed opposers of Christianity, the Jews—that pure and Apostolic faith and form of worship which has been handed down through all ages, and which retains, in our times, pure and untarnished, the faith 'once delivered to the saints.'

"So long ago as the early part of the year 1835," says the Report of this Society, 'the importance of making some more decided effort, in behalf of the ancient people of God at Jerusalem, was deeply felt by many friends of the Society throughout the country; and, in consequence of their urgent and repeated representations, the Committee were induced to make an appeal upon this subject, which was warmly responded to and encouraged.

"A correspondence was immediately commenced with the Rev. J. Nicolayson, at Jerusalem, on the subject of the best means of realizing these intentions; but it was found that much time was lost and little advancement made in the formation of plans, owing to the want of local knowledge, the peculiar difficulties of the country, and the very great uncertainty of communication at that period between Jerusalem and this country.'

"The first movement in this matter, which I find recorded, was the return of Mr. Nicolayson, in November, 1836, to England, in consequence of the difficulties just mentioned, with a double object in view—that of receiving ordination, and having personal communication with the Society upon this important subject. Mr. N. having had several interviews with the Committee, during a residence in England of some months, returned to his sphere of labour; but, through various difficulties, ground was not purchased till late in the year 1838, when two adjoining premises were bought for the contemplated purpose.

"The Report of the Society before-named, in reference to the purchase, says, 'He,' (Mr. N.), 'considers that it could not have been better situated; it is on Mount Zion, exactly opposite the Castle of David, near the gate of Jaffa, and on the very confines of the Jewish quarter; its dimensions are sufficient for the erection of a church, and the requisite dwelling houses for four Missionary families.' Its actual available dimensions I subsequently found to be 210 feet north and south, by an average of 120 feet east and west; the boundaries are very irregular, and only one of its many angles is rectangular; this might naturally be expected, as the Orientals rarely build on any premeditated plan. After the purchase of the land, Mr. N. proceeded, with the assistance of a native Greek, to collect materials for future buildings, to repair the old water tanks, and to dig and build another, in order to obtain an adequate supply of water for the contemplated erections, and also proceeded to erect the buildings one story high. This portion of the buildings was commenced on the 10th of February, 1840, and had just reached its present state when Mr. Hillier arrived in Jerusalem to take the charge and superintendence of the building department; he was not, however, permitted to even enter upon any active duties, being seized with fever (so common in that climate), and, in one short month from the time of his arrival, his labours ceased, and those who had hoped much from his assistance were again sorely disappointed. He (Mr. Hillier), however, reported in the only letter he wrote after his arrival, relative to the buildings before-named:—'I find,' says Mr. H., 'that the lower story of a portion of the Mission House has been nearly completed in the rude style of masonry generally adopted in the better class of Arab houses,—a style which consumes a very large quantity of materials, and which I conceive it will be

highly expedient to abandon (especially in the erection of the church), on the ground of economy, convenience, and sightliness, and with a view to meeting, so far as may be practicable, the expectations of contributors.'

In March, 1841, Mr. Johns received his appointment of architect, and at the latter end of April in the same year left England for the scene of his intended operations. At Malta he engaged masons to perform the work.

The foundation of the church is carried down to the solid rock, at depths varying from 30 to 39 feet, for the accumulated ruins were loose and uncertain, and were untrustworthy even for concrete-work. In those ruins what antiquarian treasures lie! future researches may find even the sculptures of Solomon's Temple.

Mr. Johns' publication is, to use the vulgar phrase, very beautifully "got up;" but we wish the intended cathedral which it illustrates had been in size, form, and finish, more like the "Anglican Cathedrals" of England herself, for it is but a very small chapel with a stunted nave; the whole length not exceeding 110 feet, and the utmost transeptal extent only 64 feet. The style chosen is "early English;" the nave (which is not, however, internally separated as such) is 25 feet wide, and is illuminated on each side by three triple lancet windows, something like those at the Temple Church, London; the transepts extend the internal width of the church at that part to 42 feet—(St. Andrew's Parish Church, Holborn, is throughout 64 feet wide)—the chancel of the church is 16 feet wide, and has a semicircular apsidal eastern termination. At the transeptal crossing is a tower 34 feet square; but as this scarcely rises above the apex of the roof, an effect of remarkable squatness is produced—which, contrasted with the comparatively prodigious altitude to which the pinnacles surmounting the four turret-staircases at the angles of the tower are carried, has a most extraordinary effect. The transepts have, like the chancel, semicircular apsidal terminations, the roofs of which we think have an ugly effect, cutting against the blank arched-paneling which surrounds the exterior of the tower.

Freemasonry, in its stern truth, must condemn some parts of this church. The four pinnacles of the tower, run up like those of Worcester Cathedral, which, as a rudder turned to the extreme in the moment of need, has duty to perform instantly and effectually—have no office but the picturesque,—in which they fail. The roofing is open and without tie. That of the nave, which is 25 feet wide, is restrained by no buttresses, nor has its drift diverged inwardly by any pinnacles; while the choir, which is only 16 feet wide, has its roof, which would hardly move its walls (2 feet thick), restrained by buttresses projecting 2 feet 6 inches, and only 6 feet apart; and in one instance, where a passage has been formed through one of the transeptal buttresses, no additional projection has been consequently given, though it ought on that account to have had still more absolute solid. The angles of the building are well provided with far-projecting buttresses, pinnaced at top, although they have scarcely any force to diverge or restrain; they, however, will tend to render that part of the work more durable.

Of this cathedral we say, go on and prosper, and if its anomalies and construction can be remedied, so be it.

## NEW BUILDING-ACT.

Sir James Graham has appointed Messrs. Hosking and Higgins to be official referees under the new Metropolitan Building-Act.

## THE HOUSES OF PARLIAMENT.

The following is the second report from the select committee appointed by the Lords' Committees, to inquire into the Progress of the Building of the Houses of Parliament, and to report to the House, and to whom leave was given to report from time to time to the House:—

"That the Committee have met, and considered the subject-matter to them referred, and examined witnesses in relation thereto; and it appears to the committee that an understanding was entered into, when the arrangement for the existing accommodation of the Houses of Parliament was determined upon, that the new House of Lords, with its necessary appurtenances, should be proceeded with more speedily than other parts of the building.

"That there is no record of any orders having been officially given, and no steps have been taken in accordance with such an understanding.

"That the Committee appointed last session, in their report to the House, recommended that the architect should so conduct his operations as to secure the occupation of the new House of Lords, with temporary fittings, at the commencement of the session of 1844; and that if he should find that more time would be required, he should report the same to the Commissioners of her Majesty's Woods and Forests, in order that such report might be communicated in due time to the House.

"That instead of the new House of Lords being covered in by Christmas last, as was stated to be practicable by Mr. Barry in his evidence last year, it is now only in course of erection.

"That Mr. Barry now states, that if great exertions are made, the House of Lords, the lobbies at each end of it, the corridors connecting the same with the front building and the libraries, the committee and other rooms belonging to the House of Lords, may be covered in before winter; and the committee having examined the building, with the clerk of the works and one of the contractors, are of opinion that the whole of these apartments may be prepared for the use of the Lords by April next.

"That the Committee do not recommend that any temporary fittings should be prepared, but that all the works connected with the buildings above mentioned should be advanced with the greatest possible speed.

"And the Committee have examined Mr. Barry with respect to the style of internal fitting and decoration, and he has distinguished those parts of the building to which he considers the more costly and elaborate style should be applied. In respect to the remaining portions of the internal arrangements, the Committee entertain the strongest opinion, both in reference to economy and despatch, that the committee-rooms and secondary apartments should be completed in the most simple and solid manner consistent with the character of the general building, but not involving any extraordinary expenditure.

"In respect to the deviations from the original plan, it has been satisfactory to learn that they have not been of a character to vary or affect the builder's contract; and that no future deviations are to be allowed, without the previous sanction and authority of the Commissioners of Woods and Forests.

"And the Committee have directed the minutes of evidence taken before them to be laid before your Lordships."

## IMPROVEMENTS IN WESTMINSTER.

The Metropolitan Improvement Commissioners having decided on opening a direct communication from the new Houses of Parliament to the north-west district of London, various plans and estimates were sent in, the majority of which were rejected, in consideration of the large amount of compensation which would be demanded by the owners of household property in the respective localities. The line has, at length, been definitely marked out, and a contract concluded for two-thirds of the work. The new street will commence at the western extremity of the Houses of Parliament, running in an oblique line from Abingdon-street to Eaton-square, from which

point there is already a corresponding continuation to the Great Western Road. By the formation of this street, two very desirable objects will be attained. It will afford a nearer and more convenient approach to the Houses of Parliament, the law courts, and the Government offices; whilst the removal of the numerous obscure streets, courts, and alleys, in that part of Westminster, will serve to abate a nuisance which has become so intolerable as to call for legislative reprehension. A great number of these dilapidated tenements have for several years been inhabited by persons of the very worst class; the property belongs chiefly to the dean and chapter, who are naturally anxious to break up this "den of thieves," and as the existing leases are nearly run out, the compensation demanded cannot be considerable; it is assumed, at least, that it will be no impediment to the prosecution of a scheme which promises an ample return for the capital invested, and which is still further commended by utility, convenience, and decency. The new street is to be of the same width as Regent-street, and will be of nearly equal length. Great part of the line, which passes through Pimlico, fronting Buckingham Palace stables, has been cleared already. In those streets which intersect the line through the other parts of Westminster, the workmen's operations are delayed only until the present occupants are expelled. Mr. Rigby Wason, late member for Ipswich, has contracted for two-thirds of the line, at a rate much below the Government surveyor's estimate. Connected with the above improvement another project has been revived with some prospect of ultimate adoption—namely, the erection of a bridge across the Thames, from the Horseferry-road to Lambeth-stairs, at the foot of Church-street, close to the Archbishop's Palace. This scheme was mooted nearly twenty years back; a prospectus was at that time issued, and a bill brought into Parliament with a view to the issue of shares for building a bridge by a joint-stock company. It met with so little support, that the Bill was rejected, and the project was consequently abandoned. However, it seems that it is now regarded with more favour; the Archbishop of Canterbury and the Marquis of Westminster having withdrawn their opposition, it is not improbable that the sanction of Parliament would now be obtained, should the application be renewed; more especially as a bridge at the point indicated would form an appropriate continuation of the new street, and facilitate communication between the northern and southern districts of the metropolis.—*Times*.

## MONUMENT TO THE LATE EARL OF DURHAM.

The foundation-stone of the monument to be erected on Pensher-hill, in the county of Durham, to the memory of the late Earl of Durham, was laid on Wednesday, the 28th ult., with masonic honours, amidst an immense concourse of spectators, assembled from all parts of the adjoining district. Pensher-hill is the western extremity of a long range of lofty mountains, running, in a direction nearly east and west, from the sea-coast, a considerable distance into the county of Durham, and the elevation of it is such as to command an extensive view of the adjacent country. At the foot of this lofty mountain range the river Wear pursues its meandering course to the German Ocean, which is also visible from Pensher-hill. The locality of the monument is on the estate of the late Earl, in a neighbourhood full of romantic associations, and a more suitable spot for the erection of a monument to the late lamented Earl could not have been selected.

The proposed monument is already in a very forward state, the works having been in operation some months, so that the spectators could form a pretty accurate conception of what it will be when completed. The form approximates to that of the Temple of Theseus, with a rectangular basis of solid masonry 100 feet long by 54 feet in width. The foundation rests on the solid lime stone rock, 20 feet below the surface of the soil, and the base rises 10 feet above the platform of the hill. At the sides of this rectangle stand eighteen lofty open equidistant columns, 30 feet in height and 6½ feet in diameter, supporting at each end

a magnificent pediment, and at each side deep entablature, which will serve as a promenade when the building is complete. The promenade will be reached by spiral stairs to be formed within one of the pillars. From the ground to the upper point of the pediment will be about 70 feet. The structure stands nearly due east and west, and will form a prominent object to travellers on the line of the Great North of England Railway between Darlington and Newcastle, and will soon become a place of resort for parties of pleasure.

The stone for this magnificent edifice was presented to the building committee by the Marquis of Londonderry, and was obtained from his lordship's quarries at the village of New Penser, distant about a mile from the top of the hill. The lime is from the Earl of Durham's kilns at Newbottle, about the same distance; and the sand from an excellent bed at the foot of the hill. The materials are conveyed up the hill by a temporary winding railway, the bed of which will form a permanent carriage drive when the building is complete.—*Times*.

TIMBER—ITS TREATMENT AND USES.  
BY JAMES WYLSON.

(Continued from p. 428.)

75. POONA; otherwise Poon or Peon. This timber is superior to Mahogany and Riga Fir in the three primary requisites of strength, toughness, and stiffness; and it should, therefore, be well calculated for the heavier purposes of the house carpenter; it is employed in ship building, for decks, spars, &c. The appearance of the wood is that of a dusky mahogany, and it seems qualified for many of the uses to which that wood is usually applied; it is light and porous, but uniform in texture; the annual rings not very distinct, and there are no larger transverse septa.

76. PLANE.—The species generally known of this large and handsome description of tree are the oriental and occidental; the former being a native of the East, and the latter of North America; although not indigenous to they are both grown in Britain; the occidental being the more common of the two. Their introduction has been ascribed to Lord Chancellor Bacon, who certainly brought them first into notice at Verulam; but other writers fix the period at a year previous to the birth of that eminent statesman, and which took place in 1560. Though so beautiful a tree, and desirable as well for useful as ornamental purposes, it has not yet been cultivated in proportion to its merits.

77. The Oriental Plane is indigenous to Greece, in the earliest records of which it is mentioned; also to Persia, where from the pleasant shade which it diffuses, and tree generally being very uncommon, it is held in high estimation. It is one of those trees which attain the largest size, becoming lofty and wide spreading, with massive trunk and crooked branches; these, with the variegation produced by the peeling off, in large patches, of its smooth grey bark, imparting a striking and picturesque effect; in stateliness and beauty it is second to no tree of the East. The leaves are wedge formed at their base, palmate and cinque-lobed lanceolate and sinuated in the divisions; but in the spring the blossom-balls appear before the foliage. The seeds ripen late in autumn and should be sown immediately in the shade and in a moist, healthy loam; in a rich alluvial plain, adjacent to a stream, they attain their greatest magnitude. The wood of young trees is of a yellowish white colour; that of a more advanced age browner, and streaked with reddish veins, somewhat resembling walnut, or rather beech, but more finely figured. An impression exists that it is deficient in hardness, compared with the occidental; whilst in fact it is the hardier of the two; and though regarded here little better than in the light of fuel, in Greece and Persia it is employed in carpentry doors, windows, furniture, and cabinet-work and for which it is generally well calculated.

78. The Occidental Plane has been styled "the king of the western forests;" it is the largest tree of the American woods, rising in the most graceful forms, with vast spreading lateral branches, and covered with a bark of a brilliant white. In the Eastern states, it is called Button wood; in the western, Sycamore.\*

\* In the north of England the Sycamore or Great Maple is called the Plane tree.

It is also called by the Americans the Water Beech; the latter possibly from its durability in water, which property it possesses to an eminent degree. In the structure, colour, and other general particulars, the wood much resembles beech, but the larger transverse septae are more plentiful, and present very beautiful flowers when the wood is cut favourably for such development; it is harder than the oriental, but works easily and stands very well.

79. In both species, the tree appears to be exempt from the ravages of insects, which renders it the better adapted for purposes where beauty of foliage is desired.

80. **TEAK or Indian Oak.**—This tree is a native of mountainous parts in India; it grows with rapidity, to a great height, wide-spreading and erect, affording most useful timber, which requires but little seasoning, and has very little shrinkage: being light, strong, durable, and easily worked, it is well adapted for the purposes of both the house and ship carpenter. In strength and stiffness it excels our British Oak, and is said to have been known to last firm where even the latter has failed: it is oily in its nature, and yields tar of good quality. It is from both the Malabar and Coromandel coasts, but that from the former is the most highly esteemed, and at Bombay is much used for ship-building, for which it is well adapted. There is a kind, it is said, in Hindostan, of which the wood is of a more compact texture, and heavier than that of the common teak; being likewise beautifully veined, and altogether well suited for furniture. The Teak tree is, in the Birman empire, the lord of the forests (which are large and numerous), and is esteemed superior to European oak.

81. **TURTOA or African Teak,** also sometimes called African Oak, is imported from Sierra Leone; it is a compact and hard but rather brittle wood, similar in colour to oak, but in grain more uniform. It has no larger transverse septae, but the smaller are strong and abundant; the annual rings are visible but not distinct; it is more difficult, and consequently more expensive to work than British Oak, but nevertheless is used to a considerable extent; and is, indeed, thought suitable for those purposes to which that timber is usually applied, both as regards house and ship carpentry. The wood tastes bitter, but is inodorous when dry; it is disposed to split internally in the seasoning, and inclines also to shakiness.

82. **COVRIE.**—This timber is from a large cone-bearing tree of the pine species, and is imported from New Zealand. The wood is in colour somewhat similar to cedar, with some of that silky lustre which is observable in several of the pines: it has no large transverse septae, is straight and fine in the grain, and uniform and close in texture. The annual rings consist of two parts, light and soft, and a harder and darker, with resin in considerable abundance; it is not much liable to shrink, holds very well with glue, and seems to stand the weather tolerably. It is used by ship-builders for masts and spars, and, is excellently suited for internal joinery.

(To be continued.)

#### ON THE CONDUCTING AND ABSORBING POWERS OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 429.)

THE processes of Nature, by which concrete masses of rock are produced, furnish many valuable hints to the builder, not only for making the most durable cements, but also for remedying the defects of those concrete masses which are most generally employed for building purposes, but which, from their porosity, or from the preponderance of lime, are apt, when they come in contact with atmospheric air, to fall into rapid decay. In the organic kingdom, as is palpably manifest to all men, the most solid portions of the animal frame, as shells, bones, and horns have a cementing base of gelatinous matter; and the more intimate the union of this matter with the earths and other substances, the harder, the more compact, and consequently the more durable, are the members of the organic body. The coral tribes which pass into limestone from the living state have all of them this gelatinous or

mucilaginous base, which is analogous to, and passes into the state of silica; many of them have also peculiar oils, which are compounds of carbon and hydrogen, and these components also enter into and become identified with the solid ponderable rock; the presence of iron, magnesia, excess of animal oils, &c. gives characteristic quality to the rock: thus we have magnesian limestones, bituminous limestones, ironstone, &c. On the other hand, when rocks are formed by the concretion of sedimentary deposits, the cementing material of the various masses is ever varying in its nature, being carbon, silica, or alumine, as the case may be, but under all circumstances it is mineralized organic matter. The shell of the oyster is chiefly composed of phosphate and carbonates of lime, every atomic part of which is surrounded by a firm membranous matter, which constitutes the strength of the shell, for mere compact solutions of calcareous matter and water would embrace neither strength nor durability. All cements must, therefore, have some common basis, possessing adhesive qualities, and conforming in character to the objects which they embrace, otherwise the atmospheric or aqueous power acting upon them must inevitably decompose their masses.

All rock which is simply concrete, and not crystalline, is none other than a natural cement; and the uncertainty of its composition, and character for durability, attest the accident of circumstances which brought its material together. Take for instance Portland stone: under this name we have a variety of material, the nature of each being determined by the predominating material, which is either lime or alumine, or an union of these with silica; the first, a mere agglutinated mass of calcareous *veynes* and other lime secreting species, with chalky deposits, and having little cohesion of its parts, like ill mixed mortar, soon falls to pieces; the second being calcareous matter blended with argillaceous earth, has a better cement or base, and is more durable; but under atmospheric influences this also readily parts with its lime, and consequently disintegrates: the third quality produces stone at all times better than the other two, and increasing in value, so far as regards durability, as silica becomes its most prevalent material.

The more siliceous there is in concrete masses, the more siliceous there is in making artificial cements, the more durable is the material. Siliceous is almost indestructible, air makes no change in it; by absorbing water, it sometimes assumes the crystalline state, but it cannot be dissolved in water by chemical methods; the acids to which it may be exposed have no effect on it, and uniting with alumine, it renders the latter harder and more durable. Buildings built of flints, if the cement were equally durable, would be indestructible in this climate, for contrary to other earths they love a moist climate, and more tenaciously retain the bodies with which they are mechanically united in temperate and cold, than in tropic regions. Formed by atmospheric influences, they are by nature calculated to resist them.

The durable quality of concrete bodies having a siliceous base is palpably manifest in the basalts, porphyries, clinkstone, and other varieties common to this country, and would have the effect of bringing them more universally into use, were it not for the vast expense of preparing them; in many of the crystalline varieties of rock, their durability is less sensibly exhibited, in consequence of the slight cohesion of the crystalline particles.

Natural concretes almost always attain greater cohesion and solidity of parts than artificial cements; but still there are many exceptions to this rule, and I have seen cements in India having a gem-like hardness. I remember in particular witnessing the pulling down of an old fortress in the southern part of

[\* The kinds containing oyster and other shells are frequently found the most durable, a small portion only of the cement disappearing while the shells remain sharp and slightly prominent, as may be seen down the walls of the columns of St. Paul's Cathedral, the stone of which was selected with such admirable care that the greater portion of its masonry remains exhibiting the finest marks of the tools used from 140 to 170 years ago. On its northern and eastern sides hardly a time-speck is to be observed upon its delicate and extraordinary carvings.—ED.]

the Deccan, where the cement was so exceedingly hard as to turn the points of the iron implements, and it was found much easier to break the stones to pieces. A great deal, it is true, depends upon climate, but much is really due to the care and attention bestowed in making these cements. The very best shell lime is used, and this shell lime contains a great deal of siliceous matter; equal quantities of this and the very fine sand of the country is used, the lime being first slaked with water; they are then left for three days. A liquid is then made of 2 lb. sugar (grog) to one gallon of water, and this is sometimes boiled with vegetables of a gelatinous nature; to the lime and sand is added chopped hemp, and the whole mixture is then well stirred together into a very fluid state; some add milk to this mixture, and others increase the quantity of sand. When used, the bricks or stones are bedded in layers of it, as thin as possible, and if the material is of a spongy nature, it is saturated with the mixing fluid.

This is following Nature in her course, the natural cements or concrete rocks being of analogous composition; the carbonaceous matter and the silica conjointly forming in union the cementing base, and in both the natural and artificial product, enveloping, as in the shell of the fish, every atomic particle of the lime. In Persia, most of the concrete rocks abound with bitumen, and it is here, therefore, that bitumen is employed in making cement, and we frequently read of the bitumen being employed in ancient structures in this and also all the surrounding countries, being built of brick, stone, or marble, and cemented with bitumen. But this must not be taken literally, for bitumen alone in these hot dry countries would be of little real use, but when it forms the cementing base of the lime, it then becomes exceedingly hard and durable.

I have already stated that rose jasper, and many other conglomerate masses present, in the first instance, the appearance of a simple conglomerate mass of siliceous pebbles held together by a natural cement, bearing great resemblance to that made by artificial means; at first very slightly adhesive, but gradually becoming indurated, and finally silicifying, and thus becoming one and inseparable from the general mass; in fact, when the change is perfected, it appears but as one variegated stone. To effect this change, time and intense atmospheric heat are necessary, but simple silicification, or, as it is wrongly termed, petrification, takes place in every part of the world; and in this country, in particular, we find Nature incessantly occupied in forming conglomerate masses from the commingled masses of matter constituting strata, or in changing the isolated bodies and fragments of bodies of animals and vegetables into stone. If, then, Nature can cement chalk, or a bone, or a tree, into flint, securing it, by this means, against the future ravages of time; why should not men, by studiously following Nature in her operations, attain the same power, and by the same means? Were Bath stone saturated with liquid silica, or with alumine and iron instead of with water, it would speedily be changed into an indestructible body, resisting alike the atmosphere and the waters; and there is not the least reason, other than the present ignorance of man, why the quarried and sculptured stone should not be saturated with a fluid compound which would at once alter its very nature and qualities.

Man has much to learn concerning the earth on which he treads; his imitations of nature are too often feeble and imperfect; he beholds the fluid drop converted into a stone; he finds the common earth alumine converted into topaz, ruby, and emerald; carbon converted into coal and into diamond; he beholds silica congealed in a thousand forms, as agate, crystal, quartz, and crystalline, and amorphous rock; but of the origin of silica he knows nothing, although it is the most abundant material of the earth; the processes of nature are continually liquifying it for the uses of the vegetable kingdom; and that its elements are abundantly diffused in liquids, is evidenced by the enormous processes of congelation and concretion continually taking place.

It is evident that there is no other cementing base so capable of resisting the action of the atmosphere or of water, as silica; of the carbonates and sulphates of lime, including the

immense varieties of limestone, there are none capable of withstanding the corroding hand of Time in this country over a few centuries, and most of them rapidly disappear; it is only when carbon is in excess, that the stone is marked with a lengthened durability. Still it is to be observed that, while they continue in their natural and undisturbed state, they appear to be indestructible, presenting their vast precipitous fronts even to the storm and the tempest for ages, ere they yield inch by inch to its fury; the causes of which are, the apparent state of rest in which they exist; their absorbing pores are ever filled with moisture, which is the clue by which heat finds its way into their remotest parts, and the medium by which uniformity of temperature is preserved. But when quarried, the stone becomes the subject of incessant action and reaction; it is affected by heat and cold; its moisture is continually received, and as continually withdrawn; and its spongy texture is free to admit elastic fluid bodies inimical to its compound structure. It is the same with the common cements of the day, they are acted upon in the same manner, and too often by soluble salts, with which they are unthinkingly united, and the inevitable consequences are rapid and uniform decay.

Chemists unhesitatingly affirm that the induration of cements is caused by the absorption of carbonic acid; but, although I stand alone in this respect, I most decidedly differ with them in an opinion which is contradictory to existing phenomena; for the supply derivable from the atmosphere must, in many cases, be infinitely short of the demand. On the other hand it is evident that, on the introduction of water, chemical action is generated, and a general interchange of bodies takes place; internal action continuing until the carbon, the lime, and the silica acquire a reciprocal relationship to each other. I should be far more inclined to believe that, on the decomposition of the water, while the oxygen is absorbed by the lime, the hydrogen attacks the gelatinous and siliceous matter, causes it to expand, and becomes in this state firmly united with the lime by the force of affinity.

In tropical countries the most agreeable habitations are those which are built of very thick massive stones, the least so are those built of wood; the black basalts in particular being non-conductors of heat, absorbing very little moisture, and exceedingly durable, are universally employed by the natives in the construction of their temples; and the massive structures still existing in Egypt, demonstrate that the ancients were well acquainted with the nature of building-material, always choosing that which possessed the least absorbing power, or otherwise employing much larger blocks of the lighter and more spongy material. In this country the latter is most desirable, because it preserves a more even temperature throughout the year.

(To be continued.)

#### THE NATURE OF DESIGN.

A Paper read at the meetings of the Decorative Art Society, March 13th and 27th.

BY MR. CRABB, V.P., MEMBER OF THE INSTITUTE OF FINE ARTS.

(Continued from p. 430.)

WITH a few exceptions our pattern drawers or designers have not been educated, nor have they taken any comprehensive view of Art. Design has, in fact, been understood neither by the manufacturer, the public, nor the designer himself, and the extent of our national as well as individual deficiencies, in every thing approaching to systematic information or education in Art, subsequently to be applied to manufacture, can at present alone be understood by comparison with the continental nations. The steady but constant improvement and extension of their manufactures will be found to be progressive with their schools of Design.

The increase of our population causes a greater competition for employment, rendering it every man's business to consider by what means additional trade can be obtained; bearing in mind the alterations which have

taken place abroad, it would be exceedingly interesting to consider the probable extension of the present, and what additional occupations would arise in our own country, were the *entire people, wealthy and poor*, as familiar with Fine Art, as they are upon the Continent. Our present improvements are chiefly those of actual utility, taste being secondary. The application of geometrical design has greatly added to the beauty, while it has also effected a great saving of material in the frame-work of our engines and machinery generally. Without doubt, elaborate work in beautiful design might be added to all our manufactured metallic and other substances, which would cause an immense increase of employment. We possess knowledge, and specimens of very fine examples in wrought iron work and brass screen work, as Henry Seventh's tomb. We could consume brass furniture mountings to a great extent; bronze architectural ornaments, tazzas, vases, figures, &c., for the production of which the French are so justly famous; fine iron castings, as of Prussia, France, or Belgium. Our wood carving is very deficient, and our decorative painting has now passed into the hands of foreign artisans. Nothing would prevent our silk manufacture equalling the finest efforts of Lyons, were our weavers and artists educated. Carpets the same, together with an immense list of products from the loom, tapestries, &c. Why could not we, instead of importing, make watches as Geneva? and also *watch-glasses*? Their great skill and beautifully applied design originates but in a practical school of design. A similar source supplies the French with their superior distemper printing colours, by which, and their botanical knowledge, they wholly eclipse our paper-hangings. Scientific knowledge of colouring is as visible in the work-room of their milliners as in their manufactures. Are we not as capable of transplanting to our land the light and easily followed trade of artificial flower-making as the French, who took it from Italy? Only instruct our people in botany as they did. Consider the immense field that is open for lace-work; I know of nothing upon which such distinctive varieties of magnificent design have in olden time been lavished, and never was there a better opening for its reproduction than at the present time. Foreign jewellery, and goldsmith's work (often enriched by enamels), is daily growing in fashion. Abroad, you will see females employed in gem engraving, and other light works of fine art. Look to the thousands of cameos brought from Italy; can it be said we are unequal to their production?

The continental cabinet-work is inferior in quality, but its ornaments display all the taste resulting from educated design; and the elegant arrangements of French upholstery have become almost proverbial. These examples might be extended, but my purpose is answered when I draw attention to the advantages of fixing upon our already substantial manufactures, the profitable intimacy of the entire nation with fine art.

Superior elegance of form is perfectly reconcilable with bare utility, and is exemplified in numerous instances; from the most refined works of the antique designing, down to their commonest domestic utensils and implements.

When a people become familiar with the exceeding beauty of Art, they require its application to every article of general use, whether for elegant luxury, or simple utility. This causes an application of elaborate workmanship, creating innumerable trades. Art is cheap, all can enjoy it, and while it affords pleasure to all, supports by its lighter employments thousands who might otherwise be in indigence.

Practical institutions for instruction are the first grand and special object; give the people opportunities of seeing the most beautiful objects of art in the particular branch they may follow—gradually form collections of models of the best styles of furniture, and every other requisite manufacture—and have able instructors to teach the principles by which they are produced. This, in addition to accessible collections of celebrated buildings, is the obvious and certain mode of universally extending taste and a knowledge of the arts among the people, and of causing their application to manufactures.

With such statements, coupled with a foreign rivalry, in active operation, immedi-

ately and particularly affecting those who may be expected to become members of this society, I submit we are entitled rigidly to inquire into the measures lately pursued for educating or diffusing a knowledge of design and its purposes among our own people.

Since the School of Design was established eight years ago, I have had frequent opportunities of being acquainted with its management, and at various intervals have been in communication with members of the council. I have, throughout, taken a different view of the plan desirable to be pursued, from that of those gentlemen, or rather of the majority, for the council has been divided in opinion upon the point. The school has had ample time to produce designers of its own formation, and to have laid a solid foundation for a well-digested plan of education; but that the various plans successively adopted have failed, none can deny—and persons capable of forming a sound judgment consider the system unsuited to produce efficient draughtsmen—and I take the liberty of challenging the school to produce one real designer of its own education. Is it not, therefore, fair to ask the reason?

I attribute no blame to the gentlemen of the council; they have acted to the best of their judgment, and encountered many inconveniences, for which we are greatly their debtors; but these gentlemen being only theoretically and limitedly acquainted with design, its practical diversified requirements cannot possibly be known to them. They therefore commit the first grand error in choosing an artist, portrait or landscape painter, as the sole director, a class of gentlemen confessedly not men of business, and certainly not familiar with practical design. It is a separate question whether an artist should or should not be at the head of the institution, but I am perfectly certain that unless talented designers of varied experience, and familiar with trade and foreign manufactures consumed in England, be associated with the institution, it is impossible for the council to confer the benefits they propose.

My own business is wholly with design, and I have allowed no opportunity to escape for discussing this topic with gentlemen and with manufacturers, and each, without exception, has admitted the plain common sense of my position.

There are persons who have a management in the first class cabinet, upholstery, and decorative houses of London, who know more about the practical requisites for teaching design than all the school put together. These persons are few in number, and possess advantages no other class of men can possess; it is their immediate business to examine thousands of designs that are constantly recurring, for their decorations and furnishings, in ornamental works, in chintzes and silks, carpets, floor cloths, furniture, iron, brass and marble, &c.; every description of design, foreign and English, is constantly requiring their notice, and it is not unusual for noblemen to take their opinion upon a choice of lamps, bronzes, plate, and various et ceteras.

When I am called upon to decorate and furnish, say an entrance vestibule, dining room and drawing room, observe the information upon design requisite:—The general plan has first to be determined; it may be a modern built London house, capable of receiving the Greek, Roman, Italian, French, or even Elizabethan styles—an intimate knowledge of each style, its leading characteristics and treatment, the ornaments and furniture of the respective period is perfectly essential, otherwise I cannot successfully direct my customer's choice; and when determined, there remains the practical acquaintance with home and foreign manufactures, my immediate province being to point out superior products of either. The floor of the hall may be laid in plain or patterned marbles, with tiles or tesserae, plain oak or inlaid woods. The walls and ceiling are to receive due and respective embellishment; and though little furniture is required, it varies from the Roman eagle and slab to the bracket. The dining room, even if plain, can have a distinctive character marked in its frieze, cornice and ceiling, its chimney grate and leading pieces of furniture, the carpet, and the mode of fitting up the windows, in which the wide diversity of materials for curtains, resulting from the efforts of many manufactures, present me with every quality of design. The drawing room usually demands

the chief attention, its decorations admitting of greater variety; walls, ceilings, and chimney-pieces being determined, there remain the form and ornaments of furniture; consoles, cabinets and glasses, carpets and curtains, all may be British or foreign, and all come under my direction or notice; but now observe, if skill and education in the application of colour is not matured, there is certain failure in producing ultimate unity and harmony of effect; the key note, as my friend Mr. D. R. Hay would express it, will be wanting.

Thus, the designer in a large establishment is a person of importance, in connection with this subject; he submits, recommends, or influences a vast amount of money to be expended upon English or Foreign manufactured design; he passes all his time in connection with it, and in the mansions of the nobility he has opportunities to observe the finest works of great masters in design. I have often had occasion to thank the liberality of gentlemen in displaying to me choice specimens or books, and to regret that circumstances and opportunities did not permit my giving to the public the results of experience in applied design, so much required by manufacturers. I have referred to my own particular business, because from that source, aided by observation and peculiar facilities, is derived whatever information I possess, and because I consider the School of Design may there find the most valuable practical intelligence, not to be obtained elsewhere, and with which, to judge by their practice, they appear wholly unacquainted.

Design is perfectly simple, and its principles are easy of communication by proper persons; let it be divested of the mystery at present allowed to surround it, and teaching the great principles of design will be found more than sufficient to occupy the attention of our school; those are what the manufacturers require to be cultivated, not *fresco painting* or *wood engraving*, which may be safely left to their own circle of clever artists. In consequence of an absence of practical information, *copying* is made the fundamental practice, as also drawing from the human figure; this instruction chiefly tends to prepare pupils for the Royal Academy, and not to produce manufacturing designers. Copies after Raffiello's works make the school look pretty, and assist the decorative painter; but they may mislead the uninformed and confuse the manufacturer. I should prefer their place being occupied by geometrical principles of design, examples of form and the theory of colouring, executed by the masters themselves; by them frequently explained as the source of Raffiello's excellencies, and with detailed principles of application to manufacturing design. Teaching drawing forms but one link in the chain of teaching for manufacturing design, and it is difficult to make the uninitiated comprehend the full extent of the mischief, in rendering *fine art the principal aim of the school*, when it ought to be *industrial art*. I admire fine art, and advocate its indissoluble connection with manufacturing design; but let us have practical utility first, the necessities of the manufacture require it. Fine art will assuredly follow, and with increased success; but practical men can alone achieve this successful issue, and the school does not possess them! If a physician were appointed operating surgeon to an hospital, his failure would excite no surprise, though both are doctors; so between the artist, painter, sculptor, and designer, there is even a wider difference of acquirement and purpose. Five years since, I recommended to the council, that existing designers should be induced to attend the school for a more complete instruction, by which, important benefits would be exchanged; but a theoretical course of their own was preferred—let us judge of its success by their recent appointments of *masters to schools* at Birmingham, Newcastle, and other places. The one sent to Birmingham, described as an intelligent pupil of the school;—a leading manufacturer tells me they are exceedingly dissatisfied, and very likely, for I have long known him to be a person without pretension, and he acknowledges himself to be unacquainted with manufacturing design. A worthy man, a *wood engraver*, has been sent to Newcastle; he neither pretends to, nor possesses the slightest manufacturing knowledge. There must be some serious misapprehension among the council to suppose that men of such

acquirements can teach what they know not—*manufacturing design*. I do assure them, they are extending an evil that will provoke the contempt of the manufacturers; if men of ability were sent, manufacturers would soon see their interests in subscribing handsomely for their support, and incalculable benefits must arise; *in three years, or less, they might have designed and modelled trained to their own peculiar requirements upon the spot.*

Freely admitting the Foreign designer's superiority, I insist upon the Englishman's capability of equalling him (with similar advantages), and thus hold it to be a matter of high moment, that the gentlemen of the council be made sensible of the insufficiency of their present arrangements. Certainly, the school in London should not be suffered to remain a perversion of its title, a mere *cheap drawing school*, made to look inviting by some extra attention paid to a few scholars, intended as decorative painters; there is every opportunity for rendering the most important service to the arts of design by *educating those who can already draw well*, and who would eagerly attend the school, and pay a portion of its expenses also, provided practical men were there to direct the studies and communicate that information which no other artist, painter, sculptor, or architect can possess. Let the subject be treated with energy and liberality, and there is no difficulty in doing this, nor in widely diffusing a popular knowledge of the nature and purposes of design to the public at large. I do not speak theoretically, but with ample knowledge of the difficulties, and with my opinions sanctioned by gentlemen, whose names are an honour to our country.

(To be continued.)

#### A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARKHAM, IN NORFOLK.—NO. IV.

WITH NOTICES OF THEIR ACTUAL CONDITION. (Continued from p. 407.)

Lyng.—“*Tu, ne lividus et mordax videare, caveto.*”—There is generally some point of interest about each of our old churches, some beauty of architecture, a porch, a window, a font, a monument; the Lord's house at Lyng, dedicated to St. Clement, has charms for the ecclesiastical antiquary in more than one of these particulars. It consists—or rather consisted once—of a nave with south porch and a chancel, the latter feature wretchedly shorn of its fair proportions.

Notice will readily be drawn to the porch; its existing state affords sad token of the neglect and spoliation to which the entire edifice has been subjected. We enter by passing under a very obtuse Tudor arch, inserted within a square compartment with enriched spandrels: the archivolts spring from short semi-circular pillars, with stilted bases. A niche for the benatura, or holy-water stoup, appears in the outer wall to the right;—the cause of this peculiarity will be seen presently. Two fine windows in the perpendicular style have been bricked up below, and above, over the entrance, a square-headed window of three “days” lighted an upper chamber or parvise: it was reached by a narrow winding staircase, the doorway, now closed, being still perceptible on your right *within* the church. The great or south door has its surface elaborately carved with perpendicular panels and tracery, the whole inclosed within a wide bordure of quatrefoils. The ancient key, we were informed, was unfortunately destroyed some years since, having burst while being employed *en fusil* after a wedding.

In ancient times the towers of churches, it is thought, were not unfrequently used as fortresses, to which the parishioners retreated on occasion of danger. The peculiarly massive character of this steeple, with narrow lancet-shaped windows, the lowest at considerable height from the ground, as well as the only access to it being through the church, may strengthen this view. On the other hand, the lower portion having a lantern—that is, being

pierced by a lofty belfry-arch,\* now partially closed by an unsightly “scaffolding,”—may weigh in the balance of opinions. There can be but one regarding the elegant windows of the nave, the perpendicular crockets of which are intersected by embattled transoms, the central at a higher elevation than the rest. The pointed dripstones or hood-mouldings of these windows are boldly projected, and canopy the lofty jambs and mullions with fine effect. Many good specimens of painted glass, happily free from the lime-wash so plentifully applied elsewhere, yet further embellish the masonry. The walls, we regret to say, are in a state that augurs ill for the endurance of these beauties, although braced by iron girders within, and propped externally with massive buttresses of the most debased character.

This church, according to Parkin, has “two aisles and a chancel:” a spacious nave, covered by an exceedingly mean roof of no late date, and a recess in lieu of the chancel, already noticed as dilapidated, come much nearer the reality. How far this last has been despoiled of its ancient honours, indications are not wanting to shew. A low door on the north side afforded access probably to a chantry-chapel; some incline to the notion of a charnel-pace existing there. A spiral staircase of stone leading to the roof-loft might be traced within memory of the present generation. The lower or inclosed portion of the chancel-screen, *cancelli*, yet exists, but in a very mutilated state. Panelled arches, embellished with decorated tracery, and having spandrels enriched by trefoils and figures of animals, the whole supported on buttresses of the most chaste design—out on the wanton devastators that have so marred them! An ancient altar-cloth of purple velvet, having the crucifixion and effigies of the saints, &c., wrought on it in needle-work and gilt tinsel, claims notice here. Not so the pulpit and reading-desk, of which we know not whether they offend most in design or position—both in the highest degree exceptionable.

To what other cause than that of violence—the authorized mutilations of fanatics—may we attribute the injuries sustained by so many of our ancient fonts? That at Lyng, a capacious octagon, leaded and originally provided with a drain, stands on a tasteless modern pedestal of brick-work; it has a conical oaken cover, in the early English style, surmounted by a finial. Those which crest what remain of the ancient seat-ends are of rather inferior handicraft; too many of them have been discarded to make room for the “earthly state and vain distinction” of unseemly pews. The steeple boasts of six bells.

We were pleased to encounter an article of church furniture unhappily of rare occurrence; a date on it informs us that *ten*. Car. II. poor's boxes, and consequently works of charity, were held as now essential to the worship of Him, the source of every blessing. A large antique chest or locker, with semi-circular top and giant iron bands, has been thrust aside as useless, under the gallery. An ancient grave-stone, adjoining the font on the south side, has been ‘disrobed’ of its brass, and by some further mischance the position has become reversed.

This church shews that some regard is had to its cleanliness, but the pavement generally is in very damp condition. The site, well high adjoining the river Wensum, here artificially raised to form a mill-head, doubtless promotes the evil; but the surface of the grave-yard—particularly on the south side, where tombstones crowd upon the very foundations—sadly overtops the interior level. We sought in vain for any indications of a pure and chastened taste in the monuments, although numerous epitaphs stand about to proclaim how closely

“Our little life

Is rounded with a sleep.”

“He is highly pleased,” says the Homilist, “with those that diligently go about to amend and restore such places as are appointed for the congregation of God's people to resort unto.” Were it not better that such a visitant—long to be waited for, we fear,—should to the credit of all parties, be anticipated at Lyng?

The reader will be invited in our next to accompany us to Elsing.

\* We are by no means assured of this being an original feature.

INTERIOR VIEW OF THE REFECTORY OF ST. MARTIN'S PRIORY, DOVER.

TO THE EDITOR OF THE BUILDER.

SIR,—I beg to send you the accompanying sketch, and the following particulars:—

This building, now used as a store-house or barn, is situated within a short distance of the Maison-Dieu. The priory has been long famous for the gateway, which still retains much of its original beauty, and leads to the residence of its worthy possessor, John Coleman,

Esq., in whose family this farm has been for a long series of years.

The exterior of the building offers little worthy of observation, but internally it bears considerable evidence of antiquity. The priory-buildings were begun by Archbishop Corboyl, in the reign of Henry I., and were finished by his successor Theobald, who filled it with Benedictine monks; and king Henry

II. decreed, that no religious order, other than that of St. Benedict, should reside there.

The farm-buildings stand in a very pleasant situation, near the commencement of the Folkestone road, and the whole precinct is still surrounded by a stone-wall, within the boundaries of which many a mass has been sung, and offering made to St. Martin.

EDWARD STOCK.

#### THE ELEMENTS OF ARCHITECTURE.

COLLECTED BY SIR HENRY WOTTON, KNIGHT,  
From the best Authors and Examples.

(Continued from p. 423.)

##### OF CHIMNIES.

In the present Business, *Italians* (who make very frugal Fires), are perchance not the best Counsellors. Therefore from them we may better learn both how to raise fair *Mantels* within the Rooms, and how to disguise gracefully the Shafts of Chimnies abroad (as they use) in sundry Forms (which I shall handle in the latter Part of my Labour), and the rest I will extract from Philippe de l'Orme, in this Part of his Work more diligent than in any other, or, to do him right, than any Man else.

First, He observeth very soberly, that who in the Disposition of any Building will consider the Nature of the Region, and the Winds that ordinarily blow from this or that Quarter, might so cast the Rooms which shall most need Fire, that he should little fear the Incommodity of Smoak; and therefore he thinks that Inconvenience for the most Part to proceed from some inconsiderate Beginning. Or if the Error lay not in the Disposition, but in the Structure itself, then he makes a Logical Enquiry, That either the Wind is too much let in above, at the Mouth of the Shaft, or the Smoak stifled below: If none of these, then there is a Repulsion of the Fume by some

higher Hill or Fabriek, that shall over-top the Chimney, and work the former Effect: If likewise not this, then he concludes, That the room which is infested, must be necessarily both little and close, so as the Smoak cannot issue by a natural Principle, wanting a Succession and Supply of new Air.

Now, in these Cases he suggesteth diverse artificial Remedies, of which I will allow one a little Description, because it savoureth of Philosophy, and was touched by Vitruvius himself, (Lih. 1. Cap. 6.) but by this Man ingeniously applied to the present Use: He will have us provide two hollow Brass Balls of reasonable Capacity, with little Holes open in both for Reception of Water, when the Air shall be first sucked out: One of these we must place with the Hole upwards, upon an Iron Wire, that shall traverse the Chimney a little above the *Mantel*, at the ordinary height of the sharpest Heat or Flames, whereof the Water within being rarified, and by rarification resolved into Wind, will break out, and so force up the Smoak, which otherwise might linger in the Tunnel by the Way, and oftentimes revert: With the other (*south he*) we may supply the Place of the former, when it is exhausted, or for a need, below the Fire in the mean while; which Invention I have interposed for some little Entertainment of the Reader. I will conclude with a Note from

Palladio, who observeth, that the Ancients did warm their Rooms with certain secret Pipes, that came through the Walls, transporting Heat (as I conceive it) to sundry Parts of the House, from one common Furnace; I am ready to baptize them *Caliducts*, as well as they are termed *Ventiducts* and *Aqueducts*, that convey Wind and Water; which whether it were a Custom or a Delicacy, was surely both for Thrift and for Use, far beyond the *German* Stoves; and I should prefer it likewise before our own Fashion, if the very Sight of a Fire did not add to the Room a kind of Reputation, as old \* Homer doth teach us in a Verse, sufficient to prove that himself was not blind, as some would lay to his Charge.

Touching Conducts for the Suillage, and other Necessities of the House (which how base soever in Use, yet for Health of the Inhabitants are as considerable, and perhaps more than the rest) I find in our Authors this Counsel, That Art should imitate Nature in those ignoble Conveyances, and separate them from sight (where they want a running Water) into the most remote, and lowest, and thickest Part of the Foundation, with secret Vents passing up through the Walls like a Tunnel to the wild Air aloft, which all *Italian*

\* Αἰδομένα καὶ πύρος γεραιότερος οἶκος ἰδέναι.  
—Hom. Epig.

Artizans commend for the Discharge of noisome Vapours, though elsewhere, to my knowledge, little practised.

Thus having considered the precedent Apertions, or Overtures, in Severality, according to their particular Requisites, I am now come to the Casting and Contexture of the whole Work, comprehended under the Term of Compartition; into which (being the mainest Piece) I cannot enter without a few general Precautions, as I have done in other Parts.

First, Therefore, let no Man that intendeth to build, settle his Fancy upon a Draught of the Work in Paper, how exactly soever measured, or neatly set off in Perspective; and much less upon a bare Plant thereof, as they call the *Schizographia*, or Ground-Lines, without a Model or Type of the whole Structure, and of every Parcel and Partition in Pastboard or Wood.

Next, that the said Model be as plain as may be, without Colours or other Beautifying, lest the Pleasure of the Eye preoccupate the Judgment; which advice, omitted by the *Italian Architects*, I find in Philippe de l'Orme, and therefore (though France be not the Theatre of best Buildings) it did merit some mention of his Name.

Lastly, The bigger that this Type be, it is still the better; not that I will persuade a Man to such an Enormity, as that Model made by Antonio Labaco, of *St. Peter's Church in Rome*, containing twenty-two Foot in Length, Sixteen in Breadth, and Thirteen in Height, and costing four Thousand one Hundred and eighty four Crowns, the Price in truth of a reasonable Chapel. Yet in a Fabrick of some forty or fifty Thousand Pounds Charge, I wish thirty Pounds at least laid out before-hand in an exact Model; for a little Misery in the Premises, may easily breed some Absurdity of greater Charge in the Conclusion.

Now, after these Premonishments, I will come to the Compartition itself, by which the Authors of this Art (as hath been touched before) do understand a graceful and useful Distribution of the whole Ground-Plot, both for Rooms of Office, and of Reception or Entertainment, as far as the Capacity thereof, and the Nature of the Country will comport. Which Circumstances in the present Subject, are all of main Consideration, and might yield more Discourse than an elemental Rhapsody will permit. Therefore (to anatomize briefly this Definition) the Gracefulness, whereof we speak, will consist in double Analogy or Correspondency. First, between the Parts and the Whole, whereby a great Fabrick should have great Partitions, great Lights, great Entrances, great Pillars or Pilasters; in sum, all the Members great. The next, between the Parts themselves, not only considering their Breadths and Lengths, as before, when we speak of Doors and Windows; but here likewise enters a third respect of Height, a Point (I must confess) hardly reduceable to any general Precept.

True it is, that the Ancients did determine the Longitude of all Rooms which were longer than broad, by the Double of their Latitude. Vitruvius (Lib. 6. Cap. 5.) And the Height by the half of the Breadth and Length summed together. But when the Room was precisely Square, they made the Height half as much more as the Latitude; which Dimensions the modern Architects have taken leave to vary upon Discretion; sometimes squaring the Latitude, and then making the Diagonal, or overthwart Line, from Angle to Angle, of the said Square, the Measure of the Height, sometimes more, but seldom lower than the full Breadth itself; which Boldness of quitting the old Proportions, some attribute first to Michael Angelo da Buonaroti, perchance upon the Credit he had before gotten in two other Arts.

The second Point is Usefulness, which will consist in a sufficient Number of Rooms of all Sorts, and in their apt Coherence, without Distraction, without Confusion; so as the Beholder may not only call it *Una Fabrica bene raccolta*, as *Italians* use to speak of well-united Works, but likewise that it may appear airy and spirituous, and fit for the Welcome of cheerful Guests; about which the principal Difficulty will be in contriving the Lights and Stair-Cases, whereof I will touch a Note or two: For the First, I observe, that the ancient Architects were at much Ease; for both the *Greeks* and *Romans* (of whose private

Dwellings Vitruvius hath left us some Description) had commonly two cloistered open Courts, one serving for the Womens Side, and the other for the Men; who yet, perchance, now-a-days would take so much Separation unkindly. Howsoever, by this Means the Reception of Light into the Body of the Building was very prompt, both from without and from within; which we must now supply, either by some open Form of the Fabrick, or among graceful Refuges, by Tarrassing any Story which is in danger of Darkness; or lastly, by perpendicular Lights from the Roof, of all other the most natural, as shall be shewed anon. For the second Difficulty, which is casting of the Stair-Cases, that being in itself no hard Point, but only as they are Incumbrances of Room for other Use (which Lights were not) I am therefore aptly moved here to speak of them. And first of Offices.

I have marked a Willingness in the *Italian* Artizans to distribute the Kitchen, Pantry, Bakehouse, Washing-Rooms, and even the Buttery likewise, under Ground, next above the Foundation, and sometimes level with the Plain or Floor of the Cellar, raising the first Ascent into the House fifteen Foot or more for that End, which, besides the Benefit of removing such Annoys out of Sight, and the gaining of so much more Room above, doth also, by Elevation of the Front, add Majesty

to the whole Aspect. And with such a Disposition of the principal Stair-Case, which commonly doth deliver us into the Plain of the second Story, there may be Wonders done with a little Room, whereof I could alledge brave Examples Abroad, and none more artificial and delicious than a House built by Daniel Barbaro, Patriarch of *Aquileia*, before-mentioned, among the memorable Commentators upon Vitruvius. But the Definition (above-determined) doth call us to some Consideration of our own Country, where, though all the other Petty-Offices (before rehearsed) may well enough be so remote, yet by the natural Hospitality of *England*, the Buttery must be more visible, and we need, perchance, for our Ranges, a more spacious and luminous Kitchen than the foresaid Compartition will bear, with a more competent nearness likewise to the Dining-Room; or else, besides other Inconveniencies, perhaps some of the Dishes may straggle by the Way. Here let me note a common Defect that we have of a very useful Room, called by the *Italians*, *Il Tinello*; and familiar, nay, almost essential, in all their great Families: It is a Place properly appointed to conserve the Meat that is taken from the Table, 'till the Waiters eat, which with us, by an old Fashion, is more unseemly set by in the mean while.

(To be continued.)

## LECTURES ON ARCHITECTURE AND ANTIQUITIES.\*

REMAINS OF CORINTHIAN ARCHITECTURE ON THE CAMPO-VACCINO AT ROME,  
Sometimes called the "TEMPLE OF THE THREE COLUMNS," but more commonly the  
"TEMPLE OF JUPITER-STATOR."†

## Lecture IV.

## ROMAN ARCHITECTURE.

ON the other side of the Sacred Way, and nearly opposite to the temple last described, stands the Temple of ANTONINUS and FAUSTINA, of the Corinthian order. This building

was erected by the Roman Senate in honour of the Emperor Antoninus Pius and his wife Faustina, although by some writers the latter has been confounded with her daughter of the same name, who was the wife of Marcus Aurelius, the adopted son and successor of Antoninus Pius; whence therefore the credit of

\* Continued from p. 398.

† Described in p. 398.

having erected this temple to the memory of Antoninus has been ascribed to his successor in the empire. The inscription on the front of the portico is DIVO ANTONINO ET DIVÆ FAUSTINÆ, EX. S. C. Six columns formed the portico in front, with two more on each side; all of which remain, though much decayed. Each column has its shaft, 38 feet 3 inches in height, and 4 feet 10 inches in diameter, of one block of "cipolino" marble, so called from the resemblance of its layers to the green and white shades of the leek (*cippola*, *It. an onion*). By some writers the columns are said to be of Pnygian marble.

This marble is supposed to have been brought from Carystus, one of the Cyclades in the Ægean sea,\* alluded to for its rocky nature by Statius, "Non te, saxosa Caryste" (Theb. vii. v. 370); and also by Lucan, "Quæ maris angustat fauces saxosa Carystos" (De Bell. Civ. l. v. 232); and the green layers of which the marble is composed are compared by Statius to the waves of the sea, "Et Chios, et gaudens fluctus æquore Carystos" (Syl. l. 11). Valadier mentions that the introduction of such marble for columns was ascribed to Augustus, and that the marble was called by his name.

The whole of the cornice and pediment of the front is destroyed, though much of the former remains on the flanks, well executed, but having neither dentils nor modillions, the only instance, I believe, of their omission in a Corinthian example.† In the frieze, on the sides, is an enrichment composed of griffins, vases, and candelabra. Within the walls of the ancient temple a modern church is formed, dedicated to S. Lorenzo.

The Temple of MARS ULTOR is supposed to have been erected by Augustus in his Forum on the occasion of his going against Brutus and Cassius, and to have been dedicated by him on their defeat to Mars the Avenger (Utor). Other writers assert that it was built by Augustus on the occasion of his recovering from Phraates the eagles of the legions under Crassus and Antony, which had been defeated by the Parthians. Some critics, from a passage in Ovid, contend that this temple should be called that of Mars Bisultor, *i. e.* Twice-avenger:

"Parthe refers aquas: victosque porrigis arcus.  
Pignori jam nostris nulla pudoris habes  
Rite Deo templamque datum nomenque Bisultor."  
FAST. l. v. v. 593.

Yet it is not impossible that two temples were dedicated by Augustus to Mars as the avenger, and that the recovered Roman standards were placed in one, which, from ancient medals of Augustus, must have been circular, and which is believed to have been the temple under the hill of the Capitol, alluded to by Dion Cassius in his mention of the dedication of the eagles. The temple which we have been considering formed part of the Forum of Augustus, the two being often spoken of together, as "Forum Augusti cum sede Martis Ultoris." Of this once magnificent temple only three columns and a pilaster of the flank of the Corinthian order remain. On the walls of the cell is erected the campanile of the convent of nuns, called the Annunziata, whose buildings occupy the site of the ancient temple. Augustus ordered that the Senate should always hold in this temple their consultations on affairs of war.‡ The original structure, of white marble, as ascertained from the plans of Labacco and Palladio, consisted of a noble portico of eight columns in front, having four behind them, there were eight columns on each flank, in the interior were two rows of six columns each. The proportions are very large, the diameter of the columns being 6 feet, and their height 58 feet, consequently they are nearly ten diameters high, and the loftiest in Rome. The details of this building are very rich, and afford a good example for

\* "Il marmo di questo colonne è l'antico Caristo, marmo che si trae dall'isola di Caristo, una della Cicladi, detta parzialmente da Stazio, e da Luciano Sossosa." (Valadier.)

† [The example of the Temple of Vesta, at Tivoli, is without modillions and dentils, although it has the undivided member denominated "dentata."—Ed.]

‡ Falloz "an arma sonant non fillarum, arma sonabant: Mars venit; et veniens bellica sella dedit: Utor; ad ipse ausos celo descendit honores, Templumque in angusto conspicienda foro. Et Deus extingens, et opus; dedit in Urbe Non alter nati Mars habitare sui, &c.

OVID, FAST. v. 549.

imitation. It is highly probable that the architect of this temple was Hermodorus, the same who designed the temple of Jupiter Stator, and he is recorded to have built a temple in honour of Mars. Augustus, who prided himself that having found Rome of wood, he would leave it of marble,† erected many stately buildings in that city; and his example was followed by his friends and relations, but by none more than by Marcus Agrippa, his son-in-law. Of the numerous public works built by him, the most celebrated is that which is one of the greatest ornaments of Rome, the temple of Agrippa, or, as it is most commonly called, the PANTHEON,†

"To art a model."

Michael Angelo considered that the portico, the interior, and the attic were erected at three different epochs.‡ Pliny speaks of it (Book 3) as if the portico was built by Agrippa, and says that he dedicated it to Jupiter the Avenger. The inscription on the frieze records that Agrippa built, at all events, the portico: "M. AGRIPPA L.F. COS. TERTIUM FECIT." He wished to place a statue of Augustus within the temple, which that emperor would not permit, but allowed him to set it up in one of the niches under the portico (Dion. b. liii.); Agrippa therefore determined to make the portico worthy of its destined inhabitant, and the result is the splendid composition so well described by Lord Byron:—

"Simple, erect, severe, austere, sublime—  
Shrine of all saints, and temple of all gods,  
From Jove to Jesus—spared and blest by Time,  
Looking tranquilly, while falls or nods  
Arch, empire, each thing round thee, and man  
plods  
His way through thorns to ashes—Glorious dome!  
Shalt thou not last? Time's scythe and tyrant's  
rods  
Shiver upon thee—sanctuary and home  
Of art and piety—Pantheon! pride of Rome!"  
CHILDE HAROLD, Canto iv. 140.

The portico, which is of the Corinthian order, consists of eight unfluted columns in front, having eight more behind, disposed in two rows (*i. e.* two behind each angle column, and two behind the second column from the angles). The diameter of the columns measures 5 feet, and each shaft is 38 feet 8 inches high, is in one block, weighing 45 tons. The front columns are of grey granite, the inner ones of red oriental granite, the capitals and bases are of white marble; the architrave and frieze are in single blocks, extending from centre to centre of the columns, and weighing 36 tons, each block being 15 feet long, 6 feet 8 inches high, and originally 6 feet thick; the cornice is 4 feet 3 inches in height. The pediment is generally considered too high (at least, according to the proportions in Greek temples), and its effect is much injured by the second pediment rising above it. Pliny states that this temple was adorned with statues, the work of Diogenes, the Athenian, and which were, no doubt, placed at the angles and summit of the pediment, and the tympanum was also probably enriched with figures in relief, as shewn by Palladio. In the niche corresponding to that in which the statue of Augustus was placed, was the statue of Agrippa (of the "heroic" size, and now in the Palazzo Grimani, at Venice), and his ashes were preserved in a beautiful porphyry sarcophagus, now containing those of Pope Corsini, and placed in the church of Saint John Lateran. The walls of the Pantheon, constructed chiefly

\* A modern Pasquin has contrasted, with as much truth as bitterness, the imperial boast with the practice of a modern architect, to whom we owe the perishable splendour of Regent-street:—

"Our Nash has prov'd himself a much greater master,  
He found London brick, and will leave it of PLASTER."

Cordially agreeing with Mr. Bartholomew (Specifications for Practical Architecture, ch. 52, &c.) in his condemnation of external stucco, and in his conviction that its use has tended to degrade architecture, I believe that we cannot expect to have good street architecture so long as stone is limited, in some composition, whether unadorned, painted, cement, stucco, *aut quocunque alio nomine gaudet*. Let any one compare the south and east sides of Fitzroy-square, which are faced entirely with Portland stone, with the north and west sides, which are built with "composed" fronts, and the difference will be seen at once; and it is probable that the latter, with their constantly recurring patchings, stoppings, and colourings, have already cost more than the opposite fronts. G. R. F.

† The western portico of the New Royal Exchange, London, is partly copied from the Pantheon; it does not, however, project so much as its prototype by an intercolumniation, and consequently has fewer columns within the portico.

‡ Mr. Gell thinks the circular part was built in the time of the Republic, with the simple large niches in the interior, and that Agrippa added the portico at 14 A.D. But he died before that date, *viz.* 12 B.C.

of brick, are 23 feet in thickness, having at every 3 feet in height a layer of tiles, the weight over each opening being discharged by arches also formed of tiles; the dome is constructed in a similar manner, diminishing by degrees to the thickness of 3 feet at top, with an opening of 30 feet diameter, the sole aperture by which the vast building is lighted. The great doorway is 39 feet high and 19 feet wide, having folding doors of bronze, through which is entered the Rotunda which is 142 feet in diameter,\* the height of this immense circle is the same. The interior circumference is ornamented with eight recesses (of which the doorway is one) converted into chapels; they are adorned with columns and pilasters, 34 feet high, of yellow antique marble. These columns are fluted with capitals one-third of their height. Agrippa decorated the interior with statues of bronze and silver, among which that of Julius Cæsar occupied the most conspicuous station, and he dedicated it to all the gods, whence its name of the Pantheon. The continued entablature over the interior columns is of white marble, except the frieze, which is of porphyry, and the dome is divided into panels or caissons in five stages. Pancirolo says that the temple was covered with silver tiles, which were destroyed by lightning, and that the emperor Hadrian, in the year A.D. 130, covered it with bronze. Pomponius Leto and Prospero Parisio add that the interior was covered with plates of silver, which were taken away by Heraclius, the nephew of Constantine, in the year A.D. 636, together with the statues and other decorations, to adorn the new city of Constantinople. The pavement is set in patterns alternately of porphyry, and granite. The effect of the light pouring into this mighty fabric through its single "eye," is truly wonderful. "The flood of light, which once fell through the large orb above on the whole circle of divinities, now shines on a numerous assemblage of mortals, some one or two of whom have been almost defiled by the veneration of their countrymen." (Note to Childe Harold, canto iv. 147.) Among the mighty dead, lies the great master, Raffaello, whose bust adorns the interior, with many effigies of the illustrious departed, some by the hand of the modern Phidias, Canova. This building, of which the architect was Valerius, a Roman, born at Ostia, was in 609, A.D., converted into a church by Pope Boniface IV., and dedicated by him to the service of the Virgin and the holy martyrs. Various alterations were made by the Popes; in the interior, by Benedict XIV.; Alexander VII. restored three columns of the portico; Clement IX. added the heavy railing between the columns of the portico; and under Urban VIII., Bernini erected the campanile towers behind the pediment, whilst the same pope carried away the bronze covering of the dome, which he cast into cannon, and out of which he also made the four colossal twisted columns (they are 120 feet high), supporting the canopy of the high altar of St. Peter's, a robbery which drew down upon him the bitter pasquinade—

Quod non fecerunt Barbari Romæ, fecit Barbarini.†

Our notions of the extraordinary taste of the Romans for magnificent buildings must be heightened, when it is considered that the superb edifice under review was probably only a saloon to the baths of Agrippa, erected by that great patron of art, and plans of which have been given by Palladio and others, on a scale of great splendour. It is also the opinion of some antiquaries, that the original floor of the Pantheon was considerably below the pavement of the portico, and that the interior could be completely flooded by water being led through it, so as to form one vast swimming-bath. The Thermae, or baths of the Romans, formed a remarkable feature

\* The diameter of the dome of St. Peter's is 139 feet, of St. Paul's 112 feet, of St. Sophia 115 feet, of St. Maria delle Fiore (Florence) 139 feet.

† "That which Barbarians left undone at Rome, the Barbarini did;" in allusion to the family name of the pope, who scrupled not to despoil the ancient temple of those riches which even the Barbarian Goths had respected.

‡ Agrippa alone constructed 170 public baths at his own expense. He is introduced by our Shakespeare among the dramatis personæ in "Anthony and Cleopatra," as one of the chief captains of Cæsar (Augustus), who there bids him "Go forth, Agrippa, and begin the fight." He did good service at Philippi and at Actium, and had defeated Sextus Pompey in a naval engagement; and for which he had the first naval garrison ever decreed on such occasions. He was one of the greatest men of the Augustan age, and his generosity was only equalled by his modesty; he refused a triumph for his many victories.

among their public buildings; there were 800 at one time for the use of the public, under the emperors, who vied with each other in the splendour of these useful and truly liberal institutions; and which contained not only the various apartments necessary for ablutions of all kinds, but also places for recreation and amusement, libraries, porticos, terraces, crowded with columns, and enriched with precious works of art. In the ruins of the bath of Titus was found the Laocoon; in those of Caracalla were found the Toro Farnese, the Hercules of Glycon, and the Flora (now at Naples); and many fine statues have been discovered in the other baths.

G. R. F.

(To be continued.)

#### CHURCH-BUILDING INTELLIGENCE, &c.

**New Church at Seasalter.**—On Monday, the 19th ult., the first stone of this edifice was laid by Sir Brook W. Bridges, Bart., in the presence of a numerous and highly respectable body of spectators, comprising many of the clergy from this district, and the gentry of the surrounding country. Accommodation having been afforded by the Canterbury and Whitstable Railway Company, a great number of persons went from this city to witness the interesting ceremony. Divine service was performed by the Rev. G. T. Dawson, the incumbent; and after the 100th Psalm was sung, the laying of the foundation stone took place. Sir Brook Bridges addressed the large assemblage, congratulating them upon the gratifying event, and was listened to with marked attention and respect. The following is the inscription on the plate of the stone:—"Glory to God in the highest, and on earth peace; good will towards men." This foundation stone of the new church, Seasalter, was laid on the 19th of August, in the year of our Lord, 1844, and in the 8th year of the reign of her most gracious Majesty, Queen Victoria, by Sir Brook William Bridges, Bart., of Goodnesstone Park. H. Marshall, architect." At the back of the plate are cast the names of the tradespeople employed in the undertaking, as follows:—"W. Knowler, bricklayer; W. Wilson, joiner; J. Marshall, carpenter; J. Bligh, plasterer; H. Jones, mason; G. Homersham; plumber." This church is designed to afford accommodation to 950 persons in the body; the seats are to be unappropriated, and thrown indiscriminately open to the inhabitants of either Seasalter or Whitstable. The cost of the erection is set at 2,751.

**New Church near Colchester.**—On Tuesday the 27th ult. the first stone of All Saints' Church, for the district of Lexden and Staneway, near Colchester, was laid by Mrs. Papillon, of Lexden House, in the presence of a numerous assemblage of the gentry and parishioners of Lexden and Stanway, and several of the neighbouring clergy; service being performed by the Rev. John Papillon and the Rev. Henry Jenkins, the rectors of the two parishes. The church, which will be built of dark red bricks with stone dressings, in the late Decorated style, consists of a nave 60 feet by 24 feet 6 inches, a chancel 25 feet by 14 feet, a belfry tower, organ transept, vestry, &c., and will accommodate nearly 300 persons, two-thirds of the sittings being free and unappropriated. The architect is Mr. George Russell French, of London, and the builders are Messrs. Fisher and Son, of Stratford and Plaistow, Essex.

**Princely Donation.**—A short time since an anonymous letter was forwarded to the Bishop of London with the princely sum of 5,000*l.*, and a request to apply the amount "for the erection of a church in the metropolis." Since the receipt, an eligible site for the erection of a sacred edifice has been purchased by some charitable individuals, in Charlotte-street, Fitzroy-square, at a cost of nearly 5,500*l.*, upon which a church will be built for a district which contains a population of more than 16,000 persons.

The Bishop of Gloucester has presented the handsome donation of 100*l.* to St. Andrew's Church, Bristol. The right rev. prelate has forwarded a liberal sum to defray the expenses contingent to the repairs of St. John's Church in that city, and within the last few days his lordship has sent a donation of 25*l.* towards the erection of a parsonage-house to St. John the Evangelist, Clifton.

The Marquis of Lansdowne has presented 20*l.* to the fund for the restoration of St. Mary Redcliffe church, Bristol, which fund now amounts to 5,200*l.*

The first stone of a new church, at Bednall, Staffordshire, was laid last Week, by Lady Margaret Littleton.

#### RAILWAY INTELLIGENCE.

**Norwich and Brandon Railway.**—The terminus for this line at Norwich is now in course of erection, and the permanent rails have been laid as far as Carrow-road bridge. The rails will diverge from the Yarmouth line, just above this bridge, crossing Mr. Kerrison's meadows. Men are at work, driving iron piles of great strength for the bridge across the river. A number of men are also at work near Hartford bridges. The line is to pass over two bridges here, one 20 feet and the other 30 feet wide. The road has been diverted for a short distance, and men are cutting through the turnpike, to the depth of 18 feet, where the first bridge is to pass over. To the right of the turnpike, piles have been driven for the second bridge crossing the river. The cuttings here extend through Mr. Thurtell's land to the river, for about 88 feet in length. The works are going on rapidly near Ketteringham, where part of the permanent line has been laid. More than 1,000 men are employed at various points for the whole length of the line to Brandon end, and a great many at Ketteringham, Hethersett, Wymondhan, Spooner Row, &c. Before Christmas, 3,000 men will be employed on this line, including mechanics, bricklayers, &c. A large proportion of the workmen belong to Norfolk, and their wages average 2*s.* 9*d.* per day. Mr. Merritt, under Messrs. Grissell and Peto, is the general contractor for the works. Under him, the sub-contractors for various parts of the line are, Messrs. Weaver, at Trowse; Farrall, at Hartford Bridges; Kershaw and Scrivener, at Ketteringham; Durham, at Wymondham; Mackenzie and Jardine, between Thetford and Brandon. The labourers are employed by these sub-contractors either by the piece or the day.

**Northumberland Railway from Newcastle to Berwick-on-Tweed.**—A prospectus of another important railway, projected from Newcastle to Berwick-on-Tweed, has just been issued. The proposed capital is 1,000,000*l.*, the line to be about 60 miles in length, and to be constructed upon the atmospheric principle. The intended route of the line, throughout its entire length, is as nearly as possible in the general direction of the present main turnpike road from Newcastle to Edinburgh, passing by Morpeth and Alnwick, and the populous eastern district of the county. Amongst the provisional committee are Lord Morpeth, Lord Howick, M.P., and Lord Ossulston, M.P., and several other members of Parliament. Should this project obtain the sanction of the legislature, in preference to that proposed by Mr. Hudson, an uninterrupted railway communication will still be effected between London and Edinburgh by the construction of this railway and the North British line, the latter of which has already received the sanction of Parliament. J. K. Brunel, Esq., is the engineer of the line.

**Eastern Union Railway.**—The works of this railway have now fairly commenced at Brantham and across the valley of the Stour. The house lately occupied by W. Dean, Esq., Brook-street, has been hired for the term of two years as offices for the clerks and others employed in getting out the necessary plans and sections, and carrying on other business connected with the railway. It is intended to carry the line from Ipswich to Bury St. Edmund's, and also from Ipswich to Norwich in a direct route. The proprietors of the Brando line are most desirous to obtain a branch from Attleburgh to Diss, and the survey is now being made under the directions of J. Locke, Esq., engineer.

George Hudson, Esq., has purchased the Branding Junction Railway, which runs from Newcastle to Shields and Sunderland, and is, we believe, about 28 miles in length. It is expected that the purchase is on behalf of the Newcastle and Darlington Railway Company.

**New Locomotive Power.**—A first trial of M. Andrau's new locomotive power, by means of compressed air, was made on Monday, on the Versailles Railroad (left bank), in the presence of Messrs. Bineau and Baude, commissioners appointed by the government of the engineers of the railroad, and a great number of spectators. Although the locomotive was charged upon the low pressure system, because there was not a sufficient power to compress the air to a greater extent, the experiment perfectly succeeded. In expanding two or three atmospheres, the locomotive ran a quarter of a league with great rapidity and regularity. The trial is to be repeated in the course of the next month. M. Andrau has for the last four years been engaged in experiments with compressed air.

**Blackburn and Preston Railway.**—The cutting on this line was commenced on Tuesday, the 20th, near Houghton Tower, in the neighbourhood of which there will be the heaviest cutting on the whole line. The railway runs through the noble woods which surround the tower, almost on a level with the highest point of King's Hill, which adjoins the hill on which the tower stands. At the south-east side, where the Darwen flows between the two hills, the ravine will be crossed by a viaduct entirely constructed of ashlar masonry, standing 108 feet high, and of three arches of 65 feet span each.

**Lynn and Leicester Railway.**—After many changes, the proposed line, which was brought forward under this title (afterwards altered to "Midland and Eastern Junction Railway"), is withdrawn as an independent project. It is to form part of the contemplated extension lines of the Midland Company, with whom the promoters have entered into arrangements.—*Railway Record.*

**New Railway.**—A line of railway from the Lancaster and Carlisle Railway at Kendal to the head of Lake Windermere is projected, thus affording an uninterrupted railway communication from London to the Lake district. This branch line will also give the benefit of a convenient station to the town of Kendal, which the levels of the Lancaster and Carlisle line would not allow.

**North British Railway.**—Tenders for the formation of twenty miles by this line of railway, commencing at Berwick, were on Wednesday received by the directors at their office in Edinburgh. They were very numerous, and the successful competitors are Messrs. Thompson, of Darlington. Their estimate was 35,000*l.* Operations will be commenced immediately.

**London and York Railway.**—Mr. Astell, M.P. for Bedfordshire, the chairman of this company, and Mr. E. Beckett Denison, M.P. for Yorkshire, the vice-chairman, with Mr. Locke, the engineer and others, on Wednesday week, had an interview with the Board of Trade.

**Extension of the South-Western Railway.**—At the close of the meeting on Friday, the directors of the South-Western Company took active steps in respect of an extension of their line to Waterloo-bridge.—*Railway Record.*

A plan for the formation of a railway to connect the metropolis with Richmond has been announced.

**More Railways.**—A special general meeting of the proprietors of the Preston and Wyre Railway company is convened for the 13th of September, to determine on the propriety of applying to Parliament for powers to make branch railways from Poulton to Blackpool, and from Kirkham to Lytham. It is expected that both these lines will be constructed.

**STATUE OF GOETHE.**—The colossal bronze statue, from the model of Schwanthaler, intended to ornament one of the squares of Frankfort-on-the-Main, his native place, has been completed. Goethe is represented clad in a mantle, but having his hands free. He wears the simple costume of the present period. His right arm is resting on the trunk of an oak tree, and in his left he holds a laurel crown. His eyes are turned towards heaven. The subjects of the bas-reliefs on the pedestal are borrowed from the works of Goethe.

## Correspondence.

## THE NEW BUILDING-ACT.

SIR,—On looking over the new Building-Act, I find that the thicknesses of the walls to the different rates of building are thus described to be, viz.—8½ in. 13 in. 17½ in. 21½ in. and 26 in. I have before me some stock bricks from the fields belonging to the Messrs. Rhodes and Messrs. Webb, two brickmakers in the vicinity of London, and also some from the fields of Messrs. Herron and Rutter of Cowley, who make a great number annually. I find in the sizes of the bricks from the before-mentioned field, an almost imperceptible variation, *if any*; they are as near as possible 9 in. long and 4½ in. wide. Now, Sir, how is it possible (I speak as a bricklayer) to keep to the thickness of the walls in the new Act, without cropping the bricks? If you work the bricks without a cross-joint, you cannot do it; and if you crop the brick, you never will make sound work, besides the extra labour.

How is this difficulty to be got over? You can perhaps point out a remedy.

Stoke Newington, CHARLES EVE.  
August 28.

[The intention is that the thicknesses shall not be less than those stated; which might be the case if bricks somewhat smaller than ordinary were used; the precaution is observed in the old Act, which will next year be superseded by the new one.—Ed.]

SIR,—In glancing over the Building-Act, contained in your excellent journal of this week, I am glad to find that the clause appointing the institute of the B. A. as examiners of the new district surveyors has been struck out, and a clause inserted instead, nearly in accordance with my suggestions contained in a letter in "The Builder," No. 72, with one exception, I do not see any provision made for the payment of the examiners. B.

## MEASURING WORK.

SIR,—I am a small builder, and I have frequently to measure work performed by myself; I have experienced on more than one occasion an objection on the part of the surveyor, employed by the party for whom I have done the work, to measure with me, on the ground that I was not a regular surveyor; in other cases, where there has been some difference in the quantity, they have refused to refer the matter to another surveyor, unless I had previously had my work measured by a surveyor. What I wish to know is this—is it requisite that I should become a regular surveyor? If so, how am I to proceed to obtain that distinction? Is any licence required? If so, what would be the expense? "Tyro."

[We think nothing could be more ridiculous than for any surveyor to refuse to measure the work of any building with the master tradesman who has executed it, and is respectable and capable of measuring his own work, and either has time for it, or chooses to do so: we venture to say the surveyor who assumes such airs, will be found to rank with the "queer ones." The licence is a common appraiser's one of 10s. To become a regular surveyor, requires a regular tuition, ten years' study, in fact; the fee for tuition may range from 50l. to 200l., according to the rank, repute, ability, and practice of the master.—Ed.]

## PRACTICAL DRAWING FOR ARCHITECTURE AND BUILDING.

SIR,—The beauty and advantages of drawing will, I am sure, have manifested themselves to every person connected with the building-craft, and especially to the steady industrious working-man, who has seen others convey their ideas so clearly by it, to whom I now particularly refer. I have on many occasions seen clever workmen, who have laboured under difficulties in the performance of their work from drawings, through not being able to associate correct ideas relative to the drawings and the work to be done; and again I have seen good workmen labour under alike difficulties consequent upon a bad education, in explaining their ideas of work that was doing, and that had to be done; whereas if a knowledge of drawing were inculcated, the pencil could be employed with ease and satisfaction.

Feeling assured that great numbers, who

industriously employ their time in the workshop, and who enjoy the fireside of the cottage, reading your valuable magazine, will labour under the difficulties I have above mentioned, to remedy this, I offer the hint that a column in "The Builder" be devoted for a short time to the laying of the fundamental principles of the different kinds of drawing suited to practical purposes, of which you will know much better than I can say. This would have its good effects in various ways:—First, it would be of great practical use to the possessor. Secondly, improve the taste and enlarge the ideas connected with the craft. And thirdly, be an endless source of improvement and amusement during the winter months, when many of the artisans have to be at home. It would, I feel confident, cause many to make their cottage their studio, instead of seeking amusement at the tavern.  
August 27th. J. F.

## CRACK HOUSES.

SIR,—The object of THE BUILDER is, I presume, not only to represent the interest of this numerous and influential body, and the several trades and professions connected therewith, conveying to them all possible information, but also occasionally to admonish those who, not having the fear of loss of reputation before their eyes, and greedy of gain, 'put up houses,' which not only compromise the whole class of builders, but also, besides clearing out the pockets of ignorant purchasers, endanger the lives of individuals. We all know what a put up house means, but I am sure respectable builders are not wholly aware to what an extent the system goes. I was walking about the vicinity of High-street, Camden Town, a few weeks since, and was more surprised than amused to see a whole row of buildings springing up as mushrooms in a meadow, and nearly as frail in fabric. The bricks, were they worthy of that name, were not only old material, but such as I observe dug out of the foundations of the old buildings now disappearing from Bloomsbury, literally rotten, and scarcely an entire one to be seen among them: nor was there a redeeming quality in the mortar, which was as black as bitumen, without any of its adhesive qualities: the timber of the beams and joists was of the same quality, and appeared to be derived from the same source, having all the venerable marks of antiquity about it. On the other hand, the floors were young sucklings, such as will soon shrink before the hand of Time, leaving large chasms between each other, to the endangerment of children's legs and the loss of their playthings. The exterior of these sepulchres of decayed brick was then handsomely covered with stucco and whitewash, the doors and shop-fronts were prettily painted, and in the lower windows might be seen sundry bills, on which was written in a fair legible hand, "This house to be let or sold!"

