to the public. The alley of "chop and steak" houses, cigar-shops, &c., which formerly ran along the east side of the old Exchange, has also been destroyed, although Finch-lane still remains intact and unimproved. In Threadneedle-street the increased width of the thoroughfare will shortly be carried out along its whole length by the removal of the houses and shops in front of Mercant Tailors'-hall; and the "Hall of Commerce" (as it is termed) has been erected, since 1842, upon the site formerly occupied by the old French Protestant church—as ugly a building, perhaps, as architect ever devised. It had stood, however, for nearly three hundred years, and some curious antiquarian discoveries were made beneath the foundations when it was pulled down by Mr. Moxhay.—*Times*.

RAILWAY BUSINESS IN THE HOUSE OF COMMONS.

TUESDAY, MARCH 26.

*Maryport and Carlisle Railway Bill.*—Read a second time and committed, and referred to the committee of selection.

*Brighton and Chichester Railway Bill.*—Motion made and question proposed "That the Bill be now read a second time;" amendment proposed, to leave out the word "now," and at the end of the question to add the words "upon this day six months;" question put "That the word 'now' do stand part of the question?"—The house divided; ayes, 99; noes 48;—main question put, and agreed to.—Bill read a second time and committed, and referred to the committee of selection.

*Stratford (Eastern Counties) and Thames Junction Railway Bill.*—Motion made and question proposed, "That the Bill be now read a second time;" amendment proposed, to leave out the word "now," and at the end of the question to add the words "upon this day six months;" question proposed, "That the word 'now' stand part of the question;" amendment, by leave, withdrawn; main question put and agreed to.—Bill read a second time and committed, and referred to the committee of selection.

*Colchester and Harwich Railway (No. 2) Bill.*—Read a second time and committed, and referred to the committee of selection.

*Manchester and Birmingham Railway (Macclesfield and Poynnton Branches) (No. 2) Bill.*—Reported; report to lie on the table, and to be printed.

*Norwich and Brandon Railway Bill.*—Report considered; amendments agreed to; Bill to be engrossed.

*York and Scarborough Railway Bill.*—Report considered; amendments agreed to; Bill to be engrossed.

*Midland Railways Consolidation Bill.*—Reported; report to lie on the table, and to be printed.

*Furness Railway Bill.*—Reported; report to lie on the table, and to be printed.

*Guildford Junction Railway Bill.*—Report considered; amendments agreed to; Bill to be engrossed.

*Brighton, Lewes, and Hastings Railway Bill.*—Read a second time and committed, and referred to the committee of selection.

*Gravesend, Rochester, and Chatham Railway.*—Petitions for leave to proceed; of James Pim, and members of the provisional committee for constructing the Gravesend, Rochester, and Chatham Railway; to lie on the table, and to be printed.

*London and South Western Railway (No. 1) Bill.*—Read a second time and committed, and referred to the committee of selection.

COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. II.

TO THE EDITOR OF THE BUILDER.

SIR,—Having in a late number of THE BUILDER considered the word *ABACUS*, it is now proposed to define the moulding called *ECHINUS*.

Professor Hosking thus explains the word: "Echinus (Gr. *εχωω*, an egg), a moulding of eccentric curve, which, when it is carved, being generally cut into the forms of eggs and anchors alternating, the moulding is called by the name of the more conspicuous." Mr. Gwilt

defines it as "the same as the ovolo or quarter-round, though the moulding is only properly so called when carved with eggs and anchors. It is the shell or husk of the chestnut, though the ornament does not seem to bear much resemblance to it." (*Encyclopædia*, p. 963.) The learned Evelyn's quaint description may be welcome: "It is, indeed, a quarter-round, and sometimes more, swelling above the cinctures, and commonly next to the abacus carved with ovals and darts (by our workmen called eggs and ankers as little politely), which is frequently shut up with a smaller ovolo of beads and chaplets, or like ornament; but so adorned, it commonly runs under the Ionic voluta, and that of the Composita, and next the Doric abacus, as in that singular example of the Trajan column, it creeps under the plinth of the capital. Such as pretend to etymologies for every thing they hear, will have it *εχινος* *κατά τὸ ἔχινον*, or *συνέχινον ἱανθῶν*, because of a kind of self-contraction; others more rationally, from the resemblance of roughness in the carving, *εχινου* *πραχόρτος*, as bristling with darts like a hedge-hog, or rather the thorny husk of a chestnut, which being opened discovers a kind of oval-figured kernel, which dented a little at the top the Latins call *Deacuminata Ova*." To these definitions we may add that the word is Latin, but derived from the Greek, "qui terrestris est, et erinaceus etiam appellatur, et marinus, a spinis quibus *εχεται*." (*Lex. Schrevelii*.) The primary meaning of echinus is a sea-urchin which is armed with prickles. Secondly, it is put for the rough prickly shell of chestnuts, and lastly, for the chestnut itself, from a resemblance of whose contour the moulding under consideration derives its name. In Roman architecture this moulding is called an ovolo, from *ovum* (Latin) an egg, to which in shape it is somewhat like, more especially when carved. We shall first consider the moulding as it is found in Grecian architecture, to which alone the term echinus is strictly applicable.

In the best examples with which we are acquainted, as, for instance, in the Parthenon and Theseum, the echinus has nearly the same projection as the abacus (it is actually the same in the temple of Apollo Epicurius at Bassæ), and we shall find that the sharper is its outline, that is, the more it is remote from the quarter-round, the more it is held in estimation; and that as it approaches the ovolo in form so it may be traced to belong to a declining period, or one nearer to the time of the Roman use of the Doric order. If we grant for a moment that timber construction afforded the first hints for architectural composition, and that the origin of the abacus may be traced to the intervention of a cube of wood between the column and its entablature; where will the advocates of this system find the prototype of the echinus? To the Greeks we must look for the adoption of this beautiful moulding, which connects in such a happy manner the square abacus with the circular shaft; and truly may it be said to be their own invention, even if we are compelled to admit that some slight hint for it is to be found among the heavy capitals of Egypt. Professor Hosking has well observed: "Greek architecture is distinguished for nothing more than for the grace and beauty of its mouldings; and it may be remarked of them generally that they are eccentric and not regular curves. They must be drawn, for they cannot be described or struck; so that though they be called circular or elliptical, it is seldom that they are really so; not but that they may be, but if they are, it is considerably the result of chance, not of design. Hence all attempts to give rules for striking mouldings are worse than useless, for they are injurious; the hand alone, directed by good taste, can adapt them to their purpose, and give them the spirit and feeling which render them effective and pleasing." (*Treatise on Architecture*, p. 38.)

In those buildings which belong to the best age of Grecian art, the days of Pericles and his chief architects, Calliades and Ictinus, as seen at Athens, Bassæ, Sunium, Thoricus,

\* We do not believe this to be borne out by example; on the contrary, we think the Greeks had a rule for every thing in their architecture, the discovery of which was directed by genius, but its practice mechanical.—Ed.

Eleusis, Rhamnus, and elsewhere, we shall find that the echinus has its lower part either very slightly curved (No. 1 illustration) or else

No. 1.

perfectly straight; whilst in buildings of later date, and of equivocal taste, we find that the moulding nearly resembles an elongated or ovate quarter-round, as in the Agora at Athens (No. 2 illustration), and in a build-

No. 2.

ing at Cadacbio (No. 3). Professor Donaldson has drawn notice to the general principle which "directed the Greeks in the

No. 3.

composition of their Doric capitals. From the necking to the abacus the outline is that of a cyma-reversa, having a projection that varied according to the era, or style of art peculiar to the country; the existing Attic examples being but slightly projecting, while the immense abacus of the orders now remaining at Corinth, Paestum, and in Sicily, gives a holder profile to the capital." Some idea may be formed of the vast proportions of the temple of Jupiter at Agrigentum, when we find that the echinus of each column is formed of two stones, each weighing 21½ tons, held together by plugs or dowels by the centre stone of the abacus, which is in three pieces. (See No. 4.) In the capitals

No. 4.

of the antæ of Greek examples, the echinus is

generally undercut, so as to form that remarkable moulding called the hawk's-beak or birds-beak moulding. (See No. 5, from the Parthe-

No. 5.

non.) No. 6 is an antæ capital from the Doric temple at Rhamnus, in which the egg-and-

No. 6.

anchor ornament is introduced in the echinus, only the sharp outline described above. The proportionate depth of the abacus and echinus to each other is not always the same; but as a general rule it may be held that the former member should have the greatest depth. In the Parthenon the relation in this respect is as 11 to 9; at Sunium and at Bassæ as 7 to 6; at Thoricus as 6 to 5; at Eleusis as 12 to 9.†

In the temple of Hercules, at Agrigentum, the echinus is deeper than the abacus; and in the temple of Jupiter, at the same place, it is considerably so, as seen in the cut above. This moulding, besides its place under the abacus, is likewise seen in various parts of the entablature. In Doric structures the echinus is

† The pure Grecian method of proportioning the abacus and echinus to each other, whatever their profile, was to render them symmetrical visually by striking a circular line from the lower edge of the abacus, as at C No. 1 and c No. 2, the upper edge of the abacus and the lower edge of the echinus being both found in the circular curve-line. In No. 5 this symmetry is twice repeated in the same antæ-capital, the circular curves being struck from D and d. See notes to Bartholomew's "Specifications" on this subject. Where the visual breadth of the abacus is less than that of the echinus, as in the examples No. 3 and 4, the effect is peculiarly disagreeable, from the want of symmetry; that of Agrigentum, however large, being much too small to be proportionate.—Ed.

found in the upper part or crown-moulding of the cornice, having only a fillet above it, as in the Parthenon. In the Grecian Ionic it is found in the cornice, and it also forms one of the mouldings which divide the architrave from the frieze, as in the temple on the Ilissus; and this moulding, which is left plain in the last-named example, is enriched in others, as in the temple of Minerva-Polias.

In all cases where an ovolo is employed, it should be placed above the eye; and the most judicious use of it appears to be where it has a flat member above as well as below, and thus we generally find it placed under a fillet and above a fascia.‡

Vignola, in his design for a Tuscan profile, makes the crowning member of the entablature a deep ovolo, a practice which cannot be defended. This moulding enters very largely into the composition of Gothic architecture. In the next paper we shall consider the word *amulet* as in immediate connection with capitals of columns, and the two important members which have been noticed.

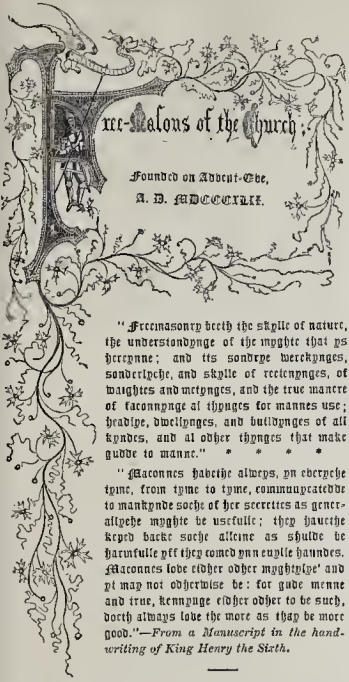

G. R. F.

THE NEW ROYAL EXCHANGE.

WITH the promptitude and punctuality which have attended all the proceedings connected with this great work, the mass of Bank-buildings which concealed the principal or west front, have been removed within a short month, and the portico in all its splendid proportions is now exhibited. We understand that this portico is the largest by far in London, and that it is only second to the portico of the Pantheon at Rome and the Madeleine at Paris. It consists in front of eight Corinthian columns, the extreme breadth being 90 feet, and the height to the apex of the pediment 76 feet. At the meeting of the Joint Gresham Committee which took place on Saturday last, this feeling was exhibited by the most liberal suggestion for further decorations in sculpture at the expense of the committee; and it was resolved, that in addition to the sculpture on the pediment, the interior should be decorated by a statue of our gracious Queen Victoria, and that inasmuch as the statue of the munificent founder, Sir Thomas Gresham, in the old Exchange, was destroyed by fire, a new one should be provided and placed in the niche of the tower over the great eastern entrance. Other suggestions for further decorations were referred to a sub-committee for consideration. The place of the statue of the Duke of Wellington in front of the portico of the Exchange is also determined upon, and it will be about thirty yards back from the corner of Prince's-street, and in the centre of the area created by the destruction of Bank-buildings. In reflecting on these great changes, it is rather curious to recur to the state of things which existed on this spot not more than eighty years ago; at that time, though Cornhill was a broad street, the houses on the site (subsequently occupied by Bank-buildings) came up to a point, and Threadneedle-street is marked in "Gwynn's Plan" as only 14 feet 9 inches wide. The Bank of England was first built in 1732; it consisted then of what is now only the centre of the present building, but the proprietors soon after began to acquire ground and premises both east and west. Eastward, they quickly bought the property up to Bartholomew-lane; but, westward, they were stopped by the church of St. Christopher Le Stocks, which stood until after the riots in 1780, when, from a conviction of the danger of a lofty tower overlooking the Bank, an act was obtained for taking it down, and soon after that time all the principal front of the Bank was arranged and completed by Sir Robert Taylor up to the corner of Prince's-street, then a crooked and narrow street leading to Coleman-street. Bank-buildings, just pulled down, were built by the Bank, under the advice of the same architect, in the place of a mass of old houses, placed there after the fire of London, and which were bought by the directors for the purpose of the improvement. Names of streets appear to have been improved as well as streets themselves; for in the "Plan of Gwynn" before referred to, the continuation of Broad-street westward into Threadneedle-street is marked with the elegant name of "Pig-street," a name which was abandoned about the date of these improvements.—Times.

‡ Where the ovolo is placed below the eye, it is reversed, and becomes, as in some bases, a peculiar kind of "torus."—Ed.

**Freemasons of the Church**

Founded on Advent-Eve,  
A. D. MDCCLXIII.

"Freemasonry beeth the skylle of nature, the understandinge of the myght that ys byegonne; and its sondry werkynges, sondertylde, and skylle of recognynges, of wyghtes and myngtes, and the true manere of faconage of thynges for mannes use; of bradte, duellenges, and butlynges of all kyndes, and all other thynges that make gudde to manne."

"Fracones habetis: always, yn everysche tyme, from tyme to tyme, communicatinge to manynghe soche of her secretis as generalltche myghte be usefull; they haucthe kepte backe soche alleine as shulde be harmfulle yf they comed ynn euyle handes. Fracones love eider other myghtyltche, and yt may not odyerwise be: for gude menne and true, kenngage eider other to be such, docty always love the more as they be more good."—From a Manuscript in the hand-writing of King Henry the Sixth.

An adjournment of the 16th, or "Our Lady's Chapter," was held on Saturday evening, the 30th March, at which was a very numerous attendance. The Rev. George Pocock, B.C.L., was called to the chair, and though many were absent, attending the *soirée* of the Marquis of Northampton, President of the Royal Society, we recognized many well-known to us, among whom were the Rev. T. M. Fallow; Messrs. Stothard; Geo. Aitchison, Sen.; Geo. Aitchison, Jun.; V. Bartholomew; W. P. Griffith, F.S.A.; Papineau, Sen.; Papineau, Jun.; Moon, Barr, Thomas, Archer, Perry, East, C. H. Smith, T. Deighton, Ninn, W. G. Rogers, W. H. Rogers, Finn, Staples, A. Bartholomew, F.S.A.; G. P. Pocock, Fisk, Houle, Cull, Winterbottom, Springbett, and many others.

The tables were spread with the effects of the college, and the rooms were hung with various architectural subjects, among which were rubbings from ancient monumental brasses, and two from very beautiful modern ones by Mr. Archer.

Mr. William Gibbs Rogers exhibited two holdly and exquisitely carved specimens of fruit and flowers, previously to their being placed in the School of Design at Edinburgh; and an elaborately chased "benitier" of bronze, with, rising from the bowl of it, a figure of our Saviour, an Italian work of the early part of the 17th century; and a richly-carved royal trophy in the style of Grialing Gibbons, 5 feet high and 4 feet wide, and of such extraordinary relief as to project nearly a foot, consisting of the point lace neckcloth of Charles the First, elegantly grouped with the sword and sceptre of England, pearls, crowns, and other insignia of royalty; flowers and musical instruments also forming an important feature in the composition, and on each side pendent groups of dead game, of remarkable lightness and fidelity. There were also on the table fourteen groups of figures of mediæval German carving, forming a series of the "Via Crucis," and some specimens of German Gothic tracery with inter-penetrating mouldings, and five large ancient alms-dishes of laton, furnished by Mr. W. G. Rogers.

Mr. A. Bartholomew exhibited, for future explanation, a scientific catenary composed of spring weighing machines, by which may be indicated the strain on every suspension link, and also the effects of pressure on different parts of arches, whether suspended or inverted, and of masonry. He also exhibited an implement made of the vertebrae of four ox-tails, by which the curvatures of the arch ribs of

groined vaults and buttress-steeple (like St. Dunstan's-in-the-East) may be truly formed, according to the weight of the boss, spire, or other surmounting mass.

Mr. G. Aitchison, jun., presented a rubbing from an ancient monumental brass in Alhallow's Barking Church, near the Tower of London.

William Thomas, Esq., of Baker-street, Portman-square, was elected Professor of Fresco Painting to the College.

The election of new members, and the other ordinary business of the meeting being concluded, the special business of the evening was proceeded with, when Mr. Alfred Bartholomew, the secretary, delivered from a beautiful carved oak "Leterne," the property of Mr. W. G. Rogers, around which appears in raised letters, the inscription, "Scribe with Steadness the Engraved Word."

**THE FOLLOWING ADDRESS.**

THE SIXTEENTH CHAPTER of this institution being adjourned to this evening, for the special purpose of our members bearing an inaugural statement of the actual condition and prospects of the foundation of the College, it has devolved on me, Gentlemen, to address you upon a subject so interesting to our mutual profession and bonded union; one which we have had great trust, and still have, will become important to ourselves, and to all persons whose interest is concerned in the right conduct of practical architecture: and, indeed, who is there not so concerned? for even foxes who have holes, and birds who have nests, possess some knowledge of architecture; and have not many species of that which we esteem the lower animal kingdom unerring rules of architectural beauty and construction implanted by Almighty and Omniscent Wisdom, from which we may well copy, whether for the high branch of abstract taste—or the still higher one of fitness—that exact adaptation to purpose, that economy of material, and production of the greatest strength; to which few human architects have ever arrived, and perhaps none?

And here I would make the customary deferential excuses and lamentations, that one more competent was not appointed to now address you; but instead of doing so, I shall rather thank you for the high honour which I have received by being chosen to deliver to an audience so numerous, so respectable, so scientific, the inaugural address of the College, and I shall bring before you matter which, if it sparkle not, shall contain and yield some reflection of the sterling integrity of purpose, the pathos of architectural zeal, with which the spirits of the respected friends around me are radiant.

In taking the portion of time which we have, to found deliberately all our laws, and in avoiding all precipitancy, we have insured the future well-being of the College.

Let the impatient remember, that though Nelson was an hour or more before he returned a shot, resolving, though attacked, to order all well for a victory before he entered into vindictive conflict, yet did conquer through such well-set deliberation; whereas, had he entered into combat unprepared, he would himself, though so often before a conqueror, have been conquered.

Gentlemen,—Sixteen months ago our friends met here, and this college was founded: sixteen months ago we were bonded together into a fraternity, which, I have confident hope, will long survive the mural fabrications of even its discreetest members; and trust when the statically-poised dome is rent, and pulverized, and fallen,—when the masonic column lies prostrate and shivered,—when the arch, thrown out of equilibrium, is a fractured and severed ruin,—the College of the Freemasons of the Church, poised upon truthfulness, erected upon science, and depending upon the equilibrium of nature's philosophy, and through orthodox practice fused and run through every of its corporate members, from the crown of the head to the sole of the foot, shall flourish, and as old Time grows more and more boary, still be green, and spreading more widely, and bearing more fruitage, and cheering more the heart of fabricating science, and shedding the cheerfulness of its countenance into all lands, wherever Anglo-Saxon perseverance shall conquer Anglian merchandise, and literature, and civilization.

I hardly think it possible that in an assembly informed so well, knowing so intimately where have lain the corruptions, the grievances, and the disorders of our art, and which knows so well what have been our efforts, what are our views and intentions, one can be found to doubt the persevering truth of that which I have stated.

If, in times most generally accounted barbarous, and of little general science, existed such a community in our art, that from Russia to Ireland, from Norway to Spain, architecture, like the grass of the field, sprang up, and thrived, and year by year grew with the same family impress, little altered by cli-

mate,—why should we doubt, when literature has gone out into all lands like the solar rays from which nothing under heaven is hidden,—when science, in its expanse unmeasured, has stretched from the palace to the cottage, from the garden to the desert, from the rivulet to the ocean, from the quiet wild-flower-grown hyway, to the tornadoed railroad,—why should we doubt, with these advantages which this age (call it an iron one if you please) alone has possessed, why should we doubt such should occur?

Possibly some member's friend, with whose introduction we may be this evening honoured, may think that in meeting here for the bearing of an inaugural address sixteen months after the actual foundation of the institution, that sixteen months or nearly so have been expended idly. Not so. Sixteen months of collegiate industry have been passed; and within those sixteen months, by knitting together a strong and fervent *esprit de corps*, by founding good laws, and ordering every thing on firm, just, and extended principles, more has been effected than all other architectural societies have performed from their first existence.

The constant endeavour with our sturdy-bearded members has been to plan, to form, to build, and to solidify every thing preliminary, in such wise, that no future subversion shall possibly take place; that the good intentions of our founders may never (come what else may) be subverted: that all may, with the greatest minuteness, be so provided for the governance of the College, that no ill-informed or mischievous, or egotistical, or quarrelsome mar-plot, shall hereafter prevail against the sober, and proper, and wise, and fundamental principles of the institution. If, then, Gentlemen, sixteen months have been consumed in the perfecting of such design in its most minute details, I trust those sixteen months will not be accounted as lost. In fact, I may say, that there are certain things to which this foundation has set its hand which no other society has even mentally weighed, much less had the boldness to put into operation.

As a few strangers are among us, I may be excused for entering into some details which are to all others of my auditors sufficiently well known.

In this college we are of five grades,—architectural-fellows, architectural-associates, clerical-fellows, lay-fellows, and honorary-fellows. This subdivision, or rather union of classes, has been broached for the purpose of bringing under one comprehensive union, the various persons who operate either in architectural fabrication or towards it.

In calling for contributions, the strictest economy has been exercised, and yet not without the laying down of some regula of splendour.

The beautiful illuminated vellum diplomas which lie on the table before you, designed by our talented member and illuminator, Mr. W. H. Rogers, perhaps vie in beauty with the admission documents of all other societies; and by examining the laws of the College, it will be found that while rigid economy has been consulted, something of splendour has been worked out.

In fixing the amounts of contributions, the greatest consideration has been exercised in settling them at *l. 11s. 6d.* per annum, or 12 guineas for life, from architectural fellows, and at *l. 1s.*, or 7 guineas for life, from all other contributing members, the extremes of meanness and of wasteful profusion have been avoided; these contributions being within the means of the many, and beyond the means of only the few.

We have laid down very orderly rules for our chapters and other meetings, for our members' literary and graphic contributions, for our council, for the ultimate obtaining of a charter, and for the appointment of professors and officers to the College.

One part of the mechanism of the institution I think calculated to cause it to work as it should, is the description of officers denominated *Correspondent-Delineators*, whose duty consists in transmitting to us draughts and descriptions of architectural subjects at a distance from the metropolis, and thus enable us to collect, from local eye-witnesses, every information which we may require from a distance: this will in some manner re-create the wonderful community of the old freemasonry, which seemed like electricity to pervade all lands and all architecture. All competent persons who may desire to join our fraternity will be received among us in this capacity, without any contribution further than their correspondence and delineations, and will have granted to them the St. George illuminated diploma.

By the appointing of so numerous a body of scientific gentlemen, each in his office, we doubt not that we shall obtain the best scientific information upon the various subjects connected with practical architecture; and by this subdivision (for we have small faith in the man of Pantechnicon knowledge, who is often a man nearly approaching to Pantechnicon ignorance) we hope that every thing will be done well; for even in the Russian

horn-band, where each man has only to produce one sound, its note is purer and better than the artificially produced notes of any pan-phonic instrument which has ever been brought into use.

And even should any of our scientific officers be ignorant of all other things besides his particular art, to us as a collegiate architectural body it would matter little, provided he give us the fruit of the particular gift or talent for which we have elected him for our service.

If it be asked why, when there were already so many societies in existence devoted to architecture, the foundation of the College of the Freemasons of the Church was undertaken? Let me answer to such as may not be intimately acquainted with the state of architecture in England, its tone—the bearing and frame of architectural society,—that had those institutions promoted to the proper and legitimate purpose the objects of their foundation, this association would never have been framed. Allow me, Gentlemen, to say, that those who have promoted the formation of this institution, bore mentally and ennobled in their imagination this society long before any of the existing architectural societies were even thought of: those who have framed this institution, and have erected it into promising growth which will doubtless flourish, have besides original ideas of greater compass than those which have led to the formation of any of the existing and defunct societies, have had the benefit of the experience of their languishment, disense, and failure. We have, therefore, the advantage of original conception purified by such experience; we have amalgamated with our freemasonic body the result of bygone experience; we have had the advantage of much advice; and I may say that we have succeeded in uniting in one body a larger and more intelligent and respectable body of scientific persons than ever before were linked in one association of the same nature.

We have one other advantage:—for many years past not only have professional persons banded and even loudly contended that some great cause exists requiring the formation of such an association, but they and the whole public have agreed that architecture has been in a fallen state, and requires regeneration; and all in concert have complained that such societies as have been founded have failed of their objects: hence we have not only apology for this foundation, but we have been positively called into existence by the circumstances of the times, by the community of mind operating to that end, and fortuitously drawn out, and as it were crystallized together, and may such crystallization be shining, and reflect purely and in native brilliancy all the beauty of the design, and of the talent and ability and mental illumination with which, Gentlemen, I know you as a body and as scientific individuals to be gifted. It would be invidious in me on the present occasion to attempt particularizing the cases in which other societies and institutions have failed; but, Gentlemen, I shall deem it to be my duty, and I know I shall be seconded by friends so sterling in such resolve, to undo the evil offices which have been performed by others towards our noble art of architecture: where science has been trampled upon, we shall water the plant, and make it spring up many-fold; where poison has been disseminated, we shall confine it within the moderate bounds of medicating utility; where undue excision has been undertaken, we shall exercise such nurturing and such gentle pruning as may tend to wholesome fruitage, and not destroy.

In a word, the office of the Freemasons of the Church will ever be to admire and endeavour to imitate, at humble distance, the constructive wisdom of the Architect of the Universe, who while planning the entirety of the heavens' starry frame, has not forgotten the articulation of the limbs of the microscopic insect, nor has thrown away one particle of creation's mass.

By the institution of the class of Architectural Associates, we hope the greatest results.

We do not propose such grade for the teaching of old practitioners (though none of us profess to be too old to learn, on the contrary, all confessing ourselves to be mere pupils), but to imbue the rising members of the profession with principles which shall stand the test of time, that sturdiest of philosophers, and to provide for such adolescent architects, canons by which the powers of their mind directed aright and assisted orthodoxly, they may, by a moderate age, acquire all the learning which the experienced architectural practitioner has to impart.

Genius, we cannot pretend to provide for the man by nature dull; but we can teach the dullest to profit by the canons of architectural truth, with which God has stored some few minds for the benefit of the many; and when we look at the countless works of antiquity, and find so many thousands of them expressing the perfection which genius, God's gift, alone can impart, we see that genius must

have been more common (which is a thing we deny) or that through community of imparting knowledge, persons of inferior ability were able to profit, and were led according to the rules which Geniuses can impart and order in her paths, WHICH THOUGH SEEMINGLY ECCENTRIC, LIKE THOSE OF THE BLAZING COMET, ARE IN LIKE MANNER NATURAL AND ORDERLY.

We have laid down methods for numeration in architecture,—for the distinguishing of colours in cameo drawings and engravings, by which draughts of coloured glass and mosaics, can be printed in the cheapest possible manner, and be circulated among even workmen of means the most contracted, and thus found again good taste with the multitude who must ever, like the herbage of the fields, form the chief covering of the globe. We have begun the completion of the nomenclature of architecture, rendered necessary by the fact of there not being previously a distinct name for one thing in twenty in Gothic architecture,—a whole line of words being often necessary to distinguish some small article. We have undertaken the subdivision and classification of the present ill-arranged subdivisions of Pointed Architecture, so as to improve and facilitate the means of its knowledge and practice. Much of this is already done, and much more have we in hand; and if any of greater impatience than industry, knowing not how slowly have the grand improvements in art and science taken place, should grow weary under any assumed undue delay in our open appearance, my short answer is—I know we have already ventured farther, and have done more towards regenerating, and ordering, and bounding architecture under scientific limits, than any other architectural society which has existed since the decline and total decrease of the Freemasons of the older time, whose name is so great, but whose work, living in every vault, and pinnacle, and buttress, and tower, and spire, in all Christian lands, is so much greater still.

And here I might be asked by some who know not the true signification of the term Freemasonry, why we have assumed such a title? To that my answer is, we have a right so to do; as architectural constructors in durable stone fabric, masons we are, and not men of lath and plaster; free, I trust we shall be, to leap over by scientific impetus the old hedges of unarchitectural ignorance, which had impounded the art, and left us no freedom of scientific and architectural action; and if we must be compared, let us know no pale hut that of science—let us fear no straying but that of the over-leaping of the walls of integrity, sterling purpose, and scientific impetus.

We do not desire to destroy existing architectural institutions, but when they are purged and set upon a right footing, to unite all, and so to bind up one powerful weapon against future corruption and subversion.

Some might ask, why we have adjoined to the architectural department those of civil and lay fillets? My answer is, the day being past when extraneous lay interference in architecture can be prevented; we, therefore, finding that public amalgamation has so occurred with the profession of architecture that it cannot be removed or prevented, are obliged for patronage and for power so to continue it, endeavouring to educate the public to good taste and deferential reliance upon due scientific abilities: *although the Grecian temple and the Gothic cathedral were alike the result of high professional talent and taste, with which no public had ever any hand, and we could easily prove that from the hour when public interference with the management and details of architecture first began, then commenced the contempt of that public for the very works of that architecture with which it had had so much hand; THE VERY COARSEST AND GROSSEST OF THE HACKNEY, SCHIBBLING BABBLERS OF THE DAY, WHO UPHOLD SUCH LAY INTERFERENCE IN ARCHITECTURE, GENERALLY CONFINING THEIR ADMIRATION TO ANCIENT EDIFICES BUILT ALONE BY SCIENTIFIC MEN, IN WHICH IT IS IMPOSSIBLE TO SAY WHETHER MOST ABOUNDS TASTE OR SCIENCE, THOSE COMPANIONS INSEPARABLE IN EVERY EXAMPLE OF GENUINE ARCHITECTURE.*

Why we have blended the clerical with us I think can need no questioning. While the clergy must have so much to do with church architecture, their exclusion would be vain; therefore it must be for the interest of all, that clergy and laity should go hand in hand with each other, and so profiting mutually, and partaking of the same imbuing of taste and science, the fabrication of sound edifices may rightly progress.

Some may think we have affected some state, and may possibly incur the ridicule of mankind thereby; but I think no state greater than the importance of the occasion requires has been assumed. Some may think there is of the ridiculous in setting up to reform that which many attempting have failed of doing. But if such feelings and motives, or rather such paroxysms, were to prevail, and to prevent the free and powerful action of those who desire to better

any thing which has fallen into a state of irregularity, then would little be done to regenerate things so fallen.

I can, and I trust my friends here assembled can, bear to stoop to conquer—can bear to undergo that necessary preliminary to heroism which lies in undertaking something, the engaging in which borders in the minds of quiet, ordinary people, upon the ridiculous.

We have drawn together the élite of architectural science, having around us perhaps the best in each department: we have become fenced in and bulwarked by a firm esprit de corps, for the want of which other architectural societies have failed, for they indeed have never been nurtured as brotherhoods.

We have been by fortuitous circumstances placed in a situation for the diffusion of our labours, opinions, and knowledge, to all branches of the building community: we have the means of heralding into all countries the fruits of our science, research, and perseverance.

It is matter of proud feeling and high congratulation to our fraternity, that while not asking for membership with strangers so long as we have been engaged as lawgivers, our numbers have increased, and considerable revenue has been secured, while if so much as one original member has left us, it would be impossible to find a second who has.

It will be in after-life matter of some gratification to me that our friends have built up and nestled the College under this roof. I have firm confidence that, as it is growing strong on the wing, it will ere long take bolder flight and build its own nest. Till then I shall be proud of its still finding here an abiding place.

But I am warned by the lateness of the hour to desist from following a theme in which, were it possible that I could be eloquent, the subject of my present address would surely have power to make me so, for the time would fall in the endeavour to speak adequately of our beloved art.

I must, therefore, conclude, thanking you for the patient hearing with which you have honored me; and trusting that as the time has arrived when, fully formed, the College will commence openly its operations, that something worthier, contributed by our scientific members, will, on the next occasion, arrest your attention—whether it be graphic or whether it be literary.

The next meeting will be that of the 17th, or Saint Mark's Chapter, on Tuesday evening, the 16th instant.

#### CHURCH-BUILDING INTELLIGENCE, &c.

*Restoration of St. Olave's Church.*—The restoration of St. Olave's Church, which was so severely injured by the destructive fire at Topping's wharf, in the autumn of last year, is rapidly advancing. The slating of the new roof was completed on Saturday week, and the reparation of the tower is progressing briskly. The fittings of the interior are also in a forward state. The Ionic columns, a considerable portion of the side galleries, and the entire of the communion, including the statues of Moses and Aaron, and the tables of the decalogue, are in tolerable preservation. Whether the bells will be recast or not is at present undecided. It is stated that Mr. Allen, the architect, intends so far to complete the building as to have the sacred pile ready for public service by the ensuing Midsummer, if not at an earlier period. We have in hand some interesting illustrations of this beautiful work of Filicraft, who for many years assisted Sir Christopher Wren.

The site for a new church to be erected in Belton-street, Long-Acre, has been marked out, the tower of which will be built upon the exact area where stood the public-house the Guy, Earl of Warwick, which existed for about two hundred years. The sacred edifice, which will be called "Christ Church, St. Giles-in-the-Fields," will be constructed with Caen stone and Kentish rags, and will be made capable of containing about 1,000 persons, all the sittings being free. There will be galleries; and the interior of the edifice will be 50 feet wide by 70 long. The cost of it will be rather more than 4,000*l.*, a portion of which is provided from the Metropolitan Churches Fund, but the greater part has been raised by voluntary contributions from the principal inhabitants. A sum will also be subscribed for the endowment of the church. Adjoining this building will be some spacious houses, erected according to the plans of the Commissioners of the Woods and Forests, which, when completed, will make a very great improvement in this part of the metropolis.

## RAILWAY INTELLIGENCE.

*Edinburgh and Glasgow Railway Extension Bill.*

A good deal of interest has been excited during the last few days, both in Edinburgh and Glasgow, regarding certain clauses in their new bill (the 36th and 37th), which give the above company the very questionable power of opening and inspecting parcels sent along their line. If we are not much mistaken, however, the public have little to fear on this score, for we have reason to believe that these clauses were withdrawn from the bill by the promoters, even before general attention was called to them in the prominent manner in which they have recently been noticed. At a meeting of the Glasgow Town Council, held on the 7th current, at which the propriety of petitioning for the bill was considered, a letter was read from the law agent of the company, stating "that he had advised from London, announcing that in consequence of some doubts having been expressed, the clauses 36 and 37 of the Edinburgh and Glasgow Railway Extension Bill had been withdrawn from the bill for the present, and referred to the select railway committee." The council accordingly, on the distinct understanding that these objectionable clauses were withdrawn, agreed to petition in favour of the bill. A day or two afterwards a second communication was received from the same gentleman, on the part of the company, stating that the clauses "had been withdrawn absolutely from the bill, because the subject had been taken up by the select committee, now sitting on railways in general, who are to consider and report to the House of Commons whether any and what clauses ought in future to be inserted in railway bills, for the protection of the company against frauds, having regard, however, to the interests of the carriers and of the public." We are, therefore, to believe that these special clauses do not now exist in the bill referred to; but at any rate it would not perhaps be too much to ask a distinct declaration upon the point from the railway authorities, especially as the public mind, both here and in Edinburgh, is much excited on the point.—*Glasgow Herald.*

*Railway to Scotland.*—A prospectus for the continuation of the Lancaster and Carlisle Railway to Glasgow and Edinburgh, along the valleys of the Annan and Clyde, by Lockerby, Lynnington, and Lanark, has at length made its appearance, which is without exception the most satisfactory document of the kind that ever came under our notice, and cannot fail to ensure its success. Among the provisional committee are the names of Lord Belhaven, the Marquis of Queensberry, the Earl of Cathcart, Lord Abercromby, Lord Elphinstone, Sir William Jardine, Sir W. C. Anstruther, Sir Frederick Pollock, and a host of the most influential landowners along the line; and what is, perhaps, of still more consequence, the undertaking is supported by the Directors of the Grand Junction, the North Union, the Lancaster and Preston, the Manchester and Bolton, and other railway companies, by whom one-third of the capital is to be provided. The total cost is estimated at 1,800,000*l.*, and in the present state of the money market, and the almost certainty of its proving a profitable line—the committee estimate it at eight per cent.—not a doubt is entertained but the whole capital will be speedily subscribed. We fully expect to see the work undertaken and completed in a very short period.

*Important Railway Communication.*—The importance of railway communication from the British to the Bristol Channels, and the desirability of a junction between the South-Western and Bristol and Exeter Railways, have been felt by the public. Both these objects are now likely to be attained. A railway is about to be proposed from Southampton, through the New Forest, between Ringwood and Christchurch to Lytchett, which is immediately at the back of Pool Harbour; from this point it will be continued to Dorchester, thence to the river Yeal, and extending to Bridgwater. It is not yet decided whether there shall be one or two companies, but this will be known in a week or two.—*Sherborne Journal.*

*Bristol and Gloucester Railway.*—The usual half-yearly meeting of the proprietors of this railway was held on Thursday week. Great satisfaction was expressed at the report of the directors, and at the advantageous position in which the company is placed. The minimum receipts upon the line, when it shall have been completed, are calculated at a sum which will give 10 per cent. interest to the shareholders for their money, rendering this line one of the most prosperous in the kingdom. The report contains the gratifying announcement to the proprietors that no further calls will be necessary, as there are sufficient funds in hand to finish the line. From the engineer's report it appears that the whole of the permanent-way is laid upon the extension-line, and the entire line, it is now said, will be opened in three months from this time. The delay beyond the period originally contemplated is caused by the unfinished state of the line, belonging to the Great Western Company, between Stone-house and Gloucester. The meeting unanimously empowered the directors to subscribe an additional 10,000*l.* towards the projected South Devon Railway.—*Bristol Journal.*

*North British Railway Bill.*—On Thursday week, the committee of the House of Commons met to consider this Bill.—Sir C. Lemon as chairman. There were present—Mr. Macaulay, Mr. Ellice, Mr. Pringle, Sir A. L. Hay, Mr. Duncan, Mr. Stafford O'Brien, Mr. Foster, &c. Mr. Talbot opened the case for the company, and stated that the opposition to the measure arose from certain proprietors of lands through which the railway would pass. On Friday, the Lord Provost, Mr. J. F. Macfarlane, Mr. H. F. Cadell (Cockenzie), and Mr. Miller, the engineer, were examined in favour of the Bill.

*Strasburgh Railroad.*—The Council of Administration of this railroad has been finally constituted, and has presented to the Minister of Public Works a tender for the immediate execution of the works. The council includes Mr. Charles B. Baldwin, member of the British Parliament. Alderman W. Thompson, M.P., is President of the London Committee.

*Exeter and Crediton Railway.*—A meeting was held in Exeter on Wednesday week, to form a company for a railway from Crediton, to unite with the Bristol and Exeter Railway near Cowley Bridge. The meeting was attended by a deputation from the Bristol and Exeter Company.

*St. Helen's Railway.*—We learn, from good authority, that the amalgamation of the St. Helen's Railway and the Sankey Canal is now settled, and the two companies are working in concert until an Act of Parliament be obtained.—*Liverpool Courier.*

The Great Western Railway Company have bought four acres of land adjoining the railway, in the parish of Standish, a few miles below Gloucester; with the view, as is surmised, of making a large station there, should a line be carried onward across the Severn to South Wales.—*Bristol Journal.*

*ERECTION OF A ROMAN VILLA.*—A site has been selected for the house which his Majesty the King of Bavaria has ordered to be built strictly after the model of the ancient Romans, and for that purpose an architect and a painter have been sent to Naples to examine and to study all the particulars and minutiae of the best preserved private buildings at Pompeii and Herculaneum. The extensive collection of ancient utensils and furniture which his Majesty at various times received as presents from the King of Naples will be sufficient to furnish the house.

*SINGULAR DISCOVERY OF ANCIENT COINS.*—On Wednesday week, as some men were employed digging near the railway at Cheltenham, they discovered, at about 40 feet below the surface of the earth, a small earthen urn, of remarkable texture, upon which were carved some beautiful specimens of ancient Roman architecture, and upon being opened it was found to contain a number of ancient gold and silver coins; amongst others were a few of silver of the reign of Tiberius Cæsar, in high state of preservation.

*St. Mary de Crypt Church, Gloucester.*—The restoration of this beautiful church is proceeding, under the superintendence of Messrs. Dawkes and Hamilton, most satisfactorily. The sedilia in the south side of the chancel, and the sepulchre and abbots' seat on the north, which are of exquisite workmanship, have been completely restored. The canopies on each side of the altar have been re-erected, and are choice specimens of the architectural skill of the early part of the fifteenth century. The stone altar-table which had been buried, but was recently discovered in an unutilized state, has been placed in its original position. It is a slab of Forest stone, 10 feet 1½ inches in length by 3 feet 7½ inches in breadth, and stands on five massive legs. The restoration and extension of this church have been undertaken by the rector, the Rev. A. Sayers, entirely on his own responsibility. The subscriptions already received or promised do not amount to more than 400*l.*; while the lowest estimate of the projected improvements is 1,100*l.*

*New Church at Hollinwood.*—The subscriptions recently raised with the view of defraying the cost of repairing the roof of St. Martin's Church, Hollinwood, have been converted into a fund for the purpose of erecting an entirely new church at that place. Several liberal donations have been presented to effect that object, which has met with the most encouraging countenance from the Venerable the Archdeacon of Manchester. At a recent meeting of the seat-holders and other parties interested in the present church, it was determined to take prompt measures to secure the building of a new church, with adequate accommodation for the poor.

The Committee of the Birmingham Church Building Society have decided immediately to commence the fifth church, to be named St. Andrew's, on a site liberally presented to them by Messrs. E. and C. Robins, in an elevated situation on their estate, adjoining Waterylane. The land on which St. Matthew's Church, parsonage, and schools are erected, was also presented by the same gentlemen.

Contracts for new seating with carved oak, and new flooring and plastering the parish church of Tavistock, Devon, have been entered into, and will be proceeded with immediately. The seats are to be all open benches, with carved ends. The altar, pulpit, and reading-desks are to be of Caen stone, beautifully carved. The money was raised by public subscription, amounting to about 3,000*l.*

*Wiltshire.*—The parish church of Marston Maisey is in such a dilapidated state, that it is proposed to take it down and rebuild the same upon a larger scale. It is in contemplation to erect a district church at Chiltote, in the parish of Allcannings, and another at Zeals, in the parish of Mere. The parish church of Melksham will probably be enlarged.

*Rumcorn Parish Church* is about to be rebuilt in the early English style, with a tower and spire, at an expense of 6,000*l.*

**THE CHIEF TEMPLE OF HYMEN AT GRENA GREEN.**—In front of the building there is a grass lawn, green and pleasing to the eye, garnished in divers places with trees and evergreens of less size; and a carriage drive of 200 yards long, more or less, leads from the entrance gate near the Green up to the door. Moreover, an adjoining field has been taken in and added to the grounds, that nothing might be wanting, round about, which run some shady and labyrinthine walks, where lovers may saunter at will in the cool of the evening; and many stately trees growing thereby spread their nervous limbs abroad over head, whereon any who have too hastily done a rash act may go and hang themselves up at pleasure. In fine, the place is altogether tastefully laid out, with care both for joyous pastime and pleasant recreation.

**ANCIENT RELIC.**—Mr. T. Walsh, Limerick, has got a curious and rare specimen of the gold pin or bodkin which the Irish chieftains of old wore in front of their dress. It was found in the crevice of a rock at Carrigaholt Castle, on Tuesday, where a few natives were burning sea-weed. It is fully seven inches long, and is of the purest gold, weighing over two ounces.—*Cork Examiner.*

PATENTS RELATING TO ARCHITECTURE,  
ENGINEERING, &c.

Granted between 26th February and 28th of  
March, 1844.

[SIX MONTHS FOR ENROLMENT.]

William Clegg Gover, of Chester-square, Middlesex, gentleman, for a method of casting off the sash-lines and weights from the window sashes, and of taking out the window-sashes from their frames without removing the beads.—March 1; two months.

Joseph Crawhall, of Newcastle-upon-Tyne, rope manufacturer, for improvements in machinery for manufacturing ropes and cordage.—March 2.

John Stevely, of Belfast, professor of natural philosophy, for improvements in steam-engines.—March 2.

Samuel Atkinson, of Manchester-street, Gray's-inn-road, Middlesex, turner, for improvements in the construction of wheels for carriages.—March 4.

Bernard Peard Walker, of North-street, Wolverhampton, clerk, for improvements in machinery for making nails.—March 6.

William Henry Barlow, of Leicester, civil-engineer, for improvements in the construction of keys, wedges, or fastenings, for engineering purposes.—March 6.

William Fairbairn, of Manchester, engineer, for certain improvements in machinery used for propelling vessels by steam.—March 7.

Alexander Angus Croll, of Brick-lane, Middlesex, superintendent of the gas works, and William Richards of the same place, mechanical inspector, for improvements in the manufacture of gas for the purpose of illumination, and in apparatus used when transmitting and measuring gas.—March 7.

Charles Harrison, manager of the Coed Talon and Leeswood Iron Works, Flintshire, for certain improvements in the manufacture of cast-iron pipes, and other iron castings.—March 14.

William Godfrey Kneller, of Wimbledon, Surrey, chemist, for improvements in the preparation of zinc, and in combinations of zinc, with other metallic bodies.—March 14.

Henry Persbouse Parkes, of Dudley, Worcester, manufacturer of chain cables, for improvements in the manufacture of flat pit chains.—March 14.

John Browne, Esq. of New Bond-street, Middlesex, for improvements in urinary utensils.—March 14.

Moses Poole, of Lincoln's-inn, Middlesex, gentleman, for improvements in steam-engines, steam-boilers, and furnaces or fireplaces. (A communication.)—March 14.

Emanuel Wharton, of Birmingham, engineer, for improvements in steam-engines, which are in whole or in part applicable to other motive engines, and to machines for raising or impelling fluids.—March 14.

Hugh Inglis, of Kilmarnock, Scotland, mechanic, for improvements upon locomotive steam-engines, whereby a saving of fuel will be effected, which improvements are applicable to steam-vessels and other purposes, and to the increasing the adhesion of the wheels of railway engines, carriages, and tenders upon the lines of rail, when the same are in a moist state.—March 19.

John Butt, of Maldon, Essex, draper, for improvements in candlesticks.—March 22.

John Harcourt Quincey, of Old-street, City-road, gentleman, and John Johnson, of Corsitor-street, lamp-maker, for improvements in the manufacture of lamps, and shades for lamps and other lights. (Partly a communication.)—March 23.

James Hardy, of Birmingham, Warwick, gentleman, for improvements in the process of welding tubes, pipes, or hollow rods of malleable iron by machinery.—March 23.

Joseph Maudslay, of the firm of Messrs. Maudslay, Son, and Field, of Lambeth, Surrey, engineer, for improvements in steam-engines.—March 28.

A meteorological observatory has been erected on Vesuvius; it is in the form of a tower, and stands a little above the Hermitage, 2052 feet above the level of the sea.

Correspondence.

SHAM SURVEYORS.

SIR,—I agree with your correspondent "Z." that it is quite time that sham surveyors were held up to public censure, and prevented from committing depredations on the public. A few months since it came out in evidence, in the Court of Queen's Bench, that one of these sham surveyors claimed a commission from a stove-maker of only twenty per cent. If his client were plucked in the same way all through his house, the fellow had a fine picking.

Your constant reader,

A SMITH.

SIR,—By way of comment on the remarks of "Z." as to the "disgraceful practices of sham surveyors," published in your last Number, I, in common with every member of our profession, must disapprove of any one engaging to work for "no charge if not approved;" but, I think, as regards those surveyors who profess to take out quantities for builders, from architects' designs, that their charge for so doing is decidedly too much; and, I am induced to believe, that if those gentlemen were more moderate in their demands, the profession would still retain its former respectability. To illustrate this, I will mention a case which occurred in my own practice: I was engaged a short time since as architect to a house which cost nearly 2,000*l.*; I named a respectable surveyor to take the quantities from the drawings, and the builders written to approved of him; and the quantities were furnished, and the builder whose tender was the lowest paid this surveyor 2½ per cent. on the amount. Two or three other similar instances have also occurred; and looking to the fact of the architect having much trouble in preparing the designs, much anxiety in superintending the work during its progress, as well as the responsibility, and remembering the pay he receives, I think the surveyor is much too well paid. I have no desire to underrate the value of these gentlemen's services, but, I think, their fee should bear a better proportion to that of the architect. I quite disapprove of the system adopted by some architects of supplying the builders with their own quantities, because I think the architect should not receive a fee from the builder; but, I must confess, that on the next occasion that I require quantities to be taken from my designs, I shall hesitate in consenting to so large a commission being paid as that which I have adverted to, and which is called the "usual charge." Your obedient servant,  
April 1, 1844. A.

FONT IN ST. MARY'S CHURCH, DRECON.

SIR,—I have read both your correspondents' letters on the above subject, and have much pleasure in forwarding, to the best of my ability, the information required. "The moulding in the back-ground" is formed thus, but is very much mutilated. I left out the fragment in my sketch, as it certainly, in the present detached situation of the font, does not add to the beauty of the composition. I mentioned in my description, that a metal basin is inserted in the bowl, which might be removed as occasion required, and which, therefore, precludes the necessity of a water-drain, whether the bowl was originally supported by a shaft or fixed in the wall. I mention this because your correspondents seem to fancy that the bowl is lined with metal. I have no means of informing "J. K. L." of its original position, as I fancy the style of the font to be much earlier than any part of the church, which I believe to be built in the last period of the Pointed mode, perhaps as late as the reign of Edward VI. or of one of his sisters.

I apprehend its present position, near the western door of the church, is no criterion of its nature, as "J. K. L." seems to think; because even if it were originally a piscina, it has been used as a font for perhaps centuries, and might therefore have been removed to its present situation. I think "a F. S. A." in his conjectures respecting what I termed "a moulding in the back-ground," and which he has construed into a portion of the arch above

a piscina, misunderstood my meaning; if he will recollect, I believe I said it butted up against the side of the bowl, as if it were the portion of a string-moulding in a wall, the font having three whole sides and two half-sides exposed, and perhaps taking the character of a corbel. This is merely a supposition of mine, and, from my incompetency to form an opinion on the subject, very liable to be incorrect.

I think I neglected to tell you, that the left hand of each figure underneath the bowl, hid by the face, clasps an open book upon the breast, as if indicating, while pointing to the water above, that the holy origin of baptism is found in the Book of Books.

I am, Sir, your obedient servant,  
Berkeley-place, Brecknock. J. L. T.

RAVAGES OF WORMS IN TIMBER.

SIR,—In the article from Mr. James Steward, of Dover, I find a fear expressed of the timbers suffering from the ravages of the worm. Provided plies were used of a description of wood grown in the West Indies, which I believe is called mora or green heart, that difficulty I feel assured would be alleviated; for I have known the same used at Liverpool some years back, and last year I observed it, and it had entirely resisted the worm. Curiosity caused me to make some inquiry of the nature of the wood while there, and I found the properties quite understood; as such, it rather astonishes me that the same has not been applied to the purposes alluded to. The only reason I can account for it is the material not being known, or the difficulty of obtaining it; probably you will inform me through your valuable periodical the reasonable cause.

I am, Sir, your most obedient servant,  
A CORRESPONDENT.  
London, 11th March, 1844.

ARTISTS' BENEVOLENT INSTITUTION.—

The annual celebration of the festival for the support of the funds of the Artists' General Benevolent Institution took place on Saturday, in the great room of the Freemasons' Tavern, Queen-street, Long Acre, on which occasion upwards of 150 persons, connected with the fine arts and literature, sat down to a more than usually excellent banquet, prepared by Mr. Bacon, the proprietor of that well-known place of good cheer and conviviality. The chair was taken shortly after six o'clock by Sir Robert H. Inglis, M.P., who was supported on his immediate right and left by several of the most eminent patrons of the institution. The musical arrangements were under the direction of Mr. T. Cooke, who presided at the piano-forte, assisted by Messrs. Hobbs and Hawkins, of the Chapel Royal, Mr. Bradbury, and several pupils of Mr. Cooke. This part of the arrangements was very good, and was a principal feature of the evening. The chairman, during the course of the proceedings, proposed, in the usual manner, the healths of the Queen, of the Queen Dowager, Prince Albert, and of the other members of the Royal Family, which were drunk with the usual lively displays of good feeling and loyalty. A long list of other toasts was then drunk, and responded to with cheers. Several gentlemen addressed the company, in brief speeches, in advocacy of the cause of the meeting; and the result of their appeals and that of the chairman was a contribution and subscription of upwards of 500*l.* Amongst the principal contributors to which amount were—the British Institution, 50*l.*; the Duke of Sutherland, 10*l.* 10*s.*; the Duke of Northumberland, 10*l.* 10*s.*; Sir J. Swinborne, 10*l.* 10*s.*; Sir R. Inglis, 10*l.* 10*s.*; Lady Chantrey, 20*l.*; Mr. Jones Lloyd, 10*l.*; Mr. Tomlin, 10*l.*; Sir G. Hayter, 10*l.*; Mr. Dickinson, 10*l.*; Baron Rothschild, 10*l.*; Sir Martin Jones, 5*l.*; Mr. Phillips, R.A., 5*l.*; Mr. G. Jones, R.A., 5*l.*; Sir W. Ross, R.A., 5*l.*; Mr. B. Cabell, 5*l.*; Mr. Munn, 5*l.*; Mr. R. Cooke, R.A., 5*l.*; Mr. T. H. Pulbat, 5*l.*; Mr. N. Walford, 5*l.*; &c. The company separated shortly before seven o'clock.

REDCLIFF BELLS.—The seventh bell of this fine peal, which fell in November last, has been replaced.

## Miscellaneous.

**METROPOLITAN IMPROVEMENTS.**—The site of the contemplated Thames embankment on the Middlesex side of the river is undergoing a minute survey, and when carried into effect will be one of the greatest ornaments of the metropolis. A line of quays, similar to those on the banks of the Seine in Paris, is proposed to be carried from Whitehall to Blackfriars-bridge upon arches, so as not to interfere with the navigation of the river, and the numerous coal-barges approaching the wharves. At Pimlico the houses are now nearly all pulled down, and workmen are busily engaged in razing them for the new road, which will join the Vauxhall-road, and materially widen the vicinity of Buckingham-palace. The "rookery" which has existed for so many centuries in Westminster, Tothill-street, York-street, and Castle-lane, is all to come down to make way for the improvements. The widening of Piccadilly, by taking in a small portion of the Green-park, will commence this month. The new street leading from Coventry-street across Leicester-square to Long-acre is in an advanced state, as all the old buildings are pulled down, and workmen are laying the foundations of the new houses. The new street from Waterloo-bridge, across High-street, Bloomsbury, to Tottenham-court-road, is proceeding rapidly, and several hundred houses have been pulled down in the neighbourhood of St. Giles's.

**EXTENSIVE IMPROVEMENTS AT ETON COLLEGE.**—ETON, March 26.—At a recent meeting of old Etonians it was agreed that extensive alterations and additional buildings should be made in Eton College, for the accommodation of the scholars on the foundation, at the estimated cost of 23,000*l.* It was proposed to erect the new building on the site of the coach-houses and stables of the Provost and Fellows, to alter and improve the present long chamber, to form proper sewers, and provide an apparatus for warming with hot water the apartments in which the scholars will be lodged. It is also intended to form on the ground-floor of the new buildings, which from local circumstances cannot be applied to the accommodation of the scholars, one large room for the reception of the library of the school, to which his late Majesty George IV. was a liberal contributor, which room may be used as an examination room for the Newcastle Scholarship, and for the prizes given by his Royal Highness Prince Albert for proficiency in modern languages, and also rooms in which the different masters for modern languages and mathematics may receive their pupils. There will also be two rooms appropriated in the tower for the use of the upper boys in the evening. Estimates from 15 competitors were sent in to Mr. Shaw, the architect, by whom they were opened at Christ's Hospital on Monday last, and afterwards forwarded to Eton, and at a special meeting held at the College on the same day it was settled that Mr. Burton's tender should be accepted. These important and extensive works will be commenced forthwith, under the superintendence of Mr. Shaw and Mr. Harrison, the architect and surveyor of the college.

**TYNDALL'S PARK.**—We understand that the whole of Tyndall's park, and the adjacent field, is to be let for building. If the plans are carried out, the contemplated buildings will form one of the most ornamental parts of the city. They are laid out in squares, terraces, &c., and reflect great credit upon the taste of Mr. Dyer, the architect, to whom the disposal of the ground has been confided. A number of workmen have for some time past been employed in the construction of the sewers and drainage. It cannot but excite regret that this beautiful spot, so much resorted to for healthful recreation, is to be covered with houses, though it is only to be wondered at that such appropriation, so much more profitable than grazing-land, has not been before carried out, as was intended some twenty years ago. There cannot be a doubt that the land will fetch a high price.—*Bristol Journal.*

**SUBMARINE PROUGH.**—A submarine plough for removing sand-banks in shallow waters is said to have been constructed by Dr. Eddy, of Cincinnati, somewhat on the principle of the Archimedean screw, boring up the sand at one end, and passing it through the screw to be discharged at the other extremity.

**SMOKE.**—In the voluminous report on smoke, lately made in the House of Commons, by a select committee, some curious facts are mentioned; for example, Mr. Chandler, camellia-grower at Wandsworth, states that on account of the great increase of chimneys from manufactories in that vicinity, plants which formerly might be handled without any bad effect, now soil the hands to the greatest extent. Among other plants which formerly flourished, but will not now grow in the neighbourhood of the metropolis, are China roses, rhododendron hirsutum, rhododendron virginicum, and many others of the prettiest varieties, now quite extinct. Mr. Anderson, the curator of the Physic Gardens at Chelsea, testifies to the noxious effects of what he calls the "bitter smoke" upon the trees of that establishment, particularly on evergreens, and on two magnificent cedars which have so long been an ornament to the gardens, and form a very conspicuous object from the river. It appears that the sooty particles are attracted to and attached by the resinous exudations of the leaves, while the large surface of the foliage above prevents their being washed away by the rains, so that the functional action of the leaves is disturbed, if not entirely destroyed.

**DEATH OF THORWALDSEN, THE EMINENT SCULPTOR.**—COPENHAGEN, March 25th.—Albert Thorwaldsen, the greatest artist of the day, is no more. Yesterday evening he went, as was his custom, to the theatre. Before the commencement of the performance he suddenly fell back in his seat, and he was carried out, and soon after breathed his last. He was born on the 19th of November, 1770, and was consequently in his 74th year. To the last day of his life he preserved his activity and cheerfulness of spirits, and he was engaged on some important works, among which may be mentioned the colossal statue of Hercules for the Palace of Christianburgh. On Saturday, the 30th of March, the mortal remains of the great master were interred in the Holm church. All he died possessed of he has bequeathed to the Thorwaldsen Museum; but, with the exception of his works of art, his property is not so great as was imagined. He had been working on the bust of Luther upon the day of his death.

**PUBLIC EXPENDITURE.—THE ROYAL PALACES AND HOUSES OF PARLIAMENT.**—On Saturday week was issued the estimate of money required for public works and buildings, for the year ending the 31st March, 1845. For public buildings and royal palaces the sum required is 112,190*l.*; for the temporary Houses of Parliament, 5,420*l.*; for the new Houses of Parliament (beyond the sum voted), 60,000*l.*; for Trafalgar-square, 7,000*l.*; for Holyhead roads, &c., 4,169*l.*; for the Caledonian canal, 50,000*l.*; for public buildings in Ireland, 26,871*l.*; and for Kingston harbour, 8,000*l.*; making, in the aggregate, 273,645*l.* The actual decrease, compared with 1843, is stated to be 42,626*l.* Among the items for services executed in 1843-4, and not provided for, is one of 1,500*l.* for the Queen's Prison, for furniture of some offices, and for furniture and bedding for the poor prisoners.

The Royal Academy of Fine Arts at Munich is about, for the first time in the last six years, to have an exhibition, commencing on the 25th of August; for which government has placed at its disposal the new palace just completed in front of the Glyptothek. The works of foreigners are to be received on the same terms as those of the national artists; and the academy has undertaken to invite individually the leading artists of all countries to contribute their works, undertaking to pay all expenses of transmission and return.—*Athenæum.*

**PHYSICIANS' HALL.**—We observe that within the last few days workmen have been busily engaged in the demolition of the Physicians' Hall, George-street, preparatory to the erection of the splendid edifice which is intended to be raised on its site for the office of the Commercial Bank. We understand that a new hall for the Royal College of Physicians is to be built in the centre of the eastern division of Queen-street.—*Edinburgh Observer.*

The foundation stone of the New Market-house, Ruperra-street, Newport, was laid on the 26th ult.

**DEATH OF A CELEBRATED GERMAN ARTIST.**—The *Journal des Débats* announces the death, at Munich, on the 18th ult., of M. Jean Baptiste Stiglmaier, director of the Royal Foundry of Munich, in the 52nd year of his age. "This distinguished engraver, painter, and sculptor carried the art of casting metals to the highest point it had ever reached in Germany. The monuments of colossal grandeur for which the Germans are indebted to him amount in number to 193, amongst which figure in the first rank the equestrian statues of Maximilian I. of Bavaria, and the Electors, his predecessors, which have been all gilt; the obelisk erected at Munich, in commemoration of 30,000 Bavarians killed in Russia. ["The inscription on this monument goes further," says our Paris letter, "for it states that the men whose deaths it commemorates 'fell in defence of their native land (vaterland)!' At Guntzburg (and I suppose they are to be found in nearly all the other towns of Bavaria) the churches contain tablets to the memory of the Bavarian soldiers who fell in the battles against the French, which preceded the capture of Paris in 1814!"; the statues of Schiller, Jean Richter, Mozart, Beethoven, Bolivar (for Bolivia), and last, the statue of Goethe, who was the intimate friend of Stiglmaier, and at the execution of which the latter, although ill, worked with so much ardour, that two hours after the cast was terminated, and even before the mould was broken, he expired in the arms of his assistants. Some months previously, M. Stiglmaier, although he then enjoyed excellent health, had a sudden presentiment of his approaching death. From that moment he occupied himself night and day in preparing instructions for the execution in bronze of the statue of Bavaria, of which the celebrated sculptor, Schwanthaler, is now composing the model, a monument which is to be sixty-eight feet high, and which, after the famous Colossus of Rhodes, will be the largest piece of sculpture which ever existed. Fortunately, the instructions given by M. Stiglmaier have been committed to writing. They are most complete, and will be of the utmost utility to the artist to whom shall be intrusted the most gigantic operation of casting in bronze this immense monument."—*Times.*

**DISCOVERIES IN EGYPT.**—I learned from Selim Pacha, the governor of Upper Egypt, who received us in a most friendly way at Siut, that, a few months before quarries of alabaster had been discovered a short distance off in the direction of the eastern mountains, the excavation of which had been committed to him by Mohammed Ali; and I heard from his dragoman, that there was an inscription to be found on them. I accordingly set off, on a hot ride, to the place appointed, the next morning, and found there a little colony, in all thirty-one people, in the solitary, desert burning cave. Behind the tent of the overseer, I discovered the remains of an inscription, recently much longer, but still containing the name and title of the wife, so much honoured by the Egyptians, of the first Amasis, the founder of the eighteenth dynasty which drove out the Hyksos, engraved in clear, sharply cut hieroglyphics. These are the first alabaster quarries whose age can be proved by an inscription: upwards of 300 blocks, the largest eight feet long, two thick, have been cut out during the last four months. The Pacha informed me, by his dragoman, that I might have, on my return, a slab of the best quality, of whatever size I chose to fix on, as a testimony of his joy at our visit. The quarries as yet found lie all between Berseh and Gausita; one would, therefore, feel inclined to think El Bosra the old Alabastron, if one could reconcile with it the passage in Ptolemy; at any rate, Alabastron can have nothing to do with the ruins in the valley of El Amazna, which the description in Ptolemy as little agrees.—*Correspondent of the Athenæum.*

**BRICKMAKING.**—The newly-patented brick-machine, invented by Mr. W. Hodson, of this town, for making and compressing (when in a wet state) bricks of every description for building purposes, is of very simple construction, and produces a compressed stock brick with the same number of hands as is employed when in making the common stock brick. The machine is worked by hand-labour, and not susceptible of derangement.—*Hull Packet.*

**ANTEILUVIAN REMAINS IN FRANCE.**—The construction of railroads promises to afford an inexhaustible source of valuable geological discoveries. Wherever the engineers have opened trenches, numerous remains of antediluvian animals have been found. Their number is often so great in different parts that it vies with that of the round pebbles among which they are lying. At Perrigny, near Dijon, it was deemed necessary to cut the road across a small hill, where bones of bears, elephants, rhinoceroses, jackals, wolves, horses, &c. were so multiplied that it is doubtful that our burying-grounds can contain so large a quantity of human remains. Among them were fragments and stumps of elephant's teeth of so enormous a size that the imagination is actually terrified at the idea of the stature of the animals to which those frightful arms belonged.—*Monteur.*

**THE LATE FIRE AT BRAMAH'S PIMLICO.**—We are happy to observe that the premises appear from the road to be quite reinstated, and we are informed that advantage has been taken of the opportunity afforded (by the recent fire) for greatly improving the buildings, &c., for the more efficiently carrying on the business of the proprietor, Mr. Charles Robinson.

**HAMPTON COURT PALACE.**—Wolsey's splendid hall, or, as Evelyn termed it, "the most magnificent room," is once again undergoing repair. The roof is about to be again gilded, and the spirit of renovation hovers over the venerable remains of the work of him whose blighted ambition has left a name to point a moral and adorn a tale.

### ERRATA.

In the 20th line of the 3rd column, page 171, for "If he does he is not," read "If he does not he is."

### TO OUR CORRESPONDENTS.

We have had the truss and scarfing of the roof over the Princess's Theatre engraved, and will insert them in our next, if our correspondent will favour us with an account of the clear span of the roof and the scantlings of its timbers.

"Polygot" may send us any communication he likes towards an Architectural Glossary: a hint, a scarce word, an old reading, may be of service.

We have not received the communication of "Philo."

To "W. W. W.'s" "anxious inquiries" relative to our progress in collecting specimens of Gothic architectural details, we beg to reply that besides laying down general measures for their collection, we have at present in hand twenty-five such subjects.

To "A MEMBER OF THE WOODEN TRUSS SOCIETY,"—we beg to say that we have seen the trusses in question lately applied between the hip-rafters of two houses in the Westminster and Borough Road, opposite the Queen's Bench Prison. We did not measure them, but were told they were 90 feet long, with beams 2 feet 2 inches deep, in several layers, joined in their length with iron plates in their scarfings, and with only two iron queen-suspenders in the length. If any correspondent will furnish us with a draught of them, with the scantlings and full particulars of them and their iron-work, we shall with pleasure insert them in THE BUILDER.

"A Catholic Architect," who craves advice upon the use of cows, we refer to our advertisements.

The Irish Antiquities in our next.

We are sorry to say any thing disagreeable to our correspondent, Mr. CHASE-MORTISE, but we think "the less of his company the better," believing that he has cracked a great many ceilings in otherwise very good houses. When we come to treat more at large upon carpentry, he will find we have reasons enough against him.

To the appeal of "One cautious in his p's and q's," we beg to say the compound word, or appellation, should always be written Breast-simmer, from "Breast," signifying a hanging-work of masonry or brickwork, as the front of a chimney, termed a "chimney-breast," and "Summer," an old English word signifying a beam of burthen, frequently called also "Summer-tree," equivalent to the modern term "Girder," which term not expressing the office of such a beam, ought to be exploded, and the old word "Summer" should be restored. The term "Bressummer" is a gross corruption.

### MEETINGS OF SCIENTIFIC BODIES.

To-day and during the ensuing week.

SATURDAY, APRIL 6.—Westminster Medical, 32, Sackville-street, 8 P.M.

MONDAY, 8.—Medical, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 9.—Medical and Chirurgical, 53, Berners-street, 8 1/2 P.M.; Zoological, 57, Pall Mall, 8 1/2 P.M.

WEDNESDAY, 10.—Graphic, Thatched House Tavern, 8 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.; Ethnological, 8 P.M.

FRIDAY, 12.—Astronomical, Somerset House, 8 P.M.; Botanical, 20 Bedford-street, Covent Garden, 8 P.M.

SATURDAY 13.—Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

BRITISH MUSEUM.—Open to the public every Monday, Wednesday, and Friday, from 10 till 7 during May, June, July, and August, and from 10 till 4 the rest of the year; except the first week in January, May, and September, Ash-Wednesday, Good Friday, and Christmas Day, and East of Thanksgiving Days. The Natural History Collections are open for study and comparison of specimens, to persons having permission, on Tuesday and Thursday from 10 till 4. The Reading Room is open to persons having tickets of admission every day (except Sundays, and when the Museum is closed, as above mentioned), from 9 till 7 in May, June, July, and August, and from 9 till 4 during the rest of the year. The Gallery of Antiquities is open to students having tickets every day in the week, except Saturdays and Sundays (and those times when the Museum is closed), at the same hours as the Reading Room.

ROYAL COLLEGE OF SURGEONS.—The Museum is open to visitors on Monday, Tuesday, Wednesday, and Thursday, from 12 till 4, except during the month of September; on Friday to gentlemen for studying in it; and on Saturday from 10 till 1 to gentlemen desirous of comparing specimens with those in the Museum. The Library is open to members and students of the college, and visitors having tickets of admission, daily (Sundays excepted), from the 1st of October to the 1st of April, from 10 till 4; and from the 1st of April to the 1st of September, from 10 till half-past 5.

LINNEAN SOCIETY.—Library open on Monday, Tuesday, and Thursday, and the Museum on Wednesday and Friday, from 12 o'clock to 4 in the afternoon.

GEOLOGICAL SOCIETY.—Library and Museums are open every day from 11 till 5.

ROYAL ASIATIC SOCIETY.—Museum is open every Tuesday, Wednesday, and Thursday, from 11 till 4.

UNITED SERVICE INSTITUTION.—Museum open all the year, from 11 till 5 in summer, and from 11 till 4 in winter. Admission by members' tickets.

LONDON INSTITUTION.—Lectures will be delivered every Monday and Thursday evening, at 7 o'clock, until May 6.

BOTANICAL SOCIETY.—Herbarium open every Wednesday and Friday evening, from 7 till 10 (except September).

CIVIL ENGINEERS.—Library open from 9 A.M. to 9 P.M.

ENTOMOLOGICAL SOCIETY.—Museum open every Tuesday from 1 till 7.

SOCIETY OF ARTS.—Open every week-day except Wednesday, between 10 and 2. Admission by members' tickets.

The meetings of the following Societies are continued throughout the year, on the regular days:—HORTICULTURAL, ZOOLOGICAL, ENTOMOLOGICAL, BOTANICAL, ROYAL BOTANIC, and PHARMACEUTICAL.

### NOTICES OF CONTRACTS.

For executing certain extensive Additions and Alterations of County Gaol and Penitentiary at Gloucester, and of the several Houses of Correction at Horsley, Lawfords-gate, Littledean, and North-leach, in said county.—Plans, &c., at the Office of the County Surveyor, in Barton-street, Gloucester, April 8.

ERECTING A NEW SCHOOL-HOUSE AND BUILDINGS, ST. AUGUSTINE, BRISTOL.—Plans, &c., at Messrs. T. Foster and Son, Architects, Park-street, Bristol. April 8, 1844.

For Erecting a Gasholder, 80 feet in diameter.—Plans, &c., Commercial Gas Light and Coke Company's Offices, Stepney; further particulars Mr. T. Mercer, Engineer on the Works. April 10.

For putting up Pipes, Boilers, &c., for heating the new Prison, Belfast, and for supplying 700 locks.—Plans, &c., at the Office of Mr. Lanyon, Belfast; John Coates, Carrickfergus. April 10.

For works required in the enlargement of the Liverpool Workhouse.—Day for sending in Contracts, &c., postponed sine die.

For making certain Repairs on the Church of Bethelvie.—Plan, &c., J. Smith, Esq., Architect, Aberdeen. April 17.

For Erecting a Church at New Radford, near Nottingham.—Plans, &c., H. J. Stevens, Esq., Architect, 16, Full-street, Derby.

For executing extensive Additions and Repairs to the Manse of Mortlach, and for Erecting new Offices there.—Plans, &c., at the Manse. Further particulars T. McKenzie, Esq., Architect, Elgin. April 17.

CAMBRIDGE.—For the several works to be executed at the corner of St. John's and Bridge-streets. Mr. Clemence, Surveyor, Cherterson-road. The day for receiving Tenders not fixed.

### PREMIUM.

£150 for the best design, plans, and estimates for a Pauper Lunatic Asylum, Derby (unless the person furnishing the same be employed to superintend the execution of the works); £100 for the second best design, and £50 for that which may be considered next in merit.—Mr. Barber, Derby, April 20.

### ADVERTISEMENTS.

E. WOLFF & SON'S

NEWLY-INVENTED

MATHEMATICAL PENCILS,

FOR

MATHEMATICIANS, ENGINEERS, ARCHITECTS, &c.

Manufactured of Extra Hard Lead, and Warranted to retain a very Fine Point.

E. WOLFF & SON, in introducing their Extra Hard Lead Pencils for Mathematical and Architectural purposes, beg to draw attention to the advantages resulting from their adoption in preference to the ordinary Pencils. They are made of six distinct sizes, by which means they can be fitted to all instruments, and are so constructed that each Pencil may be cut in halves without waste, thus making two Pencils, each of a length the most convenient for use, and obviating the difficulties existing with respect to the ordinary pencil.

E. Wolff & Son have also half-round Pencils suitable for the Spring Bow Instrument, thus preventing the necessity of dividing the Pencil down the centre. They are also manufactured of extremely hard Lead, of the finest quality, which will retain a very fine point, and give a clear, even, and distinct line. Price 1s. per dozen.

### PATTERN OF SIZES.

\* May be had of most respectable Stationers and Instrument Makers, and of the Manufacturers, 23, Church-street, Spitalfields, London.

Drawing Pencils of every description for Architects and Engineers.

A Sample of each Size will be sent by Post to any part of the Kingdom on receipt of Postage Stamps equal to the amount.

The Builder.

NO. LXII.

SATURDAY, APRIL 13, 1844.

**M**ERTAINLY some most remarkable statistical & other evidences have been elicited by the inquiries which have been made, and from which we have quoted largely in our last two numbers; but before we ourselves enter minutely on the policy and details of any general sanitary enactment for the principal populous towns throughout the kingdom, we shall lay before our readers the first general

REPORT of the Select Committee appointed to Inquire into the Circumstances affecting the Health of the Inhabitants of Large Towns and Populous Districts, &c.

YOUR committee have inquired carefully into the matters submitted to them, and find that sanitary regulations in many of the principal towns of the realm are most imperfect and neglected, and that hence result great evils, suffering, and expense, to large bodies of the community. They have proposed several remedies; viz. general Acts to facilitate regulations in building, sewerage, and local improvements, applicable to populous districts; also the establishment of boards of health and local inspectors, and have made other suggestions detailed in their report.

Before entering into the result of their inquiries, your committee venture to lay before the house a few preliminary observations respecting the important subject which has been intrusted to their consideration.

By reference to the population returns, it appears that, from the beginning of the present century, the whole population of Great Britain has increased at the rate of nearly sixteen per cent. every ten years; from 1801 to 1811, thence to 1821, and again to 1831; and there is every reason to believe about the same rate of increase will be found to have taken place next year, when the next decennial return will be made. Whilst, however, such has been the increase in the population of the kingdom at large, reference to the same returns shews, that the augmentation of numbers in the great towns of the realm has been much more rapid: thus, whilst the increase of population in England and Wales, in thirty years, from 1801 to 1831, has been something more than forty-seven per cent., the actual increase in the number of inhabitants of five of our most important provincial towns has very nearly doubled that rate; being

Manchester . . . . .	109 per cent.
Glasgow . . . . .	108 —
Birmingham . . . . .	73 —
Leeds . . . . .	99 —
Liverpool . . . . .	100 —

giving an average increase of almost ninety-eight per cent. in five cities, whose united population in 1831 amounted to 844,700, and at the present time may be calculated at not less than 1,126,000. Far the larger portion of this vast body of persons are engaged constantly in occupations connected with manufactures or commerce.

In many other of our large towns the increase in numbers has been of a like nature, and though not so rapid in several of them, yet, from a document lately laid before Parliament, and compiled by authority, it appears that on a comparison of a large rural district with various provincial and other towns

(within or contiguous to it), the increase in population in the former, during ten years (1821 to 1831), was eleven per cent., and in the latter thirty-one per cent., shewing that the numbers in towns augmented almost three times as fast as in the country.

By reference to the Population Returns, we find that the proportion of the humbler classes occupied as manufacturers or workmen, and living in towns, is, as compared with the labourers in rural districts, completely changed.

It appears, by returns laid before the house, that the latter class was to the former, in 1790, about two to one; and now the town workmen and manufacturers, instead of being one-half, are nearly double the number of rural labourers.

It must be evident, that owing to this rapid increase in the population of great towns, the proportion of the humbler classes, of those with little leisure for education or improvement, will be augmented, as the more wealthy and educated gradually withdraw themselves from these close and crowded communities; which thus more and more stand in need of some superintending paternal care.

The difference in the proportion of numbers entirely occupied in labour is very different in different places. An account laid before your committee, and to which they believe due reliance may be given, states this proportion to vary from sixty-four per cent. in the borough of Manchester, to seventy-four in Salford, eighty-one in Ashton, and ninety-four in Dukinfield.

Your committee venture to remark, that the great towns of the realm may be divided into classes differing from each other in various circumstances, yet all requiring, more or less, the enforcement of sanitary regulations calculated for the benefit of their inhabitants. As,

1. The metropolis.
2. Manufacturing towns.
3. Populous seaport towns.
4. Great watering-places.
5. County and other considerable inland towns not being the seats of particular manufactures.

Besides these different classes of towns, there are various places, especially in the mining districts, in which a vast population of the working classes are spread irregularly over the face of the country, in some spots closely packed together, and in others dispersed in groups of dwellings more or less distinct from each other.

Your committee have only been able to inquire into the state of a portion of these towns; to have done more would have occupied them many months; but have thought they best fulfilled the trust committed to them, by confining their investigation to the condition of certain populous towns, or sometimes parts of towns, which might be considered samples of others similarly situated. They have especially directed their attention to localities in which the working and poorer classes chiefly reside, with a view, if evils are found to exist there within reach of legislative remedy, to make such suggestions of improvement as may appear practicable.

Before giving the result of their inquiries, and any abstract of the evidence adduced herefore them, they would say that considerable differences in the average state of the dwellings of the working classes, as might be expected, will be found to exist in different districts, arising sometimes from local causes, as the nature of the soil or situation, or the vicinity of a stream; and in others from the customs of the place, the nature of the occupations of the people, efficient or neglected municipal regulations.

Notwithstanding considerable allowance is to be made for these circumstances, your committee think it may be laid down as a general position, that persons of the same class, and engaged in the same sort of occupations in different populous towns, are subject, more or less, to the same evils (which are hereafter spoken to in evidence), that their health and comfort are affected by the same causes, and that the remedies suggested by your committee would be applicable to improve the condition of all or most of them.

Your committee, therefore, believe that the account given of the state of certain districts inhabited by the working classes in Manchester would be applicable to other great towns,

in which the people are chiefly employed in the cotton manufacture; that the same might be said of Leeds, with respect to those busied in the woollen fabrics, and such a general resemblance will be found in towns similarly situated, that the same suggestions which would be applicable to one might, with some variation, be beneficially extended to all.

By the report lately laid before Parliament, it appears that the mortality and diseases of cities vary greatly, and of parts of the same city. Thus, the annual mortality of Whitechapel is shewn to be nearly four per cent., whilst that of Hackney, Camberwell, and St. George's, Hanover-square, is less than half that amount, and is found, from a "comparison of the several districts, that, *ceteris paribus*, the mortality increases as the density of the population increases, and where the density of the population is the same, that the rate of mortality depends upon the efficiency of the ventilation and of the means which are employed for the removal of impurities."

Your committee now proceed to give an abstract of the principal points in the evidence submitted to them. They have made inquiries into the state of the dwellings of the poorer classes in various parts of the metropolis, in Dublin, Glasgow, Liverpool, Manchester, Leeds, Bradford, Hull, Birmingham, Coventry, and several other large towns, and though there is a great difference in many of the cases examined, they would state, as a general result, that evils of a most extensive and afflicting nature are found to prevail, affecting the health and comfort of vast bodies of their fellow-subjects, and which might be removed or much lessened by due sanitary regulations.

Evidence has been laid before them, depicting the miserably-neglected condition of the abodes of multitudes of the working classes in Bethnal Green, Whitechapel, portions of Wapping, Ratcliffe Highway, the parish of Stepney, and other districts in the east of London; an account of which has already been laid before Parliament in a "Report to the Poor Law Commissioners on the prevalence of certain physical causes of fever in the metropolis, which might be removed by certain sanitary regulations;" and which is printed in the Fourth Annual Report of the Poor Law Commissioners.

The same remarks apply, though with somewhat diminished force, to various other districts of London inhabited by the poorer classes, especially parts of the Holborn Union, of St. Olave's, and St. George's Union, Southwark, and to portions of Lambeth, Bermondsey, Walworth, Peckham, Vauxhall, and several other places.

The prevalence of fever and other disorders in these districts is attributed, in great measure, to the neglected state of the different localities, and is detailed in Dr. Arnott's evidence, p. 33, applicable more especially to the crowded eastern parts of London, viz.:

1. Houses and courts and alleys without privies, without covered drains, and with only open surface gutters, so ill-made that the fluid in many places was stagnant.
2. Large open ditches containing stagnant liquid filth.
3. Houses dirty beyond description, as if never washed or swept, and extremely crowded with inhabitants. "Heaps of refuse and rubbish, vegetable and animal remains, at the bottoms of close courts, and in corners."

In answer to the question, "Do you feel any doubt that the cases of fever and ill-health you noticed arose from some of those causes?" the answer of Dr. Arnott is, "I have not the slightest doubt of it." Reference was then made by the committee to the Report to the Poor Law Commissioners before alluded to, and the question is asked, "You state remedially at the top of page 14?" "We have no doubt that by proper sanitary police regulations, such as a board of health might decide upon, the typhoid fevers of London and other places might be made to disappear; and we think the remedial measures would cost less than it now costs to parishes and public charities to take care of the sick, and to provide for the helpless orphans and widows of those who die." "Is that your confirmed opinion?" *Answer*: "Yes, it is." This is stated to be applicable not merely to the crowded district east of London, but to any crowded districts of large towns in the realm.

Evidence of undoubted credit, and of the

most melancholy description, has been laid before your committee, shewing the neglected and imperfect state of the sewerage, paving, and cleansing in many parts of London inhabited chiefly by the working classes; and similar evidence applies with more or less force to many other great towns, the state of which has been investigated, as Dublin, Glasgow, Liverpool, Manchester, Leeds, Bradford, &c.

Your committee do not wish to go here into details as to the miserable and neglected state of the dwellings of the poorer classes in various districts of the metropolis and other large towns, but refer to the evidence for that purpose, in which statements of the most melancholy and appalling nature will be found. It will there be seen, that the sewerage, draining, and cleansing is (in many places inhabited by dense masses of the working classes) greatly neglected; that the most necessary precautions to preserve their health in many cases appear to have been forgotten; that, in consequence, fevers and other disorders of a contagious and fatal nature are shewn to prevail to a very alarming extent, causing wide-spread misery among the families of the sufferers, often entailing weakness and prostration of strength among the survivors; and becoming the source of great expense to the parishes and more opulent classes.

On these points your committee would refer to the evidence of Dr. Arnott, Dr. Southwood Smith, Mr. F. Moseley, and Messrs. J. Miller, Wagstaffe, Evans, J. Clarke, J. Wood Wilkes, E. White, Walker, &c. Many details will be found in the testimony of these gentlemen well worthy the attention of the legislature, and exemplifying the severe and extensive evils borne by the bummer classes from neglect of proper sanitary regulations and precautions.

Your committee would also refer to the valuable report of Dr. Arnott and Dr. Kay on the sanitary state of the labouring classes before alluded to, the substance of which has been verified before them on examination. They cannot refrain from quoting a few lines from a paper laid before them by Dr. Southwood Smith, whose valuable evidence on the state of several districts of the east of London will be found well worth perusal. It is headed, "Abstract of a Report on the Prevalence of Fever in Twenty Metropolitan Unions, during the year 1838," and is printed in the appendix.

Dr. Smith (who has personally inspected the districts alluded to) shews by returns stated, that in 20 metropolitan unions, giving nearly 14,000 cases of fever, above 9,000 were "afforded by seven of the unions only, namely, Whitechapel, Lambeth, Stepney, St. George-the-Martyr, Bethnal-green, Holborn, and St. George-in-the-East." These are at once the most populous and the poorest districts; and it is here that fever is "constantly committing its ravages. It is utterly impossible for any description to convey to the mind an adequate conception of the filthy and poisonous condition in which large portions of all these districts constantly remain." F.

(To be continued.)

**THE ANCIENT ROMAN WALL.**—In the course of excavations which are making adjoining Sir J. Cass's charity, to the east of St. Botolph's, Aldgate, the workmen came on the foundation of the ancient Roman wall, at a depth from the surface of about 15 feet, which was of the usual strength and width. The portion discovered was built upon a solid brick foundation, strongly cemented together. The bricks were in a condition apparently as perfect as when they were originally laid down. A short time ago another part of the same wall was discovered, at a similar depth, in Duke-street, Houndsditch, from which it appears that it passes across the lower end of Houndsditch, under the burial ground of the church of St. Botolph. A quantity of fused metal, which is supposed to have been melted in the fire of London, was discovered among the earth. There was a depth of made earth of from 15 to 20 feet, which was of a fine loamy quality. It is supposed that when the Tower ditch was excavated that a large quantity of the soil was brought there. The same sort of soil is found in many other parts adjoining London-wall, leading to the site where Winchester-house formerly stood. The ground is being dug for a sewer, and there is a depth of about 20 feet of made earth,

#### BENEVOLENT INSTITUTION OF AGED AND INFIRM CARPENTERS.

The half-yearly meeting of the subscribers and friends to the Benevolent Institution for the Relief of Aged and Infirm Carpenters was held at Radley's Hotel, Bridge-street, Blackfriars, on Monday, April 8, 1844, Thomas Grissell, Esq., vice-president, in the chair.

The minutes of the last annual meeting having been confirmed, Mr. W. Wood, the secretary, read the report, which stated that the institution was in a prosperous condition, having at the present at the banker's 131*l*. 10*s*., and in the treasurer's hands 35*l*. 10*s*., being an increase on the funds of upwards of 30*l*. within the last six months. Mr. Shunell, Jun. moved that it be received and adopted, which being seconded by Mr. Munyard, was carried.

Mr. T. W. Tonkins moved a vote of thanks to Messrs. J. Holtezaiffel, J. Buck, Moseley & Son, Huntsman, and Cox, toolmakers, for their kind support of the institution, and that they be requested to urge others to do likewise; carried.

Mr. W. Wood was then elected one of the directors in the room of Mr. Barrill, deceased.

Mr. W. Wood having addressed the meeting in a feeling manner, proposed an active canvass for increasing the funds of the institution; which proposal Mr. H. T. Munyard seconded, and added there was only one thing that the directors had in view in not calling meetings oftener, and that was the expense attending such meetings. Carried.

Resolved unanimously, that the directors do form themselves into missionaries, and call meetings in various parts of London, at least once a month.

The chairman, in putting the motion, said that as the subscribers had found fault with the expense, they might put his name down for 5*l*. towards that object.

Mr. Shunell, Jun., moved, and Mr. T. W. Tonkins seconded, that a vote of thanks be given to Thomas Grissell, Esq., for his kindness in taking the chair on this occasion.

The meeting then separated.

#### APPENDIX TO THE REPORT OF THE COMMITTEE TO THE SOCIETY OF MASTER CARPENTERS.

*Alterations recommended by the Committee to be made in the New Buildings' Bill.*

Page 16, sec. 21, line 31.—Instead of the word "six" the word "three" to be inserted.

Page 17, sec. 22, line 14; and page 19, sec. 25, line 14.—The same alteration.

Page 20, sec. 27, line 2.—After the word "operations" an insertion of the words "or sooner, with the consent of the adjoining owner."

Page 24, sec. 37, line 33.—At the conclusion of this section, the addition of "or on so much of the adjoining land as may be directed by the official referees." This would prevent a litigious withholding of permission to build or rebuild.

Page 27, sec. 42, line 43.—The words "be deemed by the surveyor to" ought to be taken out, leaving to be proved the danger of falling.

Page 31, sec. 51, line 33.—The word "first" ought to be altered to "fifth."

Page 34, sec. 51, line 34.—The words "already built or" ought to be taken out, and the words "to be" inserted between "hereafter" and the word "built."

Page 34, sec. 51, line 37.—Schedule I. ought to be K.

Page 34, sec. 51, lines 38, 42.—From the word "nor" to the word "room" ought to be taken entirely out, or very great injustice will be done to owners and occupiers of thousands of houses of all rates and classes, but most especially of the third and fourth rates under the present Act, and with but very problematical benefit to the parties occupying

rooms, although the area thereof may be a little more or less than one square.

Page 46, sec. 75, line 26.—This section relates to the appointment of referees, and the committee think that the word "two" ought to be taken out, and the words "not less than three" be inserted; they would also suggest that after the words "being architects" that the words "or other competent persons" ought to be inserted, by this insertion extending the appointment of the Home Secretary to all persons who may, from their practical knowledge, be competent to fill the office.

Page 54, sec. 97, line 13.—The committee object generally to informations by common informers; they therefore suggest that the words "any party" be taken out, and at that place be inserted the words "the surveyor of the district."

Page 54, sec. 97, line 15.—The word "surveyor" be inserted for the word "person."

Page 54, sec. 97, line 16.—The words "the amount" to be taken out, and instead thereof the words "a moiety" be inserted, and, at the end of the section, the following words to be added, "and the other moiety to the poor of the parish in which the offence is committed."

Page 58, sec. 97, line 16.—Power ought to be given to the official referees to take evidence upon oath.

#### APPENDIX, NO. 2.

*The Schedules or Second Part of the proposed Bill.*

**SCHEDULE A.—Bottom line—3 & 4 Vict., ch. 85, 1840.**—This provision or enactment ought to be relaxed so far as to permit boys duly licensed, and not less than 14 years of age, to cleanse chimneys, by climbing, as formerly; the sweeping by machinery being, in many cases, very imperfect and likely to cause much damage to the flues.

**SCHEDULE C. PART 1.**—The committee strongly recommend that the names of the rates be reversed, and that the fifth rate in the schedule be called a first rate, especially as no possible good can be obtained by thus calling things out of their proper names.

They also recommend an extension of the several superfluous, as

1st. from 4 squares to 4½ squares.
2nd. " 6 " " 7 "
3rd. " 8 " " 10 "
4th. " 10 " " 12 "
5th. " 12 " " 15 "

and also two intermediate rates between the second or third, and the third and fourth, so as to permit an addition story to each of these rates, provided the dwelling does not cover more than squares. If the limit of 4 squares was to remain, it would be difficult to arrange the back apartment of a dwelling so as to have a square of flooring.

**SCHEDULE C. PART 2.—Party Walls.**—The committee recommend that the party wall of the highest rate be reduced half a brick in the second story, and half a brick in the party above the gutter-plat.

In the next rate (*designated the fourth*), but which ought to be called the second rate, they recommend the reduction of half a brick in the first and fourth stories.

In the third rate, properly so called, they recommend a reduction of half a brick in the second story, and also in the part above the gutter-plat.

In the fourth rate (miscalled the second rate), they recommend a reduction of half a brick in all the stories.

In the fifth rate (miscalled the first rate), they recommend in both the stories a reduction of half a brick.

In the external walls, they agree in the thickness as set out, but with the same objection as to the misnomer in the respective rates.

**SCHEDULE C. PART 3.**—The committee agree in the several thicknesses, both as to external and party walls, but cannot agree to the misnaming the several rates.

**SCHEDULE C. PART 4.—Openings in party-walls.**—For the words "six" and "eight," your committee recommend the words "seven" and "nine." And they strongly recommend that the regulation regarding the piers proposed to be built at the openings in party-walls, be entirely taken out, as an useless provision, and for the words "four feet" be inserted the words "one foot."

**SCHEDULE C. PART 4.—Buildings and Offices.**—The words "new built or" should be taken out, as it is impossible to deal with buildings already built. The word "external" ought also to be taken out, and also that part of the second paragraph from and after the word "separately" to the end.

**SCHEDULE D.—Foundations.**—The whole of this ought to be taken out, as compelling the builder to go to an unnecessary expense, especially in the smaller description of houses; and the same in the bottom regulation of Walls generally.—And here it may be remarked, how could this enactment be carried out in houses already built? Also, with regard to Breast-summings, surely a builder ought to be left to his own discretion in determining their scantlings, and also the method of fixing them; this is a partial return to the objections in the proposed Act of last session.

**SCHEDULE D. PART 3.—Site of Walls.**—To this part of the Schedule ought to be added the words "and also for the additional brick-work."

**Openings in Party-walls.**—The privilege of making openings through party-walls ought, in justice, to be extended to all persons subject to the permission of the referees. The committee, therefore, recommend the taking out all the words from "with regard" to the words "first class."

**SCHEDULE E.—In the Projections.**—One of the regulations permits projections, if built of incombustible materials, while in a further regulation nothing is to project beyond the general line of building.

These regulations ought to be much better defined, as, in fact, one contradicts another.

No projection ought to be permitted, (shop-fronts or architectural decorations excepted,) beyond the general line of fronts.

The heights of shop-fronts and sign-boards might be improved by an additional three feet being added to the respective heights.

**SCHEDULE F.—Rules Concerning Chimneys.**—Chimneys ought to be permitted to over-sail sidewise, such over-sailing to be restricted to an angle of about 135 degrees: no danger whatever could arise by this permission.

**Chimney Tubes**—if inserted one foot into the chimney-shaft, are quite as secure as if inserted two feet. The word "two" might then be altered to "one."

**SCHEDULE I.—Rules Concerning Streets and Alleys.**—The width of every street upon any new site ought to be regulated by the number of stories of which the houses in such street are intended to be built. Thirty feet is much too little in a street, the houses of which are three, four, or five stories high above the footway.

**SCHEDULE K.—Under-ground Rooms.**—The committee cannot clearly understand that by this schedule only under-ground rooms are intended, nor if this be intended only to apply to such under-ground rooms, or to any other, whether let separately or not.

Your committee strongly recommend that the area of a room be not made to govern or restrict its use and occupation; but that every room having sufficient light and a chimney, be permitted to be occupied, even if not containing a square of flooring. Your committee beg to repeat and impress that if this become a law, thousands of houses, or parts of such houses, would be put out of use as dwellings, although built and controlled as to area by an Act of Parliament of nearly three-quarters of a century standing.

**SCHEDULE L.—Fees Payable to Surveyors.**—The fees in this schedule are fixed fees, to be paid upon the respective rates of buildings. They are, in four of the rates, similar to the fees under the old Act, but with this difference, that under that Act the fees were not fixed at the respective sums, but they were not to be exceeded, although they might be diminished, and which was often the case.

The committee have no objection to the scale of the first six fees; but to the seventh fee, "that for inspecting and reporting to the official referees upon party-walls," they cannot submit, the more especially as this fee will be included in the district fees.

**To New Buildings.—To Alterations or to Rebuilding.**—The committee consider that if an additional building be covered in within one month instead of twenty-one days after the

principal building, that such buildings ought then to be free from additional fees.

The word repairs, in this schedule, ought to be taken out, as repairs, generally speaking, are not intended to be surveyed by the district surveyor.

**In this schedule (L.) the Fees for Special Duties** appear in several of them as exceedingly objectionable, inasmuch as they are included in the alterations and rebuilding of new houses on old foundations.

The whole of the fees "for attending to the cutting away Chimney-breasts for External Walls."—These fees are included in the fees receivable for the new house about to be built against such "external wall."

The fee for condemning party-fence-walls would be amply paid for by a fee of ten shillings instead of a guinea.

The fee for inspecting arches or stone floors over public ways is also included in the fees for building the dwelling-house, and ought not to remain in the schedule.

**For Measuring the Width of Streets.**—This is a fee for a trifling incidental service, and although only ten shillings, yet it is not set out whether it is to be a charge upon every house in the street; if so, in a street of fifty or sixty houses, your committee must say that the work for which this fee is provided is much overpaid; but if it is to be distributed among all the houses, it would be of no very great consequence, amounting only to two-pence or two-pence-halfpenny each house.

**Fee for Inspecting Openings in Party-walls.**—This fee is also paid either at the first formation of the wall, or if at any future period, it would be payable under the scale of fees for alterations and additions.

**Fees for Drains and Cesspools.**—As these would be for surveys incidental with the foundations of the new buildings, no fees ought to be payable for so small an addition to the duty of the district surveyor.

**Fees for Inspecting Chimney-pots, &c., above a certain height.**—As this duty is of so very indefinite a character, and the fee might become a very oppressive and unjust charge, having been in no previous instance levied upon the public, your committee would strongly recommend that it be expunged.

**Fees for Special Services, not expressly provided for.**—Your committee think it is hardly possible that, following out the fees as set forth in this schedule, there are any duties, however small, that have not been fully provided for; they therefore recommend that this proviso be taken out altogether.

**SCHEDULE M.** relates to forms of notices, &c., and to which it will be unnecessary to call your attention, these being merely such as the several parties, surveyors, builders, referees, owners and others, are to have served upon them previous to any of the provisions in the Act being put in operation.

Your committee having thus brought under your notice the most material parts of this important proposed enactment, recommend to your serious consideration its several provisions, together with the amendments recommended in this report.

(Signed) H. BIEBS, President.

March, 1844.

**THE MANCHESTER GAS WORKS.**—These works, at the present moment, are no doubt the most extensive in the kingdom; what they are destined to become in a few years more, should the demand continue to increase as it has done for the last three or four years, it would be a hard guess. Some idea may be formed of their magnitude when it is stated that there is now 1,100,000 cubic feet of gasometer space, and the directors have just completed contract for an additional gasometer, to contain 200,000 feet, so that when this is in operation, which will be during the present year, there will be gasometer room for 1,300,000 cubic feet.—*Westmoreland Paper.*

**A COSTLY WINDOW.**—Messrs. Kendall, Milne, and Falkner, the eminent haberdashers, at the Bazaar, Deansgate, Manchester, have just had a window completed of costly description. It is 42 ft. long, and 12 ft. high, and contains upwards of 650 ft. of the best plate glass, and its entire cost is said to exceed 500*l.*

## ON THE INFLUENCE OF ATMOSPHERIC AIR IN EFFECTING CHANGES IN ORGANIC AND INORGANIC BODIES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

No. I.

A CORRECT knowledge of Nature enables men to think and speak with mathematical precision, to demonstrate truths, and to impart instruction to others: it enlarges their mental capacities and powers, excites and directs their inquiries, and regulates their acts and determinations. Without that necessary knowledge of Nature which strictly appertains to his profession, the civil engineer finds insurmountable obstacles in the way of his inventions and discoveries; the architect finds his stately building totter to its fall, or exhibit premature decay; and the youthful aspirant to professional fame performs his Sisyphus-like task until his young hopes withering by repeated disappointments, he sinks unnoticed, and unknown, into the stream of oblivion. In this varied and highly intellectual pursuit, each of them must bear in mind, that there are natural obstacles to be overcome, temperature and association to be guarded against, and that the varied material of the earth is called into requisition on all occasions, and under varied forms and combinations; it is therefore essentially necessary that MINERALOGY take a prominent position in the education of youth, embracing METALLURGY, or a knowledge of the metals; PETROLOGY, or the knowledge of rocks and stones; and such portions of GEOLOGY as embrace the earths, in their varied chemical and mechanical combinations, passing by the numerous absurd speculations and unmeaning phrases of the latter branch of mineralogy; and confining their studies to the several conditions under which mineral bodies and mineral beds exist,—to the affinities of bodies,—their powers of cohesion, elasticity, or expansion,—and to the manifest and demonstrable causes which compel them to change in their character and individuality.

To assist the aspiring mind, and to awaken inquiry, by holding up the mirror of nature—to teach the youthful student to avoid the shoals of induction and false philosophy—and to divest science of its forbidding features, its technicalities, and its mysticisms, will be my object in this and the succeeding articles which I purpose laying before the enlightened and studious readers of THE BUILDER.

The atmosphere, the ocean, and the earth, are the three grand divisions of this planetary body, mutually united and uniting with each other, and increasing and diminishing in the sum of their respective volumes perpetually, forming one vast laboratory, in which nature operates immense analyses, assolutions, precipitations, and combinations, in and by which organic bodies are generated, elements and elementary compounds are elaborated, and the phenomena of the fossil and mineral kingdoms are produced. Each of these grand divisions is a chaos of contending elements and elementary bodies, of conflicting and discordant material, indeterminate in their mixtures, quantities, and qualities, conflicting in their local motions, but united by one general base, and by the general motions which embrace within their revolutions all the lesser systems.

To the conjoint elements of the air and waters the varied and complicated phenomena of the latter owe their origin; to the conjoint action of the air, the waters, and the gaseous, aqueous, and consolidated matters generated within the waters, the varied and still more beautiful phenomena of the earth owe their origin, birth, and being: again, to the action and re-action of these mechanical combinations, each is indebted for its peculiar phenomena. Upon the surface of the earth as within the waters, the powers of atmospheric action are palpably manifest to all men as being derived from the sun, and communicated to the earth, by which the atmospheric volumes are enabled to combine with the compounds termed earth, being the co-operative causes of generation and multiplication of animal and vegetable species, and of fossil and mineral bodies, in their almost endless diversity of character, form, and composition. It is by atmospheric action generally manifest over the whole earth that general results are produced, and by local action or temperature that local results are produced.

The local effects of temperature are strikingly manifest in the production of the animals and

vegetables of the ocean and of the earth; and to this cause is chiefly to be ascribed the multiplication of the varied chains of animal and vegetable existence, the continued spontaneous production of species, their gradual or sudden changes, and the sudden and total extinction of many peculiar and extensive tribes and families. Thus the oak, the monarch of the British forests, transplanted to the rank soil of Bengal, degenerates into a miserable stunted shrub, and the giant banyan of that country, a forest of itself, when introduced into our greenhouses, becomes the ornament of a garden-pot. Again, the vine loses its fruitfulness in the one country, cannot exist in the other. Again, even under the same latitudes, a similar diversity prevails. Excess of heat, without moisture, causes the earth to lie bare and desolate, and to remain desert for ages; excess of heat and moisture produces rank fertility inimical to humanity, but favourable to the generation and multiplication of immense varieties of animal and vegetable species: moisture, without heat, is entirely wanting in the power to generate life. The same law governs the distribution of animal species; the marked effect of temperature, dip, and inclination, is manifest in and throughout the ocean: thus the lime-secreting polypes can only exist within or near the tropics, and species become more beautiful and more abundant as they approach towards the surface waters. Within the seas, disposed under the northern and southern hemispheres, the polypes are generally wholly divested of their calcareous covering, and all kinds of molluscous animals are less supplied with this material, the pearl oyster, and many other species, wholly disappear, and those which remain appear to be shorn of their fair proportions. Every region boasts its peculiar organic phenomena: it is the same on dry land; the llama loves its Peruvian heights; monkeys, elephants, buffaloes, rhinoceroses, hyenas, all have their climates marked out—all exist by suzerainty of temperature and association alone, the boundary of their existence being fixed and permanent.

This law of nature is carried into and directs the formation of the fossil and mineral kingdoms—the preservation, change, or destruction of the one, and the generation of the other, depending upon temperature and association; the nature of the fossil beds is determined by the nature of species locally disposed, or of motions locally manifest; and the nature of the fossil bed and of atmospheric action, locally exercised, determines the after changes of the fossil into the mineral aggregate: thus to the varied phenomena of life we are indebted for the equally varied fossil formations, and consequently for those peculiar earths, mineral bodies, and gaseous products, which, in totality, form the superficial crust of the earth. But although the coral formations of tropical seas have no analogy in northern seas, the forests of India and South America have no analogy to the forests of Europe; still, formations analogous to the one and the other, are to be found in the lands of the north, and constituting its elevated and inhabitable parts.

Lands disposed within the tropics abound with gems, precious stones, the most valued metalline bodies, and the most highly crystalline rocks: but, as we approach the polar circles, these phenomena either wholly disappear, assume a marked character of climate and association, or else they exist as unerring witnesses of causes of effects no longer manifest in these latitudes. Silicates are common to all countries, but local temperature and association are co-operative causes of species being produced; thus also of the phenomena of common flints in this country, of the jaspers of Egypt, the bole of Turkey, the porcelain clay of China, the diamonds of Peru, the East Indies, Borneo, and Malacca; the gold of Africa, the quicksilver of Spain, the platina of the Oral Mountains, and of Oriental and Occidental gems. In all warm latitudes the act of change is so exceedingly strongly marked and well defined, that it appears a matter of wonder, modern men of science should be entirely ignorant of these changes: all rocks, stones, and earths, subject to atmospheric action, undergo changes in conformity to the nature of their material, and the force of heat alone, or heat and moisture acting upon them: while fossilizing, we behold organic bodies go through the process of oxidating, which process con-

sists in the fixation and absorption of vital air by combustible bodies, and the decomposition of atmospheric air by these bodies. The vital air is the body acting, the fossil or combustible body is the patient acted upon, and having the capacity to receive, and by the force of affinity and cohesion to retain, this elastic gaseous element in certain proportions, to fix it, and to cause it to assume a solid form; the vital air thus precipitated imparting its calorific power to the compound with which it unites, and thus distributed, the calorific passes into the latent form; saturated *per se* with oxygen, the fossil body being in change a thing of another nature, having undergone a re-arrangement of its atomic particles. But this change is far from being permanent, for local influences cause further changes, by which its primary organic form and qualities become wholly obliterated as they pass by transition into the mineral kingdom: thus silicious bodies, consisting of two or more earthy constituents, under certain atmospheric influences, give up those compounds, or otherwise a further remodification of their atomic constituents takes place: the common flints and pebbles of this country, if exposed to local tropical influences, would soon become things of another name; for, here exposed in the beds of shallow streams, the grosser earths are in the course of time abstracted from the silica, or silica-aluminous base, and the silicic base is gradually converted into pure crystalline quartz, amethyst quartz, topaz, agates of varieties, and other beautiful products, known and valued as precious stones. Exposed upon the surface soil to direct atmospheric action, the changes are in conformity to the nature of the action exercised upon them; thus the coarse siliceous pebble becomes converted into carnelian, the siliceous sands and aggregates become transparent or crystalline—as jacinth, carbuncle, and garnet; or having an aluminous base, as sapphire, ruby, emerald, crysopruse, &c.: thus every region has its peculiar mineral products, the nature of the compound being determined by local temperature and association. The most beautiful marbles are the oriental and occidental, the most sonorous sienites, marbles, and porphyries, are found in the rainless regions of Egypt; and even in the mild temperature of Italy, the ignorant quarrymen, taught by experience, are guided in their choice of quarries by the peculiar dip and inclination of the beds, a southern aspect being always found to develop the most valued kinds of marble.

As regards the metals, although generated in many regions of the earth by electro-chemical action within the lower beds, yet it is apparently palpable that the causes of effects may in numerous instances be ascribed to the immediate action of the sun upon the earth. In temperate or cold countries metals are generated within the hovels of the earth, embracing in local extent the several beds in which their elements exist; but in Asia, in Africa, and other portions of the globe, they are almost invariably found superficially disposed; and where generating, as in the deserts, they are generated on the surface so fast as the inflammable bodies of which they are compounded become saturated with oxygen. Gold is most abundant in hot regions within the tropics, and is generally found united with iron, emery and aluminous earths, or gypsum—the latter being in Western Africa converted into red marble. Elevated regions are always more abundantly supplied with metallic veins than plains, because the conditions of their generation are internal heat constantly supported, and supporting electro-chemical action; it is therefore requisite that the lands be drained of their superfluous waters, which, where present in quantities, form weak solutions with the acids, and thereby destroy their chemical powers. The metalliferous regions are therefore disposed in the high lands of South America, India, and Birmanah, or in low lands, where rains are infrequent and the atmospheric heat very great.

It is not denied that orient gems and gold are found disposed within the soils of Europe, and that even in the British strata we find the most beautiful crystalline products, and the precious metals: thus the elevated regions of Scotland are analogous in composition and character to the Ghauts or hill regions of Northern India, the one and the other abounding with cairn, gorum, agates, cornelians, &c. The Wicklow mountains also contain gold, and

marbles are very abundantly diffused over the United Kingdom; gold is also found in Germany, and silver in Spain; these are facts well known; but, still, the question remains unanswered as to whether the causes of effects thus manifested to us exist in the present day. Geologists will tell you that the causes which produced crystalline rocks, gems, and gold, do not exist at present in our northern hemisphere, and that the causes of the phenomena of crystalline rocks have ceased from over the whole earth. Is this the fact? Most assuredly it is not; else why those local dispositions of peculiar species? Why this uninterrupted disposition of sedimentary beds scattered over the surface soil, which include and pass into crystalline bodies? Why should the most beautiful mineral productions be confined to the superficial beds of the earth? Why should bodies and aggregates of bodies become more highly crystalline as they approach or cover the surface of warm and tropical regions? Can the geologist, rooted to his native soil, by bygone prejudices and fashionable theories, explain why beautiful marbles, sonorous granites and porphyries, basalts and sienites, are never found disposed in the lowest beds? The singular simplicity of elements and composition of bodies composing the lowest beds has long attracted the attention of men of science, and it gave the first intimation of the progressive development of species, therein being little or no trace of animal or vegetable organization, so palpably manifest in almost all the superficial beds of the earth.

Granted that many highly crystalline rocks are often found disposed in the lower beds, and that granite often forms the basis of mountains, still it will be found that the chemical characters of granite are identified with the chemical constituents of sand, simple in the lowest beds, more complex, and branching into numerous varieties, as they are disposed on or near the surface or in the bosoms of mountain; in Ceylon, Borneo, Madagascar, Africa, and many parts of Asia, the rocks of the upper series are so exceedingly confused in their mechanical mixtures, that it is an utter impossibility to classify them, and in all these regions they may be observed in various stages of formation, as influenced by atmospheric heat and atmospheric heat conjoined with water; atmospheric air enters largely into the composition of them all. On the other hand, many of the crystalline and metalline phenomena of European strata bear evidence in their internal structure, and the configuration of their organic remains, of having been once disposed beneath the tropics. Many of the beds of the British strata are palpably wholly composed of animal exuvie, peculiar to warm and tranquil seas, and of species analogous to those now living and generating in the Pacific, Southern, and Indian Oceans; others are found of this material united in variable proportions with the animal and vegetable products of a like warm climate, the reliques of rhinoceroses, tapirs, lizards, hyenas, elephants, intermingling with arborescent ferns, giant reeds, palms, and grasses; the one and the other existing by suzerainty of climate and association only. Is this disposition of organic remains ascribed to the carrying powers of water? If so, we turn from them to still stronger testimonials, to still more undeniable proofs of change, and changes which have taken place in the earth's plane of revolution—to hill and hill ranges of chalk formed of the bodies and comminuted particles of organic bodies, to the vast limestone ranges abounding with madripores, to shell marbles and varieties of earths formed even within the polar circle. It is therefore evident that local influences ever determine local results; that the causes in active operation in one portion of the globe produce certain effects peculiar to the temperature of that portion, the sum of action and the qualities of matter determining the result; that the like cause produces the like effect; that in local transitions, causes and effects modify and in general change; many causes cease to exist in one region, and make their appearance, being re-generated, in another.

It is to atmospheric action, locally or generally exhibited, that we are indebted for many singular and apparently inexplicable phenomena; rocks are the products of slow combustion, or rather they are oxidated bodies, their oxygen being abstracted from water or atmospheric air; the bases of all rocks, and

many of their compounds, are combustible, being organic products, but these combustible properties are negated in these permanent combinations with oxygen. A mass of mixed organic matter no sooner becomes exposed to atmospheric action within or near the tropics, than it commences a series of changes in conformity to the nature of its material, the gelatinous parts of the oceanic animals unite with oxygen in definite proportions, and become SILICA; silica is therefore the animal matter found in all species united with oxygen, in definite proportions of each; lime in like manner becomes oxydized or saturated *per se* with oxygen, being exhibited in its calcareous state; bodies united by the common base silica, or alumine, or both in union, remain united and enter into the more consolidated state in consequence of their absorbing and fixing oxygen; and every body, according to its homogeneous or mixed qualities, has peculiar powers of its own, all differing from each other in the quantity of oxygen they absorb, the rapidity with which they absorb it, and the proportion of caloric which they disengage from the oxygen absorbed. All rocks are therefore results of slow or rapid oxydation, or otherwise they are formed by the force of cohesion, the abstraction of oxygen, and lateral pressure; *no crystalline rock can possibly be formed by the heat of fusion.* Kerman found 32-42 grains of fixed air in 100 grains of marble; and the experiments of Dr. Priestley demonstrated the presence of fixed air in many mineral bodies. Thus, from 7 ounces of whiting, the most simple form of calcareous matter, he expelled 630 ounce-measures of air; from 34 ounces of lime fallen in the air, he expelled 375 ounce-measures, of which about one-fifth was fixed air. These and innumerable experiments made in later times demonstrate that atmospheric air is the co-operative cause, and an essential ingredient of all rocks, stones, minerals, and earths, and that in its fixed state it constitutes a vast portion of this planetary body. The effect of an intense atmospheric heat upon a fossil bed is to oxydise the alkalies and alkaline earths exposed to its continuous influence, to convert clays by abstracting their hydrogen, into rock, and to render rock more opaque and sonorous by the gradual re-arrangement of its particles. The action of the atmosphere in this country has the effect of destroying rock by corroding its surface, or abstracting its oxygen from some one component of the rock; the action of the atmosphere in Upper Egypt is to form rock, to preserve it when formed, and in the slow progress of time to render it harder and more sonorous. Thus the ancient monuments of this country are preserved uninjured through a long succession of ages; but not so in Lower Egypt when exposed to the sea-breeze; here corrosion takes place, and all monumental stones suffer desquamation more or less. The white marbles on the heights of South America, although partially affected by running streams, are preserved from desquamation otherwise by atmospheric influences. A few hundred years pass away, and castles, palaces, and cathedrals built in this country moulder into dust.

Chemists are gradually, but unwillingly, acknowledging these truths, are gradually enlarging their conceptions of the organic origin of all inorganic bodies formed from, and perpetually united and uniting with, atmospheric air, and the luminous caloric and electric fluids which pervade and traverse it continually. It is everywhere present: the mine is no sooner opened, than, following the steps of the miner, it acts, and is immediately re-acted upon by the mineral substances composing the bed; interchanges of elementary constituents take place, its oxygen combines in variable proportions with the metals and semi-metals; and inflammable gases, held in mere mechanical union, are liberated and unite with its volumes: thus in numerous decompositions and re-combinations new results are generated, and former things are destroyed. It is from this admission of the atmospheric volumes that the choke-damp and explosive mixtures are liberated. Without atmospheric air the miner could not live—its presence and searching action too often bring destruction and desolation to wives and families. In vegetable earth atmospheric air is invariably present in its unfixed state; but when this earth passes into the state of clay, air enters into chemical combination with the plastic mass in its fixed

state, changing with the changing mass, the excess being carried off with the hydrogen. In the first stage it rapidly corrodes and decomposes all animal and vegetable remains, causing them to pass into the state of earth; in the latter state its powers are strikingly manifest in the preservation of organic matter, and in causing it to assume the mineralized form.

#### SOCIETY OF ARTS.

APRIL 3.—William Pole, Esq. V.P., in the chair.

The secretary read a paper by Mr. C. Tetley, on certain phenomena of steam, and on his plan of economising fuel in the boilers of locomotive engines.

The evaporating power of a boiler, says Mr. Tetley, is dependant chiefly on three causes:—1, The amount of boiler surface exposed to the reception of heat; 2 (and very materially), on the shape of the boiler; and, 3, on the intensity of the heat. The heat derived from that part of the boiler immediately over and about the fire he calls (according to usage) "radiating heat;" while the heat derived from the tubes or flues he calls "carried heat." After detailing a very elaborate theory of certain phenomena of steam, he describes his improvement in boilers, for the rapid evaporation of water and for the economy of fuel, which consists of a division of the boiler into two or more compartments of different heating temperatures, having channels for feeding the compartments with water from that of those containing water of a lower temperature.

The first partition is placed vertically over the water space at the back of the boiler, the top of which reaches somewhat above the water line, and the bottom below the level of the fire-brass, but leaving a passage for the water beneath it.

The second partition reaches from the bottom of the tubular part of the boiler to a little above the level of the fire-box, and is removed but a short distance from the first partition. The third partition is placed in the middle of the tubular boiler, and, as the first, runs up, above the water level.

A communication is formed for a supply of water, by a pipe running from the compartment nearest the chimney-box into the middle compartment, the top of the pipe being just under the top water level, and the bottom of the pipe entering the middle compartment at or near the bottom of the boiler.

On evaporation taking place, the steam diffuses itself over the top of the partitions, thus maintaining the same pressure on the surface of all the water.

Evaporation commences in the compartment over the fire-box, and the water converted into steam is reinstated by the surface water from the second or middle compartments, which is delivered almost or entirely at the evaporating point.

In like manner the middle compartment is kept continually fed from the top layer of water in the third compartment, which is supplied by a pump in the usual way.

By this arrangement, a saving of fuel, equal to about 21 per cent., is obtained—the prevention of a deposit of sediment is effected—the steam is got up more rapidly; and the action of a float for regulating a feed apparatus is rendered much more certain.

Mr. Wroughton explained his self-acting glass ventilator, which consists of a mahogany vertical frame, 17 inches high and 14 inches wide, standing on a platform, 14 inches long and 18 inches wide. In the frame is fixed a plate of glass, in which are ten horizontal apertures, each  $2\frac{1}{2}$  inches long and  $\frac{1}{2}$  inch wide. On the internal side of the glass are four vertical brass slides, in which work as many pieces of glass fixed in a brass case as there are apertures in the plate, but somewhat larger, in order entirely to cover them when necessary.

The two sets of glass covers are suspended from a small brass beam working on a pivot attached to the glass.

A small ivory piston, working with a nut and screw, in a glass bent tube, is attached to one set of glass covers. The glass tube contains a column of mercury altogether about 12 inches

in length, but divided at top into two arms, over which are two vertically placed glass tubes about 10 inches in length, and bent over at the top and returning down to the bottom of and close to the first tubes; these tubes are filled with spirits of wine, which, when expanded by heat, acts in conjunction with the mercury (with which it is in contact), and elevates and depresses the glass covers so as to admit fresh air in proportion to the amount required to keep the temperature of the apartment at a fixed point, which is ascertained by a scale marked on the glass plate.

The society's repository was lighted for two hours and a half with six of Young's Vesta Lamps, at a cost of 9d. for a pint and a half of highly rectified spirits of turpentine. Two additional lamps would have rendered the lighting complete.

Several specimens of Messrs. Wood and Co.'s stamped wood, in imitation of rich carving, were placed in the Repository, as also one of Mr. Varley's single lever stage microscopes.

#### RAILWAY INTELLIGENCE.

##### *The Lancaster and Carlisle Railway.*—

On Monday last, the surveyors and their assistants commenced marking out the line, which, in all probability, will be that adopted for the continuation of the railway from Lancaster to Carlisle. They started from the engine-house, and the route staked out is directly across the turnpike-road, thence behind Greenfield, and above the Bath Houses. The canal will be crossed at some distance from the aqueduct bridge; and a slanting bridge is to be built over the Lune, commencing about the Ladies'-walk, and to come out near Skirton Mill. It will then be carried through a portion of Slyne, and will be about half a mile from Kendal. The statement, that it was intended to take the line through the Kendal Fields, and then to cross the Lune near the Ford, is wholly without foundation. The bill has passed the House of Commons, and is now only waiting the sanction of the House of Lords, which will not be obtained until after the Easter recess, when the works will be immediately proceeded with. Mr. Locke and Mr. Errington are now in London, expediting the undertaking as much as possible.—*Lancaster Guardian.*

*Atmospheric Railway.*—The *Journal des Debats* publishes an analysis of the report of M. Mallet, the celebrated engineer, who was sent specially by the French government to study the system of atmospheric railroads at Dublin, and who states the advantage of that system to be, all danger of accidents from fire is avoided, an almost impossibility of the carriage running off the road, and the utter impossibility of a collision between two trains. All the objections raised against the atmospheric system have been examined by M. Mallet, and this distinguished mathematician asserts that none of them are insurmountable; but one of the principal advantages of this system consists in its preventing the necessity of levelling the soil according to the present method. M. Mallet has likewise made a comparative calculation of the expense of the two systems, and he demonstrates that the atmospheric plan offers an economy of 140,000*f.* a league, or 2,000*f.* British per mile. M. Mallet concludes his report by recommending the government to make a trial of the atmospheric system, which the *Journal des Debats* believes will be carried into effect.

Athens, a city not much larger than Liverpool or Bristol, and all whose inhabitants might have been lost in Syracuse, produced, within the short period of two centuries, reckoning from the battle of Marathon, a greater number of exquisite models in war, philosophy, patriotism, eloquence and poetry; in the semi-mechanical arts, which always accompany or follow them, sculpture and painting; and in the first of the mechanical, architecture,—than all the remainder of the universe in six thousand years.—*Walter Savage Landor.*

COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. III.

**ANNULET.**—Having noticed the signification of the abacus and echinus, two of the leading features of a Grecian Doric capital, we proceed to define the meaning of the word annulet, which is so closely connected with the above-named members. Mr. Gwilt's definition is,—“ANNULET (Lat. annulus), a small fillet, whose horizontal section is circular. The neck, or under side of the Doric capital, is decorated with thin fillets, listels, or bands, whose number varies in different examples. Thus, in the Doric of the Theatre of Marcellus, at Rome, there are three, whilst in the great temple at Paestum, they are four in number, and in other cases as many as five are used.” (*Encyclo.* p. 893.)

In attempting to illustrate this member, which is well expressed by its name *annulus*, being the diminutive of *annus*, a ring or circle, we must look to Egypt for its origin, for we shall find no corresponding feature in the timber construction, to which some writers would refer us for every detail of architecture. In an Egyptian column composed, to appearance, of a certain number of reeds tied together near their tops by a filleting of willow or cane passing two or three times round the clustered shaft, we shall not hesitate to recognize the origin of the annulets in a Grecian Doric column, and that such an opinion is not an assumption, we have only to look at a granite column now in the British Museum. A sketch of that column, whereof I do not recollect that any other writer has even taken notice, was given in No. 37 of *THE BUILDER* (p. 449), and to illustrate the present argument, the head of the column is again introduced, No. 1.

No. 1.

This column is very slender in its proportions; but in columns of more massive dimensions, more especially where the capital is bulbous,

No. 2.

as No. 2; the same arrangement of rings may be seen round the neck of the shaft, exactly like the hoops of a meal-barrel; and I conceive that the drawing together very tightly of these bands below, with the pressure of the heavy square tile above produces that swelling out of the part between, which, it is just possible, gave to the Greeks a hint for the echinus moulding, an opinion which will obtain by an attentive observation of several specimens of Egyptian capitals, wherein the oval shape of the lower part of the capitals is too obvious to escape notice.

The annulets in Grecian Doric columns vary as well in their profile as in their number. Some examples may be interesting, to shew the exhaustless genius of the Greeks, even in

details the most minute, and that although the general principles of art in their Doric order are the same, yet that they could produce great variety in their details. In the Parthenon, that best and purest of all examples, we find, under the echinus of the capitals in the porticos, five rings, placed on a slope, continued, as it were, from the lower link of the echinus, as shewn in No. 3; and in the columns of the

No. 3.

pronaos of the same edifice, there are but three rings. In the Temple of Theseus, the profile of the annulets is somewhat similar to that of the Parthenon; the rings are four in number, and the under side of the lower arris of each ring is slightly undercut; No 4 is the

No. 4.

section of these annulets of their full size. In the example from the portico at Athens, presumed to belong to the Agora, or marketplace we see (No. 5) how widely the artist

No. 5.

departed from the graceful and flowing outline of earlier patterns; this, of the age of Augustus, is one of the latest known examples of Grecian Doric, yet in many points it cannot be safely recommended for modern imitation.

In the Temple of Apollo Epicurius, at Bassæ, a building of the pure age of Greek art, the annulets are four in number, resembling in their contour those in the Parthenon, excepting that the second and third rings recede a little from a line drawn from the first to the fourth. At Rhamnus, where are two temples, at Sunium, and in the Dodecastyle portico of Ceres at Eleusis, the rings are three in number, profiled like the best

examples at Athens; at Ægea and Selinus they are three in number; at the Temple of Jupiter Olympius, at Agrigentum, of Apollo in the Isle of Delos, and in the portico of Philip, at the same place, at Corinth (where the annulets have a great projection and are very deeply undercut), in the Hypæthral Temple at Paestum, in the Temple of Diana, in the Propylæa at Eleusis, in the Propylæa at Athens (an excellent example), and at Thoricus the rings are four in number. At the latter place, the annulets are remarkable, and probably singular in their way, as shewn by

No. 6.

the figure, No. 6. By figure No. 7 are shewn

No. 7.

the annulets of a small column found in the Temple of Ceres at Eleusis, and supposed to have belonged to an upper range of columns. No. 8 is from the Temple at Cadacbio, and

No. 8.

presents a very unusual arrangement. At

No. 9.

No. 9 is shewn a capital from the Pseudo-

dipertal Temple at Pæstum, in which many peculiarities are observable; the immense size and projection of the abacus seem to crush the echinus, which has beneath it two rings, under which the flutings curl in the form of leaves. At Selinus, Mr. Woods noticed some remarkable features in the capitals:—"The shape of these capitals is very peculiar; I have seen nothing like them in Greece, except a fragment on a very small scale which I noticed at Corfu. The common Grecian Doric capitals in the best examples form a sort of ogee, and we find this curve at the third temple, but in the great temple, and in two of the three smaller ones, a deep hollow interrupts the flow of the lines." These capitals were each cut out of a block of stone thirteen feet square.

In the two colossal Doric columns at Rome, erected in honour of Trajan and Antoninus, a carved bead and a fillet are placed beneath the echinus, which in these two columns is also enriched with the egg-and-anchor ornament, the only ancient instances, I believe, in which that member is found enriched in its position under an abacus.\* Sir C. Wren carved the echinus of his famous monument on Fish-street-hill, London, in the same way. In the Tuscan capital, but one fillet is placed beneath the ovolo, and in the Roman Doric usually adopted, three fillets are found, as shewn by

figure No. 10; these, like the annulets of the

No. 10.

columns of the Agora, appear to surround the neck of the shaft, instead of being placed on a slope continued from the echinus, as in the best Greek examples. It would appear, therefore, as if those who sought to improve (as they thought) the contour of Doric capitals, were content to take for their patterns examples of the latest and most debased period of Greek art, but it is difficult to conceive how any one, with the least pretension to taste, can prefer the vertical stiffness of the fillets in Roman and modern Doric capitals before the easy flowing of the annulets in the more antique examples, wherein the graceful sweep of the echinus gradually dies against the shaft of the column, a practice never lost sight of, although, as we have seen, the detail may be carried out with slight deviations. In the next paper, the word "*Hypotrachelium*" will be defined, which will conclude the description of a capital as far as the Grecian Doric order is concerned. G. R. F.

might always glean hints for the improvement of their details.

My second sketch represents what I take to be a "GARGOYLE" from the ancient Church of St. Peter, Shaftsbury and which I merely send you as a bold and spirited specimen of

the grotesque, worth preserving, however its applicability to buildings of the present age may be contested by some.

I am, Sir, yours respectfully,

Great Newport-street,  
March 25, 1844.

METROPOLITAN IMPROVEMENTS.

The following is the first report of the commissioners appointed by her Majesty to inquire into and consider the most effectual means of improving the metropolis, and of providing increased facilities of communication within the same:—

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, the Commissioners appointed by warrant under your Majesty's sign manual, bearing date the 23rd of November, 1842, "to inquire into and consider the most effectual means of improving the metropolis, and of providing increased facilities of communication within the same," having held our first meeting on Thursday, the 9th of February following, at the office of your Majesty's Commissioners of Woods, &c., in Whitehall-place, and having continued our sittings from time to time up to the present date, humbly beg leave to lay before your Majesty this first report of our proceedings.

We have commenced these proceedings with a deep sense of the importance of the trust reposed in us, and at the same time with a conviction of its difficulties,—difficulties belonging not only to the extent, but to the nature of the inquiries which we are instructed to pursue.

The point to which in every kingdom a native looks with pride, and a foreigner with curiosity, is undoubtedly its metropolis. Other cities may be the especial depositories of learning, of science, of the arts, of manufactures, or of commerce, but the foreigner expects to find these all more or less represented in the chief city of the kingdom; and no enlightened native considers his acquaintance with his country complete till he has visited her capital.

London, as the chief city of England, from the period of its occupation by the Romans, has been gradually augmented in population and extent until it has attained to a magnitude exceeding that of any other European capital, and surpassing, in the number of its inhabitants, many of the smaller European states. With the increase of its limits, there has been a corresponding, perhaps more than corresponding, accumulation of wealth. It has become the central point of the commerce of the world; and, owing to its position in that respect, as well as to its being the seat of government and legislation of this vast empire, there have arisen, and become established within it, classes of interests—municipal, commercial, and professional—associated and represented in various ways (in accordance with our popular institutions), the magnitude and weight of which are without example in any other great city. These necessarily exercise, in their several spheres, an extensive influence on the public opinion; and as those influences are infinitely various, and often conflicting in their tendencies, they would present the greatest difficulties to the labours of this or any other commission that might be required to devise or to adopt any one general and systematic scheme for the re-construction of those parts of the capital of which the existing imperfections or deformities appear to call for removal or cure. And, even when confined to the task of selecting the most useful and practicable from the numerous plans for local improvements which have been referred by your Majesty's commands to this commission, in addition to which

TIMBER SCARFING.

TO THE EDITOR OF THE BUILDER.

Sir,—Permit me to submit to you a sketch of a roof-truss at the Princess's Theatre to the tie-beams of which I more particularly wish to call the attention of your readers. As timbers of the required length were not obtainable in London, I had them sawn in halves, each half

extending to its required length, scarfed and bolted with oak keys through both fitches, to prevent expansion. This mode of scarfing I consider preferable to any in Mr. Wylson's paper on the same subject.

Wishing you to make all allowance for imperfection, I am, Sir,

A PRACTICAL CARPENTER.

CROSS, BISHOPSTONE CHURCH, WILTS; GARGOYLE, ST. PETER'S CHURCH, SHAFTSBURY.

TO THE EDITOR OF THE BUILDER.

Sir,—Your acceptance of my last contribution to your pages has induced me to forward for insertion in your useful periodical two more architectural details from my sketchbook.

The first is a stone cross on the eastern gable of Bishopstone Church, Wilts, which is a gem of the fifteenth century, lately brought into public notice, on account of the beautiful window, designed by Mr. Willement, placed in its south transept, to the memory of the Rev. — Montgomery. Now that the temporary prejudice

against the use of such a Christian emblem has disappeared, this might be employed in any ecclesiastical building with better effect than many which I have lately observed, so crowded with enrichment as to lose their original and obvious simplicity of form. If your numerous correspondents would make a point of each sending you the outline of at least one architectural beauty (as a cross, a crocket, a boss, a finial, &c.) from every village church that might come beneath their notice, I imagine that with the least possible trouble a collection might soon be formed both interesting and valuable; and THE BUILDER, in addition to the authority of practical weight which it at present possesses, would acquire the features of a "museum," from which the architectural designer, the sculptor, the wood-carver, &c.,

many others have since been presented for our consideration, the difficulties arising from the same cause are by no means inconsiderable.

It is, however, our duty to pursue the latter course, and after bestowing upon these numerous proposals and plans our most deliberate consideration, and after carefully weighing, not only the intrinsic merits and comparative advantages of each, but also the difficulties and the cost of carrying it into execution, to lay before your Majesty our humble recommendation of those which to us appear to be the most worthy of adoption.

We are instructed by the terms of your Majesty's warrant under which we are appointed with respect to the general class of improvements which should chiefly occupy our attention, viz. those of which the object is to provide "increased facilities of communication within the metropolis." This description of improvement is, perhaps, at the same time the most useful and the most difficult. It necessarily involves the invasion of private rights, and often, to a great extent, of private comforts, by the compulsory acquisition of property for which the pecuniary indemnities may not always be an adequate compensation. It also unavoidably requires some outlay of the public money. But recent experience has fully demonstrated how extensive have been the advantages of such changes to the community in general, and how much exceeding the sacrifices made to obtain them. The general acquiescence in the acknowledgment of these useful consequences is in nothing more manifest than in the demand created, by what has already been effected, for further improvements of the same description. The plans before us are many in number, some being the suggestions of individuals, others emanating from district, parochial, or other public bodies. They are, as might naturally be expected, not infrequently conflicting in their objects; but they are all entitled to that careful consideration which they will not fail to receive from us under the authority of your Majesty's warrant. We must, however, at the same time observe, that they present collectively designs for such a vast field of alteration, and would require the application of such enormous sums of money, that all hope of effecting, even with the most liberal disposition of Parliament, any considerable portion of them within any reasonable time must be abandoned. The utmost attention will be required in selecting such of them as may appear to possess the highest claims, and to be at the same time within the limits of practical, and not too expensive execution.

The plans of Sir Christopher Wren and of Sir John Evelyn for the restoration of London after the great fire are familiar to all who are acquainted with its history. The object of those plans was to effect a recast of the city under circumstances unusually favourable to the success of such an undertaking. But the fate of these attempts bears witness to the truth of the preceding observations, concerning the difficulty of effecting great and systematic changes in such a metropolis. They were thwarted by public bodies and individual interests. Although some improvements were undoubtedly made, the event itself appears to have had comparatively little influence upon the improvement of London, except that of accelerating probably the current westward of the nobility and the wealthier classes of the community, whose dwellings had fallen a prey to that calamity. Many of these erected edifices on the northern shore of the river, between Blackfriars and Westminster-bridges, upon the site of the present "Strand," and in the localities of Westminster and Soho, which in turn were abandoned for other and more eligible districts, in which few vestiges of their original appropriation remained at the commencement of the present century.

The vast and densely peopled space comprising the cities of London and Westminster, with the adjacent parliamentary boroughs and suburban districts, all now blended together under the common term of "the metropolis of the British empire," has been undergoing, however, between the commencement of the current century and the present time, more extensive and rapid changes than at any former period of its history since the great fire of London.

Of these it might be difficult to say whether the most remarkable were those which con-

sisted in the great extension of its limits by the addition of new buildings in all directions, or those which appear in the shape of improvements in the more ancient portions of it, by the alteration and re-construction of considerable districts.

The former of these have been effected entirely by private resources, or by the spirit of enterprise of individuals or associated bodies, which in the east has supplied the increasing wants of commerce, by the construction of splendid docks and warehouses, together with spacious lines of communication and corresponding habitations, in the vicinity of the port of London; and has ministered in other directions—more especially in the west and in the north—to the demands of expanding wealth and luxury, by the formation of new ranges of habitations, which in extent and beauty are not inferior to the capitals of many of the secondary states of Europe.

But with respect to the changes under the second head—the improvement of the more ancient portions of the metropolis,—these were not of a character to be accomplished, upon any extensive scale, by private means, nor without the intervention of the state and the authority of Parliament. They were, moreover, in every sense proper subjects for public aid, as they were not designed solely, or even especially, for the benefit and enjoyment of the more opulent inhabitants, but for the advantage and gratification of every class of the community. It is to this description of metropolitan improvement, and to the numerous plans which have recently been under the consideration of the government and of Parliament with relation to it, that the attention of this commission should, as we have already observed, be chiefly, if not entirely directed.

The immediate objects of these plans of improvement are, the accommodation of the public, by the amendment of inconvenient thoroughfares, the opening of new lines of communication, the substitution of spacious and handsome streets for tortuous, uncouth, and intricate lanes and alleys, inadequate for the traffic passing through them, and, in many instances, injurious to the health of those who inhabit them, by reason of deficient drainage and imperfect circulation of air. To such a city as London, with its immense wealth, its commercial circulation, its retail traffic, its mechanical industry, and its manufactures, far surpassing in these particulars every other capital in Europe, all such increased facilities for social and commercial intercourse must be matter of interest and advantage to every portion of its dense and varied population.

The constantly-growing necessity for some improvements of this description has at all times led to occasional and partial adoptions of them. On the part of the corporation of London, improvements of a highly convenient and beneficial character were made at former periods; but the first attempt to accomplish an extensive renovation of a considerable portion of the metropolis upon a great scale and a systematic plan, was made upon the suggestions and designs of the late Mr. Nash, under the immediate auspices of his late Majesty George IV. (then Prince Regent), and, under the authority of his government, carried into effect as a part of the ordinary management of the Crown property; and although the extensive improvements of a different character in Regent-street, at Charing Cross, and in the Strand, involved the purchase of private property to some extent, and necessarily, therefore, became subjects for special legislative provision, yet they were devised in the same department, in connection with the property of the Crown, paid for out of its revenues, and involved in their accomplishment the sacrifice of a large portion of its estate.

We think it quite sufficient to advert to these circumstances to account for the locality in which these great improvements originated, especially when it is added that the Crown had, at that time, no estate at the eastern extremity of the town to which it could extend the same liberal policy. But they have proved the means of suggesting similar improvements on an extensive scale in other parts of the metropolis, so that both in themselves, and by their example, they have added greatly to the embellishment and to the substantial comforts of the town; and to the diffusion through all classes of society of that earnest feeling for

measures of this nature which is now admitted to prevail.

The considerations which governed those improvements from their commencement to their completion are set forth in documents already before Parliament and the public, and stated with a detail to which it would be impossible to do justice by any recapitulation in the present report. No one, we conceive, can read the reports of Mr. Nash upon the formation of the Regent's Park and Regent-street, and survey not only the immediate site of these improvements, but the improved condition of all property in the vicinity, without feeling how completely time has given confirmation to his opinions and justified his views, and without finding embodied in those opinions and those views nearly every principle which should govern the conduct of similar undertakings.

The facilities of which the government had thus availed itself, in devising and effecting these extensive undertakings on the estate of the Crown, were followed by the adoption of a system of improvement, upon a similar scale, by the corporation of London, with the aid of Parliament. Commencing with the removal of old London-bridge, and the substitution of the present structure, a series of improvements has been effected, and others are yet in progress, which reflect great credit on that body for the zeal with which they have been undertaken and the manner in which they have been conducted. Further plans, on a very extensive scale, for the continuation and extension of these improvements east of Temple-bar, have been recently prepared by the corporation, submitted to this commission, and will receive its early consideration.

The improvements now in progress in other parts of the metropolis, together with those which have been sanctioned by Parliament, though not yet commenced, may be shortly enumerated. Of the class first mentioned plans have been laid before us by the Commissioners of your Majesty's Woods, &c., who are themselves members of this commission, and under whom, by virtue of powers given, and with funds provided by Parliament, communications in the undermentioned lines of thoroughfare are now in progress of execution; viz.—

1. From the end of Oxford-street, at its junction with Tottenham Court road, to Holborn, at its junction with Southampton-street.
2. From Hanover-street, Long-acre, at its junction with Bow-street, through Belton-street to Charlotte-street, Bloomsbury.
3. From the east end of Coventry-street, through Leicester-square, to the western termination of Long-acre; and
4. From East Smithfield, near the entrance to the London Docks, through Leman-street to Spitalfields.

By the improvements of which the expediency has been recognized by Parliament, but which are not yet begun, it is proposed to open new lines of thoroughfare in the following directions; viz. :—

1. From Farringdon-street West to Clerkenwell.
2. From Westminster-bridge to Southwark; and
3. From the neighbourhood of the Houses of Parliament to that of Belgrave-square.

Of these, however, the first is the only undertaking of which the details have been definitively sanctioned; the lines of the remaining two have yet to be arranged, and will, we presume, be brought under the consideration of the commission.

To defray the expense of these improvements, the committee of the House of Commons by which they were recommended submitted, in the first instance, that they might be provided for without any sensible addition to the local burdens of the inhabitants of London and its vicinity, by charging them upon existing funds assigned to the corporation of London for improving the approaches to London-bridge, inasmuch as the duty of 8d. per ton upon coal imported into London, which constitutes by far the larger portion of those funds, having proved much more productive than had been anticipated when they were thus appropriated, the charge upon them would be liquidated at an earlier period than had been contemplated; viz. in the year 1858, instead of the year 1862. The committee therefore recommended that in

lieu of allowing the appropriated funds to cease when the first incumbrance upon them should be paid off, they should be continued positively until the year last mentioned, and that such further sum as could be raised upon the credit of their surplus produce within that period should be made available to these new improvements. The committee having, however, been subsequently induced to recommend for early adoption some other plans, the cost of which could not be brought within the compass of that arrangement, they ultimately recommended to Parliament the extension of the several duties composing the fund in question for four years, viz. until the 31st of July, 1862, a recommendation which Parliament adopted. By means of the resources thus created, provision was made for the final cost of the four first-mentioned plans. But with regard to the three last enumerated, the sums applicable to them are only to be advanced in aid of monies to be provided by other parties, and on the express condition that they should be completed by those parties with that assistance. Upon that principle 25,000*l.* is to be assigned to the Clerkenwell line, 30,000*l.* to the proposed communication between Southwark and Westminster-bridge, and 39,000*l.* to the proposed improvements in Westminster.

It may be proper, however, that we should here observe, that as the nature of these improvements involves not only the ultimate cost thus to be provided for, but also an intermediate outlay of very large sums for the purchase of existing interests, a part only of which will be hereafter recovered by the disposal of new sites for building, the Commissioners of Woods, &c., were authorized by Parliament to raise the sums required for these advances on the credit of the land revenues of the Crown, without which measures the works could not have been executed.

The purchases authorized by Parliament out of monies, part of those revenues for the formation of a park, to be called "Victoria Park," in the neighbourhood of Hackney and Bethnal-green, are now in progress, in conformity with a plan which is annexed to the eighteenth report of the said Commissioners to her Majesty and Parliament. From the peculiar nature of the occupancy of much of this ground, which is held by market-gardeners, the purchases and clearings of the respective properties have been necessarily dependent upon seasons, but the formation of the park, we are informed, will be begun in the course of the present year.

#### EMBANKMENT OF THE THAMES.

Upon a careful review of the many subjects of improvement for which plans had already been before the public, or were subsequently submitted to us, we considered an embankment of the river Thames to have the first claim to our attention.

For a considerable period the condition of a large portion of the river in its passage through the metropolis has been the subject of observation and complaint; and although measures have at different times been submitted to Parliament, having its improvements for their object, yet nothing of a comprehensive nature has been effected.

The causes of the great change which has taken place in the bed of the river Thames, in that portion of its course which lies between London and Westminster-bridges, may be shortly stated. Among the first, if not the very first, of these in recent times, may be considered the removal of old London-bridge—a measure, no doubt ultimately beneficial to the interests of the river as a whole, but prejudicial for a time to the navigation immediately above it.

The operation of this change upon the condition of the river, and especially in the portions between the bridges, though great, and, as already observed, no doubt the immediate cause of the present embarrassment experienced in the navigation, has been uniform in its effects, and consistent in its character. It has produced, as was also to be expected, a general, though not uniform, lowering of the level of the river bed.

While the first of these consequences, however, has been immediate and manifest, the second, it is obvious, if left to the operation of natural causes, must necessarily be the work of time; and hence, in the interval, the navi-

gation of the river must be difficult at certain states of the tide.

The shoals and irregularities, however, which constitute the greater portion of this difficulty, are, in the evidence before us, attributed to other causes. We are referred to a want of uniformity in the bends and curves of the river, to the disproportion between the breadth and volume of its waters, and probably to the varying nature of the material forming its bed, as natural agents in working out these results, and, as artificial causes, to projections and recesses in the shores, irregular dredging, and other evils alleged to have arisen from imperfect conservancy.

The conservancy of the river Thames is a privilege and a trust vested in the corporation of London by very ancient charters, confirmed and renewed at various periods. The exact extent of the rights and of the duties thereby assigned to that body have been the subjects of much diversity of opinion, and of dispute and controversy both in and out of Parliament, strongly shewing the necessity for some legal decision, or legislative adjustment, upon a matter of so much practical importance. Upon these points, however, it does not appear to us that it is within the province of this commission to express an opinion; we therefore conceive that we shall sufficiently discharge our duty under this head, by soliciting the attention of your Majesty to the information furnished on this subject (extracts of which are annexed to this report) by the Commissioners on Municipal Corporations, by the committee of Parliament on the port of London, and by the City of London Navigation Committee.

Under the authority of the corporation of London, and, on some occasions, under special authorities obtained from Parliament, the river has been extensively, though not systematically embanked, and its water-way irregularly contracted, as will be seen by a plan, annexed to this report, of that portion of the river which flows immediately through the centre of the metropolis.

Other embankments we find are in progress at the present time, under licences granted by the corporation, of which embankments plans are also appended.

The effect of these partial and occasional embankments has been from time to time to alter the currents of the river, and to impair its navigable channel.

The embankments constructed under the authority of Parliament are few. The first of these was projected by Sir Christopher Wren immediately after the fire of London. The object of this embankment was "to make a commodious quay on the whole bank of the river from Blackfriars to the Tower;" and under the authority of the Act of Charles II. for rebuilding the city, and a subsequent Act of the same reign, it was partially carried into effect.

Under the first of these acts no house, out-house, or other building whatsoever, was to be erected from Tower-wharf to Temple-stairs, within 40 feet of the river, cranes and sheds for present use only excepted.

Although few traces of such a way are at present to be found, yet a portion of it, from the Tower to Castle Baynard, was actually executed. Encroachments, however, were subsequently made upon it from time to time, and in the year 1821, "notwithstanding a very decided opposition to the measure in both Houses of Parliament, on the part of the corporation of London, and the inhabitants of Upper Thames-street and its vicinity," the Act in question was repealed.

No further plan for regulating or improving the banks of the river was entertained till the year 1767, when a measure was submitted to the corporation of London for raising 300,000*l.* for the completion of Blackfriars-bridge by embanking the north side of the river between Paul's Wharf and Milford-lane, upon a line extending about half a mile in length. Arrangements were subsequently entered into with the societies of the Middle and Inner Temple, and other parties, by which this embankment ultimately included the frontage of the Temple-gardens.

The terms in which this proposal was submitted to the corporation would apply with very little variation to many parts of the river at the present day; and considering that a century at least had then elapsed since any measure has been attempted for the "regula-

tion and improvement" of its shores, and that another century has very nearly arrived at its completion, the statement is not undeserving of attention. "The wharfs," it is observed, "within those limits, by their different and very unequal encroachments, not only form an irregular and disagreeable outline, but afford the owners of some an undue preference and advantage over others; at the same time that the reflected set of the tides, at both ebb and flood, throws the force of the stream upon the Surrey shore, opposite to Blackfriars, and of consequence slackens the current on the London side; this, together with the large sewers that empty themselves in the neighbourhood, occasions a constant accumulation of sand, mud, and rubbish, which not only destroys great part of the navigation at low water, but renders the wharfs inaccessible by the loaded craft, even at high water, unless at spring tides; the mud and filth thus accumulated, notwithstanding the frequent expense the wharfingers are at to clear it away, is, when not covered with water, extremely offensive, and in summer time often dangerous to the health of the neighbouring inhabitants."—The corporation of London, it is presumed, acquiesced in the correctness of these statements, inasmuch as they adopted the plan; and powers were subsequently given by Parliament for carrying it into effect.

The next embankment of importance took place at Durham-yard and the places adjacent, now known as the site of the Adelphi-terrace, and the buildings connected therewith. In the years 1768, 1769, and 1770, Messrs. Adam and other parties applied to the corporation of London for their consent to this embankment, but without effect. The Court of Common Council not concurring, the parties applied to Parliament for an Act enabling them to effect a large embankment in that vicinity, not in the lines originally proposed, which Act was subsequently obtained, notwithstanding the most decided opposition on the part of the corporation in every stage of the bill, and notwithstanding that the clauses subjecting the ground to be gained from the river to the acknowledgment originally offered to the corporation were not inserted in the Act.

Within a comparatively recent period, further embankments, upon a scale of considerable magnitude, have been effected in the same portion of the river. We refer especially to the embankment which forms a part of the present site of Hungerford-market, and which was sanctioned by the legislature in connection with that measure; and to the projection devised for the enlargement and rebuilding of the palace at Westminster for the accommodation of the new Houses of Parliament.

"During the last fifty years," it appears, "numerous grants have been made, under the sanction of the corporation, for embankments in various parts of the Thames, throughout the jurisdiction of the city of London, by which the general line of the river, to a certain extent," is alleged to have "been regulated and improved." It was not, however, until within the last fifteen years, and under an order of the common council, that the balance of monies received on this account, and for other accommodations on the river, after deducting the expenses applicable thereto, were brought in aid of the conservancy.

The insufficiency of the funds strictly applicable to the purposes of the conservancy appears to have long formed a subject of complaint on the part of the corporation, and we presume, that to this, among other causes, is to be attributed the fact that, as far back as there is any evidence of the defective condition of the river, previously to the year 1840, there is no trace of any measure for a general and systematic improvement of the navigation, or regulation of its banks, having originated with that body.

Of the attempts made in Parliament to apply a partial remedy to this state of things, mention will be made hereafter. They failed, as it appears to the commission, from causes which need not any longer operate:—In the first instance (in 1825), under an apprehension that the removal of old London-bridge was too recent to admit of any accurate opinion being formed as to its effects; in the second (in 1840), from the indefinite character of the measures proposed, and from the opposition of the wharfingers, and others in trade, to the plan

upon which those measures were to have been founded.

The first of these plans bore date in 1824, and was projected by Sir F. Trench. Its object was to embank a portion of the northern shore of the river between London and Westminster bridges, and to make it available as a public thoroughfare. The proceedings consequent upon that plan, including the formation of a public company to carry it into effect, are detailed at some length in his "Collection of Papers relating to the Thames Quay," published in 1827.

Sir Frederick Trench, and the other promoters of the undertaking, after memorializing the corporation as to its rights of conservancy, and the Crown as to its rights over the soil, petitioned Parliament for a Bill on the 15th of February, 1825. On the 18th of the following month the question, that leave be given for its introduction, was carried by a majority of 40 in a house consisting of 130 members. It was suggested, however, that the information then possessed, as to the effect which the removal of the bridge might produce, was too imperfect for immediate legislation, and after a petition against the measure, presented on the 15th of April, it appears to have been dropped.

On the 23rd of March, 1840, the corporation of London applied to Parliament for power to embank both sides of the river between London and Vauxhall bridges. Adverting to the proceedings in 1835 before the select committee on the building of the new Houses of Parliament, to the embankment immediately consequent upon those proceedings, and to the expediency of the continuation of an embankment at Westminster for the improvement of the navigation of the river, it was the object of the application in 1840 to shew that, upon considerations irrespective of the navigation, an embankment so continued would be beneficial to the metropolis at large, and as such deserving the aid of Parliament. On the 30th of the same month a select committee was appointed, "to report its opinions and observations thereupon to the House, together with the best means of carrying the same into effect."

The plan which formed the basis of this petition had been prepared by Mr. Walker, under the direction of the corporation, and embraced the embankment on both sides of the river, between London and Vauxhall bridges. On referring to the copy of this plan appended to our report, it will be found to differ from the later suggestion of the same gentleman, in including in the embankment on the Surrey shore two arches of Waterloo-bridge, and in other particulars of minor interest and importance, which it is not essential to specify.

The committee suspended its sittings on the 29th of July, 1840, without bringing its inquiries to a close. It reported that "several petitions both for and against the measure having been referred to the committee of the House, and many witnesses, both for and against the intended plan, being proposed to be examined, it was obliged, by the near approach of the prorogation of Parliament, to conclude the inquiry without the examination of many plans for the embankment of the river, or the consideration of any plan for the improvement of the navigation without any alteration of the present lines of shore; and that upon the general subject, therefore, of the improvement of the navigation, with or without any embankment, in the present state of the inquiry, it gave no opinion." From that period all further notice of the subject ceased in Parliament.

In July, 1841, Sir Frederick Trench addressed a letter to Viscount Duncan, then Chief Commissioner of your Majesty's Woods, &c., stating the means by which the plan of Mr. Walker and his own might, in his opinion, be combined. At that period, however, a general survey of the river was understood to be in progress, from Putney to Gravesend, under the direction of Mr. Walker, on the part of the corporation, Captain Bullock, with the sanction of the Admiralty, Mr. Saunders, the water-bailiff to the city, and Mr. Leach, the clerk of the works to the Navigation Committee. The reports and plans, the result of this survey, together with a report from certain members of that committee, were laid before a common council holden on the 20th of Jan.,

1842, and subsequently printed for the use of the court. On application to the Navigation Committee we were furnished with copies of these documents.

Upon the appointment of this commission, Sir Frederick Trench addressed a letter to our chairman, expressing his desire to lay before us his plan for "a railroad between Dowgate-dock and Hungerford-market, with a second line from Hungerford to Westminster-bridge." His object, as stated in that letter, was "to connect this plan with the erection of an embankment for the improvement of the navigation of the river, and combining these with the removal of existing nuisances, to confer immense advantages upon the inhabitants of the metropolis, not only without any demand upon the public purse, but so as to produce a large surplus after defraying the whole expense of the embankment proposed by Mr. Walker."

In compliance with his desire, the commission requested the attendance of Sir F. Trench, and examined him at some length as to the objects and alleged advantages of his plan, its practicability, and its probable expense. In doing this, it was necessary to assume the adoption of the principle of Mr. Walker's plan of embankment, Sir F. Trench's calculations and arrangements having been adapted to that plan.

#### PLAN OF SIR FREDERICK TRENCH.

The plan of Sir F. Trench is explained in a statement addressed to his evidence. Referring to the terraces at Nice and Genoa, he observes, "Between those terraces and that which I propose, there would be this difference—that, instead of a promenade, the top of the colonnade along the north bank of the Thames would be occupied by that which would be the source of all the profit which I anticipate, namely, a railway of communication. Mr. Walker's line of embankment is before the commission. My proposal is to adopt that line, with some trifling alterations, and on it to erect a terrace, supported by columns, upon which a railroad shall be constructed. I suppose the columns to be 14 feet high, and a covered promenade under the terrace of that height. Between this covered walk and the river there may be a trottoir, with steps descending into the river where required. On the other side will be a passage for carriages and horses; and commercial operations may be carried on under the covered way. Wagons can back to the river between the columns; machinery can lift the coals from the barges, which will be moored in deep water at the bank; and the occasional interruption to passengers along the promenade will not be one tithe as much as that which occurs every hour of the day from the traffic of omnibuses in Cheapside and the Poultry." The proposition of Sir F. Trench thus contemplated uninterrupted lines of communication, both for foot passengers and the ordinary traffic of a railway, extending from Westminster-bridge to Dowgate-dock—the former at an elevation of 4 feet, the latter at an elevation of 18 feet above Trinity high-water datum, without traversing the roadways of the respective bridges, without hindrance to the trade of the river shore, and without prejudice to the navigation.

Practical difficulties, it appeared to the commission, presented themselves to the execution of this plan, and these were not lessened by Sir Frederick Trench's assumption of Mr. Walker's line and principle of embankment for its basis. Of Mr. Walker's plan, as explained in his evidence before the select committee of 1840 (to which only Sir Frederick Trench could be referring in his address to the commission), the line of the embankment was the only point to be positively fixed upon. The execution of it was to be left to the voluntary determination of individual proprietors, and its projector could assign no definite or even probable time for its completion.

Assuming the commission, however contrary to Mr. Walker's design, to be prepared to recommend the compulsion and expense inevitably associated with any other course of proceeding, the proposal of Sir Frederick Trench to carry his railway under Blackfriars-bridge suggested the first difficulty. The embankment of Mr. Walker was to include only the northernmost, and consequently the lowest of its arches on the Middlesex shore, the

centre of which above Trinity high water datum is only 16 feet 6 inches. Allowing some provision to be made against the occasional occurrence of higher tides, it would be necessary, therefore, in the construction of the embankment, to abridge this roadway by at least three feet (Mr. Walker had taken four), leaving a disposable elevation, for the colonnade, together with the traffic upon the roadways beneath and above it, of something between 12 and 13 feet.

As the average height of the embankment and colonnade would, according to the proposal of Sir F. Trench, be 18 feet, it became evident that even the line of the railway on the colonnade, independently of the space required for the carriages intended to be moved upon it, could not be made to pass under the arch without material deviation from the height assigned to it. It was manifest, indeed, that unless the line of the railway were actually brought down to the same level as that of the road upon the embankment itself, the traffic upon it could not be carried under the bridge; and further, that in order to effect this object, a gradual depression of the railway, occupying on either side of the arch a space of 1,000 feet, must be resorted to. Such was, in fact, the proposal ultimately made by the projectors for overcoming this difficulty.

But it was obvious that, by these depressions of the upper line, the continuity of the lower roadway must be destroyed, and the advantages of a promenade as well as of a carriage-way be thereby excluded. The use of the embankment for the purposes of trade would also be taken away within a considerable space adjacent to the bridge; and this circumstance created an objection of so much the greater importance, as the business transacted at that part of the river is considerable.

These difficulties, inseparable from the adoption of the first arch of the bridge for the purposes of this plan, led to the suggestion by its promoters of substituting the second arch for the same object. This would not, indeed, have been in accordance with the plan of Mr. Walker, upon which that of Sir F. Trench professed to be grafted, but it was observed, in reply to that objection, that "the line of that embankment might be the best for Mr. Walker's plan, but not for an embankment with a railway."

Little doubt, we conceive, can exist, that whether for the railway, the continuance of a public promenade, or the important interests of the trade in this locality, the second arch of Blackfriars-bridge would in all respects suggest the less objectionable expedient; it would give additional headway, and if a line of solid embankment were adopted, offer less interruption to all those purposes to which wharfage is generally applied. But interests of much greater importance, as it appears to us, intervene to determine this part of the question. The width of the river at Blackfriars-bridge is only 97 feet; the deductions from its waterway for an embankment including one arch only, and for piers, may be taken at 270 feet; its navigable channel, consequently, would remain little more than 700 feet. It would be impossible, therefore, we conceive, at this point, to project any solid embankment into the river beyond the arch in question, with a due regard to the interests of the navigation.

A further difficulty opposed to the plan of Sir F. Trench we have, perhaps, in some measure anticipated, when we referred to the uncertainty attending the completion of that of Mr. Walker. Mr. Walker's plan comprised recesses of considerable width. To carry a railway across these, at an elevation of 18 feet, might of course be practicable; but it is obvious that a public promenade of the character, in the direction, and upon the level proposed by Sir Frederick Trench for his quay, would be adverse to all the objects for which these recesses were designed; and that, if the two are to form part of the same measure, the embankment throughout its whole line must be completed in the first instance.

Having pointed out these preliminary, and, as it appears to us, insuperable objections to the plan of Sir Frederick Trench, we deem it to be superfluous to advert to minor difficulties affecting the expediency, the utility, or the financial details of his suggestion, combined with those of Sir Frederick Smith and Mr.

Bidder. The evidence relating thereto is annexed to this report, and estimates will be found in the appendix. These will, no doubt, be perused with the attention which they deserve, and with that which is due to Sir Frederick Trench as the early proposer and persevering promoter, through a long period, of an embankment of the river.

(To be continued.)

Correspondence.

SHAM SURVEYORS.

SIR,—I have observed in your last week's number of THE BUILDER an article under the head of "Disgraceful Practices of Sham Surveyors," signed "Z." From having been brought up to the profession and practising in it, I have ventured to correct some of your correspondent's statements. I am well aware there are many persons practising as surveyors who have not the least pretension to the name of surveyor, and have not been in any way educated or brought up to the profession. I have endeavoured to shun such men, and have always been at a loss to know upon what capabilities persons who commence business as auctioneers attach to their calling that of surveyor. I believe there are some few exceptions; such as where auctioneers are qualified and have had professional tuition, and can claim to be surveyors; but unfortunately on every auctioneer's cards, will be found the word surveyor, and perhaps many of them may have been brought up as farmers, greengrocers, milkmen, &c., and in a variety of businesses quite contrary to that of a profession so intricate as that of a surveyor. It is of this class of surveyors the profession have most to complain.

Your correspondent is most decidedly wrong in his remarks on the very useful (and as may be termed the professional) body of builders' clerks, the major part of whom are men of respectable families, and have been regularly educated and brought up to the profession, both as architects and surveyors, and at great cost to their friends, though by some unforeseen occurrence or for want of sufficient interest to get their abilities put forward in the world, they are obliged to seek employment in builders' offices, and doubtless have been found by builders a very useful body of men. Generally they are persons who derive much practical knowledge (in addition to the theory they have before acquired) from the diversity of business, and in the superintendence of works connected with first-rate men as architects, surveyors and engineers. I do not think the profession has a right to complain of this class of men, unless they will for the future object to take any pupil who would be bound not to act in the capacity of clerk to a builder, which would be quite impossible.

I have known instances of men who have turned surveyors from some separate trade connected with the building business, such as masons, plumbers and bricklayers, and have presumed to take off quantities for builders, and have through some interested friend been put forward to the detriment of the surveyor of long-standing. I boldly say it is such men as these that the profession and the respectable builder have to exclaim against. Trusting the time will arrive when such nefarious practitioners will cease to exist, I am, Sir, April 1, 1844. A.

METROPOLITAN BUILDINGS REGULATION BILL.

SIR,—Verily, we poor men engaged in building must be a strange race, if it be absolutely necessary to consider and punish us as common felons. It would seem to be quite enough to visit us with penalties varying from fifty shillings up to twenty pounds for peccadillos; but it seems that we are capable of crimes so enormous as to require a little severer castigation; and two justices of the peace, whether they be Solons or Sir Andrew Aguecheeks, are to have power to fine us from 5*l.* to 100*l.* a day for one kind of offence, and from 5*l.* to 500*l.* a day for another kind of offence; and further, if this mild and fatherly correction should not be enough to bring us to our senses, or should we be so poor that the seizure of all our sticks will not raise money enough to liquidate these merciful visitations, we are to be thumb-screwed a little more by imprisonment in the "common gaol or house of correction"

for three months or six months, according as we shall be more or less wicked, or more or less poor, and all this at a time when "humanity" is the watchword of the day. It is very difficult to conjecture in what school the concocter of the bill has been bred; but it requires no lantern to find out it was not in the school of lovingkindness. It is to be hoped this loathsome blot will be wiped away, and such penalties only enacted as, while they ensure obedience to the law, will breathe somewhat of the spirit of Christianity. There is indeed some consolation for builders. If they are to be curbed in with bit and bridle by district surveyors, these same gentlemen are shewn not to be a whit more trustworthy, but are to be themselves curbed in by the official referees, and to be subject to correction, fine, and dismissal. They will have a nice life of it, and I fancy that the official referees will find themselves not quite in a bed of clover, at least as far as work goes. But they are to be well paid, and rightly so, if the payment were all righteous; but why the district surveyor is to be paid ten shillings for measuring the width of a street, and which fee he may demand and get from every house in every street, young or old, I am quite at a loss to conceive. Nor can I readily conjecture why justices (who may be fathers or uncles of district surveyors) are to have power to order the district surveyors to be paid for loss of time, or why district surveyors and official referees are to be empowered to assess their own charges. (See clauses 14, 18, 40, 46.) I can suppose that some striping in legislature may have vanity enough to fancy himself wiser than his forefathers, and set down a new order of rating, and a new enumeration of the stories of a building; and I

can laugh at his sapient folly. But when I see the meditated destruction of an enormous amount of house property, which has not only grown up under the fostering care of a solemn Act of Parliament, but which has also been stunted in its growth by that act of the legislature which compelled builders not to make fourth-rate houses of more than 350 superficial feet, and as a necessary consequence, not to make the back rooms 100 feet superficial, I can scarcely suppose that I live in a land where justice has a local habitation. I must hope that this cruel wrong will not be persisted in. This is too serious for a smile; but we may indulge in a little mirth over clause 49, of which the indefiniteness is so perfectly ridiculous, that truly our worthy friend "Punch" must have tried his very funniest band at it:

"Sometimes to sense, sometimes to nonsense leaning,  
And blundering somehow round about a meaning."

However, Sir, as a whole, the Bill is a very great step in advance of all late attempts, and if it be made just, if it be made merciful, and if it be made easily comprehensible, as with some correction it may be, the metropolis will owe some thanks to its promoters.

I am, Sir, your much obliged servant,  
April 9, 1844. BRICKBAT.

CUTTING A TAPERED PLANK.

SIR,—Your correspondent, S. Huggins, says he believes this question, though seemingly simple, cannot be solved but by an algebraic equation of two unknown quantities, I beg to submit the following solution without assuming any quantity, but by simply working the given quantities:—

Let the annexed figure, *defg*, represent the plank whose length, *oi*, is equal to *l*, breadth, *fg*, equal to *B*, and *de* equal to *c* by the question; produce *gd* and *fc* till they meet in *h*, and draw *hi*. Then, by similar triangles,  $B-c : l :: c : \frac{cl}{B-c}$  or the length *ho* required to complete the triangle *fhg*, for which put *p*.

Then will  $\frac{p^2}{2} =$  the area of the triangle *dhe*.

And  $\frac{B+c}{2} \cdot l =$  the area of the plank, for which put *a*.

Then  $\frac{a}{2} =$  the area of each piece.

Euclid 6 and 19,  $\frac{p^2}{2} : p^2 :: \frac{p+c}{2} + \frac{a}{2} :$

$$p^2 + \frac{a}{c}p.$$

And  $2\sqrt{p^2 + \frac{a}{c}p} =$  the distance from the point *h*, where the plank must be cut.

$2\sqrt{p^2 + \frac{a}{c}p} - p =$  the distance to be measured from the narrow end.

And  $l + p - 2\sqrt{p^2 + \frac{a}{c}p} =$  distance to be measured from the wide end.

And  $p : c :: 2\sqrt{p^2 + \frac{a}{c}p} : c$  the width of the plank where cut.

$$= \frac{c}{p} 2\sqrt{p^2 + \frac{a}{c}p} = 2\sqrt{C^2 + \frac{a}{p}c} =$$

width of the plank where cut.

$$\text{But } p = \frac{cl}{B-c}$$

$2\sqrt{\frac{c^2 l^2}{(B-c)^2} + \frac{a}{c} \frac{cl}{B-c} - \frac{cl}{B-c}} =$  the distance to be measured from the narrow end, from which we have the following rule:—

Divide the product of the length and narrow end by the difference between the two ends, and call it a certain sum; then the area of the plank multiplied by this certain sum and divided by the narrow end, added to the square of the certain sum, and from the square root of the sum last found, subtract the certain sum; the remainder is the distance to be measured from the narrow end, and the square root of the sum last found multiplied by the narrow end and divided by the certain sum, the quotient will be the width of the plank where cut; or, Geometrically—

Let the figure, as before, represent the plank, divide the length in two equal parts by the line *mn*, and through *m* and *n* draw the lines *ab*, *kl*, parallel to *hi*; now as the triangle *d am* equals the triangle *g b m*, and the triangle *k en* equals the triangle *f l n*, it is clear if the two triangles were cut off the larger trapezoid *m n g f*, and put on the smaller one *d e n m*, and the plank cut on the line *mn*, the two areas would be equal; it is therefore evident, to answer the conditions of the question, the areas of the two triangles must be taken from the larger trapezoid *m n g f*, from its narrow end, and parallel to *mn*; to do which complete, the parallelogram *d a m c*, which will equal the area of the two triangles *g b m*, *l n f*, make *mp* equal *mc*, and describe the semicircle *a s p*, cutting *mn* produced in *s*, bisect *mp* by the line *qr*, then it is evident, if the line *qr* equals the line *am*, a line drawn through *p* would answer the condition of the question; make *mt* equal to *qr*, and describe the semicircle *ts u* through the points *t* and *s*, bisect *um* by another line *qr*, and make *mt* equal to *it*, and repeat the operation until the line *qr* shall coincide with the middle of *mn*, then a line drawn through *u*, parallel to *mn*, will be the place where the plank must be cut.

For  $qr \times mu =$  the area of the trapezoid *mn u v*, but  $mt = qr$ .  
And by Euclid—2nd and 14th,  $mt \times mu = m s^2 = qr \times mu$ ,  
and  $na \times mc$ , or  $(mp) = m s^2$ ;  
hence  $qr \times mu = na \times mc$ , Q. E. D.  
I remain yours, &c. P. A. R.

CHIMNEYS AND CLIMBING-BOYS.

Sir,—In the report of the Master Carpenters on the proposed new Building-Act, it is suggested that "the wearing away of flues would be greatly diminished if the legislature would permit climbing-boys, say of not less than fourteen years of age, and duly licensed, to sweep chimneys as formerly, instead of the very imperfect method of cleansing them by machinery."

Now, it does appear to me that boys of the age of fourteen could never ascend the existing old flues 14 inches by 9 inches, to say nothing of many only 9 inches by 9 inches. The next question to be considered would be, what size flues should be made in order to admit climbing-boys of that age. But I trust and hope the legislature will never permit the revival of an occupation so inhuman and degrading. Surely some plan may be adopted for the future construction of that portion of building which will admit of machine-cleansing, and that the legislature will give the subject their consideration in framing the new Act. HUMANITUS.

Sir,—Perhaps you or any of your scientific readers would inform me of the best mode of building a brick column. I want to form an Ionic colonnade in the interior of a church, which is to support the roof; the diameter of the columns is two feet. Hoping this is not too great a trespass on your columns,

I am, Sir, your obedient servant,  
Waterford, April 5th, 1844. J. T.

Current Prices of Metals.

April 4, 1844.

Table with columns for metal types (SPELTER, ZINC, QUICKSILVER, IRON, STEEL, COPPER, TIN, LEAD, PIG-LEAN) and sub-columns for various grades and units (Foreign ton, For delivery, English sheet, per lb., per ton, etc.).

BISHOP FAIRBR'S MONUMENT.—The subscribers are respectfully informed that this monument has been erected in St. Peter's Church, Carmarthen, as intended, and the expenses paid by the original proposer. That gentleman also begs leave to acquaint the piously and generously disposed subscribers that by reason of the talented and judicious execution of the work by the sculptor, no further funds are required, and therefore they may please to receive back their subscriptions on applying to the bankers to whom such subscriptions were originally paid.—Lansdown-parade, Cheltenham, April 10.—Morning Post.

NEW CATHOLIC CHAPEL.—The ceremony of laying the foundation stone of a new Catholic Chapel took place in the retired village of Blackbrook, near St. Helen's, on Monday last. The church will be in the style of Catholic architecture of the fourteenth century. It will consist of a nave 75 feet by 24, a chancel 30 feet by 18, with a chantry chapel, sacristy, and porch, and will be surmounted by a bell gable over the east end of the nave. The design is by Mr. Hadfield, and the decorative part will be executed by Mr. Bulwer.

Tenders.

TENDERS delivered for building a pair of Cottages at Brentwood, Essex, for Ammon Moulst, Esq., James Edmeston, Esq., Architect, April 8, 1844.

Table listing tender amounts for cottages: Winter (Brentwood) £1,548 0 0; White (ditto) 1,530 0 0; Ashmote (Ilford) 1,496 0 0; Curtis and Sons (Stratford) 1,448 0 0; Hill (Brentwood) 1,278 15 8; Norris (Hackney) 1,247 0 0.

TENDERS delivered for a house at the same place, for Mr. Thompson, same Architect. Winter (Brentwood) £1,445; White (ditto) 1,442; Norris (Hackney) 1,127; Curtis and Son (Stratford) 1,094.

NOTICES OF CONTRACTS.

For works required in the enlargement of the Liverpool Workhouse.—Day for sending in Contracts, &c., postponed sine die. For making certain Repairs on the Church of Bethelvie.—Plan, &c., J. Smith, Esq., Architect, Aberdeen. April 17.

For Erecting a Church at New Radford, near Nottingham.—Plans, &c., H. J. Stevens, Esq., Architect, 16, Full-street, Derby.

For executing extensive Additions and Repairs to the Manse of Mortlach, and for Erecting new Offices there.—Plans, &c., at the Manse. Farther particulars T. M'Kenzie, Esq., Architect, Elgin. April 17.

CAMBRIDGE.—For the several works to be executed at the corner of St. John's and Bridge-streets. Mr. Clemence, Surveyor, Chesterton-road. The day for receiving Tenders not fixed.

For certain alterations about to be made at the Bath Cool.—Plans, &c., at the Gault P. George, Esq., Town Clerk, Guildhall, Bath. April 20. For Paving with Wood a portion of St. Andrew's-square, Cambridge, containing 352 superficial yards or thereabouts.—F. Randall, Clerk to Commissioners. April 23.

PREMIUM.

£150 for the best design, plans, and estimates for a Pauper Lunatic Asylum, Derby (unless the person furnishing the same be employed to superintend the execution of the works); £100 for the second best design, and £50 for that which may be considered next in merit.—Mr. Barber, Derby. April 20.

MEETINGS OF SCIENTIFIC BODIES.

- To-day and during the ensuing week. SATURDAY APRIL 13.—Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M. MONDAY, 15.—Statistical, 11, Regent-street, 8 P.M.; British Architects, 16, Lower Grosvenor-street, 8 P.M.; United Service Institution, Middle Scotland-yard, 9 P.M.; Chemical, Society of Arts, Adelphi, 8 P.M.; Medical, Bolt-court, Fleet-street, 8 P.M. TUESDAY, 16.—Free-Masons of the Church, St. Mark's Chapter, 8 P.M.; Lincaen, Sohospire, 8 P.M.; Horticultural, 21, Regent-street, 3 P.M.; Civil Engineers, 25, Great George-street, 8 P.M. WEDNESDAY, 17.—Society of Arts, Adelphi, 8 P.M. (anniversary); Geological, Somerset House, 8 1/2 P.M.; Microscopical, 21, Regent-street, 8 P.M. THURSDAY, 18.—Royal, Somerset House, 8 1/2 P.M.; Antiquaries, Somerset House, 8 P.M. FRIDAY, 19.—Royal Institution, Albemarle-street, 8 1/2 P.M. SATURDAY, 20.—Westminster Medical, 32, Sackville-street, 8 P.M.; Asiatic, 14, Grafton-street, 2 P.M.

TO OUR CORRESPONDENTS.

"Aqua."—I don't know of any premium having been offered. "H. Y."—We recommend to make a selection of particular prints from the collection of Evans, Great Queen-street, Lincoln's-Inn-Fields. We do not know any cheap work of the kind. Shaw's are the proper works, but from the cost of their execution and their necessarily limited circulation, they cannot be low-priced. "Mr. Bare-faced Tenon" is an obtrusive fellow. We cannot suffer him to enter our house, but shall confine him to our stables, or certainly not let him approach nearer than the side garden-gate. "We have received the letter of 'L. Law.'" "An Architect," 24th March.—Good or bad the window possesses originality, and if it had been an old work, would have found admirers on that account. Its author promises to become, by sending us delineations of local architectural antiquities, a valuable correspondent. "We have received the contribution of 'Restorer,' and intend paying a visit to St. Helen's."

We should be obliged by all correspondents who transmit to us algebraical subjects, sending us also their real names and addresses, in order that as their manuscripts are not always quite clear, they may have proofs transmitted to them for their own correction.

We should like to be made acquainted with the name of our correspondent at King's Langley, in order that we may write to him privately. "G. Morris."—We have no such intention.

ADVERTISEMENTS.

CREAVE'S LIAS CEMENT is particularly recommended as being manufactured from BLUE LIAS STONE—does not vegetate—never cracks—is a better colour (resembling stone) than any Roman cement, hardens by exposure to the atmosphere; and will set as hard as stone under water, possessing advantages over any other light cement, being cheap—more easily worked—carrying, as much sand, and well adapted, from its quick-setting quality, for any description of modelling or casting, however elaborate. Sold in casks, of five bushels each, at 10s. 6d., or 1s. 6d. per bushel; 2s. 6d. allowed for casks if returned in good condition.

H. HOULDER, Agent, BLUE LIAS LIME WHARF, 2, South Wharf, Paddington.

Patronized by Her Majesty's Stationery Office. H. MOKRELL'S REGISTERED INK, MANUFACTURED FOR THE USE OF REGISTRARS OF BIRTHS, DEATHS, AND MARRIAGES. And warranted made with Galls. This Ink has received its present reputation from the results of Chemical Tests, made under Authority, sold without any restriction at the Manufactory, 149, FLEET STREET, LONDON: And may be had Retail of all the principal Stationers and Bookellers in Town and Country. \* \* \* Observe, each Bottle is sealed with the Maker's Name and Address.

ORNAMENTAL WINDOW GLASS, 2s. per foot super.—CHARLES LONG having greatly improved his machinery for ornamenting glass, is enabled to offer handsome patterns at 2s. per foot super, glass included. 100 feet can be executed and delivered in two days. Address to Charles Long, House Decorator, &c., 1, King-street, Portman-square. For Cash only.

PATENT TESSELLATED, VARI-GATED, ORNAMENTED MARBLE AND PLAIN PAVING TILES, Manufactured by SAMUEL MAYER, Burslem, Staffordshire. Specimens and prices may be obtained at Mr. Charles Long's, 1, King-street, Portman-square, and also at the Manufactory.

PAPER HANGINGS. R. CHATER solicits the attention of B. BUILDERS, SURVEYORS, and others to his extensive assortment of Paper-hangings which he has constantly on stock, and very reduced prices, adapted to the decoration of Bed-rooms, Parlours, and Drawing-rooms. Also his imitations of Marbles, Granites, and Oak Papers for Halls and Staircases. Patterns sent to any part of Town or Country for inspection, and estimates given free of charge. 45, Tottenham Court-road.

PLUMBERS, PAINTERS, BUILDERS, and others supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c., &c., for Pictures, Glazing, &c., in any quantity, at Manufactory Prices. TURPS, per gallon . . . . . 2s. 3d. LINED OIL, ditto . . . . . 2s. 9d. SHEET LEAD, in sheets, per cwt. . . . . 18s. 6d. DIBB, cut to size and PIPE . . . . . 19s. 6d. WHITE LEAD, ditto . . . . . 25s. 6d.

Colours, Pipe, Brushes, &c., &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to R. COGAN, Printers, Fleet-street-square, London. PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS, can be provided with flattened Crown, Sheet Glass, and the patent Sheet Plate. Lists of which, shewing the price for any Square, from 14 by 12 to 40 by 30 of Best and Seconds quality, will be sent (gratis) upon receiving the address. Builders, Glaziers, and others having to contract, sending a copy of their specifications, with a list of dimensions to R. COGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for if required.

NURSERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London.

COMMON SHEET AND CYLINDER. The advantages of Common Sheet over Crown for Glazing St.-lights is decidedly great, and is generally used where strength or superior appearance is required; a light 6 feet 6 in. long, with openings of any width, needs only one lap. This Glass is considerably stouter than Crown, and may be had from 1s. 3d. per foot.

Also may be had, COGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES, MANUFACTURED BY THE PATENT GLAZIERS AND GLASS CONTRACTORS, FITTERS, GLASS MERCHANTS, and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, MODELLERS, and OTHERS, supplied with FRENCH ORNAMENTAL SHADES, for covering Models of Public Buildings, Geological Curiosities, &c., &c., of all sizes and shapes. List of Prices may be had on application.

French Table Frames, China Vases, Fancy Glass Ware, and Alabaster Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A Liberal Discount to Dealers keepers and others.

# The Builder.

NO. LXIII.

SATURDAY, APRIL 20, 1844.

**T**ENDING to the necessity of the case, we this week postpone our own observations which we have in readiness upon the same important subject; profiting indeed in maturity of thought by greater extent of time for consideration of matters so vital; we, therefore, in order that all our readers may become fairly acquainted with and be able to judge accurately in the matter, continue the

*REPORT of the Select Committee appointed to Inquire into the Circumstances affecting the Health of the Inhabitants of Large Towns and Populous Districts, &c.*

The returns shew that out of 5,692 cases of typhus in all the 20 unions, 4,002 were yielded by the seven unions specified as pre-eminently malarian districts.

Dr. Smith continues: "It appears that out of 77,000 persons who have received parochial relief, 14,000 have been attacked with fever; one-fifth part of the whole; and that 1,300 have died. It should be borne in mind that there is no disease which brings so much affliction on a poor man's family as fever; it commonly attacks the heads of the family, upon whose daily labour the subsistence of the family depends." The present returns afford melancholy evidence of the pauperising influence of this wide-spreading and mortal disease. They shew that while one-fifth of the whole pauper population in the year in question was attacked with fever, in Bethnal-green the proportion was one-third, in White-chapel it was nearly one-half, and in St. George-the-Martyr it was 1,276 out of 1,467.

"Placing out of consideration (continues our benevolent informant) the suffering of the individual attacked with fever, which however is one of the most painful maladies to which the human being is subject; placing out of view also the distress brought upon all the members of the family of the sick, it is plain that this disease is one of the main causes of pressure upon the poor-rates. That pressure must continue, and the same large sums of money must be expended year after year for the support of families afflicted with fever, as long as those dreadful sources of fever which encompass the habitations of the poor are allowed to remain. They would not, they could not be allowed to remain, if their nature were really understood, and if the ease with which the most urgent of them might be removed were known.

"But there do not appear to be any practicable means of removing them without legislative interference; and if the care of the public health be a part of the duty of the legislature; if in the metropolis unions, which alone include a population of 851,000 souls, it be certain that conditions exist which are absolutely incompatible with the public health, and which conditions are to a very considerable extent removable; and if it shall be found that similar conditions exist in all the large towns in Great Britain, here would seem to be a proper and legitimate field for the exercise of legislative wisdom and power."

The prevalence of fevers and other diseases arising from neglect of the sanitary regulations, is by no means confined to the populous

districts of the metropolis above described; but the same causes appear to produce the same effects, in a greater or less degree, in all our great towns. In some of them these evils, and the misery consequent upon them, is much increased by peculiar faults in the form and construction of the humble dwellings of the poorer classes. This seems owing to the want of all proper regulations in any general Building Act, applicable to the poorer class of houses in these crowded districts, for preserving due space and ventilation.

Thus in Liverpool there are upwards of 7,800 inhabited cellars, occupied by upwards of 39,000 persons, being one-fifth of all the working classes in that great town; and an account of undoubted veracity states, "that the great proportion of these inhabited cellars were dark, damp, confined, ill-ventilated, and dirty."

In Manchester also, nearly 15,000 persons, being almost 12 per cent. of the working population, live in cellars; and in the adjacent town of Salford, 3,300. Such a habitation must almost necessarily be unhealthy, as it implies the impracticability of proper drainage and ventilation.

Another form of construction of houses for the working classes, which your committee considers highly injurious to the health of the inmates, prevails extensively in many large towns, and especially in Liverpool; viz. the position of rows of small houses in close courts, built up at the sides and end, and having only one entrance, frequently under a narrow archway.

The evils arising from this cause are much increased when it is found, as in Liverpool, that it is combined with another error in the construction of rows of these houses, viz. that they are placed back to back, so as to exclude the possibility of thorough ventilation.

It has been stated to your committee, that there are in Liverpool about 2,400 courts, chiefly of this construction, containing an estimated population of about 86,000 of the working classes, in addition to 38,000 living in cellars. Independent of this faulty construction, so injurious to the health of the inhabitants, the state of most of these courts is described as almost utterly neglected, with no underground sewers, and no attention to cleansing, with no inspection of any kind, and the surface gutters frequently almost choked with filth.

These courts are thus described by Dr. Duncan, an intelligent physician resident at Liverpool:—"Very few have an entrance wider than four feet, and that is by an archway built over it; the width is from 9 to 15 feet between the rows; there is one only six feet. The backs of the houses in one court are built against the backs of houses in another court; at the further end there is generally an ash pit between two privies; they are in the most abominable state of filth."

It is scarcely possible to conceive any construction more prejudicial to the health of the inhabitants.

"The stench arising from these causes is such, in some of the courts, as to render it almost impossible to remain for any time in them."

The great mortality of Liverpool is noticed, and a question is asked, "Do you know whether fevers have prevailed in Liverpool?" to which the answer is, "Yes, fever is the great complaint of these people."

"Does that arise in any measure from the want of ventilation and cleanliness in these dwellings?—A. There can be no doubt of that; I found fever most prevalent in those districts where there is most neglect of cleanliness and ventilation."

"Can you give any facts with respect to any particular localities where fever has been for a length of time, or where it frequently prevails?"

—A. I can state the average number of cases of fever attended annually by the dispensaries, and the proportion of those occurring in courts; the average number during the last five years was upwards of 5,000, exclusive of the cases occurring among the members of clubs and friendly societies, of which there are many in Liverpool; that is about one in 35 in all classes of the population; that in the courts is about two-fifths, and between one-half and one-quarter in the cellars."

Again, it is said, "The proportion of cases of fever occurring among the inhabitants of

cellars is about 35 per cent. more than it ought to be, calculating the proportion of the inhabitants of the cellars to the whole population; the mortality of Liverpool was last year one in 33."

It appears that this kind of property is constantly increasing; is a very profitable and tempting investment; is the cause of great cost to the community, but contributes but little to the parochial burthens, as it is stated there are 16,800 cottages in the parish of Liverpool assessed under 12 $\frac{1}{2}$  per annum, and of that number only 900 contribute to the rates, and their contribution is 700 $\text{L}$ . on a levy of 10,000 $\text{L}$ .

Your committee would pause, from the sad statements they have been obliged to make, to observe, that it is painful to contemplate, in the midst of what appears an opulent, spirited, and flourishing community, such a vast multitude of our poor fellow-subjects, the instruments by whose bands these riches were created, condemned, for no fault of their own, to the evils so justly complained of, and placed in situations where it is almost impracticable for them to preserve health or decency of deportment, or to keep themselves and their children from moral and physical contamination; to require them to be clean, sober, cheerful, contented, under such circumstances would be a vain and unreasonable expectation. There is no Building Act to enforce the dwellings of these workmen being properly constructed; no Draining Act to enforce their being efficiently drained; no general or local regulation to enforce the commonest provisions for cleanliness and comfort.

It appears to your committee, that where such evils are found to follow from the neglect or inability in these respects of local authorities, that it is the duty of the legislature to take efficient steps to protect so numerous and valuable a portion of the community.

These evils, arising from the malconstruction and crowded state of their dwellings; the absence of a good system of sewerage, and all adequate inspection and cleansing of the courts and alleys in which they reside, are found to exist in like manner in many parts of the metropolis, in Manchester, Leeds, Bradford, Glasgow, and other large towns.

Thus, in Manchester, the capital as it may be called of the cotton trade, with a population of not less than 240,000, nearly 15,000 of the poorer inhabitants, constantly inhabit cellars. Though the habitations of the working classes are described as better than those of Liverpool, the want of proper building regulations, and any effectual sewerage and cleansing, as applicable to the localities inhabited by the workmen, is most justly complained of.

Your committee would here beg to quote a few lines from an able letter written by J. Robertson, Esq., an eminent surgeon, residing in Manchester, to the chairman. After addressing to the former the disgraceful state of the streets and drains, he bears testimony to the zeal of the authorities in carrying on salutary improvements in these respects, "especially when it is known that no street can be paved and sewered without the consent of the owners of property, unless a certain large proportion of the land on either side is built upon. Owing to this cause, several important streets remain to this hour disgraceful nuisances.

"Manchester," continues the writer, "has no Building Act, and hence, with the exception of certain central streets, over which the Police Act gives the commissioners power, each proprietor builds as he pleases. New cottages, with or without cellars, huddled together, row behind row, may be seen springing up in many parts. With such proceedings as these the authorities cannot interfere. A cottage row may be hadly drained, the streets may be full of pits, bristling with stagnant water, the receptacles of dead dogs and cats, yet no one may find fault.

"The number of cellar-residences you have probably learned, from the papers published by the Manchester Statistical Society, is very great in all quarters of the town; and even in Hulme, a large portion of which consists of cottages recently erected, the same practice is continued. That it is an evil must be obvious, on the slightest consideration; for how can a hole underground, of from 12 to 15 feet square, admit of ventilation, so as to fit for a human habitation?" "We have no authorized inspector of dwellings and streets."

After remarking that, when well fed, the

families of working people maintain their health in a surprising manner, even in cellars and other close dwellings, he states, "That in 1833, 1834, 1835, 1836 (years of prosperity), the number of fever-cases admitted into the Manchester House of Recovery, amounted to only 421 per annum; whilst, in two pinching years, 1838 and 1839, the number admitted was 1,207 per annum."

"It is," adds this benevolent gentleman, "in such a depressed state of the manufacturing districts as at present exists, that unpaved and badly sewered streets, narrow alleys, close unventilated courts and cellars, exhibit their malign influence in augmenting the sufferings which that greatest of all physical evils, want of sufficient food, inflicts on young and old in large towns, but especially on the young."

"Manchester," he adds, "has no public park, or other ground where the population can walk and breathe the fresh air, and, in this respect, is disgracefully defective, more so, perhaps, than any town in the empire."

Your committee have dwelt longer on the state of Manchester and Liverpool than they should otherwise have done, because these great towns are so much supported by and connected with the cotton manufacture, which employs a greater amount of capital and workmen than any other in this empire, or, perhaps, in any other quarter of the globe, and which is rapidly increasing in importance, and the number of persons occupied in it is constantly augmenting.

It seems alike a matter of duty and policy in the Legislature to take care that the industrious classes, by whose hands the great riches derived from this trade are chiefly formed, should be protected from evils (such as have been described) by the Government and the more opulent ranks, who owe so much to their unwearied exertions.

If from the great towns connected with the cotton trade your committee turn their attention to those where the population is chiefly employed in the woollen manufactures (the second in point of extent), they regret to have to report, that the evidence addressed before them shews nearly the same neglect as to any effective regulations to provide for the comfort or insure the health of the labouring community.

Thus, in Leeds, with a population of above 80,000 persons, the state of the streets, courts, and dwellings inhabited by the working-classes appears greatly neglected; paving, sewerage, and cleansing (as applicable to the health and comfort of these workmen) seem seldom thought of, and never enforced.

The Report of the Statistical Committee of the Town Council of Leeds, giving a detailed account of the state of the town, has been fully confirmed by Dr. Williamson, a physician long resident in Leeds, and well acquainted with the facts; the details are given in evidence, p. 96, &c. A few extracts will give a sample of the rest.

Referring to the condition of one ward (a populous district) the question is put, "All the streets and dwellings in this ward are stated to be more or less deficient in sewerage, unpaved, full of holes, with deep channels formed by the rain intersecting the roads, and annoying the passengers, sometimes rendered untenable by the overflowing of sewers and other more offensive drains, with ash-holes, &c. exposed to public view, and never emptied; or being wholly wanting, and as frequently the case, the refuse is accumulated in cellars, piled against the walls, or thrown into the streets; is that an accurate description?—A. It is an accurate description of the condition of the streets."

Referring to one neglected and filthy locality, the witness says, "From that yard I have reason to know cases of malignant fever are continually sent to our Fever Hospital." The district called the North East Ward (in which out of 16,269 inhabitants, 15,399 are of the working-classes) is thus described: "As containing numerous streets, 'having dangerous excavations, bad drainage, little or no sewerage, here and there pieces of stagnant water, ash-holes exposed, out-offices, without doors or seats, very unsafe,' &c."

(To be continued in our next.)

#### BUILDERS' FOREMEN'S INSTITUTION.

A GENERAL meeting of the members of this institution, Mr. Allard, president, in the chair, took place on Wednesday evening last, for the purpose of considering the report of the committee appointed to inquire into the best means of forming an asylum for ill, aged, and infirm members. It also being the quarterly-meeting, the business more immediately connected with the evening was the election of president, vice-president, secretary, &c., for the ensuing six months. There was a very full attendance of members, whose number now amounts to upwards of sixty of the principal foremen of the builders of the metropolis.

The Secretary having read the minutes of the last meeting, which were confirmed, Mr. Trow was unanimously elected a member.

Mr. Kimberley was elected president by the casting vote of the chairman.

Mr. Smith was elected vice-president.

Mr. Rowe was re-elected as secretary.

A managing committee of three members was then elected.

Mr. Stephens then proposed that the recommendation of the committee be received, and that a committee be appointed to form an asylum for its aged and infirm members.

After some remarks from the members, a high eulogium was passed on the committee who drew up the report. A committee was appointed accordingly.

#### FREEMASONS OF THE CHURCH.

##### SEVENTEENTH (ST. MARK'S) CHAPTER.

APRIL 16.—The Rev. George Pocock, B.C.L., one of the Chaplains, in the chair.

The minutes of the last meeting were read and confirmed.

It was ordered, that the subject of a letter from Mr. R. Hopton, of Leamington Priors, be referred to, and be at the next Chapter reported on by a deputation consisting of the following members:—

Rev. F. P. Pocock, (Latin Secretary); Messrs. A. Bartholomew, (English Secretary); W. P. Griffith, (Baptistographer); G. Aitchison, sen., (Cementarius); R. Cull, (Professor of Architectural Acoustics); G. Perry; F. East; A. A. Winterbottom; H. Smith, (Professor of Hydraulics); and J. W. Archer, (Monumental Brassier).

William Franck Elliott, Esq., of No. 15, New Cavendish-street, and of Taunton, in the county of Somerset, was elected a Lay-Fellow.

William Papineau, Esq., (Professor of Architectural Chemistry), presented to the Museum a stone tablet, bearing a Chinese inscription, brought from Chusan.

J. W. Archer, Esq., presented to the Library a Tract intitled "Remarks on the Value of Decorative Church Architecture."

James Wilson, Esq., F.S.A., Architectural Fellow and Correspondent Delineator for the county of Somerset, presented the following lithographic prints of edifices designed and erected by himself:—

View of Cheltenham Proprietary College.

View of St. Stephen's Church, Bath.

View of Holy Trinity Church, Milton, near Gravesend, Kent.

It was ordered, "That in case of application being made to any member of the College for information relative to the means of joining the College, the English Secretary shall be empowered to send to any applicant a minute of the laws concerning the admission of members."

Mr. Joseph Jopling, architect, exhibited his apparatus for generating lines by simple continuous motion, and is to explain his invention on Tuesday evening, the 30th instant.