Your readers may smile, Mr. Editor, but I positively see nothing to laugh at; the man who buys such a bargain buys it very often with his little all. In the large neighbourhood in the rear of St. Pancras Workhouse, there are numbers of this kind of tenements already put together, or still perpetrating; but here we sometimes find an excuse, for the experiment of residing therein is first made by the builders themselves, who, like Birmingham gunsmiths, prove them first ere they go off in the market.

A friend of mine lately purchased a house near the Regent's-park for 800l., as valued by a surveyor; on re-valuing six months afterwards, it was found to be worth less than 480l.; and in less than one twelvemonth, a general rebellion had taken place of the members of the house, every board in the establishment separating from its fellow, the handsome paper had separated from the damp walls, and hung in festoons in the upper part of the house; the house itself had settled down on one side, the windows chattered at every footfall, and nothing short of 100l. could repair the dilapidations.

I could multiply instances of like putting up without number; but this is sufficient to shew that the system, if not checked, will very soon close the business of the builders: for every one thus taken in, imbues fifty small or large capitalists with a sense of his wrongs. And it would be highly impolitic to check the present prevailing spirit of investing capital in houses, one of the very best by-the-by which can be

made in the present day, if the capitalist be treated with any degree of fairness. There never was a better time for builders to rise a step or two in their trade, and to strengthen their hands by moderate profits; and I do think that all who have their credit at stake should unite to put down practices which bring the whole of them into disrepute.

W. T. B.

## ADULTERATION OF WHITE LEAD.

SIR,—Permit me through your very valuable journal to direct public attention to the enormous adulterations of white lead now taking place in various parts of the outskirts of the metropolis. This trade of adulteration is openly carried on, and is thus managed:—A quantity of whitening is put into a tub, in which there is a machine similar to that used in mixing the clay for bricks; to this is added linsed oil, in certain proportions, and the whole is intimately mixed by the revolving knives. For the second process it passes between two mill-stones, and on being ejected has even then a very striking resemblance to white lead: this, I believe, is all the preparation required for mixing, and in this state it is applied for the purposes of adulteration: paints of every description being mixed with this valueless commodity for the consumer, the extent of adulteration being guided by the conscience of the manufacturer, or the carelessness or inattention of the tradesman who purchases the rubbish. I have often wondered why it was that white lead paints were marked up at a much less price than the wholesale cost of this material. The enigma is now solved; but the wonder still remains how large consumers of various coloured paints should have shut their eyes to this self evident fact, consenting to pay the reduced price of white lead for common chalk. It is said by those who manufacture the spurious commodity that the paint is actually improved by the mixing, that it dries better, has a better appearance, and is more durable. If such be the fact, and I readily conceive such may be the case, it is certainly a singular exception to an universal rule; but even supposing this to be the case, would it not be more to the interest of the painters, &c., to mix for themselves?

The extensive adulteration of an article so extensively used in the building-trade demands the serious consideration of every person victimized by the process.

Sept. 1st.

VERAX.

## WORKS ON PRACTICE.

SIR,—I have taken in "The Builder" from the commencement; will you, therefore, be kind enough to inform me in your next number the best work published as a guide to surveyors and appraisers, and where it can be purchased?  
Y. Z.

[The Student's Guide for Measuring, 7s. 6d.; Gibbons on Dilapidations, 3s. 0d.; Ditto on Fixtures, 3s. 6d.; and Inwood's Tables for purchasing Estates, are books of the required kind, and may be obtained of Weale, Holborn.—Ed.]

A MONUMENT TO THE LATE DR. DALTON.—On Monday week, the members of various literary and scientific societies in Manchester, held a preliminary meeting, with the object of considering what steps should be taken towards erecting a monument in memory of the late Dr. Dalton. Many gentlemen addressed the meeting, among whom was Mr. S. E. Cottam, who suggested that the most honourable memorial would be the erection of some edifice to be called the "Daltonian Institution," where the scientific discoveries of the philosopher might be promulgated from generation to generation. The meeting concluded by adopting the following resolution:—"That a requisition should be presented to the mayor, to convene a public meeting to determine what steps should be taken to secure the erection of such monument; and also to consider as to the propriety of testifying in any further, and in what manner, the sense entertained by this community of the invaluable services rendered to science by the late illustrious philosopher."

The noble Border Castle of Naworth is in course of being rebuilt under the instructions and taste of Lord Morpeth.

Miscellaneous.

**PUBLIC WORKS AT AND NEAR LIVERPOOL.**  
—Probably there are no places in the kingdom, not even excepting the metropolis, where a larger amount of money is in process of expenditure in the construction of public works than there is at this moment in Liverpool and Birkenhead. Assize Courts (corporation), cost 80,000*l.*; New Gas (corporation), cost 100,000*l.*; Albert Dock and Warehouses (dock committee), 600,000*l.*; New North Dock Works, including land and junction with Leeds Canal (dock committee), 1,500,000*l.*; Reservoirs, Green-lane, and corresponding works (high-way commissioners), 50,000*l.*; Industrial Schools at Kirkdale (select vestry), 30,000*l.*; Gas Extension (New Gas Company), 140,000*l.*; Shaw-street Park (private shareholders), 2,500*l.*; making a gross total of 2,500,000*l.* All this is, of course, independent of many other works, some in progress and others in contemplation, with prospects of almost immediate commencement, which will probably absorb not less than another million. So that, in the whole, between three and four millions of money will have to be raised and expended before the various present designs for the promotion of charity, the convenience of commerce, and the improvement of the town, are completed. But, if much is going on in Liverpool in this way, more, in proportion to population and means, is doing on the Cheshire side of the water, at Birkenhead. The magnitude of the public works in progress at Birkenhead may be inferred from the following abstract, which is taken from the estimates:—New Market (commissioners), 20,000*l.*; Town Hall (commissioners), 19,000*l.*; Park (commissioners), 25,000*l.*; Docks in Wallasea Pool (commissioners, as trustees), 400,000*l.*; Dock Warehouses on the margin of Wallasea Pool (private company), 600,000*l.*; Tunnel from Monk's Ferry to Grange-lane (Chester and Birkenhead Railway), 20,000*l.*; making a gross total of 1,075,000*l.* After these statements, it will be admitted, we think, that there are very few, if any, places where the progression of works of a public nature is greater than in Liverpool and Birkenhead; and that, if there is any rivalry between them, it should only be as to which shall best accommodate the public.—*Manchester Guardian.*

**THE HOUSE OF COMMONS.**—The speaker's house, with several other apartments connected with the House of Commons adjoining St. Stephen's cloister, have been disposed of by auction by Mr. Horne, in order to be taken down for the formation of the entrance-hall to the centre hall of Westminster Palace. The sale took place in the smoking-room, and there was a numerous attendance of purchasers of building materials. Besides the speaker's house (which was but slightly injured at the conflagration of the Houses of Parliament) to be sold, there were the two refreshment rooms, the kitchen, and the smoking and coffee rooms, which had been built since the fire for the convenience of members of parliament. The whole were divided into 46 lots, and one of the conditions of the purchase was that the entire building should be removed within eighteen days. Some parts of the premises were erected in the Gothic style, and the floorings of some of the rooms were laid with oak, and were in good condition. The several lots went for about 437*l.* The brick-work, which was put up at 26*l.*, was knocked down for 149*l.* It was considered by the trade, in general, they fetched high prices.

**THE NEW ROYAL EXCHANGE.**—In the course of last week, workmen have been employed in putting up the helms in the belfry of the tower, under the direction of the contractors, Messrs. Mears, High-street, Whitechapel. The statue of Charles II., which was in the merchants' walk of the late building, will be placed in a niche at the east end on the south side. It is composed of statuary marble, but in such a decayed state that the sculptor has not been able to restore it to its original appearance. The flagstones are laid down in the merchants' colonnade, but it will be some time yet before the encaustic painting will be finished. The tessellated pavement has not been commenced around the base of the Wellington statue; the area is being laid with large square stones, which will be continued along the whole exterior of the building.

**IRON MANUFACTURE.**—We learn, from an official return, that the iron trade on the continent has been rapidly extending, and that the following is very nearly the relative proportion of the pig and bar iron manufactured in different states:—Prussia, 199 furnaces, worked with charcoal, employ 8,674 workmen, and produce about 120,000 tons of cast iron, equal in value to 730,000*l.* Wrought iron, in bar and plate, is made at 538 forges, employing 6,049 workmen, and producing 73,000 tons, of the value of 230,000*l.* Bavaria, 44 furnaces producing 9,000 tons of cast iron, and 141 forges, producing 5,750 tons of wrought iron. Wurtemberg, 6,409 tons of cast, and 2,500 tons of wrought iron.—Grand Duchy of Baden, 7,000 tons of cast, and 4,750 tons of malleable iron. Saxony, 7,500 tons of cast, and 4,650 tons of wrought iron. Electorate of Hesse, 4,150 tons of cast, and 900 tons of malleable. Grand Duchy of Hesse, 7,150 tons of cast, and 2,400 tons of malleable. Duchy of Nassau, 14,330 tons of cast, and 1,300 tons of bar iron, and 2,375 tons of different other sorts of iron, in bars, cast and wrought iron work. Duchy of Brunswick, 2,150 tons of cast, and 7,180 tons of wrought, iron, or works in cast iron. United States of Saxe-Weimar-Eisenach, Saxe-Meiningen, Anhalt, Schwarzbourg-Hoheholsler-Siegmaringen, Reuss, Waldeck, produce 4,035 tons of cast, and 2,240 tons of bar iron, or works in cast iron. German Luxembourg, 7,700 tons of cast iron. Total production of the States of the Zollverein, cast iron 191,156; wrought iron, or works in cast and wrought iron, 107,324 tons. In proportion to the population these quantities are not great, since it only amounts to about 15*l.* for each person throughout the Confederation. In France, where this manufacture is even yet but imperfectly developed, it amounts to about 23*l.*; in Belgium it is about 36*l.*; while in England it is as high as 55*l.* to 56*l.* for each person. All, or nearly all, the Zollverein States are engaged in the iron manufacture.—*Railway Chronicle.*

**FALL OF TWO HOUSES NEAR EUSTON-SQUARE.**—At one o'clock on Wednesday morning much alarm was created in the neighbourhood by the fall of two unfinished houses in Seymour-place, North, Euston-square. They were erected on the site of a garden belonging to the corner house in the square, and were nearly completed so far as relates to the building, but little progress had been made in the completion of the interior. There is little doubt, from the total destruction which has ensued, that the foundations of both houses must have given way—one, probably, in consequence of the shock incurred in the fall of the other. Each fell outward—not towards the street, but against the backs of other houses, from which the distance was small. Of these, the one on the east side has sustained considerable injury, the whole of the drawing-room windows being dashed in, and apparently great damage done in the basement story. The only part of this construction which seems to have been adequately secured is the party-wall, which stands perfectly erect, bearing a row of chimneys, although entirely stripped on one side, and nearly detached on the other. Providentially, no person received any injury; the new buildings were of course empty, and although the inmates of the one in such dangerous proximity were much frightened, no one personally suffered. An inquiry into the responsibility for such a defective construction is imperatively required.—*Times.*

**CARISBROOK CASTLE.**—A letter from Newport, dated Tuesday week, contains the following:—"The desecration of this great and beautiful attraction to the thousands of persons who annually visit this island, by the sale by auction, for building purposes, of the plantations and meadows which surround Carisbrook Castle, is happily prevented. Government has acceded to the loudly-expressed and unanimous petition of the islanders, by becoming the purchasers of the property. In addition to the pleasure of being enabled both to preserve the hanging woods from the pollution of brick and mortar, and of thus complying with the wishes of the petitioners, they will have the satisfaction of knowing that the favour will occasion little if any loss. The rentals of the meadows will nearly pay the interest of the purchase-money.—*Ipswich Journal.*

NOTICES OF CONTRACTS.

For the Execution of the various Works in the formation, ballasting and laying the permanent way of the Canterbury, Ramsgate, and Margate Branch Railway. Plans and specifications at the office of Mr. Joseph Cubitt, Civil Engineer, 12, Manchester-buildings, Westminster; Mr. J. Whitehead, Secretary, South-Eastern Railway, London-bridge. September 24.

For sundry Alterations and Repairs at Swift's House, Cranbrook, Kent.—Plans, &c., to be seen at the House; Mr. Wilson, Solicitor, Cranbrook, Sept. 13.

For Paving, Pitching, Cleansing, and Lighting the City of Bristol for three years, commencing September 29.—Commissioners' Offices, 44, Queen-square, Bristol. Sept. 16.

For the Repairs and Alterations of the roof of the Workhouse of the parish of Lambeth.—Plans and Specification, Mr. Rogers, Architect, Palace-chambers, Lambeth. 10th September.

For the building of the new church at Lynn.—Plans, &c. Mr. Thew, Bookseller, High-street, Lynn. 1st October.

For 16,000 Larch or Baltic Sleepers of various dimensions, for the Ashton, Staleybridge, and Liverpool Junction Railway.—Secretary at the Manchester and Leeds Railway Office, Palatine-buildings, Hunt's-bank, Manchester. October 8.

For the erection of three Lodges in Birkenhead-park.—Drawings and Specifications at the office of Mr. Hornblower, Architect, Hamilton-buildings, Chairman of the Improvement Committee, Town Hall, Birkenhead. September 11.

For the addition to one of the Wings of the Union Workhouse, Newbury.—Union Workhouse, Newbury. September 11.

For the Mason's, Carpenter's, Plumber's, Slaters', Plasterers', and Smith's Work in the erection of a Lock-up House at Dewsbury.—Bridge Surveyor's Office, in Milnthorpe. September 9.

For Building a New Church at King's Cross, Halifax.—Plans and Specifications at the Offices of Messrs. Craven and Ranken, Solicitors, Halifax, until the 14th September. September 16.

For Pitching the Banks of two large Lakes and making about two miles and a half of Walks in the Birkenhead-park.—Chairman of the Improvement Committee, Town Hall, Birkenhead. September 11.

For constructing a Water-tank at the Ardwick Station, near Manchester.—Plans and Specifications at the Company's Offices, Store-street Station, Manchester. September 10.

TO CORRESPONDENTS.

A correspondent wishes to be furnished with a list, or any number of the pitches, of Cathedral, Collegiate, or other Gothic roofs or gables of different styles.

We have transmitted to the party alluded to the letter relative to the prices of metals.

The view and description of Gillespie's Monument will be inserted upon receipt of them.

There would be many difficulties in the way of accomplishing W. B.'s proposal. It shall, however, have our serious attention, and if practicable, and consistent with our other arrangements, shall be adopted.

Moving the gallery in our next.

ADVERTISEMENTS.

COMPOSITION FOR WRITING WITH STEEL PENS.—STEPHENS'S WRITING FLUIDS comprise the most splendid and durable colours, and the most indelible compositions, which art can produce; they consist of—

- A Blue Fluid, changing into an intense black colour.
A Patent Unchangeable Blue Fluids, remaining a deep blue colour. Two sorts are prepared, a Light and Dark Blue.
A superior Black Ink, of the common character, but more fluid.
A Superior Carmine Red, for contrast writing, in glass bottles.
A Liquid Rouge Carmine, for artists and contrast writing, in glass bottles.
A Carbonaceous Record Ink, which writes instantly black, and being proof against any chemical agent, is most valuable in the prevention of frauds.
A Liquid, Mechanical, and Architectural Drawing Ink, superior to Indian Ink.
Marking Inks for linen; Select Steel Pens; Inkholders.
Prepared by HENRY STEPHENS, the Inventor, No. 54, Stamford-street, Blackfriars-road, London, and Sold by Stationers and Booksellers in Bottles, at 3d., 6d., 1s. and 3s. each.

CAUTION.—The Unchangeable Blue Fluids are patent articles; the public are therefore cautioned against imitations, which are infringements; to sell or use which is illegal. Also purchasers should see that they are not served with the Blue Black instead of the Unchangeable Blue, as these articles are often confounded.

N.B.—Black Ink, and imitations of the above articles, are constantly being announced as new discoveries, but on examination, they will be found to have some new name only.

HOLBORN AND FINSBURY SEWERS, MIDDLESEX.

THE COMMISSIONERS OF SEWERS for these LIMITS give NOTICE, that their Office, Hutton Garden, is open daily between the hours of Ten and Four, where information can be obtained (gratis) by persons about to Purchase or Rent a House or Property, or take Land for Building purposes, of the situation and level of the public Sewers, capable of affording sufficient Drainage, and which they recommend all such Persons to apply for at the above Office.

STABLE and LUSH, Clerks.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-street, Soho-square.

TO BUILDERS and Others interested in buildings or in ground for building upon, within the district under the jurisdiction of the Court, drained by water-courses falling into the river Thames, between the city of London and the parish of Fulham.

The Commissioners hereby give notice, that by an Act of the 4th Geo. III. (chap. 7. local) it is required that, previously to the making of any new sewer in any street, lane, or public way, or in any part intended to become a street, lane, or public way, or to carry off or drain water from any house, building, yard, or ground, into any sewer under their management or within their jurisdiction, a notice in writing shall be given to them, or to their clerk at their office, and that such new sewer or sewers shall be constructed and made in such manner and form as shall be directed by the said Commissioners, and not otherwise.

And, in order to prevent the serious evils and inconveniences that must arise from ground proposed to be built upon being excavated to too great a depth, the Commissioners have directed that, upon application being made at this office previous to the excavation of such ground, information shall be given as to the lowest depth at which the same can be drained.

And the Commissioners do also give notice that, whenever the lower floors or pavements of buildings shall have been so low as not to admit of their being drained with a proper current, they will not allow any sewers, or drains into sewers, to be made for the service of such buildings.

It is recommended to all persons about to purchase or take houses, or other premises, situated in either such premises have separate and distinct drains into common sewers. All petitions must be delivered at this office at least three clear days before they are presented to the Commissioners, and all such petitions will be called on in the order of their presentation, and the name of any party not present when called on to support the application will be struck out, and the proceedings must in consequence be commenced de novo.

All communications made to the Commissioners without the leave of the Commissioners, will be cut off, and the parties making the same will subject themselves to a fine.

By order of the Court, LEWIS C. HERTSLET, Clerk.

TO BUILDERS, CABINET-MAKERS, AND OTHERS.

SALISBURY GLUE 60s. per Cwt.; fine Scotch do. 50s.; Turpentine do. 44s. and 42s.; Best Glass Paper 10s.; Second do. 9d.; French Polish and Spirit Varnishes 10s. per gallon; Naphtha do. 10s.; Genuine White Lead 1s. Second do. 2s. and 2s.; Improved Stucco Paint 2s.; Invisible Green and Chocolate Colours, for Pictures, and all Colours used in House Painting, prepared by a new process to dry in six hours, 6d. per lb.; Turpentine 21. 6d. per gallon; Linseed Oil 2s. 6d.; Fine Copal varnish 20s. per gallon; Drying Carriage 14s.; Oak do. 12s. and 10s.; Paper 11s., 10s., and 8s.; Turpentine Varnish 3s.; Dry Brunswick Green 3d., 4d., and 6d. per lb.; Lamp Black 3d.; Emerald Green 1s. and 3d. per lb.; White Oil 1s. 3d. per cwt.; Stockholm Tar 18s. per barrel; Pitch 10s. per cwt. Gilder's Materials, Lackers, Bronze, Dutch Metal, Patent Gold Paint, Dies and Die-woods, Aches, Aikals, Gums, and Salts of every kind, and description at equally low prices. W. NIXEY'S Old-Established Warehouse, 22, MOOR-STREET, SEVEN-DIALS, LONDON.

PLUMBERS, PAINTERS, BUILDERS,

AND OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c. for Pictures, Glazing, &c. &c., in any quantity, at Manufactory Prices.

TURPS, per gallon . . . . . 2s. 4d. LINSEED OIL, ditto . . . . . 2s. 4d. SHEET LEAD, per cwt. . . . . 19s. 6d. Ditto, cut to sizes and PIPE . . . . . 19s. 6d.

WHITE LEAD (Genuine) per cwt. . . . . 26s. 0d. Colours, Pipe, Brushes, &c. equal in low and quality warranted. Complete Lists, prices may be had on applying to R. COGAN, 5, Princes-street, Leicester-square, London.

PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS, and all other trades, supplied with flattened Sheet, and the patent Sheet Plate, Lists of which, shewing the price for any Square, from 14 by 12 to 40 by 30 of Best and Second quality, will be sent (gratis) upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for, if required.

NURSERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London.

COMMON SHEET AND CYLINDER. The advantages of Common Sheet Glass for Glazing, is that it is decidedly great, and is generally used where strength or superior appearance is required; a light 6 feet 6 in. long, with openings of any width, needs only one sash. This Glass is considerably stouter than Crown, and may be had from 1s. 3d. per foot.

Also may be had, COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES, or every description.

GAS CONTRACTORS, FITTERS, GLASS MERCHANTS and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS, supplied with FRENCH ORNAMENTS for Glazing, &c. &c. Models of Public Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application.

French Table Flowers, China Vases, Fancy Glass Ware, and Alabaster Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Bazaar keepers and others.

PAYNE'S PATENT PROCESS FOR PRESERVING AND IMPROVING WOOD.

RAILWAY CONTRACTORS, BUILDERS, and JOINERS are requested to investigate the above. A liberal Discount allowed.

For particulars apply to the Messrs. PAYNE AND LODGE, Whitehall Wharf, Canon-row, Westminster; Or at their other stations—Fleetwood-on-Wyre, Lancashire; Wisbeach, Cambridgeshire; Will be immediately attended to.

KING'S COLLEGE, London.—GENERAL INSTRUCTION in the APPLIED SCIENCES.

—The CLASSES in this Department (the object of which is to provide a thoroughly practical education for those who are afterwards to be engaged in the business pursuits of active life), will OPEN on TUESDAY, the 1st of October next.

This Department provides also (in addition to the general course) a complete system of Elementary Instruction in Engineering and Architecture.

Detailed information may be obtained of the Secretary, July 31, 1844. R. W. JELF, D.D., Principal.

WOOD, WAYGOOD, and CO. 62, Gracechurch-street, Furnishing and Export IRON-MONGERS, builders of IRON HOUSES, ROOFS, &c.

invites the attention of Builders, and others to their extensive stock of black and bright REGISTER STOVES, which they manufacture at, perhaps, lower rates than any hitherto offered. Their improved ECONOMIC RANGE is very effective, clean, and consumes only eighteen pounds of fuel per day. The stock of BRASS and IRON BEDSTEAIS embraces the four-post, tent, French, sofa, turn-up, and every other variety. GAS STOVE MANUFACTURERS and FITTINGS at astonishingly low prices.—HOT-WATER APPARATUS for heating greenhouses, &c., on an improved, yet cheap principle. Cast and wrought-iron work for FOUNDRY, &c. &c. from standard bar, forgings, hurdles, &c. Every article, however minute, calculated with reference to the utmost possible economy.

AUSTRALASIAN, COLONIAL, AND GENERAL LIFE ASSURANCE and ANNUITY COMPANY.

CAPITAL £200,000—IN 2,000 SHARES. DIRECTORS.

- Edward Bernard, Esq., F.R.S. (Gideon Colquhoun, Esq.
Robert Brodie, Esq., (C. E. Mangin, Esq.
John Henry Capper, Esq., (Richard Onslow, Esq.
Henry Buckle, Esq., (William Walker, Esq.

The advantages offered to EMIGRANTS to the Australasian Colonies by this Company are.—First, that no extra Premium is charged for Residence in any of the Australasian Colonies, except in New Zealand. Second, that no extra Premium is charged to those who Assure for the whole term of life, for one voyage out to the Australasian Colonies, and for one return voyage; and that Premiums may be paid and Claims settled in those Colonies. And to all Persons who wish to assure their Lives, the Company offers unusually favourable Rates of Premium, participation in Profits, and the guarantee of an ample subscribed Capital.

Prospectuses and full Particulars may be obtained at the office of the Company, No. 128, Bishopsgate-street, Corner of Cornhill, City.

FAMILY ENDOWMENT LIFE ASSURANCE, AND ANNUITY SOCIETY (Established in 1835), No. 12, Chatham Place, Blackfriars, London.

TRUSTEES.

- William Butterworth Bayley, Esq., (Director H. E. I. C.)
Henry Cooper, Esq., (Director H. E. I. C.)
Martin Tucker Smith, Esq., (Director H. E. I. C.)

Directors. William Butterworth Bayley, Esq., (Director H. E. I. C.)

- John Fuller, Esq., Deputy Chairman.
Edward Lee, Esq.
Robert Druce Chichester, Esq.
Edward Prinssep, Esq.
C. H. Louch, Esq.
Thomas Walker, Esq.
Elliot Macnaghten, Esq. (Director H. E. I. C.)
Major Wilcock, K.L.S.

ENDOWMENTS FOR FUTURE CHILDREN.

TO SOLICITORS, PARENTS AND GUARDIANS.—By this mode of Insurance, all advantages are obtained in securing provisions for Children. By the plan adopted in other offices there is a separate Endowment upon each child after its birth, and a separate Premium upon each Endowment, the Premium increasing as the children increase. This Office for a Premium fixed at the time of Insurance, and not liable to further increase, will ensure the same Endowment to every after-born child—and thus, which every child will have the same provision, the Parent will not be subject to the burden of increasing Premiums. This mode of Endowment has been sanctioned by the Court of Chancery upon the marriage of a young Lady, a Ward of Court, and Forms will be supplied by the Office.

The following are extracts from the Society's Tables, which have been calculated expressly for this Office.—

For assuring to each future Child 100l. on completing its twenty-first year, by the payment of a single Sum or Twenty-two Annual Premiums.

Table with 4 columns: Age of Single Sum, Twenty-two Annual Payments, Amount of Payable at Endowment, the age of the Will.

Four-fifths of the Profits are divided periodically among the assured. Annuities of all kinds are granted by this Office.

LIFE ASSURANCE.

The Society undertakes Insurance against all the ordinary contingencies affecting human life, at Premiums as low as is consistent with security; for example,

ANNUAL PREMIUM PER CENT. FOR THE WHOLE OF LIFE.

Table with 3 columns: Age, With Profits, Without Profits.

\* Liberal Commission allowed to Solicitors and Agents. JOHN CAZENOVE, Secretary.

We have in hand, as we have already intimated, and hope to commence next week, the publication of an ALPHABETICAL DIGEST of the whole of the contents of the NEW BUILDING ACT. This will be in minuteness far beyond those hitherto issued. The great public attention which this statute has excited is proved by the fact of the whole of a large extra edition of the number of THE BUILDER containing the Act being entirely sold. It is our intention to publish almost immediately the whole of the Building Act, with Mr. Bartholomew's Digest, in a pocket form, much smaller and more portable than any hitherto published.

## The Builder.

NO. LXXXIV.

SATURDAY, SEPTEMBER 14, 1844.

**NOTICE** OF COMPETITION in architectural design, like that of competition in operative building, is a subject which has so often occupied both public and professional attention, that we need no apology for saying a few words upon it. We are indeed led to do so upon the present occasion by the following advertisement:—

"TO ARCHITECTS.—It has been resolved to build a new Church for the united parishes of St. Thomas and St. Clement, Winchester. Architects are invited to send in Plans, Elevations, Sections, &c., on or before October 16, 1844, for a plain and substantial Church, to hold about 1,000 persons on the floor. Cost, independent of the old material, not exceeding 4,000*l.* As the site is peculiar, personal inspection is absolutely necessary, when further information can be obtained from the rector and churchwardens. No remuneration will be given for any plan except that chosen, for which the committee will pay 20*l.*"

A PRIZE OF £20 for designing a church to cost 4,000*l.*, besides the old materials, with the privilege of a gratis journey to Winchester, and the pleasure of returning, if not more light-hearted, at least more light-pursed.

These men of St. Thomas are truly most clement to the portion of the architectural profession possessed of aspiring genius, and cannot be endured with the incredulity of St. Thomas, or perhaps they would not believe the expense of their advertisement would be returned by any array of talent thence invoked. As far as we remember, not less than two-thirds of the cost of the tickets in a state lottery were given in prizes to the adventurers. Now let us calculate this church-lottery. Suppose for a moment only twenty young men, as little "upto snuff" as any young tradeless adventurer, who, gazing at a recruiting bill, smeared with red, blue, and yellow, and beaded "Glory," "Promotion," "Victories in Afghanistan," feels his heart tickled to enlist: suppose twenty such raw recruits in architecture take the journey, expend thereon five pounds each, make each a design, work themselves, pay only 5*l.* each for assistance, five shillings for paper

and carriage, and three guineas each for landscapes to tickle the speculative eyes of the clement St. Thomasites; and suppose only five of them spend three pounds each more in going to Winchester, to see that all is fair, or to canvass the powers in the business: this will sun up to two hundred and eighty-three pounds, to be clemently expended in that of the utility of which experienced practitioners will have more than the doubt of St. Thomas,—and thus not less than fourteen blanks will turn up to one prize. The public-house "Derby Stakes" are sound, safe, and sacred, compared with this.

But now let us see the probable result of this impudent advertisement. A church is to be built—no doubt the parties advertising have already designs—perhaps they are too expensive; and perhaps two practitioners in the neighbourhood are rivals, and the friends of neither will give way, and they will not join interests and build jointly, or dividing the architect's pay into three, set one apart for expenses, share between them the remainder, and one be virtually the architect. Half the pretences for choosing designs in competition result from the cause just mentioned.

But suppose the advertisement meet, as no doubt it will, the eye of some unlicensed architectural hawker, travelling like a Birmingham agent "in the button line," some representative of the architectural firm of Mufti and "Stratch," or any other victimizers who tout about the country, lying like "Stratch" himself; these twenty-pound-mongers will be sure themselves to be taken in—the old story will as assuredly occur like the Arabian Nights' tale of the ladies, the year of happiness, the over curiosity, and the result. The "plain church" will have a high steeple, rich tracery, profuse work; as usual, under such circumstances, a couple of thousand pounds-worth of work will be directed to be cut out, and, as usual, the actual cost will, after this retrenchment, be a couple of thousand pounds (if not double that) more than the first estimate. Fifty such instances have, we know, occurred. These scoundrels spreading ruin, unhappiness, law, and squabbling wherever their impudence carries them. We know one instance where their four thousand became twelve; another, where their twenty thousand was forty; and we believe these touters never yet completed a business without deceit and trickery;—and so deserve to be dealt with all who encourage such conduct.

But now let us examine the benefit in design and construction resulting from these paltry competitions. Not one of the twenty young men whom we have instanced above should be the man to design and execute a church; all the old churches are designed with the most mature talent—no tyro ever touched one; no man, the extent of whose Free-masonic knowledge lies in an erudite exactness of knack in the sticking of pigs or the slaying of lambs ever ventured of old to determine whether the voids and masses of a church were properly apportioned; none whose technical lore consists in knowing the temperature at which honey and spices may be kept without pecuniary loss ever ventured to say whether window-tracery or mouldings were correctly plotted; nor did any baker, the most leaured in the setting of his leaven, then ever trouble himself about the exact rise of an arch, or the proper use of roll-mouldings.

No—churches were alone designed by the persons in the world the most learned in architecture, the best constructors, the most experienced, the shrewdest, the wisest economists;

the still existing consequence is, the meanest village church outlives, by the art of its construction (however mean and perishable its materials), generations of costly mansions; however simple its architecture, its taste and picturesque quality invite, though it be old and patched, and surface worn, the admiration of the antiquary and the artist. It was made as it is, because those who built it required it to be so. It lasts, because it was put together scientifically; every part useful was made ornamental, and every part ornamental was made useful.

### THE NEW HOUSES OF PARLIAMENT.

SINCE the last notice of this important work which appeared in this journal, very considerable progress has been made in every department, and the whole structure now presents that tangible and substantial appearance which enables the visitor to form a tolerably adequate idea of its magnitude, and of the accommodation it is calculated to afford. In order more distinctly to describe the present state of the works it should be premised that the general design of the whole construction embraces the following main features—1st. The river front, consisting principally of apartments to be devoted to the use of committees, meetings for conference, &c. 2nd. A parallel and corresponding front, facing the west and fronting the Abbey. 3rd. The clock-tower, situate at the north end of the building, to be appropriated to the residence of the Speaker. 4th. The Victoria Tower, at the other or south end of the building. 5th. The central tower, designed for the purposes of ventilation. And lastly, the quadrangular space enclosed by the exterior structure just described, containing the Houses of Lords and Commons. The works already executed, and now in progress, have been divided into five contracts. The 1st, the formation of the cofferdam and of the artificial embankment, extending along the river front. 2. The foundation of the river front of the building; both of which were let by tender to the Messrs. Lee, and have been long since completed. 3. The erection of the river front. 4. The foundations of the Houses of Lords and Commons, and other buildings in the quadrangle. And 5, the erection of those buildings; all of which were let to Messrs. Grissell and Peto, by whom the 4th has been completed, whilst the 3rd and 5th are in active progress. The river front has been carried up to its full height, and the greater part of the roof is completed. The exterior of this portion of the building presents a rich display of graceful mouldings, tracery, carvings, and decorations, with innumerable shields and heraldic devices, which, whilst they strike astonishment to the beholder, must raise in his heart a high admiration for native genius, which from the solid rock of massive limestone could, with an iron chisel and a wooden mallet, produce forms so beautiful and so intricate. The Victoria, clock, and central towers have each been carried to the height of about 33 feet, and have yet to be built considerably higher. These towers are equally rich in decorations with the river front, and are now being proceeded with very rapidly. The western front, which is to correspond with the river front, has not yet been commenced. Within the quadrangle, the exterior walls of the House of Lords have been built to their full height, and the roofing is nearly completed, the whole being expected to be covered in in the course of a few weeks, whilst very little progress above the surface of the ground has yet been made with the lower house.

It is hardly necessary to mention that the whole of the stone employed for the exterior work belongs to the magnesian limestone formation. For the interior work several varieties of the native oolite were originally employed, more especially that from Painswick, in Gloucestershire; these, however, have been now entirely superseded by a remarkably fine description of oolite imported into this country from Caen, in Normandy. This French stone has for centuries enjoyed a very high reputation for the fineness of its texture, the beauty and smoothness of its surface, and the ease with which, under the chisels and graving tools of the mason, it can be fashioned into the most intricate forms; it was the favourite stone of the priest-architects, who reared most

of the English ecclesiastical structures in the middle ages, and must have been extensively imported into this country at a time when our own stone-quarries were little worked, and the mineral resources of England but imperfectly understood.

The colour of the magnesian limestone formed one of its recommendations to the commission of geologists and architects by whom it was selected. When first quarried, and for some time afterwards, whilst it retains its native moisture, the colour is not unlike that of brown sugar; when dry, the shade becomes much improved, being that of a delicate cream, and such is the condition of many blocks now to be seen in the walls; those composing the earlier portions of the building, however, have already assumed the dull, dingy, sooty appearance, which is common to all the buildings of the metropolis, and which will ultimately even reduce to an uniform shade every variety of colouring that can be introduced into the external walls of her buildings.

In examining a work of this vast magnitude, employing in its execution about 700 artificers, it is impossible not to be struck with the regularity and precision which prevail in every department, and with the numerous novel and ingenious devices had recourse to with the view of shortening the labour and perfecting the construction of the undertaking. Mr. Allan, the able foreman of the contractors, is entitled to much credit upon these points: the practical operations are for the most part confided to his care, and to him the constructive professions are indebted, amongst other matters, for great improvements in the system of scaffolding, for the introduction of zinc plates or moulds in lieu of the old wooden templets, and for improvements in the application of the travelling crane, a machine capable of far greater range, and therefore of more extensive utility, than the ordinary fixed swing crane. Besides these improvements of Mr. Allan, we notice the application of Dr. Spurgin's patent machine for hoisting bricks and mortar, thus dispensing with mortar-carriers, a class so well-known by the designation of "hod-men," and so exclusively composed of emigrants from the sister island (another grievance for Ireland!)—the employment of iron-girders and binders instead of wooden beams for all the principal floors, and of the patent galvanized iron instead of slates for covering the roofs.

The extensive use of iron, and the consequent exclusion of wood from all the main portions of the building, afford a very satisfactory security against fire, and we may therefore rejoice in the extreme improbability of the recurrence of such a catastrophe as that which destroyed its predecessor.

In concluding these brief remarks, we cannot refrain from paying a just and well-merited tribute to the genius of the able architect who designed this building, and under whose direction it is now rapidly advancing to conclusion. Not alone does the design as a whole command respect and admiration for its noble and lofty proportions, its vast magnitude and the scale of luxurious amplitude which everywhere distinguish it; but, looking further into the structure, examining it piece by piece, and feature by feature, we are everywhere struck by new instances of ingenuity, skill, and talent, which are everywhere multiplied around, even down to the most insignificant details of secondary decoration.—*Times.*

#### MINERALOGY.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 399.)

**CALCAREOUS EARTHS** are those loose or concrete masses of earth which have a basis almost wholly consisting of the earth of lime, embracing the carbonates, sulphates, phosphates, muriates, &c., all of which bear the same relationship to the animal, as vegetable earth or *humus* does to the vegetable kingdom, being the distinguishing characteristic of animals; for although the earth of lime is sometimes found in vegetable species, still physiology teaches us, that its presence in these merely proceeds from accident of absorption from the soil or from the waters in which the plant is disposed.

Calcareous polypes, crustacea, and mollusca are the chief elaborators of this peculiar earth, and numerous fanciful imaginings are promulgated by modern geologists in order to account for its vast local accumulations. The calcareous polypes, and the more numerous and varying species of lime-secreting animals, occupy the hot and temperate zones of the earth as far as latitude 36° north and south, and they are in some measure governed in this geographical distribution by the general motion of the waters, which between these latitudes is from east to west. When carried beyond these zones many species wholly disappear; others, divested of their earthy covering, become naked polypes, and are known under other names; others again pass into varieties, in which their origin becomes obscured or wholly lost.

As the vast accumulated beds of earth demonstrate the present or previous existence of vegetation from whence they derive their origin, so it is with the vast beds of calcareous earth and limestone, which still more clearly manifest their origin, by preserving their organic forms through all the changes and vicissitudes which, of necessity, connect them with the fossil and mineral kingdoms; and the coral groups, of which a great portion of the British strata is composed, speak precisely the same language as the coral groups now filling up the Pacific, Southern, and Indian Oceans. Within those latitudes in which only they can exist, the like causes produce the like effects; but in the one and the other is infinite variety; in both, organic identity is lost for ever in the succession of changes to which the organic body is subject after the cessation of vital action.

The most common form of this earth is carbonate of lime—crystalline, as marble—amorphous, as limestone—farinaceous, as chalk—each of which presents numberless varieties. Of limestone I have already spoken in my previous papers. Let us now examine the other two. CHALK consists of carbonate of lime, and carbonic acid gas, and a few extraneous substances; it effervesces in, and is almost wholly soluble in acids, calcines in the fire, but does not vitrify in the strongest heat. The most common carbonates are shell-lime, testaceous lime being the comminuted particles of animals, common shau earth or silvery chalk, arenaceous limestone, coral rag, agarie, sealy lime, &c.

Farinaceous chalk forms a vast proportion of the superficial covering of the earth, embracing hill and even mountain ranges, and descending to still unascertained depths into the lower beds, and in whatever state of combination this substance may be found, it almost invariably presents evidence of organic origin. The form presented to us in the fossil and mineral kingdom is variable and uncertain, depending entirely upon the contingencies of climate, association, and accident of union; thus even in the same region, we have a variety of aspect and union: one solitary bed, or a succession of elevations, sometimes consists almost entirely of one family, another group of several families, another is a confused mass of animal bodies and relique of bodies. Sometimes the entire masses are in the farinaceous state, at other times they abound with nodules, and again, they assume the plastic or crystalline state. In general they present the phenomena of a series of deposits periodically disposed in succession upon each other, denoting a sequence of events unbroken for a long succession of ages, being alternations of generation and destruction.

This regularity of layers, so analogous to the phenomena of formed and forming beds now progressing in tropical seas, is strikingly manifest in the British strata, and much wonder is elicited even by men of science, as well as by the unlearned, when they behold the regularity of layers of flint and layers of chalk, not considering, that this regularity is common to all the stratified beds, and is still more extensively developed in the mining districts. Thus we sometimes observe a succession of oceanic and land deposits, the former being periodically covered in by the intrusion of the latter. Rivers at the period of flood bring down their deposits which are spread over the ocean bed; the causes of effects having ceased, these river deposits are in turn covered in, the fabric gradually rising by this conjoint action to the surface of the waters: beds of pearl oyster, of the common oyster, of corals, sponges, ecrinites, &c., are

gradually formed; an eruption of matter in its disintegrated state takes place in the locality of the bed, and deposition takes place upon the bed; and in a few short hours generations are destroyed. The destroying cause ceasing, new orders, genera, and species spring forth, to be in turn overwhelmed by a similar catastrophe. Some of these disturbing causes are periodical, others result from the accident of disturbing causes, of flood, fire, or tempest. The after changes of strata thus composed depend entirely upon local influences for the form or forms they may assume.

In whatever part of the world these chalk formations are disposed, we observe similar causes effecting varying results: in the ocean is the gradual formation of the aggregate; on the earth and in the earth the after changes are carried on: both prove the source and origin of the bodies of which the aggregate is composed. However distant from the sea, however high its elevation above the sea, its organic bodies in their fossilized state and ever varied appearance, prove their oceanic origin: there the layer of organic bodies still remains unchanged in its disposition and quantities, however it may have changed in its qualities, the one generation upon another exhibiting the progressive stages of life; the sponges, corals, and beds of mollusca still maintain their natural position, and the age of some of the mollusca evidencing a long succession of years, nay of ages, ere the bed could have been disturbed by the overlying matter. All extensive chalk formations are also undoubted evidence of oceanic origin.

The chalk formations are generally stratified, the thickness of the strata and its nature depending upon the chance of climate and association, and of disturbing causes. The peculiarity of the chalk deposit depends, first, upon the nature and qualities of the organic bodies of which it is composed, and the nature and qualities of bodies by which its changes are influenced. The thickness of the strata is generally the thickness of the living bed and the generations which precede it, being sometimes two or three inches, and sometimes many hundred feet. The deposited matter is at all times variably disposed in its quantities and in its qualities, being diffused throughout all kinds of strata as carbonate of lime, sand, clays, marles, and admixtures of two or more of these compounds.

It is evident also that the periods of disturbance by which the groups and families of oceanic orders, genera, and species were simultaneously destroyed by the sudden irruption of foreign matter have ever been, as they are now, inconstant and irregular; and the causes of disturbance have been, and still are, the exposure of the aggregate mass (produced beneath the ocean waters, principally of tropical seas), to terrestrial influences, or to the intrusion of foreign matters by local disturbances or general or local catastrophes. The material of the unstratified aggregates is at all times of similar composition and character to the material of the stratified masses; the only difference being—the one is formed by the comminuted particles of bodies or of polypi separated in death; the other is formed by polypi now in their state of degradation, or of depositions of carbonate of lime, and by the fossil bodies of mollusca, sponges, fish, sharks' teeth, bones, &c., the layers alternating.

In the formation termed by geologists oolite, and which is very abundant in this country, the shells in the hills are generally changed into cube spar, their cavities being lined with crystal; the corals have also undergone a similar transformation. The ammonites and nautilus have frequently their chambers filled with spar of various colours, sometimes with clay, and commonly in the coal measures with liquid bitumen; in some the delicate partitions are converted in pyrites, and the cells are filled with white calcareous spar; but the modifications of change, and sometimes entire change, of these and other organic are far beyond enumeration, the body acted upon being the passive subject of surrounding influences.

The general character of the oolite and chalk is that of a system of ocean deposits, the progressive accumulations of years, nay of ages, beneath the waters, and occasionally or regularly interrupted by matter varying from the bulk of aggregate. Again, we distinctly see, in the orders, genera, and species, the inhabitants of quiet seas and tropical heat; deposited

in families, generation upon generation, according to the laws of nature which govern the disposition of those bodies, or a chaotic mixture of reliquæ of numerous species, but all inhabitants of the same climate. Sometimes the aggregate consists of lacustrine and oceanic reliquæ; at other times with these we find terrestrial organic remains: in all, we find the operation of ages, and the forming effects of climate.

The term chalk is applied to a group of deposits very dissimilar in their lithological composition, but agreeing in their character of oceanic organic bodies. In Europe the chalk formation extends over a great portion of the British Isles, Northern France, Germany, Denmark, Sweden, and Russia; there are also extensive formations in North America. In the United States there is very little chalk: in India the chalk is generally converted into marble in its varieties, jasper, porphyritic and other rocks: in China its constituents form the basis of marles and clays.

In England, much of the chalk strata exhibits alternate layers of flints and chalk, or otherwise the flints are generally but irregularly diffused throughout the aggregate mass. The hills which form the boundaries of Upper Egypt are of similar composition and character, although of much more recent origin; these, and other ranges extending through various parts of the Egyptian and Nubian deserts, are in general the work of madrepores, millepores, and other oceanic species, presenting various aspects of change, some of them being consolidated, as limestone; others, where removed from the influence of the atmosphere, in the soft state denominated chalk, the latter indurating when exposed to the action of the sun and air. The catacombs running into the very heart of these hills afford the lover of research into Nature a noble opportunity of witnessing her protean powers. Upon entering into one or more of these catacombs, the first chamber, if for some time exposed to the atmospheric influence, presents the appearance of progressive change in the unity of parts and quantities, the matrix is carbonate of lime variably indurated, and some portions of which are beautifully encrusted with a pure quartz formed by the exuding silica; irregularly disposed throughout are fossil mollusca, and other fish and reliquæ, gradually converting, or entirely converted into chalk, and generally retaining throughout their several stages of change their primary form; but on breaking a nodule, we can discover no trace of their organic arrangement. The fossils which are thus transmuted into chalk are generally those of the more bituminous animals, the silica and calcium of the animal being retained, but the ammonia being replaced or changed by carbon.

The protean powers of Nature are still more beautifully developed in the changes these bodies undergo. Thus, if one of these chalk nodules be accidentally disengaged from its matrix by the falling of a portion of the hill or otherwise, and become exposed to the intense heat of the valleys, it gradually indurates, becoming, in the early state of change, what is termed a petrification, but eventually it is converted into the precious and beautiful stone termed EGYPTIAN JASPER. Nor is this all; for as a chalk nodule, its internal configuration is obliterated; but in the perfect state, its whole interior economy is once more displaced, and generally sufficiently so as to distinguish the genera to which it belongs, and sometimes the cryptogamic plant attached to the animal in its living state. Yet let not the reader suppose that this alone is the cause of effects produced, as Egyptian jasper; in this, as in all things else, Nature has many ways of effecting the end desired. The valleys of those localities of which I am now speaking are covered with fossil bodies, preserved in the first instance from decomposition of parts by certain elementary proximate principles or compound bodies, with which they were primarily united; it is not at all necessary that the organic body should in the first instance become converted into chalk, for the tendency of all animal matter in these localities, and in all tropical climates, is to become mineralized, as agate, jasper, or some other calcaceous substance; the nature of the change and the ultimate result depending on the nature and qualities of the material with which they become accidentally united, and of the elements to which they are exposed. Animal matter is

the basis of all the rocks termed primary, and in most of them it forms the chief constituent; in like manner vegetable matter is the basis of most of the earths, marles, and clays.

As an illustration of this, I notice the giant balani; these animals aggregate together in families, and are the living architects of immense edifices, building after the manner of the more minute polypi; these animals contain a great portion of animal matter. On the Arabian shores of the Indian Ocean there are vast aggregates of this genera changing or changed into *Rock Jasper*. Even in the bosom of the mountains running along this coast, two hundred feet above the present level of those waters, the same phenomena is exhibited; sometimes these animal rocks being in the first instance converted into chalk; at other times, in union with other marine animals, they become bituminized, the dark liquid sometimes escaping from its bed and running down the mountain sides; in some parts of the deserts, particularly near Egypt, there are entire hills wholly composed of particular genera of balani converted and converting into carbonate of lime. In some parts of Upper India they become converted into siderous rock, exceedingly hard, iron being the chief constituent.

In England the deposits are of the like primary nature, but the results proceeding from the influence of climate are remarkably different. Here the matrix originally formed by polypi is entirely decomposed, and having a strong affinity to carbon, which it rapidly absorbs, and which is rapidly developed in this moist country, where vegetation is so abundant, the whole mass becomes chalk, and the excess of silica falling on the bituminous animal bodies and aggregates, converts them ultimately into flint. The alternate layers of this material with chalk shew the primary disposition of the organic bodies, and mark the course of deposition in the ocean, and also the causes of effects thus produced as a stratum. There is an era of life, the genera and species being madrepores, millepores, corals, sponges, radiari, echinites, and other animals, of necessity when in the living state, the inhabitants of warm and tranquil seas; a periodical deposition of atomic particles of organic animals and vegetables, exclusively the creatures and plants of the ocean formed upon this stratum, and thus the fabric arises, death upon life, life upon death. The difference of the siliceous bed and the chalk bed is, that in chalk, the basis has an affinity to silica, and under favourable circumstances becomes silica; whereas in flint, the siliceous base is developed. In the flint, the internal and external organic structure of the animal is often manifest through all the changes it has undergone; in chalk, the organic structure is to all appearance entirely obliterated in the decomposition of parts.

The chalk formations are invariably the products of organic orders, genera, and species of the ocean, and such as of necessity exist only in warm and tranquil seas; all chalk formations originate in and by the operations of life, the elementary principles and compounds of which chalk is composed being secreted by life. The modifications and changes of organic matter depend upon local association, or local action and reaction of matter with matter, or upon the accidents of union, separation, degradation, and other causes. In this country the softer madrepores are, in general, silicified; but this is the final result, the intermediate changes varying from each other, being chalk, simple carbonate of lime, and sometimes the change is effected by transition direct from the animal matter.

When chalk nodules are exposed to the sun and atmosphere on rich black vegetable soils in Upper India, the nodule, in the course of time, becomes gradually transformed into chalcidony, generally laminated, semi-transparent, and having strong bands delineated: receiving into its composition alumina, it becomes converted into another kind of precious stone.

As in the times of flood, the great rivers of the earth force their passage through the ocean waters, and finally deposit therein the numerous proximate principles and compounds held in suspension by the freshes: so when these floods take place periodically, depositions upon oceanic matter, collected within those periods, take place in like manner: again, during the dry season of the year in tropical countries,

the large rivers losing their force and volume, the ocean waters, overcoming the voice of resistance, pass up the mouths of the rivers for many miles, and there deposit matters, held in suspension by them, upon the bed of terrestrial matters; thus the TERTIARY STRATA originates. The like result is produced when the sea occasionally inundates the whole of an extensive tract lying below its level.

Lieutenant Nelson observes that the soft white calcareous mud of the Bermudas, distributed over the bottoms of the lagoons, is formed by the decomposition of eschara, flustra, cellepore, &c.; and when dried, it is not to be distinguished from common chalk. Darwin makes the same observation, accompanied with the erroneous idea that they have passed through the body of worms.

The chalk formations, as Dr. Mantel observes, attest the high antiquity of the strata in Europe, because the period of their formation, and the ages which of necessity must have passed away in their gradual developments, goes far beyond the earliest records of man; they prove also that this earth has repeatedly changed in its orb of revolution; that life is the generator of substance as life, and ultimately of mineral bodies; that the earth increases by and in the operations of life, and that the waters diminish in the like degree, the elementary constituents of the waters undergoing a change and modifications of change, as they are received or absorbed within the living system, and also in mineral bodies; that as life is the generator of substance, and as life is of necessity locally disposed in its orders, genera, and species, so must the earth of necessity locally accumulate; and also that as matter is the passive subject of moving powers, so must it of necessity form local accretions, in or beyond the sphere of action; that the causes of effects produced, as chalk, are various, but that the primary cause being life, is one and the same; but that as life is divisible in its orders and genera, so the primary causes are many.

In the extensive valley of the Mississippi, the cretaceous formation is acknowledged by its fossils, but the rock does not assume the form of chalk.

(To be continued.)

## RETROSPECTIVE ARCHITECTURAL LITERATURE.

### THE ELEMENTS OF ARCHITECTURE.

COLLECTED BY SIR HENRY WOTTON, KNIGHT,

From the best Authors and Examples.

(Continued from p. 458.)

Now touching the Distribution of Lodging-Chambers; I must here take leave to reprove a Fashion, which I know not how hath prevailed through *Italy*, though without ancient Examples, as far as I can perceive by Vitruvius. The Thing I mean, is, that they so cast their Partitions, as when all Doors are open, a Man may see through the whole House; which doth necessarily put an intolerable Servitude upon all the Chambers, save the inmost, where none can arrive but through the rest; or else the Walls must be extream thick for secret Passages. And yet this also will not serve the Turn, without at least three Doors to every Room; a Thing most insufferable in cold and windy Regions, and every where no small weakening to the whole Work: Therefore with us, that want no cooling, I cannot commend the direct Opposition of such Overtures, being indeed meerly grounded upon the fond Ambition of displaying to a Stranger all our Furniture at one Sight, which therefore is most maintained by them that mean to harbour but a few; whereby they make only advantage of the Vanity, and seldom prove the Inconvenience. There is likewise another Defect (as Absurdities are seldom solitary) which will necessarily follow upon such a servile disposing of inward Chambers, that they must be forced to make as many common great Rooms as there shall be several Stories; which (besides that they are usually dark, a Point hardly

avoided, running as they do, through the middle of the whole House) do likewise devour so much Place, that thereby they want other Galleries and Rooms of Retreat, which I have often considered among them (I must confess) with no small Wonder; for I observe no Nation in the World by Nature more private and reserved than the *Italian*, and on the other side, in no Habitations less Privacy; so as there is a kind of Conflict between their Dwelling and their Being. It might here perchance be expected, that I should at least describe (which others have done in Draughts and Designs) diverse Forms of Plants and Partitions, and Varieties of Inventions. But speculative Writers, as I am, are not bound to comprise all particular Cases within the Latitude of the Subject which they handle, general Lights and Directions, and Pointings at some Faults is sufficient: The rest must be committed to the Sagacity of the *Architect*, who will be often put to diverse ingenious Shifts, when he is to wrestle with Scarcity of Ground: As sometimes\* to damn one Room (though of special Use) for the Benefit and Beauty of all the rest; another while, to make those fairest, which are most in Sight; and to leave the other (like a cunning Painter) in Shadow, *cum multis alii*, which it were infinite to pursue. I will therefore close this Part, touching Comparison, as cheerfully as I can, with a short Description of a Feasting or Entertaining Room, after the *Egyptian* Manner, who seem, at the least 'till the Time of *Vitruvius*, from the ancient *Hebrews* and *Phœnicians* (whence all Knowledge did flow) to have retained with other Sciences, in a high Degree, also the Principles and Practice of this magnificent Art. For as far as I may conjecture by our Master's Text, (Lib. 6. Cap. 5.) where (as in many other Places he hath tortured his Interpreters) there could no Form, for such a Royal Use, be comparably imagined, like that of the aforesaid Nation, which I shall adventure to explain.

Let us conceive a Floor or *Area* of goodly Length (for Example, at least of One hundred and twenty Foot) with the Breadth somewhat more than the half of the Longitude, whereof the Reason shall be afterwards rendered. About the two longest Sides, and Head of the said Room, shall run an Order of Pillars, which *Palladio* doth suppose *Corinthian* (as I see by his Design) supplying that Point out of *Greece*, because we know no Order proper to *Egypt*. The fourth Side I will leave free for the Entrance. On the aforesaid Pillars was laid an Architrave, which *Vitruvius* mentioneth alone: *Palladio* adds thereunto (and with Reason) both Freeze and Cornice, over which went up a continued Wall, and therein half or three quarter Pillars, answering directly to the Order below, but a fourth Part less, and between these half Columns above, the whole Room was Windowed round about.

Now, from the lowest Pillars there was laid over a Contignation or Floor, born upon the outward Wall, and the Head of the Columns with Terrass and Pavement, *sub dio* (saith our Master) and so indeed he might safely determine the matter in *Egypt*, where they fear no Clouds: Therefore *Palladio* (who leaveth this Terrass uncovered in the Middle, and hallised about) did perchance construe him rightly, though therein discording from others: Always we must understand a sufficient Breadth of Pavement left between the open Part and the Windows, for some Delight of Spectators that might look down into the Room: The *Lati-*

tude I have supposed contrary to some former Positions, a little more than the half of the Length; because the Pillars standing at a competent Distance from the outmost Wall, will, by Interception of the Sight, somewhat in Appearance diminish the Breadth; in which Cases, as I have touched once or twice before, Discretion may be more licentious than Art. This is the Description of an *Egyptian* Room, for Feasts and other Jollities. About the Walls whereof we must imagine entire Statues, placed below, and illuminated by the descending Light from the Terrass, as likewise from the Windows between the half Pillars above: So as this Room had abundant and advantageous Light; and besides other Garnishing must needs receive much State by the very Height of the Roof, that lay over two Orders of Columns. And so having run through the four Parts of my first general Division, namely, *Foundation*, *Walls*, *Appertions*, and *Compartition*, the House may now have leave to put on his Hat, having hitherto been uncovered itself, and consequently unfit to cover others. Which Point, though it be the last of this Art in Execution, yet it is always in Intention the first, for who would build, but for Shelter? Therefore obtaining both the Place and the Dignity of a final Cause, it hath been diligently handled by diverse, but by none more learnedly than *Bernardino Baldi*, Abbot of *Gaustalla* (before cited upon other Occasion) who doth fundamentally and mathematically demonstrate the firmest Knittings of the upper Timbers which make the Roof. But it hath been rather my Scope, in these *Elements*, to fetch the Ground of all from Nature herself, which indeed is the simplest Mother of Art. Therefore I will now only deliver a few of the properest, and, as I may say, of the most natural Considerations that belong to this remaining Piece.

There are two Extremities to be avoided in the Cover or Roof; that it be not too heavy, nor too light. The first will suffer a vulgar Objection of pressing too much the under Work. The other containeth a more secret Inconvenience; for the Cover is not only a bare Defence, but likewise a kind of Band or Ligature to the whole Fabrick, and therefore would require some reasonable Weight. But of the two Extremes, a House top-heavy is the worst. Next there must be a Care of Equality, that the Edifice be not pressed on the one Side more than on the other: And here *Palladio* doth wish (like a cautious Artizan) that the inward Walls might bear some good Share in the Burthen, and the outward be the less charged.

*Thirdly*, The *Italians* are very precise in giving the Cover a graceful Pendency or Slope-ness, dividing the whole Breadth into nine Parts; whereof two shall serve for the Elevation of the highest Top or Ridge from the lowest. But in this Point the Quality of the Region is considerable; For (as our *Vitruvius* insinuateth) those climes that fear the falling and lying of much Snow, ought to provide more inclining *Pentices*; and Comliness must yield to Necessity.

These are the usefulest Cautions which I find in Authors, touching the last Head of our Division, wherewith I will conclude the first Part of my present Travail. The second remaineth, concerning Ornaments within, or without the Fabrick; a Piece not so dry as the meer Contemplation of Proportions: And therefore I hope therein somewhat to refresh both the Reader and myself.

PART II. — Every Man's proper Mansion-House and Home being the Theatre of his Hospitality, the Seat of Self-Fruition, the comfortablest Part of his own Life, the noblest of his Son's Inheritance, a kind of private Princedom, nay to the Possessors thereof, an Epitomy of the whole World, may well deserve by these Attributes, according to the Degree of the Master, to be decently and delightfully adorned. For which End there are two Arts attending on *Architecture*, like two of her principal Gentlewomen to dress and trim their Mistress, *Picture* and *Sculpture*; between whom, before I proceed any farther, I will venture to determine an ancient Quarrel about their Precedency, with this Distinction, that in the Garnishing of Fabricks, *Sculpture* no

doubt must have the Pre-eminence, as being indeed of nearer Affinity to *Architecture* itself, and consequently the more natural and more suitable Ornament. But on the other Side (to consider these two Arts, as I shall do, philosophically, and not mechanically) an excellent Piece of *Painting* is, to my Judgment, the more admirable Object, because it comes near an artificial Miracle, to make diverse distinct Eminencies appear upon a Flat by force of Shadows, and yet the Shadows themselves not to appear; which I conceive to be the utmost Value and Vertue of a Painter, and to which very few have arrived in all Ages.

In these two Arts (as they are applicable to the Subject which I handle) it shall be fit, first, to consider how to choose them; and next, how to dispose them. To guide us in the Choice, we have a Rule somewhere (I well remember) in *Pliny*, and it is a pretty Observation. That they do mutually help to censure one another. For *Picture* is best, when it standeth off, as if it were carved; and *Sculpture* is best, when it appeareth so tender, as if it were painted, I mean, when there is such a seeming Softness in the Limbs, as if not a Chissel had hewed them out of Stone, or other Material, but a Pencil had drawn and stroaked them in Oil, which the judicious Poet took well to his Faney:

Excudent alij spirantia mollis æra.

But this Generality is not sufficient to make a good chooser, without a more particular contraction of his Judgment. Therefore, when a Piece of Art is set before us, let the first Caution be, not to ask who made it, lest the Fame of the Author do captivate the Fancy of the Buyer: For, that excellent Men do always excellently, is a false Conclusion; wherupon I observe among *Italian* Artizans three notable Phrases, which well decipher the Degrees of their Works.

They will tell you that a thing was done *Con diligenza*, *Con studio*, and *Con amore*: The first is but a bare and ordinary Diligence; the second is a learned Diligence; the third is much more, even a loving Diligence; they mean not with Love to the Bespeker of the Work, but with a Love and Delight in the Work itself, upon some special Fancy to this or that Story; and when all these concur (particularly the last) in an eminent Author, then perchance *Titianus Fecit*, or *ôpιδιαι έρωσι*, will serve the turn, without farther Inquisition: Otherwise, Artizans have not only their Growths and Perfections, but likewise their *Vains* and Times.

The next Caution must be (to proceed logically) that in judging of the work itself we be not distracted with too many Things at once: Therefore first (to begin with *Picture*) we are to observe whether it be well drawn (or as more elegant Artizans term it) well design'd; then whether it be well coloured, which he the two general Heads; and each of them hath two principal Requisites; for in well Designing there must be Truth and Grace; in well Colouring, Force and Affection: all other Praises are but Consequences of these.

Truth (as we metaphorically take it in this Art) is a just and natural Proportion in every Part of the determined Figure. Grace is a certain free Disposition in the whole Draught, answerable to that unaffected Frankness of Fashion in a living Body, Man or Woman, which doth animate Beauty where it is, and supply it where it is not.

Force consisteth in the Roundings and Raisings of the Work, according as the Limbs do more or less require it; so as the Beholder shall spy no Sharpness in the bordering Lines; as when *Taylor* cut out a suit, which *Italians* do aptly term, according to that Comparison, *Contorni taglianti*; nor any Flatness within the Body of the Figure, which how it is done, we must fetch from a higher Discipline; for the Opticks teach us, that a Plane will appear prominent, and, as it were, embossed, if the Parts farthest from the Axletree, or middle Beam of the Eye, shall be the most shadowed; because in all Darkness there is a kind of deepness. But as in the Art of *Perswasion*, one of the most fundamental Precepts is, the Concealment of Art, so here likewise the Sight must be sweetly deceived by an insensible Passage, from brighter Colours to dimmer, which *Italian* Artizans call the middle Tinctures, that is not

\* The *Italians* call it *Una stanza dannata*, as when a Buttery is cast under a Stair-Case or the like.

as the Whites and Yolks of Eggs lie in the Shell, with visible Distinction, but as when they are beaten and blended in a Dish; which is the nearest Comparison that I can suddenly conceive.

Lastly, Affection is the lively Representation of any Passion whatsoever, as if the Figures stood not upon a Cloth or Board, but as if they were acting upon a Stage: And here I must remember, in truth, with much marvel, a Note which I have received from excellent Artizans, that though Gladness and Grief be opposites in Nature, yet they are such Neighbors and Confiners in Art, that the least Touch of a Pencil will translate a Crying into a Laughing Face; which Instance, besides diverse others, doth often reduce unto my Memory, that ingenious Speculation of the Cardinal Cusanus, extant in his Works, touching the Coincidence of Extremes. And thus much of the four *Requisites* and *Perfections* in *Picture*.

In *Sculpture* likewise, the two first are absolutely necessary, the third impertinent; for Solid Figures need no Elevation by Force of Lights or Shadows; therefore in the Room of this, we may put (as hath been before touched) a kind of Tenderness, by the Italians termed *Morbidezza*, wherein the Chissel, I must confess, hath more Glory than the Pencil, that being so hard an Instrument, and working upon so suppliant Stuff, can yet leave Strokes of so gentle Appearance.

The fourth, which is the expressing of Affection (as far as it doth depend upon the Activity and Gesture of the Figure) is as proper to the Carver as to the Painter, though Colours, no doubt, have therein the greatest Power; whereupon, perchance, did first grow with us the Fashion of Colouring even Regal Statues, which I must take leave to call an English Barbarism.

Now in these four *Requisites* already rehearsed, it is strange to note, that no Artizan, having ever been blamed for Excess in any of the three last, only *Truth* (which should seem the most innocent) hath suffered some Objection, and all Ages have yielded some one or two Artificers so prodigiously exquisite, that they have been reputed too natural in their Draughts; which will well appear by a famous Passage in Quintilian, touching the Characters of the ancient Artizans, falling now so aptly into my Memory, that I must needs translate it, as in truth it may well deserve.

The Place which I intend, is extant in the last Chapter save one of his whole Work, beginning thus in *Latin*:

*Primi, quorum quidem opera non vetustates modo gratia visenda sunt clari Pictores fuisse dicuntur, Polygnotus atque Aglaophon, &c.*

The whole Passage in *English* standeth thus:

THE first Painters of Name, whose Works be considerable for any thing more than only Antiquity, are said to have been Polygnotus and Aglaophon, whose bare Colourings (he means I think in White and Black) hath even yet so many Followers, that those rude and first Elements, as it were of that which within a while became an Art, are preferred before the greatest Painters that have been extant after them, out of a certain Competition (as I conceive it) in point of Judgment. After these, Zeuxes and Parasius, not far distant in Age, both about the Time of the *Peloponnesian* War (for in Xenophon we have a Dialogue between Parasius and Socrates) did add much to this Art: Of which the first is said to have invented the due Disposition of Lights and Shadows; the second, to have more subtly examined the Truth of Lines in the Draught; for Zeuxes did make Limbs bigger than the Life, deeming his figures thereby the more stately and majestic, and therein (as some think) imitating Homer, whom the stoutest Form doth please, even in Women. On the other side Parasius did exactly limit all the Proportions so, as they call him the Law-giver, because in the Images of the Gods, and of Heroical Personages, others have followed his Patterns like a Decree; but *Picture* did

most flourish about the days of Philip, and even to the successors of Alexander, yet by sundry Habilities; for Protogenes did excel in Diligence; Pamphilus and Melanthius in due Proportion; Antiphilus, in a frank facility; Theon of Samos, in Strength of Fantastic and conceiving of Passions; Apelles, in Invention and Grace, whereof he doth himself most vaunt; Euphranon deserves Admiration, that being in other excellent Studies a principal Man, he was likewise a wondrous Artizan both in *Painting* and *Sculpture*. The like Difference we may observe among the Statuaries; for the Works of Calon and Eggesias were somewhat stiff, like the Tuscan Manner; those of Calamis, not done with so bold Strokes; and Myron, more tender than the former; a diligent Decency in Polyctetus above others, to whom though the highest Praise be attributed by the most, yet least he should go free from Exception, some think he wanted Solemnness; for as he may perchance be said to have added a comely Dimension to humane Shape somewhat above the Truth, so, on the other Side he seemed not to have fully expressed the Majesty of the Gods; moreover, he is said not to have meddled willingly with the graver Age, as not adventuring beyond smooth Cheeks; But these Vertues that were wanting in Polyctetus were supplied by Phidias and Almenes; yet Phidias was a better Artizan in the representing of Gods than of Men; and in his Works of Ivory beyond all Emulation, even though he had left nothing behind him but his *Minerva* at *Athens*, or the *Olympian Jupiter* in *Elis*, whose Beauty seems to have added somewhat even to the received Religion, the Majesty of the Work as it were equalling the Deity. To Truth they affirm Lysippus and Praxiteles to have made the nearest approach; for Demetrius is therein reprehended, as rather exceeding than deficient, having been a greater Aimer at Likeness than at Loveliness.

This is that witty Censure of the ancient Artizans, which Quintilian hath left us, where the last Character of Demetrius doth require a little Philosophical Examination, how an Artificer, whose end is the Imitation of Nature, can he too natural; which likewise in our Days was either the Fault, or (to speak more gently) the too much perfection of Alhert Durer, and perhaps also of Michael Angelo de Buonaroti, between whom I have heard noted by an ingenious Artizan, a pretty nice Difference, that the German did too much express that which was, and the Italian, that which should be: Which severe Observation of Nature, by the one in her commonest, and by the other in her absolutest Forms, must needs produce in both a kind of Rigidity, and consequently more Naturalness than Gracelfulness. This is the clearest Reason, why some exact Symmetrists have been blamed for being too true, as near as I can deliver my Conceit. And so much touching the Choice of *Picture* and *Sculpture*; The next is, the Application of both to the beautifying of Fabricks.

(To be continued.)

#### THE NATURE OF DESIGN.

*A Paper read at the meetings of the Decorative Art Society, March 13th and 27th.*

BY MR. CRABB, V. P., MEMBER OF THE INSTITUTE OF FINE ARTS.

(Continued from p. 457.)

THE manufacturers have the matter in their own hands; let them visit the schools as men of business, and, as such, judge of the arrangements, of the instruction given, and should it continue unsatisfactory, let them, in any one district open a separate school, subscribe sufficient to remunerate a man of talent, and select him themselves, as they would one for their private business; no doubt the object could be best attained through the government school, but it can also be done by a few spirited manufacturers.

I should be proud if our efforts aroused the attention of a few gentlemen of the council, Mr. Cockerell for instance, whose valuable and instructive lectures at the Royal Academy, conducted with the greatest liberality and

listened to in admiration by a crowded auditory, form a fitting prototype for lectures that should originate with Professor Dyce. The subject cannot rest where it is; let us widely circulate what might be quickly done under proper management, and depend upon it the manufacturers who are feeling the inconveniences of a dearth of designers will come forward. The rapid success of our society at once marks the importance and attention design is now receiving; half a dozen meetings have not taken place, yet under all sorts of disadvantages, and crippled through want of leisure to mature the requisite arrangements and prepare our papers, we have not only interested the members, but our proceedings have caused the attendance of numerous visitors. The powerful incentives of zeal and a knowledge of our deficiencies will, under judicious direction, be of the utmost importance. We must keep before us the remembrance that the principles of art, of true taste and sound design are those of nature, and equally fixed and immutable; that the philosophy of art is its free interchange with every people, open and careful communication with the mighty works of past ages, produced when the refined powers of man were presented with unequalled opportunities; and that the great end and purpose of fine art, in whatever form presented, is to please and delight the understanding, and to extend that delightful region of mental enjoyment which is of the most refined and ennobling character. Those who love the results of elegant art, will avoid all excess, for the beautiful must be cultivated in their own minds ere it can be either enjoyed or imparted. This consideration will be found to greatly extend a people's happiness; it was the principle pre-eminently valued in the best period of art, courted at the revival, and now again fostered in Germany; there, in the real and true spirit, we find the monarch diffusing the rich treasures of knowledge to his people without distinction, creating a genuine love of art, and an eager desire to apply elegant design throughout their manufactures.

If we Englishmen desire similar results, we must cultivate the same spirit and adopt similar means.

#### MOVING A CHAPEL GALLERY.

This gallery was moved "bodily," on account of an enlargement of the Wesleyan Chapel, in the Liverpool-road, Islington, where it exists; in doing which, the front wall, to which the gallery is attached, had to be carried out 12 feet further. The idea was first broached by Mr. Roberts, the foreman of Messrs. Elston and Co., of Wornwood-street, the contractors for the work; and the execution of it was performed under his immediate direction, in the presence of Messrs. Chubb (of St. Paul's Church-yard), Smith, Lewis, Jupp, and many others.

Some cradles were framed to the rake of the ceiling of the gallery, which formed a carriage; trucks or wheels were morticed into the timber forming the carriage, which was bolted to the breast-summer; of those there were five, three for the ends, and two for the wings or sides; these had five pieces of timber, 8 in. by 8 in., with one side flattened, and bar-iron, 2½ in. by ½ in., fastened thereon, which formed railroad; those were supported by uprights, properly braced; and after the carriages were bolted to the timbers of the gallery, and properly leveled, the other timbers and uprights forming the railroad were well wedged up, so as to ease the weight from the iron columns, which were taken away, and the gallery stood on the railroad, ready to start as soon as the gallery-timbers, floors, and every thing else could be properly braced and secured, which required a great deal of thought and attention, so as to keep every thing in its place during the removal; for, the removal of a thing extending over a surface of 50 ft. by 30 ft., and put together in a thousand different pieces, is not so easy to remove safely as a solid mass of the same weight. When the above had been completed, two crabs were attached to it by means of chains; this being done, it was cut away at the spring of the circular part, and the word of command being given, it glided to its destination without a single accident.

Ι Α Ι Α Δ Ζ.

Ἦς εἶπον ἀλόχοιο φῆκεν ἐν χέρσιν Ἔρκε,  
Παιδίων, ἧθ' ἄρα μὴ κρῆθι ὀξέτω κόλπῳ  
Ἀκρῖον γενέσασα. — That is,

NEWS OF THE  
BUILDER  
LONDON

## TEMPORARY CHURCHES.

TO THE EDITOR OF THE BUILDER.

SIR,—I have, within these few days, designed and erected a "Temporary Church" at Kentish Town, particulars of which may be interesting (economically) to your readers. The plan consists of a tower 10 feet square, forming the entrance to two lobbies, each 9 feet by 8 feet, communicating with the nave or choir 60 feet by 30 feet, divided from the side aisle by a range of columns that support an open-framed roof; the side aisles are each 60 feet by 9 feet, thus making the whole width 48 feet. At the end of the nave is the chancel, 30 feet long by 28 feet wide, and terminating with a recessed communion, 15 feet wide by 6 feet deep, the floor of which is raised 18 inches. At the end of one of the aisles is a vestry 8 feet by 6 feet; at the end of the other aisle is the robing-room of the same dimensions, from whence are the steps to the pulpit.

The body of the church receives its light from sixteen clerestory windows of "Vitreous Cloth," the light from which, although subdued in tone, is very brilliant and equally diffused. The walls are formed in compartments, the inside finished with neat oak paper in panels, and presents a quiet appearance well adapted for its intended purpose. The outside panels and the entire of the roof are covered with *Croggon's Patent Asphalted Felt*, being the best non-conductor of heat and cold. The entire of the felt to the roofs, and all the outside wood-work, and the open-framed roof inside are covered with *Jeffery's Patent Marine Glue*, the colour of which, in the wood, has a fine rich effect, and is the most perfect non-absorbent of moisture and non-conductor of the electric fluid.

The church contains sittings for 800 persons, all open seats. The erection of this church will shew, with limited funds, how readily a congregation can be neatly and comfortably accommodated with a suitable place of worship. Buildings of this description can be erected at a cost of about 10s. per sitting.

I am, Sir, &c.,

PETER THOMPSON.

Commercial-road, Limehouse, Sept. 1844.

[We trust that all in districts where church accommodation is required, willing benefactors will be found to aid in providing the same; it must be highly advantageous to the *Church Pastoral Aid Society* to call into requisition the services of the builder of this church, who has shewn in the plan all the essentials requisite in the arrangement of Christian worship. We are pleased to see this example, which may be the precursor of many being built in wood, and might call into requisition skilled workmen as framers and carvers, similar to what has been done in the middle-ages.—Ed.]

## TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.

(Continued from p. 455.)

83. *Berot*.—This tree, although yielding to the oak in grandeur, dignity, and the picturesque, is nevertheless of other all forest trees the most beautiful, frequently emulating the oak in magnitude, and being a very desirable ornament to demesne lands, and a striking object in distant scenery: it is stately, round-headed, and thick-spreading, affording a very pleasant and refreshing shade, and place of repose for cattle, with graceful pendulous branches, a smooth rind, glossy foliage, and a stem of massive proportions, frequently attaining a hundred feet in height, and the trunk from ten to fifteen in girth: the sorts are the *black* or brown, and the *white*; there are also mentioned the *white-American*, the dark purple, and that of the iron-coloured leaf, all ornamental, and propagated by grafting on the common sorts: the leaves when mature are of a bright green, ovate in form and thin in texture.

84. It is found native throughout the greater part of Europe, though not extending so far north as Sweden; is abundant in Great Britain, and principally indigenous to the central portion of it, the best being such as have sprung from a chalky, rather rich, and not very damp soil, and a genial southern and sloping situation: it is not, however, fastidious as to soil or situation; and in those parts where the western winds blow keenly, in Devonshire for example,

it appears to excel in withstanding their severity: if there be but some portion of calcareous matter present it seems to suffice; and where there is a subsoil of chalk or limestone, similar to the dry calcareous hilly ridges of the central counties, it frequently forms extensive forests. In Hampshire, the covert of Hangerwood consists altogether of it; in Buckinghamshire, in the southern parts, it is particularly abundant; and in Sussex, in the southern range of chalk hills, near Walberton, it is very fine; in Morayshire and Cromarty, large plantations have been made; in Belgium it is employed for fences, being planted young with that view. With respect to the soil for its growth, it is said by some that that which is of a hard and stony nature is more congenial than the richer chalky ground above described; however this may be, it appears that the difference produces such a characteristic variety in the appearance and quality of the wood, as to obtain for it the distinctive appellations above stated, and to lead many to consider them as distinct species; the latter of the two is such as has been grown in a damp situation, and though the tougher, is the inferior and less hard wood, since it loses much of its toughness and strength with the seasoning: it has, however, been stated to be the most durable.

85. The Beech does not reach maturity till from 70 to 100 years old; it then retains its perfection for a similar period, after which it soon goes into rapid decay, rarely reaching the age of 500 years. It is very fruitful, its mast or nuts, which ripen in autumn, having a sweet and oleaginous kernel or seed, pleasant in flavour and not unwholesome; in feudal times they, together with the acorns, used to fatten the vast herds of deer and droves of swine which were the staple food alike of lord and vassal; squirrels, dormice, pigeons, and pheasants, feed freely on them: they are sometimes sold to the oil-miller, who procures from them by expression an oil which is useful for lamps and for other purposes. Young plants are readily raised from the seed, which may be sown from October to February, on beds, with a thin covering of loose soil, care being taken to protect them from field-mice, which would readily devour them. When grown about five or six inches high, the seedlings, like other seedlings, are reset out in rows on fresh ground, where they remain until sufficiently advanced to be transferred to their ultimate destinations. The roots of the beech keep near the surface, and are wide-spreading, causing a barrenness in the verdure surrounding the tree.

86. The colour of the wood is an ashy brown, that of the white beech being the lightest, and that of the black beech the darkest in shade; the annual rings have a light and a darker side, just serving to make them visible; but they are throughout their thickness very uniform in texture; the larger transverse septa are fine, and therefore small in the flower compared with some other woods: the wood has a dry even grain, and is tasteless and inodorous. This tree, although not very suitable for house-carpentry, is, notwithstanding, one of great importance; for although, from its great liability to rot soon from damp, and from being so subject to the destructive inroads of worms whether damp or dry, it is unfitted for beams and other bearing purposes, it is, for piling and such other purposes as keep it continually immersed in water, exceedingly well adapted, being hard, close, strong and tough, and very durable in water; indeed, in that respect it is as good as oak; and it would also endure well when dry, if kept thoroughly so, were it not for the worms which destroy it; and touching these destructionists, it has been suggested that the regularity of the pores in this wood affords a ready facility for infusing into it some bitter decoction for their prevention, and which, as they are almost the only obstacle to its attaining more general use, must be a subject well worthy of attention. It must be observed at the same time, that water-seasoning is a considerable preservative of this timber against worms, being better for that purpose than seasoning in the ordinary way. The best time for felling it is a little after midsummer, and the timber should directly be cut into planks, and then put to steep for about ten days before drying; if the tree be tapped some time before felling, for the purpose of letting out the sap, so much the better. A great supply is brought to the London market in planks and boards.

87. It is extensively used for furniture, tool-handles, turnery, and wheelwrights' work, for all of which its compact grain, smooth surface, and exemption from brittleness, admirably qualify it; it is found useful in the dockyards for wedges and similar purposes; coopers use it for clap-board, and musical instrument makers for sound-boards; it forms good charcoal, the ashes affording a good quantity of potash; the refuse wood is, in the vicinity of large towns, used for billets; like the elm and one or two other woods, it bears well the drift of spikes; and it is insusceptible of a fine polish.

88. *Alder*.—Of this genus there are said to be eleven species, nine of the number being natives of Europe and two of North America; it is also said to be a native of Asia. It is indigenous to Britain, abounding naturally in soils of every degree of moisture, from damp to marshy, and may be found on the margins of nearly all our streams, as well as by the sides of lakes; it also grows in high and even dry localities, but not with that luxuriance which it exhibits when grown in those moist situations in which it delights; and it seldom thrives, indeed scarcely lives, in soils which are of a chalky or calcareous nature, those of a strong clayey, or dry, burning, gravelly or sandy description being alike uncongenial to its welfare; the swampy places where it flourishes to perfection are such as are of good quality with their moisture. Under the most favourable circumstances, it attains a height of 50 or 60 feet, with a trunk several feet in girth, sometimes possessing a picturesque outline, and generally assimilating to the oak in appearance. It is not generally ranked amongst forest trees, and is seldom cultivated with a view to utility, the object being rather confined to its ornamental qualities, and occupying spots where nothing much better will grow; for the banks of rivers it is exceedingly well calculated, its multiplicity of roots serving to bind them together, and thus reducing the chance of their being carried away by floods.

89. Of what is termed the common alder, there are said to be four varieties, besides the hoary-leaved, oblong-leaved, wave-leaved, glaucous, and their varieties, and some shrubs, which are generally propagated by grafting on the common alder: this has leaves of a roundish jagged form, somewhat glutinous, and downy at the ramifying of their veins beneath. It is easily propagated, by large cuttings planted in spring where the tree is to remain, or by the seeds, which ripen in October. The cones should be gathered dry, thrashed and sifted, the seeds kept in sacks till spring, and sown thick in March or early in April; the ground should be smooth and even, to prevent the seeds being buried too deep. When one year old, the strongest plants should be transferred, and the weaker seedlings left for another season; in the new bed they should be placed four or five inches apart, in lines a foot asunder; in the after-culture the ground should be kept clear of weeds, which rob the young plants of their nourishment. It is of rapid growth when properly situated, and is said to be most profitable when kept as underwood, large poles suitable for the turner, or for piles or planking for bridges, bring a good price; and a considerable bulk of fuel being obtained by cutting over the copse at stated periods.

90. The Alder is another of those timbers of which the principal use, as regards building, is in piling, or any such works as are under water or on marshy ground; and for these purposes it is highly esteemed, on account of its extreme durability when so situated, being, in fact, almost imperishable: when exposed to the weather, however, or to mere damp, it soon rots; and when dry it is very susceptible of engendering worms: when employed in sea-works, it is liable to the pipe-worm, which destroys it with great ease, and fattens in it to its greatest size. The wood is tender, soft, uniform in the grain, and easy to work, and therefore suitable for the carver's art, could it be saturated with some ingredient obnoxious to worms; the roots and knots are valued for cabinet-work, being often beautifully veined; it is applied to turnery and other similar uses; it is also employed in the construction of pumps, sluices, &c., and in roofing and flooring temporary buildings; great quantities are annually felled in the Scottish Highlands for conversion into herring-barrel staves, and the Highlanders also use the bark in dyeing their tartan and other woollen stuffs; the bark,

which possesses a considerable degree of as-tringency, is besides used by tanners and leather-dressers; charcoal made from it is considered excellent in the manufacture of gun-powder. Vitruvius says that the piles whereon the whole of the buildings of Ravenna, in Italy, stand, consist of it; Virgil mentions it in the "Georgics" as furnishing the material for hoats or canoes, which were formed out of its hollowed trunk; Evelyn says the oldest boats we read of, Noah's ark excepted, were made of it; also that it was used for the piles upon which the Bridge of the Rialto, at Venice, was founded in 1591. The colour of the wood is rich, a red yellow, somewhat like that of Scotch fir, but a little variable in shade; when found in bogs it is generally perfectly black; neither the annual rings nor the larger transverse septa are very distinct. It is most durable when felled a little after Midsummer; and is rendered less subject to worms by being water-seasoned.

(To be continued.)

#### LONDON AS IT WAS, AND AS IT IS IN 1844.

(Continued from p. 410.)

The royal palace of Westminster, the great hall of which was re-built prior to 1399, by Richard II., occupied the two large areas or courts still distinguished by the names of Old and New Palace-yard. These courts being bounded by the river Thames, and on the west by the Abbey of St. Peter, St. Margaret's parish church, the little and great sanctuaries, &c., were entered on the west and south by gates. Most of this extensive pile of building was destroyed by fire in 1512, and latterly St. Stephens met the same fate.

Opposite to the principal entrance to the hall in New Palace yard, was, in olden-times, a handsome conduit or fountain, from which at coronations and other great rejoicings, wine was made to run at divers spouts. Henry III. entertained in this hall and other rooms on New Year's Day, 1236, for the honour of the king and queen, 6,000 poor men women and children. In 1399, on the building being finished, Richard kept his royal Christmas in it, with his accustomed prodigality, "with daily justing and runnings at tilt, whereunto resorted such a number of people, that there was every day spent 26 or 28 oxen and 300 sheep, besides fowls out of number. The quantity of guests daily who sat down to meat, was 10,000 people, whose messes were told out from the kitchen by 300 servitors; and not less than 2,000 cooks, well skilled in their profession, were employed to furnish the requisite number of dishes. Henry III., kept several great Christmasses in this hall, as did likewise his grandson, Edward II."

In this hall parliaments were frequently held, and during its re-building in 1397, Richard II. erected a temporary shed for the purpose, adjoining it, open on all sides and at both ends, that all men might hear what passed, "and to secure freedom of debate, he surrounded the house with 4,000 Cheshire archers with bows bent and arrows nocked ready to shoot, which fully answered the intent, for every sacrifice was made to the royal pleasure." The day of retaliation was, however, close at hand; and a second parliament held in the new hall, a short time afterwards, wrested the crown from this weak and misguided prince.

The trial of Charles I., was held in Westminster Hall, and Pennant, noticing the primitive manners at that period, observes "the commons who had an inclosed place for themselves, at a certain hour pulled out of their pockets bread, cheese, and bottles of ale.

The ancient palace of Westminster, no, having been used as a royal residence since 1532, the several apartments were appropriated for divers uses; two of which for the re-

ception of the lords and commons, and others occupied by the courts of star chamber, requests, and wards, and liveries, the hall, which at first was only used for royal banquets, and feasts for refreshing the poor, is now variously appropriated.

Adjoining to the south angle of the hall and north end of the old palace, King Stephen founded a chapel, and dedicated it to St. Stephen, the Protomartyr. Edward III. re-built it in a very magnificent manner in 1347, and converted it into a collegiate church, and afterwards endowed it with his *hospitalium*, or great house in Lombard-street, lands in Yorkshire, and an annuity out of his treasury, to make up 500*l.* per annum. John Chamber, M.D., physician to Henry VIII., and the late dean of the same, caused to be erected on the north side, a magnificent cloister at the expense of eleven thousand marks.

The revenues of this collegiate chapel at its suppression, amounted to 1,087*l.* 10*s.* 5*d.* per annum, and the same being surrendered to Edward VI., was appropriated for the reception of the representatives of the commons of England, who have ever since continued to meet therein. Contiguous to this chapel on the south was that of our lady of the Pen, to whose image many rich offerings were made. This wooden deity, together with the chapel, was consumed by fire in 1452.

Whitehall palace was erected by Hubert de Burgh, Earl of Kent, and Chief Justice of England, who, in 1243, bequeathed it to the preaching or Black-friars, in Chancery-lane. They disposed of it to the Archbishop of York, and he devising it to his successors for their city Mansion; hence it received the appellation of York-place. In the reign of Henry VIII. the royal palace of Westminster being almost destroyed by fire, the king purchased York-house of Cardinal Wolsey. In 1697 it was wholly consumed by fire. Henry no sooner became possessed of this palace than he built St. James's; and for the use and service of it, as well as that of Whitehall, enclosed a beautiful spot of ground and converted it into a park, for the accommodation of both palaces; erecting a magnificent gate opposite the Mansion-house, opposite the Banqueting-house, to which he added a fine gallery for the accommodation of the royal family, nobility, and gentry to sit in, to behold the several justings and other military exercises in the tilt-yard. He also erected contiguous to this gate, a tennis-court, cock-pit, and places to bowl in. The present magnificent fabric denominated the *Banqueting-house*, and *Whitehall Chapel*, was erected by King James I.; being the only and meanest part of his intended spacious palace that was built, and which it is thought, if finished according to the plan, would have been the finest in existence. The civil war put a stop to the work.

The Horse-guards originally had their stables in the place they now occupy; the present building was erected in the reign of George II., at a cost of 30,000*l.*

The Admiralty was removed to the spot it now occupies in the reign of George II. The former Office stood in Duke-street, the present one on the site of Wallingford-house. The equestrian statue of Charles I., by Le Sueur, stands on the same spot where formerly stood a beautiful cross, one of the celebrated memorials of the affection of Edward I. for his beloved Eleanor. It was cast for the Earl of Arundel, and was not erected till the year 1678, when it was placed on the present pedestal, the work of the admired Grinlin Gibbons. The face has been declared faulty for want of expression, but there is a certain simplicity in the whole, hardly to be met with in the equestrian statues of the present day. It is with regret we observe the corroding hand of Time marking the pedestal.

What a change has come o'er the spirit of our dream. Within thirty years, immense piles of buildings have disappeared from this neighbourhood, and piles of stately buildings have risen in their stead; aristocratic silence has succeeded the bustle of former times; and with the last remnants of old Charring-cross, the old appliances of country-waggons and stage-coaches, disappeared before the revolutionary power of steam. From hence to the Haymarket all is new, or assumes a new aspect.

The Haymarket and Hedge-lane, as late as the reign of Charles II., were literally lanes bounded by hedges; and all beyond, north, east, and west, was entirely country. In 1500, it presented a very countrified appearance, most of the houses exhibiting a mean and dilapidated appearance, widely different from the present. Thus it continued until about 1822, when the market was removed to the neighbourhood of Regent's Park. Suffolk-street and its neighbourhood was then rebuilt, the opera-house was outwardly embellished, the low pot-houses gave way to handsome wine and spirit stores or taverns, and Regent-street swept away much of the low neighbourhood in its rear.

In former times Coventry-house stood near the Haymarket, and gave name to Coventry-street. It was the residence of Lord Keeper Coventry; and Henry Coventry, Secretary of State, died here in 1686. His house occupied the site of the house formerly known as the gaming-house. A great part of the Haymarket and Piccadilly was built by Mr. Elwes, the celebrated miser; who also built several of the splendid mansions in Portland-place.

Pall Mall was formerly laid out as a walk, or place for the exercise of the mall, its northern side being bounded by a row of trees, and that to the south by the old wall of St. James's Park. The principal edifice in James's Park is Carlton-house, originally the property of the Earl of Burlington, and purchased from the family by Frederick, Prince of Wales, father to George III.; it was then far from being a commodious residence, and coming into the possession of the Prince Regent (afterwards George IV.), it was almost entirely rebuilt at a vast expense, from the designs of Mr. Holland.

Marlborough-house, now occupied by the Queen Dowager, was first tenanted by the great Duke of Marlborough; his Duchess, when the building was finished, determined to open a way from it to Pall Mall, and *vice versa* directly in front. But in order to thwart her design, on account of her altercations with the court, and declared animosity against the newly-acceded royal family, Sir Robert Walpole purchased the house before it, on purpose to block her up. This building exhibits outwardly a singular taste; it has, nevertheless, many beautiful and commodious apartments.

In 1800, where now stands Trafalgar-square was the King's Mews, a place of considerable antiquity; and so called from the word *Mews*, a term employed by falconers, implying to moult or cast feathers, because, in former times, and so far back as 1377, this place was appointed for the accommodation of the king's falconers and hawks. But the royal stables at Somerset, since called Bloomsbury, being consumed by fire in 1537, Henry VIII. ordered the removal of the hawks from the Mews, that they might be enlarged, and rendered fit to receive his Majesty's horses; and to this purpose was it, up to the time of its demolition, appropriated. In 1732, it was begun to be rebuilt by George II., and improvements and repairs were carried on up to the beginning of the present century. Whatever claims it may have had to admiration in those days, they could not arrest the march of alteration.

Northumberland-house, built by Bernard Janson in the reign of James I., derives its name from the ancient and noble family, who, for many centuries, have been possessors of it. It is still one of the largest and most magnificent private residences in London, and contains many very elegant and commodious apartments. It stands upon the site of the cell and chapel St. Mary Ronceval, suppressed among the alien priories by Henry V., but rebuilt by Edward IV., who fixed a fraternity in it. The hermitage of St. Catherine stood opposite, another monastic building, belonging 1262 to the see of Llandaff.

St. James's Church was built by Henry, Earl of St. Albans, in consequence of the increase of new buildings in St. Martin's-in-the-Fields. On the death of this earl, Charles II., by his letters-patent in 1684, granted the church and cemetery in trust to his nephew, Lord Jeunime, and his heirs for ever; who thereupon assigned it to Sir Walter Charles, Bart., and others, to be used as a chapel-of-ease of the inhabitants of St. Martin's, and it was thereupon consecrated by the then Bishop of

London, by the appellation of St. James's-in-the-Fields; the parish of St. James was then formed by Act of Parliament, the presentment to the living being vested in the Bishop of London and Lord Jermine; the Bishop of London presenting twice to once of Lord Jermine; the bishop finally became the sole patron thereof. St. James's Church, standing on one of the most imposing situations in all London, has externally a mean appearance, though its interior has few rivals throughout the world.

St. James's Palace was originally an hospital for lazars or leprous persons, founded before the conquest, and dedicated to St. James, but was rebuilt in the time of Henry III. Henry VI. gave the custody of it to Eton College, which having, for a valuable consideration, resigned it to Henry VIII., he converted it into a palace, and enclosed the park, which was subservient to the amusement of this and the palace of Whitehall. Charles II. was particularly fond of this place; he planted the avenues, made the canal and the aviary adjacent to the Birdcage-walk, which took its name from the cages which were hung in the trees. Here, Gibber tells us, the King was often seen, amidst crowds of spectators, feeding the ducks and playing with his dogs, and passing his idle moments in affability even to the meanest of his subjects. In St. James's Palace the celebrated Nell Gwin had a suite of apartments, decorated in the most sumptuous manner.

A critical writer of the last century, speaking of Burlington House, observes, "How many are there who have lived half a century in London, without knowing so princely a fabric exists. It has generally been taken for a jail. None, I am confident, ever passed under its gloomy walls late at night without thinking of ghosts, robbery, and murder. The formidable entrance, that betrays no marks of humanity but what are daubed over the doors, recalls to the imagination—

"Thrice threefold the gates  
Impenetrable;"

the character Milton gives to those gates of which the keepers were *Sin and Death*." He, however, excuses it on the score that the house was built when out of town; there is no excuse, however, for its existence in the present day, for it is a great draw-back to the improvement of Piccadilly; a screen of elegant shops would be infinitely preferable, and much more advantageous to the noble owner.

"As firm as London upon the Bridge," was formerly a saying in the city; and many a serious, sensible tradesman used to believe London to be the eighth wonder of the world: the streets were then paved, or rather half paved, with large shapless pieces of rock, and the foot-paths with sharp flints for the benefit of tender feet; and when a reformation of building began, the good old system was as ably defended as by any select vestry of the times we live in. The removal of signs and sign-posts of the Cat and Fiddle, Goose and Gridiron, Blue Boars, Green Dragons, and King's Heads, ornamenting Cheapside and other leading thoroughfares, was lamented as a falling off in national taste.

(To be continued.)

#### CHURCH-BUILDING INTELLIGENCE, &c.

*St. Mary's Church, Bury St. Edmund's.*—We have great pleasure in announcing that the extensive works of restoration at St. Mary's Church are making such progress, that the building is expected to be ready for the celebration of divine service at the latter end of November, when it is understood the Lord Bishop of London has kindly consented to officiate. Although the beauty of this fine edifice is still hidden by the massive scaffolding, and the lumber and confusion consequent upon so large a repair, the eye at every view meets evidences of the excellence of the improvements, and the judicious character of the changes which are in progress. The incomparable foliated and richly carved roof has been perfectly and substantially restored; the graceful piers of the arcades have put on a gratifying freshness of appearance; and the walls and richly-traceried lights have been completely made good. Many of the latter required much new stone work; and the great

west window, the largest we believe in any parochial church in the kingdom, has been entirely reconstructed; care being taken most scrupulously to adhere to the original design of its elegant tracery. It is to be filled with the arms of the distinguished subscribers to the restoration, executed by Willement. A new symbolic window, to be filled with stained glass representing the Martyrdom of St. Edmund, by the same talented artist, has been inserted in the clerestory wall over the noble chancel arch. The design is very rich, consisting of a compressed pointed arch, filled with intersecting triangles within a circle, all richly foliated. For this elegant window the parishioners are indebted to the liberality of J. H. P. Oakes, Esq., a munificent admirer of pure ecclesiastical architecture. The principal entrance of the church, at the west, will open into a spacious lobby, the elaborately panelled screen of which is to be filled with plate glass; thus affording the spectator an instant and striking view of the grand interior with its lengthened vista of nave and chancel, and its magnificent roof terminated by Mr. Oakes's beautiful window. The organ gallery has been entirely removed, but the side galleries, we regret to say, are still to be permitted to impede the proper effect of the various improvements; but they have been judiciously curtailed to the west, and their ends finished off with a neat and unobtrusive panelling. By the removal of the organ gallery, considerable additions will be made to the accommodation of parishioners on the floor of the church. The additional sittings will consist of open benches in the old style. We should like to see the whole body of the church covered with such benches; and regret that any feeling on the part of the pew-holders should have hindered the removal of the present unsightly *bins*; but we look with confidence to good results from that example which, it is understood, some of the seat holders, are about to set by the introduction of a few open sittings; which, while they effectually preserve the exclusive right of the holders, do not grievously offend their poorer brethren by any aristocratic distinction; nor disturb the beautiful harmony of the church's furniture. A new octagonal font, after the best models of the period, has been placed at the north-west end of the nave, on an ample stone dais, which is approached by one step. It is beautifully executed in Caen stone; is embellished with highly enriched panels, and with the arms, in enamel, of the archbishop, the bishop of the diocese, the corporation, and the donor, J. Fitzgerald, Esq., the patron. By the font, but nearer the west, will be placed within one of the arches of the nave, the fine organ; the re-erection of which, we believe, has been intrusted to Mr. Gray of London. In the centre of the nave, looking towards the chancel, the reading-desk, an elegant moveable lectern, will be placed; and the present unsightly and heavy pulpit, on the south side of the nave, will be superseded by a new one of carved oak of appropriate design; which, though placed nearly on the same site, will be more favourably situate both for the ear and eye of the congregation. The present unsightly, inconvenient, and improperly placed vestry at the end of St. Mary's Isle will be removed; and a new and commodious one constructed in the basement floor of the tower, the entrance to which will be direct from the church-yard. The secular business of the parish will then be conducted without any of those desecrations of the holy edifice which have been but too frequent; an improvement which cannot be too highly commended. The chancel will then alone remain to be done; and though the present state of the borough funds precludes the hope that the corporation will direct a complete restoration of its many beautiful and curious features, especially of the gorgeous coved roof, we trust they will not use a niggard hand in the matter; but perform at once, substantially and with propriety, the essential repairs so much needed.—*Bury Post*.

The Queen Dowager has sent a liberal donation to the fund for the completion of the re-building of the ancient church at Twitchen, North Morton, Devon.

The Lord Bishop of Lincoln consecrated the newly-erected church at Beeston, on the 5th inst. This church is provided with open seats, uniform throughout, and there is not a pew-door in the edifice.

The Church Commissioners, in their report just published, state that among a number of applications under their consideration for the perpetual patronage of new chapels, which it is proposed to build and endow, and for the assignment of districts thereto, under the Act 1 and 2 Will. IV., c. 33, is one from James Fussell, Esq., for the perpetual patronage to be vested in him, his heirs, and assigns, of a new chapel which he proposes to build and endow at Whatley, Somerset.

*St. Mary, Redcliff Church.*—The fund for the restoration of this splendid memorial of civic piety now amounts to 5,336*l*. We wish we could see a more rapid advance in the subscriptions.

The corner-stone of a new church, which is to be rebuilt for the parish of Sowton, Devon, was lately laid by John Garratt, Esq., of Bishop's Court, at whose sole expense the fabric will be erected.

The new church at Diltons Marsh, Westbury, Wilts, will be consecrated by the Bishop of Salisbury on the 30th of September.

Mrs. Lawrence, of Studley Park, has given 10*l*. towards the restoration of St. Saviour's Church, York.

#### RAILWAY INTELLIGENCE.

The *Leeds Intelligencer* states, on authority, that after a careful examination of the country, and several meetings, it has been now determined to bring before parliament, in the next session, a combined plan for forming new railways between the towns of Leeds, Huddersfield, Bradford, Dewsbury, and Halifax, in connection with the Leeds, Manchester, and Liverpool railways. This is the result of the union between the Leeds and Manchester Railway Company, and the Leeds and Bradford Short Line Company, with other parties.

*Railway from Hull to Driffield.*—A petition has been very numerously signed by the principal tradesmen and inhabitants of Driffield and its neighbourhood. The scheme of a railroad from Hull to Bridlington, by way of Beverley and Driffield, seems to meet with the approbation, not only of the people of Driffield, but also of the inhabitants of Beverley and Bridlington.

*Midland Railways Extensions.*—The directors of the Midland Railway Company have issued a statement relative to the proposed extensions into Lincolnshire. A special meeting is to be held early in October, to take the subject into consideration.

*Atmospheric Railways.*—The *Moniteur* publishes a law authorising the opening of a credit of 1,800,000 francs (72,000*l*.) for the trial of the atmospheric railway system.

The directors of the Midland Railway Company have determined to connect the town of Stamford with their line by a branch railway.

#### Correspondence.

##### CRACK HOUSES.

SIR,—The practices adopted by builders in the erection of houses for their own private speculation are so radically unworkmanlike and dishonest, that I am rather surprised it has not been more frequently brought before the notice of your readers. Houses in the present age are most frequently built for sale, consequently, the proper construction of them, in the opinions of some persons, is a matter of very trifling concern—the cheapest plan is the one adopted: the least timber, and that of the worst quality, is used; and the unfortunate buyer has the double consolation of losing his money and becoming the possessor of a tenement which is dilapidated in two years, and in about six is frequently untenable.

As much, however, as I disapprove of the present practice of "running-up" houses by speculating builders, a portion of the blame must rest on the buyers; if a person unacquainted with building chooses to follow his own opinion, instead of procuring a professional one, and by this means risks, and in many cases loses, his money, it certainly is partly his own fault, and he must pay the penalty of his own obstinacy. If we wish to reform abuses, the chief object should be to reform the temptation; by persons procuring a professional opinion, at the cost of one or two

guineas, on the safety and solidity of the buildings they are about to purchase, they would ensure a safer return for their capital, and would soon prove a barrier to the further progress of such dishonest and dangerous practices.

But another source for the spread of speculating building is one which, though less seen, and when observed is too often disregarded, is the practice of persons buying a piece of ground, and covering nearly its whole extent with the smallest and most wretchedly constructed houses for the poorer classes; ill-ventilated, single-hung sashes to the smallest window openings, small rooms, and a yard with the privy close to the back-door, and covering nearly its whole extent; these, built in the cheapest manner possible, are inhabited by persons who have the will, but not the power, to remove, being at the mercy of the hard-hearted landlord for arrears of rent; this class of speculators are the principal support of the present system, and are ably seconded by the scamping part of the building community; their reign, however, will soon draw to a close, thanks to the New Building Act.

I disagree, however, from your correspondent at p. 462; in his attempt to be facetious, he has fallen into error. The class of speculative builders will be found to include by far the greatest number of persons in the trade; and though there are some builders who for honesty and upright conduct are unexceptionable, yet they form so small a portion of the class, that they are in danger of being swamped by the host of under-price contractors and speculators who so plentifully abound. Instead of the present time being one favourable for the advancement of building, I can assure "W. T. B." that the present time is the worst for legitimate (if I may use the expression) building that has been known for many years. Go where you will, old established builders complain of no work; in fact, building, with a few exceptions, is almost at a stand-still, if we except the rows of houses springing up built by speculators, which are all taken under-price, in many cases builders of standing refusing to contract for them, with the prospect of being paid by a man of straw, and the houses mortgaged to their full amount. I would ask "W. T. B." why he objects to the use of stucco, and the shop-fronts being prettily painted? Though he uses it as a compliment, it bears the mark of sarcasm too strongly to pass muster, especially being preceded by the word "sepulchre." The other instance mentioned of his friend's house, proves not so much against the defective building as a bad choice of situation; at the same time, I think either the surveyor made a mistake in his valuation, or that "W. T. B." in order to make his case stronger, has oversight the mark in the respective amounts. Perhaps your correspondent would explain the term chattering windows, an expression which to me is utterly unintelligible.

I hope that your correspondents will take up the matter of speculating building, and seriously exert themselves to put a stop to a system which, if it goes on much longer, will end in half the builders becoming insolvent, through a set of scamps, who, having very little credit themselves, will not suffer much by its loss. The effects will be far more serious to the honest man, who endeavours to maintain himself and his family in a respectable manner.

Sept. 9th, 1844.

SCRUTATOR.

SIR,—A letter appears in your magazine of last week on the quality and quantity of material used in certain buildings; the remarks are very just, and apply to three-fourths of the buildings now erecting in the neighbourhood of the metropolis. But the fault does not rest where "G. T. B." lays it, but with the public themselves. The vast numbers of houses that have been built within the past ten years have not been required so much to meet the demand caused by increase in population, as by the rage for investment. The parties who wish to invest money seek for those houses that will produce the largest rental for the purchase; a really well-built house, producing 7 or 8 per cent., will not suit their purpose; they must make 10 or 12½ per cent.; therefore the cheaper a house is run up, the greater rental will it produce; consequently a demand is created for that kind of building, and the

man who builds a substantial house, of good material and workmanship, must be content to keep his house on his hands. An additional facility is created for the disposal of the inferior property by its falling into the hands of auctioneer surveyors, who lend money on them, afterwards becoming agents for the sale. These men are appealed to for the value; this is not estimated by the cost of house, quantity of material, or workmanship, but only by the *rental it will bring*. Therefore, a good house, valued by a respectable builder or surveyor at 600*l.*, is, in their eyes, only worth 400*l.* or 450*l.* I have seen repeated instances of this. The builders are suffering at present from the laxity shewn by some district surveyors, owing to which a house may be built in one district for 100*l.* less than in another. There is one spot in which the bricks are put in with a mixture of mud and lime from sugar refiners, the term for which is "Billy Sweet;" and in another district the same is used, but omitting the (what was once) lime.

If the public will use the same discernment in purchasing houses they use in purchasing goods in a shop, there will soon be an end to the cheap building; but while purchasers are to be found for *rubbish only*, the builders of such rubbish are not to blame.

NOT A BUILDER, BUT A LOOKER-ON.

#### ADULTERATION OF WHITE LEAD.

SIR,—It is with full confidence that justice to the trade alone, if not another sentiment, will make you give room in your valuable columns to the following reply to a statement made by "Verax" in your last, on the adulteration of white lead, and colours used by house painters:—

That white lead is lowered by *barytes* or *chalk*, no person in the trade (who at least understands it) can dispute, for the best English lead you can purchase in the market, I have found, when ground, to contain three and one-sixth of *cawk* or other ingredients to one of pure lead; and the very inferior lead, such as sold at 12*s.* per cwt., 7½ to one, which is mixed in water first (instead of being ground in oil as "Verax" states), then dried and ground in oil, which makes the dry white lead sold by colourmen as spurious, if so it may be called, as that ground in oil. It is absurd to think of having a genuine article at the price the common white lead is now sold at, and no respectable house painter, that understands his business, will purchase them to do even common work, as they are the most expensive in the end.

But as to colours of every description being adulterated with whiting, to be used by persons in the trade, is ridiculous indeed; it may do for little oil shops, &c., who sell cheap paints, but he must be a *tyro* who could not detect it; for if a house painter bought colours ground, it would not be compound colours, but the primitive ones, which, if adulterated, is easily detected by an inexperienced eye, much more by an old practitioner. It is not surprising either the white lead paints being marked up lower than the price of the genuine material, in these *puffing* times, when there is so much speculative building going on, and three perhaps out of four in the building line employ their own men, and often the employer and the employed know nothing of the nature of colours, but are obliged to trust to those that sell them, which, even if they are sold under the market price of blue lead, there would be a profit realised through the *vehicle* they are mixed with, which is often fish oil, and as great an evil as an inferior pigment.

There is no doubt but lead, with a portion of *barytes*, if well washed, is preferable to using lead alone for colour (but as to *whiting*, I should doubt, to any extent), and the resistance of certain gasses which will destroy the colour of lead, but the drying quality depends on their being well washed from acid, and the *vehicle* they are ground or mixed with, linseed oil being *tardy* in drying through the small quantity of oxygen it contains, but by adding any substance that supplies it with oxygen remedies the defect.

Persons would not be victimised, did they employ persons competent to purchase the genuine article.

Mile End, September 8th.

R. H.

#### Miscellaneous.

HOLYROOD PALACE AND PARK.—Considerable improvements are at present going on at this ancient seat of royalty. Workmen are repairing the crown which surmounts the grand entry. The roof is also undergoing necessary reparations, as well as the Chapel Royal. But the greatest of all the contemplated improvements—namely, the draining of the irrigated meadows—has now commenced in earnest, and when completed will be of immense advantage to the health of the citizens. The cut for the drain to accomplish this desirable object, extending from Duncan's-gate, St. Ann's-yards, on the east, to the foot of Arthur-street on the west—a distance of 1,000 yards—is now excavating, and a great many men being employed, the work is proceeding with great spirit. The depth of the cut is twelve feet and the breadth ten feet. The dimensions of the drain to be built within it are five feet in height by two and a half feet in breadth, or thereby. The building of the drain is now begun. Mr. Lind is the contractor for this extensive work. We may also state that the powder magazine, in the Royal Park, is in the course of removal. We trust that the approaching visit of her Majesty to Scotland will have the effect of making the Commissioners of Woods and Forests accelerate their operations at Holyrood, so that our gracious Sovereign, on her subsequent visits to Scotland, may have a residence of her own, instead of being forced to live in the palace (however splendid) of one of her subjects.—*Edinburgh Evening Post.*

PROPOSED MONUMENT IN YORK CATHEDRAL TO THE LATE DR. BEEKWITH.—A special meeting of the members of the Yorkshire Philosophical Society was held last week at the Museum, to take into consideration the expediency of making a grant from their funds towards the erection of a monument to the late Dr. Beekwith, who recently left a legacy of 10,000*l.* to that institution, and which it is said has already been paid. The Rev. W. V. Harcourt was called to the chair, who opened the business of the day by appropriate observations. Dr. Goldie moved that the sum of 50*l.* be granted for that purpose. Mr. Pritchett moved as an amendment, that the sum of 60*l.* be allowed. After remarks from several of the members, C. J. Hanson, Esq., moved that the sum of 100*l.* be granted. Some discussion then took place, and the amendment for 60*l.* was ultimately carried by a small majority. It is expected that this sum will be augmented by subscriptions from other institutions.

BRISTOL DOCK COMPANY.—A general meeting of the proprietors in this company was held at the White Lion, Bristol, for the purpose of taking into consideration the propriety of widening the south Entrance Lock of Cumberland Basin. The recommendation of the directors to widen the lock to 54 feet was adopted. The drawings exhibit a lock of 54 feet in width by 245 in length, capable of admitting a vessel of the length of 211 feet above the water line; or of 237 feet from stem to stern; and with the improvement suggested by Mr. Brunel, by sloping the wall towards the top, a steamer of 62 feet can be admitted. Mr. Brunel is of opinion that the cost will not exceed 22,000*l.*, while to repair the present lock would require 17,000*l.*

BRITISH ASSOCIATION OF ARCHITECTURAL DRAUGHTSMEN.—The town members of this association celebrated their second anniversary by dining together at Freemasons' Tavern, on Monday last, the 2nd instant. In the course of the evening numerous portfolios of valuable drawings, as well as other interesting objects, were exhibited, affording a very agreeable and instructive entertainment to all present.

NEW SCHOOL AT CHILDERDITCH.—Through the exertions of the Rev. J. Lewis, jun., the pastor of Childerditch, a commodious school, in the Elizabethan style of architecture, is building in that parish, from a plan of Mr. Kendall's. Her Majesty the Queen Dowager has graciously contributed 20*l.* towards it, the Right Hon. Lord Petre, a like sum, and the Bishop of London 5*l.*

An immense new workhouse is about to be erected at Leeds, as, in the old edifice, very gross indecency and immorality prevail, in spite of every precaution taken by the officers.

**JOHN'S AND CO'S. PATENT STUCCO CEMENT.**—We are requested by Messrs. Mann and Co., the agents for the patentees, to intimate to architects, builders, plasterers, and others, that they may now see the effect of this valuable material, properly applied, on the west wing of the quadrangle, forming the chief entrance to Guy's Hospital, in St. Thomas's-street, Southwark; and they challenge a comparison with any other cement for beauty of finish, solidity of work, facility of application, and certain durability, being perfectly independent of either paint or colouring. Any plasterer may produce the same effect with this cement, by merely working it according to the given rules, which are so simple, that it would be more difficult to deviate from them than to follow them. We recommend our readers to inspect this practical illustration, which will be of more avail in shewing what this cement really is, than a thousand advertisements, or as many attempts to explain its merits by conversation. Messrs. Mann and Co. will give every information concerning it, on application to them at No. 5, Maiden-lane, Queen-street, Cheapside.

**IRON HOUSES FOR TROPICAL CLIMATES.**—In an early number of this periodical, we gave an account, accompanied by a sketch, of an iron palace, which was lately sent out to the chieftain of Old Calabar. These edifices are, we believe, becoming popular in warm countries, and combine many advantages, especially to the settler or missionary, who above all others ought to be provided with an easily erected and comfortable home. Chapels also constructed of iron are extremely convenient, and might perhaps be made portable for the use of scattered congregations. We have great pleasure in recommending to our friends, either in the West Indies or Africa, for such purposes, the house of Wood, Waygood, and Co., 62, Gracechurch-street, manufacturers of the patent corrugated iron for houses, roofs, sheds, &c., and also of every kind of colonial implements. Our tropical readers may perhaps be obliged to us for pointing out a place which combines very moderate prices with extreme excellence of workmanship, and which, from the character of its managers, offers every guarantee for the satisfaction of purchasers.

**ASPHALTE OF SEYSSSEL.**—The uses of this material are now no longer confined to pavements and footways, they extend to the very pipes underground; it is now employed for protecting the long metallic pipes which run underneath the streets of Paris from the effects of oxidation. These pipes, being covered over with damp earth, become in a very short time so corroded as to be almost completely eaten away by the rust; hence they frequently burst, causing the water to overflow, and interrupting its circulation, thereby occasioning much expense for repeated repairs, to say nothing of the great inconvenience attending them. All this will be obviated by the new system, which consists in coating the metallic pipes with a layer of asphalt one or two centimetres thick; the asphalt being impervious, oxidation can hardly take place. The better to secure this advantage, zinc is substituted for the cast metal, as being less subject to oxidation; and the pipes are screwed together instead of being adjusted end to end. This improvement will effect a great saving in the cost of keeping the water-pipes in repair.—*Revue de Paris.*

**MONUMENT TO GENERAL KINNERSLEY.**—It is rumoured that Mr. Baily, the eminent sculptor, has been directed to prepare a memorial to the memory of the late General Kinnersley, to be placed in the parish church of Leominster, next to the monument of the late Wm. Wall, Esq., of the Ryclands, whose estate the general's family purchased.

**WELLINGTON STATUE.**—A portion of the equestrian statue of the Duke of Wellington, about to be erected in front of the Royal Exchange, Queen-street, has arrived in town, and the remainder is daily expected.—*Glasgow National.*

**EARL DE GREY.**—A subscription is being raised in Dublin for a marble bust of the late Lord Lieutenant. The bust is to be placed in the rooms of the Royal Dublin Society.

Bayley's statue of Sir Astley Cooper has been placed in Westminster Abbey.

**EXTRAORDINARY SALE OF LAND.**—A small estate, of about 88 acres, situate at East Dundry, in the county of Somerset, for nearly a century past in the occupation of the present tenant and her ancestors, and let at present for about 95*l.* per annum, was sold by auction at the Commercial Rooms, by Messrs. Fargus and Son, for the sum of 4,990*l.*, exclusive of the auction duty and expenses, being more than fifty-four years' purchase on the rental!

**DARTFORD.**—In the river Darent, near the spot where Mr. A. Dunkin imagines Cæsar hoped to attack the city of Caswallon, was found last week a beautiful flint celt. At the broad edge it is as sharp and fit for actual use as when it was finished by its primeval makers.—*Dover Chronicle.*

**DOWLAIS IRON WORKS.**—It has been stated, on pretty good authority, that the Dowlais Iron Company have at present as many orders on hand as will keep that establishment with all its irons in the fire for seven years to come.

Dr. Arnott has invented an air-pump to supply a draught to furnaces, and supersede the necessity of chimneys in factories, steam-vessels, &c. The invention also forms a powerful ventilator.

Jones	134 10 0

NOTICES OF CONTRACTS.

For Paving, Pitching, Cleansing, and Lighting the City of Bristol for three years, commencing September 29.—Commissioners' Offices, 44, Queen-square, Bristol. Sept. 16.

For Building a New Church at King's Cross, Halifax.—Plans and Specifications at the Offices of Messrs. Craven and Ranken, Solicitors, Halifax, until the 14th September. September 16.

For a National School and Master's Residence at Lofthouse.—Plans and specifications at the Offices of Messrs. Perkins and Backhouse, Architects, Leeds. September 18.

For Paving several of the Unpaved Streets, in the Parish of St. George-in-the-East.—Drawings and specifications at the Office of Mr. Andrew Wilson, jun., Cannon-street Road; Mr. W. L. Howell, Clerk to the Commissioners, Cannon-street, Ratcliffe-highway. September 19.

For about 8,000 Beech, Elm, Fir, or Larch Plies, also for Sheet Piling and Planking of the same description of Timber, at per cubic foot, for the Directors of the Dock Company at Kingston-upon-Hull.—Mr. W. H. Hulham, Secretary, Dock Office, Kingston-upon-Hull. September 21.

For a Wash-house for the Hospital Wards at the Union Workhouse, Newmarket.—Plans and specifications, Mr. Francis Clark, Architect, Newmarket. Mr. W. P. Isaacson, Clerk to the Guardians, Newmarket.

For the Execution of the various Works in the formation, ballasting and laying the permanent way of the Canterbury, Ramsgate, and Margate Branch Railway.—Plans and specifications at the office of Mr. Joseph Cubitt, Civil Engineer, 12, Manchester-buildings, Westminster; Mr. J. Whitehead, Secretary, South-Eastern Railway, London-bridge. September 24.

For an Iron Palisade Fence on the boundary wall of the Southampton Cemetery, two Iron Entrance Carriage Gates, and one Footway-gate.—Specifications, with a plan of the Iron Gates, &c., Mr. Doswell, Surveyor, Alhion-place, Southampton. Mr. C. E. Deacon, Secretary, Audit-house, Southampton. September 25.

For the building of the new church at Lynn.—Plans, &c. Mr. Thew, Bookseller, High-street, Lynn. 1st October.

For various buildings and other works at Gateshead, Brockley, Whins, and other places along the line of the Newcastle and Darlington Railway.—Plans and specifications at the Railway Office, York, from the 16th to the 30th September. Mr. G. Hudson, Chairman, Railway Offices, York. October 2.

For 16,000 Larch or Baltic Sleepers, of various dimensions, for the Ashton, Staley-bridge, and Liverpool Junction Railway.—Secretary, at the Manchester and Leeds Railway Office, Palatine-buildings, Hunt's-bank, Manchester. October 8.

For the Sinking and Walling of one or three Wells, three Reservoirs walled and puddled, one large cesspool, and a large quantity of earth removing.—Mr. John Child, Architect, 20, Guildford-street, Leeds.

A new Iron Wheel and Forhy, at Bourne Brook Mill, Northfield.—Plans and Specifications at the Office of Messrs. Arnold, Haines, and Arnould, Solicitors, Birmingham.

COMPETITIONS.

PREMIUM of 20l. for the chosen Plan for a new Church at Winchester, to hold about 1,000 persons on the floor, cost not exceeding 4,000l. Further information from Rector. 10th October.

ADVERTISEMENTS.

TO BUILDERS, CABINET-MAKERS, AND OTHERS.  
**SALISBURY GLUE** 60s. per Cwt.; fine building is Scotch do. 50s.; Town do., 48s., and 42s.; Best Glass Paper 104s.; Second do., 94s.; French Polish and Spirit Varnishes 19s. per gallon; Naphtha do. 10s.; Genuine White Lead 26s.; Second do. 21s. and 22s.; Improved Stucco Paint 28s.; Invisible Green and Chocolate Colour 28s.; Fine Green, and all Colours used in House Painting, prepared by a new process to dry in six hours, 6d. per lb.; Turpentine 2s. 6d. per gallon; Linseed Oil 2s. 6d.; Fine Copal Varnish 20s.; Quick Drying Carriage 12s.; Oak do. 12s. and 10s.; Paper 15s., 10s., and 6s.; Turpentine Varnish 3s.; Dry Brunswick Green 3d., 4d., and 6d. per lb.; Lamp Black 3d.; Emerald Green is, and is 3d.; Whiting is, 3d. per cwt.; Stockholm Tar 18s. per barrel; Pitch 16s. per cwt.; Gillet's Machine, Ladders, Bronzed Metal, Patent Gold Paint, Dies and Old-woods, Acids, Alkali, Gums, and Salts of every kind and description at equally low prices. W. NIXEY'S Old Established Warehouse, 22, MOOR-STREET, SEVEN-DIALS, LONDON.

**TO BUILDERS, PLASTERERS, AND OTHERS.**—Yellow Ochre, 3s. per cwt.; Lamp Black, 24s.; Blue Black, 16s.; Venetian Red, 12s.; Chrome Yellow, 42s.; Brunswick Green, 24s.; Emerald Green, 1s. 2d. per lb.; Glue, 42s. per cwt.; Patent Driers, 46s.; Best Ground Lead 26s. per cwt.; Second do., 21s. per cwt.; Third do., 21s.; Linseed Oil, 2s. 6d.; Turpentine, 2s. 3d.; Gold Size, 9s.; Copal Varnish, 12s. and 16s.; Paper do., 11s. and 14s.; Brushes, Varnishes, Colours, lowered with Rattled Crown, Cheap Colour and Lead Warehouses, 58, JUDD-STREET, NEW-ROAD.

**PLUMBERS, PAINTERS, BUILDERS,** and OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c., &c., for Pictures, Glazing, &c., &c., in any quantity. At Manufacturers' Prices.  
 TURPS, per gallon . . . . . 2s. 4d.  
 LINED OIL, ditto . . . . . 2s. 4d.  
 SHEET LEAD, in sheets, per cwt. . . . . 18s. 6d.  
 Oil, in casks, as per PIPE . . . . . 19s. 6d.  
 WHITE LEAD (Genuine) per cwt. . . . . 26s. 0d.

Colours, Pipe, Brushes, &c., &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to R. COGAN, 5, Princes-street, Leicester-square, London.  
**PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS,** can be provided with Rattled Crown, flattened Sheet, and the patent Sheet Plate, Lists of which, showing the price for any Square, from 14 by 12 to 40 by 30 of Best and Second quality, will be sent gratis upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for, if required.

**NURSEYMEN, MARKET GARDENERS, AND OTHERS** requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in the Kingdom.

**COMMON SHEET AND CYLINDER.** The advantages of Common Sheet over Crown for Glazing Sky-lights is decidedly great, and is generally used where strength or superior appearance is required, a light 6 feet 6 in. long, with openings of any width, needs only one lap. This Glass is considerably stouter than Crown, and may be had in 1s. 3d. per foot.

Also may be had, **COGAN'S PATENT CHIMNEY FOR GAS OR OIL,** which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

**LAMP SHADES AND GAS GLASSES,** OF EVERY DESCRIPTION.

**GAS CONTRACTORS, FITTERS, GLASS MERCHANTS** and others, supplied with nearly 600 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

**CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS,** supplied with FRENCH ORNAMENTAL SHAPES, for covering Models of Public Buildings, Geological Curiosities, &c., &c. of all sizes and shapes. List of Prices may be had on application to the undersigned.

French Table Flowers, China Vases, Fancy Glass Vases, and Alabaster Figures in every variety.  
 R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Bazaar keepers and others.

**SEYSSAL ASPHALTE COMPANY.**  
 "CLARIDGE'S PATENT," ESTABLISHED 1838.

This ASPHALTE is a Bituminous Limestone, obtained from an inexhaustible Mine at Pyrmont, in the Jura Mountains. Previously to its introduction into this country, in 1838, the Material had been used for many years in France, and from its great utility was extensively patronized by the Government of that Country.

Among the various uses to which it can be applied, the following may be enumerated:—For Road Pavements, public and others; in the Carriage Approach to Mansions, and other walks, and Terraces; the flooring of Kitchens and public basements offices; also of Cook Houses and Stables, Dog Kennels, Barn Floors, Flower Boxes, Figerias, Postery Houses, Tun Rooms, and Matings. For Roofing, Covering of Railroad and other Arches, the Lining of underground Galleries near Rivers to prevent the ingress of the Tides; also in covering the ground-line of Walls, to prevent damp rising (this application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts), thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Docks, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARELL, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," Stangate Ocept, London.

**COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS.**

THE DIRECTORS of the SEYSSAL ASPHALTE COMPANY have much pleasure in recommending to the notice of Architects, Builders, and others, the application of the ASPHALTE OF SEYSSAL as the only effectual means of preventing DAMP IN WALLS.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18.

"In 1839 I superintended the construction of a house of three stories on the Rue d'Enghien. The foundation of the building is constantly in water, about 19 inches below the level of the ground-floor. The entire horizontal surface of the external and internal walls was covered, at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

"Since the above date no trace of damp has shown itself round the walls of the lower story, which are for the most part painted in oil of a gray stone colour. It is well known that the least moisture produces spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 24 inches above the external surface of the soil, and only 19, at the utmost, above that of the sheet water.

"The layer of Asphalt having been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp have been since remarked at the base of the door-posts."

PAYNE'S PATENT PROCESS FOR PRESERVING AND IMPROVING WOOD.

**RAILWAY CONTRACTORS, BUILDERS, AND JOINERS** are requested to investigate the above. A liberal Discount allowed. Applications for Licences to P. PAYNE AND LODGE, Whitehall Wharf, Canon-row, Westminster;

Or at their other stations— Fleetwood-on-Wyre, Lancashire; Walsby, Cambridgeshire; Will be immediately attended to.

**BASTENNE BITUMEN COMPANY,** Offices, 31, Poultry. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in the erection of buildings, &c. Its application is a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot square:— 1 inch thick, 8d.; 2 inch thick, 7d.; 4 inch thick, 6d. Works not measuring 400 feet, 1d. per foot extra. Roofing executed at 6d. adapted to either inside or outside, or made in addition according to the thickness when required. Carriage and men's time are charged extra when works are executed beyond three miles from the General Post-office. Bitumen 2d. per ton, without gut. Bituminous Mortar, &c. CHARLES F. TILSTONE, Sec.

**WINDOW BLINDS.** TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHERS.

F. A. DE WILDE, (late Mills and Co. Wilde), 73, WELLS STREET, OXFORD STREET, LONDON, MANUFACTURER of the much-admired SPANISH BLIND, VENETIAN SHADES, adapted to either inside or outside, or made in general use. Blinds for Shop-fronts, Spring Roller Blinds, improved Principle. PATENT ROLLER BLINDS, Mounted with the newly-improved Scotch Furniture.

PATENT WOVE WIRE BLINDS, DWARF VENETIAN BLINDS, &c. Verandahs to any Design. Transparencies, and every description of Sun Blind, of the most improved principle, and of the very best workmanship and well-seasoned Materials.

F. A. De Wilde begs to observe he pays particular attention to the manufacture of Blinds for exportation; he also invites all parties to visit his Establishment, or visit, where they may see every description of Blind in use. Holland Blinds Cleaned, Calendered, and re-made. Venetian Blinds Painted, Taped, and Lined. Estimates furnished. N.B.—Old Blinds renovated and made equal to new.

**MOREWOOD'S PATENT GALVANIZED TINNED PLATES.**—Patronized by the Admiralty and the Honourable Board of Ordnance, being extensively used by the Army and the Navy, at the Tower and elsewhere for every variety of ROOFING, and other purposes, where a strong, light, cheap, and durable material is required. It has been found by experience that this article is beyond all comparison superior to zinc, possessing, as it does, all the advantages arising from the strength and firmness of iron, combined with perfect immunity from rust; whilst it is free from the very serious objection, which applies to zinc, viz. its contraction and expansion, consequent upon every change of temperature, and from which circumstance leakage must of course result. This material is not likely to be destroyed by fire, as in the case with zinc and lead, which melt and run down, thus freely admitting fresh air to the fire, and causing it to burn more fiercely. It is, therefore, obviously well adapted for all the purposes above named, and is most especially so, when there is the possibility of fire. It is also peculiarly suitable for chimney-tops, gutters, spouting, and out-door work generally, possessing the strength of iron and its liability to corrosion. It is by far the most economical metal roofing that can be obtained in consequence of its strength, as it may be laid without boards, and upon the lightest rafters. This mode of preserving metal from rust does not only apply to sheet-iron but also to manufactures in iron in any form, as bolts, nuts, hinges, nails, &c. &c. T. Holland, 34, Gracechurch-street.

**PATENT TUBULAR CHIMNEY FLUES, IN POTTERY OR IRON STONE WARE,** brought into use for the purposes of SECURITY AGAINST FIRE, CONVENIENCE OF SWEEPING; ECONOMY OF HEAT and FUEL, improvement of the draft, with facility and promptitude in construction and durability, being an entirely new structure of chimney.

These Flues or Earthen Tubes are formed in lengths of about 18 inches, and are built in the solid wall, so as to obviate the necessity of projections within the rooms.

Being smooth inside, there is very little adhesion of soot and being circular, the draft is much accelerated, besides that the operation of cleaning is most simple and effectual. No rapping is requisite, the necessity for chimney-pots or cowls is totally avoided.

Thus the provisions of the Act for sweeping by machinery are met; and perfect security against Fire through chimney flues is obtained. The process of sweeping is effected by dropping a plumb and brush from the top down each flue, which at one pass will remove any soot that can be deposited.

Descending Flues carry the soot and ashes downward, from every chamber to the basement, by one duct, into a reservoir, to be thence removed without soiling the chambers. Provision is made also for ventilating rooms with warm air, and to carry off the effluvia of heated apartments.

The PUBLIC is cautioned against the spurious imitation of these PATENT FLUES, the sale of which is limited to this house.

For particulars and evidence of plan apply at Ehury Wharf, Grosvenor Basin, Finsbury, where Licences may be had.

Circular Chimney Tubes 18 and 20 inches long.— For Attic and 6 inches in diameter 6d. price per foot run. Bed-room Flues 7 inches do. 7d. do. 8 do. 8d. do. 9 do. 9d. do. 10 do. 10d. do. 11 do. 11s. 4d. do. 12 do. 12s. 4d. do. 13 do. 13s. 4d. do. 14 by 9 do. 14s. 4d. do. 15 do. 15s. 4d. do. Circular Bent Tubes, 7 1/2 inches in Diameter 15. 0d. price each. 9 do. 12. 4d. do. 12 do. 2s. 9d. do. 14 by 9 Oval 2s. 6d. do.

# The Builder.

NO. LXXXV.

SATURDAY, SEPTEMBER 21, 1844.

**S**OMETIMES we have been asked what we strictly mean by the term Freemasonry, so often adopted by us, and apparently in a sense so very different from that in which the word is most generally used at the present day; and our inquirers seem unable to divest themselves of the ideas of certain frolicking, dressed-up, well-feasting, good-fellowship-lovers, charitable to their brethren, stately enough at the festive board, and who have found out the

secret of knowing nothing whatever concerning stone-masonry or of any other of the arts by which buildings can be plotted, reared, and made to endure.

Our answer is, Freemasonry is what it always used to be, and what it can alone truly be,—the sublimest science applied to architectural design and practical building.

The decayed remnant of the Freemasons have traditions that Moses, Solomon, Wvkhiam, and many patriarchs who were great builders, were Freemasons; this may be or may not be true; and till it be proved that those characters who are mentioned in the Bible, without any such information relative to them, were so, we must take as entirely rabbinical all such assertions; and we think those clergymen, who knowing how cautious it is necessary for a divine to be in matters of belief or of sacred history, must be gifted with strange consciences or extraordinary mental perceptions to give into assertions so unproved, and of which men can hardly exhibit a belief, without falling into condemnation for heresy; we do not wonder, therefore, that the Pope should have thus so condemned the modern so-called Freemasonry, since the whole of Catholicism contains in its dogmas nothing so hazardous.

It is reported that Sir Christopher Wren reinstated Freemasonry in England; and well he might; for since the fall of the old Freemasonry, no other man has existed so intimately acquainted with the subject; but how would that great man be mortified to find the fall of his darling art, as it is at present found in England! Freemasonry has been said to flourish in the nineteenth century, and yet, through the decline of the true art, buildings have become unsound, tearing themselves to pieces by their own gravitation; the engineers in their works are restoring the art partially, but with little of the beauty and economy of the old masons; few of their works approach the grace and wise thriftiness of the old examples of the middle ages; there are, it is true, many industrious persons at work, measuring, delineating, and collecting examples, so that by-and-by our reasoning powers will be able to collate them and to ascertain motives, and thence to design in the true spirit of Freemasonry; there is no mere surface-work

in masonry, all is muscle and bone; there is no mere lumber; all the material of a masonic building is dutiful in its station; tons of weight are not raised to do mischief, and tons more of other weight to restrain that mischief, and so leave no result but cost and foundation-burthen; but dynamics, and all the higher sciences, were called into action, and in proportion as these excel the ancient times in many arts and sciences, just so should modern excel ancient Freemasonry. Some minds are at work, even in the present immature condition of our knowledge of the structure of ancient buildings, to re-arrange and render again active ancient architectural science; but this must of necessity be the work of years, for little can at present be done beyond such collection and collation: no one has hitherto published so apparently simple a piece of information as a representation of a prism composed of a succession of such materials as will have equal capability throughout of resisting crushing, the densest being lowermost, and those least capable of bearing being uppermost: nor has any one shewn the proper form of a body composed all of the same kind of materials, which shall have its particles equally crushed throughout: very slender information exists as to the alterations in the capabilities of different kinds of materials when increased in bulk, whether laterally or vertically; this information settled and made notorious, will form the ground-work of restored Freemasonry. After that, a knowledge of dynamics will work the greater part of the rest, a principal component part of which must of necessity be a due acquaintance with the catenary, either approaching purity or in a broken state, whether by the effect of bosses, pinnacles, or any other expedients or devices, or from any unavoidable circumstance.

The climax of architectural knowledge will be, the so ordering a building, that there will be such a total discharge of lumber from it, that its curves, arches, vaultings, roofings, piers, columns, buttresses, and every other part of it will remain as nearly as possible where they are designed to be, and where actually placed,—which cannot be the case unless the whole building, if only strung together and inverted “bodily,” would retain every position, form, and curvature, as designed—the mere circumstance of inversion excepted: many of these things can be proved by the bones of animals: the bones of four ox tails strung together and inverted will prove a vast deal relative to the forms, and the quantity of materials proper for groined vaults, and will shew the difference of curvature necessary in proportion to the size of the central boss: if that boss be heavy, which may be shewn by tying the tails together at some considerable distance up from their small extremities, the extraneous weight thereby cut off, will occasion the curves to be straighter than if only a small boss were used, this shews the theory of steeples of four flying buttresses, like those of Newcastle-on-Tyne, and Saint Dunstan, London; the former of these has less superstructure, and buttresses very properly more embowed; the London example, though in minute detail less elegant than the other, is of much finer outline and general form, having a loftier superstructure, its four flying buttresses are consequently made much less embowed. If the four buttresses of the Newcastle example had been less bowed, the structure would have been out of balance, and they would consequently have fallen inwardly; if, on the contrary, the buttresses of Saint Dunstan’s steeple had been more embowed, the lofty superstructure would have sunk, because

the pressure would have fallen *within* the buttresses, and they would have consequently been forced more outwardly, till the whole would have fallen. These steeples, which have been supposed to have much mystery involved in their construction, are nothing but the four angle-ribs of the simplest description of groined vault, designed in such form as to balance properly with a large boss; they are simply vaults discharged of the cuticle lumber-work, which, in ordinary cases, lies between their angle-ribs. The example of the ox-tail bones will also shew one fact, viz., that in proportion as the burthen to be commenced with is great or small, so must the summit of the arch commence large or small in bulk of section: so that, using the tails for a model, and pinching off by a ligature as much of the smaller parts of the tails as will represent the burthen to be supported, the remainder of the tails will shew the necessary commencing strength, and its proportion throughout the work from thence downwardly.

Eventually it will be found that a church should consist of a series of pyramids of equilibrated pressure, disposed at uniform distances; these will be split at certain points to form buttresses, columns, vaulting-ribs, and all the other parts of the fabric without the intervention of a single particle of any material other than that composing each such equilibrated pyramid of pressure; thus each particle of such fabric will be as safe from fracture as each other particle of it.

In the New Metropolitan Building-Act some approach has been made to this branch of Freemasonry, by the adoption of a system of progressive thickness in walls from their summits, downwardly. In a perfectly designed chureh, such a progression should go on from each summit-boss to the foundation of the work, so that, beginning at the foundation, the bulk of the materials should scientifically diminish upwardly; and where flying-buttresses and vaultings commence, the same mass should be divided and proceed through the several vaulting ribs upwardly; and if any irregular extra thickness be required for any part, nature should be followed, who in such cases, in animal mechanism, always uses a material of a structure less dense, the aggregate strength of which is only suited, though of increased dimension, to the duty to be performed. Hence, in such cases, the Freemasons frequently used only chalk, tophus, or other light materials. In proportion as Freemasonry is restored, all the nonsense about roofs and construction which is being put forth in the saucy, ignorant pamphlets of the so-called Cambridge Camden Society, will be dissipated. There is not in existence, and never was, a perfect open tieless roof; science *may* make such a thing, but it never did yet. Nearly half of them destroy at least half the effective strength of their supporting walling, upon which they make war. For such a roof to maintain its due form, it must in design and model be inverted, as we before intimated, and the walls must be inverted too with it; the work will then assume, upon being erected, a state of permanent rest; but it will then be found that the walling has assumed a curved form; for want of this curved form the walls of all buildings with open roofs are invariably thrust over. In Westminster Hall, where the building is nearly literally all roof, the stumpy walls of enormous thickness, notwithstanding the enormous flying and perpendicular buttresses of the fabric, were greatly thrust over, which has been concealed by internal and external

stone casing, and the falling of the parts of the roof, by straining at its joints, has been partially remedied by screwing up and repairs.

In the violent papers upon architecture in the *Catholic Dublin Review*, every thing is shewn with the most childish reversal of genuine Freemasonry; flying buttresses are generally omitted, and the whole construction, as shewn thereby, is the weakest and most absurd, and that which is the most diametrically opposed to genuine architectonic art, while not a few of the mere surface-parts of the designs are highly exceptional.

Freemasonry being in so comparatively lost a state, as we have already binted, the observations which we have made must necessarily be most imperfect; they are rather directed with the view of exciting inquiry than with the object of teaching any one. Most of these imperfect notions have come intuitively to us, for there is not at present any treatise upon Freemasonry: when we have such a treatise, the system of church-building will be entirely altered; canons for every thing will be established; centres for the best or the most intricate vaults may be kept ready-made; for the same centres may serve for churches of the same size, and thus one of the heaviest parts of the expense of vaulting will be saved. All the rules of the Church-building Society will be altered and improved, many of them being at present most objectionable, more particularly the late alterations relative to the construction of churches.

#### NEW BUILDING-ACT.

A meeting of the Master Carpenters will be held on Wednesday, the 25th instant, at the Freemasons' Tavern; when the final report upon the new Building-Act will be laid before the meeting. We shall endeavour to place this before our subscribers on the first opportunity.

#### MINERALOGY.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 467.)

The microscopical discoveries of Ehrenberg have contributed to establish the identity of chalk with animal organizations, but, like all microscopic observers, he falls into many strange errors and inconsistencies, and by generalizing too much, sometimes throws a doubt upon the whole of his purported discoveries. That much of the chalk consists almost solely of the carapaces of animalculæ cannot be questioned, and it was to this organic origin of chalk I first drew the attention of this learned professor while making his philosophical observations in Egypt and Nubia: but, he evidently confounds the cellular structure of the animalculæ with the cellular structure of all calcareous animals; for all polypes, mollusca, and crustacea have a cellular structure, all are convertible into chalk, and all, under the form of chalk, microscopically present the cellular structure to our observation. That he is mistaken when he speaks of the vast peat mosses, twenty-three miles from Berlin, as being composed of animalculæ to the extent of thirty or forty feet in thickness, is evidenced by the fact, that these lower beds chiefly consist of decayed fuci, as is testified by Humboldt and Van Buch, and the former found the *Fucus Sacharinus* in inner peat moss from 8 to 10 inches in length, and from 1 to 1½ inches in breadth, as fresh and uncorrupted as they are found in the sea at Heligoland: the latter writer also observes, that in the vicinity of Drontheim, the flat peninsula of Cereland consists also of a great peat bed, of which the undermost strata are composed almost entirely of half-decayed marine plants, the long leaves of *zostera* and others. It is true that, together with the de-

cayed fuci of earth of marine plants, the relique of animalculæ abound, and that their internal arrangements can be made visible by the process adopted of feeding them with colouring substances; but it is equally true that he has mistaken the cellular structure of fuci, actiniaz, &c., for distinct animalculæ.

The calcareous deposits disposed beneath the tropics, both beneath and above the waters, answer exactly to the chalk formations of Great Britain, and present the like variations, evidently proceeding from like local causes: the ocean marl so commonly observed in the West Indies is also of like composition and character, being a true chalk, with which is blended masses of living fuci and animal species, and the organic remains of each. In all parts of the world, where the causes of effects are in active operation, an uniform sequence of events takes place, beginning with life, and ending in the various products forming the fossil and mineral kingdom. Several writers have supposed that this marl or chalky substance, so commonly constituting extensive beds of tropical seas, is produced by the digestive processes of animals; and this indeed is partly the case, as vegetable earth is sometimes formed by the like processes, but a great portion of it is the product of animal and vegetable decomposition.

In the ocean it is a kind of chalk, variably united with sands, marine bodies, and seawater; but these vast beds, as they gradually become elevated above the waters, so they undergo changes in conformity to their nature, local associations, and local influence. Thus, some of the calcareous groups consolidate as limestone, others decompose, and acting and being acted upon by surrounding bodies, undergo individual or general changes. Take for instance the phenomena of the Red Sea, the chains of mountains surrounding it, and intersecting Arabia, the deserts of Nubia, Egypt, and other great wastes of Africa, together with the vast forming reefs and islands of that sea: in one place we observe the coral in every stage of decomposition, pass gradually into various mineral forms, as sulphate, muriate and carbonate of lime, silica, bituminous limestone, siderite, jasper, &c.; in another, changes are more uniform and circumscribed. Some of the coral islands consist almost wholly of limestone rock, presenting various states of induration, others consist of the comminuted particles of shell-fish and relique of testacea gradually converting or already converted into silicious bodies, disunited, or in aggregate masses, as the accident of combination may determine; beaches of the sea are wholly composed of the shells, sands, and particles recently thrown up by the waves; but vast bill and mountain masses wholly consist of carbonate or sulphate of lime—the carbonate as chalk, the sulphate as gypsum.

In the midst of deserts 100 or 200 miles from the sea, the limestone, calcareous, and chalk ranges are found covering the plains to a great depth, or otherwise forming hill and even mountain chain of considerable extent. The hills marking out the boundaries of Egypt are sometimes wholly composed of chalk and marine exuvie, sometimes stratified with alternate layers of chalk and petrified shells, analogous in form and composition to the stratified beds of chalk and flint in this country. Sometimes the matrix of decomposed coral forms a soft carbonate of lime, and the enclosed shell-fish are seen passing, by the slow process of decomposition, into chalk. In all countries the causes and effects are precisely alike so far as regards the primary origin of these beds; but the after changes depend for the form they may assume upon local affections. In America the chalk formations have passed into the state of bituminous and other limestones, or varieties of sulphate of lime; in England, where there is less heat and a greater degree of moisture than in tropical lands, the matrix of soft carbonate of lime passes into the state of chalk, and the nodulates or organic relique inclosed pass into flint. If in chalk aggregates the carbonic acid be displaced by sulphuric acid, it becomes gradually converted into gypsum, other deviations exhibit alabaster and other crystalline marble, anhydrous selenite, &c.

Gypsum or selenite, otherwise termed sulphate of lime, is very extensively disseminated through the upper beds of the earth under a variety of forms and combinations, being in general most abundant in close proximity to

salt beds. Of this genus, two species are known, viz. the *prismatic* and the *acrefragible*, the first being divided into four sub-species, the latter into six sub-species. Sulphate of lime is produced under particular local influences, and however extensively disseminated the local causes of effects produced strongly simulate to each other.

After the changes above explained, oceanic earths, upon being exposed to long continuous vertical heat in regions where it seldom or never rains, become oxydated, or, as it is termed by some chemists, burnt, by which process they lose some of their primary constituents, permanently combine or neutralize with others, and dispose the oxydated mass to unite with the gases and vaporous exhalations which pass through it from the inner beds, or are absorbed from the atmosphere. One of the most common exhalations in hot, dry regions and virgin lands is sulphureted hydrogen, and lime uniting with this gaseous compound, a fixed and permanent result is produced termed ANAHEDRITE. Again, where hydrogen is present in greater quantities, a triple compound is the result, known as SELENITE or SPARRY GYPSUM. Sometimes sulphureted hydrogen or sulphurous gas passes through the dry calcareous beds, and the chemical action consequent on this intrusion gives birth to rock gypsum in its varieties.

It is generally supposed, nay it is taken for granted, that all the varieties of limestone are formed under great lateral pressure; but the facts elicited from Nature by observation give the decided negative to this theoretic idea. The change from chalk into marble is produced by simultaneous expansion of its particles produced by chemical action, and this change almost invariably takes place in beds very superficially disposed upon or within the surface of the earth. The formed crystal increases and cohesion of the particles takes place by infiltration, and the more exposed a bed of earth is to atmospheric influences, the harder the rock becomes; this is the very reverse to the process of lateral pressure. Jaspers and petrifications of the desert are much harder than flints in the British strata. The high crystalline structure of all rocks depends upon the extent of their exposure to atmospheric heat, and such is the law governing natural cements. Thus sands and gravel cohere and form breccia, and breccia exposed to atmospheric influences becomes converted into gneiss, granite, &c.; in no one instance do we find them subject to lateral pressure during the progress of change.

Lime has the tendency at all times to assume the form of chalk, having a great affinity for carbon, and absorbing it rapidly from the atmosphere as well as from the contiguous beds; for this reason it is that carbonate of lime is more extensively distributed over the calcareous regions and diverges into more numerous varieties than any other class of earths.

The after changes of an organic body, or a group of calcareous animals, excites at once our wonder and admiration; if embedded in ocean marl, they may decompose, and become identified as one with the marl, or uniting with other aggregate masses, their identity be lost in enormous masses of rock. Elevated above the element which gave them birth, they are preserved from decomposition by the salts left by evaporated waters, and they enter the petrified state, passing from thence into the form of jasper, agate, opal, carnelion, or some other product. Decomposing in the midst of the calcareous bed, they pass from the organic state into chalk, from thence into flint, or some other mineralized substance; they sometimes contribute to give variety and beauty to marbles, porphyries, and other precious stones; sometimes they mineralize, still retaining their form as a metalline substance. Again, the body may pass through other organic systems, contributing by this means to the increase and spread of life; or decomposing, it may destroy and become the grave of the living.

In Egypt, the hills have generally a matrix of soft limestone, and the fossils are converting or converted into chalk; in England, the matrix, permeated by waters, impregnated with carbonic acid, becomes converted from soft limestone into chalk, and the chalk nodules silicify as flints; in all these changes we observe traces of a beginning, and causes and effects, and effects and causes, succeeding each other; but we cannot dive into

urity, and tell what shall be the end of these manifold and in many instances inexplicable changes.

What becomes of the wild theories of Liebig, when we rightly consider the phenomena of the fossil and mineral kingdoms? Animals and vegetables are incessantly employed in elaborating consolidated matter, abstracting their material from the elements of air and water; they die, but their labours survive them; they have added to the earth during the whole period of their existence, they now in death contribute their bodies to its further increase, and as though still animated, they still go on abstracting gaseous, ætiform, or fluid matter from the medium in which they are placed. Look at the earth in which you daily tread, what is it but the relics of once living generations, inhabiting land or waters? The organic beds, absorbing oxygen from the atmosphere, become more dense in their structure, or changing in their atomic disposition and combinations, turn into things of another name and nature. Chains of mountains are wholly composed of organic exuvie of the ocean, and the vast plains built up of this material are covered by perhaps equally vast accumulations of animals and vegetables of the dry land, of lakes, rivers, and streams. To oxydate the vast surface beds, to convert farinaceous chalk into other and more ponderous bodies, to effect a continuous absorption of the elements of air and water, to the incessant and positive loss of the latter, nor are there any analogous processes by which these elements in their quantities can be replaced.

The chalk ranges of Europe are very extensive, constituting a vast portion of the superficial soil; they attest, not only to the high antiquity of the strata, but also exemplify the means taken by Nature to attain the end. When we observe a reef of coral or bed of calcareous earth forming beneath tropical waters, we cannot fail to identify the continuous increase of the earth with the continuous increase of life. We acknowledge genera, orders, and species in their various stages of decay and change, or preserved from the one or the other, maintaining their characteristic form and qualities through amazing long intervals of time; the reef, or land above the waters, presents to us the same composition and character at whatever elevation it may be, assuming gradually forms, and entering into combinations differing somewhat from the preceding, from the circumstance of being placed in another medium, and consequently the passive subject of other action manifest upon them, but there can be no mistake as to the identity of origin. Again, we find them disposed within cold and temperate regions, where they never could have existed in their living state, and forming the entire earth appropriated to the uses of man: sometimes in no respect differing either in genera, orders, or species from the now inhabitants of tropic seas; at other times presenting varieties which elicit our admiration, and create endless conjectures concerning the epochs in which they lived, and the causes of their removal from climes within which alone they could have existed.

(To be continued.)

#### BRITISH ARCHEOLOGICAL ASSOCIATION.

The first meeting of a new society called "The British Archeological Association" was held at Canterbury on Monday, the 9th inst., in the Town Hall of this fine old cathedral city. "The chief objects of the meeting," we are told in the printed prospectus of the general committee, "are to promote a personal intercourse between antiquarian and historical inquirers who reside in different parts of the country and abroad, and to afford a week's amusement and instruction by the reading and discussing of papers on antiquarian and historical subjects before the different sections, and visiting and examining together the antiquities of the locality."

The first place selected was Canterbury, a city rich in its antiquities, possessing a fine cathedral, exhibiting a long series of successive changes in the historical features of Gothic architecture, with many buildings fast going to decay, or more speedy ruin, under the hand of ignorant restoration, with many interesting churches in its immediate vicinity, and adjoining

ing downs, abounding in the rude grave hillocks—the Saxon barrows of English antiquaries.

The meeting was divided into four sections; 1. Primeval, 2. Medieval, 3. Architectural, and 4. Historical. The architectural section met on Wednesday evening, when the president, the Rev. Robert Willis, Jacksonian Professor of Cambridge, read a translation which he had made of the account of Canterbury Cathedral, written in 1174, by one Gervase, a monk of Canterbury. He exhibited at the same time a block plan of the Cathedral, and contrasted as he went on the building described by Gervase with the building as we now see it. His style of delivering his matter and his manner were equally pleasing. A communication from Mr. Repton was read, containing some remarks on Roman and Saxon columns, and Mr. Godwin exhibited a curious collection of masons' marks, which he had copied from the cathedrals of Cologne, Strasburg, Gloucester, and Canterbury. He had found, he said, the same marks in use in all countries, they were still fresh on our cathedral walls, and in a conversation with a mason, that morning at work in the Canterbury Cathedral, he found that many masons (all who were Freemasons) had their mystic marks handed down from generation to generation. The mason he, Mr. Godwin, had conversed with, had got his mark from his father or master, and he again from his father or master.

The Rev. Mr. Hartshorn read a paper on the castles and military antiquities of Kent, and Mr. A. Booth gave a description of a triangular bridge, and a stone on which was an unknown inscription at Crowland, in Lincolnshire. The proceedings of the day terminated in a *conversazione* at the assembly-rooms.

#### NEW CEMENT FOR BUILDERS.

MR. AUSTIN, of Hatton Garden, has recently taken out a patent for "a new method of gluing or cementing certain materials for building and other purposes." The mode of manufacturing and applying it is thus described in the specification:—

"The cement used by the patentee is made by mixing India-rubber with cold naphtha, in the proportion of eight ounces of India-rubber cut into small pieces to each gallon of naphtha, stirring it from time to time until the India-rubber is dissolved; then to one part by weight of this mixture two parts of lac are added, and the whole is thoroughly blended together by the application of heat, accompanied with occasional stirring. When greater elasticity is required, a larger proportion of the India-rubber solution is used; if greater hardness is necessary, a larger proportion of lac is employed; and where the India-rubber would be liable to injury from great exposure and pressure, a much less proportion is used, and it is sometimes dispensed with altogether; asphalt, pitch, or resin, or other materials of that nature, may in some instances be substituted for the lac.

"The materials for building purposes to which this cement is applied are slate, tiles, stone, glass, and metal plates. When being used, the cement is kept in a heated state in a dish or vessel containing a narrow trough, termed a stamper, which slides up and down therein between guides; the slate or other material is brought to the heat of 150 degrees Fahr., and placed upon the dish, and the stamper being then raised, imprints or stamps a margin of cement thereon. The requisite margins of cement for forming overlapping joints being thus applied to the slate or other material, the cemented portions or margins are laid in contact with each other, and in a short time become firmly united, forming water-tight surfaces. Sometimes, to expedite the process, a coating of naphtha or other spirit that will act upon the cement, or a solution made by dissolving the cement in naphtha or other spirit, is applied to the cemented portions or margins. The cement may also be used for securing the above materials to the building as well as to each other.

"The patentee connects pieces of glass together with the above cement when making skylights, conservatories, frames for horticultural purposes, &c.; he also cements slate, stone, metal, and manufactured clays and cements together, or to wood, or to woven and other fabrics, and woven or other fabrics

to wood, for building and other purposes; he likewise cements pieces of leather together for making boots and shoes, and hose or pipes for fire-engines; also leather and cork together, or to wood, metal, or woven or other fabrics, and woven or other fabrics to wood for the manufacture of trunks, portmanteaus, packing-cases, and other purposes. When joining these materials, the parts must be dry and free from dust, and should be warmed previous to receiving a coat of the cement, in order that it may not be chilled at the moment of application. If the joint is to be made at once, the parts must be expeditiously put together and pressed, as the cement rapidly loses its heat, and becomes solidified, but the junction may be effected at any subsequent period by the application of heat, or the spirit or solution before described."—*Newton's London Journal for August.*

#### THE EARL OF ROSSE'S LEVIATHAN TELESCOPE.

(From the Standard.)

TO THE EDITOR OF THE STANDARD.

SIR,—With pure delight do I communicate to you the fact that the Leviathan telescope, on which the Earl of Rosse has been toiling in his demesne at Parsonstown now upwards of two years, although not absolutely finished, was on Wednesday last directed for the first time to the sidereal heavens. I very much regret not being present on this occasion, but experiments on which I have for many years been employed rendered it impossible for me to leave home.

The letter which I have this morning received from its noble maker, in his usual unassuming style, merely states, that the metal, only just polished, was of a pretty good figure, and that with a power of 500, the nebula known as No. 2 of Messier's catalogue was even more magnificent than the Nebula No. 13 of Messier, when seen with his lordship's telescope of 3 feet diameter, and 27 feet focus. Cloudy weather prevented him turning the Leviathan on any other nebulous object.

Thus, then, we have, thank God, all danger of the metal breaking before it could be polished overcome. Little more, however, will be done to it or with it for some weeks, inasmuch as the noble earl is on the eve of quitting Ireland for England, to resign at York his post as President of the British Association, and to visit his noble relatives at Kilwinick and at Brighton. This done, he returns to Ireland; and I look forward with intense anxiety to witness its first severe trial, when all its various appointments shall be completed, in the confidence that those who may then be present will see with it what man has never seen before. The diameter of the large metal is six feet, and its focus 54 feet. Yet the immense mass is manageable by one man. Compared with it, the working telescopes of Sir William Herschel, which in his hands conferred on astronomy such inestimable service, and on himself astronomical immortality, were but playthings.

J. SOUTH.

Observatory, Kensington, Sept. 17.

CHINESE DWELLINGS.—In all China the houses are built upon the ground, *i. e.*, without any cellar under them. The apartments are paved with flat, square bricks; a thing very agreeable in warm weather, but little suitable to the cold season. To defend them from the piercing cold, which they experience in the northern parts of the empire, the Chinese have devised subterranean furnaces in every direction under the bricks of the floors, and under a kind of platform on which they sleep, so that the heat diffused by the tubes produces in the apartment the temperature desired. The fire is kept up night and day in the outer stove or furnace without the smallest danger to the buildings.

A monument has just been erected at Staindrop to the memory of the Duke of Cleveland, the work of Sir Richard Westmacott, which consists of a recumbent figure, with bas reliefs emblematic of the virtues, surrounding the altar-tomb whereon it rests. We hear that the sculptor himself values it as one of the best of the works which he has executed. Sir Richard declines, we understand, competing for the Holland Monument.

## LONDON AS IT WAS, AND AS IT IS IN 1844.

(Continued from p. 473.)

In early times Westminster, now the seat of Government, of legislature, and of wealth, was formerly a mean, wretched place, remarkably unhealthy on account of being a marshy island, surrounded on the one side by the Thames, and on others by what is called Long Ditch, a branch of the river which began near the east end of the place where Manchester-court is now situated, intersected King-street, and running along Gardeners-lane to Long Ditch, crossed Tot-hill-street, a little to the west of the Gate-house, and continued its course along the south wall of the abbey garden, where a common sewer was erected over it. The island thus formed was in a manner a waste, overgrown with briars and thorns, and was thence called Thorny Island. In this situation was the abbey church founded, and it continued thus for ages a place entirely distinct from London, there being a large space between them. The Strand was the road that led from London to that town, and it was open on either side to the Thames and to the fields. In 1385 this road was first paved as far as the Savoy; and many years afterwards Sir Robert Cecil, building a house at Ivy-bridge, his interest brought the pavement of the road to be extended thither, and many of the houses of the nobility were erected in the Strand.

Westminster owed many of its most distinguished privileges to Henry VIII., for when the abbey was in 1541 converted into a cathedral, he appointed the whole county of Middlesex, except Fulham, as its diocese. Upon this occasion Westminster became a city; it had many years before been the seat of the royal palace, the high court of Parliament, and of our law tribunals. The first important improvement was inclosing St. James's Park, which was at that time a wild wet field, it was then drained and partially planted. From that time Westminster began to extend on every side, though it did not long enjoy the honour of being a city, and even the palace was some time after burnt, for it never had more than one hishop, and he being in 1550 translated by Edward VI. to the see of Norwich, the new bishoprick was dissolved by that prince; and its right to the epithet of city was thereby lost, though by public complaisance it has retained that name ever since; but yet Westminster had not any arms till the year 1601.

The city of Westminster at present consists of two parishes, those of St. Margaret and St. John the Evangelist; but its liberties contain seven parishes, viz. St. Martin's, St. James's, St. Paul's Covent Garden, St. Mary le Strand, St. Clement's Danes, and St. George's, Hanover-square, and the precinct about where the Savoy formerly stood.

The first stone of Westminster-bridge was laid in January 1733, by the Earl of Pembroke, the last stone was laid in 1747.

The most probable account given of the origin of the abbey church of St. Peter, Westminster, is that Sebect, king of the East Saxons, who died in 616, having been converted to Christianity by Austin's discourses and his uncle Ethelbert's example, erected this church on the ruins of a temple dedicated to Apollo, and caused Mellitus, Bishop of London, to consecrate it to St. Peter.

This church and monastery were afterwards repaired and enlarged by Offa, King of Mercia, but being destroyed by the Danes, they were rebuilt by King Edgar, who endowed them with lands and manors, and in the year 969 granted them many ample privileges. Having once more suffered from the ravages of the Danes, they were again rebuilt by Edward the Confessor, who pulling down the old church, built for that age a magnificent one in the form of a cross, which afterwards became a pattern for that kind of building. In 1065 it was consecrated with great pomp, confirmed in its ancient rights and privileges, and endowed with many rich manors and additional immunities. He also gave the church and convent a charter of sanctuary, in which he declares, that any person whatsoever, let his crimes be ever so great, who takes sanctuary in that holy place, shall be assured of life, liberty, and limb, and that none of his ministers, nor those of his successors, should seize any of his goods, lands, or possessions, under pain of everlasting damnation; and that whoever presumed to act con-

trary to this grant, should lose his name, worship, dignity, and power, and, with the traitor Judas, be in the everlasting fire of hell.

William the Conqueror, to shew his regard to the memory of his friend King Edward, repaired the church, and offered a sumptuous pall as a covering for his tomb; he also gave fifty marks of silver, a rich altar-cloth, and two caskets of gold; and the following year was crowned there, being the first coronation performed in that place.