Mr. W. P. Griffith, F.S.A., presented two rubbings from a curious sepulchral-brass, engraved on both sides, in the parish church of St. Margaret, Rochester, to the memory of Thomas Cod, Vicar of that church, who died A.D. 1465.

Mr. W. G. Rogers exhibited two magnificent drops, 7 feet high, and 1 foot 8 inches wide, consisting of fruit, corn, fish, and other subjects, carved by him for the Earl of Oxford, in the style of Grinling Gibbons, embossed 11 inches with a free and perfect imitation of nature. Also three masterly specimens of grotesque paneling of the sixteenth century, 3 feet long and 11 inches wide, apparently

from the designs of Giovanni-da-Udine (the pupil of Raffaello), who was employed in decorating the Loggia and other parts of the Vatican; and who, with the exception of Morto-da-Felro, was the first who attempted that style, which, in his time, had been but recently discovered in the subterranean chambers at Rome, Putcoli, and Cumea, it being nothing unusual for Raffaello himself, Udine, Clotio, Romano, Parmigiano, and other artists, to design subjects both for sculpture and wood carving; many noble families of Italy still boasting of marriage-chests originally executed under the superintendance of some or one of the above masters; but a specimen being no where found more beautiful than the one in the collection of the Earl of Cadogan, who possesses two pillars from the bedstead of Pope Leo the Tenth, the composition of which is attributed to Giovanni-da-Udine.

Mr. W. H. Rogers presented a beautiful original drawing of grotesque ornaments, formerly in the museum of Count Caylus, and attributed to Giovanni Nanni, or Ricamatori, commonly called da Udine.

Mr. T. Whilmsburst presented a lithographic interior view of Plymouth Church, and also exhibited a quatre-feuille painted window, 1ft. 7in. diameter, of the Flight into Egypt; also drawings of stained-glass windows, executed by him, viz.:—

For the altar of St. Botolph's, Bishops-gate, London (the Ascension).

For Penzance Church,

For Plymouth Church,

For Radcliffe Chapel, Lancashire (Christ bearing the Cross).

I. J. Thomas, Esq., of No. 1, Berkeley-place, Brecon, was elected Correspondent-Delineator for South Wales.

Applications to become members were received from nine gentlemen.

Adjourned till Tuesday evening, the 30th instant.

#### INSTITUTION OF CIVIL ENGINEERS.

APRIL 16.—William Cubitt, Vice-President, in the chair.

The first paper read was an account of the railway from Amsterdam to Rotterdam, d' the Chevalier F. W. Conrad, M. Inst. C. E., translated from the French by C. Manby, Sec. Inst. C. E.

This railway, which is the first which has been constructed in Holland, was commenced under adverse circumstances, and the works languished until the appointment of the author as engineer director, when it appears that although from the defective state of the law of expropriation, great difficulty was experienced in obtaining possession of the land for the railway, the works were carried forward so vigorously, that the four divisions of the railway, extending from Amsterdam to the Hague, were completed between March 1839, and December 1843, leaving only the fifth division between the Hague and Rotterdam to finish the line, and of that, the works were proceeding rapidly. The length of the line, when the whole is finished, will be about 32½ English miles, and the cost of the single line of rails laid is about 1,475. per mile.

The detail was given of all the conditions of the contracts, the prices and quantities of materials, the methods of execution, the forms and dimensions of the buildings, and of the bridges, some of which are of cast-iron of large sizes, and very ingeniously contrived for opening for the facility of the navigation. The iron beams of one of these bridges were 73 feet long, cast in one piece. Other bridges of timber, on the American trellis-work principle, and of very large space, were also described.

The mode of construction of the permanent earth-work was then described. Almost the whole line, being through marshy ground, was laid upon fascines, and in some places it was carried entirely by these means through water of considerable depth.

An ingenious mode of cutting off the heads of the piles under water was then described, and it was thought that its simplicity would induce its introduction into English engineering works.

All the other particulars of the railway-works were given in the most minute detail,

with tabular statements of the number of passengers conveyed, the receipts, the number of miles traversed by the locomotive engines, and the paper was illustrated by a large collection of maps, sections of the line, and drawings of the construction of all the bridges and other works of the line.

The paper is a valuable addition to the effects of the institution, and reflected the highest credit upon its author, for the skill displayed in the conduct of the works, and for the able and candid manner in which he has described it.

A description was then read of the mode adopted at the Montrose Harbour for driving piles by steam power. This machine, which could not be well understood without a drawing, was described by Mr. James Milne, who had used it, and was the author of the paper, as being very efficacious, and having done its work rapidly and well. In the discussion which ensued, Mr. Rendel, under whose directions it had been used, approved fully of it, and it appeared to be the unanimous opinion that it was generally applicable to engineering work, particularly as piles can be driven either very rapidly with a light ram in sand or in silty ground, or with a heavy ram and a low fall in hard ground, and that the pile-heads would be rarely injured by it.

The papers announced to be read at the meeting of April 21, were:—

No. 678. "Account of a series of Experiments on the comparative strength of Solid and Hollow Axles," by C. Geach.

No. 667. "An account of the Scaffolding used in erecting the Nelson Column, Trafalgar-square," by T. Grissel, Assoc. Inst. C.E.

No. 680. "Description of the system of Scaffolding employed at Paris for the repairs of Public Buildings, Obelisks, Chimneys, &c., and of the Machine for raising Building Materials, in use at the Houses of Parliament and other Buildings," by Pierre Jourin.

No. 577. "Description of the Method employed for Repairing a Chimney, 120 feet high, at Messrs. Cowper's Cotton-mills, Glasgow," by J. Colthurst, Grad. Inst. C.E.

#### ELEMENTARY ESSAY ON MORTAR AND CEMENTS.

BY JAMES WYLSON, HON. SEC. B.A.A.D.

**DEFINITIONS.**—1. **MORTAR** is the compound employed to unite the masonry or brickwork of buildings erected in dry situations into a hard, compact, and tenacious mass—its ordinary constituents being lime and sand, and the former essential in all cases. **CEMENT** is a composition similar to mortar, which is adapted for and used in the construction of such works as are wholly and constantly wet or damp, or are so circumstanced as to be alternately moist and dry. These names and definitions would be sufficiently distinctive were there not some other terms unavoidably in use, which, if no reference were here made to them, would seem vague and even somewhat conflicting in their meaning, and, perhaps, tend to perplex. Mortar and Cement are the proper denominations of two separate classes; but among the limes employed in composing the former, there are some which, though they do not possess the peculiar attribute of the cement-stones so strongly as to be qualified for fulfilling their use, unaided by the admixture of other ingredients, yet have that property to so important a degree, when so combined, as fully to justify the distinctions of *Common lime* and *Water-lime*, as well as the consequent ones of *Common mortar* and *Aquatic or Hydraulic mortar*. The phrase *Water-cement* is also used, and might appear ambiguous, were it not explained that besides the way in which the term "cement" is applied in reference to subaqueous construction, it is the designation given to a number of compositions for uniting substances which, though accessories in architecture, are merely decorative, or of a character too delicate to be classed with building-materials. The meaning of this nomenclature being thus preliminarily indicated, the reader can proceed without further guidance.

2. As the ingredients in these compositions are exceedingly various, both as to kind and quality, and their different properties involve a diversity of proportions, it is absolutely necessary that we be familiar with them before undertaking to practise their use; however

subordinate and unimportant the daily seeing them mixed up by unskilful labourers may make the subject appear.

3. **LIME** is the product obtained by the calcination of calcareous substances, namely, such as contain *calc*, or lime—combined with carbonic acid; and which abound in a variety of forms in the earth's crust as well as on its surface—including marble, alabaster, many building-stones, basalt, spar, chalk, shells, coral, &c. These, however, do not afford an equal supply of lime, neither is that which is obtained from them of an identical nature: limestone, for example, are seldom pure, that is, composed solely of lime, but usually contain one or more foreign matters, such as granules of *quartz*, *silica*, *silice*, *argill*, *alumina*, *magnesia*, *manganese*, *iron*, *bitumen*, &c.; and how far the limestones are suited to the purposes of the builder depends upon the presence or absence, and the relative proportions, of these adjuncts, in the various combinations in which they occur.

Limes which contain silica are frequently termed *silicious*; when comprising silice or finny sand, *silty*, *sandy*, or *arenaceous*; *magnesia*, *magnesian*; *manganese*, *manganesian*; *bitumen*, *bituminous*; *alumina*, *clayey*, *argillaceous*, or *aluminous*; and iron, *ferruginous*. The most pure generally burn to the whitest lime, and are suitable only for mortar; the argillo-ferruginous kinds are dark when burnt, and are those possessing the invaluable property of hardening under water.

4. Limestone may readily be distinguished from sandstone, and other non-calcareous rocks, by placing a small piece in a glass, covering it with water, and adding a little of almost any acid; the latter combines with the lime and expels the carbonic acid, causing it to rise to the surface, more or less briskly, in bubbles of effervescence: this is a ready and unfailing test. It may also be scratched with an iron point.

5. **BURNING.**—Limes are not efficacious in their natural state, but must be burnt to render them available for the composition of mortar; and they are of a very infusible nature; the purpose of the calcination is to dispel the carbonic acid associated with the lime; for the reason that the latter will not combine with water if the former is present. To effect this separation thoroughly—on which the goodness of the lime so much depends—requires a red heat; for although the greater portion of the acid is readily expelled, its disengagement being facilitated by the earthy matters contained in the limestone, the latest lingering remains are tenacious and not easily evolved. The more compact limestones of course require the longer continuation of the burning. When the acid has been slowly driven off, the limestone or chalk has lost about 4ths, or 41 per cent. of its weight, and, whatever may have been its colour before burning, has changed more or less to a dun or buff hue with that operation. Attempts have been made to form a cement by burning old mortar, but without any success. It is understood that the goodness of lime does not depend on the hardness of the stone from which it is obtained, as was long supposed. As the disunion of the acid begins on the exterior of the lumps of limestone, gradually progressing to the centre, it is evident that they should be as small as is compatible with the cost of fuel and of breaking them into smaller fragments. Manganese gives to lime a brown colour when burnt: a deep brown or red colour before, and a yellowish hue after burning, generally denotes the presence of iron; silicious limestone gives a buff colour; silice renders it, before burning, sufficiently hard to scratch glass, and prevents its effervescing freely on the application of acid. This substance is so far changed in its nature by calcination as to dissolve in acids, which it does not before undergoing that operation. Magnesia also causes lime to effervesce, but very slowly, and gives to the acid a milky appearance; in hot acid, however, it effervesces as vigorously as common limestone. Some of these substances combine with the lime in burning, and thus give to it properties which it had not before that operation.

6. An easy test whereby to judge at the kiln whether lime is sufficiently burnt, is to withdraw some from the midst, and drop a piece about the size of a pea into a glass containing some dilute muriatic acid—if perfectly calcined there can be no effervescence, but if not, it is sure to present that phenomenon in some degree.

7. The white, granular, or *statuary marble* furnishes, when sufficiently calcined, the purest lime of all the calcareous stones, containing sometimes only a very little silicious earth; on analysis it has been found to contain 64 per cent. of lime, 33 of carbonic acid, and 3 of water. It is this which the chemist employs when a lime of superior purity is required; although the lime is but rarely made use of in the arts, because the stone falls into a granular powder when heated, thus rendering the ordinary lime-kiln unsuitable for its due preparation; a paste made of it and placed in a humid situation will not harden. Plymouth marble is also very pure, and, indeed, furnishes lime almost identical with that of common chalk; like the statuary, it is not at all adapted for a water cement; but for the construction as well as finishing of common buildings, in dry situations, it is sufficiently good. The plentiful shell-marble of Derbyshire affords lime of a very superior description for common mortar; but compared with the Barrow lime of Leicestershire, it is inferior for subaqueous purposes; it is of a good colour, slakes well, and does not discolour masonry. In some places on the Continent, where marble is abundant, it is extensively used for lime, and its quality is said to be excellent.

8. **GYPSEUM** (the sulphate of lime in chemistry), or, as it is more generally called, **PLASTER OF PARIS**, is a species of alabaster, dug at the village of Montmartre, near that city, and, indeed, abounding in its vicinity; it is used there to a considerable extent as lime mortar; but for building it is much inferior to the latter, being liable to decay with age, and its durability depending on its total exemption from damp; it is also rather plentiful in our own country in Nottinghamshire, Staffordshire, Derbyshire, and other parts; and it has been stated that the best and most expensive that is used in Paris is from Newark, in the first-mentioned county. Its principal use for buildings is in interior plastering, with its moulded work and enrichments. Immediately before use it is reduced to a thin paste with water, and it sets and hardens very quickly, slightly swelling at the same time; if made too thin, however, it is apt to continue of a light and friable structure.

9. It is rendered fit for the purposes to which it is applied by calcination, and grinding or pounding. Its quality is said to be judged of by taking up a handful, the good being known by its retaining the impression of the fingers, and the bad by running through them like fine sand. It is only acted on by sulphuric acid, in its natural state.

10. There is a very superior and valuable species of gypsum used in the island of Minorca, called **GURSEN**; with which partitions of stones, on edge, and only 3 or 4 inches thick, are built, so powerful is its cementing property. Like plaster of Paris, however, it must not be exposed to wet, which soon softens it to a pulp. For use, the powder is mixed with water to a fluid state. It sets almost instantly, and acquires a hardness like that of marble.

11. The Kentish-rag, Portland, Purbeck, Painswick, and Bath stones, all afford lime of very good quality; those which are hardest and most durable as building-stones, furnishing limes of relative corresponding value in these respects. Kentish-rag, which is the hardest, supplies, when properly calcined, a lime approaching in quality the Barrow lime.

12. Oolite is one of the purer sorts of lime, and therefore white when burnt. Its natural formation is an aggregate of small round grains resembling the eggs of fish, and from which appearance originates its name.

13. Grey limestone is of a slightly scaly tendency, but compact, hard, and rather difficult to quarry; it takes considerable time and quantity of fuel in burning, and becomes a white lime: the darkest calcines whitest. It contains very little foreign matter, and not exceeding five per cent. of clay and sand.

14. Swinestones (called by the French *Pierre Puante*, and by the Germans *Sinkstein*), are so denominated on account of the fetid odour they emit on being rubbed against any hard body, and which is compared to that of a pigsty, Harrowgate-water, or rotten eggs; it is attributed to the presence of sulphur of hydrogen. These stones, which include the different black marbles, may be deprived of their carbonic acid at a lower heat, and in a shorter

time, or with the consumption of less fuel than any other carbonate of lime. When burnt, the colouring matter has entirely departed, leaving a snow-white and perfectly caustic lime, of an open and friable structure, more so than that produced by any other compact limestone, and which falls down into an almost impalpable powder, either with slaking, or if left exposed to the air. These remarks apply generally to the bituminous limestones, which may be considered as identical, but for the fetid smell above referred to. These stones are of a dark hue, varying from brown to a duskiness almost black.

15. Magnesian limestone, in its structure, a concretion of small crystals, having the appearance of fine sandstone, and consisting of about two-fifths parts magnesia and three-fifths parts lime: its usual colour is a pale yellowish brown, occasionally approaching red.

16. Basaltic rocks are found by chemists to contain the same components as the best hydraulic cements; it is therefore reasonably supposed that they would, on calcination, afford cements of very good quality. The Giant's Causeway, on the coast of Antrim, in Ireland, is the most famous: the Calton-hill of Edinburgh is almost an entire mass of it. The celebrated Tarras stone of Germany, so much used by the Dutch in their great water-dykes, is a species of cellular basalt.

17. Stone limes of almost any kind are durable and excellent, if properly burnt and used immediately; or, failing the latter, kept very close. Those should be selected which slake most readily, accompanied with the greatest heat; also which dissolve in distilled vinegar with the slightest effervescence, and leaving behind the least residue of insoluble matter. Many stone limes, however, are apt to stain the masonry with which they are brought into contact, rendering them somewhat unsuitable for superior ashlar-work, if the first cleanness of the work weigh much with the architect.

18. Although chalk lime is unquestionably inferior to that produced from limestone; there are, nevertheless, vast quantities of it made, and it is extensively employed even where the other is not difficult to obtain. In the south-eastern parts of the kingdom it is the principal kind in use; and in London large quantities of it are consumed in every possible description of building, and by the most eminent architects and engineers. Unfortunately it is seldom sufficiently burnt, which indeed is said to be a general fault with the lime-trade in this country; probably owing to the high cost of fuel in some parts; and from this circumstance it often presents the disadvantage of containing, after slaking, small unburnt, or superficially-burnt lumps, or "cores," which are, without difficulty, pounded down with the spade in making mortar, although they ought to be scrupulously excluded, being manifestly quite unsuitable and injurious. The common white chalk is composed of very pure calcareous matter; therefore, though furnishing a good white lime very suitable for ordinary building as well as for interior finishings, not at all adapted for water-cement. It is soft, porous, and easily quarried; it contains about 53 per cent. of lime, 2 of alumina, 42 of acid, and 3 of water. The Sussex Clunch-lime obtained in the neighbourhood of Lewes, the Berrington grey lime procured near Petersfield in Hampshire, the grey lime of Guildford, Dorking and Merstham in Surrey, of Purfleet, and of Halling in Kent, the extensive quarries of which supply the London market, are all of chalks, but distinguished from the preceding by their dark shade, and by their possessing the essential properties of water-cements; they are harder than the common chalk: their proportion of clay varies from about 5 to 25 per cent; in the Dorking lime it is ascertained to be about  $\frac{1}{3}$ th of the whole; and the others of that district differ very little from it: they are all, after burning, of a pale brownish-yellow colour.

19. Shell lime, which is said to be the most extensively used in America for architectural purposes, is in England scarcely known. This may be owing in a measure to the circumstance of shells requiring to be more highly calcined than common limestone, and which probably is in consequence of their being purer carbonate of lime; but the chief reason of its being so little known among us, no doubt, is the abundance in which limestone and chalk are

found. It has been ascertained that the lime of cockles, &c. is the worst of all for hydraulic cements, for although it has the property of rapidly hardening it soon decomposes under water; yet, it is said, a good cement may be produced by tempering, with water, powdered oyster-shells and about  $\frac{1}{4}$ th of clay, forming the mixture into small lumps, letting these dry in the air, and then burning them for about 96 hours. The lime of oyster-shells is also said to endure fire well, and has been suggested as suitable for such purposes as the setting of furnaces, ovens, &c.

20. The substance of the CORAL islands and reefs, is lime, but whether experiments have been made on that product, inquiring its adaptation to building-purposes, or whether it has actually been made available in that way the writer is at present unware.

(To be continued in our next.)

#### PETROLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

UPON the surface of the earth, in the valleys, upon the mountains, plains, in the air, and in the waters, man finds abundant evidence of a beginning of things, of a time or times when the phenomena before him were not: he beholds that beginning in generation, regeneration, decay, and death; in the gradual development of capacities and powers, quantities and qualities; in the simple and complex structure of the organic body; and in the characteristic marks noted in each succeeding stratum. In and throughout the earth there is not a rock, stone, or mineral aggregate, which does not attest the gradual and progressive development of general orders, and species, the consequent gradual development of these earths, fossils, and species. United or disintegrated, as calcareous matter, clay, vegetable earth—or beds of mixed qualities, as rocks, stones, or minerals—we behold the same material varying in its unions, but definite in its nature, or the subject of change produced by local or general influence. In the living fountain, we see the earths generate; in the fossil kingdom, we see the earths thus elaborated, preserved in the characteristic form of the animal or vegetable; in the mineral kingdom, we behold the vegetable body, and acknowledge it in change and decomposition.

To have a correct understanding of natural phenomena, is a means whereby we are enabled to render nature more immediately subservient to our wants and purposes, and to apply its varied products to practical purposes. It is not sufficient that we become acquainted with the names, and are therefore enabled to classify rocks; it is not sufficient that we know what they are resolvable into by the tortuous means of fire, their expanding, contracting, or absorbing powers, their weight, and density: we must go still further, we must study the laws of Nature and her *modus operandi*, physical condition, and the changes likely to be undergone by materials when used for architectural purposes. It is from a want of this knowledge that men unite, in buildings proposed to immortalize themselves, the elements of destruction; from generalizing, without the appliances of sterling science, architects fall into the common error of using materials containing within themselves the elements of dissolution, or dispose them in places equally inimical to their continuance. Why do buildings so soon fall into decay in this country? Why but from the use of ill-made cements and the use of ill-chosen materials, the want of knowledge of locality in which such buildings are disposed, and of the bed on which they rest?

The difficulty of mastering the technical phrases of geology, of attaining a knowledge of its fundamental principles, and still more of reconciling its endless contradictions and palpable absurdities, has determined many practical men against the study of this science. It is indeed to be lamented that the many crude and ridiculous speculations of modern geologists should render this fair and beautiful field of Nature unapproachable by common observation, and inutile to the practical appliances of life. The operations of Nature are simple, whether we consider them in life, or consequent of living action: the laws which regulate change, and by which the varied phenomena of the earth are produced, being brought into existence, still continue to exist

in place and disposition; and it is not because the closet speculator cannot see them in operation, that we are bound to discredit their existence in the present day. Rocks, stones, minerals, and earths are still forming in every region of the earth, not at all times palpably manifest to observation, but still, ever demonstrable from existing causes; and the having correct ideas of the nature, origin, and properties of these bodies, brings with it a knowledge of the conditions under which they continue to exist, and the purposes to which they ought to be applied.

The substances of which the earth's strata are principally composed are siliceous, calcareous, bituminous, and argillaceous earths. Of these, silica is the most abundant, and the first or primary material of this earth, composing in entirety the lowest beds, as pure sands or sandstone, in which all traces of organic species are entirely obliterated, and forming the exclusive or mixed material of every stratum disposed on or near its surface. Upon this general, nay, universal, siliceous base, we find the calcareous masses and limestones locally disposed; the several varieties being distinguished by their uniformity of character and composition, by the nature of their earths, and by their organic remains. The third story of this beautiful fabric is composed of argillaceous and bituminous beds, homogeneous, or of mixed qualities, crowning the preceding beds, or variably blended with them; the crowning deposits forming *terra firma*, and all the singular and varied phenomena produced under atmospheric influences. The silica generated within the waters is the primary material in the sequence of events; but inasmuch as this particular earth is still producing, both within the waters and upon the earth, so it must be borne in mind that, besides being primary, it is secondary, recent, and still producing; in like manner with calc rocks and calcareous bodies and beds, calc is a secondary and still existing effect of the continuance of existing causes. The same remarks apply to bituminous, argillaceous, and other rocks.

Petrology, or the knowledge of rocks and stones which occur in large masses, embraces in the order of their development, according to my system, as derived from observation of natural phenomena,—

1. Siliceous rocks.
2. Calc rocks.
3. Carboniferous rocks.
4. Magnesian rocks.
5. Argillaceous rocks.
6. Composite, or aggregated rocks.
7. Siderous rocks, or those in which iron predominates.
8. Diatomaceous rocks, in which the substances are equally blended.
9. Anomalous rocks, presenting unusual combinations and singularities.
10. Transition rocks.
11. Decomposed rocks.
12. Volcanic rocks.

Under these several heads are embraced the endless varieties produced by the accidental union of one with another.

Professor Brande, in his first of ten lectures on agricultural chemistry, delivered in January last at the Royal Institution, gravely informs the student, that originally the surface of the earth was composed of hard rocks, which by the influence of moisture, or other agents, have gradually become disintegrated, and fitted to the growth of plants. This singular theory, which at once places the origin of rocks beyond the discovery of man, is not only inconsistent with observation and the rules of analysis, but actually reverses the natural order of events. Rocks are compound bodies, simple in their mixtures, as quartz, limestone, and slate; and compound when two or more minerals enter into their composition, as gneiss, granite, sienite, porphyry, &c.: they are results of agglutination, being held together by one or more mineral bodies, which form their common bases or cement; silica and alumina, together or separate, being the cementing bases of most of the rocks of the earth. They are sometimes formed from the decomposed rocks and soils of ancient lands, but primarily they are formed and are still forming by the agglutination of parts of calcareous, siliceous, and aluminous beds; the nature of the earths determining the composition and material of these rocks, and the peculiar structure they assume

depends upon the local influences to which the changing masses may be subject. The coral polypes, building their stupendous edifices within the waters of tropical seas, consolidate as they form the outer or barrier reef, as limestone rock; every succeeding generation of these minute existences contributing, during life and in death, by the addition of its organic body, to the increase of the general mass. Other species decompose and fill up the valleys and troughs with ocean marls, uniting with shell-fish and the relics of the myriads of the deep thus locally disposed. These submarine mountain ranges of limestone, embracing in their consolidated state the reliquæ of countless species, are analogous to many of the limestone ranges composing the British strata, the latter having manifestly been produced under the same influences. From this one fact we learn that limestone forms, under certain conditions, in sea-water; and that so long as these conditions exist, and it maintains local position and influences, so long will it maintain its aggregated masses unimpaired: but, although this is one Cause of a manifest Effect, we must not therefore infer that it is the sole cause, for there is no other class of rock which forms under such a variety of aspects. The calcareous masses, when abstracted from the element which gave them being, and exposed to the local action of intense atmospheric heat, change according to the accident of association, becoming converted into sulphate of lime or gypsum, carbonate of lime or common brown limestone, and, with the addition of water, into marbles of varieties. A dry heat, and the saline waters of the ocean are, therefore, both favourable for forming limestone rock; heat and moisture are favourable for the generation of marbles, and under these influences the finest marbles of the world are produced. In acquiring this knowledge we are, therefore, enabled to apply it to practical purposes in those regions where it is formed, with the surety that the same causes which produced it, will, so long as they continue in action, preserve it from the ravages of time. The ancient Egyptians used limestone largely in the building of their mighty pyramids, in their palaces and temples; and the catacombs are invariably formed in this material, the hills bounding the upper portion of this country being wholly calcareous. They are still, many of them, in their several stages of transition from a soft carbonate, resembling chalk, to the most ponderous brown limestone rock; and the beds in which the catacombs are disposed are, even now, where sealed from atmospheric influences, in this condition, being of a dazzling whiteness, uniform in composition and character, and hardening by long exposure to the atmosphere. As we approach the northern hemisphere we still find that the calcareous beds pass, by gradual transition, into limestone, embracing numerous varieties; but the conditions of change now vary, the change being effected by chemical action generated within the lower beds, and all kinds corroding on exposure to atmospheric air. In the British strata we find numerous species of calcareous rocks, many of which have been formed by causes now no longer in existence in this country; but few of them, without the influence of the atmosphere for any considerable length of time, can wisely be applied to buildings which it is proposed shall laugh to scorn the ravages of Time, and those few are confined to those compound rocks termed magnesian limestone. The presence of calcareous matter in any considerable quantity is to be deprecated, for it is readily affected by the atmosphere, and, in decomposing, causes rocks which contain felspar and mica to decompose also, by setting free the alkalis.

Linnaeus, in his classification of stones, speaks of calc or the earth of lime as originating from animal bodies, and by the presence of calc in polypes, he defined the divisions of the animal and vegetable kingdoms. In the state of nature, calc is whitish, absorbent, farinaceous when dry, penetrating, and effervescent with acids; it is elaborated in the living system of numerous genera of the ocean, and becomes a portion of the animal frame-work of many creatures of dry land, being abstracted from the earth, or entering the system through the medium of their food or drink. It is an elementary compound, generated by the direct action of light and heat, and mechanically uniting with the albumen and gelatine that form the basis or cement of the animal frame.

It is a distinguished characteristic of animal life, being exclusively of animal nature, and is always found united with mucilage, gelatine, albumen, and other parts of the organic frame, forming bones, shelly coverings, and, in coral formations, stony concretions, resembling, in appearance and mechanical and vital action, fungi and other vegetable species of dry land; it is secreted in the stony madrepores much in the same manner as the constituents of the blood are generated in the higher orders of animals. Every limestone, chalk, oolite, marble, and other calcareous bed, owes its origin to this one common formation; many of them, as the mummellite hills of Egypt, and the shell limestones and marbles of this country, being wholly composed of tribes and families in aggregated masses; and although entire decomposition has obliterated all organic traces, still we have the certain facts before us, to identify the one and the other proceeding from the same source.

Having marked out to the student in natural philosophy the origin of limestone and of calcareous beds, I now direct his attention to that very important class of rocks and earths denominated siliceous, and previous to giving their practical application, must draw his attention to their origin, and of the changes consequent on climate and association.

SILICON is a compound of 8 parts of oxygen combined with 8 parts of the earth *silicium*, to form 16 parts of oxide of silicium, or silica. Sir Humphry Davy's experiments demonstrate that it is composed of a combustible body united with oxygen; for on bringing the vapour of potassium in contact with pure silicic acid heated to whiteness, a silicate of potassa resulted, through which was diffused the silicic acid in the form of black particles like plumbago. Thomson, Berzelius, and others, conceive it to be a non-metallic body. Berzelius tells us that if presented to water while in its nascent state, silicic acid is dissolved in large quantity; and on evaporating the solution gently, a bulky gelatinous hydrate separates, which is partially decomposed by a moderate temperature, but does not part with all its water at a red heat. In its chemical relations it manifests all the properties of an acid, and displaces carbonic acid by the aid of heat from the alkalis. Silica may be said to be the first generated product of all the earths composing this planetary body, the elementary constituents composing its basis being generated in and throughout the great scale of life, from animalcules to the most complicated structure of man. It is almost the sole constituent of gelatinous animals, and a component part of the consolidated texture of all others, and is primarily manifest in the slime of oceanic animals and plants; it is elaborated by naked polypifers in a state of purity, is found as crystalline spicula in sponge, translucent as water in hyalonemidae, and in tropical reeds and other land vegetable species.

SANDS, which are thus produced by decomposition of the organic body, or by transition of the aggregate particles or entire bodies, are hyaline, without moisture, scintillant, of the same permanent hardness, and, united with other earths, fusible into glass: it accretes as

SANDSTONE.—In and throughout the ocean waters, the elaborated and laboratory matter which forms the basis of silica is exceedingly abundant, generating and elaborating within the living system of animals and vegetables. The nature, form, and composition of the inorganic compound depends, of necessity, on the nature of the material of the compounds which form the animal or vegetable body, or otherwise on the nature and qualities of bodies with which it unites in the fossil and mineral kingdoms. In the lower depths of tropical regions, or in temperatures where naked polypifers and cold-blooded animals can exist, sands only are formed, unless other material is carried into these depths by the force of running streams, and these sands are of homogeneous qualities: thus, the lower depths are ever found to be composed of siliceous bodies, and sands and sandstone form the natural basis of all the undisturbed strata covering the superficies of the earth. The presence of iron, such as is manifest in the red sands and sandstones said to constitute the primary beds of the British strata, is demonstrable proof that

these sands are of secondary qualities; for iron is not a primary product, but is elaborated within the system of animals of red blood, and is secreted in shallow, warm, and tranquil regions. Entering into the organic structure of many species, it is a secondary result. Mollusca and polypifers locate in groups and families in the various regions of the deep, and their nature and combined qualities, when the deposits are exclusively local, ever determine the nature and qualities of the sand. Thus, for instance, along the shores of the Red Sea, where the deposits, forming sea-beaches, are exclusively oceanic, various localities present varying phenomena of sands: some are formed entirely of young mollusca, almost invisibly minute in their particles; others are blended with the bodies, and fragments of bodies, of larger shell-fish, forming sands and pebbles; others are united with radiati, broken coral, and calcareous matter, varying in its mixtures—the accident of local disposition and of local union determining the result. In the decomposition of larger mollusca, the combined elements very often separate; the carbon and calx being carried away by occasional washings, the cartilaginous and outer epidermis separating as they mineralize into sands or siliceous bodies. This change is within the observation of all who choose to throw a common oyster-shell upon the earth, and leave it exposed to the action of the atmosphere for a season.

In general, the result depends upon the sum of local influences of heat and moisture. Within rainless regions, the larger mollusca thrown upon the shores, seldom decompose if thrown above the ordinary action of the waves; but they gradually consolidate, or rather become oxydated, the mechanical combination of their elements and atmospheric air being productive of the result. As they silicify, so the organic matter gradually disappears, the more delicate portions of the shell fall away, the protuberances separate, and in a very short time the main trunk of the animal becomes what is termed a petrification. If the shell become buried in moist sand it soon decomposes, and becomes one with the mass; if embedded in ocean marl, it also generally decomposes, unless arrested by local changes, the bed of marl being, by the circumstance of gradual change, abstracted from the dominion and influence of the waters. The shores of the British Isles can give little idea of the transformations taking place in distant lands, in composition and character widely dissimilar. Everywhere around England we behold the wreck of ancient strata: beds which have, age upon age, resisted the changing hand of time, washed by the ocean waves are rent asunder, their lighter particles being carried far into the bosom of the deep, their heavier aggregates remaining as barriers to further encroachments, or as warning to the inhabitants of the cliffs. Not so in other, and vastly more extensive, regions of the earth: it is true, the destroying hand is everywhere manifest, but the creative power is more sensibly and extensively exhibited; for the one locality, for the one solitary island, destroyed by the waters, thousands of miles are gradually abstracted from their dominion, and instead of the commingled phenomena of these, the older strata, which tell us of epochs of time, of revolutions and changes by flood or fire, we have phenomena peculiar to the waters above, and are enabled to mark their transitions into the fossil and mineral kingdoms.

Each region on the earth, or within the waters, varies in its capacities and in its tendency to generation, and maintains in its generations living creatures, having phenomena peculiar to itself, and common to all, the Causes of Effects, are therefore numerous. Every species propagates its kind, but the accidents of change of food, temperature, and association, may cause a change of organization. The like accidents of change are equally manifest in inorganic bodies, the mechanical or chemical union of one day giving place to the mechanical union of another day; the final disappearance of one mechanical mixture, causing another compound to make its appearance; but in all these changes, common to inorganic matter, we have not yet been enabled to note with correctness, how far silica changes in decomposition, and if it does so, under what circumstances this change takes place.

(To be continued in our next.)

RUINS OF CLONATTIN CHURCH, NEAR GOREY, IRELAND.

TO THE EDITOR OF THE BUILDER.

SIR,—At a distance of one mile from this town stand the remains of the little church of Clonattin, by its lonely situation, in the midst of large hawthorn hedges, hidden and unheeded; nothing now remains besides parts of the north and south walls, and a small portion of the western end of the fabric. The annexed sketch is a

representation of its appearance at the present time. The ivy running over its masonry, though adding to its venerable appearance, has been the active agent of gradual destruction to its walls.

To the casual observer this little church presents nothing besides two walls and the now scarcely traceable foundations of its chancel.

Of its period of erection I could learn no trace. One small window alone is to be seen

Plan of the Door-Jamb.

Elevation of part of Door-Jamb and part of surmounting Arch.

Section showing the Joints of the Arch-Stones at a and b.

Soffit of the Arch-Stones at a and b.

in the south side. The ivy with which the north side of the church is so overgrown may perhaps conceal a similar one.

I am, Sir, your obedient servant,  
Gorey, 26th March, 1844. J. K. L.

NEWS PAPER

There is, however, a rich treat to be found (to all who wish to take a retrospective view of the state of the arts at a remote period in this country), as at the heads of many of the numerous graves that surround the walls of this little spot are the scattered remains of the cut-stone dressings of an entrance doorway.

For the pages of THE BUILDER, I have made out the subjoined sketches of some portions of this doorway. The arch, which is in the Norman style, is a very curious example, and taking into account the nature of the material from which it is wrought (Mica slate), shews very considerable skill in the workmen of that day.

THE NEW BRIDGE AT BATH.—The Town Council, by an overwhelming majority, have acquiesced in the recommendation of the committee for the erection of an entirely new structure. The new bridge will be of iron, of one span, and there will be a footpath on each side of it. Among the proposals sent in to the committee, in addition to the successful one of Messrs. Armstrong and Manners, were—for one arch, Mr. Lamb, 6,000*l.*; Mr. Bell, 7,040*l.* if of stone, 9,700*l.* if of iron; Messrs. Birch, 3,555*l.*; Mr. Barry, Taunton, 3,689*l.* For two arches—Mr. Lamb, 5,250*l.*; Mr. Bell, 7,802*l.* if of stone, 8,099*l.* if of iron; Messrs. Birch, 3,000*l.*; Mr. Barry, 3,439*l.*; Mr. Manners, 3,220*l.* Mr. Gravett, for a straight bridge, supported on iron breast-summers, 4,000*l.*

LECTURES ON ARCHITECTURE AND ANTIQUITIES.\*

Conclusion of Lecture II.

OF PERSIANS, the ancient capital of Persia, but few ruins remain to attest its former magnificence. It was set on fire by Alexander the Great in one of his drunken fits, and never recovered its ancient splendour. A magnificent terrace supported an immense number of columns, whence it was called the Palace of Forty Pillars. "On ascending the platform on which the Palace of Forty Pillars once stood," says Sir R. Ker Porter, "nothing can be more striking than the view of its ruins, so vast and magnificent, so fallen, mutilated, and silent,—the court of Cyrus, the pavilion of Alexander's triumph, and the memorial of the wantonness of his power." Again, Sir R. Ker Porter says, "On drawing near the Chehel-Minar, the eye is riveted by the grandeur and beautiful decorations of the flight of steps which lead up to them. This superb approach consists of a double staircase, projecting considerably before the northern face of the terrace, the whole length of which is 212 feet; at each extremity, east and west, rises another range of steps; and again, about the middle, projecting from it 18 feet, appear two smaller flights rising from the same point. Here the extent of the range, including a landing-place of 20 feet, amounts to 86. The ascent, like that of the great entrance from the plain, is extremely gradual; each flight containing only 32 steps (none exceeding 4 inches in height), in breadth 14 inches, and in length 16 feet. The whole front of the advanced range is covered with sculpture. The eye at first roves over it lost and bewildered by the multitude of figures." Among the sculptures, figures of bulls (some of the capitals are formed of bulls kneeling), and of lions, are of frequent occurrence, and the lotus flower is often introduced.

In some magnificent portals or doorways yet standing, the large, overhanging, hollow cornice, is too strikingly like that in Egyptian temples to pass unnoticed; and Mr. Gwilt observes that "the similarity between them points to the conjecture that, though neither might have been borrowed from the other, they are not many removes from one common parent." And again: "No person can look at the style of composition and details of Persia without a conviction of some intimate connection between the architects of Persia and those of Egypt" (Encyclopaedia of Architecture.)

ECBATANA was the capital of ancient Media, and was eight leagues in circumference, and surrounded by seven walls in the form of an amphitheatre, the battlements of which were painted in various colours, and covered with silver and gold. It was here that Tobit resided with his family after the death of his parents. (ch. xiv. v. 12.) Josephus tells us (Antiq. b. x. ch. xi. s. 7) of the prophet Daniel that he "built a tower at Ecbatana in Media; it was a most elegant building, and wonderfully made, and it is still remaining, and preserved to this day; and to such as see it, it appears to have been lately built, and to have been no older than that very day when any one looks upon it, it is so fresh, flourishing, and beautiful." It was at Ecbatana that Hephastion, the favourite friend of Alexander, died, and it was here that Cyrus was buried:

"The eagle child of victory, the great, the wise, the just,  
Assyria's fam'd and conquering sword, and  
Media's regal strength."

Some writers, however, place his tomb at Pasargada, where the kings of Persia were always crowned.

SUSA, the capital of the Persian empire, when Persia and Media were united, was 120 furlongs in extent. The treasures of the kings of Persia were kept there, and the royal palace was built with white marble, and its pillars were covered with gold and precious stones. It was usual with the kings of Persia, from the time of Cyrus, to spend the summer at Ecbatana, and the winter at Susa, because the climate was warmer there than at any other royal residence. It derived its name from the quantities of lilies which grew there—*susa* being the Hebrew for *lily*. This city is the

\* Continued from p. 159.

Shushan of the English translation of the Scriptures\*: it was here that Daniel had his vision of the kingdoms (ch. viii.), and we find it frequently alluded to in Nehemiah; but in the Book of Esther we shall find some account of the magnificence of the palace, "where were white, green, and blue hangings, fastened with cords of fine linen and purple to silver rings and pillars of marble; the beds were of gold and silver, upon a pavement of red, and blue, and white, and black marble." (ch. i. v. 6.) The King Abasuerus, mentioned in the Book of Esther, is supposed, by Archbishop Usher, to be Darius Hyastaspes, whilst the learned Scaliger thinks that Xerxes was meant; and Josephus states that it was Artaxerxes Longimanus—an opinion followed by Dean Prideaux, Bishop Tomline, and others.

There is much to interest the antiquary in various parts of Asia, as at Petra, the capital of Idumea, where the sculptured rocks are very remarkable. India demands a lecture for the examination of its truly astonishing works of art—works whose history is lost amid the darkness of superstition. We propose at some future day to devote a little time to the consideration of the excavated temples of India; at present we propose to refresh our sight with the purer treasures of classical architecture, and to bask in the sunny climes of Greece, as a relief from the gloom and darkness of long-forgotten ages. G. R. F.

METROPOLITAN IMPROVEMENTS.†

THAMES EMBANKMENT.

The Plans of Mr. John Martin.

THE plans of Mr. Martin for improving the navigation of the river, and for diverting the sewerage from its shores, have been for many years before the public, and we thought it due to the exertions of that gentleman in aid of an undoubted public good, to comply with a request which he preferred to the commission, through its chairman, to be examined; and we accordingly requested his attendance.

The principal features of Mr. Martin's plan, as applied to the part of the river under consideration by the commission, viz. between Vauxhall and London bridges, are the diversion of the sewerage from the river, and the application of it as a manure; and in connection with this object, an embankment of the river, and upon it a promenade.

The improvement in the sewerage he proposes to effect by uniting the present sewers with main-trunks, or intercepting sewers, running parallel with and contiguous to the present bank of the river; and the space between the present wharfs and the embankment he proposes to fill up with solid matter, baving large chambers and openings three-quarters of a mile apart, from which chambers the contents of the sewers should be raised by steam-engines, and conveyed in pipes to certain receptacles in the country, and be there distributed in a liquid state for agricultural purposes. The value of this as a manure, the importance of so using it in a commercial point of view, and the injurious effects of its discharge into the river, are fully illustrated in Mr. Martin's description. Should the expense of this disposal of the sewerage operate to the present abandonment of his proposition, he would nevertheless recommend the adoption of the intercepting sewers, with their chambers and

\* וְשׁוֹשַׁן [Nehemiah, ch. i. v. 1; Daniel, ch. viii., v. 2.] The city of Shushan, or Susa—שׁוֹשַׁן [Canticles, ch. ii. v. 1].—Lily.

So little is known of the ancient pronunciation of the Hebrew letters, that modern Jews scattered in various nations, pronounce them very differently; whether the letter שׁ should be denominated *shin* or *sin*, and should have the power of *sh* or *s* simply, is very doubtful. The difference between שׁ and ס, supposed to be *sh* and *s*, but confused with each other by different authorities, and by which the Ephraimites were detected (Judges, ch. xii. v. 6) when asked to say שׁבַּלֵּת, but said סַבַּלֵּת, in the English translation of the Scriptures *Sibboleth* and *Sibboleth*; hence in the Vulgate they are translated *Seibboleth* and *Sibboleth*; in Bishop Scio's Spanish translation they are spelled as in the Vulgate, but from the peculiar Spanish sound of *se*, *Sibboleth* becomes as though written in English *S'tibboleth*; in Diodati's Italian translation they are spelled *Sibboleth* and *Sibboleth*, altering again with the Italian pronunciation.

† Continued from page 197.

openings, which might be allowed to discharge their contents into the river, until his more comprehensive plan could be carried into effect.

In providing for the sewerage and the embankment, Mr. Martin also proposes that a public walk should be obtained along the embankment quay, where there is sufficient width, or where any undue abutment into the river presents an extraordinary obstacle that the walk should pass behind or through it, or through the basement of any building which should form such abutment; and if a carriage-drive is insisted on, that the road should be much wider, and that inclined planes, rising about 1 inch in 30, should be substituted wherever stairs are now proposed.

Mr. Martin recommends the erection of colonnaded wharfs upon the quay, at intervals where the traffic is great, as between Blackfriars and London bridges, to afford additional room for the landing of merchandise; and over this line of colonnaded wharfs, he proposes the public walk to be continued.

"To render the depth of the river at low-water equal, and to preserve the bottom from uneven wear," Mr. Martin recommends the construction of subweirs across the river from shore to shore, by means of piles with beams pinned down upon them—about 100 feet of the middle being lower than the rest of the weir, which should be made to slope to the shore until it meets mean low-water mark. By placing the weirs at distances of a quarter of a mile, the fall would, in Mr. Martin's opinion, "be gradually and regularly distributed from Westminster to London bridge."

Of the plans and drawings laid before us by Mr. Martin, we have selected such as we think essential to a clear understanding of his views, and the statement which he addressed to the commission is printed in our minutes of evidence.

Of Mr. Martin's plan for an embankment with a public terrace, the claims were not considered equal to those of other plans prepared for the same objects and lying at the same time before us; and we felt, therefore, at a very early period of our proceedings, that we should not be justified in making it the subject of further inquiry.

The plans to which our attention has been directed, as appearing to exhibit in their details the best mode of effecting an embankment of the Thames, were three in number, viz.:

- A plan prepared by Mr. Walker.
- A plan prepared by Mr. Page, the acting engineer of the Thames tunnel; and
- A plan founded upon the suggestions of a member of the commission.

These will be occasionally referred to as plans A, B, and C, respectively. The commission proceeded, in the first place, to examine Mr. Walker and Mr. Page in reference to the objects, advantages, practicability, and expense of their respective plans. The official opinion of Captain Beaufort, and the professional opinions of Mr. Hartley, Mr. Cubitt, Mr. Gordon, Mr. Rendel, Mr. Macneil, Mr. Rennie, and Mr. Giles, were subsequently obtained; first, as to those leading and general points which appeared to apply to all the plans; and, secondly, as to the relative merits of the three.

Of these opinions, a portion, it is to be observed, was collected by the commission in the usual form of oral evidence. It occurred to us, however, subsequently, that all the essential questions in an inquiry of this nature might be more effectively condensed, and circulated in writing (an arrangement which was subsequently found conducive also to the parties consulted), and the remainder, therefore, were collected in that form.

Copies of these questions were also addressed to Sir Isambard Brunel, and Mr. J. K. Brunel, and Mr. Donkin; but considerations of health in the first case, and professional engagements and want of time in the other two, deprived the commission of the assistance of these gentlemen.

In addition to the eminent civil engineers above adverted to, we had occasion to examine, upon separate and distinct portions of the inquiry, Mr. J. W. Higgins, a surveyor extensively employed in London, and ordinarily referred to by the corporation for valuations, in cases of embankment upon the river; Mr. R. L. Jones, the chairman of the London-bridge Improvements Committee, a gentleman

possessing great information on many of the subjects involved in these inquiries; and Captain Maughan, the dockmaster of the London Docks, whose connection with a large commercial body interested in the navigation of the pool, added to his practical acquaintance with the wants and habits of the river generally, made his evidence especially desirable. Messrs. Hay, Peache, and Lucey, barge-owners and lightermen, and Messrs. Taylor, Harvey, and Pocock, coal-merchants, or general wharfingers, in the line between Westminster and Blackfriars'-bridges, were examined principally on points not touched upon by the Select Committee of 1840, and upon the probable influence of any measure of embankment upon their respective interests.

On the feelings and opinions of the trade, as a body, it appeared to us to be more consonant to the convenience of the parties to be consulted, more conducive to a right understanding of the measures contemplated, and more likely to result in a well-considered judgment upon these measures, if our chairman were to address himself to one of its members in behalf of the whole; to inclose for their consideration copies and detailed descriptions of the plans; and to express the desire of the commission to have a deliberate opinion from all parties concerned as to the principle upon which, and the mode in which (consistently with the permanent interests of the river), an embankment might be effected in nearest accordance with their own views and wishes. A letter was accordingly addressed, and plans transmitted, to Mr. Taylor, of the firm of Dalgleish and Taylor, extensive coal-merchants and wharfingers in Scotland-yard; and in the appendix a copy of that letter is inserted, as well as of Mr. Taylor's reply.

In addition to these various sources of information on the subject before us, we were favoured with the written opinions of Mr. William Cubitt and Captain Maughan, subsequently to, and in extension of their respective oral examinations; a "Memorandum upon Estuaries and their Tides," contributed by Sir Henry Thomas de la Beche; and, finally, with three letters, and various tables and statements, prepared by Mr. Page, accompanied by sections of the several bridges, and of the river, presenting a large body of valuable matter not bearing exclusively on the local topics and interests more immediately involved in these inquiries, but on the general question of embankment in tidal rivers. With these we have inserted in the appendix, papers, the result of inquiries made under our direction as to the frontages and occupations of the wharves on the Middlesex side, with the number of barges and other craft in front of each at certain periods of the inquiry; and also as to the heights above Trinity datum of the nearest line of communication parallel with the river between Blackfriars'-bridge and Whitehall, shewing the great irregularity in the level of that leading thoroughfare.

#### The Plan of Mr. Walker.

PLAN A.—The plan of Mr. Walker, referred to in a former part of this report, originally comprised an embankment on both sides of the river, between London and Vauxhall bridges. In his evidence before the commission as to the relative expediency of embanking the Surrey and Middlesex sides of the Thames respectively, Mr. Walker stated his attention to have been principally given to the northern side of the river, adding it to be his own opinion (in which, indeed, almost all the authorities subsequently consulted appeared to concur), that "it would be better to establish a principle, and to shew its working in a portion of the river in the first instance," and to make the first embankment on the northern shore. The course of inquiry, therefore, pursued in his examination by the commission, had reference principally to these considerations.

The lines of Mr. Walker's plan are those shewn upon plan A in the appendix. It contemplated the formation of quays along the greater portion of the line, at a level of 3 feet 6 inches or 4 feet above Trinity standard; these quays to become, upon terms to be settled, the property of the respective parties owning the present wharfs, of which the embankment was, in fact, to be considered an extension.

A continuous solid embankment, however, having been deemed impracticable throughout

the whole line, Mr. Walker's plan suggested four exceptions, viz.: one at Northumberland-wharf; a second above Waterloo-bridge, terminating at the bridge-stairs; a third above the Temple-gardens; and a fourth commencing at Whitefriars'-dock, and terminating at the Bridge-stairs, Blackfriars. At these places he proposed to leave recesses (shewn on the plan), varying from 400 to 800 feet in width respectively, and bearing together a proportion of about one-third to the rest of the embankment.

"As the deepening of the navigable channel might tend to draw down the ground of the respective wharfs into the river, it was proposed, where required, to support the same by close piling in the line of the embankment, the top of this piling not to be above the level of the ground where it is driven." The main body of this embankment Mr. Walker proposed to construct of materials to be obtained from the bed of the river; the embankment-wall, excepting at Somerset-bouse where the wall was to be faced with stone, being of brick, with stone dressings only.

Of Mr. Walker's plan, a roadway formed no essential feature. In the event of a terrace or a railway being thought desirable, he proposed that it should be at least 50 feet in width; that, commencing in the neighbourhood of Whitehall, it should be carried over both the embankment and recesses, upon flat arches of 100 feet span, at such an elevation generally above the river as would enable the public in the use of it to communicate with Hungerford, Waterloo, and Blackfriars'-bridges, at the level of their respective roadways. With the last-mentioned of these bridges it would end.

Assuming, therefore, the height of Mr. Walker's embankment, throughout, to be, at high water, four feet above Trinity datum, the elevation of the roadway of this terrace above it would vary at different places; at its commencement at Whitehall it would be from five to six feet, at Hungerford and Blackfriars'-bridges 27 feet, and at Waterloo-bridge 37 feet above the same standard. To a spectator from the river, it would in each case present, with the addition of its balustrades, an elevation about three feet higher.

As the fall of the tide would, throughout the whole line of the embankment, produce, to the eye, a corresponding addition to its base, the river front of the terrace and embankment together would, at times of ordinary low water, have gained an apparent addition to its height of about 16 feet; making its extreme elevation above low water, with the balustrades, about 56 feet.

The estimated expense of Mr. Walker's embankment, as stated to the select committee of 1840, assuming it to be carried to the Horse-ferry-road, was 300,000*l.* In his evidence before the commission no proportion of this amount was assigned to the shorter distance since contemplated; but it is probable that, upon the embankment above Westminster-bridge, a small portion only of that amount would have been expended.

The erection of a terrace (if it were desired) as a separate superstructure, with its piers, arches, and roadway together, would, in Mr. Walker's opinion, involve a further expense of about 400,000*l.*; making the estimated cost, therefore, of the terrace and embankment combined, between 600,000*l.* and 700,000*l.*

The plan of Mr. Walker, as we have already stated, excited considerable opposition in Parliament in the session of 1840, from the wharfingers and others interested in the trade of this locality. It was then directed exclusively to the principle of a solid embankment, subject to the exceptions already referred to, as to recesses in certain portions of the line.

The objections urged against it at that period had reference to its alleged interference with the river frontage, of which, though a large portion, in the opinion of the commission, might, undoubtedly, have been improved by the adoption of such a measure; yet a still larger had been appropriated to purposes dependent upon its proximity to the water side, and adapted principally to the habits of the coal-trade.

These objections, it should be stated, though the objections of a majority of the parties affected, were not universal. It was alleged by Mr. Walker that many wharfingers were desirous of availing themselves of the privilege to embank, upon the terms then proposed

by the city, viz.—the payment of 1*d.* per annum for every square foot of ground acquired from the river.

It was objected, however, that assuming this to be permitted, a measure so partial in its operation could not fail to be injurious to a large body of the trade, by creating recesses of indefinite width, uncertain as to the time of their existence, and in the meantime favouring the accumulation of mud.

The evidence of Mr. Walker upon all these points, together with the evidence of those who, on these and other grounds, were opposed to the principle of his embankment, has been before the public now for a period exceeding three years, in the report of the select committee already referred to. No doubt, it appears to us, can exist, upon a perusal of that evidence, that it exhibits a manifest preponderance of feeling on the part of the trade adverse to the plan before that committee.

The object of the commission, therefore, in calling Mr. Walker before them, was not to re-open the discussion of 1840, but, looking to the result of that discussion, his subsequent survey of the river in 1841, and the probability, from these and other causes, of his having communicated with parties interested in the northern shore of the river within the intervening period, to ascertain whether he had seen reason to alter his opinions or to modify his plan, and especially whether he were prepared to bring the question again under their consideration in a shape that might justify them in recommending its adoption.

From our examination of Mr. Walker on these points, his views appeared to have undergone no change; and with reference to the concurrence which his suggestions were now likely to receive on the part of wharfingers and others interested in the line, we found him unprepared to inform us either as to the extent to which such concurrence might be depended upon, or to which the commission might reasonably consider itself entitled in reviving the consideration of his plan. One of three alternatives appeared to us to be inevitable; either that such concurrence should be obtained in the first instance, and throughout the whole line, or that considerable sums of money must be expended in compensations; or, assuming the impossibility of the first of these alternatives, and the inexpediency of the second, that the embankment must proceed in small and sometimes widely detached portions of the whole line.

The latter of these alternatives would justify a revival of all the objections to the proposed embankment of 1840, and render the execution of a terrace or river road utterly impracticable.

We are not unmindful that Mr. Walker has endeavoured to provide against these contingencies by recesses sufficient in extent, and so arranged in regard to locality as to meet the wants of a large body of the trade; but we cannot but remark, at the same time, that these recesses stood in Mr. Walker's plan of 1840; that he could then give no definite assurance as to the time by which they would be completed, or the period for which they might be available; and that, upon being questioned by ourselves, as to the grounds upon which he had determined the proportions of his recesses to those of his solid embankments, he admitted that "he had calculated upon the feeling of individual proprietors in the line, of which, however, he knew little."

In stating to the commission the origin and purposes of his survey of 1841, Mr. Walker observed, "The great object of the city in that survey, as it appears to me, has been to determine a river line, to which parties making applications might, but beyond which they must not extend their premises; and, to shew how the navigable part of the river may be deepened and improved, without injuring the berths for barges where parties do not wish an extension of solid wharf, which is in no instance proposed to be compulsory."

Upon being questioned by the commission, whether that opinion should be understood as applying to the plan under consideration, he replied:

"I have stated that at present there is no intention of anything compulsory, so far as I am aware of. I am not sure that it would not be expedient for a considerable time to leave

it to be optional. I think if the measures were now intended to be compulsory, there would be demands from the owners on the banks of the river for compensation; whereas, if the thing were left to work its own way for a time, parties would be allowed to carry out and extend their premises; some in the shape of recesses or docks, and some in the shape of embankment, the property being then considered theirs in fee. In that way, portions being taken in different parts all along the river, if it should be desirable afterwards to be made compulsory upon the minority, the majority of owners and occupiers agreeing in the plan; or if they got to be all unanimous, there would be an excellent standard along the whole course of the river on which to value the land, or to pay for damages, if any were done." The commission, upon this, observed, "Then, the embankment would take place at separate intervals?" To this observation Mr. Walker answered, "Yes."

The amount of monies to be paid as compensation under such circumstances, or of other monies to be raised in consideration of the land embanked, are subjects, therefore, into which it would be obviously impossible for this commission to enter with any certainty or profit. According to Mr. Higgins, who was examined before the committee of 1840, and whose views, like those of Mr. Walker, would appear to have undergone little alteration subsequently, a revenue of about 3,600*l.* per annum might be realized if the embankment were complete; but "he had taken what would be gained by the embankment; in no case what would be otherwise lost." He had made no separate estimate of the amount to be expended in compensations, and his estimate of the revenue was admitted to be irrespective of any outlay of the kind.

The advantages of Mr. Walker's plan for a solid embankment, if it were complete, would undoubtedly consist in its simplicity of outline, its freedom from details, and its entire exemption from restrictions and regulation of any kind for its after-management. In making this observation, we desire to apply it either to a solid embankment throughout, or to the embankment with recesses to which Mr. Walker's proposal is at present limited; for, although the objections, on the score of the accumulation of mud in these recesses, and of the insufficiency of the ordinary traffic of the river for its dispersion, pervade the whole of the evidence taken by the commission, yet the general tendency of that evidence is to shew, that, if they were judiciously constructed in the first instance, a moderate application of artificial means, such in fact as is at present resorted to in the best constructed wharfs on the river, might answer every necessary purpose.

(To be continued in our next.)

#### CHURCH-BUILDING INTELLIGENCE, &c.

*New Church of St. Nicholas, East Crafton.*—On Thursday last, the Lord Bishop of the diocese consecrated the new church of St. Nicholas, at East Crafton, in the parish of Great Bedwyn. This church was commenced on the 11th of April, 1842, and is designed in the Norman style, the details being correctly and successfully carried out by the architect, Mr. Benjamin Ferrey, and executed in Bath stone by Mr. Lloyd, of Great Bedwyn. Among many presents from different individuals are some richly-stained windows, and a pavement of encaustic tiles in the chancel, given by the Marquess of Ailesbury. The windows were the production of Mr. Willement, who also designed the arrangement of the pavement, and executed the ornamental painting of the chancel. The font, copied from that still existing in Welford Church, in the county of Berks, is beautifully executed in Painswick stone, and was universally admired. It was a gift from the vicar's children, as were the books from Dr. Merriman, and the splendid altar-cloth from the Countess Bruce.

*New Church, Portsea.*—The ceremony of consecrating the new church of St. Mary's, Buckland, the parish church of Portsea, took place on Thursday, by the Bishop of Winchester. The church will in future be opened on all occasions for Divine service, and is capable of accommodating 2,000 persons. The old edifice could only give room for about 600. The fund for building this church has been raised by subscription.

*New Church in the Parish of Kingsclere.*—It is proposed to build a new church on the northern part of the common, in this parish, where five acres of land have been set apart for that purpose, under the late Act of Parliament, for the proposed inclosure.

*New Catholic Chapel and Monastery.*—The foundation-stone of a Catholic chapel and monastery, were on Thursday week laid by Mr. V. Gandolfi, of the firm of Gandolfi and Co., silk-merchants, Throgmorton-street, on the estate of Mr. T. Hornvold, Blackmoor Park, Worcestershire. The buildings, which will be erected at the sole expense of Mr. V. Gandolfi, are expected to be completed in the course of three years, at an expense of 10,000*l.*

The subscription for enlarging the parish church of Melksham already amounts to upwards of 1,000*l.*

#### RAILWAY INTELLIGENCE.

*South Wales Railway.*—Measures are being taken to carry into effect a railway in connection with both the Great Western and Birmingham Railways with South Wales, and its terminus will be Fishguard, from whence an easy and short passage may be secured to the south of Ireland. The following circular has just been published, and we find that on the 22nd of March last a meeting of the members of parliament and other gentlemen connected with Wales was held, among whom were Lord James Stuart, president; Sir J. J. Guest, Bart.; O. Morgan, D.S. Davies, D. Morris, and Frederick Cower, Esqrs.; Mr. Brunel, Mr. Russell, the chairman of the Great Western Railway, &c. The estimate of the cost of the whole line will be 2,500,000*l.*; and we have every reason to believe that Government will give every assistance to the furtherance of this great undertaking. The intended line is as follows:—

Gloucester to Stonehouse . . . . .	7 miles.
Stonehouse to Swansea . . . . .	89 —
Swansea to Carmarthen . . . . .	24 —
Carmarthen to Fishguard . . . . .	35 —
London to Fishguard . . . . .	255 —

and will pass within a short distance of Carmarthen. The interests concerned in so important a measure may thus be briefly enumerated:—Those of the government and other persons connected with the Forest of Dean. Also those of the great iron, copper, tin-plate works and collieries at Newport, Cardiff, Swansea, Llanelly, and the whole of the manufacturing and agricultural interests of South Wales, by the facility of communication it opens with the manufacturing districts of England; and likewise the interests connected with the south of Ireland, by effecting a communication between that country and London in less than fifteen hours, thus bringing the important districts of Wexford, Waterford, Cork, Kilkenny, Tipperary, Limerick, the Shannon, and many others, within an easy distance of the whole of England. The country has been carefully surveyed as far as a preliminary investigation will admit of it, and it is beyond all doubt that an excellent line may be obtained at a moderate cost of construction.—*Carmarthen Journal.*

*The Great Western and South-Western Railways.*—The Committee of the House of Commons, appointed to determine on the merits of two lines of railway proposed by the Great Western and South-Western Companies to the town of Newbury, in Berkshire, have come to the determination of granting the line from Basingstoke to Newbury, which was the one proposed by the South-Western Railway Company, and rejecting the line proposed by the Great Western Railway Company from Reading to Newbury.

*Railway to Tavistock.*—Measures are being adopted for the purpose of constructing a railway from Plymouth to Tavistock. Preliminary meetings have taken place in Tavistock. It is proposed to raise the required capital in shares of 25*l.* each.

The Great Western Railway Company have now in contemplation to make a branch line to extend to Frome and Warminster, embracing the towns of Melksham, Bradford, and Trowbridge. A line for the latter was provided for in the first Act.

*Rating of Railways to the Poor Rate.*—A case of considerable interest came before the Lewes Quarter Sessions, on Wednesday week, being an appeal by the Brighton Railway Company, against a rate made by the overseers of Cuckfield, in Sussex, in 1843; there were appeals against the rates in four other parishes, but as all parties wished the affair definitively settled, the five parishes joined, and agreed to abide by the decision on this one case.—Mr. Cobbett and Mr. Roupell appeared for the company, and Mr. Creasy and Mr. Wyatt for the parish.—The ground of appeal was "that the company were rated and assessed at a rate higher than they ought to be," the rateable value charged upon them by the parish being 1,864*l.* 5*s.*—producing a rate of 13*l.* 16*s.* 4*d.*; while Mr. Cobbett contended that the rateable value, according to correct calculation, was 293*l.* for that portion of the line situate in Cuckfield parish.—After several surveyors and engineers had been examined on behalf of the rate, and the accountant, resident engineer, and carriage-builder of the company on their behalf, the rate was confirmed.—The trial lasted upwards of eight hours, and the greatest interest appeared to have been excited as to the result.

*Railway Returns.*—A return, just obtained by the hon. and gallant member for Lincoln, Col. W. Sibthorp, of all moneys to be raised under the sanction of the acts whereby railroad companies have been incorporated between the 1st of January, 1836, and the 1st of January, 1844, gives some interesting particulars, shewing the immense resources of the country, as regards the obtaining of vast capital for public purposes. Taking some of the more important lines of railroad established within the last ten years, we find the following results are obtained:—The gross total sum to be raised according to Acts of Parliament by the Arbroath and Forfar Railway Company amounted to 160,000*l.*; the Birmingham and Derby Junction Railway Company was altogether empowered to raise 1,200,000*l.*; the Birmingham and Gloucester, 1,413,741*l.*; the Bristol and Exeter, 2,000,000*l.*; the Bristol and Gloucestershire, 876,000*l.*; the Whitstable and Canterbury (a tram-road), 80,000*l.*; the Cheltenham and Great Western, 2,000,000*l.*; the Chester and Birkenhead, 499,999*l.*; the Chester and Crewe, 458,333*l.*; the Clarence, 799,645*l.*; the Dublin and Drogheda, 600,000*l.*; the Eastern Counties, 2,533,333*l.*; the Edinburgh and Glasgow, 1,500,000*l.*; the Glasgow, Paisley, and Ayr, 1,249,900*l.*; the Leinster and Munster, 1,065,000*l.*; the Great North of England, 1,730,000*l.*; the Great Western, 4,999,999*l.*; the Liverpool and Manchester, 1,832,375*l.*; the Birmingham and London, 5,500,000*l.*; the Blackwall, 1,066,000*l.*; the Brighton and London, 2,820,000*l.*; the Croydon, altogether, 921,333*l.* (the original estimate of Mr. Gibbs, the engineer, having been only 149,000*l.*); the Greenwich, 993,333*l.* (or nearly double the original capital of 533,000*l.*) the South-Western 2,540,000*l.*; the Leeds and Manchester, 3,429,000*l.*; the Manchester and Birmingham, 2,809,000*l.*; the Grand Junction, 800,000*l.*; the Midland Counties, 1,866,333*l.*; the Newcastle and Carlisle, 1,050,000*l.*; the Northern and Eastern, 1,631,288*l.*; the North-Midland, 3,400,000*l.*; the South-Eastern and Dover, 3,630,277*l.*; the Sheffield and Manchester, 1,533,000*l.*; and the York and North Midland, 681,666*l.* The above are only a fraction of the whole, but even these will serve to prove the astonishing monetary power and resources of the British empire. It should be stated that the sums in question include both the capital in joint-stock, and the amounts raised by loan or mortgage. In some instances (and the Greenwich and Croydon lines may be named amongst others) the original estimates have been enormously exceeded; the latter insignificant line, which is only 103 miles in length, having already cost the proprietors nearly a million sterling (or 100,000*l.* per mile), whereas the originally proposed capital amounted to 140,000*l.*

*Effects of Railways on Foreign Commerce.*—The extraordinary effects of the increased rapidity of transit secured by the railroad system, not only as merely shortening the distance from town to town, but even on our commercial relations with the continent, are fully exemplified in some alterations which are about being made in the conveyance of a

staple commodity of one of the midland counties—viz. salt. The saliferous district of Cheshire, Nantwich, Droitwich, &c., produces more of this necessary article than any other salt mines, we believe, in the world, and it has hitherto been principally exported from Liverpool, continental vessels coming in ballast for the purpose. By the now full development of the railways through the midland and northern counties, arrangements are being made to transmit the salt by canal to Manchester, and thence by the Manchester and Leeds, Leeds and Selby, and Selby and Hull Railways, to the latter place for shipment, thus not only shortening the time to the Baltic about one-half, but the great probability is, that vessels which now come in ballast, owing to the length of the voyage round the Channel, will, in future, bring cargoes of grain, and thus cause an interchange of two great necessary commodities. One large wholesale house at Liverpool has already an establishment at Hull, and 300 waggons are building expressly for the purpose. It is also probable that Welsh slates, and other articles of commerce, will find their way across the island for shipment from our eastern ports.

### Correspondence.

#### GREAT MALVERN ABBEY.

SIR,—Will you permit me to correct a slight misconception in your last Number? In your report of the meeting of the Society of Antiquaries, of March 21, it is stated that drawings of the ancient Refectory, at Great Malvern, were presented by Edward Blore, Esq.; that the structure had been demolished in 1841, and it was believed that no other representations of this building, but those of Mr. Blore, had been preserved; such, however, is not the case. In the summer of 1836 I visited this neighbourhood with my friend Edward Blackburne, Esq., architect, author of a "History of Crosby Hall," a work on Pointed English Architecture, and restorer of a portion of Crosby Hall, &c. We examined this very interesting building, and took sketches and measurements of it. It was certainly a very singular and interesting example of English carpentry; the framing of the roofs and elegant wooden tracery of the windows were very remarkable. Mr. Rickman, in his work on the Architecture of England, thus speaks of this erection as the Barn of Malvern:—"Near it (Malvern Abbey) is the Abbey-Barn, a very interesting piece of wood-work, evidently of Decorated character, with some very good moulded-work in oak for windows, and tracery-piercings of a bold style in the principals of the roof."

I am more inclined to coincide with Mr. Rickman in his opinion, that it was used for that purpose, than as a refectory, as supposed by my namesake.

Begging you will excuse this intrusion on your notice,

I am, Sir, your obedient servant,  
S. Michael's place, JOHN BLORE.  
Brompton-square, April 9th, 1844.

[We should like to publish the decorative carpentry of this building.—Ed.]

SIR,—I most respectfully beg leave, through means of your publication, of making more generally known the following acts of well-timed generosity to the labouring poor, now very rarely to be met with.

At the New Conservative Club-House, now in progress of erection in St. James's-street, a bricklayer's labourer of the name of McCarty, in the month of October last, fell from one of the scaffolds and was killed on the spot; upon the members of the club being made acquainted with the circumstances of the case, and that he was the only support of a widowed mother, they immediately subscribed a fund, and granted her a pension of eight shillings a week during her life-time. In the early part of January of the present year, another labourer fell backwards from a ladder, and was very seriously hurt by falling upon some iron girders that were at the foot of the ladder; he was thereby disabled for twelve weeks, during which time he was paid by the club eighteen shillings per week, being his full wages, till again enabled to resume his work. Last week, a labourer, while assisting to erect a scaffold to the ceiling of the grand staircase, fell from

a height of thirty feet upon the stones below, and received a severe internal injury; he, also, is the recipient of their bounty to the amount of his weekly earnings. I leave you and your numerous readers to form your own opinion upon the above; at the same time I think you will agree with me when I say that such well-timed generosity has now rarely to be recorded.

I am, Sir, your constant reader,

W. BOWACK, Foreman of the Works.

April 9th, 1844.

SIR,—As the acquisition of useful knowledge is at all times both highly desirable and pleasant to all those who are anxious to obtain a more perfect knowledge of the different trades, which they, in the order of Providence, may be called to fulfil, and, however, simple may be the knowledge communicated, yet it is received by such with pleasure and delight, as it puts them in a position to become more useful members of society, and renders them capable of performing higher uses to their fellow men. With this desire I would, through the medium of your excellent paper, make the following inquiry:—

What is the difference between that system of lines as practised by those of "the old school,"

SMITH'S PATENT WEATHER-TIGHT FASTENINGS AND SILL-BARS FOR FRENCH-CASEMENTS; IMPROVED REVOLVING IRON SHUTTERS; &c.

The diagrams annexed, numbered from 1 to 5, represent an efficient means of excluding the weather from casements, being simple in construction, and easy of application.

Fig. 1 represents, to a scale of one-half the

in getting out the wreathed part of a band-rail and that system which is coming into more general practice, and known by the name of the "square cut." And whether the work published by Mr. Weale, of Holborn, is an elucidation of the said "square cut?" If you, or any one of your able correspondents, would favour me with a solution of the above questions, you would greatly oblige,

Your obedient servant, J. P.

#### BLOXHAM'S GOTHIC ARCHITECTURE.

SIR,—I am exceedingly gratified at seeing that Mr. Bloxham has published another edition of his work on Gothic Architecture, but at the same time I think that if Mr. B. had published a supplement containing the additional information in a separate volume, it would have been a method better than the one followed, since those who possess the old edition must either go without the additional information or buy the new edition. I trust he will remedy the defect by publishing a supplement, for I am sure it will meet with a very extensive sale. Hoping you will be good enough to insert this in your valuable publication,

I am, Sir,

A POSSESSOR OF THE OLD EDITION.  
Saturday, April 13th, 1844.

full size, a short length of the meeting-styles, with a fastening thereto applied, and exhibits the appearance when the casements are closed; the brass face-plates and lever with ornamental knobs only being seen.

Fig. 2 is a section of meeting-styles taken above the lock, which is shewn as being mortised into a right-hand style, and through which passes the lever-spindle, communicating a threefold motion to the bolt, the ease of which is let into a groove ploughed out of the rebate,

Fig. 1.

along the whole height of the stile, and is bolted, by simply turning the lever-handle into fastened with screws through its flanges. The position shewn by the figure, is projected

Fig. 2.

up, down, and forward at the same time, thus their whole height, and securely bolting the ploughing and tonguing the styles together casements at top and bottom.

Fig. 3 is a section of a right-hand banging-style, and the containing frame, and is a very

Fig. 3.

simple mode of hanging casements. By the above arrangement, the casements are rendered weather-tight in all their vertical joints, besides being effectually fastened, without presenting the projections of the Espagnolette bolt.

Fig. 4 is a section of a sill and casement

Fig. 4.

bottom-rail, to which is applied the patent weather-bar, the action of which is apparent. The casement is shown as shut, the tongue which passes under and raises the hinged-flap keeps it close to the face-plate, which is screwed to the bottom-rail, while the casement is closed; but so soon as the casement commences opening, the flap drops gradually till the point of the tongue has passed from under it, when it is relieved and drops into its seat, where it is protected from being trodden up or raised by accident: thus three joints are formed impervious to weather.

Fig. 5 is another description of weather-bar,

Fig. 5.

the peculiarity of which consists in the arrangement of the hinges of the flap, which is so hung that the greater the pressure of wind or

water against it, the firmer will be the joint. Figs. 6 and 7 illustrate an important improvement in the construction of revolving

Fig. 7.

Fig. 6.

iron shutters, consisting in the substitution of which fig. 7 is an edge-view, in place of the a chain of the form shown by fig. 6, and of hinge usually applied to revolving shutters;

Fig. 9.

Fig. 8.

such hinge being represented by figs. 8 and 9, by a comparison of which the efficient operation of the chain will be apparent.

The advantages sought by the use of chains to be gained without increase of cost, over hinges, are, *four times the strength, four times the working-surface, the requirement*

*of less room, greater security, non-liability to derangement, and fourfold duration.* Those interested in the application of iron shutters, casement-fastenings, sill-bars, &c., would do well to inspect the numerous and interesting models of them at the patentee's works, and will then be able to judge how nearly these desiderata are accomplished.

**GREENWICH HOSPITAL.**—A considerable number of workmen are employed within the boundary-wall of Greenwich Hospital, laying down iron piping, for the purpose of more speedily extinguishing fire, should it at any time break out in that national edifice, without the aid of fire-engines. The principle is similar to that which has been for some time urged upon the government, and tried in the streets of the metropolis. The water is conveyed in pipes of nine-inches bore, laid from the capacious reservoir in the domain of her Royal Highness the Princess Sophia, immediately above the Observatory. Thence it passes along the declivity, supplies the Naval School, crosses the Woolwich-road, and enters the Hospital at the western-gate. The piping is to be laid throughout the whole of the exterior, and it is calculated upon hydrostatic principles

that the pressure of water will be sufficient without the aid of machinery, to force its way through lengths of leathern hose sufficient to reach the highest part of the building. It has been proved by recent experiments made in town, that, though water be conveyed through 5,300 yards of iron piping, consisting of 4,220 yards of 20-inch main, 550 yards of 15-inch main, and 500 yards of 9-inch main, the force was sufficient to drive it through two lengths of 40-feet hose to a height of 60 feet, giving a delivery of 100 gallons per minute. At Greenwich Hospital it is intended to erect stand-wicks so as to command every portion of the extensive pile, and from the diameter of the piping and the height of the fall, there can be no question but that the plan, when tried upon a large scale, will prove eminently successful. The men are working long hours, in order to complete the work as soon as possible.

Miscellaneous.

LIBRARY OF SIR CHRISTOPHER WREN.—  
"To be Sold by Auction, by Messrs. Cook and Langford, in y<sup>e</sup> Great Piazza, Covent Garden, this and y<sup>e</sup> following evening. The curious and entire Libraries of y<sup>e</sup> ingenious Architect, SIR CHRISTOPHER WREN, KNT. and CHRISTOPHER WREN, Esq. his son, late of Hampton Court; both deceased. Consisting of great variety of Books of Architecture, Antiquities, Histories, &c. in Greek, Latin, French, and English; together with some few lots of PRINTS. The said books may be viewed at Mr. Cook's in y<sup>e</sup> great Piazza aforesaid, till y<sup>e</sup> time of sale, which will begin each evening at 5 o'clock precisely. Catalogues of which may be had gratis at y<sup>e</sup> place of sale aforesaid.

"Note.—The Curious collection of Coins and Medals, Bronzes, Marble, and other Antiquities, will shortly be exhibited to Publick Sale, timely notice of which will be given in this Paper."—Daily Advertiser of Oct. 26, 1748.

FALL OF A NEW BUILDING, and LOSS OF LIVES.—A serious accident occurred on Thursday week at Hull. The Hull Flax and Cotton Company are building some new offices for clerks and book-keepers, adjoining their present entrance office. The offices are built over a reservoir or drain. The accident occurred in striking some wedges from an arch over the reservoir, when the arch fell with a great crash, and at the time of the accident four men were at work underneath the arch, two of whom were killed, the other two fortunately escaping with only a few contusions.

INDIAN RUBBER PAVEMENT AT THE ADMIRALTY.—That portion of the Indian rubber pavement which has been laid down in the forecourt of the Admiralty, at Whitehall, has been tested by three heavily laden coal wagons, each carrying seven tons, being driven over it, when the pavement became considerably depressed, but, from the elasticity of its nature, resumed its former appearance as soon as the wheels passed.

EDINBURGH PUBLIC BATHS.—ROYAL DONATION.—The directors have just received by letter a donation of 100l. from his Royal Highness Prince Albert, who has also intimated that "he feels most happy to contribute that sum to the effecting of so very praiseworthy an object."

SHORT and MAHONY, Brokers,  
1, Newman's-court, Cornhill.

Tenders.

TENDERS delivered for Hildenhor' Parsonage, near Tonbridge.—Ewan Christian, Esq., Architect.  
April 4:—

Howard and Son (Newington)	£1,333
Mair (West Malling)	1,310
Kempster (Boro')	1,290
Chalkin (Tonbridge)	1,195
Cobb (Maidstone)	1,156

TENDERS delivered for the erection of five Houses at Brixton Hill, for J. Blackett, Esq.—Mr. J. W. Griffith, Architect:—

Bartlett	£2,730
Hellis	2,123
Trevors and Son	2,098
Notley	1,940

TENDERS delivered for the alterations to a House in the Old Kent-road, for Mr. B. Cowell.—April 13:—

Crawley	£235
Dean	195
Wadey	192

NOTICES OF CONTRACTS.

For the erection of a New School at Harrietsham, Kent.—Messrs. Whichcord and Walker, Architects, Maidstone. April 22.

For building Sewers in Moor-lane, Cripplegate, and Great St. Helen's, City.—Plans, &c., Sewers Office, Guildhall. April 23.

For Paving with Wood a portion of St. Andrew's-street, Cambridge, containing 352 superficial yards or thereabouts.—F. Randall, Clerk to Commissioners. April 23.

For building an Infant-School at Greenwich.—R. S. Martyr, Esq., Architect, George-street, Greenwich. April 23.

For making a Navigable Cut of about 600 yards from the Ozier Bed Reach to Newwhite, on the River Medway, Kent.—Messrs. Hoar, Beale, and Hoar, Solicitors, Maidstone; Messrs. Whichcord and Walker, Architects, Maidstone. April 27.

For the several Repairs to the Barber's Hall and Buildings adjoining Monkwell-street, City.—Specification at the Hall. Further particulars of Messrs. Closs and Son, Surveyors, &c., 33, Clement's-lane, City. April 30, 1844.

For building a House, Shed, Cellarage, and Vaulting.—Mr. Bellingham, near the bridge, Great Cambridge-street, Haggerstone. Mr. Catling, Architect. May 2.

For erection of a new Union Workhouse at Highland's Farm, in the parish of Cuckfield, Sussex.—Particulars, Plans, &c., of Mr. T. Wisden, Hampton-place, Western-road, Brighton. May 10.

CAMBRIDGE.—For the several works to be executed at the corner of St. John's and Bridge-streets. Mr. Clemence, Surveyor, Chesterton-road. The day for receiving Tenders not fixed.

For Erecting a Church at New Radford, near Nottingham.—Plans, &c., H. J. Stevens, Esq., Architect, 16, Fall-street, Derby.

For works required in the enlargement of the Liverpool Workhouse.—Day for sending in Contracts, &c., postponed sine die.

ERRATUM.

Page 181, 2nd column, line 1, for "grained," in some copies, read "groined."

TO OUR CORRESPONDENTS.

We have received the communication relative to brick columns, which will appear in our next.  
Also the Bishop of Kildare's Seal, and the figure of the first Bishop of Ferns, which are in the hands of our engraver.

Also the beautiful interior view of the Chancel of Brecon Priory Church.

We have received the plans and description of Arbnoth Infirmary, but should like to be informed in English words of the meaning of the word "Sarking."

Through want of time and space we must defer till next week answering our other numerous correspondents.

MEETINGS OF SCIENTIFIC BODIES,

To-day and during the ensuing week.  
SATURDAY, APRIL 20.—Westminster Medical, 32, Sackville-street, 8 P.M.; Asiatic, 14, Grafton-street, 2 P.M.

MONDAY, 22.—Geographical, 3, Waterloo-place, 8½ P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.  
TUESDAY, 23.—Medical and Chirurgical, 53, Berners-street, 8½ P.M.; Zoological, 57, Pall Mall, 8½ P.M.; Civil Engineers, 25, Great George-street, 8 P.M.; Antiquaries, Somerset House, 8 P.M. (anniversary).

WEDNESDAY, 24.—Society of Arts, Adelphi, 8 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.

THURSDAY, 25.—Royal, Somerset House, 8½ P.M.; Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico-Botanical, 32, Sackville-street, 8 P.M.; Numismatic, 41, Tavistock-street, Covent Garden, 7 P.M.; London Institution, Finsbury-circus, 7 P.M. (anniversary).

FRIDAY, 26.—Royal Institution, Albemarle-street, 8½ P.M.; Philological, 49, Pall Mall, 8 P.M.

SATURDAY 27.—Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

BRITISH MUSEUM.—Open to the public every Monday, Wednesday, and Friday, from 10 till 7 during May, June, July, and August, and from 10 till 4 the rest of the year; except the first week in January, May, and September, Ash-Wednesday, Good Friday, and Christmas Day, and Fast or Thanksgiving Days. The Natural History Collections are open for study and comparison of specimens, to persons having permission, on Tuesday and Thursday from 10 till 4. The Reading Room is open to persons having tickets of admission every day (except Sundays) and when the Museum is closed, as above mentioned, from 9 till 7 in May, June, July, and August, and from 9 till 4 during the rest of the year. The Gallery of Antiquities is open to students having tickets every day in the week, except Saturdays and Sundays (and those times when the Museum is closed), at the same hours as the Reading Room.

ROYAL COLLEGE OF SURGEONS.—The Museum is open to visitors on Monday, Tuesday, Wednesday, and Thursday, from 12 till 4, except during the month of September; on Friday to gentlemen for studying in it; and on Saturday from 10 till 1 to gentlemen desirous of comparing specimens with those in the Museum. The Library is open to members and students of the college, and visitors having tickets of admission, daily (Sundays excepted), from the 1st of October to the 1st of April, from 10 till 4; and from the 1st of April to the 1st of September, from 10 till half-past 5.

GEOLOGICAL SOCIETY.—Library and Museums are open every day from 11 till 5.

ROYAL ASIATIC SOCIETY.—Museum is open every Tuesday, Wednesday, and Thursday, from 11 till 4.

UNITED SERVICE INSTITUTION.—Museum open all the year, from 11 till 5 in summer, and from 11 till 4 in winter. Admission by members' tickets.

LONDON INSTITUTION.—Lectures will be delivered every Monday and Thursday evening, at 7 o'clock, until May 6.

ADVERTISEMENTS.

TO BUILDERS, &c.  
RAIN WATER PIPES, EAVE GUTTERINGS, SASH WEIGHTS, Air Bricks, Coal Plates, Stable Drain Grates, Bell Traps, and the usual castings for buildings, always ready, and supplied in large or small quantities. Prices in accordance with the present low price of iron, at JOHN YOUNG, Junior's, Wholesale Ironmonger, 18, Blandford-street, Manchester-square, leading from Baker-street, Fortman-square, where prices may be had on application, or sent postage free.

ZING DOOR AND WINDOW PLATES.  
HEWETSON from having had considerable experience in the manufacturing of this article, is now enabled to offer to the public the best DOOR and WINDOW PLATES which can be made, especially in the engraving part, either plain or ornamental, at moderate prices, for a good article. Apply at the Zinc Manufactory, 57, Cannon Street, near London Bridge.

ROYAL ADELPHI GALLERY,  
No. 1, LOWTHER ARCADE, STRAND.—Under the special Patronage of her Most Gracious Majesty. Open daily from 11 to 5 o'clock, and from 7 to half-past 10 every evening. Morning Attractions.—A continued series of Scientific Experiments, Musical Performances, Exhibitions, and WINDOW PLATES which can be made, especially in the engraving part, either plain or ornamental, at moderate prices, for a good article. Apply at the Zinc Manufactory, 57, Cannon Street, near London Bridge.  
MORNING ATTRACTIVE.—A continued series of Scientific Experiments, Musical Performances, Exhibitions, and WINDOW PLATES which can be made, especially in the engraving part, either plain or ornamental, at moderate prices, for a good article. Apply at the Zinc Manufactory, 57, Cannon Street, near London Bridge.

# The Builder.

NO. XXIV.

SATURDAY, APRIL 27, 1844.

so long celebrated for their skill and ingenuity, appears to form rather a favourable contrast, in several particulars, with the state of other large towns.

The nature of the employment generally appears not injurious to health; the general custom of each family living in a separate dwelling is conducive to comfort and cleanliness; and the good site of the town, and the dry and absorbent nature of the soil, are very great natural advantages. Still there are many regulations of great consequence to the health and comfort of the inhabitants, which appear neglected, to some of which your committee will advert in the remedies they recommend. Some sanitary regulations respecting the common lodging-houses appear absolutely necessary for the safety of the community.

In addition to their inquiry into the state of many of the large towns of England, your committee also directed their attention to the condition of Dublin and Glasgow. With respect to the former, although many improvements may be made, and additional sanitary regulations are absolutely necessary, they do not think it necessary to do more than direct attention to the able evidence of Dr. Maunsell respecting it, containing many valuable suggestions.

With regard to Glasgow, however, they are sorry to observe that the details are of a most melancholy and afflicting nature. An intelligent witness, who has had every means of knowledge, states, "that penury, dirt, misery, drunkenness, disease, and crime culminate in Glasgow to a pitch unparalleled in Great Britain." And in another place, "I did not believe, until I visited the wynds of Glasgow, that so large an amount of filth, crime, misery, and disease existed in one spot in any civilized country."

The witness was accompanied by the magistrates and heads of the police, and describes the want of ventilation, sewerage, cleansing, and attention to the health of the poorer inhabitants in the lower parts of the town, as most grievous in its effects. The result is summed up in the following terms:—"Such being the state of things in large districts of Glasgow, it is not surprising that the number of persons who died last year was 10,270, being at the rate of one in 24 $\frac{1}{2}$ , to the whole population, or that out of that number 2,180 died of typhus fever, which never leaves Glasgow." These melancholy details, which can scarcely be read without shuddering, are amply confirmed by Dr. Cowan, a physician resident in the town, whose work, called "Vital Statistics," has been laid before your committee, and its general accuracy proved. It is there stated, and confirmed in evidence, that the rate of mortality in Glasgow has increased most rapidly, and is thus given in round numbers: 1821, 1 in 39; 1831, 1 in 30; 1835, 1 in 29; 1838, 1 in 26; thus shewing the frightful increase from 1 in 39 to 1 in 26 in 17 years.

And, again, it is shewn that the mortality in children under ten years of age has risen from 1 in 75 in 1821, to 1 in 48 in 1832. "Fever, it is stated, has been gradually increasing in the city of Glasgow, and its victims constitute within a fraction of 55 out of every 100 patients treated in our hospitals." "This increase has been during a period of great prosperity." The report quoted goes on to say, "We may safely assume that the 12,895 individuals treated in the fever hospitals during the last seven years, all, with few exceptions, depending on their daily labour, and extending the benefit of that labour to others, were out of employment for a period of six weeks."

Dr. Cowan adds, "The mortality bill of 1837 exhibits a rate of mortality inferring an intensity of misery and suffering unequalled in Britain, and not surpassed in any town we are acquainted with on the continent of Europe." Remedial measures are suggested in the following words: "A few thousand pounds judiciously expended in opening up the districts most densely populated, and in other obvious ways, would greatly tend to alleviate the pressure of our heaviest municipal tax, the fever tax."

Your committee would now turn from the melancholy details, a portion of which they have thought it right to insert in their report, and would state generally, that although the main evils complained of, and proved before them, appear to arise from the want of any regulations as to buildings and ventilation, and

the deficiency in sewerage, cleansing, and other sanitary provisions, yet there appears to be some important improvement necessary, referable to especial sources of illness in certain districts, as particularly, 1st, The existence of burial-places in the midst of populous neighbourhoods.

2nd, Local nuisances from some noxious business, affecting the health of the vicinity.

3rd, The neglected and dangerous state of low lodging-houses, frequented by a wretched and migratory population, who often carry fever and other disorders into distant districts.

Independent of the physical evils to the working classes arising from the causes before adverted to, your committee are desirous to express the strong opinion they entertain, confirmed by the testimony of many of the witnesses examined, that the dirt, damp, and discomfort so frequently found in and about the habitations of the poorer people in these great towns, has a most pernicious and powerful effect on their moral feelings, induces habits of recklessness and disregard of cleanliness, and all proper pride in personal appearance, and thereby takes away a strong and useful stimulus to industry and exertion.

The wife, hopeless of being able to make his home comfortable to her husband, abandons all endeavours for the purpose; neglect leads to neglect, recrimination follows reproach, and their children are brought up amidst dirt and wretchedness, with the example of constant domestic disputes before them. Nor can it be doubtful to those who trace the effects of such causes, that the humbler classes are often induced or driven by the want of comfort at home, and by the gloomy prospect around them, to have recourse to dram-drinking, the fertile parent of innumerable ills.

Your committee have thus laid before the house an imperfect abstract of the facts proved before them in evidence, shewing the neglect of due sanitary regulations applicable to improve the health and increase the comfort of great bodies of the poorer classes.

They have traced a few of the more prominent evils which appear to spring from this neglect, and have endeavoured to shew the ill effects produced by these causes in degrading the character of their humbler fellow-subjects, in producing crime, disease, and discontent, and in counteracting in great measure (as regards the younger portion of the population) those moral and religious impressions which they might otherwise receive from education where it is afforded to them.

The cost to the country, arising from these combined causes, it might be difficult to estimate with exactness, but there can be no doubt that it is enormous. Thus it is estimated that every person in the Fever Hospital (12,895 in seven years) in Glasgow loses six weeks employment, which, calculated at 7s. 6d. per week, would amount to 29,004. lost to the community, besides the cost of attendance and support; this has been calculated, *where the patient recovers*, at 1*l.* per case, and adds here 12,895*l.* to the account of loss; chiefly owing to the want of proper sanitary regulations.

In proportion as the working classes in these great cities (rapidly increasing every year) and their children are injuriously affected in their physical condition and their moral characters by the causes alluded to, just in that proportion will their value to the community be diminished, and their cost to the kingdom increased. The property which the country has in their useful labours will be so far lessened, and the unproductive outlay necessary to maintain and restrain them so far augmented.

This consideration will not be thought beyond the province of your committee, when it is remembered that in the remedies they propose some outlay of expense must necessarily occur; yet, on reflection, it is hoped that they will be justified in the conclusion they have come to, that ultimately a great saving to the community will thereby take place; and even were that not the case, that some such measures are urgently called for, as claims of humanity and justice to great multitudes of our fellow-men, and as necessary not less for the welfare of the poor than the safety of property and the security of the rich.

## REMEDIES.

The remedies which your committee would propose in order to carry out the spirit of "Sanitary regulations for the benefit of the health of the inhabitants of the great towns of

UNITING the several detached portions of the important parliamentary document which

we have given in our last three numbers, our readers will have a pretty correct idea of the state of the great towns in general throughout the kingdom, and will become quite adept on the subject, by adding to the information already acquired, the rest of the

REPORT of the Select Committee appointed to Inquire into the Circumstances affecting the Health of the Inhabitants of Large Towns and Populous Districts, &c.

Similar or worse accounts are given of various other districts, detailing the evils arising from houses built in close courts, often back to back, frequently with no thorough draught of air, without any conveniences for cleanliness or decency, with no effective drainage, inspection, or system of paving or cleansing.

The general conclusion of the Town Council is: "That the greater part of the town is in a most filthy condition, which demands an immediate remedy, a remedy which does not seem attainable under any local Act now existing, but calls for an especial enactment, which is doubtless required (they say) not only by Leeds, but more or less by every town in the empire."

After referring to the evils constantly arising from the bad construction and position of their dwellings, the witness is asked: "Would it not then be of the first consequence to the welfare of the working classes, that there should be some general regulation laid down, either in a general Building Act or some Act generally applicable, not for interfering with the ordinary construction of houses, but for preventing their being built in such a form and manner as experience has shewn is highly detrimental to the health of the poorer inhabitants?"—To which Dr. Williamson replies: "The working classes are now exposed to the cupidity and defective arrangements of their landlords, and they appear to me to require the protection of some such general enactment to remedy the evils." The necessity and practicability of such a remedy is spoken of by several other witnesses and experienced builders.

The witness having stated that Leeds had doubled its population within 30 years, is asked, "During that time it appears from the report which you have confirmed, that no due provision and regulation has been made with respect to drainage, sewerage, and cleansing, ventilation, and building, and for the supply of water for this vast community?—Certainly not." And the witness then expresses his opinion of the necessity of legislative assistance.

Your committee have inquired into the state of several other densely-peopled towns, and refer to the evidence given respecting them, not thinking it necessary to enter into detail more than by stating, that they all appear to stand in need, more or less, of measures calculated to enforce sanitary regulations for the benefit of the humbler classes.

Your committee are, however, happy to remark, that the great town of Birmingham, inhabited by so many industrious mechanics,

the realm," are several; some of a prospective, and others of a retrospective operation.

The first measure they recommend is, a general Building Act, applicable to towns now, or at any future time, comprising a certain amount of population; laying down regulations respecting the construction of certain rates of houses (well understood among builders) which are fitted for the dwellings of the working classes.

The regulations would be framed so as to interfere no farther with every one's right to manage his own property than was necessary to protect the health of the community; nor would they extend beyond what the necessity of that urgent duty of Government justified. Such regulations would fall strictly under that rule of public law universally acknowledged, which lays down as a maxim, "*Sic utere tuo ut non alienum laedas.*"

These regulations would forbid and prevent such forms of construction specified, as experience and undoubted testimony shew to be inconsistent with health. These would embrace,

1. Cellar dwellings, unless with areas in front and back, and with sewers below the level of the floors.

2. Rows of houses erected in close courts, built up at the end.

3. Rows of dwellings built back to back, so as to prevent any thorough ventilation.

These regulations so far would be of a preventive character, and would not otherwise interfere with the discretion of builders.

There are, however, a few other rules which ought to be introduced into such an Act; one of the most important is, to require that before and behind every row of houses of this description a certain space should be left open, proportioned to the height of the houses. What this proportion should be would be matter of consideration. Experienced builders, who have given evidence before your committee (and who are unanimous in opinion as to the necessity of such a provision), differ slightly as to details, one proposing the space in front should be the height of the houses themselves, whilst another thinks two-thirds might be sufficient; and, in like measure, with regard to the space necessary to be left open at the back of these small houses.

Some provisions have likewise been suggested as proper to be inserted in a Building Act, which might insure to these humble classes of houses such conveniences as are absolutely necessary for health and decency, and such receptacles for refuse, ashes, &c., as cannot be dispensed with consistent with cleanliness and comfort. There should also be a sufficient underground drain communicating with the common sewer.

Some other beneficial provisions may probably be sanctioned as proper for a general Building Act; but these are the only new provisions which appear to your committee essentially necessary for the welfare of the working classes.

Regulations as to the thickness of party-walls, to hinder the spread of fires, and others to prevent overhanging projections and dangerous chimneys, are now in the Building Act applicable to the metropolis, and probably in some provincial Acts, and would of course be necessary.

In these suggestions your committee have kept in view the policy of interfering as little as possible with private property, and no farther than the strict necessity of the case justified.

There is in the evidence abundant proof of the absolute want of some such provisions, and of the wide-spread evils and misery resulting from their neglect. They are in the nature strictly of sanitary regulations, and are only the fulfilment of one of the first duties of a humane government, to protect those who cannot protect themselves.

It is matter of deep regret to your committee that some such Act as they suggest did not engage the attention of Parliament at the beginning of the century, before our great towns were so densely populated, and so many dwellings for the working classes had been built in contravention of the proposed rules; had such been the case, they cannot doubt but much of the discomfort and sufferings which have been detailed before them would have been prevented.

Your committee are informed that some years since a general Building Act, which

would probably have contained some regulations like those they recommend, was under the consideration of the government; but, amid the changes which subsequently took place, was laid aside.

The obvious necessity of some such enactment, arising from the evils detailed before your committee, might perhaps justify them in simply but earnestly recommending it to the consideration of Parliament; but feeling, as they do, the great importance of its speedy adoption for the benefit of a rapidly increasing and valuable class of their humbler fellow-subjects, they are induced to consider and reply to some objections which might be brought against it.

It may be said, that such regulations as have been spoken of, forbidding buildings being erected in certain forms considered prejudicial to health, is an interference with private property. This is doubtless the case, but appears to be amply justified on the plea of the general good; and the same necessity is constantly held to justify similar interference, in various Acts of Parliament for the construction of roads, railways, canals, and in the enforcement of regulations regarding police, quarantine, &c.

A more serious objection is, that such regulations, by throwing some difficulties in the way of erecting closely-packed dwellings for the working classes, would render them dearer than at present, and increase the difficulty which they often find to procure habitations in populous cities. With respect to such part of the proposed regulations as would insure a better arrangement of dwellings on the same space (as by insuring courts and streets to be open at each end), this objection would not apply. But undoubtedly the effect of some of the rules suggested for a Building Act would be to improve the dwellings of the working classes, but at a greater cost than before.

The evidence, however, of experienced builders leads your committee to believe that this cost would not be very materially increased by prospective regulations of the nature described. The cost of a little increased space of ground before it is built upon, and before additional value is given to it by the proximity of manufactories, shops, roads, and streets, is very different and much less than afterwards; but the rules suggested would apply to it when open, and thus comparatively of less cost.

The outlay on the houses themselves in construction and materials (which are the main points of cost) might be the same, whether there are 20 or 15 on the same number of square yards; yet the effect on the health and comfort of the inmates would be very different in one case from the other. Still it must be admitted, that if a larger space of ground is required for a given number of dwellings, and they are constructed in a better and more costly manner, and have appendant to them some conveniences which they are now without, that the rent to be paid for them must be somewhat higher; but your committee assert with confidence, that this addition will be amply compensated to the working classes by the additional convenience and comfort they will enjoy, and that they will gain in freedom from disease, which now so frequently attacks them and their children, a saving greatly exceeding their outlay. The chief property of these persons is their labour. The evidence shews how often this is interrupted by fevers and other disorders, arising from the causes adverted to. Regulations, therefore, which may protect them from these evils, and allow them the uninterrupted advantage of the wages derived from their labour, would more than make up to them some augmentation of rent.

It must be borne in mind that without some such improvement in the construction of his dwelling, and the conveniences appendant to it, as are suggested, it is almost impossible for a working man's home to be made comfortable, or to have any attractions for him, or that he can in any way make the most of his daily earnings, and he is thereby driven to drinking as a resource, as it is stated by many witnesses examined.

Another remedial measure, which appears to your committee absolutely necessary to facilitate proper sanitary regulations in great

towns, is a general Act for the sewerage of these densely-peopled communities.

At present these Acts are partial in their operation and extent, varying in their provisions, and very defective in the powers they give.

A reference to the evidence collected by your committee will shew how great has been the neglect of the sewerage and drainage in some of the most densely-peopled parts of London, and the large provincial towns, and how much misery and disease have been entailed on the poorer classes of inhabitants in consequence. It cannot be denied, however, that considerable attention has been directed to this point within the last twelve years, and that great improvements have been effected during that period; still the want of any general system of operation, and the defective powers possessed by the commissioners, both in the metropolis and country towns, in which they have been established by local Acts, have altogether prevented the extension and construction of sewers, upon a scale commensurate with the increase of population. Your committee cannot help repeating their conviction, that, in addition to the physical evils which this want of the means of carrying off the refuse and impurities from their dwellings entails upon the poorer classes, it is impossible to deny, from the evidence before them, that their moral habits are affected by the same causes. That a constant residence in a tainted and polluted atmosphere, whilst it predisposes them to disease, and renders them less able to repel its attacks, also produces a degradation of moral character, an indifference to the common decencies of life, and an utter recklessness of all those comforts which persons in their station might be expected to enjoy.

The effect of this utter prostration of energy, and of all the better feelings of the mind, has been to reduce multitudes, who might otherwise have passed with credit through their humble spheres, to have recourse to ardent spirits as a desperate alleviation of their wretchedness; and your committee need hardly point out, how surely this irresistible temptation leads, step by step, to habitual dissipation and debauchery.

Your committee are perfectly aware, that wherever large masses of the labouring orders are collected together in towns, it is almost hopeless to enforce strict attention to household cleanliness which is maintained amongst those of the same rank in rural districts; but it is for this very reason, and to counteract this unfortunate tendency to neglect of cleanliness and comfort, that your committee deem it essential that every practicable means should be adopted to provide, at all events, against the worst of the evils detailed in evidence before them, and due sanitary regulations, to place the poorer classes in a condition to avail themselves, by a little exertion, of those conveniences which experience has proved necessary to remove the accumulated impurities of large towns.

In pursuance of these principles, and with the view of affording to the poorer classes congregated in towns some protection from the evils to which, from the confined nature of their dwellings, and the cupidity of speculators, they are frequently exposed, your committee are of opinion that it would be advisable to establish, in every town containing a population of a certain amount, a Board of Health, whose duty it should be to examine into such circumstances and occurrences within their district as are prejudicial to the general health of the inhabitants; to call the attention of the Commissioners of Sewers, and any other local authorities that might be concerned, to such nuisances, and to devise and suggest remedies. They should report their proceedings annually to the Central Board of Health, if such a board be constituted, and if not, to the Secretary of State for the Home Department, for presentation to Parliament, by which means publicity would be insured to their proceedings, and much useful information collected and diffused. These Boards of Health might be appointed by the Boards of Guardians, or by the Town Councils in corporate towns, or directed by the rate-payers.

It is obvious that a portion of such Boards should always consist of members of the medical profession, and your committee are inclined to think, that a class of persons pe-

cularly pointed out by the nature of their avocations for a duty of this sort, are the practitioners attached to the Poor Law Unions, who, being in the daily habit of visiting the most destitute and neglected portion of the community, must become acquainted with the condition of the localities in which they reside, and with the prevalence of those disorders which result from the absence of public sanitary regulations.

Such Boards of Health would probably each have a clerk (paid for his services), whose duty it would be to make minutes of the proceedings, and give such returns, in a short tabular form, as might be useful for reference, and important as affording easy information on a subject of such vital interest to the people.

The principal duty and object of these Boards of Health would be precautionary and preventive; to turn the public attention to the causes of illness, and to suggest means by which the sources of contagion might be removed; and in this way your committee believe a great saving of expense would take place eventually, and that the necessary outlay would be compensated by the diminution, not only of suffering, but of actual cost to the community.

Your committee have next to suggest that facilities be afforded for the establishment in towns and newly-extended suburbs of an administrative authority for drainage and sewerage, without the necessity of incurring the expense and delay of a local Act.

This desirable object might be effected by passing an Act for this country, framed upon similar principles to the 9 Geo. 4. c. 82, which is restricted to Ireland, and by which, on the requisition of twenty-one householders, a public meeting may be called of all the inhabitants of houses rated at 5*l.* and upwards; this meeting is empowered to decide upon the appointment of commissioners in whom are vested the necessary powers for the cleansing, draining, paving, and lighting of the town. This Act has been already adopted in about sixty towns with general satisfaction. Your committee think it would be a good arrangement that these rates should be borne by the landlord, and that some facilities for that purpose should be given.

Your committee have been informed that doubts exist as to the powers possessed by some Commissioners of Sewers of constructing new sewers, they therefore recommend that the continuance of these doubts be obviated; and also that some additional powers, which appear absolutely necessary for remedying the evils which they have stated, be granted to existing Commissions of Sewers, as well as to those which may hereafter be constituted.

1. That of enforcing adequate sewerage for rows or streets of houses which may hereafter be created; the expense of construction to be mainly charged upon the proprietors of the houses, while that of future repairs will fall upon the general rate of the district.

2. That of enforcing a communication between private dwellings and the adjacent main sewer, at the expense of the proprietors of those dwellings, and the repairs to be placed under the superintendence of the officers employed by the Commissioners of Sewers.

3. That of prohibiting the sinking of cess-pools below the level of the main sewer, and any other similar powers which may be deemed necessary for the public benefit.

Your committee believe it would also be of the greatest advantage to the inhabitants of great towns if an inspector was appointed to enforce the due execution of sanitary regulations. They think such an officer should (whether appointed by the rate-payers, or the guardians of the poor whom they have chosen) have the power of proceeding by indictment to abate nuisances, an old remedy of the English law, which, though somewhat in disuse, it seems quite necessary to revive and extend, to prevent and put down injury to multitudes. At present, for want of some such guardian of public rights, they are continually encroached upon, and nuisances injurious to the health, comfort, and property of the people (especially of the humbler classes) are shown by the evidence adduced before the committee to be constantly increasing. It would be the duty of such an officer to prevent any encroachment on or diversion of highways, or open spaces of ground in the enjoyment of the public.

Your committee think that the inspector

should report from time to time the state of his district to the Board of Health, constituted as before suggested.

Your committee have thus given an outline of the principal remedial measures they propose. They have been obliged to detail these at considerable length, which is perhaps inseparable from the magnitude and importance of the subject.

Before, however, they conclude their report, they would state that there are several points of the utmost consequence to the health of the inhabitants of our great towns, which they content themselves with barely enumerating, because they feel assured that if the remedial suggestions they have made were acted upon, these matters would immediately be attended to.

Thus, if the legislative enactments suggested were passed, if Boards of Health and district inspectors were appointed, there can be little doubt that these subjects would soon attract the attention their importance deserves, and if legislative aid were wanted, it would in such case be promptly afforded.

1. The custom of continuing burying-grounds, crowded with constant additions of corpses, in the midst of populous cities, is spoken of by several witnesses as most injurious to health.

2. The importance of an ample and due supply of water within the reach and means of the humbler classes has been made evident to all who have attended to the subject, and appears lamentably deficient in several populous and increasing communities.

3. The augmentation of buildings in the vicinities of these crowded cities seems to call for provisions to insure some open spaces being preserved, calculated for public walks, essential to the health and comfort of the poorer classes. This was adverted to and recommended by the report of a former committee; it presses more and more as the population of these great towns rapidly increases, and many witnesses have spoken of the growing necessity for some such provision.

4. Some inspection and power of regulation of the humbler class of lodging-houses seems absolutely necessary for the health of the people. They are shewn, by evidence before your committee, to be now utterly neglected; that there are many in all our great towns habitually in a filthy condition, the abode of fever and other contagious disorders, destitute of all sanitary regulations, and inhabited from time to time by a migratory and shifting population. Thus the diseases which are frequently taken in these dirty and ill-ventilated places are spread about the country, to the manifest danger of the people.

5. Wherever local circumstances give the power to establish public bathing places for the use of the poorer classes, such a step would be highly beneficial, and the cost in manufacturing towns, where many steam-engines are employed, would not, it appears, be considerable.

Your committee have now nearly completed their outline of the sanitary regulations they recommend to the consideration of Parliament to prevent as far as practicable the recurrence and increase of circumstances highly injurious to the health and comfort of the inhabitants of our great towns and populous districts.

They cannot, however, conclude the task assigned to them, without endeavouring to suggest some method by which the existing evils may be somewhat removed, and the extent of suffering diminished.

It will be evident to any one who has considered this report, or looked into the evidence on which it is founded, that much of the unhealthiness of particular groups of dwellings, and sometimes of a whole district, arises from the want of some local improvement, in the removal of some obstruction to ventilation or drainage.

Thus, in some of the crowded and unhealthy places described, the opening of a fresh thoroughfare, giving light and air, would not only remove or abate the evil, but would give additional value to the property through which it passed.

Sometimes taking down a single house which blocked up the end of a street, or of one of those miserable courts described in the evidence, would greatly benefit all the others near, and add to their worth much more than their fair share of the cost of the whole im-

provement; or the case may be that the additional value given to the dwellings in the immediate vicinity of the proposed sanitary improvement would very nearly, if fairly estimated, cover the expense, requiring a small proportion only to be made up from some other fund.

This supposition may be varied in other ways, and is applicable to other improvements of almost any description, by which additional value is given, in different proportions, to private property, and at the same time the salubrity of the vicinity is increased.

Yet at present, however necessary for health or beneficial to private property such improvements may be, they cannot be effected, unless in each spot there be a special Act of Parliament for the purpose, which is the case in very few places. Where, however, such an Act exists, it is generally applicable only to particular improvements specified in the Bill; it only extends to cases where some fund already exists for defraying the expenses, and it gives no power of assessing the whole district benefited, or of appointing apportioners to decide in what proportions the immediate vicinity is augmented in value, and ought to be assessed in consequence. Thus, a single obstinate and unreasonable proprietor may, and frequently does, prevent an improvement beneficial to a whole neighbourhood, and even to himself; but if all the persons interested be willing to concur in the improvement, there are frequently legal disabilities which prevent their consent being available, as leases, entails, &c. Sometimes the power of exchange or sale, or long leases of a small portion of a settled property, would facilitate an improvement widely beneficial, but this now requires in each case a separate Act of Parliament.

Viewing, therefore, the necessity and advantage of such local improvements, and the difficulties which now prevent them, your committee beg to recommend the introduction of a general Act (extending to all towns above a certain population) to facilitate such improvements. They venture to suggest that such an Act should contain provisions calculated to obviate the difficulties pointed out; that it should lay down well-considered regulations as to the forms of proceeding; should enable willing parties to carry out beneficial alterations; should empower a certain majority (perhaps two-thirds) of the rate-payers of any district to adopt the provisions of the Act, and bind the minority; empower them to choose trustees or commissioners to fulfil the enactments, raise rates, purchase property, complete improvements, &c.

Your committee cannot but wish that such an Act, so essential to the welfare of these densely-peopled districts, should contain clauses to facilitate the commencement of public improvements necessary for health at the suggestion of the Board of Health, and for this purpose that, under due provisions, the Board should have the power of ordering surveys and estimates to a limited amount. Your committee also think that wherever the government, individuals, or any public body shall be willing to provide a certain proportion (as one-fourth or one-third) of the estimate of any such improvement, that there should be a power to enable such commissioners to raise a rate for the remainder. In this way they believe many spirited and benevolent persons would generously come forward to assist and stimulate such beneficial public improvements, which without some such facilities and provisions will never be made.

How far it might be advisable to enable the Lords of her Majesty's Treasury, in certain urgent cases, to advance on good security loans of Exchequer Bills to facilitate such improvements, your committee will not undertake to determine.

Your committee have thus ventured to recommend legislative measures to assist in the necessary work of laying down and enforcing sanitary regulations for the benefit of the inhabitants of the large towns of this realm. They cannot conclude this report, which they submit to the consideration of the House, without most earnestly recommending all those who, by fortune, station, or trust, are placed in a position to assist in carrying out these views, to exert themselves to the utmost, and without delay, in aiding the improvement suggested in their several towns and neighbourhoods. Whilst your committee is earnestly desirous

legislative aid should be given, they are yet aware, that with zeal, energy, and perseverance much might be done, even with the present imperfect powers, by individual and combined exertion, to lay the foundation of measures which would afterwards be extended and perfected to the permanent benefit of the community.

#### INSTITUTION OF CIVIL ENGINEERS.

APRIL 23.—The President in the chair.

The first paper read was by Mr. C. Geach, who had promised, at a meeting of the Institution in February, 1843, to give the results of more extended comparative trials of the strength of solid and hollow axles. The result of the present experiments was as decidedly in favour of the solid axles as the former ones had been in favour of the hollow ones, so that as far as the practical utility of the examination extended the results were useless.

A paper was then read by Mr. Glynn relative to the fracture of railway axles, which he attributed to the constant succession of blows received by the axle in travelling. The action was stated to be similar to that of an axle laid on the edge of an anvil and subjected to a series of smart blows of a hammer while in constant rotation. The fractures presented the appearance of a clear annular cleft all round for a depth of half an inch in the body, the centre part being crystallized and reduced so much as to be unable to bear the weight and the portion to which the axle was subjected by the pressure of the break on one of its ends. These observations had induced the Railway Company to apply the power of the break to both wheels simultaneously, thus avoiding the torsional strain.

"An Account of the Scaffolding used in erecting the Nelson Column, Trafalgar-square," by Mr. T. Grissell, was then read. This scaffolding which was first used in London for the erection of the facade of the London and Birmingham Railway Station, by Messrs. Cubitt, then by Messrs. Grissell and Peto at the Reform Club House, and also at Woolwich in forming the New Graving Dock, was composed of sills, uprights, crossheads, longitudinal timbers, braces, and struts, all of whole timber. The upright timbers were slightly tenoned into the horizontal timbers and the junctions secured by iron dogs driven into the timbers diagonally across the joints, which were preferable to bolts or spikes, as they could be more easily withdrawn and the timber was not injured. It was stated that with this scaffolding and the travelling machine at its summit, one mason could set as much work in one day as was formerly done in three days by the old system, even with the aid of six labourers, who are now dispensed with. The base of the scaffold was 96 feet square exclusive of the raking braces; the height of each stage varied from 21 feet to 48 feet, the total quantity of timber used in its erection was 7,700 cubic feet, and its cost was 240l. for labour in erecting. It was recommended that the plan adopted at Liverpool of bonding timber upon dry land instead of allowing it to float in timber ponds should be made use of in London, as by that means there would be less decay and the timber would be better seasoned, and the Kyanizing process would not be so much required.

A paper by Mr. Pierre Journet was then read, describing the scaffolding employed by him for the construction and repair of columns, obelisks, and chimneys of great height, at Paris; and also the machine used for raising building-materials at the Houses of Parliament, the mansions at Albert-gate, Hyde-park, &c.

The scaffolding consisted of a simple combination of a number of brackets, fixed at regular distances of about 5 feet apart, vertically upon girdles of chains and screws, braced tightly round the column under repair; upon these brackets the platforms were laid, and as the workmen proceeded upwards the lower brackets were alternately raised to the platforms above, where the workmen stood. The progress thus made in forming and in taking down a scaffold was stated to be very rapid, with corresponding economy of time and expense. No poles or cord were used, and no waste of material occurred. By these means the obelisk of Luxor, at Paris, was repaired in a very short period and at a very small cost.

The machine for raising building-materials consisted of an endless chain of square open links, the lower end revolving round a driven wheel, and the upper end around a corresponding wheel fixed upon the scaffold at the height of the building. The hods, buckets, and baskets were each furnished with a hook, by which they were suspended on the rising side of the chain, and when they arrived at the necessary height they were taken off by labourers, and carried to the spot where the materials were to be used; when empty they were hung upon the descending side of the chain, and lowered to be again filled. Messrs. Grissell and Peto, who had used these machines, expressed themselves much pleased at the economy they effected, which would induce them to employ them more extensively with engine power for the erection of the Victoria Tower at the new Houses of Parliament.

The following papers were announced to be read at the meeting of Tuesday, April 30:—

No. 577. "Description of the method employed for repairing a chimney 120 feet high, at Messrs. Coopers Cotton-mills, Glasgow," by J. Colburn, Grad. Inst. C.E.

No. 679. "Experimental researches into the properties of the iron ores of Samsoff, in Turkey, and the hæmatite ores of Cumberland, with a view to determine the best means for reducing them into the cast and malleable state," by W. Fairbairn, M. Inst. C.E.

No. 675. "Description of a pair of iron lock-gates, constructed in 1843 for the entrance of the wet dock at Montrose," by J. Leslie, M. Inst. C.E.

#### SOCIETY OF ARTS.

##### ANNUAL ELECTION.

APRIL 17.—The following is a list of the officers for the year ensuing:—

##### PRESIDENT.

His Royal Highness Prince Albert, K.G., F.R.S., &c. &c.

##### VICE-PRESIDENTS.

*Honorary.*—Hugh, Duke of Northumberland, K.G., F.R.S., and F.S.A.; George Granville Leveson, Duke of Sutherland, K.G.; Walter Francis Montague Douglas, Duke of Buccleuch, K.G., K.T., and F.R.S.; Bernard Edward, Duke of Norfolk, K.G., F.R.S., &c. &c.; Spencer Joshua, Marquis of Northampton, President of the Royal Society, &c. &c.; Charles, Earl of Romney; William, Earl of Radnor, F.S.A.; Philip Henry, Earl Stanhope, F.R.S., and F.S.A.; John, Earl of Shrewsbury, F.S.A.; Dudley, Earl of Harrowby, D.C.L., and F.S.A.; William, Earl of Dartmouth, F.R.S., and F.S.A.; William, Earl of Londsdale, F.R.S.; Charles Callis, Lord Western; W. Tooke, Esq., F.R.S.; Thomas Hoblyn, Esq., F.R.S.; Richard Twining, Esq., F.R.S.; Benjamin Kotch, Esq.; Joseph Hume, Esq., M.P., F.R.S.; Benjamin Bond Cabbell, Esq., F.R.S., F.S.A., &c.; William Hughes Hughes, Esq., F.S.A., and F.L.S.; William Pole, Esq., F.R.S. &c.; P. M. Roget, Esq., M.D., Sec. R.S., &c.; David Pollock, Esq., F.R.S., &c.; William Henry Bodkin, Esq., M.P.; John Ashton Yates, Esq.; Sir John Josiah Guest, Bart., M.P.

##### CHAIRMEN OF COMMITTEES.

*Accounts.*—Henry Robarts, Esq.; Joseph Payne, Esq.

*Agriculture.*—Layton Cooke, Esq.; G. Aikin, Esq.

*Fine Arts.*—George Bailey, Esq.; James Savage, Esq.

*Chemistry.*—Arthur Aikin, Esq.; Edward Solly, jun., Esq.

*Colonies and Trade.*—Hollis Solly, Esq.; P. Vaughan, Esq.

*Correspondence and Papers.*—Richard Horsman Solly, Esq.; E. Bramah, Esq.

*Manufactures.*—John Bethell, Esq.; G. T. Kemp, Esq.

*Mechanics.*—Charles Holtzapffel, Esq.; Joseph Woods, Esq.

*Miscellaneous Matters.*—Edward Binyon, Esq.; Thomas Webster, Esq.

*SECRETARY.*—Francis W. Bishop, Esq.

His Royal Highness the President was elected a Trustee of Sir John Soane's Museum in place of his late Royal Highness the Duke of Sussex.

P. M. Roget, Esq., M.D., in the chair.

The secretary read a letter from Major Parly (who was last year rewarded by the

society for his plan for a floating breakwater) as to the natural breakwater of the port of Pisa, shewing that the principle of constructing these important works as laid down by the major is perfectly correct. The following is a literal translation of a description of the port of Pisa, from Claudius Rutilius, an ancient writer and member of an illustrious family at Rome:—

"The harbour is celebrated as the emporium of Pisa, and for its marine riches; the appearance of the place is remarkable, for the coast is an open one, and exposed to every wind. There are no promontories to protect it from storms, but a long sea-weed rises from the bottom of the sea, which defends it without injuring the vessels which pass over and through it, and yet is sufficient, by rising and falling with the waves, to abate their fury, and to prevent their rolling in from the sea in dangerous masses."

The secretary next read a paper on Mr. Sholl's portable barrel-hive, introducing the subject with quotations from the 4th Georgic of Virgil as to the management of bees.

Mr. Sholl's cottager's-hive may be thus described: the stand is of wood, consisting of five pieces, which are so arranged, that they may be taken to pieces readily if required, and put away in the hive if necessary to send it to a distance.

A common American flour-barrel forms the outworks of the hive; the pavilion is formed of wood, and may be either square or circular, and is placed at the bottom of the barrel. It is furnished with a wire-gauze door fixed in the bottom, which furnishes the purposes of a ventilator; two cross-bars are fixed at the top of the pavilion, to which the inhabitants attach the comb. The entrance to the pavilion is circular, and towards the top a metal tube is carried through the wall of the house or barrel, and is furnished with a sliding shield, also of metal, to keep them in when necessary. This slide is perforated so as to assist the ventilation. The pavilion, which can be removed from the house or barrel at pleasure, stands upon four legs, for the purpose of fully ventilating the space between the outer walls of the house or barrel and the pavilion; towards the bottom of the barrel is another aperture, furnished with wire-gauze for the sake of ventilation.

On the top of the pavilion is a folding partition by which it is entirely covered; this partition contains six or any greater number of apertures that may be required, to each of which is a plug of wood with a tin cover; each plug is attached to a string which is secured to the side of the barrel, so that when the plugs are removed from the apertures they may not be lost. The use of these apertures is to admit the bees when necessary from the pavilion into the surplus cases above; a small window is fixed in the partition to ascertain the state of the bees at any time. These cases, six or more in number, are also constructed of wood, nearly fitting the sides of the barrel or house; each case is of segmental form, and open at bottom to admit the bees, and further, is lighted by a small window in the top. When the bees have filled the pavilion with honey as far as possible, admission is afforded to them to one or more of the surplus cases or additional apartments in which they deposit new comb.

The pavilion remains undisturbed, so far as removing honey is concerned, the additional apartments being supplied for that purpose. When a case is ascertained to be filled with honey it is removed to a distance from the barrel, carefully turned on one side, and the bees returning to the pavilion, the apartment may be entirely cleared of the honey accumulated, and another case may be immediately inserted in its place.

It is readily ascertained which surplus apartment is occupied by the bees, as the admission plug from the pavilion will be found placed on the top of it.

The cover or roof of the bee-house or barrel is hung with common hinges, and secured either by a common lock or a padlock.

The French Government are about to build three steam-packets, of 150-horse power each, to ply between Calais and Dover, with the view of expediting the communication between the two countries, now that the railway from London to Dover is complete, and that from Paris to Calais is in active progress.

## THE ART-UNION OF LONDON.

The annual meeting of the subscribers to receive the committee's report, and distribute the amount subscribed for the purchase of works of art, was appointed for Tuesday week at Drury-lane Theatre, and all the elaborate arrangements consequent on the largeness of the body were made. On Monday week, however, the following letter was received at the office in Trafalgar-square:—

"Treasury, April 12, 1844.

"Sirs,—I am commanded by the Lords Commissioners of Her Majesty's Treasury to acquaint you that an institution called the Art-Union of London, having for its object the chance distribution of prizes of works of art, has been brought under the notice of their lordships, and that they are advised that it is illegal; and I am also to acquaint you that the further continuance of the same will render all parties engaged in it liable to prosecution.

"I am, Sir, your obedient servant,

"W. R. REYNOLDS.

"To G. Godwin and Lewis Pocock, Esqs.,  
4, Trafalgar-square, Charing-cross."

The committee immediately met, and a memorial was addressed to Sir Robert Peel, as First Lord of the Treasury, setting forth the nature of the association, the sum of money which through its means had been expended since its establishment in the promotion of the fine arts—the fact that the arrangements for the distribution were complete; and that if stopped at this moment great loss would be occasioned to many artists, and praying that assurance might be given that no legal proceedings would be commenced with the sanction of the government in the event of the general meeting being held as already arranged. The memorial was accompanied by a letter from the honorary secretaries, soliciting the serious attention of the right hon. baronet, and asking for an interview. Sir George Clerk, Bart., on the part of Sir Robert Peel, having appointed to receive the committee yesterday, Mr. George Godwin and Mr. Lewis Pocock, honorary secretaries, with Mr. Dickson, Mr. Gaskoin, Mr. W. Donaldson, Mr. Noble, Mr. A. Tooke, Mr. Troughton, Mr. Morant, Mr. Atkinson, Mr. Morris, Mr. Hayward, Mr. Collard, and other members of the committee, attended at Downing-street.

Sir George Clerk said Sir Robert Peel had placed the memorial in his hands, and that he should be happy to hear any observations which might be offered.

Mr. George Godwin, on the part of the committee, then made the following statement:—The Art-Union of London, since its establishment in 1837 (in consequence of the opinion published in a report of a committee of the House of Commons on arts and manufactures in 1837), has distributed about 36,000*l.* independently of the present year's receipts, in the purchase and preparation of works of art, and has put into operation painters, sculptors, engravers, metal-die sinkers, modellers, and artists in bronze (a branch of art up to this time much neglected in England), to say nothing of the branches of industry encouraged by it, as paper-makers, printers, frame and glass-makers, &c. As an instance of the magnitude of their operations in this latter respect, Mr. Godwin stated, that 300,000 sheets of paper had been used for the series of outline designs about to be distributed to the subscribers of the present year. The association had correspondents not merely throughout the United Kingdom, but in our Indian possessions, Nova Scotia, Hobart Town, Mexico, and New York. Mr. Godwin contended that to bind together a large number of individuals by a common interest—an interest in the arts of peace—was of itself an important result, tending to good. A reserved fund had been put by without interfering with the subscribers' rights, and promised to produce speedily permanent funds for the advancement of the higher branches of art. The society had now been in operation for eight years, increasing in usefulness, and the committee were confirmed in their views of its legality by numerous facts. Her Majesty the Queen was patron of more than one such association, and his Royal

Highness Prince Albert had very recently expressed to the committee of the Art-Union of London, through Mr. Eastlake, R.A., his approbation of its objects. Among the vice-presidents of the Irish Art-Union were several of the judges; his Excellency Earl De Grey was a subscriber. The committee of the Edinburgh Society included numerous advocates, and, in addition to these points, the High Chancellor of Ireland, Sir E. Sugden, Mr. Fitzroy Kelly, Mr. C. Clarke, and others had stated their opinions that the Art-Unions, properly so called, were strictly legal. The committee now found themselves with 14,000*l.* in their hands—a large increase over the subscription of any former year, on the very eve of the distribution. All the elaborate arrangements consequent on the largeness of the body acted for had been made; artists had filled the exhibitions about to be opened with their works, and, in the majority of cases, looked to the funds of the association for a return for their skill and labour. The effect on these of suddenly preventing the application of the funds provided for their encouragement would be disastrous in the extreme, nor was it simply as concerned the funds of the Art-Union of London that the artists would be affected; he would speak within compass if he said that 40,000*l.* or 50,000*l.* were in the hands of committees throughout the kingdom to be applied in the way alluded to; the point then was, whether, without their entering into the question of legality, the committee might proceed with the distribution, and wind up the proceedings of the year. He would maintain that the Art-Union of London was not encouraged through the spirit of gambling; and would prove it, by shewing that with the exception of his Royal Highness the President, and men known to be patrons of art and above suspicion, the subscription was uniformly of one guinea, for which every man had his worth in the shape of engravings, the printed report, admission to the exhibition and other pleasurable and wholesome excitements. If they were prompted by a spirit of gaming, they would be found risking their five guineas or their ten guineas. The chance of obtaining a prize was too remote to be a leading motive. For the opinion entertained of the association by the artists, he would appeal to resolutions of confidence passed at a large meeting of artists, held at the Freemasons' Tavern last year, and to the fact that Sir Martin Archer Shee, the present respected President of the Royal Academy, had been a subscriber from the foundation of the society, and had been found at all times ready to give them his advice. The exhibition of prizes would, he was sure, seem to Sir George Clerk, who he was satisfied regarded the Fine Arts as important civilising agents, to be of great service. Last year, the exhibition was open four weeks, part of the time to the public without any limitation, and was visited by about 200,000 persons. The fear of the print-sellers that the Art-Union of London interfered with their trade, and which had led to the present steps on the part of the government, Mr. Godwin could not think well-founded. Prints had been distributed by the society in quarters where prints had never before been seen; the taste thus inculcated would make buyers; when one print was bought another was speedily required. That the print-sellers themselves were favourable to the Art-Union was proved by the fact that they attended the committee of that association before transmitting the memorial, and stated that they had specially excepted it in their prayer. The question then was, are the efforts now making by the committees of Art-Unions throughout the kingdom to be stopped. If the government think that speculators avail themselves of the existence of Art-Unions to injure legitimate trade, will her Majesty's ministers bring in a short Bill to place them on a more assured and permanent footing? The immediate point, however, continued Mr. Godwin, is, can the committee of the London Art-Union complete their arrangements on Tuesday, as announced, or must the artists of the United Kingdom suffer the sudden deprivation of the means of remuneration which had been offered them, and for which they had been at work all the past year? The question was one of great importance, and he trusted they might receive such an assurance as should enable them satisfactorily to keep faith with

the public, and avoid the threatened injury to a large body of meritorious men.

Mr. Dickson, Mr. Hayward, and others, followed in confirmation of Mr. Godwin's statement.

Sir G. Clerk, who had received the deputation with great courtesy, said that the attention of the Commissioners of the Treasury having been directed to the subject, they had submitted a case to the Attorney and Solicitor General, and that in their opinion, the whole of the associations referred to were illegal, and that it was thought due to the committee to give them early intimation of the fact. Sir Robert Peel could not interfere in the matter; all he could do was to inform them of the law. He (Sir George Clerk) was himself a subscriber, and so were many others connected with the government; still, for the Treasury to give any sanction to further proceedings, although he fully admitted the difficulty of the position in which the committee found themselves, and the loss which would result to artists if the proceedings were stopped, was quite out of the question. If the opinions of the gentlemen were such as were stated, they could of course act on them if they pleased. The most prudent course, he thought, would be to postpone the meeting, giving the subscribers notice to that effect, and suspend proceedings until it could be ascertained whether or not the legislature would protect that and similar societies.

The deputation then withdrew.

The committee have determined to postpone the meeting for the present, and it remains to be seen what steps will be taken by the artists out of doors to strengthen the hands of the committee. Whatever may be the result, the rise and progress of this association will form a most extraordinary page in the history of the arts.

## RAILWAY BUSINESS IN THE HOUSE OF COMMONS.

MONDAY, APRIL 15.

*Newquay Harbour and Railway (re-committed) Bill.*—Reported; report to lie on the table, and to be printed, together with the report of 29th March.

*Manchester and Leeds and Heywood Branch Railway Bill.*—Read a third time, and passed.

*Furness Railway Bill.*—Queen's consent signified; read a third time, and passed.

TUESDAY, APRIL 16.

*Eastern Counties Railway Bill.*—Read a third time, and passed.

*Eastern Counties Railway (Brandon and Peterborough Extension) Bill.*—Report considered; motion made, and question proposed, "That the amendments made by the committee to the Bill be now read a second time;" debate arising, debate adjourned till Thursday.

*Leeds and Bradford Railway Bill.*—Reported; report to lie on the table, and to be printed.

*Yarmouth and Norwich Railway Bill.*—Report considered; motion made, and question proposed, "That the amendments made by the committee to the Bill be now read a second time;" debate arising, debate adjourned till Thursday.

*South-Eastern, Canterbury, Ramsgate, and Margate Railway Bill.*—Read a third time, and passed.

*Manchester and Birmingham Railway (Macclesfield and Poynton Branches) (No. 2) Bill.*—Queen's consent signified; read a third time, and passed.

*Manchester, Bury, and Rossendale Railway, and Manchester and Leeds Railway (Bury Branch) Bill.*—Ordered, that Mr. Cowper do make the report from the committee to whom the Manchester, Bury, and Rossendale Railway, and Manchester and Leeds Railway (Bury Branch) Bills, were referred; and that such report be made to-morrow.

*North British Railway Bill.*—Report considered; motion made, and question proposed, "That the amendments made by the committee to the Bill be now read a second time;" debate arising, debate adjourned till Thursday.

VIEW OF STOKE-GOLDING CHURCH.

(From a Correspondent.)

AND "Historical account of the Church of Saint Margaret, Stoke-Golding, Leicestershire." By THOMAS LARKINS WALKER, Architect, of Nuneaton, 6 plates. London: John Weale, 1844.

THE view of this church, which was sent to us last year by a correspondent, has been engraved some months, and though inaccurate in perspective and some other particulars, we this week insert it as it is, in order that we may have the opportunity of cautioning our correspondents relative to the precision which it is necessary to observe in architectural delineations.

We are so overrun this week with important matters of immediate interest, that we have with difficulty found space for the subjoined extracts relative to Stoke-Golding, from Nichols's Topography of Leicestershire, reserving, till our next number, all remarks upon the church itself, and our Review of Mr. Walker's excellent work upon the same subject, which has been issued since our view of the church was engraved.

Stoke, in an old subsidy roll of the year 1505, (which was in Mr. Burton's possession) called Stoke Mansfield, is now called Stoke Golding. It is bounded by Dadlington on the north, by Barwell on the east, by Wykin on the south, and Higham on the west. This is one of the townships which pay suit and service to the court of Hinckley, of which parish it was formerly a chapelry, and may still be said to form a part, though the inhabitants have all the privileges of a distinct parish; and the chapel, when rebuilt in the reign of King Edward III., was regularly declared to be a distinct church; but the rectory is still annexed to the vicarage of Hinckley. In the Itinerary of 1280, Stoke, Higham, and Upton, answered collectively as one vill.

In 1293, Nicholas de Warwick and Joan his wife gave this manor to Alice, widow of William de Hinckley, in exchange for the manor of Fulbroke, co. Warwick.

In 1297, it was found that Edmund, Earl of Lancaster, the king's brother, at the time of his death, held divers lands at Stoke.

In 1342, Thomas Nevile, by fine, entailed the manor of Stoke on the heirs of his body lawfully begotten; and for default, on his brother Henry, and the heirs male of his body lawfully begotten; and for default, on John, the son of Cicely Simond, and the heirs male of his body lawfully begotten; and for default, on Thomas, the brother of the said John, and the heirs male of his body lawfully begotten; and for default, on Thomas, the son of John Woodford, and the heirs male of his body lawfully begotten.

In 1346, Robert Champaigne, Giles Meignell, John Marshall, and John Bare (on the aid then granted for knighting Edward of Woodstock, the king's eldest son) were assessed 20s. for half a knight's fee in Upton and Stoke, parcel of the honours of Leicester and Winton.

In 1361, it was found that Henry Plantagenet, Duke of Lancaster, died seised of one knight's fee in Stoke, which Ralph Champaigne then held; also of one knight's fee in Sapcoat,

Stoke, and Upton, which Ralph Basset then held.

In a book of fifteenths and tenths granted by the laity in 1416, Stoke was rated at 17. 5s., and in the subsidy of 1445, at the same sum; but an abatement was then made of 5s.

In 1427, it was found that Joan (who was the wife of Roger Swillington, Knight) died seised of two messuages and one virgate and a half of land, with the appurtenances, in Stoke, held of Sir Reginald de Grey, Lord of Ruthin.

In 1429, it was found that Margaret (daughter of Roger Swillington, Knight, and wife of John Gra, Knight), died seised of two messuages, and two virgates and a half of land, with the appurtenances, in Stoke, held of Reginald de Grey, of Ruthin, Knight.

In 1433, Baldwin Bugg, Esq., released all his right in all his lands and tenements in Stoke to Thomas Crull.

In 1474, it was found that Margaret (wife of Thomas Everingham, Kt.) died seised of the manor of Stoke, held of the king as of his duchy of Lancaster.

In 1506, it was found that — Turville died seised of the manor of Stoke, held of the king as of the honour of Leicester.

"This manor containeth thirty-two yard lands; whereof twenty-three and three-quarters was the ancient inheritance of Rafe, Lord of Basset, of Sapcote, in the time of King Edward the First, who held the same of John, Lord Hastings (whose issue was after Earl of Pembroke), as of his manor of Dadlington. From Basset (by an heir general) it came to Moton, and in like manner from Moton to Harrington, all which did appear for the said land at the Court Baron of the said manor of Dadlington, and performed the suits and services for the same, as it appeared to be proved by divers ancient court rolls belonging to the said manor; and also by inquisitions and records. The other eight yard lands and a quarter (as it appeareth by an inquisition taken 24 Hen. VI., after the death of Reginald Moton) was some time the inheritance of Sir

Roger de Stoke, Kt., who gave it in frank marriage to Sir Robert de Champaigne, Kt., with Margaret his daughter; which Robert was descended from the ancient Earls of Champaigne, one of the peers of France, whose lineal ancestor being a cadet of the said earl's house, coming into England with King William the Conqueror, received from him great lands and possessions in this shire and in the counties of Northampton, Oxford, Lincoln, and Salop. The heir general of Champaigne was married to Tourville, from whom (by alienation made) it came to Sir John Harrington, Kt., Lord Harrington, of Exton, who being afterwards seised of the whole lordship, inclosed it, and soon after sold it to the several tenants; the deed tending to the uses of the fine and recovery bearing date June 1, 3 Jac. I., wherein there is mention of a messuage and several closes to be settled for the use of William Cart."

Nov. 3, 1604, Sir John Harrington sold to Oliver Hendman, of Stoke Golding, for 28l., two closes in Stoke, called "the Oulden," lying together, between Hinckley-feld and Oulden-lane, warranted from any incumbrance done or committed by the said Lord Harrington or Sir James Harrington, Kt., deceased, father of Sir John Harrington, Kt., his grandfather, or Sir Robert Moulton, Kt., his great grandfather, or Henry Turville, of Aston Flamville, Esq. [Stoke Golding had recently been inclosed.]

Thomas Hendman died July 20, 1618, seised of a capital messuage, two bovates of land, containing 76 acres, at Stoke Golding, 10 acres of which, called Turville's land, part of Turville's manor, and 31 acres, called Harrington's lands, part of Upton manor.

Francis Brokesby died, Dec. 5, 1633, seised of six closes of pasture, &c., at Stoke Golding, one part held of the king as Earl of Leicester, the rest of the manor of Hinckley.

In 1655, there was collected in Stoke Golding, for the relief of the poor Protestants of Piedmont, the sum of 2l. 6s. 6d.

In 1703, Francis Brokesby owned and lived

on his estate at Stoke, of a capital messuage and 100 acres of land, who gave it to his only son Richard, who died without issue, and left it to his three sisters; and they, in 1730, conveyed it to Andrew Noel, of Burbage, Esq., for 1,786l. He died in 1736, and gave it to his nephew, James Wigley, Esq., of Scraftoft, M.P., for the borough of Leicester, who died in 1765, and left it by will to Thomas Boothby, jun., Esq., of Marston, and to the Rev. Henry Wigley, then Vicar of Scraftoft, to be sold, and the money arising to be applied in making such additions, alterations, and improvements about his mansion at Scraftoft, as they should seem necessary or convenient; and in case there should be afterwards any surplus remaining, it was to be laid out in buying some useful furniture, to go along with and to be used in his said mansion-house. And his heir-at-law, Edward Hartopp Wigley, Esq., of Little Dalby, in 1799 sold the same estate in five lots for upwards of 3,000l., when a moiety of the whole was purchased by William Brown, Esq., of Hinckley.

In 1775, sixteen freeholders polled for Stoke. In this village, in 1790, there were 70 families.

By the return made to Parliament in 1801, it appeared that Stoke contained 82 houses, inhabited by 87 families, 194 males 193 females, in all 387; of whom 58 were chiefly employed in agriculture, and 79 in trade, manufactures, &c.

In the field still known by the name of "Crown Hill" (three acres of which were owned in 1810 by William Sheen of Stoke), close to the north-west end of the village, there have been dug up many human skeletons; which are very common on breaking fresh ground.

A tradition remains that the crown was secreted on this hill (which is but just without the town), and that it was found afterwards by Sir Reginald Bray.

Stoke consists of about 1200 acres of land; no great part of which is ploughed, but chiefly used in dairying and feeding cattle.

DECORATIVE WORKS OF ART

Sent in, pursuant to the notices issued by her Majesty's Commissioners on the Fine Arts, now Exhibiting in King-street, St. James's-street, Westminster.

We have taken a view of these works, but must defer till next week entering into any detailed account of them.

The number of subjects, according to the official catalogue, is 170, but some specimens have been since added to the collection.

We have heard complaints uttered that from some cause many of the most able artists, designers, and workers of these matters of art, have abstained from contributing, while others

of eminence who have sent, have either submitted inferior specimens, or such as are little, if at all, applicable to the pile of buildings proposed to be decorated. This, we have been told, has mainly arisen from such parties having been strictly importuned to contribute, lest an exhibition from which so much was expected should be entirely bare of worthy specimens. In the collection there are some exemplars for iron-work; but, taking these as a whole, they do little credit to the state of English art in that department.

Perhaps while Britain affords such a wonderful proficiency in the mining, manufacture, and general application of iron, there is less general art, properly so called, in its formation,

than in the case of any other material which is manipulated; the peculiar facilities of moulding, forging, and otherwise working this metal, have rendered it one of the most useful generally applied, and indeed necessary materials, which can subserve the purposes of man's wants. Hence it is of the first importance that good taste be bestowed in forming the prototypes from which such prodigious numbers of copies may be made, as in the case of stoves, fenders, and the innumerable articles which are of every-day use, which instead of being over done with a profusion of tawdry tasteless decoration, as is mostly the case at present, may be fashioned so that any one of decency of feeling may choose them, and not

be offended by their vulgarity. We have often been importuned by gentlemen and ladies to attend them to the Carron and other warehouses to choose stoves, but have nearly as often returned without choosing any of the patterns which we have been shewn, the parties instead being willing to pay five times as much for plainer and neater articles of good quality, though, in fact, scarcely after any design, and with little elegance beyond those of the material and its polish; on some occasions we have found, after all the patterns have been looked over, only one neat one has been found, the purchase of which has been determined upon as a *pis aller*, however inappropriate it might happen to be for the particular building within which it was to be fixed. Now, if the vulgarity were to be discharged from all such articles, with few exceptions less work, both in the formation of the models and in the articles as executed, would be required.

We have been told by the vendors of these things, that if by chance any article happen to come into the market which makes some approach to neat elegance of design, such is the natural inclination of mankind towards good taste, that many thousand copies of such articles are always immediately sold, and their manufacture continues for years a source of profitable merchandizing. We shall not this week say more upon this particular subject.

There are, in the collection, specimens of stained glass, mosaics, parquets, encaustic tile pavements, and a variety of other things into which we shall go at some length next number.

Having, as we hinted above, listened to great complaints upon the subject of the specimens of carving, which are indeed comparatively few, and many of which are not applicable to the style of the building, we now only state that we have heard that Mr. Rogers, the eminent and natural carver (like Willemt) did not at first intend contributing, but being pressed so to do, sent works of art carved in wood to the value of upwards of 800*l.*, which, though few of them are in the Gothic style, are many of them brilliant, and such specimens as would do honour to any age; but on visiting the collection we were surprised to find only few of his subjects exhibited and none of them catalogued; on inquiry, we were told that many of the extraordinary works of this accomplished architectural artist were absolutely placed down in a dark cellar beneath the building; and we were facetiously told by a dry cicerone, they are there preserved like gooseberries underground, to be brought up as rare phenomena out of season. We are sorry for this, for we suppose that among the subjects must be some applicable to Pointed Architecture, in which style we know Mr. Rogers to be as eminent in correctness, elegance, and high finish as he is for his master-touch in the vivifying of dry wood into fruit, flowers, tendrils, joint and muscle, and as heretofore was his great predecessor, Grinling Gibbons.

The specimens are in general well-placed for view, though no doubt some, as must necessarily be the case, are in inferior situations. But (during this brilliant weather at least) the light from the great roof-lantern so overpowers the stained glass and some other of the specimens, that scarcely can any idea be drawn, even by analogy, of the effect which these subjects would produce, if fixed in situations in the Houses of Parliament, with the subduing of illumination caused by wire guards, and the weather-soils over mullioned windows.—We trust, in justice to the contributors of this exhibition, this matter of complaint will be remedied.

#### SOCIETY OF ANTIQUARIES.

On the 23rd instant, being St. George's day (the anniversary of the society), the following gentlemen were elected officers for the year ensuing:—

George, Earl of Aberdeen, K.T., F.R.S., President.

Thomas Amoy, Esq., F.R.S., Treasurer.  
Nicholas Carlisle, Esq., K.H., D.C.L., F.R.S., Secretary.

Sir Henry Ellis, Kat., K.H., B.C.L., F.R.S., Secretary.

Hudson Gurney, Esq., F.R.S., V.P.  
Henry Hallam, Esq., M.A., F.R.S., V.P.  
William Richard Hamilton, Esq., F.R.S., V.P.

Philip, Viscount Mahon, V.P.  
Capt. Wm. H. Smyth, R.N., K.S.F., D.C.L., F.R.S.

Thomas Stapleton, Esq.  
Albert Way, Esq., M.A., Director.  
Charles F. Barnwell, Esq., M.A., F.R.S.  
Beriah Botfield, Esq.  
Richard Aldworth Neville Griffin, Lord Braybrooke.

William Bromet, M.D.  
Sir Stephen R. Glynne, Bart.  
Thomas W. King, Esq.  
Rev. Samuel Roffy Maitland, M.A., F.R.S.  
Thomas Joseph Pettigrew, Esq., F.R.S.  
Charles Roach Smith, Esq.

The fellows of the society afterwards celebrated the anniversary by dining together at the Freemasons' Tavern, Viscount Mahon, in the chair.

#### ELEMENTARY ESSAY ON MORTAR AND CEMENTS.\*

BY JAMES WYLLSON, HON. SEC. B.A.A.D.

21. QUICK-LIME AND SLAKED-LIME.—The term *quick-lime* is applied after calcination, and before the lime has been subjected to any other agency. The operation it undergoes preparatory to making mortar is termed *slaking* or *slacking* (i.e. loosening its fixed causticity); this consists in throwing over the heap a quantity of cold water, which, if it has been properly burnt, it absorbs quickly in abundance, causing it soon to become very hot, to crack into pieces with some noise, to puff up and exhale a large quantity of slightly-caustic vapour, consisting of part of the water and a small portion of lime—then falling into a dry and nearly impalpable powder, in which the remainder of the water has intimately combined with the lime, forming what is called *hydrate of lime*, or in plain, practical parlance, *slaked lime*. A degree of discreet practical tact is necessary to be exercised in this process; for if too little water be used, the desired result is not produced, and if too much, the lime is swelled and rendered liable to continue light and porous and of a pulverulent tendency. The slaking gives an increase of about one-fourth on the previous weight, and which it would take a red heat to separate. Good common lime, properly calcined and fresh from the kiln, begins to slake the instant that water is thrown on it, greatly augmenting in volume, sometimes indeed so much as, when slaked to a paste, to have three times the bulk that it had in the state of quick-lime; if over burnt, however, it slakes slowly. Limes of poor quality neither slake so quickly, give out so great a heat, nor swell so much; which is the case also with those limes that are of an hydraulic character; for these, and such other limes as do not slake readily, there is a practice of reducing the lumps by grinding or pounding previous to slaking. Before making mortar, it is usual to screen the lime, if it is of the chalk kind, for the purpose of keeping back such pieces as are imperfectly burnt, and consequently have not been reduced to powder by the slaking, as these would otherwise injure the quality of the mortar. This method is evidently preferable to grinding, which is instead adopted in composing some mortars and cements: screening is not usually necessary with stone-lime. There is another mode of slaking often adopted in winter, which is, by totally immersing the lime in a large vat of water; when, the lime-water being drained off, the slaked lime remains in the condition of a paste; and the sand being wet with rain, as we may assume it to be frequently in that season, no further addition of water is required in making the mortar; but both ingredients are in a ready state for amalgamation. In the summer season this method is not so suitable, the sand being then, in general, too hot and absorbent; this process may better be observed towards hydraulic limes than with common white limes.†

22. Quick-lime should be used as soon as possible; but if not intended for immediate use, ought to be put into water-proof casks soon after being burnt; for, when it becomes cold, it begins to re-absorb carbonic acid, enlarges in bulk, and by falling asunder, and eventually approaching nearly its original state of chalk or carbonate of lime, or rather

that of the dust of limestone.\* Chalk-lime has a greater avidity than stone-lime for carbonic-acid, and the white limes recover it most rapidly, being therefore the most speedily injured in quality by exposure. Magnesian-lime, being one of the slowest in this re-absorption, retains its causticity much longer; Argillaceous-lime possesses a similar property. Workmen heap the slaked-lime together and cover it with sand, to preserve it as far as possible, when not required for instant use. Lime is sold in London by the hundred, which signifies 100 pecks or 25 bushels.

(To be continued in our next.)

#### VISIT OF PRINCE ALBERT AND THE COMMISSIONERS OF FINE ARTS TO THE NEW HOUSES OF PARLIAMENT.

On the afternoon of last Saturday, at four o'clock, his Royal Highness Prince Albert left Gwydyr House, Whitehall, where the Commissioners of Fine Arts, of which his Royal Highness is chairman, sit, and proceeded to the new Houses of Parliament. The Prince was accompanied by Viscount Palmerston, Lord Colborne, Mr. Gally Knight, Mr. Hallam, and Mr. Wyse, members of the commission. Upon his Royal Highness's arrival, he was received by Mr. Barry, the architect, and Mr. Grissell.

The visit was understood to be a formal one, suggested for the purpose of ascertaining the progress made in the erection of the new houses of legislature; and by inspection of the various compartments to form an opinion as to which of them were best suited for the displaying of frescos, statues, and other works of art.

His Royal Highness and the other commissioners first proceeded to the terrace, and inspected the elevation of the river front, and the carvings thereon; after which they directed their steps to the Victoria Tower, which is now 30 feet high. Subsequently to inspecting this tower, the majestic beauty of which called forth the admiration of the Prince, the party proceeded up a temporary staircase, erected where the grand staircase will be, which her Majesty will ascend on the occasion of the opening of Parliament to the guard-room, and from thence to the robing-room, where Mr. Barry produced his plans, and explained the different arrangements of that part of the works. The great point of interest at this portion of the buildings was the Victoria Gallery, through which the Queen will pass in procession from the Royal robing rooms to the House of Lords. This gallery is to be devoted to the reception of statues and busts of all the great literary, naval, and military men of hygone times; and the walls will be covered with fresco paintings. A considerable time was spent in this part of the building, and his Royal Highness paid the most marked attention to the architect's explanations of his future intentions.

The parties afterwards directed their attention to the royal porch or entry to the House of Lords, in which a temporary scaffolding had been erected in order that his Royal Highness, and the rest of the commissioners, might inspect the interior of the House of Peers. The stone-work and elaborate carving of the interior elicited unqualified expressions of praise from the Prince and the other commissioners. This building has reached an altitude of 60 feet, and the main windows on both sides are fixed. It was explained to his Royal Highness that the lower parts of the walls, to the height of about 20 feet, are to be lined with enriched carved oak wainscoting, the upper part of the walls being coated with freestone from Caen, in Normandy, having enriched cornels, supporting niches, in which are to be placed marble statues of the Kings and Queens of England.

His Royal Highness, desirous of ascertaining the effect that would be produced by a statue in one of the niches, had one of the masons placed therein, and was pleased at the result.

It was stated that the greater part of the works of the new House of Peers was of sufficient height to receive the roof, which, we understand, is composed of wrought and cast iron, and is in a state of great forwardness,

\* Continued from p. 201.

† A burning sun was considered by the Roman masons to be as hurtful to mortar as the action of frost.

\* This re-absorption is said to have been first discovered by Dr. Higgins.

and is proposed to be covered with cast-iron galvanised plates.

The Prince and his party next inspected the lobby, which is even in a more forward state than the house itself, the whole of it being embellished with carvings in stone of the richest description, and it will be finished without plaster or cement of any kind being used.

The central hall was the next object of attraction. This hall intervenes between the two Houses of Parliament, and will be made the ventilator for the entire building, by means of a tower, 300 feet in height, which will be above the ascent of smoke, and consequently will furnish fresh and pure air throughout the entire erection.

The party proceeded from the central hall to the front building, intended for the parliamentary libraries and committee-rooms, the public halls of which were minutely inspected. In one of the halls a considerable preparation had been made for the reception of works of art, the walls being lined with stone filled with niches and ready to receive statues.

The Prince and his party did not visit the other parts of the building, including the House of Commons, clock-tower, &c.; but it was explained to his Royal Highness that this portion of the works was also in a state of great forwardness, and most parts were from 18 to 20 feet high. It was also stated that there were 700 men constantly at work.

His Royal Highness and the other commissioners subsequently visited the model-rooms, which are under the direction of Messrs. Thomas and Digby. After inspecting models of the interior of the House of Lords, they proceeded to Mr. Barry's offices, where the details and drawings were laid before the Prince, and explained by the architect.

#### WESTMINSTER LITERARY AND SCIENTIFIC INSTITUTION.

On the 18th inst., being the seventh anniversary of the establishment of the institution, a very numerous and respectable company assembled in the new lecture theatre, Great Smith-street, Westminster, to hear the customary address. It was read by the secretary, and dwelt upon the gratifying fact of the great increase of the members, and the general prosperity of the society. The library, it appears, now contains 4,000 volumes on subjects of science and of general literature. This address, which chiefly consisted of general reflections on the usefulness of the establishment of literary and scientific institutions, being concluded, a lecture, illustrating the usual method of obtaining artificial light, was delivered by Dr. Ryan. In a lucid and interesting manner the lecturer drew attention to the nature of the compound by which light is produced, which is one and the same in all instances, being nothing else than the union of carbon with hydrogen gas. He then explained the conditions necessary to form the combustion, and in the course of this portion of his lecture referred to and clearly illustrated the different kinds of light now in use, and compared them one with another as regards their distinctions and relative advantages. In this way the Argand principle, the Drummond, the Bude, the Boecius lights, and Faraday's beautiful and useful apparatus for the descent of the products of combustion, were brought respectively under review. The lecture was much applauded.

#### HUNGERFORD SUSPENSION BRIDGE.

CASUAL spectators, unacquainted with the art of building suspension-bridges, when they only observe two large masses of masonry erected about 100 yards from each bank of the Thames, with no communication either from the shore or with each other, can little imagine that the structure is so near its completion that during the present summer the public will be enabled to cross from Hungerford-market to Belvedere-road, Lambeth, for the small toll of one farthing each. To the curious this bridge is worth notice, as being the only one in the metropolis dedicated to foot passengers alone, and erected on the principle of suspension. The entire length of the bridge suspended on chains will be 1,342 feet 6 inches; that is, the centre span or arch, 676 feet 6 inches; those on the side, 333 feet each. The width between the chains will be 14 feet, and of the clear pathway

13 feet; the height of the flooring above high water (Trinity standard), in the centre 31 feet 6 inches, at each pier 28 feet 6 inches, and at each abutment 22 feet 6 inches; the height of each pier above the flooring 55 feet 3 inches; the number of main plates which form the chain is 2,500, about 24 feet each in length. The total weight of iron is between 700 and 800 tons, and the estimated cost, including the approaches, is 110,000*l.* It will be seen, that its centre span alone is nearly 100 feet greater than the entire of the deservedly-celebrated Menai-bridge, which is 579 feet 10 inches. It is likewise 274 feet greater than the centre span of Hammersmith-bridge, which is 402 feet 3 inches; and above three times as great as the centre arch of Southwark-bridge, at present the largest in London. Indeed, with the exception of the wire-bridge at Fribourg, in Switzerland, which is 870 feet, it will be by far the largest in existence; and will, with the Thames Tunnel, the block-machinery at Portsmouth, the Great Western Railway, &c. &c., assist to hand down to posterity the enterprising spirit and genius of a Brunel.

#### CHURCH-BUILDING INTELLIGENCE, &c.

*St. Martin's Church, Canterbury.*—Extensive repairs, amounting indeed to a complete renovation of the ancient church of St. Martin, near this city, are now going on, the old fabric having become dilapidated and insecure. The expense is to be defrayed by a subscription, the Rev. Mr. Chesshyre being the principal contributor. The church has long been an object of great interest as traditionally the first Christian temple erected in England. Its origin is assigned by some to the Roman soldier under the first conquerors of Britain, and it is recorded by Bede that St. Augustine and his fellow-labourers resorted hither to their devotions, on their first arrival, by license of King Ethelbert at the instance of his pious Queen Bertha. It is a plain structure, built in part of Roman bricks, but from its associations an object of much interest to visitors. An ornamental stone cross about two feet long was some time since found here, bearing an inscription in the centre which it has puzzled the local antiquaries to decipher, and which still remains a mystery.

Additional churches are to be erected at Henbury, in the parish of Prestbury, Cheshire; North Brent Tor, in the parish of Lamerton, Devon; Shortley-bridge, in the parish of Lanchester, Durham; Zeals, in the parish of Mere, Wilts; Heaton Norris, in the parish of Manchester; Morpeth, Northumberland; Middleton, Sussex; Whitstable, Kent; Swanmore, parish of Droxford, Hants; Essington, parish of Bushbury, Staffordshire; Chittoe, parish of Bishop's Cannings, Wilts; Coton in the Elms, parish of Lullington, Derbyshire; and Ison-green, parish of Lenton, Nottingham.

The churches at the following places are to be rebuilt, namely, at Garforth, near Leeds; Letterston, near Haverfordwest; and Aspley Gate, near Woburn.

The churches at Wylde, near Heytesbury; Duddington, near Stamford; Boyton, near Oldham; Thame, Oxon; Semley, near Shaftesbury; Llanfihangel, Uwcegwili, near Aberguil, Carmarthen; and Dalbury, near Derby, are to be enlarged.

Her Majesty the Queen Dowager has graciously bestowed 30*l.* upon the Holme Cultram Churches, Cumberland.

#### RAILWAY INTELLIGENCE.

*South Devon Railway.*—There have been two or three preparatory meetings relative to the formation of a railroad from Tavistock to Plymouth, to unite at the latter place with that from Exeter; it will have the support of his Grace the Duke of Bedford, Sir A. Buller, and other influential persons; the former nobleman has promised a donation of 2,000*l.* the ground for the terminus, and the road where it passes through his property: an example which it is expected will be followed by other public-spirited proprietors. It is proposed to raise the required capital of 150,000*l.* in 6,000 shares of 25*l.* each; partly by tonnage investments, and partly by the issue of shares.

*Opening of the Bristol and Exeter Railway.*—On Wednesday (says the *Exeter Gazette*) there was a meeting of the active and intelligent committee, which was attended by a deputation from the Bristol and Exeter railway direction, consisting of some of the directors, and Mr. Badham, the secretary. It has been determined that the entertainment shall consist of an elegant *déjeuner-à-la-fourchette*, to be given to the numerous distinguished guests who have been invited, at two o'clock on the day of opening, in the spacious shed which has been lately erected at the terminus in this city, which measures 160 feet by 90, and the use of which has been kindly afforded by the directors of the Great Western Railway. It has also been determined that each subscriber of one guinea to the celebration fund shall have the privilege of purchasing a ticket for himself at the price of 10*s.*, and two for his friends, at the rate of 10*s.* each for gentlemen, and 5*s.* each for ladies; and that no ticket will be procurable under any other circumstances, with the exception of the guests who have been specially invited, and the shareholders of the line, who will receive invitations from the directors.

*Lynn and Ely Railway.*—This undertaking progresses favourably: the proposed line has been carefully inspected by Mr. Rastrick, the engineer, who in every respect confirms the opinion entertained by the projectors of its eligibility in regard to purchase of land and total absence of difficulties in construction. On the other hand, the details of present traffic from Lynn, and the amount of income to be derived therefrom, have been most rigidly scrutinized by men of business, not the originators of the scheme, extremely cautious in judgment, and determined not to be satisfied by mere conjecture; the result is a firm conviction in their minds that a high rate of interest will accrue to those who eventually become shareholders. A requisition to the High Sheriff for a county meeting, on the subject, is in course of signature—at which many influential landed proprietors have promised to attend.—*Cambridge Advertiser.*

*English and Bristol Channel Railway.*—This long desired project is about to be carried out. We understand the line projected will commence at Bridgwater, proceeding to Langport, thence to Ilchester, following the Ye to its source, thence to Dorchester, after which it will follow the River Frome to Wareham, terminating on the Hamworthy side of Poole. This scheme is wholly independent of a line of railway projected from Southampton to Dorchester,—it is probable, however, that a junction between the South-Western and Channel Railways may ultimately be effected from Salisbury. We have reason to believe that a prospectus of the Channel Railway will very shortly appear.—*Sherborne Journal.*

*Southampton and Dorchester Railway.*—Sir I. Brunel last week visited Weymouth, being on his survey of this projected line of railroad. His opinion is unqualifiedly decisive as to the judiciousness of the undertaking, which will be proceeded with as soon as the preliminary arrangements will permit; and further, that a railroad will be forthwith laid down from Bridgwater to Weymouth; thus completing an uninterrupted transit from the Northern and Midland Counties to the Channel Islands and South of France, and also forming a connecting and direct line, so long the great desideratum between the two channels.

*Birmingham and Gloucester Railway.*—The directors of this company have instructed their engineer, Mr. Stephenson, to make the necessary surveys, with the view of affording a communication by railway to the district situated between Warwick, Leamington, Rugby, and Oxford, by way of Banbury.

*Chester and Holyhead Railway.*—On Friday week, at a special meeting of the directors, the bill now before Parliament for a railway from Chester to Holyhead, a clause in which empowers the London and Birmingham Railway to subscribe to the line to the extent of one million sterling, was unanimously approved.

*Newcastle and Darlington Junction Railway.*—The Durham branch of this railway is now opened to the public. There is therefore now only about four miles of coach road between Gateshead and London, and the entire line, it is expected, will be opened on the 18th June.

**The Electrical Telegraph.**—This is a very ingenious contrivance or invention of Mr. Bain, by means of which communication can be made almost instantaneously at a distance of many miles from one terminus to another. A sheet or plate of zinc is placed at one terminus, and a sheet or plate of copper at another; the connection between them is by a copper wire. A voltaic battery is thus created, the electric currents being produced by the earth and this simple apparatus. The currents are constant, the variations during eighteen months being found to be very small. The mechanical part of the apparatus consists of a clock at each terminus, with an index and figures marked on a circular plate from 1 to 9; these figures point out certain letters, or words, or sentences, in a vocabulary, and by these means intelligence of various events can be communicated from one terminus to another. The electric fluid operates upon these clocks so as to stop the index at the required figures; the clocks themselves being put and kept in motion by weights. There are some other minutar and more delicate details in the construction of these engines, by means of which the accuracy is better secured than in former inventions, and there is a contrivance by means of which the numbers are printed, without loss of time, on a paper attached to a cylinder or drum. The telegraph has been at work at the terminus of the South-Western Railway, the plate of zinc being at Nine Elms, and the plate of copper at Wimbledon, a distance of six miles. The results have proved highly satisfactory, and established the rapidity and accuracy of communication, and the simplicity of the means by which it is accomplished.

**Railways in Prussia.**—The Hamburgh papers of the 13th instant contain the following singular notification, copied from the *Prussian Gazette*:—

"The Prussian Minister of Finance has issued a notice to the following effect:—

"The constantly increasing number and extent of the projects for constructing iron railways, which have been eagerly brought forward of late, begin already to have a pernicious influence on commerce and manufactures, by withdrawing from them the capital necessary to carry them on, and employing it in dealing in railroad shares. But these disadvantages must be more visible, and in many cases, undoubtedly ruinous, if besides the railroads already approved, or especially recommended by the provincial assemblies, all or the greater part of these projects should be carried simultaneously into execution, since they would require enormous sums of money, and a much greater amount of labour than can be spared from manufacturing industry. It seems, therefore, the more necessary to check these numerous extensive projects, as they are often used to carry on improper intrigues and to promote ruinous gambling in the shares. The Minister announces that he is authorised to state, that (with the exception of cases for which the most urgent reasons shall appear) no further permission for the construction of iron railways will be granted for several years to come, and he warns all persons to avoid purchasing shares in such unauthorised projects."

**Atmospheric Railways.**—The *British and Foreign Review* says—"The Atmospheric Railway is no longer an experiment, but an established means of transit, tested and proved by repeated trials, and by the opinions of the most eminent engineers, English and Continental, who have witnessed and watched its success, and expressed their opinions satisfactorily upon the subject. Amongst the opinions expressed by the most eminent of our engineers, is that of Mr. Brunel. The prospectus of a Gravesend and Chatham Company, which has recently appeared, contains a recommendation of the committee, founded upon the opinion of their engineer, I. K. Brunel, Esq., to adopt the atmospheric system. The prospectus states that 'The committee, having made a satisfactory inquiry as to the decided economy with which the Dublin and Kingstown Extension Railway is now being worked as an atmospheric line, and their engineer having satisfied himself as to the advantages this plan of motive power affords, recommend its adoption on the proposed line of communication, both as a means of keeping the capital within a very moderate compass, and increasing the profits by a reduced charge of working.'"

**Rival Railways.**—Lines of railway are projected by the Great Western Company, from Oxford to Banbury, and from that town a railway is projected to Worcester. In opposition to this movement, the London and Birmingham Company are projecting railways from Aylesbury to Oxford, and from Oxford to Leamington, by Banbury.

A railroad, to cross the river Severn near Purton, and to proceed from Stonehouse, on the Great Western line, through the Forest of Dean, to Monmouth, thence down the valley of Usk, beyond Brecon, and afterwards by the river Towy to Carmarthen, is confidently talked of.—*Gloucester Journal*.

## Correspondence.

### MORTARS AND CEMENTS.

SIR,—In Mr. Wylson's Essay on Mortars and Cements, he states in the last paragraph that he is not aware of the Coral Islands being used as lime. I beg to refer him to John Williams's "Narrative of a Residence in the South Seas," and I believe, also, Ellis's "Polynesian Researches," for information on this subject, when he will find that Mr. Williams has used it for building and plastering. I have not either of the works by me, or I would send you the passages.

While on the subject of cements, in a *Builders' Dictionary* of 1734, I find the following article on cement, which may be new to many of your readers:—

"Cement, in architecture, is a strong sort of mortar used to bind or fix bricks or stones together for some kind of mouldings; or in cementing a block of bricks (as they call it) for the carving of capitals, scrolls, or the like.

"It is of two sorts; one called *hot cement*, and the other *cold cement*, because the hot cement is made and used with fire, and the cold cement is made and used without fire.

"To make the hot cement, take half a pound of bees'-wax, an ounce of fine brick-dust, an ounce of chalk-dust or powdered chalk; sift both the brick-dust and chalk through a fine hair sieve (the brick and chalk may be beat in a mortar before it is sifted). Let all these be boiled together in a pipkin or other earthen vessel for about a quarter of an hour, keeping it continually stirring with a piece of iron or lath, then take it off and let it stand for four or five minutes, and it is fit for use.

"The bricks which are to be cemented with this kind of cement must be made hot by the fire before the cement is spread on them, and after that, be rubbed to and fro one upon another, after the same manner joiners do, when they glue two boards together.

"The cold cement is less used: and is accounted a secret known but to few bricklayers. It is made in the following manner:

"Take a pound of old *Cheshire* cheese, pare off the rind and throw it by, then cut or grate the cheese very small, put it into a pot with a quart of cow's milk, let it stand all night, and in the morning take the whites of 24 or 30 eggs, and a pound of the best unslacked or quick lime, and beat it in a mortar to a very fine powder, sift it in a fine hair sieve, put the cheese and milk to it in a pan or bowl, and stir them well together with a trowel or such-like thing, breaking the knobs of the cheese, if there be any, then add the whites of eggs, and temper all well together, and it will be fit for use.

"This cement will be of a white colour; but if you will have it of the colour of brick, put into it either some very fine brick-dust or some almagram, but not too much, but just enough to give it a colour."

I remain, Sir, yours truly,  
Marylebone, April 22, 1844. B. E. N.

### RAVAGES OF THE WORM IN TIMBER.

SIR,—In your paper of the 6th instant, I see a letter from "A Correspondent," calling attention to a description of wood grown in the West Indies, which he says resists the ravages of the worm. The value of such a wood for piling and dock-gates would be immense, and your correspondent's statement should be corroborated if possible. I have myself made some inquiry on the subject, and learn that a quantity of this timber came into London a year or two ago. Perhaps some of your subscribers may have used it, and if so, a

communication through your journal would be welcome to myself and other parties who have not seen any of the timber used.

Ought not our government to import a quantity of such a wood, which for their own works, and for the trade, would be so valuable; and which would benefit our West India Islands, at present said to be so much depressed?

I am, Sir, your obedient servant,  
London, 12th April, 1844. G. H.

### TIMBER SCARFING.—ROOF TRUSS OF PRINCESS'S THEATRE.

SIR,—Will your correspondent, a "*Practical Carpenter*," complete his description of this roof-truss by answering the following questions:—

What are the lengths of the timbers out of which he formed his tie-beams?

Are the fitches secured together by any means other than those shewn in the sketch?

What is the length of the scarfing?

What is the distance between the trusses?

and  
What iron work is attached to the kings, queens, and principals?

I am, Sir, A CONSTANT READER.

### METHOD OF BUILDING A BRICK COLUMN.

SIR,—In answer to "J. T.," I beg to send you a plan of the best and most substantial method of building a brick column of two feet diameter. Each course is so arranged that no

two bricks or joints will fall on each other, which is the very *spirit* of all brick bond; the dark space in the centre may either be filled up or left open; I should prefer the latter mode. The pieces of brick which must be cut off from each end of the stretchers will serve to fill up the small equilateral spaces, so that absolutely there is no waste material whatever.

"Then as to the method of 'carrying it up,' I have found the following the most easy, as also the most accurate: Get a cylindrical rod of iron, about half an inch diameter, also, a piece of wood cut to the proper length for a *trammel*, half an inch thick, and 1½ inch wide, bore a hole in one end, the same diameter as the rod, over which slip the trammel; then fix the iron rod perpendicular in the axis of the column, quite firmly at the bottom and top. The trammel will serve as a guide to the workman in carrying up the brickwork; at the same time the proper *entasis* could be given to the column by shortening the trammel gradually.

If you think the above description worthy of insertion in *THE BUILDER*, you will much oblige, Sir, your obedient servant,

JOHN PHILLIPS.

[If our correspondent will furnish us with the improved theory of brick bond relative to which he has written, it shall be inserted if we find it meritorious.—Ed.]

SIR,—Will you, if convenient, inform me whether a person holding the lease of two adjoining houses, and underleasing a portion of one to another person, can, without notice, build upon the yard, leaving only a passage for passing by, the light of the rooms of course being very much hindered by such building? By answering the above you will much oblige, Sir, your obedient servant,

A CONSTANT SUBSCRIBER.

Hackney, April 24, 1844.

[No person can, without being subject to action, build so as to injure any light of any adjoining premises which has been enjoyed 20 years, nor can any person injure in such way his lessee's light, without incurring similar liability.—Ed.]

COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. IV.

**HYPOTRACHELIUM.**—We find the meaning of this word thus given by Mr. Gwilt: "Hypotrachelium (Gr. ὑπό, *under*, and τράχηλος, the *neck*); the slenderest part of the shaft of a column, being that immediately below the neck of a capital." (Encycl. p. 987.) As this definition is not sufficiently explicit, we subjoin that of Professor Hosking:—"Hypotrachelium (Gr. ὑπό, *upon*, and τράχηλος, the *neck*), the part forming the junction of the shaft with the capital of a column; the neck of the capital itself. In some styles it is a projecting fillet or moulding, and in others, as the Doric, it is composed of a channel or groove, and sometimes of more than one." It would appear, therefore, that under this term, which we shall, for convenience, translate as *necking*, is included all that portion of the upper part of a column which is contained between the lowest annulet and the junction of the capital to the shaft. In some columns this joint is so fine as to be scarcely discernible, as in the temple of Minerva at Sunium, in the temple of Jupiter Nemaus, in the Agora at Athens (the only good feature in the capital), and in the principal temples at Agrigentum. In other temples, again, the joining shews a slight sinking or groove, as in the Parthenon (No. 1),

No. 1.

and in the Propylæa at Eleusis, and at Rhampus. The joint in the columns of the Propylæa at Athens resembles No. 2, whilst in those

No. 2.

of the temple of Theseus the sinking has a double chamfer (No. 3). In the columns of

No. 3.

the temple at Corinth, the necking consists of

No. 4.

three grooves, divided by fillets (No. 4), which

No. 5.

are shewn of their full size at No. 5. At

No. 6.

No. 6 is seen the necking of a column belonging to the great Hexastyle temple at Pæstum, which consists of two grooves cut in the form of beads, and agreeing with the flutes of the shaft. At No. 7 is seen the profile of

No. 7.

grooves to the columns of the temple of Apollo at Bassæ. These, which are of the full size, are from Mr. Donaldson's illustrations of that building. In allusion to examples like those last given, the Earl of Aberdeen observes:—"There are other signs which mark the antiquity of columns, one of which are the three grooves sometimes found at the hypotrachelium or necking of the shaft. Although these do not occur in every example of the earliest temples, they are never to be discerned in those of later date, and when inserted, may invariably be considered as the work of a remote date." (Enquiry, p. 154.) Judging, therefore, by the examples of the Parthenon and Theseum, and other works of good design, we may conclude that the architects of the best era of Athenian taste, the days of Pericles, did not consider it as an improvement to their columns to make the hypotrachelium a prominent feature, as important, in fact, as the annulets, as seen at Corinth and Selinus. The temple at Corinth, there is every reason to believe, is the oldest Doric edifice extant.

I know that it is usual in describing a capital to include in it the necking; and in orders, where the flutings of the shaft are carried no higher than the necking, this description is just; but as no one would dream of reckoning the flutings as part of a capital, I consider that in a Grecian Doric column we should hold that the capital in truth terminates with the

annulets, although, for convenience sake in execution, the upper part of the column is cut out of a block with a continuation of the flutings. In the Grecian Ionic and Corinthian orders, and in all the Roman orders, the necking, which is often called the astragal, invariably consists of a torus, or bead, above a fillet, and in all these orders the flutings as invariably stop under the neckings. In the temple of Minerva-Polias at Athens, the necking is placed at some distance below the volutes (the bead of this necking is carved), differing in this respect from the capitals of the Iliissus and of Asiatic-Ionic examples, where the shafts run up to an astragal beneath the moulded echinus between the volutes; such capitals, therefore, may be said to be deficient in hypotrachelia. It has been ascertained that the capitals of the columns at Agrigentum and at Tboricus were joined to the shafts by cedar plugs, through which passed cylindrical wooden pins, no cement being used. Mr. Hosking calls the space in Doric and Ionic columns, between the mass of the capitals and the hypotrachelium, by the term trachelium, or neck, and this distinction seems to be a just one.

**ΑΠΟΘΗΣΙΣ** (from ἀπό, and θέσις, thesis, position) signifies divergence, and is the term which should be applied to that curve or hollow which unites the shaft of a column to the fillet or annulet in the necks of columns, in contradistinction to the word—

**ΑΠΟΦΥΓΗ**, which implies recession (from ἀπό, far, far off, and Φυγή, Gr. *fuga*, Lat. *flight*), and which is understood to apply only to the curve found at the lower diameter of all columns which have moulded bases. Mr. Gwilt thus defines this word:—"Apophyge Gr., signifying flight). That part of a column between the upper fillet, or annulet, on the base and the cylindrical part of the shaft of a column, usually moulded into a hollow or cavetto, out of which the column seems as it were to fly or escape upwards. The French call it *coiffe*, as it were, *leave to go*." (Encyc. p. 894.) A Grecian Doric column, therefore, is the only one in which an apophyge, or common with the other orders, the apothesis or cavetto at the upper diameter of the shaft. The two hollows we are speaking of are always repeated at the two extremities of the pilasters of all the Roman orders, but are never found in such positions in the *antæ* of the Grecian Doric; and only the apophyge, or lower hollow, is found in the *antæ* and pilasters of the pure Grecian Ionic and Corinthian orders. G. R. F.

Miscellanea.

**THE ROYAL EXCHANGE.**—There is prodigious competition, we are informed, among our sculptors for shares in the allotment of the additional 10,000*l.* for statuary to adorn the Royal Exchange. Noticing which, we would inquire if the City Wellington Statue, now complete in the studio of the late Sir F. Chantrey, is to be placed, as it ought to be, on its pedestal in this locality, on the 18th of June, the anniversary of Waterloo?—*Literary Gazette*.

**HEREFORD CANAL.**—Sums amounting to a much larger total than is required to complete the Canal have been tendered in loan to the Company. On Thursday week the able engineer, Mr. Stephen Ballard, commenced the work from Withington to Hereford, and by this time next year we hope to see it completed to the bottom of Holmer-lane; by autumn twelvemonths we anticipate the completion of the entire line to Hereford, and also a glorious gathering in this city to celebrate an event fraught with interest to the city and county.—*Hereford Times*.

**THE STONE PIER AT GREENWICH.**—Considerable alarm has been excited on the stone pier in consequence of a further portion of the structure having given way.

On Dartford Heath are clearly developed the tracing of a Roman encampment, which hitherto has escaped the notice of the military Kentish historians.—*Dover Chronicle*.

\* With the single exception of the Chœregie Monument of Lyciocrates, where the necking is a plain groove, which some writers, and among them Athenian Stuart, think was intended to be "filled with an astragal or collarino of bronze;" whilst other writers consider that the artist only followed the practice observed in Doric capitals.

**BAD VENTILATION OF PLACES OF WORSHIP.**—Few spectacles are perhaps more melancholy than those presented in cases such as these. The congregation is not unfrequently placed in an atmosphere of extreme impurity, poisonous in its tendency, arresting or interfering with some of the most important functions of life to such an extent, that they are occasionally suspended for a time, when a temporary death or fainting takes place. But what must the state of the mind have been, and how far was it beneficially occupied, in the devotional exercises in which it was previously engaged. The power of the clergyman is often reduced, as well as the attention of the congregation. Too often he does not recognise the darkness of the physical atmosphere that at times oppresses all his labours, and counteracts or diminishes his usefulness, as much by the power with which it subdues his own energies, as by the careless indifference which it encourages in his congregation. At the very moment that he may be descending on the pernicious influence of vice, and pointing out the purifying power of that moral atmosphere which should surround the heart, how often are his labours shorn of their power by the physical poison that sometimes paralyzes the best intentions, the indications of which are manifest on the application of the most ordinary tests, and whose influence might be counteracted by means equally simple and efficacious.—*Reid on Ventilation.*

**AGE AND EXTRAORDINARY SIZE OF AN OAK.**—At about six miles W.S.W. of Saintes (in the Lower Charente), near the road to Cozes, stands an old oak tree, in the large court of a modern mansion, which still promises to live many centuries, if the axe of some Vandal does not cut it down. The following are the proportions of this king of the forests of France, and probably of all Europe:—

Diameter of the trunk at the ground . . . . .	from 9 to 10 yards
Diameter at the height of a man . . . . .	6½ to 7½
Principal branches . . . . .	1 to 2
Diameter of the whole head . . . . .	40 to 42
The height of the trunk . . . . .	8
The general height of the tree . . . . .	22

A room has been cut out of the dead wood of the interior of the trunk, measuring from 9 to 12 feet in diameter and 9 feet high, and with a circular seat cut out of the solid wood. A round table is put in the middle when it is wanted, round which twelve guests can sit. A door and a window admit daylight into this new sort of dining-room, which is adorned by a living carpet of ferns, fungi, lichens, &c. Upon a plate of wood taken from the trunk, about the height of the door, 200 concentric and annual rings have been counted, whence it results, in taking a horizontal radius from the exterior circumference to the centre of the oak, that there must have been from 1800 to 2000 of these rings, which makes its age nearly 2000 years.—*Annales de la Société d'Agriculture de la Rochelle.*

**BRIDGEWATER CANAL.**—Preparations are making for carrying on an extensive trade in salt between the mines, at Northwich, in Cheshire, and the port of Hull, through the medium of the Manchester and Leeds, the Leeds and Selby, and the Selby and Hull railways. This communication, it is said, is to be completed by converting the Duke of Bridgewater's canal, which was constructed about the year 1760, under the direction of Mr. Brindley, the engineer, into a line of railway from the salt mines to Manchester, to join the railways passing eastwards and communicating with the German Ocean.—*Leeds Mercury.*

At a meeting of the Five Districts Societies of St. Marylebone, held at the Court-house, Wednesday, April 24, present, the Rev. Dr. Spry, in the chair, the reports from the several districts were read, from which it appeared that, during the past year, 3,801 persons had been relieved by their visitations, and the sums distributed amounted to 1,395*l.* 0*s.* 1*d.*

**TRAFALGAR-SQUARE.**—The whole of the terrace-walks within the area of the above promenade are completed, and this square will be opened to the public on Monday next.—*Globe.*

**Current Prices of Metals.**

**NOTICES OF CONTRACTS.**

For the erection of a Bridge at Ililton, in the parish of Woodfield, Salop, and also for lowering and improving the upper part of Hilton Hill.—Plans, &c., at Mr. Stokes, Shipley, May 8.

For the erection of a Theatre at Wolverhampton, —Drawings, &c., at the Peacock Inn, Wolverhampton. Mr. Tichborne, Wolverhampton, May 6.

For re-building the Western Pier of the Number Dock Basin, and the removal of the present Pier included, or to be provided for in a separate tender, as may be most convenient.—Secretary to the Dock Company at Kingston-upon-Hull. Plans, &c., at Mr. Michael Lane's, Engineer, Castle-street, Hull, May 20.

For Warming and Ventilating the new Workhouse at Aylesbury.—The Guardians of Aylesbury Union, Bucks. Plans of the Building at the Office of Messrs. Savage and Foden, Architects, 31, Essex-street, Strand, May 1.

For works required in the enlargement of the Reigate Union Workhouse at Redhill.—Plans, &c., at the Board-room. Mr. Thomas Hart, Clerk to the Guardians, May 6.

For repairs and alterations of the Branch Bank, Aylesbury.—G. H. Taylor, Esq., Architect, 22, Parliament-street, Westminster, and 22, Queen-street, City; or at the Branch Bank, Aylesbury, April 29.

For altering and completely finishing the carcasses of two Houses in Middleton-road, Queen's-road, Dalston.—Mr. James Clark, 4, Richmond-Terrace, Queen's-road, Dalston.

For building an Union House, at Lock's Bottom, Farnborough, Kent.—Mr. Henry Nottingham, Clerk to the Guardians, Keston, Kent. Plans, &c., at Messrs. Savage and Foden's, Architects, 31, Essex-street, Strand, May 10.

For the erection of a Cast-iron Bridge, with brick piers and approaches, at Somersham, Haunts. G. Thomson, Esq., Somersham, April 29.

For Bricklayer's and Mason's Work in making

certain alterations in the front of the Ipswich Savings Bank.—Mr. J. M. Clark, Architect Brook-street, April 30.

For the erection of an Iron Bridge of one arch, of one hundred and ten feet span, intended to be built over the river Avon, at Bath.—P. George, Esq., Town Clerk, Bath.—Drawings, &c., at G.P. Manners, Esq., Architect, No. 1, Oxford-row, Bath, May 31.

For the several Repairs to the Barber's Hall and Buildings adjoining Monkwell-street, City.—Specification at the Hall. Further particulars of Messrs. Closs and Son, Surveyors, &c., 33, Clement's-lane, City, April 30, 1844.

For building a House, Shed, Cellarage, and Vaulting.—Mr. Bellingham, near the bridge, Great Cambridge-street, Haggerstone. Mr. Catling, Architect, May 2.

For erection of a new Union Workhouse at Highland's Farm, in the parish of Cuckfield, Sussex.—Particulars, Plans, &c., of Mr. T. Wisden, Hampton-place, Western-road, Brighton, May 10.

**ERRATA.**

In the diagrams from No. 1 to 5 inclusive, inserted last week, illustrating Smith's Weather-tight Sill-bars, Fastenings, Revolving Shutters, &c., the engraver neglected to reverse the subjects on the wood-blocks, so that right and left hand are changed.

Page 205, 2nd column, line 15 from bottom, after "The difference," add "is unknown."

**TO OUR CORRESPONDENTS.**

"Your Reader from the First."—We refer to page 71.

"Mr. Charles Newnham."—We have not so much fear as our correspondent on the subject of the proposed new Building-Act. Among many complaints made by him, we do not think valid his objection to having slabs 18 inches wider than chimney-openings; this requirement would be not barthenous, and would be serviceable. Indeed, we think a chimney-slab cannot, for safety, be too large. Whether chimneys be worn or not by machines (which we think does not necessarily follow), humanity requires that chimney-climbing be forbidden, and that if a few chimney-sweeps may at present be compelled to seek other employment, that is not a sufficient reason for perpetuating any thing so abominable. We think it much less humane to force young parish apprentices up narrow, sooty, and sometimes burning chimneys, than to leave "to starve," as our correspondent says, such few chimney-sweeps, if there be any, which we doubt, who prefer starving to obtaining a livelihood in some calling more wholesome and cleanly. With some of the other matters of our correspondent's letter we agree.

We have under consideration "Hints for a Design for a Cemetery Cathedral," the Cambridge Post-cover, and the Grecian Design for a School. We have received the beautiful window of Thornbury Church, and will publish it as it is if our correspondent cannot procure draughts of its jambs, mullions, label, saddle-bars, &c.

Our two correspondents' questions relative to "Tudor" Arches, will be answered in our next.

- MEETINGS OF SCIENTIFIC BODIES,**  
To-day and during the ensuing week.
- SATURDAY, APRIL 27.—Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.
  - MONDAY, 29.—British Architects, 16, Lower Grosvenor-street, 8 P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.; Zoological, 57, Pall Mall, 3 P.M. (anniversary.)
  - TUESDAY, 30.—Civil Engineers, 25, Great George-street, 8 P.M.; Free-asons of the Church, adjournment of the 17th Chapter, 8 P.M.
  - WEDNESDAY, MAY 1.—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset House, 8½ P.M.; Horticultural, 21, Regent-street, 3 P.M. (anniversary); Royal Institution, Alhmarle-street, 8½ P.M. (anniversary).
  - THURSDAY, 2.—Royal, Somerset House, 8½ P.M.; Antiquaries, Somerset House, 8 P.M.
  - FRIDAY, 3.—Royal Institution, Alhmarle-street, 8½ P.M.; Botanical, 20 Bedford-street, Covent Garden, 8 P.M.

**ADVERTISEMENTS.**

**BREWING and WASHING COPPERS**  
and COPPER WARES of all descriptions, 92 and 93, Houndsditch.—LAVER and SON, Manufacturers of Sills, Sugar Pans, Dyers' and Silters' Coppens; also every variety of minor Utensils for Chemists, Confectioners, Victuallers, Varnish Makers, &c., at prices that cannot fail to give satisfaction. Copper Work made to drawing, or repaired. Price of Drawing Coppens 1*s.* 6*d.* per lb.; Washing Coppens 1*s.* 2*d.* per lb.; with suitable allowance to the Trades.

Improved Green-house Boilers and Steam Apparatus in general.

# The Builder.

NO. LKV.

SATURDAY, MAY 4, 1844.

EVERITY of criticism it is not our intention to indulge in upon the present occasion; though from the frequent views

which we have taken in our repeated attendances in the exhibition-room in St. James's-street, Westminster, we this week commence a tolerably minutely detailed review of the

## DECORATIVE WORKS OF ART

Sent in, pursuant to the notices issued by her Majesty's Commissioners on the Fine Arts, now publicly Exhibiting.

The following works were sent in by Mr. W. G. Rogers:—

A carving in oak of a stand for an oriental bloodstone cannon mounted in gold, for her Majesty the Queen Adelaide.

A magnificent chimney-frame, executed for W. Beaumont, Esq., M.P., composed of boldly-carved fruit and flowers, boys, birds, &c.

A royal trophy, in the style of Gibbons, representing the point-lace neckcloth of Charles the First, sword, sceptre, emblems of the chase, &c.

A carved oak lectern, with black letter inscription.

Figure of Mary in carved pear-tree wood.

Three panels of Gothic tracery.

Four flower brackets.

Eight scroll brackets.

A richly carved Venetian boss.

A finial.

A hanging niche, exhibited by permission of G. Simes, Esq.

A Gothic frame, exhibited by permission of Norman Wilkinson, Esq.

Two fine groups of fruit and flowers, and one in porcelain (an extraordinary specimen of ornamental china never before attempted in this country).

A three-light girandole in wrought-iron, executed for Sir W. James, M.P.

All these works are, in their several styles, very admirable and many of them shew design of a character wonderfully fine.

1. Design for the principal door of the House of Lords, by Thomas Legg.—The centre panels contain the emblems of the three kingdoms, and two shields, on which are placed the arms of the cities of London and Westminster. At the bottom of the upper panels are ranged the crowns of the peers in the proper order of precedence, and in the heads of the end panels the arch-bishop and bishop's mitres. The royal arms and supporters are placed on the principal centre panel, and on either side the arms of England, Scotland, and Ireland. On the small shields at the top of the door are arranged the arms borne by successive monarchs, &c., from the time of Edward the Confessor.

The general design is neither rich nor original, but the specimen or work is cleanly carved.

3. Design for the principal door of the House of Lords, by William Ollett.

This composition is rich, but the figures which decorate it are too short; its framework, composed of arms, would give interest and variety to the composition.

5. Design for a door for the House of Lords, by John Steel.—This design is divided into six panels, surrounded by twelve figures, emblematical of the twelve months of the year,

placed in niches with canopies and brackets, Britannia being the surmounting figure in the centre above. In the centre two panels are urns containing corn, fruit, and flowers. In the four other panels are different shields, representing the rise and progress of Great Britain.

This is in a mixed style which ought to be entirely reprehended.

7. Design for the principal door of the House of Lords, representing the Barons demanding the Charter of Liberties from King John, by William Freeman, junior.

A fair design, though not entirely happy.

9. Design for the principal door of the House of Lords, by Samuel Pratt, junior.

A rich design, but too much in the French flamboyant style; over-done with ornament; the carved specimen of which is not sufficiently finished. The pure English style is in detail beyond comparison superior to Continental Gothic.

11. Design for the principal door of the House of Lords, by S. A. Nasb.—In this design red lines shew the extent of each leaf of a pair of folding doors, similar in arrangement, the head of the arch being left fixed. In one door is represented a portrait statue of King Henry III. (from his effigy in Westminster Abbey), the monarch under whom the first traces of the present constitution of a Parliament appeared. In the corresponding situation it is proposed to place the resemblance of the reigning sovereign. The subject of the sculpture proposed for the head of the arch is the memorable event in the history of English constitutional government, which took place in Westminster Hall on the 3rd May, 1253, when the peers obtained from Henry III. a fresh and most solemn confirmation of liberty for his subjects.

This composition has much beauty, and would, with some alteration, serve for one of the doors. The sculpture in the head of the doorway would have a very fine effect.

13. Design for the principal door of the House of Lords, by John Thomas.—This design is divided into four panels; the figures in these panels, under canopies, are the patron saints of the four divisions of the United Kingdom. Under these, in a band forming the centre style, is the name of each figure, and corresponding division, such as "St. George for England," &c.; the lower panels are filled in with the heraldic devices of hearings, helmets, crests, and mottoes proper to each; the whole resting on a plinth, with the motto of "O Lord, preserve the Queen." The tracery above the canopies is enriched with the roses of Lancaster and York united, having the thistle and shamrock on each side; the door is intended to open in the centre, the joint being concealed by an enriched buttress, which forms the centre ornament.

This is another good design with a decorative effect more perpendicular than the last.

15. Design for the principal door of the House of Lords, by John Wolstenholme.—The ornaments and mouldings in this design have been selected from some of the ancient specimens of art in the cathedrals of York and Beverley.

A good design, plainer than the preceding specimens, but the lower part of the design is too much separated from the upper work. The carved specimen is cleanly executed.

17. Design for the principal door of the House of Lords, by Francis William Browne.—The emblems are chiefly confined to the peerage.

This has some clever design and carving, but is too much broken into circles to appear elegant; it might be used for one of the doors of the edifice.

19. Design for the principal door of the House of Lords, by William Thomas.—The subject of the drawing is intended to represent the laws that have governed at different periods. In the four principal panels are bas-reliefs under the general heads of—The Divine Law, The Law of Superstition, The Law of Force, and Justice Revived. In the first is represented the Lawgiving by Moses, the Justice of Solomon, and the Death of Ananias; in the second, the Trial by Ordeal, the Inquisition, and the Martyrdom by Fire; in the third, "the Strongest shall be Right," Trial by Tournament, and Trial by Combat; and in the fourth, the Reformation, the Good Samaritan, and the Trial by Jury; these are

surmounted by appropriate figures, and in the centre (on the buttress) is the figure of Justice.

This is good, but its effect is injured by the figures being storied in three tiers, and by the lower panels being draped in the late style, which peculiarity, though often to be found, nevertheless exhibits decline of art.

21. Design for the principal door of the House of Lords, by Henry Ringham.—In this design, the doors being folding, the left hand style of the specimen is larger on that account; the extreme thickness of this door would be eight inches.

The specimen is very cleanly and freely carved, but the style of the design is too much in the continental manner of thistle crocket-work; some of the arches of the tracery-work are too much depressed, while others are of fair proportions; the work has consequently a mixed effect, which offends.

23. Specimen of carved work, relating to design No. 51, by John Lees. This shews ability.

24. Design for the principal door of the House of Lords, by James Rattee.

This design contains good work, but all its subdivisions are too stumpy, and break up the character of aspiring Pointed Architecture.

26. Design for the principal door of the House of Lords, by William Allan.—The first panels below represent a priest, a soldier, and an agriculturist, a lawyer, a sailor, and a merchant, in the costumes of the twelfth century. The centre panels represent Granmer receiving the Bible from Henry VIII., and King John signing Magna Charta, in the costumes of the respective periods. The top panels represent David I., King of Scotland, administering justice, and St. Patrick summoned before the king and princes of Tara for lighting the paschal fire. The centre figure represents Britannia, those on the left Henry III. and Henry VII., and those on the right a bishop in the costume of the eleventh century and Robert Fitzwalter.

Parts of this design are good, although it has the defect of being storied with pictorial subjects, and some of its details inferior and faulty.

25. Specimens of carved work, relating to design No. 56, by Peter Cummins. These would serve to produce variety in the carvings.

29. Specimen of carved work, being a compartment of the design No. 53, by John Black. Cleanly carved.

30. Design for the principal door of the House of Lords, by Colling and Vincent.

This, for a plain design, is good, and the carved specimen accompanying it has great merit, and is cleanly performed.

32. Specimen of carved work, relating to design No. 43, by Stephen Prebble. Cleanly carved, but the figure too short.

33. Design for the principal door of the House of Lords, by Colling and Vincent.

Richer than the last, but not so pleasing, on account of a stumpy effect, produced by the nature of its subdivisions.

34. Design for the principal door of the House of Lords, by R. B. Boyle. We entirely disapprove of this design.

36. Design for the principal door of the House of Lords, by Samuel Nixon.

37. Design for the principal door of the House of Lords, by Samuel Nixon.—Representing—1. Alfred the Great receiving an illuminated Missal, as a reward for learning to read, from his mother Osburgha. 2. Alfred at the battle of Astun. 3. The first flotilla defeating a Danish squadron. 4. Alfred scolded by the neatherd's wife for letting her cakes burn. 5. Alfred dividing his only meal with the pilgrim. 6. Alfred comforted in his adversity by the vision of St. Cuthbert. 7. Alfred in the Danish camp. 8. The meeting of Alfred with his trusty followers at Egbert's stone. 9. Baptism of Guthrum previous to his signing a treaty, Alfred standing sponsor. 10. Alfred releasing the wife and children of Hastings, his most powerful enemy. 11. Trial by jury. 12. The assembly of the Witan, or first Parliament.

This, though storied, is in many respects a good design; but its architectural details are not in good taste, the tracery work of it having a crouching, broken, and scattered effect.

38. Specimen of carved work relating to design No. 37, by Samuel Nixon. The workmanship is clean and good.

39. Design for a Gothic door, by William

Steel.—Ornamented on the top with the royal arms, surmounted by the rose, thistle, and shamrock; on the right side a figure of her Majesty, in a niche with canopy and bracket, on the sides of which are the allegorical figures of Justice and Plenty; and on the left side of the door a figure of Egbert, the first king of England, in a niche with canopy and bracket, at the sides of which are the allegorical figures of Discord and Suffering.

This would form one fair specimen among a variety, though it has rather a disagreeable lodging effect, produced by the mixture of large and small figures in the same range.

41. Design for the principal door of the House of Lords, by Thomas Drew. Apparently sent in joke.

44. Design for the principal door of the House of Lords, by Henry Ringham.—This design is for folding doors, the extreme thickness would be nine inches. Has merit; the figures are in two stories; but the carving is of less value.

45. Design for the principal door of the House of Lords, by Samuel Pratt, Jun. In many respects a good design.

47. Specimen of carved work, relating to design No. 41, by Thomas Drew. From its style altogether inadmissible.

48. Design for the principal door of the House of Lords. (In the angle near the end of the screen.) By Stephen Prebble.—The panel at the head contains the Queen's arms, the figure beneath on the right is intended to represent King Alfred, that on the left Lycurgus, the celebrated legislator of Lacedæmon. In the bottom panel, on the right, is the Tudor rose, the emblem of the union of the rival Houses of York and Lancaster, and on the left a portcullis, the arms of Westminster.

49. Design for the principal door of the House of Lords, by Benjamin Baker.

This is accompanied by good carving, but its style entirely out of the taste of the building.

(To be continued.)

#### PROPOSED MODIFICATION OF THE WINDOW DUTIES.

On Saturday the 27th April, at 2 o'clock, a deputation from the Metropolitan Improvement Society, headed by Dr. Southwood Smith, and from the Master Carpenters' Society, headed by Mr. Biers, had an interview with the Chancellor of the Exchequer on the subject of the window duties. The two deputations were introduced by Mr. H. G. Knight.

Dr. Southwood Smith explained the object for which the interview had been desired. The attention of the medical profession and the public, as well as her Majesty's Sanatory Commissioners of Inquiry, had of late been much directed to the close connection of fever, scrofula, and other diseases with the defective ventilation of houses. Air and light were as essential to a healthful condition of animal life as food. The purity of the air breathed in towns, it had been shewn, was greatly impaired by the want of perfect drainage, but this evil was further aggravated by the want of a sufficient number of openings in the walls of inferior houses, which would allow injurious gases to escape, and the pure air and light of heaven to gain admission. This defect, it appears, is occasioned by the existing mode of assessing houses to the window-duties, the tendency of which is to discourage ventilation, by causing houses to be built with the *minimum* of untaxable windows allowed by the law, and by inducing the occupiers of lodging-houses and others to block out as much light as they can possibly do without.

Mr. J. Foyne said, that as one of the surgeons of the St. George's Dispensary, he had been led by the frequency of scrofula cases among his patients to investigate the causes of that disease, and he had no hesitation in saying that the chief causes is the repeated respiration of the same atmosphere in ill-ventilated and over-crowded apartments. Low diet, bad clothing, and want of personal cleanliness are accessories only. He has often succeeded in hastening the cure and preventing the further spread of disease among the families he visited by simply introducing in their close rooms ventilators of perforated zinc plates. The proper place for these ventilators was in

the upper part of the window; but he had often found windows stopped up to avoid the window tax, and the landlord usually objected to making any new opening in the walls lest his assessment should be raised.

The Chancellor of the Exchequer inquired whether the gentlemen composing the deputations had compared the comparative mortality of towns abroad with that of towns at home, and if they could undertake to prove that there is less mortality in countries where the window-tax is unknown, as in Ireland for example, than in Great Britain?

Dr. Southwood Smith replied, that no such comparison had been made, because it would not be a fair one. The mortality of towns is the aggregate result of many influences. One source of disease is impure air, and that might be produced from various causes, all of which should, if possible, be removed.

Mr. W. E. Hickson said, that if only one predisposing cause of disease can be removed, it is surely the duty of the Legislature not to neglect it. Scrofula, which had been alluded to, prevails to frightful extent among the children received into the London Union; many of them are the most piteous objects that can be imagined, and have immediately on their admission to be sent to some sea-bathing infirmary. The present application is for the same object as that of one in 1834 to Lord Althorp, when that noble Lord was Chancellor of the Exchequer. Lord Althorp then promised, that although he could not part with the window duties, he would abate the evils they occasioned. An Act was accordingly passed, 4th and 5th William IV., chapter 54, which allowed new windows to be opened free of duty; but it had since been rendered nugatory by the strict interpretation given to the words "duly assessed on the 5th of April, 1835." The lawyers had proved that no one was duly assessed in 1835!

The Chancellor of the Exchequer observed, that it could not have been the intention of the legislature to allow the benefit of the Act to those who had evaded payment of the duties.

Mr. Biers said the case was not one of evasion, as the public could not fairly be assumed to be the proper judges of the validity of assessments. Occupiers of houses paid the duties demanded, and it was the business of the assessor to examine every house, and assess each to the right amount. In his own case a mistake had been made prior to 1835 of one window, upon which it was decided that he had not been duly assessed, although the mistake had been made, not by him, but by the assessor. With regard to the ventilation of houses, he would say, as a practical builder, that but for the tax, he should never erect a house without introducing perhaps four lancet-shaped windows in those parts of a basement where light and air were now excluded, to avoid the additional duty of 8s. 3d. upon each opening.

Mr. G. Knight laid before the Chancellor of the Exchequer the draught of a short bill, embodying the views of the societies represented by the two deputations. It proposed, not to repeal the window duties, but to amend the 4th & 5th of William IV., chapter 54, by enacting that no existing assessment should be raised from any cause whatever, that all new windows should be free from charge, and that in newly-built houses only a fixed and defined number of windows should become liable to the tax, allowing an unlimited number of untaxed openings for light and air. The rule proposed was, that one window only should be chargeable in every 300 feet of flooring on each story; but this was a matter of detail, there were, perhaps, other and equally simple means of effecting the object if the government would adopt the principle of the measure recommended.

The Chancellor of the Exchequer said, that if builders would make it their business to study the subject of ventilation, he entertained no doubt that they would find it possible to ventilate houses without any alteration of the window duties. Scrofula, he could bear witness himself, existed in the cottages of the peasantry, which were exempt from window duties. It was easy to propose an alteration in any tax, but difficult to foresee the new evils to which the alteration might give rise. The new mode of assessment proposed might be open to many

objections, but if the bill were left with him, he certainly should be willing to give it his consideration.

Mr. Goulburn was assisted during the conference by one of the Commissioners of Stamps and Taxes, who seemed altogether opposed to the object, and said that perforated plates of zinc for ventilation might be introduced in external walls free of duty.

#### FREEMASONS OF THE CHURCH.

##### ADJOURNMENT OF THE SEVENTEENTH CHAPTER.

APRIL 30.—The Rev. F. P. Pocock, B.A., in the chair.

Mr. Alfred Joseph Stothard presented a lithographic copy (one of the only twelve printed) of a drawing from a distemper painting found about the year 1825, on removing some walling on the north side of the chancel of East Burgholt Church, Suffolk.

Specimens were presented of Maud's Patent Portland Stone Cement (for internal and external stucco, water works, and underpinning), shewing different compositions with sand, and the fractures of brickwork without breaking the cement.

Mr. Frederick Godden, of No. 23, Little St. Thomas Apostle, in the city of London, was elected an architectural associate.

A model, in cork, was exhibited, made by Mr. Joseph Jopling, jun., to a scale of 20 feet to an inch, of the remains of the Cistercian Abbey of Furness; and Mr. Charles Jopling presented a drawing shewing to a scale of one inch to a foot profiles of nine beautiful specimens of base-mouldings, taken by himself from the same abbey. The same gentleman also presented a large lithographic outline elevation of the exquisite, richly-canopied sedilia, lavatory or piscina, &c., of the church of the same abbey.

Mr. Joseph Jopling, sen., explained the use of his apparatus of double-cranks for generating curved lines by simple continuous motion, and created much interest by the seeming promise of usefulness and invention.

Mr. William Gibbs Rogers exhibited a model in terra cotta 14 inches high, by Rysbrach, being the original, from which was executed the monument in Westminster Abbey to the memory of the poet Gay.

Mr. William Harry Rogers exhibited a very elaborate specimen, only 5 inches high, of ancient wrought-iron, in the form of pierced canopy-work and tracery, found at Warwick, suggested to have probably formed part of a lock. (We shall next week give an engraving of this.)

Mr. G. Aitchison, sen., exhibited a very beautiful illuminated vellum deed of the early part of the seventeenth century.

Mr. Alfred Bartholomew exhibited a drawing of the western gateway of St. Bartholomew's Hospital, Smithfield, and presented prof impressions of an interior view of St. Olave's Church, Tooley-street, as it lately appeared after its roof was burnt off. A view of the principal external doorway next Monkwell-street, in the city of London, of Barber-Surgeons' Hall. Also a view of St. Stephen's New Church, Hull, and an account of its consecration.

Notice was given that the subject of Chapter-vestments would be taken into consideration at the next meeting.

#### SOCIETY OF ANTIQUARIES.

MARCH 23.—Henry Hallam, Esq., V.P. Samuel Birch, Esq., Assistant Keeper of the Antiquities in the British Museum, and one of the Secretaries to the English Section of the Archaeological Institute at Rome, was elected a Fellow of the Society.

James Dearden, Esq., F.S.A., presented two impressions of a representation of an ancient British ornament, described as a collar, discovered in Lancashire in 1831. It measures in diameter  $5\frac{1}{2}$  inches, the weight is 1lb. 4½ oz.; one half is of a square form, enriched with zigzag lines, the other is formed of a number of twisted and engraved ornaments, separated from each other by small rings, precisely similar to the bronze ornament found in Worcestershire, and exhibited by Jahes Allies, Esq., F.S.A., on Dec. 14, 1843. This last is evidently the half of an ornament identical in design and purpose with that discovered in Lancashire.

The Lord Stanley of Alderley, F.S.A., exhibited an ancient ornament, apparently intended as a kind of necklace, formed of several pieces of jet or cannel coal, discovered near Holyhead Mountain, in Anglesea, in 1823. It is formed of several pieces, gradually narrowing towards the two extremities, attached together by means of numerous small holes drilled through the inner edges, and entirely through the breadth of some pieces. The portions of greatest width, towards the centre of the necklace, measure 2½ inches by about 5-8ths in breadth, and 2-5ths in thickness. A representation of a similar ornament, formed of amber, and found in a barrow at Kington Deverill in Wiltshire, is given by Sir Richard Colt Hoare, *Ancient Wilts*, vol. I. pl. 3, p. 46. This necklace was accompanied by another, formed of oblong beads, of a form slightly tapering from the middle, and measuring in length from ¾ in. to 1½ in.; also a small conical button, similar in form to some of bone which are represented in the same work, vol. I. pl. 12, p. 103; and a small triangular ornament, all formed of the same light and slightly inflammable substance, either coal or jet. Some portion of these necklaces appear to be deficient, and their entire length cannot be ascertained. They were deposited in a cavity of the rock, probably sepulchral, in which two urns were found, which, on exposure to the air, fell quickly to pieces.

Charles Roach Smith, Esq., F.S.A., exhibited a jug, communicated by Thomas Neale, Esq., being a specimen of Flemish ware, of a greyish-white colour, stamped with ornamental designs, and of elegant fashion. It was found at Butley Priory, Norfolk, and is now preserved in the Chelmsford and Essex Museum. Its date is of the close of the sixteenth century. A representation, drawn by John Adey Repton, Esq., F.S.A., accompanied this exhibition.

Mr. B. Hertz, of Great Malborough-street, exhibited a series of ancient keys formed of bronze, some of which bear a remarkable resemblance to the ring-keys and patented inventions of modern times.

Albert Way, Esq., director, exhibited a variety of antiquities communicated by Mr. W. G. Rogers, of Great Newport-street, consisting of German carvings in oak, forming various groups illustrative of the "Via Crucis"; an Italian holy-water vessel of bronze; and a candlestick of copper, elaborately enriched with silver ornaments, described as having been brought from the Alhambra, and similar to one which was formerly at Strawberry Hill.

It was announced that Charles Frederick Barnwell, Esq., M.A.; Beriah Botfield, Esq., M.P.; Richard Lord Braybrooke, and the Rev. Samuel Lortie Matland, M.A., had been appointed auditors of the accounts of the society for the year ending Dec. 31, 1843.

APRIL 18.—W. R. Hamilton, Esq., V.P. John Barrow, Esq., of the Admiralty, author of "Travels in Norway and Iceland," &c., was elected fellow.

Among the presents received was a copy of "Iconographie Chrétienne, Histoire de Dieu," by M. Didron, Paris, 1843, 4to. This work forms the commencement of an elaborate treatise illustrative of the symbolism of Christian art, and exhibits the varieties of distinctive conventional representation adopted by the artists of the middle ages in regard to each of the three persons of the Trinity. The volume is profusely illustrated with wood-cuts.

The Lord Stanley of Alderley, F.S.A., exhibited a British sepulchral urn, containing fragments of burned bones, found in digging for gravel, in the township of Over Alderley, Cheshire, near the Macclesfield-road, and adjacent to a supposed ancient line of communication. The form is remarkable, on account of the small perforated handles or ears, placed at intervals around the upper part, as if for suspension. Another urn, found near the same spot, is represented in "Ormerod's History of Cheshire."

Albert Way, Esq., director, exhibited various Roman remains communicated by the central committee of the British Archaeological Association. They were found on an elevated spot, about three miles south of Chesterford, and submitted for examination by Mr. Joseph Clarke, of Saffron Walden. They consist of patenæ and small vessels of red ware, some of which are plain, and others ornamented with foliage; with the potter's mark upon one of them, OF VERI (*officina*

*veri*). Also a remarkable vessel of thin glass 4½ inches high, and 2¼ inches wide, which holds about half a pint, and is embossed on its surface so as to resemble the cone of the fir; a glass lachrymatory; ornaments of bronze, fashioned as lions' faces, and apparently intended as the heads of nails; portions of various glass vessels, and of a very large amphora; with a coin of Trajan. Numerous fragments of pottery and glass were found in different parts of the hill.

Charles Roach Smith, Esq., F.S.A., exhibited a circular leaden fibula, purchased in London by Mr. B. Nightingale, and resembling at first sight the Roman medallions which occasionally are found mounted in gold borders. It measures in diameter two inches; a bust, with a rudely shaped and crested helmet appears on the obverse, and the remains of fastenings on the inner side show that it was destined to be used as a brooch. Adjoining the bust are seen certain letters, explained by Mr. Smith as indicating the name of Vitalianus, the Gothic chieftain, who, at the head of 60,000 Barbarians, waged war during six years with Anastasius.

Sir Gore Ouseley, Bart., F.S.A., communicated in a letter to the president, observations on the identity of the Fitz-Robert, one of the harons who compelled King John to sign Magna Charta, suggesting that, according to the practice of adopting a surname formed by prefixing Fitz to the Christian name of the father, he was probably the John Fitz-Robert, son of Robert Fitz-Roger, whose chief seat was at Clavering, in Essex. A pedigree was annexed shewing the descent, drawn from the Close Rolls, and Baker's History of Northamptonshire, parish of Aynhoe.

Evelyn Philip Shirley, Esq., M.P., communicated, by the hands of Sir Frederic Madden, F.S.A., a charter of the thirteenth century, preserved amongst the muniments of the Lechmere family, being a confirmation from Ralph de Mortuo Mari of a grant of land in Wribbenhall, co. Worcester. The peculiarities consist in its being signed with a cross by each of the persons who make and confirm the grant, a practice of rare occurrence; and in the mode of appending the seal, by a thin label, not from the foot, as usual, but from the middle of it. No similar instance of this mode of attaching the seal has hitherto been noticed in England; an instance in some degree similar occurs in the collection of charters at the Hotel de Soubise, Paris.

John Bidwell, Esq., F.S.A., exhibited a curious signet ring of fine gold, found at Thetford, in Suffolk, in 1823, accompanied by some observations in a letter from Albert Way, Esq., director. The ring bears, as the chief device, an eagle displayed; on the inner side is engraved a bird, with the wings closed, and intended, as Mr. Hudson Gurney supposed, to represent a raven; a conjecture which, with various other considerations, led him to appropriate the ring to Sir Rhys ap Thomas, the adherent of Henry VII. This device may, however, represent a falcon. A ducal crown is placed over the head of the bird, and, from the design of this ornament, and general fashion of the ring, Mr. Way is disposed to consider it a relic of the earlier part of the fourteenth century. It is very similar to inscribed signet rings discovered on the field of Cressy. No satisfactory appropriation of these devices, which appear to be heraldic, has been hitherto proposed. The ring was evidently a love-token, as appears by the legend inscribed both externally and on the inner side, *DEUS ME CROVOE NE VOUS SEUR A CREE—COM MOUX COUER DESIRE, God work for me to make my suit welcome to you, as my heart desires. Ovroge is the optative either of *overo*, corrupted from *operari*, or *ouvrir*, *aperire*; the word occurs often in either sense in early tales of romance. The verb *sevir*, written by Joinville *sivre*, signifies to follow, as in Anglo-Norman *sever* or *sevir*, to sue; but it may also imply to render service. This interesting ring weighs 5 dwts. 10 grs., and appears to have been partially enamelled.*

Albert Way, Esq., director, communicated a letter from Charles Tucker, Esq., of Harford, Devon, descriptive of the curious cathedral of Albi, department of Tarn, in the south of France, according to observations made during a recent journey. This noble structure is little known, it lies remote from any great

route, about nine posts north of Toulouse. It is constructed with brick; the first stone was laid by Bp. Bernard, August 15, 1282, and the church was consecrated in 1480. The tower at the west end was elevated by Louis d'Amboise, in 1475, to the height of 290 feet, and its construction is remarkable. In the interior of the church the elaborate screen and inclosure of the choir are richly sculptured, but the most striking feature of interest consists in the profusion of paintings in fresco, which decorate the walls of the cathedral, and, by their freshness of colouring, afford a striking proof of the durability of that kind of decoration. The earliest are of the fourteenth century. The stone-work of the choir, constructed under Cardinal Louis d'Amboise, by a company of itinerant masons from Strasburg, is most elaborate, and enriched with a profusion of statues and delicate tabernacle-work. This cathedral was condemned by the Directory, and preserved by stratagem, being one of the few existing monuments of architecture which escaped with comparatively little injury, although the painted glass, the numerous and splendid sepulchral brasses, the rich screens of iron-work, and other decorations were destroyed.

Edward Blore, Esq., F.S.A., exhibited two sketches representing the ancient Refectory (as supposed) of Great Malvern Priory, now wholly demolished. These sketches were made in 1837. The exterior had been much disguised by recent repairs, and the building, on account of its unattractive external aspect, had been little noticed; it had the ordinary appearance of a barn, and was usually filled with the produce of the farm to which it was attached. The chief feature of interest was the beautiful roof, as shewn in the interior view, which formed a very interesting illustration of the domestic architecture of the fourteenth century. Two years subsequently the whole building was wantonly destroyed, merely to make way for a poultry-yard and some out-buildings. It consisted of a hall, with the usual partition, and two doors at one extremity, adjoining the butteries; the general character of the construction and ornaments shewed that it was built in the early part of the reign of Edward III. It was constructed entirely of timber, which appeared in very sound state; the hall was divided into four bays, by three principals, with intermediate subordinate principals to give support to the purlins. In each bay, except in that which contained a plain door of entrance, were two tiers of square-headed traceried windows, the pattern of the tracery being varied, as usual in works of that period.

#### OXFORD ARCHITECTURAL SOCIETY.

The meetings of the society during the present term, held at the Society's Room, near Lincoln College, are Wednesday, May 1, Wednesday, May 15, and Wednesday, May 29, at eight o'clock in the evening.

The more active assistance of the members of the society is earnestly requested in preparing the third part of the Guide to the Architectural Antiquities in the Neighbourhood of Oxford.

Any notes, ground plans, or measurements; drawings or sketches, either of whole buildings, of parts, or details; or historical notices, either from books or from MSS., with accurate references to the authorities, will be thankfully received by the Secretaries.

The third part will comprise the Deanery of Cuddesden, which contains the following parishes, here arranged for convenience in rides:—

RIDE 1.—Marston, Elsfeld, Wood Eaton, Noke, Beckley, Stanton St. John's, Holton, Waterperry, Waterstock, Albury, Rycote, Forest Hill, Haddington.

RIDE 2.—Wheatley, Cuddesden, Milton, Haseley, Newington, Drayton, Stadhampton, Chislehampton, Garsington, Horsepath.

RIDE 3.—Ifley, Salford, Nuneham, Culham, Clifton Hampden, Dorchester, Warborough, Benson, Marsh Baldon, Toot Baldon, Cowley, St. Bartolomew's.

#### INDIA-RUBBER MATTING FOR CHURCHES.

The government have ordered the new Garrison Church at Portsmouth to be covered with this extraordinary manufacture to prevent the soldiers suffering from rheumatism, &c., brought on by sitting with their feet on the cold stones,

## ELEMENTARY ESSAY ON MORTAR AND CEMENTS.\*

BY JAMES WYLLSON, HON. SEC. B.A.A.D.

23. SAND is a non-calcareous ingredient which, as it forms an essential and highly important part in the composition of mortar demands very attentive consideration. The kind employed in London for the best works is the Thames river sand, which is regarded as the best that can be obtained in the south of England; but local circumstances are so various that different sorts are brought into use; the leading requisites, however, are their being sharp and clean. River sand obtains general preference, but it can only be its ready cleanness, with perhaps its good average size, that entitles it to this estimation, since the rolling motion to which it is subject in the current of the stream must necessarily impair its sharpness. The same applies to beach sand,† along with an objection of a different kind, viz. the strongly bygometric principle it has from the sea-water, and which would deter mortar from drying properly; this saline impregnation can be removed, however, by thorough washing in fresh water. Pit-sand‡ is generally found mixed with impurities, which preventing the perfecting induration of mortar, should be carefully removed by washing, until the water used becomes clear. Clean quarry and drift sand have been recommended as the best, and probably with justice, being generally hard, quartzose, flat-faced, and sharp-angled. Common road-drift, which is used to a considerable extent about town, is said to have an attraction for moisture; but it is allowed that mortar made with it is well adapted for work that is much subject to beat, as the brickwork about coppers, ovens, &c. These circumstances may, perhaps, be both referred to the likelihood of its comprising some portion of the vegetable matter employed in the composition for plastering the insides of chimney-flues. It is allowed that sands from about chalybeate springs give an extraordinary degree of hardness to mortar: they are yellow in colour from the intermixture of ochre. As a general rule, those sands should be chosen which are freest from alkaline salt, calx, clay, gypsum, or other soft matter that can be washed away.

24. Sand is sold in London by the load of one cubic yard; the yard measure is a wooden box, open at top and bottom, and commonly in two pieces in the height, the one being rebated into the other. Sand compresses into a smaller space with wetting, therefore the measure contains more in that condition than when dry.

25. MORTAR.—With regard to the best proportion of sand in mortar, it must be premised, that as it does not shrink in drying, and lime does so in a very considerable degree, as well as being liable to crack, the more sand preponderates in the composition, the less will be the settlement in the work in drying, and the greater the resistance against pressure. On the other hand, if there be too small a proportion of lime, the mortar will be what workmen call "short;" that is, the particles of sand not being all united by cementing matter, it will necessarily have a tendency to crumble away. Viewing these facts, it becomes manifest that the lime should be just sufficient to unite the particles, and no more. If we imagine a piece of hardened mortar, divested of the sand, it ought to appear like a piece of honeycomb; and this consideration suggests, that to render the lime as much as possible effectual as a cementitious agent, it ought first to be reduced with water to the state of a stiff and perfectly homogeneous paste, then mixed with the sand, and thoroughly beaten until again of uniform consistency; also, that to obtain this matrix of a nearly equal substance throughout, the sand had better be a due admixture of small and large grit than entirely of similar size. These principles being stated, some observations may be made respect-

ing proportions, which have obtained approbation. 150 pecks, or 37½ struck bushels of chalk-lime are frequently given to 2 loads, or 60 struck bushels of sand, which is so much as 5 to 8; while sometimes 20 bushels of stone-lime are considered sufficient for 2½ loads or 75 bushels of sand, or so little as 5 to 18½. Looking at these proportions, it does not appear that their vast difference is justified by a corresponding disparity between the qualities of stone and chalk limes; and if we alter the former figures to 5 to 10, and the latter to 5 to 15, that is, 1 to 2 for common chalk-lime and 1 to 3 for stone-lime, we come to a more feasible rule, and one which is sanctioned by practice. The sand may consist of grains, one-half about 1-16th and the remainder 1-30th of an inch in size, regulated by means of sieves. Of course, the proportion of the lime is in some measure dependent on the size of the other ingredient, as well as on its own quality. The proportion of sand with Dorking grey chalk-lime, which forms the basis of such excellent cements, is sometimes so much as 3½ to 1; and when it is of a coarse gravelly description, for filling-in the interior of thick walls, even 4 to 1 is not considered excessive. The distinctions of face and backing mortar, filling-in mortar, &c., referring to the relative proportions of lime and sand, are frequently observed in large works, though little to be commended.

26. The hydrate of lime in mortar is believed to have a chemical attraction for the sand, inducing the formation of a coating of lime around the grains, which, if it is not decomposable by the carbonic acid of the atmosphere, assists the mechanical combination of the ingredients in forming a hard composition around the masonry or brickwork. This induration is further promoted by the lime continuing to abstract carbonic acid from the air, at the same time parting with the water if applied in the slaking, until at length, when the water is wholly displaced by the acid, the mortar acquires its greatest solidity, becoming frequently harder and stronger than the bricks or stones which it was employed to unite.

27. The mortar used at the new *British Museum* is composed of one part Dorking lime, and three parts Thames sand; a piece of brickwork there, of one year's standing, had to be taken down for an alteration, and was found so indurated as to be extremely difficult to separate even with the proper tools.

28. WATER.—Rain-water is considered the best for making mortar; river-water the next to it, land-water third, and spring-water last, of the fresh description. Sea-water is unsuitable either for slaking or mixing, as it prevents the mortar from becoming perfectly dry; yet it is not considered very objectionable for works exposed to the action of the tides. In making mortar, a degree of caution is necessary to be observed in adding the water, as a very small quantity will, as the workmen say, *drown* it, when it has received sufficient.

29. Mortar being of such high importance ought not to be left to the unguided control of ignorant persons; but its composition should, on the contrary, be directed by some one well skilled in the nature and due treatment of its various constituent elements. It should be made with the smallest quantity of water that will reduce it to a proper consistency; and a mortar-mill is superior to manual labour, for rendering it perfectly uniform. It should always be prepared under cover, to shelter it from sun and rain: if it has been kept for some time before using, it should then be well beaten up, and no more water added, unless absolutely necessary. It was an ancient practice, and one the efficacy of which has been confirmed by modern usage, always to beat mortar well with a heavy pestle before using it, although, through the introduction of the mill, this has greatly fallen into desuetude. It is found, however, that mortars made with common white lime are improved by a much greater degree than those made with the argillo-ferruginous kinds; which is explained by the general opinion, that part of the lime combines with the clay in the process of calcination. The effect of beating is to rub off from the granules of sand the coating of silicious lime which forms on them, through the chemical affinity alluded to in article 25, and to diffuse it throughout the mass, thereby increasing and hastening its disposition to consolidate. It also serves to thoroughly incorporate the ingredients, besides preparing the mortar for

receiving more sand, and proportionately enhancing its good quality and diminishing its price, the sand being obviously the cheaper ingredient. Age rather benefits than injures mortar, if it be composed of good ingredients, in just proportions, and kept covered up; but its good quality is much injured by long exposure to the action of the atmosphere before being used. The old practice was always to make it some considerable time before use; but Dr. Higgins started the new theory that it ought to be used immediately; and unless it can be perfectly fortified against the atmosphere, his injunction had best be complied with; for mortar is dependant for its excellence on its slow absorption of carbonic acid.

30. During hot seasons, bricks and stone both being dry and very absorbent, should be perfectly soaked at the time of building, to prevent their too quickly imbibing the moisture of the mortar, for a rapid desiccation in the latter deprives it of a large portion of its strength; in fact, renders it more liable to crack, and more or less pulverulent as the lime happens to be more or less bydraulic. Mortar, therefore, combines and indurates best when allowed to dry slowly, and produces the greatest hardness, when used of a stiff clayey consistency, ductile, but firm. If it sets without cracking, it will probably always stand well afterwards.

31. Common mortar will never set under water, but in process of time will decompose; therefore it ought never to be used where it would be subject to such influence, either directly or indirectly, as in the backing of wharf-walls, and the like situations, unless incorporated with a water-cement, or some other ingredient having the power of transfusing through it that necessary property: indeed, it is best, in works of any consequence, to use, for those parts that are to be open to the common vicissitudes of the weather, such limes as are of a hydraulic character, and which must prove ultimately a thrifty precaution, since common mortars are liable to decay on the face of work, and thus require re-pointing.

32. CEMENTS.—Water cements, or hydraulic mortars, are indispensable for such works as are erected in wet or damp situations, or are peculiarly exposed to the weather, besides being eminently calculated for enhancing the durability of ordinary buildings; their importance, therefore, renders it at once evident that a familiar acquaintance with their varied nature and treatment is absolutely necessary to those engaged in the construction of bridges, docks, or any similar works, and indeed to every architect and builder, so frequent are the occasions on which their use is more or less requisite.

33. The ROMAN CEMENT, now holding so high a place among our building-materials, and which is so essential in our architectural economy, was discovered in 1796, by Mr. Parker, who obtained a patent for fourteen years, and realized by it an ample fortune. It was then known as Parker's patent cement, and was sold by Charles Wyatt and Co., of Bankside, at 5s. 6d. per bushel. Mr. James Wyatt, the eminent architect, introduced it to public notice. It is used in forming different parts of artificial masonry, such as balusters, chimney-pots, copings, bas-reliefs, &c., and being of a decidedly hydraulic character, it has entirely superseded the puzzolana and terras (hereafter noticed), so long and extensively used in forming our water-cements.

34. It was originally wholly manufactured from stones brought by dredging-vessels from the shores of the Island of Sheppy, in Kent, where they were found, having fallen from the cliffs of blue or London clay overhanging the beach; but the operations by which Nature affords the supply are too tardy for the demand; and these stones are now, from their scarcity and the reduced price of the cement, seldom to be gathered in such quantity as to afford remuneration for the search. It has been found that these balls or cement-stones, or, as they are denominated, septaria, belong to the upper and lower lias beds, and also exist in all deposits of bluish slaty clay; they are found in several of the strata of blue clay in the district, called, by geologists, the London basin, and may be seen in the low South-east cliff at the mouth of the Thames; appearing in a compressed spheroidal form, and in indistinct layers, but separated and insufficient

\* Continued from p. 218.

† The ancient writer Pliny speaks of river and sea sand as round-grained, and of pit-sand as sharp; and leads us to understand that while four parts of the latter were given to one part of lime, only three parts of the former were allowed of the like quantity.

to conjoin and form uninterrupted strata; they are strictly argillo-ferruginous lime-stones. No others, however, are equal to those from Sheppy; and so great is the demand, that much of what is made and sold as Roman cement, at half the original price of that article, is very little entitled to the name; although it can still be had as good as ever at the original patentee's, but at a more expensive rate. As originally made, it might be used during a sharp frost, which would not be safely practicable with the generality now made. The greater part of that now used is from Harwich, and when burnt by itself being much darker than the genuine cement, is frequently, by the manufacturers, depreciated in quality by the admixture of Swalecliff and other light-coloured stones, which render judgment of it by colour almost impossible. The Swalecliff stone, while it gives it the property of setting quickly, like Sheppy cement, is said to make it very liable to give way afterwards. On being analyzed, the Harwich cement was found to contain carbonate of lime 70, aluminous earth 24, and iron 6 per cent. A bushel of the stone broken small, ready for burning, weighed 118lbs., when burnt, 82lbs., and when ground, 88. 10 bushels of stone produce about 11 of cement, exclusive of waste: the best, when mixed up ready for use, is of a dusky-green colour, and being so dark, requires frequent colouring. Lime-stones are found in small quantity in the marshes of Essex, near Steeple, affording a cement which is stated to be little inferior to that of the Sheppy stones.

35. An excellent mortar is composed of one part Harwich cement, one part ground quicklime, and one part sand; these ingredients are well mixed through a sieve; and the mortar is made in a mortar-mill, if conveniently it may, the water being added gradually until the whole is perfectly incorporated, and a due pasty consistency is obtained. It is easy to work, and slower in setting than cement made without lime; but it becomes very hard in a few days, and soon acquires great strength.

(To be continued in our next.)

#### POPULAR OUTLINE OF THE QUADRATURE OF THE CIRCLE.

BY OLIVER BYRNE,

Late Professor of Mathematics to the College for Civil Engineers; author of "The New and Improved System of Logarithms;" "The Doctrine of Proportion;" "The Practical, Complete, and Correct Gager;" "The Elements of Euclid by Colours;" "A Practical Treatise on Spherical Trigonometry."

THE quadrature of the circle cannot be at variance with the strict character of a publication like THE BUILDER, as its chief designs are to spread information and discuss difficulties, which are interesting to all general readers of subjects of architecture and its kindred arts and sciences.

However, the few remarks here offered are given more with a view to gratify curiosity, than to afford any additional information on a subject so much discussed by the scientific of all ages, and long since proved to the satisfaction of reasonable men to present impossibilities, which, as such, it would be ridiculous with any existing method to attempt to overcome. The exact ratio which the diameter of a circle bears to its circumference has never been determined. This celebrated problem, called *squaring the circle*, has for ages exercised the abilities of the greatest mathematicians. Many persons of eminence have at various times laid claim to the honour of having achieved the task, but their errors have been soon detected: among these were Longomontanus, and our own countryman Hobbs; the latter steadfastly insisted that he had done so, nor would he hear any demonstration to the contrary. The world always contains a great number of such men as Hobbs, who not only deceive the mass of mankind for a while, but very often impose upon themselves.

Though the problem is apparently very simple, yet its solution defies the art of analysis, and is now generally considered an impossibility; and indeed the consideration is justly formed, if the attempt be made by any method known at present.

But although the exact relation between

the diameter and circumference cannot be expressed in known possible quantities, an approximation to the truth may be made to any assigned degree of exactness. In this manner the problem was solved by Archimedes, who, about two thousand years ago, discovered that the diameter is to the circumference as 7 is to 22, nearly. The proportion of Vietta is that of 113 to 355, which is more exact than that of 7 to 22, for it is true to six decimal places. It was derived from the pretended quadrature of Van Eick. This proportion is readily retained in the memory; for, if we set down two units, two threes, and two fives, and divide the digits into two thus:—113: 355 is the ratio.

But the first person who ascertained the ratio to any degree of exactness was Ludolph Van Ceulen, a Dutchman, who published it in his book of *Circula et Adscriptis*. He found that if the diameter of a circle be 1, the circumference will be 3.141592653589793238462643383279502884 nearly; which is exactly true to 36 places of decimals; and was effected by means of the continual bisection of an arc of a circle, a method so exceedingly tedious and laborious, that its accomplishment would occupy a considerable portion of a man's life. This achievement was at the time so much applauded, that its result was carved in figures as above on Van Ceulen's tombstone.

The industrious Abraham Sharp (amanuensis to Newton) extended the calculation to upwards of seventy places of decimals. Mr. Machin, who was Professor of Geometry in Gresham College, London, calculated the quadrature of the circle true to a hundred places of decimals; it is needless to give the figures, as they are merely a continuation of those obtained by Van Ceulen. Mons. de Lagny, Euler, and others, have continued it still further; but should we attempt to give an account of all the mathematicians who laboured at this celebrated problem, we should very far exceed our proper limits. Among the ancients were Archimedes, Thales, Anaxagoras, Philo, Brayson, Antiphon, Plato, Apollonius, Ptolemy, Vietta, and many others. With all the late improvements in science to assist them, we find among the moderns the names of Newton, Cavaleries, Dr. Willis, Mr. Huygens, Mr. J. Gregory, Mr. Edmond Halley, &c.; but in this learned age, and in the enlightened United States, we have a Mr. Young, who, according to his own account, has proved all former mathematicians in error; we believe there is one exception, Mr. Hall, of King's College, whom Mr. Young allows to be his equal. Though the equality of curves to straight lines is a subject that many of the first-rate mathematicians among the ancients were very solicitous about, yet nothing very considerable was done until the year 1657, when two Irishmen, Mr. Neil and Lord Brounker, independently of each other, demonstrated the quadrature of some curves. Soon after this, Sir Christopher Wren and Mr. Huygens contested as to the priority of having found the quadrature of a cycloidal space.

But the first who brought quadrature under an analytical calculus was Mercator, in 1683, when he published a demonstration of Brounker's quadrature of the Hyperbola. It is curious to see how great men will sometimes descend from their justly-acquired dignity: we find Dr. Wallis taking praise to himself for dressing up Brounker's continued fractions; and even Newton could not be satisfied with his great improvement on Mercator, but claimed the whole discovery.

The same magnitude may be expressed by several different series. If the diameter of a circle be *one*, its circumference will be an infinite series of fractions, each numerator being always four, the denominators in the natural series of uneven numbers; and all these terms to infinity, alternately too great and too little. Newton and Leibnitz gave two other series, apparently very simple, and many more might be added, but they are of a similar nature. Could any of these series be summed, the quadrature of the circle would be found; but this has not yet been done, nor is it at all probable it ever will be so. Even from what has been said we learn one great philosophical fact, i. e., that the extent of our knowledge comes not only short of the reality of things, but even of the extent of our own ideas. We have the ideas of a square, of a circle, and of equality, and yet perhaps shall never be able to

find a square equal to a circle. But while we assert the uselessness of all attempts hitherto made, let us not be understood to mean that a method will not yet be invented which may set the matter satisfactorily at rest for ever; a new relation of quantities may be discovered, immense improvements will probably be made in the summation of infinite series, or even a new system of notation may yet be invented, that will render this *ratio* determinate and finite: for it is impossible even to conceive the limits to which science, in its vast advancements, may extend. However, if the exact ratio could be obtained, it would be a sort of mathematical triumph rather than a real good, for any one ratio which we have given is sufficiently accurate for all practical purposes. To use the words of the justly-celebrated Charles, afterwards Dr. Hutton, whose opinions we greatly respect: "Although a space be not quadruple by the methods yet known, it does not therefore follow that its quadrature is impossible, or that some method may not hereafter be discovered by which it may be squared."

"All the methods used by geometers before Archimedes were insufficient for the quadrature of any curved space whatever; but were they therefore to infer that no curve could by any means be squared? What has since been done abundantly shews the impudence and falsehood of the assertion. Archimedes discovered a method by which he squared the parabola; and (says the doctor) by the lately discovered method of fluxions we can find as many quadrable curves as we please. But whilst I am urging the possibility of the quadrature of any space, I am not ignorant of the pretensions of several people to prove the impossibility of that of the circle in particular. There are attempts to demonstrate this impossibility in the *Leipsic acts* as well as in our Philosophical transactions; but these demonstrations are far from being sufficiently general to afford any conviction of it." It may here be remarked, that Des Cartes, in particular, insisted on the impossibility, on the ground that a right line and a circle, being of different natures, there can be no strict proportion between them.

In conclusion we may add, who can prove that even the root of *two*, or any other number whose root in the present scale is an infinite series, may not be a terminable quantity in some scale whose root is a square number, for such it must be? It is true we have not yet found the area of a circle, the diagonal of a square, or the root of 2, &c. infinite terms, yet for each of these we can assign infinite series, whose laws of progression are visible, which are more than the ancients could do, or perhaps expected could be done, if they ever at all thought of such things. And I have no doubt that hereafter will be discovered a method of squaring any figure whatever, which is the chief problem in geometry.

ROYAL PALACES, GARDENS, &c.—Of an account of the royal palaces, gardens, parks, &c., from the year 1838 to 1842, both inclusive, the following are the results:—In the year 1842-43, the sums received were as follows—viz. from Hyde, St. James's, and the Green parks, 1,089*l.*; from Kensington gardens, 70*l.*; Regent's park, 996*l.*; Greenwich park, 6*l.*; Kew gardens, 1,118*l.*; Old deer park at Kew, 1,170*l.*; Richmond park, 726*l.*; Hampton court and Bushey parks, *nil*; Windsor Great park, 5,330*l.*; New Royal kitchen gardens at Frogmore, 73*l.*; the Phoenix park in Dublin, 1,720*l.*, and the sum of 2,000*l.*, being a portion of the purchase-money received from Prince Albert, for the stock of the Norfolk and Flemish farms (purchased on behalf of the Crown in 1837, of the executors of King William IV., being part of his late Majesty's private property). Thus, the total amount received was about 14,293*l.* The account "in detail" shews this revenue to arise principally from the sale of decayed timber, loppings of trees, &c., the sale of hay, bark, stock, garden produce, and old materials; the rent of grass-lands, chairs, and free-board rents; subscriptions for keys of the pleasure-grounds, &c. The sum of 1,170*l.* is paid by the King of Hanover for the rent of the old Deer Park and Kew; and the sum of 800*l.* is annually allowed from the Lord Steward's department towards the expenses of the very valuable Botanical Garden at Kew.

ISLEWORTH PAROCHIAL SCHOOLS.

(From a Correspondent.)

PLAN OF THE UPPER-STORY.

PLAN OF THE GROUND-STORY.

At the time of the introduction of the national system of education, in the year 1814, a considerable sum of money was expended in the enlargement of the original building, which was so old and inconvenient, and at last became so unsafe, that it was considered in the year 1840 indispensably necessary to rebuild the whole; and, in the following year, the erection of the present schools took place, on the old site, from a design by Mr. C. F. Malby, architect.

The new school-house is of the late Gothic character, built of brick, with Bath stone mouldings, and contains a boys' school-room 40 feet by 20 feet, with coved ceilings; a committee-room; retiring-rooms for the master and the mistress; and store-rooms. The lower story of the building is formed with cloisters, comprising play-grounds for boys and girls, washing-rooms, &c. There is also an engine-house attached to the building.

The cost, exclusive of fittings, amounted to the sum of 1,242*l.* 6*s.* 7*d.*

The Right Hon. Lord Prudhoe on the occasion of his marriage with Lady E. Grosvenor, presented the trustees with an excellent clock for the school-turret.

[We should have liked this design better if its style had been of Pointed Architecture of an earlier date, and if it had not contained the error of possessing no centre aperture either in its front or flank. This fault, which is fatal to first-class architecture, appears to be gaining ground; such an abuse is but very rarely to be found in any of the multitudinous works of Palladio, Jones, Wren, Hawksmoor, Vanborough, Flitcroft, Gibbs, Chambers, Stuart, Wyatt, Taylor, Soane, Smirk, Burton, or Barry; and if to be found in any of their works, not often in any which have not been erected in their early career, or in which they have not been trammelled by circumstances; it is against the eternal and immutable laws of taste. We only know one strictly necessary case of the application of a central mass, viz. in the triforium-arcade of a church, where a columnar weight is frequently placed immediately over the apex of each great nave and choir arch, to perform the same office as the boss in vaultings, viz. to prevent the upper arched-work from ascending, by the falling inwardly of the haunches and work immediately above them. This fault is an undeniable element of barbarism.—Ed.]

SCALE: 1" = 10 FEET.

MONUMENT AT ST. REMI.

DETAILS OF THE LOWER ARCADE AND ADJOINING WORK.

SECTION FROM A TO B (on the above Illustration).

PLAN OF ONE QUARTER OF THE BUILDING (taken at A in the above Illustration).

TO THE EDITOR OF THE BUILDER.  
 SIR,—I beg to forward to you some details of the Monument at St. Remi, in France (a general representation of which appears in your No. 49, page 15, this year), which are copied by me from some excellent drawings of the monument which I have; besides these I have some others of the same subject, which are very interesting.

I am, Sir, your humble servant,  
 C. J. RICHARDSON.  
 Brompton-crescent, March, 1844.

Literature.

"Historical account of the Church of Saint Margaret, Stoke-Golding, Leicestershire." By THOMAS LARKINS WALKER, Architect, of Nuneaton, 6 plates. London: John Weale, 1844.

(Continued from p. 217.)

THE CHURCH dedicated to St. Margaret consists of a nave, a south and a north aisle, a north and a south chancel, in each of which is a piscina.

"Some, I hear, would have the first founder of this church to be the abbot of Lira, in Normandy, and the prior of Hinckley, who was belonging to the said abbot, and had to their use the tithes of this town. I will not deny but that they might be special benefactors; but, out of all doubt, Sir Robert de Champaigne was the principal agent, and chief in the foundation. And sure I am (by whomsoever it was founded) it is a worthy piece of work, neatly built, with cut and chased stones, freizes, and architectry, with fair and large windows equalizing some cathedral churches; the battlements are of a fine kind of fret-work, garnished with many high and curious cut pinnacles. It hath a fair and high spire steeple; the top whereof was shaken down in that general earthquake which happened in the year 1580."—*Burton MS.*

The steeple (containing four bells) which is at the west end, 30 yards high, is supported by strong abutments.

The south side and east end of the church have been by the architect finely ornamented in the windows and on the roof (which is well leaved), which gives it a pleasing and solemn appearance; but, if it had been raised higher, it would have been more majestic. Compared with the steeple, and the ground it stands upon, it is rather low, but yet makes a good appearance.

The view of the chancel from the east bears the character of gravity and veneration; on the north it is finished in a plainer manner, and supported by strong abutments of good stone and mortar, which appear hardened by standing in the air; at least the corroding hand of Time has made but little impression on them in five centuries.

In the south side wall remains an arch of an old monument.

A small gallery, at the west end of the north side of the church, was erected about twenty-five years ago.

Within are five arches, supported by beautiful clustered pillars, terminated by handsome groups of flowers intermixed with grotesque faces, &c.

On the outside of the church, on a buttress the second from the east, on the north side:—  
 T. 1620. C.

On a beam at the west end of the nave, over the belfry door:—  
 1620.

On another beam, at the west end of the nave:—  
 W.W. 1668.  
 C.W.

On another beam:—  
 A ° D. MDCXC.

D. NATH. BROKESBY PRIUS . . . .  
 The town-chest is marked:—

"Stocke Chest,  
 C. 1636. W."  
 W.B. T.O.

The king's arms were new painted in 1783; John Hayfield, churchwarden.

An octagon font, with rude figures on seven of the sides, expressive of the seven deadly sins, but almost obliterated, the eighth plain.

Here is an old dial, dated 1620, from which the hand has long been broken off.

The communion plate has the following inscriptions:—

"Hanc laganam, una cum patinâ Basilius

Firebrace miles, in usum ecclesiæ de Stoke-Golding in agro Leicester, D.D. anno Dom. 1689."

"Hunc calicem cum operculo Henricus Firebrace miles, in usum ecclesiæ de Stoke-Golding in agro Leicester, D.D. anno Dom. 1629."

"B.F. anno Dom. 1689, ecclesiæ de Stoke-Golding."

"H.F. anno Dom. 1689, ecclesiæ de Stoke-Golding."

The statue of St. Margaret stood formerly in the south chancel, painted and gilt; but in 1642 the pedestal only remained. Her figure yet stands in the west window of the steeple.

In 1619 this church contained the following arms, (Plate CX X. fig. 5—13):—

Or, on a fess gules, three plates.—*Colvile.*  
 Gules, a fess dancette between ten croislets Or.—*Engaine.*

Argent, two bars and a canton Gules.—*Boyes.*  
 Argent, a plain cross Gules.—*St. George.*

Or a fess Azure, from which a lion naissant Gules.

Gules, three lions passant guardant, or a label of France.—*Earls of Lancaster.*

Gules, a lion rampant argent.—*Moubray.*  
 Or, a fret sable.—*Champaine.*

These arms are in several of the windows, and the fretty cut on the pinnacles of the steeple.

The lead on the chancel of this church was recast, and several pieces of new timber put into the roof, by the Rev. Dr. Staunton, rector, in May, 1808.

There now remains (1810) several fragments of old painted glass, the most perfect of which are two small heads of Apostles; and the patron, St. Margaret, in the north windows of the north chancel.—*From "The History and Antiquities of the County of Leicester."* By John Nichols, F.S.A.; London, Edinburgh, and Perth. Vol 4, part 2, containing Sparkenboe Hundred.

(To be continued.)

SEAL OF WILLIAM, BISHOP OF KILDARE.

SIR,—I have copied the annexed drawing from a work lately published in Ireland. Its insertion in THE BUILDER might induce others to direct their attention to collecting similar interesting remains of former days.

The centre figure represents the Virgin and child; the figures on each side are the patron saints of Ireland, Patrick and Brigid; the lower figure in the nich is said to represent St. Conlaith, the first Bishop of Kildare. One of the shields bears the arms of France and England quarterly. What is remarkable the shield on the left, ("two keys in saltier, in chief a royal crown,") constitutes the arms anciently and still borne by the Archbishops of York.

The inscription reads as follows:—  
 "Sigillum Willmi dei gracia Kyldarensi essl."

Ware thinks this seal belonged to William, Archdeacon of Kildare, "who was appointed to this see by the provision of Pope Eugene IV. in 1432."

The design and execution of the seal shew, in my opinion, considerable taste and ability in the artists of that remote period.

I am, Sir, your obedient servant,  
 Gorey, April 11, 1844. J. K. L.

PETRALOGY, OR THE KNOWLEDGE OF  
ROCKS AND STONES.\*

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF  
NATURAL PHILOSOPHY.

I shall hereafter have occasion to speak of alumine and potash, as being the characteristics of the soils produced under direct atmospheric influences, the vegetable soils, acted upon by the atmosphere; or of the ocean waters, generating the one or the other, and not of necessity in oceanic aggregates, as is demonstrated by the aggregate masses of primary qualities, such as sands, sandstone, limestone, marls, species of porphyry, sienite, &c., but accidentally blended with many of the primary masses, by the carrying or percolating action of the waters. The sands of those vast desert regions which have been unaffected by these causes are wholly free from alumine or potash; and where the silifications, termed Egyptian jaspers, but which are common to the northern boundaries of Africa and Asia, having traces of potash in their composition: this is always produced by accidental mixture, from causes as above stated. In the older soils of Europe, the subtle distinctions of generation, reproduction, and change, lie more immediately beneath the surface discoveries of scientific men, nor can they be appreciated as truths, other than by travel and observation. Much of the strata and masses of rock of Great Britain is wholly free from these products, and it is always found that they are disposed in what is termed secondary formations, disappearing as the lower beds become more homogeneous in their qualities. The lowest red sandstones, termed primary, consist of quartz only, but the secondary beds consist generally of quartz, felspar, clay, mica, and carbonate of lime; yet, notwithstanding this manifest difference in the composition of the upper and lower beds, it is far from being a demonstrable truth that they were formed under different epochs; for the ocean bed is the general recipient of all matters carried therein by rivers and moving bodies of water, and thus the lower beds, anciently as in the present epochs, were very often of mixed qualities, the beds of sand becoming the recipients of numerous compounds deposited therein. In proof of this, we have only to look at those regions where the ocean becomes the depository of mighty rivers; and here, in the season of floods, the earths are carried down into and are distributed over thousands of square miles of the ocean bed. Thus, the vast quantities of timber and carbonaceous matters deposited in one locality give birth to the mineral coal, in its varieties of marl and clay, all of which are contemporaneously producing and produced; and were the sea suddenly thrown off these regions, the multiplicity of phenomena would rather puzzle a modern geologist, who looks for an epoch of time in every variety of consolidated matter. Even in this country the existence of bones of extinct animals, and the vast heaps of fossilized or mineralized plants, while they are the unerring evidence of tropical influences, cannot be considered undeniable evidence of their having succeeded the coral formations and other phenomena generated under the like temperature, for the one and the other, united and uniting together, contemporaneously exist, and are generating or produced at the present day.

The act of cohesion of particles and aggregates, whereby they become one consolidated mass, is observable in all countries, and is not confined to the compound silica alone; for alumine, iron, and other neutral bodies, under certain forms, possess the like powers, and, regardless of the laws of affinity, silica, like water, is capable of embracing within its volumes, numerous compound bodies without any immediate changes taking place in their atomic constituents, and having assumed the consolidated state, it possesses greater power of resistance to atmospheric action than any other earth. To effect sensible changes within its prescribed medium, it is absolutely necessary that other elemental compounds be blended with it, or that it be acted upon by chemical affinities, otherwise, it remains constant to the form assumed through a series of generations; in fact, so long as it is preserved from chemical action. Silicified rocks maintain their individuality; but strata, varying from

each other in ingredients, but having the common basis or cement, very readily unite as one whole; thus, granite is often observed to run into gneiss, and even into crystalline limestone. Again, pebbles and smaller aggregates, united with calcareous matter and some iron, readily unite as the calcareous matter becomes silicified. In the Nubian deserts, vast aggregate masses of this kind may be observed in all their stages of transition into species of jasper, the general chain of effects being palpably manifest to the senses. Changes like these are common in this country in beds of earth or clay containing lime or iron; these latter are the conductors of electric matter into the otherwise almost impervious clay; and the electric matter, abstracting the hydrogen from the clay, causes it to indurate as a siliceous body, or as clay-slate, the lime becoming converted into calc spar, which sometimes embraces portions of the earths affected by this action, or otherwise, varieties of iron-stone, pyrites, &c.

It is a maxim laid down by modern geologists "that science must study the laws of phenomena only, and never their mode of production." The absurdity of this dogma is self-evident, when we reflect that the laws which govern change extend to the very fountain-head from whence all human knowledge is derived; the matter and the action, and the local affections generated by local action, being indivisible, and producing the ultimate result or phenomena. The architect builds, but his labours are in vain, the material decomposes, and the stately fabric falls; he would ascertain the causes of decay, and he finds by the aid of chemistry that the decomposition of rocks is effected according to the chemical and mechanical conditions to which they are exposed; that these chemical affections depend upon the nature of their elementary compounds, and of the cement which binds them together; and that the mechanical effects are produced by rains, winds, heat, cold, gaseous exhalations, &c., of the nature of all which influences he must acquire some degree of knowledge ere he can proceed to apply a remedy. Again, chemistry leads him to pursue his inquiries still further, and to endeavour to understand under what conditions rocks were formed; he cannot stop at the knowledge that they consist of various undecomposed bodies chemically and mechanically united; but he would know why some are composed of quartz or siliceous grains, as the sandstones, others of quartz and felspar, of quartz, felspar, and mica, and of hornblende, as trachyte, sienite, and granite; others of oviform bodies cemented by calcareous matter as the oolites, and others of earths, lamellated as the shales and clays: he is, therefore, of necessity led on to study their mode of production. Thus it is, in the absence of information, the present geological fabric is built upon the various speculations of inductive science.

Lord Bacon observes of the chemists of his day, "that they amend some things, but cause little advancement." The same remarks apply to chemists and geologists of the present day. The builder will find little to interest him in the mysticisms of this science, which are wholly inapplicable to practical purposes. Geologists tell him that all crystalline rocks are primary products existing prior to sands, pebbles, clays, and earths, these latter being produced by the decomposition of rocks. There are few, I believe, who have had occasion to use the almost indefinitely varied material of these consolidated substances, who are not capable of disproving this assumption, for a very extensive class of the crystalline rocks exhibit by the nature of their calcareous, siliceous, and argillaceous earths, their organic origin, and the laws by and under which they were produced. The limestone series embrace within their composition species identified with or analogous to existing species of the ocean, and sometimes the relique of land animals; in some species these animals, previous to the aggregate mass crystallizing, have wholly decomposed, but the elementary constituents remain, and furnish equally decisive proof of their primary origin. Again, we observe ocean marles, madrepore structures, and beds of mollusca, continually passing through these changes, the organic body decomposing, and the earths produced by this decomposition consolidating into limestone rock. Again, in the crystalline structure of granite we do not

readily perceive traces of organic species, but microscopical observations have recently assured us that many of these crystalline bodies are wholly composed of infusoria. The sands upon the shores of this country, uniting with the shelly coverings of mollusca, may be often observed agglutinating together, and these sands are chiefly silica, the animal and vegetable matters uniting with them are chiefly silica, and this particular earth forms the general cement of the whole body; at first simple agglutination only, takes place; by degrees the union becomes more perfect, but the shells yet preserve their primary condition, they at length silicify or change in their nature; and, when the change is complete, we have a siliceous aggregate mass. But the change does not rest here, the aggregate gradually crystallizes, and the bodies forming that aggregate crystallize independently of each other; for the crystalline result varies in nature and qualities in many bodies thus united together, although the entire mass is ever governed in disposition and crystalline structure by the force of lateral pressure of the surrounding particles. Much of the strata of this country is composed of siliceous pebbles, and a great portion of those pebbles and petrified organic bodies, which, under the form of common flint, maintain the form characteristic of the species to which they belong, as sea-eggs, mussels, limpets, and other crustacea and mollusca; the bones, teeth, and vertebrae of fishes; the bones and fragments of land animals, and portions or entire trunks of trees; but uniting with these fossils are vast numbers of pebbles of the same siliceous nature, and by microscopical observation and analysis betoken the one common origin: yet men of science, while they embrace the former as fossils, designate the remainder, which are in general no other than the fragments or particles of the like organic species, as mineral bodies derived from the disintegrated rock. Again, clays exhibit innumerable traces of organization; we find aluminous clay producing from the union of the sea-water with matters deposited by running streams, which are chiefly vegetable earth. Again, subject to change produced by change of temperature, we see them pass into the state of clay-slate, or uniting with metallic matters becoming crystalline, and assuming the varied forms of rock.

(To be continued in our next.)

METROPOLITAN IMPROVEMENTS.\*

THAMES EMBANKMENT.

The objections to the plan, however, on other grounds are not so easily disposed of. According to the evidence before the commission, the abstraction of the tidal water from a navigable river is in principle objectionable, inasmuch as it diminishes the efficacy of the scour. Various opinions were offered as to the degree to which this objection would apply to Mr. Walker's embankment. Mr. Hartley was of opinion that it would be considerable; and with Mr. Giles, that its effects, if not felt in the Pool itself, would be more or less injurious in the district of the river below the Pool: Mr. Rennie, that it would operate both in the Pool and in the river below the Pool. The general tendency of these opinions, indeed, in reference to the plan immediately before us, was that, assuming the navigable current to be improved by judicious dredging, and a uniform course and increased velocity to be given to its channel, the loss would, in great measure, be compensated. But these opinions were given in reference only to a small portion of the river, irrespectively of any system for its general management, and, of course, without contemplating that extension of its present plans which this commission may feel it right to recommend hereafter.

It was objected as to the recesses, that in proportion as they were favourable to the trade, they would become injurious to the navigation. Mr. Hartley was of opinion that they would abstract from the full force of the tidal current, and in a limited or proportionate degree affect both the tide and the scour: Mr. Cubitt, that an embankment so formed would not be continuous enough above low-water mark to form a good and efficient tide to the river: Mr. Gordon, that by causing eddies,

\* Continued from page 208.

\* Continued from p. 207.

they would disturb the current of the main stream, and prevent the establishment of any uniform regimen for the river: Mr. Rennie, that they would have a strong tendency to interrupt the free flow of the tide. Mr. Rendel, speaking in his evidence of these recesses, observes, "I cannot imagine any arrangement which would be more likely to make the bed of the river worse than it is at present. If there were a series of long embankments, and a series of long recesses, they would, instead of giving a uniform velocity to the stream, make it more irregular than it is at present." On the other hand, Captain Beaufort was of opinion that, practically, they would have no effect on the scour of the river, and Mr. Macneil and Mr. Giles that "embankments, with occasional recesses," would conduce to its "improvement," and to the "benefit of the navigation."

The mode of levelling these recesses proposed by Mr. Walker, and of providing them with permanent foundations, is fully explained in his evidence. The objections on this head took a wider range, though intrinsically of less importance, than those above adverted to, inasmuch as they involved the use and the construction of these receptacles for trade. Of the persons in trade examined by the commission in reference to the dwarf piling proposed by Mr. Walker, Mr. Hay (a lighterman) was of opinion that it would be injurious to the craft. The answers of Messrs. Pocock and Peache (the first a coal, and the second a timber merchant) were not adverse: Mr. Lucey (a lighterman) gave no decided opinion; Mr. Taylor (a coal merchant) and Mr. Harvey (a wharfinger), both of them occupiers of extensive river frontages, were generally in favour of its adoption. The opinions of these witnesses, it is right to observe, were given in evidence, and without any previous reference to plans, sections, or other sources of information. Mr. Taylor and Mr. Harvey appear to have formed the most correct conception of the course proposed to be pursued.

Of the professional witnesses consulted, the attention of the majority appears to have been directed to the effect of this dwarf piling upon the navigation, in connection with the recesses: of those who expressed their opinions with immediate reference to the use or convenience of it to the trade, Mr. Cubitt thought that dwarf piling would be inconvenient, as forming a step or threshold under water, and Mr. Rendel, that barges would be liable to ground upon, and be endangered by it. These opinions, it should be observed, were given, not in evidence, but upon a deliberate examination of the sections which accompanied Mr. Walker's plan.

The objections of the trade to the general principle of a solid embankment, whether with or without recesses, have already been adverted to in the history of the proceedings upon Mr. Walker's plan before the select committee of 1840. Of the witnesses in trade examined by the commission, Mr. Harvey objected to a solid embankment, that it would prevent him from getting his barges to the warehouses; that he should have to carry all his goods twice; that his craft, by being exposed to the swell of the steamers, without proper moorings in the stream, would be subject to increased wear and tear; and that any measure which deprived him of his accustomed means of access would be attended with additional expense in the landing and warehousing of his goods. Mr. Pocock attached no great importance to the wear and tear apprehended by Mr. Harvey; but in every other respect concurred in his objections. It was suggested, and assented to by these gentlemen, that piles driven out in the main stream might diminish the difficulty as to moorings, assuming the extent of these to be equivalent to the accommodations of their present frontages (in many cases usurped); but this equivalent would have involved a projection into the navigable waterway of 160 feet in the one case, and from 180 to 190 feet in the other, and, allowing for the depth of the solid embankment proposed in this particular locality (viz., in the neighbourhood of Whitefriars), would have carried the piling, on the northern shore alone, very nearly into the present centre of the river.

The opinions of the lightermen consulted on the last-mentioned of these points had reference principally to the exigencies of their

own calling. Assuming a solid embankment to be constructed throughout the whole line, they were agreed that, with the additional velocity to be given to the stream in heavy frosts, and with a channel loaded with ice, the craft would drift at the mercy of the current, and that no system of piling would avail for their security.

The professional opinions consulted by the commission were very nearly in accordance with each other on both of these points.

On that of the wharfage, Captain Beaufort, Mr. Hartley, Mr. Rendel, Mr. Macneil, and Mr. Giles were of opinion that continuous lines of solid embankment shown upon the plans could not be made consistently with the interests of the trade or the convenience of the public; Mr. Rennie, on the other hand, that the two objects were conjointly practicable; Mr. Gordon—that, "after a serious interference with, and breaking up of, existing arrangements, the trade would be ultimately great gainers by a solid embankment."

On that of the river—Mr. Hartley thought, that "to force all the craft to moor in the navigable stream would be a source of inconvenience to the trade, and of obstruction to the navigation;" Mr. Gordon,—that "as in the present system of traffic on the Thames, the heights or bays are indispensable as places of rest and refuge, the solid embankments of plan A would tend to injure the trade;" Mr. Rendel,—that "if the Thames were embanked with a solid embankment, according to the plan suggested, the wharfingers would find it absolutely necessary for their own protection not to moor out into the stream;" that "as the object of making a solid embankment would be to give the Thames such a uniform velocity as would keep open its channel, that velocity would prevent the use of the then shores by those barges; that the strongest run of the tide could not be taken at less than three miles an hour, and that three miles an hour would be quite enough to prevent the mooring of those craft along the shore;" that the utmost extent to which such a course would be practicable would be "a couple of barges in length," and that guard piles carried out to an extent to meet the requisites of the trade "would not continue a week." The opinions of Captain Beaufort, Mr. Cubitt, Mr. Macneil, Mr. Rennie, and Mr. Giles were addressed rather to the question of recesses, and their convenience to the trade as shelter from the open tideway, than to the positive difficulties and disadvantages connected with solid projections.

The foregoing, we think, may be referred to as a faithful summary of the opinions whether for or against the adoption of Mr. Walker's plan, having reference exclusively to its own merits. Its relative advantages and disadvantages, with reference to other plans, will be referred to hereafter.

**REFUGE HARBOURS.**—In the early part of the present week, Her Majesty's steamer, the *Blazer*, Captain Washington, appeared off here, taking soundings, and placing buoys with flags on them at certain points, to ascertain the capability, it is said, of our bay for the site of a harbour of refuge. On Thursday the *Blazer* went down as far as Dungeness, and yesterday morning she resumed her survey of Dover Bay. It is confidently anticipated that the present members of the Commission (who, by the way, we have heard are all to be here next week) will, like their predecessors, recommend Dover as the most eligible site for the erection of the first refuge harbour on these shores. That *sine qua non* to a harbour of refuge—commanding and efficient fortifications—are already in existence here; and the ample depth of water, its local advantages of position at the very point in the Channel to avert the dangers of the Goodwin Sands, its proximity to the Continent, and its natural defences, must point it out as a spot eminently fitted by nature as a haven of shelter from the storm, or as a defence from the assaults of hostile fleets.—*Dover Chronicle*.

**INDIA-RUBBER HORSE SHOES.**—A sample of an India-rubber horse-shoe has been submitted to the Horse Guards, and approved of. It is intended to test immediately its capability and durability for that purpose.

## RAILWAY INTELLIGENCE.

**Birmingham and Derby Junction Railway.**—A special meeting was held at Birmingham on the 17th ult. to take into consideration the Bill for the amalgamation of the North Midland, Midland Counties, and Birmingham and Derby Railway Companies. Mr. Beale presided, and after stating the result of the North Midland and Midland Counties meeting, concluded by proposing the approval of the Bill, the clauses of which had been read over; and which was seconded by Sir Oswald Mosley, and adopted. Mr. Kahrs, of Derby, opposed the resolution, contending that the Birmingham and Derby Company had been unfairly dealt with in the arrangement for the amalgamation of the three lines. While the traffic of the Birmingham and Derby was increasing, that of the North Midland was going on but slowly; and that of the Midland Counties scarcely at all, comparing the traffic of the present with that of the past year; while the returns of the Midland Counties were much less than ever, the Birmingham and Derby showed an increase of 16 per cent. The formation of the new lines, more particularly that from London to York, led him to take this view, and to entertain strong apprehensions on the subject. It had been assumed that the Bill for that line would not pass. He was of opinion that it would; and, if so, it would seriously affect their interests. He contended that these new lines would affect the three Companies, if united; but that it would not, if unamalgamated, affect the returns of the Birmingham and Derby, who, he thought, had been sacrificed to their more powerful rivals. He concluded by proposing an amendment for protecting the Derby Junction, in the event of the Cambridge and York line being carried out, by a reference to the Board of Trade, and to determine whether in that event better terms should not be given to the Birmingham and Derby Company. The Chairman thought that Mr. Kahrs's opposition was ill-timed. He should have opposed the Bill at the special meeting lately held to consider it. He, the chairman, had no apprehension as to the Cambridge and York line, for he contended that the prospect of returns from it were such as to prevent any body of capitalists from entertaining it. If the Birmingham and Derby Company remained distinct, they would not derive that benefit which would accrue to them from the projected line from Rugby to Oxford, but would diminish one of their largest sources of income. The amendment was then put, and negatived by a majority of fifteen to three. Lieut-Col. Blane then proposed another resolution, to the effect that it was inexpedient for the proprietors to proceed further with the Bill, their interests not having been sufficiently considered. This resolution was negatived; as was also another, proposed by Mr. Kahrs, to modify the clause which provides that the Chairman of the Board of Directors shall preside at general meetings.

**Railroad from Lynn to Ely.**—The greatest activity prevails relative to this important undertaking. Shares are being taken beyond the most sanguine expectations: indeed it is confidently believed they will soon be at a premium. During the past week a meeting was convened by the Sheriff of Norfolk, to take the line into consideration, which was attended by a large and respectable assembly.

**Railway.**—It is not yet fully determined at what point the terminus of the railway shall be established in Peterborough. There seems to be a general feeling that, as Butt's close cannot be obtained, a spot should be selected near the private residence of Dr. Schrimshire, kindly offered by Mr. Gates, the lessee of the property.

**Railway from Stafford to Shrewsbury.**—Captain Huish, Mr. Errington, and Mr. Swift, on behalf of the Grand Junction Company, attended a public meeting at Shrewsbury, on Wednesday, to explain and support the scheme for a "Shrewsbury and Stafford Railway." Resolutions in favour of the project were unanimously agreed to.

It is said that the shares in the proposed railway from Wolverhampton to Shrewsbury are all taken; and that, the funds being now subscribed, the necessary application to Parliament will be made immediately.—*Worcester Journal*.

**Bristol and Exeter Railway.**—Exeter must now be considered a railway town, as a locomotive engine has this week, for the first time, made its appearance within that ancient capital of the West of England. On the 17th ult. the first complete passage of an engine from the present terminus of the railway at Beambridge to the new station at Exeter took place, the engine conveying Mr. Brunel, the engineer in chief, Mr. Fripp, one of the Directors, and several of the assistant engineers, with Mr. Hennett, the contractor for the permanent way, on whose account the engine was engaged for the conveyance of timber and other materials down the line. The arrival of the engine was hailed with much interest by the Exonians, hundreds of whom were assembled to witness this novel visitor. In a few days this will become an ordinary sight, and there will then (with the exception of a slight break between Bristol and Gloucester, which will be completed in the course of a few weeks) be an unbroken railway communication from Exeter to Newcastle-on-Tyne, a distance of upwards of 300 miles.

**Pontop and South Shields Railway.**—A special general meeting of the shareholders was held at the offices, Guildhall-buildings, for the purpose of having laid before them the draft of a Bill now before Parliament, for enabling the company to widen a part of the railway, to make branches therefrom, and for other purposes. The meeting, a mere formal one for the purpose of complying with the standing orders of the House of Lords, was very thinly attended—not more than a dozen shareholders being present. Mr. Rennie was in the chair. The Bill, which is for widening a portion of the line, about five miles in extent, lying between the Durham Junction Railway and the Branding Junction Railway, and intended to form part of the proposed line of railway between Newcastle and the Great North of England Railway, was unanimously approved of, and the meeting separated.

**New Railway.**—A direct northern railway, from London to York, by Lincoln, having in view the connection of the north of England and Scotland, by York, with the metropolis, has been recently started. This line is proposed to commence from King's-cross, and to proceed through Chipping-Barnet, Biggleswade, St. Neot's, Huntingdon, and Peterborough, to Lincoln, and thence by Gainsborough, Thorne, Snaith, and Selby, to York. The capital required is 4,000,000*l.*, in 100*l.* shares. Among the advantages which it is stated this route would possess are—that the distance between London and York would be 39 miles less than by the existing railways; that it would reduce the distance between London and Edinburgh 39 miles; and that it would be the nearest way to Leeds, Selby, Hull, Halifax, Bradford, Huddersfield, Wakefield, Pontefract, and Sheffield.

**Proposed Railway from Oxford to Wolverhampton.**—We have received information, from a source on which we have reason to place every reliance, to the effect that the projected railway from Oxford to Wolverhampton is progressing prosperously; that negotiations are now on foot with other railway companies, and that in a very short time a detailed prospectus, with the names of a most influential provisional committee, will be issued.—*Worcester Journal.*

**The Kent Railway.**—This project as originally started in 1836 has been revived. The line is proposed to go from London to Ramsgate, Margate, and Deal, passing through or near the towns of Deptford, Greenwich, Woolwich, Erith, Dartford, Greenhithe, Gravesend, Strood, Rochester, Chatham, Brompton, Milton, Sittingbourn, Faversham, Canterbury, Whitstable, Herne Bay, Sandwich, and Deal. The capital required 2,000,000*l.*, to be raised by the issue of 100,000 shares of 20*l.* each.

The Mayor of Banbury has received from Charles A. Saunders, Esq., Secretary of the Great Western Railway, a letter, intimating that it is the intention of that company to extend the Oxford Railway to Banbury, and that it is in contemplation of other parties to make a line from Banbury towards Worcester and Wolverhampton, as proposed by Mr. Elgie at the late meetings in this city, Kidderminster, Evesham, &c.—*Worcester Journal.*

**Railway Openings.**—In May, no fewer than four new railways will be opened for public traffic. The first in point of importance will be the Bristol and Exeter Railway. By this opening the public will be put in possession of an uninterrupted communication westward of 194 miles, 118 of which belong to the Great Western Proper, the remaining 76 miles being the length of the newly-opened line from Bristol to Exeter.—The Norwich and Yarmouth Railway, twenty and a half miles in length.—The Liverpool and Manchester Extension Railway, through Salford, to join the Manchester and Leeds Railway.—The West London Railway, which will form a West End terminus to the Great Western and London and Birmingham Railways, and will no doubt prove a welcome acquisition to the public, since it is calculated in the latter case, that a passenger wishing to go to Chelsea, Hammer-smith, or Knightsbridge, will save nearly one hour and a half, over the usual route to Euston-square, and thence by omnibus. It is proposed that the same carriage which brings a party, either from Birmingham or Bristol, shall convey him on to the West London Terminus.

**Railway Capital.**—The extent of railways already constructed and in operation in the United Kingdom is 2,000 miles; the sum which has already been actually expended in their formation is no less than 73,000,000*l.* sterling; the projects now before Parliament will, if sanctioned, add nearly another 1,000 miles to the existing length of our railways, and were the cost of their construction to be equal to the rate of executing the existing lines, almost other 40,000,000*l.* sterling would be added to railway investments; but as the cost will not reach that rate, to add another 30,000,000*l.* sterling to railway stock will be probably a more truthful calculation. Thus in a few years the enormous sum of 109,000,000*l.* of money will have been invested by the English capitalists in the construction of railways at home, besides a very considerable sum which has been sent out of the country to assist in the formation of foreign railways.

**Railway over the Menai Bridge.**—This bridge will be made the means of transit over the Straits, in the projected line of railway from Chester to Holyhead, for the express purpose of fully testing its capabilities, and also of ascertaining how far the ordinary traffic conducted over it may, or may not, be impeded or injured by such means; and that in case reasonable fears should then exist of its durability as a medium of railway transit, or experience should shew that such transit is injurious to the trade now carried over it, a new bridge will be erected.—*Carnarvon Herald.*

The Great North of England Railway Company have recently made an offer to the Darlington and Newcastle Junction Company (whose line is about to be opened) to contract for supplying locomotive power and carriages of all descriptions for each train at 1*s.* 3*d.* a mile. By this estimate, ten third-class passengers, charged at the rate of 1*d.* a mile, as on the London and Birmingham and other railways, would pay the expenses of a whole train, capable of conveying several hundred passengers!

**Atmospheric Spring for Railway Carriages.**—This much-approved method of giving elasticity to railway carriages is now in constant operation on the Stockton and Darlington Railway, and is universally admired for its superiority over the ordinary spring now in use. The motion given to the carriage is perfectly smooth, easy, and free from the unpleasant sensation caused by the harshness of the steel spring; and the lateral motion, which in most carriages is so very disagreeable, is entirely removed.—*Durham Advertiser.*

The Sheffield and Manchester Railway Company have purchased the Huddersfield Canal, and intend to apply to Parliament for a direct line between Huddersfield and Manchester, by way of Saddleworth, Ashton, &c., to be carried as far as practicable alongside the canal.

**Railway Returns.**—Total amount received for traffic on the London and Birmingham Railway for the week ending April 20, 19,095*l.* 2*s.* 9*d.*; Birmingham and Derby Junction, April 20, 1,360*l.* 1*s.* 10*d.*; Grand Junction, April 17, 6,607*l.* 0*s.* 9*d.*; Birmingham and Gloucester, April 19, 2,143*l.* 10*s.* 8*d.*; Great Western, April 14, 15,624*l.* 1*s.* 10*d.*

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

**Bardsley New Church.**—This structure, from its elevated site, may now be seen for many miles in every direction. It is a most beautiful specimen of the Norman architecture of the twelfth century. The whole design and execution reflect the highest credit on the architects, Messrs. Starkie and Cusley. It is cruciform in figure, the transepts contributing greatly both to the external and internal elegance of the whole structure, which is in a light and chaste style. The stone-work of the transepts and vestry is complete, and ready for the internal finishing, which will be commenced next week. The tower is raised to the level of the roof of the church, and will be completed next month. The first stone was laid on Whit-Friday last year, by Jonah Harrop, Esq., of Bardsley House, and dedicated to the Holy Trinity. The presentation is in the hands of the trustees of Hulme's Charities, who have given the land and contributed munificently to the building and endowment of the church. A parsonage and Sunday schools will be erected in the field adjacent to the burial ground, which is in a spacious plot of land of a gravelly soil.—*Manchester Advertiser.*

**Tamworth.**—Among the curious specimens of ancient ecclesiastical architecture still remaining in this country, is the winding staircase at Tamworth Church. This staircase has one centre newel running perpendicularly to the top of the church, into which a double staircase is so ingeniously laid, that two persons may walk from the bottom to the top of the church abreast, without seeing each other until they arrive at the top. This spiral staircase is almost unique in England.—*Church Intelligencer.*

**Bury Parish Church.**—The erection of a new tower to the parish church of Bury is proceeding in a satisfactory manner. It is now considerably higher than the pediment (gabel) of the body of the church. The lovers of steeple music will be glad to learn that the old peal of six bells is to be superseded by an excellent peal of eight bells.

**Birmingham.**—The bishop of the diocese has presented a donation of 20*l.* towards the Queen's College and Collegiate Chapel in this town. The foundation-stone will be laid early in May.

The parish church of Broad Chalke, near Salisbury, an ancient structure, being the mother church of the Chalke deanery, is in a sad state of dilapidation. It is proposed, as soon as the necessary funds can be raised, to entirely new roof and reweave the same. The amount required is about 1,400*l.* The subscriptions of benevolent individuals, aided by the various church societies and the liberality of the patrons of the living, amount to 1,100*l.*, leaving a deficiency of 300*l.*

Mrs. Lawrence, of Studley Park, in addition to former liberal donations, has just presented 1,000*l.* to the Ripon Diocesan Church Building Society.

Her Majesty the Queen Dowager has graciously bestowed 300*l.* upon the Holme Cultram Church, Cumberland.

**GOthic TRACERY, &c.**—At the last weekly *conversazione* of the Royal Society in Albemarle-street, some very curious and elaborate specimens of carved Gothic tracery, executed by a newly-invented machine, for which Mr. T. Pratt, of New Bond-street, has obtained a patent, were exhibited, and excited a great deal of attention. The specimens are remarkable for their finish, as well as the beauty of their designs, and they can be produced with a rapidity and at a rate of remuneration which will put it in the power of most persons to have carved doors, pieces of furniture, &c. For the fitting up of cathedrals, churches, and public buildings, the employment of this machine will obtain at a tenth part of the usual expense better carving than can be procured by other means without incredible labour and great waste of time. The carvings for the church at Camberwell are being cut by this instrument.—*Morning paper.*

**CHATHAM DOCKYARD.**—An order has been received to light this establishment with gas.

PATENTS RELATING TO ARCHITECTURE,  
ENGINEERING, &c.

Granted between 26th February and 23th of  
March, 1844.

[SIX MONTHS FOR ENROLMENT.]

John Robert Dicksee, of Old Compton-street, Soho-square, artist, for improvements in the manufacture of mosaics. March 30.

William Crockill, of the Iron Works, Beverley, for improvements in machinery for making wheels for carriages. March 30.

Henry Clayton, of Upper Park-place, Dorset-square, Regent's-park, plumber and machinist, for improvements in the manufacture of tiles, drain pipes, or tubes and bricks. March 30.

Frederick Brown, of Luton, Bedford, ironmonger, for improvements in stoves. April 10.

James Murray, of Garnkirk Coal Company, Scotland, for a new method of using and applying artificial gas made from coal, oil, or other substances, for lighting and ventilating caverns, pits, or mines, or other pits where minerals or metals are worked or extracted. April 10. (Four months.)

John Aitken, of Surrey-square, for improvements in water machines, or engines and steam-engines, and the mode of traction on, or in canals or other waters or ways. April 10.

George William Lenox, and John Jones, of Billiter-square, London, merchants, for improvements in the manufacture of sheaves and shells for blocks, and of bolt rings or washers, for the purposes of shipwrights and engineers. April 10.

James Kennedy, of the firm of Bury, Curtis, and Kennedy, of Liverpool, engineer, and Thomas Vernon, of the same place, iron ship builder, for certain improvements in the building or construction of iron and other vessels for navigation on water. April 15.

John Lawson, of Leeds, engineer, and Thomas Robinson, of the same place, flax-dresser, for certain improvements in machinery for heckling, dressing, combing, and cleaning flax, wool, silk, and other fibrous substances. April 16.

Edgar Heale, of Brixton, gent., for certain improvements in the construction of carriages for the conveyance of passengers on roads and railways. April 18.

Donald Grant, of Greenwich, Esq., for improvements applicable to the ventilation of apartments in which gas and other combustible matters are consumed by ignition. April 18.

John Bailey Denton, of Gray's-Inn-square, land-agent, for improvements in machinery for moulding or shaping clay and other plastic substances, for draining and other purposes. April 18.

Joseph Woods, of Barge-yard Chambers, Bucklersbury, gent., for improvements in regulating the power and velocity of machines for communicating power, being a communication. April 18.

William Hodson, of New King-street, Kingston-upon-Hull, estate-agent, for a machine for making and compressing bricks, tiles, square pavers, and ornamental bricks. April 18.

Peter Lear, of Boston, Suffolk, of the State of Massachusetts, America, gent., for certain new and useful improvements in machinery for propelling vessels through the water. April 23.

William Taylor, of Birmingham, door-spring manufacturer, for improvements in the manufacture of axle-pulleys, and in pegs or pins for hanging hats or other garments. April 24.

Charles Harrison, manager of the Coel Talon and Leswood Iron Works, Flintshire, for certain improvements in the manufacture of cast-iron pipes and other castings. March 26.

Elisha Haydon Collier, Esq., of Goldsworthy Terrace, Rotherhithe, Surrey, civil engineer, for certain improvements in the construction of furnaces and flues. March 27.

Joseph Dickinson Stagg, of Middleton, in Teesdale, Durham, Manager of Smelting Works, for a new and improved plan for collecting, condensing, and purifying the fumes of lead, copper, and other ores and metals, also the particles of such ores and metals arising, or produced from the roasting, smelting, or manufacturing thereof, and also the noxious smoke, gases, salts, and acids, soluble and absorbable

in water generated in treating and working such ores and metals. March 30.

William Edward Newton, 66, Chancery-lane, Middlesex, civil engineer, for an improvement or improvements in furnaces, being a communication. April 4.

John Stevelly, of Belfast, Ireland, professor of natural philosophy, for improvements in steam-engines. April 10.

Thomas Nasb, of Paul's Cray, Kent, paper-maker, and Francis Pirie, of Watling-street, London, paper-maker, for certain improvements in the manufacture of paper, and in the machinery to be used therein. April 11.

## Correspondence.

## ALTERATIONS AT THE CARLTON CLUB-HOUSE.

Sir,—Not having seen in your valuable publication an account of a most important competition now in progress, viz. for altering or rebuilding the Carlton Club-House in Pall-mall, I beg to send you an account. On the 16th of March last there was a general meeting of the Club, when it was determined to make extensive alterations and additions to the Club House, and to call upon fourteen of the first architects in London to furnish designs. The meeting then proceeded to name the architects who were to compete. The architects so named were:—

Mr. Barry, Great George-street; Mr. Sydney Smirke, Berkeley-square; Mr. Basevi, Saville-row; Mr. Hardwick, Russell-square; Mr. Cockerell, the Bank; Mr. D. Burton, Spring-gardens; Messrs. Lee and Bury, Golden-square; Mr. Pugin, Chelsea; Mr. Railton, Carlton-chambers; Mr. Blore, Manchester-square; Mr. Matthew Wyatt, sen.; Mr. Salvin, Saville-row; Mr. Poynter, Poet's corner, Westminster; Mr. Hopper, Connaught-terrace.

On the 19th a letter was sent to each of the above gentlemen, stating that at a general meeting of the Carlton Club, held on the 16th March, it was resolved that extensive alterations and additions should be made to the present Club House, and that the limited number of fourteen eminent architects should be invited to furnish plans, elevations, &c., that a premium of 200*l.* should be awarded to the most approved plan in case it should not be adopted by the Club, and that a sum of 100*l.* should be awarded to the second best plan in case the first should be adopted. The plans to be sent in to Mr. Jephson, the Secretary of the Club, on or before the 1st of May. The name of the architect not to be affixed to the plans, but a mark or motto to be attached, &c. &c.

The committee also issued instructions as to the nature of the design, accommodation required, &c.

The designs, in accordance with the resolution, were sent in this day, and as it is important that THE BUILDER should contain all information interesting to the profession, perhaps you will think this letter worthy of insertion.

I am, Sir, your obedient servant,  
A SUBSCRIBER FROM THE FIRST.

## THE SOCIETY OF ARCHAEOLOGISTS AND ARCHITECTS, NEWCASTLE-UPON-TYNE.

Sir,—You will doubtless be glad to hear of the formation of a Society in Newcastle-upon-Tyne, entitled "The Society of Archaeologists and Architects, Newcastle-upon-Tyne," to have for its objects the accumulation of architectural detail, historical data, and antiquarian information respecting the ancient buildings (especially ecclesiastical) in the north of England, and eventually the publication of the results of its labours. Thus, by being put in possession of a multitude of examples, the architect will be enabled to furnish designs for modern erections, according to the best models of antiquity, which in these matters (at least) appear to be our only true guide.

Each member is expected, at least once in three months, to produce and present to the Society a drawing or drawings of the whole or of part of an ancient building, together with any deductions, opinions, inferences, and historical data which he may have collected respecting it. The drawings and MSS. are intended to circulate among the members for their mutual use; and when the Society becomes powerful and rich enough,

they will be published, each member being entitled to a copy, and a certain number printed for general sale. When any expenses occur, each member will pay a moiety. Any person residing in the counties of Northumberland, Durham, Cumberland, and Westmoreland is eligible as a member, provided he possess a taste for such subjects, is able to engage in them, and the majority of the members are agreeable, when his admission is proposed.

The necessity of such an institution is apparent. Besides the value of a society professing a determination to do what they can for its professed objects; beyond, the great value attachable to the results of its labour, such labour is the more incumbent when we witness the almost daily remorseless demolition of so many of our venerable remains, by the utilitarian rage, when to a person of taste their very age (if even there were no higher motive) should preserve them from destruction. Although we have had but one meeting, considerable interest is excited, and many are applying for membership. A large field is open for our exertion; perhaps there does not exist one finer than that to which our labours are more particularly to be directed.

I have sanguine hopes of its ultimate utility both to its members and to the public.

G. B. RICHARDSON, Hon. Sec.  
and Treasurer.

Grey-street, Newcastle.

[We have not this week time to make any observations upon the formation of this society.—Eo.]

## TIMBER SCARFING.

Sir,—I should like to know from your correspondent, "A Practical Carpenter," whether he means the scarf he has contributed in page 193 of THE BUILDER (and which he says he considers preferable to any of those in Mr. Wyllson's paper on scarfing) to be equally applicable to timbers in tension and in compression, and if placed in any position; as it appears important to arrive at such a form of scarf as should not only be the best of its kind, but suitable under all circumstances.

It appears to me that the scarf fig. 13, page 75, is better than that above referred to, inasmuch as three keys form a greater obstacle than one to prevent the parts from sliding on each other, and the small end abutments would not be so liable to be broken off. I submit, however, to his superior judgment.

I am, Sir, your obedient servant,  
A CARPENTER.

Holloway, April 18, 1844.

## Miscellanea.

ROCHESTER BRIDGE.—On Friday, April 19, the annual meeting of the Commonalty of Rochester-bridge was held as usual within the castle of that city. On the business of the day being commenced, the annual statement was read by the clerk, George Essell, Esq., from which it appeared that the rents, dividends, &c., of the corporation of the bridge for the past year amounted to near 5,000*l.*, out of which, after paying the current expenses of repairs of the fabric, &c., and the purchase of some property near the bridge, a sum of nearly 3,500*l.* had been invested in the public funds. The present funded capital belonging to the trust amounts to about 72,000*l.* On the subject of a new bridge, the wardens informed that meeting, that they had taken means to obtain an estimate from their surveyor, and some friendly discussion arose among the gentlemen present, when the general feeling appeared to be that the time for undertaking a new bridge has not yet arrived, and the wardens assured the meeting that a work of such magnitude would not be attempted until ample means have been provided without rendering the contributing parishes liable to be burdened in the slightest degree.

THE NEW CORN EXCHANGE, COLCHESTER.—At a meeting held on Saturday fortnight, to decide on the site of the new corn exchange, it was determined to adopt the spot recommended by the committee, which comprises the site of St. Peter's Vicarage, enlarged by the addition of other ground, and which altogether affords a space about one-third larger than the present corn-exchange.

**COTTAGE-ALLOTMENTS.**—Mr. Colman, the celebrated American agriculturist, who is now on a tour through Europe, speaking on the advantages resulting from cottage-allotments, says:—"I have treated largely on the subject of allotments, as presenting one of the first and most efficient means of bettering the condition of the agricultural labourer. My own convictions are strong on this point; and they are sustained and strengthened by the testimony of many men of large experience and shrewd observation. The labourer finds in an allotment a means of turning his spare hours to advantage, and in a mode of labour which, from its very character, being in the association of his wife and children, under his own control and management, and for his own immediate and personal benefit, becomes a pleasure instead of a toil. He finds it the means of eking out his scanty wages, of providing, to a degree, for an occasion of sickness, or other suspension of his employment and wages. He is enabled to bring from this source many rare comforts to his own frugal table; and has himself, if he is a man of feeling—and why should he not be?—an opportunity of enjoying one of the richest of all pleasures, that of making a small contribution to relieve an unfortunate or a sick neighbour. It presents a good school of industry for his children, under his own immediate inspection. It quickens his own intelligence, in making agricultural experiments upon a small and useful scale; and rouses a spirit of wholesome emulation, in his crops, even with the master farmers. It removes him from strong temptations to gambling, low dissipation, and intemperance. It gives him an interest in the soil; it attaches him to his home; it involves him in all the risks of the public safety, and makes him the friend of public peace and order. It gives him the spirit of a man, raising him above the sense of slavish dependence, and the dread of becoming a pensioner on public charity. In so doing, it at once exalts him in the community; induces a most wholesome self-respect; inspires a just regard for the rights of property; attaches him the more strongly to his superior, who thus shews his willingness that he should walk erect instead of keeping him upon the ground with his foot upon his neck; and presents innumerable, constant, and powerful motives to improvement and good conduct."

**THE WELLINGTON STATUE IN THE CITY.**—At the last meeting of the Royal Exchange Committee, on the subject of placing the statue of his Grace the Duke of Wellington, by Sir Francis Chantrey, the trustees, Mr. John Masterman and Sir Peter Laurie, and the executors, Mr. Turner, R.A., and Mr. Jones, discussed, at considerable length, the question as to the most eligible position of the equestrian figure on the spot selected in front of the Royal Exchange. Upon that occasion Sir Peter Laurie stated, that Sir Francis Chantrey always expressed a wish that the statue should face the south, in order that it might have the advantage of the sun, for which purpose the eminent sculptor suggested the removal of the ugly upper story of the Mansion House, which was accordingly taken down, to the manifest improvement of that edifice. Mr. Jones confirmed the statement, as to the opinion and wish of Sir Francis Chantrey. The committee, however, came to the resolution that, as the front of the Royal Exchange faced the west, it would, notwithstanding the impression upon the mind of so high an authority, be preposterous to turn the face of the statue away from that direction, and they accordingly agreed unanimously that the duke should front Cheapside. Mr. Turner, the other executor, informed the committee that the statue and pedestal had long been completed, and he trusted that by the 12th of June, the anniversary of the battle of Waterloo, the public would have a complete opportunity of judging of the merits of the performance. The committee seemed to entertain no doubt that on the anniversary of the memorable event the statue would be erected.

**CAUTION TO SURVEYORS OF THE HIGHWAYS.**—On Friday week, at Chandos House, Mr. William Wyatt, Surveyor of the Highways of Dunkerton, was fined 10s. and costs, for using his own team for repairing the parish highways without having first obtained from two justices a license authorizing him so to do.

**PUBLIC WALKS.**—A grant of 5,000*l.*, being the first grant from the fund of 10,000*l.* voted by Parliament for the purpose of providing public walks for the use of inhabitants of large towns, has been allotted to Oldham; a communication having been received to that effect, a short time ago, from Sir Thomas Freemantle, on behalf of Government. The appropriation of the funds is in the hands of the Commissioners of Woods and Forest, upon whom a deputation of the Oldham Police Commissioners waited some time ago on the subject, accompanied by their law clerk, Mr. Kay Clegg. It is understood that additional funds will be required to carry into effect the highly desirable object in view; and measures are to be taken forthwith to promote the design.—*Manchester Guardian.*

**NEW ALMSHOUSES AT MAIDSTONE.**—A desirable site near College-lane has been selected for the almshouses directed to be built and endowed by the will of the late Philip Cortall, Esq. The erection will be of stone, and of a substantial nature.

**WINDOW GLASS.**—By the new scale of duties the Chancellor of the Exchequer proposes to reduce the duty upon white glass which is at present 2*d.* per lb., to the same as that upon green-bottle glass, which is only three farthings per lb.

We understand that at a meeting of the Iron trade, held on the 17th ult., it was unanimously resolved, unasked, to advance the wages of the colliers and miners in the Monkland district 6*d.* per day, on condition of the absurd restriction by the miners to two-thirds of their out-put being given up.—*Glasgow Argus.*

**Tenders.**

**TENDERS** delivered for painting, decorating, and generally repairing the Hall of the Worshipful Company of Saddlers, in Cheapside.—Samuel Angell, Esq., Architect. April 30.

Battam and Craeke .....	£399
George Cooke .....	404
Bishop .....	427
Taylor .....	462
Larke .....	492
Sairs .....	510

**NOTICES OF CONTRACTS.**

For the erection of a Bridge at Hilton, in the parish of Woolfield, Salop, and also for lowering and improving the upper part of Hilton Hill.—Plans, &c., at Mr. Stokes, Shipley. May 8.

For the erection of a Theatre at Wolverhampton.—Drawings, &c., at the Peacock Inn, Wolverhampton. Mr. Tichborne, Wolverhampton. May 6.

For re-building the Western Pier of the Hammer Dock Basin, and the removal of the present Pier included, or to be provided for in a separate tender, as may be most convenient.—Secretary to the Dock Company at Kingston-upon-Hull. Plans, &c., at Mr. Michael Lane's, Engineer, Castle-street, Hull. May 20.

For works required in the enlargement of the Reigate Union Workhouse at Reihill.—Plans, &c., at the Board-room. Mr. Thomas Hart, Clerk to the Guardians. May 6.

For repairs and alterations of the Branch Bank, Aylesbury.—G. H. Taylor, Esq., Architect, 22, Parliament-street, Westminster, and 22, Queen-street, City; or at the Branch Bank, Aylesbury. April 29.

For altering and completely finishing the carcasses of two Houses in Middleton-road, Queen's-road, Dalston.—Mr. James Clark, 4, Richmond-Terrace, Queen's-road, Dalston.

For building an Union House, at Lock's Bottom, Farnborough, Kent.—Mr. Henry Nottingham, Clerk to the Guardians, Reston, Kent. Plans, &c., at Messrs. Savage and Foden's, Architects, 31, Essex-street, Strand. May 10.

For making a plan and taking levels of all the drains in the town of Kingston-upon-Hull, and the Lordship of Myton.—Further particulars of Mr. R. Witty, Surveyor, 11, Sykes-street, Hull. May 22.

For the alterations and repairs of Wick Church.

Plans, &c., Mr. W. N. Young, Surveyor, Mill-denhall. May 6.

For building a new Church at West Lydford, Somerset.—Plans, &c., Mr. Phipps, Shepton Mallet. May 10.

For erection of a new Union Workhouse at Highland's Farm, in the parish of Cuckfield, Sussex.—Particulars, Plans, &c., of Mr. T. Wisden, Hampton-place, Western-road, Brighton. May 10.

For erecting a bridge over the Waveney, between Diss and Stoston.—Plans, &c., from 1st to 8th inst., at Mr. Farrow's, Diss; from 8th to 15th at Suffolk Hotel, Ipswich; and from 15th to 22nd at Royal Hotel, Norwich; Clare Algar, Secretary, Auctioneer and Land Surveyor, Diss. May 23.

For the erection of an Iron Bridge of one arch, of one hundred and ten feet span, intended to be built over the river Avon, at Bath.—P. George, Esq., Town Clerk, Bath.—Drawings, &c., at G. P. Manners, Esq., Architect, No. 1, Oxford-row, Bath. May 31.

For the executing of certain works for the improvement of Aberdeen Harbour.—Plans, &c., Mr. Abernethy, 69, Waterloo-quay, Aberdeen. June 20.

SHORT and MAHONY, Brokers,

1, Newman's-court, Cornhill.

**TO OUR CORRESPONDENTS.**

We have received, and have put in the engraver's hands, the drawings of the French Church. A historical memoir relating to its congregation and establishment would be acceptable.

We are afraid the sketches of Repton Church crypt are too rough and inaccurate to be executed by our engraver, who found great difficulty in doing so with our correspondent's last communication which is ready for insertion; but if furnished with all the exact dimensions, and with true sections of the mouldings and details of the work, with the jointing of the masonry in the walls, columns, arches, and vaultings clearly expressed, we should take pleasure in having the subject fully illustrated: perhaps on digging, complete base-mouldings to every part of the structure might be found. The details of the doorway, its construction and jointing, should also be given, as should, if possible, the thickness of the materials of the vaulting. Perhaps the joints of the vaulting might, to a certain extent, be shown on the plan, unless indeed there be a pavement work representing.

We have received the letter of "A Pupil."

We have received the block plans of Widdington and Newport Churches, with an accompanying letter, but are unable to give any reply this week.

We have received the description of the "Great Britain Steam-ship," which will appear in our next.

The drawings of Hand-rail-Screws, &c., will be inserted in our next, as will the article upon Gothic arches, for which we could not find room in this number.

# The Builder.

NO. LXVI.

SATURDAY, MAY 11, 1844.

**GLASS-STAINING** is an art of so much importance to architecture that we this week go into a detailed account of the specimens now exhibiting gratis, with the other works of art, at the Bazaar, in St. James's-street; but, as we propose at some future occasion to resume the subject generally, we shall, at present, leave the reader to gather something of our opinions from the observations which we have appended to the description of the several designs noticed by us.

We must again state, that we think justice has not by any means been done to these specimens of glass-staining, by the mode in which they are exhibited, as during the greater part of the day the strong glow of light which is upon them most effectually prevents the beholder from having any thing like a correct impression of that which these works would produce when placed in the several windows of the Houses of Parliament; though we do not intend to plead altogether inexperience on the subject, yet, we admit, we were at first in some sort deceived, and by no means gave their several artists all the credit which they deserve; but, on repeating our visit at about five o'clock in the afternoon, when the sun had left the great skylight and was externally glowing upon the stained-glass itself, we then could see many of the subjects exhibited are of very considerable merit; and, when subdued by the necessary wire-guards, by the moderate quantity of aperture in which it is presumed they would be placed, and by the duskiness which would mostly come over them, if there be now much of vulgar glare and ill-assorted colouring, such disagreement and overpowering vulgarity, we imagine, would mostly disappear.

As we suppose a vast quantity of stained-glass will be used, we think many of those who have sent designs and specimens should be employed, choosing the best for cote-armoury, ornamental work, figures, and other departments, and preventing that monopoly which must end in much of the work being done in an inferior way, notwithstanding the application by the fortunate chosen to other competitors to do part of their work.

Most of their architectural adjuncts are in inferior taste; we know that it is not the glass-stainer's business to design these things, and that it belongs properly to the architect. We are aware that much of the pictorial architecture, which was introduced into the fine old stained-glass, was very execrable in design; but that forms no reason why the architecture introduced into a fine palatial edifice, built all at once, should have any such anomalous marks of inferiority.

In the windows of the magnificent Westminster Palace of Legislature, there is room enough, besides mere pictures of sovereigns and their arms, for all manner of subjects of the history of England and its church; and we hope to see such an application of the triumphs of pictorial skill, which delights in producing effects in various ways, each the best in its kind, by the heavenly severity of unadorned sculpture, by the subdued modesty of good painting, and by the permeable glow of the glass-stainer's matchless art.

We now proceed to our review of the subjects of stained-glass among the other

## DECORATIVE WORKS OF ART

*Sent in, pursuant to the notices issued by her Majesty's Commissioners on the Fine Arts, now publicly Exhibiting.*

58. Design for a stained-glass window, by John Summers.—The upper lights are occupied by figures under canopies taken from Henry VII.'s Chapel in Westminster Abbey; in the centre lights are placed Edward III. and his wife Philippa; on the right of the Queen is John of Eltham, and on the left of the King is the Earl of Warwick. The lower lights are occupied by Edward the Black Prince and the Princess, with the young Prince, afterwards Richard II. On the left of the Princess is Sir Guy de Bryan, and on the right of the Prince is Sir Oliver de Ingham.

A storied design of figures, with the further disadvantage of the figures being set upon pavements in perspective, though the figures, some of them at least, are above the eye; the large figures surmounted in the head tracery by very small ones, and these again by ornamental subjects too small to be read.

59. Design for a stained-glass window, representing Henry III. and his Queen, and Edward I. and his Queen, in the costume of their several reigns, with their heraldic insignia and badges, by Ward and Nixon.—A good design.

60. Design for a stained-glass window, by C. E. Gwilt.—The figures are those of the first eight kings after the Norman conquest, and the general design and ornaments are intended to be of coeval date and style with the new Palace.

An excellent, chaste, and elegant design, though the figures are left uncoloured; the pedestals and canopy-work being drawn in elevation, are wholly free from anomalous perspective.

61. Design for a stained-glass window, representing the arms of British sovereigns and of illustrious individuals of the corresponding periods from the Saxon Heptarchy to the present time, by Spence and Co.

A rich design, but the largeness of the escutcheons and the smallness of its figures disagreeable.

62. Design for a stained-glass window, by Charles Clutterbuck.—Intended as one of a series to represent the wars of the Houses of York and Lancaster.

Two fine historical subjects treated in a painter-like style, more agreeable than a monotonous repetition of scroll-work and shields.

63. Design for a stained-glass window, by Daniel Higgins.—The figures represented are, Princess Mary, Henry VIII., Prince Edward, and Princess Elizabeth, forming the family group of Henry VIII. The upper part of the window commences with a Gothic screen enriched with the royal arms, with strings of shields relating to Henry VIII., and finishes with the roses of York and Lancaster.

Has the merit of containing one story of picture, but its upper work not happily managed nor in pure taste.

64. Design for a stained-glass window, representing Henry VII. and Elizabeth of York after marriage, by Robert Morrow.

An unfinished sketch of considerable merit.

65. Design for a stained-glass window, by J. Hedgeland.—This design supposes the window to contain, in the lower compartments, whole-length figures representing the sovereigns of England, in regular succession from the reign of King Alfred; the upper compartments and the tracery openings being appropriated to the reception of devices, armorial bearings, mottoes, &c., appertaining respectively to the monarchs represented immediately underneath.

A very meritorious design of one story of figures which, however, have the common fault of being too stumpy.

66. Design for a stained-glass window, by Ballantine and Allan.—Meritorious, with good colouring, and the architecture in elevation instead of anomalous perspective.

67. Design for a stained-glass window for the House of Peers, by Cobbett and Son.—The four upper openings contain the arms and badges of the Tudor family. The four lower openings contain portraits of Henry VII.,

Henry VIII., Edward VI., and Queen Elizabeth, surrounded by similar arms and badges. Every part of the design has reference to the same subject.

A work of great merit, though the medallions of sovereigns, being finished in the modern miniature style, clash with the ancient insignia surrounding them.

68. Design for a stained-glass window, by William Warrington.—This design contains the armorial bearings, consisting of escutcheons, supporters, badges, collars of SS., and suns and roses of the following monarchs:—Henry IV., Henry V., Henry VI., Edward IV., Edward V., Richard III., Henry VII. (empaled with those of Elizabeth of York), and Henry VIII. An excellent design.

69. Design for a stained-glass window, by James Warrington.—In the four principal openings are the arms of Henry V., Henry VI., Henry VII., and Henry VIII., enclosed by the garter, and surrounded by helmet, crest, and lambrequin. In the lower openings are the supporters of each monarch, holding banners emblazoned with his livery colours, and charged with his different badges. Of great merit.

70. Design for a stained-glass window, representing the hedges of the four orders of British knighthood, with the arms of the founders, &c., by Henry Pether. A very rough unfinished sketch, of ability.

71. Design for a stained-glass window, by Edward Corbould.—Edward I. entering Westminster, after having vanquished the Welch, in 1282. A painter-like window of very great merit.

72. Design for a stained-glass window, by Edward Baillie.—The upper large openings contain portraits of four kings of England, Henry V., VI., VII., and VIII. Over each are his arms and supporters, and under each is a medallion on which is either a subject or a figure illustrative of the period. The four lower openings contain portraits of four queens regnant of England. On the left, Queen Mary, with her arms and supporters. The medallion underneath represents the same queen and her royal consort, Philip of Spain. Next is Queen Elizabeth, with arms and supporters. The medallion contains her initials, with the date of her coronation and demise, with titles in a label, as in the others. The third is Queen Anne, with arms and supporters, initials and titles. The fourth is her most gracious Majesty Queen Victoria, with the arms of the United Kingdom. The subject on the medallion is intended to represent the signing of the treaty between the British and Chinese officers.

The observations upon No. 67 apply also to this design.

73. Design for a stained-glass window for the House of Peers, by Cobbett and Son.—The four large upper compartments contain portraits of her Majesty and Prince Albert on pedestals with canopies above. Her Majesty in her coronation robes; the Prince in the robes of the Order of the Garter. The four lower compartments are filled with the subject of King John ratifying the great charter of England.

A fine composition, but its several subjects each more complete than the whole.

74. Design for a stained-glass window, by J. A. Gibbs.—The four small openings at the top of the drawing represent the badges of the houses of York and Lancaster. The large left-hand opening represents the red dragon (being the cognizance of the Earl of Richmond) overcoming that of Richard III. The right-hand large opening illustrates that curious verse:—

"The cat, the rat, and Lovell the dog,  
Rule all England under a hog;"

alluding to the names of Ratchife, the king's minion, and Catesby, his spy, and to the king's cognizance, which was a boar. The four lower openings combine the battle of Bosworth Field. The arms are those of the principal personages engaged on that memorable day.

A good subject of the storied kind.

75. Design for a stained-glass window for the House of Lords, by Chance, Brothers, and Co.—The design exhibits four members of the House, a bishop, a warrior, a judge, and a statesman. The allegorical figures above (Piety, Valour, Justice, and Prudence) refer to the characters beneath, each standing on his coat of arms proper. In the upper part of the window are placed the arms of her

Majesty Queen Victoria, and those of his Royal Highness Prince Albert, together with those of London and Westminster, with emblems of the three kingdoms.

A good storied window of figures and pedestals in elevation, with minute backgrounds; but all the canopy-work and architectural decorations replete with elaborate Continental impurities.

76. Design of a complete window intended to represent Edward III. and his Queen Philippa. Beneath them, Edward the Black Prince and William of Wykeham. The four side compartments contain the various arms, badges, mottoes, &c., by Thomas Wilmshurst.—An excellent window, but perhaps requiring more depth of colour, light, and shade.

77. Design for a stained-glass window, representing Henry VIII. delivering the first English translation of the Bible to Cranmer, for the use of the people. In the upper compartments are the arms of Henry VIII. and Queen Anne Boleyn, and on either side are the arms of the principal ecclesiastical and lay peers who supported the Reformation. The various badges, &c., of the king are likewise introduced, by John Gregory Grace.—A well-designed window, but out of taste for the building.

110. Specimen of stained-glass, relating to the design No. 63, by J. Hedgeland.—A good figure, with rich though not quite harmonious colouring.

111. Specimen of stained-glass, a compartment of the design No. 71, by G. Hoadley.—The figure, placed in an artistic manner, less stiffly than glassy pictures usually are, but its glare requiring to be subdued.

112. Specimen of stained-glass, relating to the design No. 59, by Ward and Nixon.—Figure with arms and helmet richly painted, but spoiled in the exhibition by counter light.

117. Specimen of stained-glass, representing a compartment of the design No. 68, by Wm. Warrington.—A good subject, perhaps over dark, and with its leadwork over thick.

118. Specimen of stained-glass, representing a compartment of the design No. 73, by Cobbett and Son.—Contrasting, by its over-clean lightness, with the last.

129. Specimen of stained-glass, a portion of the design No. 77, by J. G. Grace.—Coat-armour very good.

130. Specimen of stained-glass, a portion of the design No. 61, by Spence and Co.—Some good drawing and colouring, but wanting in the breadth and depth suitable for the work.

131. Specimen of stained-glass, a compartment of the design No. 62, representing the Earl of Richmond receiving the Crown on Bosworth Field, by Charles Clutterbuck.—Well drawn, but its colouring poor and discordant.

132. Specimen of stained-glass, representing Henry VII., a compartment of the design No. 74, by J. A. Gibbs.—Good in colouring and drawing, though requiring depth in its accessories.

134. Specimen of stained-glass, a portion of the design No. 72, by Edward Baillie.—A very beautiful subject.

135. Specimen of stained-glass, relating to the design No. 49, by Robert Morrow.—Well drawn and beautifully finished, yet so almost totally shadeless, as to be a mere ghost, though shedding a glow around.

136. Specimen of stained-glass, relating to the design No. 66, by Ballantine and Allan.—A beautifully-painted subject, fine in colour, yet requiring more depth about the canopy-work.

137. Specimen of stained-glass, relating to the design No. 76, containing the arms of Edward III., by Thomas Wilmshurst.—Arms and varied forms, devices, bordering, and colouring, successfully worked; very suitable for some of the windows.

141. Specimen of stained-glass, relating to the design No. 75, by Chance and Co.—Well painted though with over-short figures, with the injurious effect of an over-blaze of light in parts, and some want of harmony by the injudicious introduction of pink.

142. Specimen of stained-glass, relating to the design No. 69, by James Warrington.—Very agreeable.

162. Specimen of stained-glass, a portion of the design No. 58, by John Summers.—A well-painted figure of the Black Prince, but with light and shade capable of improvement.

164. Specimen of stained-glass, relating to the design No. 63, by Daniel Higgins.—Well painted in a subdued style, yet with some lights too predominant.

#### *Additional Designs and Specimens of Stained-Glass.*

Near No. 77. A good design of intricate varied forms and colouring, by Wilmshurst, in the style of the glass at York Minster.

The martyrdom of St. Alban, an obituary window, by C. Clutterbuck; rather drolly devoted to the memory of the late estimable Archdeacon Watson.

Next No. 110. Window of Braxted Church, Essex, by W. Warrington, consisting of varied decorations and medallions of small pictorial subjects in the revived style of imperfect art, which, as painting and glass-staining advanced, our ancestors superseded by grand, effective, and speaking subjects, visible all over the largest building, a mode directly in the teeth of the wretched modern precepts of those who unable to draw figures in any way fit to be seen, attempt to humbug people with the idea that while a *Te Deum* is scrawled in characters 6 inches high, which those who have not Prayer-books cannot read, 3 inches of altitude will suffice for representing in a coarse way the Saviour in a manner which requires the ascent of a ladder for the eye to make out at all.

Next No. 111. Window by Ward and Nixon, in a good style, consisting of cote-armour, well bordered with the leaves and flowers of roses.

Design by Warrington for a hall-window of Brazen-nose College, Oxford, consisting of armorial insignia, &c.

Next No. 112. A good window, by Wilmshurst, of varied subjects, fit for some parts of the Houses.

Drawing of a chancel-window of St. Petrock's Church, Padstow, Cornwall, by Warrington. A good subject, of Christ and the Evangelists, surmounted by high canopy-work, instead of storying one set of figures over another.

Next No. 118. Design of the altar-window of St. Peter's Church, Stepey, but with stories of small subjects in medallions, instead of the effective grandeur of one subject, or one story of figures.

A piece, by Wilmshurst, in the style of the glass at York Minster; good.

Emblems of St. Mark and St. John, by E. Baillie, with borders; not in first-rate style.

Earnest the Pious, Duke of Brunswick, by E. Baillie; a fine, rich, and elaborately-painted window.

Two fair specimens of general ornamental work, by Baillie and by Wilmshurst.

Ascent of Calvary, painted for the Charterhouse, by C. Clutterbuck. The effect spoiled by the counter-glow of the skylights. Not a happy subject; we presume the figure of Christ is unfinished, its face and bands being in mere outline, and the drapery almost without a shade, except from the accidental disagreement in the different portions of glass of which the mere shape is made up, like a patchwork garment not in wear.

St. George; a fair subject, by W. Miller. Moses, by Wilmshurst. A fine and effective window, though, perhaps, in too smooth a style of painting, except it be intended to be set almost close to the eye.

Near No. 130. Arms and badges, by J. Hedgeland.—Fairly painted, yet from the disagreement of yellow and pink not happy in colour.

Near No. 130. No. 2, by E. Baillie.—Requires more depth.

Near No. 137. Queen Elizabeth, by Robert Morrow.—A magnificent horror, in spite of elaborate work, mimicry of carving, hooped washing-tub like petticoat, pinking, jewelry, sceptre, orb, lace, and sovereignty, which render the English female Solon in appearance the ugliest, the stumpest, and most graceless of old washer women.

Near No. 142. Arms of Henry VIII., rich bordering, by G. Hoadley, shewing ability to execute design.

A Gothic interior, by Spence and Co.; a style applicable to some parts of the work.

Lion's head, by D. Higgins; well painted. Two subjects of ornamental borders, by G. Hoadley, of merit.

(To be continued.)

#### TENTH EXHIBITION OF THE NEW SOCIETY OF PAINTERS IN WATER-COLOURS.

We have visited the annual display of this rising society at its gallery, No. 53, Pall Mall, and have been much gratified by the evidences of artistic ability and execution; the collection contains many subjects of very considerable rank. We have, indeed, heard that it does not contain such eminently beautiful pictures as were in its last year's exhibition; we hardly know how this can be, but we are quite sure that taken as a whole it is superior, and contains fewer bad drawings, while some are really of surpassing merit. As a minute detail of subjects of general pictorial art would be totally unsuited to the nature of our columns, we are obliged to confine ourselves pretty nearly to such as relate to architecture, among which will be found many of very great value; and scarcely one of which we shall make mention would not be satisfactory, if taken home and honourably placed in quietude, apart from the disgusting glare, clashing, and confusion, which are the almost necessary concomitants of a public exhibition-room, the worst possible of all situations for doing justice to the merits of all pictures, except such as are merely painted for the purpose of eclipsing others.

No. 4. South front of Hampton Court Palace, David Cox, Jun.—A good architectural subject of the reign of William III.

No. 15. Schloss Elz, near the Moselle, W. Robertson.—A very fine drawing of a rock-fortress.

No. 16. In the Gardens, Haddon Hall, David Cox, Jun.—A terrace-staircase subject, prettily delineated.

No. 19. Part of Bolsover Castle, David Cox, Jun.—An architectural subject, shewing a doorway with a curved pediment.

No. 29. In Brittany, R. K. Penson.—A good drawing of old buildings.

No. 31. At Aylesford Priory, Kent, E. H. Wehnert.—A good ancient architectural subject of chimneys.

No. 34. St. Edmund's Chapel, Westminster Abbey, W. N. Hardwick.—A beautiful drawing.

No. 45. Buildings at Dinan, Brittany, William Oliver.—An architectural subject of considerable beauty.

No. 46. Cathedral, Aix-la-Chapelle, west entrance, James Fahey.—A curious subject of buildings, not architectural, yet affording some hints.

No. 53. At Cologne, G. Howse.—A beautiful drawing of architecture, water and shipping.

No. 84. A halt in the Nubian Desert, Henry Warren.—A superb drawing, broad, glowing, and natural.

No. 85. Old houses at Tilf, near Liege, W. Robertson.—A very interesting sketch.

No. 91. At Bacharach, James Fahey.—A good sketch of old buildings.

No. 125.—Exterior of Anne Boleyn's apartments, Hever Castle, David Cox, Jun.—A good drawing of rather anomalous architecture, with a three-storied stack of bay-windows in a corner, and open only on two sides, and with chimneys of an inferior character.

No. 133. Gateway at Allington Castle, Kent, E. H. Wehnert.—A good drawing.

No. 136.—Alfred H. Taylor.—Rich, broad, and glowing.

No. 146. A picnic, Powis Castle, David Cox, Jun.—A rich and superb drawing of architecture and figures.

No. 151. Staircase at "the Hotel of the Carp," Bacharach, G. Howse.—A good sketch of a curious subject.

No. 178. At Mayence, G. Howse.—A good drawing.

No. 213. At Quimperle, Brittany, William Oliver.—A good subject of ancient domestic architecture, treated in a painter-like style.

No. 217. The studio of Leonardo da Vinci, in the palace of Francis the First, John Chase.—A superb drawing of the peculiar architectural subject, decked in every part with the elaborate hard carving of the style.

No. 231. The tomb of the poet Gower—St. Mary Overies, Southwark, J. W. Archer.—A good sketch of an interesting subject.

No. 288. Buildings at Lamballe, Brittany, William Oliver.—A very beautiful drawing.

No. 316. Perdita and Florizel, E. H. Wehnert.—A capital drawing.

No. 321. In Boulogne Cathedral, T. S. Boys.—A small but good drawing.

## SOCIETY OF ARTS.

MAY 1.—T. Winkworth, Esq., in the chair.

The secretary read a paper on the reformed system of laying out and constructing railways, with a view to extending the benefits of the railway system to every part of the United Kingdom.

In 1839 Mr. Wishaw laid his plan of working single lines before the Institution of Civil Engineers, and in 1840, after completing a detailed survey of all the railways in the United Kingdom, and making practical experiments to the extent of 15,000 miles as to the working of the trains on all the British railways at that time open to the public, revised and corrected his plans, and then made it public in the "Railways of Great Britain and Ireland."

Since that period the single way has made considerable progress, and engineers who scouted the idea of carrying on a large amount of traffic by the reciprocating system, are now laying out some of the principal lines on this system in a modified form, and it is understood that the great Holyhead line is to be constructed on this principle.

The mode of working a railway by this plan with any amount of traffic, may be thus described:—

The distances between the terminal and the nearest principal intermediate station, and between the two principal intermediate stations, are 20 miles respectively, which distances are made up of two engine-runs of equal length meeting together at the half-way stations.

To illustrate the mode of exchanging the trains which takes place at the exchange stations nearly simultaneously every hour, we need only describe this process between one of the terminal stations and the first principal intermediate station.

An engine (No. 1) starts from terminal station A, and another (No. 2) from the first principal intermediate station D, as the clock strikes eight, at an average speed of 25 miles an hour, including stoppages; the engines No. 1 and No. 2 will arrive by 24 minutes after eight.

At the exchange station C, where each engine-run is furnished with a large twin-table, capable of holding the engine and tender together, an engine (No. 3) is already on the up-line, ready to proceed with the up-train, and another (No. 4) on the down line, ready to proceed with the down-train.

The engines Nos. 1 and 2 which have just arrived are turned into the engine sheds on either side, and the engines Nos. 3 and 4 are connected with the up and down-trains respectively, and proceed forward precisely at 5 hours 30 minutes, there being six minutes (for the sake of example) allowed for the exchange for attaching or detaching carriages, &c., and for receiving and disembarking passengers.

At 8 hours 54 minutes, engine No. 3 will arrive with the up-train at the arrival platform of the terminal station A, where the passengers and luggage will be dispatched by omnibusses, &c.

In the meantime the nine o'clock down-train is preparing to start with engine No. 5, which has its steam up, and is waiting for the nine o'clock bell to be rung, or hughle-sounded. The clocks at each station throughout are required to be of uniform construction, and by first-rate makers, and regulated twice in 24 hours by means of the electro-galvanic telegraph, which is considered a necessary appendage to all main lines of railway.

At 24 minutes past nine, engine No. 5 will arrive with the second down-train at exchange station C, and engine No. 6 will also arrive within a minute before or after with a second up-train at the same station as on the first exchange; so, again, engines Nos. 1 and 2 are ready to proceed on the signal being given at 9 hours 30 minutes with the up and down-trains respectively; engines Nos. 5 and 6 are turned into the engine-sheds as before, and prepared to make the next exchange at 9 hours 54 minutes; engine No. 1 arrives at the terminal station A, as before, and engine No. 3 is again ready to start with the ten o'clock train, and so the reciprocating process is continued throughout the 24 hours at each of the intermediate exchange stations.

Intervals of one hour each for the starting of the trains, and also ten-mile runs are taken, merely for the sake of easy illustration, but

intervals of 90 minutes, which would give 16 daily trains, and longer runs, according to each particular case, would answer equally well.

The estimated cost of construction of a line 60 miles in length, taking the prices throughout on a liberal scale, is, including stations, furnishings, plants, &c. :—

Total cost of constructing the railway and stations	£824,787	8	2
Total cost of furnishing the railway and stations	101,320	0	0
	£926,107	8	2

Or, altogether, at the average rate of only 15,435*l.* 2*s.* 5*d.* per mile.

The annual revenue, with the amount of traffic, would amount to 324,339*l.* 1*s.* 4*d.*; and the annual expenses, including fund for depreciation of locomotives and stock, &c., and interest on loans, &c., 115,879*l.* 18*s.*

Thus the disbursements would amount, on an average, to 35-72*l.* per cent. on the gross revenue.

The English railways at present in operation extend to	1,608	miles.
The Scotch, .....	219	"
The Irish, .....	80	"

Making a total of

1,997 "

If the reciprocating plan had been adopted, the total cost of all the British railways at present open to the public would only have been 29,434,345*l.*, instead of considerably more than double that amount.

In 1841, Mr. Wishaw laid down on his railway-map the lines requiring to complete the system throughout England, Scotland, and Ireland; from which it appears that

In England there remained to be constructed	1833	miles.
In Scotland, .....	210	"
In Ireland, .....	931	"

Making altogether

2974 "

Which, if executed on the reciprocating system, would not exceed 45,903,690*l.*, instead of 91,807,380*l.* if the ordinary double way he adopted.

The latter part of this paper was devoted to a consideration of the atmospheric system of railways, giving an account of its progress from the publication of Mr. Ballece's plan in 1824 to the present time.

The next paper read was by Mr. Galt, who has lately been examined before a committee of the House of Commons on his plan for railway reform.

The value, says Mr. Galt, of all the railway property in the United Kingdom is estimated at 93,000,000*l.*, the price at which it could be purchased would pay 4*l.* 7*s.* per cent.; and as government could borrow money at little more than 3 per cent., there would be a clear profit of 1,165,000*l.* per annum, to be applied by government to meet the loss which would be incurred by a reduction of fares.

## INSTITUTION OF CIVIL ENGINEERS.

APRIL 30.—The President in the chair.

"A Description of the method employed for Repairing a Chimney 120 feet high, at Messrs. Cowper's Cotton Mills, Glasgow," by Joseph Colthurst, was read. The means adopted were thus described:—the workman was provided with a broad leather belt, to which was attached a strong spring-hook; staple-shaped ladder-irons, with flat gagged ends, were driven into the joints above each other, at intervals of 15 inches, by the man standing in them in succession as he ascended, until he reached the top; his safety was secured by fixing the spring-hook into the ladder-iron immediately opposite his waist, which enabled him to use both his hands when working, as rope was also passed round his waist and down inside the ladder-irons, to support him in case one of the irons broke or drew out; he thus succeeded in removing some ornamental plates of iron which had been loosened by a storm. In descending, the workmen took the ladder-irons out one after the other, the whole operation being performed in two days and a half. The total cost, including a bonus of 5*l.* to the workman, was only 13*l.*

The first part of a paper by Mr. W. Fair-

bairn, on the reduction of the magnetic ores of Samakoff (Turkey) was read; it commenced with reviewing the few attempts which had been made towards improving the method of treating the richer iron ores both of England and of foreign countries, the great English iron makers having restricted themselves to using the lean carbonates of iron, on account of the facilities they offered for working; the great advantages which might have resulted, both in the quantity and the quality of the metal produced from rich ores, have thus been neglected.

It is stated that Mr. Dhannes Dadian, an active and enterprising Armenian in the service of the Sublime Porte, brought to this country specimens of the magnetic iron ore and of bituminous coal found in the district of Samakoff, in Turkey. He had them analyzed at Paris and in England, and found that the ore was nearly a pure oxide of iron, containing about 63 per cent. of metal; that it was free from sulphur, arsenic, or other deleterious matters; and that there was mixed with it about 12 per cent. of silicious earth.

The ore was described as being found in the form of a fine sand covering extensive plains, where it had been deposited to the depth of several feet, probably by the action of water upon the mountains around, where a similar ore existed in considerable masses. In consequence of the favourable report of the assayers, and acting on the advice of Mr. Fairbairn, Mr. Dhannes Dadian determined to persevere in his projects, and his attention being directed to the process invented by Mr. Clay for producing malleable iron direct from the ore, as described in a paper read at the Institution of Civil Engineers, February 14, 1843, he secured that gentleman's services to conduct some experiments, and subsequently engaged him to proceed to Turkey to prosecute the working of the iron ore on an extensive scale.

Mr. Clay's report, and that of Mr. League, were fully given; they contained details of the various ingenious modes employed to work the ore, which, being in the state of a fine sand, either fell unmelting through the fire into the bottom of the furnace, or was blown out of the furnace-top by the force of the blast; at length Mr. Clay, thinking that if the ore could be deoxidized by a previous operation, it would be in a fitter state for fusion in the blast furnace, submitted it to a partial process, as far as causing it to form into lumps; in that form it was easily fused, and produced cast-iron of a peculiarly ductile fluid, and yet strong character, of which specimens were exhibited. The success of this plan was considered so complete, that the preparations were immediately commenced for erecting works in Turkey on a large scale.

Incidental to the subject of the glassy scoriae of the iron furnaces, Mr. Clay mentioned that he had studied carefully the composition of crown-glass; he believes that he was the first to point out the true atomic character of glass, that its quality depends on the ingredients being compounded in certain definite atomic proportions, and that crown-glass is silico-silicate of lime and soda. He arrived at these conclusions in the year 1835; and, at the works of Messrs. Chance at Birmingham, it was found, that on following the rules he laid down, the production of a constant quality of glass was inevitable. He then treated of the production of optical lenses and of the make of bottle-glass. The paper then returned to the forms of the furnaces proposed for working the Turkish iron ore; the various modes of treating it, and the nature of the flukes, &c., concluding the first part of the paper, with the details of the experiments made upon it at Manchester and at the Backbarrow works.

The following papers were announced to be read:—

No. 679. (Second part.) "On the relative strength and other properties of cast-iron from the Turkish and hœmatite ores," by W. Fairbairn, M. Inst. C.E.

No. 675. "Description of a pair of iron Lock-gates, constructed in 1843, for the entrance of the west dock at Montrose," by J. Leslie, M. Inst. C.E.

No. 678. "Description of a coffer-dam used for closing the end of the Building-ship at her Majesty's Dockyard, Woolwich," by B. Snow, Assoc. Inst. C.E.

No. 670. "Account of the plan adopted by William Preston White, for raising the

Innisfail steamer, sunk in the river Lee, near Cork (Ireland)," by G. P. White, Assoc. Inst. C.E.

MAY 7.—The President in the chair.

The second part of Mr. Fairbairn's paper which remained unfinished from the last meeting was read. It noticed the remarkable richness and purity of the iron ores of the East, and the superior quality of the Damascus steel produced from iron made apparently in the rudest and most primitive manner; it was remarkable that up to the present time there had been but little change in the manner of manufacturing charcoal-iron even in England. This might be accounted for by the small quantity of wood charcoal used for smelting iron, but it appeared that, with the exception of that which was sent into Staffordshire and South Wales, for mingling with the lean ores of the coal measures, but little of the hematite or rich ores of Lancashire, Cumberland, Cornwall, or Devonshire was used, although in richness and in quality of metal they equalled those of foreign countries.

The paper then entered at length upon the experiments on the transverse strength of the Turkish iron, and also of the iron from other rich ores presenting the results in a tabular form mingled with those which had been reported on previous occasions in the Transactions of the Philosophical Society of Manchester, and in the reports of the British Association. These tables were arranged so as to afford the means of comparison of the strength and other qualities of various irons, and also for practical purposes, to furnish a guide for selecting such irons as by proper mixture of the different kinds would enable nerving results to be arrived at by the founder when engaged in producing castings for the engineer, the architect, or for various purposes in the arts or in constructions. Simple rules were also given for finding the breaking weight of beams cast from the fifty-two kinds of iron which had been experimented upon. The importance of the subject of the paper, the novelty of the application of Mr. Clay's system, and the unwearied attention of Mr. Fairbairn, together with Mr. Hodgkinson, in the numerous experiments they had made, were fully appreciated by the meeting, and it was announced that the valuable tables would speedily be published entire in the minutes of proceedings of the Institution.

A specimen of steel made from the Turkish ore, and a knife manufactured from it by Mr. Durham, of Regent-street, were exhibited and were much admired.

A letter was read from Dr. Schaffhaeuti, drawing attention to some experiments made by Sir David Brewster on the prismatic colours generated in homogeneous bodies when pressure was applied to them. These experiments were recorded in the Philosophical Transactions for 1816; they furnished a method of rendering visible and of measuring the mechanical changes which take place during the compression, dilatation, or bending of transparent bodies. He also stated that the tints produced by polarized light were correct measures of the compressing and dilating forces, and by employing transparent gums of different elasticities, the changes which occurred in bodies before they were either broken or crushed could be ascertained, and that, forming models of arches of simple refracting substances, such as gum, copal, &c., giving different degrees of roughness to the touching surfaces of the voussoirs, and exposing the model to polarized light, the results of any degree of friction at the joints would be readily observed.

It was stated that similar experiments had been tried by Mr. Bist, at Paris, almost simultaneously with Dr. Brewster, and that, without doubt, this had materially assisted Dr. Robison in his valuable treatise on the strength of materials.

A description of the iron dock-gates at Montrose harbour, by Mr. James Leslie, M. Inst. C.E., was then read. These gates were described in great detail, giving all the dimensions of the several parts, which were fully shewn by some elaborate drawings.

Their framing is of cast-iron, covered on both sides with wrought-iron plates  $\frac{3}{4}$  inch and  $\frac{1}{2}$  inch thick, riveted on so as to be water-tight, and to render the gates buoyant and partly to compensate for the weight of metal

in them, which is about 87 tons. The gates are 55 feet wide and 22 feet 6 inches deep, and are entirely composed of iron, except their bottom bars and the false mitres, which are of oak. The sluice-valves are of iron, without any brass on their faces, but their backs are covered with zinc plates, and the bolts had zinc nuts screwed over the iron ones, in order to check the oxydation of the iron by the galvanic action of the two metals.

A general account of Montrose Harbour was given, and it appeared that although there had existed some doubt as to the successful formation of a harbour in such bad ground, being entirely sand and gravel, which stands full of water to within a few feet of the surface, the work having been submitted to Mr. Walker, president of the institution, and having his approval, had been satisfactorily executed, and stands well.

A model of the large swinging-jib crane used by the contractors at Granton Pier, Edinburgh, and a drawing of the mode of raising the stand-pipe at the East London Waterworks, by Mr. Wicksteed, were exhibited.

The following candidates were balloted for and elected:—Messrs. H. Clutton, S. Hocking, C. Ower, T. Brunton, and G. Evans, as associates.

The following papers were announced to be read at the meeting of May 14th.

No. 681. "Account of the atmospheric railway," by J. Samuda, Assoc. Inst. C.E.

No. 678. "Description of a coffer-dam used for closing the ends of building-slips of her Majesty's Dock-yard, Woolwich," by B. Snow, Assoc. Inst. C.E.

#### OXFORD ARCHITECTURAL SOCIETY.

MAY 1.—The Rev. the Master of University College in the chair.

The following new members were admitted:—T. A. Bowden, Esq., Magdalene Hall; G. Blomfield, Esq., Exeter College; Mr. Margetts, Church Decorator, St. John's-street.

The following presents were received:—The Journal of the British Archaeological Association, No. 1, by the committee of the Association.

Rubbings of brasses from Roydon Church, Essex, by Rev. H. S. Burr, Christ Church.

Drawings from the Churches of Chittlehampton, Devon; and Allington, Newton Tony, and Cholderton, Wilts, by Rev. W. Grey, Magdalene Hall.

Architectural Nomenclature of the Middle Ages, by Robert Willis, M.A., F.R.S., &c., Jacksonian Professor in the University of Cambridge, by the author.

Lithographic Views of Churches near Tamworth, by Rev. J. Hanbury, Thatcham, Berks.

The report of the proceedings of the society during the past term was laid on the table.

The chairman again recommended the notice of the members, and Mr. Parker observed that its object is to have members enrolled in every county or, if possible, in every parish, so that no modern improvements or alterations could be made, or any antiquarian discoveries could possibly take place, without the knowledge of the central committee in London. The secretaries of the Oxford Society are authorized to receive the names of those who are willing to join the association.

Mr. Burr, in presenting his rubbings of brasses, regretted that some delay had occurred which rendered him unable to add a rubbing of a fine brass which he had lately copied from the Cathedral of Seville, but which he trusted would soon arrive.

A paper was read by J. E. Millard, Esq., of Magdalene College, on monuments and grave-stones, recommending the revival of flat monumental stones, or of coped stones, ornamented with crosses of various forms, with inscriptions if necessary, or with emblems expressing the profession or employment of the deceased, according to the ancient custom. The average cost of an ornamented coped stone is estimated, by a person well versed in such matters, at four pounds, while that of a common head-stone is usually three guineas, and even a small brass would cost ten pounds. The paper was illustrated by a number of drawings of stone coffin-lids, and flat grave-stones, ornamented with a great variety of

devices, of which, however, the cross generally formed the leading feature, and of a curious boss in the cloisters of Norwich Cathedral, on which a funeral is represented, with eleven monks surrounding a stone coffin in the act of lowering the lid.

The chairman observed, that the adoption of these flat grave-stones, though very desirable, would be attended with much inconvenience in crowded church-yards, and that their use must necessarily be almost confined to the top of brick graves; but wherever their use is practicable, they are infinitely preferable to the modern tombs with which our church-yards are disfigured. He thought, however, that head-stones, made ornamental according to such designs as those furnished by Mr. Paget and Mr. Armstrong, would often be found more convenient than flat stones.

A member observed, that for the graves of the poor, which Mr. Millard appeared to have chiefly in view, the simple wooden cross at the head, with the name or initials and the date, a custom scarcely yet obsolete, was preferable to any memorial of greater pretension, or of a more lasting material.

#### ELEMENTARY ESSAY ON MORTAR AND CEMENTS.

BY JAMES WYLLSON, HON. SEC. B.A.A.D.

(Continued from p. 227.)

36. These nodular cement-stones are outwardly something like a bulbous root, that is, composed of concentric hollow spheres or layers; the latter are imperfectly defined, but peel away gradually with the action of the atmosphere, being clayey and slightly slaty in texture. The nucleus of the stone is of a more compact formation, though frequently intersected by fissures filled with glistening calcareous lamina, dividing it into nearly cubical fragments. The cement is made by subjecting the best of them broken into small pieces and separated by alternate strata of small coal, in a proportion of about eight to one, to a strong red heat for from thirty to forty hours, in a kiln kept in constant operation, after which they are ground to powder in a mill. The cement being liable to lose its adhesive power by exposure to the air, is then immediately packed in casks, air and water tight; when only part of a cask is used, the remainder should be repacked in a smaller one, to keep it in good condition, although it would take many months to render it altogether useless. Good cement, when perfectly burnt, is light in weight and of a light-brown colour; when imperfectly roasted, it is heavy and dark; if overdone, black, with carbonized particles interspersed. Some makers mix the scoria of copper with the burnt stone before grinding, and which, being principally composed of oxide and sulphuretted iron, is a very good addition, if introduced in due moderation.

37. It is supposed that the principal part of the lime in the cement combines with the ferruginous clay during the burning, leaving but a small portion to assume the state of hydrate on being wetted, and to return to the state of carbonate by reabsorption of carbonic acid from the atmosphere; and therefore it seems that it undergoes much less change than common mortar is subject to. Cement is not considered good unless it rise to a high temperature when mixed, although this principle never exists in it to such a degree as would be the case if water were thrown on it immediately after burning, but previous to the stones being ground, cause it to fall down into powder, as in the case of common lime.

38. Roman cement is chiefly valuable for its property of resisting the action of water; it does not stand heat well,—indeed, a moderate degree soon destroys all its tenacity. It is used for all building, whether of masonry or bricklayer's work, subject to be wet or damp, constantly or only occasionally. It is also, on account of its property of setting quickly and being incompressible (unless under a load that would crush the bricks or stones themselves), admirably calculated for carrying up such slender piers or other parts as would be in danger of derangement from the weight of the superimposed work, if constructed with common slowly-hardening mortar; as well as for the joints of old work, and a variety of purposes demanding especial care. It may be used either by itself, as in water-cisterns and tanks, casting small ornaments, &c., or with a considerable

mixture of sand, and even with yellow chalk-lime, furnishing still a water-cement of good quality at a cost materially lower. In such aquatic operations as are executed by tide-work, that is, at low-water only, it is often used alone; but in dry situations, one part of cement and two of sand are common; and in stuccoing, even one to three may be sufficient; but how much sand may be added necessarily depends on the quality of the cement, and it is a general rule that that is the best which hardens with the largest proportion of sand: such as will not take from 1½ to 2, and retain a strong cohesive power, cannot be considered good. This part of the subject is very important to observe, not only in an economical point of view, but in reference to the increased facility in working which is obtained by the addition of sand; for as by itself it sets rapidly, and only a small quantity may on that account be prepared for use at one time, the workman has the less difficulty to contend with in floating an extent of surface, in proportion as it is combined with more sand. It is not at all elastic, and therefore when worked it should not be disturbed; nor ought it to be applied where there is any liability to warp or change in any way. Contradictory statements are made relative to its admitting of being laid on in more than one coat, some averring that if batched over like the pricking-up coat of common plaster-work, another and another being added, will perfectly combine together; but its decided rejection of wet sees an overpowering argument against this supposition, seeing that the inward evaporation from the coat last applied not being absorbed by the previous one, must necessarily form a separating medium: thus, a second coat may be considered as little better than hung upon the first by means of the keys formed by the hatching; and the conclusion is, that its adhesion can in no case be complete to any surface which is of a nature similarly unfavourable to a previous coat of itself.

39. Preparatory to stuccoing, brickwork should be cleaned and damped over, the latter to prevent its too much absorbing the moisture, and giving it thereby a porousness of structure unfavourable to the perfect exclusion of wet; also to facilitate its adhesion. It is said that if the sand happen to be moist previous to mixing, the cement must be used immediately. With the genuine cement, in consequence of its setting so quickly, a skilful workman alone can produce good work; and the hand-float requires to be used with great care.

40. The LIAS LIMES are obtained from a dark-blue or dove-coloured stone, of an earthy or slaty structure, very abundant at Barrow-on-Soar, in Leicestershire; Watchet and Bath, Somersetshire; Lyme Regis, Dorsetshire; and Abergthaw, Glamorganshire. Those of Lyme Regis and Abergthaw are used in London; the latter is somewhat the better in quality and burning; by exposure to the weather they assume outwardly a liver-brownish hue; when burnt, they are buff. They are extensively employed for outside stuccoing, and are the only kind of stone-lime much used for that purpose, for which they are by some esteemed superior to the Roman cement, being less liable to blister and crack; and from their resemblance to building-stone when finished, not requiring to be coloured. The proportions commonly used in stuccoing are three parts coarse sharp sand to one part lime for a first coat, and two of fine sand to one of lime for finishing; the lime should be carefully screened. Lias lime being considerably dearer than the Dorset grey chalk lime, partly owing to the greater quantity of fuel and longer time required in its burning, is not much employed about town in forming water-cement; the chalk lime aforesaid generally answering that purpose sufficiently well, although not quite so strong; it is argilliferous in its nature. The proportion of clay in those of Watchet, Bath, and Abergthaw, is, according to one authority, about 11½ per cent.; in that of Barrow, the average of three analyses gave about 14½; that is ⅓, nearly, but as high as ⅔ has been stated. These limes are said to continue a long time good if kept in close casks; and especially if slaked to powder and closely packed: they are superior to all the five calcareous stones mentioned in article 11. The Athenæum Club-house, Charing-cross Hospital, and the

Blind Asylum in St. George's Fields, were built with lias stone-lime.

41. The hydraulic limes obtained in the vicinity of Strasburg are said to form cement of excellent quality.

42. Water-cements may be formed artificially by calcining together the different ingredients which compose natural substances of known hydraulic character; and therefore, where these cannot be procured naturally, there can seldom be much difficulty in obtaining satisfactory substitutes, even superior in quality to the others, according as they are regulated with more or less precision in the relative proportions of their essential components, and with the omission of such as are not necessary. 53 per cent. by weight of carbonate of lime, 18 of protoxide of iron, and 29 of silica and alumina in equal parts, have been stated as affording the desired result; about 30 per cent. of slaked lime, mixed with the other two ingredients after their calcination, serving if deemed more expedient, instead of the quantity of carbonate above mentioned. Bergman, a Swedish chemist, who is considered to have been the first to give an analysis of a hydraulic limestone, found that of Lena, in Sweden, to contain 50 per cent. of lime, 4 of clay, and 6 of oxide of manganese; and he was of opinion that the latter gave the hydraulic character to the lime, and was necessary in all water-cements. Guyton de Morveau, a French chemist, was the first to make an artificial hydraulic lime; and he composed it by calcining together pulverized lime, clay, and black oxide of manganese, in proportions corresponding with the Lena limestone, agreeably to Bergman's analysis. He also attributed to the manganese the merit of affording the aquatic property. This, indeed, was in accordance with the opinion that at one time prevailed; but which, however, gave way to the one permanently established, that it is clay which is essential, and that manganese is indifferent, although a little of the latter, added to mortar, makes it harden under water; as is also the case with iron. The hydraulic limestones or marls of Senoches and St. Catherine's, near Ronen, on being analyzed, were found to contain 68 per cent. of carbonate of lime, 12 of alumina, 6 of sand, 2 of oxide of iron, and 12 of water.

43. But it is not only by the method above indicated that water-cements can be factitiously obtained; for many of excellent quality are formed by mixing with common mortar a selection from a large variety of non-calcareous substances, very diversified in their natures yet affording to the mortar the property of indurating under water: wood and coal ashes and cinders, coal-dust, tile and brick-dust, pounded tiles and clinkers, burnt clay, pounded pottery, forge-scales, roasted iron-ore, pumice-stone, basalts, powdered quick-lime, and others, of which there will be occasion to treat, are put in requisition for this purpose.

(To be continued.)

#### IMPROVEMENTS IN THE METROPOLIS.

KENSINGTON.—Her Majesty's Commissioners of Woods and Forests have decided upon the plans to be carried into effect for the formation of a new avenue, to be called the Queen's road, extending from the Uxbridge road to High-street, Kensington, being the site of the late Royal Kitchen-gardens. Twenty-one detached villas, have already been commenced upon either side, and each of these will be surrounded by nearly an acre of garden ground. Various designs for the villas, gates, and lodges, have been submitted to the Commissioners, and those of Messrs. Wyatt and Brandon, Mr. Owen Jones, and Mr. Kendall have been decided upon. In the plans selected, all of which are in the Italian mode, are designs for mansions to be built of stone, and some of them contain upwards of 40 rooms, and in most are apartments *en suite* upwards of 100 feet in length. The greater portion of these structures are already secured by aristocratic and wealthy families; and Mr. Blashfield, the lessee under the Crown, has undertaken to have them finished during the coming summer. The villas upon the east side command a view of Kensington-gardens. The road will be upwards of a mile in length, and 70 feet wide, and will connect

the two great western roads. The government, police, lighting, sewerage, and indeed the entire management, is to be under the control of the Commissioners of Woods and Forests, who are about to build two lodge entrances, and to select and pay liveried gate-keepers and other subordinates, to render the undertaking as complete as possible.

ST. GILES-IN-THE-FIELDS.—The locality called the Rookery, which is situate on the line of the new street that is to connect Oxford-street and Holborn, near Southampton-street, and which for many years has been the resort of the abandoned of both sexes, is about to be removed for the improvements in this neighbourhood. Sixty houses, forming Buckenridge-street on the north, and Church-street on the west, have been sold by private contract (it not being thought advisable to dispose of them by auction, in consequence of their low value), and several men are now employed in their removal. The purchaser of the property, which belonged to Colonel Buckenridge, has great difficulty in getting rid of the inmates, and in some of the houses, though the roofs have been taken off, they still remain. The occupants of the different premises to be cleared away have received notice from the Commissioners of Woods and Forests to quit, so that in a short time a wide area of ground will be open for the erection of the new buildings, including the large stone-yard in George-street, which belonged to the parish of St. Giles-in-the-Fields, which was sold a few days ago, and the station-house of the E division, in the room of which the Commissioners of the Metropolitan Police have purchased three houses in Clerk's-buildings, Broad-street, St. Giles's, behind which cells are being erected.

TRAFALGAR-SQUARE.—Several men have been this week engaged in sculpturing the basement of the Nelson pillar; and there appears to be little doubt but that orders have been given to complete this national memorial as speedily as possible. The small portion of the promenade laid down in cement was scarcely completed on the day of admission of the public, and was consequently not set. Much of it is therefore broken, the portion being that placed between the bitumen, some of which is also broken away. Sticks, stones, umbrellas, and, in some cases, hammers have been employed by the public to test the solidity of the works,—all these attempts would probably have been successfully resisted had full time been allowed for the cement and bitumen properly to harden. The damage done will have to be repaired by the laying down of blocks of the like material sufficiently hardened at the manufactory of the patentee without allowing it to be subjected to the "practical experimentalism" of the public. It is said to be in contemplation to remove the turrets from the top of the National Gallery, and it is further said to be the intention of the commissioners to order the preparation of another statue to be placed on the north-west pedestal in the square, instead of removing that of George III., as previously contemplated.

ETON COLLEGE.—It has been notified to the authorities of the college that his Royal Highness Prince Albert will lay the foundation-stone of the extensive new buildings which are to be erected forthwith, at an expense of 26,000*l.*, immediately contiguous to the ancient edifice, in that portion of the premises known as Weston's yard. The precise period for the laying of the foundation-stone is not yet determined upon. It is expected, however, to take place about the middle of next month.

The statue of the late Duke of Gordon has been placed on its pedestal, in Castle-street, Aherdeen. The statue is by Campbell, and is 11 feet 3 inches in height; including the base and pedestal, the height, in all, is 21 feet 6 inches.

WOOD PAVING.—As an instance of despatch with which wood-paving may be laid down, the Metropolitan Company received orders, late on the evening of last Saturday week, to pave 2700 yards at the Bricklayers' Arms terminus, which they completed on Tuesday night.

Above two thousand pictures, many of them of singular merit, have been rejected at the Royal Academy, owing to want of space.

INTERIOR VIEW OF ST. OLAVE'S CHURCH, SOUTHWARK, AFTER THE LATE FIRE.

We this week present our readers with a view of the interior of this beautiful work of the architect, Flitcroft, as it appeared after the fire. This sketch shews the fine effect of the tower, which is of no great altitude, as seen from the confined space of the church when its roof was burnt off, the walls, tower, and colonnade producing something of the appearance of a classical atrium or uncovered ~~proscenium~~. The tower itself is of considerable beauty and originality, in a fine and simple style of architecture, and perhaps is Flitcroft's ~~best~~ piece of design.

The roof, which was finished with a fine ornamental groined ceiling, is now being restored. The whole of this church was finished in a very high style, and when perfectly restored, for which sufficient details and information remain, we trust will long escape such another misfortune, and as long laugh to scorn those ignorant people scarcely half skin-deep in knowledge of Gothic architecture, who, in their rash, unscientific, and ill-regulated minds, denounce many of our finest ecclesiastical buildings, Pagan, though containing deco-

tions much in the style of those edifices in which Christ's apostles and Constantine and the fathers all worshipped. Between them and the freemasons lies this difference, the freemasons united the best science of the Egyptians, Greeks, and Romans, with their own wonderful shrewdness, whereas these modern critics throw overboard the architectural science of all the three. We have in hand some exceedingly interesting further illustrations of this most valuable example of metropolitan church architecture, with which we are sure our readers will be much pleased.

## PETRALOLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 230.)

All kinds of rock decompose under atmospheric influences, the chemical and mechanical causes of decomposition varying in every region of the earth; all kinds of rock are produced by chemical and mechanical action. The evidence of their decomposition is continually before our eyes and requires no demonstration; but the forming action being local and not general, depending upon long and continuous atmospheric beat in particular regions, or taking place chemically within the bowels of the earth, is of necessity inaccessible to most men, and, therefore, requires demonstrable evidence to support it, until the truth becomes firmly established upon the conjoint evidence of observing men. Marbles form in most countries, being calcareous matter cemented together by siliceous, calcareous, or argillaceous earth; porphyry, sienite, gneiss, granites of varieties are produced under a continuous atmospheric beat, or by electro-chemical action, when the matter is disposed within the bowels of the earth or in mountainous districts. Slate rocks are produced from the induration of clay by mechanical pressure and cohesion, and by chemical change in the disposition of the particles of which they are composed. The stratified nature of these and also many of the crystalline rocks is another demonstrable proof that they are formed by sedimentary deposition of the earths.

Let any one examine the various stone quarries of this country, and he will most assuredly discover rock in almost every stage of formation, geologists will say in almost every stage of decomposition, but admitting this assertion, it gives a most decided negative to their notions of the primary nature of rocks. Again, the continued action of the atmosphere is evidently a condition of their assuming the perfect state of solidity, for many species degenerate as we dip into the earth, first losing their hardness, and eventually passing by transition into earths and clays. The lodging of water within the earth favours the conglomeration of silica and the generation of siliceous aggregates; and, uniting with the acids and salts abstracted by them from the mineral beds through which they percolate, or are conveyed by fissures and veins, they become the active agents of generation of various mineral bodies; thus sparry quartz is almost universally disposed in veins, and is the first crystalline product manifest in clay beds and in cavernous apertures of the earth; nay, sparry concretions are continually forming before our eyes, and walls and roofs of deserted mines soon become covered with them. The causes of effects manifest as quartz are therefore palpably existing in the present day, even in this country.

In the vast expanse of this planet, forming the middle regions of the earth, the sands, pebbles, marls, and clays, are palpably produced by organic action, and the consequent changes of matter as it enters the fossil and mineral kingdom; in one region we find extensive ranges of carbonate of lime formed and still forming, intersected by vast ranges of sands, the causes of their production being still in active operation; in another we observe these primary earths covered with thick deposits of vegetable earth; in neither the one nor the other do we evidence their origin as proceeding from the decomposition of rocks, for in the first instance no species other than limestone rock is yet called into being, in the second, the very nature of the soil proclaims its origin, as the extent and magnitude of the tropical

vegetation bears evidence of its continuous increase.

As atmospheric and chemical influences and also mechanical action determine the nature, character, and qualities of rocks, so they also determine the changes they undergo after their primary formation from the earths aggregated by sedimentary deposition or elaborated by organic species. The sands which contributed to fill up the ancient canal of the Ptolemies, connecting the Red Sea with the Nile, have become agglutinated into very hard sandstone, which now conceals the original bed; on the other hand, the temple of Denderah, being built of a species of sandstone uniting with much lime, is rapidly decomposing; the nature of the cement which binds the sands together in one coherent mass always determines its powers of resistance to atmospheric influences. In many parts of Asia and Africa, in Australia, and South America, porphyry, basalt, sienite, marbles, and varieties of crystalline rock form under long-continued atmospheric influences, and are apparently indestructible; in other regions of the globe they rapidly decay when they become exposed to atmospheric influences, or to the mechanical action of the winds and rains. The traveller, as he stands in the midst of the ruins of the magnificent temple at Luxor, observes that many of the granites and calcareous stones have rather improved their condition by age, becoming harder and more sonorous; others having a natural cement inimical to their preservation, have suffered partial or entire decomposition; the celebrated obelisks were very recently in a beautiful state of preservation, presenting the same, and most probably a higher state of finish than when turned out of the hand of the sculptor: gothic barbarism, led on by men of science, caused the removal of one of these obelisks to Paris, and its appearance among them was regarded as a national triumph. What is it now? a monument of the folly of the times in which we live, a reproach to civilized people, who for the sake of a childish triumph of national vanity, have broken the charm attached to it while surrounded by historical associations and revered relics of antiquity. In a few years, unless art can contend successfully against Time, this monument will be laid low in the dust.

On the shores of Great Britain the action of rolling beaches is exemplified in the waste and in the rounding of pebbles, and by giving them polished surfaces. Men seeing, and understanding these phenomena, carry their notions abroad, and wherever similar appearances present themselves, they suppose and maintain that the same causes have produced them; thus the first false link in the chain of induction being formed, they proceed to build their edifice thereon, cementing it together with theoretic fallacies and idle imaginings. In arid regions, where rains never fall, where the abrasion of waters has never taken place, the like phenomena are to be observed, vast plains being covered with rounded pebbles and polished surfaces; but here we have other causes of effects dissimilar to those observable in British strata; numerous species of mollusca in the act of silicifying lose their asperities, and become highly polished stones; echini, turtles' eggs, and other rounded bodies preserve their outer configuration through successive changes, and even aggregate masses, on consolidating into porphyritic and jasper bodies, assume that high polish which it is almost beyond the reach of art to imitate. Again, upon examining the crystalline rocks in this country, geologists find quartz to be the sole constituent of some species, and the chief ingredient of others; from these rocks they demonstrate the primary existence of quartz, and witnessing the corroding influences palpably manifest in this country and the mountainous districts of the Continent, they readily embrace the notions of M. Saussure and other geologists of the last century, contending for the generation of sands and pebbles by the desquamation of rocks; but the manifest phenomena of other regions carry us beyond the narrow boundaries prescribed by geology, developing the origin of quartz and of quartzose aggregates, as well as the origin of the earths from which, in aggregate, they are produced.

It has been observed by practical men that all species of rock belonging to this country exhibit greater durability as they approach the crystalline structure, but much depends upon the nature of the earth which forms the

cement of the crystalline particles as well as upon the nature of the local influences exercised upon it. Geologists speak of mosses and other vegetable species decomposing the rock on which they grow, and deriving therefrom the material of their organic structure; but the innumerable facts observable around us testify otherwise, for the rock or stone is no sooner covered with vegetation than the corrosion previously carried on over its exposed surface ceases, and ages may elapse without further sensible change. There is a proof of this adduced by the committee appointed to select the building material of the two Houses of Parliament; they found the frustra of columns and other blocks of stone that were quarried at the time of the erection of St. Paul's Cathedral, now lying in the island of Portland, near the quarries from whence they were obtained, coated entirely with lichens, and thus hermetically sealed from the atmosphere, presenting the same freshness as when first put out of hand, even to the chisel-marks, while the same stone forming the exterior of the cathedral exhibits in some places a considerable extent of decomposition.

The calcareous marbles of all countries are dissimilar in their qualities, although the varieties have a close relationship to the material of the rocks and beds which overlie them; but these rocks, as I have previously observed, do not decompose until they become exposed to a humid atmosphere, or to the action of running streams. Thus, in the mountains of Abyssinia, of Lebanon and Arabia, there is a waste proportional to the violence of the rains and running streams. Again, exposed to the action of the ocean waves, and even to the ocean breeze, the crystalline rock decomposes or corrodes; and monuments erected near the sea-coast, whatever may be the nature of their material, always suffer more or less from these causes, even in those regions that are most favourable for the forming of rock. Pompey's Pillar, standing near the old port of Alexandria, corrodes seaward, although composed of porphyry the most durable of all varieties of rock. Cleopatra's Needle exhibits the same effects, being corroded seaward, and maintaining its freshness of appearance on the two sides exposed to the hot, drying winds of the desert. The same phenomena may be observed in forts disposed near the sea-coast in all regions, the saline waters being inimical to most species of rock. In like manner, the rank soils forming deltas in tropical climates are equally unfavourable to every kind of stone, nay, even to the formation of stone, for the nitrous earths rapidly devour them all, and the rank luxuriance of these climates is such, that a village or town is no sooner deserted, than the very stones appear to vegetate, the poplar and other trees of rapid growth springing up from the crevices, and as their roots enlarge, the stones give way, splitting downwards, until the whole fabric is levelled to the dust. Even bricks in Bengal soon share the same fate, the nitrous salts being a component of them all.

The common gravel of England possesses neither beauty nor variety, its aggregates being generally of the nature of petrifications or joints. The stones of the Isle of Wight consist in bulk of aggregate of echini radiati, and the bodies or portions of bodies of varieties of species common to tropical seas, and of necessity produced under the same influences, being all of them in the silicified or mineralized state, and much of the British strata is composed of the like material, embracing the relique of gigantic lizards and other extinct oceanic animals, together with the relique of elephants, rhinoceroses, hippopotami, and other land animals, which can only exist and propagate in their generations under the conditions of a climate found within the tropics. The causes of these effects, which excite our wonder and stimulate our inquiries, I shall not under this head attempt to explain, but let us suppose another great change in the axis of rotation of the earth, whereby England is once more disposed beneath tropical influences; the sure and certain results would be an immediate change of action, and in the atomic disposition of many bodies: the clay beds would indurate into schistus or slate of varieties; the coarse gravels of this country would in numerous instances become converted into siliceous and aluminous gneiss; nay, the very rocks, in which the living principle exists, directing their

changes and preserving their entirety, would change in themselves and become the productive sources of changes in the various mineral bodies composing their veins, or filling up their fractures. Again, its chalk beds would be converted into marble—its indurated limestones would assume the crystalline texture—its clays would concrete into nodules of quartz, mica, felspar, and other compounds, and its verdant forests would disappear, giving place to trees, plants, and grasses of another nature, and of a nobler growth.

(To be continued.)

#### METROPOLITAN IMPROVEMENTS.

(Continued from p. 231.)

##### THE PLAN OF MR. PAGE.

The principles of Mr. Page's plan are distinct in character from those of Mr. Walker, and, in some respects, opposed to them. It proposes an embankment with side channels, the embankment of itself forming a continuous public terrace. Assuming every abstraction of tidal water from a navigable river to be injurious to the navigation below the locality of the embankment, by depriving a portion of the river of its scour, Mr. Page proposes, first, to avoid encroaching upon the capacity of the river for the reception of its tidal waters, and to make the prevention of encroachments at any future period, as far as practicable, a leading feature. Secondly, to leave to the wharfingers and others interested in the trade of the locality the possession of their present accommodations on the river shore; and, thirdly, to provide increased facilities of communication between the east and west ends of town by a public road constructed in the river.

The details of a plan professing to be founded upon these principles must, it is obvious, be far more extensive and complicated in their character than those of any plan based upon an alteration of solid embankments and recesses only. A river-wall interposed between the navigable channel and the shore must have openings to afford facilities of intercourse between the two; the position of these openings would form one subject for inquiry—their width, another—the facilities of access at different states of the tide, another. These openings could, of course, be passable only by bridges; and those bridges, in accordance with one of the leading principles of Mr. Page's plan, should be of sufficient width and height to admit of the accustomed traffic of any locality at any state of the tide. On the other hand, Mr. Page's terrace was to pass under the respective bridges which connect the Middlesex and Surrey shores of the river; and hence it would appear impossible entirely to satisfy one of these conditions without conflicting, in some measure, with the other.

Another point, the importance of which was not to be overlooked, was the convertibility of these side channels into docks or floating basins. The treatment of this question involved the discussion of locks, their position, their capabilities, their size, and their probable cost. The relative advantages of tidal-docks and floating basins, in reference to the trade and the navigable interests of the river; the supervision necessary to the regulation of either; their respective tendencies to silt, and the facilities for cleansing and keeping them free from mud, furnished further subject for inquiry, and, the commissioners are compelled to add, for much conflicting opinion.

Of the plan before the commission a copy will be found inserted in the appendix, together with a statement of its objects and alleged advantages, drawn up by Mr. Page at our suggestion. As its features were comparatively new, and as we had not before us, as in the consideration of Mr. Walker's plan, a body of existing evidence to refer to, we were induced by these and the causes previously mentioned to examine Mr. Page at great length, and to enter minutely into detail on matters some of them exclusively technical in their character, and to which therefore it is scarcely necessary to refer in this report, except as to their relative importance to, and bearing upon the main subject of inquiry.

Looking to the principles which Mr. Page assumes as forming the basis of his plan, its consideration may be divided, as stated by himself, under three heads; viz.—

1. As any embankment constructed upon

these principles may affect the Thames as a navigable river.

2. As it may affect the wharfingers and other proprietors on its banks; and

3. As it may improve the means of communication in the metropolis by opening new facilities for traffic, and for promoting generally the health and convenience of the public.

The first of these considerations opened of itself an extensive field of inquiry, and involved a class of interests not so much connected with the locality immediately concerned as with the Pool and lower portions of the river. We trust that the magnitude and importance of these interests have not been forgotten.

The abstraction of the tidal water from a river, wherever an embankment is projected upon its shores, and the prejudicial consequences necessarily arising from that abstraction, are topics upon which, of course, this commission can be competent to express an opinion only upon the evidence before it. The expediency of maintaining, if not increasing the volume of tidal water in the higher portions of the Thames, is stated by Mr. Page to have suggested a leading feature of his plan, and many of the letters and papers already referred to as inserted in the appendix to this report are addressed to this interesting but necessarily difficult branch of the inquiry. Of the soundness of the principle which it is the object of these papers to enforce, and looking to the embankment of the locality under consideration as part only of a larger system of improvement, which is at this moment professed to be in operation in various parts of the river, of its great practical value, we can entertain no doubt whatever; and, if the evidence before us is not altogether so concurrent as might have been desired as to its application to that particular locality, irrespective of other portions of the river, yet the very conflict of opinions has had its use in impressing upon us the necessity of caution.

The plan under consideration was, of course, open to little positive objection on this head. Captain Maughan, indeed, considered even Mr. Page's embankment as involving *prima facie* a violation of his own principle, inasmuch as it would displace by its own bulk a portion of that water, and, *pro tanto*, abstract it from the scour of the river below. In the letter, however, addressed by Captain Maughan to the chairman of the commission, he observes, that, assuming the water in the side channels "to pass in and out with the tide, Mr. Page's plan, compared with the other plans, would curtail in a lessened degree the tidal water; while one of his propositions being to remove the mud-banks and other inequalities of the river above low-water mark, it is probable that the cubic spaces so gained would equal those lost by the terraces, and that thus the river below would sustain no injury."

Its merits, therefore, are to be tested, in the first instance, with reference to the trade of the river shore. The principle objection to which it is obnoxious may perhaps be best stated in the words of Mr. Harvey, a general wharfinger, in considerable trade, occupying the Grand Junction Wharf, Whitefriars:—"I consider that any obstruction, whether by wall or otherwise, which would prevent me from getting my barge into the stream, at any time while she was afloat, would be a disadvantage. The embankment itself would be an obstruction; wherever a barge lies now, whether we want to go up or down, we have only to put her astern and get into the stream. If there is a flood-gate, and we have to go out at one particular spot, we must accommodate the other craft, so as to come out at that particular place. At present it requires a good deal of contrivance to place a large barge alongside of our wharf; and, if the room were much lessened, it would be almost impracticable." To a question whether his objections were confined to the inconvenience of access, he replied, "The inconvenience of access is one point. Then it shortens my water-way. If the embankment take place outside what we consider our present water-way, I could not of course complain, except as to the impediment of access." Mr. Pocock, the owner of an extensive coal-wharf in the same neighbourhood, concurred in these objections of Mr. Harvey. The outer pile of Mr. Harvey's wharf was stated to be 160

feet—that of Mr. Pocock's wharf to be from 180 to 190 feet from the shore; the space assigned to these wharfs, upon Mr. Page's plan, was about 140 feet; the space usually granted by the city, according to Mr. Richard Lambert Jones, from 70 to 100 feet.

A further reference, however, to the evidence of Mr. Jones on this point may help to clear up much of this difficulty. In reference to Mr. Page's plan, he observes, "I dare say the coal merchants would say, at first starting, that there is not sufficient room for them; for I know enough of the applications by the various coal merchants to the corporation of London to put piles in, and to have what they called floating craft; but we never can confine them to that; though they may ask for one pile, they will carry it further out. We confine them that they shall not come out more than five or six craft into the river; and they will take the liberty of having seven or eight; that is, they make the warehouses for coals on the river, instead of having them on the land, as they are at Liverpool and other outlets; it is the cheapest warehouse they can get."

Mr. Tayler, on the other hand, of the firm of Dalgeish and Tayler, coal-merchants and general wharfingers in Scotland-yard, to a question as to the bearing of this plan of embankment on their interests as wharfingers, replied, "I should rather have the river (speaking of it as merely connected with our business) as it is. It would give us a great deal more trouble getting out and in of this dock; it would impede our business a little, but I think not to a material degree." These gentlemen are the occupiers of two wharfs adjoining to each other, at which the average number of these barges is about 30, the mooring room at one of them alone being sufficient for 33.

Of the professional opinions obtained by the commission upon this part of the question there were none addressed directly to the reasonable sufficiency of Mr. Page's inner water-way. No doubt, however, as to its sufficiency is expressed by these gentlemen in the discussion of any portions of Mr. Page's plan, or of the modifications of which it was represented to be susceptible; and the commission think it will be clear, from the general tenor of their evidence, that no such doubt was entertained.

The evidence of these gentlemen as to the merits of the plan under consideration, as it would affect the wharfingers and other proprietors on the bank of the river, involved questions of detail upon which it was necessarily difficult for the commission to obtain, or indeed for them to give, direct and unqualified answers. Having no personal interests to serve, the tendency of their evidence was rather to suggest alterations than to take objections, upon all the really practical parts of the inquiry. The reply of Captain Maughan to one of the questions affords an illustration of this statement:—"Mr. Page's plan," he observes, "admits of two modes of application, —either with open entrances (or entrances open only during particular periods of the tide), or locks, which would make his side channels floating basins; but the object of it, I understand, is to leave the wharfs as they are at present, and otherwise to meet the exigencies of the trade, whichever mode of entrance may be more convenient;" and the bulk of the evidence on this point is accordingly associated with one or other of the modes of application above adverted to.

**FIRE-PROOF ARCHITECTURE, GLASTONBURY.**—The kitchen is a very curious example of domestic architecture, of comparatively recent date; the following story is told of its origin:—Henry VIII. one day said to the abbot, who had offended him, but professedly in reproof of the sensual indulgences which he appeared to believe disgraced the monastery, that he would burn the kitchen; upon which the abbot haughtily replied that he would build such a kitchen that not all the wood in the royal forest should be sufficient to carry the threat into execution; forthwith he built the existing structure.—*Knights' "Old England."*

The British Association for the Advancement of Science will assemble in York on the 26th, 27th, 28th, and 30th of September, and on the 1st and 2nd of October next.

a more profound knowledge of each particular science than was necessary for a man who only exercised one of those sciences. It is not surprising, therefore, that Plato declared it to be a rarity to find a good architect in Greece. Vitruvius, however, in quoting this assertion, observes with great justness, that "It is even rare, in the course of a century, to find a man superlatively excellent in any profession; why then is it expected that an architect should equal Apelles in painting, Myron and Polydorus in sculpture, Hippocrates in medicine, Aristoxenus in music, or Aristarchus in purity of language?"

Vitruvius, with that more moderate view which is taken in modern days, adds, "If an architect be sufficiently master in all the arts connected with his profession, to judge perfectly of the merit of his productions, it is the most that should be insisted upon."

Again, we learn from Cassiodorus, who gives a letter from the Emperor Theodosius addressed to his architect, Symmachus, on the proposed erection of a splendid palace, how much was looked for in an architect, and also the respect in which he was held by the great and powerful. "What employment more honourable, what function more glorious, than this which places you within the reach of transmitting to the most distant ages edifices which will ensure you the admiration of posterity! For you are required to direct the mason, sculptor of marble, founder of bronze, workmen in stucco and plaster, and painter in mosaic. You are required to teach them that of which they are ignorant, and to resolve the difficulties which this army of men who work under your guidance propose to you, and who are to have recourse to your enlightened judgment. Behold, then, how much knowledge he ought to have who has so many to instruct. But you will also gather the fruits of their labours; and the success of their works, which you shall have well conducted, will make your eulogy, and will become your most flattering recompense. For this reason we wish, whatever you may be charged to build, be done with so much intelligence and solidity, that only in the freshness of their date may the new differ from the ancient erections. That will be possible to you, if a base cupidity never incline you to deprive the workmen of a part of our bounty. It is easy to make yourself obeyed if they receive an honest and competent salary, without fraud or reserve. A generous hand animates the genius of the arts; and all the ardour of the artist is directed to his work, when he is not distracted by care for a subsistence. Further, consider what the distinctions are with which you are decorated: you walk immediately before our person, in the midst of a numerous retinue, having the golden rod in hand, a prerogative which, by your approaching so near to us, announces that it is to you that we have confided the execution of our palace."

Vitruvius among ancient writers, and of moderns, Alberti, Vasari, Chambers, Laugier, and many other excellent authors, have dwelt largely on the qualifications required in architects, and not only in the intellectual endowments, but on the moral qualities in which they should abound: and, as it might be expected, honour and probity rank foremost in the catalogue. Vitruvius says that an architect ought to be a model for all virtues, and that honour and not sordid interest should be the object of his proceedings. Laugier observes that when an architect suffers the desire to enrich himself to prevail, all sentiments of honour are perverted. And one of our latest writers has wisely said, "Good architecture can alone result from mutual confidence;—confidence on the part of the patron that he is employing a man of skill and integrity, who, he is sure, will be of benefit to him; and confidence on the part of the professor, that his pains, judgment, and labour will be appreciated according to their worth and honesty: architecture so practised is above most arts and professions; practised otherwise, it becomes the most injurious, the most extravagant, and the lowest of trades." (Specifications for Practical Architecture, by A. Bartholomew, architect: a work which, notwithstanding that the title is somewhat discouraging to unprofessional readers, contains in its first portions most excellent matter of general interest on the past and present state, and future

prospects, of architecture; and it is only necessary, in support of this opinion, to quote the words of the best living judge of such matters—"This is one of the most valuable works to the English practical architect that has ever appeared."—Gwill's Encyc.)

The word is very similar in many languages; *architector* and *architectus* in Latin, *architecte* in French, and *architetto* in Italian, all derived from the Greek. In the German, the word used is *ban-meister*, which we may clearly trace to the Greek *βανιστος*, *banastos*, a mechanic or artificer, and *μειστρος*, whence our master; the German term, therefore, has the same meaning as architect in the New Testament, where it is translated as master-builder. The word has been well rendered *chief constructor* by Mr. Bartholomew in the work alluded to above. G. R. F.

#### THE EGYPTIAN-HALL, MANSION-HOUSE.

THE splendid banquetting-room at the Mansion-house, known as the Egyptian-hall, has recently been repaired and decorated. The walls and ceilings are finished off in a delicate fawn colour, the chasteness of which is considerably heightened by being what is technically called flatted, which, by preventing the disagreeable appearance of gloss adds much to the purity of the style and colour. Various ornaments and decorations attached to the walls and ceilings, as also the status occupying the series of niches on that side of the hall which is opposite the grand entrance, are picked out in a suitable tint, to afford a relief to the general colour. The most striking alteration that has been made is in the appearance of the double row of lofty columns and pilasters which extend from one end of the hall to the other, and the entablature and curved roof by which they are surmounted. The length of the hall being about 90 feet, and its breadth 60, there are 10 of those columns and pilasters on each side, standing out about 10 feet from the walls. The whole of the shafts have been recut and the arrises of the fillets and sweep of the flutes made perfectly true, thus removing many blemishes and irregularities which before disfigured them. Instead of their former colour, which was an imitation of Sienna marble, they are now painted French white, a change which contributes wonderfully to the improvement of the general aspect of the room; while the effect of this delicate colour is considerably heightened by the whole of the fillets of the shafts, together with the fillets and smaller toruses in the basis and the capitals of the columns and pilasters, being gilt in pure gold. The several enriched members in the entablature, and particularly the cornice, with the enrichments on the modillions, and rosettes on the soffits, have also, for the first time, been heightened up in gold, and now present a peculiarly elegant appearance. The concave ceiling, which extends the whole length of the hall and across from one row of columns to the other, is divided into 45 square compartments, or coffers, each containing a large rosette. In each of these coffers there has been added an enriched moulding of egg and tongue, corresponding in form and pattern with a similar ornament in the entablature; besides which, there has been placed along the centre of the margins dividing the coffers bold wreaths composed of the laurel leaf, with bands at their intersections. These additional ornaments have entirely relieved the ceiling of the plainness which formerly characterized it, and, together with rosettes, being all heightened in gold, make it harmonize with the colouring and enrichments of the entablature and columns. The whole of the works have been executed according to designs and specifications prepared by Mr. Bunning, the present architect and surveyor of the corporation. The contractor was Mr. Taylor, who during the last mayoralty fulfilled a contract admirably for extensive repairs and decorations in other parts of the Mansion-house. The amount of the late contract was merely 1,400*l.*, and, notwithstanding the extent and variety of the works, the amount has not been exceeded by the addition of the slightest sum for "extras," a circumstance which speaks much for the professional accuracy and judgment of the gentleman who designed and executed them.—*Times*.

#### RAILWAY INTELLIGENCE.

*Croydon Railway.*—Opening of the *Bricklayers' Arms Station*.—This morning, May 1, the terminus was opened, despite the lamentable accident which happened so recently. Every thing is again restored, and the greatest pains have been taken to render safety doubly secure by cross braces and struts to the roofs, &c. The whole of the platforms, passages, and waiting-rooms, to the extent of at least 40,000 feet, have been laid by the Seyssel Asphalt Company, and present a remarkably even surface, and is indeed so close a resemblance to a light-coloured slate, that until the spectator's attention is drawn to the tablets inserted here and there in the asphalt, he is left in surprise as to the manner by which so large a surface could be so uniformly laid down. There is also the flat roof of the colonnade, laid with the same material in lieu of lead. It contains five thousand feet, and is free from those rolls which are necessary to secure the joints of that metal. The façade of the terminus is a very novel one, and reflects great credit upon Mr. Lewis Cubitt, the architect, and the whole of the works, which have been entrusted to Messrs. Grissell and Peto, are finished in the best possible manner.—*Railway Times*.

*Branch Railway to Worcester.*—A communication has been received by M. Pierpont, Esq., from the office of the Lords of the Committee of Privy Council for Trade, fixing by their award in writing that the terminus of a branch line of railway to connect the city of Worcester with the main line of the Birmingham and Gloucester Railway shall be in the angular spot of ground to the westward of the Bath road, where the Albion Inn is now situated; from whence the Branch line shall pass to the westward of the said road, and cross over it by a bridge near Duck-brook. Another branch diverging from the main branch is to be carried so as to communicate with the Severn to the southward of the canal basins. The branch is to pass entirely to the southward of Mr. Berkeley's property, unless the company can obtain the consent of that gentleman to allow it to pass through any part thereof; and the junction with the main line is to be to the southward of the Spetchley station, but as near to it as is consistent with the proviso respecting Mr. Berkeley's property.—*Worcester Journal*.

*Aberdeen Railway.*—All differences being adjusted by the rival projectors, a prospectus has been by them jointly issued. From this we learn that the total length of the line is to be 66 miles, including branches. Commencing at the harbour and wet docks in the centre of Aberdeen, it proceeds by the villages of Cove, Portlethen, Skateraw, and others, to the county town of Stonehaven; thence through the fertile district of the Mearns, near to the villages of Drumithie, Auchinblae, and Laurencekirk, by Marykirk, to Brechin, and having a branch to the docks at Montrose. From Brechin it is proposed that the line shall be continued to Frickheim on the one hand, forming there a junction with the railways already finished to Arbroath and Dundee, and the Edinburgh and Northern, through Fife; and, on the other hand, to be continued to Forfar, where it will meet the Northern Junction Railway from Perth, through Strathmore, thus connecting it with the Scottish central line.

*Railway to Dorchester.*—A meeting on the subject of forming a railway between this town and Dorchester is to take place at Matcham's Royal Hotel on Thursday next. The proposed plan will take in the towns of Poole and Weymouth, bringing them into immediate communication with Dorchester and Southampton. At the same time the Salisbury branch will be within about eight miles. It is the intention at present to make the terminus at Hill. Mr. Brunel is likely to be the engineer.—*Salisbury Journal*.

*Taff Vale Railway.*—On Thursday week the Branch Railway from the Lantwit Colliery, projected and completed by Thomas Powell, Esq., to the main line of the Taff Vale Railway at Merthyr, was opened. The occasion was one of great rejoicing along the line, flags and banners placed at intervals greeted the engine on its way, and with the roar of small artillery welcomed this new acquisition to the Taff Vale Railway.

The Great Western Railway Company propose making a railway from Thingley, near Corsham, through Melksham (with a branch to Devizes) to Staverton factory, Trowbridge and Bradford, thence to Dilton's Marsh and Westbury to Warminster (with a branch to Frome), and through Heytesbury and other places to Salisbury.

A petition to the House of Commons against the passing of the Newbury and Basingstoke Branch Railway Bill, now before Parliament, is in the course of signature in Newbury and the neighbourhood.

Correspondence.

"GREAT BRITAIN" STEAM-SHIP.

SIR,—In consequence of the blunder of the sapient builders of the above "gem of the sea" (which, as all gems should be, is safely *board up*), owing to the want of foresight, or perhaps, boy-like, "having an eye bigger than the belly," such is the fate of this splendid specimen of naval architecture, which has been honoured by his Royal Highness Prince Albert's admiration and approval. The above Goliath of the sea rests in the basin of the Bristol float, where its exit is denied in the eleventh hour by its bulk, being far beyond the embouchure, as will be seen by the following dimensions, which may for accuracy be relied upon.

Draft of water	ft. ins.
Breadth at the line of floatation	11 9
Breadth of the lock on the water-line	43 5
Breadth of ship 5 feet above water-line	44 3½
Breadth of lock at coping 7 feet above water-line	48 9
	44 10½

The computed weight of the ship is 1,000 tons, and the height required to be lifted from 4½ to 5 feet; even then the coping-stones must be removed. The widening of the lock would cost about 10,000*l.*, the expense of which the Bristol Dock Company will not incur, and it is currently reported the Great Western Steam Navigation Company have not the means. By the above statement the ship is 3 ft. 10½ in. wider than the lock. To obviate this great error, why not have recourse to the plan of raising vessels by the air-tight flexible cases (Austin's patent), exceeding in power 1,400 tons, under her bottom from end to end, and thereby securely lifting her without the least straining or injuring the vessel? I have been an eye-witness of their capability on other vessels.

I am, Sir, &c. VULCAN.

ALTERATIONS AT THE CARLTON CLUB-HOUSE.

SIR,—Your correspondent in last week's *BUILDER* has not mentioned that out of the number of architects who were invited to send designs for altering the Carlton Club, a very large number, including most of those whose names are familiar to the public, declined the invitation, so that the competition, whether of merit or of interest, lies, in reality, among some four or five of them.

A select trio constitute the committee to decide, and the name of one of these, is, at any rate, well known in matters of taste connected with architectural pursuits.

A great increase in all respects on the present dimensions of the building, so as to render it a worthy neighbour to its great political opponent, seems to be a very main feature in the conditions imposed; and we may hope that no parsimonious restriction of funds will cramp the abilities of the architect (whoever may be chosen for that office), as was the case with the present building, now about to be "reformed." Your obedient servant,  
May 6th, 1844. X.

SIR,—In continuance of the information sent you last week relative to this competition, I have to inform you, for insertion in *THE BUILDER*, that designs were sent in by the following eminent architects:—

- Mr. Sydney Smirke, Berkeley-square.
- Mr. Bascvi, Saville-row.
- Messrs. Lee and Bury, Golden-square.
- Mr. Railton, Carlton-chambers.
- Mr. Salvin, Saville-row.
- Mr. Hopper, Connaught-terrace.

The other architects written to declined sending in designs for various reasons.

The committee are now investigating the designs, to enable them to draw up a recommendatory report for presentation to the gene-

ral meeting of the club next week, when it is presumed some decision will be made; in the interim the drawings are open for the inspection of the members from 2 until 6 o'clock every day.

After the decision of the club, I will endeavour to send you a slight description of the several designs.

I am, Sir, your obedient servant,

A SUBSCRIBER FROM THE FIRST.

VENTILATION OF CHURCHES.

SIR,—I am glad that you have alluded to the "Bad Ventilation" of Churches, for I am sure that they would be more frequented for their too often tainted atmosphere, not to mention that hebetude of mind which your extract from Dr. Reid's work on Ventilation has so well pointed out; the drowsiness and sleep which we have all so often experienced, when listening even to a short and good sermon, is no doubt owing to our brains being supplied with blood in an insufficiently purified state.

The same want of ventilation is but too common in our houses, especially in summer, when the currents produced by fires no longer ventilate them; and when it is customary with our good (?) housewives to stop up the chimneys even of bed-rooms, and the chambers of the sick, though a fire, on the contrary, would be there serviceable.

Indeed, John Bull has yet to learn that fresh air is a pabulum of life more necessary than food; and trusting, therefore, that this subject will be again adverted to in your pages, I will no further now intrude on them by denouncing as very badly ventilated the church at Axminster, in Devonshire; where, one day last summer, it gave me pain to see so many around me, who, to my medical eye, appeared to be on the verge of apoplexy.

Yours, &c., PLANTAGENET.

SIR,—Will you be so kind as to inform me through your paper who was the architect of St. Paul's Church, Wilton-place, and where the hat-pegs there used are to be purchased? I should also esteem it a favour if you would inform me what is the proper name for the room situated between the shop and what would in any other house be called the first-floor; examples of the above may be seen over the shops of the Regent-circus, at Piccadilly, also over Messrs. Fortnum and Mason's shop, in Piccadilly, and also at the Athenæum Club, at the corner of Pall Mall and Waterloo-place; by answering the above you will confer a favour on  
Your humble servant,  
A SUBSCRIBER.

[The architect is Mr. Cundy. We cannot ourselves give the information required relative to the hat-pegs. The English name for the place mentioned by our correspondent is "*half-story*," but the terms most frequently used are the Italian one, "*mezzanine*," which means the same thing, and the French one "*entre-sol*." Intermediate rooms of this denomination ought never to be used except where some small apartments, requiring only a moderate altitude, are on the same story with very lofty ones. The schemes resorted to for lighting such apartments, when they appear in classical architecture, are mostly ruinous to the good aspect of a design.—Ed.]

ROOFING OF THE HOUSES OF PARLIAMENT.

SIR,—Can you, or any of your correspondents, describe by drawing, if possible, the iron roofing of the Houses of Parliament, and the manner in which the galvanised plates are applied for covering, and the probable cost thereof? this information would much oblige  
Cheltenham, May 6. A SUBSCRIBER.

GOVERNMENT TRIGONOMETRICAL SURVEY.

—WORKSHOP.—On Prospect Hill, about one mile from Worksoy, on the Doncaster Road, an observatory from 45 to 50 feet high, constructed of larch poles, has recently been erected by the officers and surveyors engaged on the Trigonometrical Survey of the Northern Counties of England. The object is to obtain a sight of Sutton-in-Ashfield, near Mansfield, where an erection of the same description has recently been constructed, also to complete a number of lines running into Lincolnshire and other places.

Miscellanea.

CAST-IRON LIGHTHOUSE.—The attention of the curious for some time past has been directed to an immense iron building which, for the last two or three months, has been progressing at the establishment of Messrs. Cottam and Hallen, ironfounders, of the Cornwall-road, Lambeth. It is to be a lighthouse made entirely of cast-iron, one of the first that has ever been constructed. It is composed of 130 iron plates averaging 8 feet by 6, and an inch and a quarter thick. These plates, ten of which make a circumference, are connected together by wrought-iron bolts, screws, and sheet-iron, the interstices being filled up with cement. Its diameter at the base is 24 feet, gradually decreasing to a width of 14 at the top, where it is surmounted by a gallery 20 feet wide, which is encircled by iron railings 4 feet high. In the centre of this gallery is the lantern, surmounted by a cone 8 feet high, and which is also made of cast-iron. Its total altitude is 137 feet. The top of the building is gained by a staircase of iron fixed to the sides. The structure is divided into nine chambers, the floors and ceilings of which are made of sheet-iron fastened to the sides, and to a cast-iron pillar which goes to the top of the building. It is lighted by windows 18 inches square, and glazed with strong plate-glass. Its total weight is about 300 tons. It is to be fixed on one of the Bermuda islands, on a rock 250 feet high, consequently its total height from the sea to the top of the lantern will be 337 feet. Such a building as this has been for a long time a great desideratum in these islands, for during the winter, which begins in November and ends in April, these islands are subject to severe north-west gales, which frequently dismast ships crossing these latitudes; indeed, there is scarcely a winter passes without 18 or 20 vessels being driven in by stress of weather, or forced on the rocks, which run out many miles to north and north-west.

BURIED TREASURE.—In a field at Croal-chapel, near Closeburn limekilns, while a man named Wightman was engaged in ploughing a piece of ground, which, till last year, had not been previously turned up, having formed part of Barnmoor Wood, he came upon a large number of old silver coins, of Edward I. of England, and of the Roberts and Davids of Scotland. It was considered that not fewer than 10,000 pieces were found. The discoverer of the treasure, however, was not sufficiently selfish to conceal his prize; but having given notice of the circumstance to some of his neighbours, crowds immediately assembled, of men, women, and children, from all parts of the neighbourhood, and numbers of the thrifty housewives were seen literally carrying away the money in lapfuls.—*Dumfries Standard*.

ROMAN COINS FOUND AT RAYNE.—Mr. Goss lately found on his premises at Rayne the following Roman coins:—A Vespasian, small silver; a Trajan, ditto; ditto, large brass; an Antoninus, small silver; one, ditto, illegible; a fragment, ditto, ditto; a Julia, small plated; two others, ditto, illegible; two others, large brass, ditto.—The most recent would appear to be that of Antoninus, who died A.D. 202, so that probably these coins have lain in the earth upwards of 1,600 years.—*Chelmsford Chronicle*.

The foundation-stone of a new church for the townships of Great Wyley and Cheslyn Hay, in the parish of Cannock, was laid on Tuesday week. The ceremony was performed by the Rev. W. Gresley, Frebendary of Lichfield, in the presence of several of the neighbouring clergy and gentry, and a large course of spectators. The church will be built entirely of stone, in the early English style, leaving the tower and south aisle to be erected at some future period.

NATIONAL SCHOOLS, SUTTON-IN-ASHFIELD.—His Grace the Duke of Portland has subscribed the sum of one hundred pounds to the fund for the erection of national schools in this populous place.

The Marquis of Abercorn has granted an appropriate site to Mr. Colquhoun, the engineer, for gas works, in order that the town of Strabane may be lighted with gas; and his lordship has also given an annual donation towards the expense.

**PHENOMENA OF SOUND.**—Many remarkable sounds in nature are produced by repeated reflection from surfaces. In some situations the sound of a cascade is concentrated by the surface of a neighbouring cave, so that a person accidentally entering it is startled at the uproar. In the gardens of Les Rochas, once the well-known residence of Madame de Sevigné, is a remarkable echo, which illustrates finely the conducting and reverberating power of a flat surface. The Chateau des Rochas is situated not far from the interesting and ancient town of Vitre. A broad gravel walk on a dead flat conducts through the garden to the house. In the centre of this, on a particular spot, the listener is placed at the distance of about ten or twelve yards from another person, who, similarly placed, addresses him in a low, and, in the common acceptance of the term, *inaudible* whisper, when "Lo! what myriads rise!" for immediately, from thousands and tens of thousands of invisible tongues starting from the earth beneath, or as if every pebble were gifted with powers of speech, the sentence is repeated with a slight hissing sound, not unlike the whirling of small sport passing through the air. On removing from this spot, however trifling the distance, the intensity of the repetition is sensibly diminished, and within a few feet ceases to be heard. Under the idea that the ground was hollow beneath, the soil has been dug up to a considerable depth, but without discovering any clue to the solution of the mystery. On looking round for any external cause, the observer who has supplied this description, says, "I felt inclined to attribute the phenomenon to the reflecting powers of a semicircular low garden wall, a few yards in the rear of the listener, and in front of the speaker, although there was no apparent connection between the transmission of sound from the gravel walk and this wall. The gardener, however, to whom I suggested this, assured me that I was wrong, since within his memory the wall had been taken down and rebuilt, and that in the interim there was no perceptible alteration in the unaccountable evolution of these singular sounds."

**YORK—THE GREAT CLOCK BELL.**—A second meeting of the churchwardens at the several parishes in York was held at St. Peter's School Room, on Wednesday evening week. It was stated by W. Oldfield, Esq., who occupied the chair, that the two gas companies had expressed their readiness to contribute to the fund, and that the sum which they intended each to give was ten guineas. Mr. John Robinson, of Stouegate, read a letter which he had received from J. B. Rudd, Esq., of Guisbro', in which that gentleman intimated his intention of subscribing 5*l.* in case the weight of the bell should not be less than eight tons, and 1*l.* for every additional cwt. which the bell shall weigh above eight tons. Mr. Rudd also suggested that the question as to the name of the bell should be at once settled by calling it "St. Peter," after the minister. Mr. White suggested the propriety of steps being taken to secure an arrangement for the bell, when erected, being thrown open to the inspection of the public, free of expense. There was a strong feeling on this subject, and he felt sure that many persons would be deterred from subscribing, if they thought that the bell was to be shut up and inaccessible, except by payment of fees to the vergers at the cathedral. The meeting adjourned.

**MOZART'S MONUMENT.**—A Vienna journal mentions a circumstance which reflects great honour on the celebrated singer, Madame Hasselt Barth. That lady has recently erected, at her own expense, a monument over the too long neglected grave of Mozart. On a table of grey marble are inscribed, in letters of gold, "Jung, gross, spat, erkannt, nie erreicht," (young, great, late acknowledged, never equalled). This inscription, briefly characterising the talent of Mozart, is surmounted by a medallion head of the great composer. It may be mentioned that the hitherto unauthenticated dates of Mozart's death and burial are now verified beyond doubt. The uncertainty which prevailed respecting the place of his interment is now also removed. His grave was supposed to be in the Matziendortler churchyard; but it is now certain that his ashes repose in the St. Marxer burial-place.—*Foreign Quarterly Review.*

**Tenders.**

**TENDERS** delivered for new Schools in Bunhill-row.—J. Griffith, Esq., Architect. May 3.

Curtis .....	£1,470

Page 229, col. 3, line 35, for "remains" read "remain."

**TO OUR CORRESPONDENTS.**

We have transmitted to the patentees for explanation the letter of our Newcastle correspondent. We have only stated the endeavour. The cost will be given best by the makers, who, we hope, will satisfy our correspondent.

Our correspondent who wishes to shade the base of a column correctly, will find it quite a mathematical affair, and not one of guess. The forms of all shadows depend upon the shapes of the objects intercepting light and of those receiving it. We refer our correspondent to Gwilt's and Nicholson's works, and to the study of nature, whose parallel rays are partly ousted by one object, and partly received by another, hence shadows of particular forms are said to fall, though the proper phrase would be to say "they are left."

We are requested to state that Messrs. Burton's estimate for the repair of Sadlers' Hall was 427*l.* and not 534*l.*

It would be impossible for our engraver to execute properly the architectural details of the Tipperary Church from the sketches sent to us, they not being made out with sufficient exactness.

Bishop Ridley's Seal by all means.

We are unable this week to answer our other correspondents, and have, through want of space, reluctantly been compelled to omit several valuable articles which are set up ready for insertion.

**NOTICES OF CONTRACTS.**

For painting Bramtree Union Workhouse.—Mr. Poole, Workhouse, May 13.

For the works required at Mutford Bridge.—Plans, &c., Mr. George Thompson, County Surveyor; J. H. Borton, Bury St. Edmunds. May 15.

For building and finishing Hotel opposite Railway Station, Nottingham.—Plans, &c., Mr. Winter, Surveyor. May 15.

For re-building the Western Pier of the Humber Dock Basin, and the removal of the present Pier included, or to be provided in a separate tender, as may be most convenient.—Secretary to the Dock Company at Kingston-upon-Hull. Plans, &c., at Mr. Michael Lane's, Engineer, Castle-street, Hull. May 20.

For making a plan and taking levels of all the drains in the town of Kingston-upon-Hull, and the Lordship of Myton.—Further particulars of Mr. R. Witty, Surveyor, 11, Sykes-street, Hull. May 22.

For erecting a bridge over the Waveney, between Diss and Stoston.—Plans, &c., from 1st to 8th inst., at Mr. Farrow's, Diss; from 8th to 15th at Suffolk Hotel, Ipswich; and from 15th to 22nd at Royal Hotel, Norwich; Clure Algar, Secretary, Auctioneer and Land Surveyor, Diss. May 23.

For the erection of an Iron Bridge of one arch, of one hundred and ten feet span, intended to be built over the river Avon, at Bath.—P. George, Esq., Town Clerk, Bath.—Drawings, &c., at G. P. Manners, Esq., Architect, No. 1, Oxford-row, Bath. May 31.

For enlarging, straightening, and improving the course of the rivers Devon and Smitte, and the Cardyke, in the parishes of Hawton, Fardon, &c. &c., in the counties of Nottingham and Leicester, and for the erection of, building, enlarging, &c., the several bridges connected with the above works.—Specifications, &c., Mr. Talents, Newark. June 1.

For the executing of certain works for the improvement of Aberdeen Harbour.—Plans, &c., Mr. Abernethy, 69, Waterloo-square, Aberdeen. June 20.

**PREMIUM.**

£50 for the selected plan, elevation, and estimate for the erection of two Chapels and an entrance lodge, with gateway, on the eastern side of Southampton Cemetery.—Plan and section of ground Mr. Duswell, Albion-place, Southampton; C. E. Deacon, Secretary. May 22.