Henry III. improved the church by erecting a new chapel to the blessed Virgin, but afterwards finding the walls and steeple of the old structure much decayed, he pulled them down with the design of rebuilding them, but he did not live to accomplish the work. In 1502, King Henry VII. began that magnificent structure now generally called by his name; for this purpose he destroyed the chapel of Henry III. and an adjoining house, called White Rose Tavern. This chapel was also dedicated to the Virgin Mary, and he, designing it for a burial-place for himself and his posterity, commanded in his will that none but those of blood royal should be buried there.

Before the suppression of religious houses, the abbey was surrendered to Henry VIII. by William Benson, the then abbot, and seventeen of the monks, when its revenues amounted to 3,997l. 6s. 4½d. Besides its inestimable furniture, it had no less than 216 manors, 17 hamlets, and 97 towns and villages in different parts of the kingdom. After this the abbey underwent several changes until Queen Elizabeth, after ejecting the monks established therein by her predecessor, erected Westminster Abbey into a college, under the government of a dean and twelve secular canons or prebendaries, a schoolmaster, usher, and forty scholars, denominated the Queen's, to be educated in the liberal sciences preparatory to the university, and to have all the necessaries of life except clothing, of which they were only to have a gown every year.

The Almonry receives its name from the alms of the abbey being distributed there, and was originally a chapel dedicated to St. Catharine. Near this chapel Abbot Isip erected the first printing-house that ever was in England in 1474, when William Caxton, citizen and mercer of London, brought that invaluable art from Holland. Its introduction into this country was the commencement of a new era, its first fruits the seeds of a great moral and social revolution, which before 1914 will have extended and brought forth its fruits in the most remote regions of the earth. The works issued from the Caxton press are eagerly sought for by scholastic antiquarians.

St. Margaret's Church was built by Edward the Confessor for the common services of religion. It was rebuilt in the reign of King Edward I., by the parishioners and merchants of the staple, except the chancel, which was erected at the expense of the Abbot of Westminster. In 1735 it was repaired, and the tower cased and mostly rebuilt at an expense of 3,500l. granted by Parliament. In 1758 it again underwent repair, with considerable damage to its taste. The patronage of the living is in the dean and chapter of Westminster.

A clever writer in 1735 observes, "The great men at the court end of the town are particularly distinguished by refusing to do any thing to serve others, and by a great number of tall powdered animals with two legs, who walk before a chair, or hang like a cluster of bees at the bind part of the chariot, embracing each other in an unseemly posture. For the benefit of this part of the metropolis, which includes the *beau monde*, the king has given the liberty to all idle people of walking in St. James's Park. Here is the Mall, famous for being the rendezvous of the gay and gallant, who assemble there to see and be seen, to censure and be censured; the ladies to shew their fine clothes, and the product of the toilet, the men to shew their toupees, observe all the beauties, and fix on some favourite to toast that evening at the tavern. I once happened to fall into a file of very fine fellows in this place, and remember, when we began our march, we ranked one French suit, though somewhat sullied, three pairs of clock stockings, one suit of Paduasoy, two embroidered waistcoats, the one a little tarnished, and two pair of velvet breeches. We made a most formidable show, carrying the whole breadth

of the Mall, and sweeping all before us; we thought ourselves at least capable to act upon the defensive; but by that we had got opposite to Godolphin House, we were convinced of our error, for here a puppy in a French suit pulling out a most extravagantly rich snuff-box, no less than three deserted, and went at once over to the enemy. As one misfortune seldom comes alone, a monstrous gold headed cane in the bands of a gamester, deprived us of two more of our company. So that all on a sudden our corps was dwindled away like a South Sea project, and began to look as thin as a House of Parliament at a 30th January sermon, or an independent company of foot. In this plight the remains of us stood staring up at each other as stupidly as the country people do when they go to view the royal apartments at Hampton Court or Windsor, as not knowing whether to advance or retreat. Fortunately for us, in this dilemma we enlisted one of the most beautiful sword knots that ever came into the kingdom; we could perceive recruits coming in from every quarter, and in less than seven minutes got ourselves into *statu quo*. Several revolutions of this kind happened to us in the space of about two hours, till at last I was left only with a little strutting fellow, who calls himself secretary to a foreign minister, and I got rid of him by fixing his eye upon a periwig that appeared to be made about a month later than mine was."

The Mall was long the favourite resort of loungers, the chosen spot on which to make an acquaintance, to form an intrigue, or to pick up a flat. The love of outward display was prevalent in the eighteenth century, and crowds of belles and beaux were to be met with in this walk, rivalling each other in pomp and ornament of dress, many of whom, like snails, carried all their earthly possessions on their backs. Here the ladies' maid was often mistaken for her ladyship, the valet was seen sporting the wig, sword, and ruffles of his master. Bullies, sharpers, peers, poets, dames d'honneur, courtzeans, and a motley crowd of town and country idlers were seen bravely dressed, according to the quaint fashions of the day, and rivalling each other in the ridiculous display of swords, sword-knots, toupees, bag-wigs, embroidered waistcoats, brocades, paints, and patches; laughing, talking, quarrelling or intriguing, and sometimes fighting, for the English at that period were much addicted to this elegant amusement. Combats, says Ali Mohammedi Hadji, are very common among the lower orders, the assailants fighting like rams, running head foremost, and butting each other; these exercises were in great esteem, and diverting both men and women. In the evening of their sabbaths and festivities, it was common to see the streets filled with these sorts of encounters: all kinds of servants being at liberty, and generally well loaded with liquors, have frequent quarrels and bickerings about precedence. Mothers encouraged their sons, and married women their husbands to engage, the latter holding their husbands' combs and children the meanwhile. And some people of quality lay aside their wigs, swords, and neckcloths to box, when they are insulted by mean persons, against whom they must not draw their swords, this being esteemed the most rascally thing a gentleman could be guilty of; for which reason persons of high rank might often be seen with swollen faces and black eyes.

The Mall was often resorted to as a finish to some Bacchanalian feast, or early in the morning, as a consequence of that feast, in order to discuss some frivolous question at the point of the sword, and duels were very frequent near Marlborough House. It was also resorted to by hungry expectants, as it is even to the present day, who, should no fortunate chance turn up, are fain to dine with that cold-blooded sprig of nobility, Duke Humphrey.

The Park is now filled with trees, shrubs, flowers, swans, and Muscovy ducks, but its aristocratic days have departed, few visit its elegant inclosure but holiday folks, unfashionable idlers, sentimental lovers, disappointed belles, and beaux. An occasional *spectacle* is seen on the opening or closing of Parliament, and the daily parade of the Guards; but St. James's Park is now decidedly unfashionable.

In this age of improvement and extension of the greatest and wealthiest metropolis in the world, with such houses as the new buildings

at Westminster springing up before our eyes, the magnificent club-houses now decorating Pall Mall and St. James's, and the numerous princely palaces, streets, and squares, springing up as it were by a stroke of some magician's wand, it is both a shame and national reproach to us that the sovereignty of the country has no fitting habitation in the metropolis. The situation of Buckingham Palace is the most unfavourable that could possibly be chosen; and were it not for the accidental circumstance of bird-cage walk, and the beautiful sheet of water, it would be intolerable. The old red-brick palace offended the eye, when stone and stucco became the prevailing taste; and the sums of money expended over it by the whims and caprices of George IV., would have been amply sufficient to erect an imperishable monument to the memory of some great architect, and to the taste of the times in which we live. A site in the Green Park, to the west of Constitution Hill, would have been better chosen than the present one, the gardens of Buckingham Palace being thrown into the park to compensate for what would be taken away; or St. James's Palace might have been altered.

What excites our greatest surprise is that the Woods and Forests should tolerate the low rookery of Crown-court and Angel, and the still lower den of infamy, well known to aristocracy as King's place, within the very hear of courtly St. James's; these places ought to have been pulled down long ago, and the several sites appropriated to noble mansions.

Bury-street, Duke-street, King-street, and St. James's-street, were built some few years before St. James's Church; many of their leases, which were for 99 years, have fallen in; the whole space occupied by these streets is crown property, and many reasonable complaints are made by the inhabitants against the Commissioners of Woods and Forests, in consequence of the exorbitant ground rents charged under the new leases, wholly unwarranted by the size of the houses or the class of persons who occupy them. On the east side of Bury-street formerly stood the house of the celebrated Guy, Earl of Warwick; and, previous to the improvements, a court, existing under that name, marked out the spot where he sought concealment after one of his lost battles. Bury-street was once inhabited by the first rank and fashion, and even to the present day, it is noted as the temporary residence of the gentry during the parliamentary season; in common with all the neighbouring streets it has a much less enviable notoriety for black-legs. The range of houses occupied by the Hon. Colonel Needham, have been thrown into one, and magnificently fitted up, with a taste peculiar to the eccentric owner.

In King-street is the celebrated Almack's, a most unsightly building outside, but admirably adapted in the interior for the purposes to which it is appropriated. Here also is St. James's Theatre, built in 1837 by the celebrated vocalist, Mr. Braham; it was run up very rapidly, being finished in little more than seven weeks. The house was opened with the opera of "Agnes Sorrel," in which Miss Glossop made her first appearance. King-street has much improved in appearance of late years; the court, a disgraceful rookery leading into St. James's-street, being thrown open, the Bazaar and the fine range of buildings were then built.

St. James's-square has many stately and commodious mansions; but is rapidly losing cast in consequence of the introduction of club-houses, and the removal of fashion to Belgrave-square. The principal mansion is the town residence of the Duke of Norfolk. This part of the town abounds with noble club-houses, of which we shall speak more particularly in the next.

(To be continued.)

THE ROYAL EXCHANGE.—Her Majesty has most graciously signified her intention to open the Royal Exchange in the course of the last fortnight of the month of October. His Royal Highness Prince Albert is to accompany her Majesty upon the occasion.

#### SIR R. PEEL AND MANCHESTER PUBLIC PARKS.

WE have very sincere and very great gratification in laying before our readers the copy of a letter received by the Honorary Secretaries of the Public Parks' Committee from the Premier—a letter which reflects honour upon the Right Hon. Baronet for the sentiments it avows, the associations adverted to, and the acknowledgments made; and which we commend to general attention as a noble example, worthy to be followed by many other gentlemen formerly connected with Manchester, and on whom it has much stronger claims individually. The following is the Premier's letter:—

"Whitehall, Sept. 7, 1844.

"Gentlemen,—Although I have no longer any personal connection with the town of Manchester, by property or other local tie, yet, considering Manchester to be the metropolis of a district, to the industry of which I and my family are under very deep obligations; and most heartily approving of the wise and benevolent design to provide for those who are doomed to almost incessant toil, the means of healthful recreation and harmless enjoyment, I willingly contribute to the furtherance of that design, and offer my cordial wishes for its success.

"I request my name may be added to the subscription which has been commenced for this purpose, for the sum of one thousand pounds.

"I am, Gentlemen, your obedient servant,  
"ROBERT PEEL."

"Malcolm Ross, Esq.;  
"Edward Wadkin, Esq."

This munificent donation is, to our mind, greatly enhanced in value by the graceful and liberal terms in which it is conveyed. We hail it, too, as a pledge that, in the estimation of every benevolent mind, no petty party feelings should be allowed to obtrude into this excellent design for the benefit of a large and industrious community. That object, which commands from Sir Robert Peel on the one hand, and from Mr. Mark Philips on the other, such substantial proofs of their cordial and generous support, can scarcely, even to the most suspicious mind, be deemed a political movement to serve a party purpose. We trust to find the example of Sir Robert Peel addressing itself with all the weight that justly belongs to it, to those who, after having realized handsome fortunes in Manchester, are now enjoying them in other parts of the kingdom. They, too, are under deep obligations to the industry of Manchester; and we hope they will not lose so favourable an opportunity as is now presented, for proving that they are not insensible to the claims herein made upon their liberality. Let the strength of their past associations and reminiscences be shewn by their present zealous and cordial generosity.

We understand that, at a meeting of the committee on public parks on Monday, a resolution was unanimously adopted, expressive of their high appreciation of the opinions expressed by Sir Robert Peel, and conveying to him their sincere thanks for his munificent gift, and for the gratifying terms in which he has communicated it.—*Manchester Guardian.*

#### STATE OF PARTS OF THE METROPOLIS.

THE Report (with minutes of evidence annexed) of the Commissioners for Inquiry into the State of Large Towns and Populous Districts, was lately laid before Parliament by command of her Majesty, and printed for circulation among the peers, &c. Some of the evidence is of deep interest. In that of Mr. Henry Austin, architect, and resident engineer during the construction of the Blackwall Railway, he stated that in that capacity he had opportunities of examining the habitations of the labouring classes in the district through which that line passes. Many of the rooms of the tenements, he says, were small, varying in size from 8 feet by 10 to 10 feet by 12, and generally under 8 feet in height. "The inmates, houses, and every thing in them, horribly filthy; and there was such a complete want of ventilation, that it was extremely offensive to go into their rooms on account of the smell. The privies were frequently close to the back-door, always in a neglected and offensive condition, and fre-

quently running over. . . . It was the state of the subsoil that first drew my attention to the necessity of abolishing cesspools in towns. I found that the focal matter, or the soakage from the cesspools, had in some cases actually joined from house to house. . . . The soil in the immediate connection with the houses and surrounding the foundations was so saturated from cesspools as to be, in my opinion, in a worse condition than in dung-heaps. It was exceedingly offensive to remove, and it was constantly matter of remark how human beings could be found to do it. When exposed it drew forth the complaints of the neighbours at some distance." In speaking of the existing tenements for the poor, he refers to an "existing court at Westminster, called 'Snow's-rents,' a striking example, among many worse, of the dreadful condition to which the poorer classes are reduced from the want of proper structural arrangement and control. This court is of considerable width—upwards of 20 feet, but the houses are mostly without yards, and the refuse, when become intolerable inside the house, is deposited in the court itself, the whole centre being a pool of black stagnant filth, that accumulates from time to time, and is left to decompose and infect the whole neighbourhood. I wish I could convey the faintest notion of the awful stench that is engendered there. Ventilation, or rather a healthful state of the atmosphere, is impossible. What little disturbance of the air does take place, would appear only to render its state more intolerable. The chief reasons for this dreadful state are the want of yards to the houses, and the width of the court being greater than required for the traffic. Had the court been narrower, the accumulation could not have taken place, for the houses would have been inaccessible, and some other provision for the refuse must have been made. . . . In wet weather, when the water attains a certain height in the court, it finds its way into an open, black, pestilence-breathing ditch in a neighbouring court; but in the ordinary state of things, the whole centre of this place is one mass of wet decomposing filth, that lies undisturbed for weeks, from which, so dreadful is the effluvia at times arising, that in the tenants' own words, "they are often ready to faint, it is so bad." . . . There is one exposed privy at the end of the court for the use of the inhabitants, male and female, of nine houses, which has not been emptied for four years or more, and in seasons of wet is actually overflowing with soil. . . . The supply of water consists in this, that sixteen houses are accommodated with one stand pipe in the court. On the principal day (Sunday) the water is on for about five minutes, and it is on also for three days in the week for one half hour, and so great is the rush to obtain a modicum before it is turned off, that perpetual quarrelling and disturbance is the result, and water-dray is but another name for dissension." Such is the state of things the New Metropolis Buildings Act is designed to obviate, and ultimately to remedy; and indisputably remedy is imperative.

CHINESE CAST-IRON BUILDINGS.—A Berlin correspondent of the *Débats* writes: "M. Gutzlaff, the missionary in China, states that the art of constructing buildings of cast-iron, of which the English pretend to have lately been the discoverers, has been practised for centuries in the Chinese empire. On a hill near the town of Tsing Kiang, in the province of Kiang Nan, is a Pagoda entirely of cast-iron, covered with bas-reliefs and inscriptions, which, from their forms, characters, and dates, are as old as the dynasty of Tang, which is as far back as from the fifth to the tenth century of the Christian era. It is an octagonal pyramid, 40 feet high and 8 feet in diameter at its base. It has seven stories, each with curious historical pictures. This building surpasses every thing M. Gutzlaff had before seen in China."

ACCIDENT TO ONE OF THORWALDSEN'S WORKS.—The *Journal des Débats* announces that an accident occurred, a few days since, in the studio of the late celebrated sculptor Thorwaldsen, at Copenhagen. The colossal model in plaster of Esculapius, the last work which this illustrious artist ever completed, and which was intended to serve as a pendant to his colossal statue of Hercules, placed in the Museum of Copenhagen, fell to pieces, and was so completely broken, that this magnificent specimen is totally lost for all purposes of art.

ALL SAINTS' CHURCH, NOW ERECTING FOR THE PARISHES OF LEXDEN AND STANWAY,  
NEAR COLCHESTER, IN THE COUNTY OF ESSEX,  
BY GEORGE RUSSELL FRENCH, Esq., ARCHITECT, LONDON.

This church, of which a perspective view from the north-east is here given, is now in progress of erection, and is intended to accommodate the surplus population of the parishes of Lexden and Stanway, the site of the building being at the boundary of the two parishes, about two miles from Colchester. The style adopted is the late Decorated, which prevailed about the middle of the fourteenth century, in the reign of Edward III. In the church in question the architect did not aim to give the effect of antiquity by means of rubble or flint-work at the risk of the stability of the building but, as our ancestors generally did of old, employed those materials which were nearest at hand; the walls, therefore, are constructed of bricks, in some cases having three bricks in thickness and in others two-and-a-half bricks; the facing-bricks are of a dark purplish red character, making a contrast to the window and other dressings, which are of Caen stone. The nave, which is 60 feet long and 24 feet 6 inches wide, has an entrance on the north from a tower, and also from the west doorway, in which are introduced "nook-shafts." Above the west door is a window of three lights, the head having a great deal of tracery. On each side of the nave, which is divided into six bays, are two single-light and two double-light windows, having dripstones or hood-moulds over them, those on the north side (being that most seen) resting on carved heads. The buttresses between the windows have a projection of 2 feet 6 inches. The nave is divided from the chancel by an arch, and the latter, which is raised two steps, is 25 feet by 14 feet, the sacarium being elevated three steps. The chancel is lighted by an east window of three lights, and by a single-light window on the south side. The entrance to the vestry from the chancel is by a small arch near the chancel-arch, and by which access is also had to a stone

pulpit projecting from the wall; on the south side of the nave, a small transept is carried out for an organ, of the depth to which a future aisle may be added, arches being inserted on the south side to facilitate such an addition. The height of the walls from the ground-line will, when finished, be only 18 feet; but the roof having a very high pitch, being at an angle of 38 degrees, will make the interior sufficiently lofty. The belfry tower, 10 feet square, is constructed to contain a peal of five bells, and is 35 feet high, crowned by a spire of 30 feet additional height, covered with oak shingles, and surmounted by a copper weather-cock. The roof, covered with slates, will be open, showing the entire construction, the timbers and slate-boarding being planed smooth, stained, and polished. From the steepness of the roof, the tie-beams are not continued, being only hammer-beams, supported by trefoiled spandrils resting on stone corbels, and having moulded curved ribs, collars, and purlins, with king-heads introduced, and the braces above the collars trefoiled. On each side of the east window is a slab of stone, on which the Decalogue will be cut in plain Roman capital letters, so that the people may best "see and read the same," as the canon directs. Above each table of stone will be a trefoiled canopy, the back diapered. Within the chancel, glazed encaustic tiles, from Chamberlain's Worcester Manufactory, will be laid down; the four Evangelists, emblems of the Trinity, the cross, &c., within a border of trefoiled pattern, occupying the space within the rails; and the path up to the steps having the arms of the benefactors towards the endowment of the church. The font will be of carved stone, with appropriate devices in each of its octagonal sides, and with a drain. The fittings will be of deal or of sycamore, consisting of low benches, with

finials and carved panels in their ends. Not a particle of paint will be used inside the church, excepting to the iron-work of the roof; the whole of the fittings being stained and polished like the roof. The body of the nave will be paved with tiles. The whole external length of the building is 91 feet, and its width from north to south is 42 feet. The cost of the church will be under 1,700*l.*, and it is calculated to hold 300 persons, 20 inches in width for each adult being allowed.

#### TIMBER—ITS TREATMENT AND USES. BY JAMES WYLSON.

(Continued from p. 472.)

91. **ELM.**—There are in Great Britain several species of this tree:—the small, or rough-leaved common *English elm*; the smooth-leaved, or *Wych-elm*; the broad-leaved, or *Wych-hazel*; the *Dutch elm*; the cork-barked, declining-branched, spreading-flowered, white elm, and others; with some more recently introduced—the *Huntingdon*, *Chichester*, fan-leaved, &c. That particularly designated as the *English elm* is common in the south, and is, in respect of size and beauty, a tree of the first rank; in utility, it is perhaps excelled by the *Wych-elm*, the wood of which is generally, of all the elm-species, the most esteemed; the trunk of the former is frequently crooked and rugged, the bark rough, having a cracked and wrinkled appearance; the leaves are doubly-serrated; it is comparatively slow in growth, but hard and durable, and notable for its excellence in resisting moisture; it is thought to be probably an exotic, from the circumstance of its seeds never ripening in this country: its propagation being by suckers, which spring in abundance from the old roots, rendering the tree very eligible for hedge-rows, a constant succession being insured, wherever it has been planted, however often the grown timber be felled; in situations where the appearance of suckers would be objectionable, it is propagated by grafting on the *Wych-elm*; it is also raised from layers. The *Wych-elm* is common in Herefordshire, Essex, and the north and north-eastern counties of England, and grows to the

largest size. It is distinguishable by its leaves, which are smooth on their upper side; also by the bark, which is of a dark leaden colour, and smooth; it is likewise of a more branching nature than the preceding, and its boughs take a somewhat depending character: it is the only species raised from seed; it blooms early, and its seeds ripen in May, and may be sown in a fresh loamy earth; it is tough and flexible in the wood. The Wych-hazel is common throughout Europe, and particularly in Scotland and the northern parts of England; its wood has been estimated at about half the value of the best. The cork-barked and Dutch elms are both very inferior, and, indeed, almost useless; the former is very common in Sussex, the latter is the smallest species, and is a native of Holland. The others, which are raised in nurseries, are not yet sufficiently known to enable us to enter into a statement of their characteristics or qualifications; that described as the declining-branched is said to be truly picturesque in appearance; and, generally, they are of the most rapid growth and luxuriant foliage, but not affording timber in quality equal to that of the common elm.

92. The Elm is a tree of rapid and majestic growth, producing in fifty years as many cubic feet of timber; and attaining within a century a height of from seventy to ninety feet, and a trunk of four or five feet in diameter; when permitted, it also expands its branches over a large extent of ground, forming a delightful summer shelter; but it has been, and indeed still is, frequently trained to a vast height with a single stem, for the purpose of being bored into pipes; a disfigurement, however, from which the general adoption of iron-piping for underground water-conduction will speedily exempt it. It may here be mentioned that no tree bears lopping or shredding better, it being hardly possible to injure it by dismemberment. Though a tree of such magnitude, and clothed with a massive and thick foliage, affording a perfect shade, it is, from the lightness of its spray, the comparative smallness of its leaves, and the loose, free manner in which these adhere, rendered less heavy in appearance than the horse-chestnut or the plane. It possesses the double advantage of its foliage coming early and staying late; in the latter respect it stands alone, bearing its green vesture after every denizen of the forest has been stript by the autumnal blasts. When first expanded, its leaves are of a pale but cheerful green, which deepens in colour, with somewhat of a shiny appearance towards the fall, before which, chilled with the early frosts of winter, they fade to a bright yellow. One elm-tree is said to produce 1,584 millions of seeds, each having the power of producing as many more. The narrow-leaved are of slower growth, and live longer than the broad-leaved species.

93. It can scarcely be called a forest tree, its limits being rather about dwellings, or where such have stood; and the finest specimens are found forming avenues in public walks and drives; or planted singly, adorning the parks of our landed proprietors, for which its quick growth and picturesque grandeur of form undeniably recommend it, and leave it very few rivals. All the species delight in a gravelly loam, or any similar soil, which is not too wet; no tree can be better employed for hedge-rows, nor can they succeed better when re-planted, after being considerably matured.

94. It should be felled when between 50 and 100 years old, and in winter, when it has little or no sap; and, however green, if immersed for four or five days in water (if salt-water, so much the better), it will obtain an admirable seasoning, and be qualified for almost immediate use: this mode of treatment prevents, in a very great degree, warping, distortions, and worms. The shrinkage in the width in seasoning is said to be about 1-4th; it also shrinks lengthwise.

95. The wood bears in colour some resemblance to oak; but is in the heart-wood somewhat redder and darker, and in the sap-wood lighter, with an inclination to yellow and to red in the pores; it has no larger transverse septa. It is a hard, strong kind of wood, with a peculiar odour; rather coarse, cross-grained and porous, tough, and difficult to work; it warps and shrinks in the drying, as well as afterwards, in some degree; it is not liable to split, but, on the contrary, it is said to be better than any other wood, the driving of nails and bolts. It is a timber which, for the

general purposes of building, is of little value, being seldom so used; and indeed, from its uneven grain, very unfit for beams, or other purposes where a cross-strain has to be sustained; in consequence, however, of its great durability when constantly wet, it is much esteemed for water-wheels, piling, planking below water-mark, and sundry other works of a similar nature: it is also said to be very durable, if kept perfectly dry, though not so fit subject to the action of the weather; yet, for the weather-boarding of out-buildings on farmsteadings, it is, when coated with paint or tar, found to stand very well under such exposure. It is used in ship-carpentry for the keels, and sometimes for gunwales of vessels; in husbandry, many implements are made of it, axle-trees, wheel-naves, blocks, gate-posts, rails, &c.; for particular purposes it is even preferred to ash: it is sometimes carved and variously employed for ornamental work; it is also very suitable for dressers and chopping-blocks, as it does not break away in chips like the generality of timber: for coffins, the English elm is preferred by the undertaker.

#### LECTURES ON ARCHITECTURE AND ANTIQUITIES.

REMAINS OF THE ANCIENT TEMPLE AT TIVOLI, Reputed to be that of Vesta, or of the Sibyl.

#### Lecture IV. ROMAN ARCHITECTURE. (Continued from p. 461.)

Of peripteral round temples in and near Rome, two have been preserved, both dedicated to the goddess Vesta; (for whom that form was prescribed, as symbolical of the earth:\*) one is at Rome, the other, often called the temple of the Sibyl, is at Tivoli, eighteen miles from Rome. THE TEMPLE OF VESTA at Rome is on the left bank of the Tiber, near the Campo Vaccino; and consisted of twenty columns of white marble, (one only of which is wanting,) raised on three circular steps, and placed round the cell, of which part of the wall remains, but none of the entablature exists, all above the columns having disappeared. The columns, which are in good Greek taste, of the Corinthian order, are of lofty proportion, being nearly eleven diameters high, their whole height being 34 feet 7 inches, and their lower diameter 3 feet 2 inches; the internal diameter of the cell of the temple is 28 feet, and the inside received its light from two windows, placed on each side at no great

\* And thus the temples of Vesta are represented in ancient medals. Valadier says, "I templi di Vesta erano rotondi, perchè questa forma simboleggiava la terra: così Numa edificò il suo primo tempio in Roma al diè di Pietraro. La forma rotonda era tanto propria di Vesta, che le mense rotonde perfino Veste erano dette. Costantemente nelle rotonde si diceva il tempio di Vesta era presentato rotondo." (Raccolta delle più insigni fabbriche di Roma antica; a truly magnificent work.) (Thus Ovid, "Vesta dea est, quæ Terra.")

distance from the doorway; the columns were distant 7 feet 5 inches from the outer wall of the cell, and were placed, each with its centre 7 feet 6 inches from the centre of the next in the peristylum. This temple is converted into a church, dedicated to the Virgin, under the name of La Madonna del Sole. Panvinio enumerates three separate temples of Vesta at Rome, viz. in Vth, VIIIth, (the one under review,) and Xth Regions.

The temple under consideration has been by different authors assigned to different divinities: by P. Ligorio to the marine deity, Portumnus (the Palæmon of the Greeks); by Pomponio Leto, to Aurora; by Volaterrano, to Hercules; by Nardini, to the goddess Volupia; and lastly, to Vesta. Valadier, who inclines to the last-named dedication, states that Flavio Biondo was the first who ascribed this building to Vesta; he has been followed by Fabricio Varano, Marliano, Fieorini, Venuti, and many other able critics.

Tivoli, surrounded by the most romantic and beautiful scenery, has been a fruitful subject for the painter, and by none has it been more frequently or ably treated than by the glowing pencil of Turner. The circular temple of Vesta stands on the summit of a rock,

"Where the precipitate ANIO thunders down,"  
ROGERS.

and forms the principal feature in the charming landscape. Ten only of the eighteen Corinthian columns remain; they are 9½ diameters high, and are placed on a circular basement, about 5 feet high, at the foot of which were probably two steps, according with the Vitruvian precept. The columns are 2 feet 5 inches in diameter, 23 feet 6 inches in height, including base and capital; the entablature is 4 feet 3 inches high, whereof the architrave, which has two faces, occupies 1 foot 3 inches, and the frieze 1 foot 7 inches; this is adorned with a continued enrichment of pateras, and the heads of oxen, sacrificed to the goddess, connected with each other by the fillets and garlands, with which they were decorated for the occasions. The cornice is not enriched. The capitals have always excited great admiration. "The leaves of the capital, instead of being *applicuées* to the bell, as in other examples, are in this cut into it, and impart a magical appearance to it." (Gwilt.)

Besides the remarkable characteristics of the capital, the column has many other peculiar features; the flutes, which are twenty in number, terminate at top with a square head, and at the lower extremities of the shaft in a singular manner, and the base rests at once on the stylobate, without a detached plinth. Messrs. Taylor and Cressy, taking an ancient medal for their guide, have restored the roof to the temple, making it rest on the entablature, and cut in the shape of tiles. The internal diameter of the cell was 23 feet 11 inches, and it was lighted precisely in the same way as the temple of Vesta at Rome, by two windows; the distance from the columns to the outer wall of the cell was 5 feet 6 inches; and the ceiling of the ambulacrum was formed in coffers or panels (containing large roses or pateras) of two rows of fifty in each, of which thirty-six remain.

Some writers consider that this building was erected in honour of Hercules, who was the chief deity worshipped at Tivoli, the ancient name of Tivoli; but the temples built in honour of that god were required to be of the Doric order. (Vitruvius.) Some, again, contend that it was built in honour of the sibyl Albunea; but it is more probable that her temple was that which is near the circular building, a tetrastyle Ionic structure, walled up and greatly in decay. Valadier justly concludes that it should be ascribed to Vesta, "to whom the circular shape of the temple is so appropriate; to whose stately matronal garments the fluted columns have allusion; the oxen, are symbolical of the cultivation of the ground; while the fruits, the ears of corn, the poppies, and the productions of the kitchen-gardens, distinguish the continual fertility of the earth."\* Piranesi was of the same opinion, and of the few letters (shewn by the large capitals) which remain of the inscription on

\* "La forma orbicolare de' templi è propria di questa dea, le colonne striate al maestoso matronale vestimento hanno allusione; i fiori, le spighe di grano, le pappaveri, le frutta, le spighe, i papaveri, ed i prodotti degli orti la continua fertilità della stessa terra distinguono."—VALADIER.

the frieze, he conjectures that it originally ran thus:—

"*Ædem Vestæ S. P. T. Pecunia Publica Restituit Curator E. L. GELLIO L. F.*"

There were two persons of the name of Lucius Gellius—one who was surnamed Poplicola, and was consul B.C. 72, in which capacity he defeated a party of Germans in the interest of Spartacus; the other, probably the son of the former (and as such alluded to in the inscription, *Lucii Filio*), was pro-consul in Greece, and was also censor, in which capacity he so conducted himself that Cicero deemed him worthy of a civic crown, at the time of the suppression of Catiline's rebellion, B.C. 63; and as Cicero died B.C. 43, somewhere between these two dates is the probable period of this temple being erected; unless, indeed, it was only restored by Gellius, in which case it is impossible to assign the real date of its building.

Tibur was often famous as a place of refuge for illustrious persons; hither Cinna, the consul, retreated when banished by Octavius; and here also came Brutus and Cassius, after the death of Julius Cæsar;

"*Quid referant veteres Romanæ gentes apud quos, Exsilium tellus, ultima Tibur erat?*"

OVID. *POETIC. I. ELEG. 3.*

At Tivoli, Mæcenas had a villa (the ruins of which are yet seen), where he was often visited by his imperial friend Augustus, in company with Horace, to whom tradition assigns also a villa on this spot\* (as asserted by Suetonius); Quintilius Varus, the poet's friend, had a villa near Tibur (Horace dedicated to him the 18th ode of his first book); and two illustrious captives of the Romans had residences on the banks of the Anio, the Numidian emperor Syphax (who died B.C. 201); and the celebrated Queen of Palmyra, Zenobia, taken prisoner by Aurelian, A.D. 273, lived here in great splendour.

"It is remarkable that the capitals of the columns in the Basilica at Pompeii are precisely of the character of these (of Vesta, at Tivoli), though certainly not so well executed; there are also similar ancient capitals found at Cora and at Præneste." (Messrs. Taylor and Cress.) But we have fortunately at home an opportunity of judging of the character and details of this temple, in the beautiful adaptations made of this example by the late Sir John Soane, who employed it entirely in the exterior of the Bank of England (the first instance of this temple being imitated); and besides the elegant compositions in the different fronts, where the porticos in antis are varied with such picturesque effect (Roman examples planned with Greek taste), we have at the north-west corner a circular arrangement, in which one may see an exact copy of the proportions of the temple, even to its frieze of ox-heads and festoons; the details of the doorways and windows are also accurately imitated. A writer in "Wesley's Quarterly Papers" (Part 3), does justice to the memory of Sir John Soane, and predicts that the time will yet come that his works will have great influence on taste, *i. e.* when "the world has done hating him."

The only remaining example in Rome (besides the temple of Concord already noticed) of the Ionic style, in which insulated columns are to be found, is in the Temple of FORTUNA VIRILIS, or Manly Fortune, situated in the Roman Forum, nearly opposite to the Temple of Vesta. Like most of the ancient pagan temples, it has been converted into a Christian church, and it is dedicated to St. Mary the Egyptian. Its arrangement is supposed to have been tetrastyle in front, the pronaos having a projection of two intercolumns, but the sides and rear were pseudo-peripteral; and the whole of the seven columns which formed one flank still remain with their continued stylobate, the columns of the pronaos being walled up. The columns, which have twenty flutings, are nearly nine diameters high, the diameter being 3 feet 2 inches; the architrave is divided into three faces, and the frieze is enriched with festoons between candelabra, ox-skulls, and bays, placed alternately; the cymatium of the cornice is adorned with acanthus leaves and lions' heads. Although the design of this building cannot be compared

favourably with the tasteful examples of the Greeks, yet it is to be preferred before the wretchedly debased style of the Temple of Concord, a restoration only, in the age of Constantine, and to be altogether shunned by the modern architect.

Some of the most remarkable features of Rome are the triumphal arches, although indicating generally a corrupted taste, being mostly designed in the Composite style. These erections served at the same time to gratify the vanity of the Romans, and their love of magnificence, and are peculiar to this people, not being known among the Greeks, with whom the nearest resemblance is to be found in the Propylæa.\* A triumph is said to be derived from *Θριαμβος*, Thriambos, the Greek name for Bacchus, who is said to have been the inventor of such processions. (Plin. vii. 56.) It may be said also to have its name from *Σπίους ὑβαίνων*, to walk about with leaves, as did those who had the honours of a triumph. It had its origin at Rome from Romulus carrying the spolia opima in procession to the Capitol (Dionys. ii. 34); and the first who entered the city in the form of a regular triumph was Tarquinius Priscus (Livy i. 38), and the next Marcus Valerius (brother of Poplicola), who defeated the Sabines in two battles. The earliest triumphal arches were very simple, and in the time of the Republic, such structures were of brick, without ornaments, and having merely an inscription recording the event, and perhaps a statue of the person so honoured. Under the emperors, the arches of triumph became costly and elaborate works, adorned with numerous statues, and with bas-reliefs commemorating their achievements in war. At Rome and in her provinces many arches were built, of which some still remain, bearing the names of the persons by whom they were built, or to whom they were dedicated. Orosius mentions 320 as the number of triumphs.

These triumphal arches were designed with one opening in the earliest times, afterwards with two or more. Of arches with one opening may be named that of Drusus, in the Appian Way, at the entrance of the wall of Aurelian, and which is of the age of Augustus, by whose name it is sometimes called; the arches of Augustus at Pola, at Pompeii, at Susa (in good preservation), and at Rimini; and at Carpentras; one of Titus, at Rome; arches of Trajan at Ancona and at Beneventum, and probably his at Rome consisted of one opening; arches at Vienna and at Vicenza, imitated from that of Titus; of Aurelian and of Janus, both at Rome, and having two stories of columns; at Cavillon; at St. Remi, with two columns on each side; at Verona, an arch termed by Palladio "exceedingly beautiful;" of Gallienus, at Rome; of Hadrian, at Athens, and one at Mylasa, in Greece; many other arches, of which only the names remain, were probably of one opening, as of Verus, Gordian, and Germanicus. Arches are found with two openings, but such are hardly to be classed with triumphal arches, and may be considered rather as town-gates, and they were seldom decorated; two examples are seen at Verona, one more elaborate than the other, called the Gate of the Lions; one at Nismes; one at the Pont de Naintes, and imitated in modern times by Blondel, in the Porte St. Bernard, at Paris; and it is probable that the Porta Capena, at Rome, the gate at which victors were first received by the Senate, and thence called also the Triumphal Gate, consisted of two openings, one for egress of pedestrians, and the other for the entrance of chariots—such is the Roman gateway at Lincoln, and in other English cities. Arches of three openings are of later date, and displayed the utmost magnificence—such were the arches of Septimius Severus and of Constantine, both at Rome; one at Orange, commonly called after Marius, seven times consul; one at Rheims (which appears to have had three equal openings with eight columns in front), called the Porte de Mars, erected, according to some writers, in honour of Julius Cæsar, but by others ascribed to Julian. At Palmyra is an arch of three openings, in which pilasters take place of columns. (In China there are numerous arches of three lofty openings, of course designed after the style of that country.)

At Autun is an arch of four openings, the two in the centre being large, with smaller doorways on each side; the lower part plain, but the attic with an arcade adorned with small columns.

At Madrid is a gateway of five openings, called the Puerta de Alcalá, finished in 1788; three of the openings are arched, and two are square-headed, placed between coupled Ionic columns, the whole front extending 128 feet.

#### ADELPHI THEATRE.

DURING the recess, the interior of this theatre has undergone very considerable alterations and improvements, under the superintendence of Mr. Charles Manly. Hitherto, every frequenter must have suffered more or less from the very defective ventilation that prevailed: the architect's attention has been particularly directed to this evil, and he has most ingeniously contrived an apparatus to admit, when requisite, an ample supply of fresh air, so as not to interfere with the comfort of the audience, while the warm air will be carried off through the centre of a dome in the ceiling, by a cowl 5 feet in diameter. His attention has also been successfully directed to those other points in the construction of theatres which are scarcely less important than ventilation, namely, sight and hearing. He has re-arranged the boxes, and made them all radiate to the centre of the stage, removed various projections in different parts of the house which interfered with the diffusion of sound, and slightly reduced the height of the seats, thereby increasing the comfort of those who have to sit for several hours.

A greater depth has been given to the stage, by throwing into it a part of the premises in the rear of the theatre, and several modern improvements have been added for producing the many effects which it is now thought essential to introduce into the performances. While the health and convenience of the public have been attended to, the comfort of the performers has not been neglected: in an adjoining building, a spacious green-room and several dressing-apartments have been added. We understand that the theatre will be opened for the season in about a fortnight from the present time, under the management of Madame Celeste.

#### CHURCH-BUILDING INTELLIGENCE, &c.

Her Majesty's Commissioners for Building New Churches have at the present time under their consideration the following applications for the perpetual patronage of new chapels, which it is proposed to build and endow, and for the assignment of districts thereto, under the Act of the 1st & 2nd Will. 4, c. 38; namely from James Fussell, Esq., who proposes to build a new chapel at Whatley, Somerset; from James Foster, Esq., at Amblecote, Worcester; from William Wilherforce, Esq., at Markington, Yorkshire; from Andrew Lawson, Esq., M. P., at Roelcliffe, Yorkshire; from George Bengough, Esq., at Ridge, Gloucestershire; from Joshua Stanger, Esq., at Summers Town, Surrey; from Henry Kemble, Esq., M. P., at Camberwell, Surrey; from Le Gendre Nicolas Starkie, Esq., at Heyhouses, Lancashire; from the trustees of the late Sir George William Japps Jarvis, Bart., at Bournemouth, Hampshire; from John Partridge, Esq., at Bishopswold, Hereford; from Miss Sarah Brinton, at Mount Sorrell, Leicestershire; from Miss Marianne Pidsley, at Salterton, Devonshire; from the Right Honourable Henry Goulburn, at Brockham, Surrey.

*Sodbergh Church.*—A beautiful stained-glass window, the offering of an anonymous individual, has been placed in the south aisle of the parish church. It is the work of Mr. Wailes, of Newcastle, and consists of two Norman lights; one represents the Baptism of the Saviour, in a vesica piscis, surrounded by the words—"Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God;" the other, Christ Blessing Little Children, with the words—"Except ye be converted, and become as little children, ye shall not enter into the kingdom of Heaven." Above the former light is the evangelical symbol of St. Matthew; below, that of St. Mark; above the latter light that of St. Luke,

\* Thus, the delightful author of "Italy."

And thro' the surging mist a poet's house

(So some aver, and who would not believe?)

Reveals itself."—ROCKS.

\* Among the Greeks, when a person returned victorious from the Olympic games, a breach was made in the walls of the city, the ordinary gates not being considered worthy enough to receive him. For victories over an enemy, a trophy was usually erected on the field of battle.

and below, that of St. John. An elegant border goes round each light, and the intervals are fitted up by Norman patterns. Altogether it is an exact imitation of ancient glass.—*Westmoreland Gazette.*

**Fire-proof Church.**—A district church, for the parish of St. Mary, Lambeth, is being erected in York-street, York-road, Westminster, near the New-cut. It is built of stone and brick, with iron columns and rafters to the gallery, with iron rafters and roof, to render the edifice fire-proof.

## RAILWAY INTELLIGENCE.

**Direct Railway from London to York.**—A great sensation has been created in the railway world, by the announcement that the directors of the Wakefield, Lincoln, and Boston Railway have united with the promoters of the proposed London and York direct Railway, and that the latter line, as surveyed by Mr. Locke, will be brought before Parliament in the ensuing session supported by a majority of the House of Commons and favoured by the Government. A union with the Wakefield, Lincoln, and Boston Railway will, in fact, be a union with the powerful and wealthy Manchester, Leeds, and Hull line; and it appears that the condition on which the Wakefield directors have consented to transfer their subscriptions and coalesce with the London and York is, that the entire scheme of the Wakefield, Lincoln, and Boston Railway, both as to its connection with the town of Wakefield, and occupation of the Foss and Witham Banks to Boston, form a part of the undertaking; and that the line joins the Hull and Selby line at the latter town, and from thence direct to York, which they confidently state, will make the most extended and complete railway communication presented to the public, at once bringing the great manufacturing and agricultural portions of the kingdom into railway communication with each other, as well as with the metropolis, reducing the distance of the principal towns in Yorkshire and the North from ten to thirty-five miles with London, while the natural facilities for its formation are such as to insure its completion at a cost of little more than one-third the amount expended on existing railways connecting Yorkshire and the North of England and Scotland with London. The entire line from London to York will not have a greater deviation from a dead level than one in 800; it will contain neither a tunnel nor a bank, or cutting exceeding 13 feet; and it is estimated, that in its construction, and in providing the working stock, the advantage of being guided by the experience and warned by the errors of others will be equivalent to a saving of nearly 2,000,000*l.* The united companies are determined to bring into operation upon the new line all the latest improvements in railway locomotion; the carriages, waggons, and engines are all to be of the most approved construction; and this, combined with the favourable gradients will, it is added, secure a rate of speed that may be fairly averaged at thirty-five miles per hour.—*Westmoreland Gazette.*

**Railway Operations at Edinburgh.**—The works in connection with the various railways are proceeding with great activity. The drift tunnel through the mound is nearly completed, and in the eastern garden the ground nearly all levelled for the rails of the Edinburgh and Glasgow extension line. Three large old dingy tenements close under the Calton-hill, between Burns's monument and the gaol, have been demolished, on the North British line. The brewery property to the west of them will speedily share the same fate, as well as many ruinous and closely-wedged domiciles in this plebeian district; by the removal of which the general health of the city, if it do not gain, will undoubtedly lose nothing. In addition to the ruin to which the imperious claims of the railway Acts are consigning so many of the old-fashioned architectural embellishments of our city, it is satisfactory to know that a good deal of building is going on in various directions. We trust we may take this as a token of a return to the prosperity which this capital enjoyed years ago, but which it has lost for some time for want of a proper stimulative power.—*Edinburgh Advertiser.*

**The Atmospheric Railway near Dublin.**—Frequently since the opening of the line from Kingstown to Dalkey—the only railway on the atmospheric system yet in existence—we have had to notice the arrival of distinguished visitors, from the Continent as well as Great Britain, to view the works in actual operation. A deputation from the directors of the Great Western Railway Company arrived in Kingstown, on the 13th instant, for the purpose of witnessing the successful working of the atmospheric principle on the line of railway from Kingstown to Dalkey. C. Russell, Esq., M. P. for Reading, chairman of the Great Western Railway Company; Messrs. Simons, Barlow, &c.; Mr. Gooch, superintendent of the locomotive department; Mr. Isambard K. Brunel, chief engineer, with other of the officers, contractors, &c., were of the deputation. Lord Courtenay, Chairman of the South Devon Railway Company, was also of the party. They were received by George Pim, Esq., and others of the directors of the Dublin and Kingstown Railway; Mr. James Pim, jun., Mr. Bergin, Mr. Jacob Samuda, one of the patentees, Mr. Gibbons, &c.; and proceeded so early as nine to inspect minutely the principle and the working of the railway in every way possible, to obtain a thorough conviction of its advantages and its applicability to long lines. The ordinary traffic of the day was not deemed necessary to be interfered with. One of the most gratifying results of the experiments made was, that after stopping half way, the train attained in a few seconds a speed of 35 miles an hour, ascending the steepest part of the incline. Nothing could have been more gratifying to the proprietors of this important national work than the unqualified approbation it received at the hands of those gentlemen. For nearly six hours the party were engaged in their investigations, and departed highly gratified as well as satisfied with the results. Lord Montagu, and his son-in-law, Mr. Marshall, of Leeds, proceeded to Dalkey by this railway, being his first visit to it. Not the least interesting portion of the day's experiments was the accurate signalling from end to end by means of the electro-magnetic telegraph. We understand that the Great Western Company are about to apply to Parliament for several new branches from their main trunk, on which it is intended to adopt the atmospheric system.—*Dublin Evening Post.*

**Warwick and Leamington Railway.**—This line, it is officially announced, will be opened on the 2nd of December next. It joins the London and Birmingham Railway at the Coventry station, and will be worked entirely under the control of that powerful company, of whose undertaking indeed it has become an integral portion, although originally projected by other parties. At the last meeting of the Birmingham Company, Mr. Glyn, the chairman, intimated that the line would be ready for traffic in the course of this year, but he appeared to question the policy of opening in winter.—*Railway Record.*

**Chester and Birkenhead Railway Tunnel.**—The tunnel between Monk's Ferry and the present station of the Chester and Birkenhead Railway in Grange-lane, will be opened for the conveyance of passengers and merchandise on Friday, the 4th of October next. The commissioners of Birkenhead, to whom the premises belong, have resolved to enlarge the Monk's Ferry Hotel, by erecting 100 additional bedrooms, and making other improvements, at a cost of 3,000*l.*

**Hereford and Gloucester Railway.**—A meeting of the Provisional Committee appointed by the four counties of Hereford, Gloucester, Monmouth, and Brecon, for carrying into effect the project of a line of railway into South Wales, was held at Ross, on Monday, the 9th inst. After a rather long discussion, the meeting resolved that the project of a line of railway from Hereford to Gloucester, *via* Ross, with a branch to the Forest of Dean, should be persisted in.

At a special meeting of the Ribble Navigation Company, full powers were given to the directors to co-operate with the directors of the North Union Railway Company in carrying a branch railway to the river. Each party is to bear half the expense.—*Westmoreland Gazette.*

**Railroad in Holstein.**—We learn from Keil (Holstein) that the last section of the railroad from Altona to Keil, which unites Rochs with the latter place, is finished; so that this grand line, which runs to the length of 32 French leagues, the only one yet existing in the states of Denmark, is entirely completed, and will be opened by the king and queen towards the middle of the present month.

**The Railway Dock at Hull.**—Mr. Tadmam, on the part of the dock committee, and Mr. Ryder, on the part of Mr. Broadley, have been engaged during the week in having the Dock-green staked out, preparatory to its being taken possession of for the railway dock, the works of which, it is expected, will be commenced almost immediately.—*Hull Packet.*

A new railway from Liverpool to Manchester in opposition to the present one, is in contemplation. It is proposed to commence at Sutton, pass through Ince, Runcorn, and Warrington. The route is said to be favourable for the construction of a railway at comparatively little cost. At a preliminary meeting at Birkenhead, a few days back, six gentlemen, representing 1,700,000*l.*, were present, and expressed a sanguine opinion of success. The new line is intended to be conducted on the principle of low fares, and a large traffic.—*Westmoreland Gazette.*

**French Northern Railway.**—The adjudication of rails and sleepers for the northern railroad, which had been adjourned to Tuesday, only produced the result of having the rails necessary for the first section contracted for. MM. Schneider took them at 33*fr.* 50*c.* In the second section the prices fixed by the Government as the maximum, 330*fr.* and 332*fr.*, were below the offers. It was the same for the sleepers, the prices of the ministry being 225*fr.*, 220*fr.*, and 215*fr.*, and the proposals being 238*fr.*, 229*fr.*, and 227*fr.* It would appear from this that the offers of the iron-masters have become higher. No time has been fixed for a new adjudication. The Minister of Public Works has decided that a certain number of locomotives and tenders being necessary for the northern line of railroad, in one part between Paris and Clermont, and in the other between Arras, Lisle, and Valenciennes, the adjudication shall take place on the 25th, amongst a certain number of houses sanctioned by him. The supply is to be composed of thirty-four locomotives, thirty-four tenders, and three lots of accessories.—*Galignani.*

**French Railways.**—A trial is being made on the Valenciennes Railroad with soft wood for the sleepers, to prevent decomposition by the humidity of the ground in which they are fixed. Like those used in the Belgian railroads, they are steeped in a solution of sulphate of iron, which, it is expected, will render them incorruptible. If the experiment be successful, the saving will be very great, as a sleeper of oak wood costs 12*fr.*, while that made of soft wood will cost no more than 4*fr.* To this is to be added the cost of the sulphate of iron, which, however, is but comparatively trifling.

## Correspondence.

## ARCHITECTURAL COMPETITION.

SIR,—Your very just remarks upon architectural competition, will, I have no doubt, do much good in abating the fraud practised in a great number of instances in advertisements for designs, when the parties well know, and among one another in the secret, avoid "that it is done only as a matter of form." The practice is far from being new; to my knowledge it has existed for many years. About thirty years ago, an advertisement appeared in the papers for designs for a new St. Paneras Church; a friend of mine, at that time a leading man in the vestry, suggested to me that I might send in a design, as he thought, from having seen several of my drawings at the Academy and elsewhere, that I should, as he expressed it, "stand a pretty good chance." Being a "little up to snuff," as you have it in your remarks upon this subject in your last publication, I told him that I had no objection to send in a design, if he would guarantee me the cost of my time, paper, &c., as I was quite sure under any other arrangement I should have only my trouble for my pains. My friend did not appear to understand that a competition was not to take place, but pointed out the

advertisement that designs were to be sent in, and he would not believe me when I told him, that although the advertisements were only just issued, that the design had been approved, and the working drawings were then being made; and I named to him the architect who was to have the job. This eventually turned out to be the case. It is true that a very talented architect was selected. But if parties are put to the expense of sending in designs where it is already decided to select a particular person to carry out the works, and where these advertisements are only put in as a matter of form, it would be very desirable if some spirited architect thus jilted would try some method for making these building committees pay for their fun.

I am yours very truly,  
Dorset-place, Dorset-square. H. B.

WESLEYAN CHAPEL, LIVERPOOL-ROAD.

[We think that we cannot "do justice" to Mr. Parkinson more effectually than by inserting his letter, which we have done *verbatim et literatim*.]

SIR,—As the Architect employed by the Trustees of the Wesleyan Chapel Liverpool Road I beg to inform you that as a matter of course all the works have been and still are under my constant and most diligent superintendance. And your omission of my name among the persons present at the time of removing the gallery would never have been noticed by me had not numerous friends of mine expressed their disapprobation of such omission in the strongest terms. I beg further to say that did I suppose for one moment that such omission was invidiously intended to injure me, I would not have condescended to have noticed such paltry conduct on the part of any individual whether an Editor or any other person capable of offering such a contemptible insult, but as I am given to understand that the statement sent to you did ample justice to all parties concerned and to myself among the rest, I am inclined to think the omission was accidental and not intentional, under this impression I beg simply to state that when such a mode of removal was mentioned to me before the tenders were delivered my answer like that of any other Architect was that I could not object to give any one who might become the Contractor the full benefit of any ingenuity he or they might possess at the same time stating that he or they should be held responsible to the Trustees and myself to complete the works in every respect according to the true intent and meaning of the drawings and specification, which I am happy to say has been done to the very letter. I only now beg to observe that the whole operation was carried into effect under my personal superintendance as I was in duty bound to see that such an operation was performed in a manner not in any way to deteriorate from the soundness of the works. And in conclusion beg to state that I have never had occasion to trouble the press with any notices of works executed under my superintendance although the press has often born testimonies of the most flattering kind to the operations which I have been engaged in, without my request or knowledge until I have seen the statements in print. Having stated thus much unwillingly but to satisfy friends, I leave you to do justice to the matter.

I remain Sir Your's Obediently  
JOHN PARKINSON

P. S. I had no hand in framing the statement which was forwarded to you.  
20 Rahere Street King Square  
18 Sept. 1844

#### ZINC TEMPLATES.

SIR,—Having for a length of time taken in your valuable publication, I of course, with every other person in the trade, feel interested with all improvements connected therewith; and, also, that every one, whether inventor or improver, should have his meed of praise, and no more. In your last week's BUILDER I see, in an article copied from the *Times* newspaper on the new Houses of Parliament, amongst other statements, how greatly the constructive profession is indebted to Mr. Allen for his improvements, in introducing zinc plates or moulds, in lieu of the old wooden templates; for the other improvements I can say nothing, not having seen them, but for the one I have mentioned, I beg to say, that Mr. Allen has

not the least claim to it, it being upwards of twenty years since I saw it in common use in the north of England, with two pieces of wood cut in the form I have shewn below, and a screw-bolt through one of the projecting pieces, which piece is made so as to move to suit the thickness of the stone; these fasten the mould securely, whilst the mason is "cutting it in," which is a term generally used amongst the craft. Should you think this worthy of a place in your publication, you will much oblige

A MECHANIC.

Tonbridge, Sept. 16th.

#### PRICES OF LATH WOOD.

SIR,—In your list of prices I find quoted Memel Lathwood per fm. 12*l*.; will you do me the favour to say where I can get some at that price; for although the greatest reduction in the duties occurred on the article of lathwood, yet it is now dearer than before the duties were taken off. I presume the above quotation is for 8 feet. M. L. B.

#### Miscellaneous.

THE SURFACE OF THE CITY OF LONDON.—During excavations for the sewers in different parts of the city, information has been gained relative to the depth of artificial ground above the natural surface. The following is the very curious statement relating thereto made by Mr. R. Kelsey in evidence before the "Commissioners for inquiring into the state of large towns and populous districts."—Thickness of made ground at Paul's-wharf up to St. Paul's Churchyard, 9 feet to 12 feet; Watling-street, 11 feet to 12 feet 6 inches; Bread-street, 17 feet 6 inches; Cheap-side, the natural earth was not reached—the cutting varied from 14 feet to 23 feet; Gracechurch-street, 14 feet to 18 feet; King William-street, 12 feet to 17 feet 6 inches; Princes-street, 10 feet to 33 feet 6 inches; Moorgate-street, 16 feet 6 inches to 21 feet 6 inches; Fenchurch-street, 15 feet 6 inches to 17 feet 10 inches; Bishopsgate Within, 9 feet 6 inches to 16 feet; Fish-street-hill, 5 feet 6 inches to 18 feet 10 inches; Eastcheap, 12 feet to 15 feet; Redcross-street, 7 feet to 9 feet; Barbican, 10 feet to 13 feet; Cannon-street, 9 feet throughout; Rosemary-lane, 8 feet to 12 feet; Water-lane, Fleet-street, 5 feet to 9 feet; Cateaton-street and Lad-lane, 12 feet to 14 feet 2 inches; streets in Cloth-fair, 4 feet 6 inches to 12 feet 6 inches; streets in St. Ann's, Blackfriars, 4 feet to 13 feet 3 inches. The plinth of Temple-bar is buried in accumulation. The east end of Newgate-street was lowered about 12 inches, when the present Post-office was built. London-wall has in part been raised above 2 feet within the last 25 years. The Pavement and Little Moorfields have been wholly re-arranged within the last 10 years. All the improvements from London-bridge to London-wall have largely altered the surface of the main line, and of the adjacent streets. The north side of what is termed Holborn-bridge, the north end of Farringdon-street, has been raised above 2 feet. Such occurrences as these are distinctly noticeable in some way, but the insensible alterations are equally great and curious; as, for instance, from levels taken in 1770 and 1842, it appears that in Bishopsgate-street without, at Bishopsgate-churchyard, the surface has risen 2 feet 2 inches in 72 years, but at Spital-square only 12 inches in the same time. The result of this examination is confirmed by the depths of the sewers, as originally built, and as they now measure.

PAPER TO RESIST HUMIDITY.—This process, which is due to M. Edgle, consists in plunging unsized paper once or twice into a clear solution of mastic in oil of turpentine, and drying it by a gentle heat. The paper, without becoming transparent, has all the properties of writing-paper, and may be used for the same purposes. It is especially recommended for passports, workmen's books, legal papers, &c. When preserved for years it is free from injury, either by humidity, mice, or insects. It is further added that a solution of caoutchouc will produce even a still better effect.—*Kunst und Gewerbe-Blatt*.

THE BUILDING MANIA.—Foreigners who arrive in London are struck by the immense speculations in building which now give life and activity to the metropolis and its environs. Every district presents a picture not unlike Virgil's description of Carthage. The workmen extend their walls, raise houses, pushing along unwieldy stones or masonry timber. Some mark out the ground for building. Others carry bricks and mortar. They all toil like bees. There is no part much more animated by this movement than Lambeth. The prodigious increase of houses is really astonishing. It appears by Parliamentary papers that within 50 years of the last century there was only an increase of 5,600 houses. From 1790 to 1800 the total number of houses within the parish has been doubled. In 1822 the number was about 14,000. The increase since that period is almost incalculable. Kennington-common, Stokewell, Brixton, South Lambeth, Wandsworth-road, Vauxhall, and the more remote parts of the parish, are formed into streets and rows of first, second, and third-rate buildings. Several squares have been formed and churches erected. Much taste is displayed in the architectural style of the suburban villas and cottages; but amidst this mass of buildings which strike the eye in almost every direction, hundreds of houses remain unoccupied. How so many private residences can find occupants is a question not easily solved. A vast amount of capital has been expended by persons who have drawn their money from the funds in the expectation of getting better interest for it in these building speculations; but the general opinion is, that a considerable portion of the new speculations will produce little return to the capitalist. According to the calculation of those who watch the increase of our metropolitan population, the houses already built are more than enough for the inhabitants of Lambeth, Wandsworth, and Camberwell for the next 20 years.—*Globe*.

THE CATHOLIC CHAPEL AT CLEWER.—Considerable alterations are now in progress at the Roman Catholic chapel at Clewer (which is situated about a mile and a half from the Castle), for the accommodation of the King of the French and suite, upon the arrival of his Majesty at Windsor, upon a visit to the Queen in the early part of next month. A new wing, the brick-work of which is completed, has been added to the north side of the chapel, and an opening, by means of an arched window, made into the interior of the edifice, close to the altar and opposite to the pulpit. This apartment (or tribune), which is intended for the use of the King and his suite, will be completed, and appropriately furnished before his Majesty's arrival. This addition to the only place of Roman worship within several miles of Windsor will be a very great convenience and accommodation to those royal and distinguished Catholic families who occasionally visit her Majesty and the Prince Consort at Windsor Castle. The tribune, which is upwards of fifteen feet square, will contain, comfortably, during the performance of mass, from twenty to thirty persons.

NEW POLICE COURT.—Within the last few days orders have been issued for the speedy erection of a new Police Court, at Kentish Town, in a position where it will afford facilities for the inhabitants of those daily increasing localities, Hampstead and Highgate. It is stated that the new court will not only comprise the places already named, but also Finchley, and the populous districts of Camden and Kentish Towns, Holloway, and the entire of the S division, which extends to Barnet.

A cement which gradually indurates to a stony consistence may be made by mixing twenty parts of clean river sand, two of litharge, and one of quicklime into a thin putty with linsed oil. The quicklime may be replaced with litharge. When this cement is applied to mend broken pieces of stone, as steps of stairs, it acquires after some time a stony hardness. A similar composition has been applied to coat our brick walls under the name of mastic.—*Dr. Ure*.

BERWICK CASTLE.—That venerable and interesting monument of antiquity the ancient castle of Berwick is to be levelled with the ground, in order to allow space for the terminus of the railway forming between that town and Edinburgh.

BUONAPARTE'S ROAD OVER THE SIMPLON. —This road, which is considered one of the most magnificent works of modern times, was made between the years 1800 and 1805. It connects the town of Briegg, in Wallis, with Domo d'Ossola, in the valley of the river Toce or Tosa, in Piedmont, and is about 38 miles long. The width is about 9 yards, and its rise and fall only about 1 1/2 inch for every yard, so that it can easily be passed by carriages. It runs in most places between steep and nearly perpendicular rocks, and at six places, tunnels or galleries have been made through the rock. The longest tunnel, which is below Gondo, on the side of Italy, is nearly 500 feet long. These tunnels are generally 30 feet high, and at least as wide as the road itself. There are openings on the sides by which they receive the light. In several other places the road traverses precipices of great depth by means of substantial bridges. The highest part of the road is 6,576 feet above the sea-level; Briegg is 2,334 feet, and Domo d'Ossola 1,004 feet above the sea-level. At certain seasons the waters descend from the glaciers in rapid torrents, and frequently carry away the bridges; the road is also much damaged by the avalanches and masses of rocks which fall from the adjacent mountains. The original cost was 400,000*l.*, and it is supposed that from 5,000*l.* to 6,000*l.* are annually required to keep it in repair.

THE DWELLINGS OF THE POOR.—We refer with great gratification to the unanimous decision of the Town Council (Manchester), that a portion of the funds at its disposal shall be devoted to the opening out of close courts and narrow streets, with the view of causing the thorough ventilation which is necessary to the preservation of health. Look at the evidence of Dr. S. Smith and Mr. P. Holland, as to the effect upon health, and even upon morals, of residence in ill-ventilated, ill-drained, and ill-cleansed courts and streets. The one tells us that the benevolent aid of the physician is comparatively useless when the patient is so situated, and the other that mortality in the worst houses in the worst streets is double that in good houses and good streets! The report on the condition of large towns and populous districts is full of similar proofs.

THE NELSON TESTIMONIAL.—The public were for a few hours on Tuesday morning last gratified by a view of the Nelson Testimonial unencumbered by the wooden hoarding that has so long obscured the base and lower portion of the pedestal from observation, and which, when removed, gave this national work the appearance of completion. In furtherance of the determination of the government to complete the monument, a model of the steps and platform round the base had been prepared, and was inspected by the Earl of Lincoln, Chief Commissioner of her Majesty's Woods and Forests; the architect, Mr. W. Railton; and other gentlemen connected with the land revenue department.

MARBLE STATUE FOR HER MAJESTY.—A marble statue belonging to the Queen was landed on the 13th inst. at the St. Katharine's Dock, out of the ship Effort, from Leghorn, and in consequence of the absence of her Majesty from Windsor, on her excursion to Scotland, the same has, at the request of her agent, been securely deposited in the docks, pending the decision of the removal to the Palace, and an officer of the Customs will be appointed to superintend the examination at the Palace, when her Majesty's pleasure is known on the subject.

PUBLIC WALKS.—A government agent has visited Sunderland, and surveyed and approved the site selected by the Public Walks Committee as a recreation ground for the inhabitants.

Attics, stables, cow-houses, and other places with slated roofs, generally intolerably hot in summer, may be rendered comfortable by giving the slates two or three coats of white paint.

Nearly 1,000*l.* has already been subscribed towards the cost of erecting a suitable monument to the memory of the late lamented Earl of Lonsdale.

It is in contemplation to erect a monument to George Stevenson, the railway engineer, at Liverpool.

A subscription has been opened to construct baths for the working classes at Greenock.—Hereford Times.

Current Prices of Wood and Metals.

September 17, 1844.

Table with columns for material names and prices in £ s. d. format. Includes categories like Box, Cedar, Ebony, Lignum Vite, Mahogany, Teak, Oak, Fir, Pine, Deals, Copper, Iron, Lead, Tin, Spelter, Zinc, Platinum, and Quicksilver.

Tenders.

TENDERS delivered for rebuilding Warehouses at No. 28, Bishopsgate-street Without. — Charles Broadbridge, Surveyor, 87, Great Portland-street. Whitelaw £894. Pipers 878. Reeve and Co. 829. Jay 794. Ashby 757. Estimated from Bills of Quantities.

TENDERS delivered for Repairing, Painting, and Graining the Vestry Rooms of St. Pancras. Hewitt £143 0 0. Miller 142 0 0. Boulting 126 7 3. Edge 125 10 0. Schaller 110 17 0. Winter 110 0 0. Hatfield 110 0 0. Day 104 0 0. Short 102 11 0. Johnson 99 0 0. Hopkins 97 3 6. Steer 90 0 0. Bolton, Charles-st., Seymour-st. 79 14 0. The lowest tender accepted.

TENDERS delivered for the intended Alterations at the Union Workhouse at Newbury, Berks. Salisbury £342 8 6. Adey 311 0 0. Westcombe 310 0 0. Boyer 300 0 0. Eyles 285 0 0. Harrison 278 0 0. Hanson 260 0 0. Elliott and Balding 259 0 0. Stratton 247 12 6.

TENDERS delivered for Works to be done at Ball's Pond for John Musgrove, Esq., Alderman and Sheriff.—James Edmeston, Esq., Surveyor. Trayhorn £184 0. Barber 123 15. Norris 117 0. Rumens 115 10.

NOTICES OF CONTRACTS.

For completing the Bricklayers', Carpenters' and Joiners', Plasterers', and Smiths' Works of two Villas, at present in carcase.—Specifications, &c., Mr. H. Mabin, Surveyor, Castlenear Barnes, near Hammersmith-bridge. September 24.

For three Six-roomed Houses at Kenish Town.—Plans, specifications, &c., A.Z., at Mr. Jennings's, opposite the Chapel, Kenish Town. September 23.

For such Bricklayers', Carpenters', Masons', and other Works, in the Cleansing, Building, and Repairing the public Sewers and Drains for the City and Liberty of Westminster.—Mr. Lewis C. Hierslett, Clerk, 1, Greek-street, Soho. October 15.

For one hundred single Iron Bedsteads for the Union Workhouse at Aylesbury.—Mr. W. Gleadah, Clerk. September 25.

For 1,300 yards of Cast Iron Pipe of six inches diameter, at per yard, for the Commissioners of Water Works for the Town of Southampton.—Mr. Charles E. Deacon, Clerk, Audit-house, Southampton. October 3.

For paving certain of the Foot Paths of the Parish of St. John, at Hackney, with York paving of the best quality, not less than three inches in thickness; and relaying a quantity of old York paving, at per foot super.—Mr. C. H. Pulley, Clerk, Upper Homerton, and 28, Great Winchester-street, Old Broad-street. September 26.

For the Execution of the various Works in the formation, ballasting, and laying the permanent way of the Canterbury, Ramsgate, and Margate Branch Railway.—Plans and specifications at the office of Mr. Joseph Cabitt, Civil Engineer, 12, Manchester-buildings, Westminster; Mr. J. Whitehead, Secretary, South-Eastern Railway, London-bridge. September 24.

For an Iron Palisade Fence on the boundary wall of the Southampton Cemetery, two Iron Entrance Carriage Gates, and one Footway-gate.—Specifications, with a plan of the Iron Gates, &c., Mr. Doswell, Surveyor, Albion-place, Southampton. Mr. C. E. Deacon, Secretary, Audit-house, Southampton. September 25.

For the building of the new church at Lynn.—Plans, &c. Mr. Flew, Bookseller, High-street, Lynn. 1st October.

For various buildings and other works at Gateshead, Brockley Wharf, and other places along the line of the Newcastle and Darlington Railway.—Plans and specifications at the Railway Office, York, from the 16th to the 30th September. Mr. G. Hudson, Chairman, Railway Offices, York. October 2.

For 16,000 Larch or Baltic Sleepers, of various dimensions, for the Ashton, Staleybridge, and Liverpool Junction Railway.—Secretary, at Manchester and Leeds Railway Office, Palatine-buildings, Hunt's-bank, Manchester. October 8.

For a new School and Master's House, at Leicester.—Plans, &c., at the Vestry Room, Creation.—Mr. S. Fry, Architect. September 27.

For the erection of Amberswood Bridge, in the township of Ince.—Mr. A. B. Chambers, Bridge-master, Cable-street chambers, Liverpool. September 30.

COMPETITIONS.

PREMIUM OF 20l. for the chosen design for a new Church at Winchester, to hold about 1,000 persons on the floor, cost not exceeding 4,000l. Further information from Rector and Churchwardens. 10th Oct.

TO CORRESPONDENTS.

"Well-wisher" is somewhat hypercritical in his remarks. The back-front of the New Houses of Parliament need not be similar to the river-front; their difference forms, in our opinion, a beauty.

MR. SMITH'S letter will be answered next week. The notice respecting the new Hospital for Consumption, &c., can only be inserted, in its present form, as an advertisement. If, however, our correspondent will furnish us with drawings of the elevations and ground-plans, together with a description of the intended building, we shall be happy to give them a place in our publication.

In page 471 of our last number the words "and might call into requisition skilled workmen as framers and carvers, similar to what has been done in the middle ages," were merely the suggestions of a private individual, and being written in pencil, were accidentally printed.

One or two advertisements were accidentally mixed with the other contents of our last number.

Page 469 near the bottom of column 3 read "for the locomotion safely of a thing extending over a surface of 50ft. by 30ft. and put together in a thousand pieces, is not so easy as that of" &c.

ADVERTISEMENTS.

CHEAP AND DURABLE ROOFING.

By Her Majesty's Royal Letters Patent.

TO ARCHITECTS, SURVEYORS, BUILDERS, &c.

F. McNEILL and Co. of Lamb's Buildings, Bunnhill Row, London, Manufacturers and only Licenced Importers of THE GROOVED RIDGE FELT, for Roofing Houses, Verandahs, &c. beg to call the attention of the Trade to their ROOFING FELT, which has been exhibited at the great Agricultural Shows of England, Scotland, and Ireland, and obtained the prize, for being the best and cheapest article for Roofing, to supersede slates, tiles, &c. It has been very extensively used by Noblemen, Gentlemen, and Tradesmen, in all parts of the Kingdom, from whom the most flattering testimonials have been received. Its advantages are lightness, warmth, durability, and economy. It is impervious to rain, snow, frost, and a non-conductor of heat and sound. The Felt can be cut to any length, by 32 inches wide.

The price is only One Penny per Square Foot. Samples, with full directions as to its uses and the manner of applying it, will be sent gratis, on request to any of the gentlemen who have extensively used it, sent free to any part of the town or country. A Dry-hair Felt, for covering Boilers, &c., is also manufactured, by which a saving of about 25 per cent. in fuel is effected.

A Liberal Discount allowed to the Trade. Patent Felt Works, Lamb's Buildings, Bunnhill Row, London.

AT THE ANNUAL MEETING OF THE ROYAL SOCIETY OF ARTS AND SCIENCES, held in London, on the 10th of June, 1844, His Royal Highness Prince Albert presented to Mr. ROBERT BROWN the medal awarded by the said Society for his invention of the ORNAMENTAL GROOVED RIDGE TILE.

The Grooved Ridge Tile was invented by Mr. Robert Brown, in 1840, and first used by Mr. Kendal, architect. The Tile being now used by architects generally, the inventor has been induced to establish a manufactory for the same at Surbiton, Surrey, and trusts, that being the inventor, that architects and builders will give him the preference, he being enabled to supply them at the lowest possible rate. The merits of the Grooved Ridge Tile consist in its forming of itself an excellent ridge, whilst the groove along the top enables the architect to introduce whatever outline of ornament he may think proper, at a cheap rate.

Ornamented Plain Tiles, which are now used by architects generally as an elegant covering for buildings, instead of the common square plain tiles, can be supplied at the manufactory at nearly as cheap a rate.

Two kinds of Serrated Plain Tiles, the round end and the pointed, have long been used in the county of Surrey, but not as a covering for roofs, only as an ornamental covering for walls of houses, such tiles being placed vertically thereon. The great excellence of the Serrated Common Plain Tiles as a covering for roofs consists in this, that when put on the building they are made to lap over each other, something in the manner of the scales of a fish, by which means they form an excellent protection against either heat or cold, a most important element of consideration. By Mr. Brown's plan the tile can be made of almost any desired colour at a trifling expense.

Orders to be addressed to Mr. ROBERT BROWN, Tile and Pottery Works, Surbiton Hill, near Kingston, Surrey.

BASTENRE BITUMEN COMPANY.

Offices, 31, Poultry. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in its various applications. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP AND WETNESS from the interior of buildings, the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot square:—1 inch thick, 8d.; 2 inch thick, 7d.; 3 inch thick, 6d. Works not measuring 400 feet, 3d. per foot extra. Roofing executed at 6d. and 7d. per foot square. Concrete is charged in addition according to the thickness when required. Carriage and men's time are charged extra when works are executed beyond three miles from the General Post-office. Bitumen 26 per ton, without grit. Bitumen 25 per ton, with grit.

CHARLES F. TILSTON, Sec.

TO BUILDERS, CABINET-MAKERS, AND OTHERS.

SALISBURY GLUE 60s. per Cwt.; and fine Scotch do. 50s.; Town 45s., 44s., and 42s.; Best Glass Paper 9d.; Second do. 8d.; French Polish and Spirit Varishes 19s. per gallon; Naphtha do. 10s.; Genuine White Lead 9s.; Second do. 24s. and 22s.; Improved Stucco Patent 28s.; Invisible Green and Chocolate Colour 28s.; Fine Green, and all Colours used in House Painting, prepared by a new process to dry in six hours, 6d. per lb.; Turpentine 2s. 6d. per gallon; Linseed Oil 2s. 6d.; Fine Copal Varnish 20s.; Quick Drying Carriage 14s.; Oak do. 12s. and 10s.; 100s., 10s., 10s., and 5s.; Turpentine Varnish 3s.; Dry Brunswick Green 3d., 4d., and 6d. per lb.; Lamp Black 3d.; Emerald Green 1s. and 1d.; Whiting 1s. 3d. per cwt.; Stockholm Tar 18s. per barrel; Pitch 10s. per barrel; Gilder's Materials, Ladders, Bronze, Dutch Metal, Patent Gold Paint, Dies and Die-woods, Adhes, Alkali, Guns, and Salts of every kind and description at equally low prices. W. NIXEY'S Old-Established Warehouse, 22, MOOR-STREET, SEVEN-DIALS, LONDON.

ESTABLISHED 1821.

THE LONDON MARBLE AND STONE WORKING COMPANY, by PATENT MACHINERY, beg to call the attention of the TRADE to their choice collection of BLOCKS and SAWN SLAB, and being the ONLY Manufacturing Company importing Continental Marbles, thereby enabling us to furnish our customers with their superior Sawing, to prepare Chimney-pieces, &c. at 25 per cent. lower than the common description of Work submitted generally for Sale.

POLISHED MONEY ONLY. 3 in. Vein Marble slab, from 1s. 6d. per ft. sup. Inch do. " 1s. 7d. " St. Ann do. " 2s. 0d. " Dove do. " 2s. 4d. " Barilla do. " 2s. 0d. " Black do. " 2s. 6d. " All other Marbles in proportion. Vein Blocks, from 9s. per foot cube; Statuary and Vein Sealings sent to the Works Cut to Order, at 7d. per foot superficial.

The Directors invite the Public to inspect their extensive Show Rooms and Works containing the largest manufactured Stock in this country, and by the great superiority of workmanship combined with talent and an artistic skill of the first order, the Company have supported their reputation unrivalled by other competitors in executing superior Chimney-pieces, Dressings for Doorways and Windows, Staircases, Slabs for Furniture and Dairs, Flaying for Walls, Peristyles, &c. In the department for executing MONUMENTS, TABLETS, ALTAR-PIECES, and FONTS, and for all Sculptured as well as other Works, Drawings and Estimates are submitted.

Address ESHER-STREET, top of Holwell-street (on the left hand) MILLBANK, WESTMINSTER.

Please to be accurate in copying the Address, to prevent imposition, the Company having no connection with any other establishment but that in ESHER-STREET.

PEAKE'S TERRO METALLIC TILE

DEPOT, WHITEFRIARS, and 29, WATER-LANE, FLEET-STREET, LONDON; from the TILES, Newcastle, Staffordshire, THOMAS PEAKE, Manufacturer, having by various means, and during a considerable time, published the names of the Tiles, and by this means his duty to announce that he has no longer any Agent there; that, consequently, he has opened a Metropolitan Depot, situated three minutes' walk from the Temple, to supply genuine articles and at just prices as possible. The Tiles are central, and goods are sent thence direct to any Place inland, or to the Mercury, to which they are retranshipped for the British and Irish coasts, the Colonies, &c. The Proprietor feels most grateful to his numerous friends, by assuring them, and the public also, that as probity and fair dealing have been his aim for thirty years past (although no one can control the circumstances which too often arise, affecting alike the quality of manufactures and the time required for them to be at their destination), so he trusts to his conduct in future to retain and increase his estimable connection.

BLUE TILES for various purposes, namely, to cover roofs, both plain and pitched, to soot chimneys, &c. They are easily laid on, as they do not require dressing, fitting, pegs, or nails; for ridges and hips of any angle, plain, copped, roiled, or with a variety of upright ornaments; for valleys; for chimneys; for awning, barrel drains, gutter, surface, terraces, and other purposes; for paving, &c. BLUE BRICKS for paving stairs, areas, foot-paths, barns, and warehouses; also for building docks, piers, wharfs, tunnels and other arches, culverts, and bridges. FIRE BRICKS of the time line, steam, and other uses; and also squares to pave head ways. Depot at the corner of Temple-street, and Water-lane, City. Lists, in preparation, describing the articles and their use, containing also remarks, testimonials extracted from various works. The bricks being made of clay peculiarly good in quality, and triturated by machinery, and being carefully moulded and burnt, are, in fact, the best Newcastle blue bricks, the hardest and most durable of any made in England.—Life of Telford, p. 77.

"The tiles being formed of terro-metallic earth, have somewhat of the colour of cast-iron; they are almost equally hard and must, from their nature, be incomparably more durable. In short, we consider them as the best of all coverings for roofs, whether of small or large buildings." There are suitable ridge tiles and valley tiles, all manufactured by Peake in the same superior style.—London Ency. of Cottage, Farm, and Villa Architecture, p. 648, sec. 1363; and Longman & Co. 1833.

BUILDERS, PLASTERERS, and others

Should compare the Prices,— Linseed Oil, 2s. 2d. per gall. Yellow Ochre, 8s. per cwt. Boiled Oil, 2s. 8d. per do. Lamp Black, 2s. do. Turpentine, 12s. 6d. per do. Blue Black, 18s. do. Best Ground Lead, 36s. p. cwt. Venetian Red, 12s. do. Second do. do., 24s. do. Gold Size, 9s. per gall. Third do. do., 21s. do. Copal Varnish, 12s. & 16s. do. Town Glass, 4s. do. Paper Varnish, 11s. & 14s. do. at PEISLEY'S noted Cheap Lead and Colour Warehouse, 58, JUDD-STREET, NEW-ROAD, Brighthelm, Varnishes, Dry and Ground Colours, at lowest prices.

PLUMBERS, PAINTERS, BUILDERS,

and OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures, Glazing, &c. &c., in any quantity, at Manufactory Prices.

TURPS, per gallon . . . . . 2s. 4d. LINED OIL, ditto . . . . . 2s. 4d. SHEET LEAD, in sheets, per cwt. . . . . 18s. 6d. Ditto, cut to sizes and PIPE . . . . . 19s. 6d. WHITE LEAD (Genuine) per cwt. . . . . 26s. 0d.

Colours, Pipe, Brushes, &c. &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to R. COGAN, 5, PRINCE-STREET, Leicester-square, London.

PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS, can be provided with flatted Crown, flattened Sheet, and the patent Sheet Plate, Lists of which, showing the price for any Square, from 14 by 12 to 40 by 30 feet, and the price for any quantity, will be sent gratis upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive the return of the lowest price for all quantities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for, if required.