**MEETINGS OF SCIENTIFIC BODIES,**

To-day and during the ensuing week.

**SATURDAY, MAY 11.**—Royal Botanic, Regent's-park, 4 P.M.; Asiatic, 14, Grafton-street, 2 P.M. (anniversary).

**MONDAY, 13.**—Geographical, 3, Waterloo-place, 8 ½ P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.

**TUESDAY, 14.**—Civil Engineers, 25, Great George-street, 8 P.M.; Medical and Chirurgical, 53, Berners-street, 8 ½ P.M.; Zoological, 57, Pall Mall, 8 ½ P.M.; After-dinners of the Church, 18th Chapter, 8 P.M.

**WEDNESDAY, 15.**—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset House, 8 ½ P.M.; Microscopical, 21, Regent-street, 8 P.M.

**THURSDAY, 16.**—Royal, Somerset House, 8 ½ P.M.; Antiquaries, Somerset House, 8 P.M.

**FRIDAY, 17.**—Royal Institution, Albemarle-street, 8 ½ P.M.

# The Builder.

NO. LXVII.

SATURDAY, MAY 18, 1844.

**A**NTIPPE would most probably have scolded us for continuing this week the subject of the Exhibition of the

Works of Art; but with even more probability would she have scolded us for omitting to do so, if her husband had chanced to be an architectural decorator, or an embosser of leather, instead of the sagest of Grecian philosophers, as a Frenchman once told us, through being the son of a "sage-femme." However, we this week continue our review, reserving for the present our more general and closing remarks.

The exhibition contains many specimens of paving, in various styles, and of various materials, most of the patterns which might be used with propriety in the proposed work are of encaustic tiles, the majority of the others are, more or less, out of the right character, and only shew (for this case) variety of material and dexterity of workmanship.

82. Designs for ornamental pavement; the first representing the arms of the barons present at the granting of Magna Charta; the second representing the arms of her Majesty's Commissioners on the Fine Arts; by Richard Prosser.—This contains some good armorial picturing.

86. Design for ornamental pavement, by C. Burton.—Not exactly in the right taste. Good mosaic, but not in character.

89. (Repeated.) Designs for mosaic pavement, by Owen Jones.—This pavement is supposed to be formed partly of encaustic tiles and partly of pieces of porcelain of various colours, proposed to be executed according to the patent process of Mr. Prosser, of Birmingham.

Rather in the Moresco style.

92. Design for an ornamental pavement, shewing the application of some of the specimens exhibited by Messrs. Singer and Co., by Henry Pether.—The vacant space in the centre of the design is left for the pedestal of a statue of her Majesty. The adjacent diaper is composed of encaustic tiles. The design consists of an interweaving of the ribbons of the four principal orders of knighthood with their legends, surrounding the respective badges of the orders. No. 116 A is a specimen of this part of the design. The eight circular panels, bearing the arms and emblems of the kingdom, might also be formed of encaustic tiles, but are capable of being wrought in mosaic-work formed of small tesserae, which would be preferable, as calculated to last for ages. The space between this portion and the general border is proposed to be all mosaic, of the Gothic or Tudor foliage: one of the leaves of the full size is wrought in the slab No. 116

B. The border is intended to receive the Tudor badges, or similar enrichments, with the arms of her Majesty and of his Royal Highness Prince Albert. The outer margin is proposed to be of British marble, and the shields (for arms), of mosaic or encaustic tiles, are calculated to conceal the juncture of the slabs.

Not altogether happy—best in some of the detached parts.

113. (Repeated.) Seventeen specimens of ornamental inlaid and tessellated pavement. 113 A. corresponding designs, by Samuel Mayer.—Among these are good and effective patterns; in some cases, however, the jointing is imperfect; some specimens, with patterns in lines, producing the effect of shading, might be used for a portion of the work. The marbled specimens not so good.

114. (Repeated.) Five specimens of encaustic tiles for pavement. 114 A. Designs for ornamental tiles, by Copeland and Carrett.—Some of these are good and appropriate.

115. (Repeated.) Six specimens of ornamental pavement, composed of encaustic or inlaid tiles, with examples of glazed and unglazed grounds; manufactured in the plastic state under Wright's prolonged patent. 115 A. Design for an ornamental pavement, by Minton and Co.—These are of various merit; some of the tiles with writing are very good.

116. (Repeated.) Eleven specimens of ornamental pavement, by A. Singer and Co.—Among these are some good subjects, with effective colouring; some of them of tesserae are imperfectly jointed, and the forms broken.

119. (Repeated.) Thirteen specimens of ornamental and inlaid pavement. 119 A. Design for ornamental tiles, by H. and R. Haywood.—Some of the patterns are effective, though with the slippery inconvenience of high glaze.

120. (Repeated.) Five specimens of ornamental pavement. 120 A. Design for ornamental tiles, by Chamberlain and Co.—Many of these are excellent, and quite applicable. We presume the colours may be made and varied in any manner which the architect may desire.

121. Specimen of inlaid pavement, composed of serpentine stone, found entirely in the county of Cornwall; by Thomas Jago.—Doubtful, though might be introduced in part of the work.

123. Specimen of ornamental pavement; by Thomas Crinsley.—Arms in yellow in a broad style, upon an Indian-red ground, extremely effective.

124. (Repeated.) Specimens of mosaic pavement, composed of Derbyshire and Staffordshire marbles. The specimen of mosaic work, above No. 124, representing a portrait of her Majesty, is partly composed of foreign marbles; by William Milnes.—Might be introduced in part, if the materials be of approved hardness.

125. Specimen of composition pavement, in imitation of those found in Pompeii; by Paterson and Son.—Disagreeable in effect.

126. (Repeated.) Specimens of painted decorations and painted hangings, by F. and J. Craze.—Containing arms and legends, and might, under Mr. Barry's direction, be partly used.

133. Specimen of tessellated wood pavement, by Crannis and Kemp.—This affords a fair example of work, though not in suitable style, and the wood has greatly shrunk.

138. Specimen of inlaid flooring, by Austin and Rammel.—This is a mode of forming

decorative floors which appears to be applicable.

139. Specimens of the material (proposed to be employed for the designs, No. 89) manufactured by Messrs. Minton and Co. under Prosser's patent, and put together by Messrs. Parker, Wyatt, and Co., by Owen Jones.—These are good.

143. (Repeated.) Specimen of decorative painting, adapted for stained-glass, by William Warrington.—In the surface-style of work, rather flat and tawdry; one specimen, *in pale*, as at the south end of the Savoy Chapel, extremely disagreeable to look at.

146. (Repeated.) Specimens of decorative painting, by John Goodison.—A large arabesque in the illuminated style, with a blue ground.—Inadmissible.

147. A panel painted in Fresco, containing the figure of Henry VII., with the supporters and peculiar badges of that king, by F. and J. Craze.—A mixture of portrait and surface-painting, without depth, and with harsh outlines.

148. Specimen of decorative painting, by James West.—In the Byzantine mosaic style of painting, with gilding, harsh black outlines, and little shading, to be all done, except the outlines, by very inferior artists.

149. Specimen of decorative painting, by Thomas Clark.—Scroll-work and foliage; in spite of some gothic forms, not adapted to the place.

150. Specimen of decorative painting, by J. H. Lloyd.—Perhaps adapted to some part of the work, yet replete with the unnatural stiffness and other defects of inferior art now being attempted to be fixed upon architectural decoration.

151. (Repeated.) Specimens of decorative painting, by Leonard William Collman.—A style of work which, under the direction of the architect, and from his designs, would be appropriate.

152. (Repeated.) Specimens of decorative painting, by W. B. Simpson.—Though in form of ornament unsuited to the building, yet in management of colour, gilding, and workmanship, very effective and beautiful.

154. (Repeated.) Three specimens of decorative painting, executed by the students of the School of Design, under the direction of Mr. Wilson.—Though not pure in design, yet, with alterations, suitable for the work.

156. Specimen of decorative painting, by F. and J. Craze.—An emblazoned panel, illustrating the foundation of the Order of the Garter. The border is formed by a series of coats of arms of the twenty-six first knights. In the centre of the panel is the patron St. George conquering the dragon; above him is the badge of the sun issuing from a cloud, adopted after the battle of Crecy.

Not pure in design, yet, being rich and magnificent, would be suitable, under the chaste-ning of the architect.

157. Specimen in the style of ancient decorative painting, by Coulton and Elliott.—Of very considerable beauty; the quiet green-grounded work, slightly heightened with gold, is chaste, elegant, tasteful, and appropriate.

158. Specimen of decorative painting and writing.—A piece of trivial and childish waggery, idle, ugly, and though not original, from its absurdity bordering upon the blasphemous.

159. Specimen of ornamental pavement, by H. P. Vaile.—Partly admissible, but ornamental designs very far from pure.

160. Specimen of green slate unpolished pavement, ornamented with inlaid mosaic tiles, 160 A. Corresponding design, by W. North.—Good, and, under the architect's approbation, applicable.

165. Specimen of inlaid flooring, by Samuel Pratt, Jun.—Good work, but patterns out of taste.

166. Specimens of inlaid flooring, by Anthony Binns.—Some very good work.

DESCRIPTIVE CATALOGUE OF THE  
RAFFAELLO TAPESTRIES.

Executed at Brussels in 1517, by order of Pope Leo X. From the celebrated Cartoons at Hampton Court. Now exhibiting at the Gallery, No. 213, Piccadilly.

While the public attention has of late been so much directed to architectural decoration, we cannot do better than to say a few words on the subject of the celebrated Raffaello Tapestries.

Perhaps no other mode of decorating the walls of buildings yields such beauty and magnificence, or affords a greater opportunity of bringing out the skill of eminent artists. It is true, that while some of the paintings of the old masters, through a bappy union of materials and execution, have by time become rather perfected than injured, others have miserably faded. So in tapestries, when they become venerable, like these, the same vicissitudes must be expected: the effect of centuries of dust and damp must be reckoned upon. These, however, are no more faded than might have been expected under the most fortunate circumstances. No doubt their lights must have become somewhat deadened, and in some portions of the dark tones, the colour seems to have chipped off, leaving the thread light, as though not worked in-grain; and we were informed of the curious circumstance, that the distances in the pictures, which are perhaps now over-vivid for such subdued parts of an effect, had entirely disappeared from the tapestries, through being packed up in cases during ten years, and only slowly returned to view after exposure to the light.

These works, which are exciting comparatively little notice in this vast metropolis, where so many rivals claim attention, on the first day of their exhibition at Manchester, caused so much excitement among the manufacturers, that no less than 800 persons visited them; and at Liverpool their exhibition-room was almost equally thronged.

This exhibition consists of seven magnificent pieces of tapestry, forming part of the set of ten, presented by Pope Leo the Tenth to King Henry the Eighth.

When Leo was embellishing the galleries and walls of the Vatican, he commissioned Raffaello D'Urbino to furnish designs for a series of tapestries from scriptural subjects; and to this circumstance the world is indebted for the celebrated cartoons of that master, which were designed by him expressly and entirely for this purpose. Leo caused two sets of the tapestries to be executed at Brussels, which were done from the instructions of Raffaello himself, and under the constant superintendence of his talented pupils, Bernard Von Orlay and Michael Coxis.

One set continues to adorn the walls of the Vatican after having been twice carried away among the most valuable spoils which the fortune of war put into the hands of the conquerors—the first time at the sack of Rome by Bourbon's army in 1526, after which they were restored during the Pontificate of Julius the Third by the Duke of Montmorenci:—they were carried away the second time on the invasion of Italy by the French in 1798, and were restored by purchase to 1814.

The other set, of which the present exhibition forms a portion, having been presented as before mentioned, remained in the possession of the Crown of England until the death of Charles the First, and were considered as some of the most valuable ornaments of the royal palace at Whitehall. They were sold in the time of Cromwell to the Spanish ambassador, Don Alonzo de Cardenas, and by him carried to Spain; they were afterwards in possession of the Duke of Alva's family until 1823, when they became the property of Mr. Tupper, the British consul, who brought them back to England; and from him they passed into the hands of the late proprietor.

From these circumstances, the authenticity of which is well attested, they possess a value and interest altogether different from, and superior to any other works of the kind in existence, with the exception of the duplicate series at Rome. They are remarkable for being finished representations of the original designs of Raffaello, and for the singular fidelity with which the spirit and expression of the immortal artist are carried out. They are also very valuable to the lovers of the

arts, as serving to correct the errors that were committed by Conke when he repaired the cartoons by order of King William the Third, which had been cut into strips, and defaced and otherwise injured by the use made of them as patterns for the tapestry, and moreover some of the pieces had been lost. These tapestries claim the merit of shewing the designs of Raffaello in their perfect state.

Nine only of these are in existence—seven corresponding to the Cartoons at Hampton Court, and two others, namely, the Stoning of St. Stephen, and the Conversion of St. Paul, of which the Cartoons are irretrievably lost. They are all in an excellent and equal state of preservation, the colours having suffered comparatively little from the lapse of nearly 330 years. It has been found impossible to obtain in London, at the present season, a gallery of sufficient height and size to exhibit these tapestries at the distances from which they should be viewed, as, although their details are finished with the nicest accuracy, and bear the closest inspection, the effect of the whole is best felt and understood from a distance; and two of the pieces, viz. the Death of Ananias, and Paul preaching at Athens, are of necessity excluded from want of room.

No. 1. *Christ's Charge to St. Peter.*—Dimensions, 18 feet 7 inches wide, 12 feet 8 inches high.

The locality is the Lake or Sea of Tiberias—numerous buildings (part of the city of Tiberias) form a beautiful back landscape. The figure of Christ in this tapestry is undoubtedly one of the most noble representations of our Saviour that was ever conceived and executed. His air of Divine composure and calm dignity contrast finely with the fervent devotion of the kneeling St. Peter, who is listening to the command of his master, "Feed my sheep." St. James and St. John are the two next figures, the latter strikingly characterized by an expression of affectionate attention: the figure further back in profile is St. Andrew, and is of finished elegance. Behind St. Andrew is St. Thomas, with a book in his hand; this figure is marked by an inquiring position. The heads of all the Apostles are finely diversified, and many nice distinctions and gradations of character are portrayed. The graceful draperies are elaborately and beautifully wrought, and the colours harmoniously blended.

In comparing the tapestries with the Cartoons, it will be observed that they are exactly reversed in position. In the latter, all the figures are left-handed, in order to render the tapestry perfect and right-handed; and the figures, &c. on the right side of the one are on the left of the other.

No. 2. *St. Paul and St. Barnabas at Lystra.*—Dimensions, 19 feet 4 inches wide, 13 feet high.

On the right, St. Paul and St. Barnabas are standing beneath a portico—the former indignantly forbidding the sacrifice: "Sirs! why do ye these things?" averting his head and resting his clothes; St. Barnabas, with clasped hands, implores Heaven to stop the profanation. The sacrificial group is of especial force and beauty. The Priest of Jupiter, of Herculean proportions, is raising an axe to strike down one of the oxen. A young man, supposed to be Timothy, is endeavouring to arrest his arm. Another priest, of strongly-developed muscular powers, is bringing in a ram. On the foreground appears the cripple, who has just been restored, clasping his hands in the eagerness of gratitude and joy—his crutches lie useless at his feet, and an old man raises his garment with a look of astonishment at the restored limb. In the background is the Forum of Lystra, with several temples, and a statue of Mercury.

This subject is an instance of the consummate skill of Raffaello in bringing together a variety of circumstances, so as to make his story perfectly intelligible. The figures and heads, as well as the grouping and drawing, are perfect. The whole is full of movement, interest, and dramatic effect, and the spirit and power with which all these are expressed in the tapestry are most wonderful.

No. 3. *The Beautiful Gate of the Temple.*—Dimensions, 18 feet 4 inches wide, 13 feet high.

The magnificent composition before us offers great scope for display and contrast. This

architectural details are expressed with singular accuracy and effect in this tapestry, while the expression and character of the actors in this wonder-stirring scene are vividly portrayed. To appreciate the great merit with which the architectural part is executed, it is desirable to view this subject from as great a distance as the limits of the gallery will allow.

The figure of St. Peter, who is holding by the hand a miserably deformed cripple, is one of much dignity and grace, mingled with full confidence in the power by which he speaks the words "Rise up and walk." The expressive and well-formed head and neck, and finely delineated hand and foot, are several studies in themselves. The beloved disciple's countenance expresses benevolence and deep compassion. The misery and distortion of the cripples are made as striking as possible, to contrast with the elegant and graceful figures abounding in this tapestry. The young female on the right, who is carrying an offering to the temple (and leading a child with another pair of doves), is considered a model of feminine beauty. Immediately over the cripple is a fine Jewish head strongly expressing doubt and incredulity: between him and St. John is another of much dignity and lofty sentiment. In the cartoon, probably from having been rubbed and effaced, the deep wrinkles in his forehead have been converted into a fillet, which is decidedly injurious to the expression—this alteration is further proved by a sketch from the original, drawn by Antonio, now in the British Museum, which is perfectly free from fillet or other covering. The figures between St. John and the beautiful female, another female on the other side, with a splendid head-dress, and carrying an infant, and the figures between the columns, are all most worthy of observation, for the diversity of character and expression they offer. On the whole it may be considered that as this is one of the most striking of the invaluable designs of Raffaello, so is it also one of the most effective of the tapestries, when viewed in proper light and from a right distance.

No. 4. *The Miraculous Draught of Fishes.*—Dimensions 14 feet 6 inches wide, 12 feet 9 inches high.

With this subject Raffaello commenced his great undertaking of a series of cartoon drawings, illustrative of some of the principal events recorded in the New Testament, for the execution of these tapestries.

The locality is the lake of Gennesareth, where "as the people pressed upon him to hear his words," our Saviour entered into the boat of one of the fishermen, and "prayed him to thrust out a little from the land."

The point of time is that when having, in obedience to the Divine command, let down their nets, although they had "toiled all the night and had taken nothing," they inclosed such a "multitude of fishes that the nets began to break;" and Peter, awe-struck and terrified at the presence of a Being of supernatural power, falls on his knees exclaiming, "Depart from me, for I am a sinful man, O Lord!" Throughout the whole of this composition nothing is tame or weak.

In the action and form of our Saviour we discover the usual felicity of the artist's genius. The Divine composure of Omnipotence, the simple and graceful posture, the countenance radiant with benignity, the hand which wielded the elements raised in accordance with his words, contrast finely with the merely human character of his companions. The head is in the most graceful style of manly beauty; so meekly grand, so benevolent, and yet so full of power.

In the air and attitude of St. Peter, is denoted that precipitate temperament which caused him to place himself foremost on all occasions. His countenance expresses mingled wonder, humility, and awe. There is also a striking difference between the rough hardy fisherman, the man of toilsome occupation, and the same person when represented as the inspired apostle, full of dignity and grace. (See the Beautiful Gate.)

The third figure is St. Andrew, the brother of St. Peter; his attitude is finely conceived and skillfully expressed; the entire figure is evidently actuated by an instantaneous and powerful impulse of awe and deference; the head and beard are finely proportioned.

In the second boat are the two sons of Zebedee, James and John, both still engaged

in securing the unexpected prize; they are nearly divested of clothing, and in positions favourable to the display of muscular strength. The last in the group is Zebedee, who is depicted as a fisherman, attentive only to the management of his little vessel. On the shore may be seen distant groups of people, part of those who had thronged together to hear the words of our Saviour.

*No. 5. The Stoning of St. Stephen.*—Dimensions, 13 feet wide, 12 feet 10 inches high.

The admirers of Raffaello will not fail to estimate as precious relics, the work now before us, and the next tapestry in this collection, the Conversion of St. Paul, of which the cartoon drawings are unfortunately lost, and no other representations remain but the duplicate tapestries in the Vatican.

As a work of art this composition unites a variety of excellences, and the first glance is sufficient to declare it the work of Raffaello. The peculiar attitudes are so chosen, as to display, in the most striking manner, his vast knowledge in anatomical science. With intuitive and never-failing skill he has seized the leading points of the subject, at the precise moment best suited for representation; he has worked up the tragic scene in accordance with the text of Scripture; and has portrayed the characters with so much strength of feeling, and disposed of them in the grouping so effectively, that the spectator is at once master of the whole subject.

The holy martyr is on his knees; a more perfect picture of calm submission, and entire resignation cannot be conceived. There is nothing like fear, or pain, or anger. "Lord, lay not this sin to their charge."

The contrast between him and the savage and enraged actors in this scene of cruelty is very forcible. In the stupendous figure which is represented in a stooping posture, picking up a large stone, the drawing and the strength are alike wonderful. Another individual in this group cannot fail to arrest especial attention, by his fine attitude, muscular development, and powerful action; he is grasping a large piece of rock, and in the act of hurling it on the devoted head of the martyr, with such well-directed aim, as to make the beholder shudder. The drawing of this splendid figure is exquisite. Saul, seated, with the clothes lying at his feet, is on the right side of the picture.

The beautiful group at the top of this tapestry increases our admiration of the artist, who, with so much skill and tact, could combine such variety of subject and expression.

*No. 6. The Conversion of Saint Paul.*—Dimensions, 18 feet 3 inches wide, 13 feet high.

As before stated, there is no cartoon of this subject remaining. The tapestry before us is replete with life and energy. The appalling flash of heavenly light, the determined leader struck to the earth, the terror and dismay of the troopers and followers, are presented to the eye in a manner and with a spirit truly surprising; the Scripture narrative is embodied with astonishing vigour and effect.

The lofty walls and towers, battlements and turrets, of the city of Damascus, occupy the back-ground. Great care and skill have been exercised in depicting the gorgeous dress, military trappings, and peculiar ornaments of the prostrate chief, as well as the warlike accoutrements, &c. worn by his followers; not merely for their great beauty, but also as illustrative of Asiatic costume and peculiarities, one of these may be mentioned: the tail of the grey horse is brown, which is in accordance with the custom frequently practised in Asia, of dyeing the tails of horses. There is much beauty in the two figures who are seizing the horse of Saul, and in the spirited delineation of the affrighted animal.

The sublime group at the top is in Raffaello's best manner—the figure of our Saviour is executed with remarkable vigour, and is full of dignity and majesty; the colours of the draperies are arranged with the most signal propriety and judgment; and the subject before us proves the power of tapestry to convey in the most striking manner the vivid imaginings of the immortal artist.

*No. 7. Elymas struck with Blindness.*—Dimensions, 19 feet 10 inches wide, 13 feet high.

The scene lies in Paphos, a city of Cyprus. The Proconsul, Sergius Paulus, is seated in

the Hall of Justice surrounded by his officers. The commanding figure of St. Paul, denouncing vengeance on the sorcerer, his fine outstretched arm carrying with it the force of an electric shock on the crouching form of Elymas, "blind to his fingers' ends," and groping his way, may well be cited as a triumph of consummate skill.

This composition is especially remarkable for concentration of effect. The figures are portrayed with such extraordinary truth to nature, that they appear almost to breathe and think. On the right of Elymas is an individual whose desire to satisfy his doubts is expressed in the most lively manner; a female richly attired, supposed to be the wife of Elymas, is indignantly pointing to the Apostle as the author of the catastrophe. The Roman magistrate, who became a convert, is here represented with all the dignity of state; his countenance and person evince strong emotion.

In the cartoon for this subject at Hampton-Court, four feet in length, the drawing has been lost. It contained the part of the building on the right of St. Paul, in which is a niche holding a statue and a fine bas-relief. The tapestry exhibits the whole as designed by Raffaello. The two following tapestries are necessarily excluded from this exhibition from want of room.

*No. 8. The Death of Ananias.*—Dimensions, 19 feet wide, 13 feet high.

The first glance at this awfully grand composition conveys the lively impression of a recent catastrophe which is still in the act of completion.

The writhing form of Ananias, with distorted limbs and death-stricken countenance, lies on the foreground. The agony is verging to the last point, and the spectator almost expects to see the body, which is partly upheld by the left arm with the wrist bent nearly double by the weight, fall prostrate. The anatomical proportions of this figure are portrayed in the tapestry with amazing force.

Intense emotion is exhibited by two persons immediately in front of Ananias. The countenance and outstretched hands of the male figure denote the instant of the event, and express a perfect concentration of horror. It is supposed to be Barnabas, who had recently become a convert. The female, who is of great beauty, appears to be preparing to escape from the dreadful scene, and at the same time unable to withdraw her eyes from it; further on, on the same side, may be seen St. John, assisted by his brother St. James, distributing relief to the necessitous. On the left of the falling Ananias is a most expressive and highly-finished figure. It is that of a Jew, with a turban on his head, bending over the sufferer. From head to foot this figure indicates powerful feeling. Another is pointing to the Apostles as the authors of this event. On the extreme left is a female figure engaged in counting money, supposed to be Sapphira.

In the centre of the picture, nine of the Apostles stand together on a raised platform: St. Peter in the middle is in the act of speaking. The firm attitude, the severe look, the hand pointed towards the culprit, denote the terrible result of the words "Thou hast not lied unto men, but unto God!" The whole group on the platform is of extraordinary merit; several of the figures are little inferior in interest and dignity to St. Peter himself.

The greatest writers and critics of the fine arts, Vasari, Lanzi, and others, have lingered over the duplicate tapestry on this subject at Rome, and declare it to contain the highest qualities of the great designer.

*No. 9. St. Paul preaching at Athens.*—Dimensions, 15 feet 2 inches wide, 12 feet 6 inches high.

This splendid composition is not surpassed by any of its predecessors in force of expression and beauty of execution.

St. Paul, of imposing dimensions, is standing on elevated steps preaching to the Athenians in the Areopagus. We at once recognize in him the great Apostle of the Gentiles.

Directly in front of St. Paul are four very remarkable personages. Nothing can be imagined more highly intellectual than this group of thinking figures, each so absorbed in attention, and yet so varied and individualized. The Stoic, with folded arms, and cloak muffled round him (as if retiring within himself for meditation), appears to think from head to

foot. The Cynic is resting with both hands on his crutch, his severe countenance and impatient gesture, shown by the raised heel and bent knee, indicate his disapprobation of the speaker and his doctrine. The disciple of Epicurus is distinctly characterized in the mild, placid countenance of the third figure. It expresses attention, without deep interest or conviction, and that habitual, easy acquiescence, which was their first principle. The next is probably the head of a philosopher of some other sect. The finger on his mouth is expressive of caution and prudence. The space between the last-mentioned character and the Apostle is filled by a group of persons of various ages, who appear to be discussing some one of the novel doctrines they have just heard. Behind St. Paul are three individuals of character quite distinct from the philosophical group; the figure in the red cap is supposed to be a likeness of Leo the Tenth. The one in the sitting posture leaning with his hands on his stick, is designed and executed with much care and force. In the cartoon, as it is at present, this head, and that of the young Greek immediately over the head of the Cynic, have suffered considerably from repairs. There is much simple dignity in the standing figure between the one leaning on his stick and that representing Leo the Tenth. On the extreme left, in the foreground, are two figures of great interest and beauty. They represent Dionysius and Damaris, who are recorded by the sacred historian as converts on this occasion. These heads are exquisite for drawing and graceful expression; the hands and general figures appear to partake in the eager satisfaction with which they listen to the apostle's words.

No one of Raffaello's designs has furnished more subjects for artistic study than the one under consideration.

Their proprietor has offered, for the sum of 6,000*l.*, to restore these genuine works to the British Crown, whose property they formerly were, and whose they ought undoubtedly to be; but we understand this offer has been most unaccountably rejected.

The nation still possesses the original bull, sent by the Pope, constituting Henry VIII. Defender of the Faith, and we lately saw it at the Rolls' House, Chancery-lane; it is in fine preservation, and its seal consists of a beautiful pendent medal of gold, struck on purpose for the occasion, and so large, that its bullion alone is worth about eight guineas.

#### INSTITUTION OF CIVIL ENGINEERS.

MAY 14. — William Cubitt, V.P., in the chair.

The paper read was an account by Mr. J. Samuda, Assoc. Inst. C.E., of the Atmospheric Railway. It commenced with the general principles of the system, describing it as a system of working railways, in which the moving power is communicated by means of a continuous pipe or main laid between the rails, and for exhaustion divided by valves into suitable lengths. A partial vacuum is formed in the pipe by air-pumps, worked by machinery, at intervals along the line. Along the upper side of the main is a continuous aperture, which is covered by a leather valve, guarded above and below with iron plates, hinged on one side to the pipe, and falling into a groove containing a mixture of wax and tallow on the opposite side, so as to close the aperture. A piston is attached at some distance, in front of and beneath the leading carriage of the train, and, by means of a packing of leather, fits within the main pipe, so as to be nearly air-tight. When a vacuum is formed in the main in front of the piston, and in the direction in which the train is to travel, the air, impinging on the other side of the piston, carries it forward with a velocity due to its pressure upon the area of the piston, which being attached to the leading carriage, carries the train forward with it; the valve which covers the continuous opening along the main is opened by a frame and wheels, which precede the carriage, and it is closed and sealed down as the train proceeds, by a heater, which slightly melts the wax and tallow as it passes over it.

The details of all these parts of the contrivance were then given, and were illustrated by a series of drawings. The paper then proceeded to notice the early attempts at using the pressure of the atmosphere for conveying

goods and passengers; the proposals of Medhurst in 1810, of Vallance (of Brighton), and others. It appeared that the first intentions were, to have exhausted cylinders of considerable area, within which the carriages should travel; but as it naturally was objected that the passengers might not approve of this mode of conveyance through a continuous tunnel, means were devised for connecting the piston within the tube with the carriages travelling upon the rails outside it; and, after numerous attempts, Messrs. Clegg and Samuda succeeded in the system described, and which, after being tried for some time, imperfectly, at Wormwood Scrubs, has been carried out practically on the line from Kingstown to Dalkey, near Dublin, a distance of  $\frac{1}{2}$  miles, up a series of inclines averaging 1 in 115.

It appeared that most of the previous attempts had failed chiefly because the continuous valve was defective, and that Mr. Clegg suggested the use of wax and tallow, which had proved so successful as a means of hermetically sealing up the opening caused by the passage of each train.

The manner of applying the power was then examined, and the adaptation of the electric telegraph, for giving the signals of the time for starting the engines at periods along the line, was shewn. The accumulation of power in the main, from forming a vacuum previously to the arrival of the train at each division, was shewn to be in proportion to the degree of vacuum which was formed.

The friction of the various working parts was stated to be very small, and that on the Kingstown and Dalkey line it was scarcely appreciable.

The leakage of the valve, &c. was then examined, and it was argued, that the power lost by leakage was inversely as the speed of the trains, for the faster the piston passed along, the less time the pipe would be under exhaustion, and consequently the less time would the leakage exist. Experiments upon the 15 in. main, on the Dalkey line, shewed that five horses' power would be required to overcome the leakage of three miles of railway.

The system was stated to be peculiarly applicable to such steep inclines as, with locomotive engines, would be called bad gradients; for so long as the steepness of the inclines was not too great for the trains to descend without the use of the break, no power was lost, and the cost of working was no greater than on a dead level, for the whole of the additional power required to overcome gravity, while ascending the incline, was restored in descending, particularly when the planes were of great length, and at a convenient inclination; in which latter case, there would be a slight saving in working an undulating line.

The safety from collision between the trains was much argued upon, and it was stated to be impossible for the trains to approach nearer than three miles to each other, unless at the stations especially appointed for the purpose. Single lines of railway could therefore be worked with safety.

The cost of working was then fully examined, and, taking for data the results of the expenses on the Dalkey line, and supposing the system to be adapted to a line of 112 miles long, similar to the London and Birmingham Railway, on which the cost of working with locomotives was stated to be:—

Per train per mile, for haulage . . . . 15d.

Ditto for maintenance 8½d.

The cost of working the atmospheric apparatus would be:—

Per train per mile, for haulage . . . 5½s. d.

Ditto for maintenance 5½s. d.

with the additional advantage of travelling at a mean speed of 50 miles per hour, instead of between 20 and 25 miles per hour, as with the locomotive system.

The discussion of the paper, and upon the merits of the system, was commenced, but as the interest of it would be lost by giving it in a disjointed form, it is reserved until after the meeting of Tuesday, the 21st inst., when the discussion will be renewed.

The papers announced to be read at the meeting of May 21st were:—

No. 670, "Account of the plan adopted by William Preston White for raising the Innisfail steamer, sunk in the river Lee, near Cork (Ireland)," by G. P. White, Assoc. Inst. C.E.

No. 552, "Essay upon the causes of preventing and method of determining the amount of priming in Steam Boilers," by R. Pollock.

No. 678, "Description of a Cofferdam used for closing the end of the Building-slips at H.M.'s Dockyard, Woolwich," by B. Snow, Assoc. Inst. C.E.

#### COOKE'S ELECTRIC TELEGRAPH FOR THE SAFE WORKING OF SINGLE LINES OF RAILWAY.

The extraordinary saving in the formation of railways where a double line can be dispensed with, and safety and punctuality secured by only a "single line," with tidings at proper intervals, renders the full elucidation of the powers of this invention of the utmost importance, not only to projectors and engineers of proposed new lines, but to the public at large. W. F. Cooke, Esq., having been requested by several gentlemen connected with railways to give them an opportunity of inspecting the apparatus, previous to its being sent to its destination, the Norwich and Yarmouth Railway, it was exhibited in operation at the Society of Arts, Mr. Cooke attending to give any explanation required. The principle on which this form of telegraph is constructed is founded on Oersted's celebrated discovery, that a magnetic compass needle, through the agency of a voltaic current, be invested with an artificial polarity; and that a magnetic needle placed parallel, and near to a conducting wire, will, during the transmission of the current, stand at right angles to the disc. The apparatus for carrying out this principle consists of a handsome polished mahogany case, precisely similar to a modern chieffoener, the lower part containing the batteries, the upper five dials with magnetic pointers in the centre of each, as follows, with a handle to each:—

Up.	Down.	Up.	Down.	Up.	Down.	Up.	Down.	Up.	Down.
Norwich.	Brandon Junction.	Brandall.	Reedham.	Yarmouth.					

Above this is a case of smaller dimensions, containing the "Speaking Telegraph," having a dial, with the letters of the alphabet, numerals, &c., with two magnetic pointers, shandles, and a variety of conventional signals, &c., together forming an elegant structure of cabinet-work, about five feet six inches in height; the pointers are suspended vertically, on an axis moving freely through the face of the dial; behind is another magnetic pointer, so that they move together on the same axis; the conducting wire is coiled many times longitudinally round a frame in which the magnet moves, to subject the magnet to the multiplied deflecting force of the voltaic current, and the magnet's motion is limited on both sides by stops. The motion of the handle either right or left completes the circuit of the conducting wire with the voltaic battery, and deflects the needle in the same direction. The length of the Norwich and Yarmouth line is 20½ miles, with two intermediate sidings at Reedham and Brandall. The conducting wires extend along the whole line, suspended in the air on wooden standards nine feet high; strong posts of timber are firmly fixed in the ground every quarter of a mile, from which the wires are strained, and between every two "straining posts" are placed seven others, 55 yards apart, for supports. There are a number of winding apparatus on each straining post and at all the wires, and carefully insulated by being attached to non-conductors, of earthenware, and covered with boxes with bores for the clear passage of each wire, as, if not perfectly insulated in wet weather, the dampness of the wood in connection with the fire would conduct the electric current into the earth. The experiments at the Society of Arts were highly interesting and satisfactory to all who have witnessed them. Six telegraphs were stationed in distant parts of the Society's rooms in the Adelphi, and the correspondence kept up was perfect and rapid. General Pasley has carefully investigated its action, and approves of it in every respect, and took notes of the number of signals, &c. it passes in a minute. The Lords of the Admiralty also honoured Mr. Cooke with a visit last week, and expressed their high satisfaction at the result of all the experiments exhibited at the Adelphi, as well as on the Great Western from Paddington to Slough.

#### COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. VI.

EXCHANGE.—The place in which merchants, brokers, and others meet to transact business.

The interest which is taken by the public in the New Royal Exchange induces me to submit to the readers of the BUILDER a few observations on the subject.

In the time of Henry the Eighth, and long afterwards, such a building was called the *Burse*. This word, as well as *purse*, is evidently derived from the Greek *Bursa*, *bursa*, which comes from a Hebrew word, signifying a *skin* or *hide*, the substantive of a verb which means to sever, because the skin is separated from the body. The word is found in many languages: in Latin *bursa* stands for an *ox-hide*, as well as for a *purse*, which, like bottles, were anciently of leather, made of course from skins.\*

When Dido obtained her territory in Carthage, by inclosing a space of ground by means of a bull's hide cut into small thongs, she built in the midst a citadel, which she called *Byrsa*, to commemorate the exploit.

Devenere locos, ubi nunc ingentia cernes  
Moenia, surgentemque novæ Carthagini arcem;  
Mercatique solum, facti de nomine Byrsam,  
Taurino quantum possent circumdare tergo.

Virgil, Æn. I. 365.

Hence the name was given to the place in which merchants were accustomed to meet, which in Paris is called *la Bourse Royale*, whilst in Italian the term, *Borsa de' Mercanti*, implies the spot

"Where merchants most do congregate."

In our language the treasurer of Colleges at the Universities is called a *Bursar*; and we say to disburse, to reimburse.

Mr. Gwilt, in his Encyclopædia of Architecture (p. 799), observes that "the Exchange at Amsterdam seems for a long time to have prevailed as the model for all others. It was commenced in 1608, and finished in 1613, and its architect was Cornelius Dankers de Ry. It is about 271 feet long, and about 152 feet wide. The whole edifice is supported on three large arcades, under which flow as many canals. On the ground floor is a portico surrounding a court, above which are halls supported on 46 piers. The divisions are numbered and assigned each to a particular nation, or class of merchants. In the court, and within the enclosure, is the place of meeting for mercantile affairs."

The first Royal Exchange in London, however, was commenced in the year 1566 by Sir Thomas Gresham, son of Sir Richard Gresham, called "the King's Mercant," who had endeavoured, but in vain, to erect a suitable building for the merchants, hitherto accustomed to meet in the open air. In the year 1571, Queen Elizabeth went from the house of Sir Thomas Gresham to visit the new "Burse;" and "after that she had viewed every part thereof above the ground, especially the *Pawne*, which was richly furnished with all sortes of the finest wares in the city, she caused the same to be proclaimed the *Royall Exchange*, and so to be called from thenceforth, and not otherwise." The building of Sir Thomas Gresham was almost entirely consumed in the great fire in 1666, and the new structure was from the designs of one of the city surveyors, Mr. Edward Jerman, and not, as has been supposed, from those of Sir Christopher Wren. The new Exchange was opened in 1669; it was considerably repaired in 1767, and again in 1820, when the stone tower was rebuilt, from the design of Mr. George Smith. A second time has the 'Change been destroyed by fire, and again it has arisen from its ashes. The new building, which is familiar to most persons, is designed by Mr. William Tite, and is rapidly approaching its completion. Its portico is a copy of the famous entrance to the Pantheon at Rome.

Mr. Gwilt considers the Bourse of Paris an admirable model, both in distribution and design, and describing it, says—"The edifice in question was begun in 1808, under the designs of Brogniart, and completed by Labarre at a much protracted period. The general

\* Thus, in the *Vulg. Etymolog.* we find the origin of putting new wine into old bottles (Luce v. 37), we must understand that the bottles were made of skins, just as in the present day in Italy and other warm countries, wine is kept in bottles of skins.

form on the plan is a parallelogram of 212 feet by 126 feet. It is surrounded by an unbroken peristyle of 66 Corinthian columns, supporting an entablature and attic. The peristyle forms a covered gallery, to which the ascent is by a flight of steps extending the whole width of the western front. The intercolumniations on the walls are filled in with two tiers, one above the other, of arched windows, separated by a Doric entablature, and surmounted by a decorated frieze. The roof is formed entirely of iron and copper. In the centre of the parallelogram is the *salle de la bourse*, or great hall, 116 feet long and 76 feet broad, wherein the merchants and brokers assemble. The Doric order is that used, with arcades round the sides, and between the arcades are inscribed the names of the principal mercantile cities in the world. The ceiling is formed by a cove, and in the centre a large skylight serves for lighting the great hall just described. It is rich in sculpture, and decorated with monochrome paintings, to imitate bassi-relievi, 16 in the whole, that is, five on each long, and three on each short, side. They are all allegorical. The hall conveniently contains 2,000 persons.

Sir Christopher Wren was of opinion that an exchange should be formed upon the model of the forum of the ancients, and it is supposed that the basilicas of the Romans were used for such a purpose. G. R. F.

#### THAMES EMBANKMENT.

As the commissioners "for the improvement of the metropolis," in spite of the rebuff administered by government to their proposition of an additional coal-tax for defraying the expense of the Thames embankment, have manifested some intention of persevering in that notable project, we recur to their report for the purpose of enabling those of our readers who cannot afford time to examine it for themselves, to judge how far the resolutions of the commissioners respecting the general question of the Thames embankment, and the particular plan selected by them, are consistent with the evidence collected in that voluminous document.

At the close of the report we find the following passage:—

"We have observed with great satisfaction the almost unanimous concurrence in opinion upon all the main topics to which our inquiries were directed among the scientific and professional gentlemen thus consulted; and it was with a corresponding confidence that we finally came to the following resolutions:—

"1. That it appears to the commission that the present state of the river Thames above London-bridge is such as to render highly expedient the adoption of some proceedings for remedying the existing defects, and for preventing the further deterioration of the navigation.

"2. That for securing these important objects, an embankment of the river would be the most effective measure.

"3. That though a general embankment between Vauxhall and London bridges appears to be highly expedient, yet that it is most urgently required on that portion of the Middlesex, or left bank of the river, which lies between Westminster and Blackfriars bridges.

"4. That such an embankment might be advantageously combined with the formation of a carriage and foot-line of communication between Scotland-yard and Blackfriars-bridge, whereby the great objects of public recreation and health would be promoted, and considerable relief be given to the existing insufficient thoroughfares between the eastern and western districts of the metropolis.

"5. That by the adoption of the general principles of embankment presented in the plan of Mr. Page, or plan B (with certain modifications which have been suggested, and others which may be suggested hereafter), there is reason to expect that the great public benefit of the improvement of the river, and the obtaining a new line of communication, may be acquired without detriment to the trade now conducted on the Middlesex shore."

The mention of plan B in the foregoing resolutions requires a few words by way of explanation. It may be necessary to remind our readers, that the inquiry upon which the report was founded was chiefly directed to three distinct plans for the embankment of the

Thames, designated by the letters A, B, C. The first of these was proposed by Mr. Walker, the second by Mr. Page, and the third by Mr. Barry, a member of the commission. Plan A contemplated the formation of a continuous line of quays along the Middlesex shore, at the elevation of four feet above high-water mark, with occasional recesses for the accommodation of trade, occupying about one-third of the whole length of the line. Upon this, if deemed expedient, might be constructed a roadway on arches of 100 feet span, crossing the recesses, and accommodating its level to that of the bridges which it was intended to intersect.

In plan B (the one adopted by the commissioners) a very different arrangement is proposed. Its author, Mr. Page (who, by the bye, was acting engineer in the Thames Tunnel), apparently ambitious of producing as useful a work above the surface of the river as his predecessor had made beneath it, has devised a novel and ingenious mode of perambulating the Thames by means of a detached quay, running nearly parallel to the shore, between which and itself a channel is to be left open for the purposes of trade. The quay is to be reserved for the accommodation of the traffic which is expected to be diverted thither from the other thoroughfares of the metropolis, while access to the wharfs on shore will be obtained only through flood-gates, established at stated intervals, in the quay itself.

In plan C, to which a very moderate space is assigned in the report, an attempt is made to combine the respective advantages of plans A and B, by constructing a line of solid embankment with narrow slips, extending in shore for the reception of barges.

Let us now proceed to consider how far the report of the commissioners as to "the almost unanimous concurrence in opinion upon all the main topics, among the scientific and professional gentlemen who were consulted," is borne out by their respective evidence. And first, with regard to the question of the necessity and expediency of *any general embankment at all*, we are sorely baffled in our attempts to discover this unanimity of sentiment. On referring to the tabular appendix before mentioned, we find that, out of the eight "scientific and professional gentlemen" consulted, two, viz. Mr. Hartley and Mr. Rennie, do not think an embankment necessary at all. The former states it as his opinion, that the object intended may be accomplished "by dredging, at a much less expense than by a general embankment;" and the latter, that "the object cannot be better accomplished than by a well-organized system of *dredging*." Mr. Macneil speaks of *dredging* in conjunction with *walls and embankments*, but says not a word about the necessity of a *general embankment*. Mr. Rendel, though on the whole favourable to an embankment, "does not think it expedient to embank the Surrey side, and disapproves the plans submitted, as each carries the embankment too far." He is of opinion, that "concurrently with any plan of embankment, it will be absolutely necessary to *dredge* the bed of the river to its proper depth and width." Now considering the very great importance attached by these gentlemen to a uniform system of dredging, we are surprised to find that remedy entirely thrown overboard in the report, or rather treated as a positive evil. Either the authorities in question are good for nothing, or they are very cavalierly treated by the commissioners. As to their unanimity, it is pretty clear on which side that lies. Of the other four gentlemen who are decidedly favourable to a general embankment, Captain Beaufort, hydrographer to the Admiralty, says little or nothing. Mr. Cubitt says, that "a continuous embankment is not absolutely necessary all along both sides of the Thames; . . . nor is it necessary to execute all parts at the same time." On the other hand, Mr. Gordon says, "that embankments on both sides are highly expedient, and should be carried out as part of the same plan, and at the same time." And Mr. Giles, in a still more positive tone, pronounces the embankment "equally necessary on both sides of the river, and" that it "should be executed at one and the same time."

So much for the "almost unanimous concurrence of the scientific and professional

gentlemen" as to the question of a general embankment. Equally discordant are their opinions upon the next and most important resolution—the particular plan adopted by the Committee.

The evidence as to the relative merits of the respective plans A, B, and C, is classed under the following heads:—

1. As to the effect of each upon the navigation of the river.
2. As to the trade upon the shores.
3. As to the facilities for traffic by land.
4. As to the accumulation of mud.
5. As to the sewerage.

The questions relating to the first head are evidently proposed with a view to elicit as little information as possible respecting plan B, since, with one exception, they have reference only to plans A and C. The answers, however, are very different from what the nature of the questions would have led one to expect. The questions amount to this—whether the operation of plans A and C upon the tidal water of the river would be injurious to the navigation? The answers are five to three to the effect that it would not. Of the other three, only one, that of Mr. Rennie, is decidedly adverse.

The questions involved under the second head are such as can only be satisfactorily answered by persons practically acquainted with the necessities of the trade, and the solution must therefore be sought in another part of the report, where the evidence of those witnesses is given at length. The answers of the scientific and professional gentlemen are as follows:—Captain Beaufort, hydrographer to the Admiralty, and Mr. Giles, are in favour of plan A. The rest are all in favour of plan B, though differing materially as to its application.

Of the wharfingers and lightermen examined on this branch of the subject, the majority are decidedly adverse to the side channel proposed in plan B, which they consider would encroach seriously upon their present accommodation.

The questions under the third head, which relate to the facilities for land communication afforded by the respective plans, are met with a similar diversity of opinion. The general question, it should be observed, is put directly as to A and C, but only indirectly as to B. Of the answers, four are in favour of plan A, three are adverse, and the other equally in favour of all.

On the tendency of each plan to favour the accumulation of mud, which forms the topic of the fourth head, the answers are by no means so unanimous as represented in the report. Of the eight authorities above mentioned, Captain Beaufort, Mr. Cubitt, and Mr. L. Gordon think the same objection applicable to all the plans, but in the greatest degree to plan C. Mr. Macneil is of opinion that the docks or channels in plan B would have a greater tendency to "silt up" than the recesses in plan A; but that in both cases the mud may be easily removed. Mr. Rendel, on the other hand, holds that the channels in plan B will "silt up" the least of the two, but they will require artificial means to keep them clear. Mr. Hartley and Mr. Rennie incline to plan B; while Mr. Giles thinks that both the recesses of plan A and the channels of plan B will be kept clear by the wash of steam-boats and other artificial applications. All doubt upon this point, however, is removed from our minds by the evidence of Mr. Walker, who adduces the most conclusive proofs that no considerable accumulation of mud would take place in the recesses of plan A, and mentions the circumstance that several parties who had objected to the embankment for the new Houses of Parliament on this very score have withdrawn their objections, because they could not substantiate damages.

As the question of sewerage is but little affected by any of the proposed plans, we shall cite no evidence on that head. Enough has been said, we think, to show that, considering the great diversity of sentiment which prevails as to the general expediency, the details, and the consequences of an embankment, as regards the navigation, the trade, and, above all, the safety of the bridges, the Commissioners would act wisely in turning their attention to improvements of a more practical and less questionable character.—*Times*.

LONGITUDINAL SECTION OF ST. OLAVE'S CHURCH, SOUTHWARK.

(Reduced from the Architect's original drawing in the Royal Library at the British Museum.)

SCALE. 10 5 0 10 20 30 40 50 60 70 80 FEET.

#### ST. OLAVE'S CHURCH, SOUTHWARK.

The following interesting particulars relative to the appointment of the architect, and the building and cost of the church, were read by Mr. Alfred Bartholomew, at the last meeting of the Freemasons of the Church. We intend in our next number to present our readers with an elevation and plans of the spire of the church as designed to have been built, and some further interesting particulars relating to the church.

Mr. Bartholomew stated, that in the Royal Library, in the British Museum, are preserved the original drawings made by the architect for the fabric, a reduced copy of one of which we give this week.

The former old church baving, it appears, partly fallen, application was made to the legislature, and from the original document, which still exists in Mr. Corner's possession, Mr. Bartholomew read the following form of application:—

"To the Honble. the Commons of Great Britain in Parliament assembled.—The humble petition of Philip Ayscough, Clerk, Rector, Edmund Brown, Daniel Alexander, and William Lessoe, churchwardens of the parish of St. Olave, in the city of London and borough of Southwark, in the county of Surrey, and other inhabitants of the said parish, whose names are hereunto subscribed.

Sheweth:—That the church of the said parish is a very ancient fabric, and that considerable sums of money have been laid out in repairing and supporting the same, notwithstanding which part thereof is lately fallen down, and the remaining part, which is now standing, is in a very ruinous condition, and in the opinion of able workmen, who have sur-

veyed the same, is absolutely necessary to have rebuilt.

Therefore your petitioners humbly pray this honble. House, that leave may be given to bring in a Bill to enable the parishioners of the said parish to rebuild the said church in such manner as to this honble. House shall seem meet.

And your petitioners shall ever pray, &c." (Followed by 76 signatures.)

An Act of Parliament for the rebuilding of this church having been obtained, appointing trustees, the work was proceeded with, and in the original minute-book of the church-trust, are the following entries:—

"July 6, 1737.—The said trustees took into consid<sup>n</sup> the business of a surveyor to the intended new church, upon which Mr. Fleetcraft and Mr. Porter attended, and they were separately called in, and being asked sev<sup>l</sup> questions ab<sup>t</sup> the business of a surveyor, and what they intended to do under the character and denomination of a surveyor, Mr. Fleetcraft informed the said trustees of his intention and design, and that he would perform his business as a surveyor for 4*l*. per c<sup>t</sup>. Mr. Porter also informed the s<sup>d</sup> trustees to the same purpose, and offered to perform the same at 2*l*. per cent., but the same being debated, as well in regard to the difference of price and the proposals of the said surveyors as also of the prov<sup>d</sup> ability of Mr. Fleetcraft, a previous question was putt, whether the s<sup>d</sup> trustees sho<sup>d</sup> at this time proceed to the choice of a surveyor. Ordered, that the s<sup>d</sup> trustees do proceed to a choice.

It was mooved, that the s<sup>d</sup> trustees put up Mr. Fleetcraft and Mr. Porter separately, to be surveyor of the new church, and, upon major-

rity of hands held up, the choice fell upon Mr. Fleetcraft. The said trustees, after the said choice was over, informed Mr. Fleetcraft, that as they chose him their surveyor, they hoped he would abate somewhat of his proposall. He replied that he would contract for no less than 4*l*. p. c<sup>t</sup>.; but in regard to the parish he wo<sup>d</sup> be obliged to make a deduction of an half p. c<sup>t</sup>. Ordered accordingly.

Aug. 17, 1737.—This day Mr. Fleetcraft attended with a ground plan, and also a plan of the church and steeple, and also a view of the inside and outside of the east end, but the said trustees came to no resolution.

Sept. 14.—Mr. Fleetcraft's clerk attended at this meeting with several drawings, intended for the rebuilding of the church, wh<sup>ch</sup> the said trustees having viewed, and maturely considered, do approve of, as the drawings for the rebuilding the same."

About this time it seems Mr. Dance the elder, who was architect of the city "Mansion House," and who had been employed to give evidence in Parliament relative to the necessity of rebuilding the church, applied for payment; and that the men of St. Olave's were economical, will be further seen by the following entry:—

"Sept. 28th, 1737.—Reported that Mr. Dance had sent a letter to the treasurer that he made a demand of 5 guineas for his attend<sup>ce</sup> at the House of Lords, and had sent a letter for the purpose, which was read; and upon debating the same, it was agreed that he should have 3 guineas."

Then occurs the following rather summary minute:—

"Ordered, that the monuments of the church and tombstones in the church-yard be advertised in the *Daily Advertiser* and *Daily Gazetteer*, that unless the owners come to take them down within a month, they will be pulled down and sold to the best bidder." But,

12 Oct.—No advertisement had been made, because the east end was too ruinous for workmen to safely go there.

At length the design for the church approached completion, as will be seen by the following minutes:—

"9th Nov. 1737.—Mr. FLITCROFT (for the first time spelled correctly) attended with the plans, elevations, and sections of the designs for St. Olave's Church, which were approved of by the trustees, as also an alteration proposed to be made in the front, by introducing two narrow windows instead of the large windows proposed in the said drawing, which drawings were all signed by the trustees."

These are the very drawings with one tier of windows, and all signed, which are now at the British Museum; however, by another minute of the same day,

"Mr. Flitcroft was desired to draw and deliver copies of the said drawings to Mr. Hucks treasurer."

The drawings being perfected, the following minutes of further proceedings occur:—

"Dec. 7, 1737.—This day Mr. Flitcroft again attended with the copies of sev<sup>l</sup> elevations for rebuilding the church approved off and agreed with the last meeting, and the comm<sup>tee</sup> then desired the said Mr. Flitcroft to make estimates of the particular charges of the sev<sup>l</sup> kinds of work to be performed by the sev<sup>l</sup> workmen, and what the said church and steeple may be built for, and also such other directions for the use of the materials of the old church, the better to enable the comm<sup>tee</sup> to contract and agree with workmen for the purpose; and at the same time left the said copies in the hands of Mr. Hucks, the treasurer, for the perusal of the said committee.

Jan. 18th, 1737.—This day Mr. Flitcroft attended the trustees, and that the alteration of the roof and of the ceiling, as the same is now laid before them, were approved off; and, at the same time, produced and read over the general measures, and also the particul<sup>r</sup> of the masons work, bricklayers work, and carpenters work, intended for the building of the new church, which were in like manner approved off."

After this tenders for the execution of the work were obtained; and the little coquettings with the tradesmen who offered their services, are not without affording amusement, as will be seen by the next extracts:—

"Feb. 1st, 1737.—This day Mr. Dunn for himself, and Mr. Townsend the mason, Mr. Devall, and Mr. Horsenaile, masons, and also Mr.

White Mr. Cole and Mr. Pratt, bricklayers, attended with their sev'l proposals; and upon reading the masons proposals in their sev'l turns,

Mr. Dunn's amount to ..	£2513	0	0
Mr. Horsenail's ,, to ..	2470	0	0
Mr. Devall's ,, to ..	2450	0	0

But Mr. Horsenail and Mr. Devall's being the two lowest, and so near each other, they were severally called in, and ask'd if they would lessen their proposals, and then they were desired to withdraw to consider thereof; upon which Mr. Horsenail and Mr. Devall withdrew, and signed a further proposal which amounted to 2425*l.*; but even that was objected to as being too large a sum for the intended business, and they were then informed by Mr. Fleetcroft that the masons work may be completed for the sum of 2277*l.*; and if they thought proper to contract for that sum, they were at liberty to renew their proposal; and being again called in, Mr. Devall and Mr. Horsenail agreed to perform the business for the sum of 2277*l.*, and both signed their proposals accordingly.

After which Mr. Cole, Mr. Pratt, and Mr. White, the bricklayers, proposals were respectively read, and the amount of

Mr. Cole's Proposal was ..	£1030
Mr. Pratt's ,, ,, ,, ,, ..	940
Mr. White ,, ,, ,, ,, ..	905

Mr. White being called in, acquainted the trustees that Mr. Pratt was intended to be concerned with him, and they both agreed to perform the bricklayers work for 905*l.*, and signed their proposals accordingly.

"Feb. 15th, 1737.—The following tenders were received for the carpenters work:—

Mr. Barnard .. .. .	£863
— Phillips .. .. .	855
— Pulney .. .. .	800
— Spencer .. .. .	640
— Tall .. .. .	967
— Taylor .. .. .	650
— Marquand .. .. .	580
— Marty .. .. .	582

Whereupon Mr. Marquand was declared to have the contracts, and signed his proposal."

The chief works thus contracted for progressed till the approach of winter, when, as usual with our prudent ancestors, they were suspended, as appears by the following entry:—

"Nov. 2nd, 1738.—Ordered that the masons and bricklayers work be, on acct of the season, suspended till spring."

In the mean while, as this was, in those good old times of sound work, a comparatively cheap church, we find—

"Jan. 31st, 1738.—Mr. Fliteroft proposed for the approbation of the trustees, that the fronts of the galleries of the church should be wrought in deal, which would be cheaper than having them wrought in plain wainscot. Upon debating the same, it was ordered that the galleries be wrought in deal."

And this was perhaps the first occasion of using deal in metropolitan church-work. Wren's joiners' work seeming to be all of "Right wainscot;" nevertheless, though at that time so comparatively dear a commodity, iron was not spared in the building, as appears by the next extract:—

"Sept. 26, 1739.—Mr. Hucks reports that there has been 168 dozen & 5 new cramps, weight 23c. 2q. 18lbs, delivered and made use of with the walls of the new church and tower, besides several dozens of old cramps. Screw bolts, 4c. 0q. 17lbs. Wall books, 3qrs. 15lbs. Three chain-bars and rings in the tower, 23c. 1q. 18lb., all which cost 75*l.* 19s. 7d."

Then costly chandeliers were ordered, and how cautious were the trustees not to be cheated, is shewn by the following entries:— "The commissioners agreed with Mr. Bright-head, of St. Margaret's Hill, for the making, within 2 months, of two brass branches, as at Christ Church, Newgate-street, at 35*l.* each, and the treasurer, or some other person, to see that the same weigh 2c. 3q. 0lbs., within 14lbs. each before they be laquered.

24 Oct.—The treasurer was requested by the trustees to get some judicious person to assist him in looking upon the branches, to see that the same are finished in a workmanlike manner, and that the said branches be every way finished according to contract."

But what would a modern radical parish say to the outlay, then so large, for a chancel-table, or for iron pew-hinges, as next appears:—

"It was reported that the communion table was purchased of Mr. Horsenail for 16 guineas, including the iron-work, polishing, and fixing.

Apl. 4, 1739.—90 pairs of pew hinges were ordered to be made, at 2s. 3d., and screws 3s., a gross."

And, on the same day was made relative to the wood-carving, the following interesting minute:—

"Mr. Boson, the carver, also attended with his proposal for performing the carved work of the church, and produced a specimen of a cherub's head, &c.; which proposal being read over, it was ordered that the said Mr. Boson perform the said work for 50*l.*, according to his proposal, and that the same be entered in the book of the contracts."

FREEMASONS OF THE CHURCH.

18TH (ST. PHILIP'S) CHAPTER.

MAY 14.—The Rev. S. Pocock, LL.B., in the chair.

The report of the deputation appointed to consider the subject-matter relating to Mr. Hopton's letter was received, and is to the following effect, viz:—

"That it is inexpedient to make any new order or law, either to admit or to exclude from membership with the college any builder; but that in case any applicant for admission to become a lay-fellow of the college be a builder, whether he shall be admitted or not shall be left, in the ordinary manner, to the discretion of the members, who shall, in such case, ballot."

Specimens were received of Martin's cement, in the forms of mouldings and flat work.

The Rev. Thomas Fallow and the Rev. Henry Fybbe were elected chaplains.

On the same evening, Mr. J. A. Stothard was directed to engrave the common seal, which consists of a band, or margin, in the form of the Vesica Piscis, bearing as a legend, the college motto, which is taken from the *Te Deum*, and is as follows:—"Te per orbem terrarum sancta confitetur ecclesia." Within this a Cathedral front, with three spires, each thrice banded, the letters *W* appearing on the field at the sides of its principal spire; below the building, the Christian emblem of a Cross-Calvary, indicative of a cathedral-plan, and surrounded by the three triple symbols of the rose, thistle, and shamrock,—the style of the design and inscription being of the early decorated character of the time of Edward the First, when Pointed-architecture was more elegant and scientific than at any other period.

It was announced that the seal would be finished within a month, when it will be affixed to the illuminated election-diplomas, which are otherwise ready for distribution.

Among the exhibitions were a beautiful and delicately-pierced carving of a net, fishes, primroses, &c., by Mr. W. Gibbs Rogers; and a cross, with the symbols of the Evangelists in its four arms, and the sacred monogram in its centre, the work of Mr. Walter Chamberlaine, of Worcester, a member, being the result of the first attempt to produce the effect of the enamel of the middle-ages.

Mr. Alfred Bartholomew presented a tracing from the architect's original longitudinal section of St. Olave's Church, Toodle-street, and he also read an authentic memoir of Henry Fliteroft, the architect of the fabric, drawn up by George Corner, Esq., F.S.A., vestry-clerk of the parish, principally from particulars furnished to him by the solicitor of the deceased architect's family.

ORNAMENTAL IRON-WORK,

No. 1.

Having already noticed the great want of good design in articles of iron-work, and having already intimated our intention, we this week give, of the full size of the original, an exact elevation and two plans of the extraordinary specimen of iron-work found at Norwich, and mentioned in page 224, No. 65. The work, which now bears some marks of being battered by time, has a continental appearance, and is formed of double plating, with a delicacy of workmanship, the imitation of which would puzzle a modern maker of

chimney-bars or horse-shoes. Now the operating of all this is very simple, and we doubt not its performance occasioned its artist very little trouble, and consumed comparatively little of his time. It is design which is required; and to the extent which our modern machinery and tools, whether for large or small work, are superior to any in use when this subject was fabricating just to such an extent ought workmanship to be better made in modern times.

The fine old gates, replete with leaf, scroll, and cote-anory, remaining at the fine old half-deserted mansion of Enfield and other places, and the magnificent internal gates of St. Paul's cathedral (of which more hereafter), shew what hammer, punch, and file can do with iron, all which articles we have now in improved forms; while the superior durability of cast-iron peculiarly fits it for the facile process of moulding, in which, we are sure, that with proper encouragement and direction, our workmen are more able than ever.

The needed thing in the varied departments of the iron manufacture is the employment of superior taste, so that vulgarity may be expunged, and usefulness and beauty fostered. Men of fortune might so obtain a large increase of wealth, with the satisfaction of being patriotically beneficial.

ANCIENT IRON-WORK FOUND AT NORWICH.

LOWER PLAN.

ELEMENTARY ESSAY ON MORTAR  
AND CEMENTS.BY JAMES WYLLSON, HON. SEC. B.A.A.D.  
(Continued from p. 239.)

44. **POZZOLANA** is a porous, nearly non-calcareous substance, which gives to mortar made of common white lime the property of hardening to an extraordinary degree and of setting in water; also of not settling, it is said, while hardening. It was discovered by the Romans, whether fortuitously or by experiment is unknown, in the vicinity of Puteoli, a town in the Bay of Baia, not far from Mount Vesuvius, and is considered a volcanic lava. It was used by that people in making their aquatic cements, not only for their villas in that town, some of which stood in the water, but wherever water-cement was necessary; and the essential requisites for which they found it to possess in the highest degree. Vitruvius terms it *pulvis puteolanus*; but Puteoli is now called Pozzuoli, and hence, by an easy transition, the material itself has acquired the name of pozzolana; it is a concretion, cellular and slightly cohesive in texture, and of a rusty colour. An analysis produced 56 per cent. of silica, 20 of iron, 19 of alumina, and 5 of lime. The only process required, preparatory to mixing it with the mortar, is pounding and sifting. There is a Roman pozzolana which is superior to the Neapolitan, as it will make into a proper cement with lime alone; while with the other a proportion of sand is necessary. The Neapolitan effervesces slightly with acid, which the Roman does not; and therefore it probably contains more lime, to the exclusion of a corresponding quantity of some other ingredient more virtual in a water-cement. Pozzolana was long extensively used in this country in composing hydraulic mortars; but the necessity was completely obviated by the discovery of our Roman cement.

45. **TARRAS** is a bluish basalt much resembling pozzolana in its structure, and is equal to it in its hydraulic properties. It is quarried at Andernach, in the neighbourhood of Cologne, on the Rhine, for the purpose of making mill-stones; and the fragments which accumulate in forming these are sent to Holland, where they are ground to powder, and used on a vast scale in composing the cements for the dykes and other water-buildings. The Dutch are said to have been the first who used it in this way; and they must have found it a most valuable acquisition. Large quantities were imported here and employed for similar purposes, until the discovery of the Roman cement happily rendered foreign aid in this important particular no longer indispensable. The Dutch and Germans call it *trass*; in this country it is commonly styled Dutch *tarras*. It has been stated to be inferior to the pozzolana, in regard that cements made with it do not set so firmly when exposed to the action of the air as they do under water; also that they are liable to decay, either so circumstanced or alternately wet and dry—being excellent only if always under water. But there is reason to suppose the specimens used in the instances upon which this opinion was founded, must have been impure, or in some other respect imperfect; for in Germany and the north of France, as well as in Holland, it is considered to be equal to the best Italian pozzolana, whether in a wet, damp, dry, or inclement situation; and the Dutch at least must, from their extensive experience, be well qualified to judge. Still, as there is, unavoidably, much opportunity for adulterating a commodity of this nature in the course of transmission, it is not improbable that in general, by the time it came to market in this country, it might hardly be fit to support the high reputation it obtained on the Continent. Another disadvantage attributed to it, is a troublesome growth from the joints, produced by a chemical action among the ingredients, and which sometimes projects so as to require being cut away.

46. **Tarras** may be mixed either with common or water limes, but the proportions that are adopted in the two cases are different. When common white lime is employed, equal parts of it and the *tarras* compose the mixture; the former being in the state of quick-lime ground. These should first be thoroughly mixed, then, with a very small quantity of water, beaten to the consistency of paste. When a hydraulic lime is used, two parts slaked in powder, one

part *tarras*, and three parts sand, are the ingredients and their proportions: the latter is considerably the cheaper of the two, and is little if at all inferior to the other as a water-cement.

47. **ROWLEY RAG**, a non-calcareous stone, the essential ingredients of which seem to be oxide of iron and burnt clay, is very similar and little if any thing inferior to *tarras* in the power of giving to mortar made of white lime the property of setting under water.

48. **ARENE** is the name given to a fossil sand accidentally discovered by the proprietors of some mills situated on the river Isle, in the department of the Gironde, which gives to mortar made with common white lime not only great durability, but the quality of setting under water: it requires no preparation, but is only used instead of ordinary sand.

49. **M. Vicat**, a good authority on the subject of calcareous cements, especially on that part which relates to artificial hydraulic limes, and who established a manufactory at Paris for making the latter on a large scale, chiefly from lime and clay, states the proportions of clay to be added to one part of lime as varying so widely as from about  $\frac{1}{10}$ th to  $\frac{3}{10}$ ths; the lesser quantity being given to such as are naturally hydraulic in the greater degree, and therefore already possessing a certain portion of clay. The due allowance to the best carbonate, however, he states at  $\frac{1}{10}$ th: when the larger proportion is incorporated with the lime, it does not slake, but still pulverizes easily and hardens readily under water. It has to be remembered, on this head, that all clays are not identical, and that the finest and softest are the most suitable.

50. There are several methods employed at the manufactory mentioned: one, the superior but more expensive, is formed by burning together slaked lime of a rich quality with its due proportion of clay. In another, which is also of a satisfactory character, chalk, or some other calcareous substance which can be bruised down with facility, is reduced to a paste with water, and being amalgamated with the clay as intimately as it is susceptible of, is then subjected to the calcination. By this mode an important saving is effected in the burning alone, although the hydraulic lime which it affords is in quality rather inferior; but the course usually adopted is to burn together four parts of very rich slaked lime, or seven parts of carbonate, with one of dry clay; the lime being, when this formula is followed, free in itself from the latter ingredient.

51. Artificial pozzolana is also manufactured in various ways at the establishment referred to: the best is composed by strewing pulverized clay, psammite, or *arène*, in a layer of (as deduced from the French measure) rather better than one-third of an inch in thickness upon an iron plate, at a heat somewhat under forging temperature, and continually stirring it thereon with an iron rod, until the calcination is uniform throughout, which takes from five to twenty-five minutes, according to the material. The stiff brown clays, which do not contain lime, and which calcine to a brick red, are rather better than the white or pipe clays in which silica prevails, and that change to a light pink. The pozzolana obtained from the former, when mixed with an equal quantity of lime, sets hard in about three hours; a similar combination with the latter takes double the time to set and does not become so enduring. Those clays which are fine and soft to the touch, consisting chiefly of silica and alumina, and that contain the least carbonate of lime, but are more or less ferruginous, afford by the above method pozzolanas of excellent quality, which acquire in water the hardness of brick.

52. There is an artificial pozzolana, or rather water-lime, made by burning one part slaked lime with three parts clay for some hours at a red heat, and then covering it over in the kiln with sand or earth, and leaving it there to cool; after which it is kept in close casks till wanted.

53. **FROST'S ARTIFICIAL POZZOLANA** (patented 3rd April, 1823) is carbonate of lime, calcined at a heat not higher than the temperature at which cast-iron softens, and cooled without the access of atmospheric air or moisture: this has the property of setting under water.

54. It is considered, and probably with good reason, that a very good and quick-setting

water-lime may be made of five parts chalk and two parts common clay. Most clays contain a metallic oxide, which will give the hydraulic property to common limes. It is stated that a good hydraulic lime may be composed of pure limestone and one-sixth of clay, by the process specified in article 18, in reference to oyster-lime.

55. The ash mortar, celebrated under the name of **CENDRÉE DE TOURNAY** in France, so highly esteemed as a water-cement and extensively used in the Low Countries, is procured from the kilns in the Scheldt district, the lime from which contains a considerable portion of ferruginous clay, and is burnt with pit-coal of a slaty description, abounding in argillaceous schist impregnated with iron. When the main part of the burnt lime has been withdrawn from the kiln, the ashes of the fuel are found to be mingled with a remnant of lime-dust, averaging in its proportion 25 per cent. This mixture, when equalized, is taken about a bushel at a time, and water thrown on it just enough to slake the lime: when the whole has been treated thus it is thrown for several weeks into a pit and is covered with moist earth; then on being removed, it is put into a wooden vat, or trough, and beaten with an iron pestle until it becomes of a pasty consistency; after which it is spread out for a day or two in the shade, and is then again beaten up. These modes of treatment are continued alternately until the mortar acquires a degree of stiffness just proper for use. It adheres firmly with either masonry or brickwork, quickly forming a very compact mass, and in the course of 24 hours indurates like stone: it may be subjected to water almost instantly, and will endure the action of the most turbulent streams.

56. In London there is a blue mortar made of Dorking lime and cinders, which it is thought might be rendered, in quality, nearly equal to the *Cendrée de Tournay*, by bestowing on it similar careful preparation: it is used about work much exposed to weather. A mortar, composed of two parts of newly-slaked lime and three of wood-ashes, is said to be, for withstanding the effects of alternate dryness and moisture, superior to *tarras* mortar, although under water very inferior to it: it is best when kept for some time, and frequently well-beaten before used. There is an African maltha, or *strucco*, of some celebrity, which is composed by mixing three parts sifted lime-powder, two parts wood-ashes, and one part sand, with a little water; and after beating it up, adding a little oil and again beating the composition: this is repeated alternately for three or four days, until the composition is of the consistency proper for use: it is applied in the usual way, and shortly acquires the hardness of stone.

57. **Forge-scales** and common lime, in equal quantities, make a water-cement that is very good for small works; the former should be pounded, and the latter, in a state of hydrate, in fine powder. **Forge-ashes**, also, with lime, make a very useful cement for securing the joints of buildings against the weather, and for similar purposes, although not capable of resisting the continual action of water. Mortar composed of iron scales two parts, argillaceous lime two parts, and sand one part, or an equal portion of each, if pure carbonate of lime be used, is said to be quite equal to *tarras* mortar; 34 lbs. of sulphate of iron, incorporated with mortar, composed of one bushel of lime, and half a bushel of fine gravel sand, is said to render it equal to Roman cement. **Plaster of Paris**, mixed with iron-rust in the proportion of one-tenth, affords a water-cement which immediately sets very hard; plaster and iron-flings also make a good cement. Oxide of iron, in almost any form, especially when not completely oxidized, not only enhances the peculiar property of mortars made with the brown and yellow limes, but gives tenacity and the property of hardening under water to those made of the common white kinds. Grey oxidized *forge-scales* are said to be, when pulverized and sifted, equal to pozzolana.

58. Common mortar, composed of lime and sand, and mortar in which there is burnt clay, are said to be much enhanced by the addition of boiled potatoes. The incorporating of vegetable matter certainly seems opposed to the orthodoxy of mortar-making; but it must be admitted that this objection is met, in a measure,

by the approved formula for compounding the pargetting for chimney-flues.

59. The inferior water-cements are very serviceable for bedding brick—or flag—paving in damp situations.

60. An excellent cement for outside plastering is formed by slaking 100 parts of quick-lime in water just sufficient for that purpose, then reducing it to the substance of cream; also diluting five parts of either white or coloured clay to a like consistency, and, after a while, mixing it carefully with the other. After remaining in the tub for twenty-four hours, during which it is frequently stirred, it is coloured by an addition of two parts of yellow ochre; this is a very tenacious coating, and one that resists to a high degree the action of wind and rain. Another facing for houses is composed of limestone and road-dust, or sand, reduced to powder and heated in an oven, and one-fourth part of tar, pitch, or rosin, added while the other ingredients are hot.

61. BAILEY'S CEMENT, for stuccoing, consists of three parts Dorking lime, and one part clean, fine, river sand, and is kept mixed dry, in air-tight casks, till used, when it is made into mortar, and applied and finished in the usual manner, the walls being prepared for it by a thick wash of the same material.

62. ROUGH-CAST is a cheap substitute for outside stuccoing, in which the smoothing operation, called floating, as well as the ash-laring, or lining, to imitate masonry, are dispensed with.\* It is executed by first giving the works a coat of hair-mortar, sufficiently rough on its face to receive when dry another coat of the same. The second is laid on tolerably evenly, and is immediately covered with the third coat, or rough-cast, which is composed of clean, fine gravel, the largest stones scarcely so big as a pea, mixed in a trough with lime and water to a semi-fluid consistency, and with a tool similar to a dust shovel dashed upon the work, so as to adhere firmly to the second coat, while still soft; when dry, it is generally tinted with a stone-coloured wash, which gives it an uniform and finished appearance.†

63. ATKINSON'S CEMENT is, in quality, similar to Roman cement; but of better colour. It is often preferred for ornamental work in dry situations; but being more absorbent, is inferior for construction; it does not set so quickly as the Roman cement.

(To be continued in our next.)

## PETRALOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY O. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 242.)

### Siliceous Rocks.

QUARTZOSE ROCKS;—consisting of silica only, or uniting in their semi-crystalline structure small quantities of other earths and mineral aggregates, as plates of mica, felspar, metalline bodies, &c.

HORNBLÉNDE ROCKS, consisting chiefly of silica, iron, magnesia, and lime; the union of quartz and hornblende produces varieties, the introduction of schorl, garnet, and mica is productive of other varieties; these rocks are generally laminated.

FELSPATHIC ROCKS; quartz, embracing potash and alumina, and sometimes lime and metalline earths; they are of innumerable varieties.

GRANITE;—said to be a corruption of *geranites*, a term applied by Pliny to a stone of the colour of a stork's neck, and originating with Italian antiquaries.

Of the varieties of rocks distinguished from each other by the peculiarity of their composition and character, none lay higher claims to our admiration than this very extensive class, or are more really deserving of notice: the hardest and most ponderable rocks we

are acquainted with, they are at the same time capable of receiving the highest and most exquisite polish, and are therefore equally desirable for the exterior of buildings, for casing canals, for bridges, lighthouses, temples, palaces, and prisons, and for the wear and tear of machinery, as they are for the ornamental interior of public and even private edifices of magnitude. In their natural state granites constitute the bases, and very often the chief material of many elevated portions of the earth, being the most common matrix of the metals, and of some of the precious stones. In its simple primary state it is chiefly quartzose uniting with iron, magnesia, and lime, and consisting of parts variably disposed, without any determinate order, silica forming the common bases of the whole aggregate mass,—the earths of which it is composed, and from which it is produced, being exclusively oceanic. In the changes produced by local influences, we observe the fossil bed consisting of the oceanic animal and vegetable reliques; or the earths produced by their decomposition gradually assuming its determinate form, the shelly coverings of the mollusca silicify—veins of quartz intersect the calcareous mass—by degrees the whole becomes cemented together, the common flinty bodies assume the crystalline form, the cementing material is embraced in the crystalline or granular structure, and the ultimate result is granite. In all these changes, we observe that the several aggregate bodies pass through slow and progressive stages of change, the act of silicifying, or, as it is universally but most erroneously termed, petrifying, being gradual, and depending on the conditions to which it is exposed, and the final act of crystallization being produced by the gradual displacement of calcareous and other earthy matters. All siliceous bodies, such as flints and other common stones, gradually assume the crystalline form, under certain conditions of atmospheric heat and moisture, unless prevented from doing so by being united with some earthy compound inimical to further change; and so far from lateral pressure being necessary to produce crystalline bodies, as is generally affirmed by geologists, and weakly demonstrated by the experiments of Sir John Hall, it is absolutely necessary for the right development of the regular crystalline structure, that there be a perfect freedom from lateral pressure which is palpably manifest in the act of crystallization of rocks, for invariably, in the first instance, the matter is simply cemented together, and in this state it is enabled to resist the pressure of surrounding bodies, the earth or earths being held in union by the one common basis. When we examine a mass of matter thus agglutinated together, it conveys no idea of any further change, but all bodies, organic and inorganic, are the subjects of unintermitting change in the disposition of their quantities and qualities, and although there is an apparent *vis inertia*, or state of absolute rest, in rocks and stones, and consolidated beds of the earth, all of them in reality are the subjects of incessant change; thus the simply agglutinated mass goes on changing, some of its elementary constituents being abstracted, and the vacancy thus produced being filled up as it takes place by the expanding body, which, divested of its impure mixtures, assumes another form.

The largest aggregate masses of the earth are governed in their combinations and changes by the same laws that govern the disposition of the smallest particles of matter, and every atom, being a component part of a large consolidated body, must have room to change its place and disposition, to act and to be acted upon; otherwise, like sandstone, it continues a mere heterogeneous mass of particles mechanically united and readily separated from each other. The crystalline texture of granite depends upon these conditions, and the more room the siliceous aggregates have to expand, the larger is the crystal, and consequently the coarser the granite. The same law is observable in crystalline carbonates of lime; they generally form (or, as is palpably manifest by their disposition and qualities, they have been formed in preceding epochs) upon or near the surface of the earth, and previous to assuming the crystalline state were permeable to all fluid bodies, and becoming the recipients of particular fluids, crystallized by expansion of their atomic particles.

Geologists inform us that granite is primary rock, formed of matter once in a state of

fusion; and this unphilosophical notion is made the basis of modern systems of geology; but the very confused and uncertain nature and disposition of the material is of itself sufficient to compel us to negative this supposition, independently of facts derived from travel and observation in various parts of the earth. It passes by transition into all kinds of rock and under all circumstances its elementary constituents are identified with the varied beds of the earth, from which, by cohesion and subsequent crystallization, it is even now being produced. The substances of which the strata are principally composed are siliceous, calcareous, and argillaceous earths, the two less being chiefly produced within the ocean, being the resolution of oceanic animal and vegetable bodies; the latter is produced by the resolution of animals and vegetables of *terra firma* united in variable proportions of each; all these several beds exhibit more or less organic remains of species allied or analogous to those now existing, and by their union with each other produce the varied phenomena; the agglutination of calcareous matters causing them to pass into limestone, of clay into slate, and of siliceous matters in sandstones; the further change or crystallization producing peculiar results, as marbles, jaspers, granites, &c. The organic remains entombed at various depths, and very often disposed in groups and families, demonstrate that the strata were deposited over each other at distant intervals of time, and that each stratum in which they occur and under which they were formed was once the uppermost stratum of the globe, there being a manifest period of time in which species have uninterruptedly lived and propagated their kind; the materials of such strata could not therefore have been suddenly brought together. Again, they everywhere manifest conversion of calcareous animals into simple carbonate of lime, the conversion of vegetable bodies into vegetable earths and their transition into clays and shales, demonstrates that organic matter ever ultimately assumes form in which all traces of its original bodies are for ever obliterated. The absence of organic remains in granite cannot therefore be adduced as evidence of its primary nature, any more than limestone or slate recently formed and still forming from calc and clays.

Simple granite, according to geologists, consists of felspar and quartz, the component parts varying in their predominance; but, the presence of the former, which is a combination of silica, potash, and alumina, and sometimes lime, demonstrates, that it is a secondary product, the alumina and potash being derived from *terra firma*; whereas hornblende, which often replaces the felspar, is strictly oceanic, and therefore, as regards precedence of origin, is assuredly a primary product.

True granite consists of quartz, felspar, and mica, the latter being composed of the like ingredients of felspar, together with oxides of iron and manganese, and very indeterminate in its mixtures. Besides these ingredients true granite is sometimes mixed with other minerals as shorl, hornblende, crystals of garnet, steatite, and alumine; the felspar is often flesh-coloured, the quartz generally white, and rarely greenish; it is found in innumerable varieties of hardness, proportion, distribution, and colour of parts. It takes a very high polish, and for this reason has always been employed in architecture and other economical uses. Of these compounds quartz is invariably the first to assume the crystalline texture, and in doing so occasion the changes in the enveloped ingredients. Granite, in fact, is no other than conglomerate masses of earth which, united in the first instance by simple cohesion of parts, are more durably united by time and the accident of change, the particles and aggregates of which they are composed undergoing a simultaneous and progressive change from their petrefactive state to the crystalline structure, and their crystalline nature and composition depending upon the nature and composition of the primary beds. All granites are produced by sedimentary or mechanical deposition, the material of which they are composed being derived from organic depositions locally accumulating within the ocean. A deposition of pure sands, when no longer disturbed by the tidal action, and preserved from further change of position as a portion of *terra firma* becomes of necessity, in its whole aggregate mass, the subject of change when acted

\* [Some old specimens of rough-cast are to be found, rusticated by smooth channelings, so as to resemble rustic masonry, some examples of which are to be seen at Highgate.—Ed.]

† [Rough-cast, having projecting surfaces, which retain wet, is the least estimable kind of stucco, though if made with hydraulic lime, and afterwards trowelled smooth, it would perhaps, from its stony nature, be one of the best.—Ed.]

upon by the atmosphere, or by chemical ingredients held in solution by the waters which it may contain, and the nature of the action determines the result, thus in some instances it remains in its granular state, but assumes a milky whiteness; in others it puts forth crystals from dark granular masses; in others it assumes entirely the crystalline structure. Sometimes these granular bodies are simple, united by the force of cohesion with some common basis or cement, and the whole body is then denominated *sandstone*; at other times, it assumes in aggregate the crystalline structure, and is then known as quartzose rock. Much of the ancient strata exhibits this purity of composition, being wholly composed of pure siliceous bodies, as sands, sandstone, or quartzose rocks, and aggregate masses, and all these several beds owe their origin to the one common mechanical action of sedimentary deposition, their homogeneous nature obliterating all traces, if they ever had any, of stratification. The ejected material of volcanoes has never been known to assume the quartzose structure, nor can we rationally attribute the origin of this material to volcanic causes, for although bodies in cooling down very often assume the crystalline structure, it is not in the nature of silica so to do unless acted upon by those chemical agents which have the power to direct its movements. Thus in metalline beds siliceous bodies are converted into quartz by the same chemical agents, which, by their action, generate the metals, although these agents do not, of themselves, unite with the body. Again, as a bed of clay contracts and opens into fissures, by the gradual loss of its moisture, so silica separating from the clay, assumes the quartzose form, its crystals increasing in size by constant depositions of silicic acid, in the same manner as staelectites increase in cavernous apertures of the earth. Again, flints, as we behold them, are solid bodies, but all of them contain earths in variable proportions, and therefore when these flints become exposed to long continuous tropical heat, united with moisture, chemical action is produced within the stone, gradually extending from the exterior to the circumference, the earths or metalline bodies are abstracted, or the latter, chemically acting with the silica, causes it to assume the quartzose form; these, and innumerable other means, may be adduced whereby nature forms quartz, which is the chief ingredient of almost all the crystalline rocks.

(To be continued.)

#### METROPOLITAN IMPROVEMENTS.

(Continued from p. 242.)

To the inquiries of the commission as to the best mode of improving the navigation of the river, with reference to the trade of the locality, and assuming proximate uniformity of width to be desirable for such improvements, Mr. Hartley observes, "I am of opinion, that approximate uniformity of width is desirable for the purpose mentioned, and I conceive this may be obtained without injury to the trade of the locality, by leaving open the spaces between the embankment and the shore for the use of those now occupying the margin of the river." Mr. Gordon—that "as in order to regulate the river, it should be brought to approximate uniformity of width, the best mode of accomplishing this, with reference to the convenience of trade, would be the principle of the plan B, whereby the present river fronts remain intact, and, all things considered, the craft would have better and safer accommodation than at present." Mr. Rendel—that "the local trade would be best consulted by leaving the space between the wharf and the embankment open to the tidal flow and ebb." And Mr. Macneil—that "the best mode of accomplishing the object, having reference to the trade of the same localities, will be to construct a wharf wall sufficiently wide to form a thoroughfare upon it, and at such a distance from the shore as to allow barges and other craft to ply to the different wharfs, as at present upon the principle of plan B." In Mr. Cubitt's judgment, on the other hand, "the better mode would be to construct the shores of the river with strong walls, and to form floating docks between such walls and the present shores, and wharfs for the accommodation of the trade." The opinions of Captain Beaufort, Mr. Rennie, and Mr.

Giles are not directly expressed on the point, and are consequently not available.

To a subsequent question, whether the principle of plan B would be better carried out by the substitution of locks and floating basins for tidal docks or side channels, as originally proposed, the replies of Mr. Cubitt, Mr. Rendel, Mr. Rennie, and Mr. Giles, were in the affirmative; of Mr. Hartley, Mr. Gordon, and Mr. Macneil, in the negative. In the series of questions submitted to the Hydrographer to the Admiralty this question was inadvertently admitted.

We think it right, in reference to this point of our inquiries, to advert to the distinct and practical testimony of Captain Maughan. "Side channels," he observes, "admitting the rise and fall of the tide, would, in my opinion, be preferable to docks. The former appear to possess advantages over the latter plan, viz. access for the barges at all times of the tide (at least as long as there is water inside the terraces), the saving of a very considerable expense in constructing locks, double lock gates, &c., as also the usual cost of maintenance, and of the establishments for working them. Locks would also very much encroach upon the side channels, and, if many of them should be required for the admission of barges, the annual cost would be very heavy indeed."

He adds, "If the side channels were converted into floating basins, the abstraction of tidal water would of course be equal to the cubic contents of these docks; and so far as the navigation is concerned, this modification of Mr. Page's plan would be as injurious as a solid embankment."

The next in the series of considerations connected with Mr. Page's plan are the alleged difficulties of entrance to these side channels from the river. The number, position, and dimensions of these, it is obvious, might be modified at almost any period previously to the commencement of the works, and we confined ourselves, therefore, to points less susceptible of modification. Mr. Hay, a lighterman, observes, "I think Mr. Page's plan is the best I have seen, and if a project of that kind is to be executed, I have never seen any plan equal to it; but if the river is narrowed, the tide will go up with greater velocity. We have great difficulty, now, in bringing up with our craft. Now we can bring up to the wharfs, and bring up in a recess, and get out of the way; but I doubt whether we can ever bring up at all when the tide is running so hard as it would. Still Mr. Page's plan is a very excellent one; I have seen nothing equal to it, if these difficulties of getting in at the openings can be done away with." On being further questioned whether his objections would equally apply to open entrances, he replied, "If there is a plan intended to be carried into effect on the river, there cannot be a better; but I fear when we come to the openings the tide will carry us by." Mr. Lucey, also a lighterman apprehended no difficulty whatever; referring to the entrances of London and St. Katherine's Docks, he depended upon the eddy to assist him, and gave his reasons for that dependence. Mr. Taylor thought there would be no difficulty "unless the speed of the tide were very much increased. In the flow of the tide it would then require some very experienced bargemen to bring up, and rig-bolts or piles must be resorted to for the purpose." Assuming an increase of 15 per cent. upon a velocity of three miles an hour, he anticipated no difficulty whatever. Mr. Harvey had conversed with intelligent lightermen, and inferred, from the same causes, that admission would be more difficult. Mr. Pocock adverted to the increase of existing difficulties since the removal of Old London Bridge, and was also of that opinion, attaching little importance to the drift or eddy anticipated by Mr. Lucey; and Mr. Peache, referring to the fact that a great portion of the craft were worked by only one man, considered that there would be difficulty, in such cases, in getting in without further assistance.

On this point it is observed by Captain Beaufort, "the entrance to the docks in plan B would be often difficult when the tide might be strong; and, if these entrances were converted into locks, great inconvenience would probably arise from several barges arriving at the same time. At the docks which are used by large vessels, specific times of the tide are selected for letting vessels in, and they are

then attended by a sufficient number of men to overcome all difficulties; whereas a barge is moved about the river by a single man, who would be quite incapable of conducting her into a narrow gate or lock."

Looking to this question as one having rather a practical than scientific bearing, the opinions of the engineers consulted were, perhaps, not unexpectedly discordant. Mr. Hartley and Mr. Cubitt disapproving of the particular entrances shewn in plan B, were nevertheless of opinion that there would be no difficulty in designing entrances such as should afford entire protection against strong currents and high winds; the first, however, saw no necessity for locks, the second admitted locks in deep recesses. Mr. Gordon also was of opinion that there would be no difficulty, thought the gates in the plan "judiciously placed," and recommended the addition of others. Mr. Rennie, observing that "all the entrances to the various docks at present on the river are occasionally affected by currents and high winds," assumed that "a careful observation of the prevailing winds would determine their position;" Mr. Giles, that "they would be affected by the same causes, but that these would not impose greater difficulties than exist at the entrances of the various docks on the river, and which might, by the means resorted to in these cases, be overcome."—On the other hand, Mr. Macneil was of opinion, that "these entrances would impose difficulties and obstructions such as do not now exist at the entrances to the various docks or wharfs on the river; and Mr. Rendel, "that they would be difficult, if not dangerous, except for an hour and a half, at most, before and after high and low water."

The experience of Captain Maughan may here be again of service in elucidating a practical question. To questions whether the entrances should be at right angles with the stream, he replied "As regards facility of entrance, I think that is of very little importance. The craft will have to stop outside first of all, and, if there is no tide, which I apprehend there will not be, close to the embankment wall, they will go in as they like; I do not think the stream will run rapidly close to the terrace, so as to prevent the easy ingress of barges." He apprehended no difficulty in getting in, no pressure of the tide upon the vessels at the entrances. In his letter he observes, "The difficulties which have been raised about entrances at right angles I confess I cannot understand; they appear to me very much exaggerated. With a floating platform or dumb-lighter, and piles driven down at proper distances to check the barges, any lighterman could pass in his craft, even should the stream run up rapidly outside, but which I very much doubt its doing, as stated in my evidence."

The discussion of these entrances, without reference to the principle involved in the one or other of the modes of appropriation already suggested, involved a further consideration of some difficulty. The sufficiency of their width was generally admitted, but their height above high-water mark, assuming moveable bridges to be dispensed with, afforded subject for much difference of opinion. Mr. Taylor and Mr. Pocock considered, as coal-merchants, that from six to eight feet headway would be sufficient for their purposes; but for straw barges, and other descriptions of craft engaged in similar traffic, and, in short, for general uses, Mr. Hay regarded, 10; Mr. Lucey, 11; Mr. Peache, 12; Mr. Taylor, 14 or 15; and Mr. Harvey, 30 feet, as the smallest allowable reservation. The diversity of opinion upon such a point, between parties whose interests and daily habits should make them conversant with these details, is sufficient, we think, to justify a doubt as to the reasonableness of some of these requisitions.

As the object of any measure for the improvement of the river should be obviously to get rid of the mud at present accumulated upon its shores, the attention both of Mr. Walker and Mr. Page had, of course, been directed to these points: Mr. Walker trusted chiefly to the inclination of his recesses towards the river, and to the tide in cleansing them; Mr. Page, to an inclination to be artificially given in the first instance, and to the subsequent operation of culverts and sluices.

The relative advantages of, and objections to, Mr. Walker's recesses in regard to this

question have been already stated in referring to his plan. The tendency to such an accumulation in the side channels of Mr. Page, and the efficacy of the means devised for its prevention or removal, gave occasion to much diversity of opinion, and incidentally involved the discussion of a point already adverted to, viz. the relative merits of open docks and floating basins. Upon the former of these points, it is observed by Mr. Cubitt, "I think the docks proposed by plan B, with single pairs of gates only at their entrances, and subject to be filled up and emptied at every tide, for the purposes either of navigation or scouring, would be very subject to silt up with mud."—Mr. Gordon's opinion was to the same effect, though qualified; Mr. Macneil's, that they would have a greater tendency to silt than the recesses of Plan A; Captain Beaufort's, that the tendency would be at least as great; Mr. Hartley's and Mr. Rendel's, that it would be less. Captain Beaufort and Mr. Cubitt were of opinion that, by the conversion of these docks into floating basins, the evil would be diminished; and all concurred in stating that either by the means immediately recommended, or other artificial resources, they might be rendered practically unobjectionable.

The necessity of resorting to these means, however, even upon the simplified basis of side channels, as originally proposed, implied at the same time a necessity for supervision, and this supervision an expense, to which any modification of the plan in the shape of floating basins with lock entrances, would of course involve some addition. Assuming, therefore, the plan B to give to the wharflingers in common the use of large reservoirs of water, and to require the supervision of officers whose duty it would be to regulate the scour, and the ingress and egress of craft at particular states of the tide, we submitted to the professional gentlemen consulted, whether this supervision, if restricted within proper limits, would entail any serious expense, or offer any obstruction to the trade, or injuriously affect the interests, or trench upon the convenience of the owners or occupiers of the adjoining property. We submitted, at the same time, a second question, viz., whether it would give them any advantages which they do not possess at present?

In reply to the first of these inquiries, Mr. Rennie answered simply, and generally, in the affirmative; Mr. Giles, "that it would become an objectionable restriction upon the freedom of the navigation of the river;" and Mr. Rendel, "that the interests and views of the numerous owners and occupiers of wharfs would make the supervision and police of such docks difficult and expensive; that supposing the entrances to be made sufficiently commodious and numerous, and the docks kept clear of mud, the owners of the wharfs would have no reasonable ground of complaint." Captain Beaufort, Mr. Hartley, Mr. Cubitt, Mr. Giles, and Mr. Macneil, were of opinion that the supervision need entail upon the parties affected no injury, serious trouble, or expense, or none, at least, for which its advantages would not afford ample compensation; and concurred with Mr. Rendel, that the conversion of the side channels into floating basins, notwithstanding its attendant increase of expense, would give them a positive accession of advantages.

The remaining considerations connected with the plans before the Commission involve a discussion of their relative claims to adoption. With the plans of Mr. Walker and Mr. Page a terrace and public thoroughfare are undoubtedly consistent. In both plans the sewage is treated upon the same principle—viz. by extending the sewers to the outer line of the embankment, and connecting it with the river under low-water mark.

**PUBLIC WALKS, BIRMINGHAM.**—At the meeting of the Town Council, Alderman Cutler gave notice of a motion for the next meeting, that a communication be opened with the Commissioners of Woods and Forests, with a view to obtain from them a grant of money, for providing public walks for the inhabitants of the borough.

**LEAMINGTON.**—The opening of the new Proprietary College is expected to take place immediately on the termination of the ensuing Midsummer vacation,

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*St. Stephen's Church, Bristol.*—*Interesting Discovery.*—The interior of this edifice, agreeably to modern fashion, is being remodelled, and the high mahogany pews, which were built in 1733, are to be succeeded by more spacious and airy sittings. On removing the mahogany wainscoting on the north side of the church, lately, the workmen discovered a beautiful ancient monument in high preservation. It is a raised tabular cenotaph, faced with shields, and interspersed with effigies of different characters. On the table are two cumbent figures of exquisite workmanship; the male is clad in short or three-quarter tunic, fitting close to the body, and reaching half down the thighs; the legs are bare and feet unshod; the tunic is buttoned in front and secured by a studded belt or baldric, to which is attached a sheath for a small sword or dirk; there is no helmet or covering to the head, but the hair is cushioned up like a small wig; a slight moustache passes from the upper to the lower lip, and what in modern parlance is styled a *favor*, is on the chin; the countenance is impressive, and the age may be supposed under fifty. The female is a very elegant figure with beautiful and regular features, the costume is decidedly that of a person of distinction; the head is enveloped in deep fillets, which form three sides of a square, and such as were in fashion in the fourteenth century; a long flowing robe or manteau is beneath the figure which is clothed in a long close-fitting dress, the hands, which are quite perfect, are raised over the breast in the attitude of prayer; the hands of the male figure are gone, but their position must have been the same. The head of each figure rests upon a cushion, and the feet are supported by some animal emblematical of affection and faithfulness: the whole is surmounted by a Gothic canopy or festoon. The rumour of the discovery soon spread, and numbers visited the shrine, and conjecture, of course, became busy in naming to whom the monument belonged. Several suggested that it might be that of John Shipward, who erected the tower in 1470, and whose effigy and that of his wife were cut in painted glass in the great west window, now destroyed. No doubt the right owner will be discovered by the researches of antiquaries, and, whoever may be proved to have a title to the distinction, we trust that it will never again be condemned to obscurity to suit the convenience or economy of churchwardens and vestrymen.—*Bristol Gazette.*

*New Church of St. Alkmund.*—On Monday week last, the ceremony of laying the foundation or corner stone of the intended new Church of St. Alkmund, Derby, took place.

## RAILWAY INTELLIGENCE.

*Eastern Counties' Railway Extensions.*—The *Railway Times*, in noticing the extensions of the Eastern Counties' Railway, says—"The original line to Colchester, of 51 miles, has cost the proprietors 2,850,000*l.* Look at all their extensions and leases as purchases, and observe only how much cheaper than this they have acquired valuable new lines and branches. The above gives a rate of about 56,000*l.* per mile. In acquiring the Northern and Eastern Railway of 37 miles, at a rent of 5 per cent. on 970,000*l.*, the rate of purchase does not exceed 26,200*l.* per mile; the Harwich on lease, 18 miles at 4 per cent. on 210,000*l.*, gives a rate of about 11,660*l.* per mile; the extension to Peterborough and Brandon, 73 miles, at 5 per cent., on 850,000*l.*, gives a rate of 11,643*l.* per mile. Add the capital of the whole of these three new lines together, 2,030,000*l.*, and divide them by the aggregate mileage, 128 miles, and the result is 15,870*l.* per mile. If the Eastern Counties' Company could make half-a-dozen more such bargains, their proprietors ought to rejoice."

*Railways in Denmark.*—In the island of Seeland, a railway is to be laid down from Copenhagen to Elsinore, a distance of thirteen leagues. Another line, crossing the island at its widest part, will run from Copenhagen to Corsoer, on the Grand Belt, passing by Rothschild, Ringsted, and Slagelse, a distance of about thirty-one leagues. By means of this line, all the letters between the capital and the rest of the kingdom will be despatched, as well

as the correspondence between Denmark and the continent of Europe, during the season when the steam-navigation of the Baltic is suspended. It is in contemplation to lay down six lines of railway in the Duchy of Holstein, branching from the great line between Kiel and Altona. By this means, a complete communication will be effected between all the principal cities of Holstein, and between the North Sea and the Baltic.

## Correspondence.

## THE PROPOSED NEW BUILDING-ACT.

SIR,—Can you or any of your readers inform me what is doing with regard to the proposed New Building-Act, and whether it is likely to pass the Legislature this session?

I am, Sir, your humble servant,  
Blackheath, May 13. A LANDLORD.

SIR,—I have been looking for these two weeks past for the appearance of the very excellent report by the Builders' Society relative to the above bill, and respectfully beg to inquire why it is that such a document should not already have found its way into the very instructive pages of your journal.

A CONSTANT READER.

[We have not received a copy of this report.—Ed.]

## EGYPTIAN HALL, MANSION-HOUSE.

SIR,—I have been much edified by the description copied from a morning paper of the "improvements" just made at the Egyptian Hall, in the city, by means of erasing the former marbled-work, and by repainting that great and magnificent apartment just as any common painter would have painted any common room. Surely the architectural world must be delighted to hear of the patronage of a "design" for rendering lean the fittings of interior Corinthian columns, by re-working them, and of the merit of superseding, in the smoke-dried heart of the city, sienna by French-white and delicate fawn-colour. No doubt the economists who have been terrified by City jobbing and extravagance will hear with great satisfaction that a room in the "Mansion-house" has been whitened without extra charge; but joking apart, I think it due to the public that public journalists should not occupy their readers' time by such twaddle; and I hope your own reception of such into your columns was rather intended as a quiz than with a *con amore* desire to waste money by *washy-washy*ing our public buildings. Perhaps, however, I may be myself mistaken, and may not see that this seemingly frivolous affair is intended as a serious City quiz upon the national idea of ornamenting the Houses of Parliament in a very different manner, and I may therefore be altogether wrong in being exceedingly disgusted at finding that while this vulgar whitening and huffing has been transacted, a more substantial extravagance has been fallen into, by adding the enrichment of "egg-and-tongue" around the coffered-work of that vaulted ceiling which before, in its happy medium of decoration, combined great richness and elegant simplicity, so as to render it one of the very finest and noblest in Europe, and the admiration of the world, and requiring nothing but the withholding from it of all audacious hands.

I suggest that a penny subscription be raised in the city for making this ceiling again just as it was, and that the citizens in future employ themselves in *repairing* and increasing their fine buildings, instead of adding to them that which they do not require, or in diminishing their number.

I am, Sir, your humble servant,  
VANDYCK BROWN.  
Painter-Stainers' Hall, May 13.

SIR,—You will greatly oblige me if you will inform me where I can obtain a work on statues, with the different monastic dresses, and with figures and dresses of different saints and apostles. Also, armour figures, and, if possible, the prices.—I am, Sir, &c.

A CONSTANT SUBSCRIBER.

[We have not time at present to give any list, as it would entail upon us some considerable trouble; perhaps our correspondents will lighten that charge.—Ed.]

Miscellaneous.

WESTMINSTER-BRIDGE.—From some returns relating to the money expended, and to be expended on Westminster-bridge, and the probable cost for the completion of the repairs thereof, &c., recently moved for by Sir R. H. Inglis, Bart., M.P., it appears that the gross total amount of the sums expended on the bridge for repairs, alterations, professional and other services, from the 5th of April, 1810, to the 5th of April, 1838, a period of 28 years, is 83,097l. 6s. 9d., of which 31,944l. was for repairs and alterations in the structure and foundation of the bridge, and 26,014l. for lighting, watching, watering, and maintaining the roadway on the same. Law expenses, &c. consumed a sum of 1,923l. 18s. 6d., whilst salaries and allowances swept away 12,787l. 12s. 7d. The total amount of the costs for the repairs and alterations of this bridge (including the sums already expended, or now due), since the 5th of April, 1838, is 82,661l., which is about as great a sum as the amount of money disbursed during the 28 preceding years. Of this large sum, 58,321l. was for the costs of erecting cofferdams, securing foundations, and restoring piers and arch-stones; 12,100l. for the costs of elongating the piers, in order to receive a widened superstructure; and 5,232l. for the costs of the works lately executed in lightening the superstructure in consequence of the recent sinking. The total amount which will be required to defray the probable cost of the further works and services is stated at 52,879l.—of which 23,579l. is for the repairs of foundations and arches, 5,900l. for the elongation of the piers, 20,100l. for repairs and alterations of the superstructure, and 3,300l. for miscellaneous services. The total income of the Commissioners of Westminster-bridge, arising from property belonging to the commission, amounts to the sum of 7,464l. 11s. 8d. It appears that, in order to widen the superstructure or roadway of the bridge 12 feet, making the whole width of the carriage-way and footpaths 53 feet 6 in. (the same as London-bridge), an extra sum of 40,000l. would be required, in addition to the 20,100l. above mentioned.

A self-acting ventilator for theatres and other places of public resort, intended to admit precisely such a quantity of external air as will purify the internal atmosphere, and bring it down to a determined point, was submitted to his Royal Highness Prince Albert by Mr. Thomas Wroughton, at Gwydyr House, on Friday, the 10th inst.

The Cathedral of Durham is now open to visitors seven hours a day, without any fee being required. Those who wish to see our cathedrals (if not our parish churches) constantly open, will be glad to hear of this commencement.

EFFECTUAL METHOD OF PRESERVING IRON FROM RUST.—Heat the iron to redness, just perceptible in the dark, then cool it in tallow.

The exterior of that magnificent building, Castle Highclere, the princely domain of the Right Hon. the Earl of Carnarvon, is now quite completed, the lofty tower of which is seen from almost all points.

The buildings formerly occupied as a nunnery at Coxside, Plymouth, are about to be converted into a soap manufactory.

TO OUR CORRESPONDENTS.

We have received and put in hand the details, &c. of Rockhampton Church, but should be obliged by the addition of correct sections, &c. of one quarter of the quatre-foi ornament on the head of the font, also sections of the mouldings of the piscina and door.

The Seal has duly come to hand, and will be returned when engraved.

Having been told several letters sent to us on the subject of the proposed Building Act have neither been published nor acknowledged, we have looked carefully over our correspondence, and found none such have been received, with the exception of one, intimating that, as the district-surveyors are handsomely paid for seeing every brick laid, they ought, if they desire any work to be opened for inspection, to pay the expense thereof themselves, since such could only be requisite through their neglect. This letter was suppressed, as we imagined it could only be sent out of jealousy. But if any other side letters on this important subject are sent to us, we shall take care that they are inserted.

[ADVERTISEMENT.]

AN ADDRESS TO THE CARPENTERS OF LONDON.

The Committee, encouraged by the strong assurances of support they have received, and animated by the hope that the patronage they have already secured is only the prelude to the sanction of the whole trade, again venture to call the attention of the journeymen carpenters of London to the importance of providing an asylum for those who, by age or infirmity, are unable to maintain themselves by labour.

The numerous institutions of this description which have arisen, and are rising up on every side, afford a strong proof of the estimation in which such establishments are held by the higher as well as the humbler classes of society, since both are united in their promotion; and it is not too much to expect that when the working classes perceive that those whom fortune or superior abilities have placed above them are anxious for their welfare, and willingly co-operate with them in acts of charity, sentiments of respect and gratitude will arise, and that good-feeling prevail, which should ever exist amongst the various classes of a civilized community. The object of the institution, for which the support of the master and journeymen carpenters is respectfully solicited, is to provide for the humble but honest workman a peaceful home and a slender maintenance in his declining years. Is there a heart not wholly dead to the sacred calls of charity, to whom the appeal for assistance can be made in vain? Is there a working-man who can behold his companions around him sinking into age and indigence, and yet refuse to contribute a trifle, (and no more than a trifle is required), to promote their comfort? It is believed that few will refuse to respond to this call among the journeymen carpenters of London.

But time hastens away, and those who desire to take a part in this good work should act at once come forward; for where is there a man, however elevated his station in trade, or however bright his prospects, that may not by adverse circumstances hereafter be glad to partake of those advantages which the institution will afford? And those who never need such assistance will never know enjoyment higher and purer than flows from the recollection of acts of mercy, benevolence, and charity.

Mr. Wood's Tender was accepted.

TENDERS delivered for painting, &c., the Warehouse of St. Martin's in the Fields. May 13, 1844.

S. Roper (Wardour-street) .....	£856 0s.
Simmons (St. Martin's-lane) .....	805 0
Jones and Richardson (Salisbury-wharf) .....	800 10
Clements (Villiers-street) .....	661 0
Laing (ditto) .....	639 0

NOTICES OF CONTRACTS.

For re-building the Western Pier of the Humber Dock Basin, and the removal of the present Pier included, or to be provided for in a separate tender, as may be most convenient.—Secretary to the Dock Company at Kingston-upon-Hull. Plans, &c., at Mr. Michael Lane's, Engineer, Castle-street, Hull. May 20.

For making a plan and taking levels of all the drains in the town of Kingston-upon-Hull, and the Lordship of Myton.—Further particulars of Mr. R. Witty, Surveyor, 11, Sykes-street, Hull. May 22.

For erecting a bridge over the Waveney, between Diss and Stoston.—Plans, &c., from 1st to 8th inst., at Mr. Farrow's, Diss; from 8th to 15th at Suffolk Hotel, Ipswich; and from 15th to 22nd at Royal Hotel, Norwich; Clare Algar, Secretary, Auctioneer and Land Surveyor, Diss. May 23.

For the erection of an Iron Bridge of one arch, of one hundred and ten feet span, intended to be built over the river Aron, at Bath.—P. George, Esq., Town Clerk, Bath.—Drawings, &c., at G.P. Manners, Esq., Architect, No. 1, Oxford-row, Bath. May 31.

For enlarging, straightening, and improving the course of the rivers Devon and Smite, and the Cardyke, in the parishes of Hawton, Farnon, &c. &c., in the counties of Nottingham and Leicester, and for the erection of, building, enlarging, &c., the several bridges connected with the above works.—Specifications, &c., Mr. Talents, Newark. June 1.

For the executing of certain works for the improvement of Aberdeen Harbour.—Plans, &c., Mr. A. Abernethy, 69, Waterloo-quay, Aberdeen. June 20.

PREMIUM.

£50 for the selected plan, elevation, and estimate for the erection of two Chapels and an entrance-ledge, with gateway, on the eastern side of Southampton Cemetery.—Plan and section of ground Mr. Doswell, Albion-place, Southampton; C. E. Deacon, Secretary. May 22.

MEETINGS OF SCIENTIFIC BODIES,

To-day and during the ensuing week.

MONDAY, 20.—Statistical, 11, Regent-street, 8 P.M.; British Architects, 16, Lower Grosvenor-street, 8 P.M.; United Service Institution, Middle Scotland-yard, 9 P.M.; Chemical, Society of Arts, Adelphi, 8 P.M.; Medical, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, 21.—Civil Engineers, 25, Great George-street, 8 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M. (anniversary.)

WEDNESDAY, 22.—Society of Arts, Adelphi, 8 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.; Ethnological, 8 P.M.

THURSDAY, 23.—Royal, Somerset House, 8 ½ P.M.; Antiquaries, Somerset House, 8 P.M.; Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico-Botanical, 32, Sackville-street, 8 P.M.; Numismatic, 41, Tavistock-street, 7 P.M.; Philological, 49, Pall Mall, 8 P.M. (anniversary.)

FRIDAY, 24.—Royal Institution, Albemarle-street, 8 ½ P.M.; Philological, 49, Pall Mall, 8 P.M.; Literary, Soho-square, 8 P.M. (anniversary.)

SATURDAY, 25.—Royal Botanic, Regent's-park, 4 P.M.

The Builder.

NO. LXXVII.

SATURDAY, MAY 25, 1844.

**Z**EALOUSLY were it to be wished that in architecture some standard of taste could periodically in modern times be so promulgated among the public, that whatever should be done in innocence of heart by various designers and practitioners should be accepted, and become professionally and historically legitimate and commendable—the one method or style of the day, as heretofore the Egyptian in the best days of Egypt, the Grecian when Pericles flourished, the Roman in the Augustan age or shortly afterwards, and the Gothic or Pointed in the mean time of the three Edwards.

What an end would then be put, what a quietus to the incessant habbling which is at present held upon architectural taste! How much abstinence from nonsense! What a surceasing from tongue-active idleness! But devoutly as all this were to be wished, it is at present hopeless.

In viewing the works of art sent in for the decoration of the Houses of Parliament, we think most have arrived at very nearly the same general conclusions. Those usually accounted of the greatest wisdom and of the most delicate taste in such matters, are so nearly agreed as to the propriety of finishing the new Westminster Palace all in one style, that it becomes almost idle to propose any other. Viewing this as a settled point, a grand sweep is made of nearly two-thirds of the specimens now exhibiting.

We ourselves, amid all the turmoil—all the discussion—all the fury—all the gall—all the milk, and all the milk-and-water, which have been so plentifully poured out upon the subject, viewing the building as a magnificent structure, one of the largest in the world, and, from its nature and purpose, likely to become one of the most celebrated which was ever erected, deem that not the slightest innovation whatever should be made or even broached in its carving, glass-work, paving, or painting—homogeneous in its walls, homogeneous would we have it in all the rest; and we have a very low idea of the taste of all who should attempt to make in it the slightest innovation. Hence, we should finish the structure (and we imagine such a resolution must be already come to), and should carve, glaze, pave, paint, and gild, all in one style.

How few then, indeed, of the exhibited specimens are suitable for the work.

Perhaps we might express some regret that the particular period of the style of Pointed Architecture chosen for the Houses of Parliament, is not that of the latter part of the reign of Edward the First, when capitals, crockets, finials, and other carvings were freer, more

fanciful, and more original; mouldings were richer, more curious, and more elegant in design; arches were loftier, tracery was more geometrical and varied, and construction more daring, yet more scientific.

We think that if there ever really were any project to call for *Designs* for the doors and other works, no idea more ridiculous could have been entertained; all this is the architect's business, and his alone. The carver's office is to execute with curious and delicate exactness the architect's inventions; or if he give any of his own, they must be directed congruously by the master-eye and the master-hand of the designer of the whole fabric.

We therefore think the chief information to be found by the exhibition of these specimens is, *who is INDEED a carver; who can stain glass; who can make tesserae, or encaustic tiles, or parquettes; who can paint, who can gild—in such manner, under the architect's direction, that the building can be finished PROPERLY.*

As we hinted formerly, we think, in glass-work, the perspective of buildings should be but sparingly used; representations of pavements in false perspective, placed many feet above the eye, and which could not in reality be seen, unless tilted forward, so as for the persons and objects represented upon them to fall off, should be totally avoided; and, perspective be confined to the relative sizes of figures and detached objects, of curved forms, in which perspective anomalies cannot be detected.

Parts of the windows, and some of them wholly, we should have to consist of scroll-work, flowers, or armoury; many of the windows we should have speakingly resplendent with scenes from the History and Church of England, avoiding as much as possible the injury to effect, which the mullions and transoms unskillfully managed would produce.

We see no reason why portraits of the sovereigns and other eminent national persons should not be admitted as far as possible; nor do we think any important historical matter of the realm should be omitted; as in the masonic sculptures the same taste will pervade, so do we think in the glass-staining, carving, and painting, the like subjects may be continued.

In the scroll-work or other wall-decorations, we have no doubt that the good taste of Mr. Barry will "give the right about" to all anomalous Byzantine or other inferior or impure works, though such may be seen in such-and-such buildings or in such-and-such manuscripts, and that they will be with him of no avail, his own natural taste being the sure guide; a better cultivation of taste in the decorative painting of Gothic edifices ought to be encouraged, if such mode of embellishment he intended to be carried forward generally.

With regard to floorings, we imagine plain oak, parquettes of different kinds, encaustic tiles, marble, stone of various colours, and tesserae of various sorts, will be used. For all these, among the specimens are good examples, though, as we have before said, all should in the matter in question be submitted to the architect's control.

We have gone already into greater length than we intended, and yet have much to say, and, moreover, having received numerous letters upon the subject, which we have not time to go into this week, we must defer till next number the closing of our remarks upon this matter, so very important to architecture.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

The Central Committee of this Association have issued their first Quarterly Journal, from which we learn the following particulars of the principal matters of antiquarian interest which have hitherto been laid before it:—

A letter from the Rev. W. L. Giradot, curate of Godshill, in the Isle of Wight, respecting some paintings recently found on the walls of the church of Godshill. The subject is that of the Saviour on the cross, which, Mr. Giradot imagines, is placed against a shrub or tree.

A letter from the Rev. W. Dyke, curate of Cradley, Herefordshire, concerning the site of St. Michael's chapel, Great Malvern. Some small remains of this chapel, which was probably the oratory of St. Werstau, who first made the settlement on the Malvern Hills, adjoining the position subsequently occupied by the priory, still exist within a walled garden in the upper part of the village.

A letter from the Rev. John L. Petit, on some peculiarities of Church Architecture in Wiltshire and Gloucestershire.

Mr. W. H. Rolfe, of Sandwich, forwarded for inspection some minute pieces of worked gold, found on the sea-shore, under the cliff opposite the Infirmary at Margate. The fragments appear to be portions of coins and ornaments. One is evidently part of a half-noble of one of the Edwards or Henrys, another resembles the loops attached to Roman and early French gold coins, for the purpose of wearing them as decorations of the person.

Mr. C. Roach Smith informed the Committee that Mr. Joseph Clarke, of Saffron Walden, had recently visited Wootton, in Northamptonshire, for the purpose of obtaining authentic information respecting a discovery of coins, reported to have been made at that village about a year since. Mr. Clarke's visit proved successful, and although many of the coins had been dispersed since the discovery took place, he succeeded in obtaining the remainder (615) for examination. They were deposited in an urn; the mouth protruded from the side of a bank in which it had been buried, and had been noticed for years by labourers going to and from their work. The coins, all of small brass, are as follows:—

	Reverses.	Total.
Gallienus	29	66
Salonin	8	16
Posthumus	16	25
Victorinus	12	212
Marius	2	3
Tetricus Pater	9	117
Tetricus Filius	5	46
Claudius II.	24	63
Quintillus	4	6
Aurelianus	10	15
Tacitus	9	18
Probus	16	28
Numerianus	1	1
		615

Among these coins not a single new variety occurs, and but very few rare reverses. They afford, however, another example to those noted in many similar discoveries, of the usual occurrence of this and other series of coins in conformity with their accepted degrees of rarity.

A note from the Ven. Archdeacon Hill, giving an account of the discovery at Burchurch, Isle of Wight, of some urns containing burnt bones and ashes. These remains were found by the Rev. James White, during excavations for building a cottage, at a distance of about 600 yards from the sea.

Mr. Thomas Charles, of Maidstone, communicated a notice of researches now under prosecution by himself and Mr. C. T. Smythe, which he hopes will be of interest to the antiquary, as they may furnish particulars respecting the discovery of a Roman building on the banks of the Medway, close to Maidstone. The excavations, as far as they have yet proceeded, have disclosed walls, pavements, of a coarse kind, fresco paintings, &c.

Mr. Fitch, of Ipswich, forwarded for exhibition an aureus of Vespasian, found at Helmingham, county of Suffolk. The reverse exhibits the Emperor, crowned by Victory; in the exergue, COS. VIII.

Mr. C. R. Smith exhibited drawings, executed by Mr. Kennett Martin, of Ramsgate, shewing the positions of two human skeletons,

and also of some urns, which, a few years since, were discovered during the excavations for the foundations of a house on the Western Cliff, near Ramsgate. The skeletons were deposited in a horizontal position, at a considerable distance from each other, in a basin-shaped grave, dug out of the solid chalk, and filled in with chalk rubble. This grave appears to have been of more extensive dimensions than would have been absolutely necessary for two corpses. In a recent discovery of skeletons at Stowting, in the same county, it was noticed that in a grave scooped out of the chalk soil, which was capacious enough for seven or eight bodies, only one skeleton was discovered. The urns were found arranged in groups on either side of, and a few feet from the grave. Some of them contained burnt bones, and with them was found a bronze fibula and a patera of the well-known red Roman pottery, with the ivy-leaf pattern on the rim. These sepulchral interments, although so contiguous to each other, would appear to belong to different times. The urns are unquestionably Roman, and their contents warrant their being referred to the Romano-British epoch, but the skeletons would appear to indicate a burial of a later period.

Mr. Martin also contributed a sketch of the excavations which uncovered part of the remains of the ancient pier of Ramsgate, with the depth in feet, the nature of the soil, the specimens of coins, and other objects found. At the depth of from seven to eight feet, coins of the Henrys and Edwards were met with; three or four feet lower, large flints and bricks (presumed to be Roman); at the depth of from sixteen to twenty feet, piles of wood sunk in the solid chalk were discovered, and among them Roman coins in small brass, of the Constantine family.

Mr. C. R. Smith informed the Committee that in consequence of a communication from Mr. W. Bland, of Hartlip, in Kent, he (Mr. S.) had visited the village of Stowting, in the same county, and inspected some ancient remains recently discovered in cutting a new road up the hill leading towards the common. They consist of long swords, spears, and javelin-heads, knives, and bosses of shields, of iron; circular gilt brooches, set with coloured glass and vitrified pastes; buckles of bronze, silvered; beads of glass, amber, and coloured clay; a thin copper basin, and three coins of Pius, Plautilla, and Valens. These objects were found deposited by the sides of about thirty skeletons, at from two to four feet deep, in the chalk of which the hill is composed. The graves in which the skeletons were found were filled in with mould. One of the bosses, like a specimen noticed in Douglas's *Nenia Britannica*, is ornamented on the top with a thin plate of silver, and the tops of the nails or rivets, which fastened the boss to the shield, are also silvered. Since Mr. Smith's visit, an urn has been found and some other objects, of the whole of which careful drawings will be made by the Rev. Frederick Wrench, who has promised to forward them, as soon as the excavations are completed, for the inspection of the Committee.

The village of Stowting is situated in a secluded nook in the chalk-hills called the Back-Bone of Kent, about two miles from Lyminge, and seven from Folkstone. In a field below the hill where the antiquities before mentioned were discovered, two skeletons were dug up, many years since, together with iron weapons; and in a field called Ten-acre Field some hundreds of large brass Roman coins were ploughed up. Five of these, now in the possession of Mr. Andrews, the proprietor of the field, are of Hadrianus, Aurelius, Faustina Junior, Commodus, and Severus. Coins are often found in the adjacent fields, and in the village. Two small brass coins of Carausius and Licinius, picked up in a locality termed the Market-place, are in the possession of the Rev. F. Wrench. On the hills are barrows, some of which seem to have been partially excavated.

Mr. John G. Waller made three communications. The first related to the state of the monument of Brian Rocliff, in Cowthorpe Church, twelve miles distant from York, which records the founder and builder of the church, *fundator et constructor hujus ecclesie*,

*tocius operis usque ad consummationem*. He is represented with his lady holding a model of the church between them; over their heads are canopies and heraldic decorations. "I found this interesting memorial in a most disgraceful state of neglect; the canopies much mutilated, many fragments with escutcheons of arms, and the whole of the inscription, in the parish chest, liable to constant spoliation: added to this, a large stone was placed upon the figures. Surely a monument like this, a record of a benefaction and an event (for so we may call the erection of the church), deserves to be rescued from a lot but too common to such remains. The history of Brian Rocliff is found in the very interesting volume published by the Camden Society, "The Plumpton Correspondence."

The second communication of Mr. Waller was a notice respecting some effigies of wood, at Little Horkesey, in Essex, which when Mr. Waller visited the church about six years ago were placed near the porch. They represent two knights and a lady, apparently of the early part of the fourteenth century. Mr. Waller states that he was informed they had been recently displaced from their proper position in the church, and were then, with unbecoming neglect, put out of sight in a corner near the porch.

The third communication described not the destruction of a monument only, but that of a church and its monuments. Mr. Waller states: "About five years ago I visited the ruins of Quarendon chapel, in the immediate neighbourhood of Aylesbury, county of Bucks: I found the walls in good condition as far as regards stability, and only suffering from neglect and wanton injury. The interior presented all the pillars and arches supporting them in good condition, save the injury caused by the visitors cutting their names thereon, and every thing shewing how little share time had had in the work of demolition." This matter has, however, been long since made known (See the "Gentleman's Magazine," for Dec. 1817, where exterior and interior views of the chapel were given.)

Mr. Way reported that the monumental brass of Sir John Felbrigg, the founder of Playford Church, Suffolk, had been torn up, and, at the time when he visited the church, not many years since, was in the church chest. By a subsequent communication from Mr. D. E. Davy, of Ufford, it appears that this interesting memorial has been affixed to a stone in the chancel, but many portions are now defective.

Dr. J. Jacob, of Uxbridge, announced that he proposes to publish a new series of the monumental brasses of England.

Mr. William Sidney Gibson, of Newcastle, communicated to the committee, that the corporation of that city propose to demolish an interesting example of ecclesiastical architecture, the ancient church of the Hospital of the Blessed Virgin, on the wreck of which a grammar-school was founded by Queen Elizabeth. Mr. Gibson promises a detailed description of this curious structure, the preservation of which for the purposes of public worship in a populous city, where increased church accommodation must be highly desirable, could not fail, at a period when much attention has been given in Newcastle to architectural decoration, to benefit and gratify the public. It also appears that this venerable monument interferes with no local convenience, and that persons who take an interest in its preservation would gladly contribute.

The Archaeological Journal, in addition to the preceding report, contains brief articles on Numismatics, by Mr. C. R. Smith; on Painted Glass, by C. Winston, Esq.; on Anglo-Saxon Architecture, with numerous wood-cuts, by T. Wright, Esq.; on Bell Turrets, with engravings, by the Rev. J. L. Pettit; on the Medieval Antiquities of Anglesey, by the Rev. H. L. Jones; on the horn-shaped head-dress in the reign of Edward I., by T. Wright, Esq.; on the Cross-legged Effigies commonly attributed to Templars, by Watson S. Walford, Esq.; a Catalogue of the Emblems of Saints, by the Rev. C. Hart; Early English Receipts for Painting, Gilding, &c., communicated by Mr. Wright; a Review, with wood-cuts, of M. Didron's *Iconographie Chrétienne*, &c.

The members of the association now amount to about 660, including ten bishops and ten deans. We are enabled to announce that the general meeting is definitively fixed to take

place at Canterbury (with the sanction of the dean and chapter) about the middle of July, and that it is proposed to proceed at that time with the excavations commenced last year, by private parties, at the Roman town, or fortress, of Richborough.

#### OXFORD ARCHITECTURAL SOCIETY.

MAY 15.—The Rev. the Rector of Exeter College in the chair.

The following new members were admitted:—Rev. J. S. Smith, Great Wilbraham, Newmarket; R. Oldham, Esq., Wadham College; Rev. John Griffiths, Ch. Ch.; C. S. P. Hunter, Esq., St. John's; E. Palmer, Esq., Balliol.

The following presents were received:—Transactions of the Exeter Diocesan Architectural Society, part II. by the society; Design for a Wooden Cross of Gothic character at the head of a grave, by J. E. Millard, Esq., Magdalene College; Tracing of a head in stained-glass from Dorchester Church, Oxfordshire, by the Rev. W. Grey, Magdalene Hall; and a Rubbing of a Brass of Sir Roger de Northwold (a cross-legged knight) and Boon, his wife, from Minster Church, in the Isle of Sheppey, by G. S. Master, Esq., Brasenose College.

A paper was read by the Rev. W. Grey, of Magdalene Hall, on Garsington Church, Oxfordshire, illustrated by a number of drawings. The tower of this church is of transition Norman character, with more of the Early English features than Norman; the pillars and arches on the north side of the nave are of the same period, though perhaps more decidedly Early English. The rest of the church is decorated, late in the style, but very plain, without even cusps to the chancel windows; the side windows of the aisles are square-headed, with good segmental heads inside; the east window of the south aisle is good Decorated, with flowing tracery. The south porch is open timber-work of the Perpendicular style. The clerestory windows are small foliated circles, with four-centred arches inside; the roofs are of later character, having been rebuilt in the time of Charles II., when several buttresses were also added. On both sides of the chancel, under the westernmost windows, are low side-openings, which retain the old iron-work, and have evidently been glazed, though long blocked up within to accommodate modern pews. The circumstance of these openings being found on both sides of the chancel, and having been originally glazed, contradicts most of the theories that have been stated respecting the use of them. None of those mentioned at a recent meeting of the society seem to agree with these examples, still less will the name of Lychnoscope apply to them.

A set of Drawings of St. Bartholomew's Chapel on Cowley Marsh, with an accurate calculation of the cost of building a fac-simile of it, was laid on the table. Also a design by Mr. Cranston for a wooden Church, according to the suggestion of the Bishop of Newfoundland.

MIDDLE LEVEL DRAINAGE AND NAVIGATION.—The parliamentary estimates of the promoters of this Bill amount to 226,473*l*. A report and estimates have lately been made by Sir John Rennie, Mr. Cubitt, Mr. Rendall, and Mr. Giles, of the same works, on behalf of the opponents to the measure, which amount to the enormous sum of 492,897*l*. When this scheme was first projected, its authors guaranteed that the entire cost of the new works should not exceed 173,000*l*. The sum of 492,897*l* is independent of any works which may be considered necessary for the regulation of the supply of fresh water at Stanground Sluice, the preservation of the navigation between Peterborough, Wisbeach, Lynn, the Wisbeach canal, the towns of Upwell and Outwell, and the security of Marshland and the adjoining district.

An ancient fresco painting has been discovered in Rotherham Church, Yorkshire. Over the point of an arch is a half-length figure of the Saviour, surrounded by a great number of figures, with their hands clasped in a devotional attitude. From this description we think the subject is most probably the Last Judgment. The figures were about four feet in height, and each is distinctly marked by a broad black outline.

ARCHITECTURAL EXHIBITION AT THE ROYAL ACADEMY OF ARTS, TRAFALGAR-SQUARE, WESTMINSTER.

The seventy-sixth exhibition of the Royal Academy contains in its architectural room only two hundred and eighteen works of art; of these sixty-three are as obviously disconnected from architecture as any subjects of art could be; and if an examination more rigid still were gone into, it could be shown that the room contains scarcely more than a hundred subjects strictly architectural. With such a limitation in quantity does not follow a like limitation in quality; and though for some years past many of the most eminent architects have almost abstained from exhibiting here, still, upon the present occasion, if there be fewer absolutely good subjects than usual, there are fewer which are common-place or of reprehensible design.

Artists, architects, and the public generally, have for some time past had their eyes gradually opening to the truth that good architecture, and drawing good for a Royal Academy Architectural Exhibition, are very different things; and it is now pretty generally admitted, that the dashing slices of colour, which are not sufficient to outvie a neighbouring picture, and the fitness, and the patient mathematical, notational, and sculptural perfections, which characterize good architectural design, are very different things.

In the present exhibition are fewer Norman subjects and projects for buildings of an impure or anomalous character; there are fewer that contain those piece-meal blemishes of various kinds, which for some years past have not only pervaded private and ordinary buildings, but strangely have become fashionable even in buildings of a public character. We observe among the designs comparatively few with incongruous one-sided masses, which, because many ancient buildings which have grown up bit-by-bit have been so successfully managed by the artists who had to alter and enlarge them, and have been, as it were, so set about with beauties as though the hand of "wisdom" were laid upon them behind and before, that such anomalies are scarcely noticed, and such buildings appear beautiful, in spite of that which would otherwise have appeared intolerable, there not being a single example of any great building throughout the world, whether Indian, Egyptian, Grecian, Roman, Moresco, or Gothic, which was designed to be irregular; such an idea being against nature, who delights in regularity; animals deformed, being so alone through some accidental circumstances, and the planets returning habitually to the same points in their paths in revolutions of time exactly the same to a moment.

We shall defer till next week going into the separate merits of these architectural drawings.

#### ELEMENTARY ESSAY ON MORTAR AND CEMENTS.

BY JAMES WYLSON, HON. SEC. B.A.A.D.

(Continued from p. 255.)

64. BEAVAN'S MORTAR, or Building Cement, is composed of marble, flint, chalk, and lime, in equal portions; the first two being pulverized. All except the lime are mixed together and sifted very fine; then the latter, which has been slaked for three months, added, with just water enough to form the mixture into a thin paste. This, when used for stuccoing, is spread as thinly as possible and made smooth over a rough preparatory ground; and it is susceptible of a high polish by means of Venetian talc.

65. HAMELIN'S PATENT MASTIC, for coating and ornamenting buildings, is said to consist of Portland stone, pounded and mixed with oil; the latter is used instead of water: it is susceptible of an arris and smoothness equal to marble. A method of using it, extensively practised about town, is first to work the surfaces, projections, mouldings, &c., roughly in Roman cement, and then finish them with the mastic, about  $\frac{1}{4}$ th of an inch thick. Great nicety and experience were necessary to lay it properly and make it attach firmly, but the thinner the coating is the better, and it should never exceed  $\frac{1}{4}$ th of an inch; the more extravagantly thick it is laid on, the more certain it is to fall off. The

front of the Union Club-house in Trafalgar Square was stuccoed with it.\*

66. DR. HIGGINS'S CEMENT consists of 1 lb. pure stone lime, or a very little more chalk lime, 1 lb. bone-ash, 4 lbs. sand  $\frac{1}{2}$ th, and 3 lbs. ditto  $\frac{1}{4}$ th, of an inch in size; the sand is mixed and spread out flat, about six inches deep, on a hard wooden bench, and wetted with lime-water: the lime is then added in successive portions, mixing and beating them well together; after which the bone-ash, which gives tenacity and prevents cracks in drying, is added in like manner. The inventor says this cement is, when dry, as hard as Portland stone; it dries quickly, and must therefore be used with expedition; it is intended for building, plastering, stuccoing, &c., and is applicable besides for forming artificial stones in moulds, with flints, hard stones, brick, &c. It is unfortunate that the above proportions have been stated by weight, as both lime and sand are variable in that respect, and their relative properties necessarily contingent on the same.

67. The cement for the *Edtystone Light-house* was composed of equal measures of slaked Welsh lias lime and pozzolana, both in fine powder; it was heated until it possessed its greatest degree of tenacity and toughness, and was used stiff for the horizontal thorough joints, as well as for the facings of the vertical ones, and in grout for the internal parts of the latter.

68. The cement used for the piers of the new *London Bridge* was made of one part Welsh lias lime, two parts Neapolitan pozzolana, and two parts Thames sand.

69. The cement in the *London Docks* was for the depth of one and a half or two bricks composed of four parts lias lime, one of pozzolana, one of calcined iron-stone, and six of River sand.

70. In reference to the building of ovens, &c., it has already been stated that Roman cement does not at all endure fire, and hardly even a moderate heat; also that oyster-lime, as well as mortar made with road-drift, are considered suitable for such purposes: but, perhaps, there is nothing better than the WINDSOR LOAM whereof fire-bricks are made, and which is very generally used for building those parts of furnaces and other similar works that are exposed to flame or to intense heat; it is reduced to a proper consistency with water, and laid extending about 2 inches into the joints, the remaining portion of the work being constructed with good ordinary mortar.

71. PARGET, or PARGETTING, is the name given to a composition for plastering the interior of brick or stone flues; and consists of mortar mixed with horse or cow dung, the latter being preferred and most usually adopted; and is very suitable for that purpose, as it stands the heat well. It is usual to include in building contracts the "earing out" of the flues when the building is completed; which signifies removing the mortar and rubbish, which fall into and adhere in them, out of reach, while the brickwork is being carried up. This was, previous to the passing of the new prohibitory Act, generally done by a climbing-boy. Common mortar, mixed with bullock's hair, and called hair-mortar, is sometimes used for the above purpose, but cannot be so sound or good, as the soundness of the mortar must be impaired by the heat, and it may be considered as chiefly held together by the hair with which it is mixed.

72. GROUT, is mortar or cement in a liquid state, frequently used to insure the complete filling up of the internal joints of brick or rubble walls, the outside joints on both faces being in carrying up the work stopped with stiff mortar. It is sometimes considered advisable to grout every course, but in ordinary cases

\* [We believe this mode of working mastic insures its most rapid falling off, from the dampness of the under-coating disagreeing with the oil of the mastic; and the thinness of Parker's cement and lime which we have instantly found destroy the cohesiveness of mastic; in many buildings in and about London the mastic cement in two or three years has fallen into a frightful state of decomposition. At the Pavilion at Brighton, the under part of the mastic was found most destroyed. External bleaching, and the paring away of its oil underneath, in a very short time prove mastic to be of all stuccos the least enduring; for these reasons we have long since ceased from using it, except for repairing internal plastering which is intended to be immediately painted with oil colour.—Ed.]

about every fifth course of brickwork is sufficient: its effect is obviously to form the work into a solid mass, by filling up all those interstices which unavoidably occur in constructing the masonry with stiff mortar. It is often merely mortar or cement diluted; but greater economy may be observed without detriment to the work, from five to seven parts of sand being generally considered admissible. When made of mortar, however, it should be made of such as has been kept for a considerable time and well beaten, and then it will set perfectly in a few days; for if composed of mortar that has been newly made, it will take a long time to harden, and perhaps will never thoroughly set. The approved method is to mix the materials dry, dilute and incorporate them well on the spot, and pour the grout immediately into the work. What is termed *hot-lime grout* consists of slaked lime and water only. It need scarcely be remarked that the practice of grouting is beneficial to an important degree; indeed, its omission in any building of consequence would be highly reprehensible, since the walls cannot be perfectly solid without it. Where cement is used instead of mortar, the same material is used in a liquid state as grout.

73. "CONCRETE" (Fr. Beton) is a kind of artificial rock, composed of large gravel, sand, and lime, a substratum of which is formed preparatory to receiving the footings of buildings, where the ground is of an unsound and treacherous nature: it is a most valuable expedient, and is fast superseding the use of piles and planking, and, indeed, all old methods of obtaining a foundation by factitious means. The concrete about London is usually composed of Thames ballast, limited in coarseness to the bulk of a hen's egg, the larger stones being reduced to that standard; but large flinty gravel, in admixture with clean, sharp sand, frequently occurs in natural strata, in proportions adapted for immediate use. The broken granite which is used for macadamizing roads has also been used with advantage.

74. Its most approved component proportions are, fresh well-burnt lime and sand, in the relative quantities that are allowed in making good mortar, with stone in quantity equal to twice that of the sand; that is to say, one of lime to six of the other materials when chalk-lime is used, and one to nine for stone-lime: the latter ought always to be used in ordinary cases; and blue lias stone-lime, in the proportion of one to six, is the best for works subject to the action of water. It must be observed, however, that with regard to concrete, a remark applies similar to that which was made in article 24, in reference to the composition of mortar, viz., that the more incompressible material abounds in the mass, if properly cemented together, the greater stability will be produced, and the less costly will it be.

75. The usual mode of concreting is to grind the lime to powder, without slaking; mix it well with the stones and sand, dry, beside the spot where the concrete is to be formed; add just sufficient water to give to the mixture the semi-fluid consistency of mortar; precipitate it immediately into the trenches from a height of about ten feet; puddle it quickly to a level, and then leave it totally undisturbed until hard, and ready to receive the footings of the superstructure. To disturb it after it had begun to set (which it does speedily), would be materially impair its solidity; and it should be borne in mind, that when a great depth of it is required, it will be incomparably better if the whole mass can be made at one operation, than if done in successive strata, as the union of these can never be perfect. There is a diminution of bulk, averaging about a tenth, in wetting the materials, and there is an expansion in setting and hardening, perhaps sufficient to restore that loss.

76. The name of *Pebble Mortar* is sometimes given to a mixture similar to concrete, which is occasionally used for filling-in, at intervals, the heart of thick stone or brick walls, or large masses of masonry. It may consist of four parts sand, fine and clean in equal quantities, eight parts small coarse pebbles, four parts slaked lime, and one part pozzolana or tarras: it is very excellent for the purpose, and, with proper hydraulic materials, is well adapted for sea breast-works, &c., being done with a casing, after the fashion practised by the Romans: it may be considered analogous to grout, and identical with concrete.

77. Lime is extensively employed for other purposes connected with buildings, besides those which have been here treated of—interior, plain, and ornamental stuccoing, and white-washing, for example; but as the intention of the present paper is only to illustrate its use in construction, and its application in fortifying the exterior of work against the weather, it is deemed unnecessary to extend it to those particulars.

78. The practical knowledge of the properties of calcareous substances, and necessarily that of lime-burning, is unquestionably of very high antiquity; for although they appear to have been unknown to the Egyptians and early Greeks, we have, besides the testimony in the sacred writings, the evidence afforded by those remains popularly believed to be the ruins of the Tower of Babel, as well as by parts of those of Babylon and Nineveh, to refer us to much earlier times; and the specimens handed down to us may be judged of by their apparently imperishable stability. But it is to the magnificent works of the ancient Romans we must turn, to see fully the capabilities they afford; for not only in the buildings of that people, but in their great military roads and ways, their lime-mortar still manifests an eminent and scarcely imitable skill. It is from them that we have inherited this important branch of knowledge; for, until the Roman subjugation, it was unknown to the primitive inhabitants of our island, even on those shores where the near vicinage of the European continent, and their consequent superior civilization, might have induced an acquaintance with it. It was they who opened the still unexhausted lime-quarries of Tadcaster, in Yorkshire, the *calcarie*, as they called them; and some ancient works in this country still exist to testify, together, excellence in British materials and Roman workmanship—where the mortar has exceeded even the bricks in hardness, and remains, to all appearance, proof against the ravages of Time. It is to them, also, that we are indebted for the invaluable ingredient called *pozzolana*, which was so indispensable in the composition of our aquatic mortars prior to the discovery of the Anglo-Roman Cement, it being in some way similar to that in which, within the last half century, Mr. Parker, by reflective sagacity and experiment, first revealed the latent powers of the latter estimable material, that they discovered the highly hydraulic properties of the former. Fortunately, we have the writings of scientific men who flourished coevally with those skillful practitioners, to indicate the course of our own endeavours. On the subject of mortar, Vitruvius informs us, that one part of lime to three of sand was considered the best proportion; which corresponds with the approved practice about London at the present day, in regard to stone-lime. Their water-cement consisted of one part lime and two parts *pozzolana*. According to Pliny, there were failures in some of the buildings of his time, in consequence of a deficiency of lime in their mortar: it appears by him that the mixture of tile-dust in the latter was practised in those days, as is now sometimes the case; he states that the addition of one-third of that ingredient greatly improved its quality. We also learn from him that there was a Roman law regarding mortar, which enjoined, that after mixing the ingredients with a small quantity of water, they should, before being put to use, be kept in a covered pit for three years. The custom was then, just before using, to beat it for a length of time, until of a thoroughly uniform consistency; the efficacy of which is satisfactorily proved by modern practice. Pliny distinctly states that while the above-mentioned law was in force, the buildings were not liable to crack. The Romans practised a method of building corresponding in materials with our concrete: it consisted in packing pebbles and fragments of stone, not bigger than a man's closed hand, into a casing of wood, and running the interstices full with hot lime grout. For stucco-work or plastering, the Greek and Roman architects had certain calcareous compositions denominated *Maltha* (*Maltha*); that of the former is said to have consisted of lime, sand, and milk. The Roman, we are informed by Pliny, was fresh-burnt lime, slaked with wine, and beaten in a mortar with hog's lard and figs; a tenacious compound, acquiring a hardness like marble. Another was composed of fine slaked lime, bullock's blood, and powdered forge-scales: before

plastering, the surface of the parts was moistened with oil to assist the adhesion of the stucco. Although so much has been attained, architecturally, about London, since the discovery of Roman cement, the practice of stuccoing externally is by no means one of modern introduction, and not only thus far is the Temple of Jupiter Olympius at Agrigentum a proof, but on comparison we find that the ancients possess a palpable advantage in the three grand essentials of appearance, hardness, and durability. In the instance quoted, the coating is like a fine white marble. Ancient Alexandrian as well as Roman remains also afford examples of this practice, and almost impenetrable in their hardness. Of the condition of the building art in our own country, in the early portion of last century, we may approach a conclusion when we read in Batty Langley on Bricklaying, that *equal parts of lime and sand were used for inside and 2 to 1 for outside work.*

#### RAILWAY INTELLIGENCE.

**Tavistock Railway.**—The intended line of this railway, as laid down in the prospectus issued by the company, is from Tavistock on the high ground above Abbey-bridge, passing just above Ash, in the parish of Whitchurch, crossing the Old Plymouth-road and the New-road, with the valley of the Walkban, about midway between the two-mile stone and Bedford-bridge, across the Old Wheel Franco mine, in front of the Roborough Inn, and crossing Herrowbeer and the Dartmoor-road, approaching near to the Plymouth and Dartmoor line, which it leaves a little to the left, and continues its course to Crabtree, where it meets the South Devon line about two miles from Plymouth, on the London-road. It is to be a subject of future consideration whether the company shall proceed on the South Devon line to Eldad, or cross it at Crabtree, and have a distinct terminus of their own in Plymouth. The receipts, on the usual principle of calculation, that the facilities of the railway will double the traffic between Tavistock and Plymouth, are expected to realize 260*l.* a week, which, allowing 10*l.* per week as the expense for working the road, will be sufficient for a dividend of 5*l.* per cent. on the contemplated outlay of 150,000*l.* The length of the road will not exceed fifteen miles, even should it be decided to make the terminus in Plymouth, and not more than thirteen, if the line terminates at Crabtree. The Duke of Bedford has offered land for the Tavistock terminus and its approaches, together with so much of his property as the line will pass over; and in addition to this, a donation of 1,000*l.*; and Sir R. Lopes and other landowners are stated to have pledged themselves to afford every facility to the work.

**Railway from Oxford to Banbury and Rugby.**—A meeting took place at the Angel Hotel, Banbury, on Tuesday week last, for the purpose of hearing the statements of Mr. Barlow, director, Mr. Brunel, engineer, and Mr. Saunders, secretary, to the Great Western Railroad relative to the proposed line from Oxford to Rugby through Banbury. The chair was taken by Dr. Marsham, warden of Merton College. After hearing and questioning the gentlemen connected with the Great Western, the meeting being perfectly satisfied with their statements, it was agreed that the proposed line to Rugby *via* Banbury, was the most eligible one for the city of Oxford.

**Cambridge and York Railway.**—The promoters of a line of railway from Cambridge to York, through Lincoln, have given up that project, in consequence of the indisposition of the Northern and Eastern Railway Company to act with them, and the same parties are now proposing a line of railway direct from London to York, passing nearly along the line of the great north road, by Biggleswade, Stamford, Grantham, &c., but not by Lincoln.

**Railway Communication.**—It is in contemplation to construct a railway to connect the towns of Poole, Blandford, Ilchester, Langport, and Bridgewater, to be called the English and Bristol Channels Junction Railway.

**Atmospheric Railways in Ireland.**—A company, called the Grand Canal Atmospheric Railway Company, has been formed for laying down a line of atmospheric railway from Dublin to Sallins, in the first instance; and for its general introduction afterwards to the south and west of Ireland. They have concluded their arrangements with the directors of the Grand Canal Company, as to the terms on which they are to be permitted to avail themselves of the facilities which the canal affords. The arrangement is not merely from Dublin to Sallins, but embraces any further portions of the banks which may be found desirable for future extensions. It is said that the terms are one-tenth of the gross receipts of the railway, for such portions of it as may be constructed along the canal, and an annual sum of 250*l.* as an acknowledgment of the canal company's rights. There is also a separate arrangement made for the transfer of the canal company's establishment at Portobello to the railway company, for their station, for which it would be admirably adapted, there being an excellent spacious hotel and extensive offices at Portobello. The prospectus is expected to appear in a few days. A deputation has been appointed to proceed to London forthwith, to enter into communication with the Board of Trade upon the subject.—*Herald.*

**Great Western Railway.**—The competition between the Great Western and South-Western companies is likely to increase very materially the facilities of railway travelling. A very important branch, connecting the two lines, is now projected by the Great Western Company; and at a meeting, held at Devizes last Saturday, the details were explained. The line is to commence between Chippenham and Corsham, at a place called Thingley, pass through Melksham (with a diverging line to Devizes), Staverton, Trowbridge, by Warminster, Westbury Leigh, and along the vale of Willey to Salisbury, where a south-western branch is to terminate. The distance is 52 miles, the estimated cost about 10,000*l.* a mile, and the Great Western Company offer to take a quarter, a half, or the whole of the shares, or any other part, after local parties have subscribed, and to guarantee 3*l.* per cent. to the shareholders.

**Railway over the Menai Straits.**—We noticed the project of carrying the Chester and Holyhead Railway over the Menai bridge; but we now learn that the landed proprietors in the vicinity oppose the railway, and it is therefore probable the passage across the straits will have to be made at the Britannia rock, and will involve, at least, two arches of 350 feet span. This will be the most gigantic railway work ever undertaken.—*Birmingham Journal.*

A local committee has been formed, and vigorous steps have been taken, with a view to obtain an Act in the next session of Parliament, for the formation of a branch railway from the Great Western line, at or near Bath, to Salisbury. There will then be two important termini, one from the South-Western, and the other from the Great Western Railways.

**Leeds and Thirsk Railway.**—The prospectus for this projected line has been issued, but we cannot believe that it is seriously intended to carry out the formation of the line.—*Yorkshire Gazette.*

**The Lincoln Railways.**—The understanding between the Manchester and Leeds Railway Company and the Eastern Counties Company, to co-operate, and to make their lines meet in Lincolnshire, has been broken off.

The capital of British railways now exceeds sixty millions sterling, and yields a revenue of six millions per annum.

The Cheltenham and Great Western Railway Bill has received the Royal assent.

Hamburg is fast rising up from the ashes of 1842. Notwithstanding the vast number of buildings that have been erected, great activity is still prevailing in various parts of the city, and houses are rearing their heads where, but a few days before, nothing was to be seen but the remnants of former habitations.

## ST. OLAVE'S CHURCH, SOUTHWARK.

(Continued from p. 253.)

The plan of the body of this church is a parallelogram, divided into nave and aisles; the columns, which separate from each other these three compartments, are fluted, of the Ionic order, in each range four in number, and, with their square wainscoted pedestals, are all of Portland stone, and have diagonally-voluted capitals, bearing in each curved recess of their abaci a beautiful rose, carved after nature, instead of conventionally; against the eastern and western walls of the body of the church are also four pilasters, fluted, diagonally-voluted, and otherwise corresponding with the columns themselves. The column-capitals, which were much damaged by the late fire, have been renewed; the western pilasters as yet remain in a very mutilated state, and their capitals are entirely destroyed. Behind each of the Ionic columns is a small pilaster, attached to its shaft, and reaching only up to the underside of the gallery.

The nave is prolonged eastwardly by a very beautiful apsis, containing the altar-compartment, which is a semi-circular tribune.

At the west end of the nave lies the tower of the church, north and south of which adjoin the great staircases ascending to the church-galleries.

Behind, or on the north side of the church, lies the parish cemetery, and there was, till lately, another cemetery, granted to the parish in the reign of Henry VIII., which has, however, been taken, under several acts of Parliament, for the site of the railroad station.

At the north side of the altar is a small robing-room.

Over the Ionic columns ranges an enriched entablature, consisting of architrave, frieze, and cornice; the architrave in three faces, its lower face surmounted by a small pater-noster; its middle one by a small enriched ogee, and the whole architrave crowned by a much larger enriched ogee, filleted above. The soffit of the architrave is in each inter-column ornamented with a central circular coffer, flowered with a patera, the remainder of the soffit filled up on each side by a leafy pilloved panel, conforming evenly to the circular coffer. The frieze is plain, unbroken, and without the winged cherub over each column shewn in the original design; the cornice consists of a plain cavetto, surmounted by an enriched ogee and dentils, its corona bearing an enriched ogee, filleted above, supporting a plain cyma-recta.

The entablature continues all round the interior of the fabric, including the altar apsis; but, except the west end of the body of the church, where only a string-course, enriched with a Vitruvian scroll, ranges with the Ionic cornice.

The nave of the church is continued upwardly from the stone Ionic columns by carpentry, its outside perpendicular part being covered with lead, and the clere-story roof itself, as well as the roofs over the galleries and staircases, are slated.

Over the whole nave of the church extends a most beautiful groined ceiling of five divisions, very highly finished.

More than half the light within the church is admitted through ten clere-storial windows, one in the perpendicular side of each compartment of the groining.

The five groined compartments of the ceiling over the nave are separated from each other by archivolts, rising from enriched consoles (which are not in the original design), with an acanthus-leaf in front, and surmounted by an enriched impost, which is continued along the sides and west end of the clere-story. These archivolts have their soffits enriched by double scroll-work foliage and husks, the summit of each archivolt being distinguished by a patera; the groin-points are enriched by a bead divided by long rolls and three husks alternating, and the centre of each groin, where the beaded groin-points cross each other, is marked by a very large flower.

Each of the four compartments of each groin is divided into two panels by a curious raised bolection roll-moulding, enriched by a voluted ribband, alternating with peculiar oblique-shaped lozenge-flowers.

In the restoration of the church, some distance within each of these bolections has been formed a sunk panel, bearing close to its margin a Grecian enriched bead.

Though we have a rooted dislike to improvements, by other hands, upon architects' original designs, we are obliged to confess this paneling has a good effect.

Before the fire, the west end of the clere-story was ornamented in stucco, with a relief of the angelic choir, below which was a decorative relief, containing musical instruments and other work: this should have been restored.

Over each gallery answering to the five inter-columns, the ceiling is divided into five compartments by bands or beams which spring from and agree with the corona; the corona-soffit, on the four sides surrounding each gallery-ceiling is beautifully and very boldly and effectively enriched with the simplest form of the fret-ornament, but the soffit of the four beams on each side, separating the ceiling into compartments, is enriched with this fret-ornament twice repeated side by side.

The great Ionic entablature is continued all round the four sides of each gallery-ceiling, but round the other sides of the five compartments themselves, only the corona and crown-mouldings are continued.

Within each of the ten compartments of the ceilings over the galleries, a sunk panel, surrounded by an enriched Grecian bead, has been added in the restoration, as in the compartments of the groined ceiling over the nave of the church.

The plastering, which was very choice, and a late instance of the fine ornamental stucco-work done by hand, was performed by Mr. Batson, who signed a contract (which still exists among the parish documents) for the sum of £295. Other tenders for the work had been received, viz. from—

Mr. Fairbrother, for	£200	0	0
— Yoade	340	2	5
— Warrall	348	0	0
— Wilton	354	0	0
— Weston	359	0	0
— Farnley	374	0	0

but after some inquiry and consideration, the lowest tender was declined.

The galleries have very beautiful fronts, appearing to be supported upon plain architraves, beaded below, and divided by an ogee into two faces, crowned by a plain cornice, which is supported by an ovolo between two fillets, crowned by a dripped and scaped corona, surmounted by a cyma-recta; in Flitcroft's original design, these gallery fronts are shewn with each inter-columnar length divided into six panels, with five cherubim between them; but in the execution of the work, this arrangement was improved upon in simplicity and boldness by dividing each compartment into only four panels, separated by a peculiar kind of terminal attic pilasters, three in number, with trinitarian allusion to the Three that bear record in heaven, each carved with the figure of a cherub, with wings folded in front, something like those over the stalls in St. Paul's Cathedral, though inferior in design and delicacy of workmanship. At the feet of these pilasters ranges all round the gallery-fronts a peculiar torus-moulding, wrought in the fashion of primrose-flowers within small circular compartments; and under each cherub is a carved tail-piece of foliage, in the form of a rich husk.

The gallery-fronts are finished upwardly by an impost mitred over the cherubim, coronaed and surmounted by a small egg-and-tongue moulding, filleted, and in the bed-moulding of which is an enriched ogee, also filleted above.

Where the pew-divisions in the galleries rise above the gallery-fronts, that which would otherwise have been a deformity is rendered an elegance, by these pew-divisions being terminated towards the nave by beautiful scroll-brackets carved with primroses and other ornaments. The pews in the galleries are principally of deal, but all finished with broad wainscot cappings.

The western gallery, which is being restored, had a centre part somewhat advanced, supported by two wainscot fluted Doric columns. Instead of being paneled, this centre compartment of the gallery-front was decorated by turned balusters, in the centre of which was placed a dial surrounded by some carved-work. Over each Doric column was an attic pilaster, paneled and carved with a shell and pendent husks.

The wings of the western gallery-front were only divided each into three panels, by two ter-

minal attic pilasters bearing angels, as the others. The pulpit was a very elegant piece of design, very beautifully executed in very beautiful materials, and was, like most of the pulpits in the city of London, replete with symbolical carving and marquetry.

The altar-apsis is separated from the nave by two fluted Ionic pilasters on each side, from which spring two archivolts, enriched like the others; and at the back of the apsis are two other fluted Ionic pilasters, surmounted by another enriched archivolt of less compass, which cuts geometrically into the domed ceiling: between these pilasters are the Decalogue and altar-window.

The ceiling of the altar-apsis, which was apparently not much damaged, however, has required to be restored; it was a semi-dome, forming a rich piece of gilt coffered-work: three ranges of octagonal panels, eleven each, with small diagonal lozenge-panels between them, and half-lozenge-panels next the inclosing borders of the work, each coffer containing a roset, formed the decorations of the Domed work.

The altar is very beautifully finished, and we hope hereafter to give some of its details, as well as the gallery-cherubim and other decorations.

The two tables of the Decalogue are set within one beautifully-designed and richly-carved frame, surmounted by a gilt stellar crown, with gilt palm-branch mantlings, and carved and gilt scroll foliage in the sprandrils between the arched heads of the tables and their inclosing frame. At the sides of the decalogue are the Dominical Prayer and the Creed in oval frames, enriched with eggs-and-tongues, and mantled nearly all round by palm-branches ascending from below.

Above these are statues of Moses and Aaron, in circular niches, within square architraves scrolled at top, between the turns of which, over each niche, is a cherub and a pendent garland.

Around the altar-tribune, at the level of the gallery-imposts, is carried a string or impost, with its ovolo enriched with shells instead of eggs, and beneath this, immediately under each niche, are two enriched and gilt consoles, between which are pendent garlands consisting of the sacramental emblems of corn, vine-leaves, and grapes.

The whole of the exterior of the tower and of the southern and western fronts of the church are of fine Portland stone.

The back or north side of the church next the cemetery nearly resembles the southern front, but between the window-architraves, cornice, parapet-coping, and projecting quoins, the wall is faced with fine red brick, which being restored and pointed with very dark blue mortar, instead of white mortar, has a very good effect, though little seen by the public.

The tower was substantially constructed with vaultings under the ringing-loft and over the bell-chamber, so as to be capable of bearing the spire, as originally designed by the architect, and we hope to see money raised for the completion of the fabric, the more especially as since the raising of the new structure of London-bridge and the hemming in of lofty warehouses, this beautiful church has been, as it were, trampled down into a hole, and, moreover, as much difficulty does not seem to have been created in the raising of money for an enlarged organ and for a stained altar-window—little, indeed, to be commended.

It would seem that, besides the one design for the steeple, something cheaper must have been projected by Flitcroft, for in a Minute, June 4th, 1740, relating to paying the architect his account, appears the following:—

“For Designing and Estimating the new church, with proposals for the several artificers, and assisting the Trustees to make their Contracts; making all the necessary drawings and Conducting the Works, with measuring the extra works, and Examining their accounts; for making models of the Roof and Ceiling, and the Alter End of the Church, patterns of moulding for the plastering, Designs for the Steeple, Consisting of Elevations, Plans and Sections, with the Estimate of the Charges of each, one of about £1050, the other £650, as the scaffolds were then up.”

We think every church requires, as a beacon, to be made the loftiest, as well as the best, house in the parish.

In the accounts for building the church will be found considerable expense gone to

*Elevation of the Tower and Spire from the Belfry upwards.*

*Plan of the Upper Stage of the Spire.*

*Plan of the Gallery and Lower Stage of the Spire.*

*Elevation of one compartment of the South Flank of the Church.*

for removing a high chimney-stack, which interfered with the view of the tower.

Now other buildings so completely interfere with the view of the church, its steeple should be raised proudly above them; this the occasion demand.

In the original design, as already noticed, the architect proposed only one tier of flank-windows, and all the attic pedestals, as well as the apex of the pediment over the western entrance, were designed to be crowned by vases: a compartment of this we give to show Flitcroft's first intention.

The restoration of the church under the superintendence of George Allen, Esq., architect, of Tooley-street, has been contracted for by Messrs. Rider and Son, of Union-street, Southwark, for the sum of 4,618*l.*; beyond which are to be some extra charges, sanctioned by the committee having the direction of the work; by agreement, the church is to be completed by Midsummer next, but is not expected to be opened till two months after that time.

A stained-glass window will be inserted in the altar, which Mr. Collins, of the Strand, has contracted to execute for the sum of 160*l.*

Under the direction and superintendence of Dr. Gauntlett, the organist, a new organ is being built by Mr. Henry Lincoln, who has contracted to supply it for the sum of 495*l.*; it is to contain upwards of two thousand pipes, and is to consist of a grand-organ, a pedal-organ, and a swell-organ.

A vestry has lately been erected at the south side of the church; for this we are sorry, as it hides the east end, which, with its window rustications and other work, was picturesque, and gave the church a loftier appearance, hemmed in as it is by warehouses.

(To be continued.)

#### ARCHITECTURAL ABUSES.

##### No. I.—NORMAN ARCHITECTURE.

For many years past has the architectural world flowed with precept and criticism, which, had such precept and criticism been all sound and tending to the right end, they should most certainly have banished every abuse, have produced a code of just architectural canons, and have raised a modern school of English architecture which should have been honourable in our time, enduring in fame, and would have gradually wrought throughout the world a beneficial change, to be remembered as the truthful Anglo mode of architecture of the nineteenth century.

But after deluge upon deluge of precept, canon, denunciation, strait-lacing, logatious upon taste, discourses upon decoration, long-headed searchings into constructive principles, every thing of this kind seems thrown overboard; the vessel of Architecture may pilot itself; as for an architectural compass to steer by, who ever heard of such a thing, except in the hands of plodding fools? In fact, architectural lawfulness now consists in the lawlessness of every man doing that which is right in his own eyes—whatever his soul listeth after, without restraint of architectural Decalogue or other statute. Is there a mean and corrupt emanation of good old architecture? Adopt it. Was there in any age of building a certain style universally condemned for containing abuses? Regardless of future fame, and of the busy hands of the next who have to do with the same edifice, who, under the plea of correction, will pull the work all in tatters, copy it without a sin omitted, but with many added. Is there a mode of roofing over edifices at which the prudent shake their heads? Leap into the gulf of impudence, and batter your walls with those timbers which ought to hold them together. In fine, is there any thing which a foolish man not a builder would be laughed at for doing? Do it,—do it with a good heart!

We have addressed ourselves so far to that class of persons upon whom good advice is lost, or who, if any thing of doubtful policy chance to come from a wise instructor, out of perverseness avoid it, for fear it should be good, though the like coming from a fool would be admired and adopted as the profundity of excellence.

Knowing that the enemies of orthodox architecture are legion, and that an ignoble army of martyrs is warring against, and annihilating the funds of the church and public,

while we, if not single-handed, cannot wield so many weapons, we shall endeavour to imitate that noble conqueror, the Duke of Wellington, at the battle of Waterloo, who, attacked by a larger army, contented himself with beating off and destroying the assailants singly, till, long persevering, he at length saw the advantage. So we, attacking singly the abuses of architecture, as they chance to assail, shall be content to annihilate them one by one, and when we have reduced them, and have the residue ready for striking on the hip, we shall bring out our reserves, and, like Wellington, exclaim, "Up guards, and at 'em!"

The first abuse which we have the courage to attack is the re-introduction of NORMAN ARCHITECTURE.

Perhaps the whole history of architecture does not contain any thing else so scandalous and silly as the re-introduction of this species of Romanesque building.

In the twelfth century, a mighty stride was made in the construction of architecture; this was the almost simultaneous use all over Europe, of the pointed arch. We do not, on the present occasion, mean to hazard any opinion as to who invented the pointed arch, and where it was first used, or to enlarge upon its taste, but merely to speak as to its introduction, which was a mighty stride in architecture, and changed the whole face of it.

Certain it is, that after the pointed arch came into use, it was universally adopted; few years were required for the entire explosion of the use of semicircular Norman or Romanesque arches—and when once pointed arches came into use, no return was ever made to the employment of Romanesque arches during the whole time that Pointed architecture flourished; nor could any such return have taken place without a violation of that common sense, which, along with refined intellect, shews itself to the philosophical inquirer, amid all the seeming wildness of the inventions of Pointed Architecture. After the discovery of the properties of the pointed arch, in which are omitted the crown-work of Roman and Romanesque arches, which, hanging in jeopardy, made constant war upon the abutments, endeavouring to overthrow them, no return to the former immature style of building could possibly take place till the foundation of the advanced art of architecture was sapped; and this was actually the case.

It is the duty of an architect, as it is of every wise man, to effect the most with the least means: he, therefore, who returns to

the use of the Norman style is extremely blameworthy, for he wastes a vast quantity of material in the larger and heavier abutments which his arches require. His work is far less safe, and is calculated to be far less durable. At first, when the Freemasons came to adopt the pointed arch, they were so delighted with its economy, its comparative safety, and the wonderful loftiness which it enabled an edifice to assume with a given outlay, that the charm occasioned them to be over-daring. Edifices of a wonderful thinness, and often of a nature wonderfully aspiring, were piled aloft; but experience proved that sometimes they were over-confident in an art which as yet required the practiced experience to be obtained alone by the actual fabrication of many exemplars. Hence, in many of the very early specimens of Pointed Architecture, the abutments, being scarcely a title of that which they were in Norman Architecture, the slender sustaining masses were thrust out of perpendicular, and during the very progress of the work remedies had to be applied for preventing further settlement and derangement of the masses of the buildings then rising.

In the vaulted Temple-church, London, which is an early, very immature specimen of Pointed Architecture, with the Freemasonic magical system of vaulting and abutment but little developed, the vaulting over the central avenue being wider than those over the aisles, and springing immediately from the slender, detached columns, has obtained the mastery, and, expanding, has thrust over the supporting columns; while the vaults over the north and south aisles of the fabric have, by the pressure, collapsed from their summits, and become narrower at their feet, being unable to move the ponderous buttressed flank-walls of the church.

Those who have praised this Temple-church, and have recommended it as a model proper for modern imitation, are ignorant of architectural construction; their advice is pernicious, and, if followed, would lead to squandering and similar failure.

In the fully-developed Pointed Church architecture, the central avenue was lightly carried up as the clerestory, and instead of the energy of the central vaulting being discharged against the vaultings of the aisles, so as to make them collapse, the pressure of the central vaulting was carried above the aisles, and continued, without mischief, down to the solid work of the wall-piers and buttresses, the pinnacles rising above the impinging-places of the pressure, diverging it within the heart of this solid abutment.

CHANCEL OF BARFRETON CHURCH, KENT.

The example which we exhibit with this article is from Barfreston Church, Kent, copied from a drawing by Wm. Twopenny, Esq., and is introduced for the purpose of shewing the ultimate condition into which Norman architecture must fall. However strongly built, and with whatever expense of abutment, time is sure to bring all Norman edifices into the same falling, settled, and decrepit state in which Pointed Architecture, which is erected with flimsy and insufficient abutment surely comes.

In this specimen will be seen where the abutments have given way, how they have been forced over by the injurious arch-crowns pendent in jeopardy; and in addition will be observed where occur the cracks in the arches. Now these are precisely at the places where the Freemasons, after they had acquired a right knowledge of the use of pointed arches, would have left off carrying up an arch any further, for the portions of these Romanesque semicircular arches which remain below the fractured arch-crowns comparatively sound, are just such portions of the arch-work as would, if brought so as to meet together, form pointed arches; the decrepitude of age which had fallen upon innumerable buildings at the time no doubt taught the Freemasons, as soon as pointed arches came into use, how much lighter, cheaper, sounder, and more durable than semicircular arches they were; and what a culpable folly it would have been to return to the use of Romanesque arches at the expense of soundness, wisdom, and cost vastly increased.

Lately, a semicircular vault of a church fell, and slew the clergyman; now, if the vaulting over that building had been a Freemasonic vault of Pointed Architecture, aspiring loftily,—though thin,—broad, yet scarcely leaving its bed,—with scarcely any part of it so tilted as to slide from its seat under the shock of an earthquake,—and restrained with the economical refinement of abutment which in the glorious days of Pointed Architecture was perfected,—no such accident could have occurred.

There is at present afloat a most irrational and false idea that Norman architecture is cheap. Norman architecture is not cheap, but dear; it is considered to be cheap, because it may be made plain, coarse, and rude; but the ancients made it not plain, nor in their idea either coarse or rude, but adorned it with all the curious entail (much of it deduced from Grecian and Byzantine architecture) of which they were capable.

A small compliment is it to the builders of the so-called Norman architecture to copy from them the by-gone science of which they would never again themselves have made use after the discovery and development of Pointed Architecture, retaining that which they would not have retained, unless it be possible to imagine they would have become fools, and stripped it of the zig-zag, fillet, chevron, flower-work, hatching, scroll, and other decorations, of which even the Pointed architects continued to make use for some time after that discovery with which they became so much enraptured.

We can feel as keenly as any one the sublimity of effect produced by the contrasting of its broad and massive piers and other parts, with rich carvings of a primitive aspect; but legitimate architecture requires something more; it must be built with the most advanced science of the time, or it becomes an affair of the profligate spendthrift, and is the only thing of the day of stark folly.

The Cambridge Camden Society, in fostering the Norman style of architecture, has given a blow to its reputation, which, if it had not sinned too deeply in other respects, it could never survive. Cambridge, celebrated for its mathematical knowledge, has received an undutiful and unfilial blow, from the pupils of its University, so long famed for science, by promulgating such a Cimmerian darkness of ignorance in this as well as so many other subjects of architecture, a circumstance totally unparalleled in the history of architecture, and academic daring.

Intoxicated by the shallowness of knowledge, evinced in the publications of this frivolous society, in the most culpable ignorance, have these semi-skin-deep triflers sent Norman designs to New Zealand, while at home, in their very Cambridge, verily in their little pet the Round Church, the walls were thrust over by the

weight of the crowns of the Romanesque arches operating against them; and though, too, over their very heads, some of the arch-stones were loose and falling out, a thing never seen in true-pointed arches, which generally remain up and tight, and very often halves of them so remain when the other part of the work has been wrenched away.

Very long the Government Church Commissioners refused to admit or to sanction any design for a church in the Norman style; but, first, the Incorporated Society for the Promotion of the Building and Enlarging of Churches and Chapels gave way, under evil advice, that society having never been half so prudent as the Government Commissioners; and at length the Commission itself relaxed into the same imprudence.

This abuse, which is disgraceful to the nineteenth century, must, with many other subjects of complaint, be remedied.

Those who erect modern Norman churches, waste one-third of the outlay, make them sensitive to the slightest settlement, renege their duration one-half, and render them rude, bald, shabby, and unworthy of the refinement and philosophy of the age.

#### PETRALOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 256.)

In those regions of the waters which are undisturbed by tidal action, and in the absence of the requisite degree of heat, are favourable to the accumulation of sands, these pure and unmixed beds are forming in the present day; but the conditions under which they were primarily formed only exist now in a modified form, for we can hardly conceive any portion of the ocean wholly free from lime, magnesia, and other compounds, which, uniting with the sands, form so extensive and indefinable a class of rocks and mineral beds as is known to us in the present day. Many of the ancient beds of sand, sandstone, and quartzose rocks, were therefore produced from causes differing from those existing in the present day, the waters were then pure, being in parts and primarily entirely free from other earths except silica, and this notion is further strengthened by the appearance of the lower beds of the earth, as well as some of the quartzose rocks, all of them so far as our discoveries have extended, being of homogeneous qualities, all traces of organic remains having disappeared.

From these primary bodies formed and still forming within the waters, and changing in form and combination within and upon the earth, we turn to the next stage of combination and the results produced by the introduction of other matters. In those aqueous regions which, like the Red Sea, the Persian Gulf, and parts of the Great Pacific and Southern Oceans, are still unaffected by the tidal action of rivers, and the consequent deposition of vegetable earths and animal matters from these rivers, the sands and larger aggregate bodies covering the plains of the deep or forming hill and mountain masses are united in variable proportions with marine earths only, such as lime and magnesia, iron and animal matters, the sands vary in their form and qualities, being coarse or fine, free of larger aggregates, or uniting in their composition the fragments and bodies of mollusca, crustacea, and other species of the deep. In the progress of time the waters in localities disappear, and this oceanic soil becomes the subject of other influences; and as in the former instance of sands and the consequent changes produced by unity of parts, so it is with calcareous matters: the vast sedimentary depositions cohere at first as a mere mass of conglomerate, but as the body in all its parts becomes affected by atmospheric and chemical action, so its parts undergo a physical change, the larger aggregates, having definite proportions of particular earths in their composition, produce in change certain determinable results which constitute the varieties of hornblende and bornblende rocks, and another distinguishing characteristic of many species of granite.

Again, turn to another region of the waters,

in which some great river discharges its contents abstracted from the fertile soil over which it flows; here we have mixtures of soils, of the land and of the ocean, in some places continuously blending together, in others, periodically deposited; the first forming beds of uniform composition, the latter continuous successions of layers of earths; each intermediate layer having composition and character peculiar to the aqueous region in which it is proposed, and to the animal and vegetable species from which it is produced. In its second stage we see it standing above the waters as a constituent part of the dry land. Does it continue in this its primary condition? Most assuredly it does not—its aggregate masses cohere, are affected by atmospheric influences or chemical action, and these masses, or aggregates, pass by transition into felspar or felspathic rock, or such other forms and combinations as local affections may determine. Thus, where there is an excess of land vegetable and animal matters, micaceous bodies are produced.

In all these changes and vicissitudes which inorganic bodies undergo, we have the incontrovertible evidence of a beginning of things, the gradual development and increase of organic matters; the gradual appearance and increase of the beds of the earth spread over one another, uniformly and continuing to increase, so long as the causes which produced them continue to exist; and gradually or suddenly ceasing and giving place to varieties, or to objects and things of another form and composition. In the after changes we see no violence done to nature, other than that effected by atmospheric or chemical action; the bodies agglutinated become one perfect result, but still, in this intimate union passing through further changes peculiar to themselves.

Sir Richard Phillips truly observes, that "it is the proper object of philosophy to investigate the mechanism of causes, or to determine those proximate means or secondary causes by which natural phenomena are produced." To know the nature and origin of bodies and the conditions under which they exist, or by which they are enabled to assume other forms and properties, and to enter into other combinations, is the proud aim of all our inquiries, and the means by which we are enabled to assert our superiority over all created forms, and to render nature subservient to our uses. All the elemental works on geology teach you that granite is an igneous product, and here all further inquiry is supposed to cease; but passing by these narrow notions as incompatible with the present age of inquiry, my endeavour is to give a more correct, a more rational explanation of phenomena, tracing the steps of nature from the beginning to the ultimate result; for, inasmuch as in a particular species of bird we can form no true conception of the egg from whence it was produced, or on viewing the egg, we can form no true conception of the bird, other than by observation, so it is in petralogy; to know and understand the nature and origin of rock, we must by observation observe it in all phases, from the beginning to the ultimate result.

Although granite is one of the hardest and most durable of all rocks, and in dry climates may be said to be indestructible, it is nevertheless subject to disintegration in this and many other countries, the extent of its durability depending upon its crystalline structure, and the nature of its material. Exposed to the action of waters, it rapidly decomposes, its exterior surface peeling away, and the rents and fissures continually widening, it is apt to separate in large masses, and to assume most extraordinary forms of large artificial structures. At Huelgoet in Lower Brittany, and also in the Vosges, enormous masses are seen piled on one another, forming very singular groups; the granites being here divided into masses by fissures, which are filled up with granite possessing less solidity; this latter is sooner acted upon by atmospheric agency, and by its disintegration the masses become partly detached, and adopt various positions. This singular appearance is often observable in the East, in the now dried-up beds of lakes.

Sowerby makes mention of a curious kind of granite found in the Island of Corsica, termed orbicular granite, it has a basis of ordinary grey granite which, however, in most parts exhibits a considerable portion of hornblende. Its particular characteristic is a

number of halls from one to two inches in diameter, each composed of several concentric and perfectly parallel layers, the outermost of which, generally white, opaque, and two or three times thick, is composed of quartz and felspar blended in various proportions, and exhibiting a radiated appearance, rather converging towards the centre of the ball. The second layer, which is a greenish black colour and about one line thick, is composed of fine laminar hornblende, and this is surrounded by a white generally translucent quartz layer of about four or five lines in thickness, inclusive of two or three very fine layers of hornblende, that are generally seen within the substance of this third principal layer. Each of these layers is generally of equal thickness in the whole of its circumference, these three parts may be considered as the coating; the interior of the ball is less defined than the surrounding layers; it consists of a blackish and a whitish substance, the former surrounded by and passing into the latter, the centre of which is usually a dark grey spot.

The use of granite for architectural and economical purposes was well known to the ancient Egyptians, their most splendid monuments, and many articles of domestic use and ornament, being of this material, and the fine polish still remaining on many of these colossal remains attests a degree of skill not to be surpassed by sculptors and lapidaries of the present day. In Europe it is now absolutely necessary for many of the economical purposes of life, and would be very extensively used for building and ornamental purposes were it not for the very great expense attending its cutting and polishing. Its use is more amply displayed in Petersburg than perhaps any other capital in the world; not only are the imperial and other palaces built of this material, but many of the ordinary dwellings have their lower parts lined with slabs of it. The left bank of the great river Neva, from the foundry to the Gulf of Cronstadt, and both banks of the Fonbanka and of the Catharine Canal, are lined with high walls constructed of such slabs, as are many bridges over the Neva, their balustrades, &c., being also composed of the like material. The pillars, stairs, balconies, &c., in the palace of Cronstadt are almost all of the finest kinds of granite. Those employed for ornamental purposes are cut and polished by lapidaries, but others are worked by the peasantry, and are left in their rough state. The gigantic rock-pedestal, on which the equestrian statue of Peter the Great stands, is one solid mass of granite.

In this country, from being a costly material, it is less extensively employed in ornamental works, still we have many splendid specimens of British granites, as monuments, bridges, and internal decorations; of these Waterloo bridge stands the most prominent. Quarried in the rough, it is most extensively used in street paving and macadamizing, the latter plan being the most ready way conceivable of converting it into mud, the granite being first broken into small pieces, mixed with sand and water, and then ground down to powder by the iron-bound wheels of vehicles of every description. This theoretic fallacy is giving way to the new fashion of wooden pavements, which threatens to banish granite altogether from the streets, or to confine it to their curbs and crossings alone.

**THE METROPOLITAN IMPROVEMENTS.**—The Commissioners of Woods and Forests have, by their auctioneer, just disposed of some houses in High-street and Essex-street, Whitechapel, which are upon the line of the new street to be formed from Shoreditch Church to the London and St. Katherine's Docks. Upon their removal, with the old buildings at the back of them, there will then be a direct opening to Spitalfields Church. Considerable progress has been made, during the last few weeks, with the improvements in this neighbourhood.

**CITY OF LONDON SCHOOL.**—The statue of John Carpenter, founder of the City of London School, which has been executed by Mr. S. Nixon, is now fixed under the north window of the staircase: this took place in the presence of the Lord Mayor, members of the Common Council, and the School Committee.

## A BILL FOR THE BETTER PREVENTION OF DAMAGE BY FIRE IN THE METROPOLIS AND ITS NEIGHBOURHOOD.

[Note.—The words printed in *Italics* in the body of the clauses are proposed to be inserted in the committee.]

**Preamble.**—WHEREAS by the several provisions of an Act specified in the schedule (A.) to this Act annexed, provision was made for the prevention of damage by fire in the metropolis and the neighbourhood thereof;

But forasmuch as many of such provisions are now inapplicable or defective, it is expedient to amend the same.

**GENERAL PROVISIONS.**—1. *Operation of Act.*—*Certain Provisions repealed of Building Act, 14 Geo. 3, c. 78 (1774).*—Now for that purpose, and especially with relation to the service of water, the supply of engines, and other necessary implements, and to the rewards to be given to engineers and other persons for the prompt service of engines; be it enacted, by the Queen's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, with regard to this Act generally, so far as relates to the operation thereof in reference to time, that it shall come into operation from and after the first day of January, one thousand eight hundred and forty-five; and that thereupon the several provisions set forth in the said schedule (A.) bereunto annexed, shall be and are hereby repealed.

2. *Construction of Words.*—And be it declared with regard to this Act generally, so far as relates to the construction of certain terms and expressions used herein, that the following terms and expressions are intended to have the meanings hereby assigned to them respectively, so far as such meanings are not excluded by the context or by the nature of the subject matter; that is to say:—

**Building.**—The word "Building" to include all buildings of what nature and kind soever, not excepting royal palaces and buildings in the possession of her Majesty, her heirs and successors, or employed for her Majesty's use or service.

**Parish.**—The word "Parish" to include all parochial districts and extra-parochial places in which separate churchwardens, overseers, or constables are appointed; and also where two or more parishes have been united for ecclesiastical purposes, the word "Parish" is to include such united parishes.

**Churchwarden.**—The words "Churchwarden and Overseers" to apply to the overseers of the poor in every precinct or place not having a churchwarden; and in every extra-parochial place not having either a churchwarden or an overseer, to apply to the constable, if any, or in default of the constable, to any officer performing the duties usually performed by churchwardens, or overseers, or constables.

The word "Month" to mean calendar month.

**Official Referees.**—The term "Official Referees" to mean the persons appointed to be official referees of metropolitan buildings in pursuance of an Act passed in the present session of Parliament, and commonly called "the Metropolitan Buildings Act."

**Justice of the Peace.**—The term "Justice of the Peace" to mean a justice of the peace for the county or city within which shall arise any subject-matter of which a justice of the peace is made cognizant by this Act; unless it arise within the city of London, or the liberties thereof, in reference to which any matter or thing elsewhere required or authorized to be done by two justices of the peace may be done by the Lord Mayor of the city of London, or by any two justices of the peace for the said city.

**Local Officers.**—And, generally, whensoever the name of an officer having local jurisdiction in respect of his office is referred to, without mention of the locality to which the jurisdiction extends, such reference is to be understood to indicate the officer having jurisdiction in that place within which the subject-matter to which such reference applies doth arise or is situate.

**Singular and Plural numbers.**—*Masculine and Feminine genders.*—*Individuals and Corporations.*—And, subject as aforesaid to the context, and to the nature of the subject-

matter, words importing the singular number are to be understood to apply also to a plurality of persons or things; and words importing the masculine gender are to be understood to apply also to persons of the feminine gender; and words importing an individual are to be understood to apply also to a corporation or company, or other body or association of persons.

3. *Limits of Act.*—And he it enacted, with regard to this Act generally, so far as relates to the operation thereof, in reference to localities, that the operation of this Act shall extend to all places within the following limits; that is to say,—

To all such places lying on the north or left bank of the river Thames as are within the exterior boundaries of the parishes of Fulham, Kensington, Paddington, Hampstead, Hornsey, Tottenham, Saint Pancras, Islington, Stoke Newington, Hackney, Stratford, Bromley, Poplar, and Shadwell:

And to such part of the parish of Chelsea as lies to the north of the said parish of Kensington:

And to all such parts and places lying on the south or right bank of the said river as are within the exterior boundaries of the parishes of Woolwich, Charlton, Greenwich, Lee, Lewisham, Camberwell, Lambeth, Streatham, Tooting, and Wandsworth:

And to all places lying within two hundred yards from the exterior boundaries of the district hereby defined.

4. *Power to extend the limits of Act.*—*Application of Act.*—And be it enacted, with regard to this Act generally, so far as relates to the application thereof to other parts and places in the neighbourhood of the districts appointed by this Act, whether such districts immediately adjoin such parts or places or not, that if, from the growing increase of the population or otherwise, it shall appear to her Majesty in Council to be expedient that the provisions of this Act should be extended to any place within twelve miles of Charing-cross, in the city of Westminster, then it shall be lawful for her Majesty in Council to direct, by order in Council, that at or from a time to be named in such order, the provisions of this Act are to apply to such places; and that at or from such time all such provisions, of whatever nature, whether penal or otherwise, so far as they shall be capable of application to such places, shall and are hereby declared to apply thereto, as if such places were expressly named herein.

**SERVICE OF WATER.**—5. *Providing and fixing of fire-plugs, &c.*—*Order by official referees.*—*Owners of water-works to fix plugs, &c.*—*Refusing of plugs on the removal of pipes.*—*Expense of plugs and boxes.*—*Reference of disputes to official referees.*—*Award of official referees thereon.*—*Penalty for not providing fire-plugs.*—And now, for the purpose of making provision for the service of water for the extinction of fire: be it enacted, with regard to the fire-plugs, fire-cocks, and other apparatus for such service, so far as relates to the providing and fixing thereof, that if any office for insurance against loss by fire, or the commissioners of the metropolitan police, or the churchwardens or overseers or constable of any parish or place, or any inhabitant, apply to the official referees of metropolitan buildings to direct such apparatus to be fixed at any one point or place, or more, then it shall be the duty of the official referees, and they are hereby required, to inquire into the matter, and to order and award that the owners of water-works, the mains of which lie within the limits of this Act, do fix such apparatus at any such points or places as to the said official referees shall appear proper, having regard to the proximity of buildings to the mains of any such water-works, and to the opening of streets, and to any other circumstances which render a supply of water necessary or expedient, or which will render the service thereof more easy and efficient for the purpose; but not so as to require that such fire-plugs, or other such apparatus, shall be fixed with any less interval than fifty yards; and that upon such order and award being made, it shall be the duty of the owners of such waterworks, and they are hereby required, to provide and to fix such apparatus, and to protect the same by proper iron boxes, and from time to time to repair

such apparatus and hoses; and that if the mains or pipes be removed, or changed or altered, then it shall be the duty of such owners of waterworks, and they are hereby required, to replace and fix like apparatus, in the same or like situations, and at the same distances, or as near as conveniently may be; and that the expense of any such apparatus and boxes (except when the same shall have been occasioned by the removal of the mains and pipes, or other act of owners of waterworks) shall be borne by the parishes and places within which they may be situate, out of the funds by this Act provided for the purposes thereof; and that if at any time there arise any dispute or question as to such works, or as to the manner in which such works shall be executed, or as to the expense thereof, then such dispute or question shall be referred to the official referees; and that thereupon, for such purpose, as well as for the purpose of the first inquiry as aforesaid, it shall be lawful for them, and they are hereby required, to make such order and award in respect of the matter in question, and in respect of the costs of the reference to them, as to them shall seem fit; and for that purpose to authorize such survey of the works or place in question, and to examine witnesses on oath or otherwise, and to require the production of papers, as they shall think necessary, for determining the matter in question; and their award, duly signed and sealed, according to the provisions in that behalf of a certain Act passed, or to be passed, in the present session of parliament for regulating the construction and use of buildings in the metropolis and its neighbourhood, shall be final; and that if the owners of such waterworks fail to comply with the provisions of this Act in this behalf, or with such order and award, either as regards the providing, the fixing, the protecting or the repairing, replacing and fixing such apparatus and protection boxes as aforesaid, then they shall forfeit for every fire-plug and fire-cock so wilfully omitted to be provided, placed or fixed, or replaced and fixed, the penalty of ten pounds.

6. *Service of Mains for extinction of Fires.—Penalty.*—And be it enacted, with regard to the several waterworks, so far as relates to the service of the mains with water for the extinction of fires, that at all times it shall be the duty of the owners of the several waterworks, the mains of which lie within the limits of this Act, and they are hereby required, to keep such mains duly charged with water; and that if such owners fail so to duly charge such mains, then, on conviction thereof, they shall forfeit for every wilful default in that behalf a sum not exceeding ten pounds.

7. *Access to Waterworks.—Penalty.*—And be it enacted, with regard to such several waterworks, so far as relates to access thereto, that it shall be the duty of the owners of the several waterworks, the mains of which lie within the limits of this Act, and they are hereby required, to cause duplicate keys of all the branch mains within every parish to be deposited at the engine-house for such parish, and at the nearest police station; and that if such owners fail so to do, then, on conviction thereof, they shall forfeit for every wilful default in that behalf a sum not exceeding ten pounds.

FIRE-ENGINES.—8. *Supply of Fire-engines, &c. by Parishes.—Retention of old Engines.—Report thereon by Churchwardens.—No Rewards for Engines not so kept.—Sale of old Engines.—Application of Proceeds.*—And be it enacted, with regard to fire-engines and implements, so far as relates to the supply thereof, that at all times hereafter it shall be the duty of the churchwardens and overseers of every parish within the limits aforesaid, and they are hereby required, to have, and to keep in good order and repair, and in some known and public place within such parish, at least one large engine and one set of scaling-ladders, and such other implements and things as are required and specified in the Schedule (B.) hereunto annexed; in the proportion of one engine, one set of scaling-ladders, one set of the requisite implements, in respect of every one hundred and fifty thousand pounds of the rental assessed to the poor-rate of such parish; and that it shall be lawful for such churchwardens and overseers, and they are hereby authorized, to retain and keep in repair, or purchase or otherwise obtain, any other engine-ladders, implements, or things whatsoever not conformable to the directions of this Act; and that within two months after Easter in each year,

and from time to time, it shall be the duty of the churchwardens and overseers, and they are hereby required, to report to the petty sessions of the division within which such parish shall be situate, the state of the said engines, ladders, and other implements and things; and that no reward shall be payable under the provisions hereinafter contained, in respect of any engine which shall not be of the dimensions and so provided as by this Act directed: provided always, with regard to such engines, ladders, implements, and things whatsoever, so far as relates to the disposal of such of them as shall not be conformable to the requisitions of this Act, or such of them as shall exceed the number hereby required, that from time to time it shall be lawful for the churchwardens and overseers of every parish within the limits of this Act, and they are hereby authorized, subject to the consent of the majority of the parishioners in vestry assembled,—or if there be a select vestry, then subject to the consent duly given of such select vestry,—to make sale and dispose of such engines, ladders, implements, and things in any way which may be deemed proper; and with regard to the proceeds thereof, when so sold and disposed of, so far as relates to the application of such proceeds, that it shall be the duty of such churchwardens and overseers to apply the same in the same manner as any rate levied for the relief of the poor, or as any other fund by or by means of which the costs of such engines and other implements shall have been originally defrayed.

9. *Preservation of Engines.—Repair of Engine, Hose, Ladders, &c.—Penalty.*—And be it enacted, with regard to parish-engines and implements, so far as relates to the preservation thereof, that it shall be the duty of the churchwardens and overseers of every parish within the limits aforesaid, and they are hereby required, to provide one engine-house or more, sufficient to contain as well every such large engine as the scaling-ladders and other implements hereinbefore required to be kept by every such parish; and that if any churchwarden or overseer of any parish neglect to have and keep in good repair every such large engine, hose, ladders, and other implements or any of them, or to make reports thereof as aforesaid, then he shall forfeit for every such default a sum not exceeding ten pounds.

10. *Access to Engines.—Duplicate Keys.*—And be it enacted, with regard to parish-engines, so far as relates to access thereto, that at all times it shall be the duty of the engine-keeper in every parish, and he is hereby required, to live within two hundred yards of the engine-house, and to keep a key of such engine-house; and that it shall be the duty of the churchwardens and overseers, and they are hereby required, to deposit duplicate keys of the engine-house at the nearest police-station, and also with every one of the four men whose duty it shall be to work the respective engines.

11. *Quarterly working of Engines, &c.—Residence of Engine-workers.—Quarterly Fees to Workers of Engines, and to others working at Fires.*—And be it enacted, with regard to parish-engines, so far as relates to the trial and proving thereof, that it shall be the duty of the churchwardens to employ at least four able men to work every engine and try the ladders and implements hereinbefore required to be provided by the respective parishes within the limits of this Act, once in every three months; and that it shall be the duty of such men, and they are hereby required, to reside in the immediate neighbourhood of the respective engine-houses, and to work and to assist in working such engines and implements on all occasions of fire within their respective parishes; and that such persons shall be paid by the churchwardens and overseers of their respective parishes a quarterly fee, as specified in the table of fees and rewards in Schedule (C.) hereunto annexed; and that it shall also be the duty of the churchwardens, in every parish in which any fire may originate, and they are hereby required, to pay unto as many persons as may be required to work such engines such compensation as shall be usually paid in similar cases by the several companies for insurance against loss by fire.

12. *Rewards.*—And be it enacted, with regard to rewards, so far as relates to the amount thereof, that the turncocks, firemen, and other

persons respectively mentioned in the Schedule (C.) hereunto annexed, shall be paid by the churchwardens and overseers the rewards specified in the said schedule.

13. *Distribution and payment of Rewards.—Consent of Justices.*—And be it enacted, with regard to such rewards, so far as relates to the distribution and payment thereof, that if a fire happen in any parish, then, on its being proved by the testimony of two or more credible witnesses to a justice of the peace that some part of the building in which the fire happened, or any fixtures therein, shall have been scorched by such fire, it shall be the duty of such justice, and he is hereby required, to issue an order, under his hand and seal, to the churchwardens and overseers, directing them to pay such rewards as such justice shall find to be due under the provisions of this Act; and that, thereupon, it shall be the duty of the churchwardens and overseers of such parish, and they are hereby required, to pay such rewards.

14. *Repayment of Rewards by Parties causing Fires.—Proceedings of Justices.—Non-appearance of Party offending.—Distress.*—And be it enacted, with regard to such rewards, so far as relates to the repayment thereof, that if any fire occur in a chimney only, or be occasioned by the taking fire of any chimney only, then the occupier of any room or apartment to which any such chimney belongs, being a lodger or inmate to or with any tenant, renter or holder of any building, of which such room or apartment is part, or, if such chimney belong not to any such lodger or inmate, then the tenant, renter or occupier of the building wherein any such fire as last mentioned first began, shall be liable to reimburse and pay to the churchwardens and overseers all rewards or other recompenses made pursuant to the directions of this Act, in respect of any such fire, or such part of such rewards, as any justice of the peace, upon the application and complaint of such churchwardens, and hearing the party complained against, shall, under his hand and seal, award and direct; and that, to the end that such justice may be better enabled to award and direct what may in any such case be just and reasonable, it shall be lawful for such justice, and he is hereby authorized, to summon before him the party complained against on the matter of any such complaint, and all persons able to give evidence touching the premises, of whom he shall have notice or information; and to examine them upon oath (which the said justice is hereby empowered and required to administer without fee or reward); and that, if, on being so summoned, the party complained against fail to appear, then it shall be lawful for the said justice, and he is hereby authorized, to proceed to examine the matter of the complaint and such evidence as is produced; and thereupon to make such award and direction as shall be just and reasonable, and as if the party making such default of appearance had been present and had been heard in his defence; and that if, within fourteen days after demand of any sum of money so awarded and directed to be reimbursed or repaid to any such churchwardens and overseers, such sum be not so reimbursed or repaid, then, on application being made to such justice or any justice, it shall be his duty to grant a warrant, under his hand and seal, empowering such churchwardens and overseers to levy every sum awarded or other recompense so directed to be paid, or such part thereof as shall have been so awarded and directed, by distress and sale of the goods and chattels of the party making default of payment, or of any goods or chattels found in the room or apartment to which such chimney belongs, where such fire began, or in any other part of any house or building whereof such room or apartment is part.

15. *Fire-Engines, &c. to be paid for out of Poor Rates.—Levy and Recovery of Rates.—Accountability of Officers.*—And be it enacted, with regard to the funds requisite for the purposes of this Act, so far as relates to the raising thereof to defray the charges of providing and maintaining such fire-plugs and fire-cocks, and other apparatus for the service of water, and such fire-engines, and other implements and materials, and such ladders and such engine-houses, and the payment of engine-keepers and other persons employed to work the engines, and the payment of the rewards directed by this Act; that from time to time, as often as there shall be occasion, subject to the consent of the majority of such inhabitants as shall be

at any vestry or any other public meeting of such parish duly assembled, or subject to the consent, duly given, of any select vestry, it shall be lawful for the churchwardens and overseers of the poor of the several parishes within the limits of this Act, or the major part of them, and they are hereby authorized, to levy, raise, or apply any rates for the purposes of this Act; and out of the moneys to be received thereby, or out of the moneys to be raised or received by any poor-rate made or to be made for the relief of the poor of every such parish respectively, or by any special rate to be made for the purpose of this Act, to pay, apply, and dispose of such sum of money as may be requisite for the ends aforesaid, in like manner as by law may be done for the maintenance and relief of the poor; and that on every such special rate which shall be so made, being allowed and confirmed in like manner as the rates made for the relief of the poor are or ought to be allowed or confirmed, and subject to the like appeal as in cases of rates made for the relief of the poor, it shall be lawful to levy and recover such rate in the same manner as the rates made for the relief of the poor now may or ought to be levied and recovered; and that the said churchwardens and overseers shall be accountable for the same, and be liable to the like pains and commitments for not accounting for the same; and to the like distress and penalties for not paying the moneys by them collected, levied, or received, and remaining in their hands, in like manner as overseers are accountable and liable in respect of moneys collected by virtue of any rates for the relief of the poor.

**INSURANCES.**—16. *Application of Money insured on Houses burned.*—And be it enacted, with regard to buildings which may hereafter be burned down, destroyed, or damaged by fire, so far as relates to the application of money insured thereon, that if any person having an interest in or entitled unto any such building, request that such money be laid out in rebuilding or reinstating or repairing any such building, then on such request, it shall be lawful for the respective governors or directors of the several offices for insurance against loss by fire, where such buildings are insured, and they are hereby required, to cause the insurance money or such part thereof as may be requisite to be so laid out and expended; or if within sixty days after the claim shall be adjusted, the person claiming such insurance money do not give a sufficient security to the governors or directors of the insurance office where such buildings are insured, that such insurance money shall be laid out and expended as far as the same will go, towards rebuilding, reinstating or repairing such building; or if within the said period of sixty days the said insurance money be not settled and disposed of to and amongst all the persons interested, to the satisfaction and approbation of such governors or directors of such insurance office respectively, then it shall be lawful for the respective governors or directors of the several offices for insurance against loss by fire, where such buildings are insured, and they are hereby authorized, to cause the insurance money or such part thereof as may be requisite to be so laid out and expended.

**FIRES THROUGH NEGLIGENCE.**—17. *Punishment of Persons negligently causing fires in the Metropolis.*—Penalty.—Imprisonment of offender.—And be it enacted, with regard to fires caused by negligence, so far as relates to the punishment of persons in fault, that if any person through negligence shall fire or cause to be fired any building within the limits of this Act, then, on being thereof lawfully convicted by the oath of one or more credible witnesses made before any two or more of her Majesty's justices of the peace, such person shall forfeit a sum not exceeding ten pounds unto the churchwardens and overseers of such parish where such fire shall happen; and that if at any time after such conviction the said churchwardens demand such penalty, and on such demand such person fail to pay the amount thereof, then it shall be lawful for any two or more of her Majesty's justices of the peace, by warrant under their hands and seals respectively, to commit such person to the common gaol or house of correction, as the said justices shall think fit, for any time not exceeding three months.

**OFFENCES GENERALLY.**—18. *General Penalty.*—And be it enacted, with regard to

offences, so far as relates to the punishment of the offender in respect thereof, that if any person be guilty of any default in respect of the provisions of this Act, to which no penalty is hereinbefore affixed, then, on conviction thereof, the offending person shall be liable to forfeit for every such default a sum not exceeding twenty pounds.

19. *Recovery of Penalties.*—Appropriation thereof.—And be it enacted, with regard to every such penalty or forfeiture, so far as relates to recovery and the appropriation thereof, that at any time within three months after such penalty shall have been incurred, it shall be lawful for any party to proceed for the same; and that if such penalty be not otherwise specifically appropriated, then the person so proceeding shall be entitled to receive one-half of the amount thereof for his own benefit, and the other half shall go to the poor of the parish in which the subject-matter of the prosecution shall arise or be situate.

**LEGAL PROCEEDINGS.**—20. *Recovery of money under awards.*—Distress.—Imprisonment.—And be it enacted, with regard to every sum of money by this Act, or by any award or order directed to be paid in pursuance of this Act, so far as relates to the recovery of such sum of money, that it shall be lawful for the party claiming the same to proceed in a summary way before any two justices of the peace, or if the matter arise within the district of the metropolitan police, then before any police magistrate having jurisdiction within that district; and that, on proof of such sum of money being still due, it shall be lawful for such justices, or such police magistrate, and they respectively are hereby required, to issue a warrant under their hands and seals to levy the amount thereof, and also of the cost of the proceeding, to be levied by distress of the goods and chattels of the person in default; and that if such person have no goods and chattels whereon to distrain, or if such goods and chattels be insufficient for that purpose, then it shall be lawful for such justices or police magistrate, or for any other justice or police magistrate, to commit the person in default until the amount of such sum so due, and of such costs, shall have been fully paid.

21. *Prosecution of Offences.*—Distress.—Imprisonment.—And be it enacted, with regard to all offences against the provisions of this Act for which no other proceeding is provided, so far as relates to the prosecution thereof, that it shall be lawful to proceed by complaint before any one justice of the peace; and that it shall be lawful for such justice to summon the party against whom such complaint shall be made; and that on conviction of the offender before two justices, or before any police magistrate, it shall be the duty of such justices or magistrate, and they are hereby required, to issue a warrant under their hands and seals to cause the amount of the penalty hereby imposed in respect of such offence, and of the costs of any such proceeding in respect of such offence, to be levied by distress of the goods and chattels of the offender; and that if such offender have no goods and chattels whereon to distrain, or if they be insufficient for that purpose, then it shall be lawful for such justices or magistrate, or for any other justice or magistrate, and they are hereby empowered, either on failure of such distress, or in the first instance, to commit the offender to the common gaol or house of correction, with or without hard labour, for a period not exceeding three months, or until he shall have paid the full amount of such penalty and such costs.

22. *Appeal to Quarter Sessions.*—Proceedings.—And be it enacted, with regard to any conviction, order, or judgment of any justices of the peace made out of sessions by virtue of this Act, so far as relates to any appeal therefrom, that if any person be dissatisfied with the decision of such justices, and if, within two days after such decision, notice be given to the party appealed against, by or on behalf of such person, of the intention to appeal, and if he enter into a recognizance, with two sufficient securities, conditioned to try such appeal and to abide the order of the court, and pay to the party appealed against such costs (if any) as shall be awarded against him, then it shall be lawful for such party so dissatisfied to appeal against such conviction, order, or judgment to the justices of the peace at their general quarter sessions of the peace to be holden

within four months after such conviction, order, or judgment; and that if within such period of two days such appellant shall have entered into a recognizance as hereinbefore required, then it shall be lawful for such justices, and they are hereby empowered, to proceed to hear and determine the matter of such appeal, and to award such costs to be paid by either of the said parties as they think proper; and the determination of the said justices in their sessions shall be binding and conclusive upon all parties.

23. *Removal of Orders, &c. into Superior Courts; Certiorari.*—And be it enacted, with regard to every order which shall be made by virtue of or under this Act, and to any other proceeding to be had touching the conviction of any offender against this Act, that it shall not be lawful for any person to remove such order or other proceeding by certiorari (or suspension or advocacy in Scotland), or any other writ or process whatsoever, into any of her Majesty's superior Courts of Record; and every such order and other proceeding are hereby declared not to be so removable.

24. *Distress of Churchwardens and Overseers.*—And be it enacted, with regard to churchwardens and overseers, so far as relates to the levying by distress any penalty or other sum of money payable by them under this Act, that whenever any penalty, reward, or other payment is by this Act made recoverable from or against any churchwarden and overseers, the same shall be levied and recovered by distress and sale of the goods and chattels of such churchwarden and overseers, or any of them.

25. *Informalities in Distress.*—Action for Damage.—And be it enacted, with regard to any distress for any sum of money to be recovered by virtue of this Act, so far as relates to the remedying of any damage occasioned by any irregularity therein or in reference thereto, that notwithstanding there be any defect of form in the proceedings relative to any such distress, neither the distress itself shall be deemed unlawful, nor shall the party making the same be deemed a trespasser ab initio; but that if any irregularity be committed by any party, then, subject to the conditions in this Act prescribed with regard to actions brought for any thing done in pursuance thereof, it shall be lawful for the person aggrieved by such irregularity, and he is hereby entitled, to recover full satisfaction for the special damage only; and that by action on the case, and not by any other action whatsoever.

26. *Tender of Amends.*—Payment of Compensation into Court.—And be it enacted, with regard to any action for any irregularity or other proceeding, so far as relates to the tender of amends or payment of money into court in respect thereof, that if, before such action be brought, the party who committed or caused to be committed any such irregularity or wrongful proceeding, make or cause to be made tender of sufficient amends, then the plaintiff shall not be entitled to recover in such action; and that although such tender shall not have been made, yet if, at any time before issue joined, the court in which such action shall be depending, or a judge of any of the superior courts, grant leave, then it shall be lawful for the defendant to pay into the court any sum of money by way of compensation or amends, in such manner and under such regulations as to the payment of costs and the form of pleadings as is and are customary and in force in the said superior courts.

27. *Regulation of actions against Persons acting under this Act.*—Limitation of Action.—As to Notice of Action.—Venue in London.—Venue in Middlesex.—Plea in Evidence.—Verdict.—Costs.—And, for regulating proceedings against persons acting in pursuance of this Act; be it enacted, with regard to any action or suit against any person in respect of any act or thing done in pursuance of this Act, so far as relates to the limitation thereof, and to the notification thereof to the offending party, and to the venue thereof, and to the pleadings therein, and to the evidence of the matters thereof, and to the verdict therein, and to the judgment of the court thereon, and to the costs of such action, and to the recovery of such costs, that, after the expiration of six months next after the fact committed, it shall not be lawful to bring any such action or suit against any person in respect of any such act;

and that, if twenty-one days at the least before the commencement of the action or suit, notice in writing of an intention to bring such action or suit be not given to every person against whom such action or suit shall be brought, then it shall not be lawful for any person to bring any such action or suit against any persons in respect of any such act; and that if the cause or matter of any such action or suit shall arise within the said city of London or the liberties thereof, then such action or suit must be laid in the city of London, and not elsewhere; and that if the cause of any action or suit arise in any part of the limits aforesaid, out of the said city of London and liberties thereof, then it must be laid and tried in the county of Middlesex, and not elsewhere; and that in every such action or suit it shall be lawful for the defendant, and he is hereby entitled to plead the general issue, and at the trial to be had thereof, to give this Act and the special matter in evidence, and to prove that the matter or thing for which such action or suit is brought was done in pursuance and by the authority of this Act; and that if upon the trial of such action it appear that the said matter or thing has been so done in pursuance of this Act, or if it appear that such action or suit was brought before the expiration of twenty-one days after such notice given as aforesaid, or if it appear that sufficient satisfaction was made or tendered before such action was brought, or if, upon plea of payment of money into court, it shall appear that the plaintiff has not sustained damages to a greater amount than the sum paid into court, or if any such action or suit be not commenced within the time herein for that purpose limited, or be laid in any other county or place than as aforesaid, then it shall be the duty of the jury and they are hereby required to find for the defendant; and that if a verdict be found for the defendant, or if the plaintiff in any such action or suit become nonsuited, or discontinue or suffer a discontinuance of any such action or suit, or if judgment be given for the defendant therein, on demurrer or by default or otherwise, then the defendant shall be entitled to have judgment to recover his costs of suit, and to such remedy for recovering the same as any defendant shall have by law.

**ACCIDENTAL FIRES.**—28. *Legal proceedings relative thereto.—General Issue and Costs.—Saving Contracts.*—And be it enacted, with regard to such legal proceedings on account of accidental fires, so far as relates to the liability thereto, to the pleadings therein, to the evidence therein, and to the costs thereof, that if any fire accidentally begin, then no action, suit or process whatever in respect thereof shall be bad or be maintained or prosecuted against any person in whose building or on whose estate such fire happened, nor shall any such person be compellable to make recompense for any damage suffered thereby, any law, usage or custom to the contrary notwithstanding; and that if any action be brought, then, in such case, it shall be lawful for the defendant and he is hereby entitled to plead the general issue, and at any trial to be had thereupon to give this Act and the special matter in evidence; and if the plaintiff become nonsuited or discontinue his action or suit, or if a verdict pass against him, then the defendant shall recover his costs: provided always, that no contract or agreement made between landlord and tenant shall be hereby defeated or made void.

**MISCELLANEOUS.**—29. *Exemption from Stamp Duty.*—And be it enacted, with regard to the following document, so far as relates to the payment of stamp-duty in respect thereof, that every award required to be made or signed by the official referees, shall be and is hereby exempted from stamp duty.

30. *Public Act.*—And be it enacted, that this Act shall be deemed to be a public Act, and shall be judicially taken notice of as such by all judges, justices, and other persons whomsoever.

31. *Amendment of Act.*—And be it enacted, that this Act may be amended or repealed by any Act to be passed in this present session of Parliament.

The foundation stone of the new Northern Hospital, Liverpool, was laid by the mayor, on Wednesday week last, on the vacant piece of land given by the corporation for that purpose at the eastern end of the borough gaol, in Great Howard-street.

#### CHURCH-BUILDING INTELLIGENCE, &c.

*Jews' Synagogue.*—A synagogue, in a style of splendour surpassing any thing hitherto attempted in England, is about to be erected in the western part of the metropolis. Sir Moses Montefiore has contributed 5,000*l.* towards the building, on the understanding that the worship is to be according to the usages of the Spanish and Portuguese Jews. The site is not yet determined upon, but several have been offered upon liberal terms; the committee will, however, not decide hastily, as they are determined to possess one where so splendid a building may be an ornament to the neighbourhood.

*New Church and Parish at Woolwich.*—At the weekly meeting of the Board of Commissioners of the town of Woolwich, held on Tuesday evening last, in the New Hall, William-street, the Rev. W. Greenlaw, rector of the parish of St. Mary, Woolwich, stated that the ecclesiastical commissioners had determined, with his entire concurrence, to create another parish there, which it was proposed to call the parish of St. Thomas, and to build a church at the end of Brewer-street, to be named after the same saint. The proposed parish will embrace an extensive plot of building-ground on the western side of the existing parish, where building is proceeding with the utmost rapidity, and an increase of inhabitants taking place daily.

*St. Mary's Church, Bury.*—It is proposed by the architect to insert in the west window of St. Mary's, in accordance with precedents to be found in most of our cathedrals, a series of heraldic bearings of the nobility and gentry connected with the town and neighbourhood in painted glass, to be executed by Willement. The Queen's arms will occupy the centre compartment, and the corporation have consented to insert theirs. The Dukes of Grafton and Norfolk, Lady Cornwallis, Lord Bristol, Lord Calthorpe, Sir Thomas Cullum, Sir Henry Bunbury, H. Waddington, Esq., Rev. H. Hasted, and others, have consented to the insertion of theirs at their own expense.

*Queen's College, Birmingham.*—The ceremony of laying the foundation-stone of the chapel about to be erected at Queen's College took place on Friday week last.

A lady has left at the chambers of the Incorporated Society for Promoting the Enlargement and Building of Churches and Chapels, a Bank of England note for 1,000*l.*

#### Correspondence.

SIR,—I am happy to lighten your charge of replying to "A Constant Subscriber," by referring him to a little book published by Knight, 22, Ludgate-street, entitled "History of British Costume," containing no less than 136 wood-cuts. For monastic dresses he may look into the great work called "Dugdale's 'Monasticon,' or 'Tanner's Notitia Monastica,'" or more conveniently, perhaps, "Fosbroke's British Monachism;" and for the emblems of Saints, the first number of the "Archaeological Journal," to be had at Longman's, in Paternoster-row.

The works of Dugdale, Tanner, and Fosbroke are expensive, but may be consulted in the reading-room of the British Museum.

PLANTAGENET.

*SIR WALTER SCOTT'S MONUMENT.*—The London committee for completing this truly national work have been compelled to appeal to the public for assistance to finish it. The monument consists of a Gothic shrine, from a design by the late Mr. Kemp, inclosing a marble statue by Mr. Steele, to the memory of Sir Walter Scott. The committee were guided in their adoption of the plan by the weight of public opinion in favour of that ultimately selected, and from which the monument is now in course of erection in Edinburgh, the city of Sir Walter's birth. The greater part of the building is already erected, but the funds originally subscribed are found inadequate for its completion, and although great exertions have been made to raise the whole amount in Edinburgh, about 1,000*l.* is still wanting.

**IMPROVEMENTS AT WINDSOR.**—The Commissioners of Woods and Forests have recently determined to dispose of, by public competition, the piece of ground, of nearly two acres, which was lately occupied by the Royal Lower Mews, for the purpose of erecting a double line of houses of a first-rate description, according to the plans of the commissioners.

#### TO OUR CORRESPONDENTS.

We have this week received an unusual quantity of correspondence, but the anxious labour in which we have been engaged in the preparations of our different articles, precludes us this week from giving any answers, the more especially as some questions put to us would require research and consideration.

#### NOTICES OF CONTRACTS.

For re-building the Western Pier of the Humber Dock Basin, and the removal of the present Pier included, or to be provided for in a separate tender, as may be most convenient.—Secretary to the Dock Company at Kingston-upon-Hull. Plans, &c., at Mr. Michael Lane's, Engineer, Castle-street, Hull. May 20.

For making a plan and taking levels of all the drains in the town of Kingston-upon-Hull, and the Lordship of Myton.—Further particulars of Mr. R. Witty, Surveyor, 11, Sykes-street, Hull. May 22.

For erecting a bridge over the Waveney, between Diss and Stoston.—Plans, &c., from 1st to 8th inst., at Mr. Farrow's, Diss; from 8th to 15th at Suffolk Hotel, Ipswich; and from 15th to 22nd at Royal Hotel, Norwich; Clare Algar, Secretary, Auctioneer and Land Surveyor, Diss. May 23.

For erecting New Schools at Wrotham.—Plans, &c., Messrs. Whitehead and Walker, Architects, Maidstone. May 30.

For erecting a Cottage and Range of Offices at Kintore.—Plan, &c., A. Abel, 54, Union-street, Aberdeen. May 31.

For the erection of an Iron Bridge of one arch, of one hundred and ten feet span, intended to be built over the river Avon, at Bath.—P. George, Esq., Town Clerk, Bath.—Drawings, &c., at G. P. Manners, Esq., Architect, No. 1, Oxford-row, Bath. May 31.

For enlarging, straightening, and improving the course of the rivers Devon and Smitte, and the Curdyke, in the parishes of Hawton, Farndon, &c. &c., in the counties of Nottingham and Leicester, and for the erection of, building, enlarging, &c., the several bridges connected with the above works.—Specifications, &c., Mr. Talents, Newark. June 1.

For the erection of Two Shed-Buildings, to adjoin the main building of the New Workhouse at Rye-hill, Sussex; also for the erection of extensive inclosure-fences of brick, stone, and iron palisade in front of the Workhouse, and other necessary works. The Guardians, Rye Union, Workhouse Tender. June 1.

For the executing of certain works for the improvement of Aberdeen Harbour.—Plans, &c., Mr. Abernethy, 69, Waterloo-quay, Aberdeen. June 20.

#### PREMIUM.

£50 for the selected plan, elevation, and estimate for the erection of two Chapels and an entrance-ledge, with gateway, on the eastern side of Southampton Cemetery.—Plan and section of ground Mr. Doswell, Albion-place, Southampton; C. E. Deacon, Secretary. May 22.

#### MEETINGS OF SCIENTIFIC BODIES,

To-day and during the ensuing week.

**SATURDAY, MAY 25.**—Royal Botanic, Regent's-park, 4 P.M.

**MONDAY, 27.**—Geographical, 3, Waterloo-place, 8½ P.M. (anniversary); Medical, Bolt-court, Fleet-street, 8 P.M.

**TUESDAY, 28.**—Medical and Chirurgical, 53, Berners-street, 8½ P.M.; Zoological, 57, Pall Mall, 8½ P.M.

**WEDNESDAY, 29.**—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset House, 8½ P.M.

**FRIDAY, 31.**—Royal Institution, Albemarle-street, 8½ P.M.

**SATURDAY, JUNE 1.**—Asiatic, 14, Grafton-street, 2 P.M.

**CIVIL ENGINEERS.**—Library open from 9 A.M. to 9 P.M.

**ENTOMOLOGICAL SOCIETY.**—Museum open every Tuesday from 1 till 7.

**SOCIETY OF ARTS.**—Open every week-day except Wednesday, between 10 and 2. Admission by members' tickets.

# The Builder.

NO. LXIX.

SATURDAY, JUNE 1, 1844.

NATURALLY

prone to esteem things genuine of their several kinds, we again express our earnest desire that the Parliament houses shall be genuinely finished. The edifice is large, lofty, and grand, of the first class for situation and purpose, and therefore likely to influence both nationally and privately, the cause of architecture for some time to come; for these reasons we again return to the subject of the works of art

exhibited in St. James's-street, which we have so often visited, and have noticed so repeatedly.

With regard to carvings, which form a prominent feature in the collection, we must say those not prepared for the purpose bear the palm for execution, which, as we have already stated, we deem to be the fact sought to be elicited. The Gothic works exhibited by the two Thomases, those by Nash, and some of those by Pratt, have merit, and the artists who executed them may fairly be entrusted with the execution of parts of the work. The finest piece of carving in the collection is undoubtedly the frame exhibited by Rogers, which was executed by him for W. Beaumont, Esq., M.P.; and for which he received the sum of five hundred pounds; the grouping of the fruit, flowers and other objects, the delicate finish, the giving life to the dead tree, the quickening up the sapless wood, the swelling the dried ligneous fibres into the rich pulpy fruit, must cause every beholder at once to exclaim, this is excellent, without looking into a glossary to see if it be Byzantine, or Norman, or Elizabethan, or Venetian, or Flemish, or Louis-quatorzeine, to find whether it be lawful or respectable, or *a-la-mode*, to exhibit any emotion; whether boorishness or ignorance will be displayed by admiration of that which evidently cannot be admired without some antiquarian or other leader to direct.

With regard to glass-staining, if the quantity which will be required be any thing like that which we suppose it may be, twenty glass-stainers at least should be employed.

Wellment ought, for the arms, to be employed, though not an exhibitor.

Clutterbuck, Cobbett, Hoadley, Baillie, Ballantine, Higgins, Allan, Warrington, and Wilmshurst may be placed among those who should be entrusted with the execution of the ornamental work and pictorial and historical subjects.

Among the decorators we should include Messrs. Coulton and Elliot, who had the good taste and good sense to send in that quiet and appropriate green-grounded subject, No. 157.

The elaborate design for the pavements and floors, by Mr. Owen Jones, reflects very great credit upon him. His notion, that the representation of things estimable should not be trampled upon, is good, and may, to a certain extent be acted upon; however, by this notion what would become of monumental brasses? Part of the work we should compose of the materials which he proposes for use; but his acquaintance with Moresco patterns he has hardly been able to throw off, and we doubt whether any part of his elaborate design is altogether free from a Moresco appearance. We, therefore, have considerable doubt whether any part of it would be appropriate just as it is.

Of encaustic tiles, many of those by Chamberlaine and Co. are good in design, and are very proper for the work. We, however, wish the colours of some of them were changed for those of a richer and more *recherché* kind; the glazed brown patterns, for instance, have too much the effect of common pan-ware to be valued according to their cost and merits.

The Indian-red patterns, by Grimsley, are exceedingly beautiful and appropriate; and many of those by Copland and Garrett, Minton, Singer, and Mayer, are worthy of being adopted.

With regard to the metal-works, there is a clever perforated casting in a right style, by Mapplebeck and Lowe.

We think all the stoves should be designed on purpose, as should the fenders, fire-irons, escutcheon-plates, hinges, locks, and other visible metal-work.

The embossed leather decorations, by Leake and Co., some plain, some coloured, and some gilt, may be used for various parts of the work. Some of the effects produced in this material, of reliefs, flowers, and arabesques, are wonderful; judging from the ancient specimens which still remain, they would be very durable; and we have little doubt that other spectators, as well as the artists of this material, will say, after viewing their handy-works, "nothing like leather." At any rate, if carried no further, these specimens shew how well they are adapted for going round the doors. This employment alone would occasion no trifling amount of work throughout this great national palace.

We have, in this review, endeavoured to be as impartial as possible, and that we have been so is attested by the numerous letters which we have received on the subject.

If we have chanced to know any of the parties who have exhibited, they have not been praised beyond their merits, and some such we have greatly dispraised. D.

## NEW BUILDING-ACT.

THE proposed new Building-Act, as amended in committee, has been printed; it is much improved in many respects: the rating is nominally reversed, so as to agree with the present Act, and all preconceived notions of first and last; but some objectionable parts still remain, and some new propositions are inserted. The most objectionable project to forbid chimneys to be turned away from their bases in any way which in practice may be found requisite (and which long and extensive experience proves may be soundly done), is still pertinaciously and ignorantly insisted upon, but which, if it became law, would, from its tyrannical nature, insure the repeal, in less than six months, of the whole Act, within this

free empire. When we have carefully looked over the whole Bill in its present form, we shall give a minute critique upon it.

On Wednesday last there were meetings at the Freemasons' Tavern, Great Queen-street, of the district surveyors and of the master-carpenters relative to the Bill: with what occurred at the former we are unacquainted; at the latter, Mr. Biers, the president, explained generally the nature of the emendations made in the Bill, which appeared to meet with approval, many oppressive proposals being expunged from it; the matter was referred back to the committee which drew up the report, (and which had interviews with Earl Lincoln upon the subject), in order to the effecting of a removal of the remaining objectionable parts of the Bill.

## BETHLEHEM HOSPITAL, ST. GEORGE'S FIELDS.

WE have just seen a sketch for a proposed alteration to this edifice in a manner of which we totally disapprove; the change contemplated to be effected is by the removal of the present cupola, and the raising above the centre of the building a loftier lantern-cupola, in the French style, with scroll consoles at the bases of its supporting piers or pilasters. Three or four years ago, the facade of this pile was injured exceedingly by the addition of wings, which have a very unsatisfactory and indeed unhappy effect. Now, to the summit of the edifice, which is in the very simplest style of Grecian Ionic architecture, this incongruous and ill-advised addition is proposed, and perhaps, before the damage can be stopped, things may have advanced too far for the prevention of this wasteful breach of propriety. So it is our English architecture suffers more from injudicious alterations by those whose duty it is to increase the splendour of our national works, than by all the direct attacks of acknowledged barbarians.

## THE SEVENTH-SIXTH EXHIBITION OF THE ROYAL ACADEMY.

ARCHITECTURAL DRAWINGS.—SECOND NOTICE.

915. Interior—West Hill House, Hastings, by John Hornby Maw, H.

This honorary amateur drawing is a glorious one; its whole effect—deep, rich, and brilliant—is wonderfully fine. The apartment which it represents is handsome, and is richly furnished in the style of the time of James the First. Its accessories are beautiful, the light and shade of the female figure sitting against the oriel window are perfect. Even the spaniel upon the Turkey carpet is represented as spaniels are not every day shewn by the pencil. Paper, in this superb work, totally disappears. Carving, furniture, embossed ceiling, Turkey carpet, light, shade, colour, and execution, all combine to make this a production which, architecturally considered, we should prefer to any other picture in the exhibition.

1055. St. Peter's Church, Islington, as recently executed from the designs and under the superintendence of Gough and Rounieu.

This is one of Charles Barry's inferior works altered. The church, as originally built, perhaps was the cheapest and most homely structure which its architect ever erected. The building has been enlarged, but little improved, and in many respects injured. The one-sided tower, surmounted by a spire, which has been built at its north-west corner, is a needless piece of irregularity added to a regular design, and ought to be removed; it is so mean, thin, and skewerlike, as to appear ready to fall upon the beholder. Many of the details of the new work are impure, and are applied in an un-Freemasonic manner.

1056. Design for the Water Temple, and Fountains for supplying the City of Pest, in Hungary, with Water, by W. T. Clark.

In an inferior style abounding with revived old

errors, which should be avoided. We think a man educated to the science of architecture should have strength of mind enough to avoid the trumpery which from time to time arises as fashion in architecture, as in many other things. Pilasters and columns far down from the entablature over them, arches intervening, a second series of triflingly small pilasters upon the heads of the lower and larger angle-pilasters, may be found in some work or other, but that mere circumstance, though it afford a reason for avoidance, can give none for imitation.

1075. All Saints' Church, Thelwall, by J. M. Allen.

This design contains some good parts, but portions of it are injured by the vice of placing narrow windows in duplicate instead of large and noble windows divided into three days or lights.

1081. View of London, from the steeple of St. Bride's Church, Fleet-street, by T. Allen.

A beautiful drawing, showing as much of the vast city as possibly can be seen in one view, except from the summit of St. Paul's cathedral.

1083. North-west view of Shottesbrooke Church, Berksire, by G. Buckler.

This church, surmounted by a tower over its central crossing, contains many genuine parts.

1106. Design for the altar window of Chichester Cathedral, by W. Warrington.

Of small work, and miniature pictures, a style which we hope soon will meet the *coup de grace*, and make way for the nobler style of art.

1119. Approved design of a new Church, to be built at Woolwich, by F. E. H. Fowler.

Of considerable beauty; the tower and spire over the great crossing. We should alter the transept, making, instead of the rose and six narrow lancets, only one grand window of five days; the convex triangular clerestorial windows, divided each into three trefoils, are good, but the aisle-windows, divided each by one mullion, are to be deprecated.

1120. Western elevation of a Church, with transepts, designed for a late competition, by H. T. Wright.

Partly copied from Wells and Salisbury cathedrals; at the crossing surmounted by a steeple, not in good taste, nor with a good outline.

1121. Design of the Holy Trinity Church, Hull, by W. Granville.

A church containing some noble parts; the surmounting of the great gable by a horizontal-topped screen-wall, however, very unnaturally injures the effects of the view.

1123. Design for the Bookbinders' Almshouses, by W. J. Short.

We disapprove of the timber-work of this design, as neither useful nor elegant.

1142. Holy Cross, New Church, now erecting at Leeds, by J. M. Deriek.

Many parts of this design are to be commended: the tracery of the great five-light west window is no un-English to please. The clerestorial windows and the side windows of the west front are of three lights each, and have a better effect than windows of two lights.

The pinnacle-shaped roof over the turrets by the porch is too much stunted. It may be a fault that the doors of the church are comparatively so small, but these, as at Wells Cathedral, cause the whole building to appear more vast.

The tower and spire, which rise from the great crossing of the church, are copied from St. Mary's, at Oxford. The angular masses serving, however, as restraining pinnacles, are not altogether to be approved of. The heavy pinnacles over the clerestory are against Freemasonry, and are to be altogether condemned as pernicious. The ponderous bell-turret, on the west gable, is far too heavy; good Freemasons would make this as light as possible.

1145. The Hall, near Barnstaple, as proposed to be rebuilt by Robert Chichester, Esq., by P. Hardwick, R.A.

A quiet Elizabethan design, with an Italian porch, surmounted by arabesque scroll-work, mullion-shafted windows, Gothic chimneys, and two turrets.

1149. New church, building at Sorbiton, Surrey, by Stevens and Alexander.

We shall abstain at present from all remarks on this class of open roofs. We do not like the same three words repeated between eighty and ninety times over on the roof, but should desire an instructive variety; otherwise managed, the cost would be to no purpose.

1157. Design for Torquay Church, South Devon, by T. Allom.

A dashing drawing, but un-Freemasonic. The outline of the steeple is broken and inferior and unlike the ancient works; the lower series of flying buttresses rising against the octagonal lantern-stage of the tower would, by their energy, tend to drive in the window-jamb, against which they are pitched; instead of being of use they would add weight, and they are disagreeable in appearance. The upper tier of flying-buttresses are pitched against the piers of the upper lantern, which they would tend to cripple by driving them inwardly; while the thrust of the spire, where it saddles upon these piers, is left unrestrained, and would tend to drive their heads outwardly, instead of being restrained by these flying buttresses, which should be placed exactly where the active forces impinge. The altar three-sided apsis rises so high that the eastern gable, against which it is placed, would be considerably hidden. Each severity of the clerestory of the nave is divided inelegantly into four compartments instead of into three. Flying-buttresses are only applied in two places of each flank of the clerestory, and appear to be only for effect: these two impingements performing no good duty, and, indeed, acting injuriously if there is no internal moving force to be restrained. In some cases the windows are needlessly divided by central columns. This design, which is beautifully drawn by a most accomplished artist, requires in every part the chastening hand of good Freemasonry. In ancient Pointed architecture all is alive, all is active, nothing is dead.

1158. Design for a chancel and east end of a parish church, by F. E. H. Fowler.

This has some good parts, but the rough character of rude gothic is blended overmuch with rich decoration; the crosses on the gables are so thin as to require to be of metal. We think the expense of fringe-work up ridges is best dispensed with; it is of no use, and must occasion some part of the work to suffer.

1172. North-west view of Lee Church, Kent, erected from the designs and under the superintendence of J. Brown.

A good church, finished partly in stone, and partly in stucco; its duplicated windows to be objected to, but contains very good parts: the interior of this church has a pleasing effect.

1174. Design for the exterior of the new church at Torquay, by J. Brown.

A design of considerable merit; only a small part of the nave has duplicate windows; the tower at the crossing would with small additional study be beautiful.

1180. View of the intended choristers' school, St. Mary Magdalene College, Oxford, by J. C. and C. Buckler.

A good drawing.

1219. Design for an extension of the Banqueting-house, Whitehall, on the site of Gwydyr House, appropriate for government offices or a club establishment, by Wyatt and Brandon.

We disapprove entirely of this. The rustic cinctures on the pilaster-shafts are not of the character of Inigo's work, which is much purer. The rising of the five key-stones through architrave, frieze, and partly through the corners of the window-dressings, is in a vicious style, which is gaining ground, and which we think it behoves all to deprecate; the mixture of Venetian windows, none being in Jones's work, mar the design. The great receding hollow between the Banqueting-house and its proposed duplicate copy has a broken effect, and the turrets at the side of it appear deformed, irregular additions to the work of the chaste English Palladio; their surmounting work is quite foreign to the character of Inigo's work; which, though it have its entablatures mitred over each pilaster, nevertheless has a wonderful air of beautiful chasteness, quietude, and simplicity.

## NAWORTH CASTLE.

The melancholy destruction of this noble edifice by fire may be deemed a calamity not only to the county of Cumberland, but to the whole of England. It was by far the most perfect of those castles in the border country, where the fierce barons of former years lived in feudal magnificence, and whence they were wont to issue with a retinue of followers to scare those with whom they might for the time be at variance. To a lover of antiquity a visit to this fortress was one of the most interesting employments that a summer's day could afford. The times which the imagination of Sir Walter Scott delighted to wander in, and his genius to body forth—the days of which our ballad minstrelsy was at once the inspiration, the effusion, and the history, were brought more vividly before the mind by an explanatory ramble through Naworth, than by any other object in the "North Country." The contrast of the period referred to with the present, in point of security to person and property, and with regard to the habits of life which states of things differing so widely generate and uphold, could be nowhere more pointedly impressed upon the attention; for, thanks to the noble house of Howard, the castle, until the fire broke out, was kept in a habitable condition, and matters preserved to our day pretty much as they existed two centuries ago. Its very position upon the edge of a ravine, overlooking a large expanse of ground; the amazingly thick walls, to be measured not by feet but yards; the "secret winding passages," the dungeons, the portcullised gateways, the narrow stone staircases, all spoke of a period and a place that required watchfulness and defence before comfort and embellishment.

Let us first describe the castle as it appeared before this disastrous accident reduced it to a few bare walls. It was built in a quadrangular form round an extensive court-yard, just at the point where two foaming brooks before becoming confluent swept down the hill at the opposite sides of a precipitous rock. It was only to be reached from the south, and on that side it had formerly been protected by a double moat, whilst a barbican defended the drawbridge. Here the principal front extended to a length of 208 feet. This front was guarded at each end by a lofty battlemented tower, from a corner of which sprang a slender watch-turret, like a feather in a cap. The grand gateway led into the outer court, and above it were boldly sculptured in stone the armorial bearings of families who possessed the castle before it came into the hands of the Howards. To gain admission to the great court-yard the visitor had to pass through a low narrow archway, that pierced the main building not quite in a line with the grand gateway we have mentioned. Out of this court-yard, which, from the picturesque appearance given to it by oriel windows, sculptured doorways, fantastic chimneys, and thick bushes of climbing ivy, demanded something more than a passing glance, many entrances led into the interior of the mansion.

The apartments were numerous, but our space will not allow us to particularize more than the principal ones. The great hall was a noble room, 70 feet by 24, chiefly lighted by a large bay window. The ceiling was divided into a great number of panels, containing portraits of our English monarchs, from Brute to Henry VI., all accurate likenesses no doubt. Lord William Howard's suit of armour hung in the hall, and one of the two remaining suits that were there was bestowed, through want of an owner nearer home, upon the knight who led Joan of Arc to the siege of Orleans. The dining-room was lined with tapestry, storied with faded and undecipherable designs. Many portraits, valuable in an historical point of view, hung high on the walls. Amongst them were portraits of Philip, Earl of Arundel, celebrated as the introducer of coaches into England; three of the eighth Harry's queens, and that famous lady Ann Clifford, Countess of Dorset, Pembroke, and Montgomery. With the pride of ancient family, the genealogical tree of the Howards, and of the previous owners of Naworth, was reserved for the chapel, upon the ceiling of which some quaint old painter had depicted ideally ugly likenesses of the persons mentioned in holy writ, carefully appending his name and date, that neither envious time nor equally envious brother

linners might steal the glory of the performance from him:—

“Magister Lucas Egliement,  
Pictor. M.D. XII.”

The guard-room, 116 feet long, formed a sort of gallery in the south front. Here were deposited several paintings, the refuse, for the most part, of Castle Howard, and many pieces of rusty armour. Some of the paintings, however, were of great excellence, and it is to be hoped that these have been saved from the fire. A portrait of Charles I. by Vandyke was one of the finest we ever remember to have seen. The King was represented in armour, his left arm resting on his helmet, which lay on a table beside him, and his right hand holding a baton. The pensiveness which was natural to Charles sat well upon his handsome features, and exhibited as clear a prophecy of his doom as the most ardent physiognomist or republican would desire. Here, also, was Raleigh, with his olive complexion and hair of midnight darkness; a painting of Lord William Russell winding up his watch for the last time before his execution; Queen Bess, with a ruff so stiff as to lead to the belief that the three kingdoms had been ransacked for starch to fortify its regular folds; Arthur Lord Capel, beheaded in 1648;—all these, with many others, hung in the guard-room. Memorials of “Belted Will” were here submitted to the stranger’s inspection. There was his cradle, and there his military saddle, the belt that braced him in many a tough encounter; the gloves that grasped his good Bilboa. The belt was (we hope that we might say is) a curiosity well worth examination. It was of leather, three or four inches broad, and covered with metal studs arranged so as to form this couplet in the German language:—

“O mensch gedeneck an diesen tag  
Dass Gottes starcke hand vermag.”

The distich comprehends a fine moral, and may be thus translated:—

“O man reflect that on this day,  
God’s hand hath power to save or slay.”

This is the “broad and studded belt” alluded to in the “Lay of the Last Minstrel,” from which the Lord Warden of the Marches derived his well-known epithet. Perhaps we may be pardoned for pausing a moment to notice that Mr. Howard, of Corby Castle, who wrote a large volume, containing memorials of his family, thus alludes to the passage in the lay already quoted:—“Lord William Howard is called by Sir Walter Scott ‘Belted Will Howard,’ meaning, I apprehend, that he was in the habit of wearing the baldrick, or broad belt, which was formerly worn as a distinguishing badge, by persons of high station. But this, as to him, is not at all founded in fact, as the belt which he wears in his pictures are particularly narrow. But the characteristic epithet with which his name has come down to our times is ‘Bauld,’ meaning ‘Bold Wyllic.’” With submission, we think Mr. Howard is wrong upon this point. Whatever may be the dimensions of the Warden’s belt in his pictures, the baldrick shown at Naworth was nearly four inches broad. This cannot be called “narrow,” nor is it, perhaps, remarkable for its breadth. It is very probable, however, from the lines in a foreign language wrought upon its face, that there was some superstition connected with the belt, such as being endowed with a secret potency protecting the wearer from harm, and hence the origin of the epithet in question. Sir Walter does not tell us where he acquired his description—possibly by ocular inspection. At all events, we see that on this, as on other occasions, the poet was minutely accurate as to costume.

Passing from the guard-chamber, where we have been lingering so long, into one of the towers on the south front, a dark cavernous passage was entered leading to Lord William’s bed-chamber, a small apartment containing a bed, such as not even a board of guardians would dare to give to a pauper *protégé*. The room was furnished with appliances of defence, and means of escape to boot. The first consisted in a floor formed of a composition as hard as stone, and doors of enormous thickness, secured with bars and bolts past counting. The second is a secret apartment, vaulted, and without light, entrance to which was gained by removing a portion of the wainscot panelling. But the person who inhabited these rooms was

a scholar as well as a soldier. A winding staircase conducted from the sleeping apartment to a room above, stored with books and manuscripts, which, when we saw the place two summers ago, were in a sad state of disorder. Many volumes, once there, had disappeared; what remained had been woefully mutilated, and were in such a dirty condition that the fingers instinctively recoiled from the operation of opening them. Curiosity in the end overcame minor considerations. The books, upon investigation, seemed to have been more studied by Lord William 200 years ago than by all his posterity since. His lordship, in many instances, in addition to inscribing his name on the title-page, had written a few words in allusion to the subject. Thus, in a copy of a work by the “Starry Galileo,” was written—

“For their glory is to change,  
And their liberty to range.”

In “Calvin’s Institutes” he had placed, “Qui sibi videtur stare, videat ne cadat;” and in a controversial work “Merces amoris amor,”—a hint, we suppose, to the polemic author.

Alongside the place of study was the place of prayer. The oratory contained a quantity of carved wood brought from the neighbouring priory of Lanercost, and a confessional. Before descending from this “peaceful citadel” we might have conducted the reader to the watch-turret, thence to gaze upon an undulating plain, scattered with villages and farms, woods and pastures, that stretched away to the border highlands. What a different prospect from that beheld by the watchmen from this very turret, when homestead and rick, blazing through the gloom of night, disclosed deeds of rapine and spoliation in the plain below, which the castle inmates were immediately roused by sound of horn to remedy or avenge! In those days it was requisite that a castle should be a man’s house, if he wished to experience the truth of the proud maxim which declares every Englishman’s house to be a castle.

The dungeons (to make a rapid transition from airy turrets to airless dens) are formidable affairs indeed. Not a ray of light was allowed to penetrate, and rings in the wall remained to show that my lord warden knew how to keep a prisoner when he had caught him.—*Times*.

THE ROYAL EXCHANGE.

THE interesting ceremony of opening the new Royal Exchange, it will be remembered, was originally fixed by the Gresham Committee to take place in the course of July, and, although no decisive promise was made, still there was little doubt that her Majesty and her royal consort would honour the city of London by opening it in person. An event, however, of the deepest and most lively interest to the nation at large, and which is likely to occur about the same period, precludes the hope of her Majesty’s presence at so early a date, in consequence of which the ceremony will be deferred in all probability, for as yet no day has been named, until September. Since the completion of the masonry of this splendid structure, the committee have diverged from the plans they had formerly agreed upon, and have made several important improvements, which when completed will render the building far more interesting than was anticipated. Amongst those of the most moment are the clock, bells, and chimes. The clock, an important feature in the consideration of the committee, is being made by Mr. Dent, the eminent chronometer-maker in the Strand. The works are nearly completed, and for ingenuity and correctness will surpass any other of the kind in this country. The original intention of having the same number of bells (eight) as before the fire has been abandoned, and the number increased to fifteen. The alteration was at the suggestion of Mr. Dent, who, having visited Brussels and other parts of the continent to obtain information as to the arrangement of curillons, for which the artisans of Flanders have acquired a well-deserved celebrity, was induced to recommend that number, so that a more harmonious chime might be gained, 15 bells giving three octaves, thereby increasing the melody. They have been cast by Messrs. Mears, the bell-founders in White-chapel, and are almost ready for hanging in the tower. The largest weighs 22 cwt, and

the smallest 5 cwt., the whole set weighing 7 tons. The largest is also the hour bell, and bears the following inscription:—“Cast for the Royal Exchange in the year of grace 1844; Richard Lambert Jones, chairman of the Gresham College Committee; Daniel Watney, Master of the Mercers’ Company; Ebenezer Trotman, Assistant; William Tite, Architect. Charles and George Mears, founders.” The others only bear the words “Royal Exchange, 1844.” As yet the whole of the tunes have not been agreed upon, the only ones decided on being “God Save the Queen,” “Rule Britannia,” and an ancient madrigal. The barrel for the chimes is completed, and appears to be an astonishing piece of mechanism; it contains upwards of 7,000 holes. The clock and chime works will be securely protected in a separate and well-fitted apartment in the tower, and not exposed, as is generally the case in the metropolitan steeples, to the inclemency of the weather. The pendulum weighs 4 cwt., and is 16 feet in length; each vibration being two seconds. The roof of the arcade, or merchants’ walk, will present a very beautiful appearance, work-people being now busily engaged in painting it in the fresco style. The roof of the southern entrance is already done, and may be seen from Cornhill. It is also understood that Lloyd’s and other public rooms will be similarly decorated. The sculpture executed by Mr. Westmacott for the pediment of the grand façade will be erected in the course of a few days. The foundation for the Wellington statue has been laid, and awaits the masonry, and nothing has as yet transpired that will prevent the statue being raised on the 18th of next month.—*Times*.

ARCHITECTURAL GEOMETRY, No. I.—CENTRES OF TUDOR ARCHES.

TO THE EDITOR OF THE BUILDER.

SIR,—Will some one of your talented correspondents furnish me, through the medium of your valuable periodical, with a correct rule for drawing the Tudor (or four-centred) arch?

This is sufficiently easy when the height is not limited; but I have had the following proposition given me, which, with the slight attention I have given it, I am unable to solve:—

Given.—The width at the impostes A B, the height C D, and the angle at the vertex E D F, formed by the chords of the upper arcs.

Required.—The radii E I and E H of the arcs forming the curve.

An early solution will oblige, Sir, yours, &c.,  
A SUBSCRIBER FROM THE BEGINNING.

[In such arches, the point of union, E, of the two curves composing one limb of the arch, and the centre, I, of the smaller curve, and the centre, H, of the larger curve must all be in the same right line; otherwise the two curves will not blend perfectly. If the situation of the point E be not previously determined, it may be found practically by finding a radius, the centre of which shall be in the line A—B, which will strike a circular curve, which shall, at E, meet the line E—D. When this is done, a line must be produced through the points E and I indefinitely, and on this line will be found, at H, a centre for sinking the larger circular curve, which shall extend from D and blend at E with the smaller curve properly, and without

an angle. If sufficient dimensions be given, the case may be argued arithmetically. The letters F, K, and G, are repeats, and may be dispensed with in the description. The premises are deficient; the smaller radius ought to be first determined; this would render unnecessary several trials in order to prevent the curves from not blending without an angle.—*Ed.]*

#### INSTITUTION OF CIVIL ENGINEERS.

MAY 21.—The President in the chair.

The discussion upon the atmospheric railway was extended to such a length as to preclude the reading of any papers, but as many points, both of the theory and practice of the system, still remained to be examined, it was decided that the discussion should be renewed at the next meeting, of June 4th, after which a full report of the proceedings will be given.

The president's annual conversazione was announced to take place on the evenings of Friday, 7th, and Saturday, 8th June, to which the members and the president's friends were invited, and their co-operation was requested in procuring models, works of art, and curiosities for exhibition on the occasion, when a more than usually interesting meeting was anticipated.

The following papers were announced for reading at the meeting of June the 4th, there not being any meeting on Whit Tuesday, the 28th instant:—

No. 670.—“Account of the plan adopted by William Preston White, for raising the ‘Innisfail’ steamer, sunk in the river Lee, near Cork (Ireland).” By G. P. White, Assoc. Inst. C. E.

No. 678.—“Description of a coffer-dam used for closing the ends of the building-slips at H.M.’s dockyard, Woolwich.” By B. Snow, Assoc. Inst. C. E.

No. 683.—“Description of the iron shed roof at the London terminus of the Eastern Counties Railway.” By W. Evill, jun., Grad. Inst. C. E.

#### REDCLIFFE CHURCH.

THE vestry of the parish of St. Mary Redcliffe again appeal to the public on behalf of the beautiful fabric of which they are the present custodians. They do not feel justified in entering upon so great an undertaking as the substantial repair of the church, until they have obtained a sum sufficient to ensure the satisfactory execution of that portion of the work absolutely essential to the stability of the building; and this sum they have fixed at 7,000*l.* The amount already raised we understand to be about 5,000*l.*, and latterly subscriptions have come in but slowly. We believe the public are not fully aware of the nature of the demand made upon them. They do not know that this magnificent fabric is crumbling away with a rapidity that must soon reduce it to ruin, if steps are not speedily taken to check the progress of decay, and support its declining masses. We can speak from observation, having carefully inspected the building; and we are sorry to say that the architects, Messrs. Britton and Hosking, whose report has been published, have not exaggerated the dangerous condition in which it stands. The rotten state of the external stone-work is an evil only of second magnitude, yet one not to be fully appreciated without close inspection. The crockets, finials, half-flowers, and other ornamental works, are crumbling away; but however much we might regret their loss, as the stability of the fabric is little dependant upon them, there would be no imperative necessity for repairs on that account; though it should be known that these do not wear away by imperceptible degrees, but are constantly falling in fragments of considerable size. Almost the whole of the exterior surface of the stone-work consists of a loose crust of soot and sand, the disintegration of the stone having taken place to a depth of from one to three or four inches. But an evil of a much more formidable nature exists in the declension of the walls themselves from the perpendicular, in their unstable foundations, and the thrust constantly exerted by the roof to push them outward. The parts of the church most observable are the choir, with its south aisle, and the south transept. The walls of the choir (or what is called its *clerestory*) are supported

on the piers and arches that separate it from its aisles, and its heavy groined roof has, of course, a tendency to thrust them outwards; to this thrust of the roof the architect had applied the usual counteracting forces, pinnacles placed over those parts of the wall against which the ribs of the groining converge, to give the outward thrust a more downward tendency, and flying buttresses supporting the clerestory wall from that of the aisle, which in its turn was strengthened by strong buttresses, in stages. We doubt whether sufficient support was originally given to the clerestory; but probably little injury would have resulted, if the stability of the outer walls and buttresses had not materially suffered from the reprehensible practice of digging graves close to their bases. This practice has destroyed the resisting power the walls would derive from foundations firmly set in the earth; and the outward pressure of the flying buttresses, which convey the thrust of the roof from the wall of the clerestory to that of the aisle, has thrown the wall of the aisle, likewise, and its buttresses, out of the perpendicular. The clerestory, as we have already explained, was originally supported from the wall of the aisle; but as this can now scarcely support itself, it may be supposed it has become incapable of affording efficient support to the other. Some bungler has been employed to remedy this evil, and has endeavoured to uphold the outer wall by connecting it by iron bars with the inner one; thus each has now the office assigned it of supporting the other, which, as they both lean in the same direction, and not towards each other, it is impossible for them to do. The transept is in a similarly unstable state, but in that *both* the walls have an inclination to the westward. The mullions and tracery of most of the windows are so much decayed that it is with difficulty they have been held together.

On going up the tower and upon the roof of the chorch, the manner in which the masonry is crumbling away becomes more apparent than from below. We observed one mass of stone, weighing fifty or sixty pounds, which had fallen very lately from the pinnacle at the south-west corner of the church, upon the leads of the south aisle; it was part of a finial, and the iron bar in its centre, which had been used to connect it with the rest of the stonework, had made, in its fall, a hole through the leads of the size of a hen’s egg. Within the parapet at the top of the tower was a still larger fragment, which had likewise fallen within the last few weeks. A member of the vestry, who obligingly accompanied us in our examination of the building, stated that it had fallen since he was last up the tower, which was not long since. In another place we observed a split down the centre of a pinnacle, a large portion of which can scarcely fail to be detached by the first frost occurring after rain, and it will fall on the west side of the tower, towards the street.

It will be seen from what has been said, that the question of the restoration of Redcliffe Church is not merely one of what would be well in an æsthetic point of view, but it is a question of whether the building is to stand or fall. And this being understood, we cannot entertain any doubt as to the liberality with which the dwellers in the west will come forward to support the vestry in the exertions they are so creditably making. Very unjust aspersions have lately been cast upon Bristol for its alleged illiberality, merely from the thoughtlessness of a clever writer, who considered that she could not be wrong in abusing a city with a bad name. Bristol has a bad name, and though very causelessly, the sooner it is retrieved the better. A Bristol merchant built Redcliffe Church; another rebuilt it when decayed; by another the beautiful church of St. Stephen’s was erected; by another that of St. John; St. Werburgh hya fifth; the church and convent of St. James, too, were built by private munificence; and the names of Colston, and Spencer, and Forster, and many others, might be adduced to show what has been the liberality of the wealthy merchants of Bristowe in times past; whilst to this day no town is more ready in its support of all pious and charitable purposes, though it may, as yet, be behind some others in its patronage of the useful arts. We cannot believe that any real difficulty will be experienced in repairing, in the nineteenth century, when the wealth of Bristol has in-

creased twenty-fold, a church which was erected in the fifteenth by the munificence of one of her sons,—

“The morning starre of Radcleve’s rysinge raie,  
A true maune, good of mynde, and Canynge bighte.”  
The object is one in which the pious, and the useful, and the ornamental are all united; the church has claims every way upon the people of Bristol; but its claim as a temple worthy of the holy purpose to which it is consecrated will be sufficient, it may be hoped, to ensure it against being allowed to perish through neglect.—*Great Western Advertiser.*

#### SCULPTURE FOR THE NEW HOUSES OF PARLIAMENT.

A considerable number of persons of the highest rank, including the commissioners, have visited the studio of Mr. Lough to view two clay models about to be cast for the above-mentioned purpose. The first is a magnificent group, representing an incident in the life of one of the heroic race of the Plantagenets—we believe Edward III. The king has spurred his charger up a steep ascent, covered with heaps of the slain, to bestow the honour of knighthood on a soldier who has just taken the standard from the enemy, but received a mortal wound in so doing. The dying man is falling sick and faint into the arms of a companion, and though a gleam of joy passes across his face, it is evident that the voice of honour is breathed into ears that are fast becoming deaf to the pomps and glories of the world. The majestic figure of the king rises above the rest, his sword stretched out across the expiring warrior, his features elate with stern triumph, and seeming to look beyond the “ignorant present,” to the glorious future, and to heed but little of the sacrifices by which victory is to be purchased. From behind, another wounded man, overcoming the intense suffering visible in every feature, has dragged himself forward to drink in, with almost envious eagerness, the words that are to confer immortal renown on his fallen comrade. The second group, though perhaps less imposing on a first glance, as not including so many figures, and such variety of action and expression, affords a triumphant refutation of the charge of “necessary” coldness, so often brought against sculpture, or at least shews that it is in the power of true genius to mould all that is material to its purposes. A wife has sought her husband on the field, after the battle, and discovered his senseless remains,—guided, it would seem, by her recognition of his horse, who stands in a drooping attitude over the body of his master. The first agony of the discovery is over, and she is leaning her cheek in a passionate burst of grief against the face of the poor dumb mourner, who bends towards her in the mute sympathy which is the only consolation for a genuine sorrow. No one who has ever felt its power can fail to appreciate the pathos of this exquisite performance, and the sudden gush of tears which it brought to the eyes of more than one spectator was a higher compliment to the power that produces them than any that words can furnish.—*Morning Journal.*

#### USELESS LEARNING.

BY JOHN BYRNE,

Late Professor of Mathematics in the Columbian College, Washington, United States.

“The history of men’s follies,” says the inimitable Fontenelle, “makes no small part of our learning; and, unhappily for us, much of our knowledge terminates there.” But if there be one folly greater than another, it is the having the mind stored with a large amount of useless learning. Yet this is the reason why men who have spent a long apprenticeship at college very often become useless members of society.

The superfluities of life should follow only after the necessities—so it is with knowledge. Society calls forth from the mind what she calls forth from the soil—useful products. Reason should be cultivated more than memory; nor is the bare acquisition of new ideas of any real advantage, unless they be such as are adapted to the circumstance of our wants and occasions, or be capable of becoming so. We have very few instances of men who advanced the interests of society, whether by

machinery, manufacture, politics, or morality, that have not been drawn out into a sphere of active life, to perform a more or less conspicuous part. The chief object of an education is to prepare us for some useful and important vocation of active life. This is the essence of true merit—aside from this, learning is not worthy of its name. It is all the same to the present generation, whether the ecliptic will coincide with the equator in two or three millions of years—whether the Medea of Sophocles or Ovid's Metamorphoses best illustrates the doctrine of space and infinity—if the mind of man be placed in the brain or in the spinal marrow, or whether it be a spirit or an assemblage of monadical particles—if the mountains were formed at the creation, or produced by a deluge—whether the falls of Niagara will take 16,000 or 20,000 years to work their way into Lake Erie, or if what is called matter has sensation, in the same manner as it has gravitation; with a multitude of other *ifs* and *whethers*. Everything now-a-days is a science; but science is useless knowledge, unless it become subservient to human purposes, and under the direction of human reason. We would not give a straw for all the senseless prattle about the claims of one of the heathen gods over another; nor do we care whether Jupiter was born upon Mount Ida, or upon the hill of Lycotus. It makes no difference to the present inhabitants of the globe, though Venus was lovely and Minerva wise; though Janus was worshipped as the ruler of the year and all human fortunes; though Leda brought forth an egg only to Jupiter, or one to both Jupiter and Pydarus; and though Psyche, the pure, devoted Psyche, was the daughter of a king, or of Sol and Constancy, it makes no matter: all this sort of pretended knowledge has never advanced commerce or agriculture, nor can it improve manufacture. Will it aggrandize art, or enlarge science? Will it lessen the fuel or friction of our steam-engines? Can it harmonize society, or prevent men from deceiving and calumniating each other? No—it is all useless learning. We are formed to count, measure, and weigh, without engaging in a labyrinth of philosophical absurdities of first causes, which has been so long honoured by the name of science. In short, let us hold in contempt all those kinds of philosophy which do not tend to make mankind happy: which give us false notions of our duty to ourselves and our neighbour; which do not teach us to regulate our conduct; which fill our minds with uncouth terms, incomprehensible theories, or ill-founded conjectures; which do not give us a clearer idea of the author of nature than what we may acquire from his works, and the wonders that are every day passing before our sight. But if there be one thing to be more dreaded than another, it is an inveterate love for reading works of fiction, and especially for roaming in the boundless literary deserts of some of our trashy periodicals, with their effeminate tales and butterfly poetry.

It is all useless learning; and the time absorbed in weakening the mind with the paltry, effeminate stuff, is a blot on our lives, diminishing instead of lengthening. All those tender charming love-tales, that suit ladies and gentlemen of independent fortunes, who only seek an agreeable amusement in reading, bave their day, but then vanish into utter oblivion, like many of our metaphysical phantoms, or the dreams of a sick man: while the fruits of useful knowledge and industry are permanent, and remain to eternity. Again, what solid benefit does a student receive from the majority of the public lectures at college? Though rather opposed to the popular doctrine, we have very little faith in the knowledge derived from this mode of instruction. It certainly will not make scholars: and those who just get a smattering of science, are proverbially the worst kind of bores. Those we encounter every day,—they know that water will find its level; that the atmosphere presses with the force of fifteen pounds on the square inch; that all that is gained in power is lost in time; and the angle of 45° is an angle of *all-work* with those scientific gentry. Although not knowing the difference between discount and interest, they will suggest several plans of paying the national debt; without understanding the adjustment of a sextant or theodolite, they have many schemes to effect perpetual motion; and *squaring the circle* is a favourite hobby, yet not being able to distinguish be-

tween the circumscribed, inscribed, and escribed circles of a triangle. Knowledge and learning cannot be acquired without exertion. Those who aspire to possess these distinctions must prove, by industry and perseverance, that they deserve them. There are books to be studied and experiments to be gone through with. There are certainly great evils in the prevalence of this college-going spirit, and, in short, in all our lecture mania; it begets in the minds of its disciples a superficial, trashy kind of accomplishments, or rather the reputation for accomplishments; for mankind generally are fonder of appearing to know something, than of seeking after knowledge.

The system must be faulty that dubs a man A.B., or A.M., merely from his sitting still and listening to a routine of discourses, which are generally unconnected, or trivial, and often senseless. These are facts, of course, that almost every one knows; but "nothing," says Montaigne, "is so firmly believed as that which we least know;" for which reason Plato said, "that it is more easy to satisfy my hearers with a discourse about the nature of the gods than of men."

We speak to the intelligent. If you wish to benefit yourself, or the community in which you live, measure in your mind only that knowledge upon which the grand pillars of society rest for its peace and happiness. Fame sought in this channel is lasting. Knowledge of this kind is always in demand. It is from this acquirement that we daily see instances of men, who never were crowned with the lowest collegiate honour, soar into the high heavens of intellectual greatness, and win the esteem and admiration of the world. Let it not be understood that we undervalue the consideration of speculative philosophy; no, but we must distinguish between chimerical speculations and demonstrable theories; the former can never produce any thing which is not imaginary, and which does not vanish like the dreams of alchemy, or the idle reveries of judicial astrology; while the latter stands immutable amidst all the ravages of time, and ultimately must have a practical application. For instance, the conical pendulum of *Huygens* remained useless for ages, until Watt converted it into a most efficient regulator of the steam-engine. And, again, the accurate observations of the longitude, which preserve navigators from shipwreck, spring indeed from a theory which, by a chain of truths, goes as far back as the discoveries made in the school of Plato, though they were afterwards buried twenty-one centuries in perfect inutility.

#### CHURCH-BUILDING INTELLIGENCE, &c.

*Hook Church.*—The small church at Hook, near Gooles, has undergone considerable repairs and restorations, both internally and externally, which have been executed in a simple, effective, but characteristic manner, under the direction of Messrs. Hurst and Moffatt, architects, Leeds and Doncaster. Much care and attention have been paid to having every part correctly restored, an aim in which they have been ably seconded by the Rev. J. Paley, the incumbent; and as a whole this little edifice may be pronounced a model of what a parish church ought to be in a rural district.—*Hull Packet*.

*New Church, at Milton, near Gravesend.*—The foundation stone of the intended Holy Trinity Church, Milton, near Gravesend, was laid on Tuesday, the 14th May, by the Archdeacon of Rochester. The church will be built of Kentish rag-stone, with Caen-stone dressings, in the decorated English style of the fourteenth century, from the designs of Mr. James Wilson, architect, of Bath. The plan is that of a Latin cross, to accommodate, in open seats, 1,000 persons, 600 of which seats will be free. The chancel will be executed in proportion to the church, with a large eastern window. The tower and spire will be at the south-west angle 130 feet in height.

*THE HOUSES OF PARLIAMENT.*—It appears, by a return made to the House of Commons, that, in 1838, the Lords of the Treasury limited Mr. Barry's remuneration, as architect of the Houses of Parliament, to 25,000*l.* to be paid at intervals in proportion to the advance of the works.

#### RAILWAY INTELLIGENCE.

*Railway from Birmingham to Shrewsbury.*—This long-contemplated project is, we perceive, at length in a fair way of being carried out, and in a manner which must prove highly beneficial to the inhabitants of Birmingham and the densely-populated district through which the line is intended to pass. It was originally contemplated that the Shropshire Railway, communicating with the metropolis, should fall into the Grand Junction line, either at Wolverhampton or Stafford; but this plan was found, on consideration, not only to be open to many objections, but that, by its adoption, a large portion of profitable traffic would be lost. Under these circumstances, it was represented by several influential members of the Provisional Committee, connected with Shropshire, Wolverhampton, and Dudley, that by extending the line through Coseley, Tipton, Dudley, and Oldbury, to Birmingham, a liberal return might be obtained for the capital invested, while a great accommodation would be afforded to the important mining and manufacturing district of the neighbourhood. In consequence of these suggestions, several meetings of the Committee were held, and an interview was obtained with the chairman and directors of the London and Birmingham Company, when Mr. Ormsby Gore gave an outline of the plan, the mode proposed for carrying it out, the result of the reports of engineers, and the statement of traffic taken by Mr. Pore; and when these had been satisfactorily explained, the deputation, on the part of the committee, offered the London and Birmingham Company the lease of the line, on the latter guaranteeing to the subscribers of the required capital 4 per cent. interest, and a moiety of the surplus profits. This proposition was at once acceded to, and, with the powerful influence of the London and Birmingham Company, backed by the support of the noblemen and landed proprietors of Shropshire and the district through which the line is intended to pass, scarcely a doubt remains that the project will be sanctioned by the legislature, and carried out without delay.—*Birmingham Journal*.

*Legislation of Railways in France.*—The *National* has the following:—"It is said that the deputies of all shades of opinion in the chamber have decided that the proposition made last year by M. de Larochejaquein, that no members interested in any line of railroad, either as shareholders or as directors, shall take any part in the votes of the different lines to be granted, is to be again brought forward in a few days, and that all deputies having any personal interest in railroads will be invited to sign a declaration to this effect."

*Atmospheric Railways in Austria.*—A letter from Vienna says:—"We are going to have a trial of an atmospheric railroad. A company has been formed here to construct one between Vienna and Huttlesdorf, by Hiertzing, and Miedburg, on the left bank of the Wein. The expense will be 1,200,000 florins. All the shares, each of which is 10,000 florins, were disposed of the very day the prospectus of the company was published."

The *Railway Record* says—"We have reason for surmising that a new move is about to be made, more startling than any which has yet occurred in these exciting times. What will be thought of a new London and Birmingham Railway, guaranteed by the Great Western and Grand Junction jointly?"

The experiment of an atmospheric railway is about to be made on a line 21 miles in length, from Croydon to Epsom.

Several workmen are busily employed in making additions and alterations at the Royal Observatory, Greenwich, for the purpose of facilitating the scientific labours of the Astronomer Royal.

Messrs. Bright and Sons are erecting a new cotton-mill, to be 300 feet long, 75 feet broad, and five stories high, at Cronkeyshaw, near Rochdale.

ANCIENT CHAIR BELONGING TO THE EARL OF DERBY.

(FORMERLY AT STRAWBERRY-HILL.)

TO THE EDITOR OF THE BUILDER.

SIR,—Among the many rarities dispersed at the Strawberry Hill sale was a very fine old English arm-chair, lot 117, and described as “a most curious and finely-carved Elizabethan arm-chair, the back pierced and ornamented with grotesque heads: in the centre is the date 1603.”

This chair, being occupied by the person who sold the catalogues, escaped the observation of many of the numerous assemblage of visitors. At my request it was placed in one of the rooms, and I made the sketch of which the above is a copy. It is a large arm-chair, rendered imposing by the carved open work at top, which contains the inscription

ANNO  
DOMINI  
1603

in a small panel on a white ground. It is of English oak, the prominent parts of the en-

richments gilt; in the back, under the carved arch, is a coat of arms, on each side of which are the initials P. W.; these, with the architectural ornaments about them, are formed of an inlay of different coloured woods, a very common mode of decorating all kinds of furniture and joinery during the reigns of Elizabeth and James I.

The arms are:—Quarterly I. and IV. Quart, Argent and Gules, a fret or: in the first quarter an ermine spot.

II. Argent, a chevron between three coronants sable. III. Argent, two chevrons gules; in a canton of the last, a mullet or; in the nimbrel point, a martlet for difference.

Through the kindness of a friend, I am enabled to inform you that these are the arms of the Cheshire family of Warburton; and on inspecting “Ormerod’s History of Cheshire,” I am inclined to believe that the chair be-

longed to Sir Peter Warburton, Kt., one of the justices of the Court of King’s Bench, who died in 1621, who introduced a martlet in the centre of his shield. He was a very eminent man, and an account of his legal progress is given by Ormerod. The family of the Warburtons were very numerous, and there were several of the name of Peter contemporarily with the date 1603. Their descendants still remain at the ancient seat, Arley Hall, built by Peter Warburton, who died in 1495.

The small collection of details will be sufficient to shew the style of the ornaments; the patterns are repeated in the chair. I have only to add that at the Strawberry-hill auction, the chair was sold by Mr. George Robins to the Earl of Derby, for the sum of 21*l.*—I am, Sir, yours, &c.,

C. J. RICHARDSON.

22, Brompton-crescent, May, 1844.

Since I sent you the account of the old

Elizabethan chair, I have had the honour of receiving a note respecting it from my friend, Mr. R. S. S. Warburton, of Arley Hall, Cheshire. He states, "that the coat of arms upon it were those borne by Sir Peter Warburton, knight, and to whom no doubt the chair belonged." Sir Peter was not knighted till some time subsequently to the inscribed date,

1603; he was one of the justices of the Court of King's Bench, purchased the manor of Grafton, in Cheshire, and erected the Hall of Grafton, now in existence; a view of it is given in "Ormerod's History of Cheshire," likewise in the small book, "Clarke's Elizabethan Architecture." C. J. R.

ARMS AND OTHER DETAILS OF THE CHAIR.

### PETROLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 267.)

In the earliest epochs of civilization a knowledge of rocks was almost exclusively confined to the architect and sculptor, and the magnificent remains of former greatness testify that the ancients were not only well acquainted with the several varieties adapted to architecture and sculpture, but also with the localities where the materials most suited to their views were to be found, and with the conditions essential to their usefulness and durability. Little is left of Babylon commemorating of its former renown and greatness, and the little that is left denotes the more extensive use of sun-burnt bricks than the treasures of the quarry so lavishly bestowed on the perhaps equally celebrated city of Thebes; but even the latter, magnificent as they are, and evidencing a degree of excellence in finish not to be surpassed in modern times, sink into comparative insignificance before the architectural monuments of the eastern peninsula. Many of these architectural remains, in addition to the stately and primitive grandeur of the Egyptians, exhibit in an apparent exuberance of ornament an exquisitely classic style, a mathematical exactitude not to be surpassed by Greece or Rome, and a finish of sculpture and grouping of character evidencing a prior and extensive acquaintance with the arts, at a period, too, placed beyond the records of man.

Antiquarians have surmised that the Egyptians were unacquainted with the use of iron because no iron implements have been found in the ruins of tombs, temples, and palaces; but the now deserted quarries, and many of the existing monuments, exhibit marks which could only have been impressed upon them by iron, and we have it on historical record that iron was one of the earliest discoveries of man when he entered into the social state. On the other hand, iron is the least durable of all the metals, and particularly so in the arid climate of Upper Egypt, where it oxidates rapidly, and disappears.

I have hitherto spoken almost exclusively of granite, a term which embraces a vast variety of rocks as it passes by transition into all other known species, and is endlessly diversified in composition and character; its colour is generally more or less reddish, which is the prevalent colour of the felspar, usually its predominant part. Sometimes the felspar is greyish or yellowish white, approaching to the appearance of quartz, and only distinguishable from it by its peculiar fracture and lustre. Geologists

have observed that the red colour appears more frequently in the newer, while the greyish white appears to be more characteristic of the older formation of granite, but these distinctions are arbitrary and without foundation; the colour depending entirely upon the nature of its components and upon local influence: in Nubia granites present an endless diversity of composition, and every shade of colour, from the black or greenish black sienites to the milk-white quartz. Those kinds which contain a large proportion of felspar, or hornblende, and are exposed to the unintermitting and intense tropical action of the atmosphere, generally assume this reddish hue, but as the rock dips into the earth, so the colour gradually disappears, passing off by almost imperceptible shades to a greyish white; or should the rock be stratified, the change is sometimes sudden. The same conditions under which it is formed govern also its crystalline texture and hardness, the rock in those regions where it is generated, being always harder and more compact above, than it is below the surface, although all the numerous varieties exhibited in particular localities are all contemporaneously produced.

Again, the size of the crystal varies much in granite; in some kinds we observe the ingredients equally mixed, and the grain small, and this kind is termed the porphyritic granite, a material very abundant in this country, and highly desirable for the purposes of paving and numerous appliances of machinery, grinding, &c. The Portsey granite is a variety in which the felspar forms the greatest part of the mass, and which contains mica in small groups at great distances from each other; the quartz is disposed in such a manner, that when the rock is cut in a certain direction, it exhibits some resemblance to written characters, whence it derives its name of graphic granite.

The felspar is sometimes found in the shape of coniform concretions, representing on their fracture a surface comparable to the paws of some animals, or to the petals of flowers; at other times the quartz, intersecting the granite throughout in large nodules, represents the form and appearance of petrified mollusca, bearing a striking similitude to some of the shell marbles; the granite of which London-bridge is composed abounds with these nodules. The felspar of the white granites of Cornwall occurs in a completely disintegrated state; cohesion is maintained in general, but the substance is so far softened, as to yield to the knife like steatite, but upon the whole it is in a loose earthy state. In the working of a tin mine in the neighbourhood of St. Austle, the miners, laying aside the usual mode of shafts and levels, were used to quarry

the granite out like freestone. In some kinds the mica assumes very peculiar forms, being in laminated plates, and irregularly disposed in bunches within the rock. The felspar of some species, as in the Cornish mines, passes by incipient decomposition into porcelain earth.

GNEISS—like granite, is composed of parts cohering together without any intermediate cement, often in the form of crystals, and sometimes alternating in layers of a slaty texture resting on granite. It is essentially the same as granite in its elementary constituents, consisting of quartz, felspar, and mica, variably blended with each other without determinate order or regularity, and uniting with these components numerous mineral beds and veins, being the most metalliferous of all the rocks.

It is the strongly expressed opinion of geologists that gneiss rocks derive their origin from the more ancient granite and other crystalline compounds, but observation does not tend to confirm this view, for many varieties of gneiss pass gradually into the state of granite, and its laminated structure and horizontal position, independent of the nature and peculiarity of its mineral beds, point rather a modified cause, proceeding from sedimentary deposition of matter analogous to the granite beneath, but uniting with it other mixed material, which granite very often, but does not always, possess. Mr. Phillips says that as some gneiss shews evidently a degree of wearing of the edges and angles of the quartz and felspar, and much more decidedly by the laminar arrangement of the mica, and consequent minute stratification of the rock, that its materials were ready-made and crystallized when brought together, and arranged by some mechanical agent, principally influenced by gravitation,—in fact, by water. But this wearing of the edges and angles is purely imaginary, and the disposition of the mica, which is sometimes disposed in large horizontal plates, is the very reverse to being favourable to the supposition. The nature of the sedimentary deposit always determines the nature of the rock: rivers carry into the sea-sands washed from the loose beds of the earth, and the finer material of the disintegrated beds, and all these matters unite and form vast beds, covering previous deposits at the bottom of the waters, and suiting their disposition to the beds beneath; among these commingled matters there may be, and no doubt often is, the disintegrated material of rocks, but generally speaking it is the material which has not yet passed into rock, subject to the same conditions, and undergoing the same change as granite, the difference being, that gneiss is formed by continuance of deposition, modified by place and association, of the finer particles of matter, and in a similar manner to the shales, which it so resembles in structure; whereas the granites are ruder masses, thrown together as accidental circumstances may determine, the one and the other being sometimes contemporaneously produced. It is ridiculous to suppose that granite on disintegration can be thus produced, for the waste created must of necessity become united with other matters held in suspension by the waters of all running streams, and on deposition will be a bed of another nature, unless we can conceive the whole of the superficial beds of the earth to have been originally granite—but this is against reason and observation, neither can we conceive granite decomposing and recombining in its undisturbed position; nor could it, under these circumstances, assume the stratified appearance it now presents to us. It is evidently the result of sedimentary deposition, and, in common with all other sedimentary deposits, has a tendency, under favourable dispositions, to assume the form of rock, first, while in its disintegrated state, arranging its material within itself according to the laws of affinity, the force of cohesion, and mechanical combination.

Such is the order of events observed by Nature in her changes in the present era; the sedimentary deposit no sooner becomes a portion of *terra firma*, than it changes, in accordance with its nature and to the local influences to which it may be exposed. Sometimes we observe the quartz crystals first make their appearance in a rich blue unctuous marl, felspar next appears, and mica is the last to assume the crystalline structure. It is acknowledged that fragments of granite are most rarely discovered in it, and it is exceedingly improbable that they have ever been discovered,

Men go great lengths to sustain their respective theories. It must also be borne in mind that gneiss often exhibits a higher degree of crystalline structure than granite, from which it is supposed to be produced; and again, this material often alternates with hornblende slate, mica slate, and other compounds. It alternates with granite in the Reesengegrade and in Quito, and in some cases graduates into the character of granite, as on the southern declivity of the Tifis and Jungfrau; more frequently it exchanges beds with mica schist, hornblende schist, and granular limestone and clay slate.

In some of these formations we have evidence of periodical depositions such as now take place within the ocean, every successive bed marking its origin and the primary cause of that origin. The bed of gneiss alternates with mica schist, the continuous deposits of the ocean are interrupted or united for a short period with the deposits held in suspension by rivers; this action ceases, and Nature assumes her undisturbed process. Thus, year after year, the bed increases in thickness over a limited region, the sedimentary matter, singly or conjointly produced, covering in the inequalities of the ocean bed on which they repose, varying in thickness and presenting the like extraordinary curvatures throughout their whole thickness.

It is this sedimentary deposition simultaneously taking place with the chemical and mechanical increase of limestone and calcareous beds, that renders the latter so remarkably local and irregular in their occurrence, giving them the form of large lenticular masses, common to the Pyrenees, and enveloped on every side by the predominant rocks of gneiss. By the substitution of hornblende for mica, gneiss gradually changes to hornblende schist, the latter being of pure oceanic character, the former being of mixed material of the ocean and river deposits. The very numerous transitions of gneiss into other rocks, is proof sufficient that its origin is in common with all other kinds, and deducible from the like causes still existing.

Mica schist is a species of gneiss not readily distinguishable from the latter, and, in fact, no real distinction can be made other than that presented by chemical analysis or where the preponderance of mica gives it a marked character. These kinds of rock are almost unknown in England, but in Ireland and Scotland they are abundant, and include among them many gradations. Gneiss is often found porphyritic at Urt; kaolin is derived from it in the mainland of Zetland, and in Fetlar. It forms the beautiful and picturesque region around Loch Sunart.

Granite rocks, including gneiss, are formed by the slow operation of natural causes, a degree of heat far greater than that belonging to the temperate regions of the earth being essentially necessary to produce them; the equal distribution of many of the true granites and of gneiss, proves their common origin, and the true mathematical and mechanical combination existing primarily in the organic frame. A bed of shell-fish, a bed of sands and shell-fish, a bed of sands, shell-fish, and animal and vegetable matter, of dry land, or the comminuted particles of shell-fish and marine exuviae united in the like uniform manner, each of them is a type of the rock in its crystalline state, the ultimate result being the highest of a series of changes, and the after changes depending upon the accidents of time and circumstance, for all kinds of rock however durable their qualities may be, are liable to corrode and decompose as they become exposed to atmospheric action, or to mechanical action produced by winds, rains, &c.

Men are taught that the crystalline rocks are produced by the heat of fusion, but the facts collected in the present day have weakened, and must ere long banish, notions so erroneous and contradictory in their nature. It is true that the material of lavas is analogous to that of granites, and naturally so, for the beds of the earth from which the one and the other are produced simulate in their nature, and boast one common origin; the earths of which they are formed composing the interior and exterior beds being acted upon by flood or fire as accident may determine, for there is no one prescribed rule applicable to natural operations. The ancient and modern lavas are all distinguishable in the present day, and the older streams rapidly decompose

as they become exposed to atmospheric influences.

Common gneiss, used for laying the beds of large furnaces, is found in most of the mountainous parts of Europe in innumerable varieties of proportion, combination, distinguishing colour, and hardness, being covered with argillaceous slate, sand, or limestone. The celebrated Eddystone Lighthouse is said to be a species of gneiss, having a degree of elasticity, and its present state of preservation is demonstrative of its value for buildings and monuments. A species of gneiss, consisting of quartz, mica, and alumine, makes a very superior whetstone for sharpening scythes and other instruments, and a polishing gneiss found in Norway and Sweden, and composed of alumine and mica, is much used to polish steel instruments. Steatite gneiss, consisting of steatite and mica, is used for the walls of melting furnaces, and for the covering of houses in Sweden, Hungary, &c.

Gneiss is the most metalliferous of all rocks, some of the richest mines in Europe and South America being in this formation, and in this respect also it shows its common origin with granite on the one hand, and to common schistus or slate on the other, for granite often passes into tinstone and other metalliferous rocks, and the close alliance of both kinds with their beds and veins intersecting them is demonstrative evidence of the common origin and contemporaneous formation of both. The like remarks equally apply to the schistus beds comprising so great a portion of the carboniferous series: the continental mines in Saxony and Bohemia, and the silver mines of Konesberg are formed in gneiss.

Gneiss often abounds with garnets, and this species, which is very common to Europe, is also abundant in Upper India, and may be seen under a variety of forms and combinations, from the simple conglomerated mass of garnet sands, interspersed with mica, to the most highly finished schistose beds and rocks. The low range of hills near Nagpore abounds with the most beautiful specimens of crystalline rock, interspersed with blocks of marble, hornblende, and other rich and ornamental stones. Ceylon is also abundantly supplied with this beautiful natural product, which presents a polish throughout its schistose structure utterly unattainable by art. In all countries its close alliance with granite, and its origin from the one common source, are evidenced by the same mechanical combinations of its constituents, the same colour and compound structure, the like divisions into mineral veins and beds, and the like metalline bodies, the observable difference being that some species are evidently composed of the finer particles of matter in which extraneous bodies are irregularly distributed, manifesting periodical deposition as well as local deposition, analogous to the earth forming the delta of Egypt, which, where undisturbed by the operations of man, exhibits, even in its disintegrated state, a laminated or schistose structure; the other granite, as previously observed, forming, by local deposition of larger aggregates, the intermediate species, shewing the transition of the one into the other.

**PORPHYRY.**—A term in mineralogy applied to a large and varied class of rocks falsely termed *primitive* and *volcanic* by modern geologists, and defined as having a compact basis, in which are disposed granular particles, or crystals. This base is generally siliceous, or silico-aluminous, as compact felspar, hornstone, pitchstone, pearlstone, claystone, or obsidian; the inclosed grains or crystals being of quartz or felspar. Of these varieties the pitchstone and pearlstone porphyries appear to take precedence, in the order of production, over the claystone and other porphyries containing potash and mica in their mechanical composition.

It is a very difficult matter for the practical mineralogist to separate the porphyries from other kinds of rock; for we observe them pass, on the one hand, into granite, gneiss, mica, schist, &c., and on the other, into sandstone, pitchstone, and clay.

(To be continued.)

**OPENING OF THE TROLLHATTA CANAL.**—GOTTENBURG, May 11.—It is confidently asserted on the best authority that the king will be present at the opening of the new Trollhatta Canal and Sluices; and that he will arrive here on the 31st instant.

*Report of the Committee on the Metropolitan Buildings Bill, as printed by order of the House of Commons, March, 1844.*

Your Committee would congratulate the Society on the very much improved character of this Bill, as compared with all those to which your attention has been called, as they have been severally printed by the House of Commons during the last three years, and they cannot but advert with satisfaction to the lucid form and clear arrangement which pervade the Bill as now presented.

To the general intentions and purposes of such an Act, it is quite clear that we, as builders, can offer no possible objection, in so far as it tends to improve the character of buildings generally; nor have we any right, or any disposition, to interfere in the matter further than to bring to bear upon it so much of technical knowledge and personal experience as we may be able to command, for the purpose of pointing out the probable practical effect of the proposed enactments, and thereby assisting the framers of the law to the better carrying out of their own intentions.

The leading features of the present Building Act (14 Geo. 3, c. 78) are of course generally known, it will therefore suffice for the committee to point out the most important points on which the proposed Bill differs from it.

It proposes to repeal the Act 14 Geo. 3, c. 78, except as to that part which relates to dangers by fire.

Also, the 50th Geo. 3, c. 75, which is an Act to legalize the use of patent tesserae as roofing.

Also, the 3rd and 4th Will. 4, c. 35, and 3rd and 4th Vic. c. 85 (both known as Chimney Sweepers Acts), so far as they relate to the construction of flues.

The limits of its operations are much more extensive, taking at once a circle of about eight miles round the metropolis; but as there is a provision for its further extension to twelve miles from Charing-cross, it is most probable that the rapidly increasing size of the metropolis soon will render it desirable that this extent should come under its control.

District surveyors are to be continued in office, their duties being similar to those at present imposed upon them—their numbers being necessarily increased. All public buildings, however, and all private dwellings or warehouses beyond certain limits are to be under the control of a new body of officers styled official referees; and to consist of two architects and a registrar; the duty of this latter officer being to judge of the legality of all matters connected with this Act; and, as his name implies, to keep a register of all transactions connected therewith. The official referees are further to be a court of appeal, with power to settle all questions of disputed rights, value of works, or any other matter that may arise in relation to this Act. From this court of second instance, however, there is to be an appeal to the Commissioners of Woods and Works, who have final power of decision in such cases as may be brought before them.

Your committee feel that this arrangement of official referees promises fair to constitute a ready and competent tribunal for the adjustment of differences relating to questions of building; not only as to the points touched by the proposed Bill, but as to all such questions whatever; an important benefit to the public, and to our trade especially, which, from its intricacy of detail and abundance of technicalities, offers so many difficulties to the real investigation of the differences which arise in reference to it, and renders a peculiar professional education imperative for the right understanding of them.

It appears, however, that the amount of work which will necessarily devolve on the official referees will render it desirable that their number should be increased; which will be obvious, if you consider the large extent over which their services may be required, and that under the proposed arrangement all moderately large dwelling-houses would require their special supervision.

The official referees are to be appointed by the Secretary of State for the Home Department; the registrar by the Commissioners of Woods and Works.

Under the proposed Act, buildings are divided into three classes:—  
1st. Dwelling-houses.

2nd. Warehouses, workshops, and similar buildings.

3rd. Public buildings.  
The two first classes are subdivided into rates, according to the size and height, and when in either case they exceed the limits prescribed, they are removed into the third class.

The two first classes are subject to the supervision of district surveyors, as has been the case heretofore.

The third class are to be placed under the special superintendence of the official referees.

By a reference to Schedule C, part II., you will more clearly understand this arrangement, and as it has a most important practical bearing upon the questions involved, your committee request your special attention to the schedule as it now stands, and also to the various modifications suggested.

The Bill proposes to make drainage imperative.

The broad and important features of the measure being thus before you, your committee request you to refer to the Bill itself, in which they suggest various alterations, and with regard to the detailed instructions contained in which, they have to propose certain modifications. The observations which follow will give you the opinion of your committee on these several matters, and the clauses to which they immediately refer are—

Clause 10 ..	Page 8 ..	Line 18

" H... ..	" 76	
" I... ..	" 77	

Clause 10.—The change proposed in the thickness of the party-walls of the smaller-sized houses would render it impossible to fulfil some engagements. As, for instance, a party having entered into a contract to erect upon ground a certain number of small houses, may be prevented, by the additional room required for the thicker walls, from placing that number of houses upon the ground; besides which additional expense would be entailed upon each house. Thus, if 100 houses are to be built, having each 12 feet frontage, three entire houses would be thrown out; and the probable return of rent diminished in the proportion of 3 per cent.

Provision should, therefore, be made to compensate persons under such engagements. The party under contract would be compelled to expend all the money and receive a smaller return; whereas the ground landlord would have a better article, and his reversion would be improved in value.

Clause 14.—If the surveyor should be wrong, there should be some remedy afforded to the owner or builder, otherwise the clause might be very oppressive.

Clause 15.—It is suggested that in this clause the form should be, that if the official referees do not give notice of defect within fourteen days of the survey, then the buildings may be used; but if this should be considered objectionable, then some power should exist to compel the attention of the official referee; as, otherwise, the building may be suspended indefinitely, without the owner having the opportunity of knowing why, or the means of setting the matter right.

Clause 21.—The present form in reference to this matter is three months; and for all practical purposes it has been found to be sufficient. Much inconvenience may result from the longer time.

Clause 42.—Your committee suggest that the words "to the satisfaction of the surveyor" should be erased; because, if he were dissatisfied, he has only to try the case before official

referees; whereas now, if litigious, he might withhold his consent and entail expense and vexation.

The clauses affecting the size of rooms to be used as dwellings is difficult to be dealt with, because, although it appears probable that some present injury might be inflicted thereby upon parties owning houses in which there are rooms let out in separate occupancies, yet, if a paramount necessity can be established with reference to the question of public health for the discontinuance of such occupation, your committee feel that it would not become us, as builders, to throw any obstacle in the way of a manifest public benefit; at the same time, it is suggested that if there was a discretion vested in the district surveyor, so many circumstances, besides the mere question of size, go to make up the comparative healthiness of a dwelling-room, that much of the private injury might be obviated by the wise use of this discretion, and all the public mischief avoided; for which purpose, your committee would suggest, that it should be allowed to the district surveyor to license for dwelling any room which, though not as large as required by this Act, yet had a sufficient door and window and chimney, and was so situated in respect of width of opposite street, or other circumstances, as not to appear to him to be unhealthy for such occupation.

Clause 53.—The powers given to remove nuisances within thirty years, your committee consider to be a question not affecting us as builders, but of great importance to proprietors of gas-works, &c., and owners of premises employed in the specified trades.

This Bill provides that noxious and offensive trades shall not be carried on nearer than forty feet from a public way, nor nearer than fifty feet to any other building of the dwelling-house class, and that all such as now are in existence shall, at the end of thirty years, be removed beyond the limits of this Act. Now, although this provision affects the owners of such properties only, yet as it is accompanied by another which makes it illegal to construct dwelling-houses on ground within the prescribed distance from premises so occupied, this would render a great injustice to the owners of lands so adjoining.

Your committee further feel, that the prohibition of offensive trades in this form is an unnecessary interference with the vested interests of a large number of persons, and that in the existing laws relating to nuisances, the caution of land-holders for the protection and improvement of their own property, and in the efficient drainage of the larger portion of the metropolis (and the improvement in this respect to be anticipated from this Bill), the public have quite a sufficient security in this matter; at the same time, dangerous manufactures and explosive trades, such as lucifer-match making, &c., should obviously be removed from populous neighbourhoods.

Schedule C, page 64.—It is proposed that the superficial area of the rates should be modified as suggested, because the sizes of the schedule, as proposed in the Bill, would throw all moderate houses into so high a class as to increase their expense unnecessarily; and the same remark applies to the thickness of party-walls. The thickness suggested will be amply sufficient for the weights that will have to be sustained; and because of the small amount of combustible material that such houses would contain, the resistance to fire would be complete.

The thicknesses of party-walls for the several rates are suggested as being, in the opinion of your committee, and as the result of their experience, sufficient.

Moreover, with reference to the lower class of buildings, it is most desirable that no unnecessary expense should be imposed, because if this class of dwelling is made too costly, the effect will be to huddle together many families into houses of somewhat larger size; whereas, both the health and morality of the lower classes would be improved, by facility being afforded for the erection of such dwellings as would accommodate the smaller number; indeed, as far as possible, single families in separate tenements: besides which, the expense, if increased, would necessarily fall eventually upon the poor, and tend to the decrease of their comfort in other respects.

If it should be thought that the arrangement suggested appears to give an inefficient party-

wall to the third rate of building, while it extends the area beyond the size limited by the existing Act for a much higher rate of building, it should be recollected that most of the four-story houses of the present day have been erected under such a rate as placed the upper story in the roof; and the experience of the past fifty years has shewn that the party-walls so built have been quite a sufficient protection against the mischiefs of fire. And although to the area suggested this may appear thin, yet it should be remembered that any house having four stories, however small the area, would come under the operation of the clause; and in crowded districts more stories would be required, and thus the house would be removed into a higher rate. And the sufficiency of this wall will be the more apparent when it is borne in mind that now all wood will be kept out of party-walls of this thickness, which was not the case under the existing Act. And further, that this is the minimum thickness of walls.

Besides which, this rate of building will, under the new limits of the Act, take in a very large number of houses in the outskirts of the town, where additional expense would be important, and where the area, from the value of land, might be increased without much increase of cost in this respect; which within the immediate metropolis could not be the case, because of the value of the land.

It appears to your committee very undesirable to adopt the change suggested of calling the smaller houses first rates, and so upwards, it being at variance with all practice, not only in reference to buildings, but other matters also. The largest vessel is called a first-rate, and there would be an obvious absurdity in the announcement, that a fifth-rate house in Belgrave-square was to be submitted to competition. The third class may be easily designated as a class by itself; the limits as to extreme of size and height in each of the two first classes being defined, all buildings exceeding those limits would be taken out of those classes as they now are, and would not need to be designated by a rate under them; but if it be considered imperative to place them in a rate, then they may be called an extra rate.

Schedule C, page 60.—No authority can compel the shutting of these doors, but if they are considered desirable, then it is submitted that the size should be increased, and it is suggested that if the opening were allowed to be not more than 9ft. by 8ft., leaving it to the discretion of the parties to plan the height or width within those limits, as they pleased, much advantage would be afforded; and further, it is suggested that the piers should be omitted, as they will occupy great space, impose considerable additional expense, afford no important additional security against fire, and would also prevent the use of sliding-doors, which under some circumstances would be a most desirable arrangement, on account of the small area they would occupy.

The limit as to stables appears unnecessary, and would in some cases be vexatious.

Schedule C.—Green-houses and aviaries are so unimportant in their character, and affect the question of health, or risk by fire, so little, that it is submitted they might be left altogether out of the supervision, particularly when detached from the house.

Schedule D, Part 1, page 68.—It is submitted, that if the Act provides sufficient walls, private interest is the best security for their being placed upon proper foundations; and as to natural solid strata, the expression itself is too vague to be used in an Act of Parliament in this way.

Materials.—The word stock should be omitted, being a trade name for a particular description of brick, leaving the description—good sound bricks.

Construction.—This can only be properly illustrated by a sketch, because a course of bricks and a course of stone may differ very widely, and if the width at the bottom is defined, it may then be stipulated that the wall shall not be brought into its thickness in less than a certain height.

Width.—The increase of 9in. on a 9in. wall is unnecessary; if it was made 4½ in., and to the thicker walls 9in., enough would be provided; or it might stipulate that the footings should spread to one-half more than the net width of the wall.

Height.—This would be unnecessary altogether, being provided for in construction.

*Walls generally, and depth below lowest floor.*—This is an unnecessary interference, which would not be certainly efficient for the purposes proposed, and would involve vexatious interference.

**Part 2.—Eternal Walls.**—It is suggested that recesses may be allowed to be made in all stories that are above one story above the ground, nor would any evil result if, in case of building two stories only above the ground, these should be allowed to be carried through both stories.

**Part 2.—Brestsummers.**—The whole of this appears objectionable, and, in the opinion of your committee, ought to be left to the security the public enjoy, from its being the private interest of the parties building to make them efficient, and particularly ought not to be subject to the dictation of the surveyor, who, for his own security, will be obliged to impose an unnecessary degree of strength, and, as before stated, it is not right that the power of law should be given to the opinion of an individual.

**Part 2.—Eternal Walls as Party Walls.**—The provision of present Act should be continued, that if 14 in. from top to bottom and sound, the wall might be allowed to stand.

**Part 3.—Party Walls—Division of Buildings.** A.—It is suggested that this should not have a retrospective operation.

**Part 3.—Site of Walls.**—Provision should be made in this for the payment of the additional brickwork as well as for the site.

**Schedule D, Part 3.—Construction and Materials.**—The object of this appears to be the exclusion of bond timber from the centre of party-walls; but the words do not clearly convey this. Your committee are of opinion that this regulation would be a wise one, and they recommend that this should be made clear. In all other respects this clause appears unnecessary, and going into details which would involve vexatious interference, and is sufficiently provided for by the former provisions of this schedule.

**Openings in Party Walls.**—This provision should be extended to all rates of buildings, and, under the restrictions hereimposed, could involve no public risk.

**Part 6.—Party Fence Walls.**—This is altogether a matter not involving public right, and might be well omitted.

**Schedule E.**—The regulation of height of wooden shop-fronts appears unnecessary.

**Schedule F.—Construction of Chimneys.** Page 73.—It is submitted that the limitation of chimneys and chimney-backs as existing in the present Act has been found a sufficient security against fire, and if it be deemed imperative to have some more definite regulation, there is no necessity to compel the chimneys

of the upper floors to be brought, as to their projections and the inconvenience of it, through the more important floors below.

**Schedule E.—Slabs.**—Cement should be allowed.

**Schedule H.—Cesspools and Privies.** Page 76.—It is suggested that all this had better be omitted, because if a sewer is within reach, it would be in most cases better to have no cesspool. The whole of this clause has more the aspect of the description of a specification than the general provision of a legislative enactment.

**Schedule M,** page 79, affords a good illustration of the clear and lucid arrangement which pervades this Bill. It is a tabular view of the various acts to be done, notices to be given, &c., and will be found a most useful guide when the Bill shall become the law of the land.

Upon the whole, your committee are of opinion that the great amount of skill and labour which has been called into requisition in this matter, has produced the result which might have been anticipated; and that we may expect to have for our guidance an intelligible and wise enactment, which cannot but be a great advantage to all who will have so much to do with its practical effects and operation.

THOMAS PIPER, JUN., Hon. Sec. Freemasons' Tavern, April, 1844.

Alterations in the Thickness of Walls, under the Proposed New Building Act, suggested by the Building Society, viz: half a brick less in the stories marked A.

## Correspondence.

## TENDERS FOR BUILDINGS.—SCHEDULE OF PRICES.

Sir,—At a time like the present, when the spirit of competition is abroad, and the existing practices of builders appear to militate against the great body of that community, I am desirous of proposing the revival, in some degree, of a practice which has now become nearly extinct. I allude to the practice of a SCHEDULE OF PRICES being furnished to contractors, instead of the present uncertain and pernicious practice of estimating.

The benefits arising from this system appear, in my mind, to be of very great importance, inasmuch as there is a possibility of carrying it, in detail, to the advantage of all connected with the science of building. I would refer to the satisfaction a schedule of prices affords in the working of the Government establishments, such as the Ordnance, in which department all the works are executed at the rates and agreeably with the descriptions given in the said document, subject to percentages over or under, as the case may be.

It may be argued, that in private practice this regulation could not be effected, upon the principle that no individual about to commence building would do so without first ascertaining the cost. We cannot surely find fault upon that account, but I think that this could also be done in a manner to give satisfaction.

I shall now enter into the details of my plan by taking a case in this way. A gentleman requires a mansion to be erected. His first step is to engage an architect to furnish the designs for the work; they are approved of, and the individual is desirous of ascertaining the expense.

A frequent mode of acquiring this information is by advertisement, inviting builders to tender for the erection of such works. Here the spirit of competition makes its way, and instead of allowing a reasonable profit for the outlay and anxiety of the builder, we find, in most cases, quite the contrary result. My proposal is, that the architect having his designs approved of, should be empowered to hand them over to an experienced surveyor, for the purpose of ascertaining as nearly as possible, by estimate, the expense of the proposed work.

This would be of course for the satisfaction of the individual who is about to make an outlay.

The description of work required in the erection of such a building can be ascertained by the architect thereof, a schedule of such work, with fair prices thereto attached, might be thence framed, a general specification and the terms of the proposed contract being attached. Thus contractors being invited to tender would, on examination of those prices, be enabled to state at how much per cent. above or below them they were willing to execute the work.

It would be desirable that the works should be measured as they proceed, so that at the end of each quarter or half year, the contractor's bills might be prepared for payment.

In order to the proper execution of the works, it is suggested that intelligent individuals be selected to fill the situation of clerks of works, whose duties being well known, I shall not stop here to describe.

Such is the nature of the plan I propose. The objects to be gained by it are these:—

1st. The employer for whom the work is being executed can ascertain actually the amount of work performed as it proceeds.

2nd. By the employment of a responsible individual as a clerk of works, he is assured the work is properly executed.

3rd. The architect who has designed and superintended the works from time to time, can extend his engagements, having the assistance of a resident clerk of works.

4th. By this means a source of employment would be opened for a large number of young men of talent, who, from circumstances, instead of occupying the position to which they of right belong, are obliged to rest contented as clerks in builders' establishments. I allude to the young surveyors who, for want of interest or connection, are unable to follow their profession.

To the existing surveyors I see no disadvantage in my plan, as the field for the extension of their labours would be increased.

It may be argued that by this arrangement spurious surveyors might get into the profession, but I see no difficulty in setting that question at rest.

I would suggest that the body of respectable surveyors form themselves into a society for the protection of their profession, and that they procure power, such as that enjoyed by the Royal College of Surgeons, or other bodies similarly constituted, that candidates be examined in open court, touching their abilities, and be not allowed to practice as surveyors unless found capable of bearing such examination.

To builders I would recommend the introduction of this practice in consequence of the satisfactory results to be derived from it. The expense of the engagement of a competent surveyor would be but trifling compared with the present hazardous system of estimating; which, however great the perfection to which it has been brought, can afford no security, in the event of circumstances occurring over which neither the architect in making his specification, or the surveyor in framing his estimate could have any control.

Builders should form themselves into a society for the promotion of such a desirable object, the interests and respectability of their business require it.

I leave these few suggestions with you, and must apologize for the length to which I have extended this letter.

I am, Sir, yours, &c.  
Brecon, May 27th, 1844. STABILITAS.

## PETRALOLOGY.

Sir,—In reading an article in last week's Builder entitled, "Petrology, or the Knowledge of Rocks and Stones," I was surprised to find granite described as of sedimentary origin, and the idea of its having been produced by the agency of fire, or "formed of matter once in a state of fusion" discarded, as being an unphilosophical notion. Now I would ask the writer how he accounts for granite being found as at Glen Tilt, in Scotland, described by Mac Culloch; where it is found intersecting different strata, and occasionally "intruding itself in tortuous veins into the beds of clay slate and lime-stone." Mac Culloch also describes another instance, "in the same district, where the granite sends forth so many veins, as to reticulate the lime-stone and schist, the veins diminishing towards their termination to the thickness of a leaf of paper or a thread." There are also numerous other junctions of a similar nature, where, according to Lyell and other eminent geologists, "large masses of granite are found to send forth dikes and veins into the contiguous strata, very much in the same way as lava and volcanic matter penetrate aqueous deposits."

If, therefore, granite be of sedimentary origin and deposited by water, I should like to see how these are to be accounted for in a satisfactory manner. It appears to me that some subterranean and internal power must have been employed to have effected such a complicated arrangement.

The writer also says that "Geologists inform us that granite is primary rock,"—now it has been discovered of late years that granite has been produced or formed at different geological periods, some of which are comparatively modern, therefore, the term primary or primitive cannot be at all applied to it. For instance the granite of Dartmoor, in Devonshire, which was formerly supposed to be a primary or primitive rock, has been satisfactorily ascertained to be newer than coal.

I am, Sir, your obedient servant,  
May 21, 1844. J. K. C.—B.A.A.D.

## THE ATMOSPHERIC RAILWAYS.

Sir,—In your valuable journal several allusions have been made to Messrs. Clegg and Samuda as the inventors of the Atmospheric Railway. Allow me, however, to state that these parties have not the slightest claim to the invention, and that they themselves disclaim it. They rest their claim entirely upon a valve, which valve is to be found in my specifications. Their patent was taken out in 1839, my patents are dated in 1834 and 1836. The Dublin and Dalkey line has been constructed in conformity with my specifications; and though some important details are omitted, nothing has been done which is not in direct violation of my legal rights;

consequently, it becomes my duty, through our journal, which has so great a circulation, among practical engineers and builders, to state that Messrs. Clegg and Samuda will not be permitted to continue in their infringement of my rights, and that any parties connected with them will be liable with them as parties to the infringement.

In order that the public may be on their guard, and that these assertions may be received with their due weight, I beg to refer to my specifications, and also to the following extract from a letter from Mr. Clegg:—

"April, 1838.  
"I must be informed of all particulars. Your first patent, as it appears to me, is of much more consequence than your last for improvements. Your patents are of that importance that nothing must be left to conjecture."  
(Signed) "SAMUEL CLEGG."

In conclusion, permit me to state that a true history of the Atmospheric Railway will soon be placed before the public, containing documentary evidences; a portion of them under the hands of Messrs. Clegg and Samuda, which will astonish those who have witnessed the proceedings of these parties, who seem to flatter themselves that such pretended histories as that in the "British and Foreign Quarterly Review" will save them from the opprobrium which, sooner or later, overtake all men who endeavour to impose upon the credulity of the public.—I am, Sir, with sentiments of respect, your obedient servant,  
HENRY PINKUS.  
Maddox-street, May 30, 1844.

## WINDOW LIGHTS.

Sir,—I should feel obliged by your stating in your next number what restrictions exist as regards building walls near windows, the light of which may be partially obstructed by such walls, or in what work information on this point may be found?

Yours obediently  
GNICK.  
May 28th, 1844.

[We have repeatedly answered questions much the same as this. No window-light rightfully held must in any way be injured by a neighbour: twenty years' possession gives the right of maintaining unimpaired a right of the kind. If such a window be through a party-wall, by the present Metropolitan Building-Act it is necessarily sacrificed upon rebuilding such wall, for by that Act no holes are allowed in party-walls.—Ed.]

## Miscellaneous.

THE TRIGONOMETRICAL SURVEY.—SPIRE OF THAXTED CHURCH.—One of the points selected for the purposes of the trigonometrical survey of England, now in active progress, under the superintendance of the officers of the Royal Engineers (Sappers and Miners), is the spire of Thaxted Church, in this county. The church is one of considerable beauty, of a late period of Gothic architecture; is built of rubble, with stone dressings, the rubble being coated with cement, so as to give the whole an appearance of stone. It consists of a nave, with a clerestory, aisles, chancel, transepts (north and south), porches, and a tower surmounted by an elegant spire, nearly 200 feet high. Around the spire is erected the scaffolding supporting the platform for the purposes of the survey, presenting a singular aspect. The construction is firm and ingenious, every advantage being taken of the condition of the spire. From each of the lowest windows are seen projecting a couple of planks laid edge-wise, well secured at their ends at about eight or nine inches apart, blocked together, and forming a case for the reception of the main scaffold poles. The plan of the spire is octagonal, the windows being in every other face; and, consequently, the plan of the scaffolding is square. The projecting ends of the planks are further supported by struts from the roof of the tower; horizontal ties are fixed upon the projecting planks, over the flying buttresses, and between the finials of these and the spire. The main poles are received in the before-mentioned cases, formed by the projecting planks, and are braced by horizontal and diagonal ties, and firmly secured to the spire, the whole height to the platform. The platform is hexagonal, and is supported by the main poles and extra struts from these. From the lowest windows of the spire the ascent to

the platform is by ladder. A daring fellow of the corps of Sappers and Miners ascended the spire, prior to the erection of the scaffolding, by means of the crockets, and removed the vane, weighing about a quarter of a hundred weight.—*Chelmsford Chronicle*.

**IRON TRADE.**—This branch of business appears now to have fairly recovered from the effects of the late depression, the improvement has been gradual, and is likely to be permanent. The capital invested in it is enormous, and the effects of an improved price and demand, in the underground workmen, can scarcely be understood by those not immediately interested in the business. The quantity of pig-iron now used in this country is unprecedented, and, independent of foreign demand, exceeds the present production. Continental orders are already coming to our manufacturers; during the last month upwards of 1,300 tons of pig-iron have been exported for France, being two months earlier than was anticipated. The certainty of an increased demand for home and foreign consumption is sure to keep prices up, and the manufacturers are sanguine of realising 4l. per ton; this rate is now quoted as their price, with one or two exceptions, and the trade know perfectly well that the makers who are quoting under this, have not only none to sell, but cannot fulfil their orders for past contracts.—*Glasgow Citizen*. On Saturday last, and since the above was written, a meeting was held in Glasgow, at which it was finally arranged to give the men 1s. 6d. per day extra, making their wages now 6s. a day—an increase which is equal to 7s. 6d. or 8s. per ton on the price of iron. This, of course, will have to be added to the present prices, therefore, a further rise is confidently expected. The market was very much brisker on Monday, in consequence of the news from Scotland, and holders are unwilling to dispose of their stocks at present prices, having great confidence in the market. The Acadia, which arrived on Wednesday last, brought extensive orders for iron, at an advance of 15s. per ton upon the limits per the Samuel Hicks, which sailed ten days before her, and it is expected that the next steamer will also bring higher rates. In tin there has also been a large business doing at improved prices, and a further advance of 2s. to 3s. a box is generally expected.

**THE WORKS OF THORWALDSEN.**—A letter from Rome of the 26th ult. says:—"The spacious galleries of the Barberini palace, in which the numerous works of art belonging to Thorwaldsen were placed, and which were constantly open to the public, and to the study of artists, has been closed, and put under seal, in virtue of authority from the testamentary executors of the deceased sculptor. The whole of the collection will, according to his last will, be sent to the Thorwaldsen Museum, at Copenhagen; but, before their departure, in compliance with a clause in it, casts from all these works will be taken, and presented to the Kings of Württemberg and Bavaria, who honoured the great artist with their esteem and friendship."

**WEIGHT OF BRITISH COINS.**—The following is the legal current weight of the various silver coins:—The crown, or 6s. piece, 18 pennyweights 4.4-11 grains; the half-crown, 9 pennyweights 2.2-11 grains; the shilling, 3 pennyweights 15.3-11 grains; and the sixpence, 1 pennyweight 8 grains. The gold sovereign, 5 pennyweights 21 grains; the gold half-sovereign, 2 pennyweights 13 grains one-eighth.

TO OUR CORRESPONDENTS.

*Ap.*—On further inquiry we find, the ancient iron work, given in page 253, No. 67, was found, some years ago, in the neighbourhood of, and for some time occupied a place in the museum of an antiquary of Norwich, at the sale of whose property it was purchased by its present possessor, Mr. G. Isaacs, of Claremont-terrace, Pentonville.

We have received and sent to our engraver the Tower Doorway of Thornbury Church.

"A Student"—*At Leeds, June 30.*

"R. C. W.'s" communication relative to draining piles is received, and will appear in our next.

Tenders.

TENDERS delivered for a pair of detached Cottages, to be built in Barnsbury-park, for R. Matthews, Esq. A. Trimmer, Esq., Architect.

SHORT and MAHONY, Brokers, 1, Newman's-court, Cornhill.

NOTICES OF CONTRACTS.

For enlarging, straightening, and improving the course of the rivers Devon and Smite, and the Croyde, in the parishes of Hawton, Farnham, &c. &c., in the counties of Nottingham and Leicester, and for the erection of, building, enlarging, &c., the several bridges connected with the above works.—Specifications, &c., Mr. Talents, Newark. June 1.

For the erection of Two Shed-Buildings, to adjoin the main building of the New Workhouse at Rye-hill, Sussex; also for the erection of extensive inclosures, &c., at Rye, Sussex, and New-park, Kent, front of the Workhouse, and other necessary works. The Guardians, Rye Union, Workhouse Tender, June 1.

For the executing of certain works for the improvement of Aberdeen Harbour.—Plans, &c., Mr. Abernethy, 69, Waterloo-quay, Aberdeen. June 20.

COMPETITIONS.

A PREMIUM of 100 guineas will be given by the commissioners appointed to erect a lunatic asylum in the vicinity of the city of Kingston, Jamaica, to the person who shall produce the best plan, accompanied by a specification, of an asylum for the reception of the insane. The institution must accommodate 200 patients of both sexes, with the requisite number of officers and servants, and due attention must be paid in the plan to the proper classification of the patients, and the climate in which the asylum is to be erected. The plan must also show how an addition may be made for the accommodation of 100 patients more, in the event of such being required. The plans must also set forth the probable cost of the building in stone, brick, and iron. The principal portion of the building is to be allotted to paupers, but the commissioners are desirous of setting aside sufficient apartments for the accommodation of about 25 persons in better circumstances of life, and direct the attention of competitors to this arrangement. The plans must be prepared and transmitted to William Buge, Esq., Q.C., 1, Paper-buildings, Temple, on or before the 22nd of August next.—London, May, 1844.

The Committee of the Hardy Testimonial are desirous of receiving designs for a plain and substantial pillar, to be erected on the summit of a high and exposed hill, not far distant from the sea, at an expense of from 500l. to 750l. A premium of 10 guineas will be given to the architect whose plan shall be adopted. The designs are to be forwarded to the hon. secretary, at Dorchester, on or before the 14th day of June next.

MEETINGS OF SCIENTIFIC BODIES.

To-day and during the ensuing week.

SATURDAY, JUNE 1. — *Asiatic*, 14, Grafton-street, 2 P.M.

MONDAY, 3. — *Entomological*, 17, Old Bond-street, 8 P.M.; *British Architects*, 16, Lower Grosvenor-street, 8 P.M.; *United Service Institution*, Middle Scotland-yard, 9 P.M.

TUESDAY, 4. — *Linnean*, Soho-square, 8 P.M.; *Horticultural*, 21, Regent-street, 3 P.M.; *Civil Engineers*, 25, Great George-street, 8 P.M.

WEDNESDAY, 5. — *Society of Arts*, Adelphi, 8 P.M.

THURSDAY, 6. — *Royal*, Somerset House, 8½ P.M.; *Antiquaries*, Somerset House, 8 P.M.; *Zoological*, 57, Pall Mall, 3 P.M.

FRIDAY, 7. — *Royal Institution*, Alhambra-street, 8½ P.M.; *Botanical*, 20, Bedford-street, Covent Garden, 8 P.M.

SATURDAY, 8. — *Royal Botanic*, Regent's-park, 4 P.M.

CIVIL ENGINEERS.—Library open from 9 A.M. to 9 P.M.

ENTOMOLOGICAL SOCIETY.—Museum open every Tuesday from 1 till 7.

SOCIETY OF ARTS.—Open every week-day except Wednesday, between 10 and 2. Admission by members' tickets.

LINNEAN SOCIETY.—Library open on Monday, Tuesday, and Thursday, and the Museum on Wednesday and Friday, from 12 o'clock to 4 in the afternoon.

GEOLOGICAL SOCIETY.—Library and Museums are open every day from 11 till 5.

ROYAL ASIATIC SOCIETY.—Museum is open every Tuesday, Wednesday, and Thursday, from 11 till 4.

UNITED SERVICE INSTITUTION.—Museum open all the year, from 11 till 5 in summer, and from 11 till 4 in winter. Admission by members' tickets.

LONDON INSTITUTION.—Lectures will be delivered every Monday and Thursday evening, at 7 o'clock, until May 6.

BOTANICAL SOCIETY.—Herbarium open every Wednesday and Friday evening, from 7 till 10 (except September).

ROYAL COLLEGE OF SURGEONS.—The Museum is open to visitors on Monday, Tuesday, Wednesday, and Thursday, from 12 till 4, except during the month of September; on Friday to gentlemen for studying in it; and on Saturday from 10 till 1 to gentlemen desirous of comparing specimens with those in the Museum. The Library is open to members and students of the college, and visitors on Monday, Tuesday, Wednesday, and Thursday, from the 1st of October to the 1st of April, from 10 till 4; and from the 1st of April to the 1st of September, from 10 till half-past 3.

# The Builder.

NO. LXX.

SATURDAY, JUNE 8, 1844.

HE proposed New Metropolitan Building-Act, as it now appears amended

in committee, though in many respects still objectionable, is in a form and is of a tenour so greatly improved, that we have confident hopes the measure will be perfected as far as human legislation can be: the remaining objections are chiefly of a technical nature, and lie principally in certain points

of minute practice, which, though the insisting upon them by the framers and promoters of the act could give them no satisfaction, yet the enacting them might render an otherwise good statute so obnoxious as to endanger its usefulness and permanence. We are engaged upon a minute review of the bill in its present form, in comparing it with the form in which it first appeared, and in weighing the various suggestions which have been made upon the subject in the different reports which have been published: all this is no small labour, and the result of our occupation upon the subject we propose giving in our next number, with cuts of the sections of walls, as they are now proposed to be arranged. We advise a temperate and close immediate view of the details of the bill to be made by every person likely to be affected by the enactment of such a measure, so that if a new Building-Act be not passed this year, one may be so perfected that early in the ensuing spring it may be passed without the necessity for new agitation, or further consideration of its details.

The separate bill relating to the prevention of damage by fire, a copy of which we lately gave, is so short that it might well have been inserted in the same general act, nor do we see why it is otherwise, unless, indeed, the government, despairing of passing any new Building-Act, resolved that the less intricate matter of a Fire-bill meeting with no opposition, might without delay be passed, containing any improvements which could be suggested.

One thing we observe in the improved proposed Building-Act, viz., sufficient care has not been taken to diminish the quantity of combustible materials used in buildings. We firmly assert good building, and a proper humane care of the lives and property of every human being within the realm, imperiously demand that combustible materials shall be kept from all party-walls.

It is some years since we have used any bond-timber whatever in any building; iron rat-hooping is so much better a tie, is so readily carried without danger near flues, as to be in every respect superior to timber. Whenever it is necessary to insert the end of any timber in a party-wall, we should so allow it only when covered with a

sheath of iron; plates in party-walls are commonly so broken by the occurrence of flues, that they become useless as ties, hence we have for a long while past mostly superseded them by granite and other kinds of stone. The day is not very far distant when a knowledge of architectural statics being duly restored, a total change will come over practical architecture, and those roofs which are now made combustible will be no longer so,—when vaulting and abutment are so distinctly understood, that churches and other public buildings, improved in fabric and beauty, will have their excellences carried down to posterity, because they cannot be burnt. We know there is a sad perverseness in the human heart, by which abuses, though again and again brought to prominent view, are still persisted in, notwithstanding the remedy of such abuses is again and again shewn to bring increase of beauty. When this is reformed, into oblivion will fall the unstable timber roofs, which, in defiance of science, prudence, and a right knowledge of legitimate architecture, are now so frequently set over churches and chapels, and which, indeed, have never received the approval of any competent judge, but are, from their false construction, in the very teeth of every prudent and scientific architect who has ever practised or laid down canons upon the subject. Ere long a right knowledge of Freemasonry will cause these nuisances to be entirely superseded by vaulting compressed firmly in every joint, and adroitly buttressed and pinnacled into stability; walls of even very small buildings will no longer be thrust over, roof-tenons will no longer be all in a state of destructive strain, nor will there be that concealment or mystification of ignorance and bad construction which is so fatally indulged in by the modern perverters of architectural science, who have lately gone back some centuries in the scientific knowledge and construction of roofs.

We are pained by seeing the observations relative to the re-institution of the use of chimney climbing-boys, which will be found in the report inserted in another part of our work. We can see no case sufficient for the retolerance of so inhuman a practice. If the present machines used for chimney-cleaning be insufficient for the purpose, that does not, in our opinion, afford the slightest reason for repealing an act which has declared penal a brutal practice, the mere necessity for the forbidding of which by statute was a disgrace to the age and country; and we trust, that if there were in a Parliament, forgetful of its public duty in a Christian land, the bare shadow of a chance of repeal, the whole body of the humane in these realms would rise up in arms, to decry, with one acclamation, a practice so savage and disgraceful. We have heard of such a thing as the kidnapping of one master carpenter's child, and the selling of him to a chimney-sweep. We have heard, too, of another master carpenter, who, languishing in "the article of death," recognized, in the body of a half-roasted child, who had been forced up that father's kitchen-chimney on fire, which should have cooked his sustenance,—that illegitimate offspring whose neglect he was counting over with his other sins.

We have had thirty years' experience on the subject of chimneys, and we beg to declare our unqualified opinion, that no necessity whatever exists for the employment of chimney-climbing-boys. We believe that, with proper apparatus, chimneys can alone be properly cleaned. The mere passing of a boy through a flue is not the slightest guarantee that it shall be cleansed; and we do not believe that,

when boys ascended chimneys, they were ever half-cleansed. We believe that the kicking and scrambling of children through difficult parts of flues, practically damages them an infinite deal more than any ordinary machine; but even though machines may damage flues, that only affords a reason for the improvement of such machines, by shortening their rods, or by other modifications. But the most powerful argument against such a frightful scandal is the necessity which the continuance of such an act would bring for an improved structure of flues themselves, by obliging them to be made easier in their turns, and of materials better than those used at present. Now flues, which ought to be of the choicest work and materials, are made so unsoundly, that in many places, particularly in their cross-withs, there is often nearly as much mortar as brick: no wonder then that withs should be worn away, and smoke should penetrate from one flue to another.

It is not our intention this week to carry further our observations relative to the measure, but we shall give thereon amply detailed observations in our next.

J.

## NEW BUILDINGS BILL.

In our last number we noticed the meeting of the Master Carpenters which took place at the Freemasons' Tavern, Great Queen-street, Lincoln's-Inn-Fields, to receive a report, and further to consider the amended new Buildings Bill; we now having received a detailed account of the proceedings which then took place, are enabled to lay them before our readers. Mr. H. Biers, the president, upon bringing up the report of the committee, stated that the deputation appointed at a former meeting had had an interview with Lord Lincoln, the First Commissioner of Works and Buildings, who was assisted at the conference by Mr. Pennethorne, one of the Crown surveyors. The deputation urged upon his lordship, that although the Bill formed a considerable improvement upon many of its predecessors, yet several objections existed in the intended new Bill. The proposed Act then under their notice is dated 1st March, 1844, the interview with his lordship was on the 25th of April, since which period the Bill has gone through a Committee of the House, and an amended Bill has been printed, dated the 17th inst. He (the chairman) would call the attention of the meeting more particularly to this amended Bill and the alterations therein, as meeting the objections urged upon his lordship as to the several clauses in the former Bill. The deputation stated the objections to reversing the rates in the Bill, calling what is at present a first-rate house a fifth-rate house, and a fifth-rate house a first-rate house, a method of description at variance with all present practice, and likely to lead to much inconvenience; in the amended Bill this has been altered, and a first-rate house now remains of its original designation; and buildings beyond a first-rate are now called, as suggested by your report, an *extra*-rate. The amended Bill still leaves undecided what is to be for the future the general line of fronts, for the regulation and restriction of projections; this is one of the faults in the existing Act of Parliament (14 Geo. 3, cap. 78), and ought in any new enactment to be defined precisely.

Your report recommended that in all new sites for building, the width of the streets ought to be regulated by the height of the intended buildings; by the amended Bill, it is proposed that no street shall be less than 40 feet wide, and that where houses are of height greater than 40 feet, the street is to be widened in proportion.

The section relative to dwelling-rooms, which were not to be inhabited unless of an area of 100 feet, has been altered, by taking away the restriction as to superficial extent, thus removing from the Bill a very objectionable and unjust proposition, which the society have from its first introduction opposed and endeavoured to get expunged; and as the amended Bill now stands, a room may be occupied as a dwelling apartment, if properly lighted and ventilated, propositions with which this society most fully concur. But upon the subject of ventilation, be (the chairman) was sorry to say that the government did not go so far as he thought they should; and here for a few minutes he would digress, and state that

a deputation from this society, conjointly with a deputation from the Metropolitan Improvement Society, waited by appointment upon the Chancellor of the Exchequer, for the purpose of obtaining some concession in the window duties, and more particularly in the ventilation of cellars and basement stories, especially in the houses of the poorer inhabitants. At that interview he (the chairman) took the opportunity of stating that the very stringent way in which the window duties are levied by the several assessors, under the direction of the Board of Stamps and Taxes, almost entirely binders that ventilation, which ought in a great number of instances to be permitted, and that window-lights ought not to be assessed, unless placed in dwelling apartments; but if purely for ventilation, that they ought not to be charged to the window-duties. It must be some satisfaction to the society to hear that, although they might not be permitted to the full desirable extent, yet that light and air are always permitted free of tax to privies; and water-closets, being only an improved description of these conveniences, he supposed were also exempt; but further than this, the chairman of the Stamps and Taxes (who assisted the Chancellor of the Exchequer at this conference) stated that a frame with perforated zinc paneling would be permitted free of duty, although fixed in an external wall. This the society, he was sure, would appreciate as of great moment; and it gave him much pleasure, inasmuch as the endeavours and suggestions of the deputation had not been without a beneficial result. That the society and the public in general might know exactly the footing on which they stand regarding these ventilating apertures, he had, as directed, addressed a letter to the chairman of Stamps and Taxes upon the subject, the answer to which he hoped to be able to lay before the society at its next meeting.

Having laid before the meeting the result of this communication with the Chancellor of the Exchequer, upon the subject of ventilation, and having stated to the society some of the improvements which have been made in the amended Bill as to the regulation of buildings, it now became his duty to state, and he did it with much regret after so much discussion had been entertained upon the subject, that there were still many important objections to the present Bill, and many improvements that might and ought to be effected in it prior to becoming law. One improvement, and he had most seriously considered the subject in all its bearings, would be the repeal of the 4th & 5th of Wm. 4, cap. 35; and the 3rd & 4th of Vict. cap. 85, commonly called the Chimney Sweepers' Bill. Persons unconnected with the building business are unaware of the very inefficient method as now adopted of sweeping any flue, but most especially those flues built with angles; and also the great damage that is occurring to the wits of flues at their salient angles, by the machinery now in operation. The society would see by the drawing which he held in his hand, and which drawing he submitted to Lord Lincoln, that these flues must, at their salient angles, be in a very short period of time worn away one into another, and the damage that will be done will be irreparable, and the liability to damage by fire be greatly increased. It is true that in new buildings this wearing away may be in a manner prevented by iron-work fixed at the salient angles of flues; yet in old houses, or houses built previous to the passing of these Acts, great damage must inevitably be progressing, and no flue, whether of new or old construction, is it possible to cleanse completely by a small round brush at the end of a stick, and which, after a little use, becomes diminished to less than a fourth of its original size.

The amended Bill still retains the clause preventing the over-sailing of chimney-breasts, which is an useless prohibition, and ought to be expunged.

The amended Bill still retains a most objectionable clause or section connected with the appointment of a registrar, whose salary is to be £1,000, per annum! but it is provided that in case of absence, the duties are to be performed by deputy, who is to be paid by part of the salary of the registrar, or is otherwise to be remunerated, as the Lords of the Treasury shall appoint; this is so objectionable,

that although his lordship's attention was particularly called to this subject, and precedents were adduced to shew that where a large salary is appropriated, and the duties of office are permitted, nay, even sanctioned, by Act of Parliament, to be done by deputy, that principal office will no doubt become an absolute sinecure.

The attention of the society is also directed to the alterations in the fees proposed to be paid in the various matters under this Bill, and it is with much regret that, great as the fees are under the present Act, under this amended Bill, a variety of fees not included in the fees at present chargeable are now introduced. In the proposed Bill an exemption is made in any trifling addition to a principal building, if such addition be carried up at the same time, or within twenty-one days after the principal building is covered in. By a most ingenious leaving out of a few words, these additions will all have to be paid for by additional fees; and although to an unprofessional observer it will appear that but one fee, according to the rate of the house, yet, in fact, several fees will be payable in new buildings, and in alterations and additions; nor are these fees all defined, even in the elaborate tables as set forth, but there appears a special table for special fees, and which no person can comprehend until enlightened therein by the official referees. As regards the fees payable under the present Act, they amount now to nearly 10,000£ per annum; under the new Bill, with its extended limits, fees to the amount of nearly 30,000£ will be payable by the public; for although a Building Bill is supposed only to interest the builder, yet it is the public generally which have to bear all its contributions, and to share in its enactments. Much has been done by this society in watching, in considering, in petitioning, in advising, and in shaping into its present form the twelve or fourteen Acts of Parliament which have been introduced to the Legislature since 1841, and he still hopes this amended Bill may, by the exertions of its committee, be still further amended, so that, without looking to the interests of those who may be looking forward to the various appointments under the intended Bill, they will still work as they have heretofore done to obtain a Bill really beneficial to the public.

In conclusion, although he had trespassed so much upon their attention, he could not but congratulate the society upon the great benefit they had done to all persons dwelling within the limits of its operations, and to the exertions of the society might be traced the alterations and improvements in the Bill. Compare the Bill brought in by Lord Normanby in 1841 with the amended Bill, and read the evidence, and the various petitions and reports by this society, and it will be found that although they stood almost alone in opposition to the objectionable Bills on their first appearance, yet they have, by exertions, now assisted by members of both houses of Parliament, been enabled to obtain thus far an improvement upon all its predecessors; and the committee cannot but regret that from the multiplicity of business in which the noble lord at the head of the Woods and Forests must be engaged, he must have forgotten the arrangement made by him at the last interview, that, previous to the Bill further progressing, the deputation was to have a further interview with his lordship and the Crown surveyors, as his lordship was obliged to leave the meeting before it could come to a conclusion upon the merits of the matter. If another meeting had been obtained, no doubt some of the objections in the amended Bill might have been rectified, altered, or expunged; but, as it is, it is to be hoped it is not even now too late to obtain such alteration in the Bill as an experienced and disinterested person may think an improvement. The chairman sat down amidst loud cheering.

Mr. W. Cubitt moved the thanks of the society to the chairman and committee for the great trouble they have had in the various Bills brought before the public, and hoped that until a good and sufficient Bill be before the public, they would still continue their valuable services. He then moved that the amended Bill be referred back to the committee to re-examine, and to report thereon.

Mr. Higgs, in seconding the motion, stated that his only objection was, that it entailed so large a portion of trouble, and must engage so

large a portion of the valuable time of their excellent chairman; for although to all appearances the various reports were the works of the committee, yet in fact they were the sole labours of the chairman; and he could congratulate the society on the good fortune of having such a president at such a time. Still trespassing upon their worthy chairman's time and attention, they could not do better than to again refer it to the committee, feeling assured that although it must, after four years' strict superintendence, be exceedingly irksome, and no doubt, from the many public as well as private calls upon the chairman's vigilance and care, yet he felt convinced the matter would still have his advice until finally completed. It was then carried unanimously that the amended Bill be so referred again to the committee.

After the thanks of the meeting were passed to the chairman, the meeting adjourned until the last Wednesday in June, unless specially summoned previously by the chairman.

#### OXFORD ARCHITECTURAL SOCIETY.

MAY 29.—The Rev. the Rector of Exeter College in the chair.

The following new members were admitted:—Rev. R. P. Smith, Feubroke College; E. J. Howard, Esq., Lincoln College; R. Gray, Esq., Exeter College; Rev. Folliot Baugh, All Souls; Alexander Joseph, Esq., Brasenose; J. G. Joyce, Esq., Magdalene Hall.

Pugin's Glossary of Ecclesiastical Ornament and Costume, 4to., was added to the library.

Short notes of several churches in the immediate neighbourhood of Oxford, prepared for the third part of the "Guide," by different members, were read, illustrated by sketches.

Marston.—Mr. Rooke, *Oriel*.—The pillars and arches are of the time of Richard I.; the outer walls and windows of Henry VIII. The windows are square-headed, with rather singular returns to the dripstones, inclosing in a square form the letters I I C and I H S, and other ornaments. The tower is also late.

Wood Eaton.—Mr. Rooke, *Oriel*.—This church is chiefly of the thirteenth century, with a tower added in the fifteenth, in an unusual manner, being built *within* the original walls of the church, standing partly on the west wall and partly on arches, instead of being added on the outside. It is very picturesquely situated.

Noke.—Mr. Rooke, *Oriel*.—A small plain church, of the thirteenth century, with some alterations of a later period, which are far from being improvements.

Cuddesden.—Mr. Rooke and Mr. Freeman.—A cruciform church, of the end of the twelfth century, with a tower at the intersection. The mouldings of the west doorway are very remarkable, shewing the change from the Norman zig-zag to the early English tooth ornament. The pillars and arches of the nave, walls of the aisles, and the south door, are of the thirteenth century. The chancel has been rebuilt in the fifteenth, and has arches in the side walls, as if for the addition of aisles, but these do not extend more than half through the thickness of the wall, so that they must have been built for ornament.

Stanton St. John's.—Mr. Freeman.—A very interesting church, of the time of Edward I., and a valuable specimen of early decorated work. A paper on this church has previously been given to the society, with drawings, by Mr. Simpson, of *Oriel*.

Elsfield.—Mr. Freeman, *Trinity*.—A small church, of the thirteenth century, the west end of which, with its two lancet windows, separated by a tall buttress, supporting a bell-turret, with small buttresses at the angles, is a particularly good design. There is a low side-window, in the usual situation (blocked up), in the inside of which is an original stone seat.

Cowley.—Mr. Millard, *Magdalene*.—The chancel and walls of the nave are of the end of the twelfth or beginning of the thirteenth century; the east end has a triple lancet; the side windows of the chancel are square-headed, but the mouldings shew them to be of the same age as the east end. There is a low side-window. The tower is very small and low, scarcely appearing above the roof of the nave; it was added in the sixteenth century.

St. Bartholomew's Chapel.—Mr. Millard.—

A small but elegant building, of the latter part of the fourteenth century, shewing the transition from the decorated to the perpendicular styles. Drawings of the chapel are about to be published by the society, and an accurate estimate has been obtained of the cost of building a copy of it, which would be 280*l*.

**ELEMENTARY ESSAY ON MORTAR AND CEMENTS.**

BY JAMES WYLSON, HON. SEC. B.A.A.D.  
(Continued from p. 262.)

**MAUDE'S PATENT PORTLAND CEMENT.**

There has lately been introduced into the London market, by Messrs. Maude, and Co., of Upper Ordnance Wharf, Rotherhithe, a cement which bids fair to leave in the rear all other competitors for distinction in that line. Through a recent introduction to London, its excellence has been successfully tested by many years' experience not only in and about Wakefield, where the manufacture was carried on by Mr. Aspidin, the inventor, but throughout the northern counties of England, where its extensive use is the best testimony to its superiority. The expense of conveyance, and the comparatively high price of the cement itself, had, however, deterred the proprietors hitherto from attempting its introduction into the metropolis to any important extent; but the firm above named have at length surmounted those obstacles, by concluding arrangements with the son of the patentee, empowering them to manufacture it in town; by which means the London price of the article is considerably reduced, and increased facilities are made available for its most perfect preparation.

The distinguishing properties of the Portland cement, which, indeed, are essential to a good cement, each and all of which it possesses in an eminent degree, are—

1st. That which is a permanent recommendation, viz. a very remarkable resemblance to Portland stone (from which circumstance it derives its name), and its permanently retaining its resemblance to that material; thus obviating a serious annual outlay for colouring or painting, the necessity whereof is inseparable from other cements, but which, for this, is not only unnecessary, but would be a proceeding evincing as much bad taste as the injuriously covering the beautiful stone itself.

2ndly. Its perfect freedom from any liability to be changed, in its substance or superficially, by atmospheric influences, whatever the season or the climate, having none of those tendencies to vegetate and oxidate which so commonly shew themselves in cements.

3rdly. The extraordinary strength of its cementitious quality, which admits of its receiving more sand than any other cement now in use; and, indeed, is the circumstance enabling the proprietors to offer it in competition with other cements, which the cost would otherwise preclude.

From the ease with which it is worked, its extreme hardness, adhesiveness, uniformity, and durability, and being impervious to damp, it is obviously well-calculated for all the varieties of uses to which cements are applied; and when the expense of stone ashlar in London is considered, the incomparable superiority of its appearance over that of the ordinary stuccoing, and the unquestionable imitation of it which this cement affords, no doubt can be entertained of its obtaining that decided preference to which it is so highly entitled.

For carrying up any brick-work, where the necessity for superior strength, or its immediate hardening without settling, requires that a cement superior to common lime mortar should be used, one part of the Portland cement of the best quality (there being two sorts), and four parts of clean, dry river-sand, form the admixture recommended. For stuccoing, one part of the best cement, and four parts of sand, or one part of the second quality, and three parts of sand, are proper. The materials being mixed with water to the consistency of mortar, are applied immediately, and are finished in one coat. In damp situations a smaller proportion of sand should be employed in the admixture; and for building in water, the cement should be used alone. The building materials with which it is to be brought into contact ought, in every case, to be thoroughly wetted previous to its application

(especially in summer), to prevent the too rapid absorption of moisture.

Nor is it merely for building, exterior stuccoing, and the usual adjuncts of balusters, chimney-pots, copings, &c., that it is suitable; for it is also well adapted for landings and paving, both plain and ornamental; its compact and enduring nature, together with its uniformity of surface, renders it superior to Yorkshire paving stone, the laminar structure of which is exceedingly objectionable, where it is subject to the vicissitudes of the weather, or, being within doors, it has to be frequently cleansed by washing; from this disadvantage the artificial Portland cement paving is, from the nature of the method observed in making it, quite free. In the inclosed quadrangle of Trafalgar-square, to which Mr. Barry was devoted so much care and attention, the darker asphaltic paving is relieved by portions executed in the Portland cement; the lining of the basins for the fountains is also of the same composition, the preference being awarded to it in consequence of its great resistance to the action of the atmosphere and of water, and from its possessing and retaining so eminently the texture and colour of stone.

For friezes in bas-relief, and other similar purposes, it is peculiarly available, on account of the baking that is necessary in other artificial stones being dispensed with in this, thus obviating that warped irregularity in the plain surfaces and joints which has formed the stumbling-block to their general application. For sculpture generally, as applied to architectural embellishments, it needs no exertion of fancy to perceive that so felicitous a material is not only most suitable, but that it is suggestive even of a more ambitious range of design,

and presents facilities for embodying any triumphs of conception; a consummation which, however devoutly it might be wished, was utterly unachievable in Roman cement, as the denizens of Battle-bridge have not yet had time to forget.

With regard to the expense of the Portland cement, it appears, according to the statement of the proprietors, that paving can be laid down below the price of the commonest Yorkshire paving-stone; and that, for stuccoing, if the best cement be used with four-fifths of sand, the composition will cost somewhat less than that formed of equal parts of Roman cement and sand, which is inferior in strength and appearance, and involves the necessity for frequent re-colouring.

In order to test the comparative strength of the Portland and Roman cements, Messrs. Grissell and Peto caused a series of experiments to be made in October last, at the new Houses of Parliament, under their own superintendence; these experiments and their results are exhibited in the diagrams appended to this paper, and the tabular comparisons accompanying them. The deductions thence arrived at shew an advantage on the side of the Portland cement, which speaks most strongly in its favour; and which, judging by the authority from which these contrasts emanate, must be considered as at once authentic and conclusive, establishing this to be, beyond all doubt, decidedly superior to the Roman cement, whether as to strength, adhesion, or the capability of receiving sand, the latter of which properties it is shewn to possess to such a degree as to render it actually cheaper than the other; whilst its other recommendation, of beauty and the saving of colouring, alone render it highly preferable.

**EXPERIMENTS at the New Houses of Parliament, made by order of, and under the superintendence of Messrs. Grissell and Peto, October, 1843.**

**ROMAN CEMENT.**

**FIRST TRIAL.—Half Brick Beam, 3 courses deep, tested on third day after formation.**

**NOTE.**—The figures denote the number of bricks each specimen carried before it broke from the wall. These trials of adhesion were worked without a centre. The dotted lines indicate the points of fracture.

## INSTITUTION OF CIVIL ENGINEERS.

JUNE 4.—The President in the chair.

THE applicability of the system of the propulsion of railway carriages, by the pressure of the atmosphere upon a piston, travelling within an exhausted main, or line of pipes, has occupied a portion of three evening-meetings of the society; and although much time has been devoted to the discussion, it cannot be said that any positive conclusion has been arrived at. Indeed, when it is considered that the system has only been tried upon a line peculiar in its locality, in its steep gradients, in the engine having only to exert power in drawing the carriages in one direction, and their descending by their own gravity, and in the trains being only required to run a distance of a mile and three-quarters from end to end of the line, without stopping at any intermediate station, it may be argued, that although, as is evident from the testimony of the several speakers, extraordinary results have been obtained, it is scarcely possible to infer what the results would be on lines with gradients in both directions, with a great number of heavy trains at short intervals, and under all the varied circumstances of ordinary railway traffic.

It appeared, however, to be the general opinion, that the present system of atmospheric propulsion, as employed on the Kingstown and Dalkey Railway, although susceptible of much improvement, was in a more advanced state than the system of traction by locomotive engines, at a corresponding period from the date of the introduction of the several systems upon railways.

Messrs. Clegg and Samuda, the improvers and executors of the present atmospheric system, detailed the progress of the improvements, and in answer to questions from the members, reiterated the information which has been already published in the various reports of the examinations before the committee of the House of Commons on the Epsom Railway Bill, and which it is useless now to repeat.

The various previous plans of Medhurst, Vallance, and Pinkus, for somewhat similar systems, were explained, and it was shewn that the system had been taken up by Clegg and Samuda where the former speculators had abandoned it, and, as usual in such cases, the practical improvers had been more successful than the inventors.

The principal improvement was shewn to be in the continuous valve, and the mode of closing it by a mixture of tallow and bees-wax, which, under all variations of temperature and seasons, remained unchanged, and enabled a good vacuum to be formed. Many other improvements in the mechanical details were also described at length.

Mr. Barry Gibbon, as engineer of the line, stated his satisfaction with the manner in which it worked. Thirty-five trains per day had at times been conveyed without danger, and with great regularity. The train was enabled to be started in one minute after the engine commenced working to form a vacuum. Mr. Samuda detailed the progressive trials of the system at Wormwood Scrubbs during two years and a half, until it was laid down at Dalkey, where a load of fifty tons had been propelled up gradients averaging 1 in 115, and a maximum velocity of nearly fifty miles per hour had been obtained, with an engine which was stated to be of 100 horse-power, using, as a divisor, 66,000 lbs., raised one foot high in a minute. This deviation from the ordinary calculation of Boulton and Watt, who used 33,000 lbs., was justified on the plea that steam-engines were now made in such a superior manner, that their effective power nearly doubled their nominal power, and that the usual acceptance of the term "horse-power" was no longer to be relied upon. This position was combated by several members, who argued that the commercial question should not be mixed up with the scientific inquiry; and that for the latter purpose the accepted divisor of 33,000 lbs., as fixed by Boulton and Watt for the horse-power, should have been used, when the power exerted would have appeared nearly double what had been quoted, which would materially affect the question of the cost of first laying down a railway and the expense of subsequent working.

In considering the comparative questions of traction by locomotive engines, by fixed en-

gines with ropes, and propulsion by the atmosphere, it was argued that, in the two former cases, the weight of the moving power must be carried along the rails at a corresponding cost and loss of power; added to which was the loss resulting from the slip of the driving-wheels, in the one case, and the friction of the rope against the pulleys, in the other case. The destruction to the rails resulting from the beat of the driving-wheels being put out of the question. Against this it was argued, that with the atmospheric system the whole power of the engine must be used whether for heavy or light trains; that a power capable of pumping out the leakage, stated at ten horse-power per mile, must be always provided, although it was only exerted for a part of the length of each section; and that the real power employed at Dalkey, if calculated by the usual standard of Boulton and Watt, was shewn by Indicator diagrams to be nearly double what had been stated, and that, consequently, a greater outlay for power was required than was imagined.

The additional security in traversing the rapid curves of the railway at high speed appeared to be admitted. A curious circumstance was mentioned which deserved more attention; it was, that the temperature of the air on leaving exhausting air-pumps was increased to upwards of 200 degrees, and that there was a certain absorption of power consequent upon this increase of temperature. Our limits will not permit the whole, even of the heads of the discussion, to be detailed, and, although much time has been devoted to it, the question was not fully examined, nor were all the necessary data clearly stated; so that for all practical purposes we shall only arrive at the comparative value of the new system, after it has been applied to such a line as the Epsom, where, under the scrutinizing care of Mr. Cubitt, the engineer of the line, there is no doubt of its merits being fairly tested; meanwhile the question remains open, and, as before, to be discussed as the interest or prejudices of parties may dictate.

The papers read were:—A description, by Mr. Rankine, Assoc. Inst. C.E., of a simple and ingenious safety drag, which has been applied to the carriages of the Edinburgh and Dalkeith Railway, for preventing accidents to the carriages in case of the fracture of the rope, by which they are drawn up the incline plane of 1 in 30. The drag consists of two cheeks of iron, united by rivets; it is attached at the end of an iron bar, and is suspended at the back of the carriage behind each hind wheel; when a retrograde motion commences, the drag falls beneath the wheel, and turning over, acts as a wedge between the wheel and the rail, and, by skidding the wheel, stops the downward progress of the carriage.

A description was also given by Mr. G. P. White, Assoc. Inst. C.E., of the mode of raising the Innisfail steamer, which was sunk in the river Lee, near Cork. It was accomplished by making a slight coffer-dam against one side of the vessel, and by pumping this out, the leak was arrived at; which being temporarily repaired, the vessel was enabled to be floated, and, at an expense of 350*l.*, was saved from total loss.

A description was also given by Mr. W. Evill, Grad. Inst. C.E., of the corrugated iron roofs over the terminus of the Eastern Counties Railway; the drawings accompanying the description, which was necessarily of a purely technical character, were much eulogized by the president, and the members who examined them.

The president renewed his invitation to his conversation of the 7th and 8th instant, at which many distinguished personages may be expected, and all models and works of art for exhibition were requested to be sent as quickly as possible.

Messrs. H. T. Wright, J. Reid, and J. L. Manby were elected as associates, and the following papers were announced to be read at the meeting of June 11th:—

No. 687. "On the purification of coal gas, and the application of the products thereby obtained to agricultural and other purposes." By A. A. Croll, Assoc. Inst. C. E.

No. 688. "On the means of rendering large supplies of water available in cases of fire, and on the application of manual power to the working of fire-engines." By J. Braidwood, Assoc. Inst. C. E.

## SOCIETY OF ANTIQUARIES.

MAY 2.—Lord Viscount Mabon, V.P., in the chair.

T. W. King, Esq., F.S.A. Rouge-Dragon Pursuivant of Arms, communicated some remarks upon the Stall-plates of the Order of the Garter, existing in St. George's Chapel at Windsor. It appears that, on an examination made in the year 1757, there were no plates for 146 of the ancient knights, and of those which exist many are not contemporary with the knights whose achievements they represent. Mr. King's remarks were directed first to the point of the shields of arms being surrounded by the garter, which is not the case in the oldest plates. The first so represented is that of the Duke of Burgundy, K.G., from 1469 to 1477. The plate of Lord Lovell, in 1 Richard III., is the first English subject whose arms are so encircled, and many of later date have no garter. The fashion became prevalent in the reign of Henry VII., and constant in the next reign. Mr. King remarked, secondly, upon the form of the helmet. The side-standing close helmet now assigned to the rank of esquire is found used by a peer (the Earl of Derby) in 13 Elizabeth., and by two other knights in the next reign. The barred-helmet is first used by a baron (Lord Knollys), in 1615, and gradually became universal with peers. This distinctive use of helmets appears, in fact, quite a modern notion, nearly, if not entirely, subsequent to the actual use of helmets in the field of battle.

MAY 9.—W. R. Hamilton, Esq., V.P., in the chair.

Extracts were read from a third letter of William Roofs, Esq., to Mr. Hamilton, dated May 6, respecting the relics extracted from the Thames by the ballast-heavers near Walton. Two articles recently found are, a portion of a dagger or small sword, and a pocket-piece of Charles the First and Henrietta Maria. Mr. Roofs is inclined to attribute the former to the same age as the latter, and thinks that both are memorials of the conflict on Surbiton Common, in which Lord Francis Villiers was killed, not a quarter of a mile from the place of their discovery.

The reading of Mr. King's paper on the Stall-plates of the Garter was concluded. His remarks were directed to—3. The use of coronets. Many earls and viscounts have no coronet in the reigns of Henry VIII. and Edward VI., and its use did not prevail until the beginning of Elizabeth's reign. 4. Supporters. Among the privileges of the Order of the Garter is that of using supporters, whether the knights are peers or not. Supporters are not, however, of high antiquity. The plate of the Marquis of Dorset (afterwards Duke of Somerset), K.G. in 20 Henry VI., which has supporters, is not contemporary. That of John Lord Dinham in 1 Henry VII. has supporters, which (as in many other ancient achievements) really support the helmet and crest, not the shield. But there are only five plates with supporters to the 29th Henry VIII., after which time they are universal.

Charles M. Joplin, Esq., communicated a memoir on the remains attributed to the Druids in the neighbourhood of Furness, in Lancashire. His descriptions were illustrated by several drawings, which represent—1. Various monuments at Stone Walls, Urswick, consisting of ruins of an oblong inclosure, a square one, a third of an extraordinary wheel-like form, and two cromlechs. 2. A temple of two circles of stones, called Sunbrick, at Birkrigg. 3. A circular temple or camp called the Kirk, at Kirky Moor, accompanied by a cairn, which, on being opened, disclosed a tomb and a stone chest. 4. The Moot, at Aldingham, an artificial hill now situated on the brow of a high cliff above Morecambe Bay. 5. A British camp at Appleby Slack, Birkrigg; and, 6. Three stone hammers, or celts, found at Lindale and High Haums.

MAY 16.—Henry Hallam, Esq., V.P., in the chair.

The following gentlemen were elected Fellows of the Society:—Charles Tucker, Esq., of Harpsford, county of Devon; Major John Arthur Moore, of Queen Anne-street, and Frederick William Fairholt, Esq., of Grosvenor Cottage, Regent's Park.

Robert Porrett, Esq., F.S.A., exhibited a gold ring, containing a miniature painting,

supposed a contemporary portrait of Mary Queen of Scots. It belongs to R. B. Aldersey, Esq., of Cbigwell-row, Essex; and its descent is traced for a century and a half.

W. R. Hamilton, Esq., V.P., exhibited, from W. Roots, Esq., two relics drawn from the bed of the Thames just above Kingston, one of them a spear-head.

Dawson Turner, Esq., F.S.A., communicated five drawings, the subjects of which are as follows:—

1. An urn found at Burgb Castle, the Gariounum of the Romans; it was exhumed on the 29th December last, in the same field, called the Brick-kiln Field, on the eastern side of the castle walls, as were three figured by Ives, p. 35, and was partly filled with bones, which were accompanied by four iron nails.

2. A Pax, from the same village, carved in front with the Holy Rood, the Blessed Mary, and St. John.

3. A Roman sacrificial instrument, or præfericulum of brass, found at Heringfleet, in July, 1842; it is inscribed QUATTENVS F. Its length is 10½ inches, and its diameter 6 inches.

4. A gun, of wrought iron, of the time of Henry VII. or VIII., found in the sea near Lowestoft, and now in the possession of Geo. Edwards, Esq. Others have been found near the same spot, and probably from the wreck of the same vessel. Its total length is 9 feet.

5. A wooden shield, 24 inches long, and three-quarters of an inch thick, found in the wall of a house at Yarmouth. It is carved with the quarterings of the Prince of Orange, and painted in colours.

Richard Almack, Esq., F.S.A., of Melford, communicated a letter written by Sir Thomas Stanhope, of Shelford, county of Notts, to Lord Burghley, in 1588, relative to the funeral of his mother, Lady Stanhope, the widow of Sir Michael Stanhope, one of those who suffered with the Duke of Somerset, in the reign of Edward the Sixth. The lady was lying dead at Nottingham. Mr. Almack supposed this document to be indorsed by Lord Burghley himself; but the indorsement is in the writing of one of his secretaries.

Edward Hailstone, Esq., communicated transcripts from the register of trials before Major-Gen. Lambert and the Council of War sitting in Yorkshire in the year 1647.

May 23.—W. R. Hamilton, Esq., V.P., in the chair.

Walter Hawkins, Esq., exhibited an ancient sword found in the bed of the river Thames, in 1739, at the building of Westminster Bridge. It resembles the large swords of state of the thirteenth and fourteenth centuries. The silver furniture of the sheath (itself decayed), adheres to it by the rust, and is impressed in several places with the motto, *tufti* and a stag's head. It is probable the sword itself was a century at least older than the sheath. Its length is 5 feet 6½ inches. It has been welded, and it may be presumed has lost something by the mending.

The Rev. J. B. Reade, of Stone, near Aylesbury, exhibited an impression, in tinfoil, of a Norman font recently placed in his church (to which it is suitable in style), after having been long since removed from its original site, the church of Hampstead Norris, in Berkshire. It has been for some years in a garden of a southern suburb of London, and was presented to Mr. Reade by J. Y. Akerman, Esq., F.S.A. Mr. Reade noticed a statement in "Dr. Lipscomb's History of Buckinghamshire," which asserts that Stone Church was erected on an artificial mound, whereas it has been ascertained to be a natural sand-hill.

The Rev. John Webb, F.S.A., communicated a memoir upon a Preceptory of Templars (and afterwards of Hospitaliers), at Garway, in Herefordshire, which is neither described nor enumerated, even in the new edition of the *Monasticon*, but of which he has collected many very interesting notices, both historical and architectural. Their church (of Norman architecture) remains, and extensive indications of the site of their mansion, together with a remarkable dove-cote, which is still perfect. It is built of stone, the wall of rubble rough-casted without and lined with ashlar within, of circular form, measuring 17 feet 3 inches in diameter, and 16 feet in height. There are twenty tiers or compartments for the birds, forming altogether 666 boles. From the following inscription over

the door, it is shewn to have been erected in the year 1326.

The two last lines being somewhat obscure, from the wear of centuries. On the interior face of the building occurs in one place the name

GILBE  
RTVS

and on other stones are carved the double cross of the Templars, accompanied in one instance with the letter R, of the scriptorial form.

#### THOROUGH DRAINING.

Mr. J. H. Charnock, secretary to the "Yorkshire Land-draining Association," has lately published a pamphlet on the important subject of Thorough Draining,—a paper read before the Wakefield Farmers' Club. It was truly said by Lord Spencer, a short time ago, that farming was yet in its infancy; and many circumstances present themselves to the attention which amply verify the assertion. Through the operation of the several agricultural associations which have been established throughout the country, much valuable information upon this important matter has been extensively diffused. Much good has been already produced, and much more will inevitably follow, so long as scientific men turn their attention to all the various matters which are comprehended in the subject. Amongst these, thorough draining has been considered one of the most important. Mr. Charnock has ranged himself in the ranks of those who have devoted their attention to supply the most efficient means for the attainment of the most beneficial ends. His attention, and skill, and devotion to the subject, will, we trust, meet with their due appreciation, and his suggestions engage the attention of all who are not only labouring in the same field as originators of improvements, but anxious to carry into practical operation the plans which are based on experience and a due conviction of all needful means, modes, and appliances. We should deem it wrong to transcribe an undue portion of this useful publication; but we confidently recommend it to the cultivator of the soil, with the assurance that it is fully entitled to their attentive perusal, merely subjoining the following general observations:—

"In the first place, then, if there is one operation more than another in which the maxim 'that what is worth doing is worth doing well,' holds good, it is in draining; effective and permanent must be your work, or it is comparatively money and labour thrown away. And for this reason, if for no other, should it be done under the superintendence of the landlord; it is in truth an owner's work; it is principal invested, and cannot, except by an occupier, be with justice treated as a mere outlay for repair. It is a permanent improvement of the fee, and if permanently and effectually done, gives as surely a rental fully commensurate with the outlay. At the same time, however, rather than farm undrained land, it is the palpable interest of the occupier himself to undertake the work, and especially if he previously concludes for any certainty of tenure. But the most desirable arrangement is, that owner and occupier should act mutually in the matter, and as the best interests of each are so intimately bound together, they should mutually concur in the execution of the work. And here I may mention the plan which is adopted on the Greenwich Hospital estates in Northumberland, under the superintendence and by the advice of that eminent agriculturist Mr. Grey, of Dilton, which I think may be considered as perfectly equitable and unexceptionable in all cases. The rule is this,—if the drainage is done during the first seven years of the lease, the hospital pays one-third of the entire cost; if during the second seven years, one-half the cost; and if in the last seven years of the term, it pays two-thirds of the cost of draining, the lease being for twenty-one years.

"In the second place, prior to commencing operations, great care should be taken accu-

rately to ascertain the character of the subsoil—its porousness or tenacity—thereby to regulate, as far as practicable, both the distance and depth of the drains. That of the former should in no case, where drainage is necessary at all, exceed ten yards; and where the substratum is tenacious, it will often require not to be more than half that distance in order to be thoroughly effective, without which, I repeat, it is comparatively lost labour. With regard to the latter, if circumstances permitted, I would never (as a general rule) have drains shallower than two feet, but I should prefer thirty inches or three feet, in order to admit, without apprehension, of the subsoil plough following; and so as to be out of the way of all damage, under any circumstances.

"Thirdly, I would have the drains cut with a little more slope at the sides than is usually practised, affording thereby the operator more room for laying the tile and clearing the bottom, both which are very essential, but in a deep drain cut perpendicularly, somewhat difficult without injury being done. And besides, I conceive it affords a more regular percolation into the drain, with less liability to the washing in of the sides, or any portion of them; and also because the edge is thus rendered much safer and firmer for the tread of a horse.

"Fourthly, I would in all cases use some porous substance, other than the earth from the cutting of the drain, as covering over the tile; such as broken stone, where the locality afforded it, or burnt clay, or engine ashes (the best of all) if obtainable; and in the absence of all such materials, heath or ling (very good and durable) and thorns, or brusbwood, properly cut and put in; but in no case the soil from the drain alone immediately over the tile.

"Fifthly, it is desirable the drains should be cut as near the exact width of the tile at the bottom as practicable, otherwise, in filling up, the tile is almost sure to get displaced, and thus create an interruption. Much greater pains too than are usually bestowed should be given in the general manipulation of the work, particularly in laying the tiles firm and clean; which would be readily acquired by the men, without any diminution of their allotted task, were the superintendents persons of skill and judgment.

"And lastly, I must ever bold the opinion, that in all cases of ordinary levelness of surface, the most advantageous as well as cheapest disposition of the drains is down the furrows; that being usually the natural direction of the fall, and because the surface water thereby the more readily reaches the drain, and at the nearest point. Not that I would continue to retain the high ridge and furrow after the land is drained, but in every case would work the lands down to a suitable flatness as soon as practicable without injury to the succeeding crops. There are two other points which I also consider essential; the one is practicable under all circumstances, and must, therefore, not be disregarded; it is, never to permit one drain to enter another (and especially the main receivers) at right angles, but to give them such an inclination in their junction as shall allow the water free course without injury to the recipient drain: the other is, perhaps, a matter of more difficulty, but nevertheless, of great utility—I allude to the drains being so disposed as to admit the air through-out their entire course, in fact beneath the whole surface of each field; the effect upon strong tenacious clay will be to facilitate their operation most materially, and will be obvious to every reflecting mind."—*Doncaster Gazette*.

**THE NELSON COLUMN.**—The committee lately assembled for the purpose of taking into consideration the completion of the column in a manner due to the memory of the illustrious hero. The additional sum required for the purpose of making lions, bas-reliefs, and steps, is between 10,000*l.* and 12,000*l.* The committee have expended 20,000*l.*, the total amount possible to be raised by public subscription, and are obliged to express a decided opinion, that if the government do not come forward and supply the money for finishing the monument, it must remain in its present condition, and be viewed rather as a reproach upon the metropolis than a credit. They agreed in the propriety of waiting upon Sir Robert Peel, to represent the exact state of the case, and to request the Minister's aid.

INTERIOR VIEW OF THE CHANCEL OF THE PRIORIAL CHURCH, BRECON.

TO THE EDITOR OF THE BUILDER.

SIR,—Having a short time ago sent you an exterior view of the Priory Church of Brecon, which appeared in page 54 of the present volume, and as I then described the chancel of the fabric as possessing a great degree of architectural beauty, I now beg to send you this view of the interior, to which I am sure you will feel pleasure in giving equal publicity. It will be plainly seen, that the roof was originally groined, or was intended to have been so, as a portion of the ribs appear springing from the tops of the columns. The large outside arch is one of the four upon which the tower stands, the piers of which may be seen by referring to the plan which is already published with the exterior view. Each side is pierced by five lancet perforations, supported by slender clustered columns, which

throw over the whole structure an airiness and elegance. Many of the corbels are beautifully carved into the most delicate and fanciful foliage, curling round and recoiling from the moulding above, as if restrained in their farther luxuriant career, like the ivy which here and there peeps through the windows. The end window has a very fine appearance in the interior, being formed of five lancet-lights, divided by slender clustered columns, and rich flowing mouldings.

There is not much to admire in the roof, except the richly-gilded bosses which appear to be deeply sunk, forming shadows which, from the floor beneath, are very effective. In the floor are stones of a very early date, bearing very strange characters, now nearly obliterated. This chancel contains also many fine monuments, the most ancient of which represents the effigy of Sir David Williams, one of the judges

of the Court of Queen's Bench in the reign of Elizabeth, the maternal ancestor of Col. Wood, M.P., who has represented this county in Parliament for nearly forty years. This monument is peculiarly interesting, as a relic of that period of transition wherein the Pointed mode (which having prevailed for so many centuries at last dwindled into the imbecility of age), at length, on the introduction of the architecture of the great Italian masters, whose celebrity at that period became a subject of great interest in this country, mingled incongruously with the wrecks of another style. Within two corresponding arches to the right and left of the entrance into the chancel, are two handsome marble monuments, designed in accordance with the character of the arches. The one on the right is to the memory of the late Marquess Camden, who deserves a national tribute of respect for his munificent gift to the state. As

FWSPAD  
L.D.E.I.

I think it will not be out of place, I give the inscription entire, as follows:—

Sacred to the memory of  
the Right Honourable  
JOHN JEFFREYS PRATT,  
Marquess Camden, K.G.  
Who died October 8, 1840,  
Aged 81 years.

During a long life passed in the  
service of the public,  
and in the highest offices of the state,  
He contributed by voluntary donations  
towards the exigencies of  
his country,  
366,116*l.* 14*s.* 3*d.*

This tablet,  
to record his patriotism and virtues,  
is erected by his affectionate niece,  
Lady Caroline Wood.

"A good name is rather to be chosen than  
great riches."

The other memorial within the arch on the left, records the name and virtues of his mother, the Baroness Camden, from whom the noble family inherited the priory. Both works are from the chisel of John Evan Thomas, F.S.A. There are several other finely-wrought works, by Thomas; one a beautiful monumental figure to the memory of the late John Powell, Esq., and on the opposite side another, commemorating the Rev. Thomas Coke, LL.D., the celebrated missionary, and a native of Brecon. But the work which forms the chief attraction, and gives to this church the greater interest and importance, is a beautiful group of figures, by our immortal sculptor, John Flaxman, R.A., to the memory of the Rev. Thomas James, of Brecon. Sweetserenity and spirituality pervade them; while a soothing influence involuntarily attracts and fixes the attention of the observer, and seems to extend and enlarge his faculties, to catch, by intuition, the contagion of virtuous tranquillity, and reach the level of such exalted associates. These almost breathing marbles, sculptured by such a master-hand, have a chaste and softening effect, when contrasted with the solemnity of the architecture and the loneliness of a country church, and appear to me to possess a far more sacred character than the gorgeous effigies of a city cathedral. We seem to fancy these huddled spots, fixed by our forefathers in Nature's penetralia ages long gone by, possess a peculiar guardian sanctity, free from the busy hum of human life, and the fiercer passions which degrade humanity; it sanctuaries, therefore, for these productions of genius, so intimately connected with the last haven of repose.

I am, Sir, your very obedient servant,  
Berkeley-place, Brecknock. J. L. T.

#### RESTORATION OF ROSSINGTON CHURCH.

The above church during the last twelve months has been undergoing great alterations. These having lately been completed, the sacred edifice has been re-opened for the celebration of divine worship. Before entering into the details of the improvements which have been effected in the re-building of the greater portion of the church, we give the following extract descriptive of its former state, taken from "Wainwright's History of the Wapentake of Strafford and Tickhill."

"The church," says Wainwright, "before it underwent the process of improvement, was a venerable and highly interesting piece of architecture; but it now exhibits an aspect difficult to bring within the pale of technical description. To the world a sample of taste is left by its renovators, highly derogatory to the chastity of their views, and inimical to the end for which the edifice was originally reared.

"The era of its erection, like that of most others, cannot be precisely ascertained. The few remains of the original structure bespeak an early foundation, and throw back its building to an age coeval with the reign of King Stephen.

"The archway, under which we pass into the chancel from the nave, presents, in its mouldings, a genuine specimen of the Anglo-Saxon or early Norman mode of decoration.

The inner pilaster is short, round, and massy, and entwined with a spiral band, which is succeeded by some ornamental tracery-work and a number of rude devices. Above these is placed a square abacus, whence springs a circular arch ornamented with a chevron border, and other Saxon embellishments.

"The pedestal, whereon the western pilaster is placed, is unusually high, and corresponds in make with the abacus. The outer or eastern side of the same opening shews a face somewhat different to that of the western, being formed by columns taller and more slender, but in other respects it partakes of the same order and age.

"The door leading into the interior of the place from the porch wears also an antiquated aspect. On each side are plain round pillars, headed by square abacuses, supporting a circular arch with a billeted moulding, corresponding in age with the residue of the primeval structure.

"The ambo or pulpit is an aged oaken box, carved in the style which prevailed before the reign of Henry VIII. On the upper border is the following mutilated inscription:—

RICARDI STANSILE, ET UXORIS EJUS.

"The residue is hidden by the wall, to which it is fastened. This venerable piece of sacred furniture is reported to have been brought from the desecrated church of St. Mary, in Doncaster.

"The tower is placed at the west end, and is of an age subsequent to the original erection of the church. It is divided into four parts by embossed partitions, flanked with light buttresses and surmounted with eight pinnacles.

"The fatality attendant on the alteration of the church, in reference to its architecture, was not less subversive of its monumental remains, for not even one, of either note or antiquity, has escaped the fangs of modern Goth. The injury done to the cause of truth by this wanton demolition of ancient tomb-stones is incalculable. To the biographer and the local historian the preservation of monumental memorials is of greater moment than is generally supposed. Not content with a bare recital of the good deeds, &c. of the defunct, the ancient as well as modern epitaphs often preserve, with scrupulous accuracy, much genealogical information, and bear forth to posterity historical and biographical notices, with a fidelity unequalled by any other documents whatever, save testamentary writings.

"This church is an ancient rectory, and from its foundation has belonged to the patronage of the De Maulays, from whom it descended to the Salveys, of New-Biggin; and, in the reign of Henry VII., passed with the manor to the burgesses of Doncaster, in a way already noticed.

"In its ecclesiastical character, it belongs to the deanery of Retford, in the archdeaconry of Nottingham; is a living in charge, and valued in the king's books at 1*l.* 5*s.* 3*d.* Archiepisc. pro. syn. 4*s.*; Archidiacon. pro. Prox. 6*s.* 8*d.* In the age of Queen Elizabeth it bore the estimated value of 10*l.*, and in that of Pope Nicholas IV. 8*l.* It is dedicated to St. Michael."

The advowson belongs to James Brown, Esq., of Leeds, who purchased it, along with the estate and manor of Rossington, from the corporation of this borough, in the year 1839. After Mr. Brown had made his purchase, he found the church in a very dilapidated state, and almost unfit for the performance of public worship. He immediately determined that it should be entirely renovated. With this view, upwards of twelve months ago, workmen, under the direction of Mr. Clarke, architect, of Leeds, commenced operations. It was then intended to build two new transepts, to add a vestry, to enlarge the chancel, and to raise the roof of the body of the church. It was, however, ascertained that the foundation would not allow of the insistent walls being enlarged. On this being made known to Mr. Brown, he at once determined to re-build the whole of the church, with the exception of the tower, which is placed at the west end. New plans and new contracts were accordingly made and entered into, and hence the erection of the present neat and chaste edifice. The adoption of the latter, we feel confident, Mr. Brown will never have cause to regret, since the former plan would not, had the foundation

allowed, have rendered the building so neat and appropriate as it now is. The present church is built in the form of a cross, standing east and west. The style of architecture adopted is the early English, or general style of the 13th century, of extreme beauty, and highly distinguished for its chaste simplicity and purity of design. The windows, which are long and narrow, consist of two round columns, with fine carved capitals and lancet arches, enriched with plain mouldings, relieved by deep narrow hollows. The columns of the two transept windows are banded in the middle. The roof is covered with dark blue slate, and the rain water is taken away by square cast-metal spouts, supported by fine carved buttresses. No alteration has as yet taken place in the tower, and the crevices having some years ago been pointed with lime, in a great measure detract from the beauty of the rest of the building. The church now consists of a nave, a chancel, two transepts running north and south, a vestry erected on the north side of the chancel, and a porch on the south side, as well as one under the tower at the west end. The arch formerly existing between the tower and the nave, which formed the western entrance, is now built up, with the exception of a small door to obtain access to the tower. The whole of the floor of the church has been considerably raised. From the nave to the chancel there are two steps, and the like number are also placed in front of the altar. The aisles are paved with dressed flag-stone, and on each side there is an iron grating running the whole length, under which is placed cast-metal pipes containing water. The water in these pipes is heated by a fire and boiler erected underneath the vestry, which will at all times render the church warm and comfortable. Underneath the whole of the chancel a family vault has been formed for the interment of the present and future lords of the manor of Rossington. The walls of the interior of the church are plastered and pannelled, with a view to keep them perfectly free in all seasons from damp. In front of the communion table a fine oak painted rail has been placed, covered with a beautiful mahogany top. The roof is open, and supported by pointed deal arches, also painted oak, and resting upon some stone corbels, carved after the same design as the capitals over the columns in the windows. The nave and transepts are fitted up with pews, with pannelled doors, of a dark oak colour. On each side of the altar table, which is of oak, of rude construction, boards are to be erected, containing in gilded letters the ten commandments, the Lord's prayer, and Apostles' creed. The position of the several entrances is precisely the same as in the old building. The font is placed opposite to the principal entrance, and near to the western arch. "This situation at the entrance of the sacred edifice is a most significant and appropriate position for the celebration of holy baptism, it being emblematical of that solemn sacrament by which persons are admitted members of the church of Christ." The tower contains three bells, which are not remarkable for that fine and clear tone so often met with in village peals. The only portions of the old building preserved in the present one are the arch over the porch door, and the arch leading from the nave to the chancel. The pulpit, which now stands at the north end of the south transept, has been repaired and made to correspond with the other portion of wood-work in the interior. The arch, the span of which has been enlarged, between the chancel and the nave, has been cleaned and repaired, displaying its rich tracery and zig-zag moulding. The arch over the entrance from the porch has likewise been repaired and cleaned, exhibiting more perceptibly its nail-head and raven-beak moulding. The new portion of the building has been erected of Mexbro' stone, supplied by Mr. Willey, of that village. The several contractors for the various departments of the work reside at or in the vicinity of Leeds, viz.:—Joiner, Mr. Shires, Chapeltown; painter, Mr. Wood; mason, Mr. Nettleton; metal-piping, &c., Mr. Nelson; and plumber, &c., Mr. Richard Gott. The architect is Mr. Clarke, of Leeds. It is stated that the cost of the alterations will not be less than 3,000*l.*, which sum has been entirely provided by the worthy proprietor of the estate, James Brown, Esq. of Leeds.—*Doncaster Gazette.*

PETROLOGY, OR THE KNOWLEDGE OF  
ROCKS AND STONES.BY HENRY G. MONTAGUE, ESQ., PROFESSOR  
OF NATURAL PHILOSOPHY.

(Continued from p. 273.)

The learned Bacon truly observes that "they who have presumed to dogmatize on nature, as on some well-investigated subject, either from self-conceit or arrogance, and in the professional style, have inflicted the greatest injury on philosophy and learning: for they have tended to stifle and interrupt inquiry exactly in proportion as they have prevailed in bringing others to their opinion; and their own activity has not counterbalanced the mischief they have occasioned by corrupting and destroying that of others." Never were words more truly applicable than to the plutonic geologists of the present day, who, having no facts of their own, presume to select those facts and opinions of others suited to their own theoretical absurdities, concealing or perverting the rest. The facts and opinions of such men as Saussure, De Luc, Werner, Van Boch, and numerous other observing mineralogists, are wholly lost sight of in the present day; senseless imaginings supersede facts the most important, and closest philosophers now seek rather to follow in the wake of discovery, than, by extensive travel and observation, to lead the way. The most recent works on geology and mineralogy are without exception so interwoven with extravagant speculations and theories, violating the natural operations of nature, that there is not one work fit to direct the minds of youth to the proper path of inquiry, and to prepare it for observation.

The writer of the letter in *THE BUILDER* of last week having skimmed the surface of one side of the question, adopts the opinions of others as his own, and were he to direct his steps abroad, the usual consequences would follow: instead of reviewing rocks, stones, minerals, and earths, as a sensible mineralogist, and studying the several causes of effects manifest to the senses, we should hear from him, as we do from others, that the mountains of such a district are plutonic; that their bases consist of primary rocks; that such and such beds and formations were of volcanic origin, and in every piece of jasper, porphyry, granite, &c., in every circular hollow in a mountain, in a plain, or in a coral reef, he would fancy he beheld the workings of volcanoes. The merest tyro in geology may, now he has the igneous marks pointed out, sally forth in his Quixotic voyage of discovery, and, by a few generalizing touches, become the fashion and the favourite of the day; but what do we learn by these generalizing terms, or who but geologists would apply local phenomena to general, nay to universal explanations?

I am asked if I can account for the filling up of veins, and the appearance of dykes and faults? Most assuredly I can, without having recourse to hypothesis, no matter whether these veins be filled up with granite or any other material. But those departments belong more strictly to that part of mineralogy which embraces the metalline formations, and to understand them rightly requires much disquisition. To the question of the writer I will put another. Whence come the veins of steatite, or mineral tallow, so often found intersecting the granites of Cornwall? Again, whence come the veins, lodes, faults, cross-courses, dykes, and other curious phenomena, as faithfully depicted in one small piece of tinstone as in the most magnificent mineral bed? Are they the one or the other, produced by some subterranean and internal power? Again, whence come the veins of nature, generally filled with quartz, and so common to granite and to all kinds of rock? Again, I ask, what is granite?

The material ejected from volcanoes is not generally melted masses of earth; it is more usually torrents of mud, or mud and water, ashes, fragments of rock, and other matters simulating to known strata of that locality. When in the state of molten lava, it moves a dense ponderous body, slowly advancing, melting small impediments, but encircling the larger; it flows as a stream of water would through a valley, but it does not throw out diverging lines even in yielding masses, nor is it known to fill up veins and fractures to that delicate point noticed at Glen Tilt; nor is it known to penetrate beds in contact in this manner, nor would it do so even in the most yielding

soil. Again, when it is seen discharging rivers of mud, sea-sand, sea-shells, and rocks, it must be borne in mind that these materials are like to the most recent formations, consisting sometimes of vegetable earths, sometimes of ocean marls and chalks, of sands common to the shores where the volcano is disposed, and of fragments of rocks common to observable strata. This, therefore, is but a displacement of matter, attended, of course, with new chemical and mechanical combinations, but still such as we know the origin of. The molten lava never forms as mountains, much less mountain-chains; it has never been known to elevate a mountain or an island, except piecemeal; for Humboldt's account of the rise of the Jurugo is purely fabulous. As it was ejected from the earliest records of man, so is much of it unaltered in the present day, and no two lavas are to be found alike. The appearance of the granite in Glen Tilt is that of a sedimentary deposit, filling in rents and fissures, produced by various causes, in the limestone and clay-slate; and it is well known that clay, as it consolidates and imparts its moisture, separates into regular and irregular parts, and if much silica be therein, it exudes and fills up these divisions in the form of quartz, and the earths, after digestion in hot water, produced by volcanic or chemical action, on abstraction of their moisture, have a tendency to assume the basaltic form; for basalt is no more a volcanic product than is the muddy deposit of some rivers, which, treated as above, would, under like contingencies of climate and association, pass into the like result.

Granite is an ever-varied and perpetually-varying substance, and is equally varying in its form, disposition, and external character: although frequently found in continuous masses, or aggregated, it is very often stratified, and exhibiting in this stratified state two or more perpendicular fronts in common with limestone, and presenting the same perpendicular front along a whole chain of hills or mountains. All parts of Mont Blanc are thus composed of vast layers of granite, perpendicular to the horizon, and directed from south-east to north-east. The stratification is the same near Carlsbad and Tiplitz, in several parts of Bohemia, and also towards the Riesengebirge. La Perouse describes the granite of part of the Pyrenees as disposed in layers and beds; Cronstedt and others speak of it as existing in this state on the Kenne Kulle, in Sweden, and Belling, in West Gothland; Pallas followed vast and continuous layers of granite through whole tracks of mountains in Siberia, part of the Ural Mountains, in the neighbourhood of the lake Kolywan, having the appearance of huge artificial structures, in which the layers appear to be loosely piled on one another. Professor Playfair found stratified granite in England, at Chorley Forest, in Leicestershire, where, particularly near Mount Sorrel, beds of granite are seen boding the same direction with those of the subjacent "horn-stone schistus;" also at Fasset Water, in Berwickshire, and Humboldt, Charpentier, Von Gersdorf, and others, testify to the stratified state.

Again, granite is found alternating with gneiss, as for instance, on the Schneekoppe, the highest point of the Riesengebirge. Again, granite is found in some parts of Northern India, resting on a common and extensive base of a bluish clay; in Finland, micaceous quartz and clay-slate form the base in common, with or upon granite; in Nuhia, it rests upon an undisturbed calcareous basis, in the Egyptian desert on clay.

Again, it passes by gradual transition into other kinds of rock; thus, for instance, the greatest part of the north-east side of the chain which separates Seleca from the county of Glatz, between Wartha and Reachenstein, is covered with sienite, which passes into granite; in many parts of the world it passes into gneiss, hornblende rock, coarse sandstone, mica-slate, steatite, &c.

Granite occurs in continuous masses, forming the chief component part of many mountain-chains, the basis of some, the apex of others, and disseminated or intersecting other beds.

That granite is not the product of fusion, or ejected from the howels of the earth, is demonstrated by the position, inclination, and dip of mountain-masses; by the unbroken continuity throughout parallel ranges and groups;

by its exact conformity to the laws of formation governing matter in its distribution in the ocean even in the present day; by the impossibility of these continuous mountain-masses having been once in the state of melted lava, as demonstrated by vast mineral beds, bitumen, sulphur, steatite, and other products which they contain, and of which we have no analogy in lavas; by their crystalline structure, their granular composition, and in some varieties perfect mathematical disposition of their compounds, which could not have been thus exhibited in the cooling down of a melted body of earths; by their known progression from the plastic state to semi-crystallization, and finally to the highly indurated state, which latter is only acquired by long exposure to atmospheric air. By the numerous reasons which I have adduced to prove the origin of the various kinds of rock, their gradual transition into each other exhibiting a common origin and common properties, and finally by the proofs with which I am furnished that the volcano, however deeply seated, is always locally disposed, and at a comparatively small depth within the earth.

Granite, in common with other sedimentary deposits, intersects and is intersected, covers or is covered in with others; there are no laws of distribution other than those arising from tidal action, sedimentary deposition, organic aggregation, and the action of winds, of expanding gases, and fire. Look for a moment at the phenomena of the uncovered regions of the desert, the loose masses consolidate into here rocks, the rocks, by the expansion of atmospheric heat, open into vast fissures, and the sands, driven by the winds, cover in these rocks and fill in their fissures. Again, in hot and even warm regions, the thirsty soil, parched up with drought, opens into cracks and rents of incredible extent and depth, and when the rains fall abundantly, the waters, loaded with the lighter matters of the surface soil, rush into these fissures, which thus filled up, the lower beds become traversed with dikes and veins of material differing from their own in composition and character. Admitting that the fiery deluge, pouring over the rent and distorted earth, would fill up those rents in a similar manner, still the violence done to nature by these subterranean movements must be impressed upon every bed exposed to its influence.

To talk of mountain ranges being bodily lifted up without displacement, and to assume the exactitude of sedimentary deposition, or of the limestone ranges which are the architectural displays of living action and local disposition, is to talk foolishly; to talk of those masses so contradictory in their nature, and disposition of parts, and containing many combustible bodies within them, being spouted out of the interior of the globe by one or by a thousand channels, is as repugnant to human reason, as it is contrary to all our acquired experience. The beds of this earth are locally disposed upon or among each other; the coral formations assume directions within the waters, precisely similar to those limestone, chalk, and oolite ranges we find now composing so vast a portion of dry land; the valleys and troughs of the ocean are filled up with sand-banks taking the direction of the tides, with chalky deposits blending with shells and other marine exuvia, with vegetable earths, and clays carried into them by rivers and deposited in the line of action, and over local areas, the one deposit covering, the one deposit blending with the other. Again, the dry earth is subject to like changes; the deposit of one epoch, the hill and the mountain chain, becomes covered with or intersected by the sedimentary deposition of another epoch; the necessary, the inevitable result is numerous changes; some of these unite, others exchange peculiar properties; the lower and disintegrated beds become substances of another nature by the addition of alumina, lime, iron, or some other product derived from the overlying beds, the elevated portions of primary matter are intersected by beds of recent deposits, and the rents and fissures produced by the action of heat or running waters are again blocked up.

The material from which granite is produced is variously accumulated; its vast perpendicular face and uninterrupted duration demonstrates an origin, gradual and progressive, within the waters, and firmly fixed in its position during the whole period of its accumulation; it often assumes the conical form, and appears

## RAILWAY INTELLIGENCE.

*Atmospheric Railways.*—Mr. Stephenson, the celebrated engineer, was appointed by the provisional directors of the Chester and Holyhead Railway, to examine into the atmospheric system, and report on its applicability to their project. Mr. Stephenson has made his report, and it is unfavourable. The following is a summary of the conclusion Mr. Stephenson has come to:—

“1st. That the atmospheric system is not an economical mode of transmitting power, and inferior in this respect both to locomotive engines and stationary engines with ropes. 2nd. That it is not calculated practically to acquire and maintain higher velocities than are comprised in the present working of locomotive engines. 3rd. That it would not, in the majority of instances, produce economy in the original construction of railways, and in many would most materially augment their cost. 4th. That on some short railways, where the traffic is large, admitting of trains of moderate weight, but requiring high velocities and frequent departures, and where the face of the country is such as to preclude the use of gradients suitable for locomotive engines, the atmospheric system would prove the most eligible. 5th. That on short lines of railway, say four or five miles in length, in the vicinity of large towns, where frequent and rapid communication is required between the termini alone, the atmospheric system might be advantageously applied. 6th. That on short lines, such as Blackwall Railway, where the traffic is chiefly derived from intermediate points, requiring frequent stoppages between the termini, the atmospheric system is inapplicable; being much inferior to the plan of disconnecting the carriages from a rope, for the accommodation of the intermediate traffic. 7th. That on long lines of railway, the requisites of a large traffic cannot be attained by so flexible a system as the atmospheric, in which the efficient operation of the whole depends so completely upon the perfect performance of each individual section of the machinery.”

We subjoin a very brief summary of Mr. Brunel's evidence before that committee, in favour of the atmospheric system:—

“Mr. I. K. Brunel was then examined on the part of the promoters of the Croydon and Epsom line. He had been consulted by the promoters of this line, on the expediency of laying down the atmospheric principle on the Croydon line. He had witnessed the experiments upon this principle which had been made at Wormwood scrubs. He made a portion of those experiments himself. He thought this line was peculiarly adapted for the atmospheric principle. He thought the atmospheric principle would enable them to run trains more frequently and with greater rapidity. He also thought that the expense of working would be less than on the ordinary railway, particularly in certain cases—such as that of a steep gradient. Considering the gradients which prevailed on the Croydon line, he should say that the atmospheric principle would be far less expensive than the ordinary locomotive principle. That was assuming that a great number of trains would be worked in a day. He could not fix a maximum speed by the atmospheric principle; but he would say that a speed of sixty miles an hour could easily be accomplished. He had himself reached that speed with a locomotive engine.”

*Railway to Rugby.*—It is intended to bring forward in the next session of Parliament the project of a line in continuation of the Great Western Railway, passing through Banbury to Rugby, which for a distance of about thirty miles from Oxford will be identical with the line now suggested; and it is thereupon proposed that if such a project be brought forward and should succeed, the line from Wolverhampton shall merge into that line about eight miles north-west of the town of Banbury. That rough estimated cost of the work from Wolverhampton to this latter point, including the branches to Stoke Works and the river Severn, is 1,000,000*l.*, and the rough estimated cost of the work from the point of junction to Oxford is 500,000*l.*

Arrangements have been effected by the London and Birmingham Railway Company with the Eastern Counties for the purchase of their line from Ely to Peterborough.

only the face of an altar tomb. This face is separated by square buttresses into six very shallow compartments, which contain mourning figures about 18 inches high—two are male, three female, in ordinary dress, the sixth is much mutilated, but may represent a knight by the conical head-dress. The square buttresses terminate in plain shields, and at the junction of these spring trefoiled ogee arches with crockets and finials, forming canopies to the figures.

We have described the arch and the altar tomb as far as their imperfect state will permit, and have only to add that they have been charged with colour as well as the figures recumbent on the tomb.

As the effigies of two sons of Edward III., one in York Cathedral, the other in Westminster Abbey, are the only published specimens of figures of the 14th century not in armour, this male effigy deserves inquiry as to the personage it may represent. For the present we can only describe the figures. They are, as was the custom in the middle ages, in the attitude of prayer; the hands have been placed together palm to palm, but those of the male figure have been broken off above the wrists. The female effigy, which is on the inside, is partly built into the masonry of the wall, under a rough arch of later date than the front arch of the monument. This is the longer figure, and appears to be that for which the monument was erected.

The head of the male effigy is uncovered—the hair is parted in the middle and falls down in a single curl over the ears—the face is not that of a young man, though without whiskers, and having the moustache and beard but slightly marked. The dress consists of a doublet, buttoned down in front, fitting close to the body and reaching to the middle of the thighs; round about the hips is an ornamented hawdrick, from which a dagger has been suspended on the right side. This doublet has a small cape over the shoulder, and leaves the neck to be covered by a loose collar; the sleeves reach below the elbow, and beneath them appears a covering for the lower arm, towards the wrist closely buttoned. The legs wear close-fitting hose, and the feet have pointed sandals of similar material. This costume belongs to the latter end of the 14th century. The feet rest upon a lion, and the head upon a diamond-shaped cushion with tassels.

The head of the female effigy rests upon a square tasselled cushion, and the feet, which are scarcely visible, against a dog.

The head-dress consists of a netted drapery, of square form, beneath which appears the hair, braided each side the cheek. The hood, or veil, falls from the back of the head, and a whole of linen encloses the chin and covers the whole of the neck and shoulders, except some strips in front of the neck. The body is habited in a surcote; the sleeves are tight and close, up to the wrist; the hands are without gloves or ornaments. The surcote, as far as the hips, fits closely to the shape, but below enlarges into numerous folds; the dress is not buttoned or laced in front, but two buckles of large size are placed low down the waist in front. The mantle, or cloak, is short, and stretches round the back and shoulders, being fastened by a cordon across the breast. This costume properly belongs to the date 1350, whereas the costume of the male figure appears to be later. The different sizes of the figures and other things above mentioned leave little doubt in the mind of the writer that the monument is compiled of two separate ones, which have been put together in their present situation since the time of Henry VIII.—*Great Western Advertiser.*

A circular is in private circulation, entitled a “Proposed Equitable Tax on the Transfer of Real Property in place of the Income-Tax.” The writer estimates the entire property of England at 6,186,000,000*l.*, and proposes that all real property should be taxed with the probate and legacy duty. The produce of such duty would, he thinks, be about 12,000,000*l.* annually. Were his idea adopted, he says that Sir Robert Peel might dispense with the Income-tax, and still have a much larger revenue than he has at present.

to have accumulated in heaps, and the recent formations of the Red Sea are very often little else than vast clumps or mounds of sand, sea-weed, and the finer particles of young shell-fish; at other times it is evidently a sedimentary matter periodically deposited on the continuous ocean deposit, differing in nature from the latter by containing more or less animal and vegetable matters of the earth. This material is as likely to intersect clay-slate and limestone as the two latter are to intersect granite; and its peculiar disposition at Glen Tilt is a much greater proof that it was in a soft and permeating aqueous state, than that it was a burning liquified mass, which could not by any possibility have produced the like phenomenon, nor is there any analogy to it in the existing lavas of the day.

It is true, as the writer observes, that geologists, changing their opinions continually, and following instead of leading in the path of discovery, have been compelled to acknowledge different epochs of granitic formation; but a very slight acquaintance with the most recent publications of the day must shew him that the basis of all their theories rests upon the notion of granite being a primary product, and constituting the lower or inner portion of the globe, surrounding the inclosed fire; of this, Mr. Lyall, in the last edition of the “Elements of Geology,” gives his supposed section of the earth; and Mr. Phillips, in his Treatise on Mineralogy, assumes for granted that the crystalline rocks are products of fusion and primary formations. Dr. Buckland, Professors Brand, Thomson, Farraday, Sir W. Herschell, and other eminent men, implicitly follow the same volcanic theory, and unfortunately as unwisely make it the basis of their respective systems.

## MONUMENT IN ST. STEPHEN'S CHURCH, BRISTOL.

This monument is a very pretty subject for antiquarian discussion. It is older by a century than the church;—it has been built into the wall probably after the erection of the church, and it is composed of parts that do not appear to have been originally conjoined.

Costume is not always an infallible guide in determining the period of the erection of an ancient monument, as it was not uncommon for persons to be represented in the dress they wore, though the fashion of that dress had passed away at the time the monument was erected. It is possible, therefore, that the effigies now lying side by side were originally so placed; though several reasons would lead to the conclusion that the male figure formed no part of the original monument; there may be a difference of fifty years in the date of their costume, as well as in that of different portions of the architectural work.

From the manner in which this monument is built up,—the figures being on separate slabs, and the table-face of the tomb being without sides or back, and disjoined from the jamb-mouldings of the arch under which it is placed,—it is certain that we do not see the parts in their original connection.

The male effigy is one of the few specimens of a figure not attired in armour. Such eminent effigies have been hitherto considered as belonging only to royal personages, with the exception of ecclesiastics, who have their proper costume; but as this figure appears to be of about the year 1400, it may represent some wealthy burgess of Bristol. Wealthy he must have been, as sumptuary laws in Edward III.'s reign imposed restrictions upon such luxuries as armour and monumental effigies.

The female figure is habited in the costume of Edward III.'s reign, about the year 1350. The architecture of the monument has the usual outline of that period—broad and low. It consists of a flat ogee arch, tri-cusped in the middle, with two smaller hanging cusps on each side—the moulding a simple fillet and hollow with square flowers at intervals. It had a crocketed ogee canopy, and a low-crowned buttress on each side, probably similar to the Berkeley monuments in our cathedral. The base is either cut away or sunk under the surface, yet unopened, which is about 18 inches beneath the floor of the church. There seems no reason to think that the floor of the present church has been much raised.

Under this monumental arch is no tomb, but

**The Projected Line from London to York.**—Three lines have been projected direct to York, and all of them cross the head of the Hull and Selby Railway. The first, Walker's line, was intended to commence at Cambridge, and proceed to York by way of Lincoln. The cost of this line, which it was proposed should join the Northern and Eastern Counties Railway at Cambridge, was estimated at 4,600,000. This line, however, according to the most authentic information of which we are in possession, may be considered abandoned. The second project sets out in the direction of the Great North-road from London, Barnet, Hatfield, Hertford, St. Neot's, Huntingdon, Stamford, Ryhall, Corby, Grant-ham, Newark, Gainsborough, and Doncaster, to York. This line would pass about thirteen miles from Lincoln, which would be connected with the main line by a branch railway. The third proposed line, and the most likely to be adopted, is that laid down by Sir John Rennie. This line would commence near King's-Cross in the New-road, the most central situation in the metropolis, both as regards the west-end and the city, proceed through Chipping, Barnet, Biggleswade, St. Neot's, Huntingdon, and Peterborough, between Market Deeping and Stamford, a little west of Bourn, and pass within five miles of Sleaford and Grantbam to Lincoln, and thence direct by Gainsborough, Thorne, Snaith, and Selby, to York. It is said this line would be the nearest route to Leeds, Selby, Hull, Halifax, Bradford, Huddersfield, Wakefield, Pontefract, and Sheffield. It is considered that this line may be constructed at a moderate expense, that the fares will be proportionably less, and that an ample profit would be realized by the shareholders. But these are not the only points which ought to be taken into account; the probable benefits or losses of the towns along the line or in its neighbourhood ought to be considered. But no doubt the projectors of this line take care, if they be determined to carry it out, to make such deviations as shall meet the wishes of the towns on the Great North-road, and at the same time tend to augment the profits of the shareholders.

**Manchester and Leeds Railway.**—It was stated by Captain Laws, R.N., in his evidence before the committee of the House of Commons on the Hull Docks Bill, that the warehouses of the Manchester and Leeds Railway, at Manchester alone, comprise six acres of flooring. In their various warehouses along their line the company have had flour at one time, in sacks, which, when ranged together, extended over eleven acres of ground. The recognizances of the engineer of the Manchester and Leeds Railway, who, it will be remembered, was indicted, and very heavily fined, for violating the Act of Parliament, in stopping a public road, was on Wednesday discharged in the Court of Exchequer. General Pasley has certified that the road is completed, and that it affords greater facilities to the public than before.

**The Eastern Union Railway.**—The report of the committee on this Bill was agreed to in the House of Commons, on Tuesday week last. Some delay has been occasioned in consequence of it having been found necessary to deviate from the proposed line at Brantham, and the third reading will not be moved until the proper notices have been published in the *Gazette*.

**The Leeds and Thirsk Railway.**—In the committee on the Harrogate and Knaresbro' Railway Bill, Mr. Locke, C.E., proved that the tunnel, a mile and an eighth long, which is proposed to be made on the Leeds and Thirsk line, would cost more than the entire construction of the Harrogate and Knaresbro' line.

**German Railways.**—A letter from Berlin states that the responsible principals of the company for the intended railroad from Potsdam to Magdeburg are the Princes Frederick, Charles, and Albert of Prussia, and M. Jacob, a cloth-manufacturer, of Potsdam. The cost of the road is estimated at four millions of thalers (15,200,000*l.*). The company engage to take only five per cent. interest for their capital, and to devote the surplus profit to works of charity.

**Rating Railways to the Poor-Rate.**—The Court of Queen's Bench has, after deliberate argument and much consideration, decided (in the case of the *South-Western Railway Company, Appellants*, and the parish of *Mitcheldiver, Respondents*), that railways are rateable to the poor-rate in respect of *de facto* occupation; or, in other words, that the rate shall be assessed on the general amount of the profits which a railway company receives from the occupation of its own railway, and to an exclusive use of it, and not on the amount of certain tolls which have been fixed by statute, as payable by all carriers for the use of the railway.

**Railway from Inverness to Perth, by Badenoch.**—At a very numerous meeting, held at Badenoch, last week, Major Macpherson, Glentworth, through whose estate the projected line of railway must pass for several miles, publicly announced that, provided the other proprietors in the Highland districts along the line agree to do so, he will be ready to give the requisite ground on his property without making any charge.

**Worcester and Cardiff Junction Railway.**—A meeting was held at the Castle Inn, Merthyr Tydvil, on Monday, the 27th ult. when it was unanimously agreed that this railway would prove of the greatest possible advantage to Merthyr, and all the towns on the line, and also to all the country through which it will be taken.