NURSEYBEN MARKET GARDENERS, AND OTHERS requiring small Glass, will find a great variety of sizes at large stock which is constantly on hand than is kept by any other House in London.

COMMON SHEET AND CYLINDER. The advantages of Common Sheet over Crown for Glazing Sky-lights is decidedly great, and generally used where strength and superior appearance is required, a light 6 feet 6 in. long, with openings of any width, needs only one flat. This Glass is considerably stouter than Crown, and may be had from 13.3d. per foot. Also may be had,

COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES.

OF EVERY DESCRIPTION. GAS CONTRACTORS, FITTERS, GLASS MERCHANTS and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, AND OTHERS, supplied with FRENCH ORNAMENT SHAPES, for covering Models of Public Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application.

French Table Flowers, China Vases, Fancy Glass Ware, and Alabaster Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Bazaar keepers and others.

SEYSSAL ASPHALTE COMPANY.

"CLARIDGE'S PATENT," ESTABLISHED 1839.

This ASPHALTE is a Rituinous Limestone, obtained from an inexhaustible Mine at Fyrimont, in the Jura Mountains.

Previously to its introduction into this country, in 1839, the material had been used for many years in France, and from its great utility was extensively patronized by the Government of that Country.

Among the various uses to which it can be applied, the following may be enumerated:—For Foot-Pavements, public and others; in the Carriage Approach to Mansions, Garden-walks, and Terraces; the flooring of Kitchens and other basement offices; also of Coach Houses and Stables. Dog Kennels, Bath Rooms, Cow Houses, Piggeries, Poultry Houses, Tun Rooms, and Maltings. For Roofing, Covering of Railroad and other Arches, the Lining of underground Cellars near Rivers to prevent the ingress of water, and in covering the roofs of Docks, to prevent damp rising. (This application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts), thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Docks, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARRELL, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," Stungate Depot, London.

COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS.

THE DIRECTORS OF THE SEYSSAL ASPHALTE COMPANY purpose to send a copy of the report, in recommendation of the notice of Architects, Builders, and others, the application of THE ASPHALTE OF SEYSSAL, as the only effectual means of preventing DAMP rising in WALLS.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18.

In 1839 I superintended the construction of a house of three stories on the Lac d'Engelien. The foundation of the building is constantly in water, about 18 inches below the level of the sea. The entire horizontal surface of the external and internal walls was covered, at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

Since the above date no trace of damp has shewn itself round the walls of the lower story, which are for the most part painted in oil of a gray stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 2 inches above the external surface of the soil, and only 10 1/2, at the utmost, above that of the sheet of water.

"The layer of Asphalt having been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp had been seen remarked at the base of the door-posts."

The Builder.

NO. LXXXVI.

SATURDAY, SEPTEMBER 28, 1844.

Freemasonry again this week will occupy a small portion of our columns.

We have hinted that the principal thing at present to be done towards its restoration is the gathering together of facts and details of ancient buildings: we have now, it is true, a very large collection of publications upon ancient Gothic architecture, but, unfortunately, very few of them are treated in a freemasonic manner: to a certain extent perhaps it is well that they should be so published at the present; for as the bias of mind in those who have put forth these works has not been trained philosophically, mischief might have resulted from the issue on their part of false dogmas upon the subject of architectural construction; but while it may thus be well that abstinence be held by these authors from any approach to authoritative assertion on a subject so all-important, we must still complain of a want in them of the right kind of information: for few of them go beyond mere outward forms; whereas we require every the most minute detail, and, above all, the exact jointing of every part of their construction; so that the reason of their holding together, or failure,—the causes of fracture, subsidence, falling from the perpendicular, or any dilapidation, may be found,—and in the copying of such examples, be avoided. A very beautiful work has been just completed, (and which we shall shortly review), denominated "Illustrations of Baptismal Fonts," nearly all the wood-cuts of which are most exquisitely engraved; but the subjects being in perspective, without plans or sections, the publication will serve very little towards a restoration of font-work; for, on account of the want of such details, it will in the hands of country clergymen and country masons be entrusted to the use of workmen who, not learned in such matters, will, even where they have ancient details at hand, rarely copy them, choosing rather to depend upon the resources of their own minds, which have been embodied five hundred years after the fall of really good Gothic architecture. We perceive among the examples in this work one or two which we have in our engraver's hands with the necessary details. While speaking of publications upon Gothic architecture, we must notice one, only two parts of which have at present been issued, denominated, "An Analysis of Gothic Architecture, illustrated by drawings made from actual measurement, of existing examples throughout England, and carefully delineated to scale, by Raphael and J. Arthur Brndon, architects." We shall also reserve ourselves for a minute review of this work

when some one department of it is complete, at present only noticing that, having the plans, sections, and details, which the other wants, it is, though more roughly executed, of far more use, and especially so from many of its plates exhibiting an attempt towards the revival of the decorative branch of Freemasonry, by the insertion of many formation lines and centres for the radiation of its different curves. This, in the examples here quoted of the flowered open para-

(Scale 1/4 inch to a foot.)

pet, or termination of the doorway, leading from the south aisle of St. Alban's Abbey to the cloisters which formerly adjoined the church, by the simple system of triangulation gives the centres for striking a figure apparently very complicated, and determines the dimensions of several parts of the work without further premeditation, thus leading to a certainty, as well as ease of operation, which can alone distinguish the true artist from the bungler. By and by it will be seen, that certain elements in a work first given, a sequence of freemasonic science directed all the rest. We doubt not that the greater part of this will be brought to light again, and as any discovery of the kind is made, we shall promulgate it to the utmost of our ability.

The subjects of this work are to be classed as 1st, Windows; 2nd, Doorways; 3rd, Porches; 4th, Buttresses; 5th, Pinnacles; 6th, Parapets, and other external features; 7th, Piers; 8th, Arches; 9th, Capitals; 10th, Bases; 11th Church furniture; the whole to be comprised in about 150 royal-quarto plates, and with an accompanying description.

It will be scarcely necessary for us to impress again the absolute necessity for these and all other delineations of architecture to contain the jointing of the masonry and all the other constructive peculiarities. In genuine architecture they are always part of the design, for where the workmen are left to form as they please such part of the work, failure is most commonly the result.

These in architecture, instead of being slurred over, frequently form the very pride of the work; for wherever concealment of them is allowed, the work is sure to be slighted, and inevitable failure thence occurs, which, being like a disease fatal within the human frame, is the more fatal,—the very intended remedies which are applied often burthening parts already too feeble, or absolutely cutting away the little inherent strength of the fabricated patient, cause still greater failure, if not absolute ruin.

There is a branch of architectural art which we do not see proposed to be touched upon in Messrs. Brndon's work, viz. the subject of vaultings, which is precisely the one relative to which we need the most information

from actual survey; and till which branch of art is thoroughly revived, we may say Gothic architecture will still be in a fallen state: buttresses and pinnacles are but members of a system, neither of these is anything by itself; and both together form only part of that system: the form of a vault, its thickness, the dimension and number of its ribs, the weight of the bosses, the size and projection of the buttresses, the situations and inclinations of their tablings,\* the weight of pinnacles, and the size angle and position of flying-buttresses,—all depend upon each other:—if the curves of a vaulting be straightish and steep, the boss must be large; if a vaulting be flat, the buttresses must either project greatly or be suddenly diverged inwardly by huge pinnacles; if heavy pinnacles be placed above a clere-story, the internal piers must be more capable of sustaining weight; and in general if there be no pinnacles above the outer buttresses, those buttresses must either be of enormous solid projection, or must be separated from the walling, as at Gloucester Cathedral, and many other buildings where sufficient weight of pinnacle has not been applied to reduce the vaulting-drift within buttresses of any ordinary projection: in all such delineations, every course of the masonry, and all its vertical and other jointing should be most carefully marked and all failure should be indicated, so that the reason of it may be ascertained, whether it be from accident of foundation, from insufficiency of pinnacular weight, or whatever other cause, and in vaultings the jointing of the masonry should be also given, as also the nature of the several materials, whether chalk, or lighter ordense stone, and the effect which they have experienced, whether by time, pressure, extraneous injury, or other cause.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The fourteenth meeting of the British Association, to be held in York on the 26th inst., is to continue till Wednesday, the 2nd of October.

The objects of the British Association are to give a stronger impulse and a more systematic direction to scientific inquiry,—to promote the intercourse of those who cultivate science in different parts of the British Empire with one another, and with foreign philosophers,—to obtain a more general attention to the objects of science, and a removal of any disadvantages of a public kind which impede its progress. At the annual meetings of the association, the state of science in its various departments is taken into consideration, notices of recent scientific discoveries are brought forward for examination and discussion, and pecuniary encouragement is granted from the funds of the association for the advancement of particular researches which require such assistance, and appear likely to benefit theoretical and practical science. In the course of the last ten years, the sum of 10,000, has been thus expended by the association exclusively in the advancement of science.

Amongst the eminent visitors who are expected to attend the present meetings, we may mention the names of Liebig, Lamont, Matteucci, Brewster, Faraday, Peacock, and Whewell. The hospitalities of Wentworth

\* Contrary to the new dogma of Welby Pugin, the water-tallings of buttresses conforming to the catenarian curve of pressure grow steeper as they approach the ground, vide the Temple Church, and many other ancient examples; where they are otherwise, they have mostly been unskilfully renewed. The mere eye-service of making them steeper as they are further from the ground, is unnecessary, because the elegance of their profiles can be detected from the peculiarity of not being mitered all round the work, but with the molded and table-work usually cut off perpendicularly at their sides.

House will, on this occasion, be transferred to York, and Earl Fitzwilliam will, as president of the Yorkshire Philosophical Society, entertain a very large party of the visitors at dinner, in the De Grey rooms, on Friday. We hear also that the archbishop, the highly respected patron of the society, and a constant friend and supporter of every useful design in York, will receive at Bishopsthorpe many distinguished members of the association, and exercise towards others that graceful hospitality, which operated so favourably to cement together, in 1831, the various elements that now compose the body of the association. The Earl of Enniskillen and the Earl of Rosse have also made arrangements to enable them being present on the 28th inst.

#### MINERALOGY.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 479.)

A few more years, and the dreary speculations of geologists will have disappeared forever; the mind of man has hitherto constantly tended to speculate on impossibilities, and in doing so, shuts itself out from nature, and the natural simplicity of truth. What reasoning being can follow the absurd calculations and mathematical demonstrations of modern philosophers? One tells you exactly how old the earth is; another measures out its sum of air and water, of hydrogen, oxygen, nitrogen, and carbon; another gives a section of the interior of the globe, and describes its composition, how long our hidden recesses of coal will last—how many miles high our atmosphere exists—how the inhabitants of tropic climes could live in frigid regions—how nature plays the see-saw game of elevation and depression, as though animated by a vital, thinking principle—how millions of worlds may be seen in the sweep of a telescope—how this earth is a huge high-pressure engine, regulating itself by funnels and safety-valves, and avenging itself by awakening our fears, destroying the fruits of our labours, and hurrying tens of thousands into eternity by its momentary summings. These are the absurdities of science, which men love to hear, in preference to the simplicity of truth; and upon which literary empirics found their fame and fleeting popularity, striking the weak mind with awe and wonder, appealing to its prejudices and superstitions, rather than to its reasoning powers. In the days of Woodward every fossil body was a *busis nature*, or plastic freak of nature; and the theories of Bishop Burnet, Whiston, and others, are existing monuments of the taste and superstitions of the day. We have since those times advanced in knowledge at a railway pace, but our thinking faculties do not keep pace with the knowledge acquired; the bulk of the community still sigh after or adhere to the marvellous, even though it convict them of folly and inconsistency.—Empiricism will flourish!

In continuing the subject-matter of Petrology under the more comprehensive term of Mineralogy, I do so in order to treat more at length on the nature and qualities of earths, which form the bases of rocks and stones. It will be understood by every one, that the rocks, and the materials of which they are composed, are so intimately associated together, and are so dependent on each other, as to be inseparable; that rock may be seen in every stage of decomposition, and in every stage of formation, from the forming concrete to the biggest crystalline rock. Under the head of calcareous substances I must, therefore, naturally embrace many bodies embraced under the head of petrology.

I have already spoken of the origin of calcareous earths, and, influenced by climate and association, their conversion into rock; but when limestone or marble is subjected to the process of burning, calcareous earth is again produced, and in this state is commonly known under the name of lime, the purest of which is yielded by calcareous spar and some white marbles. Limestone is said to be composed of lime and carbonic acid, because chemists, on the application of heat, extract a gaseous body from it, which by Priestly, Black, and others, was termed fixed air, but latterly denominated carbonic acid gas, still it is very questionable, as I have observed elsewhere, whether carbon forms the actual cementing base of the lime

stone. In 1808 Sir Humphrey reduced lime to a metal, having the colour and lustre of silver, and burning with an intense white light into quick lime.

Gypsum, commonly called plaster of Paris, is a carbonate of lime combined with sulphuric acid; the plaster of Paris being prepared from gypsum by calcination; the varieties employed for this purpose by the ancients were chiefly *alabastrites* or *alabastrum*, effervescing with nitrous acid; but moderns have applied the name of alabaster to quite a distinct substance, which being united with sulphuric acid, the nitrous acid produces no effect. The alabastrites of the Romans were most probably, according to the description given of them by Pliny primarily derived from Egypt only, whence they obtained their porphyries, and other precious building stones; for Egypt, as is manifest in the present day, abounds with this material, particularly in the neighbourhood of the ancient quarries; it exhibited, in general, a stratified appearance, was distinguished by its yellow colour, and often by brown stripes, arising from successive depositions, with some resemblance of the layers of the onyx, whence the onyx baths and pavements of the ancients. Burckhardt notices vast quantities of it in the hills near Cossier. Pliny says, our ancestors thought that onyx was only produced in the mountains of Arabia, and in no other region; it is, therefore, probable that the Romans themselves were not certain at the first of the precise spot where it was procured. It is exceedingly abundant in the chains and groups of hills and mountains running parallel to the Red Sea, and on both sides of it. At first only drinking vessels were made of it; but afterwards the feet of beds, and even seats. Cornelius Nepos says that "It was reported a great wonder when P. Lentulus Spinteo displayed amphore of onyx as larges Chian casks; yet five years after he saw columns 32 feet in length. But from more refinement in the choice of this stone, four columns of a middling size, placed by Cornelius Balbus in his theatre, were esteemed monuments of surprising grandeur. We have seen more than thirty in the dining-hall, which Callistus, well known by his power among the freemen of the emperor Claudius, had erected at a great expense."

"Some have called this stone alabastrite; and of it little pots or boxes for ointments are formed, as in them it is supposed less liable to corrupt. When calcined, it is also used for plaster. It is produced towards Thebes, in Egypt, and near Damascus in Syria; but this last is white, and little esteemed. The best is from Carmania, the next from India, and a valuable sort is also found in Syria and Asia Minor. The worst, and that without any splendour, is that of Cappadocia. They are chiefly approved when of a honey yellow, with orbicular clouds, and little translucent. It is esteemed of little value when of a horn colour, or white, or of a glassy appearance." This peculiar marble of the ancients has been latterly found in small pieces at Mont Martre, near Paris; in Spain, in rocky masses of great beauty; and, it is said that the territory of Volterra, in Tuscany, affords no less than twenty remarkable varieties.

Patrin says, those most esteemed are the agate alabasters, to which this name is given on account of their fineness; and the onyx alabasters, which present clear and distinct layers of different colours, all of them undulated and festooned, with salient and re-entering angles, like the zones of fortification agates, of which the whole forms a figure nearly circular. The formation of these zones is owing to a play of crystallization, like that of agates; and in like manner they are always found exactly parallel among themselves, whatever may be the irregularity of their course. A perpetual circulation takes place in the interior of the alabaster, while it is still in its natural site, which arranges the various particles, of which it is composed, according to the laws determined by their mutual affinities.

The onyx alabaster is sometimes formed in sheets on a horizontal plane; and then these layers, instead of forming re-entering courses, describe straight lines, or slightly undulated; and as these layers are of lively marked colours, such as the white and red, cameos may be made of them, as they are of onyx agate.

The onyx alabaster of Sienna is of the utmost beauty; it presents layers of three bright and distinct colours—yellow, red, which is opaque,

and white, which is very transparent. The other alabasters of Italy, which are most valuable, are the agate alabaster of Sienna, which is nearly transparent, and of a fine uniform yellow; *pecorino*, which is transparent, of a uniform fawn colour, or mingled with brown veins. Malta also furnishes various alabasters, and particularly one of the colour of wax, like the agate alabaster of Sienna; its paste is of the greatest fineness, and of a beautiful semi-transparency. The name of oriental alabaster is given to that which adds to a fine paste lively and distinct colours, and a hardness which renders it susceptible of a fine polish.

The celebrated sculptor Puget discovered, near Marseilles, an alabaster so transparent, that the eye could penetrate into the interior of the substance, and to the depth of two fingers, trace the beautiful tints with which it was coloured. Guellard says that the waters of Aix, in Provence, form a deep brown alabaster, mingled with whitish zones, which make it resemble the oriental kind. This alabaster is found in an ancient conduit, built by the Romans, which brings the water from a spring about half a league from the town.

At Montmatre, and in the other hills of plaster-stone in the environs of Paris, and especially at Laguy it is very abundant, resembling the fine oriental stone; but this is, in reality, a stalactitic gypsum, which takes but a slight polish, and is much less brilliant.

Alabaster, from its beauty, and the great facility of working it, has always been in great demand as a building material; it is used for ornamental architecture and sculpture, and in climates favourable for its preservation might safely be used for the entire structure. The ancients were very fond of this material, and went to enormous expense in procuring the most varied and beautiful kinds from all parts of the world. The Temple of Fortune, built wholly of that species called *phenigites*, has long been famous. Its great beauty being in its transparency, from which alone this temple was perfectly light when the doors were shut, though it was built without a window, and had no other light but what was transmitted through the stone its walls were built with. It was anciently found in Cappadocia, and is still plentiful there, as also in Germany, France, and Derbyshire in this country. It takes an excellent polish, and is very fit for ornamental works, when there is no great strength required. Other writers observe that *phenigites* seem more applicable to a marble capable of reflecting light like a mirror, than to one transparent; and Suetonius, in his life of Domitian, observes of this monarch, that "fearful of being assassinated, he lined, in various places, the walls of the portico where he used to walk, with the stone called *phenigites*, by the reflection of which he could see every object around him."

The extreme solubility of the stone renders it ill-suited to resist atmospheric action. Dr. Watson tells us that he suspended two ounces of alabaster in a pail of water forty-eight hours, changing the water several times, and found that it had lost one-thirtieth part of its weight; but little in reality can be gathered from this experiment, for some alabasters are so soft, as to be little better than concrete masses. There is a kind of alabastrite called in Italy *fiavito*, implying that it is marked with irregular spots faintly resembling flowers. Two columns of this kind, according to Brard, are placed in the Museum at Paris; they were discovered in 1780, in the ruins of Galbium, four leagues from Rome.

Common alabaster is generally of compact texture, resembling the hardest loaf sugar; sometimes it exhibits the fibrous structure; the colour is generally of the purest white, sometimes slightly tinted with grey; but when stalactitic, its veins are sometimes yellow and brown, by errigenous infiltrations; at the old passage near Bristol, they assume a rose colour; in Nottingham they appear blue.

Alabaster, like alabastrite, is generally regarded by mineralogists as being a sinter or deposition; on the shores of Africa and Arabia it is often found interposed in thin plates or successive layers in the small calcareous hills, at other times it is evidently produced by sedimentary deposition in undisturbed waters. M. Gruelin says that it forms entire mountains, and it is certain that there are immense formations of this material crowning the vast heights of America. In many parts of the deserts it forms immense strata, being evidently the

decomposed remains of calcareous animals, chiefly polytes, and rarely exhibiting specimens of organic remains. Sometimes, in forming, it passes through several stages of change, as sulphate and common chalk; it is allied to gypsum, almost always indeed being found in contact with it, and the latter very often passes into it. The Marsigli marble is rather an alabaster than a marble. Alabaster may be distinguished as belonging to the older and newer formations, but the terms primary and secondary, when applied to this material, only tend to divert the mind from the real object of pursuit, which is to discover its origin, qualities, and the varying purposes to which it may be adapted. The hills of Egypt, in which the catacombs are disposed, might reasonably be classed under the head of alabaster formations, and there is no doubt, that were these soft calcareous beds disposed beneath a more humid climate, that they would pass into this state. In these hills all traces of animal organization are slowly disappearing before the changing hand of Time; and in some strata the change is so exceedingly slow that although thousands of years have elapsed, the mineralogical observer will not fail to observe that they are still in the infancy of progress.

Gypsous alabaster is distinguished by not effervescing in nitrous acid; it loses its transparency, its lustre, and solidity, when exposed to fire, and changes into plaster of Paris. It is so soft, as to be marked with the nail, and takes an indifferently fine polish; the most valuable variety is sensibly transparent, milk-white in colour. Many of our finest monuments, and a vast variety of statuary work are of alabaster, chiefly brought from Italy, and often wrought in that country. The alabaster of the department of Mont Blanc is of the most beautiful white, sometimes veined with grey, and receiving an exquisite polish.

Anhydrous alabaster is of several colours, white, rose, grey, and even blue, which is called celestine; the white is also found at Vizil, near Grenoble, and was used by the Romans, as appears by the column at Thim, on the banks of the Rhone, erected in the time of Aurelian. Mixed with a considerable quantity of silex, it forms the *bardiglio* of the Italians, found near Vulpino, fifteen leagues from Milan, and employed in making columns, tables, and vases. There is also white alabaster from Derbyshire; with a blue transparency from Nottingham; yellowish white alabaster from Laguy, about twenty miles from Paris, translucent and full of little cracks, used for columns and vases; bright grey alabaster, with green and yellowish spots, from Taormini, in Sicily, another remarkable spot for a variety of marbles and serpentines; translucent alabaster, of a bright yellow, waved with white, from the Isle of Goyzan, near Malta; Anhydrous alabaster from Grenoble, &c. &c.

(To be continued.)

PIMLICO SLATE WORKS.

WE have been highly gratified this week by an inspection of the slate works exhibited in the show-rooms of Magnus and Company, at Pimlico. Slate, except as a material for coverings, and manufacturing writing-tablets, is but of recent introduction into London, and though during the last few years it has been occasionally, and in some instances extensively, employed in flooring warehouses and forming cisterns, the extent of its applicability is little known, and its most valuable properties still remain unfamiliar to the public at large. Strength far beyond that of the best Yorkshire stone, amazing durability and cleanliness surpassing that of most other material, are qualities that must recommend it to every person having a regard to comfort or economy, whilst its cool and non-absorbent nature renders it eminently suitable for shelves and tables in the larder, dairy, and other receptacles for food; for skirtings it is also particularly well-adapted. There are great varieties of slate: in some places it is found in thick laminae or flakes, and it differs in its qualities and colours. White, brown, and blue are the common colours; that under consideration is distinguished from all others by its beautiful *ebon-like* appearance, and its freedom from green spots or stains of any kind; it is produced from the proprietors' own quarries in North Wales. It is impossible to withhold

the tribute of admiration when we behold the improvements made in the manufacture of the different objects which constitute the splendid show at Pimlico. Enamels, hitherto confined to plates of metal, are now painted on slate with beautiful effect; the colours are vivid and permanent: the aid of fire, so essential to the method of painting in enamel, is also used; indeed, the intensity of the heat in various stages of the process is so great, that the slate is rendered superior to marble. Among numerous specimens that attracted our attention was

a mosaic table recently completed for Colonel Dawkins Pennant, the owner of a Welsh quarry, a billiard-table made similar to one supplied to the Duke of Wellington a short time since, some splendid imitations of mosaic pavements, chimney-pieces of the most costly description, with exquisite paintings burnt in, similar to those of the finest china or papier maché, and enriched with sculptured slate caps, pateras, &c.; some highly ornamented loo and work-tables, together with several vases and flower-pots on plinths, columns, &c.

TUPPER'S PATENT "SAOTAPE NOSING," OR "CARPET-GUARD" FOR STAIRS AND STEPS.

THE annexed wood-cut, fig. 1, represents a flight of stairs altered to this new patented method of laying down carpets, &c., and of ornamenting stairs, and it is a drawing of a full-sized model at present deposited at the Polytechnic Institution.

The chief peculiarities of this patent consist in the prevention of carpet or oil-cloth from wearing out at the edge of the stairs or steps, which is very perceptible in all houses; it also occasions the use of less of the fabric put down, as there is a saving of from 1 to 2 inches upon every step, and this fact is shewn in fig. 3, which is a section of two stairs, the upper one exhibiting Mr. Tupper's principle, the other being upon the old method. It will be seen that the carpet or other covering will be preserved upon the former, whilst upon the lower step it would be submitted to the action of the feet, and in that way would soon wear out.

In addition to these economical features, it also possesses that of preventing the stretching of the carpets by which the stair-rod is so frequently displaced by getting out of the "eyes." This invention is also intended to be in those houses in which the proprietors will not go to the expense of new nosings, applied by cutting through the tread

obliquely close to the nosing, as shewn in fig. 3; in the slit so made the carpe is passed tightly down, in contact with the wood-work of the stair *everywhere*, presenting no edges for wear and tear, being protected by the nosing, which may be left either plain or painted wood, or covered.

The nosings may be altogether separate from the stairs, and the method of fixing them is very simple, and is effected by wrought-iron studs and plates; they may also be secured by screws, hinges, &c., they being made of various woods and metals, and can be ornamented to any extent or pattern, either by carving or by casting, so that the staircase is intended by this invention to coincide with the architecture and appointments of the house. In the large model, the nosings are of carved oak and walnut, and the effect is both neat and decorative.

In these moveable nosings, two or more "stays" are so placed, that when the nosing is applied and is fixed, to the *riser* of the stair, these stays clamp the carpet securely, obviating the use of stair-rod and eyes. This patent is intended to be applicable to all stairs, whether of wood or stone; and in large houses, where support *might* be required, the stair-rod is proposed to be made of an arch-like form, as shewn in fig. 2.

## LONDON AS IT WAS, AND AS IT IS IN 1844.

(Continued from p. 481.)

ACCORDING to Dr. Johnson the term *club* is used to signify "an assembly of good fellows under certain conditions." Todd says, "an association of persons subjected to particular rules" the latter definition is more appropriate to the leading clubs of the present day. They are a kind of *hybrid* establishments, where what is wanting in witty and humorous intercourse, distinguishing the clubs of the last century, is replaced by ostentatious display, cheap living, and warranted wines, embracing all the advantages of first-rate hotels divested of their extortions. They are aristocratic larders in which any thing can be obtained for money—repositories of peers, politicians, poets, continental perambulators, and wealthy plebeians; of statesmen in place, and statesmen wanting place; of churchmen, embryo-warriors, and matured veterans; representing *en masse* the wealth and power of the country.

We have little or no account of clubs previous to the seventeenth century, possibly from their existence not being worthy of record. About the year 1570 existed a celebrated club, which met at the Mermaid Tavern in Friday-street, of which Shakspeare, Beaumont, Fleteber, Raleigh, Seldon, Donne, and others were members. Ben Jonson belonged to another club which met at the Devil Tavern. *The King's Head Club*, noticed in Tate's continuation of Dryden's "*Abselem and Athrophel*," was a celebrated whig club wearing a green ribbon as a badge.

*The Calves' Head Club* is said to have been instituted by Milton in the time of Oliver Cromwell, and its members are said to have consisted exclusively of Independents and Anabaptists, whose object was to celebrate the triumph of free principles over "kingly tyranny," and to commemorate the decapitation of Charles the First. They had no fixed place of meeting, but for some time used a house in a blind alley near Moorfields, where an axe hung up in the club-room was revered as a memento of the execution of that monarch. The bill of fare consisted of large dishes of calves' heads, dressed several ways, by which symbols they represented the king and his friends who had suffered in the cause; a large pike with a smaller one in its mouth, as an emblem of tyranny; a cod's head, typical of the king; a boar's head with an apple in its mouth, and other symbolical dishes. At the conclusion of the repast, one of the elders presented an *Ikon Basilike*, which with great solemnity was burned upon the table while the anthems were singing. After this, another produced Milton's celebrated *Defensio Populi Anglicani*, upon which all laid their hands, and took oath to stand by and maintain the same. The famous Jerry White, chaplain to Oliver Cromwell, officiated; and after the entertainment the pious memory of the fallen patriots was drunk from a calf's skull filled with wine and other liquors.

*The Vertuoso's Club* was first established by some of the principal members of the Royal Society, in order, as a witty writer observes, to propagate new whims, advance mechanic exercises, and to promote useless as well as useful experiments; being initiated in this respect by many of the literary associations of the present day. They met at a tavern in Cornhill to experimentize, and many singular schemes are said to have emanated from the club, such as a plan for conveying the Hampstead air into town by means of pipes, &c.; they claim the merit of the invention of the barometer, having given the idea to Mr. Tompion, watchmaker.

*The Knights of the Order of the Golden Fleece* consisted of a merry company of tipping citizens and 'Change brokers, who used every night to wash away their consciences with salubrious claret; the initiating fee was one shilling and sixpence, and nicknames were attached to all the members, after their known propensities or peculiarities. This club was held for many years at the Golden Fleece, Cornhill, and afterwards removed to the Three Tuns, Southwark.

*The Surly Club* or Wrangling Society was composed of master carmen, lightermen, old Billingsgate porters, watermen, and kindred

professionals, and was held at the Billingsgate Dock, where the debates were often of a very stormy nature, and their mutual exchanges of civility with the fish women was extremely edifying to the juvenile aspirants to the civic honours of their reputed fathers.

*The Atheistical Club* was kept at a tavern in Westminster, and consisted chiefly of young libertines, whose "wish was father to the thought." They are said to have been broken up by a wag, who, clothing himself with horn and hide, suddenly appeared among them at the back of the landlord, and dispersed the assembly in the most admired disorder; they tremblingly returned after all was over, but the smell of the sulphur left by his satanic majesty had such an effect upon them, that nothing was heard of them afterwards.

*The Split Farthing Club* consisted of miserly merchants, traders, and city, who met weekly to consider on the most desirable means to attain their ends, to hear of sources of speculation for thousands, and to quarrel over the division of a farthing. *The Ugly Face Club* was named after Hatchet, a well-known usurer of that day who carried all the flesh of his face upon his nose, as a Cape sheep does upon its tail. There was also a well-known club kept in the stews of the Mint, called *The Broken Shopkeepers' Club*, who met there to proclaim their individual honesty, and rail at their creditors.

The celebrated *October Club* was a violent Jacobin club, got up to favour the Pretender in the reign of Queen Anne, when the Tories lost their power, after the trial of Sachaveral. Their designation was the result of a laughable mistake of the drawer of the tavern where they met for the first time, who used their pass-word *October* as the title; and thus christened them while they were deliberating on the name they should assume.

*The Man-hunters' Club* consisted of a parcel of young rôtés, chiefly limbs of the law, who at the quiet hours of 10 and 11 o'clock at night used to sally forth in small bands, and selecting a prey, cause him to run for his life, and hunt him over Lincoln's-Inn-Fields; on their return they had to report progress for the amusement of the rest; some of them having been killed in these wild frolics, and time dispersing the rest, the club was eventually broken up. *The Mock Hero's Club* was also an assembly of lawyers' clerks of a lower grade; they held forth in Baldwin's Gardens, assuming the names of heroes and the swagger of bravos, maintained with the spirit of curs.

*The Beau's Club*, or *Lady Lap-dogs' Club*, kept at a tavern near Covent Garden, consisted of fashionable non-descripts who met to compare dresses, invent new fashions, boast of their exploits with the fair sex, and toast their imaginary mistresses.

*The Wrangling, or Hussle Farthing Club*, consisted of a set of noisy wrangling politicians who disputed upon politics and war until they came to blows with each other, settled the affairs of nations, and very often left their own to be settled by their creditors.

*The Lying Club* originated with Sir Harry Blunt, a witty gentleman, who kept an excellent table. Finding great amusement in the travellers' talent of his guests, he proposed, over the bottle, a weekly meeting, which was carried *nem. con.* One of the rules of the club was, that if any member spoke a word of truth between six and ten o'clock, he should forfeit a gallon of wine.

*The Brother's Club* was noted in the time of Queen Anne, and for many years afterwards; among the distinguished names figuring as members we find Harly, Bolingbroke, Swift, &c. *The Beef-steak Club* consisted of many of the celebrated public characters of the day; Mrs. Woffington the actress was president, being the only female member.

*The Kit-Cat Club* is one of the most celebrated clubs handed down to us; it is said to have been formed about the time the seven bishops were tried. This grand monopolizer of wit and poetry of the times in which it existed in full vigour, owed its origin to a rather curious circumstance. Boccia, a bookseller and printer, used to regale himself at a mutton-pie shop, situate at the end of Ball's-court, Gray's-Inn Lane; and his liking for these delicacies extending to the vendor of them, he persuaded him to emerge from this his cymerian darkness, and to take a shop near

the Fountain Tavern, in the Strand, with the assurance that Boccia and his friends would pay him a weekly visit. Boccia, making himself acquainted with several poetical sprigs, persuaded them to visit the piewman's, who, prepared for the visit, had put forth his whole culinary art, and so tickled the palates of his visitors, that Boccia had no difficulty to persuade them to renew their visit weekly, bringing their friends with them. The club was formed, Boccia was made president, and it was conditioned that he was to have the refusal of all their juvenile productions. The cook's name being Christopher, for brevity called Kit, and his sign being the Cat and Fiddle, it was agreed that the club should be known by the cognomen of the *Kit-Cat*. Boccia, in return for the poetry supplied him, published the daintiest pieces, and, by his bookselling-craft, soon spread the fame of the club over the whole metropolis. An accidental and well-told hit completed their triumph. Among the rest of the celebrated pieces that owed their origin to this witty society was that most accurate banter of the *Wind and Panther*, called the "City-mouse and Country-mouse." This completely established the fame of the club; every wit and poetical aspirant became ambitious to become a member; and the piewman's house being found inconvenient, it was agreed to remove to the Fountain Tavern, wine being wisely considered a greater provocation to wit than mutton-pies. They, however, still continued to patronize the piewman, who was thus enabled to supply them with the most *recherché* products of the oven; and Boccia derived still greater advantages by being the authorized and exclusive publisher of their flights of fancy. In 1764 there was a *Literary Club*, of which Johnson, Boswell, Burke, Reynolds, and Goldsmith, were members.

Of the oldest and most considerable clubs now existing are *White's* and *Brooke's*; the first consisting of Tories, and the latter of Whigs; both are conducted on very exclusive principles, and many public and honourable men have been black-balled in consequence of a defect or absence of pedigree. This power of balloting has been much abused in its exercise by both clubs. *The Union Club*, in Cockspar-street, is perhaps older than either of the above; it was formerly held in a small house at Charing Cross, and while the new house now occupied by them was building, they occupied the old Morley's Hotel. *Boodle's*, named from the proprietor and founder of it, has seen upwards of a century; it chiefly consists of country gentlemen, and is well attended in the winter season. Fuller, the present proprietor, was formerly a waiter there, and passed through all the degrees to the possession of wealth; contrary to the general usage in these cases, he is a good master, and bears his fortune with humility. *Crockford's* is too well known to need description; the late Mr. Crockford was a poor fishmonger, but being fond of betting, he was always seen on the turf, and was remarked for his shrewd and successful hits in a small way. His was the prize among many blanks—he became rapidly rich, and of course respected by the honourable fraternity of gamblers and noble horse jockeys. Having attained the summit of wealth, he turned out of doors the vicious instrument of his rise, and married his nursery governess, Miss Fitz, whose mother was wife of Richardson, a lawyer in Bury-street. Such is a small scrap in the history of the late owner of Crockford's, a building magnificently fitted up within, and every way adapted for the purposes to which it was appropriated.

(To be continued.)

**LIGHTING THE METROPOLIS.**—The following statistics, prepared by one of the principal gas companies, will give some idea of the means at present employed for lighting London and its suburbs:—There are eighteen public gas works, conducted by twelve companies; their capital amounts to upwards of 2,800,000*l.* employed in pipes, tanks, &c. The revenue derivable therefrom is estimated at 450,000*l.* per annum. There are about 180,000 tons of coals used annually; there are 1,460,000,000 cubic feet of gas made; 134,300 private lights; 30,400 public lights; 389 lamplighters; 176 gasometers, several of them double, and capable of storing 5,500,000 feet; and about 2,500 persons are employed in various ways.

## RETROSPECTIVE ARCHITECTURAL LITERATURE.

## THE ELEMENTS OF ARCHITECTURE.

COLLECTED BY SIR HENRY WOTTON, KNIGHT,  
From the best Authors and Examples.

(Continued from p. 469.)

First, therefore, touching *Picture*, there doth occur a very pertinent Doubt, which hath been passed over too slightly not only by some Men, but by some Nations; namely, whether this Ornament can well become the Outside of Houses; wherein the Germans hath made so little Scruple, that their best Towns are the most painted, as Augusta and Noremberg. To determine this Question in a Word: It is true that a Story well set out with a good Hand, will every where take a judicious Eye: But yet withal it is as true, that various Colours on the Out-Walls of Buildings have always in them more Delight than Dignity: Therefore I would there admit no Paintings but in Black and White, nor even in that kind any Figures (if the Room be capable), under nine or ten Foot high, which will require no ordinary Artizan; because the Faults are more visible than in small Designs. In unfigured Paintings the noblest is the Imitation of Marbles, and of Architecture itself, as *Arches, Friezes, Columns* and the like.

Now for the *Inside*, here grows another Doubt, whether *Grotesca* (as the Italians) or *Antique Work* (as we call it) should be received against the express Authority of Vitruvius himself, Lib. 7, Cap. 5, where *Pictura* (saith he) *fit ejus, quod est, seu potest esse*; excluding by their severe Definition, all Figures composed of different Natures or Sexes; so as a *Syrène* or a *Centaur* had been intolerable in his Eye: But in this we must take leave to depart from our Master, and the rather, because he spake out of his own Profession, allowing Painters (who have ever been as little limited as Poets) a less Scope in their Imaginations even than the gravest Philosophers, who sometimes do serve themselves of Instances that have no Existence in Nature; as we see in Plato's *Amphibotania*, and Aristotle's *Hircocervus*. And (to settle this Point) what was indeed more common and familiar among the Romans themselves, than the *Picture* and *Statue* of *Terminus*, even one of their Deities? which yet, if we will consider, is but a piece of *Grotesca*. I am for these Reasons unwilling to impoverish that Art, though I could wish such medley and motley Designs confined only to the Ornament of *Friezes* and *Borders*, their proper Place. As for other storied Works upon Walls, I doubt our Climate is too yielding and moist for such Garnishments; therefore leaving it to the Dweller's Discretion, according to the Quality of his Seat, I will only add a Caution or two about the Disposing of Pictures within.

First, That no Room be furnished with too many, which, in truth, were a Surfeit of Ornament, unless they be Galleries, or some peculiar Repository for Rarities of Art.

Next, that the best Pieces be placed not where there is the least, but where there are the fewest Lights; therefore not only Rooms windowed on both Ends, which we call thorough-lighted, but with two or more Windows on the same Side, are Enemies to this Art; and sure it is, that no Painting can be seen in full Perfection, but (as all Nature is illuminated) by a single Light.

Thirdly, That in the placing there be also some Care also taken, how the Painter did stand in the Working, which an intelligent Eye will easily discover, and that Posture is the most natural; so as Italian Pieces will appear best in a Room where the Windows are high, because they are commonly made to a descending Light, which of all other doth set off Men's Faces in their truest Spirit.

Lastly, That they be as properly bestowed for their Quality, as fitly for their Grace; that is, cheerful Paintings in Feasting and Banqueting-Rooms; graver Stories in Galleries; Landscips and Boscage, and such wild Works, in open Terrasses, or in Summer-Houses (as we call them) and the like.

And thus much of *Picture*, which let me close with this Note, That though my former Discourse may serve, perchance, for some reasonable Leading in the Choice of such Delights, yet let no Man hope by such a speculative Erudition, to discern the masterly and mysterious Touches of Art, but an Artizan

himself; to whom therefore we must leave the Prerogative to censure the manner and handling, as he himself must likewise leave some Points, perchance of no less value, to others; as for Example, whether the Story be rightly represented, the Figures in true Action, the Persons suited to their several Qualities, the Affections proper and strong, and such like Observations.

Now for *Sculpture*, I must likewise begin with a Controversy, as before, (falling into this Place) or let me rather call it a very meer Fancy, strangely taken by Palladio, who having noted in an old Arch or two at Verona some part of the Materials already cut in fine Forms, and some unpolished, doth conclude (according to his Logic) upon this Particular, that the Ancients did leave the outward Face of their Marbles or Free Stone without any Sculpture, 'till they were laid and cemented in the Body of the Building; for which likewise he findeth a Reason (as many do now and then very wittily, even before the thing it self be true) that the Materials being left rough, were more manageable in the Mason's Hand than if they had been smooth; and that so the Sides might be laid together the more exactly; which Conceit, once taken, he seems to have farther imprinted, by marking in certain storied *Sculptures* of old Time, how precisely the Parts and Lines of the Figures, that pass from one Stone to another, do meet; which he thinks could hardly fall out so right (forgetting while he speaks of ancient Things, the ancient Diligence) unless they had been cut after the joining of the Materials. But all these Inducements cannot contravert the sole Inconvenience of shaking and disjointing the *Commensures* with so many Strokes of the Chissel, besides an incommodious Working on Scaffolds, especially having no Testimony to confirm it, that I have yet seen, among the Records of Art; Nay, it is indeed rather true, that they did square, and carve, and polish their Stone and Marble Works even in the very Cave of the Quarry, before it was hardened by open Air: But (to leave Disputation) I will set down a few positive Notes, for the placing of *Sculpture*, because the *chusing* hath been handed before.

That first of all it be not too general and abundant, which would make a House look like a Cabinet; and in this Point, Moral Philosophy, which tempereth Fancies, is the Superintendant of Art.

That especially, there be a due Moderation of this Ornament in the first Approach; where our Authors do more commend (I mean about the principal Entrance) a *Dorick*, than a *Corinthian* Garnishment; so as if the great Door be arched, with some brave Head cut in fine Stone or Marble for the Key of the Arch, and two incumbent Figures gracefully leaning upon it, towards one another, as if they meant to confer; I should think this a sufficient Entertainment for the first Reception of any judicious Sight, which I could wish seconded with two great standing Statues on each side of a paved Way, that shall lead up into the Fabrick, so as the Beholder at the first entrance may pass his eye between them.

That the Niches, if they contain Figures of white Stone or Marble, be not coloured in their Concavity too black; for though *Contraria juxta se posita nigis illucescant* (by an old Rule) yet it hath been subtly, and indeed truly, noted, that our Sight is not well contented with those sudden Departments from one Extrem to another; therefore let them have rather a dusky Tincture, than an absolute Black.

That fine and delicate *Sculptures* be helped with Nearness, and Gross with Distance; which was well seen in the old Controversy between Phidias and Alcmenas about the Statue of *Venus*: Wherein the first did shew Discretion, and save Labour; because the Work was to be viewed at good Height, which did drown the sweet and diligent Strokes of his Adversary: A famous Emulation of two principal Artizans, celebrated even by the Greek Poets.

That in the placing of standing Figures aloft, we must set them in a Posture somewhat bowing forward; because (saith our Master, Lib. 3, Cap. 3, out of a better Art than his own) the visual Beam of our Eye, extended to the Head of the said Figures, being longer than to the Foot, must necessarily make that Part appear farther; so as to

reduce it to an erect or upright Position, there must be allowed a due Advantage of stooping towards us; which Albert Durer bath exactly taught, in his forementioned Geometry. Our Vitruvius calleth this Affection in the Eye, a Respiration of the Figure: For which Word (being in truth his own, for aught I know) we are almost as much beholding to him, as for the Observation itself: And let thus much summarily suffice, touching the choice and use of these adorning Arts. For to speak of garnishing the Fabrick with a Row of erected Statues about the Cornice of every Contingentation or Story, were Discourse more proper for Athens or Rome, in the time of their true Greatness, when (as Pliny recordeth of his Age) there were near as many carved Images as living Men; like a noble Contention, even in point of Fertility, between Art and Nature; which Passage doth not only argue an infinite abundance both of Artizans and Materials, but likewise of magnificent and majestic Desires in every common Person of those Times, more or less according to their Fortunes. And true it is indeed, that the Marble Monuments and Memories of well-deserving Men, wherewith the very Highways were strewn on each side, was not a bare and transitory Entertainment of the Eye, or only a gentle Deception of Time to the Traveller, but had also a secret and strong Influence, even into the advancement of the Monarchy, by continual Representation of Virtuous Examples; so as in that Point, Art became a Piece of State.

Now, as I have before subordinated *Picture* and *Sculpture* to *Architecture*, as their Mistress; so there are certain inferior Arts likewise subordinate to them: As under *Picture*, *Mosaic*; under *Sculpture*, *Plastick*; which two I only nominate, as the fittest to garnish Fabricks.

*Mosaic* is a kind of Painting in small Pebbles, Cockles and Shells of sundry Colours; and of late Days, likewise of pieces of Glass, figured at pleasure; an Ornament, in truth, of much Beauty, and long Life, but of most use in Pavements and Floorings.

*Plastick* is not only under *Sculpture*, but indeed very *Sculpture* itself; but with this difference, that the Plasterer doth make his Figures by Addition, and the Carver by Subtraction: wherupon Michael Angelo was wont to say somewhat pleasantly, that *Sculpture* was nothing but a Purgation of Superfluities: For take away from a piece of Wood, or Stone, all that is superfluous, and the Remainder is the intended Figure. Of this *Plastick Art*, the chief use with us is in the graceful fretting of Roofs; but the Italians apply it to the mantelling of Chimneys, with great Figures; a cheap piece of Magnificence, and as durable almost within-doors, as harder Forms in the Weather. And here, though it be a little Excession, I cannot pass unremembered again, their manner of disguising the Shapes of Chimneys in various Fashions, whereof the noblest is the *Pyramidal*; being, in truth, a piece of polite and civil Dissimulation, to convert even the Conduits of Soot and Smoak into Ornaments; whereof I have hitherto spoken so far as may concern the Body of the Building.

Now there are Ornaments also without, as Gardens, Fountains, Groves, Conservatories of rare Beasts, Birds, and Fishes: Of which ignobler kind of Creatures, *We ought not* (saith our greatest \* Master among the Sons of Nature) *childishly to despise the Contemplation; for in all things that are natural there is ever something that is admirable*. Of these external Delights, a Word or two.

(To be continued.)

VENTILATION, AND INTERMENT IN TOWNS.—Mr. Parker has given notice of his intention to bring in a bill next session, "to enforce the ventilation of workshops in certain cases:" and Mr. Mackinnon has put a notice on the books, that he will "call the attention of the House to the necessity of forming some legislative enactment, in accordance with the Reports of the Committee on the Health of Towns, and of the Ecclesiastical Commission, in which the practice of interment in the large towns and under Churches and Chapels is recommended to be abolished."

PLAN OF THE UPPER-STORY.

This building, which is just completed, has been erected by public subscription, at a cost of about 1,650*l.* It is intended for the benefit of the town of Arbroath (Forfarshire) and the surrounding country, the object of the institution being to provide medical and surgical assistance, and other necessary means of relief and recovery for those, especially the indigent poor, suffering under accidents and disease, more effectually than these could be had in their own houses; and likewise to afford the means of separating from the healthy those who are affected with certain contagious diseases, so as to arrest the spread of contagion.

The following general description of the building has been furnished by its architect, David Smith, Esquire, 31, Reform-street, Dundee:—

"The building is erected on an elevated site at the west end of the town of Arbroath, and from which an extensive view of the surrounding country, St. Andrew's Bay, and part of the German Ocean, is obtained. The grounds belonging to the infirmary contain nearly an acre and a half,\* inclosed on three sides by a stone wall, about 7 feet high, and in front by a parapet-wall about 3 feet high, surmounted by an iron railing. The best free stone found in the district was used in the construction of the walls of the building; the front and both ends are faced externally with Ashlar-work; all the other walls are externally of the best rubble-work; the internal division-walls are constructed of brick-work. The lobby, kitchen, wash-house, dead-house, porter's-room, coal-house, and passages, are floored with Arbroath pavement; the stairs are formed of polished stone; the flooring of the wards and other apartments consists of Petersburg battens 1½ in. thick, with grooved and tongued joints, and supported by Memel timber joists. The doors, windows, and other finishings are of American yellow pine. The roof coverings are of Memel timber, the sarking of Petersburg timber, and the roof is slated with the best Easdale slates. The walls and ceilings in the respective apartments are finished with three coats of lime-plaster, and with stucco cornices run in all the ceiling-angles.

"VENTILATION.—Ventilation is carried on in the wards by means of fresh-air-flues constructed in the walls, which are carried round at the back of the skirting-boards, which have openings in them to admit the fresh air into the wards; these flues are tempered by valves.

"The removal of the foul air from the wards is accomplished by means of ornamental openings formed in the ceilings, connected with flues, which descend in the back wall of the building, and are joined to a main flue constructed under the ground-floor, which leads to the extracting-shaft W. In this shaft there is placed a furnace, which is to be kept constantly burning for the purpose of causing the flues to ventilate by rarefaction.

This institution originated under the auspices of Alexander Mann, Esq., as chief magistrate of Arbroath, and through the exertions of him and others the necessary funds were soon provided. The Right Hon. Lord Panmure, the patron of the institution has bestowed upon it, towards an endowment, the munificent sum of 1,000*l.* Its management is vested in a board consisting of a patron, a president, vice-presidents, and directors. Means are now being used for procuring the necessary furnishings, and it is proposed that the house shall be opened for the reception of patients in the early part of the ensuing winter.

To the preceding description we quote the following from a Report, dated 8th of July, 1844:—"The general meeting of subscribers, held on the 6th of June, 1843, having approved of the site of the infirmary on the High Common as then proposed, the ground was shortly afterwards exposed to sale by 'public roup,' as required by law in regard to burgh property, and was purchased by the committee at the nominal 'feu-duty' or 'ground annual' of 1*s.* per annum. Possession was immediately thereafter given to the committee on behalf of the subscribers. The titles have not yet been made out to this ground, but the right is secure under the articles and minutes of roup, followed by possession and payment of the feu-duty or ground annual. Your committee recommend that a proper conveyance should be taken from the magistrate and council, and that it should be taken in favour of themselves and their successors in office in trust for behoof of the subscribers to the infirmary. By making the corporation of the burgh the trustees, perpetual succession will be insured, without the necessity of any renewal of the investiture, and the right will continue clear and complete without expense.

"While on this subject, it may be proper to mention that shortly after the general meeting of the subscribers, at which the proposed site had been approved of, objections were stated to it by the medical practitioners of Arbroath (with the exception of Dr. David Arrott, who was a member of committee), as being in a situation which, though unexceptionable in point of free air, prospect, and beauty, they yet considered exceedingly inconvenient, and tending to increased expense to the institution, on account of its distance from the centre of population. The committee gave instant attention to these objections; they communicated with the medical gentlemen in writing and by personal conference; and after discussion and mature deliberation, they continued of opinion that the site unanimously adopted by the committee, and approved of and confirmed by the general meeting of subscribers, was the best site attainable, and they still remain of this opinion without a dissenting voice. They have recorded in their minutes the objections and discussions, that reference might be made to them, if necessary.

"Having acquired the ground for the site, they lost no time in proceeding to contract for the erection of the building, according to the plans and specifications that had been adopted and approved of by the subscribers. Estimates had been advertised for and received, and the

committee preferred as the most eligible the tenders for the whole work (exclusive of the enclosing wall) given in by Mr. David Murray, mason in Forfar, and Messrs. Nicol and Wallace, wrights in Arbroath, at the contract price of 1,123*l.* 10*s.* A contract was accordingly entered into with these parties. The work was forthwith commenced, and has been finished in a most satisfactory manner. The contract price has been paid, and there only remains to be settled for some extra work of no great amount, which was judged necessary, and is now nearly completed. The architect and inspector, Mr. Smith, has communicated to your committee from time to time his approval of the manner in which the contractors have fulfilled their engagements, and there is every reason for your committee reporting their satisfaction with the building.

"Early in the spring the committee procured from Mr. Smith a plan and specification for the erection of boundary walls and office-houses, with railing on the parapet wall, and gate for the main entrance to the infirmary. Estimates were taken in for this work. Mr. Murray, one of the contractors for the infirmary, was preferred as being the lowest offerer for the 'mason work,' at the sum of 135*l.*; and Messrs. William Munro and Co., founders in Arbroath, were preferred as contractors for the 'smith work,' at 24*l.* 15*s.* These contracts have also been executed. The contract price of the 'smith work' has been paid; and Mr. Murray has received 125*l.* on account of the 'mason work.'"

## SUGGESTIONS ON THE MANNER OF MAKING ARCHITECTURAL NOTES.

Professor Whevell, on Describing Churches.

By comparing actual buildings with descriptions conveyed in precise and determinate phraseology, the architectural observer will become aware how completely words alone may avail to preserve and transmit distinct and adequate conceptions of an edifice; and when he has thus begun to feel the import and value of technical language, a little practice and contrivance will enable him thus to register for himself or for others the principal features of any building which may attract his notice.

In describing a church, mention first what is the GENERAL STYLE of the work (Romanesque, Transition, Complete Gothic, Perpendicular, &c.), for this both conveys a general notion of its appearance, and modifies the interpretation of the terms afterwards used. Describe next the GROUNDO-PLAN, and then the VAULTING, for these being given, the number and position of almost all the members is determined, and the rest of the description will have a reference to a known arrangement of parts. In the vaulting, mention whether it is Roman vaulting, or some other form of quadripartite or sexpartite, &c.; if quadripartite, whether both transverse and longitudinal ribs are pointed, whether in single or double compartments; the ribs, where they occur, their form and mouldings; and whether the side aisles are of the same kind as the centre aisle. Describe next one COMPARTMENT of the inside, selecting that which is most frequently repeated, and noticing, first, the piers, whether they are columns, pilasters, shafts and pier-edges, clustered shafts, or piers of clustered mouldings, and what the difference is of the intermediate piers, if any, their capitals, whether Corinthian, cushion, sculpture, upright leaves, woven foliage, &c.; the aisles, whether they have pillars like those of the piers (their vaulting having been already noticed), what are the windows, and whether the wall is ornamented; then the pier-arches, whether round or pointed, and whether the arch is plain, rebated, chamfered, or with what mouldings; then the triforium, whether blank, pannelled, of detached shafts, with wall behind, or of openings; the openings, whether single or double, &c., or subdivided, and if either double or subdivided, how separated, whether by shafts, clustered shafts, pilasters, &c., and whether with round or pointed openings; then the clerestory, the windows, whether single, in pairs, or in triads; if not single, how separated, with what mouldings, what capitals to the vaulting shafts, and what mouldings are on a column they offer any thing remarkable.

Afterwards notice any particularities or deviations from this compartment which ap

pear in the *apse*, the *intermediate compartment*, the *transepts*, in the supporting piers of the *crossing*, and at the *west-end*.

In describing the *exterior*, the order of description does not appear to be of much consequence. The most important points are the number and position of the *towers*, whether they are east, at the crossing, &c.; whether their sides end in gables, and whether these have strong or light cornices, especially the horizontal lines; how the different stories of the towers are decorated; the *apses*, whether round or polygonal, whether they have the peculiar *apsidal gallery* of the Romanesque,—the finishing of the wall, whether by a corbel table with notches, round or pointed, plain or moulded; or by a cornice, balustrade, canopies, pinnacles, &c. The *buttresses*, also, or their absence, should be remarked; what projection they have, what offsets, what termination, how ornamented. *Flying buttresses* are to be noticed, and how they are stopped and supported at the lower end. Finally the *west front* is a leading part of the building when it is ornamented, and the *porches* in the other parts; and these portions often contain the richest and most ornamented workmanship in the whole edifice. If the church has many subordinate members externally, and is remarkable in detail, it may be proper to take notes of a single *compartment* externally from the ground to the roof in order. The *windows* in particular will require attention; the mouldings of the window-sides, the dripstones, canopies, and panelings which accompany them, and especially the *tracery*. If any one were to observe in succession a great number of different windows of the complete Gothic, he would probably be led to devise some simple and technical phraseology or notation by which the form of the tracery might be conveyed.

By adopting a method such as is here suggested in the examination of churches and other similar buildings, the architectural student might throw much valuable light upon the history of this branch of his profession, for all sound speculation must be founded on the accurate knowledge of an extensive collection of particular instances.

#### THE MAHOGANY TRADE.

The mahogany annually exported from Honduras by British settlers may be calculated at about sixty square-rigged vessels, at 120,000 feet each, value about 400,000*l.*; and the value of Guatemalan produce, such as indigo, cochineal, &c., exported, amounts to three times as much again. It is supposed that the sales of one commercial house at Belize average 15,000*l.* currency per month, which is one-twentieth part of what is sold, and would make the sales of British dry goods imported for the supply of that colony and Guatemala, at least 2,500,000*l.* currency, or about 1,500,000*l.* sterling.

The number of ships entered inwards and outwards during the last three years has averaged 100; their aggregate tonnage being 20,000.

The inhabitants of Belize are dealers only in the raw material; the mahogany tables of their dwellings being manufactured in England, whilst the wood from which they were cut travels upwards of 15,000 miles before it reaches the spot of its ultimate destination, that being the same shore on which it grew. One of the largest of the logs ever imported into England was bought at Liverpool for 37*l.*, and was supposed to have returned to the manufacturer at least 1,000*l.* If cut into veneers, 550*l.* of this sum would be paid in wages to British mechanics.

Not long since, Messrs. Broadwood, the distinguished piano-forte manufacturers, gave the enormous sum of 3,000*l.* for three logs of mahogany! These logs, the produce of a *single tree*, were each about fifteen feet long and thirty-eight inches square; they were cut into veneers, of eight to an inch. The wood was particularly beautiful; capable of receiving the highest polish, and when polished, reflecting the light in the most varied manner, like the surface of a crystal; and from the wavy form of the pores, offering a different figure in whatever direction it was viewed.

Dealers in mahogany generally introduce an *auger* before buying a log; but, notwithstand-

ing, they are seldom able to decide with much precision as to the quality of the wood; so that there is a good deal of lottery in the trade. The logs for which Messrs. Broadwood gave so high a price were brought to this country with a full knowledge of their superior worth.

The cutting of mahogany at Honduras takes place at two different seasons; after Christmas and towards Midsummer. The negroes employed in felling the trees are divided into groups of from ten to fifty. The trees are cut about twelve feet from the ground, and are floated down the rivers.—*Symmond's Colonial Magazine*.

#### CHURCH-BUILDING INTELLIGENCE, &c.

On the 4th inst. the Lord Bishop of Gloucester and Bristol consecrated a new church at Eisey, near Crickdale, in place of a former one (which having become unsafe, had been taken down), within the churchyard, but on a different site. This church is a simple Norman structure, built at the sole expense of Earl St. Germans, to hold about 120 persons on open seats, which are moveable, the floor being of stone. The circular apse contains six windows filled with stained glass, the present of a lady, and painted by herself in diaper. The capitals of shafts, stone pulpit, corbels, and other parts, have been left entirely plain, to be enriched at future opportunities. The communion-table is of stone, detached some space from the wall, and the floor round it is laid with encaustic tiles. There is a lectern on a single shaft, copied from an ancient example, and a small kneeling desk within the chancel; both of which, as well as the font, are plain, and well suited to the church.

*New Church in the Parish of St. Giles, Westminster.*—The steeple of this church being complete, the scaffolding has been taken down from it: the crowning spire rises from the square tower by corbelling over, and not by the use of squinches, pinnacles, and flying-buttresses. The clerestory walls are now in progress, and are supported by six detached octagonal piers, the shafts of which are of blue-lias lime-stone, which is hard and will take a roughish polish.

*New Church at Creve.*—A new church is being erected at Creve by the Grand Junction Railway Company, for the use of their workmen. It is to be a neat blue brick structure, with stone coignes in the Anglo-Norman style of architecture. At present service is conducted in a room of the company's works. The Rev. J. Appleton has been the chaplain, but on account of ill-health he has resigned.—*Liverpool Chronicle*.

*Holy Trinity Church, Halsted.*—The style and character of this building is Gothic, with tower and spire. Accommodation is provided for 703 persons; namely, in pews 199, and in free seats 504. The first stone was laid in the month of July last year.

Her Majesty's Commissioners for Building New Churches have at the present time under consideration plans for a new church to be built in the parish of Woolwich, in the county of Kent, and at Morton and Stockwith, in the parish of Gainsborough, in the county of Lincoln.

A stone pulpit, elaborately and beautifully worked, is about to be placed in the parish church of Langford Budville, the gift of Captain Perceval, Bindon-house, Milverton; and another is in preparation for Oldridge chapel, near Crediton.

A beautiful sculptured font, of Caen stone, is about to be placed in Broadcliff church, the gift of the Hon. and Rev. Charles Courtenay and Henry Acland, Esq., son of the worthy Bart. of Killerton.

On Friday week a new church at Rotsclair, in Belgium, on which the masons and carpenters were still at work, but which was nearly finished, fell suddenly to the ground. Seven men were injured, but no life was lost.

**PUBLIC WALKS AT CONGLETON.**—We understand that John Latham, Esq., town clerk of Congleton, is in communication with the Lords of the Treasury, for the purpose of obtaining a grant for the construction of public walks in the Town Wood, which it is hoped will be successful. The plans are already made, and it is expected that workmen will very shortly be employed in carrying them out.—*Macclesfield Chronicle*.

#### RAILWAY INTELLIGENCE.

*New Branch Railway to Blackpool and Lytham.*—A special general meeting of the proprietors of the Preston and Wyre Railway, Harbour, and Dock Company, took place at Fleetwood on Friday. The purpose of the meeting was to consider and determine the propriety of applying to parliament in the next session, for power to enable the company to construct two branch railways from the Preston and Wyre line—one from near the Poulton station to Blackpool, and the other from the Kirkham station to Lytham; to consider and determine the measures to be taken for raising such further capital as may be advisable or expedient in connection with them; and for the purpose of giving such powers and authorities to the directors of the company as might be necessary in relation to these matters. Sir H. Fleetwood, Bart., M.P., and other gentlemen of influence, were present. Sir H. Fleetwood stated that the directors had procured a survey and estimate of the line from Poulton to Blackpool; and it was calculated that the total expense would be about 20,000*l.*, 24,000*l.*, or, at the utmost 25,000*l.* The consent of every land-owner, he believed, had been obtained. It was not at present contemplated to take immediate measures for the formation of the line from the Kirkham station to Lytham, at least until they were more certain as to the success of the other. It would save expense, however, to make an application to parliament for the construction of both lines. A call of 8*l.* 6*s.* 8*d.* would be necessary for both lines; but in the meantime a call of only 4*l.* 3*s.* 4*d.* upon the 6,700 shares would be necessary. Resolutions in accordance with the object for which the meeting was called were carried unanimously.

*English and Foreign Railways.*—In his evidence before the select committee of last session, Mr. Laing of the Board of Trade, stated that the average railway charges in Belgium, for 100 miles, are for the first, second, and third-classes respectively, 10*s.*, 7*s.* 6*d.*, and 4*s.* 8*d.*; in Germany, 12*s.*, 8*s.* 6*d.*, and 5*s.* 6*d.*; in France, 15*s.*, 10*s.*, and 8*s.* 6*d.*; and in England, 25*s.*, 17*s.*, and 10*s.* As one cause of the comparatively high rate in England, he states that the average cost of railways in this country is three or four times that of the German lines; double that of the Belgian, and greater by one-half than the cost of the French. Mr. Laing is of opinion that the advantage is in favour of the English in regard to speed; but that in point of accommodation the second and third-class passengers in Belgium, and on the Continent generally, have the decided advantage over those of the same classes in England.

*Proposed London and Portsmouth Atmospheric Railway.*—A very numerous meeting of the inhabitants of Portsmouth was held on Monday evening, at which the preliminary measures for a direct line between London and Portsmouth were resolved upon unanimously.

The proposed line is to be an atmospheric one, and extend from Epsom (for a railway between which place and Croydon an Act had already been obtained) to Godalming, Petersfield, Havant, and on to Portsmouth. From the statement of Mr. Cubitt, the engineer, it appears that the promoters of the plan pledge themselves that the fares will not be more than two-thirds of the present fares by the South-Western route, and, in addition, the journey is to be made in half the time. The line will be about eighty miles in length.

*South-Eastern Railway.*—The South-Eastern company has declared a dividend of 10*s.* 6*d.* per share on the old shares, and 1*s.* 3*d.* per share on those issued in February last. The feature of the meeting was the discussion arising from a limited Liverpool opposition, which, however, was defeated. It was contended that a number of the Liverpool shareholders are not satisfied with the manner in which the business of the railway is conducted, particularly in reference to goods traffic; but after a stormy debate of several hours, the resolutions proposed for the appointment of committee were rejected.

*Copenhagen, Sept. 14.*—Mr. Radford, an English civil-engineer, has been chosen, and has arrived here to direct the execution of the iron railway between Copenhagen and Roeskild.

**Poole Railway Communication.**—A public meeting of the inhabitants of this town was held at the Antelope Hotel on the 19th inst., in accordance with a resolution passed at a meeting of the railway committee on the 10th inst. The chair was taken by the sheriff, Joseph Crabb, Esq. The following resolutions were carried unanimously:—That this meeting fully approves the proceedings of the railway committee in reference to the communications and interviews which have passed between it and the "Bristol and Exeter Railway Company," and consider that the line of railway now proposed to be made by the latter, namely, from near Bridgewater to Yeovil and Dorchester, in connection with the "Southampton and Dorsetshire Line," from Dorchester to Wareham and Poole, forms a communication of the Bristol and English Channels, deserving a co-operation and support of this town and neighbourhood. That the additional line proposed to be made by the "Great Western Railway Company," from Yeovil to Frome, and from thence to Bath or Chippenham, is to be viewed with much satisfaction, as establishing an important chain of communication between this county and the "Great Western Railway," which will prove highly beneficial both in a commercial and social point of view. The powers of the committee for carrying into effect the "Bristol and English Channels Junction Railway" having terminated, a committee was formed to see that the interests of this town are properly provided for in the approach from the "Southampton and Dorsetshire" line, and for the purpose of watching the general progress of the several undertakings. The thanks of the meeting were then given to J. Brown and M. K. Welch, Esqs., for their efficient services in promoting the interests of the town, and to the sheriff for his able conduct in the chair, after which the meeting was dissolved.

The South-Eastern Railway Company have offered to purchase the Greenwich Railway, or, as it is called, lease it for 999 years. They are to pay a rent of 36,000*l.* for the first year, and 10,000*l.* a year additional each succeeding year until it shall amount to 45,000*l.* Meetings of the proprietors of both railways have approved of the proposal; but the sanction of Parliament is required before it can be carried into effect. It is proposed that the lease should commence on the 1st January next. At the half-yearly meeting the directors announced that they had plans under consideration for extending their railway to nearly all the important places in Kent. A branch to Canterbury, Ramsgate, and Margate, will shortly be commenced; one to Maidstone is now completed; they intend to lease the Whitstable Railway. They propose lines from London through Woolwich, Gravesend, Rochester, Chatham, Sittingbourne, Faversham, and Chatham, to unite with the Canterbury branch; from Rochester to Maidstone; from the Ramsgate and Canterbury branch to Sandwich and Deal; and a branch from Tunbridge to Tunbridge Wells, and thence to Hastings.

**Direct London and Portsmouth.**—A meeting of the landowners and inhabitants of the town and neighbourhood of Godalming was held on the 20th inst., for the purpose of having laid before them the merits of the projected direct line of railway between London and Portsmouth. Mr. Roker, the high constable was called to the chair. A deputation from the committee of direction, among whom were Mr. Wilkinson, the chairman of the company, Mr. Crowley, the deputy chairman, and Mr. Greig, attended the meeting with Mr. Kilgour, the solicitor Mr. J. Cubitt, the engineer and Mr. Samuda, one of the patentees of the atmospheric system; various resolutions in favour of the line were adopted.

**South-Western Railway.**—A report has prevailed that the South-Western Company intended to carry on a branch from Salisbury to this city (Exeter). We believe we have authority to state that the intention has been abandoned. Mr. Locke, the engineer, has been surveying the country west of Yeovil during the past week, with the view of extending the South-Western line to Exeter, but he found the difficulties of the country so great, that the directors will not this year attempt to carry their line further than Yeovil.—*Western Times.*

**Railway in Connection with Exeter.**—A plan is in progress, and will shortly be laid before the public, for a line of railway from Exeter to Barnstaple and North Devon. It will be formed on the western bank of the river, and connect itself with the terminating stations of the Bristol and Exeter and South Devon Railways. It will pass within a very short distance of the town of Crediton, where there will be a station, and the atmospheric principle will be adopted. There is now little doubt that Exeter will be reached on its eastern side by a liberally conducted railway, on which, likewise, the atmospheric power or traction will be used.—*Western Times.*

**Cost of Railways.**—The London and Blackwall Railway cost 326,670*l.* per mile, which is the highest cost of any railway in the kingdom. The Greenwich is next for expensiveness, and cost 264,736*l.* per mile. The three lines which were executed at the lowest cost per mile are the Arthroath and Forfar, the Aylesbury Junction, and the Hayle Railways, which severally cost 9,130*l.*, 8,710*l.*, and 6,949*l.* per mile. London and Birmingham cost 53,780*l.* per mile; the Great Western, 55,330*l.*; and the South Western, 27,750*l.* The Liverpool and Manchester cost 41,320*l.* per mile; the Manchester and Leeds, 59,800*l.*; and the London and Brighton, 64,370*l.*

The Prussian government, in order to obviate, in future, accidents on the railroads, has constituted at Berlin a school for the especial purpose of giving instruction in the art of conducting the locomotives. The number of pupils is fixed at 400. The annual payment to be made by each pupil is very moderate. The course of instruction is completed in one year.

**One Thousand Miles an Hour by Railway!**—M. Arago says the atmospheric pressure principle may be so applied as to insure safe transit at the rate of six leagues a minute, or 1,000 miles an hour.

### Correspondence.

#### CRACK HOUSES.

SIR,—The answers in my letter, in your valuable journal of the 7th inst., are any thing but satisfactory. "Scrutator" says the party investing his capital in houses does so on *his own opinion*, and therefore he is justly punished. "A Looker-on" says they are valued by auctioneer's surveyors, and that the largest rental is the sole object of the purchaser; both therefore agree that the fault, or what you will, is shifted from their own shoulders to that of the unfortunate purchaser. Now, Sir, I must decidedly say that few if any cases can be named in which the speculator purchases on his own opinion. He who invests largely always employs some surveyor in whom he places confidence; the smaller speculator not being able to afford the expense of a surveyor, employs his neighbour, who is reputed to be a *respectable builder*. The majority of purchasers are retired or retiring tradesmen and citizens, who, desirous of sitting down for the remainder of their lives rent-free, and, with a life annuity, purchase a single tenement or small lot of houses, in one of which they take up their abode; it is therefore ridiculous to suppose that such men as these, from a "pig-headed" idea of their own infallibility, would thus make "ducks and drakes" of their money; and equally ridiculous to suppose that, while capitalists are desirous of making the most of their money, they can be indifferent to the finish and stability of the thing they purchase.

Admitting, with "A Looker-on," that auctioneer's surveyors are very great rogues, and some capitalists very avaricious, this has nothing to do with the fact stated, that "crack houses" are put up by speculating builders; it is neither a plea nor a justification for downright dishonesty. People do use the same precautions in purchasing houses as in purchasing goods, and the linen-draper's devil's dust has the same effect in the one instance as stuccoed-rubbish has on the other; both, as Lord Denham has it, are "*a delusion and a snare*" when employed for the purpose of deception.

In the neighbourhood of the Hampstead-road may now be seen on a large painted board, "This ground to be let for building on; money advanced if required." No comment is required on such a notice as this. A few

doors off there is an instance of the working of this principle; a journeyman builder came forward, undertook the job, employed country labourers, boarded and lodged them while they were at work, and actually completed the thing on credit, much to the satisfaction of himself, provided he is lucky enough to pick up a flat to purchase it; if not it goes in acquittance of advances made to him. Another builds on his own responsibility, mortgages, and goes on building until he makes his fortune, or *gets into the Gazette*. The late M.— began by building, brick by brick, cottages, or rather dog-kennels, of 10*l.* rental, from the position of labourer rose to that of master, and died exceedingly wealthy. We object not to legitimate building or to legitimate speculation, but we do object to putting up houses which, like the Jew's razors, are made for sale, and not for use. Only fancy the fact, as fact it is, of some of the houses in Russell-square having a clause in the lease prohibiting dancing, and some of the houses in the streets near it, built scarcely thirty-five years ago, are of such doubtful composition, and indeed are now falling down, that it would have been wise to prohibit walking with shoes on in the upper rooms.

The sources of speculative building are evidently not confined to constructing houses for the poorer classes, nor can all the odium of building "crack houses" be confined to the smaller classes of builders, or to those who undertake the task being no builders at all. We trace those causes in the avarice of ground landlords, in the competition of brick-makers, in the credit system of timber merchants, in the neglect of duty of surveyors, in the necessities of the builder, and in the want of unanimity of the builders among themselves. The temptations being so great, why do not the builders incorporate themselves as a body, and by union produce strength of good resolution, protecting their own class-interest, and, at the same time, giving tone and character to the profession?

"Scrutator," who evidently seems touched on the *raw*, labours under a strange mistake in supposing that "W. T. B." has any objection to stucco, to beauty of finish, or ornament; admitting the use, he condemns the abuse of it for the purposes of deception, and often of downright fraud. Stucco and paint are admirable in place, but when used, as by nymphs of the *paré*, to hide a distempered frame, it awakens only feelings of disgust, instead of calling forth our admiration.

September 22, 1844.

W. T. B.

SIR,—Having passed through Percy-street, Tottenham Court-road, this morning, my attention was attracted by the front of the house, No. 16, which has lately been, I presume, attempted to be coloured and drawn, or pointed, or something I know not what to call it. I shall feel obliged if you will call the attention of my brother readers to this; perhaps some of them can inform me of the name of this style of beautifying the fronts of houses, and who is the *patente*.

Islington, September 23.

T. W. M.

#### TUBULAR AND OTHER CHIMNEY-FLUES CALLED "PATENT."

##### TO THE EDITOR OF THE BUILDER.

SIR,—In reference to an advertisement in your last number, my flues are not at "Ebury Wharf," and consequently are denounced as "spurious imitations," against which "the public is cautioned." (1.) I have manufactured the tubular flues for chimneys, for heating churches, green-houses, and the like, for *more than twenty years*, yet that advertisement calls them "an entirely new construction of chimney." Any architect who has practised in the county of Stafford during that period can prove the truth of what I have asserted. It has been my habit to make the tubes with either plain or rebated joints, also pieces to form angles and curves, and all of *proper texture*. In 1835 (I think it was) I was entrusted with an order for rebated flues for the chimneys of King Edward's School at Birmingham (Charles Barry, Esq., architect, Mr. Cowlshaw, clerk-of-works), and it was executed satisfactorily. Where was the patent for these things at that time even, not to go further back? If I can prove my facts, as I undertake to do, together with a fact to place in juxta position, viz., that the first cogitation

about the Ebury Wharf concern dates some three years ago, the saddle will be placed upon the right horse, and the charge of "imitation" will not injure me. (2.) The oval flues for brickwork are of more recent origin, as far as I know, than tubular ones; but I formed and published the first, therefore they are public property. The first lot were used at Moreton Hall, Cheshire (Edward Blore, Esq., architect, Mr. Oliver, clerk-of-works), they were designed by Mr. Oliver, as I stated some time afterwards in the *Civil Engineer and Architects' Journal*, upon first making them public. I have regularly sold them since, and shall continue to do so, without any risk of the charge of imitation being proved against me.

Having abundant and easy means as regards the "Patent," I shall consider the word "spurious," in reference to the fabric, or mixture of materials composing these flues, and this I know to be ALL-IMPORTANT. Having then supplied them for a quarter of a century without any complaint, establishes their legitimacy and adaptation to the objects in view. From the appearance of those at Ebury Wharf, however, and referring to a letter which I received from thence in May last, I conclude that the parties have been, as they continue to be, ignorant of the fabric or mixture (the public can test both the flues and the parties easily), and consequently though their material is legitimate and adapted to drains were always cold, it would, I fear, turn out "spurious" in chimney and other flues, which are subject alternatively to so great variations of temperature, to expansion and contraction, and to the rubs and knocks of cleansing engines.

Now, as to the word "caution" offered to the public—forced as I was into extensive business at the age of fourteen by the death of my father—possessing as I now do 30 years' experience—I admit the wisdom and prudence of caution being in lively exercise. Also, I give due praise to honourable efforts to excite that caution in others. The public, however, are aware that a man may sometimes cry loudly and long "stop thief," pointing all the while in the wrong direction, namely, at his neighbour instead of himself. So, in like manner (without intending discourtesy to Ebury Wharf, or to any who are interested in it), the public will weigh the facts of the case, and do justice; they will apply the words "imitation" and "spurious" rightly. In consideration too of a firm of yesterday, all but unknown, on the one hand, compared with one who is known on the other; who was bred to the trade; who has occupied a long period in it; whose perseverance in it is acknowledged; by whose capital and skill, brought to bear upon it, not his own family merely, but the families of workpeople live in comfort, and, in more than one way, the community is benefitted; in such a comparison the public is not wont to exhaust its "caution" upon the assailed, but, in justice, reserves more than a little for the assailant.

I am, Sir, your obedient servant,  
THOMAS PEAKE.

22, Water-lane, City,  
from "The Tileries Tunstall."

#### NEW BUILDING-ACT.

Sir,—Having some ground to build about twenty pairs of fourth-rat detached cottages on, and wishing to begin them before January 1st, 1845, in order not to come under the restrictions of the new Act of Parliament, I should feel obliged if you would inform me how much footings I ought to put in to constitute the term "already built," which is expressed in the new Act.

September 16, 1844.

FELIX.

[It does not appear by the definition in section 5 of the new Act, that any considerable quantity of a building is required under such circumstances to be done; "commenced" is the term used, and a year thence afterwards is allowed for the completion of the buildings "fit for use."—Ed.]

STATUE OF NAPOLEON.—In the open space where the rue de l'Université and the Grande Chaussée of the Esplanade of the Invalides meet, workmen are employed in making the enclosure of the ground on which the equestrian statue of the Emperor Napoleon is to be erected. In a short time the works for the pedestal, on which it is to be raised, will be begun.

#### Miscellaneous.

##### THE PORCELAIN PAGODA AT NANKIN.

In a work recently published, and entitled "An Aide-de-Camp's Recollections of Service in China, by Captain Arthur Cunyngham," is an account of a visit which the author and his companions made during their stay at Nankin to the far-famed porcelain pagoda, which so many travellers have desired to see, but have been refused. The exterior and interior are covered with plates of porcelain so neatly joined together as to give the work an appearance of being made of one entire piece. "A wondrous of the tower, together with a short description of it, was sold to the visitors for a few shillings,\* from which I will here quote a line or two, having received a translation from a friend. The paper stated that a pagoda had been, at various times, erected on the spot where the present porcelain tower stands, records of which are still retained as far back as the second century of the present Christian era, each successively, as they fell into decay or were destroyed by fire, being replaced, either at the expense of government or by funds supplied from the generosity of some pious private individual. The credit of rebuilding the present edifice is ascribed to two very celebrated emperors. The usurper, Gong-Lo (a monarch of the Ming house), being about to remove his capital to the north, erected this pagoda in honour of his mother, the celebrated spouse of Hang-Woo, as a tribute to her worth, and called it the Pagoda of Gratitude, Paon-gan-tai, or Paont-gan-she. The pagoda, it states, was commenced in the tenth year of Gong-Lo, and was not finished until the seventh year of Lenatik, taking a period of nineteen years for its accomplishment. It was built under the direction of one Whang-ghe-tai, a member of the Board of Public Works, and cost, so says this chronicle, 2,485,484 taels of silver, or 621,371l. sterling. It is 329 covils four inches in height, having nine stories, with a golden globe on its top. The colours were given to the stones partly by a kind of gilt amalgam, and also by glazing, so as to be imperishable and lasting through future ages; and the best proof thereof is, that it has never required repair, with the exception of its having been struck with lightning about forty-two years since, and that it still retains all the freshness of a recently-erected building. An iron rod, of considerable thickness, towers above the whole building, encircled by rings of gold, from beneath which there are 152 chains hanging gracefully down; 140 lamps, requiring no less than 64 catty (about nine gallons) of oil for a single night's consumption, are fixed in the niches, shedding their lustre around equally upon the virtuous and the wicked, and removing darkness from amidst nankind. Gold, silver, and pearls adorn the structure, and render it an object of the highest admiration." When at the top of the pagoda, Captain Cunyngham and his companions added their names to the many Chinese autographs that were scribbled on the walls, and uncorked sundry bottles of champagne to drink her Britannic Majesty's health, and success to her arms.

PUBLIC BATHS AND WASHHOUSES IN LONDON.—A project is on foot, which, if realized, will materially benefit a large portion of the London community. It is proposed to establish baths, coupled with washhouses for clothes, on such a scale as to place the comforts of cleanliness within the reach of all. "It is contemplated," says the *Spectator*, "to begin with four foundations, three on the Middlesex, and one on the Surrey side of the river, at a total expense of 30,000l. The annual charge thereafter to be met by the payments of those who use them; 1d. for a cold, and 2d. for a warm bath (the use of a towel inclusive), being the rates for the bathers; while at the washhouses all appliances and means for six hours' scrubbing, drying, and ironing, are to be supplied for 2d. With the aid of an income to be derived from a few baths of a more expensive kind, the institutions are thus expected shortly to compass their own support. It cannot be doubted that the 30,000l. will speedily be raised."