The opening of the West London Railway took place on Monday week. The line commences at the basin of the Kensington canal, south of the Great Western-road, under which it passes, from whence it proceeds across the Great Western Railway at Kensall-green, and thence passing under the Paddington Canal, joins the London and Birmingham Railway.

**Bristol and Gloucester Railway.**—This line of railway will be opened throughout to Gloucester, on Monday, the 1st July next.

The South Eastern Railway Bill was on Friday week read a third time in the House of Commons, and passed.

TRUSSED PILES.

SIR,—I beg to submit to you a method of equally distributing the weight of those buildings which, from the nature of the ground, require to be erected upon piles; for this purpose I propose trussing the piles with iron arms, as shewn in the annexed sketch, which will more clearly illustrate my proposition. If this object be thus attained, it would undoubtedly prevent the possibility of a partial settlement, the evil consequences of which are too well known to require comment.

P P P (fig. 1) represent the piles; *l l l*, flat

iron bars attached to their heads, *h*: at the top of these bars, eyes are to be formed, to which the arms, *a a a*, are to be secured with bolts and nuts. These arms will rest at bottom in shoes, with the exception of those attached to the outer row of piles, which are intended (as will be seen in the sketch) to be secured at both ends, to preserve them in a perpendicular position, in case of a general settlement. On one side of each of the arms a feather should be cast, to resist any tendency to knuckle which the weight upon them might produce. Fig. 2 shews the general arrange-

ment. The ground is to be excavated to the depth of about 2 feet below the intended level of the first course of stones or bricks, and the requisite length of the piles first ascertained by driving a common one to the greatest possible depth. The length should be such that the tops of them (or that part to which the iron-work is fixed) shall be wholly above the ground-level after the excavation; by this means the arms will be fixed without difficulty: the spaces between them will then be filled up with concrete, forming one solid bed.—I am, Sir, yours, &c.,  
R. C. W.

Fig. 2.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

**York Minster.**—The restoration of the nave of York Minster may now be pronounced as completed. The workmen have commenced taking down the wall which separates the nave from the transepts, and in a short time the whole will be thrown open to the public. Mr. Oliver, the bell-hanger, from the establishment of Messrs. Mears, of London, is now engaged in preparing the frames, in the south-west tower, for the reception of the new peal of bells. The repairs of the north-west tower, in which the great clock-bell will be placed, are likewise progressing. During the fire of 1829, in York Minster, the monument of Archbishop Huton received considerable injury. The present high sheriff (Timothy Hutton, Esq.), being a descendant of that eminent divine, has determined to restore the monument to its original condition at his own expense.

**Vestries in Parish Churches.**—The bill before Parliament (brought in by Mr. Stafford O'Brien and Mr. Beckett Denison) for prohibiting the holding of vestries in parish churches, provides that vestries shall not be held in churches, but in some other convenient place, to be named by a vestry meeting, to be hired or rented by the parish; notice to be given of time and place; but the bishops may grant licenses, on cause shewn, for holding vestry meetings in churches. All proceedings contrary to this to be null and void. The act is not to affect ecclesiastical law, and not to extend to Scotland or Ireland.

**New Church, Greensted Green, Halsted.**—The contract has been taken by Mr. Johnstone, from London, who is also building Trinity Church, in the same parish. Messrs. Scott and Moffat, of Spring-gardens, London, are the architects for both churches.

It is intended to erect a church at Coalpitheath, from the design of W. Butterfield, Esq. The style is Decorated, and the plan comprises chancel, nave, aisles, south porch, and western tower.

A new church is in course of erection at Eisey, near Cricklade, Wilts, and will soon be ready for consecration.

## Correspondence.

## BENEVOLENT INSTITUTION FOR THE RELIEF OF AGED AND INFIRM CARPENTERS.

**SIR,**—The above society determined on taking a trip by railway to Brighton, in aid of their funds, and appointed a committee to carry the object out in March last, which committee applied to the directors of the Brighton Railway to know upon what terms they would carry a number of persons to Brighton and back on Whit-Monday. This application took place three weeks before Easter, when Mr. Parsons, the chairman, wished to know how many persons we thought would go upon the occasion; in answer, we said about 500; but if the charge were low, there was no doubt it would be 700 or 1,000. "Well, if you will guarantee to us 500 persons, we will take them to Brighton and back at 4s. each;" so that we should pay 100l. if only twenty went; and we paid them 20l. deposit to bind the bargain a fortnight before Easter, and they were to supply us with third-class carriages, and nothing worse, and we thought we had made a good job for the institution, as nothing of the kind had ever taken place before; but directly we had paid them the 20l., they, the directors of the Brighton Railway, issued advertisements to run trains at the very same fare they knew we should do; doing away with all novelty for us, and doing us a great injury, as no one would buy our tickets, as they gave the public liberty to go by all the trains during three days. As soon as the committee saw that, they went to them and complained of the breach of faith they, the directors, had committed, when the chairman treated us very roughly, and said it was only an experiment; could not say whether they would do so at Whitsuntide, but if we came after Easter they would let us know. We went again after Easter, and he said he could not say anything about it, but at any rate they would do nothing to injure us. Upon that assurance we proceeded, and were again surprised about a fortnight before Whitsuntide with another

advertisement from them to run their trains as they did at Easter. We again applied to them to allow our company the same privilege, but they would not, but reminded us that three-quarters of the money must be paid two days before the time, and the remainder before the trains started, which we on our parts were prepared to do, and did do; but when we went on the morning of the excursion, we found, instead of all third-class carriages, as per agreement, they had put cattle-trucks, and six of their luggage-trucks; we protested against them, but they paid not the least attention to us; and we tried to prevent our company using them, but it was of no use, they would go into them, and thus, after we had got all our company seated in the trucks and waggons, we went to settle with them; but they started the train, and left five of the committee behind, who had to go by their next train, which did not get into Brighton before one o'clock. Therefore I wish you to set us right with the public and the trade, as our agreement with them was to have third-class carriages, and nothing worse, for which we were to pay them 4s. per head, and which sum we did pay them; therefore, we have been most scandalously treated by the Brighton directors.

I am, Sir, your obedient servant,  
June 6th, 1844. WM. WOOD, Sec.

## COMPETITION IN BUILDING.

**SIR,**—In your last week's number I find inserted some remarks on the propriety of building by schedules of prices, as was formerly done; which plan I believe would not have been abandoned for the present one of competition, but for the inordinate desire of builders to obtain too large an amount of profit.

I am, Sir, your obedient servant,  
June 4, 1844. L. O. G.

## Miscellanea.

**DISCOVERY OF A VERY VALUABLE PICTURE.**—A strange discovery of a valuable and interesting picture was made in this city a few days since, under the following singular circumstances:—Mr. Howis, portrait-painter and picture renovator, residing in Henry-street, had in his possession an original, and what is considered a good portrait of Lord Chancellor Brougham. He offered it for sale to a gentleman well skilled in such matters, who proposed to purchase it, provided Mr. Howis consented to take two old pictures be deemed little else than lumber in exchange. This proposition was agreed to. One of these was apparently a portrait of a woman, about what is termed half size, that is, 30 by 25 or 26 inches. The gentleman had received this with some other pictures about fourteen years ago from a friend in Italy, but it was considered such a horrible production that it had been flung aside immediately, and remained covered with dust up to the present time. The exchange and bargain having been duly perfected, Mr. Howis, in the presence of the gentleman from whom he had the picture, rubbed some of the paint off, and finding another coat under it, proceeded to remove the top altogether, when it was discovered, to the no small delight of the party, that inside was a beautiful picture, which subsequent inquiry and competent connoisseurs have pronounced to be nothing less than an undoubted original of Saint Catharine (the martyr), by the great Spanish master Murillo. The gentleman who had just parted with this gem, being fortunately a good judge, at once, and before the artist was conjectured, proposed to give Mr. Howis 50l. His offer was accepted, and thus he once more became possessed of what had been so long a hidden treasure. Many gentlemen of undoubted judgment have valued this work so high as 700l. The former and present fortunate proprietor of this gem is Thomas C. Duffy, Esq., of Pembroke-road.—*Freeman's Journal.*

**CHELMSFORD SEWERAGE.**—The committee appointed to carry this work into effect met on Friday week, to receive tenders for that part intended to be completed in the present year. There were six competitors; the difference in the sum proposed between the highest and lowest was nearly 100 per cent. The tender of Messrs. Roper and Last, of Chelmsford, was accepted, and the work is in rapid progress.

**IMPORTANT IMPROVEMENT IN THE MANUFACTURE OF IRON.**—It is stated, in the *New York Tribune*, that a discovery has been made by Mr. Simeon Broadmeadow, of New York, in the manufacture of iron, by means of which the iron ore is by only one process converted into wrought-iron without being first made into pig-iron, and at a less expense than the pig-iron can be made. The iron ore is placed upon the floor of a reverberatory furnace, the flame of fire passing over it, when a chemical compound is used to unite the elements of the iron by separating the "slag" entirely from it. By this first and only operation the wrought-iron comes out as perfect in every respect as that by the double operation of "puddling" and piling pig-iron, and for the purposes of manufacturing steel even surpasses it. By this process wrought-iron of the best quality can be produced at a cost not exceeding 25-50 dollars per ton. To make the iron ore into balls of wrought-iron will require no blast, nor machinery of any kind; the anthracite or bituminous coals being used with equal advantage in a common air-furnace, a good draft being all that is wanting. These balls of wrought-iron can be made with a good profit (if the furnace is built near the mines of mineral and coal) for 14 dollars per ton. In the single article of railroad iron it will be a saving of millions of dollars to the United States; for, by statistical tables, we have already sent to England for that article alone the sum of 32,000,000 dollars. The inventor says that with a capital of 100,000 dollars 40 tons of railroad iron can be manufactured every 24 hours.

**WINDOW DUTIES — IMPORTANT TO BE ASSESSED.**—It has been the practice, in most country districts, to include in the assessment for the window duties all external openings for the admission of light and air, whether the same be glazed or not. It now appears from a competent authority, that such a practice is contrary to the intent of the Act of Parliament. A deputation having waited on the Chancellor of the Exchequer on the subject of those duties, the hon. gentleman declined holding out any hopes of a modification of the duties; but on its being urged by the deputation how necessary free ventilation was for the promotion of health, a Commissioner of Assessed Taxes, who was present to assist the Chancellor, gave it as his opinion that perforated plates of zinc may be placed in external walls for the purpose of ventilation, without being liable to the duty. His opinion, if correct, is a very important one; and it would be worth while to bring the subject formally before the local commissioners.

**MONUMENT TO THE EARL OF DURHAM.**—Preparations have been actively entered upon for the erection of the contemplated memorial in honour of the late Earl of Durham, on Pensher Hill, near the base of which runs the great northern line of railway. The design is an approximation to the Temple of Theseus, and is to consist of a rectangular base of solid masonry, 97 feet long, and 54 in width, rising 10 feet above the platform of the hill, and surmounted by 18 lofty, open, equi-distant columns, supporting at each end a magnificent pediment, and on each side a broad, deep entablature, which will serve as a promenade. The edifice will be at least 70 feet in height, and will be visible from a great portion of the surrounding country. The trench for the foundation has been dug down to the solid limestone rock.

**WESTMINSTER IMPROVEMENTS.**—The Lord Mayor and Aldermen, the governors of Emanuel Hospital, have let the extensive gardens at the back of that charity on building leases; and the governors of the Blackcoat School have given notice to the tenants on Palmer's Village estate to quit, with a view to the laying out of new streets there.

A very large quantity of copper coins, of the reign of Elizabeth, amounting to 14 pounds weight, were found lately by a labourer, while digging in a field in the townland of Brigh, barony of Ennismowen. The figures 1601 are quite legible upon them.

The total number of schools in France is 40,000, communicating instruction to about 3,000,000 of children and adults.

**EDITORSHIP.**—It is not so easy to write for a newspaper as people suppose. A man may be a good scholar, a profound thinker, and a vigilant observer of passing events, without being able to write for a newspaper. The power of writing a leading article for a newspaper is a *tact* which few possess, and which I have known many, with all their learning and diligence, unable to acquire. It requires a large amount of information on a variety of subjects, and a readiness of application that must never be at fault, or the writer will fail. Few remember that the editor is always writing against time, and the inexorable printer must have his copy, so that there is no time to revise and amend; but as slip after slip is written, the devil snatches it away, and one half is usually set up in print before the other half is written. This exacts a decision of poetry and a facility of writing which, like poetry, seems rather a gift of nature than an acquired faculty. And as to brevity, this is the most difficult task of all. Diffuseness in a leading article is like water added to brandy—what it gains in quantity it loses in quality. It is comparatively easy to write a long article; but to be able on the instant, without previous consideration, without having time to consult either books, or dates, or authorities, to concentrate the pith and marrow of an argument in a few sentences: to grasp, as it were intuitively, the real question at issue, and to present in a striking point of view that particular truth or illustration which the public mind is prepared to receive, and would be disappointed to miss,—is, in my opinion, one of the most difficult operations of the human mind.—*Rowcroft's "Man without a Profession."*

**FOSSIL REMAINS IN DEVONSHIRE.**—There has been dug up in Devonshire, near Barnstaple, a fragment remarkable as being, it is said, almost the only instance of antediluvian animal remains having been found in that quarter, in the shape of the tusk of a fossil elephant, or born of some extinct monster, of that class. It was lying on the lower gravel bed, with a superincumbent stratum of four or five feet of the blue clay; above which is about six feet of the yellow plastic clay, with several feet of coarse gravel and soil above. The tusk must have been of large dimensions, about eighteen inches in circumference, and from four to seven feet in length. It has the shape, grain, and markings of ivory, but the colour and consistence are those of horn, and it contains a considerable degree of elasticity.

**SCOTT MONUMENT.**—Upwards of 2,000*l.* have been contributed by the public since the meeting, three months ago, in the Music-hall; the deficit, therefore, does not now amount to 1,000*l.*, and as sub-cription-lists still lie at the banks, club-houses, and at the Royal Institution, the admirers of the genius of our illustrious countryman now in Edinburgh who have not yet contributed, have still an opportunity afforded them of assisting in completing this national monument to his memory.—*Edinburgh Post.*

**IRON TRADE.**—An enormous furnace has been blown in at Blaensfon. The greatest number of men they have employed are at present fully occupied, with every prospect of a continuance.—*Carmarthen Journal.*—We are most happy to learn that matters proceed very improvingly with our manufacturing neighbours, and that by every calculation we may expect a successful career in the iron trade for three or four years, if parties do not become too inflated with sanguine hope, and put "too many irons in the fire."—*Monmouthshire Merlin.*

The following is a copy of a joiner's bill for jobbing in a Roman Catholic church in Bohemia. "For solidly repairing St. Joseph, 4*s.*; for cleansing and ornamenting the Holy Ghost, 6*d.*; for repairing the Virgin Mary, before and behind, 6*d.*; for turning a nose for the devil, putting a horn upon his head, and gluing a piece to his tail, 4*s.* 3*d.* Total—9*s.* 3*d.*"

**ERECTION OF AN INN AT ALDERLEY.**—The Manchester and Birmingham Railway Company have determined upon building a splendid inn on their line at the Alderley station. The building is to be commenced forthwith, at a cost of nearly 4,000*l.*

TENDERS delivered for Hotel at the Railway Terminus, Southampton, for G. Radley, Esq.—F. W. Vigers, Esq., Surveyor. May 31.

Roe .....	£2,700 0
Grimon (Southampton) .....	2,480 0
Nicholson (Wandsworth) .....	2,447 0

TENDERS delivered for a new Public House, to be built at Bell Green, Sydenham.—Mr. Wm. Smith, Royal-hill, Greenwich, Surveyor. May 28, 1844.

Livingston .....	£711
Millar .....	564
Major .....	560
Wade .....	550

The latter tender was accepted.

TENDERS delivered for two villas to be erected in the Camden-road.—R. Pulford, architect.

Mr. Coleman .....	£2,130
Messrs. Lawrence .....	2,092
Mr. Hellis .....	2,010
Mr. Lucas .....	1,708
Mr. Nicholls .....	1,637

**TO OUR CORRESPONDENTS.**

We have received four letters relative to the drawings of Tudor arches, but have not yet been able to go through their reasoning; we intend to publish such of them as we prize of.

We have received "Remarks on the subject of the stone altar and credence-table recently erected in St. Sepulchre's Church, Cambridge, and resolutely opposed by the Rev. R. R. Faulkner, Incumbent;" also new parts of Knight's London; and Mr. Johns' work on the new church at Jerusalem.

For the names of granite-merchants in London we refer to our advertising columns.

**NOTICES OF CONTRACTS.**

For the necessary Iron-work of a Bridge over an arch, 110 feet span, to be built over the river Avon, at Bath.—Drawings, &c., Mr. Manners, Architect, 1, Oxford-row, Bath. June 25.

For building Sewers in Old Fish-street, Trinity-lane, &c.—Plans, &c., Sewers' Office, Guildhall. J. Dear, Prin. Clerk. June 25.

For the excavation, masonry, and ridding of two Gas-holder Tanks, at the Radford Station of the Nottingham Gas-light Company.—Drawings, &c., Messrs Hawkster and Jackson, Nottingham. June 14.

For building a House and Premises suitable for a haking business, for Mr. Hobbs, Woolwich. June 13.

For the execution of certain works for the improvement of Aberdeen Harbour.—Plans, &c., Mr. Abernethy, 69, Waterloo-quay, Aberdeen. June 20.

**COMPETITIONS.**

Plans, &c. are wanted for erecting a Church at Southwall, Notts.—Further particulars, Mr. Wm. Shaw, Southwall, Notts. The successful competitor will be employed on the usual terms.

A PREMIUM of 100 guineas will be given by the commissioners appointed to erect a lunatic asylum in the vicinity of the city of Kingston, Jamaica, to the person who shall produce the best plan, accompanied by a specification, of an asylum for the reception of the insane. The institution must accommodate 200 patients of both sexes, with the requisite number of officers and servants, and due attention must be paid in the plan to the proper classification of the patients, and the climate in which the asylum is to be erected. The plan must also show how an addition may be made for the accommodation of 100 patients more, in the event of such being required. The plans must also set forth the probable cost of the building in stone, brick, and iron. The principal portion of the building is to be allotted to paupers, but the commissioners are desirous of setting aside sufficient apartments for the accommodation of about 25 persons in better circumstances of life, and direct the attention of competitors to this arrangement. The plans must be prepared and transmitted to William Burge, Esq., Q.C., 1, Paper-buildings, Temple, on or before the 22nd of August next.—London, May, 1844.

The Committee of the Hardy Testimonial are desirous of receiving designs for a plain and substantial pillar, to be erected on the summit of a high and exposed bill, not far distant from the sea, at an expense of from 500*l.* to 750*l.* A premium of 10 guineas will be given to the architect whose plan shall be adopted. The designs are to be forwarded to the hon. secretary, at Dorchester, on or before the 14th day of June next.

**MEETINGS OF SCIENTIFIC BODIES,**

To-day and during the ensuing week.

SATURDAY, JUNE 8.—Royal Botanic, Regent's-park, 4 P.M.

MONDAY, 10.—Geographical, 3, Waterloo-place, 8½ P.M.

TUESDAY, 11.—Medical and Chirurgical, 53, Berners-street, 8½ P.M.; Civil Engineers, 25, Great George-street, 8 P.M.; Zoological, 37, Pall Mall, 8½ P.M.

WEDNESDAY, 12.—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset House, 8½ P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.

THURSDAY, 13.—Royal, Somerset House, 8½ P.M.; Antiquaries, Somerset House, 8 P.M.; Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico-Botanical, 32, Sackville-street, 8 P.M.

FRIDAY, 14.—Astronomical, Somerset House, 8 P.M.; Philological, 49, Pall Mall, 8 P.M.

SATURDAY, 15.—Astatic, 14, Grafton-street, 2 P.M.

CIVIL ENGINEERS.—Library open from 9 A.M. to 9 P.M.

ENTOMOLOGICAL SOCIETY.—Museum open every Tuesday from 11 till 7.

SOCIETY OF ARTS.—Open every week-day except Wednesday, between 10 and 2. Admission by members' tickets.

LINNEAN SOCIETY.—Library open on Monday, Tuesday, and Thursday, and the Museum on Wednesday and Friday, from 12 o'clock to 4 in the afternoon.

GEOLOGICAL SOCIETY.—Library and Museums are open every day from 11 till 5.

ROYAL ASIATIC SOCIETY.—Museum is open every Tuesday, Wednesday, and Thursday, from 11 till 4.

UNITED SERVICE INSTITUTION.—Museum open all the year, from 11 till 5 in summer, and from 11 till 4 in winter. Admission by members' tickets.

The Builder.

NO. LXXI.

SATURDAY, JUNE 15, 1844.

LITERATURE

requires to be constantly stimulated; those who, instead of waiting till

genius shall inspire them, are obliged periodically to bring a literary crop from their brain, without any following interval, must of necessity sometimes fall into repetition, sometimes savor of dryness; it is therefore cheering, amid the mingled pleasure and drudgery of such a pursuit, to find any approval, any

applause; and still more cheering is it to find such labour acknowledged to be useful; it requires a man of some nerve, who, careless of evil advice, while regardful of the truth, remains unbiassed and unquailing; he must expect, indeed as he would were he to found a new college, or any other useful or noble institution, to meet occasionally with a Thersites, a Marplot, who, alike destitute of genius and goodness of disposition, has activity and industry enough to undo the effect of all his ancestors' labours of worth, so that the world would have profited more, except for example's sake (the mere culprit's value), if his whole race had never existed; in the case of a new college or other noble foundation, the offending member may be expelled, as indeed has invariably been found to have been a providential ordinance of fixity before the world began; but in the case of the literary man, the dependence alone is to be had in quietude, keeping from entanglement, taking no revenge but that silence which can alone stop the mouth of such a Thersites—a line of conduct which forms the only punishment which the wortless habillard can feel.

In going through the amended proposed Metropolitan Building-Act, we have, amid such drudgery, received some consolation by finding two-thirds at least of the observations which we published upon the subject have been strictly attended to, and the suggestions which they contained have been embodied in the revised Bill. We this week give quotations from the Bill in its present form, with our own remarks; but as we have as it is, been compelled to go to great length, we are obliged to reserve till next week all observations of a general nature.

To the Bill as amended has been prefixed a copious table of its contents, occupying four pages, under several heads, in which are stated the particulars of each department.

In the preamble, page 1, the words "And forasmuch as many buildings and parts of buildings unfit for dwellings are used for that purpose," are still used, though lame, and would, as Mr. Bartholomew suggested, be improved by being altered to "Buildings unfit

for the purposes of human habitations are used as human dwellings."

Page 2, line 15.—The words "It is expedient to make provision for the adoption of all such expedients" are still retained, and require to be improved in form.

Page 3, line 18.—The words "or place along which carriages are intended to pass," is not sufficiently explicit; the kinds of carriages ought to be stated, and if wheel-harrows or trucks of any kind would be considered as coming within the meaning intended.

The word "floor to mean the horizontal platform," would be of no avail, if the flooring descended, as in the case of a theatre.

Page 4.—The sentence should run, as suggested by Mr. Bartholomew, "or in the occupation of such ground or tenement, other than as a tenant from year to year, or other than as a tenant-at-will."

Page 5.—"And to all places lying within two hundred yards from the exterior boundaries of the district hereby defined." We do not find that any provision is now made for giving the district surveyors power to act over this extra territory.

Power to be given to THE COUNCIL to extend the operation of the proposed Act "TO ANY PLACE WITHIN TWELVE MILES OF CHARING-CROSS." We must again urge that some clear definition ought to be given how admeasurement would be made, whether by the roads or by the compasses upon a map; also, if this be carried, whether a town or other place, partly within the twelve miles, is to be wholly included or wholly excluded. And we must again state that no provision whatever is made for the counties of Essex and Hertford to bear any portion of the expense of the official referees and registrar of metropolitan-buildings, nor for increasing, according to extent of land, the number of official referees, nor for altering the scale of contribution according to the increase in some counties. We must also again urge we think the council would be so delicate in the use of this power, that the provision would consequently become obsolete; and that we think a matter so strictly penal as a Building-Act should depend alone upon statutory enactment. St. Paul's Cathedral, we again repeat, is nearer the centre of the metropolis and the villages immediately adjacent to it. We therefore think it the vertex from which the admeasurement in question should be taken.

Page 7, line 26, "in accordance to," should be altered to "in accordance with."

The unjust clauses relative to building contracts have been withdrawn, as Mr. Bartholomew suggested, as too arbitrary to form part of an English statute, and the following improved form has been substituted:—

"Provided always, and be it enacted, with regard to any building of whatever class, so far as relates to the modification of any written contract or agreement now in force for erecting or altering such building (other than a contract or agreement in the nature of a building lease), that it shall not be lawful to execute such contract otherwise than in conformity with the provisions of this Act; but it shall be lawful for either party, and he is hereby entitled to deviate from such contract, so far as any part thereof may remain to be executed after this Act shall have come into operation; and the alterations rendered necessary by this Act shall be performed as if this Act had been in force when such contract was entered into; and that if the parties thereto shall disagree about the differ-

ence of the costs and expenses of the works when performed according to the provisions of this Act, and the works as stipulated for in such contract, then upon notice being given in writing by one party to the other, it shall be lawful for either party, and he is hereby entitled, to refer the matter to the surveyor, who shall determine the same, subject to appeal as aforesaid to the official referees; and the award of such official referees shall be final and binding on all the parties, and in all respects as if such award had formed part of the contract; and the costs of the reference shall be borne by all, or any, or either of the parties, in such manner and proportion as the surveyor, or, in case of appeal, as the official referees shall appoint."

"Provided also, and be it enacted, with regard to any building of whatever class, so far as relates to the modification of any lease, or agreement for a lease, being of the nature of a building lease, whereby any person may be bound to erect buildings, that, notwithstanding any thing herein contained, it shall be the duty of such person and he is hereby required to erect every building agreed to be built by such lease or agreement, according to the conditions rendered necessary by this Act, in the same or like manner as if this Act had been passed and in operation at the time of making such lease or agreement; and that on the completion of such work, and on giving fourteen days' notice of his intention to apply to the official referees on this behalf, it shall be lawful for the lessee or tenant, and he is hereby entitled, to require the official referees to ascertain what loss, present and prospective, has been occasioned by the observance of the provisions of this Act, and to determine whether he is entitled to any and what compensation, whether by payment of money or reduction of rent, or both, or otherwise; and that, on the receipt of such requisition, and on proof of due notice thereof having been given to the lessor or owner of the building, it shall be the duty of such official referees, and they are hereby required, to proceed to ascertain if any and what loss has been so occasioned, and to determine if any and what compensation, as aforesaid, be due in respect thereof, and their decision in the matter shall be final."

We must still exercise our fears as to some parts of the working of the following clauses:

"And, for the purpose of preventing the express provisions of this Act from hindering the adoption of improvements, and of providing for the adoption of expedients either better or equally well adapted to accomplish the purposes thereof; he it enacted, with regard to every building, of whatever class, so far as relates to the modification of any rules hereby prescribed, that if, in the opinion of the official referees, the rules by this Act imposed shall be inapplicable, or will defeat the objects of this Act, and that by the adoption of any modification of such rules, such objects will be attained either better or as effectually, it shall be the duty of such official referees to repeat their opinion thereon, stating the grounds of such their opinion, to the Commissioners of Works and Buildings; and that, if on the investigation thereof it shall appear to the said Commissioners that such opinion is well founded, then it shall be lawful for the said Commissioners, or any two of them, to direct that such modification may be made in such rules as will, in their opinion, give effect to the purposes of this Act; and that, although such official referees shall be of opinion that such modifications are not requisite or admissible, yet if any party interested presents to the official referees a representation, setting forth the grounds whereon such modification is claimed, if shall be the duty of the official referees, and they are hereby required to report such representation, as well as their opinion thereon, to the said Commissioners, with the grounds of such their report and opinion; and that thereupon, if the said Commissioners think fit, it shall be lawful for them, or any two of them, to direct the official referees to make such order in the matter, as may appear to them to be requisite."

"And be it enacted, with regard to buildings already built, so far as relates to the building thereof in conformity with this Act, in respect of the required area, or in any other respect than the required height and thickness of walls, that if a full compliance with the provisions of this Act be attended by extreme loss and inconvenience, then, subject to the report of the official-referees, and to the consent of the Commissioners of Works and Buildings, and to such terms as the said Commissioners may impose in that behalf, it shall be lawful for the parties concerned to rebuild such buildings on the site of the old buildings as near as may be practicable, but so that, nevertheless, both the party-walls and the external walls be of the required height and thickness."

Page 10.—And be it enacted, with regard to such buildings and works, so far as relates to the supervision thereof, that if in building, pulling down, rebuilding, cutting into or altering any part of any building, or party-wall or external-wall, or chimney-stack or flue, drains, cess-pools, or any work or other thing be done contrary to or not conformably with the rules and directions of this Act; then forthwith it shall be the duty of the surveyor and he is hereby required to give forty-eight hours' notice, according to the form (No. 4.) in the Schedule of Notices, or to the like effect to the builder, foreman or principal workman on the premises, to amend any such irregularity which he shall deem to have been committed; and forthwith, after the expiration of such notice, to proceed to inspect the work."

It would be preposterous to require forty-eight hours' notice to be given before any drain or cesspool suddenly stopped, or any chimney on fire, could be opened or wrought upon. These words have been added without due consideration.

Page 11.—The words "It shall be the duty of the architect or builder" to give notice to the official-referees, still remain by no means sufficiently definite.

We must again throw out a caution as to the mischief which, for some time to come at least, may occur, from the vast and inquisitorial powers which the exercise of the unconstitutional provisions contained and attempted to be wielded under the 15th and 16th clauses of the proposed Act. Architectural construction is now undergoing a kind of earthquake change which will throw up to view advanced science. It would be against all human probability to suppose that the official-referees should be so far in advance as to the superior economy and development of the true Freemasonry which is working its silent course, to be in justice set over the works of an accomplished architect, his superior, practising within his district. It would indeed be unsafe, for fear of his quiet and reputation, for any officer to annoy such an architect; but we think the exercise of the power still would tend to abuse; and we deem it behoves the profession of architects to think very seriously of the matter. This we know,—often those buildings are the most broken and dangerous which have by unskilful plodders been erected out of a huge mountain of materials; because they are not constructed as Nature ever forms her works.

Our advice has been taken, which recommended a more explicit mention of the nature of the drawings which are proposed to be exhibited to the official-referees.

The 20th clause still requires, for clearness, a portion of it to run thus, viz. "the pulling down of timber partitions which are the property of different owners, or which are occupied by different persons, for the purpose of rebuilding in lieu thereof proper party-walls."

The 21st, 22nd, and 23rd clauses are altered as follows:—

"And be it enacted, with regard to such works, so far as relates to the notice thereof, that unless the adjoining owner consent thereto, it shall not be lawful for the "building-owner" to execute such works, until he have given notice thereof to such "adjoining owner;" and every such notice, with regard to the pulling down, rebuilding, or repairing of party-walls or party-fence-walls, must be given one month, at the least, before the survey of the work is to be made, and four months, at the least, before the work is to be commenced; and every such notice, with regard to the pulling down and rebuilding intermixed walls and timber partitions, must be given four months, at the least,

before such work is to be commenced; and every such notice must be in the form or to the effect of the notice (No. 8) for that purpose contained in the Schedule of Notices hereunto annexed."

"And be it enacted, with regard to every such work, so far as relates to the modification thereof, in order to render it suitable to the premises of the adjoining owner or his tenant, that if the adjoining owner, at any time within two months after the receipt of the said notice from the building-owner, give notice of his desire that any modification be made in the work so as to render it suitable to his premises, according to the form (No. 18) in the Schedule of Notices, or to the like effect, then, within seven days after the receipt of such notice, it shall be the duty of the building-owner, and he is hereby required, to signify his consent to, or dissent from, such modification or delay; and that if the building-owner do not within such seven days signify his consent to such modification, then it shall be lawful for the adjoining owner, and he is hereby entitled, to require the building-owner not to commence the work until the official-referees shall have determined thereon; and that if within seven days thereafter application be made in writing to the official-referees, according to the form (No. 19) in the Schedule of Notices, or to the like effect, and notice thereof to be given to the building-owner, according to the other form (No. 20), then, within ten days after such application, it shall be the duty of the official-referees to signify their decision thereon, and it shall be the duty of the building-owner not to commence the work till the decision of such official-referees shall have been given; and that if, within the period of four months from the date of the first notice, such adjoining owner do not make any objection or any requisition in conformity with this enactment, then, subject to the provisions of this Act with regard to such works, it shall be lawful for the building-owner, and he is hereby authorized to proceed to execute the same."

"And be it enacted, with regard to every such work, so far as relates to the modification thereof, in order to render it suitable to the premises, or to the convenience of the adjoining owner or his tenant. That if the adjoining owner at any time within two months after the receipt of the said notice from the building-owner, give notice of his desire that the work be delayed, so as to cause it to be executed at a more seasonable or a more convenient time in reference to the business, or to the family or domestic arrangements of such adjoining owner or his tenants, according to the form (No. 18) in the Schedule of Notices, or to the like effect; then, within seven days after the receipt of the notice thereof, it shall be the duty of the building-owner, and he is hereby required to signify his consent to, or dissent from, such modification or delay; and that, if the building-owner do not within such seven days signify his consent to such modification or delay, then it shall be lawful for the adjoining owner, and he is hereby entitled, to require the building-owner to delay the work until the official-referees shall have determined thereon; and that, if within seven days thereafter application be made in writing to the official-referees, according to the form (No. 19) in the Schedule of Notices, or to the like effect, and notice thereof to be given to the building-owner, according to the form (No. 20), then within ten days after such application it shall be the duty of the official-referees to signify their decision thereon, and it shall be the duty of the building-owner to delay the same till the decision of such official-referees shall have been given; and that if, within the period of four months from the date of the first notice, such adjoining owner do not make any objection or any requisition in conformity with this enactment, then, subject to the provisions of this Act with regard to such works, it shall be lawful for the building-owner, and he is hereby authorized, to proceed to execute the same."

Clause 25.—We must repeat, the terms "the building-owner," are not sufficiently explicit.

Clause 26.—"And be it enacted, with regard to sound party-walls, so far as relates to the rebuilding thereof, at the expense of the building-owner, that if the owner of one of the buildings desire to rebuild such party-wall, then, on giving to the adjoining owner the

required notice of four months, according to the said form (No. 8), it shall be lawful for such building-owner, and he is hereby entitled to pull down and rebuild such party-wall; but upon condition that he do pay all the costs and charges thereof, and also all the expenses incidental to the execution of the work, including therein the fees and expenses of the surveyor, and the fees of the surveyors, and in respect of any services performed by the official-referees."

We cannot admit the principle, that although a person pay all the expenses of and attendant on rebuilding a party-wall, he should have the unquestioned right of doing so to the annoyance of his neighbour, the ouster of him from occupation, and the destruction of any business which he may carry on.

Clause 28.—According to our suggestion, in the under pinning of party-walls, after the words "with good sound stock-brick and tiles, or slates bedded in cement," have been added the words "or with other proper and sufficient materials."

Clause 29.—We must again put in our attestation of unqualified disapprobation of the imperative condemnation and rebuilding of a party-wall which may be alleged to have been carelessly damaged; sufficient reparation or rebuilding, as the case may need, is all that any sensible man ought to require.

Clause 32.—"And be it enacted, with regard to party-fence-walls, so far as relates to the reparation and rebuilding thereof, that if the owner of any of the premises parted thereby give one month's notice of his intention to the adjoining owner to repair, pull down, and rebuild the same, it shall be lawful for him so to do; and if the wall be below the height of nine feet from the ground on either side, then either to raise it to that height, or to pull it down and to rebuild it to that height; but upon condition that he do pay all the expenses thereof; and that if a building be to be erected against such party fence-wall, and such wall be not conformable to the requisites prescribed for a proper party-wall for a building of that class and rate, then it shall be lawful for the building-owner, and he is hereby entitled to pull down such party fence-wall; but upon condition that he do pay all the expenses thereof; and also that he do make good every damage which shall accrue to such adjoining premises by such rebuilding."

To this clause has been added the following:—

"Provided always, with regard to the expense of so pulling down such party fence-wall, and rebuilding the same, that if thereafter the adjoining owner use such party-wall for any purpose to which, if it had not been pulled down and rebuilt, it would not have been applicable, then to such extent as such adjoining owner shall so use such wall, the building-owner shall be entitled to be reimbursed the expenses of so pulling down and rebuilding such wall; provided also, with regard to any such party fence-wall, so far as relates to the limitation of the height thereof, that if any party desire to raise such wall so as to screen from view any offensive object or neighbourhood, then, on application to the official-referees, it shall be lawful for them to authorise such work, but not so as to obstruct the free circulation of the air, or to injure the property adjoining to or in the neighbourhood of such wall."

The latter exception we think very unwise. It is well known that one neighbour annoys another by raising a stack of workshops or other buildings which overlook his premises: we were lately called in to such a case, where the offended neighbour had a family of seven grown-up daughters, and at all times whenever they appeared in the garden they were subject to observation and other annoyance; besides which they could not without offence against decency resort to the water-closet, which lay at the end of the garden.

Clause 33.—"And be it enacted, with regard to the party timber partitions of existing buildings belonging to different owners, so far as relates to the pulling down thereof, and any wall under or over the same, that if one of the buildings be rebuilt, or if one of the fronts of any such buildings be taken down to the height of one story, or for a space equal to one-fourth of such front from the level of the second floor upwards, then, without the con-

sent of the adjoining owner, but upon giving the requisite notice, according to the forms (Nos. 11, 12, 13), in the Schedule of Notices, or to the like effect, it shall be the duty of the building-owner, and he is hereby required to pull down such timber partitions, and the walls under or over the same, and in lieu thereof to build a proper party-wall; and that at the expense of the owners of all the premises parted thereby."

Our suggestion has been followed, except that we think the plural "buildings" before the words "be taken down," does not convey the meaning intended, which we suppose to be the front of any one building.

The 36th clause still leaves undefined the ultimate fate of goods, &c., removed to safe custody, for the purpose of performing work under the Act.

In clause 37, alteration has been made as we suggested, so that stone-walls having window-lights made improperly in them, are not compelled to be stopped with brick.

In clause 39, relating to building to party-walls chimneys for adjoining owners, according to our suggestion, the following words have been added, after the words "the adjoining owner shall give instructions in writing, or by a plan," the words, "and elevations or other sufficient drawings."

In clauses 41 and 42 provision has been, according to our suggestions, made for determining who shall be paid first any claims upon the proceeds of insufficient sales of the materials of ruinous buildings, and also for payment of the expenses of surveying in case of such insufficiency.

(To be continued in our next.)

#### GRAY'S THURROCK CHURCH, ESSEX.

SOME short time since architects were invited to send in designs for the restoration of Gray's Thurrock Church, Essex, and it seems a great number of designs were received. We have seen one of these, which is by Mr. East, who, we remember, was so highly spoken of in all the Kentish papers some short time since for the alterations then making to churches in that county under his superintendence. The competing architects were requested to attend personally with their designs, which request, we are informed, was complied with, when they were told the committee would meet the following Tuesday, to select designs for the approval of the vestry; on the following Friday these designs were returned to the different competitors, with the information that Mr. Eale's design was accepted. We have ever been of opinion that men who have studied, and are thoroughly acquainted with it, should be employed to make the selection; we have seen Mr. East's drawing, which, being made suitable for the very limited sum proposed for the restoration, is, of course, in a simple and church-like style; we shall say nothing of any particular items of freemasonry which it exhibits, intending by and by to take up the subject upon an enlarged scale; but without further remark, we shall conclude by saying we shall rejoice to hear the committee are pleased with their selection.

#### INSTITUTION OF CIVIL ENGINEERS.

June 11.—The President in the chair.

The paper read was by Mr. A. Angus Croll, Assoc. Inst. C. E., on the purifying of coal gas, and the application of the products thereby obtained to agricultural and other purposes. The author commenced by stating that in London alone the rental of the different gas-companies amounted to 600,000*l.* per annum; but it appeared, however, to be capable of much greater extension than it had yet attained, as it might be rendered much purer by the removal of ammonia, which is the origin of the unpleasant odours and unhealthy effluvia exhaled during its combustion. This desirable object was now accomplished by means of Mr. Croll's process, which was simple, efficacious, and highly economical; the process consisted in passing the gas through a solution of sulphuric acid of the strength of two and a half pounds of oil of vitriol to 100 gallons of water, and by a continuous supply

of acid, so that the proper amount of free acid may be always kept in the vessel, the whole of the ammonia in the gas is abstracted, preventing the corrosive effect of this impurity on the fittings and meters through which it was transmitted, and rendering the gas capable of being used in dwelling-houses; and also enabling the companies to use dry lime instead of wet lime purifiers, without producing any nuisance on the opening of the vessels, by which a considerable saving is effected, while, at the same time sulphate of ammonia of great purity is obtained, and of such a strength, that the evaporation of one gallon produces eighty ounces of this valuable salt, instead of fourteen ounces, which was the quantity rendered under the former process. This process has been introduced at the Chartered, the Imperial, and the Phoenix gas establishments, from which several tons are produced weekly, independent of the provincial gas companies. The author concluded his paper by shewing the great advantage to agriculture by the application of this produce to the land, besides its extensive application to the arts and manufactures; he stated that various experiments upon an extensive scale had been tried with this manure, with great success; one example will suffice for giving an idea of its powers. One-half of a wheat-field was manured with sulphate of ammonia, at the rate of 1½ cwt. to the acre, and at a cost of 1*l.* 2*s.*, the other half with the ordinary manure; the latter produced only 23½ bushels of corn, but the former, under the treatment of sulphate of ammonia, produced 32½ bushels, thus shewing the immense advantage derived from its application. The author gave an extract from the "Mark Lane Express" of the 27th May last, from which it appeared that seeds of wheat steeped in sulphate of ammonia on the 5th of July had, by the 10th of August, tillered into nine, ten, and eleven stems of nearly equal vigour, while seeds of the same sample unprepared, sown at the same time and in the same soil, had not tillered into more than two, three, and four stems.

In the discussion that ensued, in which Professor Grahame, Mr. Cooper, and many members of the institution took part, the advantages of the system were confirmed, and the necessity for its extension insisted on. The various modes of purifying gas, and the value of the products obtained for agricultural purposes, were canvassed at length. It was stated that seeds steeped for 40 hours in a solution of 1*lb.* of sulphate of ammonia to 1 gallon of water, sown in unmanured land, produced a heavy crop, and remained green during a dry season, when every other kind of vegetation became yellow, and withered. Another remarkable feature was that faded flowers, when plunged in a weak solution of sulphate of ammonia, were in a short time perfectly restored and revived, and that plants watered with it attained extraordinary health and beauty.

The great loss resulting from the leakage of the gas through the joints and the pores of the cast-iron pipes was incidentally mentioned, and it was stated that in some instances it had amounted to from 25 to 75 per cent. of the total quantity produced.

The following papers were announced to be read at the meeting of June 18:—

No. 688. "On the means of rendering large supplies of water available in cases of fire, and on the application of manual labour to the working of fire-engines," by J. Braidwood, Assoc. Inst. C. E.

No. 692. "On the construction and proper proportions of boilers for the generation of steam," by A. Murray, Assoc. Inst. C. E.

#### WATERLOO-BRIDGE.

THE half-yearly general meeting of the Waterloo-bridge Company was held at the Crown and Anchor, in the Strand, on the 6th inst. The Rev. Mr. Rush, the chairman of the committee, was called on to preside. The secretary read the report, which stated that the tolls received during the half-year ending the 23rd of February last, amounted to 9,087*l.* 19*s.* 10*d.*; whilst the tolls of the corresponding period of the preceding year amounted to 6,521*l.* 7*s.* 5*d.*, being an increase of 2,566*l.*, of which increase 2,330*l.* 5*s.* 3*d.* arose from

horses and carriages, and 236*l.* from foot-passengers. The tolls since February last, up to the 5th inst., amounted to 2617*l.* 5*s.* 9*d.* more than was received in the corresponding period of last year. The last dividend which the managing directors were enabled to make was 1*l.* 4*d.* on each annuity, but, owing to the improved finances of the company, after making a further dividend of 12*s.* on each annuity, there would remain at present a surplus of 1,640*l.* 12*s.* 11*d.* The company proposed to go to Parliament to obtain a bill to enable them to form an embankment, or public terrace, on the banks of the Thames, by which means their property would be greatly improved. The report was confirmed and adopted. Mr. Romeo Coates then said that he had a motion to make on the subject of the bridge. Waterloo-bridge was the finest structure of the kind in the world. As a specimen of beautiful architecture, it stood unrivalled; but it was similar to the Irishman's henbit, which was all loss and no gain. Twenty years ago the proprietors might have disposed advantageously of the bridge by means of a public lottery, and he did not see why the same course should not be adopted at the present time. This was the age of speculation. The bridge had cost two millions of money. Why not dispose of it, after the example of some west-end shop-keepers, "at a tremendous sacrifice," when they "are selling off at less than prime cost?" This wealthy metropolis contained 2,000,000 inhabitants; he would, therefore, propose that the bridge should be disposed of by means of a public lottery, and his scheme was this—they should issue 1,000,000 of tickets at a guinea each, and the prizes should be limited to 50, the fortunate holders of which should be, by the terms of the lottery, compelled to sell the bridge to government on the best terms they could, on the understanding that it should be thrown open to the public. The chairman asked Mr. Coates if he was really serious in his motion? Mr. Coates—Never more so. (Great laughter.) The chairman reminded Mr. Coates that before they could sell the bridge by lottery as he proposed, they must first procure an Act of Parliament to authorize the lottery. Mr. Coates—Oh, precisely; that is what I mean.—The chairman said the motion of the hon. gentleman came upon the meeting by surprise, and he thought they ought not to discuss it at the present time. It was a very important subject, and in order to entertain the motion, they ought to summon a special general assembly of proprietors for the purpose, and so insure a very full meeting.—Mr. Coates said he entirely agreed with the chairman; and in order to bring the subject fully before the proprietors, he would cause a special meeting to be summoned, and for this purpose would for the present withdraw his motion, which he had no doubt would be carried when brought before a full meeting of proprietors. A vote of thanks having been given to the chairman, the meeting separated.

#### ART AND SCIENCE.

BY JOHN BYRNE, PROFESSOR OF MATHEMATICS.

ART and science are, indeed, words of familiar use and great significance, yet their difference is but little understood. In the present age, notwithstanding its improvements in knowledge, exists the popular prejudice of terming almost every thing a science. It is true, if we consult our best dictionaries for an explanation, we find nothing but an abstract definition, in which one obscure notion is substituted for another, that rather casts obscurity than light on the subject. I have therefore attempted to draw a more visible parallel between art and science. To science belong such things as men may discover by the use of sense and reasoning, such as the laws of nature, the affections of bodies, the rules and criterions of right and wrong, truth and error, the properties of lines and numbers, &c. To art, on the other hand, belong such things as mere reason would not have attained, things which lie out of the direct path of deduction, and which require a peculiar cast, or turn of mind, to see or arrive at. Or a science is a series of deductions or conclusions which every person endued with sound faculties may, with a proper degree of attention, see and draw; and a formed science is no more than a system of such con-

elusions, relating to some one subject, and carefully laid down in words, comprehending the doctrine, reason, and theory of the thing, without any immediate application thereof to the offices of life. Thus, natural philosophy, ethics, logic, pure mathematics, statistics, &c., are sciences. An *art* is not founded on self-evident principles or demonstrations, but is a system or collection of rules, precepts, inventions, or experiments, which being duly observed, make the things a man undertakes succeed, and render them advantageous and agreeable. Thus, grammar, painting, poetry, sculpture, music, anatomy, dancing, &c., are arts.

The difference between the two may be illustrated by that between wit and humour: the former is a general faculty of exciting agreeable and surprising pictures in the imagination, and the latter a particular one: the former is pure and absolute in its kind, the latter tinged with something foreign and complexional. In this sense an art and a science only seem to differ as less and more pure; and my parallel becomes more like that species of mathematical lines, which continue to draw nearer and nearer to each other, *ad infinitum*, yet never meet. But a *science* is a system of deductions, made by reason alone, undetermined by anything foreign or extrinsic to itself. An *art*, on the contrary, requires a number of data and postulates to be furnished from without; and never goes any length, without, at every turn, needing new ones. Nevertheless, an art appears to be a portion of science or general knowledge; considered, not in itself, as a science, but with relation to its circumstances or appendages. In a science, the mind looks directly backwards and forwards to the premises and conclusions: in an art we look laterally to the concomitant circumstances. A science, in fact, is to an art, what a stream running in a direct channel, without regard to any thing but its own progress, is to the same stream turned out of its proper course, and disposed into cascades, jets, cisterns, ponds, &c., in which case the progress of the stream is not considered in regard to itself, but only as it concerns the works, every one of which modifies the course of the stream and leads it out of its way. It is easy to trace the course of the former from its rise to its issue, as it flows consequently; but a man, ever so well acquainted with this, will not be able to discover that of the latter, as it depends on the genius, humour, and caprice of the engineer who laid the design.

The arts which relate to the sight and hearing, Bacon observes, "are reputed liberal beyond those which regard the other senses, which are chiefly employed in matters of luxury." The mechanical arts are generally practised by means of a machine, and require more the assistance of the hand and body than the mind. However, there is no truth more undeniable than this, that if man were not really and truly a free agent, there would be no such thing as an art, at least in the sense here understood: but art would only be a name given to that system or series of effects to which man is made by nature, and in her hands, subservient; and might, with equal reason, be attributed to such effects as any other natural production is subservient to. But we must not forget those enigmatical theories, visionary speculations, and chimerical inventions, which are never matured into either an art or a science; their novelties often please, but with novelty they pass away, and now ones succeed, "like leaves of trees," though not by a similar order of nature, but because things that become useless soon become contemptible.

Among the *scientific* vagaries of the present time, we have phrenology, phrenomagnetism, mesmerism, clairvoyance, the homeopathic system, and some others: to say the least of them, they are more adapted to catch and entangle the mind, than to instruct and inform the understanding; and, perhaps, without saying the most of them, the words formerly applied to *alchemy* would define any one of them. "It is an art without sense, the beginning of which is deceit, its middle labour, and its end beggary." But when error has obtained the mastery of our minds during our tender age, we are seldom at pains to shake off its yoke, but rather strive to subject ourselves more to it.

Again, when we hear of a young person knowing a great many sciences and arts, we suspect him of understanding them very imperfectly, or of knowing only the elements at most, which is in fact knowing nothing at all. Some, it is true, have a passion for universal knowledge, and this universal knowledge consists in knowing by memory a few words upon every subject, which convey no kind of ideas. To those that would form a new science, or extend the boundaries of the old, we would suggest the following rules, which are strictly observed by mathematicians:—

1. To offer nothing but what is couched in clear express terms; and to that end, to begin with definitions.
2. To build only on evident and clear principles: hence it is necessary to proceed only from axioms or maxims.
3. To prove demonstratively all the conclusions that are drawn hence; and for this purpose, to make use of no arguments or proofs, but definitions already laid down, axioms already granted, and propositions already proved; which serve as principles to things that follow.

#### ENERGIATYPE.

A NEW PHOTOGRAPHIC PROCESS.

(From the *Athenaeum*.)

WHILE pursuing some investigations, with a view to determine the influence of the solar rays upon precipitation, I have been led to the discovery of a new photographic agent, which can be employed in the preparation of paper with a facility which no other sensitive process possesses. Being desirous of affording all the information I possibly can to those who are anxious to avail themselves of the advantages offered by photography, I solicit a little space in your columns for the purpose of publishing the particulars of this new process. All the photographic processes with which we are at present acquainted, sufficiently sensitive for the fixation of the images of the camera obscura, require the most careful and precise manipulation; consequently, those who are not accustomed to the niceties of experimental pursuits are frequently annoyed by failures. The following statement will at once show the exceeding simplicity of the new discovery.

Good letter-paper is first washed over with the following solution:—

A saturated solution of succinic acid	2 drachms.
Mucilage of gum arabic	1/2 "
Water	1 1/2 "

When the paper is dry, it is washed over once with an argentine solution, consisting of one drachm of nitrate of silver to one ounce of distilled water. The paper is allowed to dry in the dark, and it is fit for use; it can be preserved in a portfolio, and at any time employed in the camera. This paper is a pure white, and it retains its colour, which is a great advantage. At present, I find it necessary to expose this prepared paper in the camera obscura for periods, varying with the quantity of sunshine, from two to eight minutes, although from some results which I have obtained, I am satisfied that by a nice adjustment of the proportions of the materials, a much shorter exposure will suffice. When the paper is removed from the camera, no trace of a picture is visible. We have then to mix together one drachm of a saturated solution of *sulphate of iron*, and two or three drachms of the *mucilage of gum arabic*. A wide flat brush saturated with this solution is now swept over the face of the paper rapidly and evenly. In a few seconds, the dormant images are seen to develop themselves, and with great rapidity a pleasing *negative* photographic picture is produced. The iron solution is to be washed off as soon as the best effect appears, this being done with a soft sponge and clean water. The drawing is then soaked for a short time in water, and may be permanently fixed, by being washed over with ammonia—or perhaps better with a solution of the hyposulphite of soda, care being taken that the salt is afterwards well washed out of the paper. From the pictures thus produced, any number of others, correct in position and in light and shadow, may be produced, by using the same succinated papers in the ordinary way; from five to ten minutes in sunshine producing the desired effect.

The advantages which this process possesses over every other must be, I think, apparent. The papers are prepared in the most simple manner, and may be kept ready by the tourist until required for use; they require no preparation previously to their being placed in the camera, and they can be preserved until a convenient opportunity offers for bringing out the picture, which is done in the most simple manner, with a material which can be anywhere procured.

Anxious to give the public the advantage of this process during the beautiful weather of the present season, I have not waited to perfect the manipulatory details which are necessary for the production of portraits. It is sufficient, however, to say, that experiment has satisfied me of its applicability for this purpose.

Prismatic examination has proved that the rays effecting this chemical change are those which I have elsewhere shown to be perfectly independent of solar light or heat. I therefore propose to distinguish this process by a name which has a general rather than a particular application. Regarding all photographic phenomena as due to the principle *ENERGIA*, I would nevertheless wish to distinguish this very interesting process as the *ENERGIATYPE*.

I enclose you a few specimens of the results already obtained. The exceeding sensibility of the *Energiatype* is best shown by an attempt to copy engravings or leaves by it. The three specimens I enclose were produced by an exposure of considerably less than one second.

ROBERT HUNT.

Falmouth, May 27, 1844.

#### OPEN GRATES AND STOVES.

Few circumstances, perhaps, have tended so much, in modern times, to alter the state of health, as affected by the internal arrangements of dwelling-houses, as the great reduction in the altitude of the chimney-piece, and the more skilful disposition of the fire-place for the economy of fuel. The practical consequence has been, that a less amount of air is necessarily forced through individual apartments, when the coldness of the weather renders it necessary to keep the windows shut; and, above all, that the air which does pass to the fire is, in general, below the level of the head, and exercises, accordingly, little or no purifying influence upon that portion of the atmosphere which is within the zone of respiration. The cottage grate, so very generally introduced of late years, is extremely comfortable, from the low position of the fuel, the comparative absence of iron, and the powerful radiating influence of the fire-bricks that form the backs and sides; but the smaller the apartment, and the more perfect its construction, the less must it alone be trusted to in securing ventilation. A common fire heats an apartment, in general, almost solely by radiation, excepting the influence of the flue upon the wall. In some cases, fire-places have been constructed so as to partake in part of the character of stoves. The peculiar advantages of a fire-place are not merely its power of warming an apartment, the circulation of air which it induces, its accessibility, and the influence of the light which it evolves; but the very grateful effect which it produces after the body has been chilled by any special cause, whether in doors or out of doors, stimulating it, and exciting the circulation to the greatest degree which may be considered agreeable, and permitting each individual to adjust the distance which is most suitable to his own constitution, and the previous exposure to which he may have been more immediately subject. The light, also, is not to be considered a mere nominal advantage, but a real and positive benefit, affecting the whole system by its physical action, independently of the cheerful impression which its liveliness is calculated to excite, and which, to many, is so engaging, that they feel as if they were not alone when they have the company of a glowing fire. These considerations will probably always sustain the open fire-place, in countries where fuel can be procured with sufficient economy; but its disadvantages, in other respects, compared with the stove, are marked, particularly its expense, its local action, the dust it is apt to produce, and the frequent attendance which it requires.—*Reid on Ventilation.*

## WOOL MOSAIC.

This is the name given to a fabric produced by a process lately invented by Messrs. Lebenheim and Muller. The fabric has somewhat the appearance of printed velvet, but the allocation of the different threads by which the pattern is formed is very similar to that in the manufacture of Florentine mosaic. Pictures can be copied by the ingenious machinery employed, and the most delicate tints of the best German wool-work appear as if interwoven in the pile of the velvet, although the process by which the effect is produced is much more expeditious than that of weaving would be. We cannot of course describe the mode of working the machinery without revealing the inventor's secret; but it may, however, be stated that when once the tedious task of selecting and placing the different shades of threads together has been accomplished so as to complete one subject, be it a flower, a figure, a landscape, or even an historical picture, of each of which the persons selecting the yarns has a copy before him, the ends of these threads are closely placed together and then cut even, as the surface of each subject proves. A cotton or woollen cloth, of the same dimension, with a solution of India-rubber, is then pressed upon the surface, and a slice cut off; and by means of a finishing process the wool becomes so embedded on the India-rubber cloth, that the two substances appear like one. The same course of pressing an India-rubber cloth on the surface and slicing it off is gone through till there remains no more to be sliced off. The applicability of the invention may be carried on to various purposes and a vast extent. Palaces or large mansions could be decorated with this beautiful fabric, which for softness of colours could not be equalled by any tapestry, the Gobelin not excepted.

## LECTURES ON ARCHITECTURE AND ANTIQUITIES.\*

## Lecture III.

## ON GRECIAN ARCHITECTURE—THE DORIC STYLE.

UNTIL the time that Stuart and Revett published their valuable work on the Antiquities of Athens, it is surprising how little was known on the subject of Grecian architecture. Their first volume appeared A.D. 1762, and opinions began to waver as to the superiority of the Roman and Italian schools, which had prevailed through the influence of Sir Christopher Wren and Inigo Jones. It was seen that in the examples which in this volume were for the first time presented to the public, the true models of design were to be found, the real proto-types of excellence; that here was the pure fountain-head, whereas they had been accustomed to drink from a polluted stream. Stuart and Revett's succeeding volumes served to heighten the impression which had been made; emulation was excited among travelling artists, who set not up their tent, as formerly, in Rome, as if there were nothing beyond worth knowing, but they journeyed on among the different islands of the Mediterranean, where the Greeks had colonies, and thus by their labours much information has been gained in addition to that previously acquired, so that we may now be said to possess a knowledge of nearly all the existing remains of Greek temples. The many public buildings which have been erected in England of late years in this beautiful style form a convincing proof that it has recovered a place for itself which it is not likely soon to lose, especially when it is found, by a judicious selection of examples, to be quite as tractable as the Roman and Italian styles, and as well adapted to domestic dwellings, as to structures of more pretension to magnificence. Besides deriving information from professional writers, I am not aware that I can do better than quote occasionally the opinions of one profoundly versed in Grecian art, and it will be sufficient to mention the name of Lord Aberdeen, to insure attention to his remarks. "All nations," says that noble author, "in the most advanced state of civilization, have been unanimous in their admiration of Grecian architecture; and, indeed, such admiration appears to have been generally considered as inseparable from the existence of real taste and knowledge in the art."† And again,

"The pleasure which is derived from surveying the ancient models of Grecian architecture is incalculably heightened by ideas connected with learning, with science, and with art, accompanied, as they ever must be, by all the nameless charms which imagination combines with the history of the Greeks, and which it throws over all their productions." (P. 4.)

As the work by Stuart treats chiefly of temples and structures which he found at Athens, we shall commence our inquiries there first, although some older examples are to be found at Corinth and elsewhere; but the rules of the Greek orders are so strict, especially of the Doric, that the general resemblance between the earliest and latest examples of Doric buildings is very striking. It will be necessary to give a hasty sketch of the early history of Athens.

The received opinion among Greek writers of the latest period of their literature, and repeated in modern times, is that Cærops, an Egyptian, a native of Sais, led a colony into Attica, 1556 years B.C.\* Mr. Mitford, in his History of Greece, thus alludes to his arrival: "He found the inhabitants rude and ignorant, a circumstance far from adverse to his purpose of forming a settlement. The country was well adapted also for this purpose. On the verge of a plain, watered by two small streams, a haven presented itself, commodious for the vessels of the time. Between the streams, near their junction, about three miles from the shore and five from the haven, a rock, rising nearly perpendicular on all sides, had every advantage for a fortified post. This was afterwards the celebrated Acropolis. Cærops divided the territory into twelve villages, and made this rock his residence and called it Cæropia. It was recommended to the patronage of the Egyptian goddess whom the Greeks worshipped by the name of Athena, and by the Latins of Minerva. Herodotus, Plato, Strabo, and Diodorus, who all travelled into Egypt, agree in representing the Athenian Minerva as the same goddess who was peculiarly worshipped at Sais in Egypt. Cærops reigned fifty years, and by his moderation and prudence he succeeded in softening the rude manners of the native inhabitants; he gave them laws and regulations, and introduced the worship of those deities which were held in adoration in Egypt. He taught his subjects to cultivate the olive, though the Greeks, not satisfied without procuring for it a divine invention, ascribed its origin to Minerva, who had a contest with Neptune concerning the right of giving a name to the capital of Cæropia. The assembly of the gods settled this dispute by promising the preference to whichever of the two should give the most useful and necessary present to the inhabitants of the earth. Neptune struck the ground with his trident, and immediately a horse sprang forth; Minerva produced the olive, and obtained the victory by the unanimous voice of the gods, who observed that the olive, which is the emblem of peace, is to be preferred to the horse, the symbol of war. The victorious deity called the capital Athens, and became the tutelary goddess of the place." Sixteen kings succeeded Cærops, among whom was the celebrated Theseus. The adventures of any man of great strength and daring in those days were afterwards magnified into the wonderful, and indeed superhuman; accordingly, much that is recorded of Theseus is so extravagant, that doubts have been entertained whether he was more than a fabulous hero, but the fact of his having really existed and reigned over the Athenians seems to be generally recognized. He appears to have rendered great services to them, made new regulations and enacted new laws; he shewed as much wisdom as valour, and Plutarch says that he built a council-hall and courts of justice. He instituted a great festival, called Panathæna, the feast of all the gods. In memory of his services and great exploits, his countrymen erected in his honour the magnificent temple which bears his name, and of which we shall presently take notice.

The 17th and last king of Athens was Codrus, who generously devoted himself to

death to save his country; this occurred 1070 years B.C. The kingly government had therefore lasted 486 years. On the death of Codrus, the name of king was abolished, and the state was governed by perpetual archons (ἀρχων, a chief) for 317 years (that is, from 1070 to 753 B.C.);\* then by archons of ten years, which form of government lasted 69 years; and lastly the archons were chosen yearly. It was under this democracy that the Athenians signalized themselves by their valour in the field, and by their munificence, and their cultivation of the fine arts. They were deemed so powerful by the Persians, that Xerxes, when he invaded Greece, chiefly directed his arms against Athens, which he took and burnt, 480 B.C., after the inhabitants had deserted it. But the Athenians obtained a splendid revenge in the battles of Marathon, Salamis, Plataea, and Mycale. The city was rebuilt and fortified, 475 B.C., by Themistocles, whose projects were carried into execution by Cimon, and a new magnificent harbour and town were built from the designs of "Hippodamus, a Milesian architect, the first among the ancients who invented designs for new cities." (Thirlwall's Greece, vol. ii., ch. 16.)

But it was reserved for the age of PERICLES to adorn the city of the virgin-goddess with the splendid edifices, whose ruins now remain for our admiration and instruction. That great man (whose father was Xantippus, the conqueror at Mycale) obtained by his address and talents the principal share in the government of the state for nearly forty years (he died 429 B.C.); and having great taste himself, he was fortunate in being seconded in his efforts to ornament his native city by obtaining the assistance of men of talent and genius, and particularly of the celebrated PRAXIAS, the greatest sculptor that ever lived. The Parthenon, or the temple dedicated to the virgin-goddess Minerva (the Greek word παρθενος signifying a virgin), was designed by Ictinus and Callicrates, about the year 438 B.C., whilst Pheidias wrought the marble figures into life by his magic touch. This temple, erected upon the site of the old Ilæcatompedon, destroyed by the Persians, is justly looked upon as the finest example of the Grecian Doric, and has excited for twenty-two centuries the admiration and delight of all who have seen it. With the words of the noble author before quoted all will probably agree. "In the majestic simplicity of its general design, the grandeur of its proportions, and the exquisite taste and skill displayed in the execution of its ornamental parts; it is undoubtedly the most perfect, as well as deservedly the most celebrated production of Grecian art." (Lord Aberdeen's Inquiry, p. 142.) Before we proceed to a description of this and other Doric temples, it may be as well to make a few remarks for the better understanding of the orders.†

## THE DORIC ORDER.‡

THE DORIC, like the other orders, may be said to consist of two great divisions or parts, a supporting, and a supported, mass; the supporting mass is the column, and the part sustained is called the entablature. The Grecian Doric column has no base; it consists, therefore, of but two parts, a shaft and a capital. In the Ionic and the Corinthian, the only other Greek orders, bases are almost invariably added. The entablature in all the three orders is divided into three great leading parts, viz., the architrave, the frieze, and the cornice. A Doric temple is generally placed upon a platform of two or three steps, which gives to the structure a breadth and air of firmness. On the upper step rest the columns; these (as a general rule) are always fluted, the flutes from sixteen to twenty-four

\* Medon, the son of Codrus, was the first archon, and the dignity remained in his family for 200 years.

† As these lectures were originally composed for non-professional persons, the indulgence of the reader is claimed for the insertion of those observations which may seem too much like the mere alphabet of architecture; but it is yet possible that among the patrons of THE BUILDER some may be found, to whom such definitions may be welcome. I propose to give in separate papers, among other illustrations of classical architecture, the derivation and meaning of some of our architectural terms, which are too often alluded to in a very loose and vague manner. Some of these glossarial notes have already appeared.

‡ [We have to apologise to our subscribers for the matter upon the orders of architecture, and for some errors in the wood-cutting, which appeared in THE BUILDER at the close of last year, being at that period literally without an editor.—Ed.]

\* Continued from p. 295.

† "An Inquiry into the Principles of Beauty in Grecian Architecture, with an Historical View of the Rise and Progress of the Art in Greece." By George, Earl of Aberdeen, K.T., &c. Murray, 1822. (P. 1.)

\* The latest historian of Greece, the present Bishop of St. David's, better known to the learned world as the profoundest Greek scholar of the day, CONNOY THIRLWALL, considers that "the Egyptian origin of Cærops is extremely doubtful."—Hist. of Greece, vol. i., p. 67.

VIEW OF THE PARTHENON.

in number [but twenty almost invariably], being segments of circles, which meet in a sharp edge or arsis, which is peculiar to this order. In the examples of the Doric at Eleusis, Rhamnus, Sunium, and Thoricus, there is a slight fillet between the flutings, but hardly amounting to more than  $\frac{1}{12}$ th of an inch. The width of a column at bottom, called the diameter, or the measure through, determines the other proportions of the order. The height of Doric columns varies in different examples, from four times the lower diameter at Corinth, to six times and a half, as in the portico of Philip of Macedon. The purest examples are about five diameters and a half in length. The capital, which is usually in height rather less than half a diameter, consists of a necking immediately above the shaft, composed of three or four rings or annulets which follow the shape of the column; above them is the moulding called the echinus, also circular in plan or horizontal section, and above this the crowning member of the capital in the shape of a square flat tile, called the abacus, from the Greek word ἀβάξ, *abax*, signifying a calculating table or board. Some writers consider the hypotrachelium as part of the capital. As the columns would be unsightly if they were of the same thickness all the way up, the shaft is diminished by making the upper diameter about one-sixth less than its lower diameter. In the best ancient examples, the columns do not diminish in a line drawn at once from the top to bottom (although often so represented on paper), but they have a slight curve outwards,\* which is called the *entasis* (from the Greek) or swelling; this method, first observed and verified by Messrs. Cockerell and Allason (it is however mentioned by Vitruvius), should not be imitated in modern times, unless in works on a large scale, and then it should not be thrust upon one's notice, as it too often is a deformity instead of a beauty. The entablature varies in examples from one and three-quarters to two diameters in height, of which about four-fifths are divided in nearly equal proportions between the architrave and frieze, and the cornice occupies the remaining fifth.† The architrave, i. e., chief beam (compounded of the Greek word ἀρχός, *arkhos*, chief, and the Latin word, *trabs*, a beam), is in the purest Doric always plain, and it consists of but one face; it rests immediately upon the columns, for which reason its Greek name is Epistylum, from ἐπι, *upon*, and στῦλος, a column. The architrave is divided from the frieze above it by a projecting continuous fillet, called the *tænia*, which has below it guttae, or drops, whose situations are regulated by the triglyphs above. From the frieze being generally ornamented with a representation of living creatures, it was called by the Greeks the *Zoöphoros*, from Ζῷον, an animal, and φέρω, *fero*, I bear. The triglyphs, composed of two Greek words signifying three channels or glyphs (*τρῆεις*, pronounced like *trice*, and γλυφή, *glyphe*, a carving or cutting), are the distinguishing features of the Doric order, and, indeed, they determine the length of the front of a building, for a triglyph must be over the centre of a column. A space is then set off equal in height to the triglyph, which is called the metope; another triglyph is drawn, then another metope, and then a second triglyph, the centre of which is the central line of the next column, and so on to the number of columns required; thus there will be always a triglyph over every column and one between. This arrangement is considered to produce perfection in a temple, as in the Parthenon, but it was departed from where greater width was required between the columns to admit chariots, as in the Propylæa. The columns at the angles of porticos are not placed so as that the triglyphs should be over their centres, for the triglyph being at the extreme angle, a line let fall from its outer edge will touch the base of the column; so that there is less space between the angle columns and those next to them, than there is between the centre columns. The spaces between the triglyphs, called the metopes (and originally left open, as the name imports), are generally ornamented with sculptures. The cornice or crowning part of the entablature projects over it, thereby forming a covering and protection to the work beneath. It consists of several members, well adapted to their situations; as it projects considerably, the under part or soffit of the cornice is ornamented with mutules or rectangular blocks, from which depend guttae or drops; there is a mutule over every triglyph, and one between, over every metope. To hide the end of the roof, the front and opposite ends (if there were two porticos) are carried up, and form what is called the pediment, a kind of flat gable, a graceful finish to the temple; the tympanum, or triangular part which is inclosed within the cornices, is ge-

nerally filled with sculptures. Distinguishing names are applied to the Greek temples, according to the manner in which they are disposed. When a portico consists of four columns in front, as in the Ilissus, it is called tetrastyle (from τετρα, four, and στῦλος, a column); if there are six columns, as in the Theseus, it is hexastyle (a favourite arrangement with the Greeks); if seven columns, as at Agrigentum, it is termed heptastyle; if there are eight, as in the Parthenon, it is called octastyle; if nine, it is enneastyle, as at Paestum; if ten, as in the temple of Jupiter Olympus at Athens, it is termed decastyle; if there are twelve, as in the temple of Ceres at Eleusis, it is called dodecastyle. When the columns of a temple are placed between antæ or pilasters, it is called a temple in antis; this was probably the earliest form of building temples.\* Other names also apply to various dispositions in the buildings. In general, in the Greek temples the columns on the flanks are double the number of those in the front and one more, counting the columns at the angles twice over: thus, if the front had eight columns, as in the Parthenon, there were seventeen in each flank; if there were six in front, as in the temple of Theseus, there were thirteen on the flank, and so on.† In the temple of Apollo at Bassæ, the portico has six columns and the flanks fifteen, counting both angles.

As the PARTHENON is generally considered to be the most perfect Doric edifice ever designed, of that structure we shall first speak. When Sir George Wheeler and Dr. Spon visited it, A. D. 1676, the temple was entire. In the year 1687 Athens was besieged by the Venetians, when a shell falling on the structure, the Parthenon was reduced to the state in which it was seen by Stuart and Revett. This celebrated temple had at each end a portico of eight columns in front, and on the sides were thirty more, making forty-six to the colonnade which surrounded the cell of the building. The breadth of the front of the

\* [It is dangerous even merely to mention temples which have in their facades an odd number of columns, for fear of drawing out the bad taste of the perverse; the prudent reader will observe this deformity is only to be met with in very early and immature specimens of unknown origin.—Ed.]

† [Mr. Bartholomew notices the same, and adds, the Roman method was to give the flanks twice as many columns as the front, and one less; thus the flanks of the Parthenon would by the Roman method have had fifteen columns instead of seventeen.—Ed.]

\* This moulding, which adds strength to the column, is well understood by naval architects, as applied by them to ship-masts of any great size.

† Mr. Bartholomew discovers the same symmetry observed by the ancients in entablatures as in Doric capitals; in the finest Doric examples the architrave and frieze are equal in height, and the diagonal breadth of the cornice is of the same dimension.—Ed.]

building is 101 feet,\* the length 227 feet on the upper step, and the height 65 feet. The columns are 6 feet 1 inch in diameter, those at the angles are 2 inches more;† the distance from column to column is 7 feet 11 inches. The sculptures of the Parthenon extended to a range of 1,100 feet, consisting of upwards of 600 figures. Behind the great porticoes there are two of smaller dimensions, which are called the pronaos and posticus; these inner porticoes have in each six columns. The portion of the building inclosed by the columns was divided by a cross wall into two parts, whereof the larger, called the cella or naos (ship), answered to our nave; the smaller part, in which was the public treasury, was called the opisthodomus. In this part, ac-

ording to Wheeler, were six columns, but no vestige remains of them. The cell, where was placed the famous statue of Minerva by Phidias, was open to the sky in the centre\* (whence such a temple was called hypæthral, from the Greek *ὑπὸ*, under, and *αἶθρῃ*, æther, air), having a colonnade round it supporting a gallery above, in which was a second row of columns. These have all likewise disappeared, but the circles were traced by Stuart on the pavement whereon the lower range of columns had stood. The sculptures in the pediment of the eastern front represented the introduction of Minerva among the assembled gods, giving us an admirable idea of the mythology of the ancients, each of the deities being distinguished by his or her peculiar symbols. The metopes or spaces between the triglyphs recorded the battles between the Centaurs and the Lapithæ; a fruitful subject of illustra-

tion among poets as well as sculptors, and a favourite theme with the Greeks, from their famous heroes Hercules and Theseus bearing a prominent part in the contest; fifteen of these metopes are in the British Museum. The western pediment contained a representation of the contest between Minerva and Neptune (in the opinions of Colonel Leake and Mr. Cockerell, this contest was in the eastern pediment); but the most celebrated sculpture is that which represents the Panathenæic procession: this composition is 3 feet 4 inches high, and was continued in the frieze quite round on the outside wall of the cell of the temple. The figures in these groups, which occupy a length of 520 feet, are generally allowed to be of finer execution than those in the metopes. "With respect to the beauty of the basso-relievos," says the great Flaxman, "they are as perfect nature as it is possible to put into the compass of the marble in which they are executed, and that of the most elegant kind." Another sculptor, Rossi, calls them "jewels."

G. R. F.

\* The Parthenon was also called Hecatompodon, signifying that its length was 100 feet.

† [To make them appear as large as the others, according to the rule given by Vitruvius, who is esteemed by the wisest modern architects, and deprecated by few besides the ignorant.—Ed.]

‡ The late Professor Wilkins does not admit the probability of the Parthenon having been hypæthral, a mode of construction which he considers contrary to the religious observances of all nations of antiquity.

PLAN OF THE PARTHENON.

PETRALOLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 291.)

The mountains of porphyry exhibit no stratification, but, in common with the crystalline rocks, the masses, while in their disintegrated state, appear to have been formed by one long uninterrupted sequence of events, the material being chiefly such as is supplied within the ocean waters; consisting of granular particles of sand, intermixed with the resolution of ascent animals and vegetables belonging to the ocean; and when uniting with these, the animal and vegetable matters of *terra firma* branching forth into varieties, as the accident of combination may determine. But although in mountain masses, it is presented to us only in the compact state, and wholly devoid of stratification; still, under other aspects, we find it, in common with granite and gneiss, occasionally presenting a schistose texture.

Hornstone porphyry is generally red or green, with a splintery fracture, and inclosing crystals of quartz and felspar: this kind of porphyry is very common to the deserts of Africa, and its surface, when cut and polished by art, presents a striking similitude to shell marble, the crystalline change of the organic body in decomposition obliterating the organic figure: there are other varieties which, as Lesk observes, are a kind of mean between siliceous schistus and argillite. Hornstone porphyry is distinguished by its hardness, slight transparency, and want of lustre, and much of it appears to be ill cemented together, like some kinds of breccia. This variety belongs to the siliceous rocks.

Felspar porphyry, the base of which is commonly red, compact felspar, inclosing crystals of felspar and quartz, is analogous in mechanical composition with granite and gneiss, con-

sisting of a silico-aluminous base, uniting compact particles and crystals of granitic character, sometimes containing iron and lime, and, where hornblende is added, being known as sienitic porphyry. When the felspar predominates, it is utterly impossible to distinguish this kind of porphyry from granite, and mineralogists are very apt to confound the one with the other. Pitchstone porphyry, as its name implies, has a basis of this material, and is either red, green, brown, grey, black, or yellow, of various shades, having generally many colours at once in the same specimen. These varieties of porphyry are very common to the Egyptian and Arabian deserts, and were much used by the ancient Egyptians for tombs, and also for building and ornamental purposes: they differ from hornstone in texture, being manifestly conglomerate masses of marine earthy bodies, and particles of bodies cemented by silica, and sometimes by silica and alumina conjointly. Clay porphyry, or the argillaceous porphyry of Kirwan, has generally some shade of grey, or greenish grey, or brown, or blackish, or reddish brown, or isabella yellow. This species is allied to the argillaceous rocks, being indurated clay, cementing or uniting in its matrix crystalline felspar, or hornblende, and granular particles. This porphyry is often of very little use for building or other purposes, for the felspar or hornblende soon moulders and loses its lustre. The varieties of this kind are exceedingly numerous, embracing a variety of composition analogous to beds of common clay, or the simplicity of composition of the pure ocean marls. Kirwan distinguishes four sorts of porphyries, viz. the siliceous, argillaceous, muriatic, and calcareous, most of which may be compact, schistose, or slaty. It is certain that in soils of primary and mixed qualities, disposed within tropical regions, porphyry may be observed in all its various shades of induration and composition, and the stones used by the ancients have been invariably quarried

from the oceanic strata, the same rock still exhibiting varying degrees of hardness, according to the extent of exposure of its surface to atmospheric air. Its general composition in the friable state is that of sands, calcareous matter, mollusca, and other oceanic animal and vegetable *reliquæ*; and it is governed in its changes by the same laws that govern the disposition of meaner aggregates. For instance, a number of pebbles and sand particles become united with calcareous matter lying, as it were, held together by a portion of dry mortar; in this state they are exposed to unceasing atmospheric heat without moisture; the calcareous matter silicifies, and gradually the whole is united in one inseparable mass; the several pebbles forming its component parts still continuing changing, without regard to each other, until the end to be obtained is effected. The same simplicity of change is observable in vast masses of earth; local change in the disposition and association of the bodies of which it is composed, general change produced necessarily by these local changes, and under the influence of a continuous high degree of atmospheric heat. The same kind of organic matter may undergo many changes and produce many results widely differing from each other; they may silicify as flint, decompose as sands, pass by transition into the mineral state as coal, or become converted into gems. The like versatility in nature's operations is observable in aggregate masses; thus we find the material constituent of many rocks is precisely the same, and, in numerous instances, is so mechanically, nay, in some, mathematically disposed, as to denote beyond the possibility of doubt the one common origin; and yet how different does it appear in the regular sequence of events: on the one hand, we observe it assuming the most elegant and regular crystalline arrangement; on the extreme of the other, it is a mere concrete mass, without form or order in its internal character. Carbonate

of lime is presented to our view in upwards of six hundred different forms, although, on analysis, we find the same simple uncombined material; how much more then must we expect variety in the mechanical and chemical arrangements of structure of bodies containing more numerous compounds and a variety of elementary products. In fact there is an endless variety constituting each division, presenting every shade of combination with each other; this renders a correct classification of rocks an impossibility, and the utmost we are enabled to do is to mark out the type or head of each distinguishing class, and the most commonly known variety of each.

Uniformity of disposition, composition, and character marks many of the sand formations of the earth; when these are united by some one common basis or cement, this uniformity of character is still maintained in sandstone; if further change takes place, and the siliceous particles thus held together assume the crystalline texture, we have still uniformity in the quartz rock; and when, under local circumstances of atmospheric or aqueous action, the quartz decomposes, we have still the same uniform matter constituting marl or clay. It is the same with many calcareous beds; they may consist of finely comminuted particles of mollusca and other *coriis* or they may consist either with these particles and aggregate bodies of myriads of creatures, varying from each other in organical structure and mechanical arrangement of particles, but the same simple elements pervades both, and in the fossil and mineral kingdom we acknowledge the result as one consisting of the same common elements of carbon and lime; but when matters of the earth blend with these primary products of the waters, when the *reliqua* of animals and vegetables containing other earths than lime, other compounds than carbon, enter into and become a portion of their constituent parts, the line of distinction is removed, and variety is characterized by the measure of each compound constituting in unity the one whole.

It requires no very great stretch of learning to discover the characteristic qualities of rock; the experienced architect is guided by practice, by example, as well as by the existing monuments of the past; the conditions of their existence have never hitherto been laid down in writing, and therefore it is that the inexperienced man, rushing to conclusions unaided by science, has erected monuments to his own folly, using the material most easily quarried, without reference to its durability or to the local influences to which it is exposed. But it is not the mere builder alone who generalizes on the uses and disposition of rock; the man of science generalizes also, and, following the vicious example set by Werner, fashionably instructs you that one small portion of the earth, one insignificant locality scarcely perceptible on the map of the globe, is a fair sample of the whole, and that the law of production is in like manner uniform. It is, therefore, the more necessary, that the architect should have scientific knowledge on these matters, that he may be enabled to detect a concealed enemy in the material he is about to employ, because he is told that such material was employed some four or five thousand years since, and is still existing unimpaired, some thousand of miles distant from the spot in which he lives.

Porphyry, under its varied forms and combinations, is very abundantly distributed upon and within the superficial crust of the earth, forming, in many localities, hills and ranges of bills, and sometimes entire mountains. It is very rich in mineral veins, the clay porphyries being the most abundantly supplied with them. The method in use with the Italians, who work up the pieces of the old porphyry columns originally brought by the Romans from Egypt, is with a brass saw without any teeth. With this, together with emery and water, they rub and wear the stone with unwearied patience. Leon Battista Alberti recommends goat's blood to be used for tempering the chisels for working it, but experience has proved its inadequacy, although by this means the sculptors were enabled to make a flat or oval form, but could never attain any thing like a figure. In 1355 Cosmo de Medicis is said to have distilled a water from certain herbs with which his sculptor, Francesco Taddi, gave his tools such an admirable hardness and

temper, as that he performed some fine works with them, particularly Christ's head in demi-relievo, and Cosmo's head and his duceb's. Even the very hair and beard, how difficult soever, are here well conducted; and there is nothing of the kind better in all the works of the ancients. This account is, however, very apocryphal, and it is more than probable that he followed the more certain but prolonged action of gem engraving. The French have discovered another mode of cutting porphyry, viz. with an iron saw without teeth, and with a *grez*, a kind of freestone pulverized, and water.

Porphyry, on account of its hardness, is much valued in chemistry, furnishing mortars, &c.; colourmen also use it as stones on which to grind or levigate their powders, and the same quality renders it applicable to other similar purposes. Its capability of attaining the most beautiful polish has also caused it to be brought into use and employed in architectural ornaments: thus, in a church in Rome, there are two beautiful columns of black porphyry; there are also many monuments still existing in the Eternal City, composed of this material, as well as modern works of art, wrought by the Italians from the broken pillars. The tomb of Constantia is one of the most considerable pieces now remaining entire. Apollo's and the busts of the twelve emperors now in the Tuilleries are all in porphyry. Cleopatra's needle, as it is commonly termed, and the fellow obelisk, as well as another obelisk near Cairo, and numerous figures scattered throughout Egypt, are wrought in this material. In the East Indies, black porphyry was formerly very extensively used in the architecture and architectural ornaments of the temples; and the Chinese are evidently acquainted with some mode by which they can fashion it, as it is reported to be used there in their palaces and temples, and even for domestic ornaments.

Pliny, speaking of the mineral excavations taking place in his days, says, "We hew down mountains, and we drag them from their base in quest of objects which may gratify our luxury. We remove the barriers which nature seemed to have placed between nations, and we construct vessels exclusively adapted to the transportation of marble." In periods still more remote, we find the Egyptians waging the same mighty warfare, penetrating to the very heart of the mountains to form a resting-place for their dead, erecting mighty barriers against the encroachments of the Nile, and building pyramids of brick and stone vieing in size with the mountains surrounding them.

Writers find it difficult to conceive what tools the Egyptians used to fashion those mighty porphyritic monuments, whose gem-like hardness defies the best-tempered steel of our times, and many of them doubt the existence of steel implements at this early epoch; but upon diligently tracing effects to their primary causes, we find a ready solution to the enigma. Egyptian porphyry forms in the same manner as Egyptian jasper, and under precisely the same conditions, being at first simply cohesive, and readily separable in its parts, but gradually acquiring, by long continuous atmospheric heat, a more perfect unity of parts, and, in proportion to its exposed situation, a greater degree of hardness. Upon examining the quarries from whence the obelisks and pillars were taken, we find abundant evidence, in the chisel-marks, of iron implements having been used, and this is also demonstrated by the broken fragments scattered around; these may also be adduced as reasonable proofs of the porphyry having been in those early ages, and while hidden within the earth, or shielded by its position from the direct action of the sun, much softer than it is in the present day. This change in the condition of rock is common to every species; thus, much of the carbonate of lime in the bowels of the mountains is exceedingly soft in the present day; as for instance, the inner chamber of the tomb of the kings discovered by Belzoni; but upon long exposure to the atmospheric action, it becomes highly indurated. Again, some of the huge porphyritic bodies exhibit phases of change in their physical condition, as they have dipped into the earth, and the monument, or other sculptured object, some of which we have in the British Museum, exhibits a party-coloured appearance, as though formed by different kinds of rock. Again, in the gallery of Egyptian antiquities, may be observed figures sculp-

tured in breccia, which is none other than the first passage of nature into the crystalline or semi-crystalline form of rock; and here, it may be observed, cohesion terminates, as the sand and gravel bed dips into the bosom of the earth.

It should be known that all varieties of rock, while existing in their natural state, undergo changes until they have attained perfection according to their nature, passing gradually from their disintegrated form of earth to their nature or indurated state, when they become incapable of further change in atomic structure, and continua to exist in this state, on sufferance of climate, or absence of corroding or destroying causes. As the soft nodules of silica harden into gems upon exposure to tropical heat, so the larger siliceous mass, termed porphyry, progresses towards the like improved condition, the degree of hardness it acquires depending on the nature, union, and disposition of its material. Some of the porphyries are closely allied to breccia, the sands and pebbles being cemented together by clay; and the highly indurated clay porphyry is the hardest of all varieties, being in the topaz-like state; but inasmuch as in many varieties it contains bodies simply siliceous, or of a still softer nature, so is it very often exceedingly variable in this respect, even in the same piece of rock.

The Egyptians were well acquainted with corundum, the sapphire, the ruby, the emerald, the topaz, emery and adamantane spar, and also with the fact, that the pounded material of the porphyry, as well as the sandy particles, partook of the nature of the rock, and I am therefore inclined to suppose that they made free use of bodies of this nature, as the natives of the East do in the present day. Da Costa imagines, that by unwearied diligence and with numbers of common tools, they rudely hewed and broke the stone into the intended figure, and by continued application reduced it into regular designs. The modes of working it into figures were various, for some appear to have been wrought with the chisel, others with the saw, others with wheels, and others have evidently been ground down with emery, or some other very hard substance. There is no doubt that much time and labour were bestowed upon them, and time and labour were of as little value to the rulers of Egypt in those days as they are at present; of this we have evidence in the multitudes employed on the pyramids and other public works, independent of the incessant labour of canal digging.

Wallerius makes porphyry a species of jasper; and, as I have previously observed, there is both an uniformity of composition and character, and both are formed under the same influences; the existing differences arise from the former consisting of large ponderable masses or beds, whereas the jaspers are merely small nodules.

The purple porphyry is extremely hard, compact, and heavy, of a fine strong purple, variegated more or less with pale red and white, and with a small number of little black flaky spots. Its purple is of all degrees, from the deep tinge of the violet to a pure claret colour. It abounds in Egypt; and the smaller masses or nodules concentering together, pass by transition into rose jasper: this is also another striking proof that the one and the other claim the same common origin.

In the above explanations on the origin of porphyry and Egyptian jasper, I have demonstrated the non-volcanic nature of these rocks and stones; in the Egyptian and Nubian deserts, where they abound, and from whence they have been formerly quarried, in order to administer to the grandeur and luxury of the Romans, they are disposed in and among pure and undisturbed oceanic beds, the jaspers forming the surface of the valleys, from the fossilized remains of oceanic bodies, separately, as fossilized fishes, molluscous and crustaceous animals; or united in clumps or small groups by a calcareous cement analogous to their nature; the porphyries, on the other hand, are vast aggregate masses, composed of all these various bodies and fragments of bodies, presenting elevated cliffs and hills of this most beautiful product, in conjunction with many beautiful coloured marbles. Their laws of formation are long continuous atmospheric heat, exercised upon a desert or sterile soil, pregnant with saline matters, acids, and alkalis in their uncombined state, and the absence

of rain or communicating water. The term plutonic rocks is therefore wholly misapplied, so far as regards volcanic influence; that they bear some resemblance to lavas is very natural to suppose, for analogous lavas are of analogous formation; and the action of the fire, although it causes a displacement and eruption of the material, and more finely levigates the organic remains of which it is composed, cannot alter the character of its earths; still, there is no instance on record of lava passing into the state of porphyry, and therefore no foundation for the geological speculations of the present day, built upon these supposed plutonic rocks. On the other hand, considered as one of the first-formed rocks after limestone, and when of purely oceanic materials, it may be considered *primary*; but considered in common with others, as even now forming in those hot distant climates, it is equally reasonable to term it *secondary* and *recent*: the reader will therefore bear in view these distinctions, carefully avoiding the common vulgar error of generalizing on particular phenomena, for the operations of nature, camelion-like, indefinitely vary.

#### CHURCH-BUILDING INTELLIGENCE, &c.

*Church of England School at Overbury, Gloucestershire.*—It is intended to erect a school-house in the above parish, for educating the children of the poor. A very convenient site for the building has been promised on purchase.

An additional donation of 500*l.* from the Rev. Dr. Warneford has been announced subsequently to laying the foundation-stone of the chapel attached to Queen's College, Birmingham.

The Bill prepared by the vicar for the new arrangement of the parish of Leeds has received the final consent of the Ecclesiastical Commissioners, and will be cordially supported by her Majesty's Government.

#### RAILWAY INTELLIGENCE.

*Atmospheric Railway to Halifax.*—Mr. G. Buckton Browne, a civil engineer, sets forth in a local paper, a scheme for an Atmospheric Railway from Halifax to Bradford. It appears that the line would be about  $7\frac{1}{2}$  miles in length, and that it is peculiarly adapted for the application of the Atmospheric principle, having a short summit level about half-way between the two termini, at which point the entire stationary engine establishment would be concentrated. The trains (adds Mr. Browne) will thus be drawn up to the summit, and the remainder of the journey be performed by gravity alone; a single line of rails will be quite sufficient for double the amount of traffic that can be brought upon it. He proposes to apply also Messrs. Cooke and Wheatstone's electrical telegraph, in connection with which, says Mr. Browne, the Atmospheric Railway "combines a degree of safety, with speed, unattainable by the locomotive; it admits also of being worked in a great variety of ways; the trains may traverse the whole distance without stoppage, or they may stop at any point, either ascending or descending, where it may be found profitable to do so; and further, one very important advantage which this system has over the locomotive consists in the facts, that while the locomotive, to be worked economically, requires a maximum load, and of course a limited number of trains, the Atmospheric system admits of an unlimited number of trains, with very little increased cost.

*Exeter and Crediton Railway.*—We understand that for the twelve hundred shares in this undertaking there have been applications to the amount of five thousand. Nothing can more forcibly display the public confidence in this species of investment.—*Exeter Gazette.*

*German Railways.*—The *Murzburg Gazette* informs us, from Breslau, that the treaty for the construction of the Thuringen railroad has been signed by the governments interested in it, viz., Prussia, Saxe Weimer, and Saxe Coburg Gotha.

The York and Scarborough Railway Bill was read a third time, in the House of Lords, on Tuesday evening week, and passed. The length of the line is about forty-two miles, with a branch of rather more than six miles; the estimated cost is 260,000*l.*

#### PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c.

Granted between 27th April and 23rd of May, 1844.

[SIX MONTHS FOR ENROLMENT.]

Pierre Armand Lecomte de Fontaine-neau, of Skinner's-place, Size-lane, merchant, for a new mode of constructing barometers and other pneumatic instruments, being a communication. April 27.

John Dixon, of Wolverhampton, iron-master, for improvements in heating air for blast furnaces, and for other uses. April 27.

Arthur Wall, of Bisterne-place, Poplar, surgeon, for certain improvements in the manufacture of steel, copper, and other metals. April 27.

Isaiah Davies, of Birmingham, engineer, for certain improvements in steam-engines, part of which improvements are applicable to impelling wheel carriages. April 27.

Edward Cobbold, of Melford, Suffolk, master of arts, clerk, for improvements in the preparation of peat, rendering it applicable to several useful purposes, particularly for fuel. April 27.

William Jeffries, of Little Sussex-place, Hyde Park-gardens, for improvements in sweeping chimneys, and in apparatus to prevent chimneys from smoking. April 30.

Robert Gordon, of Heaton Foundry, Stockport, millwright and engineer, for improvements in grinding wheat and other grain, and in dressing flour or meal, which improvements in grinding are also applicable to grinding cements and other substances. April 30.

William Fairbairn and John Hethrington, of Manchester, engineers, for certain improvements in stationary steam-boilers, and in the furnaces and flues connected therewith. April 30.

Jacob Samuda, of Southwark iron works, engineer, and Joseph D'Agular Samuda, of the same place, engineer, for certain improvements in the manufacture and arrangement of parts and apparatus for the construction and working of atmospheric railways. April 30.

John Melville, of Upper Harley-street, Esq., for improvements in the construction and modes of working railroads. April 30.

James Hayman, of Mount-street, Lambeth, corn-dealer, for an improved construction and arrangement of certain parts of omnibuses and other vehicles. April 30.

Robert Corden, of Nottingham, tobacco-manufacturer, and Sidney Smith, of the same place, engineer, for improved economical apparatus for making gas for illuminations. April 30.

William Colborne Cambridge, of Market Lavington, Wilts, agricultural machine maker, for certain improvements, first, in machinery for rolling or crushing ground; second, for cutting and threshing agricultural products; and, third, an improved adaptation of horse power to threshing-machinery, which may also be applied to other purposes. April 30.

Charles Watterson, of the firm of Macquire, Watterson, and Co., Manchester, soap manufacturers, for certain improvements in the manufacture of soap. May 8.

Joseph Wright, of Gough-street, Gray's-inn-lane, coach-builder, for certain improvements in railway and other carriages. (Being a communication.) May 8.

James Grant, of Vine-street, Westminster, gas-fitter, for improvements in the means of ventilating buildings and other places where a change of air is required. May 8.

William Vose Pickett, of Tottenham, Esq., for certain methods of preparing in metal, or other substances, the parts and features of architectural construction and decoration, and for applying the same in the construction and arrangement of houses and other buildings. May 8.

Thomas Grimsley, of Oxford, sculptor, for a new method of constructing a self-supporting fire-proof roof, and other parts of buildings, with bricks and tiles formed from an improved machine. May 14. Two months.

Edward Hill, of Hart's Hill, Worcester, iron manufacturer, for improvements in the manufacture of railway and other axles, shafts, and bars. May 14.

William Walker, jun., of Brown-street, Manchester, hydraulic engineer, for improvements in warming and ventilating apartments and buildings. May 14.

Peter Armand Lecomte de Fontaine-neau, of Skinner's-place, Size-lane, London, for a new and improved mode or method of paving and covering roads and other ways or surfaces, being a communication. May 15.

Henry Holmes, of Derby, cutler, for improvements in the manufacture of bricks, tiles, and other plastic substances. May 15.

John McIntosh, of Glasgow, gentleman, for certain improvements in revolving engines, and an improved method of producing motive power, and of propelling vessels. May 17.

James Pilbrow, of Tottenham, civil engineer, for certain improvements in the machinery for, or a new method of propelling carriages on railways and common roads, and vessels on rivers and canals, &c. May 17.

Thomas Martin, of Withybus, Haverford-west, Pembroke, for certain improvements in the construction of slated roofs, flats or floors, tanks, or cisterns, or reservoirs for water, and in pipes, tubes, or channels of the same material, for the conveyance of water. May 22.

James Petrie, of Rochdale, Lancaster, engineer, for certain improvements in steam engines. May 22.

James Bremner, of Pulteney Town, Caithness, civil engineer, for certain arrangements for constructing harbours, piers, and buildings in water, for cleansing harbours, and for raising sunken vessels. May 22.

John Henry Moor, of Lincoln's-inn-fields, gent., for certain improvements in the construction of carriages generally. May 23.

Richard Wilson, of Newcastle, builder, for improvements in the manufacture of tiles. May 23.

John Wilkie, of Glasgow, mechanic, for improvements in machinery or apparatus for working wood into the various forms required for making doors, window-shutters, window-sashes, mouldings, flooring, and other purposes. May 23.

John Taylor, of Duke-street, Adelphi, gent., for certain new mechanical combinations, by means of which economy of power and of fuel are obtained in the use of the steam-engine. May 23.

#### SCOTCH PATENTS.

William Henry Barlow, of Leicester, civil engineer, for improvements in the construction of keys, wedges, or fastenings for engineering purposes. April 24.

John Dixon, of Wolverhampton, ironmaster, for improvements in heating air for blast furnaces, and for other uses. April 24.

John McIntosh, Glasgow, for certain improvements in revolving machines, and an improved method of producing motive power, and of propelling vessels. April 30.

William Irving, of 102, Regent-street, Lambeth, Surrey, for improved machinery and apparatus for cutting and carving substances to be applied for inlaying and other purposes. May 3.

James Murray, of the Garnkirk Coal Company, in the parish of Cadder, of Lanark, Scotland, for a new method of using and applying artificial gas made from coal, oil, or other substances for lighting and ventilating caverns, pits, or mines, or other pits, where minerals or metals are worked or extracted. May 3.

James Bremner, residing at Pulteney Town, Caithness, civil-engineer, for certain arrangements for constructing harbours, piers, and buildings in water, for cleansing harbours, and for raising sunken vessels. May 9.

John Wilkie, of Glasgow, mechanic, for improvements in machinery or apparatus for working wood into the various forms for making doors, window-shutters, window-sashes, mouldings, flooring, and other purposes. May 16.

**BRISTOL DOCKS.**—The Dock Company have requested the advice and assistance of Mr. Brunel, respecting the extensive repairs necessary to be effected to the narrow lock of Cumberland Basin.

ARCHITECTURAL GEOMETRY, No. II.—  
TUDOR ARCHES.

TO THE EDITOR OF THE BUILDER.

SIR,—Beneath is a method of finding the centres for describing the Tudor arch to any width and height: it is not a solution of the proposition given by a "Subscriber from the Beginning;" it may, however, be of service.

Let AB be the springing line, and CD the height of the arch; draw BE perpendicular to AB, and make it equal to two-thirds of the height CD; join ED, and draw DF perpendicular to ED; make BG and DH each equal to BE; join GH, and from the middle of GH draw aF perpendicular to GH, meeting DF in F; then F and G are the centres for describing the curves, and the two arcs will meet in the line FGI, which passes through their centres. By drawing FJ parallel to AB, and producing OC to O, the centres for the other side of the arch will be found by making JO equal to FO, and AK equal to BC.—I am, Sir, yours, &c., Liverpool, June, 1844. II. W.

ARCHITECTURAL GEOMETRY.—No. III.

SIR,—The centres of the Tudor arch required by your correspondent will be found

as follows. Join AE and ED, and bisect them; the intersection of the bisecting line of AE with the base AB will give the centre, I, of the arc AE. Through EI draw the indefinite line EH, and the intersection of the bisecting line of ED with this indefinite line will give the centre, H, of the arc ED.

I believe, however, the ancient Freemasons did not work on this principle; they did not fix by arbitrary choice the width and height

of their arches. By a careful study of the existing arches, it will be found that the central points are determined by geometrical proportions. The base was divided into a certain number of parts, three, four, five, or six, or more, the first division of which gives the centre of the springing of the arch. The other centres are formed on lines let fall perpendicularly on these points from the base line in some definite proportion, as follows:—

In the first figure the base is divided into four parts, and the second centre, C, is three parts distant from the base line.

In the second example, the second centre is found by drawing the line DG through the apex of the equilateral triangle DFE.

In the third, the distance EG is the diagonal

of the square DE; this I found from a doorway at Croydon Palace.

The above will be sufficient to shew to students the infinite variety of form which may be obtained by geometrical proportion. The old architects did not trust to the "rule of thumb."—I am, Sir, yours, &c., T. L.

ARCHITECTURAL GEOMETRY.—No. IV.

SIR,—In your last number a correspondent requests the solution of a problem on the Tudor arch. The following is a method of drawing Tudor arches from similar data.

AC half the width of the arch, CD height, DF direction of the chord of the upper arch.

Produce CA indefinitely to the left, produce DF till it meets the horizontal line CA in F. Draw AB perpendicularly to CA, make BK=AB. Draw KI perpendicular to DF, then will I be the centre of a circle to which DF forms a tangent, and the half arch AKD is one of the limits of the problem, the radius of the upper part KD being infinite, and therefore the curvature is nothing measurable.

Again, draw DL parallel to FC, and make the angle to DM=half a right angle. Draw AE, making an angle with CA=GD, DM, bisect ED in G. Draw GO perpendi-

cular to FD, cutting DC produced in O. Join EO, cutting HC in H, thus will H and O be the centres of an arch which is the other limit of the problem, between which limits an infinite number of Tudor arches may be described, which will answer the conditions of the problem, so that any radius less than AH and greater than AI will be the radius of the lower part of the Tudor arch agreeing with the data. The arch will be more or less pointed as the centre of the lower portion is chosen near to or remote from I.

The demonstration of the first limit is apparent, but the last is not so, and it therefore remains to be proved that the angle AEH is isosceles or the side HA = to the side HE.

Because the angles EGO and DCF are similar.

∴ the angle GOE = to DFC.

∴ the angles FEH and HNO are similar.

Hence, the angle FEH = EGO + GOE.

∴ EGO + 2GOE = HNO + NOH =

A E + H E A.

∴  $\frac{1}{2}$  (E G O + 2 G O E) =  $\frac{1}{2}$  (H A E + H

E A) = H A E = G D M.

∴ H A E = H E A, which proves H A

equal to H E.

There are other properties, not altogether without interest, connected with the problem, but I dare say the figures will satisfy your querist.

I am, Sir, your obedient servant,  
J. BURLISON.

Correspondence.

COMPETITION IN BUILDING.

SIR,—As there never was a measure proposed in the legislature that did not meet with opposition from some quarter or other, no matter how advantageous it might prove to the community at large, so it would appear that the measure I had the honour of proposing, through the medium of your valuable publication has been opposed. I allude to the policy of builders making their contracts by schedule instead of by estimate.

Your correspondent, L.O.G., appears to treat the matter truly very summarily. Yet, I would venture, with your permission, to ask him a few questions upon the point, and first, is he a private individual requiring the services of a contractor, or builder? if so, let him act upon the broad principle of upright-ness, and render to the individual he employs full value for value received. Nothing less; otherwise the "insatiable desire for gain" must rest at his own door, and not at that of his contractor. Second, is he a contractor? if so, whether had he better work for the sake of working, without profit, and of course to the injury of his brethren in the business (to use a coarse phrase, by helping to cut their throats), which is the end of estimating, or does he desire a remunerative rate of pay for the work he performs? If the former be the case, the "insatiable desire for gaining," the ruin of his business, rests at his own door, to the loss of his capital, the waste of his time, and the consequent injury of his family. If the latter be his desire, then he surely cannot be in earnest in his remarks published in your last.

I am willing to admit that the sins of our grandfathers in the business have done much to reduce the profits of the builders, but surely their misdeeds should not be visited upon the third and fourth generations, which have profited by the experience, dearly purchased, of such mistaken policy.

It is my firm conviction, that if the old system of prices by schedule were re-established, no such complaints as that named by L.O.G. would be found. I make no doubt he pays his grocer, having first carefully scrutinized his account; upon that a reasonable degree of profit is laid on each article, and so with most other branches of the trade, and yet I doubt or other trades would stare as much at a grocer were he to offer as would the grocer at him estimate of sav, "Will you supply to me an estimate of what groceries my family requires by the year?" without first delivering a schedule of prices for each article that might by probability be required.

If L.O.G. be a contractor, let me earnestly, and with a friendly spirit, recommend him to turn these matters carefully in his mind, and use his abilities in forwarding those objects which would prove a permanent benefit to his children's children, instead of having a hostile effect.

I am, Sir, yours, &c,  
Brecon, 10th June, 1844. STABILITAS.

CLIMBING-BOYS.

SIR,—I have, as a regular subscriber to your journal, read with much pleasure some able remarks in your leading article of last week relative to the proposed new Building Act, in which "re-institution of the use of climbing-boys" and beg to direct the attention of the Committee of Master Carpenters, to the fact of Mr. Seth Smith, the eminent builder of Eaton-square, so far back as the year 1830, having most effectually accomplished a me-

tallic lining for flues, which has been to my knowledge successfully applied to new and old buildings, wherein the emission of smoke through the joints of the brick-work was completely prevented, the draught of the fire adjusted, and the use of climbing-boys totally superseded; and perhaps, Sir, in justification of these remarks, I cannot do better than quote from a work written by Mr. Smith, at the above period (published by Carpenter and Son, Old Bond Street), where the author, with great truth, stated, "Besides the application of the metallic tubes to chimneys in new houses, they may also be introduced into, and form perfect linings to the flues of old and imperfect chimneys in any other buildings;" and again Mr. Smith observes, that in "forming a complete fire-proof lining to chimneys, the 'METALLIC LINING' has the additional advantage of suppressing the odious, painful, and sometimes fatal practice of climbing-boys." I am, Sir, yours obediently,

EDWARD NANGLE.

Knightsbridge Green, June 12.

LONG'S PATENT ORNAMENTAL GLASS.

SIR,—I expected to have seen in THE BUILDER, with your remarks upon the works of art sent in for the Parliament Houses, some account of Long's patent glass. Having a mansion in the country near completion, where I had some thoughts of adopting the article in question, I should feel obliged by your giving me your opinion.

I am, Sir, your humble servant,

FABRICATOR.

[We refer our correspondent to an article upon the subject which appeared in THE BUILDER last year. Long's glass is appropriate for such a purpose, for superseding window-blinds, for lights in doors, which through bad planning are often rendered necessary in buildings, and for a variety of other purposes: the patterns are numerous; many people admire the engine-turned specimens, though for ourselves we prefer the less formal patterns.—En.]

Miscellaneous.

PUBLIC WORKS AND BUILDINGS.—A parliamentary paper, under the head of "Miscellaneous Estimates" was issued on Saturday. Its title is "Public Works and Buildings." It appears from it that for public buildings and royal palaces the estimate was, in 1842, 106,085*l.*; in 1843, 105,636*l.*, and in 1844, 112,190*l.* For Houses of Parliament (temporary), in 1842, 5,395*l.*; in 1843, 9,590*l.*, and in 1844, 5,420*l.* For new Houses of Parliament, in 1842, 105,000*l.*; in 1843, 140,000*l.*, and in 1844, 60,000*l.* For Trafalgar-square, in 1843, 12,000*l.*, and in 1844, 7,000*l.* For Holyhead Roads Harbour, &c., in 1842, 4,753*l.*; in 1843, 4,169*l.*, and in 1844, 4,164*l.* For Caledonian Canal, in 1842, 50,000*l.*; in 1843, 5,000*l.*, and in 1844, 50,000*l.* For parks, buildings, &c., in Ireland, in 1842, 17,659*l.*; 1843, 25,376*l.*, and in 1844, 26,871*l.* For Kingstown Harbour, in 1842, 10,000*l.*; in 1843, 10,000*l.*, and in 1844, 8,000*l.* For Port Patrick Harbour, in 1843, 4,500*l.* For the Hall of General Assembly of the Church of Scotland, Edinburgh, in 1842, 1,936*l.* This table of expenditure exhibits an increase in the estimates for the present year as compared with 1842, of 22,342*l.*, and a decrease of 49,525*l.*, shewing a net decrease of 27,183*l.* It also exhibits an increase, in relation to the past year, of 53,049*l.*, and a decrease of 95,675*l.*, shewing a net decrease of 42,626*l.* It will be seen from this return that the sums estimated for expenditure upon public buildings in Ireland, have, during the last two years, considerably exceeded the estimates of the year 1842.

THE NELSON TESTIMONIAL.—The Emperor having ascertained that the funds for the erection of this national tribute to our greatest naval hero were inadequate to its completion, immediately directed Count Orloff to enclose a draught for 500*l.* to the Duke of Wellington, the draught was accompanied by a letter from the Count, written by command of his Majesty, and expressive of the pleasure the Emperor felt in contributing towards the erection of a testimonial to so great a warrior.—Times.

BYRON'S STATUE BY THORWALDSEN.—A case of an extraordinary nature, and in which the names of two of the greatest characters of the age will figure, is about to be brought before the London tribunals. Thorwaldsen, as is it well known, had executed a colossal statue of Lord Byron, which he considered as one of his best works, and presented it to the chapter of Westminster, on condition of its being placed in that cathedral, beside the monuments of other poets. The chapter at first accepted the offer; but it is equally well known that some scruples were raised afterwards against placing the author of "Don Juan" in this national mausoleum; and the case containing the marble was never claimed by the chapter. The testamentary executor of Thorwaldsen being informed of this state of things, made some inquiries, and the master-piece of Thorwaldsen was found lying on the floor of a cellar in a state of extreme deterioration, amongst the fragments of the case, which the humidity of the place had reduced to a state of perfect rottenness. Consequently, a person duly authorized by the executor addressed a formal reclamation to the authorities, but when the Custom-house officers went with him to the cellar, it was found that the statue had disappeared, and nothing but fragments of the case remained behind. The executors then addressed to the Custom-house a demand for indemnity. This, however, was refused, under the plea that it cannot be answerable for goods refused by the parties to whom they are addressed, and that such goods remain in their stores solely at the expense and risk of those to whom they belong. At this stage, in fine, the executors have resolved on bringing an action for damages against the Custom-house of London. The sum claimed is 30,000*l.* (750,000*fr.*), at which the statue was valued by the artists of Rome on its being shipped to London.

VISIT OF THE EMPEROR OF RUSSIA TO THE NEW HOUSES OF PARLIAMENT.—His Imperial Majesty the Emperor of Russia, accompanied by Baron Brunow and suite, arrived as early as a quarter before 11 o'clock, and were shortly afterwards joined by His Royal Highness Prince Albert and the Earl of Lincoln. His Majesty took the highest interest in the progress of the works, minutely examining the quality of the stone and its workmanship, and was much pleased with the regularity and orderly procedure of the immense body of masons and other workmen, as well as with the ingenuity displayed in moving the various materials. The Emperor and His Royal Highness having taken a view of the river front, ascended the temporary staircase at the Victoria Tower, and having walked for a considerable distance upon the top of the unprotected walls of the Victoria Gallery, proceeded to examine the interior of the new House of Lords (which is now just ready to receive the roof), passing over the ordinary scaffolding to the house lobby and the central hall, whence the Royal and distinguished visitors proceeded to the model and sculpture rooms. His Imperial Majesty evinced the liveliest interest in the whole of the works, and it was exceedingly gratifying to observe the freedom and condescension with which His Majesty conversed with Mr. Barry upon the design and arrangements of the various parts. Mr. Barry had the honour of escorting the Royal party, attended by Mr. Grissell.

THE NEW COMMERCIAL BANKING OFFICE.—On Tuesday, the foundation-stone of the building about to be erected in George-street by the Commercial Bank of Scotland, was laid in presence of the directors and office-bearers of the bank, by James Wyld, Esq., of Gilston, one of the original directors. The various coins now in use, with some documents, were deposited in the centre of the stone. The plan of this building is by Mr. David Rhind, and reflects the greatest credit on the genius and taste of the architect. It is in the Grecian style of architecture; and will add another striking and graceful feature to George-street, where so many of our public institutions are now concentrating.—Edinburgh Paper.

It is the intention of the Earl of Carlisle to rebuild Naworth Castle in a style of princely magnificence.

**THE METROPOLITAN IMPROVEMENTS.**—The greater portion of the houses between Charlotte-street, Bloomsbury, and Oxford-street—to be removed for the formation of the new street—have been taken down to the foundation. Among the number is the Hare and Hounds public-house, situate near the station-house of the E division, which was formerly a celebrated resort of the Londoners in the 16th and 17th centuries. Till the reign of Charles II. it was known by the sign of the Beggars' Bush, when the name became altered in consequence of a hare having been hunted and caught there, where it was afterwards cooked and eaten. This locality has undergone many changes. There was during the reign of Henry I. an hospital for lepers, which was founded by Matilda, the wife of that king; and subsequently the scaffold was removed to that spot from Smithfield, upon which the first victim was Lord Cobham, the friend of Henry V., who was hung in chains, and burnt by a slow fire, and which scaffold was afterwards taken to Tyburn. In a few days the site of the above public-house will be lost, as it will be nearly in the centre of the new street. Between Bedford Chapel and High-street, St. Giles's,—which was a short time ago the parish stone-yard—poles are erected to form the line of the new houses, the cellars of which are now being formed. In Belton-street, leading from High-street to Long Acre, the new church of Christ Church, the foundation-stone of which was laid a few weeks ago on the east side of the street, is in a state of great forwardness, and but few houses remain between there and Long Acre to be demolished. In Cranborn-street, an entirely new pavement has been laid down, giving the public thoroughfare all the appearance of a street; and in a short time houses will be erected on the opposite side, for which the various cellars are formed.

**THE NEW ROYAL EXCHANGE.**—On Saturday afternoon much interest and curiosity were excited in Cheapside on observing a vehicle proceeding slowly along, with a partially covered colossal figure in it, from the studio of Westmacott, the sculptor. Many persons, believing it to be the celebrated statue of the Duke of Wellington intended to be raised in front of the new Exchange, followed it to the spot, when it proved to be one of the figures for ornamenting the pediment of that edifice, many of which were already within the inclosure, and some of them elevated to their places. They are all colossal, of Carrara marble, and emblematic of British industry and enterprise.

**ROYAL INSTITUTE OF ARCHITECTS.**—The following are the office bearers for the ensuing year:—President, Earl de Grey; Vice-presidents, Messrs. H. E. Kendall, J. B. Papworth, and George Smith; Members of Council, Messrs. W. Booth, Foxhall, George Godwin, W. Grellier, S. Beazley, James Noble, C. Parker, W. F. Pocock, H. Roberts, and James Thompson; Hon. Secretaries, Messrs. A. Poynter, and G. Bailey; Foreign Secretary, T. L. Donaldson.

**GOETHE.**—The statue of Goethe meets in Frankfort with a fate to similar that of Byron in London, which has lain in the Custom-House for several years. The magistrates of Frankfort did not appoint any place within the town to erect Goethe's statue; it will be placed in a lonely alley, without the gates of the city of his birth.

**WOOLWICH.**—Under the superintendance of Capt. Denson, civil engineer, of her Majesty's dock-yard, Woolwich, a considerable enlargement of that establishment is about to take place. For some time past much inconvenience has been felt in consequence of want of room by the boiler-makers belonging to the yard.

**CORNISH ENGINES.**—The number of pumping-engines reported for the month of April is 37—the quantity of coals consumed being 3,380 tons, lifting, in the aggregate, 31,000,000 tons of water 10 fathoms high. The average duty of the whole is, therefore, 57,000,000lbs. lifted 1 foot high by the consumption of a bushel of coal.—*Mining Journal.*

The beautiful New-road, from the High-street, Cheltenham, to the back of the College, formed at the expense and under the direction of the late Sir Matthew Wood, was thrown open to the public on Thursday week.

**ARCHDEACON ONSLOW ON PEWS.**—The venerable archdeacon next alluded to the subject of selling, letting, and disposing of pews in parish churches. He had understood that this practice still obtained within his archdeaconry. In addition to buying and selling, he was informed that in some instances persons had claimed certain pews as their own property, who had not even a residence in the parish, or were absolutely separatists! He thought this irregularity arose from ignorance of the law rather than from an intentional infraction thereof. He was aware that in these days the existence of pews was condemned, and the restoration of open seats recommended; but he did not entirely concur in the sentiment. Pews were useful, as private accommodation for families, who necessarily felt a greater comfort in worshipping together and being united in the house of God. Pews were also conducive to a more undivided attention to the services. Nevertheless, he did not approve of them when not in keeping with the style of the building, or when they were unsightly, or obstructed the view of the pulpit. But to return to the question of right. It might be laid down as a general rule that all pews were the property of the parish: but the disposal of them was left to the ordinary, that is, the bishop, and to the churchwarden under him. They were to be allotted to the inhabitants according to rank and station, and in proportion to the extent of their families. It was also recommended that the churchwarden should be guided by the advice of the minister. The bishop's authority in the disposal of pews could only be superseded by faculty or prescription. Prescription could only be maintained by immemorial usage, and constant repairs by the claimant; for if proof of repair by the parish were adduced, the prescription would end. A faculty appropriated a pew in respect of a house, the occupier of which, as long as he remained in the house, and was a member of the church, was entitled to the pew; but on the house being re-let, the former tenant could have no further right. Claims were sometimes made on the plea of long possession, without disturbance; but this could not be maintained. Even the erection of a seat would not convey a permanent right; nor would the grant of a seat to any person and his heirs be legal. Now, if such was the law, it followed that the letting and selling of pews must be a violation thereof. Such things could only be done by Act of Parliament. Thus, in new churches, where large spaces were usually set apart for the poor, the pews were permitted to be let, in order to provide an income for the clergyman. Churchwardens had also been empowered to let the pews and apply the rents for repairs in certain instances. In proprietary chapels, which, as partaking of the nature of private property, did not come within the range of ecclesiastical laws, pews were legally let and sold.—*Address at Pershore, 21st May.*

**THE PLYMOUTH BREAKWATER LIGHTHOUSE** is completed. The light is at an elevation of 63 feet above the level of high-water spring tides, and appears red in all directions seaward, and white within the line of the breakwater. A bell is attached to the lighthouse, which is to be rung at intervals in foggy weather.

The Earl of Aberdeen has purchased Sir William Allan's picture of "Sir Walter Scott dictating to his daughter in the study at Abbotsford," now in the exhibition of the Royal Academy.

### NOTICES OF CONTRACTS.

For Masonry and all other work (except Iron-work) to be done in building a Bridge across the river Avon, at Bath.—Mr. Manners, City Architect, Bath. June 25.

For the erection of National Schools, with a residence for the master and mistress, at St. Ives, Hunts.—J. D. Hopkins, Esq., Architect, 25, Bedford-square, London. June 20.

For building a Lock-up House, at St. Ives, Hunts.—J. D. Hopkins, Esq., Architect, 25, Bedford-square, London. June 20.

For certain alterations and additions in the Parish Church of Melksham, in the county of Wilt.—Messrs. Wyatt and Brandon, Architects, 75, Great Russell-street, Bloomsbury. June 21.

For the additions and alterations to the County Gaol, at Nottingham; and the Nisi Prius Court, at the Shire Hall. (Separate Tenders.)—Messrs. Hawksley and Jalland, Architects, Nottingham. June 26.

For building Sewers in Old Fish-street, Trinity-lane, and several other streets and places adjacent thereto.—Jos. Daw, Esq., Guildhall. June 25.

For the alterations, improvements, and repairs to the School House in Hatton Garden.—Mr. Cooper, Architect, 1, Verulam-buildings, Gray's-Inn. June 29.

For the necessary Iron-work of a Bridge of one arch, 110 feet span, to be built over the river Avon, at Bath.—Drawings, &c., Mr. Manners, Architect, 1, Oxford-row, Bath. June 25.

For the executing of certain works for the improvement of Aberdeen Harbour.—Plans, &c., Mr. Abernethy, 69, Waterloo-quay, Aberdeen. June 20.

### COMPETITIONS.

Plans, &c. are wanted for erecting a Church at Southwall, Notts.—Further particulars, Mr. Wm. Shaw, Southwall, Notts. The successful competitor will be employed on the usual terms.

A PRIZE of 100 guineas will be given by the commissioners appointed to erect a lunatic asylum in the vicinity of the city of Kingston, Jamaica, to the person who shall produce the best plan, accompanied by a specification, of an asylum for the reception of the insane. The institution must accommodate 200 patients of both sexes, with the requi-

# The Builder.

NO. LXXII.

SATURDAY, JUNE 22, 1844.

OLLOWING this week our assigned course of proceeding, we again take up the subject of our commentary upon the proposed new Metropolitan Building-Act. We have this moment received a copy of the report of the Builders' Society, but regret that from our late reception of it we have as yet been unable to profit by any suggestions which it may contain; at the same time we may say that from the temperate and proper mode in which that society's

former report was worded, we have confident hope not only that it may contain valuable suggestions, but that their tone is such as to give them the greater likelihood of being complied with: though we have gone through the schedules of the Bill as amended, we think it better to postpone till next week the publication of our remarks on that part of the measure taking, in the mean while, the opportunity for making another review of them, so that we may speak with still greater confidence as to their correctness, policy, and profitable working; till then we invite all suggestions from those who understand sufficiently practical building, and the legal working of Acts of Parliament, and who have a general acquaintance with the subject; for that which one or two eyes may fail of discovering after a strict search, often even a casual observer fortuitously discovers at once; one thing, indeed, has somewhat surprised us, which is, that out of the multitude of letters sent to us, so very few relate to a measure so important as the one in question, as though it were generally imagined that any change in so vital a statute must be for the better; whereas the reverse is the case, as is most amply attested by the many unsuccessful attempts to produce a really good statute. We are confident in stating that by far the greater part of the evils complained of under the present Act are purely imaginary, arising from ignorance of its nature and provisions on the part of those who make such assertions. The chief requirements under a new statute are suitability to the altered times, extended operation, oblivion of the obsolete restrictions of the present Act, improvement where experience has shewn defects, the preventing of abuses, and a courting of good building by wise ameliorations of those stringent bars in the present statute which almost compel a resort to technical evasions in some cases, in order to carry forward building at all.

Clause 43 ought to contain summary power for the instant removal of chimney-pots, tiles, and other loose matters, which commonly after storms, and on many other occasions, are loose, and frequently merely lie upon the roofs

of buildings, ready with the next gust of wind to be blown down upon passengers.

The words "required to require" are still inelegantly retained in this clause.

Clause 44, for the reimbursement of the expense of making good damage caused by the fall of chimneys, should contain, in addition to recovery of the value of the building and furniture, provision for the recovery of the value of goods or merchandize, or other property so damaged.

The 46th clause provides for the recovery of the reasonable expenses of shoring up adjoining buildings, but does not render such shoring up imperative upon the party building; so that as by common law no man is obliged to shore up his neighbour's building, or even to give him notice to do so, the party building (if he doubt the likelihood of repayment, or fear allegation, that through unskilful shoring he has suffered the adjoining building to fall) may decline to shore up such building.

We think the 47th clause should not declare it the duty of the party building to make his claim WITHIN TWENTY-ONE DAYS for any portion of work to repayment for which he may be entitled.

The wording of clause 49 has been corrected as we suggested.

Clause 50.—"And be it enacted, with regard to such costs and expenses of works executed under this Act, so far as relates to contribution thereto by persons bound or liable to make contribution, that for the purpose of enabling the party upon whom the payment of such costs and expenses shall fall, either in the first instance or subsequently, to obtain contribution from other persons, being part owners IN LIKE DEGREE, it shall be lawful for every such first-mentioned person, whether he be freeholder, copyholder, leaseholder, mortgagee in possession, and whatever may be his interest or the nature and extent of such his interest, and whether he hold in his own right, or in right of others, and whatever may be the kinds and degrees of their respective interests, and he is hereby entitled to a contribution from every other person having as owner an interest in the premises of whatever kind or degree; which contribution is to be computed, according to the amount of his interest, in proportion to that of other persons interested, so far as such persons may be known, or can be reached by process of law or equity; and that it shall be lawful for any party so interested, and he is hereby entitled, to require the official-referees to settle and determine the same by their award, and their decision shall be final; and that if the person upon whom the payment of such costs and expenses shall have fallen, have paid, in respect of the interest of another or others, either unknown or who could not be reached by process of any court of law or equity, more than his own just proportion, then, on the production of such award, duly made, signed, and sealed, it shall be lawful for such person to have and exercise against other parties against whom such award shall be made, and he is hereby entitled to the like remedies, to compel payment of money, as are hereby given for compelling the first payment of such costs and charges of such expenses."

This clause (in the Bill before amended numbered 49) still contains the incongruity of setting out by laying expenses upon *part owners* IN LIKE DEGREE, and then providing for all manner of interests; we think it not improbable that excessive litigation would arise from acting under this clause; in very many cases no two persons would have interest in *like degree*. We must refer again to Mr. Bartholomew's observations upon the subject. We think this part of the Bill would "water-log" itself.

From clause 53 the minimum dimension of inhabited rooms of *one square* has been expunged. The forbidding rooms to be occupied as dog-kennels requires explanation; is it intended that no dog may be kept within a house?

Clause 54.—We think among the dangerous businesses, floor-cloth manufactories should be clearly expressed; most of those established have been burnt, and some twice within a very few years; wadding factories have all been burnt; the cotton-wool spread on strings throughout every part of such buildings in a few seconds, involving the whole in flame.

We must again refer strongly to Mr. Bartholomew's observations relative to the 55th and 56th clauses.

Clause 66. And be it enacted, with regard to such surveyors to be hereafter appointed under this Act, except district surveyors appointed to new districts, so far as relates to the ensuring the possession of due scientific and practical qualifications, that it shall be the duty of the official referees, and of the president and vice-presidents for the time being of the Royal Institute of British Architects, and of the president and vice-presidents for the time being of the Institution of Civil Engineers, and they are hereby authorized to examine any persons who may present themselves to be examined for the purpose of obtaining a certificate of qualification, with the view of becoming candidates for the office of surveyors of metropolitan buildings of any district within the limits of this Act, and that for that purpose it shall be lawful for such examiners from time to time to appoint such times as to them may seem fit, and from time to time to prescribe such course of examination as to them may seem fit, and that when such rules shall have been registered by the registrar of metropolitan buildings, they shall continue to be in force until they shall be amended, altered or rescinded by other rules to be made by such examiners and so registered; and that unless one week before the election of a surveyor for any district created by this Act, or for any district in respect of which the office of surveyor may become vacant, there be produced by or on the part of any person being candidate for the said office, a certificate of such examiners, certifying that he has been examined, and that he was thereby found to be duly qualified for such office, it shall not be lawful for any justices, by this Act empowered to appoint surveyors, to appoint such person to be such surveyor, and that if such person be so appointed, his election to such office shall be void."

We hardly know what benefit could possibly result from the president of the Royal Institute of British Architects being an examiner, he being neither an architect nor a surveyor; we happen to know that with the "Institute" a knowledge of the technical niceties of the present Building-Act does not flourish; and we believe a worse choice of examiners could not be made. We have all respect for the scientific knowledge of the president and vice-presidents of the Institution of Civil Engineers; but there again we must say their practice leads them to any thing but a mature knowledge of metropolitan building-jurisprudence. As none but a madman would choose judges from any but those who practise at the bar, so prudence and decency require that the examiners should be those who practise in the department of the Building-Act. The examiners, therefore, should be the registrar, official referees, and district-surveyors, and no others. After the publication of the two pamphlets, called "Transactions of the Royal Institute of British Architects," in which are promulgated roofings and foundation-works, which have entirely broken up and gone to utter ruin, no confidence whatever can be placed in the astuteness of that institution. While bearing every respect for its individual members, we are compelled to say that it would be an insult to the profession at large, which it by no means represents, and the confidence of which it most undoubtedly does not possess, to give it any corporate power over that profession. It is formed on no broad basis, except that of a fortunate, extravagant expenditure; for these reasons we have resisted all importunities to membership with it. And there is an extensive belief that the "Institute" will in seven years be no longer in existence; there is indeed no other instance of a body with similar funds, and professing so much, which has in a similar way misconducted itself. Its proceedings and published transactions form a bitter contrast with those of the Institution of Civil Engineers and of the Royal Corps of Engineers, and have humiliated English architecture in the face of all Europe; it has been thought *respectable* to join that society, but we never thought so.

In clause 71 and elsewhere our suggestion has been followed, in so changing the words "her present Majesty," that if the Act endure, the phraseology may still be appropriate.

Clause 77.—We must again state that we think this clause requires some restriction relative to the non-payment of fees to the district surveyor, in case work be not in all respects according to Act. We are convinced that the worthless part of the building class will evade the Act, continue to let the time for remedy elapse, and then evade payment of the fees. The parties who evade the fees are always those who cause the district-surveyor most trouble; some of the inferior class of builders are desperate characters; we know a case in which the offender stood pistol in hand, and threatened to shoot the district-surveyor if he did not go away.

The 78th clause, relating to the district surveyors' return, is still defective and contradictory: first, it is to contain an account of all works executed within the previous month; secondly, it is to be deemed to be a certificate that all the works enumerated therein have been done in all respects lawfully; and thirdly, it is not to protect offenders from proceedings for matters done before the making such return. Thus the surveyor is literally to return works improperly done, and then an indemnity is provided for enabling prosecution.

We repeat Mr. Bartholomew's suggestion, that the return "be deemed to be a certificate of all works enumerated therein, done in all respects agreeably to this Act, and of such works as have been done contrary thereto, and of the proceedings which have been taken thereon."

Clause 78.—We must again urge the utter impossibility of two official referees performing the multitudinous offices proposed to be thrown upon them; we are convinced that if power to appoint more be not reserved, a new statute must be made.

In clause 89 the words should for clearness run, "he is hereby required to report to the said commission the matter and the particular grounds and reasons for his refusal."

#### ROYAL INSTITUTION.

MAY 31.—Professor Daubeny gave a lecture "On the Provisions for the Subsistence of Living Beings evinced in the Structure of the older Rocks, and in the phenomena which they exhibit."—He began by observing, that as the attention of philosophers was that evening directed to the moon by the eclipse, he thought it might not be inappropriate to illustrate the line of his argument by reference to the supposed structure and condition of that satellite. Supposing then a human being to be transported to the surface of the moon, and to contemplate her in that condition in which astronomers represent her to us as existing—namely, as destitute both of seas and of an atmosphere, with vast cup-shaped mountains, the craters of volcanoes, vomiting forth steam and smoke, and emitting volumes of noxious gases, would he not conceive the globe in question abandoned to those destructive agencies which he saw in such intense activity, rather than that it was in a state of preparation for the abode of beings constituted like himself? Yet what the moon now is, geology leads us to infer that the earth has formerly been; and from the phenomena now presented to us by it, we may infer a train of events to have occurred which, whilst they must have been at the time utterly destructive to all kinds of life, nevertheless prepared the earth for the reception of living beings, and rendered it a more agreeable abode to those which, like man, possessed a feeling of the sublime and beautiful. The Professor then proceeded to point out the provisions for the future existence of living beings which were made in those earlier stages of the history of our globe, when it appears to have been in a condition as chaotic as that of the moon at present. Those ingredients of the crust of the earth which seem designed more especially for the purposes of living beings may be distinguished into such as minister to some object of utility for man in particular, and such as are essential to animals and vegetables in general. The former class, being commonly more or less poisonous, occurs in veins for the most part existing in the older rocks, being stored, as it were, out of the way, before living beings were created, such as copper, tin, lead, mercury, and other of the metals. The latter, on the contrary,

are more generally diffused through the strata of the globe, although, for the most part, in comparatively minute proportions. Amongst the latter are the fixed alkalis, which are present in all felspathic and other rocks of igneous origin, from which they are slowly disengaged by the action of air and water, in proportion as they are required for the necessities of living beings; whereas if they had been present in a readily soluble form in the earth, they would have been washed into the sea before they could have been made available for such purposes. Another essential ingredient in the structure of animals is phosphoric acid, which appears peculiarly suited for entering into the organization of a living body, by the readiness with which it undergoes changes in its properties, by the character of its crystallization, and (in the case of the bone-earth phosphate) by the association of the *libasic* with the *tribasic* salt, in equal proportions, which causes each to counteract the tendency to crystallize in the other, and thus renders it more capable of accommodating itself to the delicate texture of the animal fibre. The question then is, whence do animals and vegetables obtain this necessary ingredient? Professor Daubeny and others have detected minute proportions of it in many of the secondary rocks, but as these are derived from more ancient ones, it ought to be present likewise in them. Now we know at least of one instance in which this material occurs in considerable abundance in a rock which, so far as our observations at present extend, seems to have been formed antecedently to animal life. This is the slate rock of Esmemadura, in Spain, where, near the village of Logrosan, it had been pointed out as existing many years ago. Exaggerated reports had, however, been spread as to its extent, for Professor Daubeny, in a visit he paid last year to the locality, found that it formed only one solitary vein, generally about ten feet wide, and extending along the surface for about two miles. It also contains a considerable per-centage of fluat of lime, and as this ingredient appears, from recent experiments of the author of this paper, to be present generally in bones both recent and fossil, it would seem that it was treasured up by nature as one of the requisite materials for the bony skeletons of animals. Provision seems to have been also made for supplying living beings with their volatilizable, as well as with their fixed ingredients. The attraction of all porous and pulverulent bodies for gases may explain the manner in which the latter are brought into contact with the secreting surfaces of plants; but it must be remembered, that of the four elements which together constitute those parts of a living body which are dissipated by heat, oxygen alone can be directly absorbed. Of the three remaining, hydrogen must be presented in the form of water, nitrogen in that of ammonia, and carbon in that of carbonic acid. Now volcanoes appear to have been the appointed means of providing both of the two latter in quantities sufficient for the food of living beings, for both ammonia and carbonic acid are evolved in immense quantities from all volcanoes, as the Professor shewed by appealing to the case of Vesuvius and its neighbourhood, as well as to that of other volcanic vents. The production of ammonia in the interior of the earth might, he contended, be readily explained upon the principles of that theory of volcanoes which he had for many years adopted, and which was founded on the great discovery of the metallic bases of the earths and alkalis, which we owe to the genius of Sir Humphrey Davy. Once admit that those substances which we see brought up to the surface, in the shape of lavas and of ejected masses, exist in the interior of the globe, wholly or partially, in an unoxidized condition, and that first sea-water, and afterwards atmospheric air, gradually find access to them through certain crevices, and all the phenomena of a volcanic eruption may be shewn to follow; namely, the intense heat, the escape of muriatic acid, the copious deposits of sulphur, the volumes of carbonic acid, and, lastly, the salts containing ammonia; for if nascent hydrogen, disengaged from water decomposed by meeting with the alkaline metals, were brought in contact with nitrogen under a high pressure, there is every reason to believe that ammonia would be the result. Thus, the very agents of destruction,

which seem at first sight to be antagonist forces to every kind of creative energy, have been, in fact, the appointed means of supplying the materials out of which all organized beings are fashioned. But though the materials for our subsistence are thus provided, it does not follow that man is not to exert himself in order to obtain larger supplies than are naturally placed before him. On the contrary, his business is to husband his resources, and to apply them to the best account. Alluding to a late work of Professor Liebig's, he contended that this eminent chemist could not have meant to discourage the preservation of the volatile ingredients of our manure-heaps, whilst insisting on the paramount importance of supplying those which are fixed. It is true that nothing is lost, for the excrementitious matters which are washed into the sea increase the luxuriance of the marine vegetation, which affords food for a larger number of fishes, which again encourage a greater amount of sea-fowl, which finally deposit, what had been originally derived from the depths of the sea, on the islands of the Pacific, as guano. Thus England contrives, by means of her navies, to bring back from the opposite extremity of the globe, the very material which she originally wasted by the defective arrangements of her large towns. This, however, is a very circuitous mode of proceeding, and the true secret of all agricultural improvement is, to apply the means at our disposal, so as to produce a return for the toil expended in the shortest possible space of time.

JUNE 7.—Right Hon. Sturges Bourne, V. P., in the chair.

Mr. Faraday, "On recent Improvements in the Manufacture and Silvering of Mirrors."—Mr. Faraday's subjects were: 1. The manufacture of plate-glass. 2. The *ordinary* mode of silvering mirrors. 3. The *new* method of producing this result, lately invented and patented by Mr. Drayton.—1. Mirrors are made with plate-glass. Mr. Faraday described glass generally as being essentially a combination of silica with an alkaline oxide. The combination, however, presents the character of a solution rather than of a definite chemical compound, only it is difficult to affirm whether it is the silica or the oxide which is the solvent or the body dissolved. From this mutual condition of the ingredients, it follows that their product is held together by very feeble affinities, and hence, as was afterwards shewn, chemical re-agents will act upon those ingredients with a power which they would not have were glass a definite compound. Mr. Faraday noticed, that as glass is not the result of definite proportions, there are many combinations of materials capable of producing a more or less perfect result. Each manufacturer, therefore, has his own recipe and process, which he considers the most valuable secret of his trade. It is, however, well known that the flint-glass maker uses the oxides of lead and of sodium, the bottle-glass maker lime (an oxide of calcium), and the plate-glass maker, in addition to soda, has recourse to arsenic. Mr. Faraday then adverted to the corrosion which takes place in the inferior qualities of glass, owing to the feeble affinity with which their ingredients are held together. He stated, that from the surface of flint-glass a very thin film of soluble alkali was washed off by the first contact of liquid, leaving a fine lamina of silica, the hard dissoluble quality of which protected the surface which it covered. If, however, this crust of silica chanced to be mechanically removed, the whole of the glass became liable to corrosion, as in ancient lachrymatories and other glass vessels. Mr. Faraday illustrated this by the corroded surfaces of two bottles, one obtained from a cellar in Thread-needle-street, where it had probably remained from the period of the great fire of London, another from the wreck of the *Royal George*. A still more striking instance of the instability of glass as a compound was exhibited by formations in the interior of a champagne bottle, which had been filled with diluted sulphuric acid. In this case the acid had separated the silica from the inner surface of the glass, and formed a sulphate with its ingredient, lime. The result was, that the bottle became incrustated internally with cones of silica and sulphate of lime, the bases of which, extending from within outwards, had perforated the sides of the bottle so as to cause the escape of the liquor it contained.

Mr. Faraday referred to the long period of annealing (gradual cooling) which glass had to undergo as a necessary consequence of glass wanting the fixity of a definite compound. He concluded this part of his subject by describing the mode of casting plates, and the successive processes which gradually produce the perfect polish of their surface. 2. Mr. Faraday next exhibited to the audience the mode of silvering glass plates as commonly practised. He bade them observe that a surface of tinfoil was first bathed with mercury, and then flooded with it. That on this tinfoil the plate of glass, having been previously cleansed with extreme care, was so floated as to exclude all dust or dirt; that this was accomplished by the intervention of  $\frac{1}{2}$  in. of mercury (afterwards pressed out by heavy weights) between the reflecting surface of the amalgam of the mercury and the glass; and that when the glass and amalgam are closely brought together by the exclusion of the intervening fluid metal, the operation is completed. 3. The great subject of the evening was the invention of Mr. Drayton, which entirely dispenses with the mercury and the tin. By that gentleman's process, the mirror is, for the first time, literally speaking, *silvered*, inasmuch as silver is precipitated on it from its nitrate (unar caustic) in the form of a brilliant lamina. The process is this: on a plate of glass, surrounded with an edge of putty, is poured a solution of nitrate of silver in water and spirit, mixed with ammonia and the oils of castia and of cloves. These oils precipitate the metal in somewhat the same manner as vegetable fibre does in the case of marking ink—the quantity of oil influencing the rapidity of the precipitation. Mr. Faraday here referred to Dr. Wollaston's method of precipitating the phosphate of ammonia and magnesia on the surface of a vessel containing its solution, in order to make intelligible how the deposit of silver was determined on the surface of clean glass, not (as in Dr. W.'s experiment) by mechanical causes, but by a sort of electric affinity. This part of Mr. Faraday's discourse was illustrated by three highly striking adaptations of Mr. Drayton's process. He first silvered a glass plate, the surface of which was cut in a ray-like pattern. 2nd. A bottle was filled with Mr. Drayton's transparent solution, which afterwards exhibited a cylindrical reflecting surface. And 3rd. A large cell, made of two glass plates, was placed erect on the table, and filled with the same clear solution. This, though perfectly translucent in the first instance, gradually became opaque and reflecting; so that, before Mr. Faraday concluded, those of his auditors who were placed within view of it saw their own faces, or that of their near neighbours, gradually substituted for the faces of those who were seated opposite to them.

INSTITUTE OF BRITISH ARCHITECTS.

JUNE 3.—T. B. Papworth, V.P., in the chair. Mr. C. H. Smith resumed the subject commenced on the 29th of April "On the Magnesian Limestones, especially with reference to those employed in the New Houses of Parliament." Previously to the Commission appointed to investigate the choice of a material for the Houses of Parliament, the proper selection of stone for building purposes with regard to its quality had been strangely neglected. Public attention was first called to this subject by Mr. (now Sir H.) De la Beche in 1835, and the inquiries originated by that gentleman resulted in the establishment of the Museum of Economic Geology and the Commission of which Mr. Smith was a member. On the first preparations for rebuilding the Houses of Parliament, efforts were made by our neighbours in Normandy for the introduction of Caen stone, and a great number of specimens were sent, comprising stone of every quality, from the best to the worst, all passing under the same name. In selecting the stone for the Houses of Parliament, the Commissioners had to take into consideration a variety of circumstances, independent of the mere quality; as the situation of the quarries, the facility of water-carriage, and the assurance that the supply of stone would not fail during the progress of the work, and that the cost of labour upon it should not greatly differ from that upon the building stones in general use. Upon comparing the produce of many quarries,

the Bolsover Moor stone appeared to the Commission to be the best adapted; and as beds of stone of nearly the same quality extend over a tract of about fifteen miles from north to south, the quarries of North Anston were finally selected, as uniting in the greatest degree all the conditions demanded. In this locality an ample supply of stone lies at a depth of from ten to fifteen feet. Eight beds of stone, of the best quality, are found lying nearly level, the uppermost affording blocks of four feet thick, and the remainder from two feet and a half to eighteen inches. The quantity of stone supplied from the Norfol Quarry at North Anston, between February 1840, and April 1844, amounted to 726,893 cubic feet. Mr. Smith made some remarks on the effect of lichen on the surface of stone, which has been supposed favourable to its preservation. His own observation had led him to a different conclusion, as he had found stone covered with lichen reduced to powder to the depth of a sixteenth of an inch on its removal; and he suggested that the lichen had had the effect of absorbing some of the elements of the stone. In some specimens of magnesian limestone the lichen appeared to have taken up the lime, and left the magnesia. A model was exhibited, and a description read, of M. P. Journef's system of scaffolding for high chimneys and columns; also of his machine for raising bricks and other materials.

CHURCH EXTENSION.

The meeting of the Incorporated Society for promoting the Enlargement, Building, and Repairing of Churches and Chapels, for the present month, was held at St. Martin's-place, Trafalgar-square, on Monday last; his Grace the Archbishop of Canterbury in the chair. There were also present the Bishops of London, Durham, Winchester, Lincoln, Gloucester, and Bristol, Bangor, Norwich, Ripon, and Lichfield; Sir R. H. Inglis, Bart., M.P.; Revs. H. H. Norris, B. Harrison, and C. B. Dalton; Messrs. J. S. Salt, H. J. Barchard, N. Connop, W. Davis, Arthur Powell, &c. The committee ordered the payment of several grants to parishes where the works have been completed, and, among other business transacted at the meeting, voted new grants of money towards building eight additional churches or chapels, re-building one, and enlarging or otherwise increasing the accommodation in fourteen existing churches or chapels; making twenty-three grants in all. The new places of worship are to be erected for districts in the parishes of St. Michael, Lichfield; St. Clement, Truro; Kingsdere, near Newbury, Berks; Barnstaple; Wooky, near Wells; Godalming, Surrey; Windsor, Berks; and St. Lawrence, Kent. The churches to be enlarged, &c., are situate in the parishes of Castle Church, Staffordshire; Bromsgrove, Worcester; Wormley, near Waltham Cross, Herts; Beoly, Worcester; Coombe Bisset, Wilts; Ilkeston, Derby; Uppington, near Shrewsbury; Buckfastleigh, Devon; Cheetham Chapelry, in the parish of Manchester; All Saints, Hereford; Penn, near Wolverhampton; Llanwddyn, Montgomeryshire; Jevington, Sussex; Duke's-place, London; and Worcester (Block-house Church). Four of the districts in which new churches are to be erected are situate from two to two and a half miles from the nearest church; and in all the districts assisted, the bulk of the population consists of the poorer classes of society, for whom no provision of church accommodation now exists. The twenty-three parishes above referred to contain a population of 420,394 souls; they have at present church accommodation for 58,429 persons in sixty-seven churches and chapels, or less than one-seventh of the whole number; and of that provision only 18,460 sittings are free, being one free seat for twenty-three persons; by the erection of the eight additional churches, and the enlargement, &c., of the existing buildings, 6,679 seats will be added to the present insufficient provision of church room, 5,604 of which will be free; raising the proportion of free sittings to one seat for seventeen persons. The importance of providing the means of attending public worship for the poorer classes is every day becoming more apparent; it will be seen by the above statement that more than two-thirds of the whole additional accommodation is to be free

and unappropriated, and in several instances the whole of the church will be thrown open without reserve. The deficiency of church accommodation in particular parishes as it now exists will be better understood when it is stated that Ilkeston, near Nottingham, contains 5,329 inhabitants, and one church with 448 seats, or for about one-thirteenth of the population, not one of which is free. St. Clement's parish, Truro, has a population of 3,436 souls, and sittings for one person in eleven, with only ninety free seats. St. Michael and St. Chad, Lichfield, contain together 5,359 inhabitants, with 950 seats in the two present churches, 200 of which are free. Bromsgrove has a population of nearly 10,000 persons, with accommodation for one-seventh of that number, including only 268 free sittings; and Barnstaple, with nearly 8,000 inhabitants, possesses church room for 1,453 persons, including only 100 free seats. In these six parishes, containing together more than 31,000 souls, upwards of 27,000 persons have been hitherto unprovided with the means of attending public worship, while the free accommodation in the present churches is only 658 seats.

ARCHITECTURAL GEOMETRY, No. V.—

TO FIND THE CENTRE FOR STRIKING ANY SEGMENTAL ARCH.

The rule is founded on the principle that, *As the versed sine (a) is to the half chord (b), or the right sine of half the arc, so is b to the complement (c) of the diameter;* therefore c added to a is the whole diameter, half of which is the radius of the curve; thus, if the rise of an arch be 2 ft., and its half span 6 ft., its radius will be 10 ft. Example—

ft.	ft.	ft.	ft.
As 2	:	6	:: 6 : 18
		6	
		2	36
		18	ft. complement of the diameter.
		2	ft. rise of arch.
		2	20 ft. whole diameter.
		10	ft. radius.

or—  $\frac{b^2 + a}{2} = \text{radius.}$

Wherever in the semicircle the angle *d* is placed, the angle *d f e* is right or of 90°; hence the rule by which in fluting columns, if the flutes are of a semicircular plan, the angle of a builder's square moved round in them will touch in succession every part of their concave. **d.**

SOCIETY OF ARTS.—At the fifty-seventh anniversary held in the great room of the society, John-street, Adelphi, on Monday week, the silver medal was presented by his Royal Highness Prince Albert, president to the society, to A. E. Brae, Esq., of Leeds, for his improved chimneys for house clocks.

His Royal Highness Prince Albert laid the foundation-stone of the new Hospital for consumption and diseases of the chest on Wednesday week, at one o'clock, on a spot at the north side of the Fulham-road, a little west of Pelham-crescent, Brompton.

SOMATOLOGY, OR THE ESSENTIAL AND  
CONTINGENT PROPERTIES OF MATTER.  
BY ALEXANDER JAMIESON, LL.D.

THE Greek and Roman languages furnish us with many of the terms or words which we employ in scientific discourse. Among these may be classed the word that we have written as the title of this essay: it is a word purely Greek, and signifies a discourse about matter or bodily substance. The Saxon language has furnished the word body which originally signifies stature, and our old writers define it as implying a compound of matter and form; but in their application of the term, they restrict its signification to any substance possessing a definite form, as an animal.

The word *matter*, on the other hand, both anciently and now, comprehends, in common parlance, any thing in which extension predominates, together with a capability of resistance, without any regard being had to external figure. And the epithet *substance* assimilates all the objects to which it is applied to particular portions of matter presented to our senses, under various appearances and forms.

Hence, the terms *body*, *matter*, *substance*, though usually employed as synonymous, have, in reality, different significations: the first implying figure; the second, gross mass; and the third any thing not æriform; yet air or gas, or vapour is a substance, and therefore matter, as much so as a piece of coal or a bronze statue. Thus, a pint of water driven off as steam from the boiler of a low-pressure engine, fills a space capable of holding two thousand pints, and raises the piston through this with a force of many thousand pounds, and immediately afterward re-appears in the cold condenser as a pint of water which is doubtless substance.

But it will suffice for our purpose to observe that the words now under consideration, like a great many others employed in treating upon scientific subjects, are rarely confounded by their use and application. All men speak of bricks, lime, timber, iron, slates, stones, marble, &c., as the materials out of which houses are built. And we talk of the finest pieces of sculpture that represent the figures of men and women, as marbles. No one mistakes these marbles for the spherules of baked clay that children play with. So also by the term *materials* we understand rough, misshapen, uncemented, unconstructed masses; but whatever has order and symmetrical arrangement, that we call *body*; and the noun *substance* will indicate any thing palpably gross in opposition to such things as are fluid or æriform; yet we have shewn that water and vapour or the clouds of the sky, have substance as well as the rocky mountains, or the people who throng the crowded city.

We are never misunderstood when we say, the wind blows, the rain patters, the river rolls its waters along, the smoke rises, the clock strikes, the engine works, the ship sails; yet all these phrases are as metaphorical as they are literal. Who does not know that the howling is the wind, else whence the exclamation, "it blows hard?" That the pattering is the rain falling? That the declivity in its channel causes the water in the river to roll? That the air raises the smoke? That the hammer strikes the bell of the clock? That the engine is put in motion by some agent foreign to itself? That the ship is borne along on the bosom of the deep by the wind which fills her sails?

OF BODY, THAT IS, MATTER OR SUBSTANCE.

To illustrate our notion of body, that is to say, of matter, which is something that possesses qualities or properties discernible to our senses, let us take a billiard ball which has figure and colour; and which may be put in motion; but the ball is not figure, nor is it colour, and it is not motion, though it may be made to move. It is none of these individually, and collectively they do not constitute the matter out of which the ball was made. The ball has something that has figure and colour, and that may be put in motion. This is a dictate of nature and the belief of all mankind. But the ball is ivory; and ivory is the tooth of an elephant, or the tusk of an elephant is ivory. And what is ivory? Matter; the essence of which is totally unknown to us, but we have the infor-

mation of nature for the existence of those properties in matter which our senses enable us to discover, and upon which it is our province to reason and speculate. The essence, like the origin of matter, is impenetrably hid from our view.

"IN THE BEGINNING GOD CREATED THE  
HEAVEN AND THE EARTH."

Here all our boasted knowledge ends, and bere our faith dates its origin. The heaven studded with innumerable stars, each of which we may consider the centre of a system as vast as that to which our earth belongs! And the earth! the habitation of rational, accountable beings, created in the image of God, who has assigned it to man with all that it possesses and all that it can produce. It is, then, with that heaven and with this earth that natural philosophy professes to make us better acquainted, and in proportion as it augments our stock of knowledge, it is calculated to increase our faith in that sublime truth which could only be revealed of old by the Creator and Governor of the Universe, and who alone knoweth the essence of which matter hath been formed.

From an object so familiar to our view as a billiard-ball, let us now turn our attention to the materials composing the earth that we inhabit, and inquire whether they have always existed as we find them, or whether they have undergone changes as wonderful as the ivory ball made out of the tusk of an elephant.

Our earth has undergone vast changes on its surface as well as in its interior mass. If the ocean once stood at the height of fifteen thousand feet above its present level, a quantity equal in bulk to a four hundred and fortieth part of the whole earth must have passed from being above the level of the present sea to be under it. And these changes may have produced great variations in the position of the earth's axis, which may have gone through a long series of changes, and may have carried the equator, and the accumulation of waters which accompanied it, over regions from which they are now far distant. Many facts in the natural history of the earth and of its mineral kingdom give countenance to these suppositions; and if it be true that the more ancient strata have been set on edge, and that the continents have been raised up by the action of an expansive force in the interior of the earth, we shall be compelled to admit the existence of numerous agents or laws employed by the Creator of the World in regulating the varied phenomena of matter, as the action of impulse, cohesion, elasticity, chemical affinity, crystallization, heat, light, magnetism, electricity, galvanism, with the existence of a principle more general than any of these, and connecting all of them with that of gravitation.\* Let us call that indescribable principle the essence of matter. We are as far from defining what matter actually is, as we are from accounting for Saturn's ring, or the belts that skirt the planet Jupiter. In fact, we know nothing of matter but what concerns its various properties. But we have made prodigious advances upon the scanty knowledge of the ancients, who regarded air, fire, water, and earth as the four primary elements of which all things were composed, and each of which was separate and for ever distinct from the others.

The fire burns before me; it is nourished by fuel; that fuel is coal, which takes its origin from the vegetable kingdom. We found this conclusion upon experiment. By distillation coal yields a watery phlegm, volatile oil, volatile alkali, and thick oil, which last, on being rectified, produces a thin oil; but it is remarkable that this last, by exposure to the air, becomes black like animal oil. Besides, we find traces of vegetables very abundant in the strata of coal-fields. And it is no argument against our theory that many of the vegetable remains found in the coal-strata of Great Britain belong to classes of plants which are now found only to exist in the equatorial regions. Thus, the Crampian Hills had formerly spices waving on their tops, while at their bases the crocodile swam;† but at the great and universal deluge, convulsions and dislocations changed the exterior surface of our globe, and deposited in its bowels vast forests of antediluvian growth, which have become those great magazines of fuel, so con-

venient for the use of man, and in the application of which he finds such ample scope for the exercise of his industry and ingenuity.

Moreover, we convert coal into gas, which is merely an accidental state of existence in which any body may exist, according to the degree of heat which it can imbibe. How much further the ingenuity of man may change the matter we call coal, it is quite impossible to foretell; because in coal, as in all matter, there is the existence of a principle more general than any which chemistry hath yet discovered, namely its essence, and which will for ever prevent it from annihilation. But though we cannot divine this essence or principle of matter, for we may extend it to all bodies, there are some kinds of matter that we can bruise, others we can cut and divide, some we can dissolve, and the appearance of all may be changed in many ways; yet reduce them as we may by divisions, subdivisions, by chemical experiments and mechanical contrivances, the particles, how minute soever, are indestructible atoms, which occupy some space to the exclusion of all other matter from that individual space; and this occupancy of space is the simplest and most complete idea we can have of material existence.‡

The most perfect idea we can form of atoms is by viewing the tumultuous motion or agitation of the celestial fluid, which we call air, while the sun is above the horizon. The sky may seem transparent and undisturbed to the naked eye, but a good telescope will shew us what a tumult arises in the atmosphere from the agitation of the sun's beams in the beat of noon-day—not unlike what is raised in the waters of the sea by the impetuosity of the wind. It increases with the altitude of the sun, and when the evening comes on, it subsides almost into a calm.§ It may be pertinent to our present idea of atomic existence to observe that the Hebrew word *day* is derived from a root signifying *tumult, tumultuous motion*; and from the same root is derived the word *sea*, evidently from its being the submissive patient of winds, tides, currents, and caloric action. But that the reader may not fancy we have pressed this idea into our service, we refer him to Parkhurst's Hebrew Lexicon,|| in which he will find this thought handled in a very masterly style. Not that the learned lexicographer introduces the various etymons of the Hebrew word *day* to prove the signification that Moses attached to the root, but to give a true and faithful exposition of its various imports as diversified by prefixed particles and terminal adjuncts. Moses writes that "God said, Let there be light, and there was light, and the light he called 'day';" Genesis, ch. i. vv. 3, 4, 5.

Though the ancients made no experiments to prove the relation of the atmosphere to other matter in the universe, the definition which Moses, guided by the spirit of inspiration, gives of light being called *day*, and *day* signifying in the Hebrew tongue the tumultuous motion of the celestial fluid, plainly informs us that he understood how its two great and constituent ingredients existed as distinct substances. Modern experiments squeeze out the heat, make its particles collapse from their æriform distances, and assume the state of a tranquil fluid; which may then be retained as such for ever, or may be decomposed and rendered solid in combination with other bodies;¶ or it may be again set at liberty as a light, invisible, impalpable fluid, such as mankind breathe, and which envelops the earth all around to the height of many thousand feet. Such is the effect of heat, that flame and smoke are merely hotter air rising in the midst of colder. Flame is coal in the form of gas, or mineral ingredients in combustion combined with the oxygen of the atmosphere. And smoke consists of all the dust and visible particles which are separated from the fuel, without being burned. These minute particles are light enough to be borne aloft in a current of heated air; but all that is visible of smoke is in reality heavier than air, and presently falls again, as the ashes of a volcano fall upon the sea, or the surrounding country.

The subject in hand is finely illustrated by viewing the clouds that float along the sides

of high mountains in horizontal strata. At a certain temperature the water is separated from the air, which is then too dry to have clouds. It then becomes fog, or mist, which when further condensed, by groups of the moist particles uniting, forms rain; and rain greatly cooled becomes snow, and at its maximum of condensation it is hard ice. Thus we see how the atmosphere, which is often charged with noxious exhalations from unhealthy marshes and stagnant pools, may, in certain regions, be too pure to admit of these admixtures; yet in all its purity be as much a subject of philosophical speculation as a mass of ice and a stream of water.

(To be continued.)

#### THE WELLINGTON STATUE.

THE Lord Mayor having invited the King of Saxony on the occasion of his Majesty's contemplated visit to the public buildings of the city, and his Majesty having appointed yesterday, and at the same time expressed his wish that ceremony should be dispensed with as much as possible, the necessary preparations were made in accordance with that request. The Lord Mayor received the King, who arrived at a little after 1 o'clock, at the great gate of the Mansion-house, in the neighbourhood of which immense crowds were assembled, partly congregated in consequence of the report of his Majesty's entrance into the city, and partly on account of the expected opening of the statue of the Duke of Wellington in front of the Royal Exchange.

His Majesty having viewed the principal rooms in the Mansion-house, and expressed his admiration of the Egyptian-hall, the lobby, and the far-famed convivial apartments on the same floor, proceeded, accompanied by the Lord Mayor and the Sheriffs, to the Old Bailey, where he sat for a considerable time, most attentively listening to the trial of a prisoner for housebreaking, and seemed particularly struck with the mode in which the business was conducted by the learned gentlemen of the Central Criminal Court. The length of time the King remained in the court, which was until the conclusion of a long case, prevented his Majesty from paying a visit to the interior of the goal, but he expressed great interest in all that he witnessed.

His Majesty then returned with the Lord Mayor to the Mansion-house, where a most splendid *dejeuner à la fourchette* was prepared in the long parlour, consisting of the richest delicacies and wines of the highest order. As his Majesty had expressed his wish that his visit should be treated in an unceremonious and private manner, the Lord Mayor limited his invitations to about thirty ladies and gentlemen.

While the King was at breakfast at the Mansion-house, Mr. John Masterman, M.P. for the city of London, and Sir Peter Laurie, suddenly and most unexpectedly appeared as a deputation from the Royal Exchange and Gresham Trust Committee, to notify that they were about to open the statue of the Duke of Wellington, and to beg that his lordship would signify to the Royal guest that they hoped his Majesty would honour them by witnessing the ceremony. The King upon hearing the Duke of Wellington's name, expressed the most anxious desire to be present upon an occasion of doing honour to so illustrious a man, and proposed to the Lord Mayor, the Lady Mayress, and the ladies and gentlemen at the table to proceed immediately to the spot on which the statue of the Duke was to be unfolded to the public gaze.

At this moment the streets of the immediate neighbourhood were not only densely crowded, but the windows and the very tops of the houses in the adjoining parts of Cornhill, Mansion-house-street, the Poultry, King William-street, and Prince's-street, were occupied by shouting multitudes. The King walked arm in arm with the Lord Mayor, followed by his lordship's guests, through masses of people from the gates of the Mansion-house to the entrance to the space assigned for the chairman and committee, and was most warmly received.

The band struck up the national anthem as the King of Saxony and the Lord Mayor entered the space before the statue, and the committee received his Majesty with acclamations. The King appeared to be overwhelmed with astonishment at the scene which pre-

sented itself, and declared that he never beheld such an extraordinary multitude. The committee having walked twice round the statue, the covering of which was removed instantaneously amidst cheers from all around.

His Majesty then proceeded to take a view of the interior of the Royal Exchange, and we confess with regret that we never saw any place so unfit for public exhibition. A building which under other circumstances would deservedly have attracted admiration was hurried through almost without notice, every one being glad to escape with safety from the confusion of bricks and poles, and planks and lime-dust with which all the avenues were plentifully strewn.

On the return of his Majesty and the Lord Mayor towards the statue, a circle was formed around it, and

Mr. L. Jones said he thought it necessary, as it naturally might be expected, that he should state to his Majesty on behalf of the trustees and committee why they were assembled on that day on that spot. They met to pay a grateful tribute to one of the greatest men ever produced by this or any other country. It was needless for him to say that he meant the Duke of Wellington. (Immense cheering.) It would ill become him to say one word about the transcendent merits of that great man, because those merits were known to, and acknowledged by the whole civilized world. The citizens of London felt it particularly incumbent upon them to erect a statue to that illustrious person by subscription; and with the aid of the government, who had supplied the metal from the guns which Wellington himself had taken from the enemy, they had succeeded in thus proving their gratitude. This monument of a living warrior had been framed by the hand of a great artist, now no more; and it was a gratifying fact that it was the first equestrian bronze statue which ever had been raised during the life of the person represented. Never had either king or subject the opportunity of seeing himself so represented before. (Loud cheers.) Independently of the vast military renown of the Duke of Wellington, the claim of his Grace upon the gratitude of the citizens of London, for advancing its interests by promoting the improvements and embellishments which the visitors to this great city looked at with wonder, was such that they were determined to give effect to that feeling in a way which posterity would be well able to appreciate, and would leave an example worthy of imitation.

Three cheers were then given for the Duke of Wellington, and the King pulled off his hat, and joined as heartily in the cheering as any one in the assembled multitude.

A hearty cheer was then given for the King of Saxony, and his Majesty returned with the Lord Mayor, cheered all the way, to the Mansion-house, where he sat down and finished the repast, which had been thus rudely interrupted.

His Majesty afterwards accompanied the Lord Mayor to the Temple, and visited the ancient church, the hall, and the library; and at 6 o'clock the King took his leave of the Lord Mayor, having expressed the greatest delight at all he had witnessed in the ancient and hospitable city of London.—*Times*.

#### LECTURES ON ARCHITECTURE AND ANTIQUITIES.

##### Lecture III.

ON GRECIAN ARCHITECTURE—THE DORIC STYLE. (Continued from p. 301.)

THE Panathænic procession, which with fifteen\* of the metopes formerly likewise belonging to the Parthenon, now adorns the British Museum, under the name of the Elgin marbles, consists, as before observed, of many hundred figures. Among them are several equestrian figures, which are designed in the most admirable manner, and are remarkable for the varied attitudes of the horses, and for the ease and grace of the riders. Other figures in the procession are charioteers in their cars, one of whom is supposed to be the victor in a chariot-race, as a man is about to crown him. Then follow men carrying trays, then the sacrificers and the oxen, each Athenian colony sending an ox to this great festival; females are also present, some carrying dishes or

\* The sixteenth metope in the British Museum is a cast in plaster, taken from the original, which is in the Royal Museum at Paris; it is marked in red No. 9.

patelas, others hearing pitchers of water; two of the young females had situations of great importance, their office being to carry the sacred baskets. Several gods and goddesses are likewise introduced; they are seated, to denote their dignity. These figures are all in high relief, so that they were visible at some distance; and although it is impossible now to decide how much was the actual work of Phidias himself, it is highly probable that they, as well as the other sculptured decorations of the temple, were all designed by the great master. (It is known that he practised the art of painting previously to that of sculpture.) It has been ascertained that they are as carefully finished behind as before, and in places which could not be visible when once they had reached their destination; hence it is justly inferred that all these sculptures had to undergo the ordeal of a searching criticism of the public eye before they left the artist's studio.

In addition to the embellishments already described which adorned the temple, Phidias made the celebrated statue of Minerva, which stood in the cell or open part of the building. This figure, formed of ivory and gold, was thirty-seven feet high. Pausanias says that it stood erect; the goddess was represented with her garments reaching to her feet, helmeted, and with a Medusa's head on her breast; in one hand she held a spear, and on the other stood a Victory of about four cubits high. Monsieur Quatremère de Quincy, who bestowed great pains in investigating the subject of ancient sculpture, has calculated that the value of the gold employed on this famous statue was equal to 130,000*l.* sterling. "When the question was agitated in the assembly, whether marble or ivory should be employed in the statue of the goddess, and Phidias the sculptor recommended marble as the cheaper material, the assembly on that very ground unanimously decided for ivory." (Bishop Thirlwall's Greece, vol. iii., p. 68.) This majestic statue was in existence in the time of Julian the Apostate, a period of 800 years after its erection; after that date its fate is unknown. The indefatigable sculptor made five other statues of the same goddess, all colossal, one of which, the *Minerva Polias*, fifty feet high, was placed in the Acropolis, whence the crest and helmet could be perceived at sea at the distance of twenty-five miles, serving as a guide to the homeward-bound mariner as he rounded the promontory of Sunium. The great artist and his patron were assailed by the shafts of satire and calumny. "To ruin Phidias was one of the readiest means both of hurting the feelings and of shaking the credit of Pericles. If Phidias could be convicted of a fraud on the public, it would seem an unavoidable inference that Pericles had shared the profit. The ivory statue of the goddess in the Parthenon, which was enriched with massy ornaments of pure gold, appeared to offer a ground-work for a charge which could not easily be refuted. To give it the greater weight, a man named Meno, who had been employed by Phidias in some of the details of the work, was induced to seat himself in the agora, with the ensigns of a supplicant, and to implore pardon of the people as the condition of revealing an offence in which he had been an accomplice with Phidias. He accused Phidias of having embezzled part of the gold which he had received from the treasury. But this charge immediately fell to the ground through a contrivance which Pericles had adopted for a different end. The golden ornaments had been fixed on the statue in such a manner that they could be taken off without doing it any injury, and thus afforded the means of ascertaining their exact weight." (Thirlwall's Greece, vol. iii., p. 86.) Another accusation was more successful in accomplishing the sculptor's disgrace. "Some keen eye had observed two figures among those with which Phidias had represented the battle between Theseus and the Amazons on the shield of the goddess, in which it detected the portraits of the artist himself, as a bald old man, and that of Pericles in all the comeliness of his graceful person. To the religious feelings of the Athenians this mode of perpetuating the memory of individuals, by connecting their portraits with an object of public worship, appeared to violate the sanctity of the place; and it was probably also viewed as an arrogant intrusion, no less offensive to the majesty of the commonwealth. Phidias was committed

VIEW OF THE TEMPLE OF THESEUS.

to prison, and died there." (*Ibid.*) From the very high estimation in which the figures called the Theseus and Ilissus, now in the British Museum, are held by artists, it is fair to conclude that in them we behold two of the actual productions of Phidias, and the thirteenth metope in particular has been suggested to be by his hand. To protect the statue of Minerva in the Parthenon from the effects of sun and rain, a veil, called the peplos, was spread over the open part of the building. It was placed there with great solemnity at the time of the Panathenæic festival, and was the work of young virgins selected from the best families of Athens, having on it embroidered the battle of the gods and giants. In the "Ion" of Euripides allusion is made to the custom of spreading the peplos as an awning. Ion erects a tent 100 feet square,

— "in which to feast  
All Delphi, he prepares the genial board.  
Then from the treasury of the God he takes  
The consecrated tap'stry, splendid woof,  
To close with graceful shade the wondrous scene,  
First o'er the roof he spreads the skirted Peplus."

ACT IV.

The poet then describes the embroidery to represent

"The heav'n's, within whose spacious azure round  
The num'rous host of stars collective shine."

A fac-simile of the Parthenon, as far as the architecture is concerned, has been erected at Edinburgh, on the Calton-hill, in a situation resembling the Athenian Acropolis. Mr. Bankes proposed it as the model for the Fitzwilliam Museum, at Cambridge. The proportions of its Doric order are imitated in the portico of Covent Garden Theatre.

THE TEMPLE OF THESEUS, which is generally reckoned to belong to the age of Pericles, and earlier in date than the Parthenon, is one of the noblest monuments of Athenian magnificence, and in the time of Stuart was one of the most perfect. "The sanctuary of Theseus was raised by the Athenians after the Medes were at Marathon, when Cimon, the son of Miltiades, expelled the people of Scyros, a retribution for the death of Theseus, and carried his bones to Athens." (Pausanias.) "The situation is admirable, and the building is of pure white marble." (Woods.) The Athenians imagined at the battle of Marathon that they saw the apparition of Theseus in complete armour rushing before them on the enemy. "To this day the field of Marathon is said to be haunted, as in the time of Pausanias, with spectral warriors and the shepherds are alarmed in the night by their shouts and by the neighing of their steeds." (Chirwall's Greece, vol. ii.,

p. 243.) After the Median war was concluded, the oracle advised that the bones of Theseus, who had been banished, should be brought back and deposited honourably in the city. Accordingly, when Cimon, the son of Miltiades, had conquered Scyros, after a diligent search, he there found the remains of the hero, of superior stature, with the brazen point of a spear and a sword lying by him; and having embarked them on board his ship, he carried them to Athens, where they were received with splendid processions and sacrifices. Festivals were instituted and games were celebrated in honour of the event, and on this occasion, it is supposed, happened the contest between Æschylus and the youthful Sophocles for the dramatic prize. Plutarch places this event at a date which is generally considered equivalent to the year 467 b.c. The Parthenon is, by some writers, believed to have been commenced about 448 b.c. (the year in which Cimon died), and to have occupied sixteen years in its erection. In the opinion of Lord Aberdeen, "the temple of Theseus may be considered as nearly coeval with the buildings of the Acropolis, or perhaps of an origin somewhat earlier." (Inquiry, p. 143.) The Theseum is built of Pentelic marble, and is raised upon two steps, being peculiar in this respect. The portico at each end consists of six columns in front; at each side are eleven columns, not counting the angle columns of the porticos, so that the building is surrounded by thirty-four columns. Behind the porticos are others, consisting of only two columns between ante; there are three deep recesses which lead to the cell. There is here no division in the internal part, where it is presumed that the remains of Theseus were buried. This temple is 104 feet long, 45 feet wide, both dimensions being taken on the upper step, and 25 feet 2 inches high; the diameter of the columns is 3 feet 3 inches. The sculptures in the metopes were representations of the exploits of Theseus and of the labours of Hercules, who appears to have been honoured in this temple, as well as Theseus his kinsman and friend. The frieze of the wall behind the eastern portico was adorned with a representation of a battle and victory, in which six of the divinities are present, three of whom are Jupiter, Juno, and Minerva; among the combatants is one of superior stature and dignity, hurling at his assailants a stone of prodigious size; he is supposed to be Theseus in the act of overthrowing the Persians at Marathon. The battle between the Centaurs and Lapithæ was sculptured on the wall behind the western portico. The sculptures, of which there are casts in the British Museum, are, according to

Pausanias, supposed to be the work of the famous Micon.

It has been discovered of late years, that the Parthenon, and nearly all the buildings at Athens, had colours applied to their different enrichments, but it does not appear that the advocates of Greek polychromy have clearly made out that this practice belongs to the pure age of Pericles and Phidias. It is much more likely to have been introduced long after their time.

THE TEMPLE AT CORINTH is probably the most ancient specimen of the Doric order in existence. It is built of a rough, porous stone, and is supposed to have had porticos of six columns, five of which remain in the western front, and six are seen on one flank; its arrangement perhaps was similar to that of the temple of Theseus; the columns are 5 feet 10 inches in diameter, and their shafts, 21 feet in height, are composed each of a single stone. There is no sculpture upon the temple, as all above the architrave has long since disappeared. Since Stuart's time, five of the columns which appear in the flank in his work have been blown into fragments by gunpowder to assist in building the house of a governor of Corinth. Lord Aberdeen observes, "It has been said that this temple was dedicated to Venus, but in fact no information is to be obtained respecting its origin. Whatever may have been its destination, no one can doubt, from the appearance of the ruins alone, that they formed part of a structure of the most remote antiquity." (Inquiry, p. 131.) In fact, Lord Byron's description almost suffices:—

"There is a temple in ruins stands,  
Fashion'd by long forgotten hands;  
Two or three columns and many a stone,  
Marble and granite with grass o'ergrown."

SIEGE OF CORINTH, ST. XVIIII.

By some writers the date of the building has been ascribed to the eighth century b.c.

"One of the noblest efforts of the genius of Ictinus is to be seen in the temple of Apollo Epicurius, in Arcadia. It offers many architectural peculiarities, and exhibits a greater variety of details than are usually met with in the Grecian temples." (Lord Aberdeen's Inquiry, p. 143.) "It is situated on an elevated part of Mount Cotylus, three or four miles from the ruins of Phigalia, and commands one of the most enchanting prospects which it is possible to conceive;—woods, hills, and valleys, lie before it in wild confusion; the distance is determined by the sea, and the view, as it were, is bounded by the temple itself is surrounded confer an additional solemnity and grandeur on the scene." (*Ibid.* p. 145.)

Pausanias, speaking of this building, which is at Bassæ, near Phigalia, states that "the temple of Apollo Epicurius (the deliverer), which, together with its roof, is of stone, surpasses all the temples which are in Peloponnesus, with the exception of that in Tegea, in the beauty of the stone, and harmony of the proportions." "The earliest modern notice we have found of this monument," says Mr. T. L. Donaldson, who has delineated this temple with great pains in the fourth volume (supplemental) of Stuart's Athens, "is in the work of Mons. Pouqueville, who describes the temple as having been sought for about the year 1770, by a Mons. Bocher, an enterprising French architect, proceeding from Caritena, during a second visit to the Morea, who fell a sacrifice to his professional zeal, being murdered by the barbarous Morcotes, near the ruins of the temple. Our countryman Sir William Gell, who believe, was the first who procured any detailed account of the temple, which was found to resemble in magnitude, and to class with the temple of Theseus, at Athens, but to differ from it in the proportions and number of columns on the flanks, and in the singular arrangement of the cella." Attention being thus turned towards a monument of the age of Pericles, erected by one of the architects of the Parthenon, architectural travellers were induced to investigate the structure more narrowly, and in 1812 a party was formed for the purpose of excavating, consisting of Baron Haller, Mr. C. R. Cockerell, Mr. J. Foster, of Liverpool, Mons. Jacques Linckh, of Stuttgart, architects, Baron Stackelberg, a superior amateur draughtsman, Thomas Legh, Esq., M.P., and Mons. Gropius, Austrian vice-consul and banker at Athens. Having first conciliated Veli Pacha, son of the noted Ali Pacha, of Jannina, by agreeing to pay him half the value of the marbles, the expedition proceeded to the ruins, where they encamped and employed upwards of one hundred labourers to clear out the interior of the temple, and after three months' exertion they were rewarded by bringing to light the beautiful frieze in high relief that surrounded the interior of the cell, upwards of 100 feet long and 2 feet 1 1/2 inches high; it was in numerous fragments, which were carefully reunited, representing the battles of the Centaurs and Lapithæ, and of the Greeks and Amazons, the favourite subjects of the early Grecian artists." This frieze is now in the British Museum, and is known as the Phigælian Marbles; they were procured for the sum of 15,000*l.*, through the intervention of Mr. Hamilton. The entrance to the temple was facing the north, contrary to the usual practice. The temple was 47 feet broad, 125 feet long, and ascended by three steps. There were six columns in each front, and fifteen on each flank, all 3 feet 7 inches in diameter, and 19 feet 6 inches high. In the interior of the cell were attached columns of the Ionic order, of a very ancient character, (together with a single insulated column of the Corinthian order,) over which, on the four sides of the cell, ranged the sculptured frieze. The columns and walls are constructed of the hard and beautiful limestone of the country, but the sculpture and roof are of marble. It would not appear from Mr. Donaldson's description that any decorations existed in the pediments or metopes. "The arrangement of the engaged columns of the cella is very peculiar. A similar disposition has never hitherto been found, though, perhaps, in the temple of Apollo Didymæus, at Branchidæ, near Miletus, the projecting pilasters conveyed the same effect less distinctly expressed. The spaces between the Ionic columns seem to afford admirable situations for statues, as they would be secured by the columns on each side, and by the soffits above, from the occasional inclemency of even that mild atmosphere."

THE PROPYLEÆ, a Doric structure, forms the only entrance to the Acropolis of Athens. Pausanias says, "There is only one entrance to the Acropolis, it being in every remaining part of its circuit a precipice, fortified with strong walls. This entrance was fronted by a magnificent building, called the Propylæa, covered with roofs of white marble, which surpassed for beauty all that he had before seen." This was begun during the administration of Pericles, B.C. 437, and was finished in five years,

Mnesicles being the architect, at an expense equivalent to 464,000*l.* The front of the Propylæa consisted of six columns, and at the back of the building was a similar portico; between the two was the wall, in which were five gates: the centre reached from the platform to the height of the entablature; it was 13 feet wide, and was used on solemn occasions for the chariots: the road-way was between two rows of Ionic columns; a gate, 9 feet wide and of less height than the centre, occupied each side, and beyond them were two smaller doorways, which were used for ordinary passage. On the right of the Propylæa was a building called the Temple of Victory-without-wings. On the left was an edifice adorned with paintings, the work of Polygnottus, the subjects chiefly from Homer, and it is supposed that herein stood a group of the Græces draped, the performance of the celebrated Socrates, who pursued his father's profession of a sculptor, until he devoted the energies of his wonderful mind to the study of philosophy.

Plutarch and Diogenes Laertius allude to this performance. The latter says, "Moreover, Duris says that he laboured, and that he carved statues; others assert that the figures of the Græces in the Acropolis, which are clothed, are by him." The bas-reliefs, which were on the frieze of the Temple of Victory, were brought to England by Lord Elgin's agents, and are now in the British Museum. They are brilliant specimens of the design and execution of the best epoch of Grecian art; some of which represent contests between the Athenians and other Greeks during the Peloponnesian war, and others the combats between the Athenians and the Persians. In the British Museum the former are marked Nos. 160 and 161, and the latter are figured Nos. 158 and 159.

Similar in plan to the building at Athens is the Propylæa at Eleusis, and in design little inferior to its Athenian prototype. It was

erected, together with the Temple of Ceres, to which it served as a vestibule, and the connected Temple of Diana-Propylæa, by Pericles, for the solemnization of the Mysteries of Ceres, the most sacred among the religious rites of Greece. Ancient authors appear to have been prevented from mentioning the building by the deep mystery which was cast over the rites. Thus Pausanias pretended that he was deterred by a vision he saw in his sleep from disclosing any particulars concerning the Eleusinium at Athens, and the superhuman interposition forbade him to notice any object contained within the sacred precinct of the temple at Eleusis. The multitudes who resorted to Eleusis to be initiated so contributed to enrich the spot favoured by Ceres, that it began to vie with Athens in splendour and extent, and the Athenians, jealous of its rising greatness, reduced it to the rank of one of their *demi*, or borough-towns. A road, called the Sacred Way, which can be still traced, led from Athens to Eleusis. The Propylæa bears a striking resemblance to that at Athens, having at each end a portico of six columns, five gates, and two rows of Ionic columns within. To make the central opening large enough to admit chariots, the usual arrangement is departed from by the addition of a triglyph in the frieze over the space between the central columns. The pavement, the steps, and every part of the superstructure, were of fine Pentelic marble; the roof also was covered with marble slabs, worked into the shape of tiles; the joints of these tiles were covered with others which follow the slope of the roof, to prevent the admission of water. This ingenious contrivance was the invention of Byzes of Naxos, and it was so highly appreciated by the Greeks, that they honoured the inventor with a statue. The termination of the joint-tiles was formed by an upright tile, on which was painted the lotus. Byzes lived 589 years before the Christian era. G. R. F.

DETACHED FURNACES.

TO THE EDITOR OF THE BUILDER.

SIR,—From the very many fires which have happened (with loss of valuable property) from the boiling over of melting-pans or pots, containing combustible matter, I beg leave most respectfully to lay before the numerous readers of your valuable paper a plan, which I feel assured will prevent all danger if carried into

effect. All stoke-holes should be kept distant from melting or boiling-houses by party-walls; if this were done, no danger could exist, for the boiling-matter would not communicate with the furnace.

I am, Sir, your humble servant,  
W. DENLEY, Patentee of the  
Fire-proof Tubular Flues.

## FIRST LECTURE ON ARCHITECTURE,

BY J. L. THOMAS,

*Delivered at the Literary, Scientific, and Mechanics' Institute, Brecon.*

THE following is an outline report of the lecture on architecture, delivered before the members of the institute, by Mr. J. L. Thomas, on Tuesday.

Mr. Thomas having introduced the interesting subject of his lecture by remarking upon its connection with the liberal arts, and its being the only record and chronicle connecting the infancy of the world with its present state of adolescence, eulogised the spirit of inquiry which seemed to pervade all classes of society, and thought it would, ultimately, be productive of the largest and most extended benefit. He then alluded to the origin of building, which he thought little posterior to the creation of mankind, and that man soon found it necessary, in his naked and defenceless state, to erect some habitation which, however rude and inartificial in appearance, would serve the purposes of shelter and defence. He thought it probable, that if these inherent wants and his own natural ingenuity were not sufficient to instruct him, he might learn from the irrational creation; and the swallow's nest or the bee's hive may have suggested hints that were by him adopted or improved, but being destitute of all elegance and proportions, could not merit the appellation of architecture, but are yet worthy of observation as the embryo of the noble edifices which have since adorned the civilized nations of the world. As wealth accumulated, decoration was added to the original objects of building, convenience and safety; for, when the few wants of nature are satisfied, and the dangers of a savage state removed, the restless mind of man creates artificial objects of desire, and no sooner are the cravings of necessity silenced, than the calls of imagination gain attention, and taste becomes impudate when the animal appetites are at rest. He then proceeded to shew that the first great efforts of the art were devoted to religion, and that it seemed to be the prevailing opinion of the earliest, and all other nations, that the greatest human skill and industry could not be more properly exerted than to display the glory of the Omnipotence! He then attempted to give an idea of the size of Egyptian architecture, as the most ancient examples of the art extant, and described the Temple of Ammon, and the enthusiasm of Champollion and Belzoni on discovering the colossal wonders of Carnac. After mentioning many other of the grand productions of Egypt, and shewing that they excited rather the astonishment arising from magnificence of design than the delight from delicacy of execution, he glanced at the remains of Babylon, built by Queen Semiramis around the remains of the famous Tower of Babel, and enumerated her many gorgeous works, as described by historians, which appeared more the ideal fancy of a fairy tale than a stern reality. Then Nineveh, whose greatness no city has ever equalled; and proceeded with a slight sketch of Biblical architecture. Its first rude efforts exhibited in altars sacred to the Deity, and monuments commemorative of the dead, until Solomon came and reared the temple so famous and beautiful. The lecturer then arrived at a period, the most interesting in the history of art, when Ceopros emigrated from Egypt and settled in Attica, and laid the foundation of those arts which soon, under the fostering hand of the Grecians, eclipsed their origin, and assumed that symmetry and form of beauty which excite lofty and pleasing sensations in the beholders. He then compared the remains of Athens with the other great existing monuments of antiquity—Thebes, Babylon, Persopolis, and Rome—and proved the superiority, not only in form and beauty, but in memories and associations, of those master-works of the city of Minerva, which still attract the attention of the scholar and the artist of every other nation. He thought that, although men have sometimes ventured, from motives of vanity and caprice, to deviate from those models, they have commonly returned to them with the clear conviction of having lost sight of excellence in the pursuit of innovation; for the orders of architecture by the Greeks were advanced to that degree of perfection which the united intellect of all the civilized world

have not since been able to surpass. He proceeded for some time with the progress of the art in Greece, and expatiated upon the soothing and elevated effect of its general characteristics; yet, although it originally displayed that kind of beauty which, from the universality of its influence, appeared congenial with the human mind, it has at various times been lost by disuse, corrupted by vicious taste, and mutilated by ignorance. He then touched slightly upon the long train of disastrous casualties, which befel the works of the great Athenian architects, the Persian invasion under Xerxes, and its ravaging effects, their sanguinary domestic wars, the Roman conquest, and the destructive barbarity of some of the Christian emperors who imagined they were doing a service to the Deity by destroying the noblest productions of his creatures. Next, the formidable and barbaric inroads of the northern savages under Alaric the Goth and Genseric the Vandal, the irregularities committed during the crusades and the Turkish conquests. He mentioned this catalogue of disasters with the idea that it may excite those feelings of astonishment and gratitude, which all the lovers of the noble art ought to feel, in the almost miraculous preservation of its models—for the Parthenon still remains though in ruins as a guide to the admirers of the Doric. The Erechtheum, to those of the Ionic and the Monument of Lysicrates in all its faultless elaboration of style to those of the Corinthian.

He then alluded to the great encouragement given to the arts even in little republics, as well as in the great ruling states of Greece, and instance the temple of Selinus, in Sicily, as an example, and minutely described this magnificent building. He thought he should be invading the province of the historian by tracing the revolutions of the progress of the art through several centuries; he therefore rapidly glanced at a few of the great Roman structures, and thought they invariably partook more of the gorgeousness of the many nations she was mistress of mingled together, than the simple and severe forms of the early efforts of Greece. Yet he did not for a moment mean to fix the merits of one style over that of another, as both had their own peculiar excellences.

The Romans excelled in luxuriance of fancy, and richness of style; but in a perfect combination throughout of the highest and purest elements of taste, the Grecians bear away the palm. He then went through a clear and distinct analysis of the three Grecian and two Italian orders, commencing with the Tuscan, as the simplest, and that generally noticed first by all architectural writers; and after giving its general proportions, and the characteristic features by which it may be distinguished, by pointing to large well-shaded drawings representing the principal proportions of each order, he alluded to the Trajan Pillar as the best ancient example, and the Church of St. Paul's, Covent Garden, by Inigo Jones, as the best modern, and described the interior and exterior effect of that church. He then proceeded in the same manner with the Grecian and Roman-Doric orders; he noticed, as an example of the order, the great temple of Minerva Parthenon, and called our attention to a beautiful drawing of the front elevation restored. In giving a minute description of the sculptures of this sumptuous edifice, Mr. Thomas lamented the great deficiency of our modern Grecian buildings in this particular, so different from its primary practice, when the two arts always accompanied each other. But in these days of calculating utility, that which contributes more than any thing else to dignify the science of architecture, to raise it above mere necessity, and rank it with that of the imagination, to indicate at once the purposes of the structure, and appear in the most lively manner to the passions of the spectator, is generally entirely omitted, or if introduced at all, on such a petty scale, and distributed here and there with such a miserly hand, that it cannot tell decidedly of itself, or its true impressions be properly tested. In noticing the Roman-Doric, he mentioned the monument commemorating the great fire of London, by Sir Christopher Wren, and afterwards entered in a similar manner into the details of the Ionic order, and described the Small Temple on the Ilissus as a cbase and beautiful speci-

men, contrasting admirably with the richer example of the Erechtheum, of which temple he drew an interesting picture, alluding to the many holy objects of Athenian veneration inclosed therein.

He next passed on to a review of the Composite order, and exhibited a large drawing of the Arch of Titus, in which structures the Romans generally introduced the order. He thought the subject of the drawing a most interesting object, as connected with one of the greatest events in history—the destruction of Jerusalem and the dispersion of the Jews. But important as these associations are, it is not these alone which give to this work the interest and importance with which the professional man views it, but because it forms in itself a relic of a new and important epoch, by the introduction of the Arch in architecture, which, although it may have been practised by some of the primitive nations, was unknown in ancient Greece. And if the Romans could boast of no other inventions; if the origin of all that was beautiful and excellent in many other arts could not be traced to them; if their poets, orators, statesmen, and soldiers were not the greatest ever in existence; if they had not by their own glorious achievements made themselves masters of the whole habitable globe, this one discovery in itself would be sufficient to stamp an immortality on their name, as it in fact forms the true basis of the science of architecture, admitting of the extension and adaptation of its principles to works which the Greeks, with all their genius and taste, could not have executed. He next adverted to the Corinthian order, its supposed origin, characteristic distinctions and proportions, which were clearly exemplified by a drawing on a very large scale of the base, the capital, and the entablature, copied from the remains in the Campo Vaccino, at Rome, after Sir William Chambers. The graceful and elegant proportions of the order had a wonderfully fine effect, and the frieze was beautifully enriched with a classic design by Mr. Thomas. He then compared the Grecian and Roman practices of this order, and minutely described the elegant monument of Lysicrates, as one of the finest Grecian productions, but proved the superiority of the example from the Campo Vaccino in many minute particulars. He concluded his analysis of the orders by eulogising the liberality of the nation in procuring the inestimable treasures of the Elgin Collection. Mr. Thomas then apologized for the unavoidable technicalities of the description of his discourse; but his object was to excite a thirst in the workman after greater research into the minutia of the science, until he is enabled to execute the component parts with truth, taste, and delicacy, without which the finest designs will be very deficient in beauty. He encouraged them to surmount all difficulties in the acquirement of such knowledge, by persevering assiduity, for they were not only increasing the power of the head to contrive as well as the hand to execute, but elevating themselves from mere mechanical drudges to somewhat of the dignity of an artist. He then descanted upon the merits and advantages of the institutions which have been formed in almost every town in the United Kingdom for the encouragement and enlightenment of mechanics, and strongly urged all who were in any way connected with the building crafts—all who were desirous of distinguishing themselves—of raising the character of their respective employments—of emulating the glorious works of their predecessors—of rearing the prostrate column, and reconstructing the shivered arch, which had been so long a ruined mass, on the pure and firm basis of science; of acquiring those intellectual qualifications, which are as indispensable to the working mason as to the carpenter or any other artisan; of depending on their own resources for the proper carrying out of their different occupations—of restoring the dignity attached to the "masons of the olden time"—all who wish to gain the true ascendancy and superiority assuredly flowing from knowledge, he entreated to join the Mechanics' Institution of this town, which, if supported by the hundreds for whose welfare it was chiefly founded, will be enabled to carry out those principles of teaching with a spirit and energy that will be nobly beneficial in its results. The lecturer, in concluding his discourse, sincerely hoped that the patrons of the art would more extensively

use the means so largely in their power, that the barbaric mixtures which now so generally reign may be entirely discarded, and some styles adopted congenial to the history, the climate, the habits, and surrounding aspect of our country; for why should a science so eminently adapted to continue the pride of man's reason, and leave indelible marks of an enlightened and civilized age, even "to the wreck of matter"—why should a science capable of such noble and extended results be perverted by ignorance, and made by false and erroneous ideas of economy, merely a monument of our folly. He then went on to shew how architecture always flourished during this encouragement of literature, and what an active engine it was to promote tranquillity and civilization; and instanced the restoration of the beautiful models of classic celebrity during the revival of letters under Pope Leo X., and Francis I. The erection of the sublime structures of Rome when Augustus could call around those bright spirits whose genius and learning have since been translated into every tongue. The building of the famous and astonishing edifices which still adorn the Athenian Acropolis, when Socrates and Plato and a whole host of immortal names were protected and encouraged by Pericles. The rearing those mighty monuments of Luxor and Carnac, when Sesostris, although the greatest conqueror of the age, seemed to soar above the prejudices of the times and to devote himself to the enlightenment of his people, by collecting his wonderful library and transcribing over its entrance "*The health of the soul.*" It was this love of learning which was the chief incentive to the erection of those grandest works of human power, and which are now invariably the only record of these remote periods. "Surely then, this establishes the fact that although empires may decay, and the manners and customs of their people be buried in the impenetrable gloom of ages, that although literature be lost, and languages become unknown; yet the language of architecture will never die."

#### CHURCH-BUILDING INTELLIGENCE, &c.

*Restoration of Louth Church and Spire.*—This splendid fabric, which for exquisite symmetry and beauty has been pronounced by persons of the best taste and judgment to be one of the finest specimens of its character and style in the kingdom is, we are glad to find, to be restored to a state of security and perfection. The spire (288 feet high) is at present in a very dangerous state, and unless immediately repaired, is likely to fall into ruins. Mr. Cottingham (so well known for his judicious restoration of several cathedral and parish churches) is of opinion that if steps be promptly taken, by a moderate outlay the ravages of time may be effectually arrested, and a rate has been laid for that purpose. But the entire restoration of so fine a specimen of British ecclesiastical architecture is really an object not merely of local but of national interest; and on this ground it is satisfactory to find that a public subscription is set on foot in order to provide the requisite funds, which the vicar of Louth has undertaken to receive.—*Hull Packet.*

*New Church at Swanmore, Droxford.*—On Tuesday week the first stone of a new church at Swanmore, in the parish of Droxford, was laid by the Rev. John Haygarth, rector of Upham and Durdley. The building is to be erected in the Anglo-Norman style, by Benjamin Ferrey, Esq., of London, the architect, the carrying out of which is intrusted to Mr. Charles Pink, of Hambledon. The church is to be dedicated to St. Barnabas, and will afford accommodation for 300 sittings, 276 of which number are to be free and unappropriated for ever.

*Chigwell.*—On Sunday week last, this church was re-opened for divine service, after having undergone some most important repairs and alterations. The venerable structure may now fairly be classed as one of the greatest ornaments in this delightful county. The beautiful and newly-painted window erected over the altar is much admired, and reflects the highest credit upon the taste and liberality of Jas. Weddell Bridger, Esq., of Belmont, to whom the parish is indebted for this munificent gift, as well as for many other valuable donations.—*Chelmsford Chronicle.*

*Balsham.*—A telegraph has recently been erected on the steeple of Balsham church, near Linton. For some time a surveyor has been examining the different eminences in this part of the country, and the above is the spot selected.

The inhabitants of St. James's parish, Bury, have come to a resolution to raise 800*l.* by rate, to defray the expense of the restoration of the ancient bell tower of their parish.