\* A cash is a small copper coin with a hole in the centre, 1,200 of which are about the value of one Spanish dollar.

TESSELATED PAVEMENTS.—With all admirers of the arts and sciences, we hail with satisfaction the great improvements within the last few years in pavements, a subject so much neglected for many ages. Since the days of the Reformation our floors have been laid with little else than rude coarse flag-stones, raw boards, or at best, ciquers of white and black marble, while the use of the handsome mosaics of the Romans, in the universal adaptation of classical models, seems to have been altogether overlooked, as well as the tessellated pavements of the middle ages, of which a fine remnant is concealed beneath a rush matting in front of the altar of Westminster Abbey, and a more perfect specimen still may be seen in Trinity Chapel, Canterbury Cathedral. At Great Malvern, Romsey, Winchester, Salisbury, Worcester, Rochester, and York, there are also fine specimens; but the Chapter House of Westminster Abbey, where a beautiful pavement in this style was carefully hoarded over, when that building was fitted up as a record office, remains probably in greater perfection than any other extant in this country. Many of these are of great beauty; some consist of heraldic cognizances, others of figures, and others of very beautiful scrolls. They are probably as old as Edward III., who decorated the structure. Some of the first specimens of the revival of tessellated pavements may be seen in the Trinity Church and the Reform Club-house, London, and ere long Mr. Barry's good taste will be displayed in the adornment of the floors of the new Houses of Parliament with encaustic tiles. We trust that the example may not be lost sight of by those who have the superintendence of public edifices. They are also worthy the attention of architects for halls and passages even of very moderate-sized houses. Very ornamental, too, they would prove for hearths, mantle-pieces, &c. It has been thought that these pavements, on account of their cost, would be restricted to the mansions of the wealthy; but as their merits are becoming more generally known, this opinion is seen to be founded on error, for although the first outlay is more costly than some, yet, in point of economy, they must be selected in preference to every other kind of flooring.—*Nottingham Review*.

##### WHITE KNIGHT'S PARK, NEAR READING.

—In reply to the advertisement, offering premiums of fifty guineas and twenty guineas for the two best plans for laying out this beautiful place for the erection of detached villas which appeared in our columns, thirty designs were sent in. In order to prevent the possibility of complaint, the proprietor placed the decision in the hands of two professional architects, Mr. George Godwin, F.R.S., and Mr. David Mocatta, F.S.A., who, after minutely investigating the plans on the spot, selected the design marked *Albi Miltis* as entitled to the first premium, and that distinguished by a drawing of a knight as entitled to the second premium. These were afterwards found to be respectively by Messrs. Scott and Moffatt, and Mr. John Barnett, of Chancery-lane. The beauties of this extraordinary place, once the seat of the Duke of Marlborough, are such as to make us grieve at its appropriation for building purposes. It will, however, afford such sites for houses as are rarely found.—*Correspondent*.

CHIMNEYS SUPERSEDED.—Dr. Arnot has recently invented an air-pump, with which it is proposed to supply a draught to furnaces, that will supersede the necessity of funnels in steam-boats, and of the costly chimneys which now demand so great an outlay in the erection of engine-houses. This pump, when worked by a weight, furnishes a draught equal to 100 cubic feet of air in a minute, in an uncompress state. A slight transfer of power from any engine would thus suffice to create a strong draught, which can be so directed as to cause the consumption of the smoke.—*British and Foreign Quarterly Review*.

NEW CONSERVATIVE CLUB, ST. JAMES'S.—From the drawings submitted for the artistic embellishments of the interior of the new Conservative Club, the designs of Mr. Sang have been approved of and decided upon. The whole of the decorations are to be executed in encaustic, a mode which that gentleman has of late years introduced into this country, and which he has employed in the interior embellishments of the New Royal Exchange.—*Herald*.

**BRITISH ARCHEOLOGICAL ASSOCIATION.**—During the late meeting at Canterbury, Professor Buckland furnished the following facts, which, coming from so high an authority, deserve especial attention. "Two churches, the names of which he had in his possession, had been told had been destroyed by fire in consequence of an accumulation of guano in the towers. Birds, such as pigeons, crows, daws, and other kind of winged birds, congregated in the towers of churches, and on visiting the venerable edifice celebrated as the cathedral of Canterbury, he saw fifty birds at least flying through the broken lattice of the windows. Now, he apprehended the most serious consequences from this. If that guano were allowed to accumulate, and a strong wind during a thunder-storm arose, and caused a current through the tower, it was clearly his opinion that the noble building would be set on fire."

**THE BIRKENHEAD DOCKS.**—Already the most active steps have been taken for proceeding with the formation of the new dock. Mr. Tomkinson, the contractor, has a large body of men now at work upon the land, near the entrance of Wallusey Pool. There are erected a limekiln and a mortar mill, and a steam-engine is now being placed upon the ground. The elevated railway, which is necessary in such works for the conveyance of heavy stones from one place to another, is in a forward state, and the foundation is now being prepared to commence at once with the sea wall, extending from the intended coasting dock at Woodside Ferry to the mouth of the Pool. The men are at work night and day, as the tide answers, and the promoters seem determined to pursue vigorously the great and important work in which they have embarked.

**TRIUMPHAL ARCH AT DUNDEE.**—A general desire prevails throughout the town for having a triumphal arch, built of stone, similar to that through which her Majesty passed at Harbour. It would, without doubt, be a great ornament to the town, and we have no hesitation in saying, that a large subscription could be raised in furtherance of such an object. Dundee is very desitute of architectural beauty, and though the expense would be considerable, we entertain a belief that were public meetings of their constituents called to express their concurrence in such an undertaking, the trustees would cheerfully undertake the task, and the erection would be a lasting monument of her Majesty's visit to Dundee.—*Perthshire Courier.*

**REDUCTION NEW BRIDGE.**—The engineers appointed by the subscribers to this undertaking, Messrs. Motley and Hill, have prepared a new and very pretty model of the proposed erection, which, we understand, will be left at the Commercial-rooms for some days, for inspection. We hear that an eminent contractor has offered to complete the bridge for 3,000*l.*, and we trust, as the shares have been all taken up, that no impediment will be found to delay the speedy accomplishment of the undertaking.—*Western Times.*

**STATUE OF MR. STEPHENSON.**—The arrangements for carrying into effect this well-merited compliment to the Brindley of railways, George Stephenson, are now in active progress. A committee composed of the first names in Liverpool has been formed, and we now trust that a marble statue of this eminent engineer, from the chisel of Gibson, will, before long, be amongst the noblest ornaments of that splendid building, the St. George's Hall, which is rising opposite the Liverpool terminus of George Stephenson's first great railway.—*Liverpool Times.*

**THE LATE SIR ASTLEY COOPER.**—A statue has just been placed in St. Paul's Cathedral to the memory of Sir Astley Cooper, the eminent surgeon. It was raised by a public subscription, confined to the profession of which he was so valuable and valued a member. The greater portion of the donors were pupils of the late Sir Astley Cooper, headed by Mr. Callaway and Mr. Travers. The statue, exclusive of the pedestal, is 8 feet high, and the likeness is considered good. It is by Mr. Bailey, the Royal Academician.

**PUBLIC WALKS AT FOUNDRY.**—A Government agent has visited Sunderland, and surveyed and approved the site selected by the Public Walks Committee as a recreation-ground for the inhabitants.

**PUBLIC WALKS IN THE OLDEN TIME.**—Alluding to the 5th or 6th of Henry VIII., Hall says:—"Before this time, the inhabitants of the towns about London, as Isledon, Hoxton, Shoreditch, and others, had so inclosed the common fields with hedges and ditches, that neither the young men of the city might shoot, nor the ancient persons walk for their pleasures, in those fields, but that either their bows and arrows were taken away or broken, or the honest persons arrested or indicted; saying that 'no Londoner ought to go out of the city, but in the highways.' This saying so grieved the Londoners, that suddenly this year a great number of the city assembled themselves in a morning; and a turner in a fool's coat came crying through the city, 'Shovels and spades! shovels and spades!' So many of the people followed, that it was a wonder to behold; and, within a short space, all the hedges about the city were cast down, and the ditches filled up, such was the diligence of these workmen. The king's council conived at the matter, and so the fields remained open."—*Knight's London.*

**IMPORTANT IMPROVEMENT IN THE MANUFACTURE OF IRON.**—Mr. Rogers, of Nantyglo, the discoverer of the black band, has, we understand, recently made an improvement in the manufacture of iron, by the discovery of a new "flux," which will almost entirely supersede the use of limestone, and diminish the general cost of making twenty per cent. The quality of the iron will be materially improved, and be the means of saving an immense quantity of coke. The "flux," we are informed, is principally composed of soda. We hope to see the discovery shortly made more public.—*Times.*

**THE LARGEST STATUE IN EUROPE.**—The summit of Banvargie, in Sutherlandshire, is crowned by the colossal monument erected by the Sutherland tenantry to the memory of the late Duke. A statue 30 feet high, and containing 80 tons of stone, stands on a pedestal 75 feet in height. The figure, we believe, is an excellent likeness, and forms the largest statue in Europe.—*Scotsman.*

**IRON TRADE OF SCOTLAND.**—At a full meeting of the iron masters of the west of Scotland, held in Glasgow, on Friday, the trade price of iron was fixed at 5*s.*, on the usual terms. The speculators are, for the present, unable to cause a stir either one way or another, the late exposure having settled them in the meantime.—*Edinburgh Witness.*

At a meeting of the town council, Bridgewater, held last week, it was unanimously agreed to apply during the next session of parliament, for an Act to extend the quay, and also to make a branch railway from the said quay to the station.—*Somerset Gazette.*

Sir John Ramsden has left 20,000*l.* for improving the town of Huddersfield.

TO CORRESPONDENTS.

"T. K. L."—*Saw-dust might answer the purpose; but the usual and perhaps the best way is to fix between the joists strips of wood, called "sound-boarding," forming strong laths, upon which "pugging," one inch thick, composed of lime and hair mortar, is spread; perhaps some saw-dust spread over this would further deaden sound, but all such contrivances rather engender dry-rot.*

*The drawings of the antiquities of Aghadee Cathedral, Ireland, and of the Gateway of Port-ham, Wales, have been received, and are now engraving.*

"M. A. G."—*Received with thanks. His communication will shortly appear illustrated.*

NOTICES OF CONTRACTS.

For supplying her Majesty's several Dockyards with Welsh and Cornish Slates.—The Commissioner for Executing the Office of Lord High Admiral, Somerset-place. October 8.

For Repairing of Witton Church.—Plans and specifications at the Offices of Messrs. Pocock and Glover. October 12.

For Carting away from off the Dock Green the whole of the Soil to be excavated from the intended Railway Dock, Hull.—Mr. W. H. Haffam, Secretary, Dock Office, Hull. October 5.

For 16,000 Larch or Baltic Sleepers, of various dimensions, for the Ashton, Staleybridge, and Liverpool Junction Railway.—Secretary, at the Manchester and Leeds Railway Office, Palatine-buildings, Hunt's-bank, Manchester. October 8.

For such Bricklayers, Carpenters, Masons, and other Works, in the Cleansing, Building, and Repairing the public Sewers and Drains for the City and Liberty of Westminster.—Mr. Lewis C. Hierslett, Clerk, 1, Greek-street, Soho, October 15.

For the various artificers' works in the erection and completion of National Schools and Master's House, at Almonbury, near Huddersfield.—Drawings and specifications at 42, West Parade, Huddersfield; Mr. Wm. Waller, Architect. Sept. 30.

For the erection of the New Recovery House at Leeds.—Plans, specifications, &c., at the offices of Messrs. Hunt and Moffatt, Architects, 17, Albion-street, Leeds. Oct. 2.

For ten third-class Carriages for the Manchester and Birmingham Railway Company.—Secretary of the Company, Manchester. Oct. 3.

For Sewering, Paving, &c., several streets at Charlton-upon-Medlock, Manchester.—Plans and specifications at the office of Mr. Langtry, Surveyor, Town Hall, Charlton-upon-Medlock. Sept. 30.

For Sewering, Paving, &c., several Streets at Ardwick, Manchester.—Plans and specifications at the office of Mr. Langtry, Surveyor, Town Hall, Charlton-upon-Medlock. Oct. 3.

COMPETITIONS.

PREMIUM of 20*l.* for the chosen Design for a new Church at Winchester, to hold about 1,000 persons on the floor, cost not exceeding 4,000*l.* Further information from Rector and Churchwardens. 10th Oct.

ADVERTISEMENTS.

TO ENGINEERS, DRAUGHTSMEN, &c.  
**STEPHENS' RULING AND MECHANICAL DRAWING INK**, for Engineers, Artists, and Designers. This article will be found superior to the best Indian Ink for the above purposes. It does not smear with Indian-rubber, or wash off with water. It flows freely from the drawing-pen, and never corrodes or encrusts it. It may be used on a plate or slab, with a camel's hair brush, diluting it with water, or thickening it by drying, as required. It is sold in the advantage of being ready for immediate use.  
 It has in consequence of being ready for immediate use.  
 It is sold in conical-shaped Bottles, convenient for using from without any stand, by the Inventor, Henry Stephens, 54, Stamford-street, Blackfriars'-road, and by Booksellers and Stationers, 6d. each.

PREPARED FLOORING BOARDS.

**ALWAYS ON SALE, a LARGE ASSORTMENT of DRY PREPARED FLOORING BOARDS and MATCHED BOARDING of all sorts, planned to a parallel width and thickness, from 4 inch to 1½ inch thick. Rough Boarding for Flats.**  
**TIMBER, DEALS, OAK PLANKS, SCANTLING, SASH SILLS, &c.**  
 Apply at **W. CLEAVE'S** Timber Yard, Smith-street, Westminster.

PREPARED FLOORING BOARDS.

**ALWAYS ON SALE at A. ROSLING'S, SOUTH-WARK-BRIDGE-WHARF, BANKSIDE, and Old-Barge-Wharf, Upper Ground-street, Blackfriars, a very large stock of well seasoned Floor Boards of every variety.**

A. R., in calling the attention of builders and consumers, confidently presumes on his being able to supply them on such advantageous terms, as will ensure and merit their favours and approbation.

**GRANITE.—ORDERS** intended for the **ROGGIN TOR QUARRY**, from which the Nelson Pillar, the Graving Dock at Woolwich, and the embankment for the new House of Parliament were supplied,—to be addressed to Mr. Hoar, the town Manager for the Company, at **GROSVENOR WHARF, MILLBANK.**  
 Plinths, Bases, Monuments, &c. are furnished with finished labour, or Stones simply scappled to size.

PAYNE'S PATENT PROCESS FOR PRESERVING AND IMPROVING WOOD.

**RAILWAY CONTRACTORS, BUILDERS, AND JOINERS** are requested to investigate the above. A liberal Discount allowed.

Applications for Licences to—  
**PAYNE AND LODER, Whitehall Wharf, Canon-row, Westminster;**  
 Or at their other stations—  
**Fleetwood-on-Wyre, Lancashire;**  
**Whisnach, Cambridgeshire;**  
 Will be immediately attended to.

CUNDY'S MARBLE AND STONE WORKS, MILLCOTE.

**SAMUEL CUNDY** begs to inform Architects, Builders, &c., that he is supplying **VEIN MARBLE BOX CHIMNEY-PIECES,** Opening 3 feet square, and 7 inch plers, for **FORTY-FIVE SHILLINGS!**

**STONE BOX CHIMNEY-PIECES,** opening 3 feet square, and 7 inch plers, Twelve Shillings; do., do., with **MOULDING CAPS,** and 5 inch pliers, **FOURTEEN SHILLINGS.**

The above are manufactured in the best manner and of the best material. For CASH ONLY.—Address, **SAMUEL CUNDY, Marble and Stone Works, Belgrave Wharf, Piccadilly.**

SEYSSSEL ASPHALTE COMPANY.

"CLARIDGE'S PATENT."  
 ESTABLISHED 1839.

This ASPHALTE is a Bituminous Limestone, obtained from an inexhaustible Mine at Pyrmont, in the Jura Mountains.

Previously to its introduction into this country, in 1839, the Material had been used for many years in France, and from its great utility was extensively patronized by the Government of that Country.

Among the various uses to which it can be applied, the following may be enumerated—For Foot-Pavements, public and others; in the Carriage Approach to Mansions, Garden-walks, and Terraces; the Flooring of Kitchens and other basement offices; also of Coach Houses and Stables, Dog Kennels, Barn Floors, Cow Houses, Piggeries, Poultry Houses, Tea Rooms, and Maltings. For Roofing, covering of Railroad and other Arches, the Lining of underground Cellars near Rivers to prevent the ingress of the Tides; also in Covering the ground-line of Walls, to prevent damp rising (this application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts), thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Docks, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARRELL, Secretary,  
 Seyssel Asphalt Company, "Claridge's Patent," Stangate Depot, London.

COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS.

THE DIRECTORS OF THE SEYSSSEL ASPHALTE COMPANY have much pleasure in recommending to the notice of Architects, Builders, and others, the application of SEYSSSEL ASPHALTE OF SEYSSSEL as the only effectual means of preventing DAMP rising in WALLS.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18:

"In 1839 I superintended the construction of a house of three stories on the Lac d'Engien. The foundation of the building is constantly in water, about 194 inches below the level of the ground-floor. The entire horizontal surface of the external and internal walls was covered, at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

"Since the above date no trace of damp has shewn itself round the walls of the lower story, which are for the most part painted in oil of a grey stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 2½ inches above the external surface of the soil, and only 194, at the utmost, above that of the sheet of water.

"The layer of Asphalt having been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp have been since remarked at the base of the door-posts."

GLASS SHADES.

**ROUND, OVAL, or SQUARE,** for the preservation of Clocks, Aikinster Ornaments, &c. &c. &c.  
 Wholesale and Retail at Clauudet and Houghton's, the original Glass Shade Warehouse, 89, High Holborn.

COLOURED GLASS FOR WINDOWS.

**CLAUDET and HOUGHTON** beg to inform the Trade and the Public, that they have made a very considerable reduction in the price of **COLOURED GLASS,** more especially in their Ruby, which is equal in tone and brilliancy of colour to the ancient Ruby, so much admired.

PATENT PLATE GLASS.

SHEET WINDOW GLASS.

CROWN WINDOW GLASS.

COLOURED AND PAINTED GLASS.

Wholesale and Retail, at 89, HIGH HOLBORN; where lists of prices may be had.

**TERRAZZO METALLIC DRAIN PIPES, PAVING and ROOFING TILES,** and numerous other articles manufactured from the blue Terra Metallic Clay which are, in point of durability and hardness, nearly equal to the best Portland Cement, and sold at prices at WYATT, PARKER, and CO., Abbin-wharf, Holland-street, Blackfriars'-road.—Also a large quantity of Stourbridge Lamps and Tiles.

BASTENNE BITUMEN COMPANY.

Offices, 31, Poultry. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP and VERMIN. The Directors beg to refer to the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot-square—1 inch thick, 8d.; 2 inch thick, 1s. 4d.; 3 inch thick, 1s. 8d.; 4 inch thick, 2s. 0d.; 6 inch thick, 2s. 6d.; 8 inch thick, 3s. 0d.; 10 inch thick, 3s. 6d.; 12 inch thick, 4s. 0d.; # The Builder.

NO. LXXXVII.

SATURDAY, OCTOBER 5, 1844.

R I O R to giving our intended survey of the Bath stone masonry of the metropolis, we cannot abstain from in some sort forestalling the subject by the opportunity which is at present afforded by the repairs which are now going on at All Saints' Church, Langham-place, in the parish of Saint Marylebone. Hardly has a second scaffold been removed from a second repair of the Bath stone of Trinity Church, at the entrance to the Regent's park,—hardly have the balusters, cornices, and other parts of the wretched Bath stone masonry of that ill-fated church, which forms one of the only two or three buildings in which Sir John Soane ever could be perverted from prudence and economy into the use of such a mean and spendthrift material,—hardly have its perished tower-plasters been chopped away for the admission of a new facing of the same treacherous material, leaving the remainder of the stone-work of the edifice to be renewed in a very few years hence,—hardly has this occurred at one end of Portland-place, when to the church at the other end of it, a scaffolding is raised to effect a much more extensive repair to the fabric of another building erected hardly twenty years ago. Of this the balusters of its parapet are altogether rotten, many of its cornice-stones are entirely perished, of some their "drip" being totally gone, and some having scarcely any surface left; of the portico of the church the column-shafts appear to have suffered violent disease, half their component blocks having lost their wrought exterior, many are peeling or excoriated, and all exhibit the most lamentable and indecent marks of decay, as though the portico of a temple should bear more marks of mortality than the deceased conveyed beneath it to the funeral service; the column-bases are in many places so weather-worn, as to have lost even all semblance of moulding; the frail masonry of the church-tower is miserably broken with hundreds of cracks; the string-courses and window-sills are alike gone, to return no more.—How long, we ask, is such a state of things to last? How long is an architect to covet the immortality which soft stone-peelings and Bath quarry-dust can give? How long are chapels of Portland-stone to be superseded by mean edifices decorated with trumpery which hardly lasts the periodical intervals between one white-washing and another, of the tenderest plaster? How long are we to hear of the advantageous induration of Bath stone,—while scarcely one block of it in a hundred thousand will stay to harden, disappearing like the sparrows, which "may be caught by salt, if they will stay to have it placed on their tails."

We shall drop this subject at present, to be hereafter more amply resumed, only making the observation that we cannot account for the mean prostration of feeling which will prompt a man to adopt a kind of masonry bringing with it so little honour, and so extravagant an ultimate cost. We, fifteen years ago, were prevailed upon to use a little of it in three instances—in each case the decay which has ensued is miserable.

e p

## NEW METROPOLITAN BUILDING-ACT.

THE dread of the next year's operation of the new Metropolitan Building-Act has produced no small activity within its future range; this is not confined to its new territorial extension, where feeble spurious buildings are rapidly arising, but within the limits of the present statute, porches, and other projections are arising, where it may be doubted if they could be erected next year. The raising of buildings is also another subject upon which alarm has been felt, and houses are receiving additional stories which might otherwise have remained the next seven years without them. No doubt the panic, which seems to have seized the public or builders, is in a great measure of an unnecessary, or at least, of an exaggerated nature, and for much of it no cause will be found. The most serious alarm is that which is felt by proprietors who have estates in close neighbourhoods, who, if they attempted after this year to replace their tenements by new ones, would find the sites have fallen a sacrifice to the requirements of the new Act for the leaving of open space for the public health.

f l

## INCONVENIENCE OF RAILROAD CONVEYANCE.

WITH the convenience of railroad conveyance, we must complain of the very insufficient accommodation which the public receives by reason of the long intervals which occur between the starting of the different trains, particularly about the middle of the day; and having often to travel short distances, under twenty miles, we, in common with multitudes of other persons, lose much more time from waiting for the next trains, than if we were left only to the use of the worst of the old jog-trot conveyances; while the leviathan nature of the railroad system puts out of the question the most remote idea of our being served by any ordinary conveyance, so that on very many occasions we are far worse off than if railway travelling were not in existence. Last year, we had the most urgent business down the North-Eastern line (one in general most excellently managed, and upon which we do not remember that any accident has happened to passengers); it happened to be a gala-day, upon which many applicants were all being served by only one attendant, the occasion, if we remember correctly, some Cockney pony-racing at Lea-bridge. After waiting ten minutes, our turn came, when upon tendering a sovereign, change was refused to be given, and while we were obtaining it at the nearest house of merchandize, the door was shut, and we were refused passage; and there being no other train for several hours, and no other public stage conveyance, we were reduced to the necessity of hiring a post-chaise to go fourteen miles, and arrive an hour after time, or to have lost an appointment altogether. We are sure it would be to the interest of all the companies to re-consider and re-appoint all their time-tables, and not bother and inconvenience their passengers in the present reprehensible manner, and cause the waste

of their most precious possession—TIME. The day will come when the machinery of railways will be so perfected, that passengers will safely, and by statute *may demand*, at any hour or half-hour from sun-rise to sun-set, conveyance to any station they may please. The destruction of the coach system imperiously demands this for the public convenience; and we cannot see because the attendants may require two or three hours for dinner in the middle of the day, why those who dine at no such time should be so troubled and annoyed. If in providing for the right attention to public convenience, safety could alone be insured by the adoption of the atmospheric, or the wire-rope system, then should the use of one or other be legislatively compelled. By the latter system, transit to every station might be safely performed at every quarter of an hour, instead of at half a day's interval, as now occurs at some of them, even near London, as at the Edmon-ton one during part of the year.

e a

## INCREASE OF HONOUR AND PROFIT TO ARCHITECTS!

THE following advertisement has appeared in the *Manchester Guardian*:—

"TO ARCHITECTS.—St. Simon's Church, Salford.—Persons desirous of sending in Plans and Specifications for Building the above Church, are requested to forward the same, as soon as possible, to Huitson Dearman, Esq., treasurer to the committee, Springfield-lane, Salford."

To questions asked relative to which advertisement the following answer has been sent:—

SIR,—In reply to your letter to Mr. Dearman respecting the church proposed to be erected in Salford, I beg to inform you, that 3,000*l.* is the sum to be expended. The accommodation required on the ground-floor for 800 people; the site in a level open field; a handsome church of stone, without galleries, but so arranged as to admit of their being hereafter constructed, will be required; and all plans to be in with the treasurer in fourteen days hence. THE SUCCESSFUL COMPETITOR WILL BE EXPECTED TO SUPERINTEND THE BUILDING, AND NO REMUNERATION IS PROPOSED TO BE GIVEN TO HIM.

I am, Sir, yours very respectfully,  
WALTER ATKIN HAYMAN, Sec.  
9, Wellington-square, Salford, 27th Sept. 1844.

## GREAT IRON BRIDGE FOR THE NEVA FORMED AT LIVERPOOL.

THE fact of the Emperor of Russia having commissioned our townsmen, Messrs. Bury, Curtis, and Kennedy, the celebrated engineers, to construct at their extensive establishment an immense iron bridge to cross the Neva at St. Petersburg, has excited considerable interest in the engineering world. The river Neva, in the most central part of the capital named, is at present crossed by a bridge of boats—the Pont D'Isaac—over which there is a prodigious traffic, interrupted only in the night for the passage of ships through one compartment of the bridge, which can be shifted or removed for the purpose. In the spring, however, huge masses of ice, disengaged by the thaw, drift down the stream with such force, that it is necessary to let the bridge loose at one end and permit it to swing round at the other, so as to lie alongside the quay, and even this precaution is occasionally unavailing to preserve it from the destructive effects of icebergs—the boats last year, for instance, being carried away from their anchorage, and with them the superincumbent carriage and footway, into the Gulf of Finland, whence they were recovered piecemeal by steamers. To obviate such occurrences, as well as to carry out the imperial designs for beautifying and improving the capital, the Czar has resolved to erect a bridge of solid iron, on piers of Finland granite, and impatience of delay, has intrusted the castings to Messrs. Bury, who, when their new furnace, now being built, shall be completed, will be enabled to cast at the rate of 150 tons a week, so that by the time the masonry is finished, the iron-work may be

forth with fixed upon it, the whole project being to be perfected in two years, when the bridge will be opened with great éclat.

The structure will consist of seven arches. The span of the centre one will be 156 feet, and of the three arches on either side 143 feet, 125 feet, and 107 feet respectively. Another arch will be devoted to a species of swivel bridge, 70 feet wide, for the admission of ships to and from the Custom-house. The buttresses of the piers will present to the current a sharp inclined plane, so that a descending iceberg running upon them will fall to pieces from its own gravity. The bridge will be very flat, there being a fall of only seven feet from the top of the centre arch to the end of the last arch on either side. The average depth of the water in the Neva here throughout the year is about 30 feet, and as the river is a tideless one, there is little variation, except where the wind sets strongly up towards the gulf, when the waters rise considerably in some instances, doing irreparable damage. As the shores of the Neva on either side are extremely low, the height of the crown of the centre arch from the water's edge will be only 21 feet; the spring of the arch but 6 feet. The extreme length of the bridge from one abutment to the other will be no less than 1,078 feet. The weight of iron above will be nearly 8,000 tons! independent of the lamps and superb balustrades with which it is the emperor's intention to adorn it, and which together will probably weigh from 1,000 to 2,000 tons more.

An idea cannot yet be formed of the cost of the whole undertaking, but the price of the iron part alone will probably exceed 100,000*l.*; much of the labour to be bestowed upon, and the machines to be constructed expressly for it, being very expensive. The segments of the arches have to be placed with the greatest precision, and the best possible workmanship devoted throughout the details. The weight of iron will exceed by nearly five-fold that consumed in the construction of the Menai Bridge. Altogether, the Neva Bridge will be a most surprising evidence of what the skill and enterprise of a private British firm are able to accomplish, and that such an undertaking should have devolved on a Liverpool house, constitutes an epoch in the commercial progress of the locality. There are three boat bridges on the Neva, and it is highly probable they will be replaced with iron ones, when that under notice shall have come into use.—*Abridged from the Liverpool Journal.*

#### THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The first meeting of the general committee was held on the 25th ultimo at the Council Chamber, in the Guildhall, York. The chair was taken by the Right Hon. the Earl of Rosse, the President at the last meeting at Cork, who was supported by the Marquis of Northampton, Earl Fitzwilliam, the Earl of Enniskillen, the Deans of Ely and Manchester, Professor Whewell, the Master of Trinity, the Rev. W. Vernon Harcourt, the Rev. Dr. Scoresby, and most of the leading members. On no previous occasion was the attendance more numerous and efficient.

Colonel Sabine, the general secretary, read the Report of the council for the past year. In reference to a recommendation of the general committee at Cork, meeting last year, an application had been made to the Board of Ordnance requesting their aid in making experiments with captive balloons, and from which orders had been issued to the commandant at Woolwich to afford every facility for carrying out their plans. Another recommendation to her Majesty's Government respecting the Ordnance maps in Ireland now in progress had also been attended to. It was to introduce a series of contour lines, which, shewing the elevation of the surface of the country, would be useful to a variety of mechanical and engineering purposes. Amongst other cases of their probable utility was that of subserving mining operations, being instrumental in the formation of cheap roads and the improvement of farms; in facilitating drainage and irrigation, and improving the sanitary condition of towns; in sinking artesian wells, and expediting the formation of roads, railways, and canals, and other purposes of public utility. If such were introduced now, by means of the large and efficient disposable staff which the

survey had at command, it would save a great expense in the future special surveys for public works and the undertakings of private enterprise. The additional expense to be incurred would not exceed 10,000*l.*, and it was suggested that the electrotype manipulation might be easily adapted to the purpose. An interview which a deputation from the council had held with Sir G. Clerk on behalf of her Majesty's Government, respecting the publication of the results of Professor Forbes's dredging in the Ægean Sea, had also been successful.

Colonel Sabine, in the absence of Mr. J. Taylor, F.R.S., read his accounts as treasurer. They announced the total receipts of the past year as 2,657*l.* 15*s.*, of which amount there had been received from life compositions, 160*l.*; annual subscriptions, 466*l.*; ladies' tickets, 160*l.*; sectional tickets, 33*l.*; compositions for book subscriptions, 66*l.*; sale of reports, 131*l.* 9*s.* 11*d.*; dividend on stock, 165*l.*; balance at the last report, 496*l.* 5*s.* 1*d.*; and the sum of 1,000*l.* received from her Majesty's Treasury. There had been expended by the treasurer at the Cork meeting, and for incidental expenses, 317*l.* 3*s.* 3*d.*; printing the reports, 344*l.* 12*s.* 6*d.*; engraving, 42*l.* 7*s.*; salaries for the secretary and accountant, 450*l.*; and on various grants, 1,047*l.* 10*s.* 8*d.*, leaving a present balance of about 460*l.*

The active business of the various scientific sections commenced the following morning. As usual on the first day of meeting, the communications were neither numerous nor very important. The sectional rooms were very well attended, but much inconvenience was experienced by members from their want of proximity to each other, owing to the city being somewhat limited in its means of accommodation. Amongst the arrivals on the first day, were Sir Thomas Deane, Sir Isambard Brunel, Sir John McNeill, the Dean of York, Professors James and Edward Forbes, Professor Adam Sedgwick, Dr. Du-Hamel, from St. Petersburg, Mr. Leonard Horner, F.R.S., Professor Latham, Sir T. D. Legard, Archdeacon Wilberforce, Professor Walker, of Oxford, &c. The sections commenced at the usual hour of 11 o'clock.

Section G.—Mechanical science. President, Mr. G. Rennie; Vice-presidents, Mr. E. Hodgkinson, F.R.S., Mr. J. Scott Russel, F.R.S.E., and Mr. J. Taylor, F.R.S.; Secretaries, Professor Vignolles and Mr. T. Webster.

The communications made were—

1. Mr. Wylson, on a new Scantlometer.
2. Remarks by Sir Thomas Deane on the Construction of Buildings for the Accommodation of Audiences.
3. Mr. E. Hodgkinson, on the Law of Defective Electricity of Iron and Stone.
4. Mr. J. S. Russel, Report on the Forms of Ships.
5. Mr. Russel, on the Resistance of Railway Trains.
6. Mr. J. Bateman read a paper on the Collection of Water for the Supply of Towns.
7. Mr. Bridges read a paper on Wooden Railways. The author contended that the introduction of wood for the purpose of railways would materially diminish the cost of their construction, but there were two essentials to be attended to.—1. The chemical transmutation of the fibres of the wood into a more durable, hard, and almost incombustible substance; and, 2. the employment of a level guide-wheel fixed at an oblique angle before and behind each carriage, as a substitute for the flange, which is the main cause of the wear and tear in existing railways. By means of this guide-wheel the bearing and carriage-wheel would be quite flat, obviating all abrasion of the wood as well as tendency to oscillation, each acting independently, as with the wheels of an ordinary carriage. The process by which the wood is chemically transmuted is the injection of two alkaline and metallic salts, which, as it were, fossilizes the wood. The advantages of its introduction into Ireland were particularly alluded to.
8. Mr. Bevan described an improved Life-boat.
9. Mr. Bermingham read a paper on Turning Canals into Railways. His views were more particularly directed to the Royal Canal in Ireland, with the purpose of connecting the river Shannon with Dublin by that means. He proposed to construct a railroad in the canal and make sewers in the centre at the bottom, by which the waters of the country

could be brought away, and in their progress from the summit levels to the Shannon on one side, and the sea at Dublin on the other, to make use of this water at each of the present locks to assist the trains in surmounting the inclined plane which he proposed to form in their stead.

10. Mr. Bowness described a plan for drawing coals from pits without ropes. The principle was similar to that of drawing water, the coals being brought up by buckets, through the instrumentality of a scale down the centre and a slide on each side, put into impulse by the steam engine.

11. Professor Oliver Byrne described a new set of compasses, invented by M. Le Sire Lebrun, which comprised within themselves a whole case of instruments.

12. Professor Byrne described a new invention by M. Le Dru, of Paris, of cold-drawn iron pipes, specimens of which were exhibited at the late exposition at Paris.

13. Mr. Perigal read a paper on a process supposed to have been used in the construction of the Pyramids. A similar plan has previously been mentioned as that by which Stonehenge was erected, by considerable manual power being employed in their conveyance on rollers.

14. Dr. Greene described Mr. Nasmyth's steam-hammer, an ingenious invention in the fabrication of wrought iron. The one referred to was five tons weight, which, in a fall of seven or eight feet, made one hundred strokes in a minute on an anvil of seven or eight tons weight. It was much admired for its simplicity as well as ingenuity.

15. Mr. Fairhair read a paper on the combustion of smoke. To shew the importance of the removal of this nuisance, it had been calculated that in Manchester alone a saving of 300,000*l.* per annum in the cost of soap alone would be effected, if this were accomplished.

#### SECTION G.—MECHANICAL SCIENCE.

WYLSON'S SCANTLOMETER.

President—George Rennie, F.R.S.

Mr. J. Scott Russel, F.R.S., Ed., and one of the vice-presidents of this section, read the first paper on the list, "On a New Scantlometer." Mr. Russel said this was a communication which had been sent in by Mr. Wylson, a gentleman of the architectural profession, and who unfortunately was not present. The scantlometer is the result of an attempt to meet a deficiency which exists as to the means of ascertaining the scantlings (or depths and thickness) of timbers used in buildings, and which is of this nature:—None but men of mathematical acquirements can calculate the exact depths which, in a timber of a given thickness, is requisite for a given span, or the exact thickness necessary for one of a given depth to the same span, or the length which may just, with safety, be spanned by one or both of a given depth and thickness. And for those who have not the advantage of possessing this branch of education, there is but one way of acquiring the capability of determining questions of this description, namely, long experience and observation of what has been sufficient in similar cases. But of those who have occasion for such knowledge, the portion who have thus overcome the want of the more legitimate method is considerably the smaller; and the remainder, consisting, perhaps, chiefly of the rising generation of carpenters, but including also, in no small degree, men following the professions of architecture and house-surveying, have neither the one way nor the other of resolving, by themselves, the true requisites in these frequently recurring cases. It is mainly for the use of these, then, and also to obviate the necessity for calculation, to those who solve their questions by that means, that this contrivance is intended. This instrument has been invented for giving the scantlings of joists and rafters only, these having a relation to each other, and being of more frequent occurrence than the other timbers in carpentry, but for which similar provision can without difficulty be made. It consists of two diagrams or scales, both of which are generally wanted; the upper one comprehends timbers of the minimum thickness and maximum depth, embracing bearings up to 25 feet; the lower one gives equivalent scantlings from the minimum up to the maximum of thickness. The scant-

ings given had in view the joists of dwelling-  
ous floors, and rafters carrying medium  
zed slating, the material fir, the distance  
under 12 inches, and the rate of weight sus-  
ined supposed to be similar in all cases, and  
iffused uniformly throughout. In the dia-  
rams exhibited, the base line of the upper scale  
newed what should be the respective depths of  
vel joists of the thickness of an inch and a half,  
r bearings, up to 25 feet, the concentric curves  
ring the bearings which were set out on the  
right-hand boundary line, to measure on the  
ale of inches. The radiating thread gave, on  
e same principle, the depths of sloping rafters  
f like thickness, to any pitch up to 60 degrees,  
e point of intersection with the concentric  
ves of bearing shewing the measure on the  
ale of inches produced upwards. It would be  
arked, observed the author, that the higher  
e pitch of the rafter, the less is its depth to  
e same bearing; the principle of this would  
nce be understood when it was remembered  
at the load being a downward pressure, the  
ross section of the timber was to be con-  
dered vertically, not at right angles to its in-  
ination. The mode of using the lower scale  
as explained by an example. Suppose that in  
elking the scantlings for a 16 foot rafter of  
e pitch of 25 degrees, to which the upper  
ale of inch-and-half thickness assigns a  
e of 12½ inches, they wanted the thickness  
e to be 2½ instead of 1½, it was only necessary  
ide the vertical scale of inches till 12½ coin-  
ided with the left-hand termination of the  
6 foot curve, and they found that the intersec-  
on of the latter with 2½ inches of the scale  
t the top produced downwards, was at the  
vel of 11 inches on the vertical scale, and  
hich was the equivalent depth required.

Mr. Scott Russell said the description of  
his instrument was given in a simple and in-  
elligent manner, and with perfect accuracy.  
For the purpose of ascertaining the scantlings  
of timbers this was an exceedingly practical and  
useful invention. It was, in fact, a mathemat-  
ical calculation rendered mechanical, and  
which it would be found advantageous to those  
who were not mathematicians, it would also  
assist those who were, ascertaining whether  
their calculations were right.

The Chairman and Sir Thomas Deane also  
expressed their approval of the invention, the  
latter gentleman moving a vote of thanks to  
the author, which was carried by acclamation.

## LONDON AS IT WAS, AND AS IT IS IN 1844.

(Continued from p. 492.)

As we are not giving the history of clubs  
existing in the present day, which alone would  
fill three octavo volumes, we pass on to  
the *Senior United Service Club*: this building  
has little credit to its very favourable position;  
it has a poor and insipid appearance, and its  
interior is cold and comfortless, the barn-like  
dimensions of the principal rooms finding no  
relief to the dull, monotonous walls and ceil-  
ings, except by a sprinkle of lace jackets on a  
bald day.

The *Athenæum* is another specimen of  
architectural taste, having all the appliances  
of situation in its favour. This edifice was  
erected soon after the removal of Carlton  
House; the club was ostensibly formed for  
literary men; several eminent architects are now  
members of it.

The *Travellers' Club*, built by Messrs. Lee,  
after the design of Mr. Barry. This was the  
first bold step made by an English architect to  
break through the trammels of custom. Its  
interior is fitted up with the elegance suited  
to a limited number of gentlemen of the  
highest standing in society. The original esti-  
mate for building it was 19,000*l.*, the ultimate  
cost 29,557*l.* 16*s.*

It is foreign to our purpose in this review of  
the Clubs of London to enter into the history  
and adventures of each, our primary object  
being to afford to the reader a slight but  
amusing panoramic view of this our celebrated  
city, such as it was and is, whereby all may  
judge how far we have improved by change in  
our manners and customs, and how far we keep  
pace in the arts and sciences, with the general  
increase of wealth and numbers. Prior to  
1800, we had no building of any magnitude in the  
form of a club-house; nor was it then at all  
necessary, for the social bond of good fellowship

was so lightly drawn, as to render it rather the  
object of ambition than of satiety. Men met  
occasionally for the purpose of amusing  
and being amused—of instructing and being  
instructed—without reference to the rank and  
fortune of each other, wit and scholastic or  
travelled learning being the chief recommen-  
dations; and in departing from this amiable  
simplicity of the older clubs, the spirit by which  
they were animated has been wholly exting-  
uished, giving place to a system altogether  
different. In the new order of things, the  
definition of Johnson is no longer applicable;  
clubs are no longer associations of good fellows,  
but associations of men united according to  
caste, political or other feeling, and governed  
by certain rules and regulations. The first and  
most important object of all, as previously ob-  
served, is to unite the economy of a chop-house  
with the superior accommodation of a first-  
rate hotel; the minor objects of many are to  
supply the want or necessity of a town-resi-  
dence, to form a *locus standi* in society, to kill  
time, to learn the news, to discuss politics,  
polemics, or war, the sports of the field or of  
the town, the merits of the last new work or  
play, or opera-dancer, the chances of a ribbon,  
or of a vacancy in court or camp, church or  
state, being bound together like man and wife  
for life, or so long as they continue to pay the  
tax levied on themselves.

In this dividing into castes, they have  
assumed a character of greater exclusiveness  
than the older clubs, which is still further  
promoted by many men of rank and wealth  
being members of several clubs at the same  
time, to the exclusion of those who are desirous  
of becoming members, and to whom, during  
their winter sojourn in the metropolis, such  
places would be beneficial. Again, the clubs  
degenerate into an abuse, when, as is often  
the case, men use them as the current  
coin of their respectability; and there are  
instances in some of the minor clubs, of men  
about town who live entirely on the strength of  
their club-card, backed by the fallacious ap-  
pearance of a black servant, an elegant saddle,  
watch, or rings. Numbers of these men might  
be seen during the speculating mania, figuring  
at the head of bubble companies, and joint-  
stock adventures, having no other stock of  
their own but that of assurance, not readily put  
down even by exposure.

The clubs, apart from these considerations,  
have benefited London by contributing to  
increase its magnificence; to the first tasteless  
samples of architectural feebleness have been  
gradually added others, which, for taste and  
magnificence, give way to none in Europe.  
Pall Mall, St. James's-street, and St. James's-  
square, give promise of becoming continuous  
ranges of magnificent palazzos, rivalling each  
other in their internal and external decorations.

Behind the clubs, and fronting towards St.  
James's Park, are two ranges of lofty houses,  
divided from each other by the Duke of York's  
Monument; they are raised on a substructure,  
which contains their kitchens and domestic  
offices, forming a terrace 50 feet wide, adorned  
with Pæstum-Doric columns surmounted by a  
balustrade. The superstructure consists of  
three stories, ornamented with Corinthian  
columns. Resuming our review: the Hay-  
market in 1735 was full of inns and houses of  
entertainment, especially on the west side. The  
Opera House was erected by Sir John Van-  
burgh for the purpose of Italian operas. The  
prices given at that period were considered  
very expensive, varying from 1,000 to 1,500  
guineas per annum; and the celebrated Far-  
nelli is said to have netted 2,000 guineas at his  
benefit. What would our ancestors say to  
present prices?

In 1645, the precinct of Covent Garden was  
separated from St. Martin's, and constituted an  
independent parish, which was confirmed after  
the Restoration, in 1660, by the appellation of  
St. Paul's, Covent Garden. The church in  
Covent Garden has at its eastern front a  
plain but noble portico of the Tuscan or-  
der, having four massive columns, the two  
extreme ones square, and those between them  
round, and the intercolumniations being wide.

The ground on which the greatest part of  
Covent Garden parish stands was anciently a  
large garden belonging to the abbot and con-  
vent of Westminster; which garden, after the  
dissolution of religious houses, was bestowed  
by King Edward VI. upon Edward, Duke of  
Somerset. Upon his attainder, Edward, on the

6th May, 1552, granted it, together with a field  
contiguous to the north, denominated the Seven  
Acres, but from its length vulgarly termed the  
Long Acre, to John, Earl of Bedford. This  
earl erected a house for his town residence on  
the north side of the Strand, at the bottom of  
what is now Southampton-street; this, which  
was a mean wooden building inclosed by a  
brick wall, remained till the year 1704, and had  
a garden whose northern boundary was the  
southern side of the present market. The  
estate being greatly improved, Francis, Earl  
of Bedford, in 1640, employed Inigo Jones to  
build a chapel-of-ease to St. Martin's for the  
convenience of his tenants; his sons were  
allowed 7,000*l.* on account of this building and  
endowment of this church by Oliver Cromwell,  
out of the fines they were liable to pay by  
virtue of his Act to prevent the multiplicity of  
buildings in and about the suburbs of London.  
The building and adornment of Covent Garden  
Market as it now appears were a boon con-  
ferred upon the surrounding inhabitants, and  
particularly to the temporary occupants of  
the buildings over the piazza; they have not  
only added to the usefulness of the market and  
the accommodation of the fruiterers and market-  
gardeners, but they have also been the means  
of clearing away an abominable nuisance of  
heaps of putrid vegetables, and scenes of drunk-  
enness, and abuses now pretty nearly con-  
centrated within the pale of Billingsgate. Covent  
Garden was formerly an arena in which to  
pass through the ordeal of pillory, for when  
the will to punish was not wanting, there was  
no lack of rotten eggs and garbage to furnish  
the material. x x x x

(To be continued.)

## OPENING OF THE ALBERT BRIDGE, MANCHESTER.

On Thursday, the 26th of last month, the  
Albert Bridge, a fine new structure, which is  
just finished, and which connects the boroughs  
of Manchester and Salford, was publicly opened  
by the authorities of the two boroughs, and  
the magistrates of the county. The bridge  
has been built at the expense of the county,  
and is a very substantial erection thrown across  
the river Irwell by one arch. The carriage  
and footways of the bridge measure together  
18 yards from within the battlements.

About one o'clock the magistrates arrived,  
and were loudly cheered by a very large  
number of persons who had assembled at each  
end of the bridge to witness the ceremony.  
They were shortly followed by the mayors and  
corporations of the boroughs of Manchester  
and Salford, each body forming a separate  
procession, headed by the military bands now  
stationed in the boroughs, and followed by a  
large number of the most respectable in-  
habitants of both townships. The Salford  
procession was joined by the churchwardens and  
sidesmen.

Amongst the gentlemen present we noticed  
Sir Thomas Potter, Knt.; James Kershaw,  
Esq., late mayor of Manchester; R. S. Sowler,  
Esq., barrister-at-law; W. Garnett, Esq.;  
W. Wanklyn, Esq., of Pendleton; J. H.  
Wanklyn, Esq., of Pendleton; Joseph Broth-  
erton, Esq., M.P., &c. Mr. Charles Carrington,  
the bridge-master for this county, and Mr.  
Broadhurst, treasurer of the borough of Man-  
chester, had provided an excellent supply of  
wines, &c., which were laid out on a large  
table, temporarily fixed on the north-easterly  
side of the bridge for the occasion. The two  
bands stationed themselves in front of the com-  
pany, and played several airs during the pro-  
ceedings.

W. Garnett, Esq., chairman of the bridge  
committee, addressed the company at consid-  
erable length, pointing out the advantages that  
would be derived to both boroughs by the new  
bridge. He congratulated the authorities and  
the gentlemen present on the rapid improve-  
ments that were going on in the towns of  
Manchester and Salford. He called attention  
to the condition of Manchester, now with its  
wide and spacious streets, in which only a few  
years ago two carts could not pass each other.  
He well recollected the time when there was  
but one bridge for carriage across the Irwell,  
and now there were five, some of which were  
ornaments to the town. After some other ob-  
servations, he christened the new structure  
"The Albert Bridge," which was received  
with loud cheers. Mr. Garnett afterwards  
gave, "The Queen," "Prince Albert and the

Royal Family," "The Corporations of Manchester and Salford," "The Bridge Committee," "The Boroughreers of Manchester and Salford," "The Bridgemaster," "The Towns and Trade of Manchester and Salford."

These sentiments were loudly cheered and severally responded to by the Mayors of Manchester and Salford, Mr. Brotherton, Mr. Addison, and Mr. Woollan.

At the close of the ceremony the authorities and gentlemen again formed themselves into procession, and proceeded to their respective Town Halls, where they separated.

Immediately after the departure of the authorities, a large number of coaches, carts, waggons, &c., loaded with people, passed over the bridge, amidst the cheers of the multitude assembled.—*Herald.*

#### MONUMENT TO LORD COLLINGWOOD.

It affords us pleasure to learn that the committee of the subscribers to the monument proposed to be erected to the memory of the late Vice-Admiral Cuthbert Lord Collingwood have resolved upon completing the undertaking with all convenient speed, in reliance on the public for the inconsiderable amount of money yet deficient. Although no subscription list has for some time been advertised, and but little publicity given of late to the proceedings that have taken place, it appears that upwards of 2,000*l.* have been already placed at the disposal of the committee, and it is calculated that another 1,000*l.* will be amply sufficient to finish the work in a style befitting the character of the illustrious individual, the renown of whose brilliant actions it is designed to perpetuate and extend. The architectural design is by Mr. Dohson, and the execution of the colossal figure has been intrusted to Mr. Lough, a native artist, who has had the honour of being selected by Royal patronage to chisel the bust of her Majesty, to be placed in the niche above the entrance of the Royal Exchange, in London. It was at one time contemplated to place the monument in the Castle-yard at Tynemouth, but a much more eligible site has since been fixed upon, near to the entrance of the river, the requisite ground having been generously given by the Duke of Northumberland, in addition to his Grace's noble donation of 500*l.* It will form a striking object to mariners navigating our coast, and the land immediately surrounding it will be laid out as pleasure-grounds, with public walks.—*Newcastle Journal.*

#### TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLLSON.  
(Continued from p. 483.)

96. **ASH.**—This tree, the "Venus of the Forest," is a native of Europe and the northern parts of Asia, and abounds in Great Britain: it is a forest-tree of the first class, both in beauty and magnitude, yielding to the oak in girth of trunk and in circumference, but frequently over-topping it in height. Being prolific in ripening its winged seeds, it disperses itself on the winds pretty generally over the face of the British Isles; and is frequently found adorning the crumbling ruins of ancient buildings, beautifying, while, by the sinuosities of root and branch, amongst cracks and crevices, it hastens the period of their downfall: it also places its bright verdure in contrast with the arid and sterile aspect of loose and slaty rocks, where, especially in mountain-scenery, it appears to peculiar advantage, waving its slender and graceful foliage over precipices, or from inaccessible clefts, affording it the scantiest foothold. It is, nevertheless, much better when planted by itself for timber or underwood, and should neither be permitted a place in hedge-rows nor on pasture lands, for its numerous roots spread widely on the surface, engrossing the nutritive moisture within its reach, to the total deprivation and consequent destruction of surface-plants. It is rapid in growth and of a towering nature, capable of attaining, on rich gravelly loam, a diameter of four or five feet; but trees of even less than this bulk are often found to have begun to rot at the core, and it is therefore seldom allowed to arrive at full maturity; besides which, the circumstance of the young being in fact more valuable than the old wood, conduces, with its extreme usefulness for many purposes, to its being made available at a more early age: it rarely lives

to 500, and the age for felling is between 50 and 100 years,—the season, winter, when the sap is still, it being very liable to worms if felled when abounding in sap.

97. The quality of the timber is very much dependant on the situation and soil on which it is raised: it delights to grow in the woods, but will, on good soils, flourish in open grounds; and a clayey soil and northern exposure seem to be the most proper for producing it in perfection. Its general form and appearance too are determined by these circumstances; for it is found that when grown singly or unconfined, its leading stem not only shoots up, but throws out, at acute angles, numerous side branches, which, when advanced in age and increased in foliage, take that graceful sweep that obtains for the tree, when full-grown, so much admiration: when planted on the margin of some lake or stream, they take so much of this elegant pendent character, as to acquire a resemblance to the weeping willow. Its foliage consists of light, thin, pale-green pendent leaves, generally winged—having an odd one at the end, with five or six pairs of small ones; the seed-bud, which is oval and compressed, changes into a long membranaceous vessel, containing a single seed; many trees produce profusely bunches of long thin seeds, called keys, giving a singular and not unpleasing appearance, whilst others have hardly any. It is one of the latest trees in donning its vesture of green, and amongst the first to relinquish its leafy honours to the nipping influence of autumn winds. The seeds should be gathered in autumn, and the sowing in the nursery-beds may either be done immediately, or deferred till spring. When the seedlings are five or six inches high, they should be planted out in rows, to strengthen, until finally transplanted. In order to raise timber of the best quality, a piece of land, of the nature already referred to, should be thickly sown or planted—by placing the trees about two feet apart—when these have risen (which they do rapidly) and appear to be choking each other, one-half of the poles should be withdrawn, and the remainder left to attain a marketable growth of from 40 to 60 feet in height and from 8 to 12 inches diameter.

98. Besides the common ash here treated of, there are other species in America and elsewhere. There is a variety, indigenous to Italy and abundant in Calabria, grown in England, seldom exceeding 20 feet in height, which, as well as another, we believe, furnishes the honey-like concreted juice or gum called manna, that is given to infants and young children as a mild aperient. This production, which is of a granular form, about the size of coriander seeds, and of a brownish white in colour, has a sweetness and a degree of sharpness which render it agreeable. In heats, unaccompanied by rain, towards the end of July, it is obtained by slitting the stem of the tree horizontally, when the liquid gum exudes from the wound and is conveyed from it by straws, or the foot-stalks of the leaves, and received in cups formed of leaves of the maple; this exusion continues for about a month. Besides this, there are several others, one of which, a variety of the common ash, is the creeping-branched, and forms, by engrafting high on the tall stem of the common ash, a rather ornamental weeping tree; others are the yellow-barked, curled-leaved, and various-leaved, with many more which are exotics. Very interesting results have been obtained by grafting the common and Persian lilacs on the common ash; and it has been suggested that the pendulous ash would form a beautiful object having its branches grafted with the Persian species. The scions are recommended to be taken off in January or February.

99. The mountain-ash, fowler's service-tree, witch-wood, or rowan, though of the smaller class, is yet an interesting object and worthy of notice. It is very common throughout Britain, particularly in mountainous districts; in the wild and rugged scenery of the Scottish Highlands, many picturesque specimens are seen, and it imparts to woodland and suburban gardens an equal beauty, whether in spring, when bearing its cream-white and sweetly-scented flowers, or in autumn, loaded with its coral-red clusters of berries. It has much of the graceful pendent tendency of its species, with elongated branches drooping under their light and lively verdure. Superstition invested the rowan tree with a mysterious and preternatural character,

but intelligence is fast dispelling it, averting the "evil eye" which its potency was wont to cope with. It is raised from berries, which may either be sown immediately they are ripe, or kept till spring in some cool place, amongst sand. The wood is, from its comparative smallness, seldom made available for purposes of manufacture; but it is good in quality, fine-grained, hard, and susceptible of a high polish, and on these accounts is used by the turner, and for the handles of cutlery and for other small purposes. It is likewise employed in the manufacture of crates, baskets, and hoops, and makes capital poles.

100. In the common ash, the wood of young trees is, in colour, a brownish white, with an inclination to green; that of old trees is something like oak, but more streaked with dark veins; the annual rings are very distinct, being porous in one part and compact and darker in the other: there are no larger transverse septa, and therefore no flowers. The substance and quality of the wood are pretty uniform throughout, but the outer part is, in some degree, the toughest: that in which the fibre is straightest is generally accounted the best. It is difficult to work, particularly the young wood, which exceeds the old in toughness, and, indeed, is tougher and stronger than oak; the old wood has a tendency to brittleness; the wood is tasteless and inodorous.

101. With respect to seasoning, it must be observed that the ash loses substance and weight by long steeping in cold water; but, for timber that has been felled in spring (in which it may be remarked, the pores have a reddish tinge) water seasoning is very beneficial. In consequence of its great toughness and elasticity, wherein it excels every other British timber, and which render it valuable for purposes where great strains and sudden shocks have to be sustained, it is very extensively used both by the coach-maker and cartwright in making vehicles of conveyance, also for machines, ploughs, and other implements of husbandry, dairy utensils, turnery, tackle-blocks, &c., for which no wood is better adapted; and although very subject to rot when at rest and exposed to the vicissitudes of the weather, it will, when applied as above, kept in constant use, and taken proper care of, last a very long period: it is only in peculiar cases that it can be introduced in buildings, and then there should be facilities for its reinstatement in case of decay. It is too flexible for posts, and beams, but ought to be useful for ties; though tolerably durable, however, when kept dry, it is not sufficiently so for the general purposes of the house-carpenter.

102. We have now, in the description of timber-trees, reached the limit to which, in the opening of our subject, we promised to confine our attention; namely, the consideration of such only as were within the meaning of the term "building-materials:" but there are, besides those described, so many trees which, either from their actual use in the more ornamental or in the minor purposes of building, or their eligibility for being so applied, are objects of more than mere passing interest, that we need scarcely apologize for touching on them. Accordingly, before passing to the next stage of the subject in hand, we proceed to notice the leading features of some of them, whether or not yet introduced into the British Sylva.

103. **YEW.** This tree is believed to be the most ancient in Great Britain; indeed, there appears reason to think that it is, of all European trees, the one capable of attaining the greatest age: there are now individual examples in England respecting which no doubt can exist of their having been trees at the Christian era, and at least one that has considerably exceeded 3,000 years. This tree is in full health, and is perhaps the most ancient specimen of vegetation in Europe; it is also of remarkable magnitude, being about 27 feet in diameter. The yew is indigenous to Britain, grows naturally in many parts both of England and Scotland, and is hardly enough to endure the inclemencies of our severest seasons: it is most frequently grown as an ornamental shrub, and is valuable where sheltered by surrounding trees as an underwood, shooting up more rapidly and with a cleaner stem than when grown alone. Its dark foliage affords an advantageous contrast to trees of a livelier character; it has also much beauty of its own, being indeed considered by some as one of the most beautiful of our evergreens: during its growth, and till

it is several hundred years old, it is of a broad, perfectly conical shape, but arrived at full maturity, its peaked summit begins then to decay, and it assumes gradually the round-headed form: its stem is of stout proportions, stiff and erect; its branches strike out horizontally, beginning very close to the ground; and both are rough, being grooved or indented lengthwise. Its leaves are small, long and slender, of a needle form, and very close: it bears cones, also a scarlet, sweet, and glutinous berry, which incloses a small hard seed or nut, the kernel of which is not unwholesome; but the bark or wood of the tree itself would appear to be otherwise, for at Crediton, a farmer having cut down a yew-tree, and left two or three faggots lying where four bullocks had free access, and these having been for some time deprived of green fodder, they ate them with great avidity, and very soon died—the poison having, as it was proved, acted on the brain and nervous system, producing congestion in the membranes of the former, and other symptoms resembling apoplexy. The yew will grow in most soils, but it loves a sandy loam, and chalky situations are very favourable to its success: it is propagated by the seeds, sown in autumn as soon as ripe.

104. The gloomy associations connected with the yew, its qualifications for the adornment of places consecrated to solemnity, its ancient dedication to such purposes, its own sombre appearance, and the tardiness of its growth, conspire greatly against its cultivation, and leave it almost entirely to its old and appropriate haunt, the church-yard: the examples of ancient yews of great magnitude in such situations are numerous, and contain incontrovertible evidence of their having necessarily existed before either Roman or Christian had interrupted the sacrificial rites of Druidism; and a conclusion has therefore reasonably suggested itself, that this solemn evergreen was, from the suitableness of its shade, and its enduring nature, especially cultivated by the Druids in forming their sacred circles, and that the promulgators of Christianity, in superseding Druidical worship, erected their churches, and set out their church-yards, in the very groves which they desired to consign to oblivion. Of the superstitious estimation in which it has been held, we read that dead bodies were covered "by shroud of white, stuck all with yew;" and that, in some parts of England, to preserve them from putrefaction, they were rubbed over with an infusion of its leaves.

105. In older times the wood of the yew was held in high estimation, as furnishing the material for the long bow, the pliant and trusty weapon of the hero of merry Sherwood; and which contributed so greatly to securing the splendid victories of Cressy, Poitiers, and Azincourt; indeed, so highly was it esteemed, that statutes were enacted for its preservation, and for preventing the wood from being exported. It was also the law of the land that every man should have a bow made of it, or of some similar wood; the introduction of firearms, however, had the effect of deteriorating its value in a great measure, and the tree came in course of time to be regarded chiefly as an object of ornament; in which capacity, in the parks and lawns of our nobility, as well as in hedges, it was subjected to the vilest whims of fantastic imagery, being clipped into the most grotesque and ridiculous chimeras, vestiges of which are extant even at the present day. The wood is hard, compact in texture, fine and close in grain, elastic, susceptible of a very high polish, and unequalled in durability: it is therefore valuable and highly appropriate for the cabinet-maker's art, especially when cut into veneers, so as to bring out to advantage its veins and various shades of colour, which are very beautiful. It is also obviously desirable for axle-trees, but for which its nearness must preclude it being made available.

(To be continued.)

#### COLOSSAL COLUMN IN RUSSIA.

THE Alexander Column is viewed with very justifiable pride by the Russians, because it is the most remarkable of the kind in the whole world; neither ancient nor modern times ever saw so large a piece of stone fashioned from the quarry. (?) But then art has done its best to spoil the effect which this work produces.

The column is surmounted by a gigantic figure of Hope, holding the cross, and pointing upwards, but in attitude so unfortunate that, seen from two sides, the exceedingly small head of the heavenly handmaid, which is unaccountably poked forward, is hidden by the perpendicular of the cross, and gives the appearance of a headless figure, reminding one irresistibly of the favourite English sign of the "Original Good Woman." "How is it," was observed to a certain Russian, whose family was notorious for its wit, which it appears was hereditary,—“How is it that this figure of Hope is without a head?” “Would Hope itself,” he replied, “dare to take up its abode beneath the withering glance of a Russian emperor, *si elle n'avait pas perdu la tête?*” The very anecdotes connected with this column would fill a volume, and are highly illustrative of the state of things in Russia. A recent traveller relates that orders were given to procure a piece of granite eighty-four feet long; in place of which, the director having found one nearly one hundred, cut off the superfluous length, in literal obedience to his instructions. *Si non e vero e ben trovato.* \* \* This splendid pillar was found to contain a deep crack, which was hastily filled up with cement, and the whole polished over; but when raised to its present position, a few summers and winters rendered the crack again apparent. That the column was cracked there could be no doubt; that the crack will ever spread in a stone so durable as red granite is another question. But in Russia nothing belonging to the government can be admitted to have even a flaw. The imperial vanity was touched, and a commission of admirals, generals, and counsellors of state, was formed, to proceed to the top of the column by scaffolding, and verify the existence or non-existence of the alleged flaw, which stared all St. Petersburg in the face. Whether the commission endeavoured to deceive the emperor by reporting as he wished—for it is always an ungracious task to be the bearer of any tidings which disturb the serenity of the spring-head of the state—or whether they had their eye to deceive the public, is difficult to determine; but they unanimously agreed, “that it was an optical delusion, occasioned by the imperfect polish of that part.” &c. We cannot charitably admit that all the members of the unanimous commission were themselves deceived, unless they were more than St. Thomas like: because two of them were previously heard to admit that they had themselves put their fingers into the crevice before the column was raised up at all.—*Travels in Russia, 1844.*

#### LECTURES ON ARCHITECTURE AND ANTIQUITIES.

Lecture V.

ROMAN ARCHITECTURE.

(Continued from p. 484.)

LEAVING the Arches and Temples of Rome, we have now to contemplate her single columns erected in honour of some of the emperors, and styled emphatically *Triumphal*, as the inscriptions testify. The first which comes under our notice is the COLUMN OF TRAJAN, erected A.D. 114, from the design of Apollodorus. It rose in stately grandeur in the midst of a magnificent Forum which bore the emperor's name, and some fragments of the columns which composed it still remain. An extensive excavation discovered that the original pavement of the Forum was 15 feet below the level of the modern streets; and a wall is now built, by which means the whole of the Trajan column is fully developed. The Forum must have been very splendid; the part excavated shews a length of 170 feet, and it is said to have extended to 1150 feet; the width was 180 feet, divided by four rows of columns into five aisles, the central avenue being 83 feet wide. The whole of this area is supposed, from careful investigation, to have been under cover; as the marble pavement is only 1½ inch thick to those parts which were under cover, whilst it is 4 inches in thickness where exposed. This pavement was laid out in squares of different marbles, viz., white, veined, giallo antico, and pavonazzetto. In the centre of the Forum stood a noble equestrian statue of Trajan; and the top of the porticoes was adorned with equestrian and other statues, and with military ornaments, chiefly in bronze.

The Forum was surrounded by a library, a basilicon, a temple, and a triumphal arch. The column is of white marble, the pedestal is 20 feet 3 inches square, and composed of seven pieces of marble. The shaft of the column is in nineteen pieces, the lower diameter is 12 feet 2 inches; the stairs are cut out of the solid blocks; the pedestal is 17 feet 11 inches high, and the column 97 feet 9 inches. The ancient crowning pedestal is 9 feet 6 inches, on which formerly stood the statue of the emperor, which was taken down to make room for the statue of Saint Peter, placed there by Pope Sixtus V. The ashes of the emperor were contained in an urn placed on the summit, an honour, as Eutropius observes, which had never been decreed to any before him.\* This column is Roman-Doric in its style (though by some called Tuscan), having the ovolo under the abacus carved with the Ionic egg and anchor ornament, and a member below that cut into the bead enrichment. This capital is in one block 14 feet square and 5 feet deep. The shaft of the column, with the exception of about 1 foot at top which is fluted, is entirely covered with sculptured figures which proceed in a spiral direction from the base to the summit. These reliefs represent the exploits of Trajan in his different wars. The pedestal is ornamented with trophies and arms, and crowned with festoons supported by four eagles.

The ANTONINE column was erected by the emperor Marcus Aurelius, in commemoration of victories obtained over the Germans, Armenians, and Parthians, as the inscription records, and dedicated to Antoninus Pius.† It stands in a square called from it the Piazza Colonna. The height of the column itself is only 6 inches less than that of Trajan, but its diameter at the base is nearly 1 foot more, and the upper diameter is only 1 inch less than the lower diameter of Trajan's column. It has therefore rather a clumsy appearance from the want of sufficient diminution. Though the two columns are so nearly of the same height, the pedestal of the Antonine exceeds that of the Trajan considerably. The earth has accumulated round it and buried about 10 feet of it, the remainder is 25 feet 10 inches high, exceeding the pedestal of Trajan's column by eight feet. The whole height from the present doorway to the top of the capital is 123 feet, an excess of about 8 feet above the other column. It was, like that, sculptured with figures, in a spiral direction, in high relief, but not so well executed; the sculptures represent the victories of Marcus Aurelius. This column, being much ruined, was in 1589 repaired by Pope Sixtus V., who cased it with travertine stone, and placed on the summit the statue of St. Paul, instead of that of the Emperor Antoninus. To this displacement of the imperial effigies to make way for those of the Saints, Lord Byron alludes in "Childe Harold" (C. IV., s. 110):—

“And apostolic statues climb  
To crush the imperial urn whose ashes slept  
sublime.”

The pedestal is quite plain at present, but was originally adorned with sculpture.

The column of PHOCAS is of Greek marble; it is simply a fluted Corinthian column 4 feet in diameter, and the whole height, including the pedestal, is 54 feet. It is supposed to have been erected in honour of the emperor in his lifetime (he died A.D. 610), and to have had a statue on the summit, as inferred from a restored inscription which purports that the column and statue were erected by the Patrician Sinaragdus, Exarch of Italy, and Provost of the Imperial Palace. Phocas rendered himself so odious by his vices and tyranny, that Heraclius was recalled from Africa, by Priscus, son-in-law of the emperor, to rid the country of such a monster.

We have noticed some of the finest structures of Rome, in her triumphal arches, her temples, her honorary columns, but

“the greatest is behind.”

\* “He was more  
Than a mere Alexander, and, unstead  
With household blood and wine, serenely wore  
His sovereign virtues,—still we Trajan's name adore.”  
BYRON.

† M. Aurelius, Imp. Armenis Parthis Germanisq. Dello maxime Devictis, Triumphalium hanc Columnam rebus gestis insignem Imp. Antonino Pio Patri Dedicavit.

## INTERIOR SECTIONAL VIEW OF THE REMAINS OF THE COLISEUM, AT ROME.

The mighty Coliseum now comes under our consideration. Notwithstanding nearly half of its walls have been destroyed for the sake of erecting other buildings,\* it still presents to view one of the most magnificent and interesting ruins of antiquity:—

“A ruin, yet what ruin! from its mass  
Walls, palaces, half-cities, have been rear'd;  
Yet of the enormous skeleton ye pass,  
And marvel where the spoil could have appeared.

Hath it indeed been plunder'd, or but clear'd?”  
CHILDE HAROLD, C. iv. S. 143.

This immense edifice, called sometimes Colosseum from its vastness, (or from an enormous figure of Nero placed on or near the site, and which was 120 feet high,) was commenced by the Emperor Flavius Vespasian, (and from that circumstance it is frequently spoken of as the *Flavian* amphitheatre,) and finished by his son Titus about A.D. 79 or 80. It was built over the marshes of Nero, as appears from the lines of Martial (Epig. 2):

“Hic ubi conspicui venerabilis amphitheatris  
erigitur moles,  
Stagna Neronis erant.”

But it was built from a *part* only of the materials of Nero's Golden House, which was demolished by Vespasian as being too splendid even for an emperor.

This amphitheatre is of an oval form, one diameter (the conjugate) being 620 feet, and the other (the transverse) 513 feet; the height is 137 feet, it is nearly 1,800 feet in circumference, and occupies a space of about six acres; the longer diameter of the arena is 287 feet, and the shorter is 180 feet. The external wall is decorated with four orders of Roman architecture, the Doric, Ionic, Corinthian, and Composite, rising one above the other, with arches in the three lower stories to the number of eighty in each tier, between the columns which are engaged; the arches of the second and third stories were originally filled with statues:—

“Arches on arches! as it were that Rome,  
Collecting the chief trophies of her line,  
Would build up all her triumphs in one dome,  
Her Coliseum stands.”

CHILDE HAROLD, C. iv. S. 128.

\* The Farnese Palace, built for the nephews of Pope Paul III. from the design of Michael-Angelo, was erected from the marble stones taken from the Coliseum, and so was the Palace of the Cancellaria from Bramante's design; and the Palace of Saint Mark was supplied from the same noble quarry. Pope Benedict XIV. checked the plan of spoliation by erecting altars around, and a cross in the centre, and consecrating it out of respect to the blood of the Christian martyrs who perished in its arena during the persecutions.

On the occasion of dedicating this vast amphitheatre, which could contain 109,000 spectators, Titus exhibited shows to the people for 100 days, 5,000 wild beasts were slaughtered during this period by fifty in a day (Suetonius), and battles on foot and in boats were represented by gladiators. (D. Cassius.)

This mighty fabric has no parallel in the world for size and immensity; even the huge Pyramids of Egypt cannot compare with it, for they diminish at once from their base to nearly a point, whereas the Coliseum rises perpendicularly for 137 feet 6 inches. According to an early writer, it was finished in two years and nine months, “*Biennio post ac menses novem amphitheatris perfectis operis.*” (Victor.) Well, therefore, might the Roman poet exultingly declare that every other labour must yield to that of the imperial amphitheatre:—

“*Omnis Cesareo cedit labor amphitheatro;*”  
(MARTIAL.)

and from the time of its erection down to the present day it has been looked upon as one of the greatest marvels of art, and has furnished for centuries an exhaustless theme alike for the rapture of the antiquary, the pencil of the artist, or the glowing description of the poet. But in contemplating the structure we can never lose sight of the inhuman purposes to which it was devoted; the recollection of the blood of men, of Christians, slaughtered to make a Roman holiday, must always be associated with the aspect of

—“those scarce mortal arches,”

Pile above pile of everlasting wall!  
The theatre, where emperors and their subjects  
(Those subjects Romans) stood at gaze upon  
The battles of the monarchs of the world  
And wood, the lion and his tusk rebels  
Of the then untam'd desert, brought to joust  
In the arena, (as right well they might  
When they had left no human foe unconquer'd,)  
Made even the forest pay its tribute of  
Life to their amphitheatre, as well  
As Dacia men to die the eternal death  
For a sole instant's pastime, and ‘pass on  
To a new Gladiator.’”

LORD BYRON'S DEFORMED TRANSFORMED.

The practice of giving shows to the public, in which wild beasts were engaged with each other or with men, and those men Christians; and the gladiatorial fights between single com-

batants or in large numbers, was continued by the emperors until the year 404 A.D., when an Eastern monk, Almachius, or Telemachus, (and under the latter name he was sainted,) rushing into the arena to separate the combatants, was slain, and the inhuman shows were abolished by Honorius. But it ought to be remembered that a Christian poet, Procopius, had previously exhorted Honorius to put an end to this dreadful sport,

“Where man was slaughtered by his fellow-man.”

The space devoted to the arena was an ellipsis whose longer diameter was 287 feet, and the shorter 180 feet; the remainder of the immense inclosure was occupied by the seats rising in range above range, disposed in the most admirable manner for every one to see (hence such buildings were called *visoria*), and accessible by corridors and passages communicating with staircases, arranged with consummate skill that the immense numbers of citizens could find their allotted stations easily and without delay.

The lowest seats, on the podium, which were of marble, were the most honourable, being reserved for the emperor, senators, ambassadors, magistrates, and persons of the highest distinction; above these to the top of the second story, the seats, also of marble, were occupied by the knights (equires) according to their rank, the civil and military tribunes; in the upper rows were persons of inferior rank; and the common people filled the highest seats of all, which answered to the galleries of modern theatres, and placed at some distance above the rest. To protect the spectators from the heat or rain, the whole of the immense circle was at times covered by an awning (velarium) stretched from 240 masts or poles which were placed on the outside of the upper story, passing through the cornice, and resting upon corbels. This awning was commonly of woollen cloth, and sometimes of silk; on one occasion Nero caused a purple velarium to be extended across a theatre, representing the heavens, with stars of gold, and his image in the centre, seated in a car, in imitation of the sun.

The Coliseum suffered frequently from lightning; and when the Christian faith was established, and when the downfall of paganism, the sports of the arena were discontinued, and, as a consequence, the building itself being neglected, fell into decay. In the year 1084, Guiscard, the Norman, pulled down one half of the Coliseum, lest it should be used against him as a citadel; to which purpose it was actually

\* Many learned commentators, as Drs. Whitby and MacKnight and Schleusner, consider that the words of St. Paul, 1 Corinthians, xv. 32, refer to an actual combat in which he was engaged with beasts at Ephesus.

appropriated during the bitter contests of the Guelphs and Ghibellines, being held as a fortress by the Frangepani family, until wrested from them by the rival faction of the Anibaldi family.

(To be continued.)

#### DECORATIVE ART SOCIETY.

ON Wednesday, 25th ult., a paper "On Gilding" was read by Mr. Proctor, explaining the various processes adopted respectively in gilding metal, wood, and composition; with remarks on the use and abuse of the art in interior decoration.

The paper was followed by an animated discussion.

On Wednesday the 9th inst., the first part of a paper "On Paper-hangings" will be read.

#### THE EMBANKMENT OF THE THAMES.

The following is a copy of a letter from the Earl of Lincoln to the Lord Mayor, with the plan for the embankment of the River Thames between Battersea and Vauxhall Bridges:—

"1, Whitehall-place, August, 1844.

"My Lord,—As chairman of the Commissioners appointed by her Majesty for inquiring into and considering the most effectual means of improving the metropolis, and of providing increased facilities of communication within the same, I have the honour to transmit to your lordship herewith, for the information of the corporation of London, as the body intrusted with the conservancy of the river Thames, a plan which it is their intention to recommend to the favourable consideration of her Majesty for the embankment of its northern shore, between Battersea and Vauxhall Bridges; and I am to add, that it will be very satisfactory to the Commissioners to have the concurrence of the conservators in a measure which has been framed as much in reference to the improvement of the navigation of the river, as to the many other advantages of which an embankment in that locality is obviously susceptible.

"I have the honour to be, my Lord,  
Your Lordship's most obedient servant,  
"LINCOLN."

#### IMPROVEMENTS IN THE TOWER.

AFTER considerable delay, preparations commenced last week for the extensive improvements about to be made in the Tower, agreeably to plans submitted to, and approved of, by the Government. Barracks are to be built on the site of the small armouries which were destroyed by fire in 1841, but as their width will be greater than the late buildings, the frontage of the new barracks will encroach several feet upon the consecrated ground extending eastward from the Royal Chapel of St. Peter, in which are deposited the mortal remains of many distinguished and respected personages. Their hallowed remains are, however, to be carefully raised and placed in a vault at the rear of the Royal Chapel, and for that purpose a wooden barricade, to be covered, is now in course of erection (to prevent the idle gaze of the public) on the parade at the White Tower. When this solemn duty is completed, the erection of the barracks will commence, along with many other improvements in the garrison, for which a grant of money was included in the estimates last session of Parliament. The alterations in the Jewel-office proceed with small-space rapidity, to the great disappointment of strangers visiting the Tower desirous of viewing the Crown Jewels, &c., recently deposited in the Haymarket. Notwithstanding the abolition of fees from visitors to the wardens, in lieu of which they receive full compensation, these worthies seldom or ever refuse to accept a gratuity when it is tendered to them; they, in fact, expect something, and if disappointed, their snarling propensities are not unfrequently exercised. We believe His Grace the Duke of Wellington, who is Constable of the Tower, is totally ignorant of these illegal practices. The member for Montrose (Mr. Hume), who exerted himself in getting the charges for the admission of the public to the Armouries and Jewel-office greatly reduced, and the wardens' perquisites entirely abolished, should inquire into the matter.—*Times*.

HAMBURG MEDAL, COMMEMORATIVE OF THE FIRE IN 1842.

The above is a representation of a medal, lately struck by order of the authorities of Hamburg, to commemorate the dreadful fire which took place there on Thursday, the 5th of May, 1842. The impression, which has been kindly forwarded to us, was, as the inscription on the edge of it states, "Struck out of the copper from the tower of the church dedicated to Saint Peter in Hamburg." On the obverse is a representation of St. Peter's Church as it existed before the fire, with an inscription, of which the following is a translation:—"The design of benevolent patrons accomplished the first building of this church in their lifetime," or "The piety of our Forefathers built thee in their lifetime. 1342—1516."

The reverse represents the same church in ruins, as it appeared after the fire, and has this inscription:—"United powers (or public feeling) will worthily restore thee" (i.e. the ruin), to which is added, "Destroyed by fire on the 7th of May, 1842," and the artist's name, "Wilkins, Bremen."

As a specimen of die-sinking, it is beautiful and finished. If our information be correct, copies of the medal have been sent to those persons who took the most lively interest in, and most liberally relieved the sufferings of, the distressed inhabitants during their severe trials while destitute of home, food, and clothing.

St. Peter's Church was considered one of the finest specimens of ecclesiastical architecture in northern Germany. It was situated in the north-west corner of the cathedral place, and was built between the years 1139 and 1195. Its length was 225 feet, and its breadth 135 feet. The steeple, which was begun in 1342, and finished in 1516, was 416 feet high. It had two chimies of bells, one of which was put in motion by the clock machinery, and played every half-hour; the other was played by means of keys at certain times of the day, and on particular occasions, by a person specially appointed for that purpose. Downes, in his "Letters from Mecklenburgh and Holstein," 1822, while describing Hamburg, thus refers to these bells: "I was awakened by the sweetest of all sweet harmonies issuing from the belfry of one of the churches. It was neither ringing nor chiming, but a regular piece of composition, first and second."

The interior of the church was overloaded with monuments, paintings, carvings, and stained windows. The subject of one of the oldest paintings was Hamburg in the 15th century, in the foreground of which was represented the sacrilegious attempt of Heliodorus; it hung behind the pulpit, and had been there ever since 1554. In the nave hung portraits of Martin Luther and his friend Melancthon. Near the font was another painting of Hamburg in 1250, on which might be perceived three churches, two convents, and St. George's Hospital. The altar-piece was painted by S. Bendixen, in 1814; it represented our Saviour appearing to Peter while performing his devotions.

The calamity which Hamburg sustained by the awful fire in 1842, was unequalled in extent except by the fire of London: the heart of the town was reduced to a heap of ashes. Many years must elapse before the damage can be repaired, and

the traces of it effaced. The conflagration broke out in the Deichstrasse, near the Elbe, on Thursday, May 5, from what cause is unknown, and raged until the following Sunday, in spite of all efforts to oppose it, spreading, and widening as it spread, until it had involved in destruction two sides of the Alster Basin, levelling almost all the buildings, public and private, over an area of 18 acres, nearly in the form of a triangle, sweeping down 1,749 houses, 61 streets, besides courts and alleys, and even crossing the broad canal of the Alster. The attempts made to arrest the flames, when the engines had proved useless, were, first to pull down the houses; but in unroofing them, the timbers and rafters were laid open, and more readily caught fire from the sparks lodged in them; artillery was next employed to batter them down, but the balls only made holes in the walls, and passed through. Finally, the plan of blowing them up with gunpowder was resorted to, and this useful but dangerous task was executed by the English engineer Lindley, who fortunately for the town was present at the time, and understood the proper mode of proceeding. The first check was given to the fire by blowing up the Rathhaus, in whose cellars were deposited all the treasures of the state in silver bars. The churches of St. Peter, St. Nicholas, and St. Gertrude were speedily consumed. The New Exchange, though surrounded by the flames, by a miracle escaped almost uninjured. The sympathy caused by this event in all parts of the globe was proved by the voluntary subscription raised for the sufferers, amounting to 270,000*l.*, of which England contributed 41,000*l.*

Hamburg will profit to a certain extent, by the calamity, in the improvements which will be introduced in laying out the new buildings, the widening of streets, the construction of sewers, and the fitting up of some of the stagnant fieths or ditches.

The plan of these improvements has been prepared by Mr. Lindley. A new and handsome Rathhaus is to be built on one side of a new square, fronting the Borse. Another improvement is the drainage and conversion into a new quarter of the town of a low marshy tract on the right bank of the Elbe called Hammerbroek. It has been intersected by canals, the water pumped out by a steam-engine, the surface raised 4 feet over a space of an English square mile.

A correspondent, in a letter dated Hamburg, September 27, 1844, thus writes on the improvements now making in the city:—"Hamburg is progressing daily; new streets continue to be marked out, and new buildings arise so rapidly, that it is necessary to perambulate the city frequently to keep up one's topographical knowledge. A custom prevails amongst the builders, on completion of the shell of any house, to give a kind of *fete* within it to the workmen employed. The building is hung over with flags and festoons, and a band of music is engaged for the occasion. The workpeople are plentifully regaled with the good things of this life; they eat and drink to the sound of the fiddle, bass viol, and sundry horns, and then begin their favourite waltz; the reel is not attempted until it is time to depart, and it is then the favourite dance of all as they wend their way through the streets homeward."

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND.

Furnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-Inn Fields.

[SIX MONTHS FOR ENROLMENT.]

Powell, Arthur, and Powell, Nathaniel, of Whitefriars' Glass Works, glass manufacturers, for improvements in the manufacture of quarries and other panes of glass for windows. July 30.

Stratton, Benjamin Tucker, of Bristol, agricultural mechanist, for improvements in welding sheet iron for ship-building, and other uses. August 1.

Cormack, William, of Dagleish-street, Commercial-road, East chemist, for a new method or plan for purifying coal gas. August 15.

Heaton, Thomas, of Chorley, Lancaster, colliery agent, for certain improvements in hydraulic machinery, which is also applicable to raising other liquids. August 15.

Ewing, Alexander, of Dumbarton, Scotland, glass-splitter, for certain improvements in the manufacture of crown glass. August 15.

Turner, George, of Gateshead, Durham, Doctor in Philosophy, for an improved mode of directing the passage of, and otherwise dealing with, the noxious vapours and other matters arising from chemical works in certain cases. August 22.

Willames, Pryce Binkley, Legodig, North Wales, for certain improvements in the manufacture of artificial stone. August 29.

Newton, William, of Chancery-lane, civil engineer, for improvements in the means or apparatus for preventing shocks or accidents on railways, or in lessening the dangerous effects arising therefrom. (Being a communication.) August 29.

Palmaert, Jean Albert, of Brussels, for improvements in the means of economizing and applying heat obtained for known processes. (Being a communication.) August 29.

Poole, Moses, of London, gentleman, for improvements in pumps. (Being a communication.) August 29.

Smith, James, of Queen-square, civil engineer, and Jolly, William Gairdner, residing at Endrich Bank, Scotland, for certain improvements in the form of tiles for draining, in implements for manufacturing thereof, and in the modes of manufacture. August 29.

Richard, Hipolyte Auguste, of Skinner's-place, Sise-lane, gentleman, for a certain improved apparatus for heating and lighting. September 5.

Chanter, John, of London, civil engineer, and Lodge, George, of Leeds, engineer, for improvements in furnaces, fire-bars, hot-air generators, and flues. September 12.

Clark, Charles Wearg, of Westbourne-grove, Paddington, surveyor, and Reed, James, of Hamworthy, Dorsetshire, brick and tile maker, for improvements in the manufacture of bricks and tiles for chimneys and flues, and for other uses. September 12.

Handcock, Elias Robison, of Rathmoyle-house, Ireland, for certain improvements in mechanism applicable to a method of propelling vessels on the water. September 12.

Flockton, Webster, of the Spa-road, Bermondsey, turpentine distiller, for certain improvements in machinery or apparatus for sweeping and cleansing streets, roads, or ways. September 12.

Newton, William, of Chancery-lane, civil engineer, for improvements in machinery to be employed in the manufacturing of nails, rivets, screws, and pins. (Being a communication.) September 19.

Cassell, Edwin Edward, of Millwall, Poplar, merchant, for a material or combination of materials suitable for paving, piping, roofing, and most other purposes to which wood and iron are applicable. September 26.

Carter, James, of Delahole, Cornwall, gentleman, for improvements in cutting slate for roofing and other purposes. September 27.

Quincey, John Harcourt, of Old-street, gentleman, for improvements in the manufacture of blinds and shutters. September 27.

Nearly 1,000, has already been subscribed towards the costs of erecting a suitable monument to the memory of the late lamented Earl of Lonsdale.

CHURCH-BUILDING INTELLIGENCE, &c.

*New Chapel at Walpole, St. Peter's.*—A new chapel-of-ease for the fen-end parts of Walpole parish, which has been some time building, was consecrated by the Bishop of Norwich on Thursday the 26th ultimo. It has neither steeple nor side aisles, is built in the Norman style, and is 46 feet long by 25 wide, with a circular apse at the east end, and a small vestry adjoining the north side of the apse. The front is plain, consisting merely of a door surrounded with a circular arch and zig-zag moulding, and two windows in the same style above, surmounted with a turret, in which two bells are hung under zig-zag arches. The roof, which is of a very high pitch, is covered with scale-tiling, and the ridge is crowned with an open fleur-de-lis. Four small windows on each side of the chapel are divided by plain flat buttresses, and five spaces in the apse are similarly divided. The only attempt at ornament in this part of the chapel is the introduction of a series of heads and carvings, rudely executed, beneath the nave of the roof. The first thing that strikes the eye on entering the chapel is a very heavy font, raised on three steps. An inscription in Latin round the top—"Wash me, and I shall be whiter than snow"—is almost the sole ornament of a very heavy and lumbering feature, which every one must wish were greatly reduced in size, or entirely removed from its present position. The seatings, which fill the entire chapel, leaving only a small space up the chapel, are all open, and terminated by a finial carved in oak by the hand of Mr. Moore, the rector, which consists generally of clustered leaves disposed somewhat like a trefoil. The floor is composed of tiling with raised figures and inscriptions—*Vigilate et Orate*—copied from some found among rubbish in one of the Norfolk churches, whose name we have forgotten. Between this part of the chapel and the apse is a fine arch spanning nearly three parts the entire breadth of the chapel; and the twinkle of one of the small stained glass windows beyond it has a very pretty effect at the entrance. The pulpit, which is let into the wall on the north side of the chancel arch, is of Caen stone, and is in much better taste and design than the font. A small reading-desk of oak, well executed in open work of the perpendicular style, stands below it, and though in itself a very chaste and beautiful specimen of carving, is to our mind in very bad taste. The roof is open, consisting of plain timber, with leg beams resting on plain brackets. Immediately beneath the roof is one of the most singular features of the chapel—a moulding by no means Norman, which is gaudily painted in ribbons and gilt with stars, and along its centre course are eight verses of the "Te Deum," in Latin, beginning with "Holy, Holy, Holy, Lord God of Sabaoth." We now come to the apse, or chancel, which is very small—being about 15 feet by 12; a space hardly big enough for an oratory. A stone altar-table, mounted on three steps, and surrounded at the upper edge by a kind of dog-tooth quatrefoil, and an unintelligible ornament at the centre, is the most conspicuous object here, and is one of the worst deviations from style that the chapel contains. Four small windows of stained glass, containing figures of St. Catharine, St. Peter, the Virgin, and an incomprehensible saint, twinkle down on the floor of beautiful encaustic tiling, and lead the eye upwards to the roof, composed of four broad flat groinings, radiating from a central boss. A startling piece of Christian furniture meets the eye on each side of the altar-table, that to the south being a piscina on a twisted column, and to the north a credence-table on a bracket. Two stone niches, intended for seats, face the entrance to the vestry on the north side. We have now noticed every particular point in the architecture of this little chapel. We understand the expenses are limited to some fourteen or fifteen hundred pounds; a perfect building is not therefore to be expected. To the enthusiastic feeling of Mr. Moore, the rector, who has himself worked as hard as any labourer, much credit is doubtless due; and the specimens of carving, both in wood and stone, which the chapel displays, will be lasting evidences of his skill and industry. Except in a few minor details, the building is pretty regular in its style; but the initials of the seats, the reading-desk, and the

altar-table, all remind us of other periods than that which the rest of the chapel furnishes. It is true we know nothing of Norman fittings; but we know that the fittings of Decorated churches were composed of Decorated designs, and we might therefore, with some presumption, compound the ornaments of a Norman church with details from Norman architecture. Mr. Moore, or rather Mr. Buckle, who is the architect, is not blameable for this, as we know not that any architect has yet been bold enough to do otherwise, and the ordinances of the Camdenists are too strict to allow any of its members to innovate Christian architecture with any thing like invention. We are grateful for what has been done, and visitors, we are sure, will be surprised to see a chapel adapted for only 400 persons with so many interesting features of architectural taste about it.—*Cambridge Chronicle.*

*Norwich.*—*Opening of Lakenham New Church.*—This building, erected in one of the populous parts of the city, where no place of worship, connected with the Established Church, before existed, was opened on Wednesday last. The church is dedicated to St. Mark. It is a Gothic pile, having a nave and chancel, and a beautiful tower with an embattled parapet, and containing a fine ring of bells lately hung by Mr. Thomas Hurry, of Norwich. The interior is tastefully fitted up, and a flight of stone steps leads to a commodious gallery. The Bishop, the Hon. and Very Rev. the Dean, Canon Wadehouse, and about a hundred of the clergy of the city and county, attended on this occasion. The choir from the cathedral was in attendance, and sang their part of the service with extraordinary effect; after which the Hon. and Very Rev. the Dean preached an appropriate sermon from the 6th chap. of the 2nd Book of Chronicles, and the 18th verse: "But will God in very deed dwell with men on the earth? Behold, heaven and the heaven of heavens cannot contain thee: how much less this house which I have built!" It was stated that the whole 5,000*l.*, the cost of the present erection, had been raised by public subscription, with the exception of 200*l.*, and this addition, at the termination of the service, was nearly contributed. The sittings are mostly free, this being a part of the city where large numbers of weavers and other very poor persons reside.—*Ipswich Journal.*

A district has been formed at Barnstable, under the provisions of the Church Endowment Act of last year. It is called the district of St. Mary Magdalen. The minister, when licensed, is to have 100*l.* a year from the Church Commissioners, and 150*l.* as soon as the church is built. This is understood to be the first district thus formed, in this diocese.—*Somerset Gazette.*

*Burton Agnes Church.*—This ancient edifice has recently been completely renovated, and now presents a beautiful model of a village church. The chancel has been nearly all renewed; the roof is entirely new, being fine stained oak, tastefully arranged. The east window is also wholly new, and extremely elegant; it is of stained glass, by Wailes of Newcastle, having the commandments underneath on tablets in gold letters. Around the arch of the chancel is a fine scroll bearing the inscription:—"This is none other than the House of God—This is the gate of Heaven." Stalls are placed in the chancel; they are of oak, finely carved by Mr. G. Peck, of Saville-street, Hull. The floor is laid with encaustic tiles, from Minton, in Staffordshire. The west window has been entirely restored, at the expense of Sir Henry Boynton, whose arms are tastefully introduced in the stained glass. The painting and staining of this beautiful temple are by Messrs. Binks, of Hull, and the work is the admiration of all who have seen it. Messrs. Binks have lately had the ornamental and general painting of several churches in this neighbourhood, and have now acquired a high reputation in that walk of the profession. The stone work of the windows, &c., which is all very beautiful, has been executed by Messrs. Myers and Wilson of this town, who have also done some very superior work in churches lately. This restoration has been effected at the instance of Archdeacon Wilberforce, to whose piety and taste it is a splendid monument. There are daily services in the church, as well as on the Sabbath; and these opportunities, we understand, are gratefully embraced and appreciated by the parishioners of Burton

Agnes, by whom their reverend pastor is much beloved.—*Hull Packet*.

*St. Mary de Crypt Church.*—We are most happy to announce that the restitution of the chancel of this our parish church is proceeding in a most satisfactory manner; a portion of the stalls has been erected, which, although still in an unfinished state, have an appropriate and ecclesiastical appearance.—*Gloucestershire Chronicle*.

*New Church at Besthorpe, near Collingham.*—The above church, dedicated to the Holy Trinity, was consecrated on Wednesday, the 11th instant, by Dr. Kaye, Bishop of Lincoln. The sum of 37l. 8s. 3d. was collected after the service, which, added to the amount received for tickets and subscriptions sent in the afternoon, made a total of nearly 50l. The whole of the inhabitants of the village were regaled at the expense of the Rev. G. C. Gordon. The children had tea at 4 o'clock, the females at 5, and the labouring men were supplied with plenty of good beef and ale. J. E. Denison, Esq., M.P., subscribed 10l. on this occasion.—*Doncaster Gazette*.

*St. Olave's Church, Southwark.*—This church is now all but complete. The tower is finished in the same style as the original edifice, and the clock, which demands, from its novelty of construction, a passing remark, will be, before the week is over, placed in its destination. The machinery of this clock, although it will regulate with the minutest accuracy from dial-plates, is all encompassed under one action, and the most delicately-poised wheels are set in motion by a pendulum, the rod of which is 14 feet in length. The side escapement is a most beautiful piece of mechanism, and is acknowledged to be, by numbers of scientific persons who have inspected it, as accurately formed as the minutest portions of a chronometer; indeed, it is this department which most startles the uninitiated—the “pallets,” as they are termed, being jewelled, fall upon the escapement with such precision, that the best time-piece for a number of days tells no departure from its exactitude.—*Globe*.

#### RAILWAY INTELLIGENCE.

*The Eastern Union Railway.*—We are informed that in the course of next week the excavators will commence the work upon this line, in the parish of Tattingstone. The works have hitherto been delayed in consequence of legal impediments respecting the Brantham Hall property, upon which, as constituting the only heavy work upon the line, it was arranged with the contractors the operations should commence. It is not expected that the present delay will at all retard the completion of the line within the appointed time, and the shareholders have reason to congratulate themselves that the directors have not encouraged those monstrous extortions which have been the bane of other railways. With respect to the Bury extension, we are glad to learn that committees have been formed at Bury, Newmarket, and Cambridge, and surveys are going on between Bury and Cambridge, which, together with that of the Norwich line, will shortly be laid before the Board of Trade. Several lines have been surveyed between Ipswich and the other lines, but we cannot at present speak as to the route to be taken, as so much depends upon the concurrence of the landowners and the issue of negotiations with other interests. A prospectus of a railway from Diss to Colchester has been issued, under the joint patronage of the Eastern Counties and Norwich and Brandon Companies. This scheme merits little notice, except as being designed as an impediment to the Eastern Union Company. By omitting altogether the town of Ipswich, and separating it virtually from the traffic hitherto flowing towards it, the project will never meet the approval of an impartial tribunal. But by admitting that the local traffic is sufficient to support a railway, the projectors have given the best testimony to the probable productiveness of the direct Norwich, Ipswich, and London railway. We see no reason to doubt that the Eastern Union will triumph over this coalition, as it succeeded on a former occasion against the Eastern Counties and West Suffolk opposition. A meeting is called at Sudbury, on Thursday next, to consider the resuscitation of the Halsted line, in opposition to Mr. Eagle's scheme of the Theford and Stanstead junction;

but as both these lines have serious difficulties to overcome, we see no prospect of either being adopted by any public company.

*Railway Works.*—Operations for carrying on the line of the Eastern Counties railways are gradually extending in this neighbourhood. The work appears to be judiciously divided into sections, at considerable distances from each other, from which the working parties by degrees approach each other. A party is now employed a short distance from Whittlesford Mills, where a depôt for materials has been formed, and preparations are being made for forming a bridge across the river. At Great Shelford also, some cottages which stood in the way of the intended line have been taken down. Their proprietor has received notice to clear their former site by the 26th instant. The price given for land for the intended line is considered to have been on a liberal scale, and generally satisfactory to those who disposed of it.—*Cambridge Chronicle*.

*French Railways.*—Contracts for 34 locomotives, with their tenders, were awarded yesterday at the office of the Minister of Public Works, in three lots. The first was ceded to M. Cave, at 44,800f.; the second to M. Alethe, at 47,000f.; and the third to Messrs. Derosne and Caille, at 49,000f. per locomotive, with its appurtenances. A contract for 608,000 iron bolts was awarded to Messrs. Labruur and Grefix, at 487f. 45c. a ton.—*Galignani of Thursday week*.

*A Railway on Fire.*—The suspension, bridge erected for the purpose of the Middlesbrough branch of the Stockton and Darlington Railway, where it crosses the Tees, a little above Stockton, having proved insufficient, a handsome one has recently been completed, under the direction of Mr. Robert Stephenson, civil engineer, consisting of longitudinal girders resting upon solid masonry. The centre arch, or water way, is probably the widest span upon this construction extant. In forming the embankment at the east end of the new bridge, a large quantity of small coal, brought from 25 to 30 miles from the pits, has been made use of, and spontaneous combustion has taken place in this mass; the progress of the fire is not rapid, but such is the hold it has obtained, that a complete deluge of water has proved useless. Measures are now using to put in clay backs, that is, walls of wet clay, and this there is no doubt will prove effectual. In the meantime, the passenger-trains (10 each way), goods-trains, and coals, say 3,000 tons (to which if we add coal-waggons both ways, we shall nearly double the total), run daily without any inconvenience or interruption.

*Leeds, Huddersfield, Bradford, Dewsbury, and Halifax Junction Railways.*—We are authorized officially to announce, that after a careful examination of the country, and several meetings, it has now been determined to bring before parliament, in the next session, a combined plan for forming new railways between the towns of Leeds, Huddersfield, Dewsbury, Bradford, and Halifax, in connection with the Leeds, Manchester, and Liverpool Railways. This is the result of the union between the Leeds and Manchester Railway Company and the Leeds and Bradford Short Line Company, with other parties. The details of this important measure, and the effect which it will have on the Leeds and Bradford Short Line promoters, and others co-operating with that body, will appear forthwith in a prospectus, now in course of preparation under the direction of the committees which have been formed for the purpose. These arrangements will place in the centre of the manufacturing districts of the West Riding new lines of railway communication between thirty and forty miles in length, give increased facilities to the inhabitants of Yorkshire and Lancashire, materially shorten the route between those great counties, and the great manufacturing towns therein, and essentially promote the interest and convenience of the trade and population of Liverpool, Manchester, Leeds, Huddersfield, Bradford, Dewsbury, Halifax, Pudsey, Heckmondwike, Birstal, Batley, Cleckheaton, and the numerous other manufacturing and mineral districts of which Lancashire and Yorkshire are composed.—*Leeds Mercury*.

A meeting of the provincial committee of the Wilts and Somerset Railway was held on Wednesday week, at Trowbridge, Walter

Long, Esq., in the chair. The meeting was attended by gentlemen from every part of the country through which the projected lines were intended to pass; but it is now proposed that there shall be an extension from Frome through Bruton and Castle Cary to Yeovil, with a view to a further extension to Weymouth. This object attained, there will no doubt be a line from some point of the Bristol and Exeter Railway to Yeovil and Dorchester. Captain Scobell and other gentlemen attended as a deputation from the Somerset collieries, and it was determined to form a coal branch from Frome to the neighbourhood of Radstock. The capital required for the whole of the lines is estimated in round figures at 1,000,000l. The prospectus in course of circulation will therefore be called in, amended, and re-issued. Mr. Ravenhill was very desirous that there should be a branch from Bradford to Bathford; but the impracticable nature of the soil, &c., and the enormous expense it would entail, having been pointed out by Mr. Brunel, the meeting were satisfied it could not well be carried into effect.—*Wilts Independent*.

*Midland Railway.*—A special general meeting of the proprietors of this railway will be held on the 8th of October next, at Derby, to consider certain very important propositions for the formation of three lines of railway in connection with the North Midland, and also for considering and determining upon the propriety of amalgamating the Sheffield and Rotherham Railway Company with the Midland Railway Company.

The circular of Messrs. John Railton and Son, share-brokers, Manchester, states that the thirty-one railway acts passed in parliament last session will require a capital of 11,761,717l.

The Maidstone branch railway was opened for public traffic on Tuesday week. The distance from London to Maidstone per rail is 55 miles, 46 of which is travelled on the Dover line.

*The Eastern Counties Railway.*—A new street from nearly opposite the Eastern Counties, Shoreditch station westward, to join the Great North road, is contemplated. We need hardly say, it is what is much wanted, and will be a great benefit to the company and to the public.—*Railway Times*.

*American Railways.*—An extraordinary performance, equal to the greatest railway achievements of Great Britain, is recorded in the American papers. The government express, which left Boston for New York with letters, mails, and passengers, on the arrival of the Acadia from England on the 18th of August last, were conveyed the distance of 238 miles in six hours by railway.

#### Correspondence.

TO THE EDITOR OF THE BUILDER.

HYDRAULIC CEMENTS.

SIR,—By devoting a line or two of your work in giving an answer to the following question, you will much oblige.

Yours, &c., DISCIPULUS.

What is the best and quickest method of proving whether a cement be hydraulic, or not?

[The finding immediately the fact of rapid setting or the continuance in a soft state. We shall have no objection to receive communications upon the chemical part of the subject, whether after quickly setting hard, any particular limes be such as will stand the dissolving and abrading powers of water.—Ed.]

BROCKHAM NEW CHURCH.

SIR,—The inhabitants of Brockham, in the county of Surrey, are erecting a new church upon the green, according to plans designed by Messrs. Smith and Armstrong. A sum of 1,000l. was left by the late Henry Gouburn, Esq., for the purpose of endowing the church, and it is with pleasure I add that Henry Thomas Hope, Esq., of Deepden, near Dorking, in addition to a liberal contribution, has presented the inhabitants with a clock, formerly belonging to the Mansion standing in Chert Park, which was some time since demolished, and the park laid to the already extensive domains of Deepden, and at the same time he stated that he would contribute 30l. towards putting it in working order. It is from such acts as

these that the great must live in the memory of the people, and I do trust that you will aid the good work by presenting the public with a cut and a short detail of the building. I forgot to say that the church is intended to hold about 300 persons, and I regret to say that the chief material is to be a friable sort of chalk stone; I say regret, because the county contains plenty of clay, which makes a beautiful red brick. A sum of 1,800*l.* has already been collected. Wishing that you will notice the building,  
I remain, Sir, yours, &c.,  
A MASON.

London, Tuesday, October 1st, 1844.

[We cannot say whether we can give an engraving of the church without we see the design.]

## LATH-WOOD.

SIR,—Your correspondent "M. L. B.," in last week's *BUILDER*, may very justly complain of the high price of lathwood in London, which is no doubt owing to the demand being good. In many instances we have imports here from Petersburg of 6*ft.* wood, which may be readily bought at 9*l.* per fathom, and in some instances much lower; the same description of wood, I am informed, would sell in London at 14*l.*, and in some instances 16*l.* per fathom. If the importers here can afford to sell at 9*l.*, the importers into London must realize large profits.  
OBSERVER.  
Newcastle-on-Tyne, Sept. 26, 1844.

## CRACK HOUSES.

SIR,—I am not at all surprised that my remarks are unsatisfactory to "W. T. B.;" he is, I think, one of those individuals who seldom allow they are wrong. I must, however, in justice to myself, correct a mistake which he has made. In alluding to my former letter, he writes, "Scrutator" says the party investing his capital in houses does so on his own opinion, and therefore he is justly punished." This is very different from my observation, which was to the effect, that if persons, by following their own opinions, risked, or sometimes lost their money, it was partly their own fault in neglecting to procure a professional one, which I neither imagine offers a justification for the builders, or allows that all persons necessarily buy houses, trusting to their own judgments. "W. H. B." very cleverly assures me, that the majority of persons do procure a competent opinion on the houses they are about to purchase; this at once overthrows his own argument; he objects to the use of stucco and paint *only* when used as a deception; admitting, therefore, that professional persons are generally employed to examine into the stability and worth of the buildings, he must allow that the purchaser buys them, with the full knowledge of their defective state; consequently, clearing builders and stucco from the crimes of fraud and deception. This further proves the correctness of my observations, which were, that the capitalist was most to blame for the spread of speculative building; if crack houses could not be readily sold, they would soon discontinue to be built; and I certainly cannot wholly blame the builder for not building houses which, as a "Looker-on" remarks, he would be unable to sell. If, as "W. T. B." says, the majority of purchasers are retired or retiring tradesmen, it is rather puzzling to account where so many cuts of fortune can spring from.

Another instance of the garbled and incorrect quotations of "W. T. B." is the following: he says, "the sources of speculative building are evidently not confined to constructing houses for the poorer classes; nor can all the odium of building crack houses be confined to the smaller classes of builders, or to those who undertake the task being no builders at all." I flattered myself that the meaning of my remark would at once have been apparent; I find, however, that "W. T. B." requires a further explanation; my observation was, that one (not all) of the sources of speculative building was to be traced to the number of houses being required for the poorer classes, and in consequence of much finish not being required, was an additional inducement to defective building, which being not so often observed, required to be brought more prominently into notice. He further adds, that one cause is the necessities of the

builders, thus admitting the correctness of my argument. It is for him to shew in what manner the honest portion of builders, by forming themselves into a society, can prevent the scamping part from satisfying the present wants of capitalists.

Whether "W. T. B." supposes me touched "on the raw," because I requested the explanation of an unmeaning phrase, and exposed a statement, which, in the absence of any explanation from him, I consider as of very questionable veracity, I am not aware; the extreme vulgarity of the simile will, I fear, unfortunately for him, only produce feelings of disgust in the minds of your readers at the depraved taste of the author, and effectually tend to suppress any feelings of admiration they may have experienced for the perspicuity and wit he has displayed.

I remain, yours, &c.,

SCRUTATOR.

London, October 1st, 1844.

## Miscellaneous.

NEW CONCERT HALL, LIVERPOOL.—Measures are in progress for the erection of a new concert hall in this town. The shares are in great demand, and it is apprehended that there will be a difficulty in satisfying all the applications. Somewhere about 5,000*l.* of the required capital has been already subscribed.—*Gore's Liverpool Advertiser.*

KING'S COLLEGE HOSPITAL.—The authorities of this institution have it in contemplation to remove it from its present highly objectionable site to one that will be more appropriate. Some months since they made application to the Duchy of Lancaster, and the vacant space on the east side of Wellington-street, near Waterloo Bridge, was selected, but in consequence of a memorial from the inhabitants of Lancaster-place opposite, representing the deterioration of property that would ensue from the erection of an hospital in that locality, the Chancellor of the duchy refused his consent.—*Observer.*

EASY MODE OF MAKING ROADS OVER ROCKS.—In South Africa, Mr. Pringle succeeded in making a very excellent road by the removal of enormous blocks which frequently obstructed the only practicable line of road through a large extent of wild country, by the following simple operation:—"He kindled a large fire of wood upon and around the mass of rock he wished to get rid of, and when it was well heated, the fire was swept off, and several buckets of cold water were immediately thrown upon it, which, by causing an instantaneous change of the temperature in the mass, generally split it into a number of manageable fragments." Mr. Pringle, in a note of the same page of his work, "Narrative of a residence in South Africa," says, in allusion to this mode of removing rocks, "I afterwards found that this mode of splitting rocks had been practised with great success by Captain Stockenstem at Graaf Reint, in constructing an aqueduct along the side of a hill for the use of that village. The same process is also well known in Haiti, and is employed on a large scale there by the negro engineers, as I am informed by my intelligent friend, Mr. Richard Hill, of Jamaica, who, on recently travelling through that interesting island, found magnificent public roads carried through some of the most difficult passes of the mountain by this simple operation. In a country like ours, where wood and water abound, rocky roads may soon be made smooth, and inequalities of surface disappear by the use of fire and water, which, in their application to road-making, will be found less destructive of human life than steel jumpers and gunpowder."  
—*Jamaica Paper.*

NEW POLICE COURT AT KENNINGTON.—The above building in the Kennington-road is likely to be delayed some time, owing to a misunderstanding existing between the ground landlord, Mr. Allnutt, and the Home Department, respecting part of the premises belonging to the Lamb and Hare public-house, which are required for the entrance for the van and the section department for the police. Mr. Allnutt requires 600*l.* extra for about three feet frontage in the Kennington-road. The building for the police-court is erected, but will not be finished until some time after Christmas. There is likely to be some litigation respecting the ground required.—*Morning Post.*

LIVERPOOL NEW DOCKS.—The new dock works, north-end of Clarence Dock, are already actively progressing. Nearly all the ground is fenced in, and the eastern boundary wall as far as Bullen's Mill is erected. The several occupants of the houses to be pulled down have received notice to quit. At the south end of the Brunswick dock, also, active preparations are making to commence operations.—*Ibid.*

THE OLDEST TREE.—The monarch of trees, the emblem of age in the forest, is the cypress which stands near Santa Maria del Tule, in the province of Oaxaca, republic of Mexico. This tree was measured by Baron Humboldt, and found to be 118 feet in circumference. This makes forty feet in diameter. This tree has no sign of decay, though its foliage is less lively than that of smaller trees, and calculated by all the data applied to the age of trees, this patriarch of the forest has lived 4,000 years, perhaps from the creation.—[A highly respectable gentleman, recently from Gambia, mentions that he there saw a tree 132 feet in circumference.—*Salem Gazette.*]

RIGHTS OF LANDLORDS.—There is a provision in the new Insolvent Debtors Act affecting the rights of landlords which seems to have escaped notice. By the 67th section it is provided that no landlord of any tenement let at a weekly rent shall have any claim or lien upon any goods taken in execution under the process of any court of law for more than four weeks' arrears of rent; and if such tenement shall be let for any other term less than a year, the landlord shall not have any claim or lien for more than the arrears of rent accruing during such terms or times of payment. This enactment was necessary to prevent fraudulent contrivances to protect property as well as the person, which cannot now be touched for debts not exceeding 20*l.* Under the next clause, a claim by a landlord or other person to recover property can be investigated by the judge of the court out of which an execution by a creditor has issued, which provision was adopted to prevent law expenses in actions under the Interpleader Act.—*Sunday Times.*

An Architectural Society for Lincolnshire is about to be established at Louth, having for its object the "promotion of the study of church architecture, and the preservation and restoration of ecclesiastical antiquities;" the Lord Bishop of the Diocese, the Lord Lieutenant of the county, and several influential clergymen and laymen, have signified their approval. The Rev. Irvin Eller, rector of St. Clement's, Saltfleetby, has issued a circular, inviting members to join, and detailing the proposed regulation.

Government has appropriated a sum of between 40,000*l.* and 50,000*l.* to the repairing and alterations of the fortifications at Fort George, and to the construction of works of defence on and near the island.—*Guernsey Star.*

THE NEW HOSPITAL AT BROMPTON FOR CONSUMPTION, &c.—The newly-designed erection at Brompton, which is, as soon as possible, to supersede the present establishment at Chelsea, is now proceeding as rapidly as possible, the western wing being under the immediate direction of Messrs. Bird, of Brook-green, Hammersmith. From the plans submitted to his Royal Highness Prince Albert in June last by Mr. Frederick John Francis, the architect, on the occasion of the laying the first stone of the noble edifice, there can be little doubt that this will rank among the first of the metropolitan establishments which reflect so much honour upon the religious and benevolent feelings of the country.—*Herald.*

BRIDGE AT WARSAW.—The progress of the great bridge over the Vistula, which has been retarded from the deficiency of funds, has received an accelerated movement, owing to a very curious circumstance, which, in the days of superstition, must have conferred a character of great sanctity on the work; the saints themselves have provided the needful. In proceeding to the demolition of a small and very ancient Catholic chapel, to clear the approach on the Warsaw side, two barrels filled with bars of fine gold have been discovered. The value is estimated at about a million and a half of florins (upwards of 150,000*l.* sterling), and the whole has been appropriated to the completion of the bridge.

A curious fact may be mentioned with reference to the artesian well now boring at Calais, which has reached a depth of 322 metres: the water by which it will be supplied will be derived from England!

Mr. W. Dorward, of Montrose, has recently given 2,000*l.* towards the endowment of Trades Schools of Montrose, which will henceforth bear the name of Dorward's Seminary.

STRATFORD-UPON-AVON LITERARY INSTITUTION.—The meeting which was held on the 9th ult., for the establishing of a Literary and Scientific Institution, and adjourned to the 23rd, took place, as appointed, at the Town Hall, when it was agreed to form the Institution; a Provisional Committee was formed, and nearly all present became members. Dr. Thompson most handsomely offered the use of nearly 500 volumes of books, and some very liberal donations were made.—*Covenry Herald*.

NEW PRESBYTERIAN COLLEGE.—The Irish General Assembly has determined to break with the Belfast Academical Institution, and to set on foot a college of their own for the education of their clergy. For some time past there have been differences between the Orthodox Presbyterians and the Unitarians, respecting the management of the Belfast Institution, which receives a Parliamentary grant.

WOODEN PAVEMENT.—On Saturday last it was agreed to unanimously, at a vestry held in the parish of St. Marylebone, that part of the wooden pavement in the said parish should be removed, and that a granite pavement should be substituted.

The Liverpool Polytechnic Society proposes to give prizes for communications of adequate merit on the following subjects:—A medal for the best essay on any subject connected with the objects of the society; a medal for the best mechanical or architectural drawing; a medal for the best mechanical or architectural model, shewing the latest improvements. All essays, models, and drawings will be returned. The prizes will be confined to the members of the society, their sons, and apprentices of members.—*Liverpool Standard*.

HUNTERFORD SUSPENSION BRIDGE.—The works at the above bridge are nearly at a stand still, owing to the intention of the directors to apply at the next meeting of Parliament for a bill to allow them to throw a railway across the Thames adjoining the suspension bridge, and to erect railways to Richmond, the terminus of the South Western, and Brighton and Dover Railways. For some days past surveyors have been employed in measuring the ground from Goding's Brewery to London-bridge, taking the proposed line through Ann-street, Waterloo-road, across the latter road at the rear of the south side of Stamford-street, across Blackfriars-road, through Church-street, across Green-walk, Holland-street, Southwark-bridge-road, at the rear of Barclay's Brewery, to St. Saviour's Church-yard, where it will join the Brighton and Dover Railways.—*Globe*.

IMPROVEMENTS IN PICCADILLY.—On Monday, by direction of her Majesty's Commissioners of Woods and Forests, workmen were employed in the erection of a pillar upon the summit of the western portion of the gate at Hyde-park-corner, which is intended for the reception of an illuminated clock. The clock will have two dials—viz., one facing Hyde-park, and the other fronting Grosvenor-place. This, doubtless, will be as useful as it will be ornamental, a public time-piece having long been wanted in that immediate locality. The plan for widening the road has also at length been begun; it is said, however, that it will not be completed until the ensuing spring. The removal of Lady Gordon's house, and the garden which belonged to it, together with the appropriation of a small portion of the Green-park, will occasion that section of the important thoroughfare to be of equal width, from the residence of the Duke of Crafston to the archway at Hyde-park-corner. A further improvement is in contemplation, that of removing the remainder of the brick-wall which is standing between Albert-gate and Kensington, and substituting iron palisades. The parish of St. George, Hanover-square, agree to keep the roadway in repair as far as the encroachment on the Green-park is concerned.—*Times*.

Preparations are being made to crown the Arc de Triomphe in the Champs Elysées. A statue of France is to be placed on an antique car; around it, on foot, will be the genius of the French nation. All these works are to be of colossal size, and in bronze. A pasteboard model will be shortly erected.

VICTORIA DOCK.—Yesterday, persons were employed in staking out the ground for the extensive eastern dock. Mr. Hodgson has obtained the contract for making the bricks for the project.—*Hull Packet*.

PUBLIC IMPROVEMENTS.—The *Leamington Spa Courier* states that there is a project for forming a beautiful lake, with islands, pleasure-grounds, and swimming-baths, &c., in the ground at present occupied by the muddy river and the marshy meadow between the new and old towns.

PUBLIC BATHS AND PARKS.—Measures will shortly be adopted for taking the opinion of the inhabitants generally on the establishment of baths and parks. Several gentlemen are ready to aid the cause by liberal subscriptions, one of whom has promised 50*l.* when the matter shall be fairly set afloat.—*Birmingham Journal*.

MONUMENT TO THE LATE ADMIRAL SIR THOMAS M. HARDY, BART.—The tender of Mr. Henry Goddard, of Bridport, for this monument, to be placed on the summit of Blagdon Hill, has been accepted by the committee, and this national testimonial will be speedily proceeded with.—*Somerset Gazette*.

STATUE OF HER MAJESTY.—The package which was landed at the St. Katherine's Dock, out of the ship Effort, from Leghorn, and which her Majesty's agent requested might remain unexamined until her pleasure should be known on the subject, was removed to Windsor Castle yesterday, in charge of an officer of the customs, and there opened and examined. The package in question contained a full-length marble figure of the Queen, and was executed in Italy by, it is understood, the same English artist, Wolff, the sculptor of the statue of his Royal Highness Prince Albert, which was imported from Leghorn and removed to Windsor Castle about a month since.

The shares in the New River Water Company for supplying London were originally 100*l.* each: they now sell, whenever they are sold, which is a thing of rare occurrence, for 15,000*l.* each.

The lovers of antiquity will be gratified to learn that the King of Naples, with the view of perpetually preserving the Alfresco paintings, disinterred from the ruins of Pompeii, the lustre of whose colours are known to fade on exposure to the air, has employed artists of the greatest celebrity to imitate them on the walls of his own palace at Naples.

THE ROAD FROM PARIS TO GENEVA.—The piercing of the Faucille tunnel has been decided on, and the works are to commence in the beginning of spring. When this important improvement shall have been completed, the road from Paris to Geneva will be shortened by several leagues. The tunnel between Domange and Mauvage, to connect the canal of the Marne with the Rhine, is also in course of execution; it is to be 5,000 metres in length.

INJURIOUS EFFECTS OF CHIMNEY BOARDS.—The practice of closing fire-places in bed-rooms is so pernicious, that mothers of families cannot be sufficiently warned against it. It prevents the admission of pure air required to replace the air that has been deprived of the vital principle by respiration; the blood thus passes the lungs without inhaling the requisite portion of oxygen for healthy circulation; and the foundations of debility and disease are gradually laid in the system. For this reason all sleeping apartments without fire-places and chimneys are unhealthy; and to close them up with fire-boards and chimney-boards cuts off the communication with the external atmosphere, and renders them useless. The origin of consumption and other pulmonary complaints might probably be often traced to the close and impure air occasioned by chimney-boards. The chimney itself, when deprived of circulation, becomes a shaft for foul air; and life is shortened, if not sacrificed, for the sake of keeping out the little dust or soot that may fall from the chimney, and which might be prevented by sweeping it more frequently.—*Leeds Mercury*.

PILATE'S DEATH-PLACE.—Near Vienne stands a tall square Roman tower, called the Tour de Mauconseil. The legends of the country affirm that this was the abode of Pontius Pilate, and that in a fit of despair and frenzy he threw himself from its windows into the Rhone, where he perished. This point the good Catholics must settle as they can with the Swiss, who maintain that he drowned himself in a little Alpine lake on the mountain, which bears his name; and that the storms, by which it is frequently agitated, are occasioned by the writhings of his perturbed spirit.—*Hughes's Itinerary*.

Tenders.

TENDERS delivered for Building Three Houses for Mr. Thomas, in Southampton-street, Camberwell.—Mr. Henry Jarvis, Architect, 32, Trinity-square, Southwark.

Rider and Son	£1,750
Goodwin	1,746
Thompson	1,673
Jacobs	1,650
Tombs	1,636
Cooper and Davis	1,590
Wilson	1,534

TENDERS delivered for Four Houses, High-street, Deptford.—Mr. W. H. Holland, Architect.

Buzzell	£1,360	9
Crowhurst	1,329	0
Harnden	1,220	0
Coleman	1,214	0
Hubble	1,105	0
Smith	1,095	0
Williams	900	9

NOTICES OF CONTRACTS.

For supplying her Majesty's several Dockyards with Welsh and Cornish Slates.—The Commissioner's for Executing the Office of Lord High Admiral, Somerset-place. October 8.

For Repairing of Witton Church.—Plans and specifications at the Offices of Messrs. Pocock and Glover, Architect, Huntingdon. October 12.

For 16,000 Larch or Baltic Sleepers, of various dimensions, for the Ashton, Staleybridge, and Liverpool Junction Railway.—Secretary, at the Manchester and Leeds Railway Office, Palatine-buildings, Hunt's-bank, Manchester. October 8.

For such Bricklayers, Carpenters, Masons, and other Works, in the Cleansing, Building, and Repairing the public Sewers and Drains for the City and Liberty of Westminster.—Mr. Lewis C. Herslett, Clerk, 1, Greek-street, Soho, October 15.

For Building a Church at Birch, near Manchester.—Mr. Derick, Architect, Hanover-chambers, Buckingham-street, Strand. October 9.

For Building a Sewer in Robin Hood-court and New-street-square, London.—Joseph Daw, Sewers Office, Guildhall. October 15.

For the works connected with the Building of National and Infant Schools for Trinity district, Mile-end, London.—E. W. Symons, Secretary. October 9.

For re-Building of Shutter's Mill, in the Parish of Linchmore, Sussex.—The Royal Farmers' and General Fire, Life, and Hall Insurance Office. October 24.

For British Iron.—James C. Melville, Secretary, East India House, London. October 9.

For Surveying, Levelling, and Mapping of all lands lying within certain districts in Lincolnshire. Work to be completed on or before May 1, 1845.—M. Dudding, Clerk of Sewers, Lincoln. October 16.

For Excavating and Completing of several miles in length of new Water Courses, and Erecting a number of Bridges, Culverts, &c., connected therewith.—Messrs. George Leather and Son, Civil Engineers, Leeds. October 15.

For 250 Tons of the true Red Roman Pozzolano, from the works of Carlo Nepoti, called the Cave of St. Paul, near Civiti Vecchia. W. H. Huffam, Secretary, Dock Office, Hull. October 15.

For Paviers' and Masons' Work from time to time, to be required by the Commissioners of the Whitechapel-road sides, &c. David Jennings, Clerk to the Commissioners 71, Whitechapel-road, October 10.

COMPETITIONS.

PREMIUM of 20*l.* for the chosen Design for a new Church at Winchester, to hold about 1,000 persons on the floor, cost not exceeding 4,000*l.* Further information from Rector and Churchwardens. 10th Oct.

[Advertisement.]

## JOHNS &amp; Co.'s PATENT STUCCO CEMENT.

Architects, Builders, and Plasterers, have now an opportunity of seeing the effect of this beautiful invention in course of application on the entrance front of Messrs. Magnus and Co.'s Slate Works, in Upper Belgrave-place, Pimlico.

The Cement is here seen in its original self-contained Colour, without the application of paint or wash of any kind, of which it has the great advantage of being quite independent.

A lower tint than is here seen can be given to the work by selecting a darker coloured sand for mixing with the fluid cement, the uniform colour of which is that of pale stone. Remarkable adhesion, total freedom from the vegetative discolouration, extraordinary powers of resisting damp, and its never having been known to crack or blister, form the leading advantages of this Cement. We are referred also, by Messrs. Mann & Co., the Agents for the Patentees, to the following instances, amongst many others, where this Cement has been introduced, and may be inspected.

The entire front of the St. Ann's Society Schools, Brixton Hill.

The Mariner's Insurance Office, immediately opposite the Monument, Arthur-street, London Bridge.

The West-Wing in the grand Entrance to Guy's Hospital in St. Thomas-street, Southwark.

Doctor Sutherland's Asylum, Blacklands House, Chelsea.

The Superintendent's House at the Haggerstone Gas Works.

The Interior of St. Peter's Church, Cornhill, now in course of completion.

A portion of the Interior of the New Church on Hearn Hill, and the only portion which has borne out infallibly the enriched decorative painting of that edifice.

The Private Residence of F. W. Russell, Esq., No. 19, Westbourne-street, Hyde-park Gardens, the Columns in the Portico of which are particularly referred to.

## TO CORRESPONDENTS.

We have not at present by us materials sufficient for a complete memoir of Peter Nicholson, but should be happy to receive any communications upon the subject.

A. E. I. Z. — We know of no architectural "lending library" available; books we believe, however, may be so obtained from the Mechanic's Institution. We recommend application to the British Museum, where any book may be seen, and perused.

To a Correspondent inquiring, "Do you know of any gentlemen willing to give evening instruction, so as to enable a person to take out quantities and make contracts for plans?" Our answer is, we do not, but we may be the medium of furnishing an answer to this inquiry.

MR. THOMAS SMITH'S fresh query will be answered in our next number.

## ADVERTISEMENTS.

AT THE ANNUAL MEETING OF THE ROYAL SOCIETY OF ARTS AND SCIENCES, held in London, on the 19th of June, 1854, his Royal Highness Prince Albert presented to Mr. ROBERT BROWN the medal awarded by the said Society for his invention of the ORNAMENTAL GROOVED RIDGE TILE.

The Grooved Ridge Tile was invented by Mr. Robert Brown, in 1840, and first used by Mr. Kendall, architect. The Tile being now used by architects generally, the inventor has been induced to establish a manufactory for the same at Surbiton, Surrey, and trusts, that being the inventor, that architects and builders will give him the preference, he being enabled to supply them at the lowest possible rate. The merits of the Grooved Ridge Tile consist in its forming of itself an excellent ridge, whilst the groove along the top enables the architect to introduce whatever outline of ornament he may think proper, at a cheap rate.

Ornamented Plain Tiles, which are now used by architects generally as an elegant covering for buildings, instead of the common square plain tiles, can be supplied at the manufactory at nearly as cheap a rate.

Two kinds of Serrated Plain Tiles, the round end and the pointed, have long been used in the county of Surrey, but not as a covering for roofs, only as an ornamental covering for walls of houses, such tiles being placed vertically thereon.

The great excellence of the Serrated Common Plain Tiles as a covering for roofs consists in this, that when put on the building they are made to lap over each other, something in the manner of the scales of a fish, by which means they form an excellent protection against either heat or cold, a most important element of consideration. By Mr. Brown's plan the tile can be made of almost any desired colour at a trifling expense.

Orders to be addressed to Mr. ROBERT BROWN, Tile and Pottery Works, Surbiton Hill, near Kingston, Surrey.

## PREPARED FLOORING BOARDS.

ALWAYS ON SALE at A. ROSLING'S, SOUTHWARK-BRIDGE-WHARF, BANKSIDE, and Old-Barge-Wharf, Upper Ground-street, Blackfriars, a very large stock of well seasoned Floor Boards of every variety.

A. R., in calling the attention of builders and consumers, confidently promises on his being able to supply them on such advantageous terms, as will ensure and merit their favours and approbation.

## PREPARED FLOORING BOARDS.

ALWAYS ON SALE, a LARGE ASSORTMENT OF DRY PREPARED FLOORING BOARDS AND MATCHED BOARDING of all sorts, planed to a parallel width and thickness, from  $\frac{1}{2}$  inch to 14 inch thick. Rough Boarding for Flats.

TIMBER, DEALS, OAK PLANKS, SCANTLINGS, SASH SILLS, &c. Apply at W. CLEAVE'S Timber Yard, Smith-street, Westminster.

## BUILDERS' AND CARPENTERS' IRONMONGERY WAREHOUSE,

18, BLANDFORD-STREET, MANCHESTER-SQUARE, LONDON, LEADING FROM BAKER-STREET, PORTMAN-SQUARE.

## FOR THE EXCLUSIVE SUPPLY OF PARTIES ENGAGED IN THE ABOVE TRADES.

THE Proprietor of this Establishment has, by his connections with the most extensive Manufacturers, selected the largest and best-stocked of Builders' Ironmongery yet offered to notice. It includes every article in Ironmongery suited to Building purposes, such as Locks, Nails, Screws, and every requisite for internal fittings, finishing, and decoration; also, Rain Water Pipe, Sash Weights, and all kinds of Castings, and combines (being entirely new) all modern improvements in principle and design. The Prices throughout, even in the most minute article, have been the object of the strictest economical consideration, the profit of the undertaking being anticipated only by a large return. From this Stock every article may be selected, exactly adapted for its intended use, of any required quality or quantity, at a moment's notice, and Catalogues of Prices had free, on prepaid application.

JOHN YOUNG, Jun., Proprietor.

By Her Majesty's

Royal Letters Patent.

## PATENT ASPHALTE ROOFING.

THE above material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient "Protective Material" to Plants, and is now in use at the "Royal Horticultural Society's Gardens, Chiswick." It can be had of any length, 32 inches wide, at One Penny per superficial foot.

THOS. JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London. A DISCOUNT to the Trade.

## CHEAP AND DURABLE ROOFING.

By Her Majesty's

Royal Letters Patent.

## TO ARCHITECTS, SURVEYORS, BUILDERS, &amp;c.

F. McNEILL and Co. of Lamb's Buildings, Bunhill Row, London, Manufacturers and only Patentees of IMPROVED PATENT ASPHALTED FELT, for Roofing Houses, Verandahs, &c. beg to call the attention of the Trade to their ROOFING FELT, which has been exhibited at the great Agricultural Shows of England, Scotland, and Ireland, and obtained the prize, for being the best and cheapest article for Roofing, to supersede slates, tiles, &c. It has been very extensively used by Noblemen, Gentlemen, and Tradesmen, in all parts of the kingdom, from whom the most flattering testimonials have been received. Its advantages are lightness, warmth, durability, and economy. It is impervious to rain, snow, and frost, and a non-conductor of heat and sound. The Felt can be cut to any length, by 32 inches wide.

The price is only One Penny per Square Foot.

Samples, with full directions as to its uses and the manner of applying it, with testimonials from Noblemen and Gentlemen who have extensively used it, sent free to any part of the town or country. A Dry-hair Felt, for covering Boilers, &c., is also manufactured, by which a saving of about 25 per cent. in fuel is effected.

A liberal Discount allowed to the Trade.

Patent Felt Works, Lamb's Buildings, Bunhill Row, London.

## THE PANKLIBANON IRON WORKS,

WHOLESALE AND RETAIL, 58, BAKER STREET, PORTMAN SQUARE.

ARCHITECTS, BUILDERS, and Others, about to supply STOVES and KITCHEN APPENDAGES, will find at this Establishment the most unique and elegant assortment of STOVE-GRADES, FENDERS, and FIRE-IRONS ever offered to the Public, at prices considerably below the usual charges. The Proprietors at the same time beg to invite attention to their extensive Stock of FURNISHING IRONMONGERY, Tinned Copper, Tin and Iron Cooking Vessels, Block Tin Dish-Covers, Japanned Ware, Table Cutlery, and especially their Sheffield Plate and German Silver Ware, embracing every Article suitable for the Table, comprising Dish and Plate Covers, Liquor Frames, Epergnes, &c. &c. The plan adopted by the Proprietors of affixing the price to each article for cash, enables all purchasers to have the same advantage. The Patent Thermo Stove is in daily operation. THEORPE, FALLOWS, & COMPANY, 58 Baker-street, Portman-square, London.

The Builder.

NO. LXXXVII.

SATURDAY, OCTOBER 12, 1844.

N no other parts of modern habitations is there, perhaps, so much failure as in chimneys, which so often refuse to act properly, and cause instead the apartments, which they are intended to render healthful and comfortable, to be clouded, and, consequently, neither comfortable nor salubrious. We venture to say this defect arises most frequently from chimney-shafts being stunted in the endeavour to hide them, which is entirely vain; or if a chimney be externally concealed, surely the appearance of smoke issuing from the roof, though the edifice were on fire, is a most steales mode of management. One, therefore, of the methods to be adopted for the alleviation of true taste, founded upon use, in its branch of domestic architecture, is the invention of lofty graceful patterns of chimney-shafts. It is true there are already in existence many paterius which may be used; these, however, are mostly Gothic or Elizabethan. The grand fault has been the classicalizing, or rather temple-izing, modern domestic dwellings; omitting, as nearly as possible, that is not to be found in ancient, Grecian, or Roman temples. But as the fashioning of a house without obvious chimneys is about as ridiculous as the fashioning of a statue without head, or some principal feature, we maintain that chimneys should be so treated as to appear at which they really are, honourable and necessary parts of such structures. Instead, therefore, of perforating the entrance-front of a country house with a multitude of window-sillings, by which all that approach the street can offensively pry into the principal apartments, and be themselves offensively gazed at in their coming,—we on that front make scarcely an opening besides the doorway, creating the principal adornment of the facade by means of two great chimney-stacks, projecting as to appear picturesque externally, and save loss of internal space. These stacks we surmount by very high detached shafts of some kind of new invention, to which there is no limit. Between these, the principal portal can be carried to any altitude, and may be finished with any degree of decoration. As the entrance-front of a house may be made in every respect ornamental, while subserving to every required use. We may be allowed hereafter to give some patterns for chimneys. After their first requisite of altitude, their next is solid construction; their third, pure outline; their fourth, freedom from superfluous ornament, so that, while shewing fancy, they appear elegant and stable. In moderate dwellings, they may rise six or eight feet above the roof-ridges; and in park mansions

they should be carried as high as they can with safety, so as to overcome as far as possible the tendency which high surrounding trees have to cause chimneys to smoke.

We should recommend our correspondents to collect drawings of fine examples of chimneys wherever they are to be found, and to transmit them to us for publication.

Brick-work and terra-cotta are perhaps, on the whole, the best materials for chimney-shafts of ordinary domestic buildings; these may be mingled together, and occasionally some good stone-work may be added; plaster we rarely recommend, as not sufficiently sound. The manufacture of bricks we are convinced may be so improved as to prevent the necessity for much cutting of the material. The chief elements of chimneys which are not absolutely Gothic, are tall shafts, clustered, in rows, disposed cross-wise, sometimes set diagonally, sometimes winged; and of square, hexagonal, octagonal, or four-square chamfered plans; intervening spaces, either plain or arched; cornices, plain, dentiled, or bracketed so as not to hurt the outline; surmounting pots, generally rather low, either round or polygonal, or round with polygonal heads. Among their minor details may be animal heads and armorial charges. Sometimes two or four groups of chimneys may be united by arches, with some kind of balustrade or more fanciful breastwork between them, which may serve to protect the edges of a prospect-flat. Occasionally chimney-shafts may be rusticated, where the general style of the building, to which they are adjuncts, partakes of the same fashion; and in some instances they may be pyramidal, which will render them, if single, of an excellently sound construction; occasionally they may contain arched and other paneling; and the invention of the designer will, at times, fashion them with divers minute peculiarities, without descending into pettiness, or sacrificing good taste; in this branch of decoration all really good architects have succeeded, and it forms the peculiarity of their styles.

F

THE NEW METROPOLITAN BUILDING-ACT.

The Commissioners of her Majesty's Woods and Forests have just issued a notice that they have appointed Sir Robert Smirke, James Penethorne, Esq., and Thomas Cubitt, Esq., to constitute with the official referees a Board for the examination of persons who may present themselves for the purpose of obtaining certificates of qualification for the office of District Surveyor within the limits of the New Metropolitan Building-Act. All communications for the said examiners are to be addressed to the Registrar of Metropolitan Buildings, at his office, No. 3, Trafalgar-square. The notice is dated the 4th inst., and was inserted in the *London Gazette* last Tuesday.

SPECIAL PREMIUMS CONNECTED WITH ARCHITECTURE, &c.

Offered by the Society of Arts, Adelphi, London.

1. The Gold Medallion is offered to the candidate who shall produce the best original design for a town and county hall, containing the requisite accommodations for holding assizes, a large room for public meetings, and offices for magistrate's clerk, &c.; to be sent in on or before the third Tuesday in January, 1845. The expense of the building not to exceed 40,000*l*. The drawings to consist of two plans, one or more geometrical elevations, and two sections, drawn to a scale of  $\frac{1}{4}$  inch to a foot; also a perspective view.

2. *Acton Premium*.—In the year 1837, a gift of 500*l*. was made to the society by Mrs. Hannah Acton, of Euston-square, for the pur-

pose of enabling the society to offer an annual reward for the promotion of practical carpentry, applicable to civil, naval, and military architecture. In compliance with the terms of the above donation, the society offers a Gold Medallion for the best design for a roof of 100 feet span and 150 feet in length, with the walling necessary for its support. Each design to consist of a plan, and two sections, neatly outlined in Indian ink, and tinted, with a scale annexed; also a model of one bay, or larger portion (as the candidate shall see fit), should accompany the design. The model and drawings to be sent in on or before the third Tuesday in January, 1845; and to become the property of the society if the candidate be successful.

3. The Gold Medallion is offered for the best design for the hull-timbers of a steamer of 1,000 tons burden. Such design to consist either of a model or of a plan, section, and other drawings sufficient to explain the same. The model or drawings to be sent in on or before the third Tuesday in January, 1845; and to become the property of the society if the candidate be successful.

4. For the best original design as a subject for modelling or carving, adapted to furniture or internal decoration, by an operative mechanic in either of these branches of art—the Silver Medal and Five Pounds.

INTRODUCTORY LECTURE ON THE ARTS OF CONSTRUCTION IN CONNECTION WITH CIVIL ENGINEERING AND ARCHITECTURE.

Delivered on Tuesday last, October 8th, by PROFESSOR HOSKING, At King's College, London.

GENTLEMEN,—The printed paper already in your hands\* gives a general statement of the matters to which I shall have to direct the attention of the student, and I believe that every man who has had to learn these things for himself will readily admit that any instruction in them, however imperfect it may be, may become of the greatest practical value, by supplying, as a groundwork for professional study, that which has had too often to be learned in practice, and what, oftener still, is never learned at all.

We cannot hope here to make young men carpenters or masons, but we hope to make them better qualified to compose, describe, estimate, and direct works of carpentry and masonry than they can be without such assistance as that we offer them. In becoming proficient as a carpenter, a mason, or a smith, a young man is apt to overlook the importance of other handicrafts in favour of that in which he has acquired confidence; but a sound, and indeed a somewhat extensive, practical knowledge of the modes of operating in all the leading crafts, of which the three I have mentioned, together with the bricklayer's craft, are the most prominent, is essential to the civil engineer, who only exists independently of the architect on the one hand, and of the machinist on the other, through his presumed superior practical skill in applying the operations of the carpenter, mason, bricklayer, and smith, in connection with those of the navigator or earthworker and miner.

The late Mr. Telford attained the highest eminence in his profession from the most humble commencement; and late in life—with the experience of more than half a century—he thus recorded his own history and impressions:—"The early part of my life," says Mr. Telford, "was spent in employment as a mason in my native district of Eskdale, in the county of Dumfries. Wherever regular roads were substituted for the old horse-tracks, and wheel-carriages introduced, bridges, numerous, but small, were to be built over the mountain-streams; these, however, furnished considerable employment to the practical mason, and I thus became early experienced in the requisite considerations and details. In such works," Mr. Telford goes on to say—"in farm-houses and in the simple parish churches of the Scottish Border—convenience and usefulness only are studied, yet peculiar advantages are thus afforded to the young practitioner; for, as there is not sufficient employment to produce a division of labour in building, he is under the necessity of making himself ac-

\* A syllabus of the course.

quainted with every detail—in procuring, preparing, and employing every kind of material, whether it be the produce of the forest, the quarry, or the forge; and this, although unfavourable to the dexterity of the individual workman who earns his livelihood by expertise in one operation, is of singular advantage to the future architect or engineer, whose professional excellence must rest on the adaptation of the materials, and a confirmed habit of discrimination and judicious superintendence.”

Such was the early education, and such were the matured opinions, of the man who has left hardly a corner of our island without some important work to record his name;—of the man who made the Highland and Holyhead roads, with their centuries of bridges—who drained fens, and built docks and harbours—who carried the Ellesmere Canal over the vale of Llangollen, and the Holyhead road over the Straits of Menai—who connected the Irish Sea with the German Ocean by the Caldonian Canal, and the German Ocean with the Baltic Sea by the Götha Canal;—for Telford's advice and assistance were sought by foreign nations, and Norway, Sweden, Russia, and Poland bear witness to the skill and fame of the Eskdale Mason!

It may not be devoid of interest, and it may help to give a distinct perception of what the practice of civil engineering includes, if I trace the circumstances out of which it grew.

Many of the works and operations now included in the practice of the civil engineer are themselves of late origin, and a large proportion of them was formerly within the practice of architecture, and was known, when distinguished at all, as hydraulic architecture. The basis of the practice, however, and the etymology of the term, are to be found in the operations for the defence and attack of strongholds, as military places or positions. Architects built the walls and towers of towns and cities, as well as the temples, theatres, and mansions which they inclosed; and the permanent constructions, as bridges over rivers, the aqueducts which fed the cities with water, and the roads which led to and from them, were under the same superintendence and direction. But the machines used in the attack or defence of strong places were in the hands of the military, and as such machines, or, as we now term them, engines of war, became more complex, and as their range and application were extended, they obtained, in latter ages, the designation, in hasty Latin, of *macchine d'ingegno*, from the ingenuity displayed in them and in operating with them, and the officers to whom their management and direction were intrusted were hence called, in the same *lingua Franca*, *ingegneri*. Upon the introduction of that terrible *macchina d'ingegno* which rendered castles and walls of but little use for defence without outworks, these were made, as they were required, by the *ingegneri*, whose *ingegni*, or engines, as they take the word through the French, no longer demanded their attention, being superseded by the gunpowder artillery, which in its turn required a class of officers to be formed for its own particular service. Modern fortifications, or fortifications having reference to ordnance, consist in a great degree of earthworks, and, through the practice of forming them, military engineers became skilful in the disposition and working of earth, in draining for the exclusion, and in forming conduits and sluices for the admission of water. As the advance of modern civilization required operations similar to those practised by the military engineer, for protecting lands from rivers and from the sea by embankments, for draining low lands, for supplying towns, and for feeding canals with water, the peculiar designation of the military officer was adopted by the civil practitioner, who thus became what is known as the civil engineer. Throughout the continent of Europe the services of the architect had been still in requisition in aid of the military engineer, in directing the constructions for which he had occasion, and we thus find some of the finest works of many of the Italian architects, from the thirteenth and fourteenth centuries down to the present time, in the gates of fortified places. In England, however, almost ever since the introduction of gunpowder, the fortification of towns and cities, fortunately, has not been necessary, and the British architect has therefore had no practice in connection with the military engineer. Hence the almost

total deficiency of architects in this country in hydraulic constructions; so that, when a demand arose for works which imposed such constructions in connection with earthwork formations, the millwrights and masons, who had built the flood-gates and sluices with their wing and head walls for, and had learnt to direct the formation of the earthworks from, the Dutch embankers and drainers, were called upon to undertake them; and thus the hydraulic architect is found in conjunction with the formator or embanker and drainer, who brought to the profession, thus compounded, the designation of civil engineer.

Roads as now made, and railways, are late additions to the practice of the civil engineer. Roads brought bridges with them, and railways have brought many other varieties of construction that can hardly be called hydraulic; for, although their frequent connection with earthwork exposes them for the most part to the action of water, they are generally so situated as to demand the architectural dispositions which may be classed under the head of decoration. To be an accomplished civil engineer, a man must therefore be a good architect, in the ordinary acceptance of that term, as well as skilled in the sciences and arts of construction, far above what architects commonly are.

I have said that civil engineering and architecture are connected by the use in common of the most important of the arts of construction, and by the demands upon both architect and engineer, in the course of practice, for many services and duties that would rigidly be placed within the practice of the other; and I have said also that the range of the engineer within the domain of the architect might be considered as limited to constructions influenced or affected by water,—constituting him the hydraulic architect. I may draw this further general line, by defining the practice of the civil engineer to be in uncovered or uninclosed constructions, and that of the civil architect to be constructions that are inclosed and covered by a roof or otherwise. The works classed under one branch of practice, and under the other, are thus in general easily distinguished; and classes of works may be formed in accordance with such a line; but it must, nevertheless, be sufficiently obvious that the independent general practice of civil engineering, in its more distinguished works especially, requires of the practitioner that he should be as well skilled in architecture on the one hand as in practical mechanics on the other; and in the same manner of the architect, that every thing relating to constructions, at the least should be as familiar to him as to the engineer. As between the two branches of practice, the only works that can be called exclusively of civil engineering are those in which earthwork formations are the most prominent, as canals and reservoirs, and the bases or formations of roads and railways, embankments from rivers and from the sea, with their accessories, to protect or recover land, or to form ports and harbours. It may be thought that every thing relating to hydraulics must fall within the province of the engineer, but we find that, although the engineer brings water into the streets of towns, the architect directs the laying of it on for use;—the engineer drains land and clears the courses of rivers, but the drainage of towns and cities—the building and conservation of drains and sewers—are, as I have already remarked, in the hands of the architect.

In like manner, civil architecture may be said to embrace exclusively all classes of constructions for the personal and social accommodation, convenience, and delight of man. This latter practice thus includes many arts which are hardly known in that of civil engineering, but these are rather decorative than constructive, so that there are really but few things to which I shall have to direct the attention of the engineer student that are not equally essential to the intending architect. The arts of construction are the same to both, and a knowledge of them in general and in detail is as necessary, nay, as essential, to the one as to the other. The treasury of a church, or of a theatre, may be defrauded by the formation of an extravagant bill for extra works, or by the overcharging of walls and timbers with useless materials, as that of a nation in an ill-composed and therefore infirm breakwater, or that of a dock or railway company in overloaded walls and arches, or in clattering rails—

whilst the responsibility of the architect in the influences of his works upon human life is hardly less great than that of the engineer.

In promising you information and instruction that will be useful to you in the pursuit of your professions respectively, I must beg to be understood not to promise to qualify you here to practise as architects or as civil engineers. We offer you information whereby you may become qualified to avail yourselves more effectually of the practice of the engineer's or architect's office, and thereby to become *better* architects and *better* engineers, to your own confidence, comfort, and advantage, and for the advantage of society, to whom your services will be hereafter offered, than you would have been without such instruction and information as we offer. The medical student comes here versed in pharmacy and in the simpler surgical operations, and he finds his field of study and practice complete between the lecture and dissecting rooms of the college, and the wards and the operating theatre of the hospital; but to you, who come to us unskilled in carpentry and masonry, the pharmacy and surgery of your professions, we have the deficiency to supply, as well as to teach the science which those humbler arts aid you in applying; but *your* hospital must be walked in mud-boots, and your operating theatre found on the stage of the carpenter and on the scaffold of the mason and bricklayer. The young sailor may and should learn navigation on shore, and how to rig a ship and to reef and steer in harbour; but he must go to sea to become a sailor; and the young architect or engineer may and should, in like manner, acquire the theory, and learn, as far as may be, the practical arts, of his intended profession, in a preliminary education; but he must place himself with the active practitioner, through whom he may have facilities for seeing works in progress, and opportunities of assisting to forward them, together with the means of acquiring the technicalities of practice, to become himself an efficient practitioner of architecture and engineering.

But why, I may be asked, if the practice of an office and the observation of actual works are essential after you have expended time and money here,—why not go from school or college at once to a practical office? I answer, that, without such preliminary education in science and the arts as that afforded you here, the practice of an office will be in a great degree lost upon you: you may learn by rote, but you will not know the meaning of the words; you may have opportunities of seeing works, but “seeing you will not see, and hearing you will not understand.” The characters may be clear, and the meaning of the words obvious, but to you they will be unknown, and therefore unintelligible.

Architects, or those who profess themselves to be such, we know do blunder on, and make designs that cannot be executed because of false construction, and write specifications that they do not themselves understand; but if architects do thus with impunity, those who practise civil engineering cannot. Peculiar circumstances, arising from the prejudice of a class, may enable a few men to establish themselves in a peculiar practice, notwithstanding the absence of proper qualifications for it, but this cannot operate in favour of a new generation.

However ordinary architectural works may be directed vicariously, hydraulic architecture cannot be practised successfully by any but practical men acting upon their own responsibility; and if you do not bring science backed by practical skill to your work, you will find yourselves driven from the field by masons and millwrights, whom the time will call from obscurity to perform the duties for which you will have shewn yourselves unfit. I would say then, acquire superiority over the merely practical man,—the rule-of-thumb engineer,—by the attainment of sound scientific knowledge, in addition to the mere practical skill with which he tenders his services; but do not depend upon scientific knowledge alone, if you propose to become civil engineers, and hope to gain your bread by the practice of civil engineering as a profession; for it may be truly said,—paraphrasing the beautiful language of an inspired writer,—you may have all learning and all science, but if you want this practical knowledge of which I speak, you will be but “as sounding brass or a tinkling cymbal.”

## LONDON AS IT WAS, AND AS IT IS IN 1844.

(Continued from p. 503.)

The houses in Bedford-street, King-street, and Henrietta-street, were then chiefly occupied by mercers, lacemen, drapers, &c., this being the extent of their peregrinations without the walls.

St. Mary's Church, in the Strand, was consecrated in January, 1723. An old church in that parish is mentioned in the year 1222, when it was called St. Mary's and the Innocents of the Strand. It was then situated on the site now occupied by the east end of Somerset House, for erecting which palace it was taken down in 1549, by order of Edward, the proud Duke of Somerset, to the great scandal of the times. The parishioners, deprived of their place of worship, joined themselves to the Church of St. Clement Danes, and afterwards to that of St. John Baptist, in the Savoy, where they continued till the year 1723. The new church, called St. Mary-le-Strand, was the first finished of any of the fifty new churches. Its living is a rectory in the gift of the king. It is a superb, though not an extensive edifice, massive without the appearance of being heavy, and formed to stand for ages. Its position is commanding, and although somewhat in the way of public business, we can hardly wish it removed to a more quiet and unobtrusive spot. At the entrance on the west end, is an ascent by a semi-circular flight of steps, which lead to a semi-circular portico of Ionic columns covered with a dome, crowned with a vase. The columns are continued along the body of the church, with pilasters of the same order at the corners, and in the intercolumns are niches handsomely ornamented. Over the dome is a pediment supported by Corinthian columns, which order is continued round the body of the structure over the Ionic order beneath; between the lateral Corinthian columns are windows placed over the niches. These columns are supported by pedestals, and have pilasters between them bearing arches, and over the windows are angular and circular pediments alternating. A balustrade is carried round the summit of the body, supporting vases. Formerly, there was a large watch-house placed before the entrance. On the spot where this church is built, there formerly stood a very lofty maypole, which, on public occasions, used to be decorated with flags, streamers, and garlands of flowers.

Hungerford Market, another improvement to the metropolis, is built on the ground where formerly stood the house and garden of Sir Edward Hungerford; he converted it into buildings, having a street into the Strand, and leading to the market, over the market-house was the charity school of St. Martin's parish. It was originally intended as a fruit and flower market, but Covent Garden having the start of it, and being in a better situation for business, Hungerford Market was neglected. As a starting place for steam-vessels, much company is drawn thereto, and much more may be expected when the suspension-bridge is completed and open to the public.

Between St. Martin's parish and St. Margaret's, Westminster, there was large commoning (for the benefit of those parishes), of lands laid open according to ancient custom from Lammas-day; which were, in Queen Elizabeth's time, inclosed with gates and hedges, by which the inhabitants were deprived of that benefit. Upon this, complaint was made to Lord Burghley, High Steward of Westminster, who ordered an inquest to be empaneled; the parishioners thinking this an acknowledgment of their right, employed persons on the inclosing Lammas-day with pick-axes and other

instruments to pull down the fences, and break open the gates. This assumed right extended over 688 acres, viz., Eubury Farm 430 acres, the *Neat* 108 acres, St. James's Farm 100 acres, John Lazarus of Jerusalem 50 acres.

In pursuing our train of observation on London in olden times and as it is in the present day, we now enter the limits of the city; and, previous to particularizing objects, it will be as well to give a brief history, as collected from Stow and other ancient writers. Geoffrey of Monmouth, the Welsh historian (?) reports that *Brute* lineally descended from the demi-god Eneas, the son of Venus, daughter of Jupiter, about *anno mundi* 2855, and 1108 B.C., built a city near the Thames, and named it *TROYNOVANT*, or *TRENOVANT*. This tradition was formerly of such credit, as to be preserved in an ancient tract in the archives of the city, transcribed into the *Liber Albus*, and long before that by *Horn*, in his old book of laws and customs, called *Liber Horn*.

King Lud, about 1060 years after, not only repaired this city, but also increased the same with fair buildings, towers, and walls, terming it *Catre-Lud* or *Lud's Town*, and the strong gate which he built in the west part of the city he named *Ludgate*; from this term the word London is said to have originated, by corruption; but others assert that it was anciently called *Longdin*, a British word answering to the Saxon word *Slipton*, that is, a town of ships. It is certain that long before the invasion of the Romans London was in good repute, notwithstanding its early history being involved in much obscurity. According to *Cæsar's "Commentaries"* Cassibelan's town was 20 miles west from London. Tacitus tells us that *Londinium* 62 A.C. was then most famous for the great multitude of merchants, provision, and intercourse, at which time it was pillaged and spoiled by the Romans. It is soon after this that London was walled with stone, and *Julius Agricola*, by introducing the arts of industry and civilized life from Rome, so engaged the affections of the Britons, as to win them to build houses for themselves, temples, and courts of justice, and to clothe themselves after the fashion of their conqueror.

The city of London is disposed on a small hill, having an easy ascent from the south, and its position is not only the most advantageous that could possibly be chosen for the seat of a mighty city, but also the most salubrious, being open to the bracing winds of the north, and having a noble river running through the midst of it, which, administering to its wealth and greatness on the one hand, carries off all impurities, and brings it the favourable and healthy breezes of the ocean. Formerly, it was thought that wood and charcoal only could be used with due regard to the health of the inhabitants; and in the reign of Edward I. the inhabitants, on the representations of the prelates and nobles, were by proclamation prohibited from burning sea-coal; which being disobeyed by many for their private emolument, stringent laws were enacted, and for the second offence, the authorities punished the offenders by demolishing their furnaces, kilns, &c. Great care has at all times been observed to preserve the purity of the atmosphere, provision being made against all annoying smells; and in the reign of Edward III. no butcher was allowed to slaughter his cattle nearer the city than Stratford or Knightsbridge.

In the time of Stow, London measured, from Limehouse to the end of Tothill-street, Westminster, about  $7\frac{1}{2}$  miles; and from the further end of Blackman-street, in Southwark, to the end of St. Leonard's, Shoreditch,  $2\frac{1}{2}$  miles; upon a medium, he says London is 7 miles long and  $1\frac{1}{4}$  miles broad, making an area of 9 square miles. In 1686 its population was computed at 100,000 souls. In 1702 the tax *Regin. Anna* amounted to 1,979,931L, and the quota of this tax set upon London and Westminster was 198,843L, besides on Middlesex, in all 307,755L, nearly one-fourth of the whole tax upon the kingdom; this will give some idea of its populousness and wealth. In 1683 there were 84,000 tenanted houses. It was computed at that period that the city doubled its population in forty years, and that by this mode of calculation the number of inhabitants in 1840 would be 5,800,000; that the inhabitants of all England would be but inconsiderably

more, viz. 10,917,389 in number; and wherefore the growth of the city must stop before the year 1840, and be at its maximum in 1800, when the number of its inhabitants would be 5,000,359. In 1682, London was seven times larger than in Queen Elizabeth's reign.

William of Malmesbury tells us that about the year of Christ 394 the Londoners shut up their gates and defended Ethelred, their king within their walls against the Danes. Also, that Edmund Ironside, reigning over the West Saxons, Canute bringing his navy into the west part of the bridge by a trench which he had caused to be cut, east a trench about the city, and then attempted to win it by assault; but the citizens repulsed him, and drove him from the walls. Also, in the year 1052, Earl Godwin with his navy sailed up by the south end of the bridge, along the southern side of the river, and so assailed the walls. And William Fitz-Stephen, writing in the reign of king Henry II. of the walls of the city, observes, "The wall is high and great, well-towered on the north side, with due distances between the towers; on the south side also the city was walled and towered, but the fish-abounding river of Thames, with his ebbing and flowing, hath long since subverted them."

In the reign of Henry II. the city was bounded by a high wall, furnished with turrets, and seven double gates, and had in the east part a tower palatine, and in the west two castles well fortified. Further westward, about two miles on the banks of the river, was the royal palace of Westminster, "an incomparable structure guarded by a wall and bulwarks." Between this and the city was a continued suburb, mingled with large and beautiful gardens and orchards, belonging to the citizens, who were themselves everywhere known and respected above all others for their civil demeanour, their goodly apparel, their well-furnished tables, and their discourse. The number of conventual churches in the city and suburbs was 13, besides 126 lesser parochial ones. On the north side were open meadows and pasture lands, and beyond was a forest, in the woody coverts of which lurked deer, wild boars, and fierce wild bulls. The handicraftsmen, the venders of wares, and the labourers for hire, were every morning to be found at their distinct and appropriate places, as is still common in the bazaars of the East; and on the river's bank was a public cookery and eating-place belonging to the city, where "whatsoever multitude," and howsoever daintily inclined, might be supplied with proper fare. Within one of the gates also, in a certain plain field (Smithfield) on every Friday, unless it happened to be a solemn festival, was a great market for horses, whither early barons, knights, and citizens repaired to see and purchase.

The houses in Edward the First's time were built of wood, and the city was intersected with streams, which flowed through some of the principal streets. Thus the river Wells rises north-west of the city, and falling into Fleet ditch at the bottom of Holborn-hill; this brook had several mills on it, and was thence called Turmill-brook; the Oldbourne, the Fleet, which had its course through Fleet-street, Walbrook, and Langbourne-brook.

In 1410 stocks market was erected where the Mansion House now stands.

In the reign of Henry V. the city was first lighted at night by lanterns slung on ropes. Leadenhall-market was then a granary or corn-market, it was afterwards used as a wool-market, subsequently converted into an armoury.

The whole circumference of the city walls was 16,095 feet, or 3 miles and 30 poles, the superficial extent being estimated at 380 acres. In the reign of Richard I. the citizens began to encompass and strengthen their walls by a ditch. In several succeeding reigns this ditch was cleaned out at the expense of the inhabitants of London. Previous to the reign of Elizabeth, this ditch abounded with excellent fish; Fleet ditch is the only part now remaining of the town ditch, and that is dwindled down into a common sewer.

The city of London was anciently watered by the river Thames on the south, the river of the Wells on the west, by Walbrook running through the midst of the city, Langbourn running within the city through Langbourn ward. In the west suburbs was also another stream called Oldbourn, which fell into the river of Wells. There were also three

principal fountains or wells in the suburbs. viz. Holy-well, Clement's-well, and Clarken-well, and also Skinner's-well, Fag's-well, Tode-well, Loder's-well, and Rad-well. In West Smithfield there was also a pool called Horsepoole, and one near St. Giles-without-Cripple-gate; besides which, many of the streets were supplied with springs or wells.

In the year 1707, the foundations for some houses having been dug near the City-wall, at Bishopsgate, and part of the wall being applied for the buildings, Dr. Woodward took that opportunity of examining this ancient structure. The foundations of the wall at this place lay eight feet beneath the surface, and from that up to almost ten feet in height, it was composed of ragstone, with single layers of broad tiles interposed, two feet apart. To this height the workmanship was after the Roman manner, being the remains of the wall supposed to be built by Constantine the Great. The mortar was so firm and hard, that the stone itself as easily gave way to the implements of the workmen employed in breaking it down. It was thus far nine feet in thickness. The tiles used in this part of the wall were those termed *sesquipedales*, that is, tiles of 1½ ft.; each of them, in English measure, was 1⅓ in. in thickness, 11⅞ in. in breadth, and 17⅞ in. in length. On the sides were interposed open bricks, occasionally the stone outside was squared and wrought into layers 5 inches thick; between these were ultimately interposed two courses of brick of the same form as those on the inside, 11 inches long and 2½ thick.

(To be continued.)

#### A GLANCE AT THE INTERIOR OF THE CHURCHES IN THE DEANERY OF SPARKHAM, IN NORFOLK.—NO. V.

WITH NOTICES OF THEIR ACTUAL CONDITION.