It is said to be in contemplation to rebuild on the same site, the chapel of Sedghill, near Shaftesbury.

The interesting parish church of Codford, St. Mary, Wilts (which has been enlarged by the addition of a south aisle, and nearly rebuilt), is now rapidly approaching completion.

#### RAILWAY INTELLIGENCE.

*South-Eastern Railway.—Dover Terminus.*—We visited the other day the various works and buildings connected with this terminus, which is now opened; and must say that there seems a disposition on the part of the Company to finish them in a manner scarcely inferior to any on the most important lines. The architectural character of this structure, like all the minor stations on the line, is strictly Italian; and we cannot but look upon the general arrangement as affording every desirable accommodation and convenience which the public can expect. The completion of the various apartments for the reception of royalty, directors' rooms, &c., comprising the loftiest or eastern end of the establishment, is, we understand, to be delayed for a short period. The whole extent of the works when completed, we understand, will cover upwards of three and a half acres of ground, the greater portion of which is surmounted by a skillfully-constructed iron-roofed shed, covering the area, designed for the departure of the trains. This roof we admired very much, from its simplicity of construction and extreme lightness, considering it embraces, in two 40-foot spans, an area of upwards of 200 yards long, by 17 yards wide. We also inspected, with surprise and satisfaction, the application of the Seyssel Asphalt (Claridge's patent)—a bituminous limestone from the Jura mountains—for the various platforms. On the departure platform, we find a solid continuous foot pavement, upwards of 10,000 superficial feet in extent, as smooth and even as polished slate, which it much resembles in appearance, though it is as warm and yielding to the foot as a flooring of timber. In the rooms and offices this asphalt has been used; and our examination of it has convinced us that it is an excellent material for various purposes, especially as its quality as a non-absorbent ensures perfect cleanliness, freedom from damp and smells, and also secures an agreeable temperature. We invite all those who are desirous of having a beautiful, economical, and imperishable pavement, to view this. The various offices, retiring and waiting rooms, at this station, are large, lofty, and well-proportioned, and command every convenience. The finishings and furnishings are very substantially, though chastely, executed. As the eastern portion of the station (on which the tower is to be placed) is not completed, we are unable to form an opinion of its entire exterior effect.—*Dover Chronicle.*

*Railway to Rugby.*—It is intended to bring forward in the next session of Parliament the project of a line in continuation of the Great Western Railway, passing through Banbury to Rugby, which for a distance of about thirty miles from Oxford will be identical with the line now suggested; and it is thereupon proposed that if such a project be brought forward and should succeed, the line from Wolverhampton shall merge into that line about eight miles north-west of the town of Banbury. The rough estimated cost of the work from Wolverhampton to this latter point, including the branches to Stoke Works and the river Severn, is 100,000*l.*, and the rough estimated cost of the work from the point of junction to Oxford is 500,000*l.*

*The Midland Railway.*—The union of the North Midland, the Midland Counties, and the Birmingham and Derby Railway Companies having been just completed by act of Parliament, the first meeting of the board of the consolidated company, now called "The Midland Railway Company," was held at Derby last week, when Mr. Alderman George Hudson, of York, was elected chairman, and John Ellis, Esq., of Beaumont Leys, Leicester, deputy-chairman. Mr. Hudson's election is a well-earned acknowledgment of the great and unwearied exertions of that gentleman in promoting the amalgamation of the three companies, a union of vital importance to their future prosperity, and which has already improved the value of the shares between forty and fifty per cent. Mr. Hudson now holds the very first place amongst the long list of railway chairmen and directors—a body of gentlemen, it may be remarked, second to none in the United Kingdom for enterprise and talents—as Mr. McAdam obtained the cognomen of the "Colossus of Railroads," holding under his sway as chairman, in addition to the Midland Railway, the York and North Midland, the Leeds and Selby, the Newcastle and Darlington, the York and Scarborough, and the Leeds and Bradford Railways, a length of upwards of 300 miles. The accounts of the North Midland, the Midland Counties, and the Birmingham and Derby Railways, will each be kept separate to the end of the present half-year, after which they will be thrown together. A meeting was held on the 13th June, at Derby, to consider the propriety of converting the shares into stock, thus getting rid of the halves, thirds, quarters, and other fractional parts of a share, which embarrass the shareholders, and increase the labour of registration. Should the proposed plan be carried out, any amount of stock can in future be transferred in the same manner as in the government funds.—*Leamington Courier.*

*The London and York Railway.*—A general meeting of the provisional committee of this scheme was held on Friday week, at the Hall of Commerce, Threadneedle-street, the Right Hon. the Earl of Winchelsea presided. J. H. Astell, Esq., the chairman of the acting committee, opened the business of the meeting by stating that the committee having been appointed upon the 17th ult., with the view of amalgamating the companies then before the public—one styled the Great Northern Company, and the other, the London and York *via* Lincoln—having the same object in contemplation, viz. of connecting the metropolis with the city of York, and ultimately with Edinburgh, had so far succeeded in amalgamating the two committees, as that henceforward they would work together in a harmonious spirit. Mr. Pitman, the secretary, then read the report of the committee. At the conclusion of the report, the noble chairman stated that he was highly satisfied with the plans of the committee, and declared it to be his determination, notwithstanding that one line would be much better suited for his own private interest, to sacrifice every personal motive, and to give his cordial support to the line which the engineers should recommend. Upon the motion of Lord Howick, who took occasion to refer to the atmospheric principle, the report was unanimously adopted. Upon the motion of Lord Worsley, a committee of direction was appointed, with full power to take all the necessary measures to carry out the undertaking. On the motion of Colonel Polleston, a committee of management was also appointed; and after some further business, the meeting separated.

*York and Scarborough Railway.*—This railway is to be constructed immediately. The York and North Midland Company are already advertising for tenders for the execution of the works. The line is to be divided into four contracts, which will be decided upon the first week in July, and operations commenced as soon afterwards as possible.

*Rye.*—Mr. Cubitt, the engineer, has, during the week, gone over the line of road originally contemplated by him for connecting Rye and Hastings with the South-Eastern Railway.—*Dover Chronicle.*

*Eastern Counties Railway.*—On Thursday evening, 6th inst., in the House of Lords, the Royal assent was given by commission to the Eastern Counties Railway Bill.

**Hull and Beverley Railway.**—We believe we may state that this project, so important both to Hull and Beverley, is now determined upon. The following memorial from the latter town to the Directors of the Hull and Selby Railway Company is at present in course of signature, and has already received one hundred names, including the principal tradesmen and capitalists in the place:—

TO THE DIRECTORS OF THE HULL AND SELBY RAILWAY COMPANY.

The memorial of the undersigned Gentry, Bankers, Merchants, Tradesmen, and other Inhabitants of Beverley and its neighbourhood.

Sheweth,—That in the opinion of your memorialists, it would be a great advantage to them and to the public generally, if a communication were effected by a branch railway, from a point near the Minster at Beverley, to join the line of the Hull and Selby Railway in the neighbourhood of Hull.

That it is the opinion of your memorialists that the undertaking of a railway could only be made so as to yield a remunerating return for the capital required for its construction by being made as a branch of the Hull and Selby Railway, so as to be worked by their engines and carriages, without the necessity of incurring the great expense of a separate establishment and station at Hull.

Your memorialists, therefore, earnestly request you as the directors of the Hull and Selby Railway to recommend to your shareholders to undertake, without loss of time, the making of such branch railway from Beverley, to join the Hull and Selby line near Hull, and to which undertaking your memorialists hereby pledge themselves to give their hearty concurrence and support.

**Cambridge Railway.**—The committee assembled on Tuesday week, when the mayor read communications from the London and Birmingham Company, from the Eastern Counties Company, from the Dean of Ely, the High Sheriff, the Mayor of Wisbech, &c., expressive of their readiness to give every support to the Eastern Counties extension line through Cambridge. The committee adopted resolutions to the effect that the communications from the London and Birmingham and the Eastern Counties Railway Companies having been laid before them, the mayor be requested to acknowledge the receipt thereof, and he intimated that the committee would hold themselves in readiness to meet from time to time for the purpose of co-operating in any measures calculated to promote the object expressed in the former resolution of the committee.—*Cambridge Advertiser.*

**Hydraulic Railway.**—A company is in course of formation to construct a railway according to Mr. Shuttleworth's invention. The line from Dublin to Sallins, being the first great artery of the Dublin and Cork Railway, is about to be established as the "Grand Hydraulic Propulsion Railway;" it is 18 miles 850 yards in length, and will be completed for 99,900*l.*, being at the rate of 5,400*l.* per mile, including purchase of land, 900*l.*, and patent right 200*l.* per mile.

**The Leeds and Thirsk Railway.**—In the committee on the Harrogate and Knaresbro' Railway Bill, Mr. Locke, C. E., proved that the tunnel, a mile and an eighth long, which is proposed to be made on the Leeds and Thirsk line, would cost more than the entire construction of the Harrogate and Knaresbro' line.

**Witham and Braintree Railway.**—A preliminary survey has been made by Mr. Braithwaite for a branch railway from Witham to Braintree, and the undertaking receives already the cordial support of the most influential parties locally interested.

**Another Contemplated Railroad.**—It is in contemplation to lay down a railroad from Bath to Weymouth; the projected line to be connected with the principal intermediate towns, and to be designated the "South Union Railroad."

A railway from London to Richmond is projected, to start from Waterloo-bridge. The length of the line is to be ten miles; the capital about half a million.

The Eastern Union Railway Bill was read a third time and passed by the Commons on Monday.

**Splendid Railway Carriage.**—The Gondola, a most commodious and elegantly fitted-up vehicle belonging to the Leeds and Manchester Company, which arrived at Hull terminus on Friday, with, as was understood, a party of directors, excited much admiration at the costly manner in which it is fitted up, and the facility for comfort presented to those who can afford to travel by such superior accommodation. The body of the vehicle is divided into two compartments, each capable of receiving ten or a dozen persons, comfortably seated on elegant sofas, covered, as is also the sides, &c. of the compartments, with crimson silk plush, the upper parts having curtains to match, suspended over the plate-glass by which the whole, including the partition and the doors of communication, are surrounded. The interior is six feet six inches in height, and in the ceiling four lamps are placed, which, lighted curiously from the roof, most contribute to render the Gondola the most luxurious of travelling machines. The entrances are by open platforms at each end of the carriage, where the occupants can at their pleasure enjoy all the outdoor independence of a third-class carriage.—*Hull Packet.*

**Railway Station.**—The station at Peterborough will be on the premises of Messrs. Weston and Pinkney, for the erection of which arrangements are being made. The works throughout the line are progressing, and it is thought the rail will be opened to the public for travelling in less than twelve months from this time.

**Tours and Nantes Railway.**—The report of the committee on the Tours and Nantes Railroad Bill has been distributed among the members of the Chamber of Deputies. The report approves of the credit of 28,500,000*fr.* demanded by the government, and recommends the immediate execution of the measure.

**Russian Railway.**—The Emperor of Russia has it in contemplation to construct a railway a thousand miles in length, thus connecting St. Petersburg with Odessa and the shores of the Black Sea. It is proposed to raise the sum required by means of a foreign loan, the guaranteed interest on which is not to exceed five per cent.

A beginning has been made in the formation of the line of railway between Newport and Ely. At Newport the making of bricks is going on with all necessary expedition.

The works on the Norwich and Brandon Railway were commenced on the 6th inst.

The railroad from Karlsruhe to Strasburg was opened on the 23th of May.

#### CHANTREY'S EQUESTRIAN STATUE OF THE DUKE OF WELLINGTON.

This bronze work of art commemorative of the illustrious warrior, was, to use the French modern term "inaugurated," or set on its pedestal, on Tuesday, the 13th inst. It is a very fine production; the horse, which is perhaps a little too passive in effect, is beyond comparison superior to the tame one by the same artist upon which the statue of George IV. rests in Trafalgar-square. The figure of Wellington is a master-piece, and rests in its seat with a dignity which will hand down to posterity with the perfection of art the effigy of that great and simple-minded man, who is in manner himself so unaffected. The artist of the statue in Trafalgar-square would have remained unknown, if not previously celebrated; this work of the immortal Wellington would at once have raised to immortality the name of its artist, if he had been previously never so obscure. This fine production is also fortunate in being raised upon a magnificent pedestal, consisting apparently of only nine pieces of granite; the pedestals of many of our modern statues consist merely of an ignominious and coarse display of grotesque architectural mouldings, which form a libel in contrast with the works of art which they support.

#### Correspondence.

THE NEW BUILDING-ACT.

SIR,—You having taken so much interest, devoted so much space in your journal to the consideration of the new Building-Act, being I believe anxious to make it as complete as possible, and really a practical man, form my excuse for troubling you with the following few observations, hoping that you will forgive me thus trespassing on your valuable time.

In the new Act every precaution is taken to make drains perfect and *air-tight*, but not a word is mentioned as to trapping the sink-stones, and other necessary openings which must be made in them, in the houses and yards; consequently all this care and expense will be useless if the stench be allowed to escape from these places. This nuisance has been found at times quite intolerable, and has produced fevers. (*vide* Mr. Chadwick's Sanitary Reports.) I beg also to suggest that privies should not be erected within at least 10 feet of any dwelling.

It would be a great advantage in the smaller classed houses if two entrances be allowed, with separate staircases, so that the tenants could let off three rooms and part of the yard quite distinct from the other three rooms, as they would get a better class of lodgers, and thus enable them to pay the additional rent which houses must fetch erected under the Act, in consequence of their extra cost; and would also enable them to easily purchase by means of the holding societies, as shewn in a paper, "Small Street Houses," which appeared in *THE BUILDER* last year.

Have you noticed the new clause E (Mr. Donaldson's) inserted as to the qualifications of district-surveyors. If I read it correctly, the new district surveyors are to slip in without any examination; only those who come in afterwards are to undergo that process. Surely, the first lot should be *well-qualified*, so that their decisions and practice may be a good guide to those who may follow them. Are those members of the Institute who have already "advertised for situations" under the new Act afraid to stand their own test? Why should the Institute of British Architects have the power of giving certificates? What have they to recommend them? They refuse to admit surveyors amongst them, consequently cannot be the best judges of the qualifications for a district-surveyor; besides they would always give the preference to one of their own body. No doubt but district surveyors should be well-qualified, and should pass an examination as proposed in this clause, but a more permanent and impartial court should be established, for who can tell how long the Institute may exist, as it only embraces a portion of the architects, and no surveyors. I should suggest that a board be appointed by the government, paid by the successful candidate, of an architect, a surveyor, and a builder, all eminent in their several professions; and I presume a *practical surveyor* is required under the new Act, not a *mere architect*.

I am, Sir, yours, &c., B.

DRAINAGE AND FIRE-ESCAPES.

SIR,—You would confer a great boon to the public, by advocating in your valuable journal the paramount importance to the health and comfort of families, of *good drainage*, and of *fire-escapes*.

In my humble opinion, the district-surveyors ought to be authorized by the proposed New Building-Act to enforce these essential comforts, at least in all future new dwellings to be set up.

I am, Sir, yours very respectfully,  
CIVIL.

COMPETITION IN BUILDING.

SIR,—Observing in your last number your remarks upon the competitions of the present day, might I call your attention and have your opinion on the policy, justice, and satisfactory method of receiving tenders, by accepting the estimates of those parties whose amount in the aggregate should form the middle sum, which in my opinion would in a great measure do away with the now universal system adopted by our great builders of underletting different works to persons of little standing and small reputation? Such an amount of responsibility would then be attached to their performances, that the public would reap the ad-

vantage in every sense, and also give honest tradesmen a better chance of meeting the times, and of performing their works in the old-fashioned substantial and effective manner.

The present evil calls loudly for remedy, as all moral principles are set aside to gain the ascendancy, either by goading the labourer, using inferior materials, or obliging the manufacturer to take ruinous prices, which from circumstances he is often constrained to do; and as to the ultimate result I will not take on me to divine.—I have the honour to be Sir, your humble servant, and at the same time

A SUFFERER.

[Competition is in every sense to be deprecated as immoral: it is, without doubt, one of those kinds of strife which is by Scripture deprecated.]

We lately knew a case in which a Dissenting minister, whose business it is to promulgate integrity, accepted joyfully a tender for thoroughly painting his house, which is a large one, and performing some other repairs to it, for little more than 30*l.*, maple-wood, and wainscot-work included. Another tender was for about the value, and amounted to double the other: the fortunate contractor acknowledged that he lost 40 per cent. on the prime cost. Again, take the new churches, the parties interested will say "We are bound to have the work performed at the lowest possible rate: there are duties to perform," &c. &c. &c. "though we admit we should not so proceed in our own private affairs." Thus it is, the same men who would not wrong their neighbour of a farthing, combine in the robbery by which no church is indeed honestly obtained, most who ever engage in building them being ruined.

The case is very common for those who set on foot the building of a small church, to obtain 1,000*l.* at least of the property of the builder's creditors. The whole system is a foul stain upon commissioners, bishops, clergy, church-builders, church-subscribers, and the laity generally. Again, the whole system of competition for the designing of churches is still worse, being, in most cases, little more than a hoax—a scramble for a petty piece of patronage—in which the candidates in spite of their goodness of disposition, become as hungry ravens after the plunder, which turns out nothing but trouble and vexation; the cost with the fortunate mostly exceeding the payment, besides an infinitude of labour and trouble. The bishops and clergy know as well that competition leads to ruin as that sin leads to damnation. In either case can the tempter be excused? The Israelite if he gave was to give a ram or a bullock without blemish; what an accursed offering to the Deity must then be a church or a chapel designed, built, and finished in cheaterly.—*Ed.*]

#### THE RAILROAD BRIDGE OF VENICE.

SIR,—In perusing some of the back numbers of *THE BUILDER*, I was surprised to find in No. 35, a very erroneous, but luckily a short account, of the bridge which is now being built by the railroad company to connect the heretofore "island city" with the mainland. Having very lately returned from a comical tour of some months' duration, in which I spent a fortnight at Venice, I have this bridge still before me, and will endeavour to describe the same.

It extends from Mestra to Venice, crossing *The Lagoon*, which is a large shallow surrounding the city on all sides, and in former times a great protection against the enemy; this lagoon has from 2 to 5 feet of salt water, on a sandy bottom; where the channels intersect it, the depth of the water is from 40 to 50 feet. This splendid bridge is commenced in many places, and up to the present time (I was there last month), there are no less than 147 arches finished, or nearly so, and yet there is much more to be built before this magnificent work will be completed; the masonry of the arches is all stone, and the piers placed at certain distances are of brick faced with stone; the top of the arch to the surface of the water is, I should say, about 12 feet, perhaps not so much, as I had not the means of measuring it. No one besides those persons who have seen it can imagine the difficulties and labour required for this gigantic work; every morsel of earth, stone, brick, lime, iron, wood for framework and for the coffer-dams, together with the fresh water for making the cement, is brought in boats from the mainland, a considerable distance, and yet

this has all been surmounted by the indefatigable zeal, talent, and industry of a German engineer, Milano by name, by whom the extraordinary undertaking is superintended, planned, and executed.

In your statement it is said, "of thirty-four arches which it is to have, twenty are already completed, &c." This is not giving the Continental engineer "fair play," and as we love doing that which is right in old England, I am sure you will gladly correct the error, and give the foreigner his due.

It is supposed that in addition to the bridge being a viaduct for travellers, merchandize, &c., it will also be an aqueduct to supply fresh water to Venice, which up to this time owes all its supply to a few rain-water tanks, and to the fresh-water boats which bring the water from the river Brenta, not a very inviting stream. It will indeed be a grand triumph of art when Venice is independent of the water-boats by fresh water carried on arches over the sea. The railroad itself will finally go on to Milan; at present it only runs from Mestra to Padua, about one hour's steam. Your readers will be glad to hear that the engines and one-half of the iron rails are of English manufacture, this does one's heart good when away from England, and makes a man proud of his dear country.—Yours, &c., June 17th, 1844. C. T. A.

[The proposed further communication will oblige.—*Ed.*]

#### Miscellaneous.

THE NEW HOUSES OF PARLIAMENT.—The following report has been presented by the select committee appointed to inquire into the progress of the building of the Houses of Parliament:—"That the Committee have met, and considered the subject-matter to them referred, and have examined witnesses, and have come to the following resolution, viz.:—That, considering the great inconvenience of the present House of Lords, and that such inconvenience will be greatly aggravated by the progress of the new buildings before the commencement of the session of 1844, no delay should take place in the building and preparing the new House of Lords, beyond what is absolutely required for the safety of the work; that the architect be directed so to conduct his operations as to secure the occupation of the new House of Lords, with temporary fittings, at the commencement of the session of 1845; that in case the architect, in the progress of the work of the new House of Lords, shall find that more time will be required in consequence of any apprehension of injurious consequences to the building, he shall report the same to the Commissioners of her Majesty's Wood and Forests, in order that such report may be communicated to this House in due time; that it does not appear to the committee that it is advisable that any alterations in the ventilation of the present House of Lords, which would lead to additional expense, should be adopted; and the committee have directed the minutes of evidence taken before them to be laid before your Lordships."

WEYMOUTH.—The Harbour of Refuge Commissioners having completed a careful survey of Weymouth Bay and Portland Roads, and examined all those who offered themselves and were qualified to afford the necessary information, took their departure on Wednesday, fully impressed with the natural advantages presented to their notice for forming a breakwater in Portland Roads, capable of affording shelter and protection to the shipping and maritime commerce of England, of being a counterpoise to Cherburgh (from which we are only distant sixty miles) and St. Malo, and situated about midway between Portsmouth and Plymouth. In their visit to Portland the commissioners were forcibly struck with the economy that would be attendant on the erection of a breakwater here—large quantities of stone, already quarried, and now only encumbering the land and of no value, seeming to invite the undertaking, and the owners would no doubt be glad to see it removed. This stone (the rouch) being in large pieces of from ten tons and under, is admirably adapted for the construction of a breakwater; and we most sincerely congratulate the town and neighbourhood upon the prospect of this great and important national undertaking being carried into effect.—*Dorset Chronicle.*

#### PEAL OF BELLS FOR YORK MINSTER.—

In the course of a few days a very fine and powerful peal of bells will be erected in one of the towers of York Minster, and for melody, richness of tone, and power it is said, they will far surpass any other in the north of England. They are the gift of the late Dr. Beckwith, the eminent physician of York, who, amongst his many charitable bequests, directed 2,000*l.* to be named in his will for the purpose of furnishing the great northern cathedral with a suitable peal of bells. They have been cast at the foundry of Messrs Mears, in White-chapel, and are twelve in number, the largest weighing 53 cwt., and being in note C; the smallest 8 cwt., and in the whole being upwards of 10 tons in weight. In addition to the above, a complete "monster" clock bell is about being cast for the Minister at the same foundry, which is stated to be the largest in the world. It will be the enormous weight of 10 tons, and in key F; that of the great bell at Oxford being 7 tons; Great Tom of Lincoln 5½ tons; and the great bell at St. Paul's 5 tons. It will be paid for by public subscription, 1,700*l.* being already collected.

A newly-invented compass, which has already attracted a great deal of attention among nautical men, was shewn on Wednesday at the Hall of Commerce, some of the leading merchants having promised to inspect it. It is the invention of Mr. William Bush, the engineer, constructed for her Majesty's yacht the Victoria and Albert, being the counterpart of another meant as a present to the King of the French, the patentee intending to proceed to Paris with a view of submitting it to his Majesty. The appearance of the compass is in some respects quite different from the common one, magnetic bars in a neat case being attached to the framework of what we believe is technically called the box. Upon the lurching of the vessel these remain perpendicular, and the compass itself is entirely unaffected by local attraction. This has been sufficiently proved by repeated trials in Woolwich Royal Dock-yards, where thousands of tons of iron are lying, and which nevertheless failed to disturb in any essential degree the patent compass, while that constructed on the ordinary principle was subjected to violent oscillations. There have also, as we understand, been several experiments on board iron steamers, so ill adapted to the right working of common compasses, and with the greatest success to the new one. Of course, if the desideratum of non-variability of the needle shall be found to have been fully supplied (and we confess from all we have heard and seen, despite the fruitless efforts that have been made for more than a century, we believe it now is), this will have to be ranked among the great discoveries of the age.—*Essex Standard.*

Mr. J. F. Francis, of Berkeley-square, London, has obtained the prize of 50*l.* offered by the Town Council for the best architectural design for two chapels and an entrance-lodge for the new Cemetery. There were twenty-five competitors from various parts of the country. The consecrated chapel is in the Norman style; the chancel is semi-circular, and the floor and walls are well adapted for monumental brasses. The chapel in the unconsecrated ground is in the early English style; it is smaller than the other, and is not provided with a chancel.—*Salisbury Journal.*

AMENDED NEW BUILDINGS-BILL.—A meeting in committee of the Master Carpenters was held at the Freemasons' Tavern, on Monday last, to consider and report upon the above Bill. The report being agreed to, the chairman, Mr. H. Biers, was instructed to arrange for a deputation to Lord Lincoln, at the Woods and Forests, to impress upon his lordship several other improvements, and also to point out the objectionable parts in the amended Bill. We shall endeavour to lay before our readers a copy of the above report in our next publication.

THE ANNIVERSARY DINNER OF THE MASTER CARPENTERS' SOCIETY will take place at the West India Dock Tavern, Blackwall, on Tuesday next; the chair will be taken at four o'clock precisely. Visitors will be admitted at this meeting upon the introduction of a member, and, from the position of this society relating to the proceedings in Parliament on the "Buildings-Bill," it is anticipated that this meeting will be very fully attended.

**Tenders.**

TENDERS delivered for altering, dividing, and repairing Bolton House, Russell-square, and for building three first-rate houses on the adjoining ground.—A. Moseley, Esq., Architect, Keppel-street, Russell-square. June 19.

Mr. Baker	£10 400
Mr. Jackson	9 776
Mr. Mansfield	9 340
Messrs. Grissell and Peto	9 130
Messrs. Pearce and Guerrier	8 972
Messrs. Locke and Nesham	8 890
Mr. Grimsdell	8 864
Mr. Nicholson	7 790

TENDERS delivered for building six houses in London-street, Bethnal Green.—W. Howard, Esq., Architect.

Messrs. Vanderstrut and Parry	1,130 14 9
Mr. Breveter	891 18 0
Mr. Slater	816 0 0
Mr. Norris	797 0 0
Mr. Litchfield	768 0 0

**NOTICES OF CONTRACTS.**

For the additions and alterations to the County Gaol, at Nottingham; and the Nisi Prius Court, at the Shire Hall. (Separate Tenders.)—Messrs. Hawksley and Jalland, Architects, Nottingham. June 26.

For building Sewers in Old Fish-street, Trinity-lane, and several other streets and places adjacent thereto.—Jos. Daw, Esq., Guildhall. June 25.

For the alterations, improvements, and repairs to the School House in Hatton Garden.—Mr. Cooper, Architect, 1, Verulam-buildings, Gray's-Inn. June 29.

For the necessary Iron-work of a Bridge of one arch, 110 feet span, to be built over the river Avon, at Bath.—Drwings, &c., Mr. Manners, Architect, 1, Oxford-row, Bath. June 25.

For a Farmstead and House, at Dullingham Ley, for R. J. Eaton, Esq., M.P.—Mr. J. F. Clark, Architect, Newmarket. June 26.

For the erection and completion of seven Cottages, &c., in Kentish Town.—Address Black Horse Public-house, back of Cain's-place, Kentish Town. June 24.

For the repairs in restoring the Tower and Spire of Louth Church, Lincolnshire.—Mr. Cottingham, Architect. June 24.

For building a Sewer in Haberdasher's-Walk, Hoxton, Myrtle-street, Hoxton Town, Hyde-place, to end under the Regent's Canal, near the Rosemary Branch-bridge, a length of 4,350 feet.—Messrs. Stable and Lush, Office of Sewers, Hatton-garden. June 29.

For Bricklayers, Carpenters, Smiths, Plumbers, and Painters and Glaziers Work for one year from Midsummer-day next, for all such works as may be required to be done at the Churches, Chapels, Court-house, &c., of St. Marylebone.—C. Flood, Esq., Vestry Clerk. June 29.

**COMPETITIONS.**

Plans, &c. are wanted for erecting a Church at Southwall, Notts.—Further particulars of Mr. Wm. Shaw, Southwall, Notts. The successful competitor will be employed on the usual terms.

**TO OUR CORRESPONDENTS.**

We have not at present time to measure the altitude of St. Paul's Cathedral, which is variously stated, and can therefore only refer to Pugin's Public Buildings of London, in which it is given at 360 feet from the internal marble pavement, and from thence to the foot of the western steps 13 feet more, but somewhat less towards the east, as the ground ascends to Panyer-alley, which is reputed to be the highest spot within the city of London.

We have received several complaints relative to the competition for the designing of the church at Southwall, but, not knowing any of the parties or any of the circumstances, we cannot at present give any opinion.

**MEETINGS OF SCIENTIFIC BODIES,**

To-day and during the ensuing week.

SATURDAY, JUNE 22.—Royal Botanic, Regent's-park, 4 P.M.

MONDAY, 24.—Geographical, 3, Waterloo-place, 8½ P.M.

TUESDAY, 25.—Medical and Chirurgical, 53, Berners-street, 8½ P.M.; Civil Engineers, 25, Great George-street, 8 P.M.; Zoological, 57, Pall Mall, 8½ P.M.

WEDNESDAY, 26.—Geological, Somerset House, 9 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.

THURSDAY, 27.—Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico-Botanical, 32, Sackville-street, 3 P.M.

FRIDAY, 28.—Philological, 49, Pall Mall, 8 P.M.

**ADVERTISEMENTS.**

**PUBLICATION.**

In 1 vol. 8vo, price 6s, with coloured plates.  
**ASTHMA, ITS SPECIES AND COMPLICATIONS,** or Researches into the pathology of Disordered Respiration, with the Remedial Treatment applicable to each variety; being a practical and theoretical review of this malady considered in its simple form, and in connection with Disease of the Heart, Catarrh, Indigestion, &c.; illustrated by cases and plates coloured from nature; by F. H. RAMADGE, M.D., Fellow of the Royal College of Physicians, &c., London: Longman, Brown, Green, and Longmans.

TO ENGINEERS, DRAUGHTSMEN, &c.  
**STEPHENS'S RULING AND MECHANICAL DRAWING INK,** for Engineers, Artists, and Designers. This article will be found superior to the best Indian Ink for the above purposes. It does not smear with India-rubber, or wash off with water. It flows freely from the drawing-pen, and never corrodes or encrusts it. It may be used on slate or alab, with a camel's hair brush, diluting it with water, or thickening it by drying, as required. It has the advantage of being ready for immediate use.

Sold in conical-shaped Bottles, convenient for using from without any Stand, by the Inventor, Henry Stephens, 34, Stamford-street, Blackfriars-road, and by Booksellers and Stationers, at 6d. each.

**TRACING PAPER.**—SAMPLES forwarded by Post free.—WATERLOW and SONS, 66, LONDON-WALL, having devoted much attention to the manufacturing of the above article, have succeeded in producing a Paper superior to any yet introduced, combining the great requisites of clearness and a surface warranted to work well with pencil, ink, and colour. The following are the cash prices:—  
Double Crown, 20 by 30, 3a. per quire.—2l. 10s. per ream.  
Double Dile, do. 40 by 50, 6s. " " 5l. " "  
Dile, Dile, do. 60 by 40, 13s. " " 11l. " "

Outside, half-price.  
Wholesale and Retail, and every article of Stationery used in the Offices of Engineers, Architects, Surveyors, Builders, &c., at the lowest prices for cash.

**WATERLOW and SONS, WHOLESALE STATIONERS,** 66, LONDON-WALL.

**BASTENNE BITUMEN COMPANY,** Offices, 31, Poultry. The Directors of this Company beg leave to call the attention of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITUMEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more particularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot square:—1 inch thick, 8d.; 2 inch thick, 7d.; 4 inch thick, 6d. Works not measuring 400 feet, 1d. per foot extra. Roofing executed at 6d. and 7d. per foot square. Concrete is charged in addition according to the quantity used. Extra work on brick and men's time are charged extra when works are executed beyond three miles from the General Post-office. Bitumen 26 per ton, without grid. Bitumen 26 per ton, with grid.  
CHARLES F. TILSTONE, Sec.

**ANONYMOUS.**—In consequence of an Anonymous Advertisement having appeared in "The Times" of this date, stating that part of Trafalgar-square has been laid with Asphalt, the public are informed that such is not the case, the said square being only an imitation of Asphalt, composed of chalk, sand, and tar. The Pavement in Whitehall (opposite the Horse Guards), and that at the Duke of York's column, both laid down in 1838, are samples of works executed with the genuine Seyssel Asphalt.

J. FARRELL, Secretary, Seyssel Asphalt Company, 14th May, 1844. "Claridge's Patent," London.

**SEYSSAL ASPHALTE COMPANY.**

"CLARIDGE'S PATENT" ESTABLISHED 1838.

This ASPHALTE is a Bituminous Limestone, obtained from an inexhaustible Mine at Pyrmont, in the Jura Mountains.

Previously to its introduction into this country, in 1838, the Material had been used for many years in France, and from its great utility was extensively patronized by the Government of that Country.

Amount of value which it can be applied, the following may be enumerated:—For Foot-Pavements, public and others; in the Carriage Approach to Mansions, Garden-walks, and Terraces; the flooring of Kitchens and other rooms in Mansions, Houses, and Stables; Dog Kennels, Barn Floors, Cow Houses, Piggeries, Poultry Houses, Tun Rooms, and Maltings. For Roofing, Covering of Railroad and other Arches, the Lining of the ground, &c. It is also used to prevent the ingress of the Tides; also in covering the ground-line of Walls, to prevent damp rising (this application of the Asphalt of Seyssel is particularly recommended by the Commissioners on the Fine Arts, thereby rendering the basement stories in the worst situations both dry and warm. It is an excellent Cement, as applied to Docks, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARRELL, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," Stangate Depot, London.

**COMMISSIONERS OF FINE ARTS' REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS.**

THE DIRECTORS of the SEYSSAL ASPHALTE COMPANY have much pleasure in complying to the notice of ARCHITECTS, BUILDERS, and others, the application of the ASPHALTE OF SEYSSAL as the only effectual means of preventing DAMP rising in WALLS.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts Report, page 18."

In 1839 I superintended the construction of a house of three stories on the Lac d'Enghien. The foundation of the building is constantly in water, about 18 inches below the level of the ground-floor. The entire horizontal surface of the external and internal walls was covered, at the level of the internal ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

"Since the above date no trace of damp has shown itself round the walls of the lower story, which are for the most part painted in oil of a gray-stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 24 inches above the surface of the ground, and only 19½, at the street, above that of the sheet of water.

"The layer of Asphalt having been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp have been seen again at the base of the door-posts.

**PLUMBERS, PAINTERS, BUILDERS, and OTHERS supplied with CROWN and SHEET WINDOW GLASS, SHEET PLATE, &c. &c., for Pictures, Glazing, &c., in any quantity, at Manufacture Prices.**

TERPS, per gallon . . . . . 2s. 6d.

WHITE LEAD, in cwt. per cwt. . . . . 27s. 6d.  
MILLED LEAD . . . . . 18s. 6d.

Colours, Pipe, Brushes, &c., equally low, and quality warranted. Complete Lists, priced, may be had on applying to KOGAN, 5, Prince-street, Leicester-square, London. PRINT PUBLISHERS, PICTURE FRAME AND CABINET MAKERS, can be provided with flatted Crown, flatted Sheet, and the patent Sheet Plate, Lists of which, showing the price for any Square, from 14 by 12 to 40 by 30 of Best and second quality, will be sent (gratis) upon receiving the address. Builders, Glaziers, and others having to Contract, sending a copy of their specifications, with a list of dimensions to KOGAN, will receive by return of post the lowest prices for all qualities and sizes of Crown Sheet-Glass and Sheet-Plate, &c. Glazing estimated for if required.

MISERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other House in London.

ANONYMOUS CYLINDER. The advantages of Common Sheet over Crown for Glazing Sky-lights is decidedly great, and is generally used where strength or superior appearance is required; a light 5 feet 6 in. long, with openings any width, needs only one lb. This Glass is considerably stouter than Crown, and may be had from 1s. 3d. per foot.

Also may be had, KOGAN'S PATENT CHIMNEY FOR GAS OR OIL, which effects a great saving in the consumption, produces a more brilliant light, prevents smoke, and is cheaper than any other Patent Chimney sold.

LAMP SHADES AND GAS GLASSES, OF EVERY DESCRIPTION. GAS CONTRACTORS, FITTERS, GLASS MERCHANTS and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, and others supplied with Lists of nearly 100 Patterns, with prices affixed, sent to any part of the Kingdom gratis.

CLOCK MAKERS, ALABASTER FIGURE MAKERS, ARCHITECTS, and others supplied with FRENCH ORNAMENTAL SHADES, for covering Models of Public Buildings, Geological Curiosities, &c. &c. of all sizes and shapes. List of Prices may be had on application.

French Table Frames, Clock Works, Fancy Clock Cases, and Alabaster Figures in every variety.

R. C. having just completed his Show Rooms for the above articles, begs to invite the inspection of the Public. A liberal Discount to Banks, keepers and others.

The Builder.

NO. LXXIII.

SATURDAY, JUNE 29, 1844.

URSUING  
the subject  
of the  
amended  
proposed  
Building-  
Act, we

this week give the result of our consideration of the schedules as they now appear, after having been so materially altered, that indeed as the energy of the measure lies most materially in these schedules, which are now so changed, the Bill makes a near approach to a new one. We recommend to the building

interest, and to the members of the legislature who make this matter their especial concern, still to weigh it well in every passage and paragraph, and to consider minutely the former and fresh reports and suggestions which have been made upon the measure by various bodies and competent parties; and when the whole assumes a state satisfactory to the minds of the ablest builders and archi-

teets, we then recommend that before the Bill be sent up to the House of Lords, it be placed in the hands of a competent barrister and a competent architect to re-examine and polish the whole; for, after the numerous alterations which have been made in the Bill, it must of necessity contain numerous errors, incongruities, vulnerable places, and oversights, if not palpable contradictions. We still notice in it many errors in grammar, many awkward and doubtful expressions, words spelled in different ways, or taking the plural in a manner against decent usage and in different manners, and many other glaring faults of grammatical construction and orthography.

Now we trust that all who are not by nature mere bores desire that a measure which has engaged such an unusual degree of attention, relative to which an expenditure so great has been gone to, and which is of so much public interest, will be rendered nearly perfect, and as far as so technical a production can be, will be rendered elegant; that its style and orthography may be appealed to as a standard, and not be pointed at as authority for the old confusion in matters of so much importance. We therefore trust we may not be offended by seeing the misspelling "chimneys, monies, attornies, breast-summers;" but that they may be written in all cases chimneys, moneys, attorneys, breast-summers; that a proper use may be made of the words *to* and *from*, and that the present misplacing of words almost general throughout the Bill may be remedied, so as to vie with the nervous propriety of old unpunctuated English, which, somehow or other, always conveyed its meaning without any doubt, whereas a large portion of modern punctuated English is, from the false position of its words, weak and open to innumerable constructions other than the intended meaning.

We now proceed to the reconsideration of the schedules of the Bill.

SCHEDULE (C), PART I.—The following are now the proposed particulars of the *second class*:—"If a building be built originally as a

warehouse, storehouse, granary, brewery, distillery, manufactory, workshop, or STABLE, or be occupied or intended to be occupied as such, or for a similar purpose,—then it is to be deemed to belong to the second or warehouse class;"—in which it will be perceived that the word *stable* is now included.

*Rule for ascertaining height.*—The following is the original form of this proposal:—

"The height of every building is to be ascertained by measuring from the surface of the first or lowest floor of the building, up to the underside of the ceiling of the topmost story at the highest part thereof, whether such story be within the roof or not:

"And if there be no ceiling made or intended to be made to the topmost story,—then by measuring from the surface of such first or lowest floor of the building up to the underside of any tie-beam, collar beam, or other substitute for a tie-beam or within the roof of the building, and to the highest part of such roof, and the level of the under-side of such tie-beam, or such substitute for a tie-beam, is in such case to be taken to mean the ceiling of the topmost story."

The following words have been added to obviate the defect pointed out by Mr. Bartholomew: "And if there be no tie-beam, collar-beam, or other substitute for a tie-beam, or within the roof of any building,—then up to a level three feet below the level of the under-side of the ridge-piece, or substitute for a ridge-piece, to the roof of such building." But we must repeat that gentleman's observation, to the following effect:—"Any additional depth to which it may be necessary to carry down the walls of a building, in order to arrive at a secure foundation, ought to be clearly excluded from the admeasurement of stories, and if the party-walls and other walls be carried down to different levels, as is sometimes necessary, clear definition ought to be provided for such cases." And that, "The official referees ought to have a discretionary power relative to permitting addition to the thickness of walls; otherwise cases of excessive hardship and vexation will arise."

The mode of rating buildings has been altered as follows:—

SCHEDULE (C.)—PART II.—CONDITIONS for determining the Rates to which Buildings of the First or Dwelling-house Class are to be deemed to belong, and the thickness of the External Walls and of the Party Walls thereof.

In reference to Height.	In reference to Area.	In reference to Stories.	Rate of Building.	Requisite thickness of External Walls of each Rate of the First Class.	Requisite thickness of Party Walls of each Rate of the First Class.
1. If the building height be more than 70 feet, and not more than 85 feet,	-- If the building cover more than 10 squares, and not more than 14 squares,	-- If the building contain seven stories,	-- It is to be of the first rate of this class,	-- And the thickness of the external walls must be, at the least, 21½ inches from the top of the footing up to the under-side of the floor next but three below the topmost floor; and, at the least, 17½ inches from the under-side of the floor next but three below the topmost floor, up to the under-side of the floor next below the topmost floor; and, at the least, 13 inches from the under-side of the floor next below the topmost floor up to the top of the wall.	-- And the thickness of the party-walls must be, at the least, 21½ inches from the top of the footing up to the under-side of the floor next but three below the topmost floor; and, at the least, 17½ inches from the under-side of the floor next but three below the topmost floor up to the under-side of the floor next below the topmost floor; and, at the least, 13 inches from the under-side of the floor next below the topmost floor up to the top of the wall.
But if it be height more than 85 feet,	-- or if it cover more than 14 squares,	-- or if it contain more than seven stories,	-- It is to be an extra first rate of this class,	-- And the thickness of the external walls must be, at the least, 21½ inches from the top of the footing up to the under-side of the floor next but two below the topmost floor; and, at the least, 17½ inches from the under-side of the floor next but two below the topmost floor up to the top of the wall.	-- And the thickness of the party-walls must be at the least, 21½ inches from the top of the footing up to the under-side of the floor next but three below the topmost floor; and, at the least, 17½ inches from the under-side of the floor next but three below the topmost floor up to the under-side of the topmost floor; and, at the least, 13 inches from the under-side of the topmost floor up to the top of the wall.
2. If more than 52 feet, and not more than 70 feet,	-- or if it cover more than 6 squares, and not more than 10 squares,	-- or if it contain six stories,	-- It is to be of the second rate of this class,	-- And the thickness of the external walls must be, at the least 17½ inches from the top of the footing up to the under-side of the floor next but one below the topmost floor; and, at the least, 13 inches from the under-side of the floor next but one below the topmost floor up to the top of the wall.	-- And the thickness of the party-walls must be, at the least, 17½ inches from the top of the footing up to the under-side of the floor next but one below the topmost floor; and, at the least, 13 inches from the under-side of the floor next but one below the topmost floor, up to the top of the wall.
3. If more than 38 feet, and not more than 52 feet,	-- or if it cover more than 4 squares, and not more than 6 squares,	-- or if it contain five stories,	-- It is to be of the third rate of this class,	-- And the thickness of the external walls must be, at the least, 17½ inches from the top of the footing up to the under-side of the floor next but two below the topmost floor; and, at the least, 13 inches from the under-side of the floor next but two below the topmost floor up to the top of the wall.	-- And the thickness of the party-walls must be, at the least, 17½ inches from the top of the footing up to the under-side of the floor next but two below the topmost floor; and, at the least, 13 inches from the under-side of the floor next but two below the topmost floor up to the under-side of the topmost floor; and, at the least, 8½ inches from the under-side of the topmost floor up to the top of the wall.
4. If not more than 38 feet,	-- or if it do not cover more than 4 squares,	-- or if it do not contain more than four stories,	-- It is to be of the fourth rate of this class,	-- And the thickness of the external walls must be, at the least, 13 inches from the top of the footing up to under-side of the floor next below the topmost floor; and, at the least, 8½ inches from the under-side of the floor next below the topmost floor up to the top of the wall.	-- And the thickness of the party-walls must be at the least, 13 inches from the top of the footing up to the under-side of the floor next but one below the topmost floor; and, at the least, 8½ inches from the under-side of the floor next but one below the topmost floor up to the top of the wall.

TRANVERSE SECTIONS OF WALLS OF THE FIRST, OR DWELLING-HOUSE CLASS, ACCORDING TO THE DESCRIPTIONS OF THEIR THICKNESSES IN SCHEDULE (C.)—PART II.

SCHEDULE (C.)—PART III.—CONDITIONS for determining the Rates to which Buildings of the Second or Warehouse Class are to be deemed to belong, and the thickness of the External Walls and of the Party Walls thereof.

In reference to Height.	Rate of Building.	Requisite thickness of the External Walls of each Rate of the Second Class.	Requisite thickness of the Party Wall of each Rate of the Second Class.
1. If the building be in height more than 66 feet,	- It is to be of the first rate of this class,	- - And the thickness of the external walls must be, at the least, 26 inches from the top of the footing up to the level of 76 feet below the topmost ceiling; and, at the least, 21 1/2 inches from the level of 76 feet below the topmost ceiling up to the level of 36 feet below the topmost ceiling; and, at the least, 17 1/2 inches from the level of 36 feet below the topmost ceiling up to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 26 inches from the top of the footing to the level of 76 feet below the topmost ceiling; and, at the least, 21 1/2 inches from the level of 76 feet below the topmost ceiling up to the level of 36 feet below the topmost ceiling; and, at the least, 17 1/2 inches from the level of 36 feet below the topmost ceiling up to the level of the topmost ceiling; and, at the least, 13 inches from the level of the topmost ceiling up to the top of the wall.
2. If more than 44 feet and not more than 66 feet,	- It is to be of the second rate of this class,	- - And the thickness of the external walls must be, at the least, 21 1/2 inches from the top of the footing up to the level of 58 feet below the topmost ceiling; and, at the least, 17 1/2 inches from the level of 58 feet below the topmost ceiling up to the level of 22 feet below the topmost ceiling; and, at the least, 13 inches from the level of 22 feet below the topmost ceiling up to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 21 1/2 inches from the top of the footing up to the level of 58 feet below the topmost ceiling; and, at the least, 17 1/2 inches from the level of 58 feet below the topmost ceiling up to the level of 22 feet below the topmost ceiling; and, at the least, 13 inches from the level of 22 feet below the topmost ceiling up to the top of the wall.
3. If more than 22 feet and not more than 44 feet,	- It is to be of the third rate of this class,	- - And the thickness of the external walls must be, at the least, 17 1/2 inches from the top of the footing up to the level of 28 feet below the topmost ceiling; and, at the least, 13 inches from the level of 28 feet below the topmost ceiling up to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 17 1/2 inches from the top of the footing up to the level of 28 feet below the topmost ceiling; and, at the least, 13 inches from the level of 28 feet below the topmost ceiling up to the level of the topmost ceiling; and, at the least, 8 1/2 inches from the level of the topmost ceiling up to the top of the wall.
4. If not more than 22 feet,	- It is to be of the fourth rate of this class,	- - And the thickness of the external walls must be, at the least, 13 inches from the top of the footing up to the level of 9 feet below the topmost ceiling; and, at the least, 8 1/2 inches from the level of 9 feet below the topmost ceiling up to the top of the wall.	- - And the thickness of the party-walls must be, at the least, 13 inches from the top of the footing up to the level of 16 feet below the topmost ceiling; and, at the least, 8 1/2 inches from the level of 16 feet below the topmost ceiling up to the top of wall.

TRANSVERSE SECTIONS OF WALLS OF THE SECOND, OR WAREHOUSE, CLASS, ACCORDING TO THE DESCRIPTIONS OF THEIR THICKNESSES IN SCHEDULE (C.)—PART III.

SCHEDULE (C.), PART IV.—*Rules concerning Buildings of the Second or Warehouse Class—Warehouses, &c.*—“With regard to any building of the second class, hereafter built or rebuilt, in reference to the area thereof within the same enclosing-walls:—  
 “If such building exceed 35 squares, then it must have for every 35 squares thereof party-walls; unless the quantity exceeding 35 squares or an extent of 25 feet in length at the least, and the whole breadth of every such building, between every two quantities which together may exceed 35 squares, and not amount to 70 squares, and neither of which must exceed 35 squares, be built and fitted from the foundation to the highest part of the roof, or other summit thereof, wholly fire-proof; or otherwise, unless such portions of such buildings as shall be thought necessary by the official referees, upon special application, be built in like manner fire-proof;  
 “And in either such cases, no internal separation by party-walls of the same building will be required.”  
 As Mr. Bartholomew suggested, stables are

not now proposed to be confined to 25 squares, but may be made as large as any other building of the warehouse-class.  
*Openings in Party-walls.*—“And with regard to buildings of the second class, in reference to the openings in party-walls;—  
 “Such openings must not be made wider than six feet, nor higher than eight feet, unless in each case the official referees shall previously authorize larger openings.  
 “And the floor, and the jambs, and the head of every such opening must be composed of brick or stone-work throughout the whole thickness of the wall.  
 “And every such opening must have a strong wrought-iron door on each side of the party-wall, fitted and hung to such opening without wood-work of any kind; and such doors must not be less than one-fourth of an inch thick in the panels thereof;  
 “And each of such doors must be distant from the other not less than eighteen inches.”  
 Thus power is reserved to the official referees to allow such doors to be increased in dimensions; the doors which before were required

to be 4 feet apart, are now proposed to be only 18 inches apart. We must still insist that the floors, jambs, and heads of such doorways ought also to be permitted to be made of iron or other incombustible substances.  
 The following is the form of the remainder of this part of the Bill:—  
*Fire-proof part of Buildings.*—“And with regard to such second-class buildings so built in part fire-proof, in reference to the construction and materials of such fire-proof part, it must be built of such materials and in such manner as shall be approved by the official referees.”  
*Roofs.*—“And with regard to the roofs of buildings of the second class, in order to prevent the formation of curbed roofs to such buildings, the plane of the surface of the roof of every such building must not incline from the external or party-wall upwards at a greater angle than 50 degrees with the horizon.”  
 This latter provision relative to roofs is a new introduction.  
 SCHEDULE (D.)—PART I.—*Materials of Footings.*—The words, “squared stone,” have

been inserted. The word "squared" ought to be removed as ridiculous; those stone foundations which are of materials not squared, but closely jointed at various angles, in general are the soundest and freest from settlement.

**Walls generally.**—With regard to every party fence-wall, and to the external walls and party-walls of every building hereafter built, and of every addition to such building, whether already built or hereafter built,—Every such wall must stand equally on each side within the top of its footing."

Compelling the upward diminution of footings to be equal on both sides is highly objectionable; there are many cases in which walls, to be built substantially and effectively, are required to be set out of perpendicular, and with their footings more on one side than the other.

**Thicknesses of Enclosing Walls to Stories of Buildings of whatever Rate.**—"With regard to the enclosing walls to stories of buildings of the first and second classes,—Each of the enclosing walls of any such story, throughout the whole height thereof, from the top of the footing up to the top of such story, and with all the sets-off in addition required for such wall, to whatever rate or whichever class it may belong, and throughout at the least one-third of the whole length of such wall, in piers properly distributed, must be of the following dimensions (unless cross or return walls, coursed and bonded with the enclosing walls, shall, in the opinion of the official referees, upon special application to them in each particular case, give sufficient strength, with less thickness in such enclosing walls); that is to say,—

"As to first class buildings; if the story be in height more than 11 feet,—then the thickness of its enclosing walls must be at the least 13 inches.

"Or if the story be in height more than 15 feet,—then the thickness of its enclosing walls must be at the least 17½ inches.

"As to second class buildings; if the story be in height more than 9 feet,—then the thickness of its enclosing walls must be at the least 13 inches.

"Or if the story be in height more than 12 feet,—then the thickness of its enclosing walls must be at the least 17½ inches.

"Or if the story be in height more than 15 feet,—then the thickness of its enclosing walls must be at the least 21½ inches.

"Or if the story be in height more than 18 feet,—then the thickness of its enclosing walls must be at the least 26 inches.

"Nevertheless, any external wall of any building of the first class in which there are no apertures or recesses may be built of the thickness of 13 inches, of any height not exceeding 18 feet, within any story, although the rate of the wall may require a greater thickness, if another external wall and a cross wall of not less than 8½ inches thick, coursing and bonding with such external wall, or if two such cross walls occur within a length of 24 feet of such wall; but always upon condition that the substructure of such wall is 4 inches thicker at the least than such superstructure, and vertically under it.

"And also any such external wall abuted by cross or return walls within a length of 12 feet may be built of any thickness not less than 13 inches, notwithstanding the rate of such wall may require a greater thickness, if not more than one aperture or recess occur within such length of 12 feet, and not more than one-half the quantity in length be taken out of such compartment of a wall by any such aperture or recess."

**PART II.—External Walls.—Construction and Materials.**—"And with regard to the component materials of external walls to buildings of whatever class;—

"Every such wall must be built of SOUND BRICKS, or of SQUARED STONE, or of SUCH BRICKS AND STONE TOGETHER, laid in and with mortar or cement in such manner as to produce solid work; and every such wall must be carried up of its full thickness to the underside of the plate under the roof.

"Nevertheless, in such walls, besides all requisite openings for doors and windows, recesses may be formed, so that the back thereof be of the thickness of 8½ inches at the least; and so that the stability and sufficiency of the wall be not injuriously affected by making such recesses.

"And with regard to other substances than the component materials of external walls,

"There may be such wood and iron as shall be necessary.

"And every plate, lintel, bond, corbel, being of wood, and every wood-brick laid into any external wall, and all ends of joists, of girders, and of the heads and sills of partitions running into any external wall, must be fixed at a distance from the external face of the wall of four inches at the least.

"And the frames of doors and windows must be fixed in reveals at a distance from the external face of the wall of four inches at the least.

"And shop-fronts must be fixed in such manner as is herein specially directed.

"And the tiers of doors-cases to warehouses must be fixed in the openings left in such walls, at a distance from the external face of the wall of two inches at the least.

"But no timber must be laid into any external wall in such manner, or of such length, as to render the part of the wall above it wholly, or in great part, dependent upon the wood for support, or so that any such wood might not be withdrawn without endangering the safety of the superincumbent structure, except in the case of hrestsummers."

We again refer to Mr. Bartholomew's notes: absurd is the objection to "opus incertum" masonry, such as most ancient Gothic buildings are composed of, and which has in so many thousand instances survived walls of squared materials. We advise an hour's twoshilling ride to Cheshunt Church, which is of such masonry, sound, and without a fracture.

**Wood and Iron.**—"We think that no plate or bond of wood ought to be allowed to extend into a wall so much as half the thickness of such wall, and that in walls not exceeding 13 inches in thickness, the wooden plates and bond inserted therein ought to be restricted to 4 inches.

"We think that more exact definitions are required respecting the ranges of windows of printing-offices and workshops."

**Height and Thickness of Parapets.**—"And with regard to external walls, in reference to the height and thickness of any parapet thereon:—

"If an external wall adjoin a gutter,—then such external wall must be carried up, and remain one foot at the least above the highest part of such gutter.

"And the thickness of an external wall, so carried up above the level of the underside of the gutter-plate, and forming a parapet, must be at the least,—

"In every such wall of the extra first rate of the first class, and in every such wall of the first rate of the second class, 13 inches thick; and—

"In every other external wall of whatever rate or whichever class, 8½ inches thick."

The requirement of parapets 13 inches thick is ridiculous, tending to injure the formation of gutters properly, and affording no advantage. Nothing could be more absurd than to compel gothic pierced parapets, carried up for ornament, to be made expensively gouty: those roofs last far the longest which project without any parapets at all, the wet, in case of imperfection, falling without the building.

(To be continued.)

#### SOMATOLOGY, OR THE ESSENTIAL AND CONTINGENT PROPERTIES OF MATTER.

BY ALEXANDER JAMIESON, LL.D.

(Continued from p. 311.)

Our organs of sense furnish us with accurate ideas or perceptions of the various properties which all bodies possess, whether in a state of apparent rest or of visible motion. Thus, touch informs us of the exterior surface of a body, its figure, hardness, softness, or any other property essential or contingent which it may possess, except colour, smell, or taste. Sight, with the intervention of light, gives us clear perceptions of the superficial extension and figure, apparent magnitude, colour, &c. of bodies. Hence we may clearly understand how observation, or that attention which we pay to the appearances of objects that are remarkable, or which become subjects of our scrutiny, contributes to our aid in the pursuit of science. And things become remarkable as

they fall under our scrutiny and observation and not by tradition; by their reference to other objects, or by their comparison, similitude, or contrast with each other. Our familiarity from infancy with the objects around us, and the heedless gaze we glance upon, the material world, our daily intercourse with the objects of which it is composed, the knowledge we have by habit of its wonderful properties, all contribute to make us indifferent observers; nor do we readily begin to read the volume of nature to mark the various appearances under which she presents herself to our view, to learn that there is one set of phenomena which characterizes the operations of our mind in its examinations and pursuits, and another which characterizes body, matter, or the substances composing this fair world; and that these are *toto cælo* different one from the other. But when we have begun to speculate upon the material world, we find that our souls are endowed with powers capable of deriving pleasure from an accumulation of intellectual knowledge, independent of all consideration of its advantages. Our observation becomes then profitably fixed upon the properties of body or of matter, and we in some measure understand by reference to other bodies and other matter, what may be the bulk, weight, elasticity, fluidity, &c. of such as we wish to compare and contrast one with another. And if these observations be applied to what we have already said upon this subject—that is upon body or matter—the reader will clearly perceive what species of discipline the mind undergoes in entering upon the very threshold of science, and with how much stability it must be loaded, if we may speak figuratively, in order to exercise its powers for the acquisition of such knowledge as belongs to that branch of natural philosophy which we designate somatology.

All bodies are composed of elements which are supposed to be few in number, but, by their combinations, capable of producing all the varieties found in the works of nature. The extraordinary transformations we discover excite our surprise, and prove that there can be no absolute annihilation. We do not refer to mere antiseptics or those substances that resist putrefaction, or apparent dissolution by the action of the elements; nor do we glance at the wreck of the antediluvian world in coal basins, chalk-pits, and organic remains of animals larger than any now existing by as much as the lives of the patriarchs exceeded the present standard of life in the proportion, at least, of ten to one. The antediluvian world was altogether, and except one family and the animals, &c., preserved by that family, entirely changed by a visitation the most awful that could have visited the earth; but there was no annihilation of the materials composing the old world. Nor is there annihilation now of any part of nature's productions. Thus, grass seems to be the origin of blood, chyle, milk, flesh, bones: and light, air, and water are the chief nourishment of plants that grow in the earth or vegetate in any other circumstances. The oak is the same material now that it was four thousand years ago. Its essence is unchangeable. In fact, we may thence infer that the elements of bodies are not only few in number but unchangeable in character, essence, or essential properties. Men are black, copper-coloured, brown, fair: cross the breed as you will, the elements of the original remain unchangeable,—nature is always herself. And this regularity, or uniformity in the course of nature, shews that the elementary parts of bodies are permanent and unchangeable; for if these elementary particles which constituted an oak some four thousand years ago had undergone any gradual decay, the oaks of the present day would have been formed considerably different from those of the Patriarch's times; but as we cannot allege any difference, it would seem that the ultimate elements of bodies have continued the same. This is equally remarkable in the human race. Men are not more divided by speech than by cast or colour and physical organization.

We have already noticed that the ancients confined the elements of bodies to four—fire, air, earth, and water: but chemistry unfolds many combinations of air, earth, and water, into each of which that invisible fluid *heat* enters, and with which they unite in a wonderful manner. All matter which is the object of

our senses is continually being altered and changed in form, or some other of its essential or contingent properties; but never ultimately destroyed by annihilation. For all those changes which take place in the sensible qualities of bodies, result from the action of one species of matter upon another. Thus, the ascension of water from the earth in the form of vapour, by means of the sun's influence and other atmospheric causes; the conversion of certain elements of air, moisture, and earth into the structures of plants by the peculiar organization of these bodies; the formation of coal and other species of bitumen under the surface of the earth by the changes which vegetables undergo when deprived of their vital principles, and they have become subservient to other agencies; and the liquefaction of metals by means of fire;—prove that the operations of chemistry are concerned in the greater part of the secret processes of nature as palpably as of those which display the most useful and agreeable results of the art of man. But chemistry, like nearly the whole of the other subjects of human skill and industry, was practised as an art long before any knowledge of its principles was attained as a science. And our inquiries are vain when we search to discover the inventor of the first plough, the baker of the first bread, the potter who first turned a bowl on the wheel, or the wright who hollowed out the first canoe. Men used their hands for the purpose of supplying their wants long before they were acquainted with the laws of mechanics; and prompted by the power of instinct or invention, while the example of other animals favoured their imitative faculties, they exercised many of the useful arts without knowing on what principles they were enabled to attain their ends. Yet were these ends attained at a period very far anterior to that in which they had any methods of recording their acquirements; and more remote too, we should suppose, than that to which the immense grasp of human tradition can extend.

But what has all this to do with a discourse upon somatology? Much every way. Unless in those remote ages had studied the essential and contingent properties of bodies, the arts of metallurgy, dyeing, and pottery, which are mentioned in the earliest literary records we possess, would not have arrived at the excellence they had reached; and but very few people have been found so barbarous as not to present some specimens of their skill in productions allied to those arts. Nor was their genius confined to one quadrant in the circle of sciences; they traversed its circumference, else whence those difficult and abstruse chemical processes that have immortalized Egyptian invention and Mexican skill? The grape, eaten in its unfermented juice, is charged with no inebriating qualities, but its expressed juice is rendered intoxicating; and the vine is never mentioned in times of remote antiquity except as the fruit which "maketh glad the heart of man." Osiris or Bacchus traversed the globe for the purpose of teaching all nations the cultivation and use of the vine. But to illustrate our allusion to Egyptian invention. The conversion of rough ore into a finely polished metal, the application of antiseptics in the art of embalming the dead, the whole art and mystery of medicinal chemistry as practised by the corporations of mummy-makers, the manufacture of colours and of stained glass, demonstrate a state of civilization highly conducive to the comforts of man; for the Egyptians were without doubt the first people of antiquity who excelled in all the arts which are purely scientific. As it was among the nations of antiquity, so it is with us; some men record the observations that fall within their reach, others by experiments arrive at results highly conducive to the comfort of society; upon inquiry we find that the material world, and the application of its treasures to the ease or splendour of human existence, form the grand emporium in which every man, as he may be prompted by inclination or talents, is at liberty to exercise his talents and push forward his invention to convert to public advantage and private emolument the inexhaustible resources which on all hands solicit the unremitting application of his patient, laborious industry.

Mechanical means may be employed to reduce masses of hard substances to dust; the agency of fire will convert water into steam;

nay, even gold, which in the crucible becomes liquid, can by intense heat be dissipated into vapour and again collected into its original mass without losing in weight by these most extraordinary changes. In this example, the identity of the substance we call gold is the most unanswerable proof of the indestructibility of matter. Our experiments must always be limited to our apparatus. But had we the means of erecting apparatus sufficiently capacious, we might light off in vapour all the water in Loch Ness, or reduce to fine sand all the Grampian Hills. Yet the vapour, though by the laws of repulsion it was no longer water, would still exist, and the *debris* of those primitive rocks would be held down to the surface of the earth by virtue of gravitation.

Thus we see that whether we assume the veriest atom of aeriform, liquified, or gross and hard substances, as the representative of body and matter, all that we can do with that atom but enables us the more accurately to define its properties, and expatiate upon the transformations through which it can be pushed by human ingenuity. Let the gold-beater hammer his leaves of gold so thin that eighteen hundred of them would not be thicker than a leaf of this book, still it is gold! Let the chemist with a single grain of vitriol or carmine tinge a gallon of water, every particle of his vitriol, every atom of his carmine, is diffused in the water, every drop of which imbibes the die. Let the manufacturer of gas convert the pith of coal into an invisible aeriform fluid, its permanency is obvious by the light it affords, and its soot, which is generated by the flame, attests the indestructible quality of matter. Let the grave absorb the noble structures that once formed the frail tenements of immortal spirits, still the ultimate particles of kindred matter will serve again for new combinations, as inexplicable to our gross senses, and incomprehensible to our finite understandings, as the solution of the great problem which forms the basis alike of revelation and of all human knowledge; "In the beginning God created the heaven and the earth."

In that heaven and this earth we behold the greatness of Almighty Power, the infinite wisdom and unsearchable goodness of our common Parent. With bow much humility, then, doth it become us to talk about even the properties of matter. Some of these properties are essential to its existence; others are contingent to that existence, and depend upon various changes to which every created substance is liable, by reason of the invariable laws of nature, or the transformations to which it may be subjected by the ingenuity of man. But in any and in all situations matter is body, and body is matter; yet in geometrical language the term body means a solid, which in natural philosophy is defined a portion of space or of matter limited in magnitude on all sides. (Habit has fixed upon our minds a notion of space that supersedes definition. Body—that is, a solid—considered in itself, may be viewed as indifferent to motion or rest, but capable of any sort of motion, straight or curvilinear, speedy or slow, and of all sorts of figure, square, round, and oval, or of any forms we may choose to impress upon it externally. Body then is matter, of which we know nothing except by its properties; and our notions of these properties are all simple ideas, which we cannot divide, even in imagination, so perfectly uniform are they, so devoid of parts. But when we proceed to analyse these ideas, their simplicity vanishes—each forms a nucleus of an extensive aggregate; the fecundity of the whole exceeds our furthest conceptions. For, how many associations may we link with the terms extension and figure? and yet these are but two out of a dozen of properties that we might enumerate as essential or contingent to all matter, *solid or fluid*.

Moreover, all bodies have secondary properties, which may be classed as hard, soft, and elastic. A *hard body* does not yield without breaking to any stroke or percussion, but retains its figure unaltered, unless the blow or percussion be so great as to overcome the cohesion of the parts, and produce fracture or pulverization. A *soft body* is that which yields, in all its parts, to any stroke or percussion, or even impression, without ability of restoring itself to its original form. An *elastic body* is that whose parts yield to any stroke, but immediately begin to restore themselves, and

the body ultimately assumes its previous figure. There are no bodies, however, with which we are acquainted, that are perfectly hard, soft, or elastic; but all bodies—that is to say, all matter, or created substances—possess some one of these properties in a greater or less degree.

The popular distinction of matter into solids and fluids requires to be noticed in this place. Philosophers define a solid as that in which the attractive power of the particles of which it is composed exceed their repulsive power, and consequently they are not easily moved among themselves: the body therefore retains any figure with which it may be impressed. A fluid, on the other hand, is that in which the attractive and repulsive power of the particles are in exact equilibrio, or in a state of balanced rest amongst themselves, and the body therefore yields to the slightest impression, and, like the elastic body, easily and readily resumes its primitive form. A fluid is any thing which cannot be grasped by the hand like a piece of marble or the branch of a tree.

Among the mechanics of natural history, one of the most delicate examples we have to offer in illustration of a fluid is the following:—

Upon the surface of smooth water, you will see the most active little insects run their daily course without sinking, or even wetting their feet. Examine with a magnifying glass the track which one of these has run on the surface of the water, and round each foot a pit will be observed resembling the indentation which a baker makes in kneading dough. If the feet of these insects be examined with a microscope, they will present five or six spreading hairs, ranged as the rays in which we draw a star. When on the water, each fibre is surrounded by a pit, much broader than the fibre; the quantity of water displaced in the pits is exactly equal to the weight of the insect, which in its rapid course upon the bosom of an Alpine spring leaves the most beautiful tracery behind it that can be imagined, and analogous to what may be termed the mechanical undulations which we trace in the wake of a steam-vessel; so also a well-polished needle will displace its weight of water and swim, because its surface is so smooth that the water does not adhere to it. The brushy feet of the insects are in physical, but not in mathematical contact with the water, and, by repelling it, depress so much of it that they are supported. But upon luke-warm water or a glass of mixed ordinary distilled spirit and water, none of the aqueous insects can run; on these they will sink to their belly. Into the specific law of corpuscular action, which obtains in this case, our inquiry does not enter. We have shewn that a fluid is matter which yields to the slightest impression, and we might further confirm our example by reference to the whale and the minnow; the fry of the minnow, not one-tenth of an inch long, and even wonderfully smaller animals which the microscope exhibits to our gaze, swim about with perfect freedom in a globule of water. The particles of fluid bodies are spherical, and their forces are more directed to their centres than to their surfaces, by which means motion is allowed freely when any force is applied from without; whereas when these particles are at rest all their parts are in equilibrium, in respect of each other. The pressure however of incumbent bodies, and containing vessels, always produces some deviation from the perfect equilibrium. It may be that in fluids of one class the particles or molecules have no mutual power, or they may have repulsive or attractive power. Of the first we have examples in sand and fine powders; of the second are the elastic fluids, as air; and of the third all fluids, as water, mercury, &c. These three kinds of fluids are obviously produced by the original differences which exist in the primary particles of which they are composed.

EXTRAORDINARY CIRCUMSTANCE.—One mass of rock has been raised in Mr. King's quarry, Higher Bebbington, 40 feet long, 12 feet wide, and 3½ feet deep, making 1,630 cubic feet, or 120 tons. It is perfect, and without stain or flaw of any kind, and is now being cut up for use.—*Hatifax Guardian*.

## ENTRANCE TO THE BRITISH MUSEUM.

ENGLISH DOORWAYS.—No. 2.  
MONTAGUE HOUSE.

We this week give a view of the entrance leading from Great Russell-street, Bloomsbury, through the screen-wall to the courtyard of Montague House, now with the new buildings forming the receptacle of the British Museum. We hasten to insert a view of this subject, as it will no doubt very soon be no more. We have two other engravings upon the same building ready, but on account of our extended remarks upon the proposed New Building-Act, cannot this week insert either them, or any extended remarks.

THE WELLINGTON STATUE.

The cost of the statue and pedestal was 9,000*l.*, the metal having been given to the committee by the Chancellor of the Exchequer, and valued at 1,500*l.*, in addition to that amount. The money was raised by a public subscription, after a meeting held at the Mansion House. The contract with Sir Francis Chantrey was made in February, 1839, by the trustees, Sir Peter Laurie, Mr. John Masterman, Mr. Arthur K. Barclay, and Mr. R. L. Jones, the work to be completed and fixed by 1843. Sir F. Chantrey, at his death, left the whole model complete, and also the head of the duke the full size. The work has since been completed by his assistant, Mr. Weeks, under the direction of the executors. There was much apprehension from the delay in delivering the stones of the pedestal to the contractors, Messrs. McDonald and Lesley, that the statue could not have been completed on the anniversary of the battle of Waterloo, and they were not on the ground until mid-day on Saturday. Mr. Jackson, the

contractor for the Royal Exchange, then took the work in hand, and by the most spirited exertions succeeded in getting the whole of the pedestal fixed, and the statue in its place by the evening of Monday. The general opinion passed upon the pedestal during yesterday was, that it is much too high and too plain to do justice to the magnificent structure in the front of which it is placed.—[Bah!]

The statue itself is 14 feet in height from the feet of the horse to the top of the head of the duke. The pedestal on which it stands is of Peterhead, or the red granite of Aberdeenshire, with the exception of the lower course, which is of grey granite. The pedestal is altogether 14 feet high, so that the total height is exactly 28 feet. The attitude of the horse is of the quiet character which was introduced by the great artist, and greatly resembles the horse of the statue of George IV. in front of the National Gallery. The costume of the duke is generally taken from that which he wore on the great day of Waterloo, including his usual and remarkable military cloak.—*Morning Herald, June 20.*

ROYAL COMMISSION OF FINE ARTS.

The exhibition of works sent in, pursuant to notices issued by Her Majesty's Commissioners of Fine Arts, in May and July, 1843, with a view to assist them in the selection of persons to be employed in the decoration of portions of the New Houses of Parliament, will be thrown open to the public on Monday next, at Westminster Hall. The subjects included in the present exhibition, by the terms of the notices, are limited to the following departments of art:—1. Models of statues of British Sovereigns and illustrious personages, to be subsequently executed in bronze or marble, for the decoration of the New Palace. The works to be ideal or portrait, statues, or groups; the sub-

jects being left to the choice of the respective artists. The specimens, not exceeding two in number, to be sent by each artist, may be either prepared for the occasion, or selected from works already executed by him within five years; but the dimensions of each work must be on the scale of an erect human figure, not less than three nor more than six feet. 2. Specimens of fresco painting, executed on portable frames, each specimen to be composed of not less than two applications of the superficial mortar, so as to exhibit the skill of the artist in joining the work of two or more days. Each exhibitor in this department is at liberty to send a cartoon as a specimen of his ability in design and composition. The reception of subjects closed on the 15th inst., the original period having been extended one week on the petition of a large body of artists. The work of arrangement, however, has been progressing during the last fortnight, and his Royal Highness Prince Albert, accompanied by the Duke of Sutherland, Lord Colborne, the Earl of Lincoln, Viscount Palmerston, Lord Mahon, Lord John Russell, Sir R. Inglis, and several other commissioners, inspected the exhibition on Friday week. The commissioners, who were conducted through the hall by Mr. Eastlake and Mr. Barry, are understood to have expressed themselves much gratified with the general character of the works; but, in the exercise of their judgment, it was thought advisable to exclude many subjects in the fresco department, as not possessing sufficient artistic merit to entitle them to a place in the exhibition. The models for works in sculpture are both numerous and interesting. These occupy the centre of the hall, and being most favourably placed for observation, will probably form the most attractive feature in the forthcoming exhibition. The frescos, with their accompanying cartoons, are also numerous, and it is said that some of them evince a very satisfactory degree of talent in this interesting branch of art. From their limited size, how-

ever, none of the subjects exceeding eight feet in their longest dimension, and from the large number which it has been thought right to exclude, the walls of the hall do not present so well covered an appearance as on the recent occasion of the cartoon exhibition. It is expected that her Majesty will honour the exhibition with a visit previous to its being opened to the public on Monday next.

**SAFETY BEACON FOR THE GOODWIN SANDS.**

The Trinity Buoy steam-yacht, on June 20th, towed off to its station, on the Goodwin Sands, a stupendous safety beacon, designed and executed, we believe, by James Walker, Esq., C. E., under the auspices of the Trinity Board. The beacon is intended not only to be a guide to mariners, but also a place of refuge for the crews of vessels cast away on the fatal Goodwin. It will be recollected that a safety beacon, the invention of Captain Bullock, R.N., was placed on the Goodwin Sands some years since, and still braves the storm. The one that has been towed out to-day is of larger dimensions, and will be placed on a different part of the sands. This beacon is an experiment, and we understand, should it succeed, it is the intention of the Trinity Board that similar fixed erections shall supersede floating buoys. Mr. Walker's beacon consists of a strong iron column, about 40 feet high, based on a circular platform of solid masonry, the latter being upwards of 20 feet in diameter. The foot of the pillar is bell-shaped, and tapers upwards to the extent of some six or eight feet. About the middle of the column there is a convolute resembling a vessel's top, surrounded with an iron railing, capable of receiving, we should say, half-a-dozen men; and on the summit is placed an iron basket, shaped like a balloon, which is also constructed to contain about a like number of persons, should they be enabled to reach it in the case of shipwreck. The column is tied down to the stone-work by iron stays, and on it are fixed steps, by which it may be ascended.

The whole of the unwieldy machine is incased in a huge timber vessel, resembling a brewer's vat, in which it was built, for the purpose of floating it to its station on the sands. The sides of this wooden building are constructed in such a way as to admit of their being removed on the beacon settling down in the sand. The bottom, on which the masonry rests, will, however, remain under the beacon. —*Morning Herald.*

**Law Intelligence.**

**COURT OF QUEEN'S BENCH.—JUNE 12.**  
(Sittings in Banco.)

**THE QUEEN V. THE NORTHERN AND EASTERN COUNTIES RAILWAY.**

This was an application by a person named Webb, a lessee of Rye-house and farm, and of the tolls of Rye-bridge, for a mandamus against the defendants, to compel them to make a road on the line of their railway of a sufficient width, and in a manner which should accord with the requisites of the Act under which the company had been established. The line of railway went across the road, which had to be remade, and which it was contended ought to have been made 16 feet in width, and not less than one foot in 20 inclination.

Mr. Crowder, Mr. Kelly, and Mr. Wells shewed cause against the rule, and contended—first, that the bridge was in fact sufficient; and, secondly, that the provision on which this application was founded related solely to roads which were public roads, and that the road in which Mr. Webb was interested was a private road, and did not therefore come within the Act.

Mr. Erle and Mr. Gray, in support of the rule, insisted that this was a public highway, and was consequently the proper subject of this application. They further contended that the bridge was not in the state required by the Act.

The Court thought the question of liability which was raised on this application could not be satisfactorily decided on affidavit, and therefore made the rule absolute for the mandamus, that the facts might be stated on the return.

**LECTURES ON ARCHITECTURE AND ANTIQUITIES.**

*Lecture III.*

**ON GRECIAN ARCHITECTURE—THE DORIC STYLE.**  
(Continued from p. 313.)

AFTER passing through the Propylæa at Eleusis, the votaries had to enter another building, forming a second vestibule to the grand mystic temple, and here they had to encounter some of the appalling trials which awaited them. In this vestibule was a moveable floor, on which the aspirants for initiation descended to the mysteries below. The order in this building was the Ionic. Beyond this vestibule was the Temple of Ceres, which was protected by the sacred inclosure or wall. In front was a portico of twelve columns, which have the peculiarity, of not being fluted from top to bottom, as Doric columns usually are, but their shafts plain throughout their whole height, with the exception of a part at the top and at the bottom of each about 7 inches high, which is fluted. Within the temple, according to a passage in Plutarch, it is imagined there were two ranges of columns, with others over them. The architect of this building was Xenocles. Little is known concerning the Eleusinian rites, as the parties initiated were obliged to contract a solemn engagement to observe secrecy, and the celebration was conducted under the veil of impenetrable mystery. Those who revealed the nature of these mysteries were looked upon as the most impious of wretches, as unworthy to exist, and with whom it was not considered safe to hold communion. Thus Horace alludes to the general feeling of horror expressed against such persons,—

“Beneath one roof ne'er let him rest with me  
Who Ceres' mysteries reveals;  
In one frail bark ne'er let us put to sea,  
Nor tempt the jarring winds with spreading sails.”

One of the charges brought against Socrates, of impiety, arose from his contempt for the mysteries of Ceres; Diogenes, the Melian philosopher, on account of divulging some secrets of the Eleusinian rites, was proscribed, and a price was set upon his head; it very nearly cost Æschylus his life for speaking too freely of them in one of his tragedies; and the disgrace of Alcibiades proceeded from the same cause.

According to mythologic authority, when Ceres was in search of her daughter Proserpine, she was hospitably entertained at Eleusis, at the house of Celeus, king of Attica, to whose son, Triptolemus, she taught the art of agriculture, and imparted a knowledge of the holy doctrine; he in return instituted

festivals and mysteries in her honour. The celebration of these rites took place at night, to add to the impressiveness of the scene, and the aspirants were obliged to perform ablutions and sacrifices at the river Ilissus, near Athens, and after a year's preparation they were admitted to participate in the more solemn ceremonies which took place every fifth year at Eleusis, and which were called the greater mysteries (*μυστήρια μεγάλα*), whereas those observed at the Ilissus were the lesser mysteries (*μικρά μυστήρια*). They appear to have been very similar to the rites of the Egyptian goddess Isis, whence they were most probably derived. The emperor Hadrian introduced them at Rome, where they lasted until abolished by Theodosius the Great, after a total duration of 1,800 years. The colossal half-length of Ceres, brought to England by Dr. Edward Clarke, and now deposited in the public library at Cambridge, was found near the inner front of the second vestibule of this temple.

In front of the Eleusinian Propylæa was the temple of Diana-Propylæa, presenting an arrangement in its porticos differing from any examples we have hitherto noticed; instead of columns at its angles, *antæ*, which are often improperly called pilasters, terminate its fronts—the distinction between the Greek *antæ* and the Roman pilasters is very great. The former were never diminished (or so slightly as not to appear so to the eye), and were not fluted; their capitals consisted of straight lines; whereas the Roman pilasters were diminished like their columns, frequently fluted, and their capitals generally resembled those of the accompanying columns; and such pilasters were often placed in situations where the Greeks would have employed columns. The temple of which we are speaking was small, with a front measuring only 20 feet 10 inches on its upper step; its length 39 feet 9 inches, and its height to the top of the cornice 20 feet 6 inches; the building was of Pentelic marble, but with roof-tiles of baked clay.

At Olympia, in the Peloponnesus, once existed a magnificent hexastyle temple of Jupiter, of which the dimensions are presumed to have been 230 feet by 95 feet. Mr. Dodwell measured a column, of which the diameter was 7 feet 3 inches. Within this building was enshrined the master-piece of Phidias, his statue of Jupiter, of gold and ivory, 50 cubits high.

At RHAMNUS, in Attica, on the sea-coast, is a fine Doric temple of Nemesis, which stands in a noble situation, elevated 300 feet above the sea. Pausanias says that it was built by Alcamenes, the pupil of Phidias. This temple, and a smaller one adjoining it, dedicated to Themis, were inclosed by a wall of white marble, remains of which are yet to be traced. The temple of Nemesis had at

\* \* \* \* \*

Sic tralibus, fragilicque mecum  
Solvat phasilem.—*Od. li. lib. 3.*

TEMPLE OF DIANA-PROPYLÆA, AT ELEUSIS, IN ATTICA.

each end porticos of six columns, and flanks containing twelve each; the external columns, like those to the temple of Ceres, were only fluted at top and bottom.\* It is ascertained that the mouldings of the cornice were painted red, a practice adopted by the Greeks in other temples. The details in this building are very fine. Close to it is the small temple which bears the name of Themis, but which is supposed to be the original temple of Nemesis, injured by the Persians, and the Greeks not caring to repair a structure desecrated by their enemies, chose rather to erect another. The smaller building is, in fact, of an earlier style, being one of the class called *in antis*, a mode of building well known to be of great antiquity. It is very similar to the small temple of Diana, at Eleusis. These two temples in *antis*, of Themis and Diana, would serve as excellent models for an entrance porch to a gentleman's house of moderate size, and would afford a far better protection against sun, wind, and rain, than the lofty and open porticos, which are frequently designed in a way to afford no defence against the elements.

At **SCNIUM**, which is a promontory forming the southernmost point of Attica, are the remains of two Doric buildings; one is a Propylæa, the porticos of which have two columns placed between *antæ*. The other building is a temple dedicated to Minerva-Surias. The portico consisted of six columns, and ten have been ascertained on the flanks; but the building is so much in ruins that the exact number cannot be clearly made out. The structures are of marble, highly-finished, and belong to the best ages of Grecian architecture. "The striking remains of the temple of Minerva on the promontory of Sunium are, in all probability, to be attributed to the same authors." (The architects of Pericles—Lord Aberdeen's Inquiry, p. 143.)

At **THORICUS**, about eight miles to the north of Cape Sunium, are the remains of a singular Doric building, which was found half-buried in the sand, which being cleared, a portico was discovered, having fourteen columns on each front, and seven in each return; and as no remains of walls were discovered within the area, it is conjectured that the building was not a temple, but an open portico, perhaps an agora; these columns are only fluted at their upper and lower extremities.

Leaving Attica, we shall pass now into Sicily, where we find the remains of one of the most astonishing specimens of Doric architecture, surpassing in magnitude all that we have hitherto noticed. This is the celebrated temple of Jupiter Olympius, at **AGRIGENTUM**, now called Girgenti, and by Virgil styled, from a neighbouring river, Agræas. It was the wealthiest and most powerful city of Sicily, and, according to Diogenes Laertius, contained within its territory 800,000 persons. "The temples of Agrigentum, numerous and costly as they are, appear to have arisen during little more than a single century. The prosperity and independence of the city commenced with Theron, about 450 years before Christ; after the battle of Himera (fought on the same day with that of Salamis), his thoughts were entirely turned to its decoration, and the Carthaginian prisoners were made to assist by their labour in the erection of trophies to perpetuate the glory of their conquerors. The Agrigentines continued in this employment until a second and more successful invasion of the Carthaginians found them occupied in completing the temple of Jupiter Olympius, the greatest in the island, and one of the most stupendous monuments of ancient times." (Lord Aberdeen's Inquiry, p. 134.) We gather, from early writers, exalted notions of the wealth and splendour of this people. One of its merchants, named Gellias, is said to have received, at one time in his house 500 knights, and to have supplied them all with a change of raiment; the daughter of another citizen, Antisthenes, had 800 cars in her bridal train; 300 cars, each drawn by milk-white horses, superbly caparisoned, accompanied the return of Exænetus, as victor from the Olympic games. The horses of Agrigentum were long famous for their beauty and swift-

ness,\* and it is related by Pliny and by Diodorus (a native of the island, whence his additional name Siculus) that funeral honours were paid to those horses which had been often victorious in the Olympic games. Alluding to the pitch of luxury and splendour of building at which his countrymen had arrived, the famous philosopher Empedocles (the same who threw himself into the crater of Mount *Zæna* to immortalize himself) said of them, "that they so built as if they were to live for ever, and they so feasted as if they were to die on the day following."†

The temple of Jupiter was in its proportions truly colossal, and it ranked among ancient Greek temples as second only to that of Diana at Ephesus (which was 425 feet long and 220 feet in breadth); it was 369 feet in length, its breadth 182 feet, and its height 120 feet, in which dimensions Mr. Cockerell is of opinion that it exceeded the building at Ephesus. Unlike other Doric structures, in this temple the columns are not detached from the walls, thus they present only the appearance of half-columns; these, however, are 13 feet in diameter, so that if the columns had been disengaged, their circumference would have been more than 40 feet, a dimension exceeding the largest columns in Egyptian architecture. (The Roman-Doric column erected by Sir C. Wren, called the Monument, is only 15 feet in diameter, though of a proportion much loftier.) The echnus of the capitals is formed of two large stones, each weighing 2½ tons; the triglyphs are in single stones, each weighing 12½ tons; few of the stones employed in the entablature weigh less than 8 tons; and a man could stand in one of the flutings of the columns. As compared with a modern building, we may observe that the width of the cell is 2 feet more than the nave of St. Paul's, and the height exceeds it by 18 feet. The front portico, in which were seven columns, had the battle between the Gods and the Titans represented in the pediment, and in that of the other portico was sculptured a representation of the siege of Troy, in which each hero was distinguished by the peculiarity of his dress and arms. (Diodorus.) In the interior was a double row of pilasters ranging like the pillars of a cathedral, the attic story above the pilasters was supported by figures of the rebellious and defeated giants, most appropriately placed there to contribute to the glory of Olympian Jove, whose power they had dared to oppose. The proportions of these Titans are as vast as the other parts of the structure: being 25 feet in height; with heads alone 3 feet 10 inches, and chests 6 feet across.

The other temples at Agrigentum were very numerous; in the year 1790, by Sir Richard Colt Hoare, eleven could be traced in different stages of dilapidation. The next in size to that of Jupiter was one dedicated to Hercules, which was 154 feet long, and 55 feet broad, having six Doric fluted columns in each front, and fourteen on each flank; the columns were 7 feet in diameter at bottom, and only 4 feet 10 inches below the capitals, shewing a very great diminution. In this temple was the celebrated picture of an earthy Venus by Zeuxis, and a painting by the same artist representing the infant Hercules strangling the serpents, which was so highly esteemed by the painter, that, thinking no price equal to its value, he presented it as a gift to the Agrigentines. A celebrated bronze statue of Hercules likewise adorned his temple, and was held in the highest repute. The infamous Roman Prætor Verres, when he was plundering Sicily of her statues and works of art, attempted to carry off this statue by night, but was prevented by the citizens, who rose in arms to protect the temple.

The temple of Juno Lucina had in 1774 thirteen fluted Doric columns standing entire on one side; there were formerly in all thirty-four, each portico having six columns in front. In this temple was placed a famous picture of Juno, painted by Zeuxis from the choicest beauties of the loveliest women of the city. The temple of Concord was also hexastyle, and in proportions similar to the temple of Juno, and in 1790 was in tolerable preserva-

tion; it is now converted into a church. The temple of *Æsculapius* had twelve half-columns at each side, and four columns in *antis* in each front, of which two columns and one *antæ* remained in 1790. In this temple was a celebrated statue of Apollo, in the thigh of which the name of the sculptor, Myron, was inserted in letters of silver. This statue was carried to Carthage, but restored by Scipio; and it has been imagined by some that this statue is the same as the Apollo Belvidere, one of the chief ornaments of the Vatican, although Flaxman was of opinion that that celebrated statue was only a copy. (If so, what must the original have been?) Near the temple of Jupiter was that dedicated to Castor and Pollux, also of the Grecian-Doric order, and presumed to have been in arrangement similar to the other hexastyle temples, but of it only scattered fragments remained. The temple of Vulcan was also hexastyle, with fourteen columns on each side: two columns only of this temple remain, and they are much injured. In one of the five divisions of the city, called the *Rupis Athenæa*, was a temple sacred to Jupiter and Minerva, to which the hospitable Gellias (heretofore noticed) "fled for protection during the siege of Agrigentum by Hannibal, flattering himself that the enemy would respect so sacred a place; but finding that their rage for plunder knew no restraint, he set fire to the edifice, and there perished, with all the riches it contained. Of this ancient structure no traces remain, except some of the foundation stones which mark its form and situation. Beneath the *Rupis Athenæa* was another celebrated temple, dedicated to Ceres and Proserpine, which was so highly venerated, that Pindar, in his Olympics, calls Agrigentum the seat of Proserpine." (Sir R. C. Hoare.) Sicily is the scene of the myth of Proserpine, being carried away by Pluto, and the goddess, who is also called Hecate, was much honoured in this island, of which every foot is classic ground.

The Carthaginian general having taken Agrigentum after an eight months' siege, spoiled it of all its riches, pictures, and statues, and after sending to Carthage the most precious articles, disposed of the remainder by public auction. Among these trophies was the celebrated brazen Bull of Phalaris (the tyrannous, or sovereign of Agrigentum), made by Perillus (who was the first victim to his own invention), which was restored to the Agrigentines by Scipio on the fall of Carthage, 260 years afterwards.

At **SELINUS**, or Selinuntium (so called from the great quantity of parsley, *σαλυσί*), on the southern coast of Sicily, were six magnificent Doric temples, probably the largest ever erected in this style, and which appear to have been overthrown by an earthquake. One of these is believed to have been 331 feet long and 161 feet broad, with columns 60 feet high; a stone, which is supposed to have formed part of an architrave, is 40 feet long, 7 feet deep, and 3 feet thick, and some of the columns were found to be 12 feet in diameter, and others 10 feet 10 inches, and 48 feet high. Near these ruins were the remains of a hexastyle-peripteral temple, computed to have been 186 feet long, and 76 feet broad on its upper step, and to have had 36 columns in all, 6 feet 8 inches in diameter. Another temple, not far from these, was 232 feet by 83 feet on its upper step, with fluted columns, six in each front and sixteen on the flanks. The other three temples are supposed to have been unfinished when they were thrown down. One of these had porticos of seven columns in front, with seventeen on each flank; another had six columns in the porticos, and sixteen on each flank. In the quarry, near Campo Bello, whence it is presumed that the materials were derived, are yet some shafts of columns, 10 feet in diameter, and one of 12 feet, still joined to their natural bed of stone. Mr. Woods measured one block of an architrave, 26 feet 2 inches long, 4 feet 9 inches wide, and 6 feet 10 inches high. The city was, 409 B.C., nearly destroyed by the Carthaginians.

**SYRACUSE** once comprised within its walls five cities (whence it was called Pentapolis), and maintained an army of 100,000 foot and 10,000 horse, and a navy of 500 armed vessels. It was, in 414 B.C., attacked by the Athenians,

\* It seems very reasonable to presume that this practice arose from motives of economy, and that at a future period the flutings were to be carried through; the practice of the best period thus was not lost sight of.

\* Thus Virgil speaks of Agræas as famous for its breeding of horses, "magnanimis quondam genitorum equorum." † "Agrigentinos ita edificare, ac si perpetuo victuri, its convivari ac si postidit monturi forent." This expression has also been attributed to Pliny.

\* "The riches of any one of the sovereigns of Europe, and the skill of his wisest subjects, would barely suffice for the erection of only one of the six Selinuntian temples—the works of a distant colony of Greece." Dr. Meane.

who were repulsed with the loss of their generals, Nicias and Demosthenes. The city, however, was taken by the Romans, under Marcellus, 212 B.C., after a siege of three years, and among those who perished was the celebrated Archimedes, a native of the town. The Grecian Doric temple of Minerva was in the seventh century converted into a church, and is now the cathedral, the few ancient remains of which are of excellent proportions. Near the river Papyrus stand two gigantic Doric columns, about 6 feet in diameter; they have only fifteen flutings, which are not continued to the bottom. They belonged to the temple of Jupiter Olympius, whose celebrated statue was adorned with a golden robe, of great weight, presented by Hiero II.; but which was taken away by Dionysius the Elder, with the remark, "That it was too heavy for summer, and too cold in winter, and that he should provide one of woollen cloth, fit for both seasons."\* The statue was carried to Rome by Verres, the unscrupulous plunderer of Sicily.

At Segeste, the ancient *Ægesta*, is a famous Grecian Doric temple, almost entire, standing in a splendid situation on the brow of a precipice. There are six columns in each front, and fourteen at each side, making thirty-six in all; these are about 30 feet high; the length of the building is 190 feet, its width 78 feet; the stones composing the architrave are of great size, and one extends over two columns: the date of its erection, as well as the nature of its dedication, are unknown. The columns, which are not fluted, are 6 feet 7 inches in diameter at the base, and 4 feet 11 inches below the capital.

We now quit Sicily, the land of fable and of song, no less famous in the sweet strains of Virgil and Ovid, than for its ancient magnificence and patronage of the fine arts, and for its rivalry with Athens, Carthage, and the mighty Rome.

In a notice of Grecian Doric architecture we must not omit to speak of some ancient temples in Italy, namely at *Pæstum*, the ancient *Posidonium*, so denominated from its tutelary god Neptune, who by the Greeks was called *Ποσειδών*. From its unhealthiness, the place bad, in very early times, fallen into decay, and Augustus visited the temples as venerable antiquities in his day; but they were completely forgotten, until in 1755 discovered by an artist of Naples. Among the ruins, which are very extensive, are three buildings of imposing character; two of them are temples. The temple of Neptune, raised on three steps, was 194 feet long and 78 feet broad, having six fluted columns in each front, and fourteen (including the angular ones) at each side. The entablature and capitals were equal to half the height of the columns, of which the shafts only were 27 feet, the lower diameter 6 feet 10 inches, the upper diameter 4 feet 8 inches, and with twenty-four flutings; the intercolumns are 7 feet 7 inches wide. The cell is 90 feet by 43 feet, having fourteen columns in two rows, with shafts 16 feet 11 inches high, 4 feet 9 inches in diameter, and with twenty flutings. These columns support a deep architrave, on which rises another set of columns, about 11 feet high. The largest stone in this building is 13 feet 8 inches by 4 feet 8 inches by 2 feet 3 inches. Professor Wilkins in this temple detects a close resemblance to the temple of Solomon (*Prolisions*). The temple of Ceres is in a lighter style than the former building. It is 108 feet long and 48 feet broad, with the same number of columns as in the temple of Neptune; the diameter of the columns is at bottom 4 feet 3 inches, at top 3 feet 3 inches, and their shafts have 20 flutings. The third building is called a Basilica, because there is no appearance of a cell or altar. It is 170 feet long and 80 feet broad, and it is raised on three steps, having nine columns in each front (the only example of such arrangement), and eighteen on each side, with the lower diameter 4 feet 6 inches, and twenty flutings. Both fronts have a vestibule, and the interior was divided by columns. The date of these structures is unknown.

The beautiful lines by Mr. Rogers on the temples of *Pæstum* are tolerably familiar, and have been often quoted; the following, from an

\* Dicit, "Ætate gravem esse aureum amiculum, hinc frigidum; laneum autem ad utrumque tempus anni aptum." —Valerius Maximus.

Oxford prize poem, are less known, but hardly less beautiful:—

"Mid the deep silence of the pathless wild,  
Where kinder nature once profusely smil'd,  
Th' eternal temples stand;—untold their age,  
Untrac'd their annals in th' historic page;  
All that around them stood, now far away,  
Single in ruin, mighty in decay;  
Between the mountains and the azure main,  
They claim the empire of the lonely plain.  
In solemn beauty, through the clear blue light  
The Doric columns rear their massive height,  
Emblems of strength untam'd; yet conquering  
Time

Has mellow'd half the sternness of their prime,  
And bade the lichen 'mid their ruins grown  
Inhrow with darker tints the vivid stone.  
Each channelled pillar of the fane appears  
Unspoil'd, yet soften'd by consuming years,  
So calmly awful, so serenely fair,  
The gazer's heart still mutely worships there."

One of the most ancient Doric temples in Greece is in the island of *Ægina*; this was a hexastyle temple, dedicated to Jupiter *Panhellenis*. "It is said by Pansanias to have been built by *Æacus* considerably before the Trojan war; a story wholly incredible, but which serves to prove that it had outlived all tradition of its real origin. It is still nearly entire." (Lord Aberdeen's Inquiry, p. 128.) There were twelve columns on each flank, making thirty-six in all, of a porous stone, covered with a thin stucco, and the architrave and cornice were painted in colours. Fifteen statues, formerly belonging to this temple, are now at Munich; they are supposed to represent the Greeks and Trojans contending for the body of *Patroclus* (casts of them are in the British Museum); they have been restored by Thorwaldsen. Illustrations of the Temple of Jupiter have been published by Mr. C. R. Cockerell, and have proved a valuable addition to our knowledge of Doric architecture.

Despite the sarcastic allusion of Mr. Welby Pugin to what he is pleased to call "the grand cab and omnibus entrance" to the Birmingham Railway, in Euston-square, that noble building is calculated by its colossal proportions to convey an idea of the majestic simplicity of Doric architecture, more than any thing else in England; and will be a lasting memorial of Mr. Hurdwick's skill and taste in the eyes of all but those who are determined only to admire one style of building, and who refuse to recognize merit in any other. G. R. F.

#### PETROLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 303.)

GRANITIC PORPHYRY.—As basalt is said to be the base of porphyry, so the latter exhibits itself in various stages of transition with basaltic and other rocks. The passage of granite to granitic porphyry is observable in numerous varieties, and in some cases so closely are they identified with each other, that something more than mere external observation is necessary to determine their true character. Dolomieu writes very pertinently on this subject: he says, "During the great conglutinations to which the primitive mountains owe their construction, it seems that there have been substances, of which the concurrence, or the great abundance, has impeded or prevented the regular aggregation, in giving the paste a tenacity, in some manner fattening it, to make use of a term applied to mother earths, when they refuse to crystallize. Such are the particles of talc and of argillaceous magnesian earths, when free. It seems that these earths, naturally unctuous, have prevented the particles from assuming the places to which the laws of elective aggregation destined them, in causing them to slide on one another. I have pretty generally observed that the superabundance of magnesian earth chiefly raised upon the laminated texture of felspar, causing its loss, without depriving the felspar of the faculties of assuming the exterior forms of its regular crystallization. This is perceived in those felspars which constitute the large spots in green porphyry, called *serpentino antico*; and still more in the felspars, which, mingled with green hornblende, formed the granites called Egyptian greens. It frequently happens that their compact fracture no longer

presents any indication of a laminar texture, although they still affect the quadrangular prismatic form, which belongs to their mode of crystallization.

"Just as in the magma of mother waters, reduced to a state of paste by evaporation, there are particles which, escaping from the vicinity of the medium in which they are placed, aggregate and form crystals, which are found buried in the mass; in the same manner, in these kinds of magma of the great precipitation, it is rare that some isolated crystals are not found among them, and which have acquired so much more bulk and regularity, as they have had more facility of aggregation. They are distinguished from the paste which contains them, by their form, their tissue, and almost always by their colours, brighter than that of the base. Thus are formed rocks called porphyries, which in reality only differ from granites by their accident of aggregation."

Such is the opinion of this eminent man, after careful examination of the existing porphyritic monuments brought from Egypt, and carefully comparing them with the rocks common to the Alps and Appennines. Dolomieu had no opportunity of observing them in the act of formation; but his conjectures in this respect, although not strictly in accordance with nature, are well grounded and ably supported. The silicious rocks of the Egyptian, Nubian, and Arabian deserts, including almost every known variety of porphyry, are without exception portions of the oceanic soil; in their primary state we see them formed and still forming on the shores of the Red Sea, every locality presenting accumulated heaps or beds in their mixtures peculiar to that locality. Some of these vast beds are uniform in their composition, consisting of sea-weds uniting with atomic particles of oceanic bodies accumulated in mounds of vast size, or forming the lower beds; they are observed, in the first place, constituting the ocean-beds, capping the summits of submarine hills, or covering the valleys and troughs of the sea, their disposition being governed by the accident of deposition and tidal action. In the second stage of nature we find them on the gradual retreat of the waters composing a portion, and enlarging the domains of terra firma.

Dolomieu supposes them, while in this stage of formation, to be in a pasty state; but, in nature they are not so, they are loose masses of dry calcareous matter, of various salts and earths, of bodies decomposed and composing, of acids formed by the process of decay, or previously formed, now liberated, and entering into other combinations: they generally exist in this state in regions where it never rains, and where moisture is denied, thus their after-changes are produced rather by chemical than by mechanical action. Water is undoubtedly the active agent of change in some aggregate masses, as it is in the atomic disposition of many nodulates; but the great masses of rocks are more generally formed by the act of withdrawal of hydrogen, and the substitution of the elements of atmospheric air; and the porphyries form in this manner, their masses of the earths becoming gradually oxidated, and this oxidating principle being carried, by progression of time, into all parts of the mass, composed as it is of conflicting material of the alkaline earths and acids in their uncombined state: the mineralogist will readily conceive that, while general change is taking place throughout the whole, local aggregations of crystalline structure will of necessity form, their disposition being regulated by the disposition of the earths imbibing those acids freely passing throughout the whole. On the other hand, as Dolomieu conjectures, the general change often checks and diverts local change; and the cementing matter, which is always some neutral body, as silica, or alumine, or both united, in variable proportions, and equally diffused, forming the loose, friable, colourless mass; otherwise speaking, the bases of the various coloured aggregates, which are united in the masses of amygdaloidal porphyry, gradually embracing the whole, prevents further change, and by continuous increase of oxygen, the ponderous solidity of the whole is produced, not immediately, but in the slow progress, apparently of ages, the causes of effects produced continuing undisturbed during the period of time requisite to complete the operation.

It must be distinctly understood by my readers, that inasmuch as all organic species of the ocean and of the earth administer to the continual increase of the solid matter of the planetary body; so the earths thus locally produced and accumulated by living action, by death and decomposition, have a tendency, under favourable circumstances, to unite chemically or mechanically with each other, and thus to assume other forms, characterized by their varying mixtures, as rocks, stones, and mineral bodies. It is palpably manifest that both silica and alumine, when exposed to a high degree of atmospheric heat, undergo numerous changes in their physical condition; that they are capable, in the absence of water, of uniting in one general mass their atomic and aggregate quantities, and of embracing within their medium numerous mineral bodies, holding them merely by the simple force of cohesion: the same law which governs the formation of a flint, of opal, of quartz, of chalcedony, agate and jasper, is equally manifest in the formation of the most ponderable aggregates. The bodies and portions of bodies of shell-fish, by after exposure to the atmosphere, and very often within the shallows, at first silicify, the calcareous cement with which they are united, is at the same time, on exposure to the atmosphere, equally the subject of change, for its compounds are various and contrary in their nature, although every particle of the organic body may, and does generally retain its compound qualities, developed in the entire organic body; still, blending with these particles, are the material of ocean silt and of the waters, held in suspension and continually deposited by them; and this atomic disposition of parts is generally maintained through the series of after-changes, to which the aggregate masses are of necessity subject. Who then can wonder at seeing the beautiful uniformity and almost mathematical disposition of some varieties of rock, and of some varieties of stone, seeing that same uniformity manifest in many marls, boles, and clays?

Rock, while existing in its native state, and under the conditions by which it was formed, maintains its integrity of form and composition: it has, in fact, some portion of the vital principle within it, action and re-action existing within the mass; if permeable, it is permeated by the elements of the waters, and by mineral exhalations; thus its accidental fractures and natural hollows become filled up with some pure body or bodies, as crystal, quartz and metals. But this communicating action no longer exists when the rock becomes exposed, as atmospheric influences are inimical to its preservation, for it then we find it moulder away, and sometimes almost insensibly resolve once more into earth.

"The best characterized porphyries," says Dolomieu, "easily pass to the state of granite. It is enough that their base shews a beginning of regular aggregation, and there are few large masses of red porphyry among the most perfect in which spots are not observed, of more than a foot in extent, where the grains of felspar multiply so as to touch each other; little crystals of sord are then seen in the midst of them, which have also profited by the local facility given to the aggregation, or which perhaps has caused it by seizing the iron, the presence of which, when it is free and oxygenated, so far as to assume the red colour, seems to place an obstacle to the crystallization. Thus also are these parts of granitic appearance discoloured: one would often believe that those large grey granitose spots which disfigure the purple colour of the rock proceeded from foreign substances accidentally incorporated in paste of the porphyry, if one did not discern on the margin of those spots that the grains become gradually less distinct, and reassume the tissue of the base, in which there is some appearance of a solution of continuity.

"There are porphyries in which these spots, which differ by their colour and texture from the base of the rock, are so multiplied that they resemble breccias; they appear formed of an infinity of similar species, which become united by a common cement.

"It is easy, besides, to shew that the bases of many porphyries are only disguised granites; and it is sufficient to take off the kind of mask which covers them, and which depends on the colouring substance, to behold with astonishment that this base, judged to be uniform, is

itself a stone, composed of two distinct substances, which do not even always require the power of the lens to be observable."

AMYGDALITE is, strictly speaking, a variety of porphyry; it consists of a base of earth, oceanic, terrestrial, or mixed, and interspersed with nodules or kernels of chalcedony, agate, calcareous spar, zeolite, and green magnesite, or magnesian earth, mingled with iron. It affords valuable material for manufacturers. In Scotland it yields agate in abundance, which is wrought up under the name of Scotch pebbles, and in the rocks it sometimes alternates in thin layers with chalcedony, conchoidal, &c. In Italy it yields chalcedonies. In the Færoe islands, the chalcedony generally assumes the stalactitic form, being clearly deposited by water, and enveloping mosses and straws. The base of the Rock of Gibraltar is amygdaloidal, embracing, in a calcareous or limestone matrix, groups of nodules and stratified plates of chalcedonic bodies. Werner considers amygdalite as of two formations, the base of one of which is argillaceous, sometimes inclining to basalt, which it generally accompanies, and sometimes to ironstone, and a mixture of iron and clay, which is also the chief repository of phrenite. The other formation belongs to the floetz horizontal or stratified rocks.

In this latter state it is forming in great abundance in the mountains of Arabia, the silicified nodules and lamellated plates being first formed in the loose calcareous mass, which eventually consolidating, encloses the whole, forming one ponderable rock, resembling porphyry. It is also very abundant in the East Indies and South America, and in the former place passes into breccia on the one hand, and into basalt on the other. Like basalt, it contains nodules of steatite and small crystals of ironstone, and from its coarseness of polish, it manifests a common origin with basalt. Amygdalite, with open pores, abounds in the elevated regions of Mexico, and is the petzontli used in building: it is of a reddish colour, and supposed to be lava. The consideration of amygdaloid naturally leads to the consideration of agate.

(To be continued.)

#### INSTITUTION OF CIVIL ENGINEERS.

June 18.—The President in the chair.

A paper by Mr. Braidwood, superintendent of the Fire Brigade, gave the results of his experience as to the best means of rendering large supplies of water available in cases of fire, and on the application of manual power to the working of fire-engines. The author stated that if water could be obtained at an elevation, pipes with plugs or firecocks on them would be preferable to any mode at present in use; and when this could not be obtained, and the premises were of value, it would be advisable to erect elevated tanks to be kept constantly charged. When water could be obtained, however, at not less than twelve feet below the level of the premises, if it was not thought prudent to erect elevated tanks, it might be conducted beneath the surface by cast-iron pipes, with openings for introducing the suction pipes. The system of covered tanks the author believed to be the least advantageous mode of supplying water, and in many cases where the supply proceeded from large reservoirs, he thought it would be better to place plugs or firecocks on the water-pipe. The results of a series of experiments were given, shewing that the idea of extinguishing fires by jets from water-mains, without the use of fire-engines, would not succeed. They also proved the necessity of placing the plugs on the mains, and not on the service-pipes, where that could be done. The details were then given of the mode of obtaining water from pipes or mains, and the advantages or disadvantages both of the plug and fire-cock were fully entered into. The author then stated that the best mode of using manual power was by applying the greatest aggregate amount of power to the lightest and smallest machine; that the reciprocating motion was to be preferred to the rotary; and that a fire-engine with two seven-inch cylinders and eight-inch stroke, weighing 17½ cwt., was the most advantageous size that could be adopted.

In the discussion which ensued, Mr. James Simpson, of the Royal Dockyard, gave his views, but combated his ideas as to the disad-

vantages of sunk tanks, which he contended had been proved in certain situations to be essentially useful, and that they were provided in many public establishments. He stated that to the Dutch, who arrived with King William in 1688, we are indebted for the first organized system for extinguishing fires. Many parts of their system still remained; and in Cape Town, in 1817, he had been much struck with the completeness of their plans. He examined into the supplies of water for fires, and the modes of obtaining them, and thought that more water was wasted through the general excitement and want of presence of mind than was generally imagined. He recommended the use of screw-cocks rather than plug-cocks, as the latter were apt to become set and to be injured, as well as baying in general too contracted a water-way. He also disapproved of the use of jets direct from the mains, stating them to be wasteful and not efficient, and that in almost every case they had failed, except under very peculiar circumstances.

In the paper by Mr. Andrew Murray, Assessor, C. E. (Royal Dockyard, Woolwich), the author considered, in the first portion, the quantity of atmospheric air chemically necessary for the complete combustion of a given quantity of coal, examining the proportion necessary for the inflammable gases, and for the solid carbon, shewing the large excess of air that would be required if the gases were not ignited until they had passed into the flues of the boiler, on account of their admixture with the carbonic acid gas generated in the furnace. The question of the velocity with which the products of combustion pass off was next considered.

The practical recommendations given in the paper were, that the supply of air should be as free as possible; the entrance into the ash-pit should not be less than one-fourth part of the area of the fire-grate; the depth of the ash-pit should be about 2½ feet, no advantage being found to result for the combustion of the coal from its being deeper; the space between the fire-bars should be about  $\frac{1}{4}$  inch, but that depth should be regulated by the kind of coal used; for any kind of coal it should not be less than  $\frac{1}{8}$  inch, nor more than  $\frac{1}{4}$  inch; the fire-bars were recommended to be made as thin as was consistent with their required strength; half an inch in width had been found to be a good proportion. The space in the furnace above the fire-bars was recommended to be made large, about three cubic feet to each superficial foot of fire-grate, when such an amount could be obtained. The proper area of the flue was next considered, with reference to the bulk of the products of combustion, and their velocity, shewing that the area requisite for the quantity chemically required was found to be much too small, and that in practice it should not be less than two square inches for the products of combustion from each pound of coal consumed in the grate per hour.

Taking a furnace in which 13lbs. of coal were burned on each square foot of fire grate per hour (which was stated to be a very usual rate of combustion in steam-boilers), the area of the flue to every superficial foot of the fire-grate would be about 26 square inches.

The area of the chimney was recommended to be three-fourths of that of the flue.

The mode of conducting the flue to the chimney, and the angles formed in its passage, were also carefully considered. The time occupied by the gases in passing through the flues of a boiler, from the instant of their generation to that of their reaching the chimney, was shewn not to be of importance, provided that the incandescent gases were so subdivided that all the particles were brought into contact with the boiler, and were made to part with their caloric, as was the object in the construction of locomotive and other tubular boilers.

The amount of heating surface recommended was in the proportion of 18 square feet to each foot of fire-grate, when the combustion was carried on at the rate of 13lbs. per square foot per hour, though a larger amount might be employed in land boilers, where there was no objection against cooling down the products of combustion in a greater degree. The principles were stated to be applicable to all kinds of boilers used either for land or for marine purposes.

Correspondence.

IMPROVED FLUES V. CLIMBING BOYS.

SIR,—The very able and humane remarks which appeared in your leading article of June 8th, with regard to chimneys, have led me to consider how necessary it is that the formation of flues generally should be such as to preclude the possibility of using the living machine for cleansing them. The usual rectangular form of flue is just sufficient to allow this inhuman and degrading practice to be exercised; and although most flues are at present so constructed, legislative enactment prevents the use of climbing-boys; but it is possible that there may at some future time be a repeal of the Act, so highly creditable to the present age. It is therefore incumbent on those connected with building to turn their serious attention to the formation of flues, and if they can substitute a more scientific form for the transit of smoke, combination of strength, and facility of cleansing by machinery, and consequent safety from the effects of ignition, I say they will act, not only from the most humane principles, but also do that which will add far more to the health, comfort, and safety of the community at large, than any legislative enactment can do, as applied to so very important a feature in our dwellings, and which has, I am sorry to say, received very little attention from scientific men.

Mr. Hunt, Mr. Seth Smith, and a few others, have, I believe, taken out patents for the construction of flues of a circular form, which most scientific men would consider adapted to their several purposes better than a square flue. The former flue was of brick, and although its construction was extremely clever, all bond was destroyed, and its interior being glazed, there was no adhesion for the soot, which frequently descended *en masse*; moreover, this mode was very expensive. The other plan was one which is alluded to in your number dated 15th inst., in a letter signed Edward Nangle; this was the application of metallic tubes for the purposes of a lining to the flues, also a most expensive plan, and one that might be extremely detrimental to a building by expansion and contraction, and lead generally to very careless workmanship. I have given some attention to the matter, and am of opinion that a flue should be of a circular section and constructed of bricks, which should be moulded to that form, and so fashioned as to bond in perfectly with the general work; and that the interior of the flue should not be glazed or parge-tted, but be worked as fairly as possible, and be well flushed up to prevent the escape of smoke; and I really cannot imagine there would be much more expense than on the present plan. I hope you will excuse me for troubling you with these observations, but feel assured, from your observations on the subject, that you would feel disposed to assist any of your readers in the advocacy of those principles, which are an honour to the age in which we live.

PHILANTHROPY.

COMPETITION.

SIR,—I observed in the THE BUILDER of Saturday last, some very excellent remarks on the immoral practice of competition, and I do hope that, you having now declared yourself a most unqualified enemy to this vicious system, every exertion in your power will be used to wipe away this stain from the "scentcheon" of architects and builders.

The system operates as much to the injury of the employer as the employed, by creating a disposition on the part of the latter to take unfair advantages of the want of judgment in the authors of plans, to make up for deficiency of profit, and is also a premium on dishonesty, as the sharpest trader and the man of no principle generally fares best, from his determination at the outset of his contract to substitute bad materials, bad work, and, if possible, to seduce the clerk-of-works to connive at his conduct.

The present system also widens the breach that unfortunately has, for the last few years, taken place between the middle and working classes, as it gives a species of monopoly to a few capitalists to concentrate in themselves all the different branches of art connected with building, and keeps the workman to his *caste* or class, whatever may be his genius. A work-

man, whether a carpenter, or a joiner, a mason, or a bricklayer, however gifted, unless he can obtain capital to unite all these and many other trades under the denomination of builder, must never hope to be independent of servitude, or become, as of old, a master. He may become a drudge—a task-master—a tool of the great builder, but he will never be the respectable, substantial master that was commonly known forty years ago. Neither can it be expected that the same advance will be made in different branches of building while this system prevails. How can a contracting, competition builder feel that interest and pride in his work which the old master mechanics used to feel? It is impossible; it is contrary to his mode of doing business, which is cheapness; it is sufficient for him that the work obtains the architect's certificate. Moreover, the present system is the worst possible for training youth to any one of the building arts, as there is no emulation, nor proper master to direct his taste and ability.

I have had great opportunities, possibly greater than most men, of observing the changes which have taken place during the last five-and-twenty years amongst those whose trade is connected with building, and the amount of ruin and utter destitution I have witnessed among men who were once respectable master carpenters, bricklayers, masons, and plasterers of the old school,—men, who have tried to meet the new order of things, and bear up against this accursed system, has been pitiable in the extreme, have yet been crushed by its harshness and knavery. Ask any commercial traveller, who sells building-materials, to look at his journey-book, and let him tell you how many names he can point out of those who have retained their business on the new system? He will tell you that it will be more easy to recount those that have ended their days in a gaol, and whose families become paupers, in the attempt to live by "competition;" and he may tell you some tales on this score not much to the credit of members of that institution, which you seem not to respect more than others.

Your remarks in reference to competition for building churches are but too true. I venture to assert that there is not a county in England, where churches have been built on this system, in which some have not been cursed by the builders, as the origin of their ruin.

Roman Catholics are not exempt on this score, and I do hope that Welby Pugin, who, in good round terms, rates architects as parers-down of tradesmen's accounts, will lend his aid in crushing this system, and prevent, in the erection of Roman Catholic buildings, such circumstances taking place as a few years ago attended the erection of the new Roman Catholic buildings at Bury St. Edmunds and Hereford.

Surely no Christian would wish that the altar of his God should be raised in envy,

malice, and all uncharitableness; and that some of the earliest prayers whispered at its foot should be a cry for bread from the wife and children of the ruined and broken-hearted man, who literally placed the material head and corner-stone of the temple, and whose distress was occasioned by the integrity with which he fulfilled his bond.

Much of the sin lies at the door of architects, much also at that of "the builders" themselves; but let both unite in getting rid of this disgraceful mode of transacting business, and they will confer an incalculable benefit on the arts. And, I am sure, when this has been effected, that no branch of manufactures or arts will keep pace with the advances that will then be made in architecture, and in those arts which it calls to its aid.

I am, Sir, yours, &c.,  
London, 24th June, 1844.

DERBY LUNATIC ASYLUM.

SIR,—I perceive you have not received any notice respecting the result of the competition for the Derby County Lunatic Asylum. There were seventy-nine designs sent in, consisting of more than 800 drawings, some very elaborately got up.

The design chosen, and which it is intended to carry into execution forthwith, was sent in by Mr. Henry Duesbury, late of the firm of Lee and Duesbury, 20, Golden-square, London; it is certainly a very excellent plan, far superior to all the others sent in—so much so, that the committee did not even divide, but were unanimous for its adoption. Messrs. Lee and Duesbury were the successful competitors for the Derby Town Hall, which is now finished from their designs; it has a commanding elevation, and the plan is very convenient, and well adapted to the purpose intended. If a plan and elevation should be of service to your useful publication, I will, with pleasure, send it, to the proper scale.

It is lamentable to see the great expense that young architects put themselves to in competing: some of the designs sent in had very large and elaborate drawings, executed in the first style, by Mackenzie and other artists, framed and glazed. This would be all very well, did it only concern themselves; but this is not the case; it compels those, who would only otherwise attend to the designing a good building, to employ artists and make large drawings, or they stand no chance of attracting attention when the designs are exhibited for approval.

With good wishes for the success of your useful publication,

I am Sir, your obedient servant,  
A SUBSCRIBER.

Derby, June 19, 1844.

DESIGNS FOR ARTICLES RELATING TO ARCHITECTURE, ENGINEERING, &c.

Registered under 6th & 7th Vic., cap. 65.

Date of Register, 1843.	No. in Register.	Proprietor's Name.	Address.	Subject.
APRIL 29	173	William Glegg Glover.	8, Chester-square, Middlesex.	Design for window-sashes.
— 30	174	Green and Bentley.	33, Compton-st., Brunswick-square, London.	The Protean reflecting oven.
MAY 3	177	Robert Fry.	Tockington, Gloucestershire.	Design for the configuration of a bed, or a floor for thrashing grain and seeds, and for breaking stones and other matter.
— 4	178	David Middleton, Jun.	Lincoln.	Chimney-pot and cowlsweeper.
— 8	179	Isaac Luggitt.	Howden, County York.	Design for a new lamp for burning spirit.
— 11	180	Wm. and Joseph Harcourt	209, Bristol-street, Birmingham.	Harcourt's sliding blind pulley.
— —	181	George Thos. Caswell.	Wolverhampton, Staffordshire.	A double-acting pump.
— —	182	Vincent Price.	Wardour-street, Soho.	Design for a manumotive carriage.
— 14	183	William Waine.	Lark-hall-lane, Clapham.	Cordwainer's standing or sitting machine.
— 15	184	Benjamin Hick and Sn.	Bolton, Lancashire.	Design for a portable forge.
— —	185	Il. Negretti.	19, Leather-lane, London.	Thermo-hydrometer.

RAILWAY INTELLIGENCE.

A memorial has been got up by the inhabitants of Saffron Walden to the Railway Company, requesting that the station may be placed nearer to that town than at present contemplated.—*Chelmsford Chronicle*, June 21.

The South-Western Railway Company have agreed to pay to the proprietors of the intended branch line from Newbury to Basingstoke and Southampton a net annual rent in perpetuity, equal to 3½ per cent. on the outlay; and also to divide equally with the shareholders the contemplated profits, after payment of that rent, which, it is calculated, will raise the dividends to 5 per cent. The length is something more than fifteen miles, and 200,000*l.* is the estimated cost. The branch from the Bishop Stoke station to Salisbury will cost 240,000*l.*; the length is twenty-one miles and fifty-seven chains.—*Wilts Independent*.

*Southampton and Dorchester Railway.*—A correspondent states that Captain Moorsom is proceeding with the utmost expedition in making this survey, and parties under him are actively engaged on the whole length of the line, so that there is no doubt of its report being made in time for the meeting at Dorchester on the 19th of July.—*Salisbury Journal*.

*Another Contemplated Railroad.*—It is in contemplation to lay down a railroad from Bath to Weymouth. The projected line to be connected with the principal intermediate towns, and to be designated the "South Union Railroad." The scheme is said to emanate from an influential source.—*Wilts Independent*.

*Projected Line of Railway.*—A line of railway was very lately being surveyed by Mr. Stephenson, jun., from the Serray station, on the North of England line, to Boroughbridge, thence by the villages of Stavely and Furnham, to Knaresborough, by which it is intended to pass on the north-east of the town, through a field called "Hansel Pasture," and quite as well known by the name of the "Cricket Field;" thence across the Nidd, near St. Robert's Cave, through Plumpton to Braham Warren, where it comes in contact, in the Crimple Valley, near Spoforth, with the line of railway lately proposed from Star Beck to Bolton Percy, and at that point the survey has at present terminated. What is the ultimate object in view is not at present perceptible; and whether it will turn out a mere bubble, or terminate in something tangible, time only can determine.—*Doncaster Gazette*, June 21.

*Oxford.*—*Extension of the Great Western Railway.*—The directors, accompanied by a large party of their friends, went down to Oxford on Monday week by a special train to inspect the works, which they found in a very satisfactory state. After inspecting the station at Oxford, and the bridges at Nuneham and Appleford, they returned to Paddington by a special train. On the Wednesday morning following, the line was opened for traffic, and was found in very good order.—*Wiltshire Independent*, June 20.

Miscellaneous.

**AMERICAN INFRINGEMENT OF AN ENGLISH PATENT.**—Mr. Henry Stephens (the mechanical drawing-ink manufacturer, of Stamford-street), recently obtained 2,000 dollars damages in the United States Circuit Court, against Messrs. D. and W. Felt, stationers, of New York, for their infringement of the plaintiff's patent for making blue writing fluid for ink, and other colouring purposes. It appeared that the defendants did make an article similar to, or in imitation of, that made by the plaintiff, and sold it as the article made by him, but they denied that he was the first inventor of it, or was entitled to any patent for, or monopoly in, the article. Much evidence was adduced for both sides, and the jury found a verdict for the plaintiff for 2,000 dollars, liable to be increased in amount by the court to 6,000 dollars.—*Mining Journal*.

A splendid church for the parish of Horningshaw, near Longsleat Park, has been in course of erection for some months, and will be consecrated by the Lord Bishop of Salisbury in a few weeks. It has been erected at the sole expense of the Marchioness of Bath.—*Morning Herald*.

Tenders.

TENDERS delivered for building in carcass a first-rate House, adjoining the Anti-Corn-Law League Offices, Fleet-street.

Geo. Webb .....	£1,120
C. Turner and Co. ....	1,127
J. Lucas .....	1,139
E. Taylor .....	1,150
W. F. Chapman .....	1,209
J. Higgs and Son .....	1,220
Locke and Nesham .....	1,225
Pearse and Guerrier .....	1,239

Slaters and Masons' work not included in the above.

TENDERS delivered for the enlargement and improvement of the Wesleyan Chapel, Liverpool-road, Islington.—Mr. John Parkinson, Architect.

Mr. Glean .....	£1,259
Mr. Dove .....	1,098
Mr. Ashby .....	1,067
Mr. Smith .....	998
Mr. Elston .....	860

NOTICES OF CONTRACTS.

For erecting a Farm House, &c., at Court-y-Graban, in the county of Radnor.—Plans, &c., Mr. Edward Powke, at Glanhenwy, near Hay.

For erecting a Farm House at Trehendre, in the county of Brecon.—Plans, &c., Mr. Powke.

For reinstating Dwelling House and Buildings at Great Thurtot, Suffolk.—Further particulars, Messrs. Newton and Woodrow, Land Agents, Norwich.

For the erection of a New Church at Cotton-in-the-Elms, in the parish of Lullington.—Specifications, &c., J. Harding Esq., Rolleston, near Burton on Trent.—Quantities, &c., Mr. H. T. Stevens, Architect, Derby. 3rd July.

For the erection of South Hackney Church.—Plans &c., Mr. Hakewill, 8, Craig's-court, Charing-cross. 29th June.

For furnishing and setting up the necessary Apparatus for Warming by means of Water the Church of St. Clement Danes.—Messrs. Collier and Steel, 9, Carey-street, Lincoln's-Inn. 3rd July.

For building Sewers.—Plans &c., Mr. Daw, Sewers Office, Guildhall. 9th July.

For the erection of a Building on the premises of the Workhouse of the parish of St. Mary, Newington.—Plan, &c., Mr. Edmonds, Surveyor, Bridge-street, Southwark. 15th July.

For certain alterations and additions to the Treadwheels, and for Air Pumps to be connected therewith, and also for certain Hand Crank Machines for hand labour at Norwich Castle.—Drawings &c., at the Castle.—Further information, Mr. Brown, County Surveyor, Norwich. 19th July.

ADVERTISEMENTS.

**MILTON** next Gravesend, Western side of Windmill-hill.—Valuable BUILDING GROUND to be SOLD in plots, for building second-rate houses according to a plan, with a frontage of 29 feet each, and running in depth from 141 feet to 173 feet. This building-ground unites in itself what is rarely to be met with, being lower than Windmill-hill, and sheltered from the cold east and north-east winds, and by a brick wall (if erected) to separate the ground from the Tyoll Gardens; it may also be sheltered from the north wind; and being open to the milder breezes from the south-west, and having, with these advantages, a considerable elevation, so as to afford delightful views of the Kentish and Essex hills and surrounding country, the situation of the ground, combined with its mild and salubrious air, renders it worthy of attention.

For further particulars and terms apply to Mr. Edmed, solicitor, Gravesend; and Mr. E. B. Carey, 24, Southampton-buildings, Chancery-lane, London, where plans of the premises may be seen.

LITHOGRAPHY.

**H. T. CHURCH** is desirous of calling the attention of ARCHITECTS, SURVEYORS, BUILDERS, and the Public to his LITHOGRAPHIC AND GENERAL PRINTING OFFICE, 88, WATLING-STREET, CITY. Drawings of Machinery, Railway, Canal, and Estate Plans, executed with the greatest accuracy and elegance; a combination of qualities difficult to obtain, as many Printers are entirely ignorant of the nature of the drawings committed to their care for the purpose of being lithographed. H. T. Church having, besides a ten years' experience of the business, had the advantage of three years' observation in the office of an eminent Surveyor, is particularly fitted for the superintendence of drawings, &c. which require to be lithographed with great accuracy. Circular Letters, Fac-similes, Bill-heads, Cards, Labels, Gum Tickets, and every description of Printing in demand in the commercial and manufacturing world executed with punctuality and elegance, and at the lowest remunerating terms.

H. T. Church will wait upon gentlemen in any part of London for the purpose of giving estimates or receiving orders. Country orders instantly attended to, if accompanied by a London reference.

COLLINGS' PATENT HINGES.

Sole Manufactory, 64, Bridge-road, Lambeth, where a great variety are always on view, for church, park, coach-house, and all other doors and gates, of large or small dimensions, a set of a ton in weight moving with ease in an instant. Biscuit and spring hinges, of every superior construction, for exterior gates, at moderate prices. To be seen at Chas. Collinge and Co.'s patent axletree, sugar mill, and spherical hinge manufactory, 64, Bridge-road, Lambeth.

**ANONYMOUS.**—In consequence of an Anonymous Advertisement having appeared in "The Times" of this date, stating that part of Trafalgar-square has been laid with Asphalt, the public are informed that such is not the fact, the material laid down there being only an imitation of Asphalt, composed of chalk, sand, and tar. The Pavement in Whitehall (opposite the Horse Guards), and that at the Duke of York's column, both laid down in 1838, are samples of works executed with the genuine Seyssel Asphalt.

J. FARRELL, Secretary, Seyssel Asphalt Company, 14th May, 1844. "Claridge's Patent," London.

SEYSSAL ASPHALTE COMPANY.

"CLARIDGE'S PATENT," ESTABLISHED 1838. This ASPHALTE is a Bituminous Limestone, obtained from an inexhaustible Mine at Fyrmont, in the Jura Mountains.

Previously to its introduction into this country, in 1838, the Material had been used for many years in France, and from its great utility was extensively patronized by the Government of that Country.

Among the various uses to which it can be applied, the following may be enumerated:—For Foot-Pavements, public and private, in the carriage Approach to Mansions, garden-walks, and Terraces; the flooring of Kitchens and other basement offices; also of Coach Houses and Stables, Dog Kennels, Barn Floors, Cow Houses, Figgeries, Poultry Houses, and other Buildings. For Roofing, Covering of Railroad and other Arches, the Lining of underground Cellars near Rivers to prevent the ingress of the Tides; also in Covering the ground-line of Walls, to prevent damp rising into the walls. For Roadways, an excellent Cement, as applied to Docks, Breakwaters, or Walls built for resistance to the encroachments of the Sea. For lining of Tanks, Fish-Ponds, and other Hydraulic purposes.

J. FARRELL, Secretary, Seyssel Asphalt Company's Works, "Claridge's Patent," Stangate Depot, London.

COMMISSIONERS OF FINANCIAL REPORT ON THE MEANS OF PREVENTING DAMP IN WALLS.

THE DIRECTORS of the SEYSSAL ASPHALTE COMPANY have much pleasure in recommending to the notice of Architects, Builders, and others, the application of THE ASPHALTE OF SEYSSAL as the only effectual means of preventing DAMP rising in WALLS.

The following account of its application is extracted from "The Appendix to the Commissioners of Fine Arts' Report," page 18.

In 1839 I superintended the construction of a house of three stories and a half. The foundation of the building is constantly in water, about 194 inches below the level of the ground-floor. The entire horizontal surface of the external and internal walls was covered, at the level of the ground-floor, with a layer of Seyssel Asphalt, less than half an inch thick, over which coarse sand was spread.

Since the above date no trace of damp has shewn itself round the walls of the lower story, which are for the most part painted in oil of a gray stone colour. It is well known that the least moisture produces round spots, darker or lighter, on walls so painted. Yet the pavement of the floor, resting on the soil itself, is only about 24 inches above the external surface of the soil, and only 194, at the utmost, above that of the sheet of water.

The layer of asphalt having been broken and removed, for the purpose of inserting the sills of two doors, spots indicating the presence of damp have been since remarked at the base of the door-posts."

BRITANNIA LIFE ASSURANCE COMPANY, 1, Princes Street, Bank, London.

This institution is authorized by Special Act of Parliament (IV. Vic. cap. IX.), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually afforded by any other Company.

Amongst others, the following important advantages may be enumerated:—

A most economical set of Tables—computed expressly for the use of this Company, from authentic and complete data, and presenting the lowest rates of Assurance that can be offered without compromising the safety of the institution.

DECREASING RATES OF PREMIUM.

By this Table the Policy-holder has the option of discontinuing the payment of all further Premiums after TWENTY, FIFTEEN, TEN, and even FIVE years; and the Policy itself remains in force—in the first case, for the full amount originally assured; and in either of the three other cases, for a portion of the same according to a fixed and equitable scale endorsed upon the Policy.

Increasing Rates of Premium on a new and remarkable plan for securing Loans or Debts; a less immediate payment being required on a Policy for the whole term of Life than in any other Office.

CREDIT TABLE.

By this Table the Premiums may remain unpaid for five years, upon satisfactory security being given for the liquidation of the same at the expiration of that period.

Premiums payable either Annually, Half-yearly, or Quarterly, in one sum, or in a limited number of payments.

A Board of Directors in attendance daily at Two o'clock. Age of the Assured in every case admitted in the Policy.

Medical Attendants remunerated in all cases for their reports.

Extract from Increasing Rates of Premium, for an Assurance of 100*l.* Whole Term of Life.

Annual Premiums payable during										
Age.	First Five Years.	Second Five Years.	Third Five Years.	Fourth Five Years.	Remainder of Life.

PETER MORRISON, Resident Director. A Liberal Commission allowed to Solicitors and Agents.

# The Builder.

NO. LXXIV.

SATURDAY, JULY 6, 1844.

**G**AIN pursuing the subject of the proposed new Metropolitan Building Act, which, though no doubt tedious enough to our country readers, is with the London building world of all-absorbing interest, we this week finish our comments upon the schedules of the Bill, as they have been so materially altered; but as we have just received some extremely valuable remarks upon the Bill, shewing on

the part of its writer a thorough competence to undertake a criticism of the kind, we shall still extend our remarks to next week, reviewing the whole, and giving also the able report upon it made by the Society of Builders; and we doubt not that most of our readers will still bear with us for continuing a subject which, though dry enough to the readers of ordinary periodicals, is nevertheless of cardinal importance to all who possess estates and general property; nor should our country friends disesteem the matter as an useless taxing of their patience, for there exists a very strong feeling, that when this Bill is once perfected and made law within its metropolitan range, there will be no great slowness in extending its powers, in some modified shape at least, if not all over the three kingdoms, certainly to every great town within them. We must here say we cannot but very severely condemn the pertinacity with which certain provisions of the measure are still maintained, against the wholesome advice of every respectable builder, architect, and surveyor, and in opposition to the matured practical experience of the present district-surveyors. We have made some inquiries upon the subject, and have been told that the deeply-experienced respectable gentlemen who mainly drew up the bill wholly disclaim the odium and folly of these ridiculous and presumptuous blots upon the measure. And yet, strange to say, these are the very matters which, to common observers, however trivial, form the bones of contention, and are, indeed, reasons why the measure progresses so slowly.

The following is the form of words at present used in the Bill with regard to BREAST-SUMMERS and external walls and inclosures:—

**Breastsummers.**—"With regard to every breastsummer fixed to carry any front wall of a building,—

"If such breastsummer have a bearing at one end upon a party-wall,—then it must be laid upon a template or corbel of stone or iron, which template or corbel must be tailed through such wall at least two-thirds of the thickness thereof; and the end of such breastsummer must not be fixed into, and must not have its bearing solely upon such party-wall, but must be supported by a sufficient pier built of brick or stone, or by an iron column, or iron or timber story-post fixed on a solid foundation.

"And if any such breastsummer have its bearing at each end upon a party-wall,—then it must be supported by at least two sufficient piers built of brick or stone, or by iron columns, or by iron or timber story-posts fixed on solid foundations, and standing within and clear of the party-walls.

"Or any such breastsummer may bear also upon constructed returns in the direction of the length of the breastsummer of four inches at the least, coursed and bonded with the substance of the party-wall or party-walls; and such constructed returns must be increased one inch, at the least, for every six feet in length that the breastsummer may be otherwise unsupported.

"And if the height of the under-side of any breastsummer, laid from party-wall to party-wall to carry any external wall, exceed 15 feet from the surface of the public foot-pavement in front of the building,—then there must be constructed returns in the direction of the length of the breastsummer from the inside of each party-wall of 8½ inches at the least, and at the least of the full thickness of such breastsummer; and every such return must be increased one inch at the least for every foot or part of a foot the breastsummer may be in height from the surface of the public foot-pavement more than 16 feet, whether the breastsummer be otherwise supported or not."

**Materials to be used in Repairs.**—"And with regard to old external walls or other external inclosures of any building already built, in reference to materials to be used in the repair thereof:—

"If any such wall or inclosure be not built of the materials required by this Act for external walls or other external inclosures hereafter to be built, then every part of such wall or other external inclosure (except the inclosure of roofs, and the flats, gutters, dormers, turrets, lantern-lights and other erections thereon), may be at all times thereafter repaired with materials of the same sort as those of which such external wall or inclosure has been already built."

We must still insist that we think pitch and other inflammable materials ought to be forbidden.

**Materials to be used in Rebuilding.**—"But if any such external wall or inclosure be at any time hereafter taken down or otherwise demolished for the height of one story, or for a space equal to one-fourth of the surface thereof, then every part thereof, not built in the manner and of the several materials by this Act directed for external walls, must be taken down; and the same must be rebuilt in such manner, and of such materials, and in all respects as by this Act directed for external walls hereafter to be built, according to the class and rate of the building to which such external wall or inclosure shall belong."

We must again urge Mr. Bartholomew's observation upon this clause:—"The words 'one-fourth of the surface THEREOF' do not clearly express whether of one story, or if the whole inclosure be intended."

**External Wall used as a Party Wall.**—"And with regard to external walls to be used as party-walls to any building adjoining thereto (except an attached building or office as is hereinbefore described);—

"If the external wall of any building have not such footings, or be not of such heights and thicknesses, or be not built in such manner and of such materials as are herein directed for party-walls of buildings of the highest rate to which such wall shall adjoin,—then such external wall must not be used as a party-wall for any such building; but there must be a distinct external wall built as herein described for external walls, of the rate to which it shall belong."

We think that permission ought to be allowed for footings of the proper kind to be underpinned to a wall otherwise fit to remain.

**SCHEDULE (D), PART II.—Division of Buildings.**—The grammatical alteration recommended by Mr. Bartholomew has been made.

**SCHEDULE (D), PART III.—Site of Walls.**—Upon this subject Mr. Bartholomew made the following observations:—"Where the buildings are of different rates, the wording should run 'so much of THE BREADTH OR THICKNESS THEREOF,' otherwise, as one building being higher than the other, and requiring the whole thickness of the wall above the roof

of the other, such wording could not possibly be complied with."

The clause now stands thus:—

"With regard to party-walls, in reference to the site thereof;—

"If the buildings be of equal rate,—then such party-wall must be built on the line of junction of such buildings, one-half on the ground of the owner of one of such buildings, and one-half on the ground of the owner of the other of such buildings.

"If such buildings be of different rates,—then such wall must be built on the line of junction thereof, as follows: that is to say, one-half of the thickness of the wall required for the building of the lower rate, on the ground of each of the adjoining owners; and the whole of the additional thickness of the wall required for the building of the higher rate, on the ground of the owner of such building of the higher rate;

"And if such building of the lower rate be thereafter enlarged or altered, so as to become a building of a higher rate,—then the owner of such first-mentioned building of the higher rate, for the time being, shall be entitled to receive from the owner of such building of the lower rate, such sum of money as shall be a sufficient compensation for the ground occupied by that portion of the party-wall, which, according to the rate of the building enlarged, ought to have been built by its owner on his own ground, as well as the value of so much of the wall itself as may be more than the owner of such building of the lower rate had already paid for."

**Construction and Materials.**—The word "squared" has been prefixed to "stone;" this would be very oppressive.

"And with regard to party-walls, in reference to the component materials thereof;—

"Every part of such party-wall must be built of sound bricks or of squared stone, or of such bricks and stone together, laid in, and with mortar or cement, in such manner as to produce solid work.

"And as to the wood-work which it may be desired to connect with the party-walls of any building,—The bearing ends of wooden beams, breastsummers, girders, trimming-joists, and the ends of partition-leads and sills, and the bearing ends of the main timbers of a roof, and wood-bricks, may be laid into the substance of a party-wall; but no such beam, breastsummer, girder joist, partition-head or sill, nor any part of a roof being wood, nor any wood-bricks, must be laid or placed within four inches of the centre of any party-wall; and no other wood-work of any kind must be laid into, placed upon, or be run or driven into any part of the substance of any party-wall:—

"But if the ends of timbers be carried on iron shoes or stone corbels, then such iron shoes or stone corbels must be built into the wall at the least one-half of the thickness of such wall.

"And the top of every such party-wall must be finished with one course of sound stock-bricks, set on edge with good cement, or by a coping of any other properly secured and sufficient waterproof and fireproof covering."

**Height of Party-walls above Roof.**—On this subject Mr. Bartholomew's observations were as follow:—

"We think that for two or three feet back from a public way, a party-wall should be allowed to be only twelve inches high above a gutter.

"We also think if a turret or other erection upon the roof of a building be of incombustible materials, that such erection, which may often be for useful or for ornamental purposes, as for instance a chimney-shaft, a bell-cover, or a Gothic spire or pinnacle or flying-buttress, then there should be no requirement of the extension of a party-wall opposite the same."

The following is now the form in the Bill:—

"And with regard to party-walls in reference to the height thereof;—

"If a party-wall adjoin to any roof,—then such party-wall must be carried up and remain one foot six inches at the least above the part where the party-wall and roof adjoin, measured at a right angle with the back of the rafters of such roof.

"And if any party-wall adjoin a gutter,—then such party-wall must be carried up, and remain two feet at the least above the highest part of any such gutter.

"If there be fixed within five feet of a party-wall, upon the flat or roof of the building, any turret, dormer, lantern-light or other erection, of combustible materials,—then every such party-wall must be carried up next to every such turret, dormer, lantern-light or other erection, and must extend one foot six inches higher, and one foot six inches wider than any such erection on each side thereof."

*Openings in Party-walls.*—"And for the purpose of regulating the making of openings through any party-wall between one dwelling-house and another, whereby two or more such dwelling-houses shall be united—

"With regard to any dwelling-houses of any rate, such dwelling-houses may be united by means of openings in the party-walls,—

"But with regard to any dwelling-houses which when so united will contain more than fourteen squares,—

"If such dwelling-houses shall be and continue to be in the same occupation,—and if the poor-rates in respect thereof shall be paid by the same person,—then, upon its being declared by the official referees that in their opinion the stability and security from fire of any or either of such dwelling-houses will not be endangered by making such openings, they may be made accordingly; but the external and party-walls thereof must be such as are herein prescribed for buildings of the extra first-rate of the first class."

*Recesses and Chases.*—"And further, with regard to any party-wall, as to recesses, and as to chases in such wall,—

"In every story recesses may be formed, but only with the consent and authority of the official referees first had and obtained, and so that such recesses be arched over, and so that the back of any such recess be not nearer than seven inches to the centre of the party-wall in the first or lowest story, nor nearer than four inches to the centre of the party-wall in any other story, and so that the stability and sufficiency of such party-wall be not injuriously affected thereby.

"If any chases be required for the insertion of ends of walls, of piers, of chimney-jamb, of withes of flues, of metal pipes, or of iron story-posts,—then every chase for any such purpose must not be left or be cut nearer than four inches at the least to the centre of a party-wall, nor within a distance of nine inches at the least from any front or back wall, and no two such chases must be made within a distance of seven feet six inches at the least from each other on the same side of a wall, and no such chase must be formed wider than nine inches."

We presume the words should run "not nearer than," &c., "FROM the centre of the party-wall." We still think that for the words "wider than nine inches" should be substituted the words "WIDER THAN FOURTEEN INCHES."

*PART IV.—Party-walls and Party-arches between intermixed Property.*—"And with regard to ANY BUILDING ALREADY BUILT, having rooms or floors, the property of different owners, which lie intermixed, without being separated by any party-wall or party-arch or stone-floor,—

"If EITHER OF SUCH HOUSES shall be altogether rebuilt, or to the extent of one-fourth of the cubical contents thereof,—then such intermixed properties must be separated from each other as follows:

"If they adjoin vertically,—then so far as they adjoin vertically, they must be separated by a party-wall.

"If they adjoin horizontally,—then so far as they adjoin horizontally, they must be separated either by a floor formed of brick, tile, stone or other proper and sufficient incombustible materials, subject to the consent of the official referees, or by a floor formed of iron-girders and brick-arches or stone-landings, or tiles, or by a party-arch or party-arches of brick or stone of the thickness of nine inches at the least, if the span do not exceed nine feet, and thirteen inches at the least if the span exceed nine feet; and such floor or party-arch or party-arches must be built with sufficient abutments and in a sufficient manner."

We must again direct attention to the ungrammatical inelegance in the above wording, relative to which Mr. Bartholomew made the following observations:—The words

"Either of such houses" do not relate properly to the foregoing words, "any building."

*PART V.—Buildings over Public Ways.*—"And with regard to buildings extending over any public way, as to the part thereof which extends over such way, so far as relates to the separation of such part from such public way,—

"If such part be rebuilt,—then it must be separated from such public way, either by a floor or arch formed of brick or stone, or of other incombustible materials, subject to the consent of the official referees; or by a floor formed of iron-girders and brick-arches or stone-landings, or by an arch formed of brick or of stone; which arch, if the span thereof do not exceed nine feet, must be of the thickness of nine inches at the least, and which if the span exceed nine feet, must be of the thickness of thirteen inches at the least."

Relative to this clause, Mr. Bartholomew observed—"We think grievous trouble would arise to all parties from recurrence to the official referees in all such cases." This duty, so retained, forms another reason for increasing the number of official referees. In fire-proof buildings, vaultings over public passages, should not be required to be thirteen inches thick. Old firm Gothic vaults are rarely so thick; the thrust of unskillfully-built thick vaults has occasioned them to be often superseded, in defiance of geometry and statics by tasteless bunglers, by those gross, execrable, and unsightly pieces of malconstruction, formed by iron girders, bearing brick arches.

*PART V.—*"And such floor or arch, with its abutments, must be built in such manner as shall be approved of by the surveyor; but there must not be formed over any public way a ceiling of lath and plaster, or of lath and cement."

*PART VI.—Party-Fence-Walls.*—The former absurd paragraph has been altered as follows:—

"And with regard to party-fence-walls, in reference to the thickness thereof, and to the height thereof,—

"The thickness of every such party-fence-wall must be throughout, at the least one-eighth of its length, and in buttress piers properly distributed, one-twelfth, at the least, of the whole height of the wall, measured from the top of the footing to the top of the wall, and including any coping upon the wall; or if the wall be less than 8½ feet high, then such thickness must be in every part thereof 8½ inches at the least, and the intermediate parts of every higher wall must be at the least 8½ inches thick.

"And every party-fence-wall, less than nine feet above the ground on either side thereof, may be raised to that height, by the owner of the ground, on the side on which it is less than that height; but upon condition that he do pay all the costs and charges of so raising it."

This clause is now in a very improved form, though its language is not sufficiently clear. Yet if one-eighth were made one-tenth, it would be still more improved, for the very frequent recurrence of buttresses would be troublesome, and the buttresses ought to be allowed to be sloped off at top with water-tabings, and indeed should, if of squared masonry, be allowed to slope altogether.

*SCHEDULE (E).—Rules concerning external Projections.—Projections from Walls of Buildings.*—"And with regard to all buildings, in reference to projections therefrom (except the porticoes of churches, chapels, theatres or other public buildings, but including steps, cellar doors and area inclosures).—The walls of all such buildings must be set back, so that all projection therefrom, and also all steps, cellar doors and area inclosures, shall only overhang or occupy the ground of the owner of such building, without overhanging or encroaching upon any public way."

We again refer strongly to Mr. Bartholomew's observations on this.—"The utterly forbidding of cornices and other decorations to private buildings to project over public ways, would be fatal to architecture, and would have the effect of deterring, on that account, many persons from altering or rebuilding the fronts of their houses; it would be quite sufficient to forbid the dripping of water or other liquids from such projections upon any public way."

*Wooden Shop Fronts and Shutters.*—"And with regard to shop-fronts and their entablatures, their shutters and pilasters and stall-boards, made of wood,—

"If the street or alley in which such front is situate be of less width than 30 feet,—then no part of such shop-front must be higher, in any part thereof than 15 feet; nor must any part, except the cornice, project from the face of a wall, whether there be an area or not, more than five inches; nor must the cornice project therefrom more than 13 inches.

"If the street or alley be of a greater width than 30 feet,—then no part of such shop-front, except the cornice, must project from the face of a wall, whether there be an area or not, more than 10 inches; nor must the cornice project therefrom more than 18 inches.

"And the width of such street or alley must be ascertained by measuring the same, as hereinafter directed with regard to the widths of streets and alleys.

"And the wood-work of any shop-front must not be fixed nearer than 4½ inches to the centre line of a party-wall.

"And with regard to such wood-work; if it be put up at such distance of 4½ inches,—then a pier or corbel built of stone or of brick or other incombustible material, and of the width of 4½ inches at the least, must be fixed in the line of the party-wall, so as to be as high as such wood-work, and so as to project one inch at the least in front of the face thereof."

"And the height of every shop-front must be ascertained by measuring from the level of the public foot-pavement in front of the building.

"And every sign or notice-board fixed against or upon any part of any house, or other building standing close to any public way, must be so fixed that the top shall be within 18 feet at the most above the level of such public way."

The expression should run, "4½ inches FROM the centre." Whether the highest or lowest part of the foot pavement should be expressed. We think if the clause with regard to notice-boards be allowed at all, the restriction with regard to altitude would be uselessly vexatious.

*Projections beyond the general Line of Buildings and from other external Walls.*—

"And with regard to buildings already built or hereafter to be rebuilt, as to low windows or other projections of any kind,—

"Such projections must neither be built with, nor be added to any building on any face of an external wall thereof, so as to extend beyond the general line of the fronts of the houses (which general line may be determined by the surveyor), except so far as is hereinbefore provided with regard to porticoes projected over public ways, and with regard to projections from face-wall and shop-fronts; nor so as to overhang the ground belonging to any other owner; nor so as to obstruct the light and air, or to be otherwise injurious to the owners or occupiers of the buildings adjoining thereto, on any side thereof."

Mr. Bartholomew stated his opinion, that "verandahs, balconies, cornices, and decorations ought to be allowed to project, provided they cause no public or private injury, and are made of incombustible materials, and are made of the satisfaction of the surveyor or official referees." Amelioration in this respect has now been made.

*SCHEDULE (F).—Rules concerning Chimneys hereafter built or rebuilt.—Construction.*—The plural word chimneys was (like that of moneys) misspelled throughout the Bill, in defiance of that rule of English orthography, which requires if a word end with y, preceded by a vowel, the y shall be retained. We are particular in this, because we think architectural nomenclature and orthography ought to be as soon as possible corrected: the alteration has been only partially made. The language is now,—

"With regard to chimnies and chimney-stacks, in reference to the construction thereof,—

"The foundations and footings of every such chimney and chimney-stack must be built similar to those of the wall in or adjoining to which it shall be.

"And the brick-work of every flue in any party-wall must be built from the foundation of

such wall, of the full thickness required for such flue; so that the brick-work of such flue shall not in any part thereof overail or overhang any part of such party-wall.

"And every stack containing two or more flues (except angle chimneys), must be built from the foundation to the top thereof without any corbelling over, whereby any upper part of the brick-work of such stack shall overail or overhang any lower part of the brick-work on the front thereof."

Why is this ridiculous and oppressive restriction against corbelling over chimneys, possessing no earthly advantage, still inserted? We must repeat Mr. Bartholomew's observation.—"The provisions restricting and forbidding the projection of flues would be so vexatious and useless, would so deform principal rooms by irregular and needless projections, as to become virtually impracticable, and lead to the immediate repeal of the Bill, if passed into law; the party-walls being stronger as they advance towards the ground, and the chimneys growing lighter as they proceed upwardly, by the increase in the number of flues and chimney-openings, the fears of want of sufficient support below are altogether unfounded; the constant finding of the finest buildings, several centuries old, unfractured and unfinching, although from their first erection they have had chimneys corbelled out, even externally from the face of the walling, shews how needless would such prevention be."

"Nevertheless, with regard to buildings of the first-rate and extra first rate,—the jambs, breast, and flue of any *SIX* inch chimney may be built upon brick, stone, or iron corbels, above the ceiling of the third story of every such building;" (so that a house might be built with all single projecting chimneys!)

"And with regard to buildings of the second and third rates,—the jambs, breast, and flue in any single chimney may be built upon brick, stone, or iron corbels, above the ceiling of the second floor of every such building."

"But the projection both of such jambs and breast, must not in any case exceed nine inches before the face of the wall or stack, to which the same shall adjoin."

"And with regard to angle chimneys,—such chimneys may be built in the internal angle of any building, so that the width of the breast thereof do not exceed FIVE FEET, and so that it be properly supported on iron girders, with brick arches, or on strong stone-landings, not less than four inches thick, and tailed at least nine inches into each of the two walls forming such angle."

The confining such chimneys to a width of 5 feet would be truly ridiculous; the building canted-work is one of the triumphs of science; the diagonal arches, which, in oriental architecture, change a square plan into an octagon, and that again into a circle, exhibit the absurdity, in point of construction, of such a restriction, which would, while useless, be such a nuisance. The dome of St. Paul's Cathedral is raised from piers in a similar way,—the "squineches," or diagonal arches, which support the canted sides of octagonal spires, where they leave the perpendicular support of the square tower below, are such pieces of construction. The method of building chimneys upon 4-inch landings is an execrable piece of unsafe mal-construction; an angle chimney with its jambs, each started from a single heading brick, and gradually corbelled over, and firmly arched at the mantel, is a sound and scientific piece of work, and never fails; stone landings are themselves constantly breaking, and fracturing the ceilings below them. The enactment of such provisions could only have the effect of exhibiting to posterity the possession of a limited knowledge of construction by the present generation.

**Dimensions and Materials.**—"And with regard to chimnies, in reference to the dimensions of the jambs thereof,—

"The jambs of every chimney must not be less than 8½ inches wide on each side of such opening." (To angle-chimneys they should be allowed to be of any size, because the adjoining walls would alone be sufficient.)

"And with regard to chimnies and flues, in reference to the thickness of the brick-work thereof,—

"The breast of every chimney, and the front, back, withe or partition, of every flue, must be at the least 4 inches in thickness of sound bricks, properly bonded, and the joints of the work must be filled in with good mortar

or cement, and all the inside thereof, and also the outside or face thereof, next the interior of any building, must be rendered or pargetted."

Pargetting the outside of flues can have no effect other than the creation of annoyance by defacement, and giving secret licence to inferior work, because such work is to be concealed. The scandalous unsoundness of ordinary flues arises from their being pargetted.

Many halls and other apartments are required to be finished with unplastered brick-work or masonry.

"And with regard to flues, in reference to the dimensions thereof,—no flue may be used for a smoke-flue, which is of less internal diameter in any section than 8½ inches."

We are not sure that the orthography of "withe" is correct.

We think the words "where required" ought to be omitted, as evasive, from before the words "to tie in the abutments," "four inches from."

**Slabs and Hearths.**—"And a slab or slabs of brick, tile, stone, slate, marble or other proper and sufficient substance, at the least 12 inches longer than the opening of every chimney when finished, and at the least 18 inches in front of the arch over the same, must be laid before the opening of every chimney."

"And in every floor, except the lowest or first floor, such slab or slabs must be laid wholly upon stone or iron bearers, or upon brick trimmers; but in the lowest or first floor, they may be laid on a brick fender, or bedded on the solid ground" (or upon concrete or other solid bases, should be added).

"And the hearth of every chimney must be laid and bedded wholly on brick or stone, or other incombustible substance, which must be solid for a thickness of nine inches at the least, beneath the surface of any such hearth."

We should like all slabs to be at least two feet wide; the word "withe" seems to be omitted in the description.

**Backs.**—"And as to the back of every chimney-opening of every building (except backs of chimnies in the first floor of buildings of the fourth rate),—every such back, in the lowest or first floor, must be at the least 13 inches thick from the hearth to the height of 12 inches above the mantel, and in every other floor, at the least 8½ inches thick up to the same relative height."

"And as to the backs of chimney-openings in the first floor of buildings of the fourth rate,—such backs must be at the least 8½ inches thick, to the height of 12 inches at the least above the level of the mantel."

"Provided always, that if the chimney be built in any wall, not being a party-wall,—then the back of every such chimney-opening may be 4½ inches less than the several thicknesses above described."

The word "story" ought to be substituted for the word "floor." There does not appear to be any restriction in the proposed Act to prevent chimney-openings from being carried to or beyond the centres of party-walls.

**Chimney-openings back to back.**—"And as to backs of all such chimney-openings,—if two chimnies be built back to back,—then the thickness between the same must be at the least of the thickness hereinbefore described for the back of one chimney-opening."

**Angles of Flues.**—We little approve of the relaxation in the matter of flues, by which soot may be collected in horizontal and flat flues, and an addition to the execrable nuisance of soot-doors be induced.

**Close Fires.**—"And as to every oven, furnace, cokel or close fire, used for the purpose of trade or manufacture,—it must be six inches at the least distant from any party-wall, and must not be upon nor within a distance of 18 inches of any timber or wood-work."

The words EVERY and IT are not in agreement. The words should run "two feet from." We do not perceive any restriction to prevent ovens from being built upon wooden supports, while iron is expressly forbidden for their supporting and surrounding floors.

"And the floor on or above which such oven, furnace, cokel or close fire, shall be built or fixed, must be formed and paved under, and for a distance of two feet all round, the same, with stone, brick, tile or slate, at the least two inches thick, or other proper incombustible and non-conducting materials."

**Chimney-Pots, Tubes, &c.**—"And as to earthen or metal chimney-pots, tubes, funnels,

or cowl of any description whatsoever,—no such pot, tube, funnel or cowl must be fixed so as that the top of it be higher than four feet above the brick or stone work of the flue on which the same shall be placed; and every such pot, tube, funnel, or cowl must be fixed two feet at the least into the brick or stone-work of the flue on which it shall be placed."

We again repeat Mr. Bartholomew's note upon this.—"We lately had a case in which a zinc smoke funnel so fixed was blown down in a storm, carrying with it, attached thereto, a lump of 4 cwt. of brickwork, and piercing through a neighbouring roof, broke a strong carpenter's bench quite across, escaping, by only a few inches, the man who was there at work."

**Smoke Pipes.**—"And as to any metal or other pipe or funnel for conveying smoke, heated air, or steam, in reference to the position thereof,—such pipe or funnel must not be fixed against or in front of any face of any building in any street or alley, nor on the inside of any building, nearer than 14 inches to any timber or other combustible material."

Should be "Fourteen inches" from "any timbers."

**Cuttings into Chimneys.**—"And as to every chimney-shaft, jamb, breast or flue already built, or which shall be hereafter built, in reference to cutting the same,—no such erection shall be cut into for any other purpose than the repair thereof, or for the formation of soot-doors, or for letting in, removing, or altering, stove-pipes or smoke-jacks, except as directed for building an external wall against an old sound party-wall."

The unnecessary restrictions as to the nature of rain-water-pipes are now removed.

**SCHEDULE (II.)**—The following are now the propositions relative to drainage of buildings:—

"Before the several walls of any such building shall have been built to the height of 10 feet from their foundations, the drains thereof must have been properly built and made good (that is to say), if there be within 50 feet from any front of the building, or from the ENCLOSURE ABOUT THE BUILDING, a common sewer into which it is lawful and practicable to drain,—then into such common sewer; and if there be not in such situation and within such distance any such common sewer,—then to the best outlet that can be obtained, so as to render, in either case, such drains available for the drainage of the lowest floor of such building, or addition thereto, and also of its areas, water-closets, privies, and offices (if any)."

"And the inside of the main drains under and from every building for carrying off soil must be of, or be equal to, an area at least NINE INCHES IN DIAMETER."

We must here repeat Mr. Bartholomew's observations, that, the terms "Equal to an area of at least 9 inches diameter," are not sufficiently definite, the quadrature of the circle being a matter of difficulty; but some definite quantity, as, for instance, 72 superficial inches, ought to be substituted."

"And every such drain must be laid to a fall or current of, at the least, half an inch to ten feet, and so as that the whole of every such drain within the walls of such building shall be wholly covered over under the lowest floor, and independently thereof."

"And every such drain within the walls of such building must be built and covered over with brick, stone or slate, and so as to render the drain air-tight."

"And every part of such drain inside and outside the walls of every building must be built of brick, tile, stone or slate, set in mortar or cement."

**Cesspools and Privies.**—"And with regard to cesspools and privies;—

"If there be a common sewer within 50 feet from any front of, or from the ENCLOSURE ABOUT ANY HOUSE OR OTHER BUILDING,—then a cesspool must not be made for the reception of drainage from such house or other building, unless there be, or shall be built, a good and sufficient drain from such cesspool to such common sewer."

The words "enclosure about, &c.," here and in the preceding instance, require to be more definite.

"And if any cesspool be built under a house or other building,—then such cesspool must be built air-tight."

"And every privy built in the yard or area of any building, or under any street or alley, must have a door, and be otherwise properly inclosed, screened and fenced from public view."

SCHEDULE (I).—The following are now the proposed regulations relative to the widths of streets, &c.:

"With regard to every such street or alley, hereafter to be formed, in reference to the width thereof;—Every street or alley must be of, at the least, the following width, from front to front, in every part thereof respectively; that is to say:—

"Every street must be of the width of 40 feet at the least; but if the buildings fronting any street be more than 40 feet high from the level of the street, then such street must be of a width equal, at the least, to the height of the buildings above such level.

"Every alley must be of the width of 20 feet at the least; but if the buildings fronting any alley be more than 20 feet high from the level of the alley, then such alley must be of a width equal, at the least, to the height of the buildings above such level.

"And the carriage-way of every street must be at the least 24 feet wide."

"And before every row of houses there must be a footway; and every such footway must be at least 5 feet wide.

Entrances to Alleys.—"And with regard to every such alley, in reference to the entrance thereof,—every alley must have two entrances thereto, each being, at the least, of the full width of the alley, and one of the two, at the least, open from the ground upwards."

Measurement of Width.—"And with regard both to such streets and alleys,—the aforesaid width is to be ascertained by measuring (at right angles to the course thereof), from front to front of the buildings on each side of such side of such street or alley.

SCHEDULE (K).—Rules concerning Dwelling-Houses hereafter built or rebuilt, with regard to back-yards and areas, and rooms under-ground, and in the roof.—Back-yards.—"With regard to back-yards or open spaces attached to dwelling-houses;—

"Every house, hereafter built, must have an inclosed back-yard or open space of, at the least, one square, exclusive of any building thereon.

"And if any house already built, be hereafter rebuilt,—then, unless all the rooms of such house can be lighted and ventilated from the street, or from an area of the extent of, at the least, three-quarters of a square, into which the owner of the house to be rebuilt is entitled to open windows for every room adjoining thereto, there must be, above the level of the floor of the third story, an open space of at least three-quarters of a square.

"And with regard to every building of the first class:—

"Every such building must be built with some roadway, either to it, or to the inclosure about it, of such width as will admit to one of its fronts of the access of a scavenger's cart, of the ordinary size of such carts."

These restrictions, while beneficial in new building sites (where, however, close building is rare), would be found to practically prevent improvement, by old houses being perpetuated to avoid loss of available sites.

Lowest Rooms.—"And with regard to the lowermost rooms of houses being rooms of which the surface of the floor is more than three feet below the surface of the footway of the nearest street or alley, and to cellars of buildings hereafter to be built or rebuilt;—

"If any such room or cellar be used or intended to be used as a separate dwelling,—then the floor thereof must not be below the surface or level of the ground immediately adjoining thereto, unless it have an area, fire-place and window as required for rooms and cellars of existing buildings let separately and used as a separate dwelling, and unless it be properly drained.

"And with regard to every such lowermost room or cellar in any existing building used or intended to be used as a separate dwelling;—

"There must be an area not less than three feet wide in every part, from six inches below

the floor of such room or cellar to the surface or level of the ground adjoining to the front, back, or external side thereof, and extending the full length of such side.

"And such area, to the extent of at least five feet long and two feet six inches wide, must be in front of the window of such room or cellar, and must be open, or covered only with open iron gratings.

"And there must be made for every underground dwelling-room an open fire-place, with proper flue therefrom.

"And there must be a window-opening of, at the least, 9 superficial feet in area; which window opening must be fitted with a frame filled in with glazed sashes, of which, at the least, 6 superficial feet must be made to open ventilation.

Attic Rooms.—"And with regard to rooms in the roof of any building hereafter built or rebuilt, in reference to the number of floors

of rooms in the roof, and to the height of such rooms:—There must not be more than one floor of such rooms, and such rooms must not be of less height than 7 feet, except the sloping part, if any, of such roof, which sloping part must not begin at less than 3 feet 6 inches above the floor, nor extend more than 3 feet 6 inches on the ceiling of such room."

The restriction relative to 3 feet 6 inches above the flooring would certainly operate detrimentally by occasioning the cubic contents of attics to be diminished by their lower parts being hatted with "ashlar quarters," to render them perpendicular.

Rooms in other Parts.—"And with regard to rooms in other parts of the building, in reference to the height thereof:—Every room used or intended to be used as a separate dwelling must be of, at the least, the height of 7 feet from the floor to the ceiling.

SCHEDULE (L).—The following is now the List of Fees proposed to be payable to the Surveyors.

Fees for New Buildings.—For any building erected on old or new foundations, as follows:—

	Dwelling-House Class.	Warehouse Class.	Public Buildings.
	£ s. d.	£ s. d.	£ s. d.
If the building be of the 1st rate .. .. .	3 10 0	3 10 0	3 10 0
Ditto .. extra 1st ditto .. .. .	5 5 0	..	5 5 0
Ditto .. .. 2nd ditto .. .. .	3 3 0	3 3 0	3 3 0
Ditto .. .. 3rd ditto .. .. .	2 10 0	2 10 0	2 10 0
If the building be of the 4th rate, and exceed two stories in height .. .. .	2 2 0	2 2 0	2 2 0
If the building be of the 4th rate, and do not exceed two stories in height .. .. .	1 10 0	2 2 0	1 10 0
And with regard to buildings of the warehouse class, a further fee to be paid in respect of any additional 35 squares, or portion of 35 squares, in any such building, beyond the first 35 squares .. .. .	..	{ .. equal to one-half of the above fees respectively	..
And for inspecting and reporting to the Official Referees (s. 24) on party-walls and intermixed buildings:—			
If the building be of the 1st rate .. .. .	3 10 0	3 10 0	3 10 0
Ditto .. extra 1st ditto .. .. .	5 5 0	..	5 5 0
Ditto .. .. 2nd ditto .. .. .	3 3 0	3 3 0	3 3 0
Ditto .. .. 3rd ditto .. .. .	2 10 0	2 10 0	2 10 0
If the building be of the 4th rate, and exceed two stories in height .. .. .	2 2 0	2 2 0	2 2 0
If the building be of the 4th rate, and do not exceed two stories in height .. .. .	1 10 0	2 2 0	1 10 0
For every insulated building .. .. .	1 1 0	1 1 0	1 1 0
For every detached building built for the purposes of trade or collection for toll .. .. .	..	..	10 6

"For every attached or detached building, distinctly rated, such fee as is hereby imposed in respect of additions to, or alterations of buildings of the rate to which such attached or detached buildings shall belong."

Fees for additions and alterations.—"For every addition or alteration made to any building, which shall involve the execution of works subject to the regulations of this Act, the following fees; that is to say,—

	£ s. d.
If the building be of the first rate .. .. .	1 15 0
Ditto .. extra 1st ditto .. .. .	2 10 0
Ditto .. second ditto .. .. .	1 10 0
Ditto .. third ditto .. .. .	1 5 0

If the building be of the fourth rate, and exceed two stories in height .. .. . 0 15 0

If the building be of the fourth rate, and do not exceed two stories in height .. .. . 0 10 0

"And with regard to buildings of the warehouse class, a further fee, to the amount of half of the above fees respectively, according to the rate of such building, to be paid in respect of every additional thirty-five squares, or portion of thirty-five squares, in any such building."

Fees for special duties.—"For the following special duties performed by any Surveyor, according to the enactments of this Act, where such duties shall not be performed incidentally to the building or rebuilding of any building in respect of which any other fees may be payable; that is to say,—

For attending to the cutting away of chimney-breasts for external walls,—

	£ s. d.
If the building be of the first rate .. .. .	2 2 0*
Ditto .. extra first rate .. .. .	2 2 0*
Ditto .. second rate .. .. .	3 3 0*
Ditto .. third rate .. .. .	3 3 0*

\* The relative scale of these fees is no doubt erroneous.

If the building be of the 4th rate, and exceed two stories in height .. .. . 1 1 0

If the building be of the 4th rate, and do not exceed two stories in height .. .. . 0 10 6

For condemning party fence walls .. .. . 0 10 6

For the inspection and removal of projections, &c. in imminent danger, and ruinous buildings .. .. . 0 10 0

For surveying party-walls not kept in repair, and consenting to notice of repair being served .. .. . 0 10 0

For inspecting arches or stone floors over public ways .. .. . 0 10 0

For inspecting formation of openings in party-walls .. .. . 0 10 0

For inspecting chimney-shafts, pots, funnels, &c., above certain heights .. .. . 0 10 0

Fees for Special Services not expressly provided for.—"For any service performed by any Surveyor which is required by this Act, but not comprehended under any of the foregoing heads.

"Such fee, not exceeding 2*l.*, as the Official Referees shall by writing under their hands order and appoint, with the consent of the Commissioners of Works and Buildings.

When it is considered that the scale of these fees is, compared with the price of the building, only about 60 per cent. of that which the fees were at the time of the passing of the present Building-Act, and that many new duties are proposed to be cast upon the district Surveyors, by which much expense in surveying and condemning party-walls, and other processes, are intended to be avoided, which, indeed, renders the fees virtually less than half that which they were made in the year 1774, we think no reason whatever can exist, on this head, for dissatisfaction of either the public or the building interest. b.

## OXFORD ARCHITECTURAL SOCIETY.

The fifth annual meeting was held at Wyatt's Room, High-street, June 17, the Rev. the Rector of Exeter College in the chair.

After a few preliminary observations, the chairman read the annual report of the committee. He congratulated the society on the steady progress of the "Study of Gothic Architecture," which is daily becoming more general: the good effects of this are already visible on all sides, and still greater effects may yet be looked for. He rejoiced to observe the formation and successful progress of similar societies in various parts of the kingdom, and mentioned particularly the Cambridge and the Exeter Societies as very flourishing and efficient. The mutilation and destruction of the remains of Gothic architecture has been checked and well-nigh stopped, although a few more instances may still be heard of occasionally, as at Newcastle, where an ancient church has been wantonly destroyed within the last few weeks; the general indignation with which such acts are now viewed, by all persons who have any pretension to the rank of educated or enlightened men, is a guarantee that they will not be frequent. There is, however, another just ground of alarm in the mischief which is daily perpetrated under the name of restoration, which, when conducted without sufficient knowledge, is often productive of more injury than benefit, and should be very closely watched. Irreparable injury is often done by ignorant persons, under the plausible pretext of merely *scraping* off the whitewash, and still more when the decayed surface of the stone has also to be scraped.

In this university and city, there have been four instances of restoration within the past year, which are deserving of praise. At St. John's College the chapel has been restored in a very elaborate manner, and with good taste. At Merton, the roof of the ante-chapel, which was in a decayed state, has been renewed, and the floor for the ringers in the tower removed, throwing open a fine groined wooden ceiling, which is a great improvement; but the gallery for the ringers, which has been introduced in the place of the old floor, would have been better omitted. In St. Aldgate's Church the general effect of the exterior is pleasing, but there might have been more accuracy in the details; and we cannot but regret the loss of the old library. At Holywell, though the exterior is less striking, all the detail is admirable, and in the interior the good effect of open seats is fairly seen, and the manner in which this restoration and enlargement have been executed is worthy not only of praise, but of imitation. The restoration of St. Peter's in the East is now also in progress, and it is hoped that the most scrupulous care will be taken to preserve entire the character of the building, even in its most minute details, and that no attempts at *improvement* will be allowed to interfere with the designs of the original architects of this interesting and valuable relic of antiquity.

The publications of the society during the year have been: the second part of the "Guide to the Architectural Antiquities in the neighbourhood of Oxford," of which a third part is now in preparation; several sheets of working drawings of ancient pews and pulpits, which are found very generally useful, and are readily purchased. Two new sheets were laid on the table, containing the details of the pulpits of Beaulieu, fluted, of stone, very early, in the Decorated style. St. Giles's, Oxford, of wood, also in the Decorated style, but late; and Coombe, Oxfordshire, of stone, in the Perpendicular style. The drawings of Shottesbroke Church, a well-known and very perfect specimen of the Decorated style, have been engraved, and will be ready for publication in a few days; for these drawings the society is

indebted to W. Butterfield, Esq. The drawings of Minster Lovell Church, a good specimen of the Perpendicular style, promised at the two last annual meetings, are still not ready, the architect who undertook to furnish them having failed to fulfil his engagement. The drawings of Wilcote Church, presented by C. Backler, Esq., were laid on the table, and will be engraved immediately; this is a small church in the Decorated style. Also those of St. Bartholomew's Chapel, presented by C. Cranston, Esq.; this is a small but elegant building of the period of transition from Decorated to Perpendicular.

New editions are preparing of Stanton Harcourt and Hasleby: to the series in 8vo. it is proposed to add the papers on Ewelme and Dorchester, lately read by Mr. Addington, for which the drawings are ready.

At the suggestion of the Bishop of Newfoundland, designs for churches to be constructed entirely of wood, the only material to be obtained in that colony, have been prepared by Mr. Cranston, under the directions of the committee. Two of these designs are now ready, and were laid on the table.

At the request of the Madras committee for the erection of a church at Colabah, a design has been prepared by Mr. Derick, under the direction of the committee, which it is hoped will be found well suited to the climate, while it preserves a strictly Gothic and church-like character. An elevation of this design has been engraved, and copies sent for distribution to any of our members who are interested in it.

The society has in several instances given useful advice to persons engaged in church-building or restoration, and have pleasure in doing so in any case in which they may be applied to.

A paper was read on Dorchester Church, Oxfordshire, by Henry Addington, Esq., of Lincoln College, illustrated by a large number of drawings of all parts of the building, including the original drawings by Mackenzie, for "Skelton's Oxfordshire," which were kindly lent for the occasion by the Rev. H. Wellesley. Mr. A. gave an outline of the early history of Dorchester, with its bishopric and abbey, shewing clearly that there was a Saxon church on this site, but considers no part of the existing building earlier than the middle of the twelfth century (unless it is a small portion of the masonry of the tower), and the greater part is of the time of Edward I. The two semi-circular arches, which have been sometimes considered as Saxon, are evidently cut through the Norman walls, and are probably of the time of Charles II., when the church was repaired after the injury it had sustained in the civil wars. As this interesting paper is to be published, it is not necessary to attempt any further analysis of it.

A memorial was presented to the meeting, very numerously signed by members of the society, suggesting that some of the rules should be more strictly acted upon, and that others should be altered. A special committee of nine members was appointed to consider this subject, and to recommend such alterations as appeared to them to be necessary, and to report thereon to a general meeting of the society, on October 30th.

## METROPOLIS IMPROVEMENTS.

The new line of street from Coventry-street to Long-acre is now in a very forward state, and so soon as the opening from Coventry-street into Leicester-square shall be sufficiently advanced to be seen by the public (which may be expected in a very few days, as the buildings are now in the hands of Messrs. Reddin and Sons, the large contractors under the Commissioners of her Majesty's Woods and Forests for pulling down the old houses), the ground will be advertised to be let by public tender, immediately after which the new buildings will be commenced. Arrangements have been concluded with the parish authorities for the footway and carriage paving, both of which will be immediately commenced. The street will be 54 feet wide in clear of the houses, which will be of a handsome character, and may probably be expected to be completed in the course of about eighteen months. The

line of street from Oxford-street into Holborn is now rapidly advancing, the well-known rookery in St. Giles's having nearly disappeared, and the houses required for this improvement being all down, with a very few exceptions; these also are in the hands of Messrs. Reddin, and will be very shortly cleared. Contracts for the sewers and vaults have been entered into with Messrs. Bennett, and Messrs. Hayward and Mixon, respectively, and are already commenced. Ground for a French Protestant church has been sold and staked out, for which a design has been made by Mr. Ambrose Poynter, the secretary to the Royal Institute of British Architects, and will be commenced immediately. The design only awaits the approval of the Commissioners of her Majesty's Woods and Forests. It is also intended by the Commissioners of Woods and Forests to erect three handsome houses (as a standard for the houses generally, to be built on this line) immediately adjoining the new church; which said houses will be erected from the design and under the superintendance of Mr. J. Penethorne, the architect to the Commissioners of her Majesty's Woods, &c.; and under whom also, it may be proper to add, the whole of these very important and extensive alterations and improvements are now being carried into effect. The line from Long-acre to Broad-street will shortly be in a state to be thrown open to the public, it only awaiting the removal of the houses forming the block between Long-acre and Castle-street, which belong to the Mercers' Company, and are to be removed by them. A church is in the course of erection in this line, and from the rapid manner in which the works progress, under the direction of Mr. B. Ferry, promises a speedy completion. The design is of the early English character. The portion of the improvement at the corner of King-street, in continuation of Great St. Andrew's-street, is nearly completed, the buildings being, with only one exception, erected, those built by Mr. Buckingham, the rope-manufacturer, being of a very extensive, handsome, and substantial character. The line from Spitafields Church to the London Docks is now nearly cleared, and contracts will very shortly be entered into for the formation of the requisite vaults, sewers, &c.; immediately after which the ground will be advertised for tender, as in the other cases. This line is nearly a mile and a quarter long, and is being carried out with a view to ulterior continuation.—*Times*.

## LECTURES ON ARCHITECTURE AND ANTIQUITIES.

## Lecture III.

(Continued from p. 327.)

## ON GRECIAN ARCHITECTURE—THE IONIC STYLE.

The second of the Grecian orders of architecture, called IONIC, is considered to be coeval with the Doric, and it is found frequently used in the interior of Doric buildings. "The earliest specimen of which any remains are to be found is the celebrated temple of Juno at Samos; which in the age of Herodotus was considered as the largest and most stupendous edifice ever raised by Grecian art. This interesting ruin, although often visited, has never until recently received any architectural elucidation. It was built about the 69th Olympiad,\* by Rhæus and Theodoros, two natives of the island, and the style, possessing many peculiarities, is such as strongly to denote its archaic origin. The bases of the columns are remarkable from the number and complication of their parts; the shaft is not fluted, nor is there any appearance of volutes to the capitals." (Lord Aberdeen's Inquiry, p. 160.) "The octastyle temple of Bacchus at Teos is a heap of ruins, but enough remains to attest the exquisite beauty of the ancient edifice, and fully to justify the praises lavished by Vitruvius on the architect, Hermogenes of Alabanda." (*Ibid*, p. 162.) The date of this temple is supposed to be about 440 B.C. It appears from Vitruvius that the architect had prepared his materials to build this temple in the Doric style, but changed his mind to complete it in the Ionic, maintaining that the Doric was not fit for temples. A superb octastyle temple, dedicated to Apollo Didymæus, near Miletus, is supposed to have been built about 376 B.C.; its architects were Peonius of Ephesus, and

\* About 540 B.C.

IONIC TEMPLE ON THE RIVER ILISSUS.

Daphnis of Miletus. (Vitruvius.) "Three columns entire, and a profusion of marble fragments scattered around, are all that remain of this once magnificent edifice; but these are of a description amply sufficient to indicate its former beauty and grandeur, even if they had not been so highly extolled by the uniform voice of antiquity." (Inquiry, p. 169.) Another fine Ionic building, of an exceedingly rich character, is the temple of Minerva-Polias, at Priene, which was dedicated by Alexander the Great; the architect was Pythius. At Sardis was a temple, of which five entire columns remain, whose diameter is 6 feet.

But the purest and best known specimens are to be found at Athens, where we see at once the simplest and richest modes of employing this style, the former in the graceful little temple on the Ilissus, and the latter in the double temple erected in honour of the virgin-goddess and Erechtheus. Authors differ respecting the name which should be assigned to the former building. Dr. Spon supposed that it was used for the celebration of the lesser mysteries of Ceres, and that it was dedicated to that goddess; to this opinion Stuart objects that it was not large enough for the purpose, the cell being only 15 feet 4 inches square. From Plato we are led to believe that it was consecrated to Panops, an Attic hero. From Pausanias we infer that it was appropriated to the worship of Triptolemus, who instituted the Eleusinian rites; this opinion appears to be the most generally received. Mons. le Roy, who made numerous mistakes in his work, calls it a temple of Diana the Huntress. Nothing can be more simple than the design of this beautiful little building, which is only 20 feet high to the cornice; from the fewness of the mouldings, and their freedom from enrichment, it serves as a model for most of the Ionic porticos of the present day, as it is admirably adapted to domestic structures. This temple had a portico of four columns at each end, but was without any lateral columns; the columns are only 21 inches in diameter, and are eight diameters high. The architrave has only one face, and the frieze was probably also plain, although Stuart considers that it may have had an enrichment, as a fragment of sculpture, representing several figures, was found at Athens, which exactly fitted the space. The cornice is composed of the fewest possible mouldings, which throughout the building are of the simplest character. A more enriched example is that of the Temple of Minerva-Polias (so called from πόλις, a city; thus the goddess was emphatically the protectress of the city, Athens), placed in the Acropolis, at a distance of 150 feet from the Parthenon. This temple is connected with two other buildings, the Erechtheum and the Pandroseum; the former so called, not after the sixth king of Athens, but from an appellation of Neptune, and because it contained the salt-spring called Erechtheis, fabled to have been produced by the trident of that god; the other building was named after Pandrosus, one of the daughters of Cecrops, who was favoured by Minerva, because she did not indulge her curiosity (like her two sisters) in looking into the basket containing the infant and deformed Erichthonius. Here was placed the olive said to be produced by Minerva in her contest with Neptune.

Professor Wilkins is inclined to place the sacred olive in the pronos leading to the Pandroseum, and considers that the three windows were made to afford the light and air necessary for the tree. In the Temple of Minerva was an ancient image of the goddess made of wood. "It is reported," says Pausanias, "that this statue fell from heaven, but I shall not discuss whether it did so or otherwise; Callimachus made the golden lamp before the statue of the goddess. This lamp being filled with oil, from that day lasts the future year; the oil in the mean time supplies the lamp, shining night and day." The architect of these buildings was Philocles of Acharnæ, as we learn from an inscribed marble now in the British Museum.

We now proceed to notice this triple-temple more in detail, for which purpose a plan is essential. Elevated on three steps is a portico of six columns, leading to what is called by Stuart the temple of Erechtheus, but which is considered by others to be the cella of the goddess. The columns here are 2 feet 3 inches in diameter, 21 feet 7 inches high, including base and capital, and are 4 feet 8 inches apart. The width of the cell is 32 feet 4 inches, and its depth 23 feet 11 inches. In the rear of the cell, and divided from it by a wall, is the apartment which Stuart ascribes to Minerva, receiving its light from three openings, like windows (a rare and valuable example), placed between half-columns, and having on one side a communication with the Pandroseum, and on the other with a noble portico of four columns in front, having a projection of two inter-columns. These three last-named parts are on the same level, which is, however, about nine feet lower than that of the hexastyle portico. The columns of the tetrastyle are 2 feet 9 inches in diameter, and 25 feet in height. The little building the Pandroseum had six female figures called Caryatides, instead of columns, to support the entablature, and their origin has given rise to much discussion. "Their appellation has been explained by Vitruvius, but it is not probable that the story which would refer their origin to the commemoration of the captivity of the Caryan women after the destruction of the city, in consequence of its desertion of the cause of the Greeks in the Persian war, is entitled to more credit than other traditions to be met with in the pages of the same author respecting the invention of the different Grecian orders. In fact, these female figures were not represented as captives, nor, as it would seem, with any symbols of subjection and disgrace, which we might naturally have expected to find had there been any foundation for this tale of their origin. On the contrary, in the architectural enumeration of the different parts of the Pandroseum, contained in the interesting inscription already mentioned, the figures forming the portico are simply KOPAI, or the virgins, thereby intimating that they were native Athenians; and indeed, from their appearance, there is every reason to presume that they were intended to represent the Canephore, who were selected for the solemnities of the Panathenæan festival from the most distinguished families of the city." (Lord Aberdeen's Inquiry, p. 190.) These korai, or damsels, as they are termed in the inscription before alluded to, are draped entirely, with the

exception of the arms, which are bare, and their dress resembles that of the basket-bearers in the procession in the frieze of the Parthenon; and so honourable was this employment, that inscriptions, and probably statues, were granted to the young persons who had been selected for the office." Stuart has given an inscription, of which the purport is, "The council and the people (placed) Apollodora, the daughter of Apollodorus, of Gargettus, who carried the sacred things of Minerva-Polias." One of these figures, which thus appear to have been appropriate supporters of the canopy which sheltered the sacred olive of Minerva, is preserved in the British Museum, together with a capital from the Erechtheum, a base, and part of the architrave, cornice, and four pieces of the frieze. It has been supposed that these buildings were commenced during the administration of Pericles, but that his death put a stop to their progress. The architecture of the temple of Minerva-Polias has been closely imitated by Mr. Inwood in the new church of St. Pancras, and the vestries are fac-similes of the Pandroseum. There are some other Ionic structures in and near Athens, but they are of date later than those just considered, and partake strongly of the Roman manner, which, indeed, is evident from the title of one, the Aqueeduct of Hadrian. As in the Doric order the distinguishing feature is the triglyph, so in Ionic buildings, that by which they are best recognized is the volute of the capital, of which a trace may be seen in the Egyptian temples, especially in such as were dedicated to Isis. The height of Ionic columns varies from about eight diameters and a quarter, as in the temple on the Ilissus, to nearly nine and a half, as in the Erechtheum, the columns in the temple of Minerva-Polias being little more than nine diameters high.

The CORINTHIAN, the third of the Greek orders, is as rich and graceful in its decorations as the Doric is severe and majestic; examples, however, are not numerous at Athens. One of the most beautiful is the Choric monument of Lysicrates, sometimes called the Lantern of Demosthenes. This is quite a gem in architecture. It is circular in its plan, and on a high pedestal are ranged six columns which are attached to the wall; these support an appropriate entablature, above which rises the roof, or cupola, of one block of marble, the tiles of which are carved in the shape of leaves: upon the roof was an ornament adorned with beautiful foliage. The capitals of the columns are among the most exquisite specimens of design in existence, and they are unique, differing very much from the examples of the order to be found in Rome. It is a vulgar tradition among the modern Greeks which assigns this building to Demosthenes, as a place which he erected for study; it was certainly built in his time, about 330 B.C. But the inscription on the architrave sets the matter at rest, which imports that Lysicrates, the son of Lysitheides, was Chorus on the occasion of a musical entertainment. It appears that a spirit of emulation existed among

\* Vernade, the Venetian engineer at the siege of Athens in 1687, describes the Pandroseum as "Sostenute da quattro statue di marmo, quale rappresentano le Grazie che Socrate fece far vestire per burlarsi di quelli, che le hanno rappresentate nudo."

the Athenians of a certain rank to give entertainments, at their own expense, to the people. These consisted of different games, plays, and tragedies, in which the chorus occupied a prominent part, whence the giver of the entertainment was termed Chorus. Some of the most celebrated names in Grecian history may be noticed as having filled this honourable office. Lysias, the orator, the rival of Demosthenes, in one of his orations, enumerating his services to the Athenians, mentions the number of times he was a Chorus, and the expense he was put to each time, varying from 33*l.* to 208*l.* sterling. The just Aristides was a Chorus, and Themistocles obtained a victory on occasion of his having as a Chorus exhibited a tragedy composed by Phrynichus. The prize awarded to the victor was generally a tripod, a practice which was alluded to by Homer, Hesiod, and Pindar, Virgil and Horace, as well as by prose writers.

"It was the usual custom, and a very ancient one, for the victors to dedicate these tripods to some divinity, and to place them either in temples already built, or upon the top of some consecrated edifice erected for that purpose; thus they participated of the sanctity of the place, and were secure from injury and violence; to have destroyed or defaced them, had doubtless been esteemed an act of sacrilege. A tripod thus dedicated was always accompanied with an inscription; so that it became a permanent, authentic, and public monument of the victory, and of the person who had obtained it." (Stuart's Athens, vol. 1.) It is highly probable that a Choric tripod graced the summit of the little building under review, since cavities were found in the upper surface of the flower which appear suited to receive the feet of a tripod. On each panel, between the columns, two tripods are represented, and on the frieze is sculptured the story of Bacchus punishing the Tyrrhenian pirates. A modern imitation of this example may be seen in the turret of St. Philip's Chapel, Regent-street. The rest of that building is in the Roman Doric style, the architect, Mr. Repton, having been required by a committee to submit to this want of unity. In the original tower of Lycrateres, Lord Byron is said to have composed much of his poetry. Another interesting Choric monument is that of Thrasylus, on which was placed the beautiful statue of Bacchus in female costume, which is now in the British Museum.

Another singular structure which may be classed with the Corinthian order, is the marble octagonal tower of the winds, called also the Tower of Andronicus Cyrrhestes, who built it, and adorned the frieze of each side with a figure representing one of the principal eight winds. The capitals which are supposed to belong to the columns of this building have only one row of the acanthus leaves, the upper range consisting of the smooth leaves generally termed *water-leaves*, nor are there any volutes. The form of this temple is imitated as the upper stage of the steeple of St. Pancras Church.

The remains of the temple of Jupiter Olympius, at Athens, are unfortunately so few, and those in so dilapidated a state, that we cannot give much account of it. Pausanias says, that it was the largest temple in Greece, and second only to the celebrated temple of Diana, at Ephesus. Altogether there were one hundred and fifty columns (inside and out), of which only sixteen remain; the front and rear porticos had three rows of ten columns in each, and the flanks had two rows of twenty columns each; they were more than 6½ feet in diameter, and 60 feet high. The temple is considered to have been 354 feet long and 171 feet wide. From Vitruvius we learn that it was first projected by Pisistratus, who laid the foundations about 540 B.C., but soon after his death, the work was discontinued until the time of Antiochus Epiphanes, at whose expense the building was carried on from the designs of Cossutius, a Roman architect, who determined the magnitude of the cells, and adjusted the arrangement of the columns about the dipteros, and the disposition of the architraves and the other ornaments, with great skill and supreme science. (Vitr. Lib. vii.) Again the progress of the building was arrested, and the glory of finishing the temple of Olympian Jove was left to the Emperor Hadrian, nearly 700 years after its commencement.

The arch of Hadrian, and a portico called the Pantheon of Hadrian, are likewise Corinthian examples, but cannot be considered to belong to Grecian art, since their details all partake of the practice of the Roman architects. Athens at one time must have been extremely rich in temples, from the enumeration of several, besides those noticed in various historians, of which not a vestige exists. Many, no doubt, perished in the Persian invasion. The remains of a theatre, called after Bacchus, are of great interest: it is of a semi-circular form, and well arranged for all the spectators to hear and see. Dramatic representations formed the favourite amusement of the Athenians, and one advantage in favour of the Greek theatre over the amphitheatre of the Romans is, that it was not polluted by the shedding of blood, whether of victims taken in war, or of men trained to a profession, which was one of slaughter, and in which they were required

"To fall with grace, with dignity—to sink  
While life is gushing, and the plaudits ring  
Faint and yet fainter on their falling ear,  
As models for the sculptor."

ROGERS' ITALY.

At Athens not any remains by which to judge of the domestic architecture of the Greeks are now existing. But it appears that architectural decoration was expressly forbidden to be employed on any but the public edifices; thus Demosthenes mentions "that in the best times of Athens, while the public buildings and the temples were rendered so magnificent and so perfect as to leave nothing for posterity to add, the private dwellings were invariably simple and modest; and he assures us that the policy of the state was so strictly observed in this respect, that even the residences of Aristides and Miltiades, and of the other illustrious citizens of that age, could not be distinguished from the houses of their neighbours." (Lord Aberdeen's Inquiry, p. 37.) The notion of Vitruvius, that the three orders borrowed their proportions from those of a male figure, of a matron, and of a girl, is prettily turned by the poet:—

"First unadorn'd,  
And nobly plain, the manly Doric rose;  
Th' Ionic then, with decent matron grace,  
Her airy pillar heav'd; luxuriant last,  
The rich Corinthian spread her wanton wreath;  
The whole so measured true, so lessen'd off  
By fine proportion, that the marble pile  
Form'd to repel the still or stormy waste  
Of rolling ages, light as fabrics look'd  
That from the magic wand aerial rise."

THOMSON.

Yet we can only look upon this opinion as a poetical conceit. Again, in ascribing the introduction of one order to Dorus, the son of Hellen and Orseis, and of another to Ion, the son of Xuthus (brother of Dorus), Vitruvius would carry architecture to too early a date, Hellen being reputed to be the son of Deucalion, and Bishop Thirlwall considers "Hellen,

Æolus, Dorus, Achæus, and Ion, to be merely fictitious persons, representations of the races which bore their names." (Greece, vol. i. p. 107.) It would seem much more consonant to reason to look to Egypt for the prototypes of that columnar arrangement which, advancing through progressive stages of improvement, reached its climax of perfection in the age of Pericles, to whom Plato ascribed the praise of supereminence in what was wise, great, and becoming, and who adorned his beloved city with those glorious edifices wherein consummate taste was blended with magnificence; so that, "notwithstanding the lapse of ages, the injuries of barbarism, and of fanatical violence, Athens still presents to the student the most faultless models of ornamental architecture, and is still, therefore, the best school for the acquisition of the highest attributes of his art." (Lord Aberdeen's Inquiry, p. 36.) In allusion to an opinion expressed above, we may again quote the noble author.

"In thus mentioning the obligations of Grecian architecture to the practice of Egypt, the statement must be understood as limited to the mere mechanism of the art, and not as intended in any degree to detract from the just claims of the Greeks to originality. If, indeed, the discovery of all that is admirable, of all in which its beauty and attractions consist, can sanction such a claim, we may safely place this art among those which they most distinguished by the fertility of their invention, as well as by the unparalleled beauties of their execution." (Inquiry, p. 61.)

It would require a greater space than can be at present afforded to notice at large the opinion held by many writers, and which was derived from Vitruvius, that in the hut and in timber construction we see the origin of Grecian architecture. At some future period we may bring forward, *inter alios*, the arguments for and against this doctrine.

In the British Museum is a bust of Pericles, distinguished by the helmet which he usually wore to hide some peculiar conformation of his head. The face is full of a sweet intellectual expression, and it is pleasing to indulge in the idea that we behold a real portrait of that great man, and perhaps by the very hand of his friend Phidias.\* At all events, we must look with interest on the features of the master-spirit of his age, wise in council, persuasive in eloquence, equally great whether presiding over his countrymen in the field, or directing their energies in the embellishments of their native city.