(Continued from p. 457.)

*Elsing, anciently Ausing.*—The bright sunshine of an afternoon in May was expanding the wild flowers on Elsing Heath as, skirting the clump of spruce-firs that tops its western acclivity, we descended into a verdant amphitheatre, of which the parish church forms the nucleus. Serenely beautiful rose

"The grey embattled tower,  
Buttress, and porch, and arch with maze round  
Of curious fret or shapes fantastic crown'd."

Of more ample dimensions, presenting a much larger proportion of "clew hewen ashler" in the finished masonry of the more ornamental portions, and being altogether in a state of far higher preservation, Elsing Church is by no means behind that just quitted in offering its own attractions for the pilgrim of ecclesiastical beauty.

This church consists of a spacious nave and chancel, on the north side of which last is a vestry or vestry, the floor indicating that it has been the burial-place of some former incumbent. A lofty square tower, situate at the west end, and furnished with five bells, opens on the nave under a pointed arch springing from double octagonal pilasters; but this fine feature is marred by the introduction of a paltry gallery projecting into the nave. A spiral staircase at one of the angles is lighted by perforations in the masonry, of squared flint, with buttresses of solid freestone. The steeple is surmounted by an embattled parapet, as also are the side walls of the nave and chancel.

We were gratified to find the windows of this handsome church furnished with grating at the wickets to prevent, when these are set open, the ingress of birds. The crockets are for the most part arranged in flowing and ramified tracery, but several unsightly wooden bars intersecting these hardly reconcile us to the loss of effect by the additional security thus afforded. The fine east window, which fell *inwards* several years since, has suffered much disfigurement in this way; but we must own that in many such cases, recourse would have been at once had to the bricklayer, and that despite the portraits of Sir Hugh de Hastings and the Lady Margaret, "hys wyf," yet seen on the painted glass of the central light.

Some time ago it became necessary to dislodge a swarm of bees that had possessed themselves of a crevice in the south-east portion of the nave-gable, and in effecting this, parts of an ancient staircase to the rood-loft

were discovered. The chancel arch under which this stood is, from its height and breadth, peculiarly imposing. The rood-screen, or rather the closed portion of it yet remaining, exhibits a profusion of rich carved-work; it has been converted to the use of seats, *backing on the altar*, by adding fronts indifferently sculptured in the style known as arabesque. The piscina and sedilia, under a range of ogive arches, only require to be freed from the incrustations, the effect of periodical latherings, under which their beauties lie concealed. The altarrails, formed of small shafts supporting Norman arches which intersect each other, afford a specimen of commendable taste, in which the present authorities have shown themselves miserably deficient. A dossal or altar-screen lately set up here moves our spleen every way—meagre in design and gaudy in colouring. And yet we were told that the thing cost amply enough to have purchased one of far higher character. Strange that the juxtaposition of a brass mural table, placed in a niche surmounted by a canopy which is enriched with crockets and a finial, wondrous that this elegant monument hindered not the perpetration of such a deformity! A large altarcloth appears on the north side, and in the centre a marble slab with elaborate brasses, the portrait of a knight in complete armour with a lion at his feet, &c. Thus much of the chancel, which has the convenience of a priest's door at the south aisle.

The open wood-work of the leaded roof gave place in 1779 to the semicircular ceiling with tiles above, which now appears here; a change every way to be deplored, as the absence of pillars causes a defect of light and shadow within this church ill remedied by the unbroken superficies over head. An endowment for repairs amounting, we believe, to 20*l.* per annum, only shews that it avails little to hold such resources unless men of a better and purer taste than heretofore be found to direct their application. The pews over a large portion of the church have the merit of fronting the altar; but two parlour-like inclosures at the eastern angles receive, no doubt, occupants of a higher worship than the rest,—"the grave Mr. Justice *Tonson*, the good lady *Jones* and the two virtuous gentlewomen her daughters." The pulpit, reading, and clerk's desks, are sorry affairs in themselves, but their position is, *in degree*, commendable; a fine window nearly filled with painted glass of splendid design throws in its mellow light here with elegant effect. The walls offer the first instance yet occurring in this deanery of the "scrolls that teach us to live and die."

The font has high claims to notice, the fine tabernacle-work of its cover yet more so. The bowl of the former, octangular in shape, embattled and wreathed beneath with a chaplet, stands on a low shaft having its sides fluted in cavettos, and resting on an octangular base; this again impends on a square moulded plinth, the whole terminating pavement-ward in an easy eight-sided step. It will suffice in respect of the cover\* to say that Mr. Blore's cultivated taste has led him to appreciate the beauty of its miniature windows and flying buttresses without, its fan-tracery and pendants within. Lamentable to add, this elegant appendage has become, through vulgar stint, an impediment to the hallowed office our forefathers sought to embellish by it. Being now without the ancient facility for raising this in appearance light, but really ponderous adjunct to the baptistry, a pewter basin substitutes the noble leaded bowl, with its orifice to permit escape to the sanctified fluid; and, as a natural consequence, the officiating minister stands anywhere save upon the step provided for his accommodation. The site of this font, as will be shown hereafter, is highly appropriate.

The only indication of a niche for the holy water stoup is afforded on the west side of the north door, the commonly used one, by a short beam which projects there; its use, to suspend the key from. Ogive arches over the doorways both of church and porches are foliated, crocketed, and surmounted by finials. A few stunted fir-trees in the north-east angle of the cemetery contrast strangely with the wild luxuriance of their fellows on the heath—

"They cannot quit their place of birth;  
They will not live in other earth."

\* Mr. Repton, in the XVth vol. of the *Archæologia*, supposes this to have been one of the earliest instances.

#### RETROSPECTIVE ARCHITECTURAL LITERATURE.

##### THE ELEMENTS OF ARCHITECTURE.

COLLECTED BY SIR HENRY WOTTON, KNIGHT,  
From the best Authors and Examples.

(Continued from p. 493.)

First, I must note a certain Contrariety between Building and Gardening: For as Fabricks should be regular, so Gardens should be irregular, or at least cast into a very wild Regularity. To exemplify my Concoct, I have seen a Garden (for the Manner perchance incomparable) into which the first access was a high Walk like a Terrass, from whence might be taken a general View of the whole Plot below; but rather in a delightful Confusion, than with any plain Distinction of the Pieces. From this the Beholder descending many steps, was afterwards conveyed again by several Mountains and Valings, to various Entertainments of Scent and Sight, which I shall not need to describe (for that were poetical); let me only note this, that every one of these Diversities was as if he had been magically transported into a new Garden.

But though other Countries have more benefit of the Sun than we, and thereby more properly tied to contemplate this Delight, yet have I seen in our own, a delicate and diligent Curiosity, surely without parallel among foreign Nations; naely, in the Garden of Sir Henry Fanshawe, at his Seat in Ware-Park, where I well remember he did so precisely examine the Tinctures and Seasons of his Flowers, that in their setting, the inwardness of those which were to come up at the same time, should be always a little darker than the outmost, and so serve them for a kind of gentle Shadow, like a Piece not of Nature, but of Art: Which mention (incident to this Place) I have willingly made of his name, for the dear Friendship that was long between us; Though I must confess with much wrong to his other Virtues, which deserve a more solid Memorial, than among these vacant Observations. So much of Gardens.

Fountains are figured, or only plain Water'd Works: Of either of which, I will describe a matchless Pattern.

The First done by the famous Hand of Michael Angelo da Buonaroti, in the Figure of a sturdy Woman, washing and winding of Lionen Cloaths; in which Act she wrings out the Water that made the Fountain: which was a graceful and natural Conceit in the Artificer, implying this Rule, That all Desings of this kind should be proper.

The other doth merit some larger Expression: There went a long, straight, mossy Walk of competent breadth, green and soft under foot, listed on both sides with an *Aqueduct* of white Stone, Breast high, which had a hollow Channel on the Top, where ran a pretty trickling Stream; on the Edge whereof were couched very thick all along, certain small Pipes of Lead, in little holes, so neatly, that they could not be well perceived, till by the turning of a Cock, they did spurt over inter-changeably from side to side, above Man's height, in form of Arches, without any Intersection or meeting aloft, because the Pipes were not exactly opposite; so as the Beholder, besides that which was fluent in the *Aqueduct* on both hands in his view, did walk as it were under a continual Bower or Hemisphere of Water, without any drop falling on him. An Invention for Refreshment, surely far exceeding all the Alexandrian Delicacies, and Pneumatics of Hero.

Groves and artificial Devices under-ground, are of great Expence, and little Dignity; which, for my part, I could wish converted here into those *Crypteria* whereof mention is made among the curious Provisions of Tycho Brahe, the Danish Ptolemy, as I may well call him; which were deep Concaves in Gardens, where the Stars might be observed even at Noon. For (by the way) to think that the brightness of the Sun's Body above, doth drown our discerning of the lesser Lights, is a popular Error; the sole Impediment being that Lustre, which by Reflection doth spread about us from the Face of the Earth; so as the Caves before touched, may well conduce, not to a delicious, but to a learned Pleasure.

In *Aviaries* of Wire, to keep Birds of all sorts, the Italians (though no wastful Nation) do in some Places bestow vast Expence; including great scope of Ground, variety of

Bushes, Trees of good height, running Waters, and sometimes a stove annexed, to contemper the Air in Winter: So as those Cbanteresses, unless they be such as perhaps delight as much in their Wing as in their Voice, may live long among so good Provisions and Room, before they know that they are Prisoners; reducing often to Memory that Conceit of the Roman Stoick, who in comparison of his own free Contemplations, did think divers great and splendid Fortunes of his Time, little more than commodious Captivities.

Concerning *Ponds of Pleasure* near the Habitation, I will refer myself to a grave Author of our own (though more illustrious by his other \*Work) namely *Sarisburiensis de Piscinâ*.

And here I will end a second Part touching *Ornaments* both within and without the Fabrick.

Now as almost all those which have delivered the Elements of *Logick*, do usually conclude with a Chapter touching *Method*; so I am here seized with a kind of critical Spirit, and desirous to shut up these building Elements with some methodical Direction how to censure Fabricks already raised. For indeed without some Way to contract our Judgment, which among so many Particulars would be lost by Diffusion, I should think it almost harder to be a good Censurer than a good Architect; because the working Part may be helped with Deliberation, but the judging must flow from an extemporal Habit. Therefore (not to leave this last Piece without some Light) I could wish him that cometh to examine any noble Work, first of all to examine himself, whether perchance the sight of many brave Things before (which remain like impressed Forms) have not made him apt to think nothing good but that which is the best, for this Humour were too sowre. Next, before he come to settle any imaginable Opinion, let him by all means seek to inform himself precisely of the Age of the Work upon which he must pass his Doom. And if he shall find the apparent Decays to exceed the Proportion of Time, then let him conclude without farther Inquisition, as an absolute Decree, that either the Materials were too slight, or the Seat is nought.

Now after these Premises if the House be found to bear his Years well (which is always a Token of sound Constitution) then let him suddenly run backwards (for the Method of Censuring is contrary to the Method of Composing) from the Ornaments (which first allure the Eye) to the more essential Members; till at last he be able to form this Conclusion, that the Work is commodious, firm and delightful; which (as I said in the Beginning) are the three capital Conditions required in good Buildings, by all Authors both ancient and modern. And this, as I may term it, the most scientific way of censuring. There are two other, which I must not forget: The first in Georgio Vassario, before his laborious Work of the Lives of *Architects*, which is to pass a running Examination over the whole Edifice, according to the Properties of a well-shapen'd Man: As whether the Walls stand upright upon clean Footing and Foundation: Whether the Fabrick be of a beautiful Stature: Whether for the Breadth it appear well burnished: Whether the principal Entrance be on the middle Line of the Front or Face like our Mouths: Whether the Windows, as our Eyes be set in equal number and distance on both Sides; whether the Offices, like the Veins in our Bodies, be usefully distributed, and so forth: For this Allegorical Review may be driven as far as any Wit will, that is at leisure.

The second Way is in Vitruvius himself, Lib. 1, Cap. 2, where he summarily determineth six Considerations, which accomplish this whole *Art*:

<i>Ordinatio.</i>	<i>Symmetria.</i>
<i>Dispositio.</i>	<i>Decor,</i> and
<i>Eurythmia.</i>	<i>Distributio.</i>

Whereof (in my conceit) we may spare him the first two; for as far as I can perceive, either by his Interpreters, or by his own Text, (which in that very Place, where perchance he should be clearest, is of all other the cloudiest) he meaneth nothing by *Ordinatio*, but a well settling of *Model* or *Scale* of the whole *Work*: Nor by *Dispositio*, more than a neat and full Expression of the first Idea or Designment thereof: which, perchance, do more belong to

the *Artificer*, than to the *Censurer*. The other four are enough to condemn, or absolve any *Fabrick* whatsoever. Whereof *Eurythmia* is that agreeable Harmony between the Breadth, Length, and Height of all the Rooms of the Fabrick, which suddenly, where it is, taketh every Beholder, by the secret Power of Proportion: Wherein let me note this, That though the least Error or Offence, that can be committed against Sight, is Excess of Height; yet that Fault is no where of small Importance, because it is the greatest Offence against the Pursue.

*Symmetria* is the Conveniency that runneth between the Parts and the Whole, whereof I have formerly spoken.

*Decor* is the keeping of a due Respect between the Inhabitant and the Habitation. Whence Palladius did conclude, that the principal Entrance was never to be regulated by any certain Dimensions, but by the Dignity of the Master; yet to exceed rather in the *More*, than in the *Less*, is a Mark of Generosity, and may always be excused with some noble Emblem, or Inscription, as that of the Conte di Bevilacqua, over his large Gate at Verona; where, perchance, had been committed a little Disproportion.

Patet Janua: Cor magis.

And here likewise I must remember our ever memorable Sir Philip Sydney (whose Wit was in truth the very Rule of Congruity), who well knowing that Basilus (as he had painted the State of his Mind) did rather want some extraordinary Forms to entertain his Fancy, than Room for Courtiers, was contented to place him in a Star-like Lodge; which otherwise, in severe Judgment of Art, had been an incommodious Figure.

*Distributio* is that useful casting of all Rooms for *Office*, *Entertainment*, or *Pleasure*, which I have handled before at more length than any other Piece.

These are the four Heads which every Man should run over, before he pass any determinate Censure on the Works that he shall view; wherewith I will close this last Part, touching *Ornaments*. Against which (methinks) I hear an Objection, even from some well-meaning Man, That these delightful Crafts may be diverse ways ill applied in a Land. I must confess, indeed, there may be a lascivious, and there may be likewise a superstitious Use, both of *Picture*, and of *Sculpture*. To which Possibility of Misapplication, not only these Semi-liberal Arts are subject, but even the highest Perfections, and Endowments of Nature: As *Beauty* in a light Woman; *Eloquence* in a mutinous Man; *Resolution* in an Assassinate; prudent *Observation* of Hours and Humours in a corrupt Courtier; *Sharpness* of Wit and Argument in a seducing Scholar, and the like. Nay, finally, let me ask, What Art can be more pernicious, than even *Religion* itself, if itself be converted into an Instrument of Art? Therefore, *Ab abuti ad non uti, negatur consequentia*.

#### CHAPEL OF ST. EDMUND, WALPOLE.

In reference to an article which appeared in our last number headed "*New Chapel at Walpole, St. Peter's*," and which article was extracted from the *Cambridge Chronicle*, the rector of Walpole has written the following letter to the editor of that paper:—

Sir,—In perusing in your last number a descriptive account of St. Edmund's Chapel, consecrated on the 26th inst. I observe so many inaccuracies, that I must request to be permitted to say a few words in reply.

The nave is 42 feet 6 inches long, not 46 feet, as asserted by your correspondent. The apse is 16 feet by 14 feet, dimensions which, though scanty, bear a better proportion to the size of the nave than would appear from his statement.

The seats do not "fill the entire chapel," an open space being left in front of the chancel arch, and westward of the pulpit. The aisle is 5 feet in width,—and the back of each seat is 2 feet 8 inches in height.

The chapel has seats, not for 400, but for 180 persons, and are all open and free. Your correspondent's estimate of the expense is much exaggerated. The figure of Our Lord (not that of the Blessed Virgin) occupies the east window. "The incomprehensible saint" is St. Edmund, bearing in his hand an arrow, the instrument of his martyrdom. Had your

correspondent taken a little trouble to inquire, the poorest cottager would have informed him that the ancient chapel of St. Edmund formerly stood at no great distance, suggesting the same saint as the patron of the present building.

The "kind of dog-toothed quatrefoil" (?) which is the name your correspondent assigns to the ornament on the edge of the altar, is neither more nor less than the well-known *indented star*, sharp, and deeply cut—a device purely Norman—and so far from being a "deviation from the style" of the building, it is, on the contrary, a fac-simile of the top-stone of an undoubted Norman altar lately discovered in Norfolk. The cross on the frontal is also Norman. The whole design of the altar is plain and simple, somewhat resembling a tomb.

The chancel arch is 8 feet wide: instead, therefore, of its spanning "three parts of the entire breadth of the chapel," to have said *one-third* would have been more correct.

Our font is 2 feet 5 inches in diameter—a dimension by no means beyond the average in Norman fonts, nor is the size of a church necessarily a rule for that of its font. It has much of the boldness that characterizes the style. Its position in the centre of the aisle, near the west door, is in accordance with the recommendation of the Incorporated Society.

The cornice was not intended to be of Norman design, but to assimilate with the other wood-work, which follows a later date. Tastes may differ in such matters of detail; but I have reason to believe, that many persons of good taste and sound judgment would approve of the course we have adopted in reference to this point. Indeed, the poppy-heads were carved from casts taken from initials lately put up by the Camden Society in the Round Church, Cambridge, a Norman building; and it was *their* advice which was of influence in our choice of a later style for the furniture. For my own part, I have no objection to take refuge under their responsibility.

Whether in the absence of a steeple and side-aisle, *chancel* is implied, I know not; if it is, I would appeal to any person of taste whether such features would not be quite out of keeping with the size and simple character of the whole building. A bell-cote has been adopted, taken from a very elegant specimen in Buckinghamshire.

My object in the above remarks has been merely to correct some inaccuracies in your correspondent's letter. I have endeavoured to do so without acrimony. I feel grateful to him for his mention of my name with approbation, scarcely deserved on my part. I only wish that before he had put pen to paper he had applied to me, or to some other party qualified to give him accurate information on the subject-matter of his letter.

I am, Sir, yours, &c.,

ARTHUR MOORE.

Walpole Rectory, Lynn, Oct. 1, 1844.

[We have no hesitation in recording our opinion that the fitting-up of new churches with carpentry, furniture, and fittings in discordant styles, and differing from the main fabric, if not very bad taste, is taste of a very low and piece-meal description. We are sure those who *built* the Round Church would not have fitted it up in any such style.—Ed.]

#### DECORATIVE ART SOCIETY.

##### PAPER HANGINGS.

A VERY interesting and valuable paper was read last Wednesday evening, at the apartments of the above society, in Davies-street, Berkeley-square, by Mr. Cowtan, "On Paper Hangings," at the conclusion of which a discussion took place, for the purpose of eliciting further information on the same subject from those who were present. Mr. Crabb, whose paper on *Design* we have republished, took a leading part in the discussion, as also did the secretary, Mr. Laugher. We regret that our space this week does not admit of a notice of the evening's proceedings so detailed as we could wish. The quiet, unobtrusive, and successful course this society is steering, and the judicious way in which it is effecting its objects, are deserving of much praise. We shall endeavour in our next number to revert to Mr. Cowtan's paper,

CATHEDRAL OF AGHADOE.

ELEVATION OF THE WESTERN DOORWAY.

PLAN OF THE WESTERN DOORWAY.

(Only one of the Columns remains.)

5 in. dia.  
COLUMN AND IMPOST OF THE  
DOORWAY.

ARCH-STONE AT D ON THE  
ELEVATION.

SECTION OF THE ARCH-  
STONE AT D.

PLAN OF THE EASTERN WINDOWS.

Exterior of one of the Eastern Windows.

Ornaments carved under the Arch-spring at E and F, on the narrow jamb, 2 1/2 inches wide, between the Eastern Windows.

Part of one of the Eastern Window-jamb (to an enlarged scale).

PLAN OF THE CATHEDRAL.

OLD CATHEDRAL OF AGHADOE, COUNTY KERRY.

SIR,—From the willingness shewn on your part to insert the contributions of your numerous correspondents, many of whom are kindly disposed to lend a helping hand in placing before the public so much of the neglected but not the less interesting remains of the ancient architecture of the country, I beg to offer for insertion in THE BUILDER the annexed sketches, taken from the old Cathedral of Aghadoe, county Kerry.

The church or cathedral is a plain oblong building, having little to admire except the western doorway, one peculiarity alone in its arrangement being somewhat remarkable—a stone wall carried up nearly in the centre of the interior. For what purpose this wall was constructed, I beg before concluding to submit an opinion, as it has given rise to some published observations by tourists and others, tending to shew a difference in the style as well as in the antiquity of those portions of the cathedral being east and west of the central wall.

Before proceeding to remark on the above, where all at best must be conjecture, it may be desirable to notice the taste and skill exhibited in the execution of the western doorway, which, notwithstanding its present dilapidated state, confirms the general opinion, that however rude in design were most Norman churches the western or entrance doorway was well executed.

The accompanying sketch and details are intended to represent its appearance at the present time.

The doorway, when contrasted with the simple forms of the windows, may be considered a very fine specimen of workmanship. Two of the windows are still uninjured by time, probably from being less ornamental than the doorway; for from the assaults (to use a military phrase) of the neighbouring peasantry, who without hesitation frequently displace some beautiful arch-stone or other architectural ornament for the purpose of marking the spot where some departed relation "rests in peace," not thinking for a moment that such Vandal-like acts

prove in the long run highly destructive to these sacred monuments of Christian piety, left as landmarks of the munificence and skill of our ancestors, who appeared to have kept in perpetual remembrance that beautiful passage in the 25th Psalm, "I have loved, O Lord, the beauty of thy house; and the place where thy glory dwelleth." It is much to be deplored that little or no efforts have hitherto been made to stop the hand of the destroyer, whose progress in destruction will, before another half-century passes away, complete the havoc Cromwell commenced some 190 years ago.

Owing to the Cathedral of Aghadoe being in the vicinity of the far-famed Lakes of Killarney, and commanding, from its elevated site over the adjoining roadway, one of the most magnificent scenes the eye can rest on, on one side the great Mangerton and Turk mountains, clothed to near their cloud-capped summits, with the inexhaustible Arbutus tree; the wild and rugged pass through that stupendous chasm called "the Gap of Dunloe;" the romantic and beautiful island of Innisfallen, noted as being the spot where the materials were collected and written denominated the "Annals of Innisfallen," valuable for their illustration of ancient Irish history; this island is also the subject of Moore's well-known song, "Sweet Innisfallen, Fare thee well." It is, therefore, no wonder that this spot (Aghadoe) has become a favourite resort of tourists and others, independent of the attractions to be found in viewing the roofless walls of an old building. Let this be as it may, the cathedral has afforded materials for some published opinions, both as regards the architecture and antiquity of the fabric. One writer asserts, "The cathedral consists of two distinct chapels or churches, of unequal antiquity, and of somewhat different architecture, separated by a solid wall."

Having had frequent opportunity during the past year of visiting this old ruin, I never could perceive, after careful examination, any difference in the workmanship of the two tank walls, which are inclined outwardly, so as to leave the cross-wall standing in the clear, with an open space of two or three inches at the top, leaving no doubt, from having neither tie

or bond-stones into the side walls, of its being built long after the church.

But then we are left wholly to conjecture the object of such an unusual arrangement. The assertion in the quotation above, that the cathedral was "separated by a solid wall," is not strictly correct, as I found the appearance of a doorway and window, now walled up. Finding no tradition respecting this matter amongst the "oldest inhabitants" of the locality, the only thing I could glean to throw any light on the subject is, that the See of Aghadoe was suppressed about the year 1600. Such an occurrence must have made a great change in the ecclesiastical establishment connected with the then cathedral. It therefore may be fairly presumed that such a change had the effect of lessening, not only the new "staff," but the numerical strength of the flock also. Hence the necessity of suiting the church to the congregation may be judged a judicious arrangement, both as regards economy and comfort, by having the cathedral shortened by means of the cross wall in question. This alteration, whilst it had the effect of excluding much of the cold damp air, may be considered a desideratum equivalent (in those days) to that modern appendage and antidote against rheumatism, a Doctor Arnott's stove.

Your obliged servant,  
J. K. L.

Ferns, August 16, 1844.

TIMBER—ITS TREATMENT AND USES.

BY JAMES WYLSON.  
(Continued from p. 505.)

106. WILD-CHERRY, or GEAN-TREE.—The best specimens of this hardy native are such as have sprung accidentally in the woods, where, although not very commonly it is yet frequently to be met with: its wood is more used on the Continent than here, for notwithstanding the avidity with which, when felled, it is purchased by cabinet-makers, it is with us seldom cultivated as a timber-tree, and has not the care bestowed on it which it deserves. Under favourable circumstances it will attain, in a growth of fifty years, a height of 60 or 70 feet, with a trunk ample enough for general purposes, the timber being of considerable size and durability. This tree is of an ornamental and pleasing character, springing up, as it approaches maturity, in a pyramidal form, and its branches shooting out at right-angles from the stem. In the spring months it is particularly interesting on account of its luxuriance of white blossoms, which render it, in the lawn or park, a very attractive object; these, as well as the leaves, much resemble those of the orchard or cultivated cherry, its leaves are oval, pointed, serrated, and smooth; the fruit is black, small compared with the cultivated cherry, and has a stone larger in proportion. There are other species of the wild cherry of a more vigorous growth and larger size, and with red fruit. Young plants are propagated by layers, or from the stones, which in autumn or spring are sown thickly in the nursery, on a bed of good soil, and in due time are rowed out, previously to being ultimately planted. This tree makes excellent stocks wherewith to graft the orchard-cherry. From the older branches a gum exudes which serves very well as a substitute for gum-arabic. The wood of well-grown trees is highly valuable, being strong and firm in texture, close-grained, and susceptible of a high polish; it is in colour of a beautiful red. It is very suitable for boring and forming musical instruments; and is also calculated for tasteful display in cabinet-work.

107. LAWTON or WHITE THORN.—This is generally known as a plant for quick-set or living hedge-rows, for forming which it is invaluable, its appearance having a striking superiority over that of stone or stake fences; but it is nevertheless to be met with of such dimensions as to entitle it to our consideration as a timber tree. Those at Bushy Park, from which that domain has been supposed to have derived its name, are believed to have existed in the time of Cromwell, and will, therefore, seeing that he died in 1658, be about 200 years old. Instances occur of their attaining a circumference of from six to ten feet, and it is remarked that it seems to be the nature of those specimens which reach a great age, to part into a number of separate stems.

108. In early times this tree appears to have had a high poetical standing; for we find

that the ancients considered it as the emblem of hope; that the Troglodytes, an Ethiopian tribe, on that account strewed branches of it over their dead; and the Athenians, with torches made of it, illuminated the altar of Hymen, their young girls also carrying boughs of it in the wedding processions. In the days of chivalry too, when a lady favoured the suit of her knight, she wore its leaves tied with carnation ribbons, the reading of which being "hope in love," undoubtedly impelled the lover to still more stalwart feats to prove the tenderness of his passion. In our own day, its early and sweetly-perfumed blossom gives well-founded hopes of a beautiful spring, and is hailed by young people under the name of *May*. The Glastonbury thorn is a variety which is by some described as blooming twice a year; at the usual time in spring, and again, though more thinly, about Christmas; and by others as blooming much earlier than the common hawthorn, being frequently found in flower in January or February, and in very mild seasons soon after Christmas—a circumstance rare, and which in darker ages was attributed to miracle: of the correctness of the former we entertain a doubt, but not having the means of ascertaining the truth, we must leave it for some one located near the abbey to solve it. Of the sacred character of this thorn, we are informed by tradition handed down by the monks of Glaston, that "Joseph of Arimathea, to whom their abbey is dedicated, ceased from his wanderings at the place where it stands, and there stuck in the ground his staff, cut from a thorn tree in the Holy Land, and which took root and flourished," and still continues to be propagated, young plants being raised in the nurseries. When in 1752 it was deemed expedient to alter the *style*, and the common people considered themselves robbed of eleven days, a deputation was sent from a village in Warwickshire to consult the holy thorn of Glastonbury, a sprig of which—it being believed to blow every Christmas-day, and being just then in leaf or blossom—was borne back in triumph.

109. The wood of well-grown hawthorn is of a tough and strong description, an idea of which is gathered from the fact of its being made available for axletrees and tool handles.

110. *BIRCH* (COMMON WHITE).—This tree, called by Coleridge "the lady of the wood," is comparatively small, but of great beauty; light, airy, and elegant, frequently assuming the pendent character, and thence distinguished as the "weeping birch;" there are also other varieties of it, besides the poplar-leaved, the tall, and the black American. It thrives best towards the northern parts of Europe, and is capable of flourishing where no tree indigenous to Britain will grow—having been found in Scotland at an altitude of 3,500 feet above the level of the sea, though of dwarf dimensions. As a graceful ornament in landscape gardening, especially if there be water in the composition, it is scarcely to be surpassed; and it forms a chief adornment to our wild and mountainous tracts, being abundant in Wales, Ireland, and Scotland, the romantic scenery of the latter graced by the weeping variety especially. The leaves are oval, tapering to a point, and serrated, and they exhale a very pleasant fragrance; the slender twigs are made into brooms, and are besides known to the schoolboy in another form, being characterized as the

"Well-lettered birch,  
Which supplies law, and physic, and grace for the church."

The wood is not of much utility, nevertheless as a coppice-plant it is useful for many rural purposes; hoops, clogs, and various utensils are made from it, and arrows used to be formed from it in the days of archery. The smaller branches are cut for yard and stable brooms, and in the north it is even used for the covering of houses; in Lapland, water-proof boots are made from it without seams, the legs being taken from the trees entire; being resinous, it makes good fuel and even torches; it also furnishes the material from which the pleasant and wholesome beverage called "birch wine" is made, the juice for this purpose being obtained by making, in the spring when the sap is beginning to rise, a deep incision in the trunk; the bark is white, very valuable, and has been likened to layers of beaten silver. Young plants of the common birch are most conveniently raised from seeds; exotics from layers,

or by grafting on the former; the soil favourable to its growth is of a poor, light, or sandy description.

111. *ARBOR VITÆ*.—This is one of the most beautiful of our evergreens, and of a bright, lively description; the English species is merely ornamental, but the wood of the American is of considerable value for fencing, being very durable when so, or similarly employed.

112. *LIME*, OR *LINDEN TREE*.—This, if not of all European trees the one capable of reaching the greatest diameter, at least ranks in that respect in the very first class, examples of very large dimensions being found in Switzerland and many parts of Germany, some being extant which are above 50 feet in circumference, though not arrived at their growing maturity. The lime attains a height of 40 or 50 feet, and an instance exists of one in Norfolk 90 feet high. Its blossom is of a delicate light-green colour, and diffuses widely a fragrant and delicious odour. There is no clear evidence of its being indigenous to this country; indeed, from the circumstance of its seeds very rarely ripening here, an almost conclusive inference may be drawn that it is not so: the small-leaved variety, however, is generally believed to be native, and the large-leaved one an exotic: be this as it may, its introduction must have been at a very early period; for it is mentioned familiarly by the earliest writers on the subject; two examples at Hlstead, planted in 1590, and still growing, have been said to be the first planted in England; but it is rather supposed to have been introduced here by the Romans. If any exception could be taken to the appearance of the lime-tree, it would be in respect to its uniformity of outline; this characteristic, however, does not render its beauty wholly devoid of the picturesque, for when favourably situated, it is a pleasing and even striking object; and in regard to elegance of foliage, it is scarcely rivalled.

113. It is a tree of most rapid growth, the large-leaved being more so than the small-leaved. There are several varieties, and which, from its being a handsome leafy description of tree, are grown chiefly for ornament, being well adapted for avenues and situations where their grateful shade is desirable; also for the adornment of squares and public walks in large towns, to which they form a graceful, and, coming as they do early into leaf, a very advantageous appendage; intimating to the inhabitants the advent of the much-longed-for spring. The intersection of the contiguous branches of the lime over an avenue has, in the pleasant task of fixing the origin of Pointed Architecture (but which seems as elusive as the discovery of the longitude or the squaring of the circle), been construed into the veritable lancet arch; certainly no elaboration of fan-tracery could form a more delightful canopy than is afforded by its green boughs and broad beautiful leaves; nothing in sculpture can equal its beautiful branches in luxuriant blossom.\* It is, for a reason already referred to, not often raised from seeds; but when it is so, they should be sown in autumn, in a shady border of earth of a moist and light description; the seeds ripen about the end of October. It is most generally, and most advantageously, propagated by layers, which may be obtained from stoles or mother plants cut close to the ground, and laid in autumn, in almost any soil if not of a nature too arid. It possesses the singular advantage, that it may be transplanted at a considerable size with as much safety as a seedling.

114. The varieties of limes we can name,

\* [By-and-by will be seen if this notion be correct or not: whether Gothic cathedrals were or were not so invented. The greater part of their science may be referred, and that correctly, to a grove of trees. We believe that the progression of substance matter and strength which are contained in a tree from its summit downwards, agree with the *philosophical solid figure of pressure equal throughout*, modified to suit the differing vicissitudes of winter, leafage, fruitage, and storm. This is to some extent shown in the very toys of children, where trees are represented by small conoidal bits of wood, which are BRANCHED OUT, NOT BY ADDITIONS TO THE MATERIAL, BUT MERELY BY STRIPPING AWAY THE SUBSTANCE OF THE WOOD FROM AND OUT OF THE GENERAL TAPERING MASS. A correct model of a vaulted cathedral may be made, with its ramified roof-tracery, out of a grove of such toys.—Ed.]

are the common *linden*, the *small-leaved*, the *broad-leaved*, the *coral*, the *red-twigged*, the *American*, the *white*, and the *downy* lime. The small-leaved is the one believed to be our own native species, and is commonly met with in Essex, Sussex, and Lincolnshire, flourishing in the greatest perfection, and attaining a diameter of 4 feet, and in soils of a loose, deep, and fertile description, a height of 8 feet; its leaves are dark-green and smooth above, glaucous underneath, with brown hairy tuft at the springings of the leading veins, and about two inches wide; it is about a month later in flowering than the succeeding description. Our broad-leaved variety is said to be the wild lime of Switzerland and Southern Europe; it attains a size equal to that of the common *linden*, and is met with in the woods and hedges of Whitstable, in Surrey, and in various other places: its leaves are, on their underside, clothed with a white down, the ribs and veins covered with fine hairs; they have also long foot-stalks. The coral lime is so nearly allied to the broad-leaved kind as to be by some considered as a variety of it. The American lime is of recent introduction in this country, and, judging by a specimen at Whiteknights, in Berkshire, which has attained the height of 60 feet, we may anticipate its proving one of great growth: its leaves are dark-green above, paler beneath, obliquely heart-shaped, and very large, the blossom odoriferous, large, pendulous and elegant, and having, like our more naturalized varieties, a long, narrow floral leaf attached to each bunch; in its native country it flowers in the middle of summer. The white variety is mostly to be found in America, on the banks of the Ohio; the downy sort, also, on the Susquehanna; this is a native of the Floridas and the southern parts of the United States; its leaves are very downy underneath, and its flowers more plentiful, and produced in larger bunches, than in other species.

115. Respecting the purposes to which the Linden-tree is applied, it may be mentioned that the light, delicately-white, tender, and uniform texture of its wood, together with its injuring so very slightly the tools with which it is worked, has so suited it for the carver's art, as to obtain for it the designation of "the carver's tree." The celebrated Grinling Gibbons employed it in his exquisite representations of flowers, dead game, &c.; it is used in the manufacture of moulds, small toys, pill-boxes, and other light wooden wares, also sometimes in forming carriage-panels and the seats of Windsor chairs; a good board of it is capital for the leather-seller and the shoemaker to cut out upon; it is likewise used by the turner, and, having an excellent spring, is made into fishing-rods, although, from its weight and brittleness, and liability to snap through without giving the least warning, these should only be used by experienced anglers, and must for real utility give place to the hickory; when spoken of with reference to its application to this and similar purposes, it is commonly termed "Lancewood." Abroad, its bark being prepared in a particular manner, and manufactured into matting, called *bast*, is used for packing up hemp, flax, and other commodities; here it is used in like manner by the cabinet-maker, for packing furniture, also by the gardener, for fruit trees. Its flowers, from their fragrances, generally form one of the ingredients in making *pot-pourri*; and a decoction of them is said to be a good antispasmodic.

(To be continued.)

DUNDEE TRIUMPHAL ARCH.—Lord Paunre, father of the Right Hon. Fox Maule, M. P., has subscribed the munificent sum of 500*l.* towards the triumphal arch, proposed to be erected at Dundee, to commemorate the visit of Her Majesty and her illustrious consort. The loyal inhabitants of that prosperous town have agreed upon an arch, as was the case with the Perth people, when the queen visited that ancient city in 1842.

NORTHAMPTON ARCHITECTURAL SOCIETY.—A general meeting of the friends of this institution will be held at the George Hotel, Northampton, on Wednesday the 16th instant. The Marquis of Northampton, one of the presidents of the Society, has consented to take the chair.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*Re-Consecration of Saint Mary's Church, Dover.*—On Tuesday, Oct. 1, this church was re-consecrated by his Grace the Archbishop of Canterbury—the restoration (or rebuilding) and extension of the sacred edifice having rendered the ceremony necessary. The Rev. B. Harrison, the chaplain of the archbishop, preached the sermon, and took occasion to observe that the venerable fabric, the oldest portion of which still remained, had been restored—he might say rebuilt. It was originally erected about the time of the Norman Conquest, with that solidity which characterizes edifices of that period, and about 150 years subsequent had been enlarged, and broader and larger arches of a later period erected, which in like manner had been restored. The work now effected had been executed with much elegance, while the space had been made more available, and would admit of the accommodation of a larger number of worshippers. By the pulling down of the necessary portions, the whole edifice had been endangered, which rendered the rebuilding of the external wall necessary. The increasing population of the parish, and the augmented numbers of visitors, called for the enlargement of church accommodation; and these objects had been accomplished at a cost which would fall little short of 6,000*l.* The original estimate did not exceed 4,650*l.*, which is more than covered by the amount already received, that being 4,850*l.*—of which 1,600*l.* was raised by a parochial loan, 500*l.* received from the Incorporated Church-Building Society, and the remainder by individual subscription. An additional expenditure of 1,000*l.* had been necessary to gain a secure foundation.

*St. Clement's Church.*—A short time since, says the *Corwall Gazette*, as Mr. W. Pearce, statuary of Truro, was removing a portion of the plaster on the north side of this church, for the erection of a tablet, he came upon a curious old fresco painting, rudely executed, about 12 feet by 10 feet, inclosed in a quatrefoil border. The colours were well preserved. The principal figure is recumbent, and he holds in his right hand a palm branch. By his side stands a female figure, in royal ermined robe, and holding a globe and cross. Beneath is an antique ship, with quaint high forecastle and poop, and around it are sporting a number of mermaids and dolphins. In the upper part of the painting are some rude representations of churches, and at the open entrance of one of them is shewn a man pulling a bell in the steeple, by means of a leverage somewhat similar to that by which we see our smiths' bellows now worked. The whole painting exhibits a thorough disregard of proportion, grouping, and perspective. It is conjectured that the design of the painting was to commemorate the return of Admiral Hawkins, of Trewithan, in the adjoining parish of Probus, one of the commanders of the English fleet which conquered the "Invincible" Armada; with Queen Elizabeth welcoming him home, and his countrymen also testifying their joy at his return. A portion of the painting is still open to inspection; and a coloured sketch of part of it has been made by an artist, Mr. Philip Mitchell.

*Bristol Cathedral.*—The alterations so frequently made in parish churches by churchwardens have often been subjects of severe and just complaint. In cathedrals, which are presided over by an enlightened corporate body, we do not expect to find alterations made of a mean and shabby character. In our cathedral, however, we have just seen a re-modelling of some of the seats near the pulpit, which has surprised and grieved us; by whom ordered it is not for us to inquire. Several pews have been removed, and open seats substituted; but instead of being constructed of oak, like the handsome carved specimens around them, they are made of common deal; they are, too, literally *sittings*, no kneeling-places being attached to them. The pulpit-stairs, also, hitherto in the north aisle—a locality most convenient to the officiating clergymen, have been very injudiciously removed into the choir, greatly abridging the seat-room, and presenting an unsightly appearance. The recumbent stone figure of Bishop Paul Binshe, which has survived the violence of the Cromwellian troops, has been inclosed in a *glass case*, and is now visible from the choir.—*Bristol Journal*.

*New Church at Wood Green, Tottenham.*—On Thursday, October 3, the new church at Wood-green, in the parish of Tottenham, was consecrated by the Lord Bishop of London. This interesting ceremony was witnessed by about 30 of the neighbouring clergy, and a very full attendance of the founders of the church. The hamlet of Wood-green contains a population of about 400, and the church affords accommodation for about half that number. It is of the Early English style, and has been constructed from a design and under the superintendence of Messrs. Scott and Moffatt. It is entirely of stone, Kentish rag, dressed with Bromhill stone. The pulpit and font have been elegantly carved in Painswick stone by Mr. Cox, of Oxford. The roof is open. The history of the building of this little church may afford an useful lesson to building committees engaged in any similar undertaking. For some time it had been contemplated to make some provision for the spiritual good of Wood-green; but the resources of the hamlet were clearly not equal to the expense of building a church. An appeal, however, was made to the parish generally. The intention set forth was building a church, not on a niggardly and sparing principle, but of stone and in the best possible manner, and the result has been that assistance has been rendered, and that contributions, many of them anonymous, have come in from quarters whence they were least expected.—[The above particulars, though exaggerated, may not be altogether without interest.]

The chapel at Burton Constable, Yorksire, is being splendidly decorated in lively colours and gold, from designs and under the direction of Taylor Bulmer, Esq. The ceiling is divided into compartments of ultra-marine, and powdered with stars, surrounded by a *bordure* of pure scarlet and gold. The pillars and rood are also richly gilt and coloured. The several niches are of a deep azure, powdered with fleur-de-lis, having also a scarlet and gold band, with scriptures, &c. A very fine window of stained glass, originally from the Continent, and lately in the church at Tixal, has been placed at the end opposite the altar. The mouldings are to be richly painted and gilt.—*Hull Packet*.

A subscription is set on foot for beautifying the Abbey Church at Romsey. The sum of 2,000*l.* is still wanted, and about 400*l.* are already collected. A new organ is much desired by many.

*New Church, Swadincote.*—Earl Howe, Lord Teignmouth, Sir Oswald Mosley, and Mr. Colville, M.P., have given liberal donations towards the erection of a new church at Swadincote, Derbyshire.

**SOUTHEND NEW PIER.**—The progress of this construction will be completed in the course of the ensuing spring or early in the summer. Its extraordinary length, stretching out as it does over the shallow bay a distance of a mile and a quarter, renders it an undertaking of much interest. The pier is chiefly supported on cast-iron piles, which are so placed as to lean considerably towards each other, so that when united by the cross-beams and planking they have some of the properties of an arch, and present thereby a strong resistance to the pressure of the sea, which in stormy weather runs very high there. At first an attempt was made to drive these iron piles in the usual manner by the machine commonly called a "monkey." This process was abandoned in consequence of the metal splitting by the concussion. The piles are now fixed by "wriggling," their weight under an oscillatory motion serving to insinuate them into the soil so effectually, that it is found impossible to move them when fixed, and some difficulty has arisen in consequence of one or two not having been sloped inwards as originally intended. The necessity for the erection of this pier must be apparent to all who have landed at this little watering-place at any other time than the period of high water, for an awkward transit in clumsy flat-bottomed boats does not always serve to secure a landing, passengers being sometimes coolly requested to step out, and wade through the mud and water at a depth of four or five inches. But cast-iron piles have hitherto decomposed in salt water.

## RAILWAY INTELLIGENCE.

*Egyptian Railway.*—The project of still further facilitating the intercourse between Europe and India, by means of a railway across the Isthmus of Suez has been resumed, with the prospect of an early accomplishment. The consent of the Pacha of Egypt for the formation of this line was some time ago obtained by Mr. Galloway; but the premature death of that gentleman, after thirty miles of rails had been transmitted to the spot, put a stop to the undertaking. If it should now be completed, the saving of time in the overland journey will be twenty-four hours, and there is no doubt that it would be a source of increased wealth to the Pacha. The fact that from the commencement of the new year the mail to and from India will be fortnightly, instead of monthly, makes the project of greater value and importance.—*Railway Record*.

*The direct Northern Railway from London to York, via Lincoln.*—We have this week seen a plan of the above proposed line, for which Parliamentary plans, &c., are in the course of preparation, and will be brought forward early in the next session. The line, we believe, will commence near King's-cross, in the New-road, proceeding thence by Chipping Barnet, Biggleswade, St. Neot's, Huntingdon, near Peterborough and Market Deeping, by Stamford, to the west of Bourne, east of Grantham, west of Sleaford, and east of Newark, to Lincoln, and thence by Gainsborough, Thorne, Snaith and Selby, to York; thus passing through a most densely populated district, connecting the north of England and Scotland with the metropolis, completing the whole distance in 180 miles.

*Atmospheric Railway.*—It has been propagated by the organs of this scheme, in opposition to what we stated, that the Great Western directors, who have been over to inspect the working of the Dalkey line, have returned highly satisfied with it. We can, on the best authority, give this a flat contradiction. They are not only not pleased with it, but displeased, we believe we can say to a man, as being all that we had described it.—*Herapath's Journal*.

*Her Majesty's State Carriage on the Southampton Railway.*—This splendid carriage is nearly completed, under the direction of Mr. Beattie; and it is confidently expected that the application of the patent Kumpulicon (or composition of cork and India rubber), under the carpet and between the framework and body of the carriage, will entirely prevent the unpleasant vibration inseparable in all railway travelling.

*The Railway Act.*—The new Act came into operation last Tuesday week; it compels all companies to provide third-class carriages with awnings, to protect passengers from the effects of bad weather.

**WESTMINSTER IMPROVEMENTS.**—Some of the inhabitants of Westminster having seen the plan for the proposed improvements, invited their neighbours to meet them last Tuesday week, to take them into consideration. They had been unable to obtain a copy of the plan, but from what they had seen of it, reported that it was very nearly the same as that formerly projected and known as "Rigby Wason's line." The following are some of the principal defective points which it was agreed to lay before the Commissioners of Woods and Forests and the public.—By the proposed line Westminster Abbey, which ought to be thrown open to public view, is left as obscure as ever; instead of a direct line from Westminster Abbey to Picnic, it is a curved street from Westminster Abbey to Vauxhall-bridge-road; it does not improve the approaches to the Palace, but diverges further from it every yard it proceeds; it leaves the sewerage of Westminster unimproved, and does not touch the bad lanes, courts, and alleys branching out of York-street in the neighbourhood of the Palace, which are a continual source of malaria and consequent fever. There were other strong points of objection to the proposed plan, but the foregoing were considered such radical defects, that it was thought it would only be necessary to call the attention of all parties concerned to them to insure its rejection; and a subscription was entered into and a committee formed to take the necessary steps to effect this.—*Times*.

## Correspondence.

METROPOLITAN NEW BUILDING-ACT.  
"ALREADY BUILT"—BUILDINGS BEGUN BEFORE 1ST OF JANUARY, 1845—LIMITATION 1ST JANUARY, 1846.

To the Editor of "The Builder."

SIR,—I think the reply you have given to your correspondent "Felix" in reference to the time and manner in which the New Building-Act will come into operation is not quite correct, and therefore trouble you with this note, that you may take an opportunity of correcting the matter if my view of the case be the right one, as I feel assured that you would regret that the influence of your valuable journal, which is growing to be an authority in matters connected with building, should, however unintentionally, tend to mislead any one.

If you refer to the 9th clause, you will find that whatever state a building may be in at the time the operation of the Act begins, it becomes at once subject to the provisions of the Act. "So far as any part thereof may remain to be executed after this Act comes into operation;" and consequently that the Act will not be avoided, unless any such building is so far advanced as to have all those matters completed (the walls and roofs) to which the Act is intended to apply.

I am, Sir, your most obedient servant,  
THOMAS PIPER, Jun.

173, Bishopsgate-street, Oct. 2, 1844.

[BY THE 2ND SECTION OF THE ACT, "The term 'ALREADY BUILT' used in reference to buildings," is "to apply to buildings BUILT BEFORE the 1st day of January, 1845, or COMMENCED before that day, and covered in and rendered fit for use within twelve" (calendar) "months thereafter; and, used in reference to streets and alleys, to apply to all streets or alleys made or laid out before that day, and which shall be formed and rendered fit for use within twelve" (calendar) "months thereafter."

"The term 'HEREAFTER TO BE BUILT,' used in reference to buildings, to apply to all buildings to be BUILT OR COMMENCED AFTER the 1st day of January, 1845, or which, being commenced, shall not be covered in within twelve" (calendar) "months thereafter; and used in reference to streets and alleys, to apply to all streets or alleys NOT laid out before the said 1st day of January, or which, being laid out, shall not be rendered fit for use within twelve" (calendar) "months thereafter."

WE CONSIDER the provisions of the 9th section of the Act relative to contracts, whereby "It shall not be lawful to execute such contract otherwise than in conformity with the provisions of this Act," would be strictly fulfilled by the completion before the 1st January, 1846, of any building begun before 1st of next January, according to previous statute, and that all streets and alleys completed for use before the 1st January, 1846, will be legal, whatever may be their widths, though in the latter case the term use may admit of dispute; we ourselves think it cannot be intended that streets partly built shall be required to be suddenly widened throughout the remainder of their extent; the term use, we imagine, being applied to the purposes of passage, and not to habitation.

WE CONSIDER that the words in the 9th section, "It shall be LAWFUL for either party, and he is hereby ENTITLED to deviate from such contract so far as any part thereof may remain to be executed after this Act shall have come into operation; and the alterations rendered necessary by this Act shall be performed as if this Act had been in force when such contract was entered into," are not intended to compel any party to forfeit the direct allowance granted by the 2nd section; but to entitle either party voluntarily so to deviate as to comply prematurely with the new statute, with the understanding that he abide the award of the district surveyor, or by appeal that of the official referees, as to all attendant expenses and costs of appeal.

Perhaps the "RULES concerning chimneys HEREAFTER BUILT OR REBUILT" (Schedule F), may be construed to apply to all chimneys not commenced on the 1st January, 1845, although the buildings to which they are attached may be previously begun. There may be some other exceptions, which will be better seen from the alphabetical digest which we intend to publish.—Ed.]

## EXTERNAL WALLS, FOURTH-RATE, DWELLING-HOUSE CLASS.

SIR,—In conning over the various clauses of the New Building Act, contained in your valuable publication of August 31st, my attention was particularly directed to those parts which refer to fourth-rate houses; there appears a little discrepancy in the reading with regard to thickness of external walls (Schedule C. part 2nd, page 445), and the section shewn page 446.

Question.—Suppose I build a fourth-rate house of two stories, that is to say, a ground and one-pair floor, is it compulsory on me to have brick-and-half walls up to the underside of the one-pair floors, or only, as at present, the brick-and-half to the underside of the ground-floor?

Dock Head, Bermundsey.

[We do not perceive the supposed discrepancy. The wording of the schedule runs "at least 8 inches thick, from the under side of the floor NEXT BELOW the TOPMOST FLOOR, up to the top of the wall." The section given with the Act agrees with this. Therefore, in the two stories mentioned, the external walls may be only one brick thick.—Ed.]

## TUBULAR AND OTHER FLUES.

SIR,—Will you confer upon me an additional obligation, by publishing the following extract from a list of nine, circulated nearly twenty years ago. It might be of use to some who erect cottages and other buildings without brick or stone jambs, or thick walls; and would also tend to corroborate the purport of my former letter, which appears to have freed the "Ebury Wharf" advertisement of what may turn out to be both libellous and untrue.

"CHIMNEYS.—Instead of projecting brick-work occupying so much space in rooms, Thomas Peake thinks, from experiments he has made, that 10 inch socket pipes would be found an almost invaluable substitute. In appearance, when painted, they form a neat cylinder, commencing at the top of the fire-place and finishing in the ceiling. The cap of each pipe shews a projecting ring, which is rather ornamental than otherwise. As brackets would support these flues, there would be no necessity to carry jambs from the ground-floors for that purpose. The heat emitted by such funnels into every room through which they pass is so great as, in the opinion of the writer, to exceed what is produced by moderate sized grates, and consequently to supersede the necessity of fire-places in upper rooms. Perhaps outer-casings, that is, larger pipes with regulators, might be required in all lodging rooms, and might be so contrived, as either to admit the warm air or allow it to escape through the roof. T.P. believes that soot would not adhere to them; that they could not smoke; that they are of universal application, if made of suitable materials where the heat would be great; and that their cheapness or durability will not be questioned. Architects, builders and others, are invited to try the above plan, in any small shop or out-house, with such pipes as their respective localities afford; convinced that if the joints be made air-tight, the result will be preferable to anything which might be said here."

The extract may be of use to those who build cottages, &c. in places where fuel is dear.

In closing this correspondence, Sir, permit me to remark that I am prepared to prove the truth of what I have stated; and submit, therefore, that any man who has the means is at liberty to manufacture, vend, or construct the "tubular and other flues," they having been long public property, and being very likely to continue so.—I am, Sir, your obedient servant,

THOMAS PEAKE.

22, Water-lane, Fleet-street, London, from "The Tileries," Tunstall, Staffordshire.

## BROCKHAM NEW CHURCH.

SIR,—In your last number you have a statement by "A Mason" "that the inhabitants of Brockham, in the county of Surrey, are erecting a new church, according to plans designed by Messrs. Smith and Armstrong." There being some inaccuracy in this statement, and wishing to correct it I beg to inform you, B. Ferrey, Esq., of Lorton, was the architect employed to make the designs. Messrs. Smith and Armstrong are one of a party of four respectable builders who were selected to tender for the erection of the building, and although

their tender was not the lowest, they were selected by the committee to carry it into execution. It would be difficult to assign a reason for the committee having come to this conclusion, particularly as the builder whose tender was the lowest was prepared with sufficient security for the due performance of the work. Report says that it was owing to a family connection with an influential member of the committee that the parties selected were favoured in this instance; be this as it may, it has a tendency to prevent respectable builders from giving their time and incurring expense, when the result may be that, after having done so, some favoured individual, through interest, is selected. I equally regret with "A Mason," the committee should have selected doubtful materials for such a structure, it having failed where used in most instances; at the same time I do not agree with him that red brick would have been most proper; there is plenty of flint close by which could be had for such a purpose free of expense; and this, with the Bath or other stone dressings, which it is now proposed to use, would have made a more durable, picturesque, and church-like building than can be made either of chalk or bricks; instance St. Saviour's Church, in the Borough, the flints of which were taken from the immediate neighbourhood.

Having seen the design, I think the building will be an ornament to this beautiful neighbourhood, and it would be serviceable if a drawing of it were given in THE BUILDER.

I am, your obedient servant,

A SUBSCRIBER.

Dorking, October 8, 1844.

## HARDY TESTIMONIAL.

SIR,—I beg leave to forward you a few particulars relative to the "Hardy Testimonial," and hope you will insert the same in your next number for the information of your readers;—facts are stubborn things, and will speak for themselves.

There were about ninety-four designs sent in for the "Hardy Testimonial;" these were privately exhibited for about a fortnight to the committee (previous to a public exhibition); in the interim a design was concocted by one of the committee, which was adopted; the premium offered was then divided and presented to the authors of the best two designs out of the ninety-four.

I have not seen the design made by the amateur committee-man, which, however, possibly may be very beautiful; at all events, it ought to warrant the adoption of such a proceeding, which is at once an insult to the profession, and an outrage on common decency.

I am, Sir, your obedient servant,

MEMORABILIA.

London, October 5, 1844.

ST. ROLLOX'S CHIMNEY.—This giant stalk—partly perhaps on account of its vast height, but chiefly, we presume, in consequence of the constant internal heat to which it is subjected—is exhibiting considerable rents or fissures in an upward direction. The two principal seams are about half-way up; one on the east side, and one on the west. Although the stability of the structure is by no means endangered as yet, the enterprising proprietors have determined, as a measure of precaution, to clasp it with iron for a considerable way up. This appears a serious operation, when we consider the huge dimensions of the chimney (40 feet diameter at base, and 14 at summit); and to reach the height at which the rinning is necessary will be an undertaking of some difficulty. For this purpose a machine has been invented, we believe by Professor Gordon, of this university, by which two men are at the present moment working their way up to the west side of the stalk in a manner which, although it has the appearance of considerable risk and daring, seems, on examination, to be perfectly safe. The operation is an interesting one, and will become more so as the workmen continue to ascend. We may mention, that a second chimney has just been completed in the same works, to the west of the great one. It is not, however, nearly so high, its height being only 250 feet—a method having been discovered whereby the smoke emitted is rendered much less pernicious to health and vegetation; thereby obviating the necessity of carrying it to so great a height above the city.—Glasgow Citizen.

## Miscellaneous.

**THE PROPOSED IMPROVEMENTS IN WESTMINSTER.**—It has been for some time generally known that considerable improvements have been under the consideration of Government to be effected in the neighbourhood of Westminster, especially in those parts where scenes of the grossest description daily and nightly take place, which, it is reported, are leased by the Dean and Chapter of Westminster to other persons, and then sub-let to the most infamous characters. The district which this comprises consists of Orchard-street, New Pye-street, Duck-lane, New Tothill-street, and the vast number of courts which diverge from them. The whole of these buildings are to be taken down, and a most excellent improvement, not only morally but sanatorily, will be effected. The courts and alleys and streets are thickly inhabited by unfortunate creatures, and even the supply of water is obtained from the houses of persons living at a distance, who are generally their landlords, and who permit them to reside in their miserable tenements on the payment of a nightly rent. It was in Orchard-street that Oliver Cromwell had one of his palaces, but in those days Palmer's Village was close beside it, and was the seat of gentlemen's country-houses. In James-street, where Lady Dacre's almshouses now stand, Lady Dacre had her residence, and this by her will has been devoted to the erection, many years since, of one of the first institutions in England, nearly equal to that of Christ's Hospital, in the city of London. Peter-street derives its name from having been built on the grounds upon which formerly stood a splendid mansion belonging to an ancestor of the present Lord Peire. Lady Dacre left to the city an estate of between two and three acres of ground, the garden ground, and that called Palmer's Village, which has been occupied in small tenements for a number of years; and on the 2nd instant, the occupants, having had previous notice, were removing their trilling goods. The whole of this space is to form a part of the new street from Westminster Abbey to Buckingham Palace. The gentlemen connected with the woods and forests were on the same day engaged in valuing the estates belonging to the trustees of Lady Dacre and the city, in order to estimate the proportions due to them, as well as to the tenants. The work of improvement, as long desired, will commence immediately.—*Globe*.

**AGRICULTURAL COLLEGE.**—An agricultural college is about to be established, by royal charter, in the vicinity of Cirencester, to be opened for pupils from all parts of the kingdom. The necessary capital is to be raised in shares. The affairs of the company will be managed by a committee chosen by the shareholders, who will act under the authority of the charter, by which the liability of the shareholders will be limited to the amount of their respective shares. A suitable farm, and a moiety of the estimated cost of the buildings, have been provided by Earl Bathurst; the college and the other buildings will be erected on the farm. The whole establishment will be under the direction of a head-master, a practical farmer, and possessing scientific and general qualifications for so important a situation, who will have under him the requisite tutors, farm bailiffs, &c. The pupils will be instructed in the science applicable to agriculture, such as chemistry, geology, mechanics, botany, &c., and a portion of their time will be employed on the farm in manual labour, so as to obtain a complete knowledge of farm work.—*Staffordshire Advertiser*.

**THE ISTHMIUS OF PANAMA.**—The following appears in the *Courrier Français*:—We learn from a source upon which we can confidently rely, that the hopes which have been entertained relative to the cutting of the Isthmus of Panama cannot be realized. M. Garella is returned from making his survey, and the result of it is that the Isthmus rises between the two oceans not merely to the height of ten yards above the level of the sea, as stated by the Franco-Grenadine Company, but in reality to 125 yards; so that, instead of a single trench or canal without any sluice, which would have been an artificial strait, as we had been given by the company's engineers to expect, nothing can be thought of less than a canal with sixty locks.

**THE LONDON DOCKS.**—The extensive alterations and improvements in progress at this great commercial establishment are proceeding very rapidly. The dock establishment was removed some time since from the original superintendent's office, adjoining the west quay, to the building which formerly stood outside the dock walls parallel with the Custom-house, in the occupation of the Excise and Government Emigration Departments, and which has been considerably enlarged, and now includes offices for the whole of the superintendent's department in addition to committee and board-rooms for the directors, &c. The boundary-wall of the dock has been extended outside this new dock-house and also includes the Custom-house within the dock walls, coming to a point at the corner of East Smithfield and Nightingale-lane, on which spot a new entrance has been erected facing the proposed new street from Shoreditch Church. The entrance consists of two large gates, one for the entrance and another for the exit of waggons, a great though a rare convenience at similar establishments, and at the top of the pivot connecting the two gates it is intended to place a bude light of considerable power. The baggage warehouse, which formerly adjoined the superintendent's office at the west quay, has been removed to a warehouse appropriated to the purpose, a little further to the right of the quay, adjoining the Hermitage basin. On the sites of the old superintendent's office and baggage warehouse a very extensive warehouse has been erected, intended principally for the housing of tea, and underneath this warehouse spacious vaults have been made, and in which a great quantity of wines and spirits have already been deposited.

**SIR EDWARD KERRISON'S "OAKLEY HOMES,"** IN SUFFOLK.—There are now being erected in the pretty village of Hoxne, on a healthy spot, near the venerable church where many of the "forefathers of the hamlet sleep," several neat cottages, to be tenanted by respectable and industrious old people, who may have lived all their lives in the parishes on the Oakley estates. They are to be called "The Oakley Homes;" the tenants to occupy for life, and to be rent free. In addition, also, to the present well-organized school, at which nearly 100 boys are every week receiving a sound education, not only religious, but moral and industrial—many of the larger boys having small garden allotments for cultivation—there is now in course of erection a Sunday-school, which is to provide sufficient accommodation for eighty children. This work is also to be completed and carried on at Sir Edward Kerrison's expense. The whole of these new buildings are in the Gothic style, from designs by Smirke, and when completed will form a great additional ornament to the village.—*Ipswich Journal*.

**EXTRAORDINARY SALES OF SHARES IN THE THAMES TUNNEL.**—One hundred shares in the Thames Tunnel, upon which 50l. each had been paid up, amounting to 5,000l., were sold a few days since at the Auction Mart by Mr. Shuttleworth, at 6s. per 50l. share, realizing only 30l., being 4,970l. less than had been paid for them. The sale was a *bond fide* one, the shares having been put up by the executors of a deceased gentleman.

**BIRKENHEAD DOCKS.**—The day for the laying of the first stone of these important works is now definitely fixed, we understand, for Wednesday, the 23rd instant, when Sir Philip de Malpas Grey Egerton, M.P. for South Cheshire, will officiate on the occasion. Preparations for the public proceedings of the day are under the consideration of the principal inhabitants.—*Liverpool Albion*.

The most remarkable excavator in modern times, in any part of the world, has been the Pasha of Egypt. The Mahmoodie canal alone is twenty-three leagues in length; no fewer than 313,000 men having been occupied for the space of ten months in its construction. For some years past, the number of workmen employed in hydraulic works in Egypt has exceeded 350,000.—*Bombay Times*.

**PUBLIC BATHS AND WASHING HOUSES.**—A public meeting will be held at the Egyptian Hall, Mansion House, on Thursday, the 16th instant, for the purpose of promoting the establishment of cold and warm baths and washing houses, for the labouring classes. The Right Hon. the Lord Mayor will preside.

**THE VICTORIA PARK.**—A communication is said to have been made from the directors of the East London Waterworks to her Majesty's Commissioners of Woods and Forests, in which the former very liberally offer to supply two or three fountains in the Victoria-park with an abundant quantity of water gratuitously, provided it is subsequently permitted to flow into public baths to be erected in the vicinity for the use of the poor. Several benevolent gentlemen, at the head of whom is Mr. William Cotton, Governor of the Bank of England, are at present projecting a plan for the erection of baths at the east end of the metropolis, where the poorer classes of society may be enabled to obtain luxuries so conducive to health, and of which they are at present totally deprived, at a charge commensurate with their means. The want of public baths, or indeed any place for bathing, at the east end of the town has been severely felt.

## Tenders.

TENDERS delivered for repairing, &c., a House in Bedford-row.—Mr. Charles Broadbridge, 87, Great Portland-street, Surveyor. October 9, 1844.

Ashby.....	£224
Locke and Nesham.....	192
Mathews.....	188
Whitlaw.....	183

## NOTICES OF CONTRACTS.

For such Bricklayers,' Carpenters,' Masons,' and other Works, in the Cleansing, Building, and Repairing the public Sewers and Drains for the City and Liberty of Westminster.—Mr. Lewis C. Hierslett, Clerk, 1, Greek-street, Soho, October 15.

For Building a Sewer in Robin Hood-court and New-street-square, London.—Joseph Daw, Sewers Office, Guildhall. October 15.

For re-Building of Shotter's Mill, in the Parish of Linchmere, Sussex.—The Royal Farmers' and General Fire, Life, and Hail Insurance Office. October 24.

For Surveying, Levelling, and Mapping of all lands lying within certain districts in Lincolnshire. Work to be completed on or before May 1, 1845.—M. Dudding, Clerk of Sewers, Lincoln. October 16.

For Excavating and Completing of several miles in length of new Water Courses, and Erecting a number of Bridges, Culverts, &c., connected therewith.—Messrs. George Leather and Son, Civil Engineers, Leeds. October 15.

For 250 Tons of the true Red Roman Pozzolano, from the works of Carlo Nepoti, called the Cave of St. Paul, near Civiti Vecchia. W. H. Huffam, Secretary, Dock Office, Hull. October 15.

For Building a Church to contain 1,250 persons at Woolwich, Kent.—Mr. Francis E. H. Fowler, Architect, 28, Sackville-street, Piccadilly. Oct. 19.

For Building a French Church and School-House in Plumtree-street, Bloomsbury.—Mr. Jacob Vincent, 10, South-square, Gray's-inn. October 18.

## COMPETITIONS.

PREMIUM of 25 guineas for the best and another of 15 guineas for the second best design for laying out for building purposes a plot of land, containing about nine acres and a half, situate in the borough of Reading, having a frontage of upwards of 900 feet, and being of the depth of about 450 feet. Further particulars of J. J. Blandy, Esq., Solicitor, Reading; or of Messrs. Gregory, Faulkner, Gregory, and Bourdillon, 1, Bedford-row, London. November 15.

PREMIUM of 500l., being a legacy bequeathed for a painting to be placed in the recess over the communion table of St. James's Church, Bermondsey. The subject to be the Ascension of our Saviour. Further particulars of the trustees of that church.

## TO CORRESPONDENTS.

A. Z.—A letter of introduction from the clergyman of the parish in which you reside, from a banker, or from any other known responsible person, addressed to either of the Librarians, or to the Secretary of the British Museum, will gain for you an admission to the Library.

J. Bet.—We cannot without a view of the premises at Pentonville, answer the leading article "A Bath Stone" is referred to the leading article of last year's last number of "The Builder," and we advise him to become an inmate of St. Bartholomew's Hospital, where he will find relatives all around him, in every stage of disease, and of every age, from 20 to 70 years; but he must apply soon, for we lately saw Mr. Malcott, the mason, taking particulars for an estimate for the renewal of its masonry with Portland stone.

Current Prices of Wood and Metals.

Table with columns for material names (e.g., Box, Cedar, Oak, Fir, Pine, Copper, Iron, Steel, Tin), units, and prices in £, s., and d. Includes sub-sections for PAINTING, PAINTERS, BUILDERS, etc.

ADVERTISEMENTS.

H. BESSEMER'S PATENT GOLD PAINT. Sole Agents, R. TILLEY & GARROD, 245, Blackfriars-road, London. The above METALLIC PREPARATION is intended to supersede the use of Gold Leaf...

PAINTING BRUSHES, TO PAINTERS, BUILDERS, &c.

J. KENT and CO., 11, GREAT MARLBOROUGH-STREET, LONDON, offers to Painters, Builders, and Dealers in Painting Brushes, goods of quality far superior to those generally offered for sale...

TERRO METALLIC DRAIN PIPES.

PAVING AND ROOFING TILES, and numerous other articles manufactured from the blue Terro Metallique Clay which are, in point of durability and hardness, nearly equal to cast-iron...

TO ARCHITECTS, BUILDERS, &c.

A large assortment of RAIN-WATER PIPES, O.G. and plain Gutters, Sash Weights, Air Bricks, Sink Traps, Raining Bars, of which a great variety of patterns and sizes is kept...

PEAKE'S TERRO METALLIC TILE

DEPOT, WHITEFRIARS, and 29, WATER-LANE, FLEET-STREET, LONDON; from the Tiler's, Tunstall, Newcastle, Staffordshire, THOMAS PEAKE, Manufacturer, having by various means, and during a considerable time, published the name of Agents in London, he has decided to announce that he has no longer any Agent there...

TO LANDOWNERS, AGRICULTURISTS, BUILDERS, ARCHITECTS, &c.

MCKIBBIN'S improved ROOFING FELT is peculiarly applicable as a substitute for Slate, Zinc, Tiles, and other articles used for Roofing, from its ECONOMY, LIGHTNESS, and DURABILITY. The disadvantages attending other materials used in roofing, preventing, in agricultural districts, many of the houses and sheds being erected or rendered waterproof, it is submitted that the improved Roofing Felt will be a great measure...

PATENT TESSELLATED, VARIE-

GATED, ORNAMENTED MARBLE AND PLAIN PAVING TILES. Manufactured by SAMUEL MAYER, Barlham, Gloucestershire. Specimens at 2s. per piece may be obtained at Mr. Charles Long, No. 1, King-street, Portman-square, and also at the Manufactory.

ORNAMENTAL WINDOW GLASS.

2s. per foot super. - CHARLES LONG having greatly improved his machinery for ornamenting glass, is enabled to furnish patterns at 2s. per foot, and a pattern glass included. 100 feet can be executed and delivered in two days. Address to Charles Long, House Decorator, &c., 1, King-street, Portman-square. For Cash only.

BROWN OAK, &c.

Builders, Cabinet-makers, Contractors for Church fittings, and others, are respectfully informed, that a parcel of BROWN, POL-LARD, and finely FIGURED OAK, has just been landed at J. OSBORNE FRANCIS'S BRIDGE WHARF, FIM-LICO, and can be disposed of at a very moderate rate. A good assortment of Oak, Elm, Lenz, Pear, Beech, and other English Woods will be constantly kept on hand.

GILT MOULDINGS FOR ROOMS, WIN-

DOW CORNICES, &c. - The cheapest House in the Kingdom for Room Mouldings, Window Cornices, Gilt, and Fancy Wood Picture-frames, and every article connected with Carving and Gilding, is P. GARBANATTIS, 120, NEW BOND-STREET, corner of Grosvenor-street; Manufactory, 19, St. Martin's-court (the broad part), Leicester-square. A list of the Prices of PLATE-GLASS sent pre-paid. He-gilding in his practice at the lowest possible prices. Estimates given free of charge.

POLONCEAUX'S BITUMEN PAVE-

MENT for paving Foot walks, Terraces, Garden walks, Stables, Coaches, Carriages, Corn Stores, and Salt Warehouses. For the exclusion of Damp and Vermine Basements it is particularly adapted, and for Roofing Dwelling-Houses, Porchies, Balconies, and Sheds.

BASTRONE BITUMEN COMPANY.

Offices, 31, Finsbury. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works of this Company, which have given general satisfaction. Scale of prices per foot square - 1 inch thick, 8d.; 2 inch thick, 1s.; 3 inch thick, 1s. 6d. Works not measuring 400 feet by 10 feet extra. Roofing executed at 6d. and 7d. per foot square. Concrete is charged in addition according to the thickness when required. Carriage and men's time are charged extra when works are executed beyond the limits of the General Post-office. Bitumen 20 per ton, without grit. Bitumen 25 per ton, with grit.

CHARLES F. TILSTONE, Sec.

SEYSSSEL ASPHALTE COMPANY.

"CLARIDGE'S PATENT" ESTABLISHED 1838.

This ASPHALTE is a Bituminous Limestone, obtained from an inexhaustible Mine at Eyrimont, in the Jura Mountains.

Previously to its introduction into this country, in 1838, the material had been used for many years in France, and from its great utility was extensively patronized by the Government of that Country. Among the various uses to which it can be applied, the following may be enumerated - For Foot-Pavements, public and others; in the construction of Bridges, Approaches, Canal-walks, and Terraces; the flooring of Kitchens and other basement offices; also of Coach Houses and Stables, Dog Kennels, Barn Floors, Row Houses, Figerries, Poultry Houses, and many other buildings. For Roofing Covering of Railroad and other Arches, the Lining of underground Cellars near Rivers to prevent the ingress of the Tides; also covering the external face of Walls, to prevent damp rising (this application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts), thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Dock, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARRELL, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," 1, Water Lane, Deptford, London.

COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS.

THE DIRECTORS OF THE SEYSSSEL ASPHALTE COMPANY have much pleasure in recommending to the notice of Architects, Builders, and others, the application of THE ASPHALTE OF SEYSSSEL as the only effectual means of preventing DAMP rising in WALLS. The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18.

"In 1839 I superintended the construction of a house of three stories on the Lac d'Enghien. The foundation of the building is constantly in water, about 10 1/2 inches below the level of the ground-floor. The entire horizontal surface of the external face of the walls was covered at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

"Since the above date no trace of damp has shown itself round the walls of the lower story, which are for the most part painted in oil of a gray stone color. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 2 1/2 inches above the external surface of the soil, and only 10 1/2, at the utmost, above that of the sheet of water.

"The layer of Asphalt having been broken and removed, for the purpose of inserting the iron bars and doors, indicating the presence of damp, has been since remarked at the base of the door-posts."

# The Builder.

NO. LXXXIX.

SATURDAY, OCTOBER 19, 1844.

## POPULAR

as we may be, yet we trust to being none the less right on that account

if we lift up our hand to prevent the destruction of good and ancient buildings in the city and suburbs of London. We have, indeed, for many years past thought that some powerful protecting society is needed for the maintenance of the architectural beauties which our forefathers

treasured at great cost and pains, trusting no ungrateful descendants would treat them as so much rubbish, to be removed under the pretence that the wastes which violent action would leave would be denominated *improvements*. Such a society we trust would, upon any threat of the kind, by every lawful means use every lawful prevention. Some twenty years ago, Guildhall Chapel, which was an edifice of much beauty, and which might have been so restored as to have few rivals, was violently destroyed to make room for the mean and miserable courts of justice which now lie at the east side of the Guildhall-yard. The church of St. Christopher-le-Stocks had, a few years before, been swept away to provide chambers for trafficking in the funds, created by the all-absorbing national debt. Lately, the church of St. Bartholomew-the-Less was eaten up, and its site occupied by a fire-insurance-office. But a short time before, the church of St. Michael, Crooked-lane, whose lofty spire graced the city in that direction, had trenches east about it, and was blotted almost from memory, that the wayfarer crossing New London-bridge might unconsciously pace its sacred ground, and trample on the graves of its neighbouring dead.\* Thus, within a few years, the city of London has lost from within a range of half a mile four of its ancient temples, and has not received very much in return. But as if this were not a destruction of sacred architecture sufficiently large—a casting out from the religious to the worldly sufficiently extensive—there is now a violent fermentation going forward to destroy totally the remaining body of the church of St. Benet-Finck, Threadneedle-street, as may be seen by the perusal of the following communication from the *Times* :—

Sir,—Notwithstanding your strenuous, almost indignant, remonstrances on the subject, the corporation of London refused to make the necessary purchases to prevent the east end of the Royal Exchange from being almost hidden from view; the consequence is, that the portion of ground formerly occupied by Freeman's court is now being built on. The inhabitants of the parish of St. Benet-Finck thinking if a row of houses is to be erected there, that their church will cause no greater obstruction

to a view of the Exchange, are about memorializing the Bishop of London to withhold his consent to its demolition. We shall next have the shopkeepers whose houses it is intended to pull down in that immediate locality (without doubt the best in London for retail trade), petitioning and remonstrating against such a course, on the somewhat plausible ground, that if the church is allowed to remain standing, it cannot be of any service to destroy their houses.

Now pray, Sir, do give us your assistance once more. Raise your powerful voice yet again. If we cannot get a whole loaf, try to procure us the half of one. If we are not to see the whole of the Exchange, let us see a portion of it. No doubt the houses now being built in Freeman's-court will greatly obstruct a view of that end of the Exchange; but the church of St. Benet-Finck, and the houses at and near the corner of Threadneedle and Broad-streets, will completely hide it in that direction. In fact, a few houses on both sides of Broad-street, abutting on Threadneedle-street, ought to be taken down, to make the approach on that side what it should be; and such is the eagerness with which houses on that particular spot are sought for, that the corporation, instead of suffering a loss, would realize a handsome profit by the purchase.

Do pray try to shame them into it: such penny-wise-and-pound-foolish policy as they have adopted is unworthy the rich corporation of the first city in the world.

I remain, Sir, yours respectfully,

October 3.

CIVIS.

Some portion of the public may be already aware that some considerable time ago the tower of this fabric was destroyed under a pretence of its site being necessary, if not for the Royal Exchange, yet for the obtaining a view of the eastern part of that edifice; and the remainder of the church now bears, from the wrenching away of the masonry, a somewhat ruinous effect. Yet internally the fabric is untouched, and loudly demands better treatment.

Now, the Royal Exchange extends over about twice as much ground as was requisite for any public purpose. If its outline has been extended for the purpose of trafficking in the rental of taverns and merchandize-stalls, that is but poor reason for swallowing up and destroying every thing around for its sake; and, after all, its eastern front is precisely such an one as would lose half its effect by being set in a wide space. The western front of the Exchange lost infinitely when the fronting houses were removed. Its columns appeared at once small; the chimneys above them, which are neither formed as architectural maskings nor as obvious chimneys, presented themselves in an obtrusive manner; and the eastern turret grouped ill with the general view. We therefore think that, on the score of taste, there is not a shadow of reason for the destruction of St. Benet's Church. But there are other and higher reasons for its preservation. This very church was built principally by the most liberal votive means: one or two, if we remember correctly, laid down thousands of pounds, in times when money was at so different a value, that the work might be well and handsomely performed; and we think reasons better than seeing the screen-wall which incloses a tavern and a few stalls should be given before a votive oratory, so generously created, and by so great a man, be annihilated under the plea of giving a view of the Exchange. The bourse itself lies some hundred feet or more to the west, and is confined to very moderate limits. All around it is not the Exchange, not public, but a bad speculation in paltry odd-cornered shop-scantlings, and room-sheds, not one of which was strictly necessary as attached to a bourse; the only part which, out of respect to the founder, should have been retained—Gresham College—was

turned adrift, and has found refuge in a mere plastered building at the corner of Basinghall-street.

But there are higher reasons yet. All the buildings around the real new bourse are but shreds and tatters—rooms dismembered, angles out of square, tortuous dog-legged passages—scarcely is one decent and respectable apartment to be found amid the whole—scarcely has one of them the uniformity of window-light or of entrance which is to be found in the meanest ordinary apartment. The whole is a failure as a work of architecture precisely in that part which requires the architect; the whole is little more than 130,000*l.* worth of, or rather expenditure for, screen-wall. Now, the whole might have been built, while keeping to the oblique lines of the surrounding streets, so as to have had the angles of all the apartments regular, all doors and windows uniform, all passages straight, and no dismembered apartments.

And is it for the sake of this mass of new ruins that the wreckers are to be let loose upon the precious work of Sir Christopher Wren? Mark, now, what *his* architect did when he was set to work upon a piece of ground which seemed to give defiance to all ordinary capacity. Greatly restricted, and seated at the obtuse turn of the street, he nevertheless adapted a plan to the occasion, conforming to the restrictions of the public way. He threw within it a mutation in the form of an ovate decagon; and within this, he placed a hexastyle composite colonnade, at the six angles of a smaller ovate hexagon; these columns support six semicircular vaults, which are carried upon architraves and cornices to the external walls, and inwardly are faced with archivolt, between which rises an oval pendentive dome, only sufficiently high to change the plan from an ovate hexagon to an ellipsis, and to receive a modillion cornice of an oval plan, from which is sprung a complete semi-ellipsoidal dome; the four sides of the outer decagon, which exceed the number of the sides of the internal hexagon, are disposed of in a very masterly manner by four intermediate triangular ceiling-compartments. Thus, the plan of this church, though not one of Wren's best, is one of singular beauty; and there can be no plea for its destruction other than the fear, if it exist, that its science and ingenuity would, with all persons who understand the subject, be a living condemnation of the rudeness and meanness of the apartments of its more ostentatious neighbour.

When Freemasonry is duly revived, no man will dare to execute such a wasteful and dishonourable plan as that of the Exchange; and still further, no man would dare to destroy a work of such a plan as the church of St. Benet-Finck. We should cry our eyes out rather than perpetrate in brick and stone the skew odiments of the former, or destroy the higher science and beauties of the latter.