"This was the ruler of the land  
When Athens was the land of fame,  
This was the light that led the band  
When each was like a living flame,  
The centre of earth's noblest ring,  
Of more than men, the more than king."

CROLY.

\* Phidias made a *Statue* of Pericles, which was placed near the entrance of the Propylea.

PLAN OF THE TEMPLE OF ERECHTHEUS.

## INSTITUTION OF CIVIL ENGINEERS.

JUNE 25.—The President in the Chair.

A paper was read descriptive of the removal of the lighthouse on the north pier of Sunderland Harbour, by Mr. J. Murray, M. Inst. C.E. The lighthouse, which was built in 1802, was 76 feet in height and 15 feet in diameter at its base, slightly tapering upwards to the lantern, which was lighted with coal-gas with parabolic reflectors. It was built of polished stone and had within it a spiral staircase; its total weight was 338 tons, which being concentrated on an area of only 162 square feet, rendered the task of its removal in an entire mass a work of much difficulty and danger, especially when its great height was considered. Mr. Murray was induced to propose its removal, without taking it down, in consequence of the expense which would have been incurred in the establishment of a temporary light on the pier, the cost of building another lighthouse, and the success with which dwelling-houses had been removed entire in the United States. The decision was accelerated by a serious breach being made by the sea in the wall of the pier on which it stood, and in consequence, the work of removal was commenced on the 15th of June, 1841, by the masons cutting the holes for inserting the timbers for forming the cradle; those directly beneath the building were carried by 144 cast-iron rollers, travelling on 8 lines of iron rails, and the outer timbers, supporting the braces and struts, were placed upon slide-balks, which were lubricated with a mixture of soft soap and black-lead to diminish the friction. The power applied was by means of several drawing and pushing screws, and by three winches with ropes and tackle blocks, worked by eighteen men. On the 2nd August the mass was moved a distance of 23 feet 6 inches in a northerly direction, to place it in the line of the new pier. After changing the position of the rollers and slide-balks, to adapt them first to a curve of 647 feet radius, and then to a straight line in an easterly direction, the cradle with its load was propelled steadily forward at an average rate of 33½ feet per hour when in motion; the entire time of moving over 447 feet being 13 hours 24 minutes. Much time was of course occupied in taking up and relaying the rails and balks, and in preparing a solid foundation for them, as the mass advanced; so that it was not until the 4th of October that the lighthouse arrived at the extremity of the pier, where the foundation was prepared for it. The timbers were withdrawn gradually, the spaces being filled up with solid masonry, and the building was stated to have remained to the present time in a solid state without the slightest appearance of even a crack in the walls. A light was exhibited in the lantern as usual every night during its transit. The entire cost of executing the work was £27, and it was shewn that an actual saving of 893*l.* had been made by adopting the plan of removal instead of building a new lighthouse.

A paper by Professor Hosking, of King's College, containing some suggestions for the introduction of constructions to retain the sides of deep cuttings in clays and other uncertain soils, was then read. These constructions were chiefly intended to be introduced in situations where, on account of the bad nature of the soil, open cuttings or tunnels would be expensive and dangerous; they consisted of buttress walls placed at intervals along the length of the line and opposite to one another, strutted at their toes by an inverted arch, and above by built beams of brickwork at given heights, discharging arches being turned from buttress to buttress to carry the beams. The buttresses were to be made the springing walls of longitudinal counter-arched retaining walls, and all the force exerted against them would be conveyed to the buttresses, and from thence to the arches and built beams. The author then gave a detailed estimate of the expense of forming an open clay cutting with slopes at 2½ to 1, and of the proposed constructions, the same data being taken in both cases, from which it appeared that the difference was nearly one-third in favour of the constructions.

It was stated by Captain Vetch that a similar kind of construction had been successfully used in the Mosely cutting on the line of the Birmingham and Gloucester Railway, and

General Pasley stated that Mr. Adie had introduced that kind of construction on the Bolton and Preston Railway.

A paper by Mr. J. Brenner, M. Inst. C.E., described the mode adopted by him for rebuilding the piers of Sarslet Harbour (Caithness, N.B.), after they had been twice destroyed by the sea, to whose action it is much exposed, the waves frequently breaking over the works at a height of 50 feet. The works required to be completed with great rapidity, as the season in which they could be carried on was very limited. Mr. Brenner therefore contrived several gigantic cranes, which were fixed at about 20 feet above high water mark; the longest commanded a radius of 115 feet, and by it a cargo of 20 tons of large stones could be unloaded from a barge and conveyed a distance of 230 feet in half an hour, and it afforded similar facility for laying the blocks of stone in their places in the building, as also for depositing materials in front of a breach which had been made by the sea in the new work, which without such efficient means would have been, as before, entirely destroyed. The machinery and general mode of building adopted by Mr. Brenner were minutely described, and some remarks as to the inefficiency of vertical pier walls for resisting the force of the waves in exposed situations appeared to attract the attention of the members, and but for its being the last evening of the session, and the time being required for the ballot for members, an interesting discussion would probably have ensued.

The President addressed the meeting on the merits of a few of the papers which had been read during the session, and at the ballot Sir John Rennie, Messrs. D. Stevenson (Edinburgh), G. M. Miller, and R. B. Grantham, were elected members; and Messrs. Lieut. Riddell, R.A., E. Hooper, W. Vanderkiste, H. Hensman, and R. Dunkin, as associates.

## SOMATOLOGY, OR THE ESSENTIAL AND CONTINGENT PROPERTIES OF MATTER.

BY ALEXANDER JAMIESON, LL.D.

(Continued from p. 322.)

SOLIDITY is the consequence of the irregular figure of the particles, and their great deviation from sphericity, by which free motion among them is prevented, and their cohesion better secured. Now the diversity in solids arises from the various degrees of strength in the limits of cohesion; and the same principles will give rise to a class of bodies intermediate betwixt solids and fluids, namely, the viscous, whose particles attract each other more strongly than the fluids and not so strongly as the solids.\* We here see how we may account for the following facts:—

Of the conversion of rock into clay, or a solid body into an elastic one, we have ample evidence upon the island of St. Helena, a volcanic production, situated in the unfathomable ocean, and not surrounded by shoals, as islands generally are. The rock of which this island is composed is of great variety, in some places resembling basalt in texture, colour, and general character; in other places it is extremely porous, vesicular, and cellular, indeed almost cavernous. Very often it has quite the appearance of a slag; while at other places a slaty structure is found, the imperfect strata appearing variously inclined. In its decomposition and conversion into clay, the rock shews much variety; for in the same mass some part is entirely decomposed and converted into clay, while another part is not in the least altered. The decay is greatest at the surface, where the rock is exposed to an atmosphere charged with more rain than the wettest parts of Devonshire; but this decay is not exclusively confined to the exposed parts. The clays which are formed from the decayed rock are of several colours, of which brick-red and pink-red are the most common: the latter produced perhaps by manganese. Owing to the facility with which most of these rocks decompose, the soil is generally deep. Even in the most barren spots in the neighbourhood of James's Town, there is no deficiency of soil.

The general fact ascertained in this detail of rock decomposing into clay is this: Solid bodies may be converted into those that are elastic, and by the mere action of the atmos-

phere are so changed; elastic bodies may be converted into solid ones, as we shall endeavour to prove by the following example:—

A block of gypsum or alabaster, dug from the quarry, will preserve any figure a sculptor may choose to chisel it into; but put the figure he has carved, with much art, into a kiln or oven, and subject it to a red heat, its symmetry and beauty will now be destroyed, and the figure reduced to a fine powder; but on being mixed with water, may again be moulded into any figure we please. In this state it is called plaster of Paris.

The hot springs of St. Philip, which supply the baths of Tuscany, are so strongly impregnated with alabaster, that artists take advantage of this to obtain impressions of bas-reliefs, by merely exposing their moulds to a current of the water until they become filled with the earthy deposit; these impressions, when taken out, are found to be as hard as marble, and are very beautiful. In the British Museum there are some casts of medals from the water of those springs.

You may satisfy yourself that water holds in solution mineral substances by the following simple experiment:—Fill a wine-glass half-full of prepared lime-water, and breathe into the fluid for a few minutes by means of a tobacco-pipe, reed, or glass tube. The lime-water will speedily become turbid, and a white precipitate will fall to the bottom of the glass. The reason of this is, that a carbonic acid gas is expired from the lungs, and combines with the lime in the water, forming a sub-carbonic of lime, which, not being soluble in water, is precipitated. The moulds in which the gems are formed at the springs of St. Philip may have perhaps some affinity for the gypsum held in solution by the water. To understand how water holds minerals in solution, we shall take leave in this place to give our readers some idea of the composition of water, considered either as hard or soft; for, by having a distinct idea of this chemical definition and of this fluid, and the tests by which to discriminate its qualities, we shall the more readily comprehend the subsequent reasonings in which water becomes a principal agent.

Water is composed of oxygen and hydrogen, but these gases do not permit any property to be perceived. These two gases are therefore combined at the point at which their reciprocal affinity exercises the greatest effect, and they are in that state which may be compared with that of a neutral salt, in which the acid and alkaline properties have equally become latent. In strict chemical language, water should be styled the oxide, or protoxide of hydrogen; but as the term by which it is known is much shorter, and more familiar, it is universally applied. The term water is of Saxon origin, but chemists call it the protoxide, to distinguish it from a second compound of the same elements, which is water impregnated with 662 parts of its bulk of oxygen. This is the dextoxide, or peroxide of hydrogen.

Water, then, being an oxide, possesses neither acid nor alkaline properties; and consequently, if it were always pure, there would be no room for the distinction of hard and soft. In nature, however, it is seldom or never found in a state of purity.

That which is least contaminated by the admixture of foreign substances, is rain, snow water. But even that is not entirely free; because it becomes deteriorated by the different vapours it encounters in its descent. Water obtained from this source, as well as from rivers, and by boring the earth to a considerable depth, is called soft; because it possesses qualities somewhat different from those of spring water, which is denominated hard.

Hard and soft water then differ in this respect: the former holds in solution metallic and earthy salts; the latter possesses none of these. Hence, hard water impregnated with these foreign compounds is unfit for washing, boiling esculent vegetables, dyeing, and many other purposes of domestic life. Carbonate of lime or chalk, and the sulphates of lime and magnesia, comprise also other contaminating substances found in hard water. Spring water is clear and of a grateful flavour by reason of the abundance of carbonic acid which it holds in solution.

Every one knows that chalybeate water holds certain mineral substances in solution;

and this fact may be proved by a simple process. Take a few shillings and pieces of sheet iron, of the same size, if you choose; place these in a tumbler so as to form a pile or heap. Pour upon the whole some clear water; it will soon acquire the taste of iron, and become of a yellowish tint. In twenty-four hours flakes of oxide of iron will appear. We may thus easily make chalybeate water, and have a perpetual supply without going a mile from home. Copper will do as well as silver with the iron plates: but the oxide of copper, verdigris, is dangerous; whereas steel-filings or iron may be taken with safety, being often prescribed medicinally.

We have one remark to make before closing these observations upon matter; it is this: all our knowledge of the substances composing our earth, so far as it is related to the present subject, is either geometrical or philosophical; the first considers matter as being of some magnitude, or circumscribing space, and having some figure, thence called body, and is usually denominated *stereometry*, or the mensuration of magnitudes of three dimensions, length, breadth, and thickness; and the second comprehends all the properties of matter addressed to the senses, which may be styled physical or philosophical, because all the phenomena of nature are conceived to result immediately from them; as extension, solidity, inertia, and those apparently more active properties, gravity, magnetism, electricity, attraction, repulsion, elasticity.

These last are mechanical affections of matter; but its philosophical properties—distinguishable into general and specific—are such as universally adhere to every species of matter, and of which no art can divest them,—as *extension*, solidity, mobility, quiescence, inertia, figure, attraction, repulsion. Moreover, the ductility, fluidity, transparency, hardness, elasticity of matter, and of which we have in some measure already spoken, are discriminating qualities, ascertained principally by observation and experiment, though co-existent with all matter, independent of our observation or experiment. And who can tell what subordinate attributes the Creator hath impressed upon matter? And whether any inexplicable effect be owing to his immediate fiat, or some secondary material power, cannot be known; for the action of a pure spirit upon matter cannot be comprehended.

It has been argued by materialists, that we know nothing at all about what we call spirit; yet what do they know about matter except by its properties, which are manifested to their senses? Spirit is conscious of itself, and that consciousness is the sole ground of our belief in its being. What is the whole life of all human creatures, but one continual self-consciousness, varied in ten thousand times ten thousand ways! This spirit, united by life to material being, sees no spirit but itself, if I may so speak; but it sees living bodies like to that which it inhabits—warm in life—bounding with motion—characterized by gestures, looks, voice, speech responding to its own, in command, entreaty, or sympathy; and it believes these bodies to be the receptacles of spirits like itself—*beings* of will, love, wrath, compassion, tears. My senses, which take cognizance of matter, shew me nothing of its essence, any more than they do of the *substance* which thinks, or wills, or feels. The body, the domain of spirit, is matter, and all this glorious fabric, which we call the universe, is the work of infinite Power, Spirit,—to which we must aspire by holy contemplation, in a constant conviction that, at the verge and brink of this material world, in which we stand, there is an abyss unfathomable to all our thoughts. Unknown existences, incomprehensible, of an infinite world! Of what mighty powers may dwell there,—what wonders may be there disclosed,—what mutation and revolution of being, or what depths of immutable repose, we know nothing. Shut up in our finite sense, we are severed for a while, on our spot of the universe, from these vast, boundless immortalities. How near they may be to us we know not, or in what manner they may be connected with us—around us, or within us! This vast expanse of worlds, stretching into our heavens, many thousand times beyond the reach of our most powerful sight, assisted by the most powerful telescopes,—all this may be as a speck of darkness! And who, with powers fed on matter, and drenched

in sense, shall think to solve the question of what being may be beyond? Let us not by the measure of our sense circumscribe the possibilities of creation, while we pretend to believe in the Almighty; and if, where we cannot know, we must yet needs choose our belief, oh! let us choose with better hope that belief which more bumbles ourselves; and in bowed-down and fearful awe, and in presumptuous intelligence, look forth from the stillness of our souls into the silence of unknown being. Minds sturdier than ours, when the kindling aspirations of intelligence had lighted the lamp of hope over the portals of immortality, have burst from their prison-house of clay, to be united in an eternity of unextinguishable joy with their original and commutual existences. And may speculations such as these cheer our spirits in the difficulties of science, and lift them up in high conception of that Power, through whose goodness we possess a revelation to guide us in labyrinths, otherwise inextricable, impervious, and hopeless.

This union of spirit to spirit in an endless hierarchy is finely typified by one of the most obvious properties of matter—I mean attraction—and one to which our earliest notice is directed. No cement, that we know any thing of, holds bodies so finely together as the mutual attraction which nature has imposed upon substances of the same class, genus or kind. And the opposite to this law is *repulsion*. But before we enter upon these topics, we shall take leave to explain some of the leading essential and contingent properties, which may thence serve as legitimate introductions to subjects of such vast and comprehensive inquiry as attraction and repulsion. The first of these, and that upon which we shall now enter, is divisibility.

#### PETROLOGY, OR THE KNOWLEDGE OF ROCKS AND STONES.

BY HENRY G. MONTAGUE, ESQ., PROFESSOR OF NATURAL PHILOSOPHY.

(Continued from p. 328.)

The term *AGATES*, in mineralogy, is applied to a class of gems, the most remarkable of which are generally arranged according to their colours, configuration, and peculiarities of composition. Of those with a white ground there are three species:—

1. The Mocha stone, as it is commonly but erroneously termed; for although some of these stones are to be found in the mountains of Arabia, near that city, yet the most beautiful and highly prized are brought to the chief towns of the Red Sea by the merchants from Cambay, this variety being exceedingly common in Upper India. It is the same called by some authors *achates*, having the resemblance of little branches of black leaves. It is produced from small coherent masses of matter, being an union of bodies, varying from each other in their qualities, but readily united by the common silica base. While within the bowels of the earth, this and other varieties seldom present other than a semi-crystalline state, slightly cohering, and very often honey-combed in the interior, although generally these little cells appear to be filled with a black earthy matter, being, as is palpably manifest in some of them, the decomposed matter of cryptogamus. Upon accidental or intentional exposure to atmospheric influences, on dry, gravelly soils, the silica base becomes gradually converted into calcadony, the cells fill up with the like material, and the loose black mould is therein enveloped, the whole aggregate becoming one and indivisible. The time required to effect these changes is regulated by climate and association, for the same body exposed to other than the above influences would pass into another form and become another species.

The Mocha stone exhibits a degree of translucency suited to its stage of change; at first it is opaque, but as the matter becomes more harmoniously disposed within the stone, it gradually becomes first of a flinty or milky-white appearance, and as it ripens (if this term may, with propriety, be applied to inorganic bodies), it gradually becomes translucent, acquiring beauty with age while in this state of nature. In the act of change, these stones very often break to pieces, the fracture revealing its hidden beauties.

2. The dull, milky-looking agate, so common to the Bemab, Godawarry, and other rivers

of the East Indies, and also in some parts of Europe; and 3, the lead-coloured agate, called the phassa chates by the ancients, are of the same family as the Mocha stone, although differing from it in the absence of mineralized plants. Those varieties also become more translucent in tropical countries on exposure to the atmosphere within shallow streams and upon the beaches, and pass by transition into that more beautiful gem, the white topaz, also common to the East Indies, Ceylon, Borneo, &c.

Of the agates with a reddish ground, there are four species enumerated. 1. An impure one, of a flesh-coloured white, having no pretensions to beauty, and evidently, as observed of previous varieties, imperfect in its change. Sometimes we find it, in its more perfect state, prettily varied or variegated with spots of irregular figures, having fibrinated edges. It is very common in Germany, was formerly wrought extensively into gun-flints, and it still forms an article of commerce for toys, snuff-boxes, and other trifles. 2. The agate of a pure blood colour, called by the ancients *hæmaches*, or the bloody agate. 3. The clouded and spotted agate, of a pale flesh colour, called by the ancients the *cornelian agate* or *sandachates*. 4. The red lead-coloured agate, variegated with yellow, called by the ancients the coral agate, or *coralla achates*. Of the agates with a yellow ground, there are only two known species, the one of the colour of yellow wax, called by the ancients *cerachates*; the other a very elegant stone of a yellow ground, variegated with white, black, and green, called by the ancients the *leonia* and *leonteceres*.

The ribbon agate, consisting of alternate parallel layers of calcadony, with jasper, quartz, or amethyst, occurs in porphyry and gneiss, and is also common to some of the rivers of India. The brecciated agate is a variety of the above, containing small portions of the former lying in a base of amethyst quartz; the most beautiful specimens of this are found in Saxony and Siberia. Fortification agates, found in Scotland and at Oberstein, on the Rhine, are also common in some of the provinces of Upper India. The moss agate is a variety of the Mocha stone, being formed of silica enveloping animal or vegetable objects therein, and which very often maintain their form in the mineralized state.

That the entombed material, representing plants and other natural productions, was in reality derived therefrom, is not only manifest from observations of agate in its various stages of change, but is also placed beyond a doubt by the discoveries of scientific men. Dr. McCulloch discovered in Mocha and moss agates, aquatic conserve coated with iron oxide; and exhibiting their natural forms and colours. Mosses and lichens have also been detected in chlorite. In the possession of the Earl of Powis is said to be an onyx agate, set in a ring, which contains the chrysalis of a moth. Many of the agates, in like manner, with flints, preserve the form of the organic being from whence they have primarily been derived; thus, we find a large class of them termed *geodes*, which are hollow bodies, maintaining their shape of molluscous animals, and sometimes filled with liquid of crystallized bitumen. In the mountains of Arabia vast quantities of these nodules are sometimes to be observed in this state; but in the older strata they present interiorly crystals of quartz and other bodies.

Agates, from their great abundance, are in little request; but, independent of the extreme elegance and beauty of many specimens, and the very faithful representations of natural objects in others, they are wrought into many useful forms, and from their hardness and smoothness of surface, are valued by polishers, lapidaries, &c. But of the many surprising tales told of natural representations of men and animals, the greater portion may be considered fabulous, or what is more likely, as being the production of art rather than of nature, although many of them, particularly the moss agates, are what is so palpably manifest by the pictured form enclosed, the lapidified repositories of organic bodies.

Upwards of 1,000l. having been lately given for the erection of a People's College at Nottingham, there is a prospect of such an institution being erected.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*The old Savoy Church in the Strand.*—On Monday week his Royal Highness Prince Albert, attended by Sir Edward Bowater, arrived at the old Savoy Church, in one of the private carriages, for the purpose of inspecting the interior, which has been handsomely re-decorated at the expense of the Queen. He seemed highly interested at the old monuments, and praised the beauty of the workmanship of the interior.

On Sunday week the new north aisle of Weston-super-Mare church was opened for occupation. This addition to the church will afford accommodation for about 400 persons. It is in contemplation to erect a corresponding aisle on the south side, and the organ is either to be enlarged or a new one placed in its stead. The chancel is one of the most spacious in the county, and is terminated on the east by a stained window, presented by the Lord Bishop of Bath and Wells, a few years since, at the time the chancel was built by the present rector, the venerable Archdeacon Law.

*Removal of Pews.*—The dean and chapter of the Welsh cathedral of St. David's have ordered the pews that are in the nave of the cathedral to be removed, and the whole of it to be thrown open. Benches will be substituted.

The parish church of Melksham, Wilts, is about to be enlarged and repaired at an expense of upwards of 1,500*l.* The tower, now in the centre of the church, will be removed to the west end, and the increased accommodation to be secured will seat 400 persons.

A new German Lutheran church has been erected in Blenheim-street, Oxford-street, which is numerously attended by the young Germans resident in London, who had previously no regular place of worship.

*Eastwell.*—The venerable church of this parish has lately been repaired and beautified through the munificence of the Earl of Winchelsea.

The inhabitants of Mansfield Woodhouse, Notts, have it in contemplation to rebuild the north wing of the parish church, and to new pew the whole body of the church.

## RAILWAY INTELLIGENCE.

*Orford, Worcester, and Wolverhampton Railway.*—A meeting of the supporters of this scheme was held in this city, on Saturday last. Amongst those present were Messrs. Barlow, Stimmons, and Tothill, directors of the Great Western Company, and Mr. Brunel, the engineer. The mayor was called to the chair, and a committee of management was named to meet that day fortnight. Messrs. Rufford and Wragge, of Stourbridge, were appointed bankers to the company; an extensive allotment of shares was made, and a resolution agreed to, to allow 4 per cent. interest on the deposits from the time of payment.

*Lancaster and Carlisle Railway.*—It has been stated that upwards of five thousand workmen are to be immediately put upon this line, but we believe we shall be nearer the mark when we state that twice that number of men will shortly be employed in this great work. A number of labourers are now in this town waiting for the commencement of the operations. The terms of the contract require, under heavy penalties, that the line should be opened on the 1st June, 1846.—*Westmoreland Gazette.*

*New Line of Railway between London and the North.*—We can communicate, from the best authority, that a new line between London and Lancashire is decided upon, and Mr. Locke is at this time engaged upon the surveys. This will *cheapen* the travelling, as well as increase it on our side of the country.—*Carlisle Journal.*

The act for the Bury and Rossendale Railway has passed the House of Lords. The contract has already been let to Messrs. Pauling, Henfrey, and Co., and the cutting will be commenced almost immediately.

It is intended to form a line of railway from the Fleetwood line to the fashionable watering-place of Blackpool. The distance is about three miles.

*Dublin and Cashel Railway.*—The House of Commons having, in favour of the progress of this measure, suspended the standing orders, the Bill has been read a second time, and ordered to be committed.

*Another contemplated railroad.*—It is in contemplation to lay down a railroad from Bath to Weymouth. The projected line to be connected with the principal intermediate towns, and to be designated the "South Union Railroad."

We hear that the prospectus of the line from Worcester to London, in connection with the Birmingham and London Railway Company, is in course of preparation, and will shortly appear.

## PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &amp;c.

Granted between 25th of May and 26th of June, 1844.

[SIX MONTHS FOR ENROLMENT.]

CHARLES LOW, of Robinson-row, Kingsland, for certain improvements in the making or manufacturing of iron and steel. May 25.

Charles Anthony Deane, of Poplar, for improvements in the constructing, propelling, and steering vessels. May 30.

Robert Hazard, of Clifton, near Bristol, confectioner, for improvements in baths. May 30.

James Fenton, of Manchester, engineer, for an improved combination or alloy, or improved combinations or alloys of metals applicable to various purposes, for which brass and copper are usually employed in the construction of machinery. May 30.

Edward Massey, of King-street, Clerkenwell, watchmaker, for improvements in apparatus for ascertaining the rate at which vessels are passing through the water, also applicable in ascertaining the rate at which streams or currents are running. June 1.

James Murdoch, of Staple Inn, Middlesex, mechanical draughtsman, for certain improvements in the manufacture of gas, and in the apparatus employed therein. (Being a communication.) June 4.

William Henry Phillips, of Bloomsbury-square, Middlesex, engineer, for certain improvements in the means and apparatus for subduing and extinguishing fire and saving life and property, and in obtaining and applying motive power, and improvements in propelling. June 4.

George Chapman, of Claremont-terrace, Strangeways, Manchester, engineer, for certain improvements in steam engines. June 4.

Joseph Cowen, of Blaydon Burn, near Newcastle-upon-Tyne, merchant, for certain improvements in making retorts for generating gas for illumination. June 4.

Paul Griffiths, of Holywell, in the county of Flint, millwright, for improvements in washing the products evolved from furnaces. June 4.

Joseph Woods, of Bucklersbury, London, civil engineer, for improvements in producing designs and copies, and in multiplying impressions, either of printed or written surfaces. (Being a communication.) June 6.

Edmund Morewood, of Thornbridge, Derby, merchant, and George Rogers, of Stearndale, same county, gent., for improvements in coating iron with other metals. June 8.

Elijah Calloway, of Nelson-square, Blackfriars'-road, Surrey, for machinery for connecting axles or shafts, whereby when in motion they revolve at different relative velocities. June 12.

Thomas Farmer, of Birmingham, manufacturer, for certain improvements in the ornamenting of papier maché, and in manufacturing and ornamenting japanned goods generally. June 12.

Moses Poole, of Serle-street, Middlesex, gent., for improvements in wheels and axles. (Being a communication.) June 12.

John Swindels, of Manchester, manufacturing chemist, for several improvements in the preparation of various substances for the purpose of dyeing and producing colour, also improvements in the application and use of several chemical compounds for the purpose

of dyeing and producing colour not hitherto made use of. June 12.

Pierre Armand Lecomte Fontaine-moreau, of Skinner's-place, Saxe-lane, London, for a new mode of locomotion applicable to railroad and other ways. (Being a communication.) June 21.

Thomas Lever Rushton, of Bolton-le-Moors, Lancaster, iron manufacturer, for certain improvements in the manufacture of iron. June 21.

Christopher Phipps, of River, near Dover, paper manufacturer, for an improvement or improvements in the manufacturing of paper, and in marking, writing, and other papers, or in the machinery employed for those purposes. (Being partly a communication.) June 21.

Rees Davis, of Yetradgunlais, Brecon, gent., for improvements in the manufacture of iron. June 24.

William Worby, of Ipswich, for improvements in the manufacture of bricks, tiles, and other articles from plastic materials. June 24.

## SCOTCH PATENTS.

Granted between the 22nd of May and the 22nd of June, 1844.

Frederick William Etheredge, of Furnival's Inn, Middlesex, gentleman, for improvements in the manufacture of bricks, tiles, and tubes. Sealed, May 27.

William Basford, of Burslem, Stafford, brick and tile manufacturer, for certain improvements in the mode of manufacturing bricks, tiles, quarries, and certain other articles made or composed of clay and brick earth, and of burning and firing the same, and certain articles of pottery and earthenware. May 27.

William Johnson, of Richmond-hill, Surrey, Esq., for certain improvements in machinery for boring, cleaving, cutting, and dressing stone and slate, of such kinds as are, or may be used for building, and for ornamental purposes, and for paving of public and private ways. May 28.

John Taylor, of Duke-street, Adelphi, Middlesex, gent., for new mechanical combinations, by means of which economy of power and of fuel are obtained in the use of the steam engine. (Being a communication from abroad.) May 29.

William Walker, junior, of Brown-street, Manchester, hydraulic engineer, for improvements in warming and ventilating apartments and buildings. May 29.

James Fenton, of Manchester, Lancaster, engineer, for an improved combination of alloy of metals, applicable to various purposes, for which brass and copper are usually employed in the construction of machinery. (Being a communication from abroad.) May 31.

Joseph Cowen, of Blaydon Burn, near Newcastle-upon-Tyne, merchant, for certain improvements in making retorts for generating gas for illumination. June 5.

Robert Rettie, of Gourcock, near Greenock, of Renfrew, Scotland, civil engineer, for improvements in gridirons, frying-pans, and other cooking utensils, and heating apparatus. June 13.

*PICCADILLY IMPROVEMENTS.*—We hear that the long-projected improvements in Piccadilly, by widening the street from Hamillton-place to Devonshire House, by taking in Lord Coventry's gardens, in the Green Park, and part of the site of the late Green Park Lodge, are not likely to be carried into effect until next year, the Commissioners of Woods and Forests having, it is understood, resolved not to apply to Parliament for any bill during the present session for the above purpose.—*Herald.*

*THE BRISTOL DOCKS.*—There is every prospect of the locks being opened to a width sufficient to admit the largest class of steamers, the directors of the dock company having called on Mr. Brunel for an estimate for that object, the small lock at Cumberland Basin being in such a state as to require many thousand pounds even to restore it in its present form. The men employed upon the vessel in which the Great Britain was to be carried have all been taken off.

## Correspondence.

## PHOTOGRAPHY ON A CEILING.

A curious observation, apparently relative to photography, is communicated to the number for November, 1842, of the *Bibliothèque Universelle de Genève*, by a gentleman of Lyons, named Lortet. He says:—

"The ceiling of an inhabited room was composed of planks painted gray, which time had somewhat embrowned. There could be distinguished, in the part which was clearest, the trace of the beams against which the planks were nailed, and also the trace of a half-beam, added to one which had been broken: moreover, we could observe the trace of a piece of wood which had been concealed in the garret above, and placed obliquely upon two of the beams, about two inches distant from the planks. As much dust fell from the seams of the planks, I caused the ceiling to be papered, and at the end of a year, the same traces of beams shewed themselves on the paper. I then caused the planks to be removed, and a ceiling of plaster substituted. After another year, I remarked upon the plaster the forms of the beams, and, moreover, with equal clearness the images of the laths on which the plaster was fixed.

"Formerly, I had observed the same phenomenon in different houses, but without being able to discover the cause. I have often remarked, that the traces were the more conspicuous the nearer to the chimney, where the smoke had escaped into the apartment. But if the smoke is the cause, why does it deposit itself in greatest quantity upon the plaster which is not in contact with the wood? And where a piece of wood is placed above the ceiling, at a distance of two or three inches, why does the smoke deposit itself particularly on the mark of that piece of wood? These are facts worthy of being inquired into."

## TO THE EDITOR OF THE BUILDER.

SIR,—I beg to send a few observations relative to the striped appearance which commonly presents itself on the face of ceilings, shewing the semblance of beams and joists through the plaster. This, in my opinion, emanates from damp walls, occasioned either from the foundation being laid on damp marshy soil, or otherwise from the building being exposed to the south or south-west winds, which generally prevail in this part of the globe, three-fourths of the rain coming in one or other of those directions. The walls thus subjected to wet cause a dampness in the air that prevails throughout the building, but more especially between floors and ceilings where the primary cause of the circumstance under consideration most certainly originates. First, it may be naturally asked, in what respect will damp cause the occurrence? The reason is obvious; the damp generating from the wall being boxed or pent in between the floor and ceiling, descending and pressing on the crown of the plaster between the beams and joists, and, at the same time, each beam and joist preserving its own plaster, which is more immediately connected with it, from damp. So, in consequence, the plaster between the beams and joists receives all the damp, which in time penetrates to the face of the ceiling, inasmuch that the smoke in its ascent fixing and uniting itself to the damp part, only leaves the dry part under each beam and joist, which gives that marked and obvious difference, which we have often an opportunity of seeing.

Secondly, should any one say that a house is damp and smoky too, yet the circumstance does not occur, I should say, the reason is because the floors above your ceiling are not air-tight, consequently the damp will evaporate; but where the floors are ploughed and tongued, or otherwise, in the course of time they have become air-tight through the sweepings of the room, or some other cause, when the predominant circumstance will most unquestionably occur.

Thirdly, now after what has been stated herein, we may fairly admit that the primary agent is the floor; for if the floor be air-tight, it repels the damp from all escape, which renders occupation safe; but, on the other hand, where the floors are open in the joints, the case becomes prejudiced of course, the

damp refuses that duty it otherwise would perform. The boarding of ceilings alluded to, the papering and painting, or all collectively, will, in my opinion, have a similar advantageous tendency, where the two elements exist, for the smoke in action with the damp is capable of producing one and the same effect. Under these peculiar circumstances, as a principal remedy, I should recommend the application of cement or tin-foil, which would hid defiance and effectually resist all damp with impunity; the final result would be the sure possession of a dry, spotless, and unblemished ceiling.

I am, Sir, yours, &c.,  
Woolwich, Kent. JAMES GREENWAY.

## CROSS ON THE EASTERN GABLE OF CHRIST CHURCH, BRECKNOCK.

SIR,—Perhaps you will spare a corner in *THE BUILDER* for the above fine old stone cross from the eastern gable of Christ Church, Brecknock. It is very finely wrought, and seems to have sustained no injury from time or any of the other usual causes of decay. It is sunk about 9 inches or a foot into the square base upon which it stands; and I recollect being informed by some workmen, who had occasion to remove it some years since, that it is above 6 cwt. There are many far richer specimens to be found; but I think few more chaste, and still expressing the primary form of this beautiful symbol of Christianity. The college, once a Dominican priory, stands at the east end of the town, and apparently, by the present remains both within and without, the chapel is as old as the time of Bernard de Neuf-Marché (corrupted to Bernard Newmarch), who is said to have been the founder of this place. There still remains part of its old gateway, a cloister, and the refectory of St. Mary's Chapel, with the ancient choir and nave for burying, the former of which (the choir) only is roofed, Henry VIII. converted it into a college under the name of the "College of Christ Church, Brecknock," and joined to it the College of Abergwilly, Carmarthenshire. It remained so until of late years, when it was removed to Lampeter; it consisted of the Bishop of St. David's, who presided as dean, a precentor, treasurer, chancellor, and nineteen other prebendaries. It has been for years in such a dilapidated state, that no regular service has been held in the chapel; but lately a slight movement has been made, through the instrumentality of the excellent bishop and archdeacon of this diocese, which has secured to it a new roof, but it has been again shut up for want of sufficient funds to proceed. When we consider that the interior is crowded with massive marble monuments, which are real gems of art, and doubtless worth some thousands of pounds, it is painfully unaccountable that such apathy should exist.

Three Bishops of St. David's have been buried here, Mainwaring, Lucy, and Bull. Bishop Lucy was the ancestor of the present worthy proprietor of Charlotte Park, Stratford-on-Avon, George Lucy, Esq., a descendant of Sir Thomas Lucy, whose name is associated with the early history of Shakspeare. Of these monuments I shall at some

future time speak more lengthily, and perhaps send you a sketch of the interior.—I am, Sir, your most obedient servant,  
J. L. T.  
Berkeley-place, Brecknock, June 28, 1844.

## DRAINS IN HOUSES.

SIR,—Some time since I addressed a letter to Lord Lincoln, offering one or two suggestions as to the regulation of drains in houses, hereafter built, which I thought might be inserted, perhaps, in the New Building-Act. However, upon consideration, it occurred to me that his Lordship may find it will not be advisable to make law of them, and in such a case, it might not be out of place, could my ideas be made known, through the medium of your valuable journal, to builders generally. My suggestions are these, viz.: that in order to prevent the destruction and disturbance usually created by hunting for the courses of drains, for the purpose of repairs, they should be mapped on the lease, or on a separate parchment for that purpose; or that an iron brick, with the letter D cast on the face of it, should be inserted in the wall, immediately over the spot where the drain passes through, and thus might be seen at a glance where the ground required opening, without disturbing other parts unnecessarily, besides the saving of the time consumed in examining various places to find the drain.

I am, Sir, your obedient servant,  
5, Thorney-street, VINCENT YARDLEY.  
Bloomshury.

## Miscellanea.

SIR DAVID WILKIE.—The monument to Sir David Wilkie is now erected in the church of Cults. It is truly an exquisite work of art, designed and executed by a man whose strength of mind, brilliant imagination, correct taste, accurate principles, and graceful position, are all fully brought out in the admirable and striking likeness of Sir David. The drapery, too, is in excellent harmony with the other parts of the monument. The inscription is as follows:—"Sacred to the Memory of Sir David Wilkie, R.A., Principal Painter in Ordinary in England, and Limner for Scotland, to King George IV., King William IV., and Queen Victoria. Born at Cults, 18th November, 1785. Died 1st June, 1841; buried at sea, off Cape Trafalgar. As the painter of domestic scenes, his works were the ornament alike of the palace and the cottage. Through life he was guided and animated by those sacred principles to which he had often listened, when a boy, in this place, from a father's lips. In order to acquire the accurate means of illustrating by his art the history of our Saviour, he departed for the Holy Land, and died on the homeward voyage. This tablet is erected by his affectionate sister in 1841." Sir David Wilkie is placed on the east, and the monument to his father and mother, by Chantry, on the west of the pulpit, each of them within a few inches of it.—*Scotch Paper.*

SOUTHEY'S MONUMENT.—The committee appointed at a public meeting of the friends and admirers of the genius of Southey, in October last, intend to erect a shrine with a recumbent figure of Mr. Southey upon it, from a design by Mr. J. G. Lough. The subscription list is already signed by a great number of the most distinguished noblemen, prelates, *literati*, and others.

MONUMENT TO THE MEMORY OF GENERAL GILLESPIE, K.C.B., AT COMBER.—On Monday the 24th ult. the ceremony of laying the first stone of the monument, at Comber, to Major-General Gillespie, took place.

A statue is about to be erected at New Orleans, in honour of Benjamin Franklin. It is to be from the chisel of Powers, the American artist.

Workmen have been employed in affixing electrical rods from the base to the summit of the Duke of York's pillar in Carlton-gardens, to protect it from lightning.

A body of sappers and miners on Friday last commenced the erection of a scaffold upon Danbury church, for the purposes of the trigonometrical survey in progress throughout the county.

The great engine and machine manufactory of Maffei, at Munich, has been burnt, with almost all its locomotives.

**PROHIBITION OF "SMOKE."**—A Bill to prohibit the nuisance of smoke from furnaces or manufactories was some time ago brought into the House of Commons by Mr. Mackinnon, Mr. William Beckett, and Lord Francis Egerton, and is now reprinted as amended by the committee of the whole House. The number of clauses is twenty-four. Occupiers of furnaces are required, under certain penalties, to prevent the issue of "opaque" smoke for more than a certain length of time in the twenty-four hours—that is to say, from any chimney from which is emitted the smoke of one furnace only, for a longer period in the whole than twelve minutes in every three consecutive hours; and from every chimney from which is emitted the smoke of two furnaces, for a longer period in the whole than twenty-four minutes in every three consecutive hours, and so on in proportion; forty-eight minutes in every three consecutive hours being the maximum. "Opaque" smoke is defined by clause 2 to be smoke not transparent at the point of its exit from the chimney. The Bill, however, will not pass this session.

**IMPROVEMENTS AT THE TOWER.**—The contemplated improvements at this ancient fortress, which have been hid before his Grace the Duke of Wellington, the Constable of the Tower, and been approved, will forthwith be commenced. The old armoury, which was destroyed by fire, has been cleared away to make room for the new barracks. The ditches are all well dried up, and sewers have been cut to carry off the soil. What was formerly a putrid and stagnant moat round the Tower will very shortly form a fine esplanade, gravelled over and planted with trees for the recreation of the garrison.

**METROPOLITAN IMPROVEMENTS.**—The Vauxhall Bridge Company have commenced building a pier on the plan of the one at the Southwark Bridge. Mr. Cubitt, the extensive builder, has erected a row of houses on the west side of the gas-works, called Curtain-road, which conceals that unsightly building. He has completed the road 60 feet wide alongside the water. The government will complete the remainder to Battersea Bridge.—*Morning Herald.*

The Hungerford Suspension Bridge is at length progressing rapidly towards completion; the whole of the eight patent wire lengths of rope have been carried over. Several of the directors were present, and witnessed the successful suspension of the first link of the massive chains.

**THE NEW CEMETERY.**—This picturesque spot will, in the course of a few months, be further embellished by the addition of a most elegant mausoleum, of beautiful design, the Messrs. Reeves having received instructions from the executors of Mr. Pratt (whose remains were a few weeks since deposited in the cemetery) to execute the same. We understand that the mausoleum will be composed wholly of Italian marble.—*Bath Herald.*

**THE PATENT METALLIC CEMENT.**—This cement, which has lately been so much introduced to the City, is now being used by Messrs. W. Cubitt and Co., on the new Gresham Club-House, adjoining Smith, Payne, and Smith's Banking-house, and has a very beautiful and stone-like appearance.

**COUNTY OF ESSEX GRAMMAR SCHOOL, FELSTEAD.**—The foundation of this institution is now settled, the funds having been correctly ascertained, and a scheme is in preparation for the future management of the school and charities. An upper and lower school are contemplated.

**TRINITY COLLEGE, PERTH.**—Operations have commenced on Mr. Patton's estate of Cairnries, now finally fixed on as the site. The contractor for the mason-work is Mr. Buchan, who carried on and completed the additions to Abercainry Abbey.

**THE NEW GAS BURNER IN PARIS.**—The column in the place du Caroussel, for making trial of an enormous gas burner, was terminated on Monday. It is of the Doric order, about 30 feet high. The pedestal is of cut stone, and the rest of common masonry.

**SOUTHAMPTON.**—The erections of the sheds and buildings at Northam on the show-ground for the Royal Agricultural Society occupy fifteen acres of land, being seven acres larger than those built at Derby last year.

**ANECDOTE OF LOUGH THE SCULPTOR.**—When Mr. Lough, the sculptor, first arrived in London, his purse was an exact antithesis to his mind; for the first was certainly trash, but the latter pregnant with the beauties of his art, which he has since stamped on his creations. He took lodgings in a humble habitation (a shoemaker's, we believe), and there commenced forming the clay which eventually became his "Milo rending the oak." This magnificent work is of large dimensions—not quite colossal, but certainly too large to be comfortable in an attic. The sculptor worked on and completed it all but the upper portion, which required greater height. How was this to be managed? He would not leave his work incomplete, but what could he do? The thought at last struck him to break through the roof of his apartment, which, after sundry qualms, he ventured to do. His invariable custom had been to keep the door of his room locked, and now came the awful moment to make known to his landlord the dilapidations which had occurred to his property. With fear and trembling the poor sculptor led him to the room, expecting the most summary legal punishment for the injury he had committed. When the shoemaker, however, beheld his work, he was so enraptured with its beauty, that he said not a word about the injured ceiling, and gave him a pair of razors—all the poor fellow had at the moment to offer—a memento that the kindly feelings of a man in so humble a rank of life were thus called forth at the sight of Mr. Lough's first great production. We need hardly add in what value the gift is to this day estimated.—*Birmingham Journal.*

**ARTIFICIAL MARBLE.**—We learn from an American paper that a method of manufacturing marble has been discovered, which is pronounced superior to any other artificial stone or marble in use; it will supersede the use of lime mortar in the varied processes of plastering; and will be extensively used in stucco work, mosaic statuary, mantel-pieces, table-slabs, atmospheric and hydraulic cement, roofing of houses, paving of streets, &c. It will set or harden in six hours when applied to plastering houses. It will resist the action of atmospheric heat, damp, frost, &c., is susceptible of a high polish, and can be manufactured at a cost little exceeding ordinary lime mortar.—*Hull Packet.*

On Tuesday evening a new bell, weighing 25 cwt., was fixed in the belfry of St. Saviour's, Southwark. The tackling broke, and the bell fell from a height of 56 feet, crushing the stairs and banisters. The bell on being tried was found uninjured.

**THE IRON TRADE.**—In consequence of a strike, on the part of the workmen in Scotland, iron has risen from 3s. 6d. to 4s. per ton.

The price of gas is to be reduced from the 30th inst. to 7s. per 1,000 cubic feet by the leading gas companies in London.—*Standard.*

It is in contemplation to erect a bridge from Redcliffe back to the Grove, Bristol.

**Tenders.**

TENDERS delivered for painting the whole of the exterior of the Licensed Victuallers' School, Kennington-lane.—June 27.

Weeks .....	£100 0 0
Webbs .....	94 10 0
Cook .....	59 19 0
Odey .....	57 0 0
Saunderson .....	55 0 0
Davies .....	50 0 0
Johnson .....	49 0 0
Emmett .....	27 10 0

The lowest tender was accepted.

**NOTICES OF CONTRACTS.**

For building Sewers.—Plans &c., Mr. Daw, Sewers Office, Guildhall. 9th July.

For the erection of a Building on the premises of the Workhouse of the parish of St. Mary, Newington.—Plan, &c., Mr. Edmonds, Surveyor, Bridge-street, Southwark. 15th July.

For certain alterations and additions to the Treadwheels, and for Air Pumps to be connected therewith, and also for certain Hand Crank Machinery for the use of the Treadwheels.—Plans, &c., at the Castle.—Further information, Mr. Brown, County Surveyor, Norwich. 19th July.

For erecting a Farm House, &c., at Court-y-Grahan, in the county of Radnor.—Plans, &c., Mr. Edward Fowke, at Glanhenwy, near Hay.

For erecting a Farm House at Trebendre, in the county of Brecon.—Plans, &c., Mr. Fowke.

For reinstating Dwelling House and Buildings at Great Thurtow, Suffolk.—Further particulars, Messrs. Newton and Woodrow, Land Agents, Norwich.

At Liverpool, the several descriptions of ENGLISH IRON are quoted at from 5s. to 7s. 6d. per ton, and TIN PLATES (1C. and 1X.) 1s. per box, less than in London.

SPELTER on the spot has been in fair demand during the week, and several parcels have changed hands at 21l. 5s., 21l. 7s. 6d., and 21l. 10s., and there are no sellers now under 21l. 15s. For delivery in August and September, there is a seller at 21l. 10s., and no buyers above 21l. 5s.

ENGLISH IRON has undergone no alteration since our last. SCOTCH PIG IRON at Glasgow is rather easier this week, a parcel having been offered by a speculator at 64s., net cash, but the makers will not sell under 70s. SWEDISH IRON and STEEL continue flat, and lower prices have been accepted;—the former has been sold at 9l. 5s., and a parcel of the latter was sold at 16l. Holders now demand 16l. 10s.

COPPER and TIN have undergone no alteration. TIN PLATES continue in good demand.

ENGLISH and FOREIGN PIG LEAD still dull of sale.

SHORT and MAHONY, Brokers,

1, Newman's-court, Cornhill.

**ADVERTISEMENTS.**

**TRACING PAPER.**—SAMPLES FORWARDED by Post free.—WATERLOW and SONS, 65, LONDON-WALL, having devoted much attention to the manufacturing of the above article, have succeeded in producing a Paper superior to any yet introduced, combining the great requisites of clearness and a surface warranted to work well with pencil, ink, and colour. The following are the cash prices:—  
Double Crown, ... 30 by 20, 3s. per quire. 2l. 10s. per ream.  
Double Dble. do. 40 by 30, 6s. " " 4l. " "  
Dble. Dble. do. 60 by 40, 13s. " " 11l. " "  
Outsides, half-price.  
Whatman's Drawing Paper, and every article of Stationery used in the Offices of Engineers, Architects, Surveyors, Draughtsmen, &c., at the lowest prices for cash.  
WATERLOW and SONS, WHOLESALE STATIONERS, 65, LONDON-WALL.

# The Builder.

NO. LXXV.

SATURDAY, JULY 13, 1844.

last week al-  
luded to the irre-  
sponsible and  
injurious altera-  
tions which  
have been made  
in the proposed  
new Metropo-  
litan Building-Act. Why  
this very condemnable  
conduct should still be  
pursued we are at a total  
loss to conceive; for if  
through misfortune they  
should be enacted, they  
must stand will most certainly  
be of necessity as soon  
corrected. We, therefore,  
beg to advise the party,  
whoever he is, who causes  
this mischief, and so sets himself in opposition  
to experience and *bona fide* advice, to retreat  
in time, and not to so endanger a measure  
which is looked forward to with anticipations  
of beneficial working; to give up at once any  
view which would endanger the measure, and  
cease to irritate the building profession of  
London to continual outcries against the  
policy and good effect of that which  
all desire to see perfected. At present  
there is sad complaint, that as soon as one  
hole is mended another is made, and that a  
vast increase of trouble, expense, and anxiety  
is thrown upon the several interests and  
organs of our practical metropolitan archi-  
tecture, and in fact, that however near  
the measure may be to consummation, there  
are still, from time to time, lodged in it  
fresh matters of irritation, and a vast new  
consumption of time and expense is the con-  
sequent result.

In Sec. 77 exists a great practical defect,  
through the allowance, in the case of new  
buildings, before survey and payment of the  
fees, of a month to elapse, and fourteen  
days to elapse in like manner in the  
case of additions, alterations, or repairs: the  
qualifying words, "*covered in, and all the walls  
thereof have been built to their full height,*" will  
be taken advantage of by builders of low rank,  
as similar provisions under the present Act  
have often been, such persons both evading  
compliance with the statutory restrictions, and  
payment of the fees, by means of leaving off a  
few slates, tiles, or bricks, so as to answer every  
summons by the words, "*The building is NOT  
YET finished; WHEN it is finished,* the provisions  
of the Act will be fulfilled, and the fees will be  
paid."

Stronger powers are required to compel  
compliance with the statute, in cases where  
buildings have been begun without notice.

We have received many humane suggestions  
relative to the preservation of buildings from  
the ravages of fire, the most obvious of which is  
the diminution of the quantity of combustible  
materials. We therefore urge most strongly  
upon the Legislature, that whereas thick walls,  
with timber in them, become no better than  
thin walls without it, and, in fact, often have

the effect of rendering buildings as dangerous  
as if destitute of party-walls,—that every en-  
couragement should be given to safe and eco-  
nomical building, by the allowance of all ex-  
ternal walls which are otherwise required to  
be as much as a brick-and-a-half thick, to be  
half a brick thinner, provided they have no  
wood therein; and all party-walls which would  
otherwise be two bricks thick, to be half a  
brick thinner, provided they also have no  
timber in them.

At the present price of iron in England, five  
tiers of wrought vat-hooping bond may be used  
for the same outlay as one tier of fir bond-  
timber, with the advantage of continuous chain  
across flues, and in the joints, without the  
slightest severance of the work.

We insert the following remarks made in a  
letter by Dr. Benjamin Franklin, upon the  
subject of combustible buildings and their  
improvement:—

"It appears to me of great importance to  
build our dwelling-houses, if we can, in a  
manner more secure from danger by fire. We  
scarcely ever hear of fire in Paris. When I  
was there, I took particular notice of the con-  
struction of their houses, and I did not see how  
one of them could well be burnt. The roofs  
are slate or tile, the walls are stone, the rooms  
generally lined with stucco or plaster, instead  
of wainscot, the floors of stucco, or of six-  
square tiles painted brown, or of flag-stone, or  
of marble; if any floors were of wood, it was  
of oak wood, which is not so inflammable as  
pine. Carpets prevent the coldness of the stone  
or brick floors offending the feet in  
winter, and the noise of treading on such  
floors, over-head, is less inconvenient than on  
boards. The stairs too, at Paris, are either  
stone or brick, with only a wooden edge or  
corner for the step; so that, on the whole,  
though the Parisians commonly burn wood in  
their chimneys, a more dangerous kind of fuel  
than that used here, yet their houses escape  
extremely well, as there is little in a room that  
can be consumed by fire except the furniture;  
whereas in London, perhaps scarcely a year  
passes in which half a million of property and  
many lives are not lost by this destructive  
element. Of late, indeed, they begin here to  
leave off wainscoting their rooms, and instead  
of it cover the walls with stucco, often formed  
into panels, like wainscot, which being painted,  
is very strong and warm. Stone staircases,  
too, with iron rails, grow more and more into  
fashion here. But stone steps cannot in some  
circumstances be fixed; and there methinks  
oak is safer than pine; and I assure you that  
in many genteel houses here, both old and new,  
the stairs and floors are oak, and look ex-  
tremely well. Perhaps solid oak for the steps  
would be still safer than boards; and two steps  
might be cut diagonally out of one piece.  
Excuse my talking to you on a subject with  
which you must be so much better acquainted  
than I am; it is partly to make out a letter,  
and partly in hope that, by turning your  
attention to the point, some methods of  
greater security in our future building  
may be thought of and promoted by you,  
whose judgment I know has deservedly  
great weight with our fellow-citizens. For  
though our town has not hitherto suffered very  
greatly by fire, yet I am apprehensive that  
some time or other, by a concurrence of  
unlucky circumstances, such as dry weather,  
hard frost, and high winds, a fire then happen-  
ing may suddenly spread far and wide over  
our cedar roofs, and do us immense mischief."

It has been suggested that water-closets, of  
proper construction, projecting from the rear  
or sides of buildings, should be legalized, on  
account of the hardship which at present lies  
against their erection; in spite of which,  
indeed, perhaps as many as fifty thousand  
have been erected within the metropolis, many  
of them secretly, without notice having been  
given to the district-surveyor, and many in  
violation of the present statute. A great many  
of these irregular buildings are not only built  
without walls, but many of them are composed  
entirely of wood, without even the resort to

the technical evasion of making them as  
"rooms if any in the roof thereof," or the  
pretence of rendering these pieces of building  
all roof without walling.

The restricting workshops, breweries, and  
distilleries, to thirty-five squares, must be  
injurious.

We must again urge that, from the low  
state of architectural construction as found  
in ordinary actual practice, we have our fears  
relative to the policy of placing a paramount  
superintendency over the works of eminent  
architects: few architects, of very great emi-  
nence, would accept such an office; and there  
would be very gross indecency in an inferior  
in experience, technical learning, and in-  
born ability, having conferred upon him the  
graceless office of spoiling his superior's work.

Few people know, especially members of the  
Legislature, the real state of the architectural  
constructive knowledge, as actually brought to  
bear upon ordinary practical building. While  
the proposed Act contains many obnoxious  
provisions, which could only annoy the subject,  
without, in the slightest degree, improving the  
soundness of building, or preventing the de-  
vastating effects of conflagration,—none of  
those grand, practical, subverting errors, which  
have crept into building, are forbidden, or in  
the slightest degree attempted to be counter-  
vailed or discouraged.

Of all the practical abuses which have arisen,  
none has wrought a more extensive injury,  
none has lowered the characters of English  
building more than this wretched thing, which

profligate folly has substituted for sound arches  
upon geometrical principles. This error, which  
is a corruption entirely of modern growth, has,  
indeed, been lashed with all the severity  
which it deserves; but of what use is such  
denouncement, without amendment take place?  
In spite of all that has been said against so  
willful and perverse a practice, which lays the  
metropolis in ruins, the evil still goes on. In  
the line of the very improvement from Long-  
acre to the British Museum, from whence  
many sound, well-built houses have been  
removed, we yesterday observed the car-  
case of a new house, which contains fifteen  
of these things, and ere fifteen months elapse,  
that building will be shivered by fifteen  
cracks. The same folly has been commenced  
along the line of the northward continuation  
of Farringdon-street: scarcely one-third of  
such mock arches have ever escaped fracture.  
The treasurer of one of our metropolitan  
hospitals, a few weeks ago, shewed us the  
same folly in a new lodge then building for  
the establishment. We pointed out the de-  
fect—that defect was denied—but a single  
fortnight shewed a fracture in the work over  
each aperture. The new buildings near Pad-  
dington church are nearly all so erected,  
and are nearly all in a state of severance.  
St. George's Hospital was so set up, and  
though almost every window-head was re-  
paired after being broken, almost every one  
of them still shews marks of fracture.

We have come to the resolution of never  
recommending the purchase or leasehold  
tenure of any building so faulty, unless the  
offending work be taken from over every  
aperture, and proper arches be substituted, or  
unless a sufficient cambered iron bar be  
placed under the soffit of each aperture. The  
expense of constant external repairs, the in-

jury to internal finishings of houses so set up, and the meanness and annoyance of such unsoundness pervading a man's house, and the whole metropolis, one would suppose, afford sufficient reasons for the non-repeating of such a nuisance, but such seems not to be the case. Rather than acknowledge the defect, and return to proper geometrical construction, which costs nothing at first, and saves much ultimate expense, crisp cements are resorted to, which increase the expense, and only change sham arches into bad brick lintels, which fracture with the slightest jar or settlement.

But though, again, some of little experience may say, seeing this serious evil, "then let each aperture be covered with stone;" to this we object as a rule, from such practice being, though costly, little to be depended upon. They greatly err who think a single piece of stone is proper for the covering of ordinary apertures in buildings.

Unless a stone used for the covering of an aperture be compressed in all its particles, it must be dissipated by the superincumbent weight; the pressing gravity must extend its particles; if a stone be not compressed, it must fracture, even by its own weight, so soon as the gravity is greater than its cohesive strength. This is found in modern practice to have occurred to a lamentable extent—an extent to which ordinary persons, who are no great observers, have not the slightest idea—buildings cheap and buildings dear have alike suffered from the almost universal fracturing which has taken place in buildings where dependance has been placed upon lintels of stone. The stone lintels of the windows of St. Mark's Church, Pentonville, are all broken; of those at the church in Bryanston-square, about three-fourths are broken; those of Westminster Hospital are nearly all broken; and in the most costly city company's modern hall, where no expense of foundation, or cubic strength of stone, has been grudged, there is no lack of similar fracture. Were a Parliamentary commission to be instituted for inquiry upon the subject, two things would create astonishment—one, the prodigious extent of this *consumption-plague* in modern buildings, public and private; and the other, the strange laying aside of plain practical science, which has led to this insane laxity.

We may then be asked, how is this? what is its cause? where is the reason for it? The simple answer is, THE LOSS OF THE FREEMASONIC SECRET: in that secret lies the art of building soundly and economically; that secret is brought into use in genuine buildings of genuine Pointed Architecture, throughout a fabric, from its foundation to its top-stone, from its roof-summit to its base; the shrewd art of masonic compression, the causing every stone to press or gravitate to its neighbours, the keeping all tight, the cementing every thing by gravity—that sublime art which raised the thin sound fabrics of the middle ages, and keeps them firm, though very many of them are of mean, perishable materials, from the outsides of which time has pared away four inches of their subtle substance, and is still paring away more, while they stand defiant—that great secret, the knowledge of architectural dynamics—taught the mechanic the weight and position of every boss, abutment, pinnacle, flying-buttrass, and other member of those time-defying erections.

We shall go no more at present into this part of the subject, but throw out boldly the requisite caution; only adding, lintels of stone,

if weak, break by their own weight; if strong, by the slightest motion at the foundation: lintels of wood, and all wooden breast-summers, cause by their shrinkage and compression fracture of the work above them. If any of these things be arched above, so as wholly to prevent subsidence and fracture of the superincumbent walling, the work is twice done, and all the expense and weight of the lintel-work, and other trumpery, had better be saved; for, indeed, a very small portion of wood is indispensable for fixing the absolutely requisite combustible finishings.

Building is not genuine unless it contain in its outward ornamental form the undisguised constructive principle. Pointed Architecture is purely so throughout—all architectural masking is extravagantly expensive, for the ornament of it bears nothing, and the substance has to be increased to bear not only itself, and to perform its abstract purpose, but also to bear all the added trumpery; therefore, in many cases, a double expense of materials, and more, is incurred. Pointed Architecture bears in itself the seeds of its own preservation.

The next great defect in ordinary house-building, which is left to correct itself, while there has been in the Bill a branching of much unwholesome, petty interference with matters of form and good construction, which are the subject's, the architect's and the builder's inherent birthright,—the next crying evil, which completes the ruin of a very considerable portion of household architecture, and which is not in the slightest degree discountenanced by the present Bill, is that notorious abomination the V roof.

The ruin which the groaning instability of place-bricks, and the failure of breast-summers, false arches, and quartered partitions has begun, this completes.

Tenants, under ordinary leases, agree to uphold, support, and maintain such fabrics; such a roof, being like an open book, is, as long as it exists, attempting to fall flat; the two covers, instead of downwardly compressing the wall, make war laterally upon it. If two such roofs come together on opposite sides of a wall, they neutralize each other's improper effect, if equal; but if unequal, their difference of weight forms a destructive moving power. If such a roof, as in the case of a corner house, have no counter-abutment, the wall is most assuredly thrust over; the tenant, therefore, cannot uphold, though he has agreed to do it, such a wall: he may rebuild it, he may pay for it as a dilapidation, but he has, injuriously to himself, undertaken an impossibility. Again, such a roof has nearly all its weight thrown, not upon the walls which are capable of bearing it, but upon void, using the thing called a GUTTER-PLATE. Now, to make this sufficiently strong to perform its duty unflinchingly, it should be of enormous dimension; and even then, if of timber, it would shrink, compress, and sag, and so still derange the whole roof. Though the tenant has agreed to support the fabric, this he cannot do; the gutter-plate, with all its superincumbent weight of roof, bends prodigiously; it is generally in imagination supported by the quartered partitions of the house, but these are all deranged by the gravitation of the wretched roof-work, communicated by the gutter-plate to every part of the interior of the house: every floor gives way like a sheet; not a chair, a table, a chest of drawers, a bookcase, a wardrobe, or a bedstead, will stand upright, but hangs forward; every household vessel is defrauded of a portion of its available capacity, for tilted on one side, the contained liquid meets its brim while part of its intended measure is still vacant; grates run over one side of every dish and plate, and stains the table-cloth and furniture.

The tenant has agreed to maintain the house by and with all and all manner of need-

ful and necessary reparations, cleansings, and amendments whatsoever; but in vain does he have repairs done, in vain does he have doors and windows eased and rebung; gravitation constantly going on, as soon as the evil is remedied, it is renewed. In vain are ceilings repaired; they crack again as soon as mended: in vain is plastering cleaned; the gutter, following the sinking of the gutter-plate, often breaks by the derangement; the rain-water often, by this sinking, lies there stagnant, so that a few drops more make it overflow: thus, though he has been tired out by the frequent whitening of the ceilings, and the renewal of paper-hanging which has been destroyed, too, by the same radical defect, he still has, at the end of his tenure, to pay for dilapidations, on account of fancied neglects, and the fancied breach of a covenant which it is impossible to keep fulfilled: and often the tenant has to renew the cleft timbers of a house which have become rotten through the running in of water from the deranged gutter. For these reasons, we advise all our friends to abstain from taking upon a repairing lease any house which has such a roof, and we advise that the Building-Act contain a clause forbidding the formation of any such roof, except in cases of strict necessity, and then only under the special allowance of the official-referees; and we recommend that all tenants should be excused from every repair consequent upon them.

The pretence, when these execrable and destructive roofs are formed, is, that they are economical, which is entirely false. Their first saving is one gutter, but against this is to be set the extra cost of the gutter-plates, and the great increase in the height of the walling; they seldom save much at first—often nothing—in the end occasion a triple expense—besides breaking and spoiling every ceiling and cornice, setting every flooring out of level, deranging every door and window, and putting out of adjustment almost every piece of furniture.

b.

## BUILDERS' SOCIETY.

*Report upon the Metropolitan Buildings' Bill, as printed by order of the House of Commons, 17th May, 1844.*

In presenting to you a further report upon the Metropolitan Buildings' Bill, as now printed, in the form in which it is to be sent to committee in Parliament, your committee regret to notice that there is still about it too much of the minute detail to which they adverted in their last report, as characteristic rather of the specification of a particular work, than of the large and general provision which ought to distinguish a legislative enactment.

The tendency of this must necessarily be to occasion much present annoyance by interference with small and unimportant matters, and to throw great, if not insurmountable obstacles in the way of those improvements of construction and manufacture, which the temper and opportunities of the age are generally adapted to foster and bring out.

For the more clear exposition of these views, this report will first point out the various alterations which have been made in this last print of the Bill, and which appear to be unobjectionable, including those in which the recommendation of our last report appears to have been attended to; and then place together, in the order in which they stand in the Bill itself, those several matters which still appear objectionable, or to require modification; whether as the result of more mature consideration of the proposed enactments as they appeared in the former print, or arising from alterations now for the first time introduced.

Several small verbal alterations have been made, the effects of which are to render the parts in which they occur more definite, but, as they do not affect the provisions of the clauses themselves, it is not thought necessary to point them out. There are, however, some new features, so important in their character as to require specific notice.

No dwelling-houses are to be subject to special supervision.

The powers of all Commissioners of Sewers are to be saved.

Gas-works are not to come under the operations of the Act as noxious trades.

The natural order of numbering is to be stored to the rates of buildings, calling the *best* first rates, and so on downwards. The official referees are prohibited from lowering private practice as surveyors. 1. The unobjectionable alterations are as follows:—

N. B. The alterations only are mentioned, that it will be necessary to refer to the Bill itself to understand their exact effect.

Clause 10.—Power is given to the official referees to award compensation in all cases which this Act interferes with existing engagements in building-leases.

Clause 17.—A power of forcible entry for demolition is added.

Clause 18.—A power to compel appearance summons is added.

Clause 22.—In this the adjoining owner's power is confined to modification, of which it is to signify his wish within *two months*.

Clause 32.—One month's notice to be given before rebuilding fence-wall, also that if adjoining owner use, he shall pay. Also that official referee may authorize a fence-wall being raised to more than 9 feet to screen any object wished to be shut out.

Clause 38.—One month's notice inserted, and power to extend footings on to adjoining land added.

Clause 41.—The expense of making good pavement is added. Official referee to determine as to appropriation of surplus.

Clause 42.—Expense of survey added.

Clause 43.—The suggestion of report adopted.

Clause 46.—Owner more clearly defined.

Clause 51.—A new clause, saving the powers of all Commissioners of Sewers.

Clause 53.—The limitation of *size* for dwelling-rooms omitted, provided they are properly ventilated.

Clause 57.—Four days given instead of two for recognizances, and appeal to surveyor to give one month's notice.

Clause 58.—*New clause*—Provision for trial by jury at quarter sessions.

Clause 62.—Power to levy rate for compensation added.

Clause 63.—*New clause*—Gas-works exempted from the operation of the Act as noxious.

Clause 66.—Power to examine qualifications of surveyors, when candidates for districts, by official referees, Institute of British Architects, and Civil Engineers.

Clause 70.—Power given to magistrates to alter existing districts.

Clause 71.—Any surveyor acting before having made declaration, made liable to penalty.

Clause 77.—Notice to be from *builder, owner or occupier*.

Clause 84.—Revocation of power of official referee not to affect their awards.

Clause 85.—Power to official referee to take evidence on oath.

Clause 101.—Power given to justice to compel appearance by warrant.

Clause 109.—Exempting tenants-at-will, and directing services of notices to go on from party to party upwards.

Clause 114.—Power for official referees to give consent when legal incapacity prevents the proper persons from so doing.

Schedule B.—Structures underground are omitted.

The buildings of British Museum and St. Katherine Dock added.

Schedule C, Page 69.—*Rules for ascertaining height* are made to apply to buildings having no ceiling or tie-beam.

*Rules for ascertaining stories*.—"9 inches above footings" is inserted instead of "top of footings as the place to measure from."

Part 2, Page 70.—The suggestion as to order—calling the largest buildings *first rates*, and so on downwards—adopted.

The largest rate is called *extra first rate*, and the rates defined as follows:—

In reference to area.	In reference to height.
Extra 1st rate . . . . . above 14 squares, above 85 ft. high.	
1st rate . . . . . 10 to 14 " " 70 to 85 ft. "	
2nd rate . . . . . 6 to 10 " " 52 to 70 ft. "	
3rd rate . . . . . 4 to 6 " " 38 to 52 ft. "	
4th rate . . . . . 4 and under " " 38 and under.	

The alteration of stories, calling basement first story, abandoned. The thicknesses of walls regulated by distance from topmost floor downwards. This will have the advantage of

throwing on the thicker portions of walls in lower buildings.

In this part of the schedule there is an abandonment of the clause, throwing the larger rates into special supervision, so that all buildings in this class will be subject to district surveyors only.

Part 3, Page 71.—The superior area of warehouse class abandoned as a rule, and the height of walls only regarded in rating.

1st rate . . . . . 66 feet and above in height.
2nd rate . . . . . 44 to 66 feet " "
3rd rate . . . . . 22 to 44 feet " "
4th rate . . . . . 22 and under " "

Part 4, Page 72.—*Warehouses*.—The stipulations as to stables altogether out. Warehouses are limited to 35 squares, unless they have party-walls or fire-proof portions.

Part 5, Page 72.—Is only such an alteration as to make this clause effective, after the revocation of the latter portion of schedule C, part 2.

Part 6, Page 73.—*Altogether new*; prescribing that stone staircases in dwellings shall be upheld by incombustible supports, and providing that all staircases and passages, &c. for public buildings shall be fire-proof.

*Insulated Buildings*—Page 73.—*The party-walls* only kept in.

Schedule D, Part 1—Page 74.—The rules as to footings made more general and clear.

*Enclosing Walls*.—A new feature providing a power to modify the provisions of the Act in cases in which rooms of unusually large dimensions may occur in buildings of the first or second class.

Part 2—*External Walls*.—The provision as to wood not being allowed within 4 inches of centre of party-wall made more specific, and the use of wood for lintels virtually prohibited.

*Parapets*.—A new clause defining thickness of parapets; in effect same as old schedule, and rendered necessary by the rule of measurement being now made to begin at the ceiling of the topmost floor.

*External Walls*—*Party Walls*.—The clause recommended in our report adopted almost verbatim.

Part 3—*Site of Walls*.—The site is proportioned to the requirements of each side justly; and the recommendation of our report as to providing for payment for wall itself adopted.

*Construction and Materials*.—This clause is so altered as to further secure the centre of party-wall from being approached within 4 inches by any timber of any kind.

Schedule E.—*Projections*.—Official referee may allow them of any materials.

*Wooden Sign-boards*.—Sign-boards must not be fixed with the top more than 18 feet from the ground.

*Timber or Wood-work*.—No timber to be laid within 18 inches at least from surface of hearth.

A clause to provide for pargetting outside of flues, and preventing wood-work from being fixed until this is done.

*Slabs and Hearths*.—Any incombustible material now allowed, but 9 inches required solid under hearth.

*Backs*.—The thickness of backs to go 12 inches above head of mantel.

*Close Fires*.—To be 18 inches off wall instead of 24 inches.

*Chimney Shafts* must not be more than 8 feet high, unless bonded into second flue, or of extra thickness.

Schedule H.—*Drains* 50 feet instead of 30 feet. Cesspools omitted, and best outlet that can be obtained substituted.

Schedule I.—*Width of alleys* prescribed for those hereafter to be formed only.

The minimum width of streets increased from 30 to 40 feet, and if houses are higher, then the width of street must be the same as the height of houses.

Alleys to be 20 feet wide, and if houses higher, the width to be the same as height of houses.

Schedule L.—*Fees moderated*; an additional fee payable for every 35 squares of warehouse, and a fee for every separately rated building.

*Fees for Special Services* not enumerated, but limited to a maximum of 2l.

If the clauses which, in the opinion of your committee, require alteration—are clauses 14, 15, 16, 21, 54, 55, 96, 97, 103; schedule C—parts 4 and 7; schedule D—parts 1 and 3; and schedules F and K.

Schedule B.—It appears that special supervision is here made to apply in some cases unnecessarily, viz. to the construction of an area wall to a common dwelling-house, or the retaining wall of, or the construction of a small bridge, and it seems hardly right that the Bank of England, and similar important establishments, with the advantages they are sure to possess of first-rate professional advice, should be restrained from making small alterations, without the trouble of first submitting drawings, &c. to official referees.

Clause 14.—This clause remains as in the old Act, and the same objections apply. The builder is compelled to cut away work, to enable the surveyor to examine whether the provisions of the Act have been carried out, but he has no power to compel the attendance of the surveyor, and is without remedy, if the expense and inconvenience attending this examination should have been incurred ignorantly or wantonly; and although the official referees are to award by whom the costs shall be borne, yet as the surveyor will be acting in the capacity of a public officer, enforcing the provisions of a public act, while the owner will be only protecting his private interests, it will be difficult to make out such a case as would shield an injured party, unless the provisions of the Act itself are of such a character as to impose control; your committee, therefore, recommend that in case of the examination proving that the Act has been regarded, the cost of the examination should be borne by the party ordering it.

Clauses 15, 16.—These clauses have two alterations in them,—one to declare that the official referee shall give his certificate within fourteen days, *if he is satisfied*, and another empowering the magistrates awarding penalties, to take into consideration the amount of risk run by the use of an uncertified building, and also the profit involved; the minimum of 5l. is struck out, so that a lower penalty may be awarded.

Your committee are still of opinion, that the lapse of time should give power of use, and that the official referee should be obliged to intimate his objection within a given period; this might be effected by making it his duty either to give his certificate of satisfaction, or to intimate that he is not satisfied within fourteen days, *or if not, the building to be understood to be certified*—as in cases of buildings of public resort, heavy losses might accrue from delay.

Clause 21.—In notices for survey and condemnation of defective party-walls, "four months" is now substituted for "six"; but this is objectionable; three months have been found practically sufficient, and the loss of an additional month is a heavy penalty, particularly as building operations are not usually begun until the spring, and four months are too large a portion of the working year; your committee, therefore, reiterate their recommendation that *three months* should be the period.\*

Clauses 54, 55.—Your committee still think, that it will be oppressive to prevent the erection of buildings within 50 feet of objectionable trades, as the effect would be to annihilate for twenty years 100 feet, i. e. 50 feet on each side of all butchers' shops, where sheep are killed in new streets, and the same as to any of the proscribed trades; and although the alteration made in this and the preceding clause, giving power to re-erect buildings accidentally destroyed, is, as far as it goes, an improvement, still it appears far better to determine that certain trades shall not be carried on within the limits of the Act, if the requirements of a public health point out the expediency of such a course, than to put it in the power of individuals to inflict such injury on their neighbours as would result from establishing any one of these proscribed rules.

Clause 95.—A clerical error occurs here in the amount of contribution for the county of Kent, which is printed thirty for eighty.

Clause 97.—Fees are here provided, but not defined; and the result of passing this clause as it now stands would be to subject the metropolis and its environs to a tax of an indefinite amount; the fees should be made specific.

Clause 103.—*New clause*—Giving power of appeal from decisions of justices to quarter

\* [The present Act requires three months' notice, besides the time which may be consumed by ulterior proceedings.—Ed.]

sessions, when the penalty inflicted is above 50*l*. This should be extended to all cases, whatever the amount of penalty may be.

Page 72.—*Openings in Party Walls*.—Your committee still think that the whole thickness of the walls in which the doors occur would be a sufficient distance for all practical purposes.

Page 72.—*Roofs*.—It is suggested that if curb roofs are proscribed, it would be well to enact that doors of exit should be provided in roofs, as otherwise a most important means of escape from fire will be taken away.

Schedule C, Part 7.—The recommendation of our report is to a considerable extent adopted, by giving power to official referee to allow of a detached green-house being built of any form; but it is suggested that the district surveyor might well be entrusted with this discretion, and would be a more accessible officer, as the official referee will have plenty of work, within a circle of sixteen miles diameter, without this.

Schedule D, Part 1, Page 75.—The word *squared* would be better omitted as not necessary, involving a small matter of detail that might interfere with the use of very objectionable materials; as, for instance, that would prevent the use of flints, and all rubble masonry.

*Walls generally*.—The footings to spread equally on both sides would be injurious, and useless, where an external wall is built against one already in existence, when it would involve loss of ground.

Part 2.—*External Walls*.—Here again the word *squared* had better be omitted, and some such general phrase as "incombustible materials" substituted. This is one of those restrictions which would interfere with improvements. The latter part of this clause would prevent the use of wood lintels, unless with discharging arches over them, but this is not objectionable.

*Brastrisummers*.—The imposition of a detached story-post involves unnecessary expense and great inconvenience; indeed, in the public thoroughfares, where the largest surface of glass is the great object of the shopkeeper, and the value of property would be deteriorated, and this applies equally to the return piers which are allowed in this print of the Bill.

Schedule D, Part 3.—*Division of Buildings*.—It is again urged that this clause ought not to have a retrospective operation.

Part 3.—*Party Walls*.—Construction and materials: the same observations apply as to the last clause.

*Openings in Party Walls*.—Those are now allowed in houses of any rate; but the good of this extension will be virtually neutralized by the walls being required to be such as are provided extra first-rates, when the joint area exceeds fourteen squares. This size will be almost certainly passed by the junction of any two houses, and the walls of first-rates would be abundantly strong.

*Recesses and Chases*.—These may be made anywhere, but the same objection applies here as to greenhouses, and it is recommended that they be placed under the superintendence of the district surveyor.

*Party Fence Walls*.—This requires defining more clearly.

Schedule F.—*Construction*.—The Act now prescribes which is to be considered the first, second, or third story; and without this, this clause is not intelligible.

The prevention of the construction of new chimneys, unless their foundations are carried down, is still unaltered and most objectionable. The general arrangement of the better class of dwellings renders new chimneys almost imperative, immediately above the principal or one-part floor of the house, which is usually allotted to the reception rooms; and if the supports of these chimneys are to come through the best rooms, much space will be occupied unnecessarily, and a heavy needless expense entailed; this also applies with equal force to houses the ground-floors of which are occupied as shops or warehouses; it is therefore strongly recommended, as in the last report, that this portion of the clause be expunged, and this is the more confidently pressed, because no case has been made out to require such a regulation, and its

† [And would virtually put out of use the small majority of the middle ages, such as lately used at the new church, Broadway, Westminster.—Ed.]

practical operation would be to prevent the construction of fire-places in upper rooms, and to this extent diminish their healthiness.

*Dimension and Materials*.—It is suggested that flues for smoke, if of metal, might be allowed as small as 4½ inches in diameter, and need not be so large as 8½ inches in diameter, this limit being the new feature of this clause.

*Steam-Engines*.—Shafts to be regulated by official referee. This applies to buildings connected with machinery in which constant improvements are occurring. Small engines are frequently worked with common dwelling-house flues; and large engines are constructed by the most skilful engineers, whom it does not appear necessary or desirable to subject to this control.

*Fees for Special Duties*.—Cutting away of chimney-breasts: first and extra first-rate is 2*l*. 2*s*, but third and fourth-rates, 3*l*. 3*s*.: this must be a clerical error.

*Chimney-pots, Tubes, &c.*—This clause is altogether needless, and as it now stands, somewhat absurd, as it prescribes that every pot must be fixed two feet into the brickwork in which it stands, a depth that in most instances would bury the ordinary chimney-pot.

Schedule H.—*Cesspools and Privies*.—This clause is needless, and could not be carried out without producing much private inconvenience, without any sufficient public benefit.

Schedule I.—*Carriage-way and Footway*.—It seems to be quite unnecessary to prescribe how the streets, &c. shall be paved, as this is in all cases sufficiently provided for by the local boards of pavements, and the requirements of each case can be better met by those who have the necessary local knowledge.

*Entrances to Alleys must be Two*.—This may be impossible, and if it were considered desirable cannot be made imperative, as the abutment on other property may quite preclude it, and it would be unjust to prevent the use of ground for buildings, only because it may not be possible to give access to both ends.

Schedule K.—*Back Yards*.—This clause is somewhat modified, but still objectionable, and it appears to be oppressive that in the denser parts of the metropolis, and those most valuable, this back area should be made compulsory—there is added to this clause, however, a new paragraph, curiously characteristic of the specification-like form of some of these schedules, which prescribes that every first-class building must have such a roadway to it as will admit a scavenger's cart. The effect of which would however be to prevent the construction of any alley.

*Lowermost Rooms*.—The provision requiring 6 feet (out of a surface of 9 feet, the size prescribed) for a window to open, would prevent the use of sash windows of the ordinary construction; it is therefore suggested that 4½ feet, or one-half the surface, should be substituted.

*Attic Rooms*.—This is a matter of detail, unnecessary, and not of sufficient importance to be retained; it is therefore recommended that it be expunged.

Schedule L.—*Fees for Special Duties*, page 86.—There appears to be a clerical error here, as the fees for low rates are larger than those for the higher.

In conclusion, your committee advert with pleasure to the improvement which marks each step of this measure; though they cannot but regret that a more enlarged and comprehensive view of the whole subject has not been taken, by which a wide and important general measure might be obtained, applicable to all buildings, and which might be made available, like the proposed power of extension of this Act, by an Order in Council, wherever the number of inhabitants of any given place exceeded a defined number, with prescribed limits; and after the laborious investigation of the voluminous Bills which have been proposed, they are more and more convinced of the truth and justice of the remarks made in their report in an earlier stage of this business, 7th March, 1842, which they therefore repeat:—

"The excitement of public attention to this subject seems to suggest that the present is an opportunity which should not be allowed to pass without maturely considering how far it is practicable and desirable to form one general and comprehensive measure for the regulation of buildings, which may apply throughout the country, and so come into operation at once, wherever new neighbourhoods may arise, as in the case of Wolverton, on the London and

Birmingham Railroad; or large additions be made to towns already in existence, as in the case of Kingston, on the South Western Railroad; containing such precautions against the spread of fire as have been found by long experience to be salutary in the metropolis giving general powers and direction as to the width and continuity of public streets and ways, and general limits as to projections, &c. without infringing upon any of the special regulations of local boards now existing, and having the management of any particular district of pavement or roadway; at the same time, avoiding whatever would unnecessarily increase expenses of the smaller classes of dwellings, and making all provisions so general in their character, as to admit of adaptation to the varying circumstances and different building materials of each separate neighbourhood or county."

THOMAS PIPER, JUNO., Hon. Sec.  
June 13, 1844.

#### COLLECTIONS TOWARDS A GLOSSARY OF ARCHITECTURE.—No. VII.

**COLUMN**.—"A tapering cylindrical mass, placed vertically on a level stylobate, in some cases with a spreading congeries of mouldings called a base, and having always at its upper and smaller end a dilating mass called a capital." (Hosking.) Mr. Gwilt describes a column as "generally a body which supports another in a vertical direction."\* (Encyc. p. 954.) Some writers consider that the term *column* should only be applied when the shaft consists of a single block of stone, marble, or other material, and that when the shaft is formed of several courses it should be termed a *pillar*, from the Greek *πύλος*, "to bring together." Others again confine the word *column* to those which are circular on their plan, and apply the term *pillar* to square or polygonal supports.

The word is derived from the Latin *columna*, which appears from Quintilian to have been by the ancients pronounced *coloma*, and this leads one to think that it may be traced to the Greek *κόλυμα*, impedimentum, prohibitio, from the verb *κόλυμι*, prohibo, impedito, arceo, and as the latter word signifies to hold fast, to strain or tie hard, to keep in or hold together, to keep from, to save or protect, as well as to stop or to hinder, to debar, so a column may be truly said to support or keep a building from falling, to be a stay or prop.

"Do I look like a cudgel, or a novel-post, a staff, or a prop?" SHAKESPEARE.

The column is the most important member in architecture, and indeed no building, whether ancient or modern, into which columnar arrangements are not introduced, can be strictly classed among architectural compositions.

Columns are as various in their proportions as in their shapes and the uses to which they were applied. In those orders, however, which are called the classic orders, on which the Greeks first stamped the impress of genius, the proportions of columns are reduced to nearly an unvarying scale of rule.

In the earlier specimens of architecture, as among the Indians and Egyptians, less regularity is observed, and it is not unusual in some of their temples to find that no two columns are alike. The columns in the Indian excavated temples are sometimes polygonal, sometimes round, seldom tapering, but always massive, and of few diameters in height. They are seldom plain, their shafts being usually formed into vertical ridings, frequently divided by horizontal rings like the hoops of barrels; in this respect they resemble the columns of Egyptian temples, and, like them, have capitals of cushion-like and vase-shaped forms carved into imitations of the foliage peculiar to the countries.

The Egyptian columns were of colossal dimensions and thickly set together; the outer court of the great temple at Carnac contained,

\* The proper term is a *conical*, or a *conoidal* mass, rising from a platform: columns are rarely cylindrical, and if tapering with straight sides, are conical; they are frequently not placed perpendicularly, and in such cases should very rarely be so placed, but leaning inwardly at their heads, they so gain both stability and elegance of effect, especially in circular buildings.—Ed.]

in the apt language of Denon, "a forest of columns."

In the Grecian-Doric order we see the first attempt to reduce the columns to uniformity and just proportions, and the column which at Corinth (the most ancient known example of that style) hardly exceeded four diameters in height, is beheld in the Parthenon extended to the perfection of beauty. The story of Vitruvius, that the ancients "measured a man's height by the length of the foot, which they found to be a sixth part thereof, and thence deduced the proportions of their columns: thus, the Doric order borrowed its proportion, strength, and beauty from the human figure,"—will not hold good unless we admit that a dwarf was taken as the standard of his race. And in allusion to another opinion, that timber construction afforded the first hints for columnar arrangements, Professor Hosking pertinently asks, "If the trunks of trees used in the structure of tents suggested the first idea of columns, and of the Doric in particular, as many contend, how is it that the earliest specimens are the most massive?"\*

In the Ionic column is rendered still more slender than in the Doric order, and the climax of classical lightness was reached in the tall and graceful Corinthian. The assertion of Vitruvius that the proportions of the three orders were derived from those of a man, a matron, and a young girl, may afford some notion of their relation to each other, but will not account for their origin.

Engaged or attached columns are very seldom found in Greek buildings, but it is remarkable that one (and it is believed only one) example may be named in each of the three orders, viz. of the Doric, in the great temple of Jupiter at Agrigento (for which the colossal diameter, 14 feet, may account); of the Ionic, in the temple of Minerva-Polias, at Athens; and of the Corinthian, in the Chœræic Monument of Lysicræus, also at Athens; in the last instance, however, the capitals are disengaged. These, therefore, are the exceptions to the strict rule of the Greeks, that columns should be entirely detached from the walls.

Among the Romans, the flanks of temples were frequently, though not always, pseudo-peripteral (false-winged), i. e., having columns attached to the walls of the cell, instead of standing out clear therefrom, as in the peripteral temples of the Greeks. The Ionic temple of Manly Fortune is pseudo-peripteral not only on the sides, but in the rear: and the Maison Carrée at Nismes is also false-winged. The practice of using engaged columns, projecting either one-half or three-quarters of their diameter, as in the façade of St. Peter's at Rome, was extensively introduced by the Italian school of architecture, to which we are also indebted for the constant employment of order above order of columns, of which no example can be produced from the Greeks in their external arrangements.

The *Entasis*, or swelling outline, of the shafts of columns, and the flutings of columns, will be considered in separate articles, as will be the different arrangements in which columns are found in the porticos and temples of the ancients, and their intercolumniations.

Columns called *historical*, *commemorative*, *honorary*, or *triumphal*, are often used singly for memorials in honour of illustrious individuals or important events; examples of this practice, first introduced by the Assyrians in honour of their gods, are numerous; among the most celebrated are Trajan's Column, at Rome, designed by the famous Apollodorus; its diameter is 12 feet 2 inches, and its height 97 feet 9 inches, and including the lowest pedestal and the ancient crowning pedestal, is 125 feet high. It is of the Roman Doric style. On the summit was formerly a statue of the Emperor Trajan, which gave place to a figure of St. Peter, erected there by Pope Sixtus V. The Antonine Column, also at Rome, erected by the Emperor Aurelian, is of

the Roman Doric order; it is 13 feet 1 inch in diameter, and is, including its pedestal, 123 feet in height; on its summit was the figure of the Emperor Antoninus Pius, likewise removed, and replaced by a statue of St. Paul. Hence the sarcastic allusion of Lord Byron,—

— "and apostolic statues climb

To crush the imperial urn whose ashes slept sublime."

Both these columns are highly enriched with bas-reliefs, which are carried in a spiral direction around their shafts.

There is also at Rome a Corinthian column, seldom noticed by writers, erected in honour (and it is supposed in the life-time) of the Emperor Phocas; it is fluted, of Greek marble, 4 feet in diameter, and 54 feet high, including its pedestal.

Pompey's Pillar, at Alexandria, is a column of the Corinthian order, with a shaft, 9 feet in diameter, and 66 feet high, in one piece of well-polished granite; the height of the whole, including its pedestal, is 94 feet.

At Constantinople were two large triumphal columns; one in honour of the Emperor Constantine, long since destroyed; the other, of which one course of the shaft and the pedestal remain, was erected by Arcadius and Honorius in honour of their father Theodosius; this column was ornamented with bas-reliefs, after the manner of the Trajan column, which it also resembled in height and proportions.

The largest and most beautiful column of this kind is the famous "Monument," of Sir Christopher Wren's design; it is 15 feet in diameter, and its whole height 202 feet, of the Roman Doric order, and fluted, in which respect it has greatly the advantage over the Duke of York's Column, in Waterloo-place, which is about the size and proportion of the Antonine pillar.

To the memory of the immortal Nelson not less than three lofty columns have been raised in this kingdom, viz. one at Edinburgh, on the Calton Hill; one at Yarmouth (Nelson's native county), of the Grecian Doric order, fluted, 144 feet high, bearing a statue of Britannia; and one in Trafalgar-square, London, of the Corinthian order, and fluted, the enrichments of the capital being cast from bronze cannon; on its summit is placed a colossal figure (18 feet high) of the hero, by Baily, cut in Craigleith stone. If any additional proof were required to be urged against the employment of columns standing alone as monuments (a practice wholly unknown among the Greeks), it may be adduced in the fact that the Nelson column is still incomplete for want of funds; had the really fine statue been placed near the ground, an open circular temple, with the plinth adorned with bas-reliefs, might have been erected over it, a shrine worthy of the effigy within, at less cost than that already expended upon the unfinished pillar. Mr. Gwilt observes very strongly on this subject:—"In these days it is singular that no other mode than the erection of a column could be found to record the glorious actions of a Nelson. Such was the poverty of taste that marked the decision of the committee to whom that object was most improperly intrusted."—(Encyc. p. 214).\*

The Emperor Napoleon, among other architectural embellishments of his capital, erected in the Place Vendôme a copy of the Trajan column.

A *rostral* column is one whose shaft is adorned with beaks or prows of ships, and takes its name from *rostrum* (Lat.), a beak of a ship; such columns are considered as appropriate memorials in honour of naval heroes, or to commemorate sea-fights: the first of the kind was erected in the Capitol on the occasion of the defeat of the Carthaginians at sea, B. C. 260, by the consul Duilius Nepos. Augustus constructed four such columns with the prows of the vessels taken from Cleopatra at Actium, B. C. 31. At Rome, the platform in the Forum, whence the orators were wont to address the people, was called the *rostrum*, from its being decorated with prows of ships and naval spoils. The term is retained in

\* [And yet, notwithstanding the admitted inferiority of art, the one divine quality of loftiness naturally attracts public attention; it is this one quality which gains for the New Royal Exchange so many compliments, though, perhaps, in its details, the coarsest building of any considerable magnitude which has been erected in Europe for some centuries.—Ed.]

modern use to denote the place whence orators harangue an audience.

The *military* column was set up by Augustus in the middle of the Roman Forum, from which point, as from a centre, the distances of the several cities and places of the empire were reckoned: it was a short cylinder of white marble; its Tuscan capital supported a symbol of the globe, and the ball being gilt, the column had the name of *milliarium aureum*. It was restored by Vespasian, and also Hadrian.

The *colonna bellica* was a column at Rome, near the temple of Janus, from whence the consul proclaimed war by throwing a javelin in the direction of the enemy's country.

The Romans had also a *lactical column* (Lat. milk), erected in the vegetable market, which contained in its pedestal a receptacle for infants that were deserted by their parents.

Columns are either *plain* in their shafts, as are those of the Pantheon at Rome, or *fluted*, as was the usual practice with the Greeks.

*Calbed* columns are those in which the shafts are fluted, but whose channels are filled with astragals, which generally reach one-third of the height from the base; such are the columns in the porticos of St. Paul's Cathedral.

The *bundle* pillar is that which is composed of several small cylinders set round a core, and tied or banded together, of which we have many specimens in Egyptian architecture; in the Gothic style, such an arrangement is called a *clustered* column.

*Transparent* columns existed in the theatre of Scaurus, as mentioned by Pliny; they were of crystal. In the church of St. Mark at Venice are some columns of transparent alabaster.

*Diminished* columns are those which have no swelling, their shafts being tapered in a straight line from the base to the capital; this is usually the case with columns of a moderate size.

*Oval* columns are found in the Massini Palace at Rome, and in the frontispiece of the church of Mercy at Paris.\*

*Twisted* columns are seen in St. Peter's, Rome, supporting the famous Baldacchino, or canopy of the confessional; they are made out of the bronze which formerly adorned the ceiling of the Pantheon, which (spared by the rude Goths and Vandals) was taken thence by Pope Urban VIII., and converted by him (who was of the Barberini family) into four columns, which gave rise to the bitter sarcasm,

"Quod non fecerunt Barbari Romæ, fecit Barberini."

In the cloisters of the church of St. Paul, at Rome, are columns "tortured into every variety of ugliness; some spiral, some twisted, some doubly twisted, some spiral and twisted at once, with the hideous addition of inlay."—(Forsyth.)

A *niched* column is that whose shaft enters with half its diameter into a wall which is hollowed out for its reception; such are seen in the portal of St. Peter's.

The name of the columns of Hercules is given to the mountain of Abyla on the African coast, and that of Calpe on the opposite shore of Spain, once united, as the fable runs, until separated by force of the hero's arm, that a communication might be made between the Atlantic and Mediterranean seas. G. R. F.

**ROCK-TOMBS.**—A discovery has been made at Innerington, in the principality of Hohenzollern-Sigmaringen, of twenty-two tombs, hewn out of the calcareous rock, lying together, and containing each a human skeleton of giant size. The head was, in every case, turned to the south, and on the breast was laid a heavy stone, round in form, and, on the side which touched the skeleton, blackened as if by the action of fire. There is no trace of either metals or clothes in the tombs, and the skeletons fell to dust on the slightest touch. The archaeologists who have examined the tombs are of opinion that they date from a time anterior to the conquest of Germany by the Romans.

\* [The modern north façade of the church of St. Alphage, London-wall, has two modern Doric columns of an oval plan, built, we believe, by Sir William Staines, Lord Mayor of London, who lived in Barbican, and had a place of business in London-wall.—Ed.]

\* [This may be answered by the simple fact, that in early times of unartificial mechanism, all masonry was thick and low in proportion; as science advanced, the same outlay produced greater loftiness: this is the reason why the Romans so often used the Corinthian instead of the Doric order. Perhaps if the architects of the Parthenon lived now, they would discard all the present orders, retaining only that portion which is unrivalled in its sculpture.—Ed.]

INTERIOR VIEW OF THE DUTCH CHURCH, AUSTIN FRIARS.

This church measures within its walls about 149 feet long and 78 feet 6 inches wide; it is divided into nave (or choir) and aisles by eight detached columns on each side, each consisting of a cluster of four attached circular shafts surrounding an octagonal core-shaft, curved inwardly between the surrounding shafts in the form of the Roman cavetto moulding; above these rise nine arches on each side, but the centre is not carried up as a clerestory, but covered with a coarse roof, ceiled in five planes, with roughish tie-beams, exposed, and without tracery, having only plain bent knees reaching down to plain stone corbels. The aisles are roofed by slopes which are not far from horizontal, and are covered with lead. Like those of the Temple Church, London, the columns have settled considerably out of perpendicular, but not through the expansion of vaulting, for there is no vaulting here, but from some other cause; and the columns have not all been forced outwardly by a central upward expansion, for some of them lean on one side, southwardly, towards the centre, while those on the other side, following them, lean outwardly.

The capitals of these columns are smeared with black, which we were told was done as an act of mourning at the death of some principal personage connected with the church.

The windows of the church are designed in very fine taste, with rich flowering and inventive tracery, though their mouldings are over plain; we propose hereafter to give their details, and those who desire to imitate, can do that which ought always in such case to be done, viz., to improve them where they are inferior; therefore, while their general forms are retained, mouldings of a superior character may be substituted. The great western window, which has seven days or lights, divided by six mullions, is much superior to the lateral windows, which have each the condemnable number of four days, instead of the more elegant and symbolical arrangement of three such divisions.

In some of the windows, the glazing of which is in general plain, are some pieces of

rather modern stained yellow glass; in some places in them appear, on quarries of a lozenge form, the letters { h g; in others, in Roman letters, the words IESVS TEPLE accompanied by the date 1550; again, in others, on a bend-dexter of transparent white glass, the following inscription:—

THE TEPLE OF OUR LORD IESVS.

The letters, dots, and border-lines being yellow. The buttresses between the windows project very far from the walls, in spite of which, and of the absence of any very great pressure, the walls have changed from their original position. At the west end of the church, occupying a portion of the first bay, is an imperfectly separated porch, at the sides of which lie two vestries; that to the north used by the elders of the church, and that to the south by its deacons; these contain some curious portraits, books, drawings, and prints of the church and its members, with some other curious property; and at the north and south angles of the west end of the church are two turret-staircases, which lead to the side roofs of the fabric. The porch is surmounted by a gallery, containing an organ and a library, and supported by curious grotesque Ionic columns with garlands of fruit and flowers. The gallery is inclosed in front by curious balusters, each of which has pendent from it a garland.

The altar, which occupies one bay of the centre compartment of the church, is raised 2 feet 8 inches above the general level of the church-flooring, and is ascended by a flight of stairs at each end, and by two other flights near the ends of the front; the altar is inclosed in front, and at parts of its ends, by an open balustrade of oak; the remainder of the ends are inclosed by very high wainscot paneling surmounted by rich carved open scroll-work, which may be seen in our view. At the back of the altar ranges a very curious description of carved wainscotting of a Dutch fashion, consisting of arched work and paneling; the same kind of wainscotting is continued all along the eastern and western

walling of the aisles, and along portions of the lateral walls of the church. The altar-piece itself, which reaches nearly to the roof, is of painted canvas, bearing an anomalous Ionic subject of not very good classical architecture, and, like the altars of the Church of England, the decalogue, apostles' creed, and dominical prayer. The communion-table is a prodigious piece of oaken wooden-work, no less than 29 feet long, and having benches all round it, provides accommodation for a great assembly to receive the Eucharist sitting. Of the whole interior of this vast church, only two bays, out of nine of the central avenue of the church, are fitted up with pews for the ordinary use of the congregation.

Some small parts of two other bays contain open benches. The whole of the aisles, which are about 22 feet wide, and all the remainder of the church, are left open. The pulpit, which is erected on the north side of the central avenue against the third column from the east, is a very curious piece of wainscot-work in the Dutch style, covered by a great sounding-board, with carved work and pendants. In the church is lying an extremely fine oaken carved pulpit, adorned with scroll-work and garlands, taken from the late neighbouring French church in Threadneedle-street, and for the purchase of which we were told the sum 100*l.* is required.

In the third bay from from the east of the southern wall of the church is a comparatively modern porch, of the Elizabethan or immediately subsequent era. Surrounding the fabric are many achievement and fine mural monuments, and in the pavement are numerous carved flat grey marble, and other memorials of the dead; these are principally of merchants, who have been engaged in the Dutch trade.

The body of the church contains no heating flues or apparatus, but large braziers are used for that purpose, one of which is to be seen upon the floor in our view; the live charcoal is taken from thence and placed in earthen pipkins, which, being inclosed in wainscot-carved, open-work, square boxes, are, in winter, placed under the ladies' feet.

Opposite the pulpit is the seat of the Dutch ambassador, which is a kind of tribune fitted up in wainscot, with a canopy of modern Romano-Batavian architecture.

Less than a fifth part of this church is fitted up for the use of the congregation; and from the decline of the Dutch trade, scarcely half this accommodation is made use of. It is to be lamented that so fine a church, which, if restored, and its windows filled by stained-glass, would be so useful and magnificent a structure, calculated by enlivening service, by psalmody, and other reverential chants, to warm to devotion two or three thousand people, should be so cheerless and so little used; but we are pleased at finding the establishment well endowed with charities.

## SECOND LECTURE ON ARCHITECTURE

BY J. L. THOMAS.

Delivered at the Literary, Scientific, and Mechanics' Institute, Brecon.

MR. THOMAS commenced his second lecture on Architecture by a short recapitulation of the different epochs upon which he had treated in his first lecture, and then took up the subject at that period of literary darkness which, after the downfall of the Roman Empire, overspread all the nations of Europe, and when the arts, from their intimate connection with letters, were involved in the general obscurity. He thought that this grand revolution in the history of the world, though in appearance most disastrous, was ultimately productive of large and most extensive benefits; as it seemed to attract to one centre many nations who at a subsequent period radiated from this common axis to all parts of the globe, carrying with them not only a knowledge of the arts and sciences (which they must have acquired in that great school of learning), but also the spirit of Christianity, diffusing its holy and civilizing truths wherever they went; thereby exciting the devotional feeling to the invention of modes of architecture, of which there existed no ancient model. Before proceeding with a history of those styles, with their temporary modifications in England, the lecturer touched upon the previous state of the science in Britain before the Roman invasion, and exhibited a large drawing of the celebrated remains of a Druids' temple, supposed to be raised to the worship of the Sun, on Salisbury Plain, and proceeded to enumerate many other parts of the world in which such remains are found; proving that vast tracts were inhabited by some great original nation, possessing, with probably the same language, the same religion, manners, and customs; but of all those mighty nations whose events furnish important chapters in the history of the world, it has been permitted alone to the few inhabitants of the mountains and valleys of Cambria to preserve that original language unto the present day. Mr. Thomas then again adverted to the Roman invasion and the celebrity of the British architects and artificers in the third century; but after the departure of the Romans, the long train of miserable disasters in which they were involved left little room in their minds for the cultivation of those arts of peace in which they naturally delighted; and the Saxons, when they afterwards came amongst them, were more famous for their knowledge of the sword, and the temporary power and security it affords, than for acquisitions which in all ages of the world tended to dignify and establish a nation. After touching upon many of the interesting particulars connected with the early history of our country, bearing upon his subject, the lecturer arrived at the Norman Conquest—the numerous edifices erected, first for the purpose of subjugation, then for devotion; the increasing elegance of the structures as peace and security advanced, until the golden age of the style arrived, and continued from the middle of the thirteenth to the latter end of the fourteenth century, and afterwards rapidly declined, by that intoxicating desire to produce something new and still more beautiful, when it had already arrived at excellence. He then illustrated the beauties of the style, esteeming it the most appropriate for sacred edifices, as, if it were not designed solely with

that object, it ripened into full beauty under the auspices of the church, and appeals in the most direct manner to the imagination of the observer, exciting in him those feelings of awe and emotion so peculiarly adapted to the purposes of the cathedral. On entering any of our celebrated religious edifices, although shorn of their original splendour, we are forcibly struck by their solemnity and gloomy grandeur, and the apparently interminable aisles and successive tiers of lofty arches tend to hallow and solemnize the feelings when they are viewed in the rich light admitted through emblazoned windows, which concealing the extent of the pile, and affording greater play to the imagination, display to advantage the clusters of slender columns as they shoot loftily up and are lost in the richness of the fretted roof, or the splendour of the elaborate groin, while the delicate carvings of foliage and fruit, tendrils and flowers, entwining each other in the capitals and mouldings, give a gorgeous dress and finish to the whole that can rarely fail of pleasing the most fastidious.

Mr. Thomas then alluded to the domestic edifices of this country, and commenced with castles, describing the manner in which they were generally planned and constructed; and noticed Caerphilly Castle, in Glamorganshire, as one of the finest examples of the kind in Great Britain, possessing an extraordinary variety of architectural characters, connecting the wildly contrasted styles of rude feudalism with those of a later period, probably during the stirring times of the De Spencer, in the reign of the unfortunate Edward, the second from the Conquest. The strange forms in which fate has visited it are also very remarkable; the south-east tower, 77 feet in height, overhangs its base nearly 11 feet, and rests only on one part of its south side. Everywhere are deep marks of the desolation caused by battery and bombardment, and the unavoidable decay of age. But the ruins have a wonderfully grand effect, when closely visited or gazed on from the surrounding heights. It is then the astonished eye takes in at once every part of the gigantic pile. Then the savage dignity of its exterior bulwarks, its vast quadrangle, its broad battlements, its rugged buttresses, and profound fosses, are viewed with a feeling of awful admiration. We are almost induced to believe we live again the ages that are gone; that we are centuries older; and not only think, but feel with the past; we plunge deep into the secrets which seem buried in the mouldering mass beneath; the loneliness seems suddenly broken; the mailed soldier paces the terrace; the courts and halls are peopled with beings of bygone days; generation on generation passes rapidly along; and the mysteries of tradition colour the past periods of splendour, chivalry, and barbarism. The lecturer then adverted to the many great changes which took place in the constitution of our country, and the ultimate amalgamation of the two great conflicting interests of the Saxon and the Norman, when the fortress had become, in a measure, unnecessary for the protection of the invaders, and were, in many instances, dismantled and thrown down by their proprietors, or left to moulder in the rottenness of time; while they adopted for their residences the pleasing picturesque gabled manorial house, and the embattled mansion of the Tudors, of which there are specimens now extant. After describing the characteristics of this style, he passed on to consider the Elizabethan; when the noble Tudor houses, with their large pointed gateways, traceried windows, buttresses, battlements, and octagonal angle-turrets, richly carved pinnacles, and wreathed chimney-shafts, were mingled together with the architecture of Italy. The art was in this unsettled state when Inigo Jones brought himself into conspicuous notice by his ability as an architect; and the very ingenious manner in which he modified the buildings of his day is clearly shewn in many exquisite productions still remaining, which prove that he was possessed of no ordinary mind, and give him an exalted rank amongst the most illustrious of our countrymen.

The lecturer then passed on to another great era, the use of the Roman style, mingled by high science, by Sir Christopher Wren. He mentioned but one of his works, and thought that one sufficient in itself to stamp an immortality upon a nation—St. Paul's Cathedral; and after minutely describing the wonderful

edifice, said, "I shall conclude in the peculiarly beautiful language of a living author, 'It is the gem of Protestant churches,—an honour to the nation and its pure religion; of all the cathedrals in the world, by an especial divine favour, permitted to be the only one, which, like the *vesture of Christ*, was ever wrought in one texture throughout.'"

He then noticed the works of another celebrated man, Sir John Vanbrugh; and afterwards adduced a host of other famous names, amongst which were James Gibbs, James Stuart, and Sir William Chambers.

Mr. Thomas, after having concluded his historical account, commenced an analysis of the four ordinary periods or chronological divisions of the Gothic or Pointed mode, minutely describing the various characteristics of each style, and the times in which they flourished, and illustrating them by large detail drawings from some of our celebrated cathedrals, amongst which were many familiar subjects of local interest, being the principal features of a building, the doors, windows, niches, towers, and spires. They exhibited as plainly as the classic orders the easy gradation from massive rudeness in the Norman, to faultless proportion in the Decorated. He then contrasted the Grecian and Pointed modes in every minute particular, and by so doing proved the impropriety of attempting to mix them together. He eulogized the old English style as admirably adapted for country residences, where associations of an imaginative character come into play, and dictate a style more consonant with the surrounding aspect. Few that have seen these picturesque old mansions have not found their minds softened into tranquillity, and viewed in the rich setting sunlight of one of those warm and serene autumnal evenings, with its numerous ornaments of carved wood-work, its wreathed chimney-shafts, its large pointed windows, its solid castellated gatehouse, its panelled walls and buttresses, its time-worn pinnacles, and the variegated tints left by the breath of departed ages upon its walls, giving it the semblance of having grown old with the venerable trees by which it is overshadowed, blending it as mellows with the scenery as if it constituted a portion of the natural landscape; such a picture forcibly recalls to the mind past scenes and days long gone by, intimately associated with some stirring passages of our national history. He then proved this description of habitation to be appropriate to every rank, from the palace to the cottage, and gave an interesting description of the noblest residence of our beloved sovereign, Windsor Castle.

Mr. Thomas concluded his lectures with a tribute to the high objects and advantages, in a moral sense, of a just cultivation of the art-in connection with her two younger sisters, Painting and Sculpture. He thought it had risen above mere utility, to be an imperishable monument of our intellectual greatness; that they tend to carry the mind beyond the walks of ordinary life, to give it a respite from depressing cares and anxieties, and to awaken the consciousness of its affinity to purer and nobler elements. To those who think of nothing but mercenary aggrandisement, these flights of the mind, which have been the sole cause of the grandest works of human power, may appear extravagant; but all who properly appreciate sense, genius, and talent, know that it proceeds from no source other than the glorious working of the immortal intellect, which is gradually both powerfully developing itself, and exhibiting in those wondrous masonic creations the inestimable power and beauty of the mind.

The enthusiasm of the poet is not more exhilarating than the rich fancy of the architect, who sketches beyond what is present and visible, and soars after unseen and ideal imaginings. He beholds his name, in ages yet to come, associated with the mighty monuments of his workmanship, and fancies that posterity will feel the same enthusiasm in gazing upon his works with which he regards those eloquent memorials of former greatness. He then descended upon the interesting pleasures of antiquarian pursuits in architecture, and pointing to a drawing of Stonehenge, alluded to the great and comprehensive truths which may be learned respecting the early inhabitants of the world, by comparing those remains with the numerous monuments of a

\* Essay on the "Decline of Science, &c. in Architecture."

similar nature in almost every quarter of the world; and then referring to the valuable remains of the Acropolis, in the British Museum, which so expressively speak of the palmy days of Pericles, the imagination at once takes flight and visits every celebrated nook and corner of which a Homer and a Virgil sang. Egypt, with its colossal witnesses of man's pride, and Palestine, with all the interesting scenes of the incarnation of the Deity, and all the memories and associations which such scenes naturally incite, were next brought under notice, and every spot of our own country, from its mountain fastnesses to its verdant valleys, was hallowed by mystic tradition or circumstances of historical celebrity, from the Teutonic altars of Odin and Thor to the purer house of prayer, with its heaven-directed spire.

Mr. Thomas concluded in nearly these words:—"Let us hope that now, when the spirit of inquiry stalks majestically through the whole land, that the noble and delightful science of architecture will be better appreciated and more properly analysed. When it will be viewed as one great medium, connecting the weary walks of ordinary life with purer element, as the only occupation by which man finds employment for the greatest physical energies, in connection with those higher excursions of the imagination for which he feels himself born, and which enables him to contemplate all his loftier ideas, to view the great end for which man was created, and to feel and test the vast power of that ethereal essence, which must endure beyond this bound of Nature and of Time. This supremacy of architecture, connected as it is with the two sister arts, Painting and Sculpture, and their capability of contracting the evil and Epicurean effects of almost every pursuit in these days of cold, calculating utility, is more and more required as the world progresses. It is required to withstand the invasion of cold and artificial customs; it is required to spread our sympathies over all classes of mankind, to knit us by new ties with our fellow-creatures of every other nation, being the only art which admits of universal combination without betraying the depravity of our species; it is required to redeem man from those selfish, mercenary ideas which human nature is naturally prone to; it is required to bring out, increase, and soften the beauties of nature, for which purpose these expansive powers may have been implanted in our hearts; and above all, it is required as a powerful incentive to raise us above this world, and its poor enjoyments, to the contemplation of the great Architect of the Universe, and the acquirement of true happiness in a purer and holier atmosphere."

Mr. Thomas was repeatedly interrupted by the marks of approbation of his audience, having succeeded in investing his subject with suitable interest.

**SUGGESTIONS ON THE CHEMICAL CHARACTERS OF CONTAGION, AND THE NATURE OF THE EXHALATIONS GIVEN OFF FROM THE WANT OF VENTILATION, DRAINAGE, AND SEWERAGE, AND IN THE CONFINED DISTRICTS AND ABODES OF THE POOR, &c.**

BY MR. A. BOOTH, PROFESSOR OF CHEMISTRY, CHEMICAL ENGINEER, AND CONSULTING CHEMIST.

THAN drainage, sewerage, and ventilation, and the accumulated evils which arise from their neglect, there is no subject of greater importance in the whole range of *hygiene*. It is a matter of remark that in this country, and, in fact, many others, diseases have become greatly modified in their character; in many, from improved systems of diet, but in other instances, from more attention being paid to insure the purity of the atmosphere. The Pontine Marshes, near Rome, are allowed to remain untouched, productive of the most fatal malaria, and epidemical diseases of the most inveterate form, whilst in our own country, nearly every marsh has been drained, and ague is almost extinct. Sierra Leone owes its title of the Grave of Europeans to the marshy lands on which the luxurious vegetation of the tropical regions, with the numerous forms of animal life, putrefy and decay; and were we once to get rid of the cause, the effects would cease, and, in all probability, the country would be as healthy as our own. Chemical fumigating or disinfectant agents were tried, but

without effect, to neutralize the poisonous miasms on the late lamentable Niger expedition, by the use of chlorine gas. Next in importance to drainage, comes sewerage, to take off the decaying matters from our houses, and remove them from the spot where their decomposition would produce the most noxious result. Ventilation is of no less consequence in the removal of air already vitiated by respiration, or impregnated with the products of combustion, or the exhalations from decaying, decayed, or diseased bodies.

It is scarcely possible to say to what an extent a neglect of these important matters is the cause of disease in close and confined districts, where not a breeze of air comes in to disturb the still of the polluted atmosphere. The annals of medicine and the bills of mortality pourtray it too strongly to need any particular proofs; and when any old disease is revived, or new one introduced, it is sure to meet here with its first, and always its most numerous, victims. Notwithstanding some of the remarkable and anomalous careers of the distribution of these diseases, and the peculiar range that they take, it is always certain that these suffer most from epidemics. Many courts, alleys, and narrow streets in the metropolis (and doubtless in other towns), are, it is well known, never free from typhus fever, and the squalid appearance of the wretched inhabitants shews the very unhealthy character of the localities. Here we still find no sewerage; drains and gutters running down the middle of the streets; accumulated heaps of filth, and puddles saturated with all manners of decaying garbage, from which emanate gaseous compounds of the most noxious and subtle forms. Thus the pure atmosphere inhaled by the country peasant, which gives him the bloom of health, becomes saturated with poisonous matters of the most noxious kinds; nor are the effects confined to the districts in which the poor generally reside; for the incipient seeds of disease and death, wafted by the winds to considerable distances, reach the abodes of the heedless rich, who, insensate to their wants and sufferings, reside in more airy abodes and better ventilated districts. And when we look at the abodes of the poor, how much is there not to excite our sympathy and demand our exertion! Their houses have bad ventilation—their narrow courts want drainage—they have not water sufficient scarcely for domestic use, and still less for purposes of cleanliness. When the gardener wants to bleach a plant, he secludes it from the light; and here, almost immured in darkness, a most baneful influence is exerted on their health. One solitary room, with no convenience, is the only place in which all their processes of cooking and domestic economy are performed;—it is at once their sleeping-room, their kitchen, their workshop, and their constant abode. They cannot ventilate the room by opening the window, fearful of the descending smuts from an adjoining chimney. The luxury of white-washing their walls, by which adherent matters and incipient disease might be destroyed, and their deficiency of the light of heaven in some measure compensated for in its reflection, is denied them. The keeping of pigs, donkeys, and domestic animals, adds but to the accumulated evils; and, apart from the moral associations engendered, what a fearful share have not the condition and abodes of the poor in the contamination of the atmosphere, and the consequent propagation of disease!

These observations may lead us more successfully to the consideration of miasms,—those unseen and subtle causes of disease, the existence of which we reason by analogy, and of which much has been said, although little is known. We know that decomposing animal and vegetable matters produce carburetted, sulphuretted, and phosphuretted hydrogen gases, with ammonia and its compounds;—we may collect and submit these gases to experimental observation, though it is probable that others still exist, although in a state too recondite for investigation by our present resources. The last few years have added to our list of gaseous products *cyanogen*, a compound of *nitrogen* and *carbon*, which is the basis of Prussic acid, the most suddenly fatal and destructive of all poisons, which gas is also highly poisonous even in a very dilute form. The effect of unseen exhalations, but of the existence of which we are assured by

reference to other senses, is very different on the human constitution. Amongst these we recognize odours; which, as every organic compound is defined in its nature and composition, we may also consider to be chemical compounds, guided by the same laws as characterize substances which we can see, feel, taste, or handle. So convinced were the ancients of this, that they applied them as medicinal agents; and now some attribute to the odour of a cow-house, or the exhalation of newly-ploughed earth, a curative influence in consumptive cases. From inhaled the odour of beef the butcher's wife obtains her obesity; and that most disgusting of all trades, cat-gut manufacture, is amongst the most healthy of employments. So there are exhalations which have a noxious effect, and which we equally assume to be chemical compounds, not only affecting the body itself by its immediate influence, but acting upon a large body of an impure atmosphere, which it either changes by virtue of a certain chemical action, or this merely acts as a diluent for the more extensive propagation and diffusion of the poison. The situations in our towns where *epidemics* and *contagious* diseases mostly prevail are notoriously those which are most filthy and dirty; and the individuals chiefly attacked, those who, being most careless in their habits, may be supposed to carry around them an atmosphere most easily susceptible of impregnation. This view of the constitution of miasm is supported by reference to those substances, or chemical re-agents, which have attained reputation as disinfectants. Amongst these are chlorine and nitric acid, two most powerful chemical agents. Vinegar and camphor have long held repute as prophylactics; and, however ridiculous it may appear, we should not discard at once and without inquiry what has been the belief of ages, handed down to us probably as those were, the long experience of past times. Now vinegar is a powerful chemical solvent, and camphor assists in the solution of many substances which are with difficulty soluble. Charcoal in a minute state of division has a strong absorbing power for colouring matter and gaseous substances, so that if some be introduced into a jar of gas it will disappear. We have it in this minute state of division in the smoke of the burning brown paper, the popular purifier of the sick room. Heat is used in the fumigation of the clothes of persons infected with the plague, and if it destroy the *fomites*, it is by the separation of those elements which form the poisonous compound of contagion. If these substances are effectual, it is from their chemical action, and that energy can only be exerted upon chemical substances. The great improvements which have taken place in the public health have been chiefly owing to the means which have been adopted to preserve the atmosphere from contamination with these compounds of known and presumed existence. Three or four centuries back, houses were built in as close and narrow a space as possible, and land was economized as much as possible in their erection—no means were afforded for cleanliness or ventilation—drainage was not thought of, and hence the plague, sweating-sickness, and other fatal disorders and epidemics incidental to those periods were treated but as matters of course. Modern chemistry, however, teaches us the composition of air, and how to respect its purity; that pure air is essential to all the functions of life, and that whatever affects its purity must possess an injurious effect upon the constitution. We learn from it that stagnating ditches, stinking cess-pools, open drains and crowded bed-rooms, cannot long remain without producing disease—that they elaborate noxious gases, the formation of which must be prevented before we can secure immunity to health. We find that houses cannot be near each other, nor rooms over-tenanted, without a palpably injurious effect—that mistakes still exist which require rectification; but we cannot hope to obtain a remedy until the public are become more alive to the evils from which they suffer. Committees of the House of Commons have unequivocally condemned "interment in towns," and the "nuisance from smoke in the chimneys of furnaces," and yet no legislative enactments have been directed to remedy or remove these noxious evils, prejudicial to a great extent in the local contamination of the

atmosphere. Whilst on this subject, we may refer to the desirableness of promoting by every means the provision of pure air, particularly for the poorer classes, a subject recently taken up with effect in the promotion of public walks and parks. The squares and parks of London have been emphatically called its lungs, and in order that the overgrown metropolis may breathe more freely, it is necessary that the surface of these lungs should be increased to keep pace with its growing dimensions. By so doing, not only do we supply pure air to the inhabitants, but we invite their attention to exercise, to moral improvement, and to the bettering of their social condition.

The free currents of air which are necessarily in constant circulation from its proximity to the majestic Thames, and the storms which destroy the equilibrium of the atmosphere by putting in motion its elements, have been considered (and not improperly) as a great cause of the salubrity of the metropolis. Amongst other conservative agents in its purification, there is no doubt but that of watering the streets is one, from the quantities of water distributed throughout the atmosphere in its evaporation. This as it ascends will carry up with it into the atmosphere, and above the reach of mischief, the various decomposing and decomposed organic matters floating about, and which otherwise allowed to remain, would be productive of contagious miasms. We recognize the additional purity or freshness of the atmosphere by following a watering-cart as we do after a shower of rain, and the same effect is recognized in a newly-cleaned or scoured room. Here, independent of the influence of the bush in removing substances, the decomposition of which would fill the atmosphere with impurities, the evaporation of the water would produce the same effects as in watering the streets, in cleansing the air of the room. This shews the necessity of an adequate supply of water being provided for purposes of cleanliness, a deficiency too palpable in the crowded courts and habitations of the poorer classes. In watering the streets, we may observe the obnoxious practice which has been pursued in some districts in the use of the water accumulated in the sewers, which must be highly objectionable in the diffusion of noxious malaria.

The general use of wood paving may justify an inquiry into the circumstances as to how far its adoption may not be injurious to public health. No doubt can be entertained of the prejudicial effects resulting from the accumulation of decayed and decaying organic matters in the streets, giving rise as they do to various gaseous and volatile compounds, and the removal of which is most desirable; nor of the injury to property, from the dust given off by the abrasure of granite or stones. When the blocks are taken up for repair, they will be seen to be impregnated for some inches below with black matters absorbed from the surface, consisting of decomposing organic matters. The wood is likewise susceptible of absorbing water, which it may retain in its pores, or in the interstices, and when dry weather supervenes, this will necessarily evaporate, carrying with it in solution into the atmosphere the volatile matters given off from these organic compounds. In this view I am supported by Dr. Copland, who, at a recent meeting of the Westminster Medical Society, gave it as his opinion that the general use of wood pavement would have a tendency to maintain and propagate that low form of typhoid fever which has recently been so prevalent in the metropolis, and almost defied the treatment of medical men.

St. Thomas's-square, Hackney,  
July 1st, 1844.

#### WINDOW DUTIES.

To the Right Hon. the Earl of Lincoln.

MY LORD,—With every disposition to give your lordship credit for sincerity, in your endeavours to reform the Building-Act, or rather to put the laws relating to buildings in unison with the spirit of the age, I must beg to call your lordship's attention to a subject affecting the sanitary condition of the inhabitants of large towns, an object deemed of the greatest importance by all right-thinking persons, and not only felt by yourself in common with many of your colleagues, but openly avowed by your lordship; and here I would awaken your lordship's attention to the fact, that the propo-

sition I am about to submit is not calculated to cause any material diminution of revenue, if any, and would confer a boon on thousands—indeed a boon so great, that it would more than outbalance a hundred-fold any trifling diminution of revenue. The proposition I have to submit is, a slight amendment of the Window Duties-Act, by extending the exemption to ten windows, instead of seven; and this, although asked on the part of the poor and the humblest of the middle classes, might be equitably extended to houses of every class, on the first ten windows. I would remind your lordship that persons in affluent circumstances do not pay as rent more than one-tenth of their income, whereas the description of persons above alluded to pay more than a fifth of their income for rent, and, in innumerable cases, very much more. Most persons know that the smallest six-roomed houses require, for their comfortable occupation, at least nine windows, namely, one to each room, one over the door, and two to the staircase; this, I say, my lord, is the least number of windows that should exist to a house of such a description, and yet it is a notorious and a melancholy fact, that not more than one house, in one hundred of this nature, has more than seven windows, that being the number allowed by the exemption clause. Your lordship and the Chancellor of the Exchequer, I saw by a report in the newspapers, required (from a deputation on the window duties, who waited upon you) information as to the sanitary condition of the poor in other countries.

Now, my lord, I will state one fact, fearlessly defying contradiction, that in France, where a window-tax exists, there is not in that country one single window less than would have been if no duty existed, and this is owing to the moderate scale of the duties. And on one of the occasions when I was in the Chamber of Deputies in Paris, a member having incidentally stated he had understood that an enormous quantity of windows were bricked up in England, owing to the excessive duties, the assertion was received by the members with incredulity; nor was it believed till the minister, who had been appealed to, confirmed the fact—“*They manage these things better in France.*” Perhaps it may be owing to the second article of the French Charter of July, 1830, which declares, “*That all persons shall contribute to the necessities of the state, in proportion to their means.*” To put the window duties on a rational and equitable footing would be worthy of any ministry, and is necessary before the pretended anxiety for the public health will be considered other than as *cant and humbug*. Allowing the exemption on ten windows for every house, great and small, I would impose a duty of five shillings on every window above that number. Why, my lord, should the eighth window of a house, broken out to make it *barely habitable*, be subject to a duty of sixteen shillings and sixpence, and all windows above 180 be liable to one shilling and sixpence only? Perhaps your lordship may some day receive the answer from the ten-pound voters, refusing to intrust any ministry with a tax alike destructive to our domestic architecture, private morals, and the public health.

I have the honour to be, my lord, your obedient servant,  
A LOOKER-ON.  
London, June 19.

P. S.—No zinc plate expedient will answer, as a greater flood of light is required, as well as ventilation, to prevent the accumulation of filth and dirt, the natural resting-places for which are dark corners.

#### ST. MARGARET'S CHURCH, WESTMINSTER.

To the Inhabitants of St. Margaret's, Westminster.

GENTLEMEN,—Permit me to call your attention to the fact, that efforts are still being made to effect the destruction of your venerable parish church, and to remove it from the site it has occupied for 790 years. I much fear a committee of the House of Commons was prevailed upon yesterday, the 4th July, to recommend this scheme of church desecration.

I have, in my works on church building and on Westminster improvement, and by other means, endeavoured to expose the shallow pretences of the destructionists; and, as I have brought over some of the most influential persons to my views, I flattered myself that my efforts had been successful, when, to my asto-

nishment, a letter appeared a short time since in *The Builder*, announcing “the pleasing intelligence”—the pleasing intelligence!—that St. Margaret's Church was immediately to be pulled down and rebuilt on another site, both which, and funds for the purpose, had been obtained.”

Let me epitomise the reasons against this measure which I have given elsewhere at length: “That persons greatly err who would regulate Gothic architecture on Greek principles;” “that Gothic architecture does not exhibit itself naked and bare;” “that it delights in bold, striking, and picturesque irregularities”—“veiling itself with walls and screens and towers;” “that therefore appears best as an accumulation of buildings;” “therefore, the abbey church and St. Margaret's gain by juxtaposition;” “while the grandeur of the ancient edifice is increased by comparison with the more modern structure which stands beside it;” “that when the new palace of legislature is completed, St. Margaret's will be absolutely necessary to effect a harmonious union between that and the abbey;” “that St. Edward did not think the position of St. Margaret's would injure the effect of his darling abbey church;” “that its removal would involve the destruction of another of history's landmarks, a document of stone which cannot lie, attesting the antiquity of your parish;” “that instead of your venerable temple, founded by St. Edward, rebuilt by Edward I., and again by Edward IV., you would probably get a mere brick and plaster apology, on a par with those vulgar modern churches which are the laughing-stock of ecclesiologists.” But is mere taste, or rather the want of it, fit to be put in competition with the desecration of a spot on which your ancestors worshipped for nearly eight centuries? Or are ye on these matters below that nation of savages who, when urged to emigrate, replied, “But what shall we do with the bones of our forefathers?”

Inhabitants of Westminster, rouse yourselves to resist the architectural barbarians. Your ancestors rose *en masse*, and successfully resisted the Protector Somerset and his myrmidons, when they attempted the destruction of St. Margaret's. The present most excellent Dean and your gifted Rector are utterly opposed to the project of removal; put yourselves under their legitimate guidance. “Remove not St. Margaret's, restore it to its pristine beauty as left to ye by the illustrious Edward,” and you will never more hear the senseless cry of removing St. Margaret's to obtain a better view of the Abbey Church. Perhaps the best of all methods to unite St. Margaret's with the Minster would be the erection of a tomb-house, or cloister, for the reception of those mural monuments which disfigure the interior of the Abbey Church, the expense of which the accession of new monuments would probably defray. As an architectural antiquary, I have now done my duty, let the guardians of the fabric do theirs.

Park-street, July 5. WILLIAM BARDWELL.

#### SOCIETY OF ANTIQUARIES.

JUNE 20.—Richard Yates, Esq., of St. Andrew's-hill, Doctors' Commons, was elected a Fellow of the society.

Mr. Brown exhibited a small seated idol of pure gold, found on the margin of the lake of Guatavite, situated on the summit of a ridge of mountains about eight leagues from Santa Fé de Bogota, the capital of Columbia. This lake, previously to the conquest of New Granada by the Spaniards, was by the natives of that country considered sacred, and they were accustomed at certain periods to throw into it their treasures as offerings to their deities. The scenery around the lake is magnificently romantic, and well calculated to make a powerful impression on the human mind. By the remains still to be seen of extensive works, it is evident that various attempts had been made by the Spaniards to drain the lake, and it is on record that about eighty years ago so much gold was got out, that the quinto to the crown amounted to upwards of eighty thousand dollars. At that time also an emerald of immense value was found, and sent to Madrid. A company has of late been formed in Bogota for the express purpose of effectually draining the lake, and from the judicious measure

adopted and the progress already made, there is no doubt it will be accomplished. This golden idol, which formed part of the collection of his Royal Highness the Duke of Sussex, was found near the margin of the lake, and was presented to James Hamilton, Esq., by General Santander, Vice-President of Columbia.

Mr. C. Roach Smith exhibited—1. a drawing of a fresco painting in Godshill Church, Isle of Wight, by Mr. John A. Barton, representing Christ crucified on a tree or shrub, with mottoes on the side, one only legible, *Ora pro nobis Domine*.

2. Drawing of a fresco of a late date, found in pulling down Mr. Mason's house in Chichester.

3. A Runic almanack belonging to Mr. Crafter, of Gravesend, formed of several wooden leaves strung together.

4. A rubbing of the brass of Margery Arundell, in Anthony Church, Cornwall, communicated by Charles Spence, Esq., of Devonport. The inscription is as follows: "Hic jacet Margeria Arundell quondam d'na de Est Anthon' filia Warini Erchedeken militis que obiit xx<sup>o</sup> q<sup>o</sup> die Octobr<sup>i</sup> a<sup>o</sup> d'ni M<sup>o</sup>cccc<sup>o</sup>xx<sup>o</sup> cuius a<sup>o</sup>e p. p. pietetur dens."

John Adey Repton, Esq., F.S.A., communicated a drawing of an ancient vessel found in 1843 in digging the foundation of the Savings Bank at Chelmsford, and presented to the Chelmsford and Essex Museum by Mr. James Moss. It is supposed to have had two handles (one of which is lost), and each was also a spout. Its only ornament is a row of nail-head knobs.

Sir Henry Ellis, secretary, exhibited an oblong brass box containing a dial, a mariner's compass, and various tables, formerly called a Viatorium or German ring. The present specimen is marked B. S. 1587, and belongs to J. B. Heath, Esq., F.S.A., the Sardinian Consul-General.

A. J. Kempe, Esq., F.S.A., exhibited a copy by Albin Martin, Esq., made by permission of the Duke of Sutherland, of an ancient portrait now in his Grace's gallery at Sutherland-house, said to be that of Cardinal John Kempe, Archbishop of Canterbury, who died A.D. 1453. Mr. Kempe entered, on the authority of a MS. in the British Museum, at some length into the memoirs of the cardinal, who was born at his patrimonial seat of Ollantigh, in the parish of Wye in Kent, A.D. 1380. He noticed his acts of munificence and those of his nephew, Thomas Kempe, Bishop of London, to Merton College, Oxford, his diplomatic employments, as *custos privati sigilli* in the reign of Henry V., and as lord chancellor in that of Henry VI. The authenticity of the portrait of Cardinal Kempe rests on the authority of Walpole, who probably inserted in his catalogue of the collection at Strawberry Hill such account as he had received with the picture. Mr. Kempe pointed out that certain panels which have been associated with this portrait and that assigned to Cardinal Beaufort were not by the same hand. One of these panels, representing a man in the act of adoration in a stable, bears the arms of Tate impaling Boleyn; another is said, in Walpole's catalogue, to represent Humphrey, Duke of Gloucester. Mr. Kempe's paper was accompanied by a diagram, shewing that this last panel was part of a group depicting "The Wise Men's Offering," that the centre part of the composition, the Virgin and Child, was wanting; that the man kneeling in a stable was certainly Joseph, and completed the picture. The two panels said to represent Beaufort and Kempe, whatever the authenticity of their designation, were certainly distinct and by another hand. Mr. Martin's copy of the portrait attributed to Cardinal Kempe is a very spirited and faithful delineation of the original, which, as a work of art of the 15th century, has considerable merit.

The society then adjourned to the 14th of November.

**THE IRON TRADE.**—As an instance of the increasing briskness of the iron trade, we may mention that the shipping agent at Newport of a large establishment on the Hills, in one day last week, received by post advices of charter-parties for cargoes to be shipped amounting to 3,000 tons of railway iron. The rails are chiefly for Charleston, South Carolina.—*Monmouth Merlin.*

ARCHITECTURAL GEOMETRY, No. VI.—STAIRCASE SCROLLS AND CURTAILS.

TO THE EDITOR OF THE BUILDER.

SIR,—In looking over the notes to correspondents in No. 43 of THE BUILDER, I find "A POOR CARPENTER" asks for the methods of describing scrolls and curtails for staircases: I therefore venture to send you the accompanying draughts. But permit me to say that correspondents, making such inquiries, should state the dimensions of the openings, upon which the proper sizes of scrolls and curtails do indeed materially depend; those, which I submit are  $\frac{1}{2}$  inch to the foot, so that their lines may be easily enlarged for actual practice.

Fig. I. is for an eleven-inch example of a scroll, to be drawn from eight centres, which are shown by fig III., and are to be found in the following manner, viz:—strike a circle  $\frac{1}{2}$  in. diameter; within which, from six equidistant points in the circumference, draw two intersecting triangles, and number their points 1, 2, 3, &c.; then draw lines round the polygon, continued indefinitely; and begining at 1 as a centre, strike, with a radius of  $\frac{64}{11}$  inches, a circular curve line from the continuation of the line 1-2, till it meets the continuation of the 2-3: then move the com-

passes to 2, and strike from thence the curve from the line 2-3 to the line 3-4; and so proceed till the scroll is complete, the radius growing less with each remove, and the involuting being thus caused. Then draw the line A A to the centre 3; set the pitch-board, fig. VII., parallel with A A lines; draw the ordinates or the dotted A B, A C: then square off the pitch-board at C C: take off the distance from A A to C C on the pitch-board: and so proceed till the face-mould, fig. II., is complete.

To obtain the falling-mould (fig. IV.), lay down on the pitch-board the lines 1, 2, 3; two inches from the bottom draw A A: at the point 3, measure from A to 5 on the scroll; set the same at A A of the falling-mould; A 2 the same; then divide the whole into equal parts in order to ease the curvature.

Fig. V. shews a curtail-step; the outer dotted line on the same figure shews the handrail; and the inner dotting indicates the pattern for the veneered block or riser.

Fig. VI. shews the mode of obtaining the centre for a nine-inch scroll, and fig. VIII. the same for an oval scroll: the numbers will direct the order of proceeding.

I am, Sir, your humble servant,  
J. BELL, Joiner, Derby.

## CHURCH-BUILDING INTELLIGENCE, &amp;c.

*Opening of a New Church at Shirebrook, in the Parish of Pleasley.*—The ceremony of the opening of a new church in the hamlet of Shirebrook took place on Wednesday, the 19th ult. The church is in the Norman style, and is erected on a plot of land, the gift of the rector, the Rev. J. Holden, at the eastern extremity of the village of Shirebrook. The walls are of freestone, within and without. The bell is suspended over the western extremity, at which part of the church is the doorway. The interior is fitted with neat open stalls of oak, capable of accommodating from 250 to 300 persons. On entering the church, a font, in keeping with the style of the building, first arrests the eye, for which the church is indebted to the liberality of Mr. Joseph Nicholson, of Shirebrook, by whom it has been presented. The roof is oak, supported by beams, &c. The pulpit and desk occupy the south-west corner of the church, communicating with the vestry by a doorway in the eastern wall of church. The altar is a raised recess approached by steps from the nave. On each side is an oaken chair with a crimson cushion, one of which was presented by Mrs. Lucas, of Warsop Park, and the other by E. W. Wilmot, Esq., of Worksop. At the back of the communion-table is a crimson curtain, occupying the place of the ancient records. The whole of the furniture of the altar was presented by the ladies of Shirebrook. The eastern window consists of two lights; in the centre of the northern is a cross flory gule, the intersection or, around which, in a lozenge, is the following legend, taken from the Litany:—"By thy cross and passion, by thy precious death and burial, by thy glorious resurrection and ascension." In the southern light is a cross, as in the other, with a lozenge, containing the inscription: "I am the living bread that came down from heaven. If any man eat of this bread he shall live for ever." In the upper part of the northern light is the sacred monogram "I H S." At the top of the other light is the emblem of the Trinity, two inter-locked triangles. The trifolium above contains the emblem of the Holy Spirit. In the centre of the western window is a Latin inscription, from the pen of Dr. B. S. Kennedy, head master of Shirebrook School. The architects of this little church are Messrs. Patteson and Hine, of Nottingham; Mr. Lindley, of Mansfield, the builder. The cost of the erection is about 600*l.*—*Doncaster Gazette.*

The late William Stevenson, Esq., of Stamford, has bequeathed 4,000*l.* for building a church at Deeping Fen; 2,000*l.* for keeping the same in repair; and 5,000*l.* for the purpose of providing an income for the minister.

## RAILWAY INTELLIGENCE.

*Leeds and Thirsk Railway.*—At a recent meeting of the provisional committee of this railway, the attention of Mr. Grainger, the engineer, was directed to an observation made by a Mr. Cabray, at a late meeting of the York and North Midland Railway Company, with reference to this railway, to the effect that a gradient of 1 in 95 would be attended with great danger—that it would have to be wrought by a fixed engine, and that it was the intention of the Leeds and Thirsk company to work some portion of it by ropes. That there may be no misunderstanding as to the expression used, we quote the report of the meeting. It is in these terms:—"Mr. Barstow asked Mr. Cabray, the resident engineer of the York and North Midland Company, whether a declination of 1 in 95 would not be attended with great danger? Mr. Cabray said no doubt of it. It would have to be wrought by a fixed engine; the company, he believed, proposed to work it by ropes." To the statement respecting the working any part of the line by ropes, he (Mr. Grainger) gave the most unqualified contradiction; it is not now, and never was, his intention to recommend any such thing. In regard to the danger apprehended on a gradient of 1 in 95, and the alleged necessity for working any part of this line by a fixed engine, he stated his opinion to be decidedly opposed to that of Mr. Cabray. In support of his opinion he referred to the Manchester and Liverpool Railway, the inclination of which, in approaching Rainhill

from Liverpool, is 1 in 96, and the descent in proceeding towards Manchester 1 in 89. He also referred to that part of the Grand Junction Railway, which adjoins Warrington, which is 1 in 85; to the Great Western Railway, upon which there is about four miles of 1 in 100; to the Eastern Counties Railway, where there is two or three miles of 1 in 100; to the Carlisle and Newcastle Railway, upon which there is about four miles, 1 in 106, with bad curves; to the North Union line, upon which gradients of 1 in 100 will be found in four or five different places. On the Bristol and Exeter line, too, the gradient of four or five miles was very little above 1 in 100. On the Gloucester and Birmingham line there is a gradient of 1 in 36, and on the Edinburgh and Glasgow there is a gradient of 1 in 42. Upon all these lines locomotive engines are now the only power employed in working the traffic both as to goods and passengers, and some of them have been so for the last ten or twelve years, and no complaint has been made as to their safety. As respects lines which have obtained the sanction of the legislature during the present session of Parliament, he said he might refer to the railway upon the west coast of England (which is to form the only connecting link between the Lancashire railways and those in the west of Scotland), upon which for several miles the gradient is 1 in 75, and Mr. Locke has no intention of working it either by ropes or fixed engines, or otherwise than by locomotive engines; and as to danger in so doing, it never had been mooted. Other lines in the south of England might be mentioned, but instances sufficient have been given to shew that the views of engineers have very recently undergone a new change respecting the mode of working, as well as the safety of steep gradients.—*Doncaster Gazette.*

*Eastern Counties Railway Extension.*—The works of this railway will shortly be commenced in good earnest. We understand, during the past week, Mr. Hardy Wells, the surveyor, on the part of Messrs. Crowder and Maynard, the solicitors to the company, has served a great many notices of taking the land for the works, and that Messrs. Woolley, from the Tithe Office, and Mr. Saunders, of Derby, are engaged to complete the purchases of the land that is necessary. We believe that the purchases in most cases will be amicably settled. Mr. Angerstein, one of the largest owners, is already settled with. The works of the Norwich and Brandon line, near the latter place, were commenced on Monday last.—*Ipswich Journal.*

*Ramsgate.*—A petition has been numerously signed by the inhabitants of this town, in support of the South-Eastern Railway Company's branch to Hastings. At present the journey from here to Hastings is very tedious, being nearly two days in the passage, having to go *via* Dover, Romney, Winchelsea, &c., or by London. The railway company's surveyors have commenced operations to enable them to take the level of the line; they have cut away about a yard wide of the standing crops between this place and Minster, and also between here and Margate.

*Railway Station at Ely.*—A large quantity of implements and materials have reached Ely within the last few days, and workmen are employed in building workshops, stables, &c. Preparations on an extensive scale are being made for the carrying on this undertaking: the double rail is to be carried on from Ely to Norwich, and the gage made so that the same carriages may go on to Yarmouth. The exact place for the station at Ely has not yet been determined upon, but it is said that it will be near the bridge, beside the Newmarket road.

*Railway from London to Maidstone.*—The London and Dover Company have directed Mr. R. Stephenson to survey the country between their Bricklayers' Arms Branch and Gravesend, and between Gravesend and Maidstone; also from the South-Eastern line to Rye Harbour; for which lines they intend to apply to Parliament next session.

*The South Devon Railway Bill* has now become law. The House of Lords, we understand, amended the Bill in several instances, as suggested by the Admiralty surveyor, Mr. Walker, with the assent of the other House. These alterations, it is estimated, will increase the cost of the line by 100,000*l.*

*Railway Legislation in France.*—The *Presse* of July 3 says:—"All the peers and deputies who have co-operated in the formation of railway companies have, we are assured, given in their resignations." The *Patrie* of yesterday evening doubts the truth of this statement, the Chamber of Peers not having yet sanctioned the amendment of M. Crémieux against deputies being connected with railroad companies.—*Galignani.*

*The Orleans Railway.*—The Orleans Railroad Company is establishing the electrical telegraph between the passengers' station at Paris, and the warehouse for goods and the workshops at Ivry.

*Bristol and Gloucester Railway.*—The connecting link between the Northern and Western Railways is at length completed.

It is proposed to open a railway from High-bridge to the city of Wells.

## Correspondence.

SIR,—The letter of "A Subscriber," in No. 73 of THE BUILDER, relating to the Derby Asylum, tells more tales than its author really intended; and although he has neither given his name or address, the puff-direct in the second paragraph is more than a proof from whose pen it emanates. The object of this letter is to tell you, Mr. Editor, what you already know has been the case in other instances, that this competition was really *no competition* at all, for it was well known to more than one party resident at Derby, who was to have the prize, even before the committee sat to decide; which is probably the reason why the said committee did not "even divide, but were unanimous for its adoption," as your "Subscriber," in the innocence of his heart, lets out. Your "Subscriber" further states that it is "certainly a very excellent plan." Indeed! and are all the "large and elaborate drawings" so far behind Mr. Duesbury's, as not to merit even a look from the committee? Mr. Duesbury I have known for some few years; I therefore know both him and his family connections, and can tell, as well as he does, which way the wind blows in the town of Derby.

Nearly all Mr. Duesbury's friends and relatives reside in or near Derby, and as they are intimately connected with all the families in the place, of respectability, they have ample opportunities of benefiting their *protégé* by getting a committee that will be very docile and unanimous in selecting the plan that was *wanted* to be chosen. I ask you, is there nothing in the fact, that the same party should have the only two public works at Derby that has been competed for in the short space of four or five years? The real fact is, that this competition has been got up precisely in the same way that many others have, the successful candidate being known *even before* the committee met to decide!

The last paragraph contains a complaint about the heavy expense which young architects unnecessarily put themselves to in getting fine pictures, instead of real, sober, legitimate drawings, in a plain architectural style; and I am sorry to say that the pictures (for I will not say drawings) which the Royal Academy seem to take most delight in fostering are precisely the kind of which your "Subscriber" complains; plain drawings, in nine cases out of ten, being rejected from the Academy, to make room for splashy pictures, with little or no architecture in them.

Competing now-a-days is a mere farce in most cases, and I am much surprised that young architects will give themselves the trouble, as well as incur a heavy expense, in the vain hope of success or employment; for a few years' experience would inform them that, in most cases, a *pet* is selected, and carried triumphantly through, against both the better skill and better drawings of his opponents.

As I am not an architect, I have no personal interest in the matter in question, but as I do all jobs, I have given you my sentiments on the Derby competition.

I am, Sir, yours, very truly,

A SECOND SUBSCRIBER,  
(but no Competitor).

## THE NEW BUILDING-ACT.

SIR,—Be pleased to accept my best thanks for the insertion of my letter relative to the above subject. I think your proposition, as to the examiners for the new district surveyors, most excellent, for the very good and sound reasons you have given: a certificate from such a court, so constituted, would be valued by the profession, the surveyor himself, and the public generally, more than fifty from such a society as that of the Institute of British Architects; and as to the Civil Engineers, I think they have quite enough to do, particularly just now, to properly attend to their own important affairs (made so certainly by their own glorious exertions), without interfering with such intricate matters as those embraced in a Building-Act. It is a deep move on the part of the I. B. A. to couple themselves with such a well-established society as that of the Engineers; and I hope those members of the profession, not belonging to the Institute, will see through it, and call to mind the old proverb that "drowning men catch at straws."

As small street houses will cover more space, and be more expensive to erect, the tenants will of necessity be obliged to let off as much as possible, to enable them to pay the additional rent; the consequent evil will follow of over-crowding them with inhabitants; therefore, it will be important, when erecting them, to embrace any means of cheap ventilation. I venture to throw out the above hint, with the hope that some regulations for this desirable purpose may be inserted in the new Bill.

I remain, Sir, your obedient servant, M.

P. S. In THE BUILDER, No. 35, is a plan described for this purpose.

## FELT ROOFING—SMELL OF TAR.

SIR,—I have tried the Felt-roofing recommended some time since in your periodical, and find it a most excellent and serviceable article for the purpose. But I find this evil in it—the material with which it is directed to be painted is gas-tar mixed with lime, the smell from which is sickly and offensive, and affects the air of the interior of the buildings covered with it. Can any of your correspondents furnish a recipe for removing the smell?

If the felt were painted instead of tarred, there would still, I imagine, be a smell arising from the asphaltic itself, rendering it an objectionable covering for dwellings.

I remain, Sir, your obedient servant,  
Folkstone, July 8. K. D.

## Miscellaneous.

THE COMMISSIONERS OF SEWERS AND THE THAMES EMBANKMENT.—Since the recent inundations of the river Thames on the inhabitants of the south shore, the commissioners have hitherto themselves to the only method of removing the evil—namely, the sinking of the sewers and drains many feet below the present level. The fact is notorious along the neighbourhood of Bankside, that long before the tide overflowed the quays and wharfs, the cellars and streets in the rear were filled with water, which came up through the several drains and cesspools, not only causing the greatest alarm and confusion, but inflicting much injury on the public health. The commissioners have at length been made sensible of this evil, and several hundred men are now actively employed in this most necessary undertaking. Mr. Rose, the architect of St. Saviour's, states that the whole of the mischief done both to health and to property by the supposed overflowing of the south bank of the Thames is attributable alone to the long-neglected and defective sewerage.

BRISTOL—SOUTHEY.—Some friends and admirers of the late poet-laureate, residing in Bristol and its neighbourhood, of which city the poet was a native, are desirous of marking the sense they entertain of his worth and genius, by the erection of a monument in the Cathedral. The Mayor, the Bishop of Gloucester and Bristol, Lord Jeffery, W. S. Landor, Esq., and J. Cottle, Esq., have headed a list of contributors.

YORK MINSTER BELLS.—Two of the bells, which complete the Beckwith peal, arrived at York on Saturday morning last.

RIVER DUN IMPROVEMENTS.—These improvements progress very satisfactorily. The company's workmen, numbering nearly one hundred, have commenced re-building the bridges on the line of the canal from Sandall to Stainforth. There are five bridges, and these for the future will be made of wood, and swing, in order that vessels in full rigging may be able to pursue their course along the river without any interruption. On the completion of the bridges, the passages in the canal underneath the bridges will be widened. The various bridges between Thorne Waterside and Goole have also lately received considerable improvements, especially Goole Bridge, which will now admit of the steam-packets passing to and fro with a space of eight feet to spare, where formerly there was only a few inches, to the great danger at that time of the steamers plying on the river. The River Dun Company are in treaty with the proprietors of the Stainforth and Keady Canal for the purchase of their canal, which would give a still better communication with Hull and Doncaster. The present draught of water in the river Dun is about six feet three inches, and in the Keady Canal seven feet. This, however, could easily be raised three feet, by taking eighteen inches from the bottom and laying it upon the tops of the banks. It is presumed, if the River Dun Company should purchase the Keady Canal, they will make a short canal in order to join the Dutch river, which would lessen the distance between Hull and Doncaster considerably. The distance is at present, either *via* Thorne Waterside or the Keady Canal, about fifty-two miles.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST.—The first wing of this institution, of which Prince Albert laid the first stone on the 11th ult., is now in progress. It is so planned as by successive additions to accommodate from 100 to 250 patients. The interior arrangements having, after very mature deliberation, been adopted by the medical officers and approved by gentlemen of experience in such matters, it is expected that the new hospital will offer facilities for treating consumption which no other institution possesses. In the warming and ventilation, the temperature will be made to approximate to different climates, and the atmosphere of particular apartments will be impregnated with various gases and vapours. A chapel, designed by the same architect, F. J. Francis, Esq., will be attached to the hospital.

YORKSHIRE ARCHITECTURAL SOCIETY.—On Tuesday week, a meeting of the committee of the Yorkshire Architectural Society was held in the society's museum, Minster-yard, York. At two o'clock in the afternoon, the meeting was opened to the public. The Venerable Robert Isaac Wilberforce, Archdeacon of the East Riding of Yorkshire, in the chair. A paper was read by the Rev. Charles Whately, rector of Rise, upon the architecture of Swine Church, and a highly interesting detail of an ecclesiastical ramble in the northern part of Yorkshire read by J. W. Huggall, Esq., of Oulton, being one of a party of three who recently visited the churches in that riding. The society having fitted up a large room belonging to the Dean and Chapter of York, will henceforth hold quarterly meetings in that city, the next meeting being fixed for the 24th of October.

ANCIENT RELICS.—The men employed in excavating the new road to Leckhampton-hall, on Tuesday last, in removing a tumulus, discovered the skeleton of a man, with his teeth entire. From a helmet and several portions of armour being found with the bones, it is conjectured to be the remains of a Dane, who from the manner of sepulture must have borne distinguished military rank, and which had rested in the peaceful grave for nearly one thousand years. This conjecture is the more probable, as some few years since a skeleton was disinterred at Shurdington, over which a stone with an inscription denoting who remains it covered was found.—*Cheltenham Examiner*.

York Minster was re-opened on Friday week, after having undergone a complete restoration.

The whole line of coast from Dover to the Land's End is to be surveyed, with a view to its fortification.

WINCHESTER.—It is recorded by Dr. Milner, the learned author of the History and Antiquities of Winchester, that the cathedral which existed before the present structure was commenced by Bishop Walkely, about the year 1080, extended some feet further to the west. This statement is now verified in a curious manner: from the long-continued drought, the grass growing over the spots where the foundations were presents the appearance of being burnt, and the plan of the foundations is as distinctly visible as if but just marked out. A similar result is produced in the meadow adjoining the College, called "the Elizabeth Mead," where the ground-plan of a church or chapel is clearly and distinctly defined by the burnt appearance of the grass. In this meadow formerly stood a College dedicated to St. Elizabeth, and a Chapel of St. Stephen. The plan of the building now visible is therefore that of St. Stephen's Chapel, or of the Church of the College of St. Elizabeth.—*Wiltshire Independent*.

KILMERSDON.—THE EMPEROR TRAJAN.—A silver coin of this reign, in excellent preservation, was lately dug up at Cherry Garden Farm, the residence of Mr. William Ford. The bust of the Emperor is executed in a remarkably bold and striking manner, surmounted with the initials S.P.Q.R. It must have been struck off soon after Trajan conquered the kingdom of Dacia, and added it as a province to the Roman empire, A.D. 103, as the word Dacia is on the coin, also his titles of Augustus, Germanicus, and Optimus Princeps—the last "the best of Princes," awarded to him for his virtues. On the reverse is an elegant figure of a female at full-length, probably of his Empress Plotina Pompeia. The die must have been a beautiful specimen of workmanship, far surpassing any that our mint can produce.—*Somerset Gazette*.

## Tenders.

TENDERS delivered for erecting a Grand Stand on Northampton Race-course.—J. Elliott, Architect.—June 28, 1844.

Whitney .....	£1,500
Fisher .....	1,368
Harris .....	1,477
Smith and Son .....	1,445
Robinson and Sparkes .....	1,265

TENDERS delivered for building nine third-rate Houses in the Old Kent-road, for John Gurney.—J. Bird, Esq., Architect.—June 29, 1844.

Harris .....	£5,900
Hall .....	5,619
Ashbey .....	5,495
Hains .....	5,494
Lawrence .....	5,287
T. Bursenshaw .....	4,971
Hadnutt .....	4,867

TENDERS delivered at the Board Room, Mount-street, for the erection of Industrial Schools at Little Chelsea.

## NOTICES OF CONTRACTS.

For certain alterations and additions at the Workhouse at Stamford Rivers, Chipping Ongar.—Plans, &c., at the Workhouse. W. Baker, Clerk. July 22.

For erecting two Chapels, Entrance Lodge, and necessary outbuildings, at the Cemetery now in progress on the Southampton Common. Mr. Dowell, Albion-place, Southampton. July 18.

For the erection of a Building on the premises of the Workhouse of the parish of St. Mary, Newington.—Plan, &c., Mr. Edmunds, Surveyor, Bridge-street, Southwark. July 15.

For certain alterations and additions to the Treadwheels, and for Air Pumps to be connected therewith, and also for certain Hand Crank Machines for hand labour at Norwich Castle.—Drawings, &c., at the Castle. For further information, Mr. Brown, County Surveyor, Norwich. July 19.

## The Builder.

NO. LXXVI.

SATURDAY, JULY 20, 1844.

**D**URING the time which has elapsed since public view was first given of the

Cartoons and Frescos which are now exhibiting in Westminster-hall, for a shilling each on Saturdays, and gratis at all other times, from 9 o'clock in the morning till 7 in the evening, we have up to the present time, by the generous duties of following important architectural

legislation, been unable to go into the merits of these works of art, which have been sent in, in order that a selection might be made of artists fit to have intrusted to them the care and honour, and, we trust, substantial profit, of decorating the new Houses of Parliament.

In the meanwhile, that selection has been made, and will, on the whole, we deem, be satisfactory. There are other artists among the exhibitors whose works are meritorious, and they may perhaps, upon further consideration, have confided to them some portions of the quantity of work, huge as we trust it must necessarily be.

The following is an account of the selections which have been made:—

The final meeting of the Commissioners of Fine Arts for the present season took place on Friday week, at Gwydyr House, Whitehall; when the opinion of that body on the merits of the respective artists contributing to the exhibition of fresco paintings and other works now on view in Westminster Hall, was formally pronounced by the selection of six individuals from among their number, whom it has been determined to commission to execute works on given subjects, for the decoration of the new Houses of Parliament.

The commissioners present were Viscount Palmerston, Lord Mahon, Lord Colborne, Mr. Macaulay, Mr. Gally Knight, Mr. Hawes, and Mr. Vivian. His Royal Highness Prince Albert, the President, and the other absent commissioners, having previously recorded their opinions in favour of the artists selected, no difficulty arose from their non-attendance, and some preliminary business having been transacted, the names of the successful competitors were declared as follows:—

Charles West Cope, Hyde Park-gate, Kensington-gore.

John Calcott Horsley, 1, High-row, Kensington Gravel-pits.

William Dyce, 1 A, Royal-terrace, Adelphi.

Daniel Maclise, 14, Russell-place, Fitzroy-square.

Richard Redgrave, Hyde Park-gate, Kensington.

William Cave Thomas, 27, Baker-street, Portman-square.

Mr. Cope, the first-named gentleman, received a first-class prize of 300*l.* for his cartoon of the "First Trial by Jury," in the exhibition of 1843. He has only one subject in the present exhibition—a fresco marked No. 53 in the catalogue, and entitled "The Meeting of Jacob and Rachel."

Mr. Horsley received a second-class prize of 200*l.* in 1843 for his cartoon of "St. Augustine Preaching to Ethelbert, and Bertha, his Christian Queen." He has two frescos in

the present exhibition—the one, No. 9, entitled "Prayer," the border to which was designed and painted by Mr. Owen Jones; and the other, No. 63, entitled "Peace."

Mr. Dyce's name did not appear in the catalogue of the cartoon exhibition last year, but he has a subject among the frescos now exhibiting. It is marked No. 66 in the catalogue, and entitled, "Two Heads, from a Composition, representing the Consecration of Archbishop Parker in Lambeth Chapel, A.D. 1559."

Mr. Maclise, the well-known artist, contributes to the present exhibition a fresco, unpretendingly described in the catalogue, "No. 74, The Knight."

Mr. Redgrave, a name also not appearing in the catalogue of 1843, is the artist of No. 51, among the frescos now exhibiting. It has excited considerable notice, and is entitled "Loyalty: Catherine Douglas barring the Door with her Arm to withstand the Assassins of James I. of Scotland."

Mr. Thomas was a successful competitor in 1843, having received an additional premium of 100*l.* for his cartoon of "St. Augustine preaching to the Britons." He contributes to the present exhibition three subjects: a cartoon, a fresco, and an oil painting, respectively marked—Nos. 52, 54, and 55.

The following is a copy of the circular addressed to each of the artists selected by her Majesty's Commissioners to execute certain designs for the decoration of the new Houses of Parliament:—

Whitehall, July 15.

"SIR,—I have to acquaint you that her Majesty's Commissioners on the Fine Arts, with the sanction of the Lords Commissioners of her Majesty's Treasury, have resolved that six arched compartments in the House of Lords, each measuring 9 feet 3 inches wide by 16 feet high to the point of the arch, shall be decorated with fresco paintings; that the subjects of such fresco paintings shall be illustrative of the functions of the House of Lords, and of the relation in which it stands to the sovereign; that the subjects of three of the said fresco paintings shall be personifications or abstract representations of religion, justice, and the spirit of chivalry; and that the three remaining subjects corresponding with such representations, and expressing the relation of the Sovereign to the Church, to the law, and, as the fountain of honour, to the State, shall be—the Baptism of Ethelbert; Prince Henry, afterwards Henry V., acknowledging the authority of Chief Justice Gascoigne; and Edward the Black Prince receiving the Order of the Garter from Edward III.

"I have further to acquaint you that the commissioners have resolved, with the sanction of the Lord Commissioners of her Majesty's Treasury, to employ six artists, selected by the commissioners from the present exhibitors in Westminster-Hall, to prepare designs for the subjects abovementioned, and that the commissioners have selected you as one of the six artists to be so employed, under the following conditions:—

"You are required to prepare a cartoon, being a design for one of the aforesaid subjects. The size of the cartoon is to be 9 feet 3 inches wide, by 16 feet high to the point of the arch, and 10 feet 3 inches high to the springing of the arch (outlines in lithography, shewing the form of the arch in the compartments referred to, may be obtained at the architect's office, New Palace-yard). You are further required to prepare a coloured sketch, not less than 18 inches in its shortest dimension, of the entire design represented in your cartoon, and a specimen of fresco painting, not less than 3 feet in its shortest dimension, representing a part of the design in the full proportion.

"You are required to send in such cartoon, coloured sketch, and specimen of fresco painting, during the first week in June, 1845, for exhibition, to Westminster-Hall.

"You are to be remunerated for the works aforesaid with the sum of 400*l.*; but the commissioners do not bind themselves to employ you finally on the fresco paintings in the House of Lords.

"I have further to acquaint you that the six subjects are distributed among the six artists as follows:—

"The subject of Religion is given to Mr. Horsley.

"The subject of Justice is given to Mr. Thomas.

"The subject of Chivalry is given to Mr. Maclise.

"The subject of the Baptism of Ethelbert is given to Mr. Dyce.

"The subject of Prince Henry, afterwards Henry V., acknowledging the authority of Chief Justice Gascoigne, is given to Mr. Redgrave.

"The subject of Edward the Black Prince receiving the Order of the Garter from Edward III. is given to Mr. Cope.

"I have further to acquaint you that, although the six subjects are required to be undertaken by and among the six artists, the artists are at liberty to exchange subjects; and that, although the commission given to each artist is for one only of the aforesaid subjects, each artist is at liberty to treat any one of the said subjects, in addition to the one subject, which he is commissioned to undertake.

"I have further to acquaint you that a general competition is invited among artists for designs for the same subjects, to be prepared by the time before specified; and that the six commissioned artists are not allowed to be competitors for the premiums offered for such designs.

"I am, Sir, your obedient servant,  
"C. L. EASTLAKE, Secretary."

It will be observed, from the last paragraph of this letter, that a general competition is invited; and as an encouragement to artists who have not been selected, the commissioners offer three premiums of 200*l.* each, for the best subjects produced. Thus another exhibition, perhaps exceeding in interest those already opened, will take place in the summer of next year. Advertisements, also, have been issued, offering premiums amounting to 3,000*l.* for designs painted in oil.

On the whole, those who have had their fears relative to the execution of fresco will, we imagine, not be disappointed, either by the exhibition or the selection. We think some one grand subject, requiring the expression of vast space and multitude, the management of the long-drawn perspective of cathedral architecture, or the gigantic effect of Druidical remains, should be given to John Martin, so that posterity may have preserved, in an honourable place, some good picture of that clever man's work.

With regard to fresco painting, we think a great improvement might be made upon it by rendering it in fact fresco-mosaic, the whole substance, except the rough under-ground-work of the plastering, being worked to the shapes of the cartoon with different coloured plasters, and with only the finer parts of the finish done in fact in fresco; this would prevent, in a great measure, the damage by chipping, whereby some of the trial-pieces have already suffered.

In the cartoons, we observe the same defect as in almost every thing else which has been exhibited for selection for the Houses of Parliament, viz. a want of propriety to the purpose in architecture and ornament. How very defective our schools of painting and sculpture are in this particular we must lament, because while this is the case, great danger exists that patrons will force upon the architect, against the sternness of his firm taste and belief, subjects which sin by being inappropriate for the purpose. In fact, designers, painters, and workers generally, now Gothic architecture has been so much revived, require to be in many cases re-educated, in order to do their work in a style right for such purposes.

We now proceed to give our own judgment upon the subjects of trial.

1. Encounter between Cæsar and Cassivellanus on the Banks of the Thames, second invasion. (Cartoon.) 15 ft. wide, 9 ft. high. By Henry Mellinger.

This subject is well plotted, forming a

bushy historical scene; though, perhaps, the faces of the figures do not sufficiently exhibit the excitement of battle.

5. Landscape and Figures, recollections of Naples. (Fresco.) The arabesque border in tempera. 8 ft. wide, 6 ft. 7 in. high. By Augustine Aglio.

This fresco has a depth of colouring, a sparkling brilliancy of light, contrasting effectively with shade, and a delicacy of execution, which, although the subject be not one suitable to the purpose, shews it to be, as far at least as outward appearance, apart from the question of durability, goes, the best in the exhibition. While viewing the perfect beauty of the mountain and skyey distance, in which there is a total freedom from that disagreeable, unnatural, and forcibly strong effect which is but too prevalent in frescos, the beholder forgets the meaner taste, the injurious and destroying effect of the more gaudy arabesque bordering which surrounds the work.

9. Prayer. (Fresco.—The border designed and painted by Owen Jones.) 3 ft. 2 in. wide, 4 ft. 2 in. high. By John Calcott Horsley.—The artist received a premium of 200*l.* in 1843, for a cartoon representing St. Augustine preaching to Ethelbert, and Bertha, his Christian Queen.

This fresco is, on the whole, well painted, though the figure has an unfinished effect, especially in the drapery, and this effect is exaggerated by the gorgeous richness of the border, which is beautifully executed, yet somewhat unsuitably for the architecture, being a cross-breed between the Byzantine and the Moresco styles.

14. The overthrow of the Druids. (A study in oil for fresco.) 14 ft. 11 in. wide, 9 ft. 11 in. high. By E. Butler Morris.—“Suetonius Panlinus finding that the island of Mona, now Anglesey, was the chief seat of the Druids, he resolved to attack it, and to subject a place which was the centre of their superstitions. The British women and priests were intermingled with the soldiers, running about with flaming torches in their hands; and tossing their dishevelled hair, they struck terror into the astonished Romans. But Suetonius exhorting his troops, impelled them to the attack, drove the Britons off the field, burned the Druids in the same fires which those priests had prepared for their captive enemies, and destroyed all the consecrated groves and altars.”

A very proper subject, but the effect of the figures of Britons is injured by the appearance of fright not being kept up in the faces; indeed, one figure, while its limbs exhibit the effect of intense fear, has a countenance which betrays rather satisfaction, and even a feeling of extreme beatitude rather than extreme terror.

15. (Cartoon) 6 ft. 10 in. wide, 6 ft. 5 in. high. By George P. Ag.

“Others more mild,  
Retreated to a silent valley, sing  
With notes angelic to many a harp,  
Their own heroic deeds and hapless fall  
By doom of battle: and complain that fate  
Free virtue should enthrall to force or chance.”

MILTON'S PARADISE LOST, Book ii.

Good, though the faces of the figures are too much alike.

19. Discovering the Body of Harold. (A study in oil for fresco.) 6 ft. 8 in. wide, 9 ft. 8 in. high. By E. Butler Morris.—“Two Saxon monks, Osgod and Ailrik, deputed by the Abbot Waltham, proceeded to the heap of slain that had been spoiled of armour and of vestments, and examined them carefully one after another, but he whom they sought for had been so much disfigured by wounds that they could not recognize him. Sorrowing, and despairing of succeeding in their search by themselves, they applied to a woman whom Harold, before he was king, had kept as his mistress, and entreated her to assist them. She was called Edith, and poetically called the Swan-necked. She consented to follow the two monks, and succeeded better than they had done in discovering the corpse of him whom she had loved.”

Of considerable merit, the colouring subdued; differing materially from the gross unartistic and unharmonious contrasts which pervade much of the ancient Roman, Byzantine, and modern Italian frescos; but the effect of torch-light is not sufficiently sparkling and brilliant.

23. A study. (Fresco.) 2 ft. 4 in. wide, 3 ft.

high. By Augustine Aglio, jun.—Shews good workmanship.

25. Council of Ancient Britons. Nucleus of the British Parliament. (Oil painting.) 11 ft. 1 in. wide, 8 ft. 10 in. high. By Wm. Riviere.—“The glory of the forest was once a simple acorn; in like manner (under Divine Providence) this mighty empire, from its rude and primitive state, has become the greatest among nations. Seated under a Druid, and listening to the counsel of a Druid, is represented an ancient British chief. On either side, the bard and counsellor. Reclining at his feet, a youth, whose office is armour-bearer. Dogs, used in war, and ancient Britons form the auxiliary group. The Druids, who were their priests, possessed great authority among them; thus the bands of government, naturally loose among that rude and turbulent people, were baply corroborated by the terrors of their superstition.”—HUME'S HISTORY OF ENGLAND.

Of considerable merit. In this cartoon the propriety of brilliant light, and depth of shade, and the effect of gradation of tone, are better preserved than in any other oil-painting or cartoon in the exhibition. It requires alteration to be made in some of the figures, the attitudes of which are too much in the Grecian-god-style.

27. Alfred the Great. (Oil painting.) 4 ft. 2 in. wide, 4 ft. 2 in. high. By Alex. Christie.

A capital performance; though the monarch is over-burthened with a heavy folio volume and other accoutrements, and the surrounding frame has the common defect of being too glaring.

28. A wounded Greek. (Fresco.) 3 ft. 3 in. wide, 4 ft. 3 in. high. By F. P. Stephanoff. The artist received one of the additional premiums of 100*l.*, in 1843, for a cartoon, representing the Brothers releasing the Lady from the Enchanted Chair of Comus.

“Oh, woman, in our hours of ease,  
Uncertain, coy, and hard to please;  
When pain and anguish wring the brow,  
A ministering angel thou.”

A beautiful and painter-like performance; yet though deep in colouring, perhaps a little too sketchy for the purpose.

36. Head of Alfred. (Fresco.) 2 ft. 8 in. wide, 2 ft. 6 in. high. By Harold John Stanley.—Clever.

37. Study for a Head of David. (Fresco.) 2 ft. 5 in. wide, 3 ft. high. By S. A. Hart.

“Unto Thee I lift up mine eyes,  
Thou that dwellest in the Heavens.”

123rd PSALM, verse 1.

Managed adroitly.

39. The Trial of Canute. (Cartoon.) 14 ft. 10 in. wide, 10 ft. high. By John Martin.—“Canute, from his warlike ability surnamed the Brave; from his renown and empire, the Great; from his liberality, the Rich; and from his devotion, the Pious. Canute seems to have been one of those men who feel that they are born to merit the approbation of future generations, and whose actions become sublimer as their name seems likely to be perpetuated. He lived to posterity as well as to his country. It was in this strain that having, in a moment of intemperance, killed a soldier, and by that criminal deed violated a law which he had enforced on others, he assembled his troops, descended from his splendid throne, arraigned himself for his crime, expressed his penitence, but demanded a punishment. He proclaimed impunity for their opinions to those whom he appointed his judges; and, in sight of all, cast himself humbly on the ground, awaiting their sentence. A burst of tears at his greatness of soul bedewed every spectator. They respectfully withdrew to deliberate, as he had required, and at last determined to let him appoint and inflict his own punishment. The king accepted the task. Homicide was at that time punishable by a mulct of forty talents. He fined himself three hundred and sixty, and added nine talents of gold as a further compensation.”—SHARON TURNER'S HISTORY OF THE ANGLO SAXONS, chap. 10.

The painter has, in this cartoon, produced his usual effect of great space, and of a vast multitude: the architecture, too, with Saxon column and arcade continued in long perspective, betrays the hand of this artist; but there is some want of the dignified effect of repose, which, in historical subjects, should accompany the action; the treatment is too dra-

matical for English history, and some of the figures are too short and fat to be elegant.

47. Wat Tyler. (Cartoon.) See No 28. 12 ft. wide, 8 ft. high. By F. P. Stephanoff.—“Tyler having ordered his men to retire till he should give them a signal, feared not to come into the midst of the royal retinue. He there behaved with such insolence, that Walworth, the mayor of London, not able to bear his rudeness, drew his sword and struck him to the ground, where he was immediately dispatched by the king's attendants. The rebels prepared for revenge, and the whole company would have been sacrificed to their fury, when Richard, with extraordinary presence of mind, turned to the enraged multitude, and cried, ‘What is the meaning of this disorder, my good people, are you angry that you have lost your leader? I am your king, I will be your leader.’”

A good cartoon; painter-like, but, perhaps, too busy in effect.

48. A Study. (Fresco.) 4 ft 9 in. wide, 5 ft. high. By E. Armitage.

49. A Bohemian Fortune-Teller. (Fresco.) 4 ft. wide, 5 ft. 1 in. high. By E. Armitage.

These figures are finely brought out by intense blue back-ground, yet their effect is unsatisfactory and unpainter-like.

51. Loyalty. Catharine Douglas barring the door with her arm to withstand the assassins of James I. of Scotland. (Fresco.) 3 ft. 11 in. wide, 8 ft. 2 in. high. By Richard Redgrave.—“Unattended even by a body guard, and confiding in the love of his subjects, James was residing within the walls of the Carthusian Monastery at Scone, which he had founded and endowed. Grabam, of Stathearn, seized the occasion and brought down a party by night to the neighbourhood. Seconded by traitors within, he gained possession of the gates and interior passages. The king's first intimation was from his eubearer, William Straton, who, on leaving the chamber in which the king and queen were at supper, found the passage crowded with armed men, who answered his cry of alarm by striking him dead. The noise reached the royal chamber, a rush of the assassins followed, and Catharine Douglas, one of the queen's maids of honour, springing forward to bolt the door of the outer apartment, found the bar had been clandestinely removed; with resolute self-devotion she supplied the place with her naked arm.”

A good single figure, with a clever sketch for the whole subject, to consist of two compartments besides the subject of the fresco.

53. The Meeting of Jacob and Rachel. (Fresco.) 4 ft. 9 in. wide, 7 ft. 4 in. high. By C. W. Cope.—“And Rachel came with her father's sheep; for she kept them. And it came to pass when Jacob saw Rachel, the daughter of Laban, his mother's brother, that Jacob kissed Rachel, and lifted up his voice and wept. And Jacob told Rachel that he was her father's brother, and that he was Rebecca's son; and she ran and told her father.”

A good subject, treated in a painter-like style.

52. The Throne of Intellect. (Cartoon.) 17 ft. wide, 9 ft. 6 in. high. By William Cave Thomas.—(This Artist, who is professor of fresco painting to the College of the Freemasons of the Church, received one of the additional premiums of 100*l.* in 1843, for a cartoon, representing St. Augustine preaching to the Britons.)

This beautiful cartoon, which is principally painted in neutrals, has gained for its artist the approval of the commissioners. The principal figure betrays a wonderful air of thoughtful intelligence, and an effect of sublime philosophy, truly inimitable.

54. Philosophy. (Fresco.) See No. 52. 5 ft. 3 in. wide, 7 ft. 9 in. high. By W. C. Thomas.

This fresco is of the principal figure in Mr. Thomas's cartoon, and is very fine in effect; though we think what it has gained upon the cartoon by colour it has lost by the background of gilding, which, in addition to its lowering the tone of brilliancy of the colouring, being upon the plastering, has a rough and Dutch-metal-like effect.

55. The Throne of Intellect. (Oil painting.) See No. 52. 17 ft. wide, 9 ft. 10 in. high. By W. C. Thomas.

This is the same design as No. 52. The

figures are in the style of Raphael, something too light, and as if prepared for the browning of time, and for a situation not over light; perhaps the extreme beauty of the separate figures outvies the merit of the whole composition. In drawing, in fresco, and in oil, this painter shews himself to be a man to be employed.

59. The Building of Oxford University. (Fresco.) 8 ft. 2 in. wide, 6 ft. 2 in. high. By Marshall Claxton.—“Alfred founded the University of Oxford, and endowed it with many privileges and revenues; he invited over the most celebrated scholars from all parts of Europe.”—HUME'S HISTORY OF ENGLAND.

A beautiful work; with colouring over-strong, seemingly purposely for the fading of time.

60. The Parting of Sir Thomas More and his daughter Margaret Roper. (Fresco.) By S. A. Hart.—“When Sir Thomas More came from Westminster to the Tower-ward again, his daughter, my wife, desirous to see her father whom she thought she should never see in this world after, and also to have his final blessing, gave attendance about the Tower Wharf, where she knew he should pass by, before he could enter into the Tower. There tarrying his coming, as soon as she saw him, after his blessing, upon her knees reverently received, she hastening towards him without consideration or care of herself, pressing in amongst the midst of the throng and company of the guard, that with halberds and bills went round about him, hastily ran to him, and there openly in sight of them all, embraced him and took him about the neck and kissed him, who well liking her most natural and dear daughterly affection towards him, gave her his fatherly blessing, and many godly words of comfort besides. From whom, after she was departed, she, not satisfied with the former sight of her dear father, and like one that had forgotten herself, being all ravished with the entire love of her dear father, having respect neither to herself nor to the press of people and multitude that were there about him, suddenly turned back again, ran to him as before, took him about the neck, and divers times kissed him most lovingly; and at last, with a full heavy heart, was fain to depart from him; the beholding whereof was to many of them that were present thereat so lamentable, that it made them for very sorrow thereof to weep and mourn.”

Very fine; the colouring and depth of tone good.

62. Milton dictating to his Daughters. (Fresco.) 8 ft. 1 in. wide, 5 ft. 6 in. high. By John Bridges.—(The artist received a premium of 100*l.* in 1843, for a cartoon representing Alfred submitting his Code of Laws for the approval of the Witan.)

“Of man's first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our woe,  
With loss of Eden, till one greater Man  
Restore us, and regain the blissful seat,  
Sing, heavenly Muse.”

“What in me is dark  
Illumine; what is low, raise and support;  
That to the height of this great argument  
I may assert eternal Providence,  
And justify the ways of God to men.”

An extremely beautiful composition—by singular coincidence having three figures much in the same position as those of Mr. Thomas's subject.

63. Peace. (Fresco.) 8 ft. 2 in. wide, 6 ft. high. By John Callcott Horsley.

A picture of sweet repose, in Raphael's style, over-light.

64. Death of Thomas à Becket. (Cartoon.) 9 ft. 7 in. wide, 12 ft. 4 in. high. By J. Cross. A very fine subject.

66. Two Heads, from a Composition representing the Consecration of Archbishop Parker in Lambeth Chapel, A.D. 1559. (Fresco.) 3 ft. wide, 2 ft. 5 in. high. By Wm. Dyce.

Of great merit; yet, perhaps, not sufficiently finished for a near view.

68. King John signing Magna Charta. (Fresco.)—The border painted in encaustic by William A. Parris.) 7 ft. 11 in. wide, 11 ft. 4 in. high. By E. T. Parris.—(The artist received a premium of 100*l.* in 1843, for a cartoon representing Joseph of Arimathea converting the Jews.)

A very fine subject; perhaps over rich, and in manner less quiet than Mr. Thomas's design.

The gilding and other ornamental work surrounding the picture, though mayhap over rich, are however, in taste better for the purpose than most which have been exhibited.

74. The Knight. (Fresco.) 6 ft. 2 in. wide, 8 ft. 2 in. high. By Daniel Maclise.

A fine subject, with rich colouring, which is, however, too much broken up into deep shady portions; it is painter-like, but falls of the harmony and repose shewn by Mr. Thomas's works.

75. Justice. (Fresco.) 4 ft. 2 in. wide, 6 ft. 3 in. high. By James Henry Nixon.

Colouring and finish good, but the outlines of the small figures not sufficiently subdued.

80. Luna and Endymion. (Fresco.) 8 ft. 3 in. wide, 5 ft. 5 in. high. By E. V. Ripplingill.—(The artist received one of the additional premiums of 100*l.* in 1843, for a cartoon representing the Seven Acts of Mercy.)

Very beautifully painted, though not a subject proper for the purpose.

We shall next week again take up the subject, and more particularly that of the sculptures, now exhibited with the cartoons and frescos, though a selection in this particular has also been made, as will be seen by the notice to that effect here subjoined. e.

#### ROYAL COMMISSION OF FINE ARTS.

IN addition to the selection of six artists to execute designs for frescos in the new Houses of Parliament, it will be seen from the subjoined interesting document, that her Majesty's Commissioners of Fine Arts have chosen three sculptors from among the number contributing to the exhibition in Westminster Hall, whom they recommend for employment on such works as may be hereafter required for the purposes of decoration in the New Palace.

The letter runs thus:—

“Whitehall, July 9, 1844.

“We the undersigned, having inspected the models for sculpture submitted to us in Westminster Hall, are of opinion that the exhibition is highly creditable to the country. We have recorded our judgment on the merit of many of the works of the exhibitors; but not being at present in possession of sufficient information as to the extent of the decorations in sculpture which may be considered desirable in the Palace at Westminster, or as to the time when such decorations may be required, we have thought it expedient to limit our present selection to those artists whom we consider have especially distinguished themselves in the exhibition referred to; and we hereby recommend the following artists—viz, W. Calder Marshall, John Bell, and John Henry Foley, for employment on such works in the Palace at Westminster, and for such remuneration as may hereafter be determined. At the same time, we wish it to be understood that the present selection does not by any means imply the exclusion of other sculptors, whether they may or may not have exhibited specimens of their ability on the present occasion.

“ALBERT.	“C. S. LEVEVRE.
“SUTHERLAND.	“R. PEEL.
“LANSDOWNE.	“J. R. G. GRAHAM.
“LINCOLN.	“T. B. MACAULAY.
“ABERDEEN.	“H. G. KNIGHT.
“PALMERSTON.	“B. HAWES, jun.
“MELBOURNE.	“L. ROGERS.
“MAHON.	“G. VIVIAN.
“ASHBURNTON.	“T. WISE.”
“COLBOURNE.	

Mr. Marshall has two works in the present exhibition, marked respectively in the catalogue No. 100 and No. 165, the one a full length of “Geoffrey Chaucer, the father of English poetry,” and the other a figure of “Eve.”

Mr. Bell contributes two models of sculpture—the one, No. 106, favourable known as “The Archer, or Eagle Slayer,” and the other, No. 134, a figure of Jane Shore. Mr. Bell also exhibits a cartoon (No. 81), entitled “The Angel of the Pillar.”

Mr. John Henry Foley has also two subjects, Nos. 155 and 156, the first being the figure of a youth at a stream, and the second a group of “Ino and the Infant Bacchus.”

#### THE NEW HOUSES OF PARLIAMENT.

The Select Committee, appointed to inquire into the present state of the building of the new Houses of Parliament, and to report thereon to the House, have, pursuant to the order of the House, examined the matters to them referred, and have agreed to the following report:—

Your committee have examined Mr. Barry as to the progress already made in the buildings of the new Houses of Parliament, and have endeavoured to ascertain from him the probable time that will elapse before the whole of the works can be completed, and the period at which the two Houses may be occupied for the transaction of public business.

He has stated to them, that, were it urgently required, the Houses, and a certain number of committee-rooms, and other offices, might be prepared for occupation at the commencement of the year 1846; but your committee do not feel themselves justified in affirming that such occupation could take place without inconvenience to the members, or impediment to the further progress and satisfactory completion of the building; and they think it right to observe, that the general arrangements for ventilation cannot be completed till the commencement of the year 1847.

Your committee have examined the Speaker, the Clerk of the House, and the Sergeant-at-Arms, as to various alterations which have been lately proposed in the interior arrangements of the House of Commons, and of some portions of the building immediately adjoining, and have to report that Mr. Barry will be able to adopt several valuable suggestions, which the experience of the officers of the House have enabled them to offer, without any increase of the expenditure already authorized.

Your committee have examined various parties as to the course hitherto adopted by Mr. Barry, with reference to alterations of the interior arrangements shewn in the plan approved by committees of both Houses in 1836. They impute no blame to Mr. Barry for that course, and have every reason to believe that all the alterations hitherto made have conduced to the convenience and general effect of the building; but looking to the misapprehension that appears to have prevailed as to these proceedings hitherto, they are prepared to recommend that in future Mr. Barry should make a half-yearly report of the progress of the works to the Commissioners of Woods and Forests; and should also submit to that board any alterations which may hereafter be deemed advisable, and accompany such report with plans of the alterations proposed.

Your committee further recommend, that as several alterations, entailing more or less expense, have recently been sanctioned by the Government, the Chief Commissioner of Woods shall, at the commencement of the next session of Parliament, lay upon the table of the House of Commons a statement of the total estimated cost of the building, according to the latest plan approved.

Your committee also suggest that a plan, prepared by Mr. Barry under their direction, and exhibiting the present state of the building, and the alterations adopted up to the present time, shall be signed by the Chief Commissioner of Woods, and deposited in the libraries of both Houses.

June 4, 1844.

TRAFALGAR-SQUARE.—The Earl of Lincoln and Mr. Young have introduced a bill to provide for the care and preservation of Trafalgar-square, in the city of Westminster. It enacts, that Trafalgar-square, and all the works now being, or which may be hereafter erected thereon, shall be vested in the Queen's Most Excellent Majesty, her successors and heirs, as part and parcel of the hereditary possessions and revenues of her Majesty in right of her Crown, within the ordering and survey of the Court of Exchequer. The care and management of the square, and of all the works therein, are invested in the Board of Woods and Forests.

On Wednesday last, Mr. T. Duncombe presented a petition from the distillers of London, praying that they might be exempt from the operation of the Metropolitan Buildings Bill.

**METROPOLITAN BUILDINGS BILL.**  
HOUSE OF COMMONS, TUESDAY, JULY 16.

The Earl of LINCOLN moved that the House go into committee on this Bill.

Mr. HAWES said that a paper had been laid on the table that morning containing more than a hundred alterations which were to be proposed. Now, he must protest against being called on to decide on all these alterations until he had heard something by way of explanation of those amendments. If he did not get a satisfactory explanation, he would oppose the Bill in all its details, and move the "previous question."

The Earl of LINCOLN said, that a more unfair ground of objection he had seldom seen, for nearly the whole of the alterations were merely verbal alterations, not at all affecting the principle of the measure; and, let him add, that he had, contrary to the general practice on such occasions, printed the whole of them for the information of hon. members. The hon. member for Lambeth had no later than last night informed him of his intention to move a variety of amendments to this Bill, but he had not informed him of the nature of even one of them. He regretted the opposition of the hon. member, but he should proceed with the Bill.

Mr. HAWES contended that many of the noble lord's proposed alterations were substantial and grave, and would require mature deliberation. He looked upon the bill as a complete warfare upon the whole trade of the metropolis, inasmuch as it interfered with every kind of building, great or small, and if the Bill had been in force at the time when those great undertakings, the docks and railway sheds, termini, and bridges were erected, they could not have been built under a heavy penalty unless the permission of the Commissioners of Woods and Forests were first obtained. If any person used any such building or bridge by walking over it, he would be subject to a penalty of 500*l.*; and any such building, bridge, dock, warehouse, or shed, having been built without such permission previously obtained, would be deemed a nuisance which the Commissioners of Woods and Forests would have power to abate by pulling down. Another provision of the Bill imposed a penalty of 50*l.* on any man employed in the erection of such buildings. On all these grounds he should move the previous question as an amendment to the motion for going into committee.

Mr. MACKINNON supported the amendment, and contended that, though the Bill contained many good points, it was in many others of its provisions directly the reverse of the recommendations of the committee from which it professedly emanated.

The Earl of LINCOLN said that the opposition of the mover and seconder of the amendment formed an apt illustration of the remark that extremes meet. The one hon. member objected to the Bill because, as he said, it went too far, and actually made war on the trade of the metropolis; while his seconder complained that it did not go far enough, and did not carry out some of the most useful recommendations of the committee. The noble lord went on to shew, that every practicable means had been adopted in the Bill for promoting the cleanliness, and, of course, the health of the metropolis; and that it interfered not with any private interest, further than was necessary for the protection of the public. The hon. member for Lambeth complained of what he termed the ridiculous minuteness of the Bill. No doubt the hon. member was a great critic in his way, but there was no style of phraseology would please him, as long as it emanated from the government. If the details of the Bill were so plain, as that all who ran might read, as he contended was the case with this Bill, still, there would be no pleasing him as long as the details were those of the government, and, of course, they must be wrong. The hon. member had not proved any one of his objections. His was simple allegation, and no more. He objected to having many public buildings, such as the theatres, included in the Bill; but did he recollect that a theatre had tumbled down, occasioning the death of some eight or nine individuals? Had a proper survey by competent architects been made, that accident could never have happened, nor could the accident at the ter-

minus of the railway at the Bricklayers' Arms have occurred had such a Bill as this been in operation. As to the question of patronage which had been created by the Bill, he defied the hon. member to bring in such a Bill with fewer appointments to carry it out. There were two referees, who must be architects, a registrar, and a clerk, which were not one-fourth the number of persons who had been considered by many to be necessary for carrying out the Bill. With respect to many minor objections urged by the hon. member, he would decline any notice of them until they went into committee, which was the proper place for their discussion.

Mr. TUFNELL objected to the Bill on the ground that it was an unwarrantable, because an unnecessary, interference with private property. He also objected to a Bill containing such various detail being brought in at this period of the session.

The house then divided, when the numbers were—

For the original motion . . . . .	39
For the amendment . . . . .	5
Majority . . . . .	—34

The house then resolved itself into committee on the Bill. A number of the clauses were agreed to, and some verbal amendments added.

WEDNESDAY, JULY 17.

The Metropolitan Buildings Bill was further considered in committee, and all its clauses from clause 55 were agreed to.

Schedule A was amended and agreed to. Schedule B being put from the chair,

Mr. HAWES protested against the manner in which the present Bill had been hurried on by the noble lord, notwithstanding his intention to propose some amendments in it was known. It was a mode of legislating upon measures of the utmost importance which was any thing but satisfactory; and he hoped that what he had said would go forth to the public. He did not despair, however, of throwing out the Bill in the other House (hear), where, at all events, it would have more attention than here. He had attended during the morning sitting in hopes of being able to bring on his amendments, but he had been called away, and, during his absence, the Bill had been thus hurried forward. He had no right, strictly speaking, to complain of the noble lord opposite, but he certainly did think, under the circumstances, that a little courtesy was due to him with respect to the progress of the measure. It was most unusual to press forward Government measures on a Wednesday, which was generally devoted to private business and motions. He, however, would not be diverted from his intention, but would propose his amendments on the bringing up of the report.

The Earl of LINCOLN hoped the hon. member would preserve that equanimity which he had displayed on a former evening respecting this measure. The hon. member could have no fair ground of complaint, for he (Lord Lincoln) had informed him that the Bill would be proceeded with on Wednesday. If the delay occasioned by the threatened proceeding were prejudicial to the measure, the hon. member would alone be to blame for it.

Mr. HAWES expressed his readiness to take the blame on himself.

The Earl of LINCOLN.—The hon. member had certainly expressed his intention of bringing forward some amendments, but it could not be expected that public business could be suspended or the progress of a most useful Bill jeopardized to meet the convenience of one hon. member. There never was a Bill which had received more mature consideration from all parties best able to judge of its merits than the measure before the house had done. It had been for two successive sessions on the table of the house, and it had been discussed in all the carpenters' and builders' societies on repeated occasions; so that there was no foundation or even excuse for the hon. member's observations. The government had no desire to smuggle the bill through the house. It was no party measure, nor had they any interest in it beyond the public good.

The schedule was then agreed to. Schedule C, No. 2, being read, Mr. HAWES proposed, that instead of the words "official referee," there should be inserted "district-surveyors."

The Earl of LINCOLN objected, as the

functions of the district-surveyors were strictly confined to ministerial offices.

The committee divided, when the numbers were,—

For the original words . . . . .	25
For the amendment . . . . .	10
Majority . . . . .	—15

On our readmission into the gallery, we found that Mr. HAWES had proposed another verbal amendment,

On which the committee divided. The numbers were—

For the amendment . . . . .	5
Against it . . . . .	29
Majority against the amendment . . . . .	—24

During our absence from the gallery (there not being 40 members present on the division) we understood that the Speaker resumed the chair, and several members having entered along with the right hon. gentleman, a house was made, and the proceedings of the committee were continued.

Mr. HAWES said he had no wish to obstruct public business; and certainly he had no right to complain of the conduct of the noble lord opposite (Lord Lincoln). At the same time he must say he thought it would have been more courteous if this Bill had been postponed till a later period of the evening. It appeared from this schedule that no person could erect so paltry a building as a greenhouse, within twelve or fifteen miles of London, without coming to Whitehall to ask the official referees to approve the plan. He thought this was a contemptible regulation. He would add, that he considered the Government ought to have taken care that a larger number of members should be present during the discussion of a Bill of this importance.

The Earl of LINCOLN said, he had before stated the reasons which had induced the Government to require that the plans should be submitted to the official referees, in preference to district-surveyors. The hon. member for Lambeth (Mr. Hawes) divided the House on that question, and his (Lord Lincoln's) impression was, that the hon. member took the division for the purpose of destroying the House.

Mr. HAWES begged to assure the noble lord that such was not his intention.

The Earl of LINCOLN begged the hon. gentleman's pardon. He must remind the hon. member that in some instances conservatories were erected in places of public resort, where any defect in their construction might be attended with great danger.

Mr. HUMPHREY wished to know whether the official referees were to determine what description of brick or of glass should be used in the construction of such buildings?

After some further conversation, it was agreed that the subject should be discussed on bringing up the report.

The schedule was then agreed to.

On schedule D.

Mr. HAWES objected to a portion of the schedule which gave to the official referees the power of determining the materials of which the foundation of external walls should be composed.

The Earl of LINCOLN said, that the hon. member for Lambeth must not suppose that the House was now legislating on this subject for the first time. This schedule, which related solely to the materials used in the construction of external walls, greatly modified the existing law, the provisions of which were most stringent.

The schedules of the Bill having been gone through,

Mr. HAWES felt it his duty to say that the summary of the Bill was highly creditable to the Board of Woods and Forests for the manner in which it was got up.

The CHAIRMAN reported progress, and the House resumed.

The Earl of LINCOLN said, he would fix the report for 12 o'clock to-morrow.

Mr. HAWES objected to the Bill being pressed on at this railroad speed. He hoped the amendments would be printed, to give time for their being read.

The Earl of LINCOLN said, every one of the amendments had been printed and circulated yesterday, and were of a purely technical and verbal nature. He would not hesitate to accede to the request of the hon. member if he did not think the delay would be the means of defeating the Bill.

Mr. HAWES said, unless the noble lord was prepared to say that the Bill would be defeated if the report were not brought up to-morrow, he must persevere and press for delay.

The Earl of LINCOLN said, unless he could send the Bill up to the House of Lords on Friday, he knew that strong opposition would be made to it on account of the period of the session, and an attempt would be made to defeat the Bill on that ground.

Mr. HUMPHREY said, this Bill was a most obnoxious Bill, and he would not allow it to pass unless the report were to be brought up on Monday, to give time for the amendments to be read. It was now 10 o'clock at night, and the idea of sitting at 12 o'clock next day to pass the Bill! There would hardly be a house. There were then, out of 658 members, but 15 present at the discussion of the Bill. He was very sorry hon. gentlemen were kept waiting for their dinners, but dinner was of no consequence to him. (Laughter.) He should divide the house on the question that the report be received on Monday. It was only fair.

The CHANCELLOR of the EXCHEQUER said the Bill had been fully considered, and he hoped the hon. member would withdraw his opposition to its further progress next day.

Mr. HUMPHREY.—No. I will divide the house.

The Earl of LINCOLN said, in the present state of the house, that would adjourn the house. The hon. member had paid very little attention to the Bill, and knew nothing about it.

Mr. HUMPHREY.—I beg your pardon.

The Earl of LINCOLN would tell the hon. member, that he would not consent to his proposal. The hon. member had not the power which he supposed he had. He should allow the house to be counted out, and the question would come on as a dropped order next day.

Mr. HUMPHREY said he had paid great attention to the Bill, and considered it to be an obnoxious Bill. He could not be in that House from 12 o'clock in the day till 12 o'clock at night. He should certainly count out the House.

The Earl of LINCOLN said, the hon. member should have the extreme satisfaction of taking the unfair advantage which he had done, and he (the Earl of Lincoln) would fix the report for 12 o'clock on Friday.
